

FLOODPLAIN FORWARD 2026

FLOODPLAIN FORWARD COALITION

Who We Are

The Floodplain Forward Coalition is an innovative collaboration between 35 organizations based in conservation, biology, water management, farming, and local government. We have come together to create a more sustainable path forward to support our fish, wildlife, cities, farms, and rural communities. By working together to find the best possible solutions, we can create vibrant landscapes and healthy California river systems for generations to come.

FLOODPLAIN FORWARD

A 35-member organization representing landowners, irrigation districts, higher education, and conservation groups. The coalition, and the collaborative model of dynamic conservation, has resulted in farms, refuges, and managed wetlands providing essential habitat for waterfowl and shorebirds as well as potential food production for endangered fish species.

How We Are Reconnecting the Floodplains

Read More

[Read more on the Four Critical Actions](#) ►

When the Sacramento River Basin is not in flood stage, we look to alternative ways to make the most of our water. Instead of having water leave the valley as quickly as possible, we are implementing functional flows which allows water from our rivers to come out onto the bypasses, ricelands, refuges, and riparian zones. This ensures the floodplains offer a diverse and critical landscape that support and protect life for a variety of species and

their needs. By slowing down the water and spreading it across the landscape in key times throughout the year, we are able to provide food for fish, habitat for migrating birds, flood protection for our cities and farms while replenishing our groundwater supplies. This only works on a large scale and with the collaboration of landowners, water managers, scientists and public agencies.

Why it Matters

The Sacramento River Basin is fertile ground for developing a new path forward for holistic water management that incorporates best available science and practical know-how of farm and refuge managers to reactivate the floodplain in a way that serves multiple-benefits. Our floodplains offer a place to grow crops – predominantly rice fields – in the spring and summer, while creating desirable habitat in the fall and winter when the fish and birds need it the most. We are trying to maximize value from every

inch of land and every drop of water in the Sacramento River Basin through the Floodplain Forward Coalition.

Through the necessary use of land, funding and permitting, we can create a system that benefits people and aids endangered wildlife species. If provided with adequate resources, we can demonstrate that the Floodplain Forward approach is climate resilient and ensures greater water security for all Californians today and into the future.

WADE CROWFOOT

California's Natural Resources
Secretary

We have to figure out how to modernize our water infrastructure and management systems for the new weather whiplash we are experiencing. Expanding floodplains is a really smart flood protection strategy; it protects communities under flood risk but it also allows us to restore our salmon population and create environmental habitat as fish, birds and wildlife are more stressed from climate change. It is a cost effective, smart, proven, multi-beneficial investment in our future.

In this time of climate change, which is fueling extended droughts and catastrophic fire, action is urgently needed to protect fish and wildlife resources and communities. Restoring floodplains through collaboration is a wonderful example of how we accomplish this task.

PAUL SOUZA

U.S. Fish and Wildlife Service,
Pacific Southwest Region
Regional Director

[Ridgetop to Rivermouth Approach](#) ►

A Functional Sacramento Valley Depends on Healthy Rivers, Landscapes and Communities.

The floodplains are at the epicenter of our ridgetop to river mouth approach – a nature-based solution to protect and restore our biodiversity while increasing the reliability of our water supply for cities, farms, fish, wildlife, hydropower production, and recreation.

N O R T H E R N C A L I F O R N I A

Floodplains

Spanning from Chico to the Delta and from the Sierra Nevada to the Coast Ranges, nearly the entire Sacramento River Basin is part of the historic floodplain that provided an abundance of habitat for fish and wildlife. Construction of levees and dams may have altered the landscape but the Floodplain Forward Coalition is working on innovative ways to reconnect the rivers to the floodplains while still providing critical flood protection.

Floodplains

Mountain Range

Rivers

Reactivating Floodplains in the Sacramento River Basin.

Marrying Sun, Land & Water, for a Bountiful Life.

Fish and Wildlife Habitat on Both Sides of the Levees

With today's knowledge of the landscape and scientific understanding of how wildlife interacts with these historical floodplains, we have improved our water management to mimic natural flows across the lands once seen here centuries ago.

Wet-Side Lands

Wet-Side Lands are located within the footprint of the current flood protection system, including the river channels, riparian zones and bypasses. Allows for fish to freely access during wet stages.

Dry-Side Farm Fields

are located outside the current flood protection system but were once part of the historical floodplain. Fish cannot access this side.

Wet-Side of Levees Lands within the Flood Protection Footprint

Projects within the river channel (i.e., riparian zones) and the bypasses (flood relief areas) create seasonal wetland

habitat desired by fish and wildlife. By managing the flows, we increase the duration of flood events and give the water residence time necessary to spur robust aquatic food production for our native species. Migratory birds use the flooded bypasses to rest and feed during their journey along the Pacific Flyway. Chinook salmon enter and exit the floodplain fields as directed by increasing or decreasing flows, thus providing them with high-density food foraging

opportunities, refuge from predators, and an unimpeded migration corridor to the San Francisco Bay.

These projects operate in conjunction with enhanced fish passage at various weirs to increase the frequency of floodplain activation and optimize adult fish passage through the bypasses. Inundation of the floodplain occurs during the late fall and winter months allowing for duck hunting and continued farming during the growing season.

Dry-Side of Levees Lands Protected by the Levees within the Historic Floodplain

When Dry-Side fields are flooded during the fall and winter months to decompose remaining rice straw, they become a haven for a large assortment of waterfowl and shorebirds during key migratory seasons. These ricelands are critical for providing rearing habitat as well as a rich nutrient food source as birds feed on bugs and leftover rice grain. However, fish cannot access these aquatic habitats naturally, which means special water management is implemented on ricelands and other managed wetlands (duck clubs and refuges) to create useful fish habitat.

This is done by holding water on these fields for several weeks during the fall and winter months which in turn produces abundant amounts of zooplankton and invertebrates (fish food). Fields are then periodically drained, transporting the food and water back to the river ecosystem. These projects have the potential to re-integrate several hundred thousand acres of historical floodplains and provide a critical food source for endangered fish populations.

Focused on the Fix.

Committed to Floodplain Reactivation

Landowners throughout the Sacramento River Basin are committed to projects that advance floodplain reactivation to

improve habitat for fish and wildlife, while maintaining farming and managed wetland operations. The historical floodplain has been divided by levees, yet there are actions being taken by landowners and agencies on both sides of the levees that reactivate the historical floodplain. Combining these actions mimic natural, shallow, long-duration

flood patterns and restores the ecological process that drives healthy and productive aquatic ecosystems.

Together, Wet-Side and Dry-Side water management strategies show tremendous promise for fish and wildlife populations on working lands.

How leading landowners and conservationists are united in using scientific solutions for fish and wildlife management on our floodplains

[Read More](#)

[Landowners](#) ► [Conservationists](#) ►

Conservation groups are teaming up with landowners throughout the Sacramento River Basin to help boost wildlife populations on working farmlands year-round. Fields, wildlife refuges, riparian zones, and the bypasses that are designed for flood protection, are being managed to work together for dynamic conservation efforts. Spreading out and slowing down water across the

landscape mimics natural flows and provides multiple benefits year-round by allowing farmers to cultivate rice and other crops for humans during the spring and summer, habitat for wild birds, reptiles, and other fauna in the fall, and food for migratory birds and native fish species in the winter.

Farming & Conservation

Julie Rentner

River Partners

If we can demonstrate strong collaboration and show the results of successful projects, we can enact change across the entire state.

Mary Wells

Land owner in Williams & Maxwell

There were those who said we'd have to choose farms over conservation or vice versa. We've had the opportunity to showcase that we can use our water to grow rice and benefit wildlife the year-round.

Fritz Durst

Tule Farms

We can't wait around to see the extinction of native species. We need diverse habitat and farm fields in the valley can now provide the floodplains these birds, fish and insects need to thrive.

Jacob Katz

California Trout

By integrating a working knowledge of natural process into the management of natural resources like rivers and farm land, we are demonstrating that it is possible to balance the needs of people and wildlife, even in the middle of one of the world's most productive agricultural landscapes.

Bryce Lundberg

Lundberg Family Farms

By flooding the fields, farmers across the valley are able to recreate a historic wetland habitat. The reemergence of the great Pacific Flyway demonstrates what is possible for all species.

Ann Hayden

Environmental Defense Fund

Figuring out smart ways to create functional habitat on working lands that result in measurable benefits for wildlife is key to developing resilient river systems that also meet human needs for drinking water and irrigation.

Virginia Getz

Ducks Unlimited

We are heavily reliant on agricultural lands for waterfowl habitat, which means it is more critical than ever that we work in partnership with farmers to ensure a balance for crops and wildlife.

MAKING HEADLINES

Los Angeles Times

Editorial: Restore California's floodplains to capture more stormwater, protect human life

[Link to Full Article](#)

California needs to restore its floodplains. Not the whole valley floors, and not as they were in the pre-development era. But it needs to have many more acres of land reserved for floodwater.

There are multiple benefits. The first is, of course, protecting life and property, because floodwaters are given a place other than city streets to gather. Beyond that, water that settles over floodplains percolates into the soil and, where the geology permits, recharges groundwater that has been dangerously depleted by agricultural over-pumping.

And restoring floodplains restores seasonal wetlands, which is good for the entire natural web that holds California together — including native plants that are less likely to burn during fire season than invasive species, fish that regain spawning habitat, migratory birds that find nesting areas, mammals that can once again migrate across the valley.

State must act now to head off future floods

[Link to Full Article](#)

Flood-plain restoration also increases habitat for endangered fish, water birds and even monarch butterflies. It locks up carbon dioxide, which helps fight climate change.

A 'Floating Fillet': Rice Farmers Grow Bugs to Help Restore California's Salmon

[Link to Full Article](#)

Carson Jeffres – an aquatic biologist with UC Davis – and Katz published a study last year that suggests that, when farmers and conservationists work together, there could be more fish in California Rivers. He thinks projects like this could help eliminate the popular farms versus fish argument.

A Return to Glory

The floodplains are not just a hopeful, unproven idea. They have shown to be vital in the health and wellness of people, fish and wildlife throughout history.

Through the success of ricelands, private lands, riparian zones and refuges working together as critical bird habitat, we have seen the dramatic return of migratory waterfowl along the Pacific Flyway over the last 30 years. Today, those same sites are also home to shore birds, reptiles and even endangered fish. As evident in the photo on the next page, more floodplain fatties may mean we see an increase in Chinook salmon spawning in our rivers once more.

When Spring arrives and the fish and birds continue on their migratory journey, these fields become productive crop lands that support people as well as provide the economic resources to manage the fields as habitat when wildlife returns.

In places like Butte and Putah creeks, this coalition has proven that working together to address critical life-cycle stages for salmon can lead to a robust return of migrating fish in our streams and rivers. This is truly a multi-beneficial model that can have profound impact on how we manage water and land in California. We are hopeful that with the necessary land, adequate funding and manageable permitting, we can create a system that benefits people and wildlife the year round. The Floodplain Forward Coalition is focused on the fix and we hope you will join us in solving one of California's biggest issues.

Collaborative Solutions: Benefiting People, Fish & Wildlife

The Floodplain Forward Coalition is a unique partnership of 35 organizations in farming, conservation, water management and local government that are making a difference by using land and water to benefit people and wildlife year-round. Our model proves that collaboration between public and private entities can have a positive and profound impact on our environment.

Reactivating the historic floodplains happens because we are focusing on the fix, rather than the fight. The trust we are building is the true answer to creating a sustainable way of life for people, fish and wildlife in California.
