

Subcommittee on Imported Water

Incorporating Climate Change in the Colorado River Post-2026 Guidelines Analysis

Item 3a

August 26, 2025

Item 3a Incorporating Climate Change in the Colorado River Post-2026 Guidelines Analysis

Subject

Incorporating Climate Change in the Colorado River Post-2026 Analysis

Purpose

To provide the Board with information on why hydrologic assumptions Reclamation will make when analyzing alternatives as a part of the Post-2026 NEPA process.

Next Steps

Continue efforts to provide the Board with information relevant to the Post-2026 NEPA process

Historically the Indexed Sequential Method Used for Developing Hydrologic Traces for Analysis

ISM Example
Hypothetical
Data
1901-2000

- USBR and Metropolitan have both used Index Sequential Method (ISM)
- 2020 IRP adjusted the ISM hydrologic traces to account for climate change

Potential Future	Forecast Year						
	Yr1	Yr2	Yr3	Yr4	Yr5	...	Yr30
Trace 1	1901	1902	1903	1904	1905	...	1930
Trace 2	1902	1903	1904	1905	1906	...	1931
Trace 3	1903	1904	1905	1906	1907	...	1932
Trace 4	1904	1905	1906	1907	1908	...	1933
Trace 5	1905	1906	1907	1908	1909	...	1934
Trace 6	1906	1907	1908	1909	1910	...	1935
	⋮	⋮	⋮	⋮	⋮		⋮
Trace 100	2000	1901	1902	1903	1904	...	1929

USBR Has Looked at Drier Conditions Over Time

Different Ways of Developing Hydrologic Conditions for Consideration

Observed History

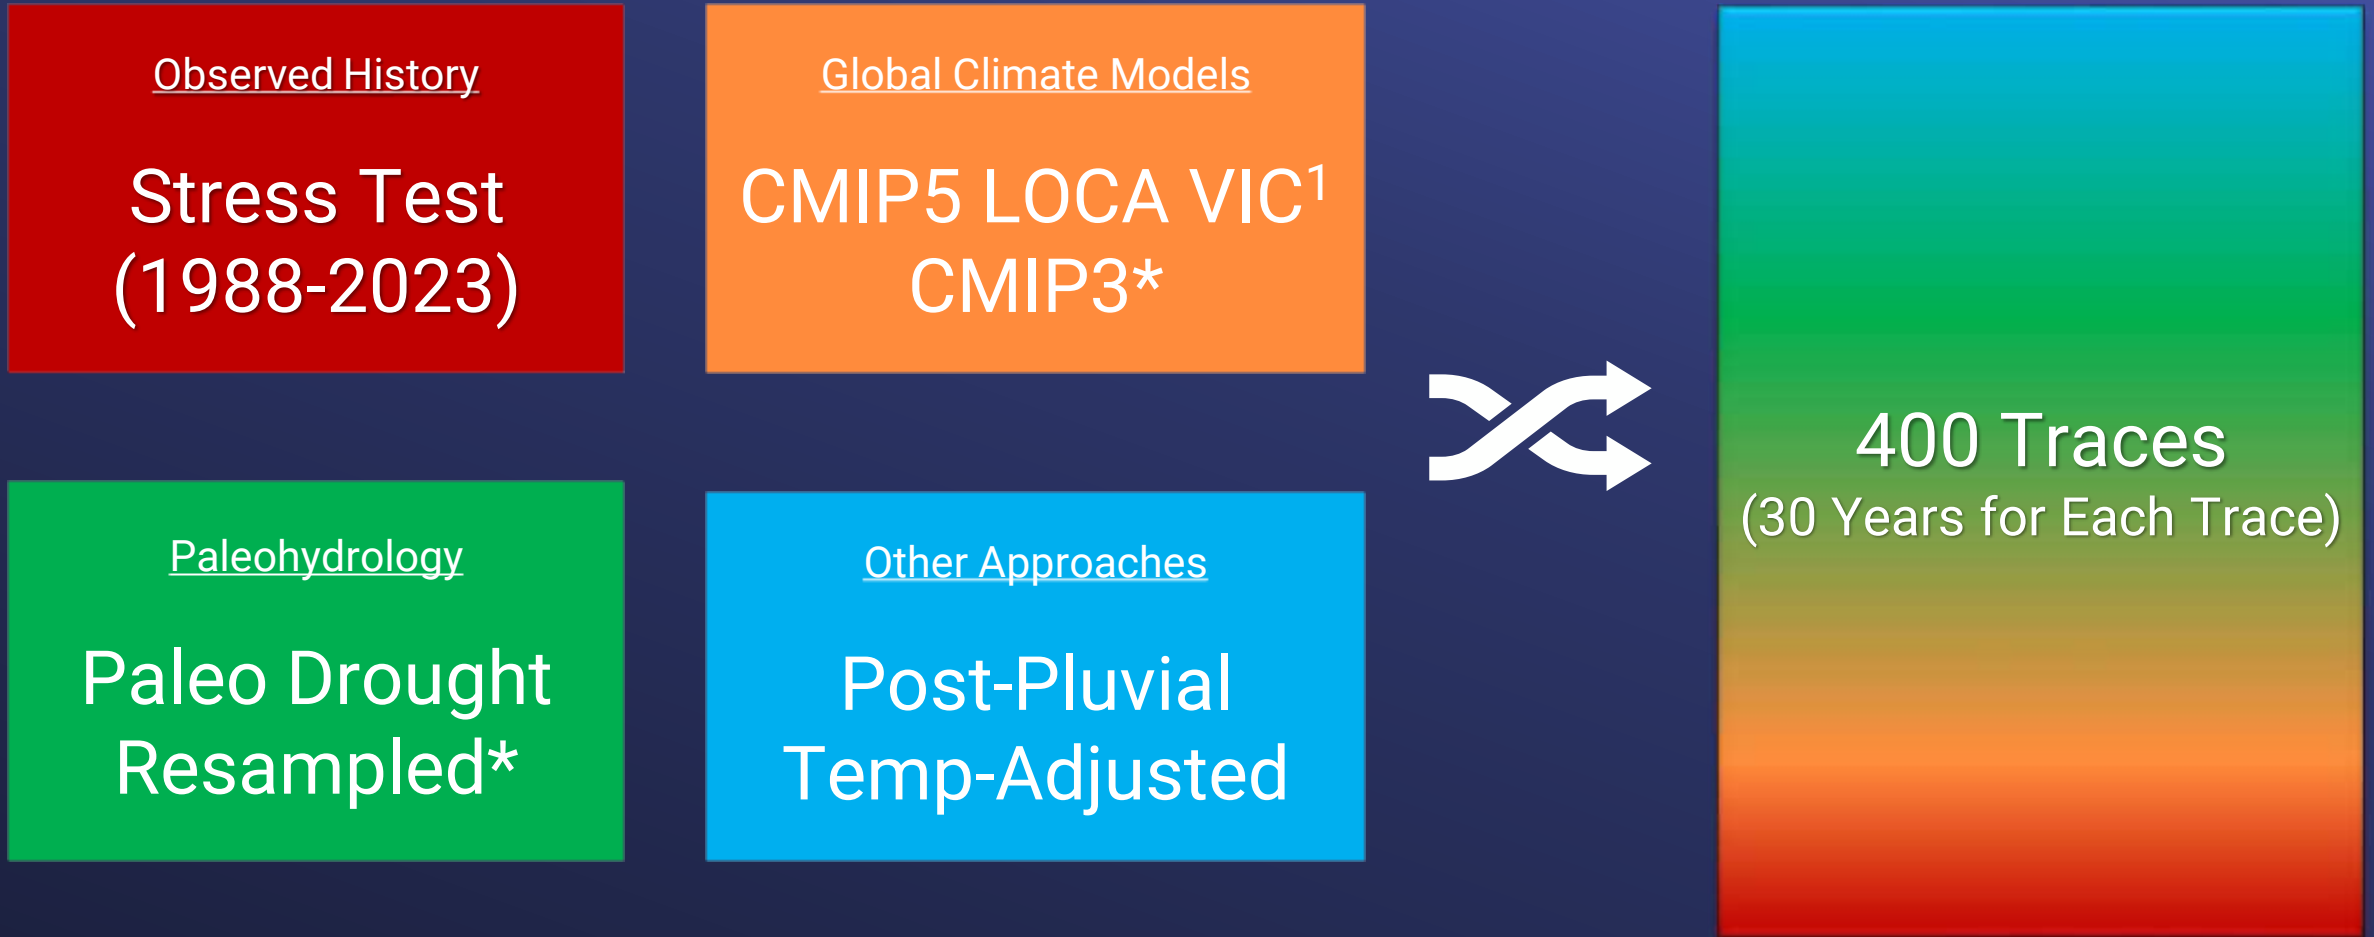

Global Climate
Models

Paleohydrology

Other Approaches

- Temperature Adjusted

What is USBR Assuming

¹ LOCA = Localized Constructed Analogs; VIC = Variable Infiltration Capacity

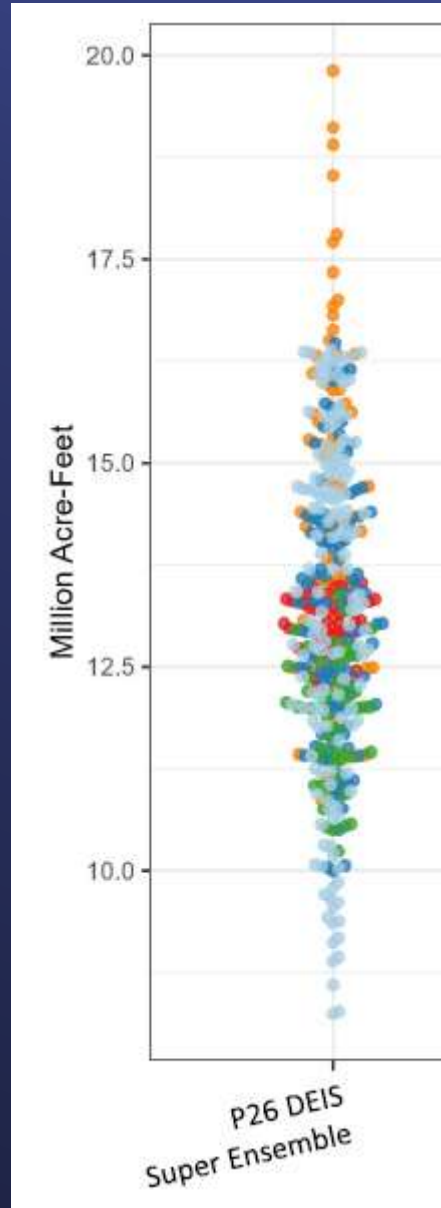

*A portion of the hydrology set was used to develop the Super Ensemble

Using
Hydrology
from
Multiple
Approaches
Provides
Coverage for
Unknown
Future

USBR Evaluating Hydrology in Many Ways

- Annual Average Runoff
- Annual Minimum
- Annual Maximum
- Min/Max/Median of 2-year to 20-year running averages
- 30-year trend

2027-2056 Annual Average of each Trace

The Super
Ensemble is
Comprehensive

Wide Range of
Annual Average
Conditions

20 MAF – 8.5 MAF

A Shift is Needed When Thinking About Results

Understanding the Likelihood of a Given Future

Simulate Every Possible Future

Identify the Conditions that Cause Undesirable Outcomes

DEIS Evaluation: Robustness and Vulnerability NOT Probability

Robustness

- A property of how well an alternative performs over many possible futures
- Provides information about outcomes across large numbers of traces
- Robustness thresholds represent a desirable outcome

Vulnerability

- Vulnerability analysis discovers the conditions that cause a strategy to have unacceptable performance

Percent of the 400
Traces

Robustness

Example Robustness Definition:

Performance will be acceptable if the Mead Pool Elevation stays above 1,050 feet 80% of the time or more over the next 20 years.

Robustness Example

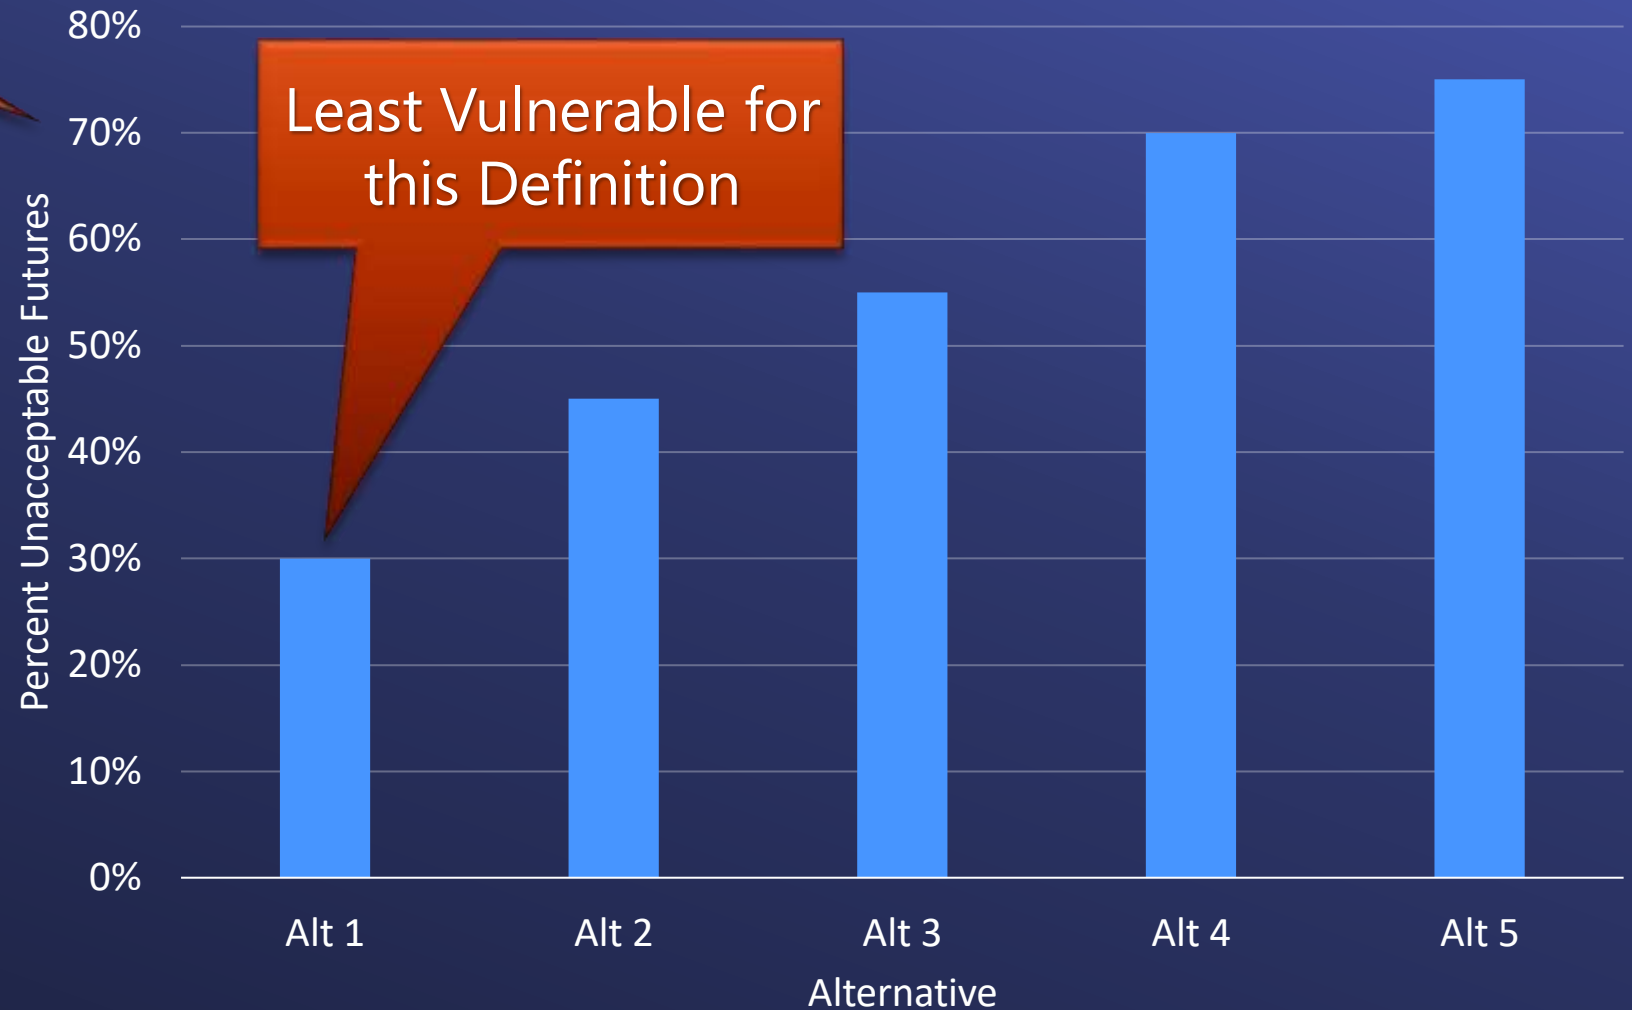

Percent of the 400
Traces

Vulnerability

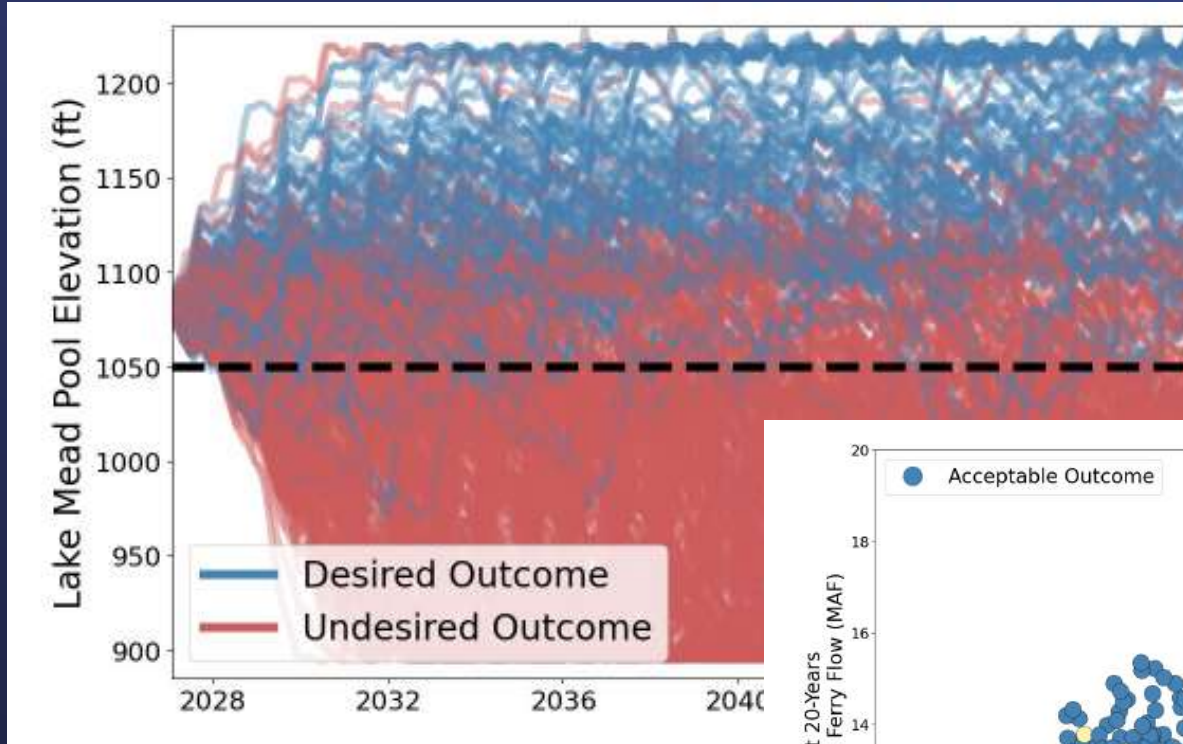

Example Vulnerability Definition:

Performance will be unacceptable if the Mead Pool Elevation stays below 1,000 feet 10% of the time or more over the next 20 years.

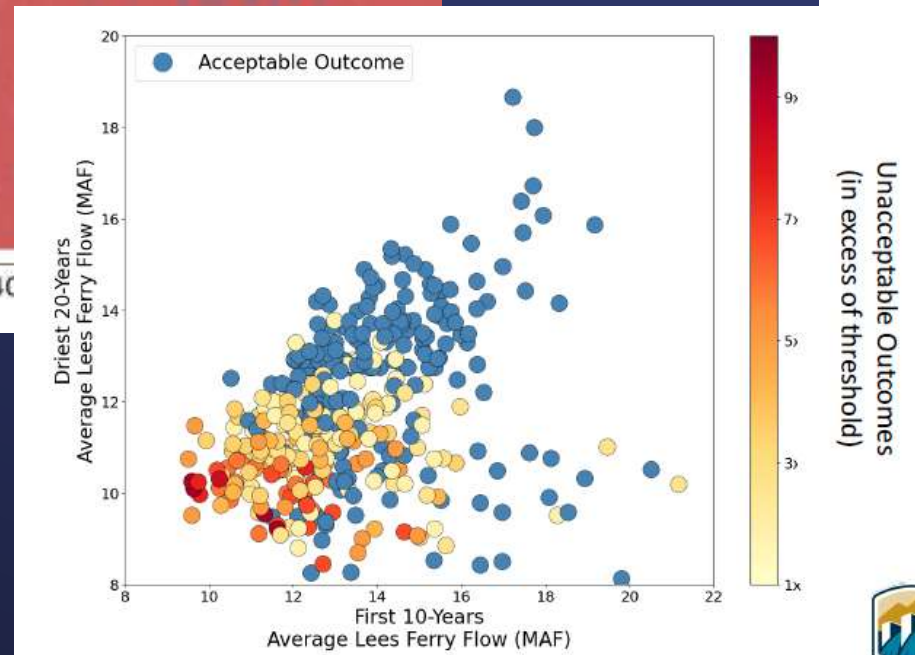

Vulnerability Example

There are Many Ways to Display Robustness and Vulnerability Metrics

Boxplot Legend

Additional
Information
is Available
