

# Adopt the 2020 IRP Regional Needs Assessment

Integrated Resources Plan Special Committee

Item 7-1

March 22, 2022

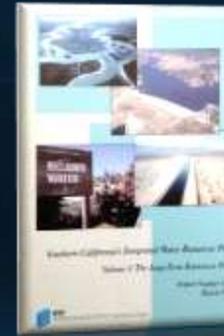

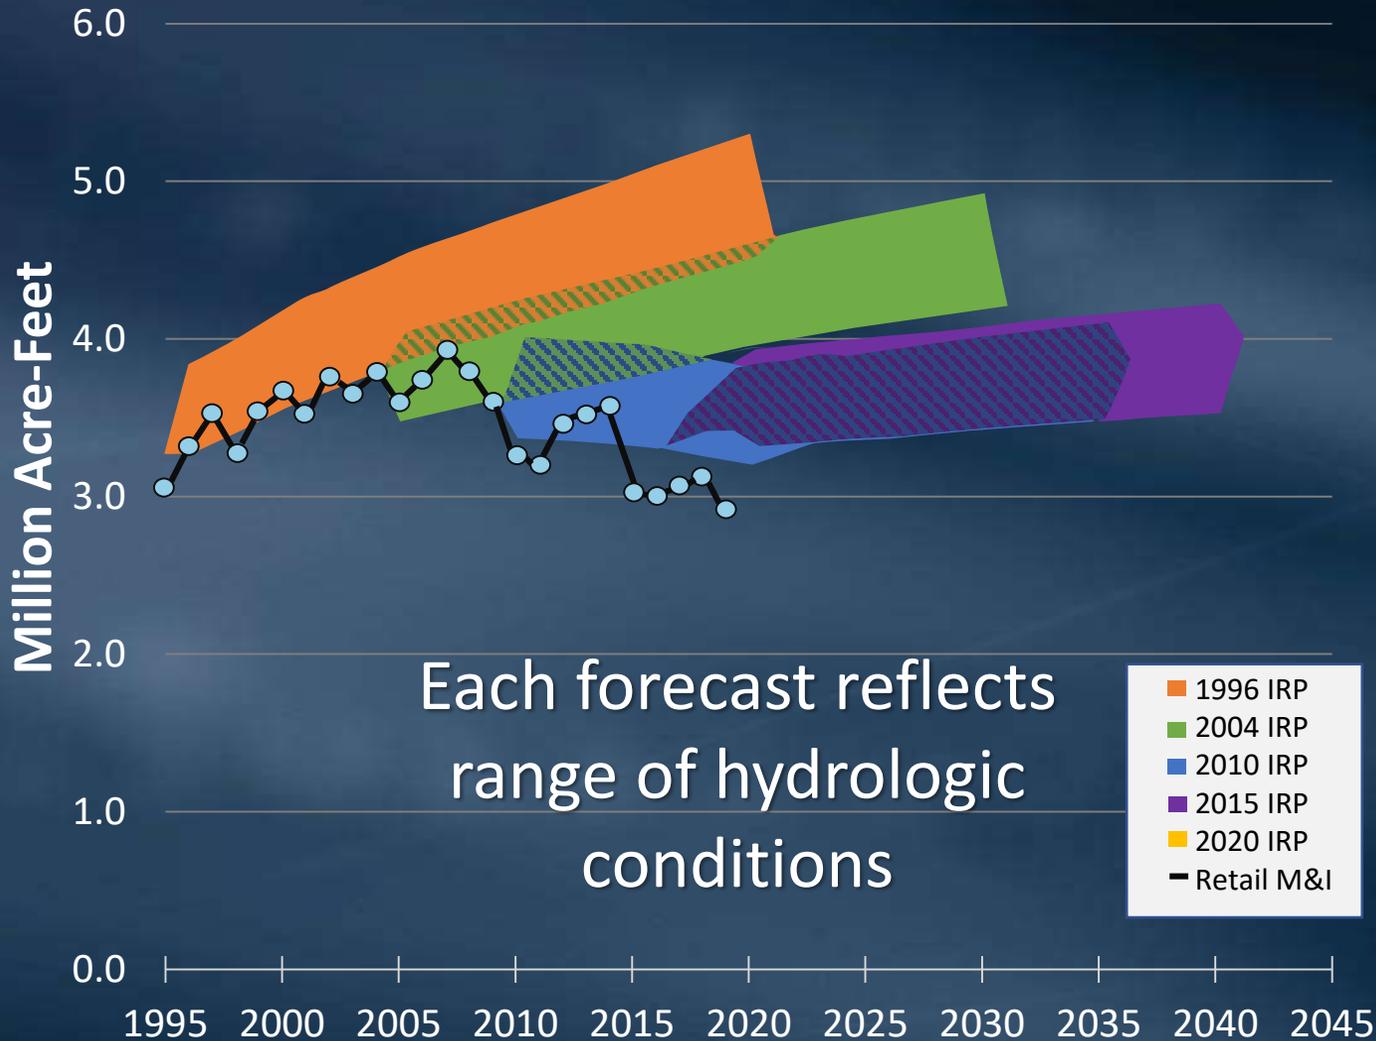

# Outline

- IRP Purpose and Evolution (1996 to present)
- Findings
- Collaboration and Analysis

# Ensuring Regional Water Reliability

- The Integrated Water Resources Plan (IRP) establishes a long-term comprehensive water resources strategy
- Since its inception, the IRP has been at the forefront of innovative ways to address water reliability and is consistent with and supports the One Water philosophy
- Metropolitan is guided by statutory directives (MWD Act Sections 130.5 (b) and 130.7) that set priorities for new water supply investments
- 2020 IRP incorporates scenario planning to address wide-ranging uncertainties

# Evolution of the IRP

## 1996 IRP

- 1987-1992 Drought
- Preferred Resource Mix

## 2004 IRP

- Colorado River cutbacks
- Planning Buffer

## 2010 IRP

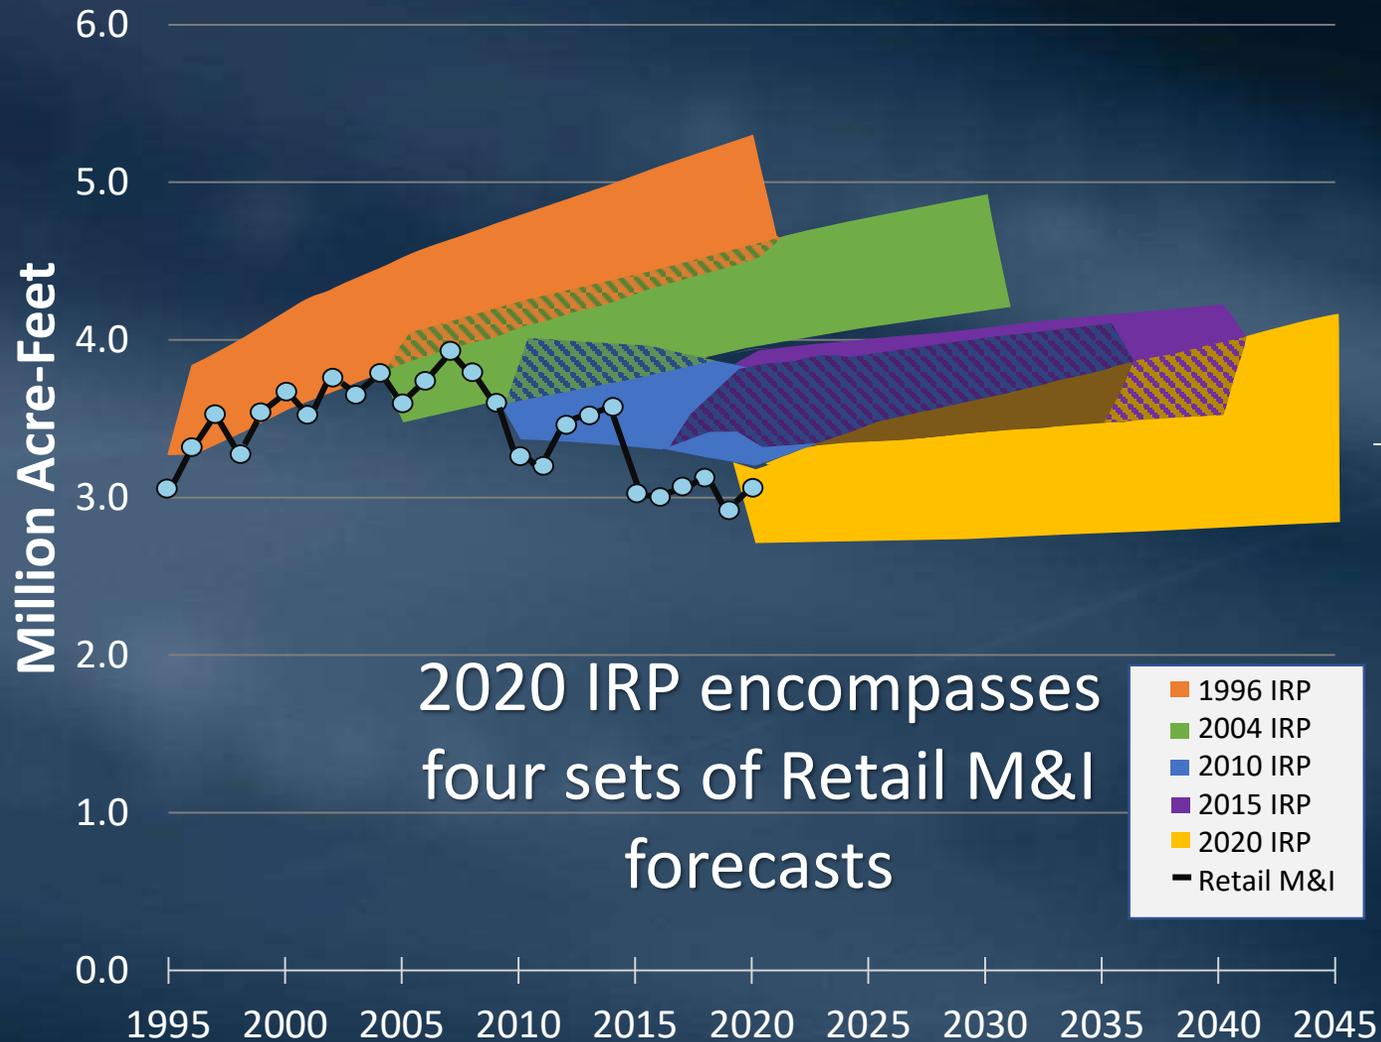

- SWP cutbacks
- Adaptive Management Strategy

## 2015 IRP

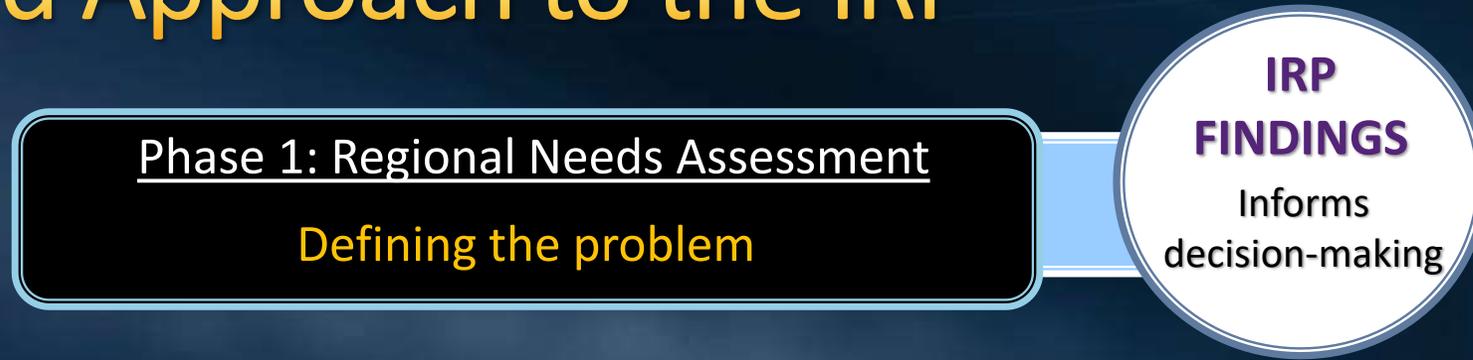

- 2012-2016 Recession and Drought
- Emphasis on outdoor conservation and local resource protection and development

# Evolution of the IRP

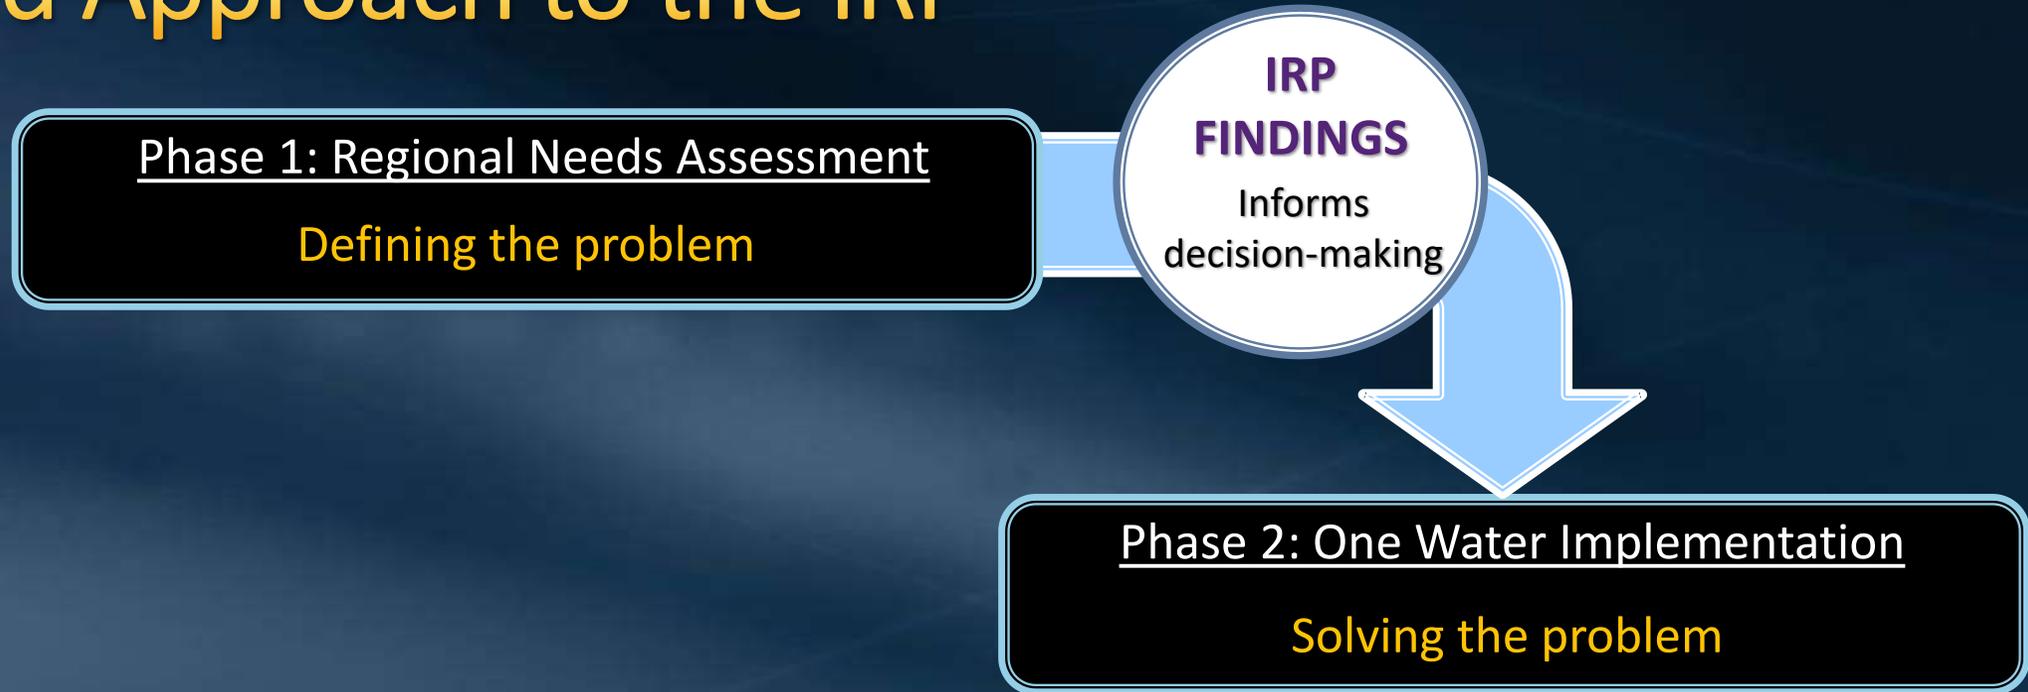

- Scenario planning takes a step forward from prior IRPs
- Reflects a range of hydrologic conditions and incorporates a broader range of outcomes for underlying uncertainties
- Increases preparedness, improves resiliency, and manages vulnerabilities

# A Phased Approach to the IRP

- Phase 1: Regional Needs Assessment serves as a stand-alone guide for Southern California's uncertain water supply future

# A Phased Approach to the IRP

- Phase 2: One Water Implementation will use the results and findings from Phase 1 as a basis for development and evaluation of potential policies, programs, and projects
- Phase 2 should also develop a comprehensive adaptive management strategy and evaluation criteria based on the key drivers of uncertainty to guide specific actions

# Recommending Adoption of IRP Assessment

- Surplus/Shortage - Quantified for each scenario
- Portfolio Categories - Examined for effectiveness
- Findings - Grouped into five focus areas

SWP Dependent  
Area

Storage

Retail Demand/  
Demand  
Management

MWD  
Imported  
Supplies

Local  
Supply

# FINDINGS – SWP Dependent Areas

- Vulnerabilities in the SWP Dependent Areas are more severe given reduced reliability of SWP supplies and Metropolitan distribution system constraints. Actions identified in the implementation plan will address the area's reliability challenge.

**Vulnerabilities in the SWP Dependent Area are more severe due to reduced SWP supply reliability and limited access to existing storage and CRA supplies**

- New core supplies and existing core supplies will improve access to storage and CRA supplies, will improve reliability, and will improve access to Metropolitan's distribution system.
- Enhanced accessibility to SWP Dependent Areas and Metropolitan's distribution system will improve reliability and access to storage and CRA supplies.
- Storage capacity, performance, and reliability for the SWP Dependent Areas should be consistent with the portfolio analysis. New storage must be accessible to the SWP Dependent Areas.

# FINDINGS – SWP Dependent Areas

- Vulnerabilities in the SWP Dependent Areas are more severe given reduced reliability of SWP supplies and Metropolitan distribution system constraints. Actions identified in the implementation phase must prioritize addressing the SWP Dependent Area's reliability challenge.
- New core supplies must be accessible to the SWP Dependent Areas. Greater access to existing core supplies can also increase SWP Dependent Area reliability.
- Enhanced accessibility to core supplies and storage, both existing and new, will improve SWP Dependent Area and overall reliability. This includes improvements to Metropolitan's distribution system and capacity to deliver non-SWP supply and storage.
- Storage capacity, put/take capabilities, and accessibility are critical considerations for the SWP Dependent Area. New storage capacity and put/take capabilities should be consistent with the portfolio analysis. New storage must be accessible to the SWP Dependent Areas.

# FINDINGS – Storage

**New storage helps. Increasing accessibility to existing storage and/or developing new storage accessible to the SWP Dependent Area helps achieve reliability.**

- Storage capacity, put/take capabilities, and accessibility are critical considerations in maintaining reliability of the system under various conditions, especially for SWP Dependent Areas.
- Maintaining Metropolitan's ability to meet the needs of the SWP Dependent Areas, including the consideration of storage, is a key element of the Integrated Resources Plan.
- Expanding existing storage capacity and/or developing new storage accessible to the SWP Dependent Area helps achieve reliability. Metropolitan's development to meet the needs of the SWP Dependent Areas, including the consideration of storage, is a key element of the Integrated Resources Plan.
- When evaluating storage options, Metropolitan should consider the impact of storage on the system's ability to meet the needs of the SWP Dependent Areas; even storage programs with modest put/take capabilities help reduce the need for flexible supply.

## FINDINGS – Storage

- Storage capacity, put/take capabilities, and accessibility are critical considerations in maintaining reliability under the region's current and future conditions, especially for SWP Dependent Areas.
- Maintaining Metropolitan's existing storage portfolio is critical, including the consideration of re-negotiating contracts when they expire.
- Expanding existing or developing new storage programs and investments in Metropolitan's distribution system can reduce the need for new core supply development to meet potential future shortages and adapt to climate change.
- When evaluating storage options, put/take capabilities are essential; even storage programs with modest put/take capabilities help reduce the need for flexible supply.

## FINDINGS – Retail Demand/Demand Management

- Metropolitan's future supply reliability may fluctuate based on demand increases and decreases.

- Variability in retail water use. Outdoor water use is highly variable based on climate and by implementing conservation measures.

- It is important to focus on demand reduction measures to ensure long-term water security.

- Managing long-term water demand is critical to reducing the dependency on external water sources.

need for extraordinary conservation measures.

**Managing retail water demand is very important. Focusing on outdoor water use efficiency measures can help mitigate the impacts of climate change.**

door water use is highly variable based on weather and climate conditions. Implementing conservation measures can help reduce outdoor water use.

growth, and water conservation is necessary.

ter reduces outdoor water use and helps to reduce the

## FINDINGS – Retail Demand/Demand Management

- Metropolitan's future supply reliability may fluctuate based on demand increases and decreases.
- Variability in retail demand largely comes from changes in outdoor water use. Outdoor water use behavior is complex, influenced by weather and climate and by awareness of water scarcity and other conservation measures.
- It is important to pay attention to demand rebound, demand growth, and demand reductions, and take appropriate regional measures as necessary.
- Managing long-term demands through the efficient use of water reduces dependency on supplies, helps preserve storage, and helps reduce the need for extraordinary conservation measures.

# FINDINGS – MWD Imported Supplies

- Existing imported supplies are at risk from various drivers of uncertainty.
- Maintaining existing imported supply reliability reduces the need for new core supply development and the associated financial and operational risks.
- SWP supplies are at risk from climate change, and regulatory restrictions.
- Variability and capacity constraints during wet periods for use in storage reduce the ability to distribute or store water, reducing system reliability, particularly during wet periods. Colorado River Aqueduct storage.
- Shortages on the Colorado River Aqueduct deliveries as a core supply in the future.

**Stable imported water supplies help achieve reliability and leverage storage. Further erosion of imported supplies increases the need for potentially costly new core supply development.**

# FINDINGS – MWD Imported Supplies

- Existing imported supplies are at risk from various drivers of uncertainty.
- Maintaining existing imported supply reliability reduces the need for new core supply development and leverages years of investments.
- SWP supplies are highly susceptible to varying hydrologic conditions, climate change, and regulatory restrictions.
- Variability and capacity in SWP supplies provide opportunities to store water during wet periods for use in dry years, including Colorado River storage. Metropolitan's ability to distribute or store SWP supplies when they materialize will enhance the region's reliability, particularly the SWP Dependent Areas. The Colorado River system and Colorado River Aqueduct capacity do not offer the same opportunities concerning SWP storage.
- Shortages on the Colorado River will limit the reliability of Colorado River Aqueduct deliveries as a core supply in the future.

# FINDINGS – Local Supply

- Maintaining existing and developing new local supplies is critical in helping meet the water needs of the Metropolitan Water Resources Council.
- Impacts to reliability are not achieved; the success of local supply development is affected by the lack of local supply development. Implementing local supply development is critical to the future of the Metropolitan Water Resources Council.
- Additional and improved local supply development is needed to meet the future water needs of the Metropolitan Water Resources Council.

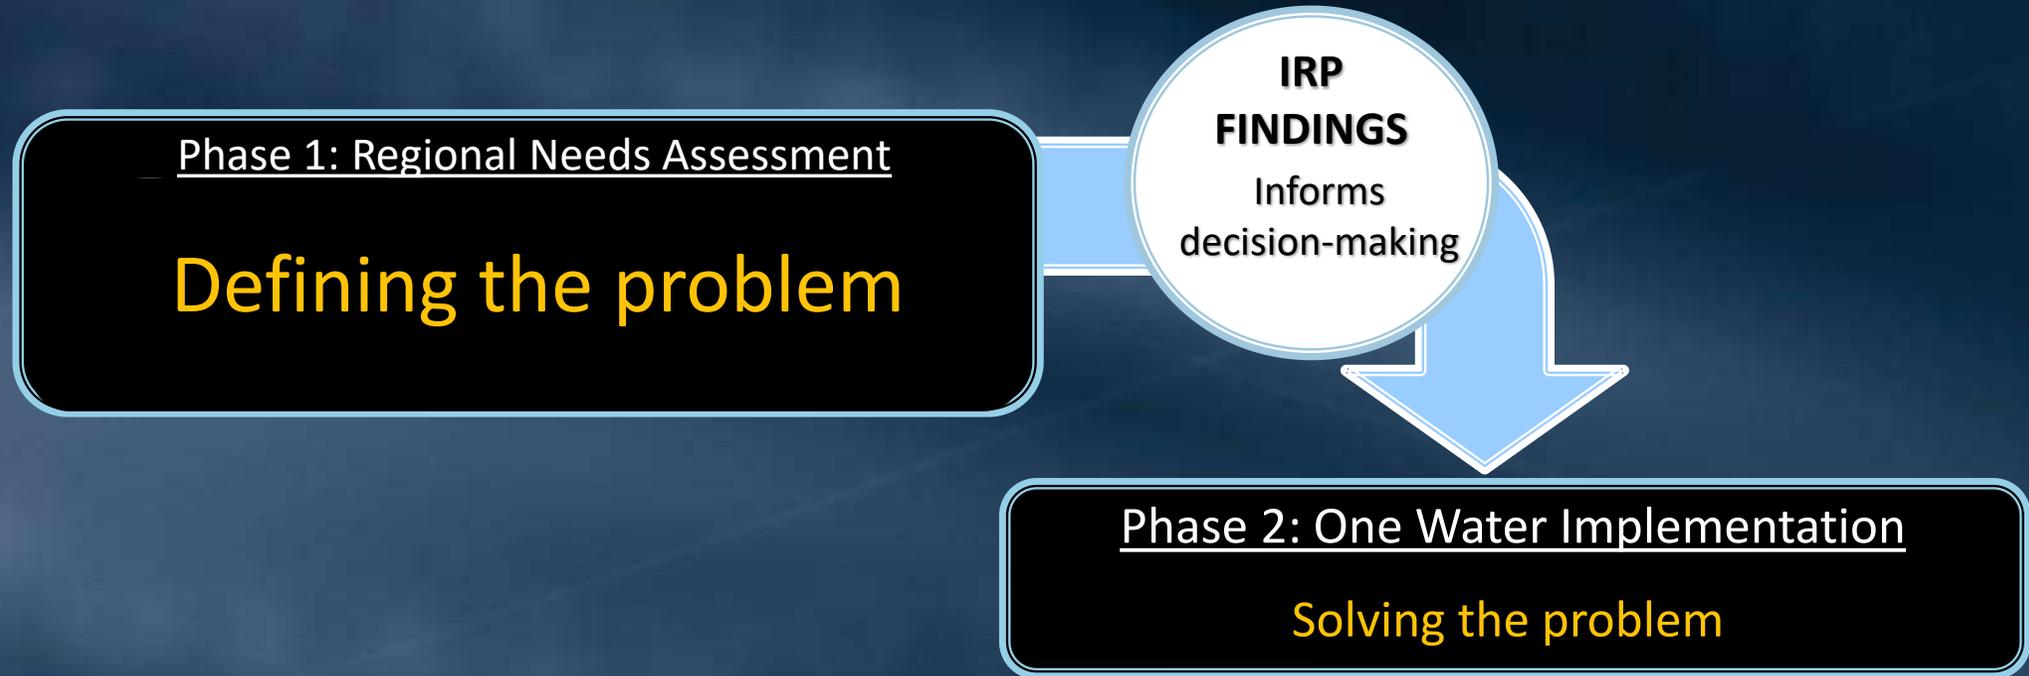

**Demand on Metropolitan is affected by local supply production. Lower than assumed local supply will impact reliability and need for further investment**

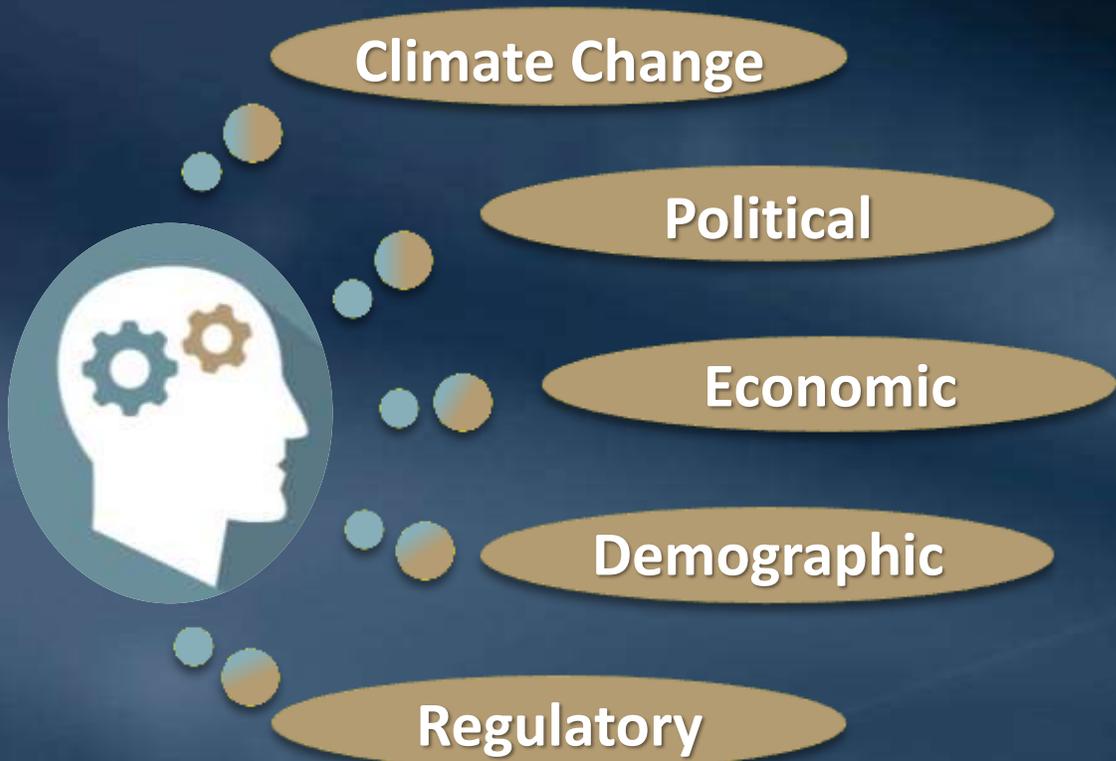

## FINDINGS – Local Supply

- Maintaining existing and developing new local supplies is critical in helping manage demands on Metropolitan.
- Impacts to reliability occur if local supply assumptions are not achieved; therefore, it is important to track the progress of local supply development as one of the signposts in the One Water Implementation phase.
- Additional actions may be needed should existing and future local supply levels deviate from IRP assumptions.

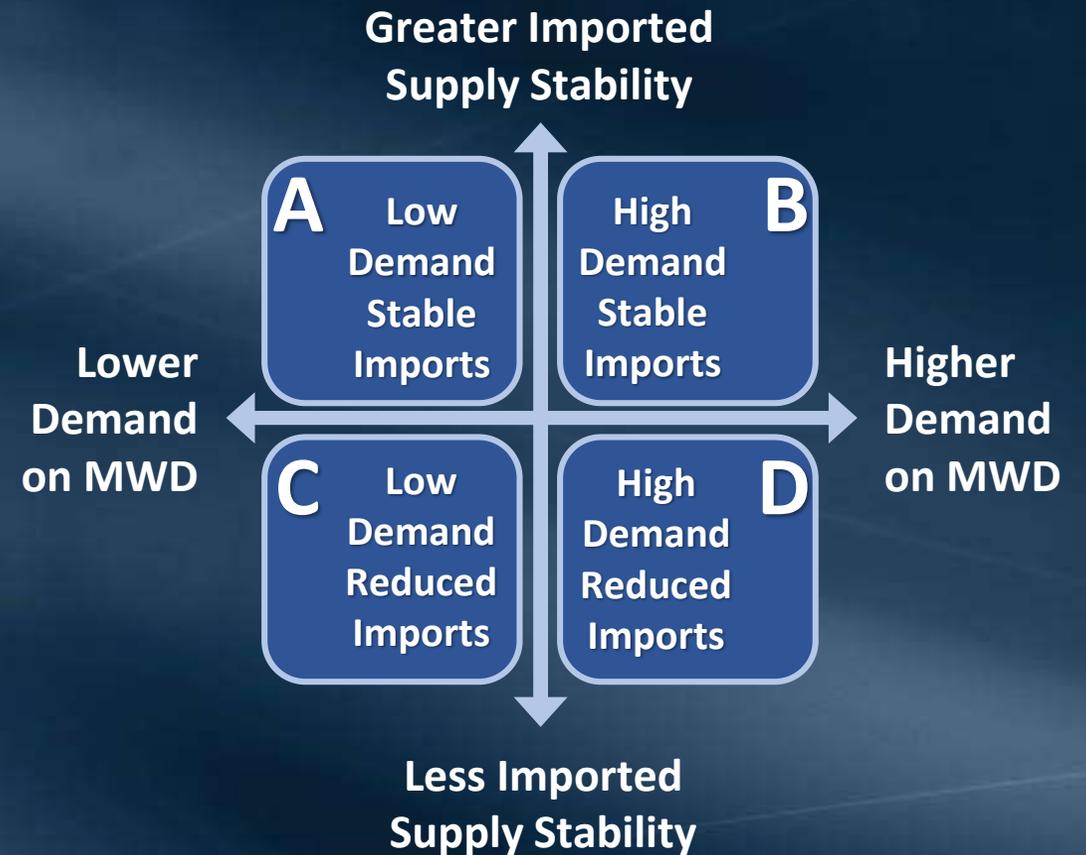

# Stepping Through the Process

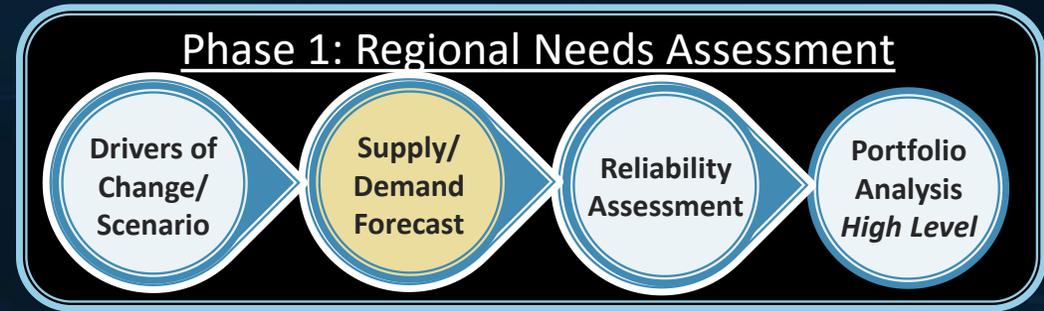

# Uncertainties

Brainstormed Drivers of Change: *Conducted surveys and workshops, and collaborated with MWD Board, member agency staff, climate and demand experts, and other interested parties*

# Assumptions

## Feedback Received

- Member Agencies
- Groundwater Basin Managers
- Climate Experts
- Demand Experts
- Other interested parties

## Four Scenario Projections

Retail Demand

Local Supply Production

Imported Water Supply

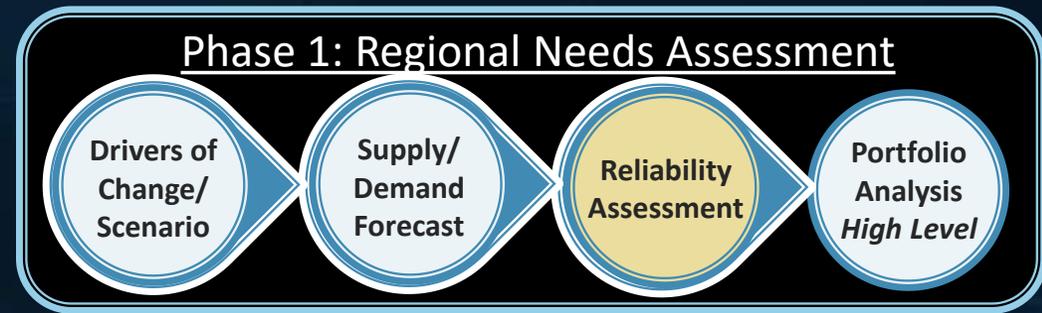

Difference equates to demand on MWD

## Model Results

- 25-year planning horizon
- Projected variable weather outcomes
- Based on 4 sets of assumptions for each Scenario

# Quantification

## Identifying Shortage and Surplus

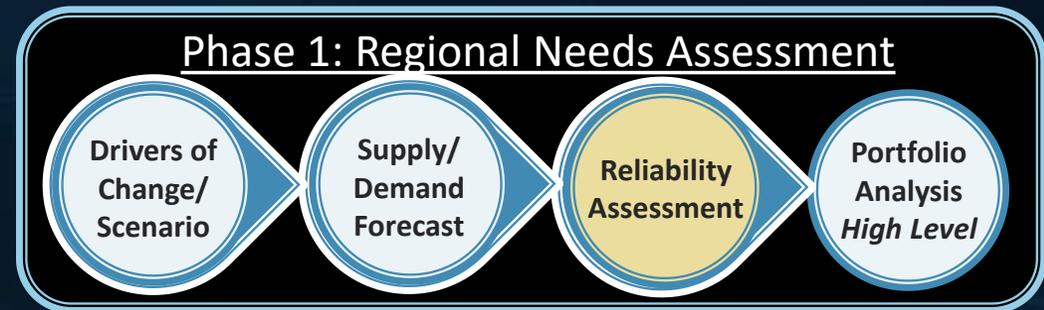

IRPSIM modeling provides:

- Magnitude and probabilities of net surpluses and shortages for each forecast year
  - *Net shortage refers to the magnitude and frequency of a supply-demand gap after taking from available storage*
  - *Net surplus refers to the magnitude and frequency of surplus after filling available storage*

# Quantification

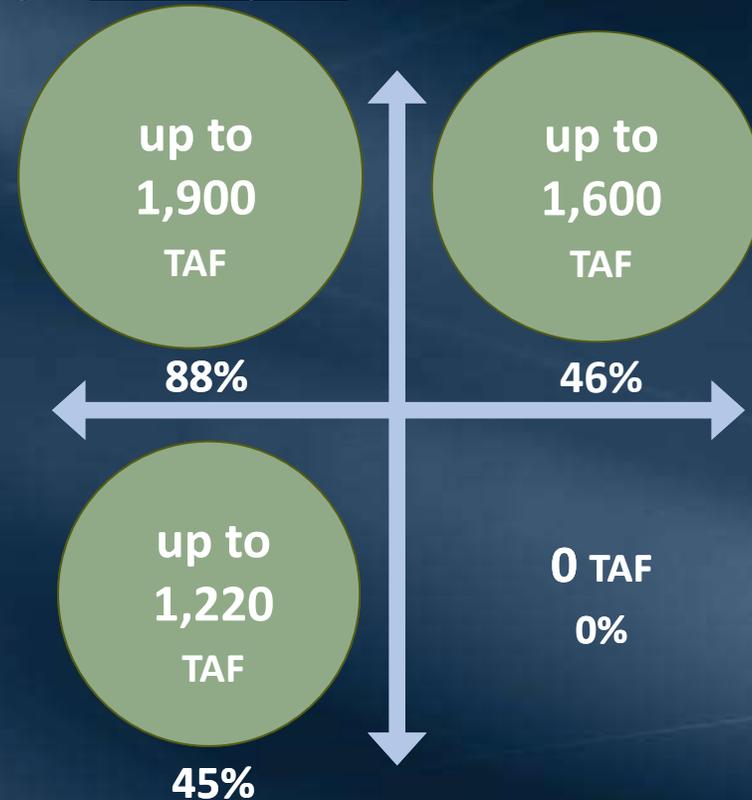

## Identifying Shortage and Surplus

Maximum Magnitude (TAF) and Frequency (%) of a Net Shortage in Forecast Year 2045

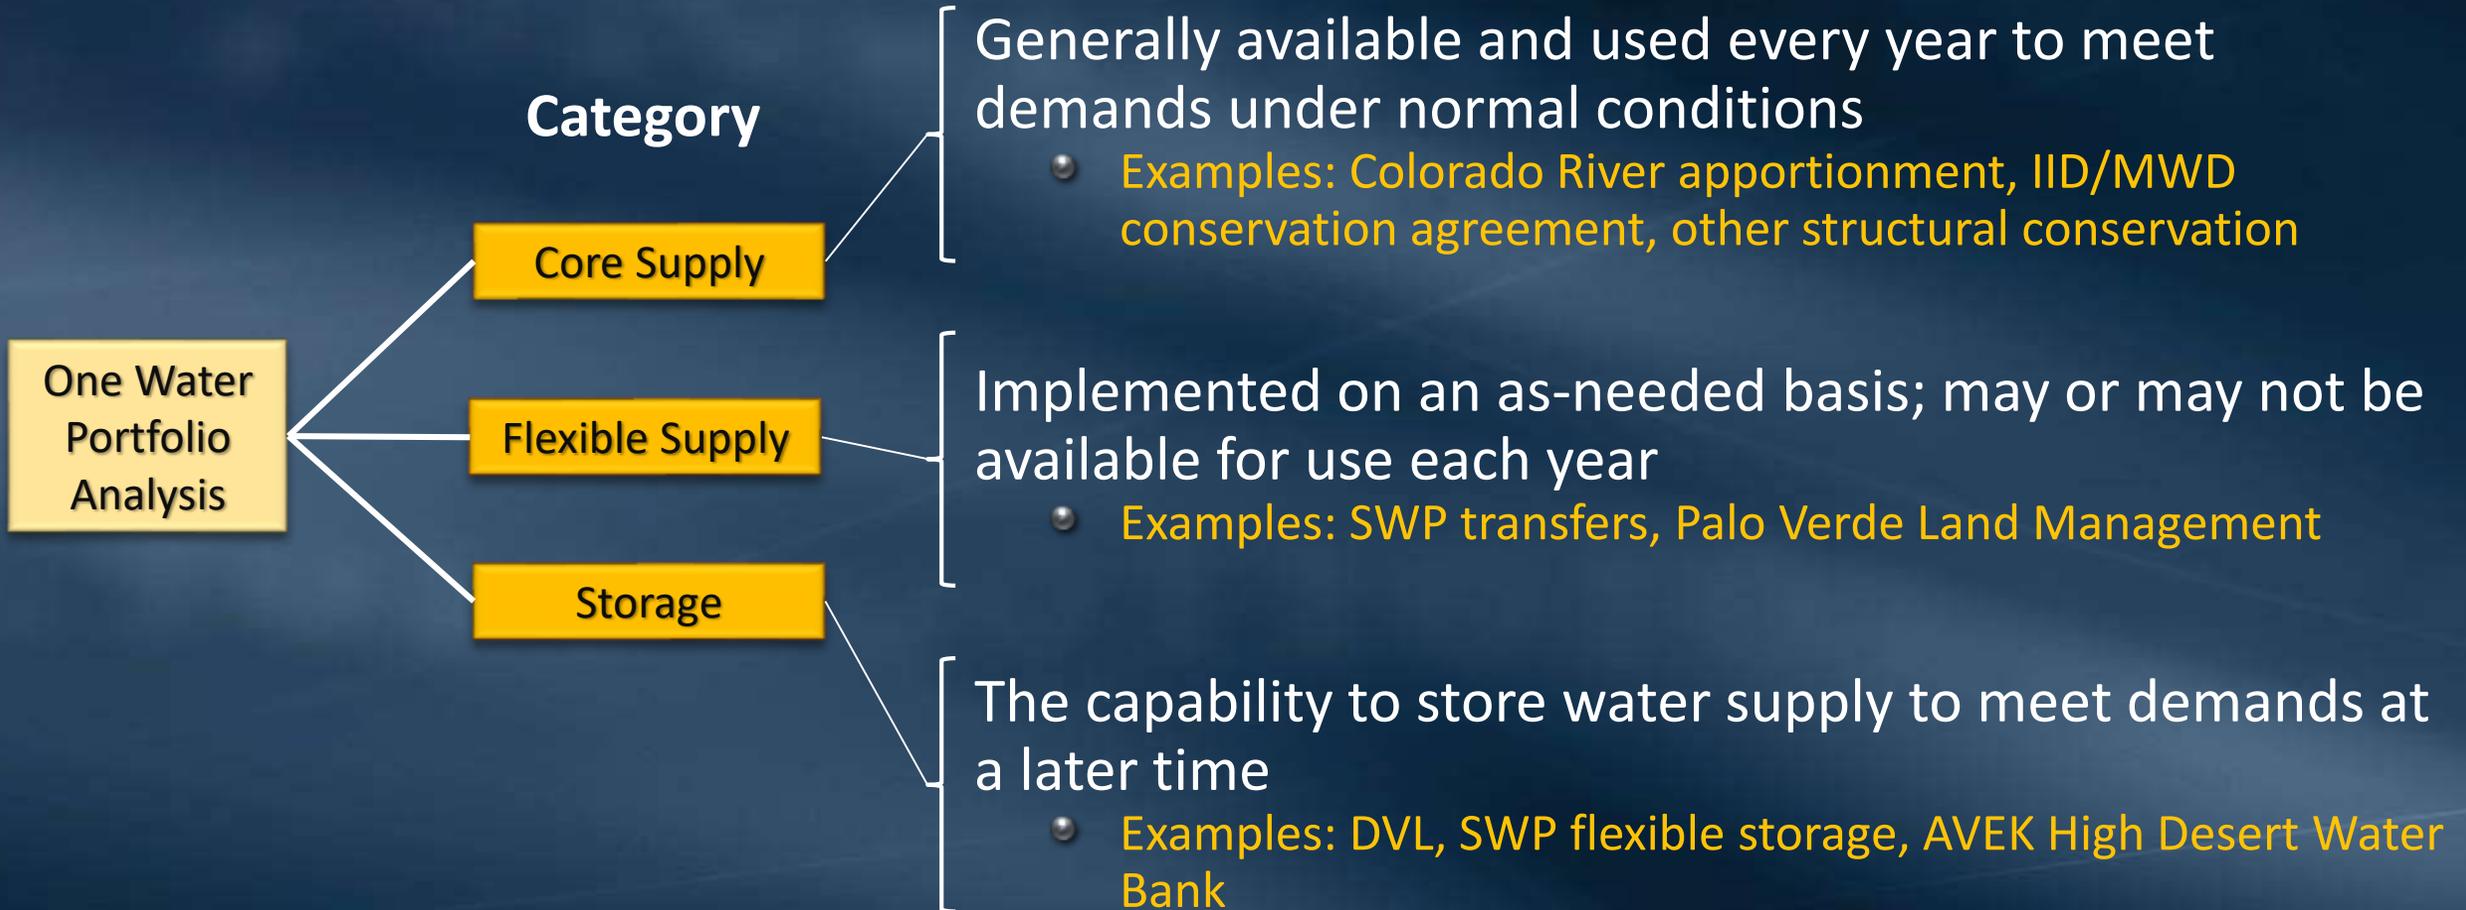

Maximum Magnitude (TAF) and Frequency (%) of a Net Surplus in Forecast Year 2045

# Quantification

## Examining Effectiveness of High-Level Supply Categories

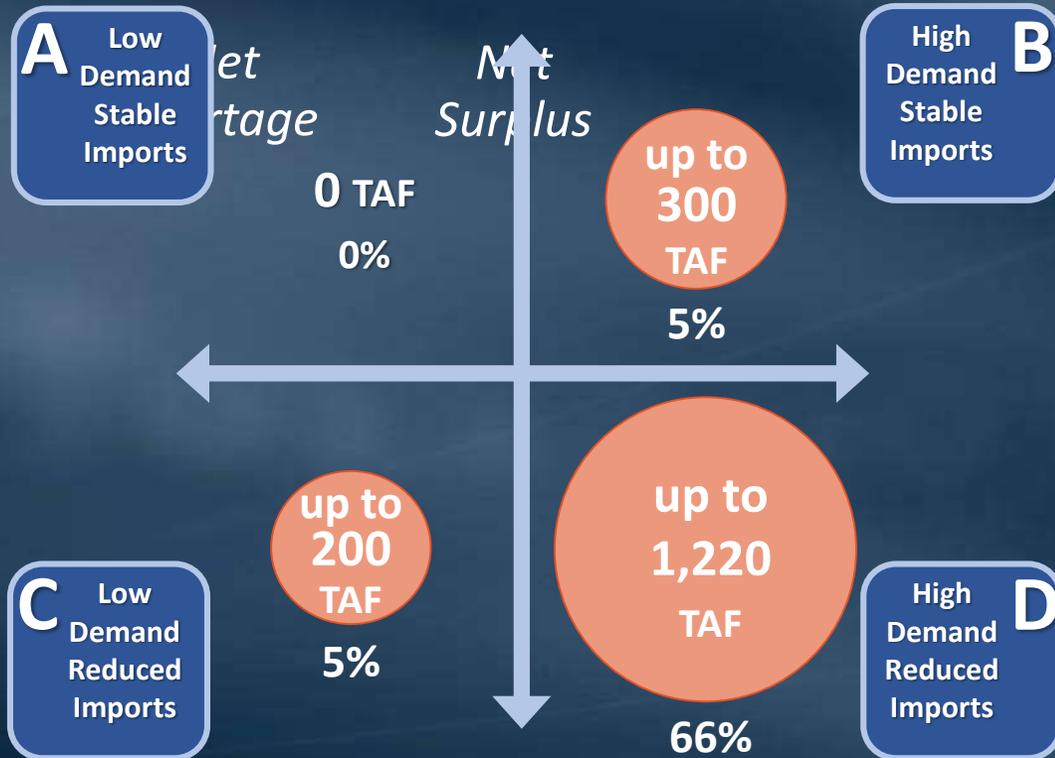

# Quantification

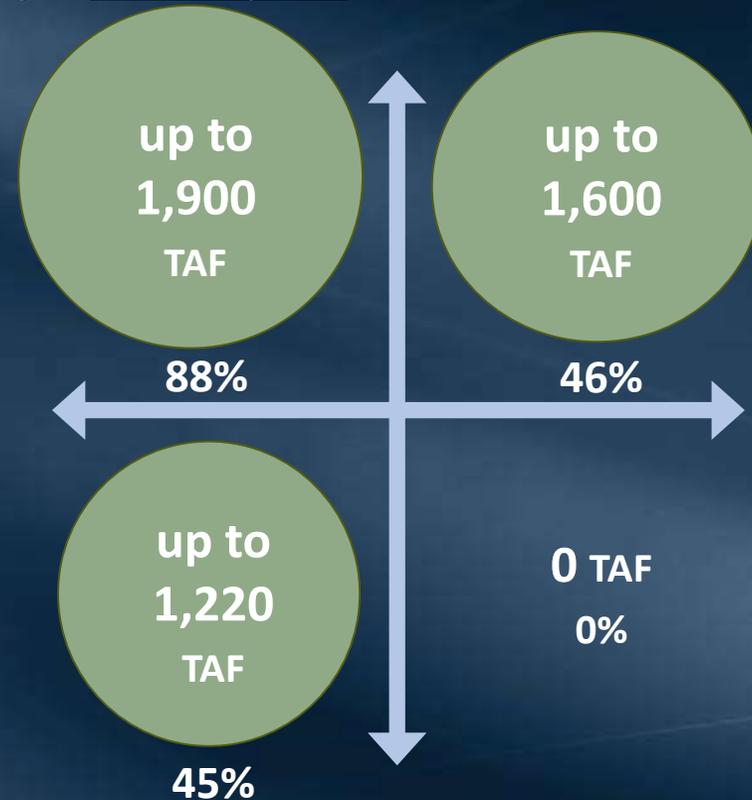

## Examining Effectiveness of High-Level Supply Categories

Maximum Magnitude (TAF) and Frequency (%) of a Net Shortage in Forecast Year 2045

Maximum Magnitude (TAF) and Frequency (%) of a Net Surplus in Forecast Year 2045

# Quantification

## Examining Effectiveness of High-Level Supply Categories

### Reliability Assessment Forecast Year 2045

Net  
Shortage

Net  
Surplus

High Demand Stable Imports **B**

up to  
300  
TAF  
5%

up to  
1,600  
TAF  
46%

### Scenario B Portfolio Category Need – Not Combined Forecast Year 2045

New Core Supply (TAF)	New Flexible Supply (TAF)	New Storage Capacity (TAF)
150	300	500 <i>(250 TAFY put/take capacity)</i>

Unrealistic and risky to depend on such a large amount of flexible supply in a dry year

# Quantification

## Examining Effectiveness of High Level Supply Categories

### Reliability Assessment Forecast Year 2045

Net  
Shortage

Net  
Surplus

High Demand  
Stable Imports  
**B**

up to  
**300**  
TAF

46%

### Scenario B Portfolio Category Need - Combined Forecast Year 2045

New Storage Capacity (TAF)	Flexible Supply (TAF)	Core Supply Needed by 2045 (TAF)
0	Capped at 100	100
100		70
250		30
500		30

No additional reduction in core supply if new storage capacity above 250 TAF

# Open Process Seeking Input

Board

Member  
Agencies

Interested  
Parties

# Next Steps

- Seeking IRP Special Committee recommendation to adopt the 2020 Integrated Water Resources Plan Regional Needs Assessment today
  - Follows two years of an open collaborative process with the Board, Member Agencies, and other interested parties
- Seek Board adoption of the 2020 Integrated Water Resources Plan Regional Needs Assessment on April 12, 2022
- Initiate Phase 2: One Water Implementation following adoption of the 2020 Integrated Water Resources Plan Regional Needs Assessment

# Board Actions

- Option 1

- Authorize the General Manager to adopt the 2020 Integrated Water Resources Plan Regional Needs Assessment.

- Option 2

- Do not adopt the 2020 Integrated Water Resources Plan Regional Needs Assessment.

# Staff Recommendation

- Option 1
