Two Phase II Environmental Site Assessments (ESAs) were conducted for Project private parcels that were identified by the Applicant's Phase I ESAs as sites with potential environmental contamination due to former agricultural activities (since at least 1978) and the presence of waste drums and fuel aboveground storage tanks (ASTs) (Stantec, 2024). The Phase II ESAs included limited shallow soil testing for total petroleum hydrocarbons (TPHs), volatile organic compounds (VOCs), organochlorine pesticides (OCPs), and metals. The sampling and testing for the 2 Phase II ESAs were conducted in May 2022 and October 2023/February 2024. Results of the analyses found OPCs and VOCs were not detected above laboratory reporting limits, and metals concentrations were found to be within the range considered natural for soil within California (Stantec, 2024). Petroleum hydrocarbons (TPH) in the oil and diesel range were found in low concentrations in the soil at the identified fuel ASTs and waste drums, however the detected levels

were not above the commercial screening levels (Stantec, 2024). Stantec recommended further sampling and analyses at one of the ASTs, which is currently ongoing.

3.10.1.6. Battery Energy Storage Systems

The Project includes the installation of up to 650 MW of 2- or 4-hour energy storage. The storage system would consist of battery or flywheel system technology housed in electrical enclosures and buried electrical cable. Up to 300 electrical enclosures would be installed on concrete foundations designed for secondary containment. The storage component would have a footprint of approximately 35 acres. A battery energy storage system (BESS) is a type of system that uses an arrangement of batteries and other electrical equipment to store electrical energy. Containerized systems, which are one form of a modular design, have become a popular means of integrating BESS projects efficiently.

The battery energy storage system (BESS) could use any commercially available battery technology, including but not limited to lithium ion, flow, lead acid, sodium sulfur and sodium or nickel hydride. Battery systems are operationally silent. Flywheel systems have a noise rating of 45 dBA. However, either system would be accompanied by air conditioners or heat exchangers and inverters, and a 150,000-gallon water tank would be located at each BESS unit/area/location.

The BESS would be designed, constructed, operated and maintained in accordance with applicable industry best practices and regulatory requirements, including fire safety standards. The BESS would comply with the current California Fire Code (CFC), which governs the code requirements to minimize the risk of fire and life safety hazards specific to battery energy storage systems used for load shedding, load sharing and other grid services (Chapter 12 Section 1206 of the 2019 CFC). In accordance with the CFC, the battery enclosure and the site installation design are all required to be approved by the State Fire Marshal. Final safety design would follow applicable standards and would be specific to the battery technology chosen, including, but not limited to, National Fire Protection Association 855 (standard for the Installation of Stationary Energy Storage Systems) and Section 1206 of the California Fire Code.

If applicable, the BESS would be certified to UL 9540, the standard associated with control, protection, power conversion, communication, controlling the system environment, air, fire detection and suppression system related to the functioning of the energy storage system. The battery would be tested to UL 9540A, a test method intended to document the fire characteristics associated with thermal event or fire and would confirm that the system would self-extinguish without active fire-fighting measures. The system would be designed, such that, during a fire event, the results of the UL 9540A test would show that any internal fire is contained within the enclosure and not spread to the other parts of the facility. The results of this test are used to inform facility safety system design and emergency response plans which would be shared with first responders. If applicable, the system would use a chemical agent suppressant-based system to detect and suppress fires. If smoke or heat were detected, or if the system were manually triggered, an alarm would sound, horn strobes would flash, and the system would release suppressant, typically FM 200, NOVEC 1230 or similar from pressurized storage cylinders. Final safety design would follow applicable standards and would be specific to the technology chosen.

Large-scale BESS are commonly designed for high-powered and rapid-charge cycles that can generate heat quickly and affect the safe operation of the batteries (Conzen et al, 2022). BESS require a reliable and well-performing cooling system that either directly cools the battery cell/modules or cools the enclosure in which the battery packs are installed. Failures of the BESS cooling or fire prevention systems can result in fires and explosions within BESS containers. This can occur under a variety of scenarios (i.e., short circuit), in which the stored chemical energy is converted to thermal energy with the results of cell rupture and the release of large amounts of flammable and potentially toxic gases, which can lead to fire and explosion (Conzen et al, 2022). As of June 2021, approximately 30 global large-scale BESS have experienced failures and destructive fires.

A notable event that led to a shift in the industry in terms of hazard mitigation at BESS in the USA occurred in 2019 at a BESS unit owned and operated by Arizona Public Service Company. The facility experienced a thermal runaway event and, even though the BESS was equipped with a clean agent suppression system, it was not provided with deflagration venting or explosion prevention systems (i.e., the requirement for explosion control was not satisfied). When the HAZMAT team attempted to enter the BESS to survey the scale of the event, an explosion occurred, seriously injuring the firefighters. Five contributing factors that led to the incident were identified: Internal failure in the battery cell initiated thermal runaway; the clean agent fire suppression system was incapable of stopping thermal runaway; the facility lacked thermal barriers between battery cells, this lack of barriers allowed the thermal runaway event to cascade to adjacent cells, without a means to ventilate the enclosure, the flammable off-gases from the batteries concentrated to explosive levels; and the emergency response plan did not include extinguishing, ventilation, or entry procedures.

3.10.1.7. Wildland Fires

The Project is located in both Federal Responsibility Areas (FRAs) and Local Responsibility Areas (LRAs) (CAL FIRE, 2007; Riverside County, 2021). According to the California Department of Forestry and Fire Protection (CAL FIRE) Fire Hazard Severity Zones (FHSZ) Map and County of Riverside General Plan Safety Element, the Project would be in areas of FRA and LRA Moderate FHSZ (CAL FIRE, 2007; Riverside County, 2021). The Project is located adjacent to the Lake Tamarisk Community, which is within a Local Responsibility Area. Agencies that are likely to provide wildfire protection to the Project would be Riverside County Fire Department and BLM Fire and Aviation Program. Because the Project is not located in a State Responsibility Area, CAL FIRE would not have primary responsibility for fire management or suppression activities in this area. While individual fire agencies have primary responsibility for specific geographic areas, under interagency cooperative and mutual aid agreements, fire agencies throughout the region aid each other as needed. Typically, when a wildland fire is reported, the nearest available firefighting units are dispatched, as it is not always immediately clear which wildland parcels are involved and which agency has jurisdiction. There is limited potential for wildfire on the site due to sparse vegetation. (See also Section 3.19, Wildfire, where wildfire hazards are discussed in more detail.)

3.10.1.8. Schools

There are no schools or learning centers located within a 0.25-mile radius of the proposed Project. As discussed in Section 3.16, Public Services and Utilities, the closest school to the proposed Project is the Eagle Mountain School, located approximately 6 miles northwest of the Project.

3.10.1.9. Airports and Airstrips

The closest airport to the Project is the private Desert Center Airport, located approximately 1 mile east of the proposed Project. (See Figure 2-1, Project Area). The airport has one runway and is part of the Chuckwalla Valley Raceway and is available for daily use for airplane, helicopter, and skydiving operations. No master plan has been prepared for the Desert Center Airport and because the airport activity level is very low, the outer edge of the FAR Part 77 horizontal surface serves to define the Airport Influence Area Boundary. The Project site is not located within the Airport Influence Area Boundary nor any of the Airport Compatibility Zones; the Airport Influence Area Boundary and the outer edge of Compatibility Zone E are located just east of the portion of the Project east of Highway 177 (RCALUC, 2004). Compatibility Zone E is defined as the area wherein 10 to 15 percent of near-airport accidents occur. There are very few restrictions for development within Zone E, except uses that represent a hazard to flights. Uses that attract very high concentrations of people in confined areas also are discouraged in locations below or near the

~~principal arrival and departure flight tracks, and where concern for risks applies to uses for which potential consequences are severe (e.g., very high intensity activities in a confined area).~~

The Blythe Airport is the nearest public airport serving Riverside County, located approximately 40 miles east of the Project. The airport has two runways and is mostly used for general aviation (AirNav, 2023a). Julian Hinds Pump Plant Airstrip, a private airstrip, and the Chiriaco Summit Airport, a public airstrip, are located about 14 and 18.5 miles west of the proposed Project (AirNav, 2023b). The Project is not within the airport influence area of these airports.

~~Based on the California Military Land Use Compatibility Analyst (CMLUCA) database the Project site is not within 4,000 feet of a military installation, or within of a military special-use airspace, or beneath a military designated low-level flight path. Based on the California Military Land Use Compatibility Analyst (CMLUCA) database, However, based on the CMLUCA, the Project site is located within/crossed by military training Visual Route (VR) flight paths (CMLUCA, 2023). The FAA Military Training Route (MTR) map indicates that the Project site and surrounding area are crossed by military training routes that include low level training with elevations that range from 200 to 7000 feet MSL (FAA, 2024).~~

3.10.1.10. Electric and Magnetic Fields

Electric voltage and electric current from transmission lines create electric and magnetic fields (EMF). Possible health effects associated with exposure to EMF have been the subject of scientific investigation since the 1970s, and there continues to be public concern about the health effects of EMF exposure. However, EMF is not addressed here as an environmental impact under CEQA. EMF has repeatedly been recognized as not an environmental impact to be analyzed in the context of CEQA because (1) there is no agreement among scientists that EMF does create a potential health risk, and (2) there are no defined or adopted CEQA standards for defining health risks from EMF.

3.10.2. Regulatory Framework

Hazardous materials are defined by federal and state regulations that aim to protect public health and the environment. Hazardous materials have certain chemical, physical, or infectious properties that cause them to be considered hazardous. The term “hazardous materials” refers to both hazardous substances and hazardous wastes. Under federal and state laws, any material, including wastes, may be considered hazardous if it is specifically listed by statute as such or if it is toxic (causes adverse human health effects), ignitable (has the ability to burn), corrosive (causes severe burns or damage to materials), or reactive (causes explosions or generates toxic gases). Hazardous materials are defined in the federal Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) Section 101(14), and also in the California Code of Regulations, Title 22, Chapter 11, Article 2, Section 66261, which provides the following definition:

A hazardous material is a substance or combination of substances which, because of its quantity, concentration, or physical, chemical or infectious characteristics, may either (1) cause, or significantly contribute to, an increase in mortality or an increase in serious irreversible, or incapacitating reversible, illness; or (2) pose a substantial present or potential hazard to human health or environment when improperly treated, stored, transported or disposed of or otherwise managed.

For this analysis, soil that is excavated from a site containing hazardous materials would be considered a hazardous waste if it exceeded specific California Code of Regulations Title 22 criteria or criteria defined in the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) or other relevant federal regulations. Remediation (cleanup and safe removal/disposal) of hazardous wastes found at a site is required if excavation of these materials occurs; it may also be required if certain other activities occur. Even if soils or groundwater at a contaminated site do not have the characteristics required to be

defined as hazardous wastes, remediation of the site may be required by regulatory agencies subject to jurisdictional authority. Cleanup requirements are determined on a case-by-case basis by the agency taking lead jurisdiction.

3.10.2.1. Federal Laws, Regulations, and Policies

USEPA California Toxics Rule (Title 40 Code of Federal Regulations (CFR) 131). In 2000, the U.S. Environmental Protection Agency (USEPA) promulgated numeric water quality criteria for priority toxic pollutants and other water quality standards provisions to be applied to waters in California to protect human health and the environment. Under Clean Water Act section 303(c)(2)(B), the USEPA requires states to adopt numeric water quality criteria for priority toxic pollutants for which the USEPA has issued criteria guidance, and the presence or discharge of which could reasonably be expected to interfere with maintaining designated uses. These federal criteria are legally applicable in California for inland surface waters, enclosed bays, and estuaries.

Resource Conservation and Recovery Act (RCRA) (42 U.S.C. § 6901 et seq.). The RCRA authorizes the USEPA to control hazardous waste from “cradle to grave” (generation, transportation, treatment, storage, and disposal). RCRA’s Federal Hazardous and Solid Waste Amendments from 1984 include waste minimization and phasing out land disposal of hazardous waste as well as corrective action for releases. The Department of Toxic Substances Control is the lead State agency for corrective action associated with RCRA facility investigations and remediation. Under RCRA, decommissioned solar panels are treated as hazardous waste.

Toxic Substances Control Act (TSCA) (15 U.S.C. § 2601 2692). The TSCA authorizes the USEPA to require reporting, record-keeping, testing requirements, and restrictions related to chemical substances and/or mixtures. It also addresses production, importation, use, and disposal of specific chemicals, such as polychlorinated biphenyls (PCBs), asbestos-containing materials, lead-based paint, and petroleum.

Comprehensive Environmental Response, Compensation, and Liability Act (42 U.S.C. § 9601 et seq.). CERCLA, including the Superfund program, was enacted by Congress on December 11, 1980, and is administered by the USEPA. This law provided broad federal authority to respond directly to releases or threatened releases of hazardous substances that may endanger public health or the environment. CERCLA established requirements concerning closed and abandoned hazardous waste sites; provided for liability of persons responsible for releases of hazardous waste at these sites; and established a trust fund to provide for cleanup when no responsible party could be identified. CERCLA also enabled the revision of the National Contingency Plan (NCP). The NCP provided the guidelines and procedures needed to respond to releases and threatened releases of hazardous substances, pollutants, and/or contaminants. The NCP also established the National Priorities List (NPL). CERCLA was amended by the Superfund Amendments and Reauthorization Act (SARA) on October 17, 1986.

Clean Water Act/SPCC Rule (33 U.S.C. § 1251 et seq.), formerly the Federal Water Pollution Control Act of 1972. As part of the CWA, the U.S. EPA oversees and enforces the Oil Pollution Prevention regulation contained in Title 40 of the Code of Federal Regulations, Part 112, which is often referred to as the “SPCC rule” because the regulations describe the requirements for facilities to prepare, amend, and implement Spill Prevention, Control, and Countermeasure (SPCC) Plans. A facility is subject to SPCC regulations if a single oil (or gasoline, or diesel fuel) storage tank has a capacity greater than 660 gallons, or the total above ground oil storage capacity exceeds 1,320 gallons, or the underground oil storage capacity exceeds 42,000 gallons, and if, due to its location, the facility could reasonably be expected to discharge oil into or upon the “Navigable Waters” of the United States.

Occupational Safety and Health Administration. OSHA is the agency responsible for assuring worker safety in the handling and use of chemicals in the workplace. The federal regulations pertaining to worker

safety are contained in Title 29 of the Code of Federal Regulations, as authorized in the Occupational Safety and Health Act of 1970. They provide standards for safe workplaces and work practices, including standards relating to hazardous materials handling. At sites known or suspected to have soil or groundwater contamination, construction workers must receive training in hazardous materials operations and a site health and safety plan must be prepared. The health and safety plan establishes policies and procedures to protect workers and the public from exposure to potential hazards at the contaminated site.

Department of Transportation, CFR Title 49, Subtitle B. The United States Department of Transportation (USDOT) is the primary federal agency responsible for regulating the proper handling and storage of hazardous materials during transportation (49 CFR. §§ 171-177 and 350-399).

National Fire Protection Association (NFPA) 855. NFPA 855 (Standard for the Installation of Stationary Energy Storage Systems) provides minimum requirements for mitigation of hazards associated with Energy Storage Systems (ESS). The design, construction, and installation of ESS and related equipment shall comply with NFPA 855 Chapter 4 and as supplemented or modified by the technology-specific provisions in Chapters 9 through 13. Chapter 4 includes, but is not limited to, provisions regarding gas release, testing requirements, hazard mitigation analysis, availability of operation and maintenance manuals, and staff training. UL 9540 falls under the NFPA 855 and addresses key issues associated with energy storage including battery system safety, functional safety, environmental performance, containment, and fire detection and suppression. The UL 9540A test is a method to evaluate thermal runaway fire propagation in an ESS. ESS plans and specifications should be submitted to the jurisdictional agency.

Federal Aviation Administration (FAA). The Federal Aviation Regulation (49 CFR Part 77) establishes standards and notification requirements for objects that may impact navigable airspace. Airports and navigable airspace that are not administered by the Department of Defense are under the jurisdiction of the FAA. This regulation includes: (a) FAA notification requirements for proposed construction, or the alteration of existing structures, that meet specific standards; (b) the standards used to determine obstructions to air navigation, and navigational and communication facilities; (c) the process for aeronautical studies of obstructions to air navigation or navigational facilities to determine the effect on the safe and efficient use of navigable airspace, air navigation facilities or equipment; and (d) the process to petition the FAA for discretionary review of determinations, revisions, and extensions of determinations.

With regard to aviation safety, Subpart B, Section 77.9 of the regulations indicates that for areas around airports having runways longer than 3,200 feet, if any construction that is more than 200 feet above ground level or results in an object penetrating an imaginary surface extending outward and upward at a ratio of 100 to 1 from a public or military airport runway out to a horizontal distance of 20,000 feet (approximately 3.78 miles), then an applicant is required to submit FAA Form 7460-1, Notice of Proposed Construction or Alteration, to the Manager, Air Traffic Division, FAA Regional Office having jurisdiction over the area for review and approval of the Project (FAA, 2018).

Currently, there are no defined thresholds for project size, type, or distance from the airport available that automatically trigger FAA airspace review with respect to solar glare on aviation safety (FAA, 2018). However, proximity to the airport and solar technology are two indicators of likely FAA interest in a solar project (FAA, 2018). According to a FAA technical guidance document, it is the responsibility of local governments, solar developers, and other stakeholders in the vicinity of an airport to check with the airport sponsor and the FAA to ensure there are no potential safety or navigational problems with a proposed solar facility, especially if it is a large facility. Sponsors should notify the FAA when such activities are proposed, and the FAA needs to participate in public meetings or permitting processes.

Federal Land Policy and Management Act of 1978 (43 U.S.C. § 1701 et seq.) and Title 43 Code of Federal Regulations (43 CFR § 9212.2). BLM is authorized and required to manage federal lands, which includes providing funding, resources, and regulations for prevention and protection of wildland fires. In California,

BLM establishes seasonal and year-round fire prevention orders and restrictions to assist with wildland fire prevention efforts throughout federal public lands within the California Desert District (CDD), which consists of Inyo, Imperial, Kern, Mono, Los Angeles, San Bernardino, San Diego and Riverside Counties.

Federal Wildland Fire Management Policy. On BLM-administered lands in the California Desert, the BLM implements Federal Wildland Fire Management policies and objectives in coordination with state and other federal agencies as part of the California Desert Interagency Fire Management Organization. The Federal Wildland Fire Management Policy was developed by a federal multi-agency group that establishes consistent and coordinated fire management policy across multiple federal jurisdictions. The policy acknowledges the essential role of fire in maintaining natural ecosystems, but also prioritizes firefighter and public safety first in every fire management activity and focuses on risk management as a foundation for all fire management activities. The policy promotes basing responses to wildland fires on approved Fire Management Plans and land management plans, regardless of ignition source or the location of the ignition.

National Electric Safety Code (NESC) and American National Standards Institute (ANSI) Guidelines. A variety of line and tower clearance standards are used throughout the electric transmission industry. Nationally, most transmission line owners follow the NESC rules or ANSI guidelines, or both, when managing vegetation around transmission system equipment. The NESC deals with electric safety rules, including transmission wire clearance standards, whereas the applicable ANSI code deals with the practice of pruning and removal of vegetation.

3.10.2.2. State Laws, Regulations, and Policies

California Environmental Protection Agency. The California Environmental Protection Agency (Cal EPA) was created in 1991, which unified California's environmental authority in a single cabinet-level agency and brought the ARB, SWRCB, RWQCBs, Integrated Waste Management Board (IWMB), Department of Toxic Substance Control (DTSC), OEHHA, and DPR under one agency. These agencies were placed within the Cal/EPA "umbrella" for the protection of human health and the environment and to ensure the coordinated deployment of state resources. Their mission is to restore, protect and enhance the environment, to ensure public health, environmental quality, and economic vitality.

California Hazardous Waste Control Law. The California Hazardous Waste Control Law (HWCL) is administered by Cal EPA to regulate hazardous wastes. While the HWCL is generally more stringent than RCRA, until the EPA approves the California program, both the state and federal laws apply in California. The HWCL lists 791 chemicals and about 300 common materials that may be hazardous; establishes criteria for identifying, packaging and labeling hazardous wastes; prescribes management controls; establishes permit requirements for treatment, storage, disposal and transportation; and identifies some wastes that cannot be disposed of in landfills.

California Department of Toxic Substance Control (DTSC). DTSC is a department of Cal EPA and is the primary agency in California that regulates hazardous waste, cleans-up existing contamination, and looks for ways to reduce the hazardous waste produced in California. DTSC regulates hazardous waste in California primarily under the authority of RCRA and the California Health and Safety Code. Other laws that affect hazardous waste are specific to handling, storage, transportation, disposal, treatment, reduction, cleanup, and emergency planning. Recent revisions to DTSC hazardous waste regulations (revisions in Cal. Code Regs tit. 22, div. 4.5, sections and articles in chapters 10, 11, and 23) allow PV solar panels in California to be managed as "universal waste" instead of under the HWCL, beginning on January 1, 2021. By being classified as universal waste, PV solar panels will now be subject to a streamlined set of standards that are intended to ease regulatory burden and promote recycling. The revised regulations also include requirements for reporting and notifications to DTSC, training, handling, response to breakage and releases, containment and record keeping.

California Fire Code (CFC). Chapter 12 of the CFC provides provisions related to the installation, operation and maintenance of energy systems used for generating or storing energy to safeguard the public health, safety and general welfare from the hazards of fire, explosion or dangerous conditions in new and existing buildings, structures and premises, and to provide safety and assistance to fire fighters and emergency responders during emergency operations. Section 1207 of the 2022 CFC provides requirements for Electrical ESS. Battery Energy Storage Systems (BESS) greater than 600 kWh are required by the CFC to be UL (Underwriter's Laboratory) listed and have full-scale testing using the testing standard UL9540A. UL9540A tests a variety of fire and life safety features on the battery including thermal runaway, gas venting, and fire propagation.

Porter-Cologne Water Quality Act. The Porter-Cologne Water Quality Act is a state law that provides a comprehensive water quality management system for the protection of California waters. The act designates the SWRCB as the ultimate authority over state water rights and water quality policy, and also established nine RWQCBs to oversee water quality on a day-to-day basis at the local and regional level. The Colorado River Basin RWQCB is responsible for protecting the beneficial uses of surface water and groundwater resources in the Project area. The Colorado River Basin RWQCB adopted its Basin Plan (Water Quality Control Plan for the Colorado River Basin Region) in 1993 and amended it in 2019. This Basin Plan set forth implementation policies, goals, and water management practices in accordance with the Porter-Cologne Water Quality Control Act. The Basin Plan establishes both numerical and narrative standards and objectives for water quality aimed at protecting aquatic resources. Project discharges to surface waters are subject to the regulatory standards set forth in applicable regional basin plans, which prevent the discharge of hazardous materials into waters of the State.

Unified Program. In 1993, the State (Cal-EPA) was mandated by Senate Bill 1082 (Health and Safety Code Chapter 6.11) to establish a "unified hazardous waste and hazardous materials management" regulatory program (Unified Program). The Unified Program consolidates, coordinates, and makes consistent the administrative requirements, permits, inspections, and enforcement activities of the following six environmental and emergency response programs: Hazardous Materials Release Response Plans and Inventories (Hazardous Material Business Plan [HMBP]), California Accidental Release Prevention (CalARP) Program, Underground Storage Tank Program, Aboveground Petroleum Storage Act, Hazardous Waste Generator and Onsite Hazardous Waste Treatment (tiered permitting) Programs, and California Uniform Fire Code: Hazardous Material Management Plans and Hazardous Material Inventory Statements. The Unified Program is implemented at the local level by local government agencies certified by the Secretary of Cal-EPA. These agencies, known as Certified Unified Program Agencies (CUPA), implement all the Unified Program elements and serve as a local contact for area businesses. The CUPA for the area is the Riverside County Department of Environmental Health Hazardous Materials Branch. The CUPA also oversees the two Participating Agencies (Corona Fire and Riverside Fire) that implement hazardous materials programs within the County.

The California Public Resources Code (CPRC) Sections 4292 and 4293. CPRC sections 4292 and 4293 specify requirements related to fire protection and prevention in transmission line corridors. CPRC Section 4292 states that any person that owns, controls, operates, or maintains any electrical transmission or distribution line has primary responsibility for fire protection of such areas, and shall maintain around and adjacent to any pole or tower which supports a switch, fuse, transformer, lightning arrester, line junction, or dead end or corner pole, a firebreak which consists of a clearing of not less than 10 feet in each direction from the outer circumference of such a pole or tower (CPRC § 4292). CPRC § 4293 states that any person that owns, controls, operates, or maintains any electrical transmission or distribution line upon any mountainous land, or in forest-covered land, or grass covered land which has primary responsibility for the fire protection of such area, shall maintain a clearance of the respective distances.

California Department of Industrial Relations, Division of Occupational Safety and Health Administration. The California Occupational Safety and Health Administration (Cal/OSHA) is the primary agency responsible for worker safety in the handling and use of chemicals in the workplace. Cal/OSHA standards are generally more stringent than federal regulations. The employer is required to monitor worker exposure to listed hazardous substances and notify workers of exposure (8 CCR Sections 337 340). The regulations specify requirements for employee training, availability of safety equipment, accident-prevention programs, and hazardous substance exposure warnings.

California Strategic Fire Plan. The Strategic California Fire Plan was finalized in June 2010 and directs each CAL FIRE Unit to prepare a locally specific Fire Management Plan. In compliance with the California Fire Plan, individual CAL FIRE units are required to develop Fire Management Plans for their areas of responsibility. These documents assess the fire situation within each of CAL FIRE's 21 units and six contract counties. The plans include stakeholder contributions and priorities and identify strategic areas for pre-fire planning and fuel treatment, as defined by the people who live and work with the local fire problem. The plans are required to be updated annually.

Assembly Bill 203. Adds section 6709 to the Labor Code regarding occupational safety and health related to Valley Fever. This section applies to a construction employer with employees working at work sites in counties where Valley Fever is highly endemic, including, but not limited to, the Counties of Fresno, Kern, Kings, Madera, Merced, Monterey, San Joaquin, San Luis Obispo, Santa Barbara, Tulare, and Ventura, where work activities disturb the soil. This includes, but is not limited to, digging, grading, or other earth moving operations, or vehicle operation on dirt roads, or high winds. Highly endemic means that the annual incidence rate of Valley Fever is greater than 20 cases per 100,000 persons per year. An employer subject to this section shall provide effective awareness training on Valley Fever to all employees by May 1, 2020, and annually by that date thereafter, and before an employee begins work that is reasonably anticipated to cause exposure to substantial dust disturbance. Substantial dust disturbance means visible airborne dust for a total duration of one hour or more on any day. The training may be included in the employer's injury and illness prevention program training or as a standalone training program. Riverside County's Valley Fever incidence rates are currently not high enough to be considered highly endemic and require Valley Fever awareness training under AB 203.

3.10.2.3. Local Laws, Regulations, and Policies

Riverside County General Plan. The intent of the Safety Element of the Riverside County General Plan is to reduce death, injuries, property damage, and economic and social impact from hazards. The following policies included in the Safety Element generally relate to the proposed Project with respect to hazards and hazardous materials (Riverside County, 2021).

■ **Policy S 5.1.** Develop and enforce construction and design standards that ensure that proposed development incorporates fire prevention features through the following:

- All proposed development and construction within Fire Hazard Severity Zones shall be reviewed by the Riverside County Fire and Building and Safety departments.
- All proposed development and construction shall meet minimum standards for fire safety as defined in the Riverside County Building or County Fire Codes, or by County zoning, or as dictated by the Building Official or the Transportation Land Management Agency based on building type, design, occupancy, and use.
- In addition to the standards and guidelines of the California Building Code and California Fire Code fire safety provisions, continue to implement additional standards for high-risk, high occupancy, dependent, and essential facilities where appropriate under the Riverside County Fire Code (Ordinance No. 787) Protection Ordinance. These shall include assurance that structural and nonstructural archi-

tectural elements of the building will not impede emergency egress for fire safety staffing/personnel, equipment, and apparatus; nor hinder evacuation from fire, including potential blockage of stairways or fire doors.

- Proposed development and construction in Fire Hazard Severity Zones shall provide secondary public access, in accordance with Riverside County Ordinances.
 - Proposed development and construction in Fire Hazard Severity Zones shall use single loaded roads to enhance fuel modification areas, unless otherwise determined by the Riverside County Fire Chief.
 - Proposed development and construction in Fire Hazard Severity Zones shall provide a defensible space or fuel modification zones to be located, designed, and constructed that provide adequate defensibility from wildfires.
- **Policy S 5.6.** Demonstrate that the proposed development can provide fire services that meet the minimum travel times identified in Riverside County Fire Department Fire Protection and EMS Strategic Master Plan.
 - **Policy S 7.3.** Require commercial businesses, utilities, and industrial facilities that handle hazardous materials to: install automatic fire and hazardous materials detection, reporting and shut-off devices; and install an alternative communication system in the event power is out or telephone service is saturated following an earthquake.
 - **Policy S 7.14.** Regularly review and clarify emergency evacuation plans for dam failure, inundation, fire and hazardous materials releases.
 - **Policy S 7.15.** Develop a blueprint for managing evacuation plans, including allocation of buses, designation and protection of disaster routes, and creation of traffic control contingencies.

The proposed Project would be consistent with County policies and requirements for fire safety and handling of hazardous materials and would comply with the requirements of the applicable federal and State regulations.

County of Riverside Department of Environmental Health (DEH). The DEH is responsible for protecting the health and safety of the public and the environment of Riverside County by assuring that hazardous materials are properly handled and stored. The DEH accomplishes this through inspection, emergency response, site remediation, and hazardous waste management services. The County of Riverside DEH also acts as the CUPA for Riverside County and is responsible for reviewing Hazardous Materials Business Plans. A CUPA is a local agency that has been certified by Cal EPA to implement state environmental programs related to hazardous materials and waste. The specific responsibilities of the DEH include the following:

- Inspecting hazardous material handlers and hazardous waste generators to ensure full compliance with laws and regulations.
- Implementing CUPA programs for the development of accident prevention and emergency plans, proper installation, monitoring, and closure of underground storage tanks and the handling, storage and transportation and disposal of hazardous wastes.
- Providing 24-hour response to emergency incidents involving hazardous materials or wastes in order to protect the public and the environment from accidental releases and illegal activities.
- Overseeing the investigation and remediation of environmental contamination due to releases from underground storage tanks, hazardous waste containers, chemical processes or the transportation of hazardous materials.
- Conducting investigations and taking enforcement action as necessary against anyone who disposes of hazardous waste illegally or otherwise manages hazardous materials or wastes in violation of federal, state, or local laws and regulations.

3.10.3. Methodology for Analysis

The hazardous materials analyzed include those potentially existing on the site and those that would be used as part of Project construction, operations and maintenance, and decommissioning. Potential existing hazardous materials hazards were assessed based on review of information in state hazard databases and maps for the Project area.

Some hazardous materials would be used on a short-term basis during construction and decommissioning. Others would be stored on site for use during operations and maintenance. Therefore, this analysis examines the choice and amount of chemicals to be used, how the Applicant would use the chemicals, how they would be transported to the facility, and how the Applicant plans to store the materials on site.

Potential and existing physical hazards such as wildfire, aviation hazards, valley fever, and unexploded ordnance, are assessed based on review of information from online sources and from local and state agency databases and maps for the Project area and are analyzed based on proposed Project construction, operation and maintenance, and decommissioning footprints and potential areas of impact.

3.10.4. CEQA Significance Criteria

The criteria used to determine the significance of potential hazards and hazardous materials impacts are based on Appendix G of the CEQA Guidelines. The proposed Project would result in a significant impact under CEQA related to hazards and hazardous materials if the Project would:

- *Create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials (see Impact HAZ-1).*
- *Create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment (see Impact HAZ-2).*
- *Be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would create a significant hazard to the public or the environment (see Impact HAZ-3).*
- *Result in a safety hazard or excessive noise for people residing or working in the project area within an airport land use plan or, where such a plan has not been adopted, within 2 miles of a public airport or public use airport (see Impact HAZ-4).*
- *Impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan (see Impact HAZ-5).*
- *Expose people or structures, either directly or indirectly, to a significant risk of loss, injury, or death involving wildland fires (see Impact HAZ-6).*

The County of Riverside's Environmental Assessment Form includes additional significance criteria, which were also used in the analysis. Almost all of the County of Riverside criteria for the issue area of Hazards and Hazardous Materials are identical to existing the CEQA criteria for that issue area, except for several criteria related to airports and aviation hazards. The additional criteria differing from the above CEQA criteria that indicate that a project could have potentially significant impacts are:

- *It would result in an inconsistency with an Airport Master Plan (see Impact HAZ-4).*
- *It would require review by the Airport Land Use Commission (see Impact HAZ-4).*

The following CEQA significance criteria from Appendix G and County of Riverside were not included in the analysis and are not discussed further beyond this summary:

- *Emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school.*

No schools are located within one-quarter mile of the site. The proposed Project would not use acutely hazardous materials and the limited amounts of hazardous materials (such as fuels and greases) used during construction and operation and maintenance would be used, stored, transported, and disposed of following all applicable laws and regulations. Therefore, the Project would not result in hazardous materials impacts to existing or proposed schools.

- *For a project within the vicinity of a private airstrip, or heliport, would the project result in a safety hazard for people residing or working in the project area?*

There are no private airstrips or heliports in the vicinity of the Project, therefore, construction and operation of the Project would not result in adverse aviation safety hazards related to private airstrips or heliports.

3.10.5. Proposed Project Impact Analysis

The scoping effort conducted by the Riverside County Planning Department revealed several public concerns related to hazards and hazardous materials. Public concerns raised during scoping involved health effects from the increase in wind-blown dust, which carries silica, pollens, and other chemicals/pollutants (herbicides); concerns relating to Valley Fever; health hazards related to EMF; increased risk of wildfire due to presence of power lines; contamination from chemicals used for vegetation management; and concerns regarding hazardous materials releases if/when the solar panels are broken.

Project decommissioning impacts would be the same as those described under Project construction.

Impact HAZ-1. Create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials.

LESS THAN SIGNIFICANT WITH MITIGATION, CONSTRUCTION AND DECOMMISSIONING. Construction of the Project would involve the use of small amounts of hazardous materials. No extremely hazardous substances (i.e., those governed pursuant to Title 40, Part 335 of the Code of Federal Regulations) are anticipated to be produced, used, stored, transported, or disposed of as a result of Project construction. Hazardous substances would include fuels and greases to fuel and service construction equipment and small quantities of chemicals required for construction. Onsite fuel tanks no larger than 1,000 gallons may be used to fuel construction equipment and would comply with all applicable regulations. Trucks and construction vehicles would be serviced from off-site facilities. Helicopters may be used during construction; however, helicopter refueling will take place off site, likely at the Desert Center Airport. Hazardous materials storage, use, transportation, and disposal procedures would be dictated the HMMP developed prior to construction and by local, state, and federal regulations.

Hazardous liquids would be stored in secured areas (fenced or locked building on the solar site) and all hazardous material storage containers would be properly labeled to indicate the contents of the container. Hazardous materials would be stored only in designated areas on impervious surfaces, on plastic groundcovers, or with secondary containment, to prevent spills or leaks from infiltrating the ground. Material Safety Data Sheets for all applicable materials present on site would be made readily available to on-site personnel. If quantities exceed regulatory thresholds, the Applicant would ensure that storage is undertaken in compliance with the SPCC Rule and a HMBP, which would be developed prior to construction. The use, storage, transport, and disposal of hazardous materials used in construction of the facility

would be carried out in accordance with current applicable regulations and the Project-specific HMMP (IP Easley, 2023, Appendix W). Implementation of these procedures and plans and compliance with applicable local, state, and federal regulations would minimize the risk of adverse effects from use, disposal, and transport of hazardous materials to less-than-significant levels.

The Project may use a variety of PV technologies including, but not limited to, cadmium telluride panels, crystalline silicon panels, or copper indium gallium diselenide panels. None of the panels being considered contain materials that are classified as hazardous wastes. The chemicals within PV modules are highly stable and would not be available for release to or interaction with the environment. If a panel is broken during construction or operation, the pieces would be cleaned up completely and returned to the manufacturer for recycling. At the end of the Project's useful life, solar panels would be decommissioned and dismantled per an agency-approved Closure and Decommissioning Plan. Upon ultimate decommissioning, the panels will be suitable for recycling or reuse, and Project decommissioning would be designed to optimize such salvage as circumstances allow and in compliance with all local, State, and federal laws and regulations in effect at the time of decommissioning. With current technology, although very expensive, approximately 90% of a PV system is recyclable with the glass, metallic, and PV film components separated by mechanical and chemical processes for remanufacturing into new panels or other products (Westcoast Solar Energy, 2023; Peplow, 2022). Currently, approximately 80% of a silicon panel's mass including the aluminum frame and glass covers is easily recycled (Peplow, 2022).

Throughout construction, waste materials would be sorted on site and transported to appropriate licensed waste management facilities. Non-hazardous construction materials that cannot be reused or recycled would be disposed of at county landfills. Hazardous waste and electronic waste would not be placed in a landfill but would be transported to a hazardous waste handling facility (e.g., electronic-waste recycling). All contractors and workers would be educated about waste sorting, appropriate recycling storage areas, and how to reduce landfill waste.

During construction, herbicides may be applied to control weed growth. If needed, herbicides to control the spread of invasive weeds following construction disturbance would likely be part of an integrated pest management strategy. Weed management also would be performed in accordance with an approved Weed Management Plan. Use of herbicides would occur in accordance with all recommended application procedures as identified on product labels. If herbicides or pesticides are required to be used on BLM land, BLM-approved herbicides would be used to control weed populations. The process for treatments would be characterized in a Pesticide Use Proposal that would be approved by the BLM. Although the Project would not contain a residential or commercial component that would potentially directly expose people to herbicides, workers or people at nearby residences or businesses could be exposed to adverse effects due to herbicide use. Use of any herbicides for weed control would follow all local, state, and federal guidelines, and on BLM-administered land would follow the BLM-approved Weed Management Plan and Pesticide Use Proposal. Therefore, the application of herbicides during construction would not have an adverse effect on workers or the public and would result in a less-than-significant impact.

The Project site is within the historic World War II DTC/C AMA training camp/maneuver area where military exercises with tanks and troops were conducted, including practice artillery fire, weapons training, and land mine placement and removal. During construction, maintenance, and closure and decommissioning activities associated with the proposed Project, ground disturbance could unearth unexploded World War II-era munitions (UXO and MEC), including conventional and unconventional land mines, personnel mines, shells, mortars, and bullets, the detonation of which would pose a safety risk to the workers. For example, surface and shallow sub-surface UXO could be disturbed by vehicles, walkers, and excavation using shovels or similar hand tools, and deeper sub-surface UXO could be disturbed by the earth movement and excavation processes required for development of the Project. Implementation of Mitigation

Measure HAZ-1 (UXO Identification, Training and Reporting Plan) would formalize UXO training, investigation, removal, and disposal to ensure that potential UXO impacts would be less than significant.

Decommissioning impacts are anticipated to be similar to those occurring during construction as described above. The actual impacts would depend on the proposed decommissioning action and final use of the site.

LESS THAN SIGNIFICANT, OPERATIONS AND MAINTENANCE. During operation and maintenance of the proposed Project, small quantities of a variety of hazardous materials would be transported to the site and used and stored on site for miscellaneous, general maintenance activities. Chemicals would be stored in appropriate chemical storage facilities with secondary containment, if necessary. Hazardous materials would be transported, stored, and disposed of as required by the HMMP (IP Easley, 2023, Appendix W). Because each of the substation transformers would contain mineral oil, the substation would be designed to accommodate an accidental spill of transformer fluid by the use of containment-style mounting. Herbicides may be used for weed control. If quantities exceed regulatory thresholds, SPCC Plan and HMBP and associated emergency response plan and inventory would be prepared and implemented during operation. Preparation and compliance with the required SPCC and HMBP, if necessary, implementation of the HMMP, and compliance with applicable state and federal regulations would minimize the risk of damage or injury from use, disposal, and transport of hazardous materials ensure that impacts remain less than significant during the Project's operation and maintenance.

Mitigation Measures for Impact HAZ-1

MM HAZ-1 UXO Identification, Training, and Reporting Plan. See Section 3.10.9 (Mitigation Measures) for full text.

Significance After Mitigation

This impact would be less than significant with implementation of mitigation.

Impact HAZ-2. Create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment.

LESS THAN SIGNIFICANT WITH MITIGATION, CONSTRUCTION AND DECOMMISSIONING. As noted above, construction of the Project would involve the use of small amounts of hazardous materials, such as fuels and greases to fuel and service construction equipment, and small amounts of chemicals needed during construction. Improper handling and storage of these hazardous materials could result in the accidental release if not managed appropriately. The small quantities of chemicals to be stored at the Project during construction would be stored in their appropriate containers in enclosed and secured locations.

The HMMP includes and requires spill prevention and response training, and procedures to follow in the event of a spill (IP Easley, 2023, Appendix W). During construction, spill kits and materials that can be readily deployed would be stored at staging areas and mobile spill kits would be available for use in any fueling operations. Each construction crew would have sufficient supplies of absorbent and barrier materials on hand to allow the rapid containment and recovery of any spills. The construction contractor would immediately notify the Project operator, and the Project operator's Construction Supervisor and environmental monitor of any spills and/or clean-ups, regardless of the size of the spill. Small spills or leaks (less than 5 gallons) would be dealt with within 24 hours of the incident and would be documented in the spill report form. If a spill on BLM-administered land is between 5 and 50 gallons, the BLM contact would be given a courtesy call within a few hours of the incident. If the spill is larger than 50 gallons, the appropriate authorities/agencies would be notified. Should a major spill occur on BLM land, the Field

Office would be notified within 24 hours. All incidents on BLM-administered land would be properly recorded and addressed in accordance with BLM requirements. The Project operator would determine environmental reporting requirements and would notify appropriate environmental agencies.

A Stormwater Pollution Prevention Plan (SWPPP) or SWPPP equivalent document would be prepared by a qualified engineer or erosion control specialist and would be implemented before and during construction. The SWPPP would be designed to reduce potential impacts related to erosion and surface water quality during construction activities and throughout the life of the Project. It would include Project information and best management practices (BMP). The BMPs would include storm water runoff quality control measures, concrete waste management, storm water detention, watering for dust control, and construction of perimeter silt fences, as needed.

The Project would implement the SWPPP (or SWPPP equivalent document) and the HMMP, and would comply with all applicable local, state and federal regulations to reduce the potential that spills or leaks of hazardous materials would occur. In addition, if quantities exceed regulatory thresholds, the Project would develop a SPCC Rule and a HMBP which would include additional hazardous material requirements. Implementation of these plans and compliance with local, state, and federal regulations regarding hazardous materials use, storage, and disposal reduces potential adverse effects from spills or leaks to a less-than-significant level.

As noted above in Section 3.10.1.2, Valley Fever (coccidioidomycosis) is considered endemic in California and *Coccidioides* fungus are present in the arid desert regions of California, including Riverside County. Riverside County has increasing numbers of cases and in 2021 reported ~~471~~ 455 ~~a high for the last decade of~~ cases for and incidence rate of ~~19.2~~ 18.7 per 100,000 population, which ~~is approaching~~ approached the criteria of 20 incidences per 100,000 required to be determined endemic. There is a potential that construction activities such as grading, excavation, and construction vehicle traffic, could loosen and stir up soil containing *Coccidioides* fungus spores, exposing workers and the public to contracting Valley Fever. Construction activities for the Project would be subject to stringent dust control requirements (including SCAQMD Rules 402 and 403). Implementation of Mitigation Measures AQ-1 (Fugitive Dust Control Plan) and HAZ-2, (Worker Environmental Awareness Program) would reduce the potential for workers and the public to contract Valley Fever due to exposure to substantial concentrations of dust which may contain *Coccidioides* fungus spores to a less-than-significant level.

LESS THAN SIGNIFICANT WITH MITIGATION, OPERATIONS AND MAINTENANCE. If regulatory thresholds are exceeded for storage of hazardous materials during Project operation, a SPCC would be prepared and implemented, as required by the SPCC Rule. BMPs would be employed in the use and storage of all hazardous materials within the Project, including the use of containment systems in appropriate locations. Appropriately sized and supplied spill containment kits would be maintained on-site in the O&M area, and the Project's employees would be trained on spill prevention, response, and containment procedures. The chemical storage area would not be located immediately adjacent to any drainage. The Project HMMP requires spill prevention and response training for employees handling hazardous material, best management practices for handling and transporting liquids, requires spill clean-up equipment on site, and monitoring and inspecting of vehicles for leaks. In addition, if an HMBP is required, an associated emergency response plan and inventory would be prepared and implemented. Therefore, there would be a less-than-significant impact due to the use, storage, and disposal of the small amounts of hazardous materials anticipated to be used during Project operation. The likelihood to overheat or ignite is increased if the batteries are poorly packaged, damaged, or exposed to a fire or a heat source.

The Project would include operation of up to 650 MW BESS that would consist of batteries housed in storage containers. Potential hazards related to the BESS could include fire, gaseous build up, explosion, and hazardous materials. Lithium metal batteries contain potentially toxic metals, such as copper and nickel, and organic chemicals, like toxic and flammable electrolytes. Once ignited, the resulting fires can

be especially difficult to extinguish as temperatures can rapidly increase to up to 500 degrees Celsius (932 degrees Fahrenheit) as a result of interactions between a battery's cathodes and anodes, and water is an ineffective extinguisher. The likelihood to overheat or ignite is increased if the batteries are poorly packaged, damaged, or exposed to a fire or a heat source (79 Fed. Reg. 46011, 46032, Aug. 6, 2014).

As noted previously, the BESS would be designed, packaged, constructed, and operated in accordance with applicable industry best practices and regulatory requirements, including, but not limited to, National Fire Protection Association 855 (Standard for the Installation of Stationary Energy Storage Systems) and Section 1206 of the California Fire Code and if applicable, certified to UL 9540. The configuration of the safety system would be determined based on site-specific environmental factors and associated fire response strategy and would contain a safety system that would be triggered automatically when the system senses abnormal conditions and/or imminent fire danger. A fire safety system would be provided within each on-site battery enclosure. Components of the system could include a fire panel, aspirating hazard detection system, smoke/heat detector, strobes/sirens, and suppression tanks. If applicable, the BESS would be tested to UL 9540A, which would confirm that the system would self-extinguish without active fire-fighting measures. Additionally, Mitigation Measure FIRE-1 (Fire Safety) would require components specific to fire response and safety at the BESS be included in the proposed Fire Management and Prevention Plan for the Project. Implementation and compliance with these design and safety regulations and MM FIRE-1 would reduce the impact to a less-than-significant level.

Mitigation Measures for Impact HAZ-2

MM AQ-1 Fugitive Dust Control Plan. See full text in Section 3.4, Air Quality.

MM FIRE-1 Fire Safety. See full text in Section 3.19, Wildfire.

MM HAZ-2 Worker Environmental Awareness Program. See full text in Section 3.10.9 (Mitigation Measures).

Significance After Mitigation

This impact would be less than significant with implementation of mitigation.

Impact HAZ -3. Be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would create a significant hazard to the public or the environment.

LESS THAN SIGNIFICANT WITH MITIGATION, CONSTRUCTION AND DECOMMISSIONING. As noted above, the Project site is located within the WWII DTC/C AMA where maneuvers included weapons training, firing exercises, and laying out and removing landmine fields. Therefore, there is a potential to encounter UXO, MEC, or MD during construction activities. Implementation of proposed Mitigation Measure HAZ-1 (UXO Identification, Training, and Reporting Plan) would require UXO training, investigation, removal, and disposal to ensure that potential UXO impacts would be less than significant.

Phase and Phase II ESAs conducted for the private parcels of the proposed Project identified several potential contamination sources on Project private parcels and included preliminary soil testing for petroleum hydrocarbons (TPHs), pesticides (OCPs), VOC, and metals.

No known hazardous material or environmentally contaminated sites have been identified at the Project site according to EnviroStor and GeoTracker, as of February 2023. However, there is current and historical agricultural use on properties immediately adjacent to the Project site. Pesticides used at these adjacent sites may have spread to the nearby Project areas due to improper application, overspray, or by surface runoff. Although limited testing of the private agricultural parcels did not reveal any pesticide (OCP)

contamination (Stantec, 2024), residual pesticide-contaminated soil may be encountered during Project ground-disturbing activities for solar components and associated facilities near current and former agricultural areas. Additionally, petroleum hydrocarbon contaminated soil may be encountered near current and former fuel ASTs. Implementation of mitigation measures HAZ-2 (Worker Environmental Awareness Program) and HAZ-3 (Soil Management Plan) would ensure that workers and the public are not adversely affected by pesticide or petroleum hydrocarbon contaminated soil.

NO IMPACT, OPERATIONS AND MAINTENANCE. Operation and maintenance activities would not involve significant ground disturbance or excavation activities and would therefore have no potential to encounter UXO, MEC, or MD nor pesticide contaminated soils.

Mitigation Measures for Impact HAZ-3

- MM HAZ-1** **UXO Identification, Training, and Reporting Plan.** See full text in Section 3.10.9 (Mitigation Measures).
- MM HAZ-2** **Worker Environmental Awareness Program.** See full text in Section 3.10.9 (Mitigation Measures).
- MM HAZ-3** **Soil Management Plan. Significance After Mitigation.** See full text in Section 3.10.9 (Mitigation Measures).

Significance After Mitigation

This impact would be less than significant with implementation of proposed mitigation measures.

Impact HAZ-4. Result in a safety hazard or excessive noise for people residing or working in the Project area for a project within an airport land use plan or, where such a plan has not been adopted, within 2 miles of a public airport or public use airport.

LESS THAN SIGNIFICANT. The proposed Project is located within 2 miles of the Desert Center Airport. The Desert Center Airport was purchased by the Chuckwalla Valley Raceway and is no longer included in the Riverside County Circulation Element. The Project site is not located within the Airport Influence Area Boundary nor any of the airport Compatibility Zones; however, it is located just outside of these areas (RCALUC, 2004). For uses in Compatibility Zone E, Riverside County Airport Land Use Commission review is required for objects greater than 100 feet tall. Because the Desert Center Airport is no longer part of the General Plan and the Project is not within the 2004 RCALUC influence areas, this review is not required.

Additionally, the only components of the solar facility that would be potentially over 100 feet tall are the gen-tie line structures, which would be on average 120 feet tall, with a maximum height of 199 feet. The gen-tie line structures would be approximately 2 to 2.5 miles south and southwest of the single east-west trending runway. The closest Project element would be approximately 1 mile northwest from the runway. Impacts to the airport due to the Project structures would be less than significant. However, low level military training flight paths are located crossing and in the vicinity of the Project and the gen-tie line structures could potentially represent an aviation hazard to low level training flights. Depending on the outcome of the BLM-DoD consultation, infrared obstruction lighting may be installed on structures over 180 feet high that are located in areas where the new structures would be taller than existing nearby structures. Compliance with BLM-DoD required lighting would reduce potential impacts to low level training flights to less than significant.

The PV solar panels for the proposed Project would not create significant adverse impacts from reflection and glare (see Section 3.2, Aesthetics). The Project would result in less-than-significant impacts associated

with reflection and glare impacts to the Desert Center Airport and on low level military training flights. See Section 3.2, Aesthetics, for more information on glare.

The proposed Project would not include residential or commercial uses that would be affected by operations at the Desert Center Airport on those occasions when it is in use. Project workers working in the project area would not be exposed to excessive noise from the airport, as the Project site is not located within the airport's noise contours. Further, the Project is not considered a sensitive use and would not introduce new residences on the project site which could experience excessive noise from the airport. Overall, any impacts to the safety for people residing or working in the Project area impacts would be less than significant.

Mitigation Measures for Impact HAZ-4

No mitigation would be required.

Significance After Mitigation

This impact would be less than significant.

Impact HAZ-5. Impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan.

LESS THAN SIGNIFICANT, CONSTRUCTION AND DECOMMISSIONING. The proposed site is in a remote area with generally few rural residences; however, approximately 80 residences (primarily mobile homes) are located in Lake Tamarisk Desert Resort located just south of the Project site boundary. Access to the solar facility site would be provided from Rice Road/State Route 177 through up to five primary and three secondary driveway entrances via locked gates. None of these driveway entrances are near LTDR or on its access road and, therefore, construction traffic should not physically interfere with emergency access to LTDR. BLM open routes and agricultural roads would also be improved. Flagging operations at site access points may be implemented during construction if/when traffic control needs are indicated through either monitoring traffic operations during construction or determined to be required during construction stage planning. Construction of the solar facility is not expected to require any temporary lane closures that could restrict the movements of emergency vehicles or impair an emergency evacuation. The site would have controlled access points for ingress and egress into the solar facility. These access points would allow for emergency vehicle access into and through the site. Thus, construction of the proposed Project would result in less-than-significant impacts related to implementation of or physical interference with an adopted emergency response plan or emergency evacuation plan.

LESS THAN SIGNIFICANT, OPERATIONS AND MAINTENANCE. Operations and maintenance of the Project would generate very few vehicle trips with only 2 onsite staff and 8 remote Project operators. Once constructed, maintenance activities would occur as needed at the solar facilities but are not expected to require any temporary travel lane closures that could restrict emergency vehicle movements. The proposed gen-tie line would be located within the Oberon Energy Renewable Project and would not introduce a new obstruction that would adversely affect emergency access or evacuation efforts. See Section 3.17, Transportation, for detailed discussions regarding access in and around the area. Thus, operation of the proposed Project would result in less-than-significant impacts related to implementation of or physical interference with an adopted emergency response plan or emergency evacuation plan.

Mitigation Measures for Impact HAZ-5

No mitigation would be required.

Significance After Mitigation

This impact would be less than significant.

Impact HAZ-6. Expose people or structures, either directly or indirectly, to a significant risk of loss, injury, or death involving wildland fires.

LESS THAN SIGNIFICANT WITH MITIGATION, CONSTRUCTION AND DECOMMISSIONING. During construction and decommissioning, fires could be caused by a variety of factors, including vehicle exhaust, sparks associated with grading activities, welding activities, parking on dry vegetation, and the overall temporary increase in human activity. The Project site consists of undeveloped open space, with minimal native or ruderal vegetation with a few rural residences, a mobile home community (LTDR), agricultural, and commercial properties located adjacent to and near the Project. Pursuant to the Code of Federal Regulations, Title 29, Part 1926.24 (29 Code of Federal Regulations [CFR] 1926.24), the Project operator would be responsible for the development and maintenance of an effective fire protection and prevention program through all phases of construction, repair, alteration, or demolition work for the solar facility, BESS, Project substation, gen-tie line, and associated components. The Project Fire Management and Prevention Plan (FMPP) includes procedures for minimizing potential ignition, work restrictions on high fire hazard days, requirements for spark arrestors, prohibition of smoking near vegetated areas or near combustible materials, and requirements for firefighting equipment suitable for extinguishing small fires (IP Easley, 2023, Appendix V). The FMPP for the Project would be implemented during construction to ensure that hazards related to exposing people to wildland fires would be less than significant.

Implementation of Mitigation Measure FIRE-1 (Fire Safety) which provides additional required procedures and information to be included in the FMPP, and of a WEAP, as required under Mitigation Measure HAZ-2, would further reduce wildfire risks. Accordingly, the proposed Project is not expected to expose people or structures, directly or indirectly, to a significant risk of loss, injury, or death involving wildland fires during Project construction. Therefore, impacts would be less than significant with mitigation. See Section 3.18, Wildfire, for detailed discussions regarding wildfires and wildland fires in the Project area.

LESS THAN SIGNIFICANT WITH MITIGATION, OPERATIONS AND MAINTENANCE. As discussed in Section 3.19, Wildfire, the Project is located within both LRA and FRA areas of moderate fire severity. The Project site is not located within a high/very high fire hazard area, as determined by CAL FIRE. The solar facility would be designed and constructed to industry safety design standards (i.e., Institute of Electrical and Electronic Engineers, National Electric Code) and Riverside County Building and Safety Department requirements to reduce the risk of electrical fires at the site. Solar arrays are fire-resistant, as they are constructed largely out of steel, glass, aluminum, or components housed within steel enclosures. Wires would be buried at a minimum of 18 inches below grade, minimizing the potential for faulty wiring to ignite a fire. All electric inverters and the transformer would be constructed on concrete foundation structures or steel skids and tested prior to use to ensure safe operations and avoid fire risks. In the event of a higher-than-normal temperatures (from events that could start a fire or during a fire events) units could be remotely shut down or generation curtailed remotely until corrective actions (i.e., inspections and repairs) are taken. In a wildfire situation, the panels would be rotated and stowed in a panel-up position. Fire safety and suppression measures, such as smoke detectors and extinguishers, would be installed and available at the O&M facility. Implementation of Mitigation Measure FIRE-1 (Fire Safety) which provides additional required procedures and information to be included in the FMPP, in addition to compliance with applicable regulations, would reduce wildfire risks to less-than-significant levels.

Thermal runaway or other system failures could lead to fire or explosion of the BESS. In order to minimize hazards related to fire and explosion, the BESS would be designed and constructed per all applicable design, safety, and fires standards for the installation of energy storage systems, including, but not limited

to, National Fire Protection Association 855 (Standard for the Installation of Stationary Energy Storage Systems) and Section 1207 of the 2022 California Fire Code. These standards would require installation of fire suppression systems, thermal management, ventilation, and exhaust and deflagration venting systems in the BESS. A fire safety system would be provided within each on-site battery enclosure. Additionally, MM FIRE-1 would require components specific to fire response and safety at the BESS be included in the proposed Fire Management and Prevention Plan for the Project.

Mitigation Measures for Impact HAZ-6

MM FIRE-1 Fire Safety. See full text in Section 3.19, Wildfire.

Significance After Mitigation

This impact would be less than significant with mitigation.

***** The impact analyses for all Project alternatives have been moved to EIR Section 5. *****

3.10.6. Cumulative Impacts

Geographic Scope

The geographic scope considered for cumulative impacts from health, safety, and hazardous materials/fire and fuels management is the area extending one mile from the boundary of the Project. One mile is the American Society of Testing and Materials (ASTM) standard search distance for hazardous materials. Tables 3.1-1 and 3.1-2 list existing and reasonably foreseeable projects in the region. The West-wide Section 368 Energy Corridors; SCE Red Bluff Substation; Devers–Palo Verde 1 Transmission Line; Palen Solar Project; Athos Renewable Energy Project; Oberon Renewable Energy Project; Sapphire Solar Project (proposed); and Arica and Victory Pass Solar Projects would all be within one mile of the boundary of the Project site and could therefore combine with the proposed Project and result in a cumulatively considerable impact to hazards and hazardous materials.

Cumulative Impact Analysis

The cumulative effect of transport, use, and disposal of hazardous materials during construction would be limited to the areas where concurrent construction is occurring or where concurrent roads are being used for construction traffic. Operation and maintenance of the proposed Project, including the proposed substations, shared switchyard, and O&M buildings, would involve periodic and routine transport, use, and disposal of minor amounts of hazardous materials, primarily petroleum products (fuels and lubricating oils) and motor vehicle fuel. The implementation of Mitigation Measure HAZ-2 (Worker Environmental Awareness Program) and agency regulations that address the handling of hazardous materials would ensure that the Project would not create a significant hazard to the public or the environment related to the handling or accidental release of hazardous materials. Past, present, and reasonably foreseeable future projects are also subject to existing agency regulations that address the handling and accidental release of hazardous materials, and all of the solar projects would have their own WEAPs for construction and operations. Therefore, existing regulations would ensure that the combined effects related to hazards and hazardous materials from the cumulative projects within the geographic scope of analysis would not be cumulatively significant, and that the proposed Project would not make a cumulatively considerable contribution to these effects.

Construction of the Project could encounter previously documented and undocumented hazardous materials sites within the area. Since the proposed site is located within an area with a history of WWII military use, there is a potential for UXO, MEC, and MD. The Project would be required to implement an

UXO Identification, Training, and Reporting Plan (MM HAZ-1) which addresses the identification and treatment of UXO and munitions debris, a WEAP (MM HAZ-2) which addresses hazardous materials handling and disposal training and information, and a SMP (MM HAZ-3) to address potential pesticide contaminated soil. All the cumulative projects would also be located on former military land with a history of UXO and munitions debris, so may have a similar potential for encountering UXO and munitions debris, and would also likely require an UXO Identification, Training and Reporting Plan and a WEAP and/or similar measures to minimize impacts to minimize impacts on and off the site. Because of the history of UXO in this area, the projects collectively could help reduce the overall impacts due to UXO hazards once they are operational and have potentially cleared areas of UXO hazards. Under cumulative conditions Cumulative impacts would be less than significant, and implementation of the Project would not make a cumulatively considerable contribution to public health and safety hazards.

Construction of the Project could result in mobilization of *Coccidioides* fungus spores in airborne dust. If inhaled, this could expose workers and the public to contracting Valley Fever. Implementation of stringent dust control regulations, Mitigation Measures HAZ-2 (Worker Environmental Awareness Program) and AQ-1 (Fugitive Dust Control Plan) minimizes the risk of workers or the public contracting Valley Fever. Past, present, and reasonably foreseeable future projects are also subject to existing agency regulations that address fugitive dust and would likely have similar mitigation to prepare a fugitive dust control plan. Therefore, existing regulations and mitigation would ensure that cumulative impacts are less than significant and the proposed Project would not make a considerable contribution to the potential for contracting Valley Fever.

The Easley Renewable Energy Project and other cumulative solar projects would all involve the storage, use, disposal, and transportation of hazardous materials to varying degrees during construction and operation. Impacts from these activities would not result in significant cumulative impacts, nor would the project result in a considerable contribution to cumulative impact because the storage, use, disposal, and transportation of hazardous materials are extensively regulated by various federal, state, and local laws, regulations, and policies. ~~It is foreseeable that~~ The Project and other cumulative projects would implement and comply with these existing hazardous materials laws, regulations, and policies.

Construction and operation of the Project could introduce a risk of wildland fire through accidental ignition of the sparse native vegetation during construction or operation activities, including equipment or BESS malfunction-related fires. The proposed Project would be required to comply with applicable federal, state, and Riverside County requirements relating to fire safety and fire hazards, the FMPP, and Mitigation Measures FIRE-1, minimizing the risk of wildland fire occurring. In addition, projects in the cumulative scenario would similarly be required to comply with fire safety and fire hazard guidelines and policies. Therefore, cumulative impacts would be less than significant, and the Project would not make a cumulatively considerable contribution to potential wildland fire impacts. In addition, the proposed Project would not make a considerable contribution to impact related to impairment of the implementation of or physical interference with an adopted emergency response plan or emergency evacuation plan because no aspect of the Project would interfere with emergency response (e.g., construction is not expected to require any temporary lane closures that could restrict the movements of emergency vehicles).

Mitigation Measures for Cumulative Impacts

MM AQ-1 **Fugitive Dust Control Plan.** See full text in Section 3.4, Air Quality.

MM FIRE-1 **Fire Safety.** See full text in Section 3.19, Wildfire.

MM HAZ-1 **UXO Identification, Training, and Reporting Plan.** See full text in Section 3.10.9 (Mitigation Measures).

MM HAZ-2 Worker Environmental Awareness Program. See full text in Section 3.10.9 (Mitigation Measures).

MM HAZ-3 Soil Management Plan. See full text in Section 3.10.9 (Mitigation Measures).

Significance After Mitigation

The Project's incremental contribution to hazard and hazardous materials impacts would not be cumulatively considerable.

3.10.7. Mitigation Measures

MM AQ-1 Fugitive Dust Control Plan. See full text in Section 3.4, Air Quality.

MM FIRE-1 Fire Safety. See full text in Section 3.19, Wildfire.

MM HAZ-1 UXO Identification, Training, and Reporting Plan. Where ground disturbance work is involved, contractor(s) shall be OSHA HAZWOPER-trained in accordance with standard 29CFR1910.120 and hold a current certification. The Applicant shall prepare a UXO Identification, Training, and Reporting Plan to properly train all site workers in the recognition, avoidance and reporting of military waste debris and ordnance. The Applicant shall submit the plan to the County and BLM for review and approval prior to the start of construction. The plan shall contain, at a minimum, the following:

- A description of the training program outline and materials, and the qualifications of the trainers; and
- Identification of available trained experts that will respond to notification of discovery of any ordnance (unexploded or not); and
- Work plan to recover and remove discovered ordnance, and complete additional field screening, possibly including geophysical surveys to investigate adjacent areas for surface, near surface or buried ordnance in all proposed land disturbance areas.

MM HAZ-2 Worker Environmental Awareness Program. The WEAP prepared for the Project shall include a personal protective equipment (PPE) program, an Emergency Action Plan (EAP), and an Injury and Illness Prevention Program (IIPP) to address health and safety issues associated with normal and unusual (emergency) conditions. It will be reviewed and approved by the County and BLM prior to construction. Construction-related safety programs and procedures shall include a respiratory protection program, among other things. Construction Plan documents shall relate at least to the following:

- Environmental health and safety training (including, but not limited, to training on the hazards of Valley Fever, including the symptoms, proper work procedures, how to use PPE, and informing supervisor of suspected symptoms of work-related Valley Fever)
- Site security measures
- Site first aid training
- Site fire protection and extinguisher maintenance, guidance, and documentation
- Furnishing and servicing of sanitary facilities records
- Trash collection and disposal
- Disposal of hazardous materials and waste guidance in accordance with local, state, and federal regulations

MM HAZ-3 **Soil Management Plan.** Prior to issuance of demolition or grading permits, the Applicant shall prepare a Soil Management Plan (SMP) to guide activities during construction that will disturb potentially pesticide or petroleum hydrocarbon contaminated soils to ensure that potentially contaminated soils are identified, characterized, removed, and disposed of properly. The SMP shall be submitted to the County and BLM for approval prior to Project construction. The purpose of the SMP is to establish appropriate management practices for handling impacted soil or other materials that may be encountered during construction activities.

The SMP shall be implemented during Project construction and shall include, but shall not be limited to, the following components:

- Description of soil testing, which shall include (but not be limited to) the collection of shallow soil samples and analyses for pesticides to verify presence or absence of unknown pesticide soil contamination and the collection of soil samples at locations at and near onsite current and former fuel ASTs for analyses for petroleum hydrocarbons. This soil profiling shall be performed prior to initiation of Project construction.
- Protocols for sampling of in-place soil to facilitate the profiling of the soil for appropriate off-site disposal or reuse, and for construction worker safety, dust mitigation during demolition and construction and potential exposure of contaminated soil to future users of the site prior to Project construction.
- Procedures to be undertaken in the event that contamination is identified above action levels or previously unknown contamination is discovered prior to or during Project construction.
- Sampling and laboratory analyses of any excess soil requiring disposal at an appropriate off-site waste disposal facility.
- Procedures and protocols for the safe storage, stockpiling, and disposal of any contaminated soils.

If contaminants are identified at concentrations exceeding applicable screening levels, the Applicant shall submit the SMP sampling results to the County DEH and BLM and obtain oversight from the appropriate regulatory agencies. Copies of the approved SMP shall be kept at the Project site.

Any contaminated soils identified by testing conducted in compliance with the SMP and found in concentrations above established thresholds shall be removed and disposed of according to California Hazardous Waste Regulations. Contaminated soil excavated from the site shall be hauled off-site and disposed of at a licensed hazardous materials disposal site.

3.11. Hydrology and Water Quality

This section presents the existing local and regional water resources baseline for the Easley Renewable Energy Project (Project), the regulatory framework for water resources, and an assessment of the effects of the Project on groundwater and surface water sources. The Project area relevant to the analyses of water resources is the underlying Chuckwalla Valley Groundwater Basin (CVGB) and adjacent groundwater basins for groundwater resources and the Chuckwalla Valley Drainage Basin for surface water resources. The Easley Solar Project Hydrology Study by Westwood Professional Services (Westwood, 2023) is used as a primary source the surface water information in this section.

3.11.1. Environmental Setting

This section refers to certain laws and regulations that apply to water resources in this area. These laws and regulations are described in more detail in Section 3.11.2.

3.11.1.1. Surface Water

Drainage Characteristics

The Project site is in the Chuckwalla Valley of Riverside County near the community of Desert Center, California. Although in the Mojave Desert Geomorphic Province, the Project lies within the Sonoran Desert ecoregion consisting of isolated mountain ranges separated by expanses of desert plains. The site is within an interior enclosed drainage system, meaning there is no outlet to the ocean. Drainage is to shallow lake beds which, being dry most of the time, are known as dry lakes or playas. Figure 3.11-1 (Project Topography) shows the topography of the Project site.

The Project lies on wide, flat alluvial fans emanating from the Chuckwalla Mountains to the south and from the Eagle Mountains to the east. Alluvial flows from these two mountain ranges form a series of numerous shallow, inter-braided, small washes which enter along the western boundary of the Project and traverse the Project from southwest to northeast. The Big Wash originates in the Eagle Mountains and crosses along the north side of the Project to join with the Pinto Wash, originating from the Eagle Mountains and from the area north of the Eagle Mountains. The Pinto Wash passes northwest to southeast adjacent to the north and east side of the Project site. All these washes are similar in character (numerous shallow inter-braided washes flowing over a wide area).

The elevation of the Project site ranges from about 550 feet above mean sea level (amsl) on the northeastern boundary of the site to 740 feet amsl at the southwestern edge. The surrounding mountains rise to over 3,000 feet amsl. The Project's site is relatively flat to gently sloping to the northeast.

Climate and Precipitation

The Chuckwalla Valley is characterized by high aridity, low precipitation, hot summers, and cool winters. Average maximum temperature at the nearby Eagle Mountain Climate Station is 104.9 degrees Fahrenheit (°F) in July. Average minimum temperature is 46.2°F in December (WRCC, 2023). Average annual precipitation is approximately 3.67 inches at Eagle Mountain Climate Station and 3.39 inches at the Blythe Climate Station (NOAA, n.d.[a]; NOAA, n.d.[b]; WRCC, 2023). Most rainfall occurs during the winter months, or in association with summer tropical storms which tend to be of shorter duration and higher intensity than winter storms. Eastern Riverside County is currently (February 2023) classified by the U.S. Drought Monitor as being in a moderate drought (U.S. Drought Monitor, 2023). Due to the aridity of the region, natural surface water within the Project area is ephemeral. Natural drainage courses (the washes described above) remain dry most of the time, carrying flows only after rainfalls sufficient to produce runoff.

Flooding

At the location of the Project, the ephemeral desert watercourses exhibit characteristics of alluvial fans. Water from mountain canyons and drainages discharges onto the alluvial desert floor and spreads into a series of relatively unconsolidated channels and sheet flow which can inundate wide areas. Flood depths are generally (though not always) shallow resulting from the inability of the small, braided drainage channels to contain large flows. Flow patterns, as exhibited by visible watercourses, can shift over time, even within the duration of a single flood, as existing channels fill in and new channels are made.

The Federal Emergency Management Agency (FEMA) has not prepared flood insurance rate maps for the Project site; however, nearly all the site is within California Department of Water Resources (CDWR) Flood Awareness zones (Westwood, 2023) as shown in Figure 3.11-2 (DWR Flood Zones). These zones are approximate, for general information only, and are not intended as regulatory floodplains.

Westwood Professional Services (Westwood, 2023) has prepared a flood analysis appropriate for unconsolidated alluvial fan flooding on the Project site. Because of the complex and distributary nature of the flow path upstream and throughout the Project site, the Westwood study analyzed major sources of flooding in the area on a fixed-boundary terrain using a two-dimensional model grid with 50-foot cells. This study showed that much of the Project site would be subject to 100-year flooding as follows:

- Flood depth < 0.5 feet = 64.9% of the Project site.
- Flood depth 0.5 feet to 1 foot = 31.9% of the Project site.
- Flood depth 1.01 feet to 1.5 feet = 2.5% of the Project site.
- Flood depth 1.51 feet to 2 feet = 0.3% of the Project site.
- Flood depth 2.01 feet to 2.5 feet = 0.1% of the Project site.
- Flood depth 2.51 to 6+ feet <= 0.3% of the Project site.

Based on the above flood depths, and the nature of the alluvial terrain as already described, it is concluded that nearly every portion of the Project site could be subject to flooding, but most flood depths would be shallow (less than one foot). Figure 3.11-3 shows areas expected to be subject to flooding of more than one foot, which amount to roughly 3.2 percent of the site.

Flow velocities over most of the site range from 1 to 1.5 feet per second for the 100-year flood, with a few areas as much as 3 to 4 feet per second. Expected scour is mostly 1 to 1.5 feet. Highest velocities and scour would be associated with the deepest depths roughly shown in Figure 3.11-3.

The 100-year flood, used as a regulatory flood by FEMA and Riverside County, has a one percent chance of occurring in any year. Although the probability of occurrence remains the same (1 percent) for any given year, on average, a flood of this magnitude can be expected to occur once every 100 years. The flood limits shown in Figure 3.11-3 and described above are not regulatory floodplains. The purpose of the figure is to show the most-likely areas of worst-case 100-year flooding under current (year 2023) conditions. Because the flood model used a 50-foot grid, and because natural flow channels can shift through avulsion (the rapid abandonment of and the formation of new channels), there is a potential for the flood pattern shown in Figure 3.11-3 to change at some point in the future. Most flood depths over the Project site are likely to remain less than 1 foot as indicated in the Westwood study.

Water Quality

Historical beneficial uses of water within the Colorado River Basin Region have been determined by the Colorado River Basin Regional Water Quality Control Board (RWQCB) and are largely associated with irrigated agriculture and mining. Industrial use of water has become increasingly important in the Region, particularly in the agricultural areas (RWQCB, 2019). The RWQCB Water Quality Control Plan for the Colorado River Basin Region (Basin Plan) (RWQCB, 2019) lists specific beneficial uses for surface waters

and groundwater. The surface waters on the Project site would be classified in the Basin Plan as washes (ephemeral streams) which have the following beneficial uses: Groundwater Recharge (GWR), Non-Contact Water Recreation (REC II), Warm Freshwater Habitat (WARM) (to be established on a case-by-case basis), and Wildlife Habitat (WILD). Beneficial uses of the groundwater in the CVGB are Municipal and Domestic Supply (MUN), Industrial Service Supply (IND), and Agriculture Supply (AGR).

None of the waters in or near the proposed Project are currently listed as impaired on the Clean Water Act (CWA) Section 303(d) list of impaired waters (SWRCB, 2020).

Jurisdictional Waters

Jurisdictional waters were delineated for the Project site in the Jurisdictional Waters Report by Ironwood Consulting (Ironwood, 2023; see EIR Appendix F). Potential areas of jurisdiction include waters of the U.S., administered by the U.S. Army Corps of Engineers (USACE) under the CWA, waters of the State, administered by the RWQCB, and waters subject to the jurisdiction of the California Department of Fish and Wildlife (CDFW).

The Ironwood report concluded that there were 398.38 acres of unvegetated ephemeral wash and 0.6177 acres of anthropogenic wetlands which are unlikely to be jurisdictional under the Clean Water Act. There are 742.38 acres of dry desert wash woodland and 0.4495 acres of non-native riparian vegetation which are not jurisdictional under the Clean Water act. All these resources are either subject to or likely subject to RWQCB jurisdiction. All are subject to CDFW jurisdiction, necessitating approval of a Streambed Alteration Agreement.

Springs and seeps in the area include Corn Springs, Box Spring, Crystal Spring, Old Woman Spring, Cove Spring, Mitchell Caverns Spring, Bonanza Spring, Agua Caliente Spring, Kleinfelter Spring, Von Trigger Spring, Malpais Spring, and Sunflower Spring (RWQCB, 2021). All these springs are in the surrounding mountains, and none are located such that they could serve as water supply for or be affected by the Project.

3.11.1.2. Groundwater

The information presented below for groundwater resources and the CVGB is primarily from the Project's Water Supply Assessment (WSA), which is included as EIR Appendix G (GSI, 2024). References used are cited in the WSA (EIR Appendix G).

Groundwater Overview

The Project is located within the California Department of Water Resources (DWR) Bulletin 118 CVGB (Basin No: 7-5), which is in eastern Riverside County and encompasses an area of approximately 940 square miles (DWR, 2004) (see GSI, 2024, Figure 3 in Appendix G). Groundwater has been identified as the primary source of water in the CVGB. DWR has categorized the CVGB as a very low-priority basin under the Sustainable Groundwater Management Act (SGMA) (DWR, 2020a).

The CVGB is located within the Southern Mojave Watershed (Hydrologic Unit Code 8-18100100). The Chuckwalla Valley watershed, a subunit of the South Mojave Watershed, contributes to the CVGB via percolation of precipitation. Percolation of precipitation occurs within the Chuckwalla Valley watershed via runoff from the surrounding mountains and from precipitation to the Chuckwalla Valley floor (DWR, 2004; CEC, 2010).

There are no perennial streams in Chuckwalla Valley. Drainage in the CVGB is to the Palen and Ford Dry Lakes located in topographic low points (DWR, 2004). All surface water in the western portion of the CVGB, which includes the Project area, flows to Palen Dry Lake, located approximately 10 miles east of

the community of Desert Center and roughly 7 miles east of the Project area. Surface water in the eastern portion of the Chuckwalla Valley flows to Ford Dry Lake, located approximately 10 miles southeast of the Palen Dry Lake (RWQCB, 2021). Documented springs and seeps in the area are in the surrounding mountains, and none are located such that they could serve as a water supply for the Project (Aspen, 2021).

The CVGB underlies the Palen and Chuckwalla Valleys. The CVGB is bounded by the consolidated rocks of the Chuckwalla, Little Chuckwalla, and Mule Mountains on the south; the Eagle Mountains on the west; and the Mule and McCoy Mountains on the east. Rocks of the Coxcomb, Granite, Palen, and Little Maria Mountains bound the valley on the north (DWR, 2004).

Water-bearing units of the CVGB include Pliocene to Quaternary age continental deposits divided into Quaternary alluvium, the Pinto Formation, and the Bouse Formation (DWR, 2004). Bedrock is as deep as 5,000 feet below ground surface in the eastern portion of the CVGB. Wells in the vicinity of the Project extend to depths of approximately 550 to 875 feet below ground surface, with water levels approximately 100 to 150 feet below ground surface (RWQCB, 2021; Shen et al., 2017).

The CVGB is located within the jurisdiction of the Colorado River Basin RWQCB and is subject to management direction of the Water Quality Control Plan for the Colorado River Basin (Region 7) (RWQCB, 2019). The CVGB is bordered by the Pinto Valley, Cadiz Valley, Rice Valley, and Ward Valley Groundwater Basins on the north; the Palo Verde Mesa Groundwater Basin on the east; the Arroyo Seco Valley and Chocolate Valley Groundwater Basins on the south; and the Orocopia Valley Groundwater Basin on the west.

The CVGB is an unadjudicated groundwater basin. Owners of property overlying the CVGB have the right to pump groundwater from the CVGB for reasonable and beneficial use, provided that the water rights are neither severed nor reserved. Groundwater production in the CVGB is not managed by a specific entity and a groundwater sustainability plan has not been prepared and ~~nor~~ is not required, per SGMA, to be submitted to DWR based on its basin prioritization (very low priority) (DWR, 2020a). An Urban Water Management Plan and an Integrated Regional Water Management Plan have not been developed for the area.

Groundwater Trends

The following sections summarize available groundwater level and groundwater quality data for the CVGB.

Groundwater Levels

Depths to groundwater are as deep as about 400 feet below ground surface in many parts of the CVGB (RWQCB, 2019). Based on groundwater contour data from 1961, 1979, and 1992 groundwater in the CVGB moves from the north and west toward the gap between the Mule and McCoy Mountains at the southeastern end of the Chuckwalla Valley (AECOM, 2010a; DWR, 2004). Available data indicate groundwater levels were stable as of 1963 and that a total groundwater extraction of 9,100 AFY was obtained in 1966 and 9,023 AF in 2019 (DWR, 2004; DWR 2020a).

The direction of groundwater movement is not expected to have changed since 1992, but there have been changes in groundwater levels, especially localized around areas of increased extraction. For example, data from wells within the Desert Center area show a period of water level decline from the mid-1980s through the early 1990s during periods of expanded agricultural operations. During the mid-1980s, combined pumping exceeded 21,000 AFY, which is well above historical water usage for the Desert Center area of the CVGB (AECOM, 2011; GEI, 2010).

The National Park Service has noted that groundwater levels throughout the CVGB appear to have been trending downward for several decades (BLM, 2012). Most wells in the CVGB have not been used for

collecting monitoring data such as groundwater level trends since the 1980s. However, groundwater data collected from several wells for the past 25 years indicate that groundwater level trends have remained largely stable in the eastern CVGB, and that groundwater levels have risen gradually back towards pre-agricultural pumping groundwater levels in the western CVGB (where the Project is located), while dropping steadily in the central CVGB (Aspen, 2021). In 2012, the U.S. Geological Survey (USGS) installed monitoring wells in the eastern CVGB. Available water level data from these wells indicate generally rising groundwater levels over the period of data collection (USGS, 2023).

~~In general, h~~Available historical groundwater level data show ~~relatively~~generally stable groundwater levels in the CVGB, interrupted in the Desert Center area in the past mainly by relatively intensive agricultural pumping. ~~Available H~~Available historical groundwater level data from the Desert Center area indicate rising, or recovering, groundwater levels following the cessation of most agricultural usage since the 1980s (AECOM, 2010a).

Groundwater Quality

The Project is located in the jurisdiction of the Colorado River Basin RWQCB. The Water Quality Control Plan developed by the RWQCB establishes water quality objectives, including narrative and numerical standards, to protect the beneficial uses of surface and ground waters in the region. The Water Quality Control Plan describes implementation plans and other control measures designed to ensure compliance with Statewide plans and policies and documents comprehensive water quality planning.

Beneficial uses of waters, designated by the RWQCB, are of two types: consumptive and non-consumptive. Consumptive uses are those normally associated with people's activities, primarily municipal, industrial, and irrigation uses that consume water and cause corresponding reduction and/or depletion of water supply. Non-consumptive uses include swimming, boating, waterskiing, fishing, hydropower generation, and other uses that do not significantly deplete water supplies. Historical beneficial uses of water within the Colorado River Basin Region have largely been associated with irrigated agriculture and mining. Industrial use of water has become increasingly important in the Region, particularly in the agricultural areas (RWQCB, 2019). The RWQCB Water Quality Control Plan for the Colorado River Basin Region (RWQCB, 2019) lists specific beneficial uses for groundwater. Beneficial uses of the groundwater in the CVGB are Municipal and Domestic Supply (MUN), Industrial Service Supply (IND), and Agriculture Supply (AGR).

Total dissolved solids (TDS) concentrations across the CVGB range from 274 milligrams per liter (mg/L) to 12,300 mg/L. The lowest TDS concentrations are in the western portion of the CVGB, where TDS concentrations range from 275 to 730 mg/L (DWR, 2004). In the northwest portions of the CVGB, arsenic concentrations have ranged from 9 micrograms per liter (ug/L) to 25 ug/L (GEI, 2010). Water quality in the CVGB has concentrations of sulfate, chloride, fluoride, and TDS that are higher than recommended levels for drinking water use. Likewise, elevated concentrations of boron, TDS, and percent sodium impair groundwater for irrigation use. In general, groundwater in the CVGB is sodium chloride to sodium sulfate-chloride in character (DWR, 2004).

Recent available water quality data near the proposed Project is limited to four wells, with nitrate being the only constituent analyzed in three of the four wells. Reported nitrate concentrations in all four wells were below the federal and California Maximum Contaminant Level of 10 mg/L (nitrate measured as nitrogen).

Groundwater Storage Capacity

Total groundwater storage capacity of the CVGB is estimated to be from 9,100,000 AF to 15,000,000 AF (DWR, 2004). A project-specific 2013 analysis estimated the storage capacity of the CVGB to be about 10,000,000 AF (SWRCB, 2013).

Groundwater Recharge

Recharge to the CVGB occurs from subsurface inflow from other groundwater basins, infiltration of precipitation, irrigation return flow, and wastewater return flow. Leakage from the Colorado River Aqueduct has also been identified as a possible source of inflow.

Subsurface Inflow and Mountain Front Recharge

Groundwater in the CVGB generally flows west to east. Subsurface inflow originates from the Pinto Valley and Orocopia Valley Groundwater Basins, which are west of the CVGB (DWR, 2004; BLM, 2011). The amount of inflow from the Pinto Valley and Orocopia Valley Groundwater Basins is highly-uncertain, and there have been a wide-range of estimates from different publications ranging from a low of 372 AFY to a high of 6,575 AFY (Aspen, 2021; Fang et al., 2021).

Two groundwater budgets were developed for the Project WSA (GSI, 2024). The first (Table 3.11-1) is a best estimate using data that have been widely reported and used in previous WSA-studies (see Section 3.11.1.2 and GSI, 2024, Sections 5.7 and 5.8). The second water budget analysis (Table 3.11-2) uses lower input estimates (see Section 3.11.1.2 and GSI, 2024, Sections 5.7 and 5.8). The first, or “normal conditions” groundwater budget developed for the Project WSA uses 877 AFY as established in Fang et al. (2021) as the upper bound as of the amount of natural groundwater recharge from subsurface inflow from the Pinto Valley Groundwater Basin. This was the upper range of the groundwater inflow estimates from the Pinto Valley Groundwater Basin. Groundwater budgets in WSAs for nearby projects in the recent past have used 3,500 AFY (RWQCB, 2021), which is approximately in the middle of the range of estimates. The second, or “reduced recharge”, groundwater budget uses 372 AFY as the amount of natural groundwater recharge from subsurface inflow, which was developed by Fang et al. (2021) as the lower bound. These mountain front recharge volumes represent the upper and lower bounds in Fang et al. (2021). Notably, the upper bound of subsurface inflow used in the WSA (877 AFY) represents a conservative assumption, as groundwater budgets in WSAs for nearby projects in the recent past have used 3,500 AFY (Aspen, 2021), which is approximately in the middle of the range of estimates.

Mountain front recharge is recorded as lateral subsurface flow that passes from thin mountain soil to the aquifer at the mountain foot (Fang et al., 2021). The Project WSA (GSI, 2024) groundwater budget uses 210 AFY for mountain front recharge. The analysis also applies the 107 AFY for the reduced groundwater recharge scenario. These mountain front recharge volumes represent the upper and lower bounds in Fang et al. (2021).

Infiltration of Precipitation

Groundwater recharge to the CVGB by precipitation is difficult to assess due to lack of data quality and the aridity of the region. The CVGB receives a total precipitation of approximately 205,376 (Fang et al., 2021) to 258,000 AFY (CEC, 2010). Recharge from precipitation has been estimated by previous CVGB studies as a percentage of total precipitation. The California Energy Commission (CEC) recommended using 8,588 AFY (about 3.3 percent of total precipitation) for a conservative groundwater budget analysis (CEC, 2010). These results are supported by the findings of a study included in a USGS report on groundwater recharge in the arid and semiarid southwestern U.S. (USGS, 2007) which identified a range of approximately 3 to 7 percent of total precipitation for the Mojave Desert, depending on the amount of precipitation received. Fang et al. (2021) (using the CVGB precipitation estimate of 205,376 AFY) estimates

a range of approximately 3.4 percent to 5.6 percent of precipitation that falls within the Chuckwalla Valley watershed contributes to groundwater; resulting in a groundwater recharge from precipitation range of approximately 6,983 AFY to 11,501 AFY.

The groundwater budget developed for the Project WSA (GSI, 2024) uses 8,846 AFY of groundwater recharge from precipitation. The recharge from precipitation estimate is approximately 4.3 percent of the Fang et al. (2021) estimated annual CVGB watershed precipitation. Because of the uncertainties of water budget components included in the Fang et al. (2021) water balance (see GSI, 2024, Section 5.7.1), the 5.6 percent recharge from precipitation from Fang et al. (2021) could not be used in conjunction with all of the inflow water budget components included the Project WSA.²⁴ The resulting groundwater inflow estimate would have exceeded the upper bounds of the total recharge estimated by Fang et al. (2021).

For the reduced groundwater recharge scenario, 4,997 AFY of recharge from precipitation is used for the groundwater budget, representing approximately 2.4 percent of average annual precipitation (Fang et al., 2021). Similarly, because of the uncertainties of water budget components included in the Fang et al. (2021) water balance (see GSI, 2024, Section 5.7.1), the 3.4 percent recharge from precipitation from Fang et al. (2021) could not be used in conjunction with all of the inflow water budget components included the Project WSA. The resulting groundwater inflow estimate would have exceeded the lower bounds of the Fang et al. (2021) total recharge estimate.

Irrigation and Wastewater Return Flow

Irrigation water applied to crops within the CVGB has the potential to infiltrate to groundwater depending on the amount and method of irrigation, soil, crop type, and climate. The CEC estimated irrigation return recharge as 10 percent of total irrigation volume as determined by a 2009 study (WorleyParsons, 2009), and determined that 800 AFY would reach the CVGB (CEC, 2010).²⁵

Wastewater return flow within the CVGB originates from the Chuckwalla State Prison, the Ironwood State Prison, and the Lake Tamarisk development near Desert Center (CEC, 2010; WorleyParsons, 2009). The prisons use an unlined pond to dispose of treated wastewater, and it is estimated that 795 AFY infiltrates to the CVGB (WorleyParsons, 2009). Another 36 AFY is estimated to originate from Lake Tamarisk, for a total of 831 AFY (WorleyParsons, 2009).

Colorado River Aqueduct

Leakage from the Colorado River Aqueduct, which runs across the western edge of the CVGB, has not been documented, but was hypothesized by the Argonne National Laboratory (Argonne) in a 2013 study of the Riverside East Solar Energy Zone (Argonne, 2013). Argonne estimated a 2,000 AFY contribution to the CVGB from the aqueduct based on measured leakage rates from the Central Arizona Project in Arizona (Argonne, 2013). This recharge component is not well documented and, if it does occur, the use of it would require a corresponding entitlement; therefore, it is not used in the Project WSA.

Groundwater Demand/Outflow

Groundwater outflow from the CVGB occurs as subsurface flow, groundwater pumping, and evapotranspiration. The three outflow components are summarized below.

²⁴ There are uncertainties associated with the Fang et al. (2021) groundwater budget recharge components because they were categorized (or grouped) differently than those described in the Project's WSA and limited explanation was provided by the Fang et al. (2021) for each group of recharge components. -The percent recharge from precipitation in the Project WSA was reduced to ensure the total annual groundwater recharge was consistent with Fang et al. (2021).

²⁵ Groundwater extraction for agricultural irrigation was estimated at 6,628 AF in 2019 (DWR, 2020a). Therefore, the 6,400 AFY estimated by WorleyParsons (2009) and used in the Project WSA for agricultural irrigation return flow is acceptable, although slightly underestimated according to the CEC.

Subsurface Outflow

Subsurface outflow from the CVGB is to the Palo Verde Mesa Groundwater Basin and has been estimated as ranging from 400 to 1,162 AFY (CEC, 2010). The Argonne 2013 study of the CVGB assumed zero subsurface outflow; however, justification was not well documented. Using gravity data, Wilson and Owens-Joyce (1994) found that the area through which discharge is suspected to occur is significantly more limited than previously thought due to the presence of a buried bedrock ridge. Given that this discovery was made after the 1,162 AFY estimate was reported (which was in 1990), the lower estimate of 400 AFY outflow was adopted for the Project WSA. Subsurface outflow calculations from the CVGB to the Palo Verde Mesa Groundwater Basin have included 0 AFY (Argonne, 2013), 400 AFY (Metzger et al., 1973), 870 AFY (Woodward Clyde, 1986), and 1,162 AFY (Engineering Science, 1990). The Metzger et al. (1973) calculation was based on a cross sectional profile of the boundary between the two basins derived using geophysical methods and regional data regarding groundwater gradients and hydraulic conductivity. Woodward Clyde (1986) revised this estimate based on the same cross-sectional area and hydraulic gradient but with an updated hydraulic conductivity derived from a pumping test conducted at the Chuckwalla State Prison. Engineering Science (1990) updated this estimate to 1,162 AFY using updated gradient information that considered the results of monitoring and return flow from prison effluent disposal. Wilson and Owens-Joyce (1994), using existing gravity data from the USGS, identified a bedrock ridge underlying the CVGB fill east of the cross-section produced by Metzger et al. (1973), indicating the area through which discharge occurs is more limited than assumed in previous studies (CEC, 2010; Genesis Solar and WorleyParsons, 2010). Therefore, the Woodward Clyde (1986) and Engineering Science (1990) estimates are likely too high.

The Metzger et al. (1973) calculation of 400 AFY was adopted for the Project WSA. The Metzger et al. (1973) estimate was derived using a repeatable scientific method and was used in GEI (2009). Additionally, due to the limited magnitude of the range of values, the selected value is inconsequential to results of the cumulative impact scenario (see Section 7 of WSA).

Groundwater Extraction

Current and historical groundwater extraction in the CVGB includes agricultural water use, pumping for Chuckwalla and Ironwood State Prisons, pumping for the Lake Tamarisk development and golf course, domestic pumping, and a minor amount of pumping by Southern California Gas Company (CEC, 2010). Using data from 2005 to 2010, DWR (2015) estimated the total amount of pumping at 5,000 AFY for the entire CVGB. Argonne (2013), using DWR data, estimated 5,100 AFY. Other recent studies have calculated higher estimates. Specifically, the Palen Solar Project Environmental Impact Study and CEC staff assessment for the Palen Solar Project, both used 10,361 AFY (BLM, 2011; CEC, 2010). AECOM, in a WSA for the Palen Solar Power Project (AECOM, 2010a), estimated 5,745 AFY to 7,415 AFY, with no source technical citation identified. DWR (2020a) estimated 9,023 AF total annual groundwater use in the CVGB in 2019. For the purposes of this analysis, the most recent estimate of 10,361 AFY is used as an reasonable upper estimate of total extraction, as was used by the BLM (2011) and the CEC (2015).

Since the reporting of the studies related to the Palen Solar Project, an additional approximately 340 AFY of groundwater extraction occurs within the CVGB for qualifying projects located within the Development Focus Area (RWQCB, 2021).²⁶ Therefore, the total baseline groundwater extraction amount determined for purposes of the Project WSA is 10,700 AFY. Annualized total pumping used in Fang et al. (2021) was 8,101 AF.

²⁶ Qualifying completed projects (i.e., operational groundwater uses only) contributing to the baseline groundwater extraction include Genesis Solar Electric Plant (218 AFY), Desert Sunlight Solar Farm (0.3 AFY),- Desert Harvest Solar Project (40 AFY), Athos Renewable Energy Project (40 AFY), and Palen Solar Project (41 AFY) (RWQCB, 2021).

Evapotranspiration

The groundwater table at the Palen Dry Lake was identified at a depth of 8 feet below the ground surface (WorleyParsons, 2009). This suggests that groundwater could be close enough to rise through capillary action and be lost through evaporation (CEC, 2010).

The CEC (2015) estimated groundwater discharge rates from Palen Dry Lake using measured evaporation rates at Franklin Lake Playa in Death Valley, adjusted for differences in the characteristics of the two dry lakes, as a reference. The result was 0.0583 feet of evapotranspiration per month, for 3 months of the year. Over the 2,000-acre area considered susceptible to groundwater evapotranspiration, this amounts to 350 AFY (CEC, 2010).

Baseline Groundwater Budget

The baseline groundwater budget is the groundwater budget for the CVGB in the absence of the Project and all other known cumulative projects not already in place. For the purposes of this analysis, agricultural uses and existing cumulative projects are considered as part of the baseline budget. There are no manufacturing water uses in the area.

Normal (Average) Year

Table 3.11-1 provides a baseline groundwater budget during normal climatic conditions for the CVGB based on the adopted information presented in Section 3.11.1.2 and the Project WSA (GSI, 2024). The baseline basin yield for the CVGB is estimated at 100 AFY (budget balance from Table 3.11-1).²⁷ This budget would be for a normal (average) year, in terms of precipitation and water use. Assuming a 100 AFY average year yield, the CVGB would have a surplus of approximately 5,200 AF at the end of the 52-year period, ~~meaning groundwater levels and groundwater in storage in the CVGB would gradually recover from deficit that may have been created during past periods of increased agricultural pumping.~~²⁸ Groundwater levels and groundwater in storage in the CVGB would be expected to gradually increase over the 52-year period.

Although Table 3.11-1 is described as a baseline groundwater budget during normal climatic conditions, it is also considered the more accurate estimate and is relied upon here for purposes of the impacts discussed below. As described in Section 5.7 and 5.8 of the Project WSA (GSI, 2024), the adopted groundwater budget components are considered conservative. The adopted groundwater recharge components are generally in the lower range of published volumes and the groundwater outflow components are generally on the higher range of published volumes. Because of the aridity, sparse population, and limited development of the CVGB (when compared to the size of the CVGB), the groundwater budget is driven by precipitation related groundwater recharge and groundwater extraction from pumping. Total annual groundwater inflow for the CVGB is consistent with volumes calculated by Fang et al, (2021). Total annual groundwater pumping used in the Project WSA however is approximately 1,340 AF greater than the annual groundwater pumping estimated by DWR (2020a) in 2019. If the DWR (2020a) annual groundwater pumping estimate was adopted for this WSA, the average annual yield for the CVGB would be approximately 1,500 AF and the CVGB would have a surplus of approximately 78,000 AF at the end of the 52-year

²⁷ Basin Yield is the volume of pumping that can be extracted from the basin on a long-term basis without creating a chronic and continued lowering of groundwater levels and the associated reduction in the volume of groundwater in storage. Basin yield is not a fixed constant value but a dynamic value that fluctuates over time as the balance of the groundwater inputs and outputs change. Basin yield is not the same as sustainable yield. Sustainable yield is defined in SGMA as “the maximum quantity of water, calculated over a period representative of long-term conditions in the basin and including any temporary surplus that can be withdrawn annually from a groundwater supply without causing an undesirable result” (California Water Code 10721).

²⁸ The 52-year period is equivalent to the Project’s approximate 2-year construction period, assumed 48-year operational period, and estimated 2-year decommissioning period.

period. This 76,500 AF discrepancy demonstrates the weighted significance of the water budget assumptions (even without consideration of cumulative project pumping) and should be considered when reviewing the various projected groundwater budgets presented herein. For comparison, an additional “Budget Balance” row that incorporates the DWR (2020a) estimated groundwater pumping is included in the projected groundwater budgets presented herein.

Table 3.11-1. Estimated Normal Baseline Groundwater Budget for Chuckwalla Valley Groundwater Basin

Budget Components	Acre-Feet per Year
Inflow	
Recharge from Precipitation ¹	8,846
Underflow from Pinto Valley and Orocopia Valley Groundwater Basins ²	877
Mountain Front Recharge ³	210
Irrigation Return Flow ⁴	800

Dry Year/Reduced Recharge Assumptions

Because of the uncertainties involved and to provide a range of values, two groundwater budgets were developed for the Project WSA. The first (Table 3.11-1) is presented above. The second (Table 3.11-2) is presented below. The first budget is a best estimate using data from recently developed numerical groundwater models for the CVGB and data used in previous WSA studies (see Section 3.11.1.2 and Project WSA Section 5.7 and 5.8). The second budget analysis (Table 3.11-2) which uses lower input estimates (Table 3.11-2) (see Section 3.11.1.2 and GSI, 2024, Sections 5.7 and 5.8). Specifically, the second budget uses a recharge from precipitation estimate of 4,997 AFY, and an underflow from the Pinto Valley Groundwater Basin of 372 AFY. All other inflow/outflow estimates are the same for both budgets. The two groundwater budgets together provide insight into a range of potential outcomes related to groundwater use in the CVGB.

Using the lower estimates of precipitation and underflow recharge, the baseline budget indicates the CVGB to be in deficit, with a loss of approximately 4,400 AFY, resulting in a cumulative deficit of approximately 228,800 AFY over the 52-year period. Groundwater levels would be expected to lower and the

volume of groundwater in storage would decrease. Incorporating the DWR (2020a) annual groundwater pumping estimate into the CVGB groundwater budget, the baseline reduced inflow groundwater budget for the CVGB indicates a reduced annual deficit of approximately 3,000 AF and a total deficit of approximately 156,000 AF at the end of the 52-year period.

As noted above, the baseline groundwater budget presented in Table 3.11-1 is considered the more accurate estimate and includes a conservatively high annual groundwater pumping estimate (see GSI, 2024 Sections 5.7, 5.8, and 6). The CVGB reduced recharge groundwater budget indicates an annual deficit, however reported groundwater levels in the CVGB have been generally stable and, in some areas, indicate an increasing trend which can result from a decreased groundwater pumping and (on average) an annual basin groundwater surplus. Additionally, the reduced recharge groundwater budget is inconsistent with previous studies, including USGS (2007), CEC (2010), and Fang et al. (2021). As discussed in the WSA, USGS (2007) and CEC (2010) calculated a range of precipitation-related groundwater recharge in the arid and semiarid southwestern United States and the CVGB, respectively, and Fang et al. (2021) is the most up-to-date groundwater model for the CVGB and has been used or suggested by other agencies (including BLM) and experts for modeling the CVGB.

Table 3.11-2. Estimated Normal Baseline Groundwater Budget for the Chuckwalla Valley Groundwater Basin Using Reduced Estimates of Precipitation and Subsurface Inflow

Budget Components	Acre-Feet per Year
Inflow	
Recharge from Precipitation ¹	4,997
Underflow from Pinto Valley and Orocopia Valley Groundwater Basins ²	372

3.11.2. Regulatory Framework

3.11.2.1. Federal Laws, Regulations, and Policies

Clean Water Act (CWA) (33 USC § 1251 et seq.). Formerly the Federal Water Pollution Control Act of 1972, the CWA was enacted with the intent of restoring and maintaining the chemical, physical, and biological integrity of the waters of the United States. The CWA authorizes the USEPA to implement federal water pollution control programs such as setting water quality standards for contaminants in surface water, establishing wastewater and effluent discharge limits for various industry categories, and imposing requirements for controlling point and nonpoint source pollution. At the federal level, the CWA is administered by the U.S. Environmental Protection Agency (USEPA) and USACE. However, the CWA gives states the primary responsibility for protecting and restoring surface water quality. At the state and regional levels, the Act is administered and enforced by the State Water Resources Control Board (SWRCB) and the nine RWQCBs. The Project site is located within the Colorado River Basin Region, over which area the Colorado River Basin RWQCB has primary responsibility for the protection of water quality.

Section 303 of the federal CWA (as well as the Porter-Cologne Water Quality Control Act, discussed further below) requires that states adopt water quality standards. Water quality standards consist of designated beneficial uses, numeric and narrative water quality criteria (also referred to as “water quality objectives” under state law) that protect beneficial uses, as well as the state and federal antidegradation policies. Each RWQCB has a Water Quality Control Plan (Basin Plan) that designates beneficial uses, establishes water quality objectives to protect the beneficial uses, and contains implementation programs and policies to achieve those objectives for all waters addressed through the Basin Plan.

The RWQCB sets water quality objectives to ensure the protection of beneficial uses and the prevention of nuisance, although it is understood that water quality can be changed to some degree without unreasonably affecting beneficial uses (RWQCB, 2019). Current objectives for surface water in the area include those for aesthetic qualities, tainting substances, toxicity, temperature, pH, dissolved oxygen, suspended and settleable solids, dissolved solids, bacteria, biostimulatory substances, sediment, turbidity, radioactivity, chemical constituents, and pesticide wastes. Groundwater objectives include those for taste and odors, bacteriological quality, chemical and physical quality, brines, and radioactivity. The RWQCB has objectives for groundwater overdraft for several specific groundwater basins, but the CVGB is not listed among these (RWQCB, 2019).

Section 402 of the CWA provides that the discharge of pollutants to Waters of the United States from any point source is unlawful unless the discharge is in compliance with a National Pollutant Discharge Elimination System (NPDES) permit. NPDES permits contain industry-specific, technology-based limits and may include additional water quality-based limits, and pollutant-monitoring requirements. An NPDES permit may include discharge limits based on federal or state water quality criteria or standards. Amendments to the CWA added a framework for regulating municipal and industrial stormwater discharges, as well as stormwater discharges from construction sites. In California, the SWRCB and the nine RWQCBs have been delegated permitting authority for discharges regulated by NPDES permits.

The RWQCB administers the NPDES stormwater permitting program. Construction activities disturbing one acre or more of land are subject to the permitting requirements of the NPDES General Permit for Storm Water Discharges Associated with Construction and Land Disturbance Activities (Construction General Permit, Order 2009 0009 DWQ as amended by Orders 2010 0014 DWQ and 2012 0006 DWQ), as described further below. Additionally, the NPDES General Permit for Storm Water Discharges Associated with Industrial Activities (Industrial General Permit, Order 2014 0057 DWQ as amended in 2015 and 2018) regulates discharges of stormwater associated with certain industrial activities, excluding construction activities.

Section 404 of the CWA authorizes the USACE to regulate the discharge of dredged or fill material to the waters of the U.S. and adjacent wetlands. Filling of waters of the U.S. must be avoided where possible and minimized and mitigated where avoidance is not possible. Permits are issued by the USACE.

Section 401 of the CWA requires that any applicant for a federal license or permit to conduct an activity that may result in a discharge into waters of the U.S. obtain a certification from the State in which the discharge originates that the discharge will comply with the applicable provisions of CWA Sections 301, 302, 303, 306, and 307. This certification ensures that the proposed activity complies with state water quality standards.

~~Because~~ If the USACE ~~has determined~~ determines that waters on the Project site are not jurisdictional Waters of the United States under the CWA, no NPDES permits under Section 402 or 404 are required, nor is a water quality certification under Section 401. Water quality impacts from the Project will be addressed under state law through Waste Discharge Requirements.

National Flood Insurance Act/Flood Disaster Protection Act. The National Flood Insurance Act of 1968 made flood insurance available for the first time. The Flood Disaster Protection Act of 1973 made the purchase of flood insurance mandatory for the protection of property located in Special Flood Hazard Areas. These laws led to mapping of regulatory floodplains and to local management of floodplain areas according to federal guidelines which include prohibiting or restricting development in flood hazard zones.

Colorado River Accounting Surface. Based on the Colorado River Compact of 1922, and the 1928 apportionment of lower Colorado River water by the U.S. Congress, groundwater in the river aquifer beneath the floodplain is considered Colorado River water, and water pumped from wells on the floodplain is presumed to be river water and is accounted for as Colorado River water (USGS, 2009). The accounting-surface method was developed in the 1990s by the U.S. Geological Survey, in cooperation with the U.S. Bureau of Reclamation, to identify wells outside the floodplain of the lower Colorado River that yield water that will be replaced by water from the river. This method was needed to identify which wells require an entitlement for diversion of water from the Colorado River and need to be included in accounting for consumptive use of Colorado River water as outlined in the Consolidated Decree of the United States Supreme Court in *Arizona v. California*. The method is based on the concept of a river aquifer and an accounting surface within the river aquifer. Wells within the CVGB that draw water from below the accounting surface require an entitlement for the use of that water (USGS, 2009). Within the Project area, the accounting surface is at elevation 238 to 240 feet (USGS, 2009). Extractions of water below that elevation are prohibited without an entitlement. Entitlements to extract and use the groundwater below the accounting surface are granted by the U.S. Bureau of Reclamation (USBR) through its designated representative in California, the Colorado River Board of California. Entities in California are using California's full apportionment of Colorado River water, meaning that all water is already contracted, and no new water entitlements are available in California.

3.11.2.2. State Laws, Regulations, and Policies

California Streambed Alteration Agreement

Sections 1600–1616 of the California Fish and Game Code require that any entity that proposes an activity that will substantially divert or obstruct the natural flow of any river, stream, or lake, or substantially change or use any material from the bed, channel, or bank of, any river, stream, or lake, or deposit material into any river, stream, or lake, must notify the CDFW. If CDFW determines the proposed alteration will impact a jurisdictional river, stream or lake, a Lake or Streambed Alteration Agreement (LSAA) will be prepared. The LSAA applies to any stream, including ephemeral streams and desert washes.

California Porter-Cologne Water Quality Control Act

The Porter-Cologne Water Quality Control Act (Porter-Cologne Act, Water Code § 13000 et seq.) establishes the SWRCB and each RWQCB as the principal state agencies with primary responsibility to coordinate and control water quality in California, in accordance with Section 303 of the CWA. The SWRCB establishes statewide policy for water quality control and provides oversight of the RWQCBs' operations. The RWQCBs have jurisdiction over specific geographic areas that are defined by watersheds. In addition to other regulatory responsibilities, the RWQCBs have the authority to conduct, order, and oversee investigation and cleanup where discharges or threatened discharges of waste to waters of the State could cause pollution or nuisance, including impacts to public health and the environment. Waters of the State is defined by the Porter-Cologne Water Quality Control Act as "any surface water or groundwater, including saline waters, within the boundaries of the State."

Actions that involve or are expected to involve discharge of waste to waters of the State (other than into a community sewer system) may be subject to Water Discharge Requirements (WDRs) under the Porter-Cologne Act. The Act requires anyone proposing to discharge waste that could affect the quality of the waters of the State to submit an application to the appropriate RWQCB. The RWQCB staff will review the application and determine whether to propose adoption of WDRs to regulate the discharge, prohibit the discharge, or waive the WDRs. The Porter-Cologne Act also provides a variety of civil and criminal enforcement tools.

State Wetland Procedures. WDRs under the Porter-Cologne Act are issued for discharges of dredged or fill material to waters of the State that are outside federal jurisdiction and not regulated under CWA Section 401. On April 2, 2019, the SWRCB adopted the State Wetland Definition and Procedures for the Discharge of Dredged or Fill Material to Waters of the State (Procedures), which became effective May 28, 2020, and were revised April 6, 2021. Applicants proposing to discharge dredged or fill material are required to comply with the Procedures and obtain WDRs from the appropriate RWQCB unless an exclusion applies, or the discharge qualifies for coverage under a separate order.

The Procedures provide that unavoidable temporary and permanent adverse impacts to waters of the State authorized by WDRs should be offset through compensatory mitigation. Compensatory mitigation means the re-establishment, establishment (creation), rehabilitation, enhancement, and in some circumstances, preservation, of aquatic resources. The permitting authority must determine the compensatory mitigation to be required in the WDRs, based on what would be environmentally preferable.

SWRCB Construction General Permit

The Construction General Permit, issued pursuant to the federal CWA, regulates stormwater runoff from construction sites of one acre or more in size. The permit is a statewide, general order issued by the SWRCB and implemented and enforced by the RWQCBs. For all new qualifying projects, applicants must electronically file permit registration documents using the Stormwater Multiple Application and Report Tracking System (SMARTS) and must include a Notice of Intent (NOI), risk assessment, site map, and Storm Water Pollution Prevention Plan (SWPPP) to be covered by the Construction General Permit prior to beginning construction. The risk assessment and SWPPP must be prepared by a State-qualified SWPPP Developer.

The Construction General Permit requires the preparation and implementation of a SWPPP, which must be prepared before construction begins. At a minimum, a SWPPP includes the following:

- A description of construction materials, practices, and equipment storage;
- A list of pollutants likely to contact stormwater and site-specific erosion and sedimentation control practices;
- A list of provisions to eliminate or reduce discharge of materials to stormwater;

- Best Management Practices (BMPs) for fuel and equipment storage;
- Non-stormwater management measures such as installing specific discharge controls during activities such as paving operations and vehicle and equipment washing and fueling; and
- A commitment that equipment, materials, and workers will be available for rapid response to spills and/or emergencies. All corrective maintenance or BMPs will be performed as soon as possible, depending upon worker safety.

The SWPPP provides specific construction related BMPs to prevent soil erosion and loss of topsoil. BMPs implemented at a typical construction site could include but would not be limited to physical barriers to prevent erosion and sedimentation, construction of sedimentation basins, limitations on work periods during storm events, use of swales, protection of stockpiled materials, and a variety of other measures that would substantially reduce or prevent erosion from occurring during construction. Post-construction requirements require that construction sites match pre-Project hydrology to ensure that the physical and biological integrity of aquatic ecosystems are sustained in their existing condition.

The Construction General Permit prohibits the discharge of pollutants other than stormwater and authorized non-stormwater discharges and prohibits all discharges which contain a hazardous substance in excess of reportable quantities established in 40 CFR §§ 117.3 and 302.4 (pursuant to CWA Section 311). In addition, the Construction General Permit incorporates discharge prohibitions contained in water quality control plans. Discharges to Areas of Special Biological Significance are prohibited unless covered by an exception that the SWRCB has approved. Authorized non-stormwater discharges must be infeasible to eliminate; comply with BMPs as described in the SWPPP; filtered or treated using appropriate technology; meet the established numeric action levels for pH and turbidity; and not cause or contribute to a violation of water quality standards. Discharges to stormwater that cause or threaten to cause pollution, contamination, or nuisance are prohibited. Pollutant controls must utilize best available technology economically achievable (BAT) for toxic pollutants and non-conventional pollutants and best conventional pollutant control technology (BCT) for conventional pollutants.

The CWA provides definitions for the types of controls that can be used to satisfy BAT and BCT requirements. Specific BAT and BCT pollution controls and BMPs may include runoff control, soil stabilization, sediment control, proper stream crossing techniques, waste management, spill prevention and control, and a wide variety of other measures depending on the site and situation.

If a project does not qualify for a notice of non-applicability (NONA), then the Applicant would seek coverage under a Construction General Permit and submit a Notice of Intent and application package.

SWRCB Industrial General Permit

The Industrial General Permit regulates discharges of stormwater to surface waters associated with certain broad categories of industrial activities. The Industrial General Permit requires the implementation of management measures that will achieve the performance standard of BAT for toxic pollutants and non-conventional pollutants and BCT for conventional pollutants. The Industrial General Permit also requires the development of a SWPPP and a monitoring plan. Through the SWPPP, sources of pollutants are to be identified and the means to manage the sources to reduce stormwater pollution are described. The monitoring plan requires sampling of stormwater discharges during the wet season and visual inspections during the dry season.

BMPs may include, but not be limited to, spill and overflow protection, stormwater control, covering of fueling areas, proper clean-up methods, spill prevention, preventative maintenance on equipment, inspections, and training. Specific BMPs vary by situation and site.

SWRCB Policies

The State Antidegradation Policy (Resolution No. 68 16). Discharges of waste to high quality waters must comply with SWRCB Resolution No. 68 16, Statement of Policy with Respect to Maintaining High Quality of Waters in California, which generally requires that high quality waters be protected. Any change in water quality from the discharge of waste must be consistent with maximum benefit to the people of the State, not unreasonably affect present and anticipated beneficial uses, and not result in water quality less than that described in SWRCB or RWQCB policies. Any activity which discharges waste to existing high-quality waters must meet waste discharge requirements and implement the best practicable treatment or control of the discharge necessary to assure that: (a) a pollution or nuisance will not occur and (b) the highest water quality consistent with maximum benefit to the people of the State will be maintained (RWQCB, 2019).

The State Antidegradation Policy also incorporates the federal antidegradation policy which requires the maintenance and protection of existing uses and water quality conditions necessary to support such uses. In addition, the federal antidegradation policy maintains and protects water quality in outstanding national resource waters.

Sources of Drinking Water Policy (Resolution No. 8863). This policy designates all groundwater and surface waters of the States as potential sources of drinking water, worthy of protection for current or future beneficial uses, except where: (a) the total dissolved solids are greater than 3,000 milligrams per liter, (b) the well yield is less than 200 gallons per day (gpd) from a single well, (c) the water is a geothermal resource, or in a water conveyance facility, or (d) the water cannot reasonably be treated for domestic use using either best management practices or best economically achievable treatment practices (RWQCB, 2019).

Water Rights

California water law is embodied in the California Water Code and the Water Commission Act of 1914. There are two basic kinds of rights to surface water: riparian and appropriative. As the Project does not propose the use of surface waters, these rights are not relevant to the Project. Percolating groundwater, under which category the CVGB falls, has no SWRCB permit requirement, and supports two kinds of rights: (a) overlying rights, a correlative right of equal priority shared by all who own overlying property and use groundwater on the overlying property; and (b) groundwater appropriative rights for use of the overlying property or on overlying property for which the water rights have been severed. The right to use groundwater on property that is not as an overlying right is junior to all overlying rights but has priority among other appropriators on a first in time use basis. Overlying users cannot take unlimited quantities of water without regard to the needs of other users.

The California Water Code allows any local public agency that provides water service whose service area includes a groundwater basin or portion thereof that is not subject to groundwater management pursuant to a judgment or other order, to adopt and implement a groundwater management plan (California Water Code §§ 10750 et seq.) Groundwater Management Plans often require reports of pumping and some restrictions on usage. The California Legislature has found that by reason of light rainfall, concentrated population, the conversion of land from agricultural to urban uses and heavy dependence on groundwater, the counties of Riverside, Ventura, San Bernardino, and Los Angeles have certain reporting requirements for groundwater pumping. Any person or entity that pumps in excess of 25 acre-feet (AF) of water in any one year must file a "Notice of Extraction and Diversion of Water" with the SWRCB. (California Water Code §§ 4999 et seq.)

The Project is located on land that overlies the CVGB, for which a method was developed by the USGS, in cooperation with the USBR, to identify groundwater wells outside the floodplain of the lower Colorado

River that yield water that will be replaced by water from the river. The specific method to determine whether wells draw water from the Colorado River (referred to as the accounting surface) has not been promulgated by the USBR. ~~However, wells placed into the groundwater beneath and within the Project's vicinity that extract groundwater may, depending on whether the groundwater surface is above or below the accounting surface, be considered as drawing water from the Colorado River and require an entitlement to extract groundwater.~~

California Senate Bill (SB) 610

SB 610, passed in 2002, amended the California Water Code to require detailed analysis of water supply availability for certain types of development projects, and to improve the link between information on water supply availability and certain land use decisions made by cities and counties. SB 610 requires detailed information regarding water availability to be provided to city and county decisionmakers prior to approval of specified large development projects. SB 610 requires that a project be supported by a Water Supply Assessment if the project is subject to the California Environmental Quality Act, and ~~would demand an amount of water equivalent to, or greater than, the amount of water required by a 500 dwelling unit project. According to SB 610 Guidelines, one dwelling unit typically consumes 0.3 to 0.5 acre-feet per year (AFY), which would amount to 150 to 250 AFY for 500 units~~ meets any of the criteria in Water Code section 10912 and 14 Cal Code Regs section 15155(a)(1).

3.11.2.3. Local Laws, Regulations, and Policies

Riverside County Ordinance No. 682 (As Amended Through 682.4)

This ordinance regulates the construction, reconstruction, abandonment, and destruction of wells and incorporates by reference Ordinance No. 725 (Penalties for Violations of Riverside County Ordinances). The purpose of this ordinance is to provide minimum standards for construction, reconstruction, abandonment, and destruction of all wells to: (a) protect underground water resources; and (b) provide safe water to persons within Riverside County. The provisions of this ordinance within its jurisdiction are enforced by the Riverside County Department of Environmental Health.

Ordinance No. 650 (As Amended Through 650.6)

Ordinance 650 regulates the discharge of sewage in the unincorporated areas of the County of Riverside and incorporating by reference the Riverside County Local Agency Management Program (LAMP) for Onsite Wastewater Treatment Systems. This ordinance protects water quality and public health by establishing regulations for the installation, replacement, and performance of Onsite Wastewater Treatment Systems. This ordinance provides minimum standards for construction, operation, and abandonment of Onsite Wastewater Treatment Systems (OWTSs). An OWTS is any individual on-site wastewater treatment, pretreatment and dispersal system including, but not limited to, a conventional or alternative OWTS having a subsurface discharge. The LAMP presents County of Riverside OWTS policy, regulations, and standards.

The development and operation of the proposed Project would be done in compliance with County ordinances regulating wells and sewage discharges and protecting water resources.

3.11.3. Methodology for Analysis

The impact analysis analyzes potential direct, indirect, and cumulative impacts of the proposed Project on water resources, including the Project's potential to adversely affect groundwater supplies, alter geomorphic features/processes, modify drainage and flooding conditions, induce erosion and sedimentation, and

degrade water quality. The analysis also considers the potential for incremental impacts of the Project to combine with impacts of other projects and activities to adversely affect water resources. Mitigation measures to avoid or reduce potential impacts are identified, and the potential for residual impacts is evaluated.

3.11.4. CEQA Significance Criteria

The criteria used to determine the significance of potential hydrology and water quality impacts are based on Appendix G of the State CEQA Guidelines. The Project would result in a significant impact under CEQA related to hydrology and water quality if the Project would:

- *Violate any water quality standards or waste discharge requirements or otherwise substantially degrade surface or ground water quality (See Impact HWQ-1).*
- *Substantially decrease groundwater supplies or interfere substantially with groundwater recharge such that the project may impede sustainable groundwater management of the basin (See Impact HWQ-2).*
- *Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner which would:*
 - *result in substantial erosion or siltation on- or off-site (See Impact HWQ-3A);*
 - *substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or offsite (See Impact HWQ-3B);*
 - *create or contribute runoff water which would exceed the capacity of existing or planned storm water drainage systems or provide substantial additional sources of polluted runoff (See Impact HWQ-3C);*
or
 - *impede or redirect flood flows (Impact HWQ-3D).*
- *Conflict with or obstruct implementation of a water quality control plan or sustainable groundwater management plan (See Impact HWQ-1).*

The County of Riverside's Environmental Assessment Form includes additional significance criteria, which were also used in the analysis. The additional criteria indicate that a project could have potentially significant impacts if it would:

- *Cause changes in absorption rates or the rate and amount of surface runoff (See Impact HWQ-3);*
- *Cause changes in the amount of surface water in any water body (See Impact HWQ-3 and HWQ-3);*
- *Substantially degrade water quality (See Impact HWQ-1); or*
- *Expose people or structures to a significant risk of loss, injury or death involving flooding, including flooding as a result of the failure of a levee or dam (See Impact HWQ-4).*

The following CEQA significance criteria from Appendix G were not included in the analysis:

- *In flood hazard, tsunami or seiche zones, risk release of pollutants due to project inundation?*

There is no body of water in the area that could produce a tsunami or seiche. There is therefore no impact related to seiche or tsunami.

The following CEQA significance criterion from the County's Environmental Assessment Form were not included in the analysis:

- *Include new or retrofitted Storm Water Treatment Control BMPs (e.g., water quality treatment basins, constructed treatment wetlands), the operation of which could result in significant environmental effects (i.e., increased vectors and/or odors).*

No new or retrofitted Storm Water Treatment Control BMPs are included in the proposed Project. Therefore, this criterion is not applicable to the Project.

3.11.5. Applicable Best Management Practices

A Stormwater Pollution Prevention Plan (SWPPP) or SWPPP-equivalent document would be prepared by a qualified engineer or erosion control specialist, and once approved by the State Water Resources Control Board and a BLM hydrologist, would be implemented before and during construction. The SWPPP would reduce potential impacts related to erosion and surface water quality during construction activities and throughout the life of the solar and storage facility. It would include Project information and best management practices (BMPs). The BMPs would include stormwater runoff quality control measures, management for concrete waste, stormwater detention, watering for dust control, and construction of perimeter silt fences, as needed.

3.11.6. Proposed Project Impact Analysis

The scoping effort conducted by the Riverside County Planning Department revealed several public concerns related to hydrology and water quality. Regarding surface water, concerns were raised about the potential for floods due to the modification of washes and removal of vegetation, creating impacts to stormwater runoff. The public also expressed concerns that flash floods could cause undetermined changes in erosion patterns.

Issues related to water resources, hydrology, and water quality raised during scoping include the quantity of water needed for the Project and the source of the groundwater. Comments included specific questions regarding groundwater availability and water quality in the CVGB, such as groundwater pumping, pollution, and the effect on regional aquifers and existing community and domestic water supply infrastructure and project maintenance operations (e.g., weed abatement) impacting groundwater quality. Commenters also recommend that BLM require all applicable Conservation and Management Actions (CMAs) from the Desert Renewable Energy Conservation Plan (DRECP) to prevent groundwater overdraft.

Commenters recommended that the impacts of changing precipitation patterns due to climate change should be analyzed, and this should be considered regarding groundwater availability and when developing a stormwater plan. The placement of panels within and adjacent to washes should be analyzed and designed to minimize impacts. Multiple commenters suggested that there would be impacts to jurisdictional Waters of the U.S. and Waters of the State of California, and surface hydrology on the site. The California Department of Fish and Wildlife (CDFW) recommended micro-siting the Project to avoid and protect ephemeral drainages or desert washes and dry wash woodlands. The U.S. EPA recommends a revised site plan to avoid critical habitat, as prescribed by CMAs.

These concerns are addressed in the analysis below. Note that the purpose of the Water Supply Assessment (EIR Appendix G) according to the DRECP LUPA is to determine whether over-use or over-draft conditions exist within the project basin(s), and whether the project creates or exacerbates these conditions. Compliance with DRECP CMAs will be determined by BLM during the NEPA process and is outside of the scope of CEQA. In accordance with SB 610, the Water Supply Assessment also addresses whether available water supplies will meet the Project's water demands in addition to existing and planned future uses.

Groundwater Budget with the Project in Place

In June 2023, BLM issued a Proposed Rule to amend its existing ROW regulations, issued under authority of the Federal Land Policy and Management Act (FLPMA), and is considering issuing Right-of-Way (ROW) grants for durations of up to 50 years (BLM, 2023). To prepare for potential issuance of a 50-year ROW grant by the BLM and to determine whether there are sufficient supplies to sustain the Project, the Easley

WSA (EIR Appendix G) conservatively extends the total projected period of the Project to 52-years. For the purpose of the CVGB water budget (see GSI, 2024 Section 6) and predictive Project water demand impacts analysis (see GSI, 2024 Sections 5.4 and 7) presented herein, 52 years is equivalent to the projected total duration of the Project, including construction (20 months), operations (48 years), and decommissioning (20 months).²⁹

The CVGB is assumed to be the water source for all groundwater demand (i.e., groundwater would not be imported from outside of the CVGB). Total water use by the Project would be up to 1,000 AF during the planned 20-month construction period³⁰ and up to 50 AFY during the Project's operational and decommissioning periods.³¹ Based upon these quantities of water demand, a total of approximately 3,500 AF of water would be used by the Project over the Project's construction, operational, and decommissioning periods (52 years [i.e., 2-year construction period, 48-year operational period, and 2-year decommissioning period]).

Based on the groundwater budget balance given presented in Table 3.11-1, the CVGB under average-year conditions would have a cumulative surplus of 5,200 AF at the end of during the 52-year period. The net CVGB surplus with the Project in place would therefore be 1,700 AF, or 33 percent of the surplus that would exist without the Project. Using the DWR (2020a) estimated annual groundwater pumping, the net CVGB surplus with the Project in place would be 74,500 AF, or 96 percent of the surplus that would exist without the Project. By contrast, using the reduced recharge rates for precipitation and underflow (Table 3.11-2), the 52-year deficit without the Project would be 228,800 AF, increased to 232,300 AF by the Project. The Project would contribute about 2 percent to this cumulative deficit.

According to SB 610 guidelines, a dry year can be considered a year with a precipitation amount that is at 10 percent probability of occurrence. A critical dry year would be a year with 3 percent probability. The historical precipitation data at Blythe, California, approximately 35 miles east of the Project and at a similar elevation with similar climate, was used as a reference. Historical precipitation data for Blythe, dating from 1893 to 2014, was obtained from the U.S. Historical Climatology Network (NOAA, n.d.[b]). A nearby station at the Blythe Airport (NOAA, n.d.[a]) was used to supplement additional data for up to the year 2021.

The baseline groundwater budgets for a dry year and critical dry year are expected to have a deficit of approximately 5,900 AF for a dry year, increasing to 7,100 AF for a critical dry year. Using the reduced estimates of precipitation and underflow recharge, each scenario, dry year and critical dry year, would have annual groundwater deficits, amounting to 8,000 AFY and 8,700 AFY, respectively.

For a single dry year and single critical dry year with the Project in place, the worst-case scenario is for one of those year types, dry or critical dry, to occur during the construction period of the Project (assumed to be 2024 to 2025) in which up to 1,000 AF of water would be used. If a dry year or critical dry year occurs during this period, the CVGB annual deficit would be approximately 6,400 AF and 7,600 AF, respectively. The Project would increase the dry year and critical dry year deficit by 8 and 7 percent, respectively, if one of those year types were to occur during the construction period of the Project. Assuming normal precipi-

²⁹ Although the estimated Project construction period and decommissioning period described in the EIR Chapter 2 (Project Description) is 20 months, the water budgets (see GSI, 2024 Section 6) and Cone of Depression and Cumulative Drawdown Analysis (see GSI, 2024 Section 7), were developed in 1-year time steps, and therefore, assume the same overall water usage but over Project construction and decommissioning periods of 2 years.

³⁰ As described in EIR Section 2.3.11, the Applicant has updated its construction water requirements in the Partially Recirculated Draft EIR based on water usage data obtained following construction of other projects in the area, such as the Oberon Renewable Energy Project. The analysis in EIR Section 3.11 (Hydrology and Water Quality) and EIR Appendix G (Water Supply Assessment) conservatively still assumes use of 1,000 AF during construction.

³¹ It is assumed that Project decommissioning would take approximately 20 months, similar to the construction duration, and have the same water use as Project operations (approximately 50 acre-feet per year). Project decommissioning would occur in accordance with an agency-approved Closure and Decommissioning Plan. The Project Closure and Decommissioning Plan will include an evaluation of alternate water sources and impacts, if any, in accordance with the DRECP LUPA.

precipitation returns, this total deficit (dry year plus Project use) would not be recovered during the 52-year period, with or without the Project, under baseline groundwater budget assumptions.

If a dry year or critical dry year occurs during the Project construction period, using the DWR (2020a) estimated annual groundwater pumping, the CVGB annual deficit would be approximately 5,000 AF and 6,200 AF, respectively (Budget Balance Using DWR [2020a] rows in Tables 6 and 7 minus 500 AFY [1,000 AF / 2 years]). The Project would increase the dry year and critical dry year deficit by 11 and 9 percent, respectively. Assuming normal precipitation returns (see Table 4), this total deficit (dry year plus Project use and critical day year plus Project use) would be recovered in less than 4 years and 5 years, respectively, with the Project in place.

The longest consecutive series of years with below average precipitation on record at Blythe was 12 years, from 1893 to 1904. During this period, the average annual precipitation was 1.42 inches, or about 42 percent of the overall average. This period was considered to be representative of a series of multiple dry years for the Project WSA. Development of a 12-year groundwater budget, assuming a repeat of the 1893 to 1904 drought at Blythe, without Project conditions, indicates the ~~cumulative~~ groundwater deficit would be approximately 60,950 AF at the end of the 12-year period. ~~Using the reduced estimates of precipitation and subsurface recharge, at the end of the 12-year period the cumulative groundwater deficit would be approximately 87,570 AF.~~ Using the DWR (2020a) estimated annual pumping, the 12-year CVGB groundwater deficit would be approximately 44,150 AF.

The precipitation record indicates that a series of dry years has typically been followed by a series of years with above-average precipitation. To assess the probable effect of this over the 52-year life of the Project, a 52-year running average analysis was made ~~of using~~ the 129-year precipitation period of record. The driest 52-year period was the period beginning in 1893 and ending in 1944. Average annual precipitation during this period was 3.44 inches, or about 1 percent greater than normal. If a repeat of this 52-year period occurs under current (no qualifying projects not already in place) conditions, at the end of the 52-year period the CVGB would have a ~~deficit-surplus~~ of approximately 21,060 AF assuming ~~adopted precipitation normal and infiltration and underflow~~ conditions (see Tables 3.11-1 and 3.11-2). The greatest groundwater deficit during the repeated ~~drought~~ historical period would occur during 2039, in which the total deficit would be approximately 64,170 AF. ~~Using reduced recharge data, the same analysis results in a groundwater deficit totaling approximately 214,020 AF after 52 years.~~

Using the DWR (2020a) estimated annual pumping, at the end of the 52-year period the CVGB would have a surplus of approximately 93,860 AF assuming normal infiltration and underflow conditions (see Table 4). The greatest groundwater deficit during the repeated historical period would occur during 2039, in which the total deficit would be approximately 412,7760 AF.

The same analysis with the Project in place gives similar results as the one without Project conditions, with a total groundwater surplus of approximately 17,530 AF at the end of 52 years. ~~Using reduced recharge data, the same analysis, with the Project in place, results in a groundwater deficit totaling approximately 217,520 AF after 52 years.~~ Using the DWR (2020a) estimated annual pumping, at the end of the 52-year period the total groundwater surplus would be approximately 90,330 AF.

Impact HWQ-1. Would the Project violate any water quality standards or waste discharge requirements or otherwise substantially degrade surface or ground water quality? Would the Project conflict with or obstruct implementation of a water quality control plan or sustainable groundwater management plan?

Surface Water

LESS THAN SIGNIFICANT WITH MITIGATION. Construction of the Project would require ground-disturbing activities (excavation, grading, and compaction) of a minority of the ground surface (~~about 2.7 percent~~) of the Project site for access roads, buildings, substation, and other features. In addition, approximately 534 percent of the Project site would be levelled and smoothed for the solar facility. These ground-disturbing activities, described in more detail in Tables 2-2 and 2-3 of Section 2, could result in soil erosion and lowered water quality through increased turbidity and sediment deposition into local ephemeral streams. Downstream beneficial uses could be adversely affected through violation of RWQCB water quality standards and objectives for suspended solids, total dissolved solids, sediment, and turbidity.

Accidental spills or disposal of harmful materials used during construction of the Project could wash into and pollute surface waters. Materials that could contaminate the construction area or spill or leak include diesel fuel, gasoline, lubrication oil, cement slurry, hydraulic fluid, anti-freeze, transmission fluid, lubricating grease, and other fluids. Downstream beneficial uses could be adversely affected through violation of RWQCB water quality objectives for toxicity and chemical constituents. Likely downstream beneficial uses in the Project area include GWR and WILD.

The dry nature of most of the surface streams is such that should harmful material spills occur during construction, these could easily be cleaned up prior to surface water being contaminated. Storage procedures for hazardous materials during construction would be dictated by the Hazardous Materials Plan (HMP) that would be prepared prior to construction. Trucks and construction vehicles would be serviced from off-site facilities. The use, storage, transport, and disposal of hazardous materials used in construction of the facility would be carried out in accordance with federal, state, and county regulations. Other construction wastes would be collected and recycled or disposed of in municipal county landfills.

The Applicant has committed to development and adherence to an SWPPP or SWPPP-equivalent document, which will require BMPs to prevent and control erosion and siltation during construction; prevent, contain, and mitigate accidental spills during construction; and prevent violation of water quality objectives or damaging beneficial uses identified in the water quality control plan.

Potential threats to surface water quality during operation and maintenance activities include potential increases in erosion and associated sediment loads to adjacent or downstream washes, and accidental spills of hydrocarbon fuels, greases, and other materials associated with operation of equipment on site. The Project would include electrical transformers, modifications to an existing electrical substation, an operations and maintenance building, and battery storage systems (BESS). There would be regulated hazardous materials on site. These materials are not intended to be released to the environment, but if spilled or otherwise accidentally released they could have the potential to contaminate surface. The HMP would be prepared to provide protocols for containment and clean-up of spills.

Alterations to site topography due to the site preparation would affect both RWQCB and CDFW jurisdictional waters of the State that traverse the Project site. Surface flow patterns would be affected by alteration to jurisdictional waters of the State (unvegetated ephemeral washes and desert wash woodland) on the site which could result in increased siltation or downstream erosion. Drainage controls, including berms and potentially channels, would be required in some areas to capture and direct stormwater flow around Project facilities such as the BESS.

Construction of the Project would avoid most desert dry wash woodland in accordance with BLM's CMA LUPA-BIO-RIPWET 1. Changes to streambeds classified as RWQCB and CDFW jurisdictional waters of the State would require the Applicant to obtain a LSAA from the CDFW and a waste discharge (WDR) permit from the Colorado River Basin RWQCB. The LSAA and WDR will require the Project to avoid and minimize impacts to surface waters (through conditions of approval and BMPs) and may require compensatory mitigation for impacts to waters of the State. Impacts related to surface water degradation due to alterations to waters of the State would be minimized or prevented through compliance with CDFW and RWQCB regulations and permits and implementation of Mitigation Measures (MM) BIO-3 (Minimization of Vegetation and Habitat Impacts), MM BIO-5 (Vegetation Resources Management Plan), MM BIO-13 (Streambed and Watershed Protection), MM HWQ-1 (Drainage Erosion and Sedimentation Control Plan (DESCP)), and MM HWQ-5 (Project Drainage Plan).

Existing State and federal water quality regulations, including the proposed SWPPP, are intended to ensure that water quality standards and waste discharge standards are not violated during construction or operations. However, portions of the site would be subject to flooding. Although mass grading is not proposed, some ground disturbance is expected, and some of the solar panels and other proposed structures would be placed in areas that are subject to flooding, creating a potential for erosion and sedimentation leading to potential water quality impacts during operations. Mitigation Measure HWQ-1 requires the development of a Drainage Erosion and Sedimentation Plan that would address and mitigate erosion impacts during construction and operations.

Decommissioning of the Project is expected to result in adverse impacts related to water resources similar to construction impacts. Work could result in potential increases in sediment loads to adjacent streams and washes and/or accidental spills of hydrocarbon fuels and greases and other materials associated with motorized equipment and construction work. However, decommissioning activities would be subject to the same state and federal water quality regulations discussed above, as well as the mitigation measures applicable during construction of the Project, which would minimize potential water quality impacts. Accordingly, impacts related to surface water quality would be less than significant with mitigation.

Groundwater

LESS THAN SIGNIFICANT WITH MITIGATION. Groundwater quality impacts could occur during construction if contaminated or hazardous materials used during construction were to be released and allowed to migrate to the groundwater table. Given adherence to the Project Hazardous Materials Business Plan and the NPDES General Permit for Construction Activities, the potential for such impacts to groundwater quality are low.

The Project would produce sanitary wastewater from the O&M building, which would be treated and disposed of at the Project using a septic disposal system. The federal (EPA), state (RWQCB) and local (Riverside County Department of Environmental Health) governments have requirements for septic system design, including requirements for percolation, vertical distance from the groundwater table, and setback from the nearest groundwater well. The use and application of septic fields is an established practice as a method of wastewater treatment. The use of a septic system within the designed system capacity is not anticipated to cause groundwater quality degradation.³²

DWR has categorized the CVGB as a very low-priority basin under the SGMA (DWR, 2020a). Per SGMA, due to the CVGB classification as a very low-priority basin, a Groundwater Sustainability Plan (GSP) is not required to be developed for the CVGB. As of this writing, no GSP has been developed for the CVGB.

The Project is located in the jurisdiction of the Colorado River Basin RWQCB. The Water Quality Control Plan developed by the RWQCB establishes water quality objectives, including narrative and numerical

³² Use of a septic system is subject to regulatory approval and issuance of an applicable permit.

standards, to protect the beneficial uses of surface water and groundwater in the region. The Water Quality Control Plan describes implementation plans and other control measures designed to ensure compliance with statewide plans and policies and documents comprehensive water quality planning. The Water Quality Control Plan for the Colorado River Basin Region (RWQCB, 2019) lists specific beneficial uses for groundwater. Beneficial uses of the groundwater in the CVGB are Municipal and Domestic Supply (MUN), Industrial Service Supply (IND), and Agriculture Supply (AGR).

Total dissolved solids (TDS) concentrations across the CVGB range from 274 milligrams per liter (mg/L) to 12,300 mg/L. The lowest TDS concentrations are in the western portion of the CVGB, where TDS concentrations range from 275 to 730 mg/L (DWR, 2004). In the northwest portions of the CVGB, arsenic concentrations have ranged from 9 micrograms per liter (µg/L) to 25 µg/L (GEI, 2010). Water quality in the CVGB has concentrations of sulfate, chloride, fluoride, and TDS that are higher than recommended levels for drinking water use. Likewise, elevated concentrations of boron, TDS, and percent sodium impair groundwater for irrigation use. In general, groundwater in the CVGB is sodium chloride to sodium sulfate-chloride in character (DWR, 2004).

Recent available water quality data near the proposed Project is limited to four wells, with nitrate being the only constituent analyzed in three of the four wells. Reported nitrate concentrations in all four wells were below the federal and California Maximum Contaminant Level of 10 mg/L (nitrate measured as nitrogen).

Pursuant to BLM (2016a and 2016b) requirements, a WSA must include an analysis of “estimates of the total cone of depression considering cumulative drawdown from all potential pumping in the basin, including the project, for the life of the project through the decommissioning phase.” To evaluate the potential cone of depression induced by proposed Project groundwater pumping and cumulative drawdown from all cumulative projects (see GSI, 2024 Table 12), a predictive MODFLOW groundwater model (Model) was developed and projected for the 52-year duration of the Project. The Model incorporated estimated inflow and outflow terms consistent with the Project water budget presented in Section 6 of ~~GSI the WSA~~ (2024) as well as hydrogeological properties used in the Fang et al. (2021) numerical groundwater model.

The Project impacts are discussed in terms of the zones of influence of the total cone of depression considering ~~cumulative~~ drawdown as a result of the Project, cumulative projects, and the CVGB projected agricultural, municipal, and domestic pumping. The zone of influence after 2 years of Project construction pumping (500 AFY) is an approximately 4.5-mile radius cone of depression out to 0.5 feet of drawdown. Project operational and decommissioning pumping (50 AFY) for 50 years has a cumulative drawdown with an approximately 15-mile radius out to 0.5 feet of drawdown. This zone of influence also includes pumping from cumulative projects.

The modeling results indicate that impacts to groundwater levels as a result of Project and cumulative project pumping are confined to the northwestern part of the CVGB. Although most of the non-cumulative project pumping (see GSI, 2024 Section 5.8.2) in the CVGB occurs in the northwestern part of the CVGB, ~~total agricultural, municipal, and domestic pumping is limited and the magnitude of the simulated drawdown is not anticipated to adversely affect existing water users and water rights claimants in the CVGB~~ CVGB (the total agricultural, municipal, and domestic pumping is limited to approximately 7,900 AFY [CEC, 2010]), cumulative project pumping is not anticipated to adversely affect existing water users and water rights claimants in the CVGB due to the limited magnitude of the simulated drawdown (see the previous paragraph).

~~Based on the simulated drawdown due to Project and cumulative project pumping, and the size and storage capacity of the CVGB, the Project is not anticipated to result in changes in water quality that affect other beneficial uses~~ Based on the limited magnitude of the simulated drawdown due to Project pumping,

groundwater levels would not be lowered to a level that would cause a degradation of groundwater quality that affects other beneficial uses. Additionally, groundwater levels would not be lowered to a level that causes pumping wells near the Project to begin to capture deeper/older groundwater within the CVGB. Deeper/older groundwater typically contains increased salts and nutrients as a result of prolonged exposure to the aquifer material (leaching of minerals from the host rock into groundwater) (USGS, 2019). In addition, there are no known point source plumes near the Project. Therefore, there are no known contaminant plumes Project pumping could potentially mobilize.

Although there is no sustainable groundwater management plan for the CVGB with which the Project could conflict, the Project would not adversely impact the sustainable management of the CVGB, as discussed further below in Impact HWQ-2.

~~Mitigation Measures (MMs) to reduce Impact HWQ-1 include MM HWQ-1 (Drainage Erosion and Sedimentation Plan) and MM HWQ-2 (Septic System Review and Permitting) which would enable the Riverside County Department of Environmental Health to ensure that the Project is compliant with Riverside County, RWQCB, and EPA regulations and protective of water quality. Mitigation Measure HWQ-3 (Palo Verde Mesa Groundwater Basin Protection) would implement a~~includes the development of a Colorado River Water Supply Plan (CRWSP) to monitor groundwater extractions from the Applicant owned and/or operated on-or off-site well(s) to ensure that groundwater extractions do not go below the Colorado River Accounting Surface. HWQ-4 (Groundwater Monitoring, Reporting, and Mitigation Plan (GMRMP)) would be implemented for the Project in coordination with the RWQCB and BLM to ensure that groundwater wells surrounding Project supply well(s) are not adversely affected (i.e., chronic lowering of groundwater levels and degradation of groundwater quality) by Project activities.³³ Thus, impacts would be less than significant.

Mitigation Measures for Impact HWQ-1

- MM BIO-3 Minimization of Vegetation and Habitat Impacts.** See full text in Section 3.5 (Biological Resources).
- MM BIO-5 Vegetation Resources Management Plan.** See full text in Section 3.5 (Biological Resources).
- MM BIO-13 Streambed and Watershed Protection.** See full text in Section 3.5 (Biological Resources).
- MM HWQ-1 Drainage Erosion and Sedimentation Control Plan (DESCP).** See full text in Section 3.11.9 (Mitigation Measures).
- MM HWQ-2 Septic System Review and Permitting.** See full text in Section 3.11.9 (Mitigation Measures).
- MM HWQ-3 Palo Verde Mesa Groundwater Basin (PVMGB) Protection.** See full text in Section 3.11.9 (Mitigation Measures).
- MM HWQ-4 Groundwater Monitoring, Reporting, and Mitigation Plan (GMRMP).** See full text in Section 3.11.9 (Mitigation Measures).
- MM HWQ-5 Project Drainage Plan.** See full text in Section 3.11.9 (Mitigation Measures).

³³ Groundwater quality thresholds are pursuant to federal and state regulations, including the Water Quality Control Plan for the Colorado River Basin Region (RWQCB, 2019).

Significance After Mitigation

This impact would be less than significant with the implementation of recommended mitigation measures.

Impact HWQ-2. Would the Project substantially decrease groundwater supplies or interfere substantially with groundwater recharge such that the Project may impede sustainable groundwater management of the basin?

LESS THAN SIGNIFICANT WITH MITIGATION. In June 2023, BLM issued a Proposed Rule to amend its existing ROW regulations, issued under authority of the Federal Land Policy and Management Act (FLPMA), and is considering issuing ROW grants for durations of up to 50 years (BLM, 2023). To determine whether there are sufficient supplies to sustain the Project, the Easley WSA (EIR Appendix G) extends the total projected period of the Project to 52-years. For the purpose of the CVGB water budget (see GSI, 2024 Section 6) and predictive Project water demand impacts analysis (see Sections GSI, 2024 5.4 and 7), 52 years is equivalent to the projected total duration of the Project, including construction (20 months), operations (48 years), and decommissioning (20 months).³⁴ Based upon these quantities of water demand, a total of approximately 3,500 AF of water will be used by the Project over the Project's construction, operational, and decommissioning periods (52 years [i.e., 2-year construction period, 48-year operational period, and 2-year decommissioning period]).

Water for construction, operation, and decommissioning would be obtained from several potential sources, including an on-site groundwater well, an off-site groundwater well, and trucked from an off-site water purveyor. However, it is assumed all Project water needs would be sourced from the CVGB. Groundwater has been identified as the primary source of water in the CVGB. DWR has categorized the CVGB as a very low-priority basin under SGMA (DWR, 2020a) and based on the adopted water budget components (primarily based on Fang et al. [2021]) in the Project WSA (GSI, 2024), the CVGB is not in a state of overdraft.

In accordance with SB 610 and the DRECP Land Use Plan Amendment (LUPA), and to determine whether there are sufficient supplies to sustain the Project, a 52-year water budget was developed for the Project. The water budget uses information summarized in Section 3.11 to provide a baseline normal-year groundwater budget for the CVGB. The water budget also includes a normal-year groundwater budget assuming the Project is in place. ~~A second groundwater budget was developed for the Project WSA using lower input estimates (see Section 3.11.1.2 and GSI, 2024, Sections 5.7 and 5.8).~~ The same approach was repeated for ~~both water budgets for single and multiple dry-year scenarios.~~ Details and the results of the analysis are summarized in Section 3.11.1.2 and presented in the Project WSA (GSI, 2024).

The CVGB under average-year conditions would have a ~~cumulative~~ surplus of 5,200 AF at the end of the 52-year period. The net CVGB surplus with the Project in place would therefore be 1,700 AF, or 33 percent of the surplus that would exist without the Project. Using the DWR (2020a) estimated annual groundwater pumping, the net CVGB surplus with the Project in place would be 74,500 AF, or 96 percent of the surplus that would exist without the Project. Thus, with the Project in place, groundwater in storage and groundwater levels in the CVGB would be expected to increase over the life of the Project. ~~By contrast, using the reduced recharge rates for precipitation and underflow (see Table 5), the 52-year deficit without the Project would be 228,800 AF, increased to 232,300 AF by the Project. The Project would contribute about 2 percent to this cumulative deficit.~~

³⁴ Although the estimated Project construction period and decommissioning period described in the EIR Chapter 2 (Project Description) is 20 months, the water budgets (see GSI, 2024 Section 6) and Cone of Depression and Cumulative Drawdown Analysis (see GSI, 2024 Section 7), were developed in 1-year time steps, and therefore, assume the same overall water usage but over Project construction and decommissioning periods of 2 years.

Using the reduced estimates of precipitation and underflow recharge, for a single dry year and single critical dry year with the Project in place, the worst-case scenario is for one of those year types, dry or critical dry, to occur during the construction period of the Project (assumed to be 2024 to 2025) in which the Project would increase the dry year and critical dry year deficit by 8 and 7 percent, respectively. Assuming normal precipitation returns, this total deficit (dry year, or critical dry year, plus Project use) would not be recovered during the 52-year period (with or without the Project). Using reduced inflow data, these deficits would increase by 6 percent. The likelihood that a dry or critical dry year would occur during Project construction is 10 percent and 3 percent, respectively. If a dry year or critical dry year were to occur during Project construction, it would not result in groundwater overdraft of the CVGB, which is defined as the condition of a groundwater basin in which the amount of water withdrawn by pumping exceeds the amount of water that recharges the basin over a period of many years during which water supply conditions approximate average conditions. The deficit associated with a dry or critical dry year during construction does not approximate average conditions and, further, would be limited to those years, after which average conditions (resulting in an annual groundwater surplus, as discussed above) would be expected to return.

If a dry year or critical dry year occurs during the Project construction period, using the DWR (2020a) estimated annual groundwater pumping, the CVGB annual deficit would be approximately 5,000 AF and 6,200 AF, respectively (Budget Balance Using DWR [2020a] rows in GSI, 2024 Tables 6 and 7 minus 500 AFY [1,000 AF / 2 years]). The Project would increase the dry year and critical dry year deficit by 11 and 9 percent, respectively. Assuming normal precipitation returns (see 3.11-1), this total deficit (dry year plus Project use and critical day year plus Project use) would be recovered in less than 4 years and 5 years, respectively, with the Project in place. The Project also would implement various construction techniques designed to reduce overall water use during construction, including using “overland travel,” designating primary travel routes, limiting grading, using approved soil binders in lieu of water, utilizing small rubber-wheel vehicles, and phasing construction, as described in Chapter 2.

Historically, dry and critical dry years do not occur over multiple consecutive years. Rather, the precipitation record indicates that a series of dry years has typically been followed by a series of years with above-average precipitation. To assess the probable effect of this over the 52-year life of the Project, the WSA analyzed a 52-year running average using the 129-year precipitation period of record. Using the driest 52-year period recorded at the Blythe Airport meteorological station, the WSA indicates there would be a 21,060 AF surplus in the CVGB if there were a repeat of this 52-year period under current conditions. With the Project in place, there would be a total groundwater surplus of approximately 17,530 AF at the end of 52 years. Using reduced recharge data, the same analysis, with the Project in place, results in a groundwater deficit totaling approximately 217,520 AF after 52 years. Using the DWR (2020a) estimated annual pumping, at the end of the 52-year period the total groundwater surplus would be approximately 90,330 AF with the Project in place.

Thus, using the normal (average) conditions groundwater budget presented in Table 3.11-1, the available water supplies during normal, single dry, and multiple dry water years from the CVGB would meet the projected water demands of the Project, in addition to existing uses and planned future uses (see GSI, 2024 Table 15 for the 52-year projection).

The Project has a limited overall water demand and, further, would require very little water each year for operation; however, the WSA considered the potential for the Project to result in localized impacts to existing wells. Groundwater use during the Project’s construction, operation, and decommissioning would cause drawdown in the immediate vicinity of the well(s) used to produce groundwater for the Project. Pursuant to BLM (2016a and 2016b) requirements, a WSA must include an analysis of “estimates of the total cone of depression considering cumulative drawdown from all potential pumping in the basin, including the project, for the life of the project through the decommissioning phase.” To evaluate the

potential cone of depression induced by proposed Project groundwater pumping and cumulative drawdown from all cumulative projects (see GSI, 2024 Table 12), a predictive MODFLOW groundwater model (Model) was developed and projected for the 52-year duration of the Project. The Model incorporated estimated inflow and outflow terms consistent with the Project water budget presented in Section 6 of the WSA (GSI, 2024) as well as hydrogeological properties used in the Fang et al. (2021) numerical groundwater model.

The Project Impacts are discussed in terms of the zones of influence of the total cone of depression considering cumulative drawdown as a result of the Project, cumulative projects, and the CVGB projected agricultural, municipal, and domestic pumping. The zone of influence after 2 years of Project construction pumping (500 AFY) is an approximately 4.5-mile radius cone of depression out to 0.5 feet of drawdown. Project operational and decommissioning pumping (50 AFY) for 50 years has a cumulative drawdown with an approximately 15-mile radius out to 0.5 feet of drawdown. This zone of influence also includes pumping from cumulative projects.

The modeling results indicate that impacts to groundwater levels as a result of Project and cumulative project pumping are confined to the western part of the CVGB. Although most of the non-cumulative project pumping (see GSI, 2024 Section 5.8.2) in the CVGB occurs in the western part of the CVGB (the total agricultural, municipal, and domestic pumping is limited to approximately 7,900 AFY [CEC, 2010]), cumulative project pumping is not anticipated to adversely affect existing water users and water rights claimants in the CVGB due to the limited magnitude of the simulated drawdown (see the previous paragraph).

Additionally, the Project is not anticipated to cause lowering of groundwater to levels greater than the recorded historical lows and there is no reported evidence of subsidence in the CVGB as a result of either historical or present pumping (GEI, 2010a). Based on available data from CGPS stations located in the CVGB, Orocopia Valley Groundwater Basin, and Palo Verde Mesa (POR from 1996 through present) Groundwater Basin, no significant land subsidence has been recorded. Therefore, the Project is not anticipated to cause subsidence, increase the rate of subsidence, or cause loss of aquifer storage capacity in the CVGB. The Project also would develop a GMRMP in coordination with the RWQCB and BLM to ensure that groundwater wells surrounding Project supply well(s) are not adversely affected (i.e., chronic lowering of groundwater levels) by Project activities (MM HWQ-4).

Finally, due to the CVGB's location adjacent to the Palo Verde Mesa Groundwater Basin (PVMGB), CVGB recharge as a result of leakage from the Colorado River Aqueduct was considered in the Project WSA. Direct or indirect use of Colorado River water requires documented entitlement. Therefore, Project-related groundwater use inducing flow of Colorado River water (groundwater within an area referred to as the "accounting surface") from the adjacent Palo Verde Mesa Groundwater Basin (PVMGB) into that CVGB was considered. The Colorado River Accounting Surface is at an elevation between approximately 238 and 240 feet above mean sea level (amsl) in the Chuckwalla Valley (Argonne, 2013). Groundwater elevation in the Project area is approximately 489 feet amsl as of the first quarter of 2024, approximately 249 to 251 above the Accounting Surface. The numerical groundwater model developed for the Project WSA (GSI, 2024) included estimates of the total cone of depression considering cumulative drawdown from all potential pumping in the CVGB, including the Project, for the life of the Project through the decommissioning phase. The estimated drawdown at the Project well after the planned 2-year construction period was less than 2 feet, approximately 247 to 249 feet above the Accounting Surface. The temporary drawdown at the well during pumping, however, would be greater.

Assuming a conservatively large temporary drawdown of 100 feet at the Project well (up to 80 feet of temporary drawdown has been recorded from a well used for construction of a nearby solar project) during peak water demand during Project construction, the water levels in the Project well would be at least 150 feet above the Accounting Surface. Further, the water levels within the Project well would be

monitored as part of the GMRMP (MM HWQ-4) per the DRECP LUPA Conservation and Management Action (CMA) Soil and Water (SW) 24. Pumping from the Project well would be decreased or stopped well before water levels reached the Accounting Surface, pursuant to MM HWQ-3 (PVMGB Protection). Thus, the Project will not extract water from below the Accounting Surface.

For the reasons described above, the Project would not substantially decrease groundwater supplies or interfere substantially with groundwater recharge such that the Project may impede sustainable groundwater management of the CVGB. Groundwater use during the Project's construction, operation, and decommissioning would cause drawdown in the immediate vicinity of the well(s) used to produce groundwater for the Project. Pursuant to BLM (2016a and 2016b) requirements, a WSA must include an analysis of "estimates of the total cone of depression considering cumulative drawdown from all potential pumping in the basin, including the project, for the life of the project through the decommissioning phase." To evaluate the potential cone of depression induced by proposed Project groundwater pumping and cumulative drawdown from all cumulative projects (see GSI, 2024 Table 12), a predictive MODFLOW groundwater model (Model) was developed and projected for the 52-year duration of the Project. The Model incorporated estimated inflow and outflow terms consistent with the Project water budget presented in Section 6 of GSI (2024) as well as hydrogeological properties used in the Fang et al. (2021) numerical groundwater model.

The Project impacts are discussed in terms of the zones of influence of the total cone of depression considering cumulative drawdown as a result of the Project, cumulative projects, and the CVGB projected agricultural, municipal, and domestic pumping. The zone of influence after 2 years of Project construction pumping (500 AFY) is an approximately 4.5-mile radius cone of depression out to 0.5 feet of drawdown. Project operational and decommissioning pumping (50 AFY) for 50 years has a cumulative drawdown with an approximately 15-mile radius out to 0.5 feet of drawdown. This zone of influence also includes pumping from cumulative projects.

The modeling results indicate that impacts to groundwater levels as a result of Project and cumulative project pumping are confined to the northwestern part of the CVGB. Although most of the non-cumulative project pumping (see GSI, 2024 Section 5.8.2) in the CVGB occurs in the northwestern part of the CVGB, total agricultural, municipal, and domestic pumping is limited and the magnitude of the simulated drawdown is not anticipated to adversely affect existing water users and water rights claimants in the CVGB.

Based on the adopted water budget components (primarily based on Fang et al. [2021]) in the Project WSA (GSI, 2024), under normal conditions (see Table 3-11.1) the CVGB is not in overdraft. The CVGB is a very low priority basin and DWR (2004) estimated the total groundwater storage capacity of the CVGB is 9,100,000 to 15,000,000 AF. The Project's water use of 3,500 AF over the 52-year life of the Project represents approximately 0.0004 percent of the assumed 10,000,000 AF of groundwater storage capacity in the CVGB. Under conservative recharge and pumping assumptions, there would be an annual and net surplus of groundwater in the CVGB over the Project's 52-year life with Project groundwater pumping in place. Only during the unlikely event that a dry or critical dry year overlaps with Project construction (10 percent and 3 percent chance of occurring, respectively) would there be an annual groundwater deficit. However, Project groundwater use would not result in long term deficits or overdraft of the CVGB. Indeed, if the driest 52-year period recorded for the CVGB were to repeat during the Project's operational life, the WSA indicates there would be between a 17,530 AF and 90,330 AF surplus in the CVGB with the Project in place. Overall Project pumping would be limited by both MM HWQ-3 and HWQ-4, which would minimize potential pumping impacts to nearby wells and the larger CVGB. Thus, with mitigation, impacts would be less than significant.

Impact HWQ-2 would be reduced through the development of a Colorado River Water Supply Plan (CRWSP) to monitor groundwater extractions from the Project operated on or off site well(s) and

~~prevent, replace, or mitigate Project impacts that deplete the PVMGB groundwater budget to prevent impacts (MM HWQ-3, Palo Verde Mesa Groundwater Basin Protection). The CRWSP would be submitted to the U.S. Bureau of Reclamation and BLM prior to commencement of any Project construction activities. The CRWSP would be based on the results of the Project GMRMP. The GMRMP for the Project would be developed in coordination with the RWQCB and BLM to ensure that groundwater wells surrounding Project supply well(s) are not adversely affected (i.e., chronic lowering of groundwater levels) by Project activities.~~

Mitigation Measures for Impact HWQ-2

MM HWQ-3 Palo Verde Mesa Groundwater Basin (PVMGB) Protection. See full text in Section 3.11.9 (Mitigation Measures).

MM HWQ-4 Groundwater Monitoring, Reporting, and Mitigation Plan (GMRMP). See full text in Section 3.11.9 (Mitigation Measures).

Significance After Mitigation

This impact would be less than significant with the implementation of the recommended mitigation measure.

Impact HWQ-3A. Would the Project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner which would result in substantial erosion or siltation on- or off-site?

LESS THAN SIGNIFICANT WITH MITIGATION. Earthwork for Project construction would require the use of heavy machinery for vegetation grubbing, grading, and installation of roads, solar fields, transmission facilities, the O&M building, the BESS, the energy storage systems, and other facilities. Construction of these facilities would involve the use of tractors, bulldozers, graders, trucks, and various other types of heavy equipment, and would involve minor changes to on-site topography. These activities would loosen existing surface soils and sediments, increasing the potential for erosion during storm events, along with associated effects such as increased downstream sediment yields from on-site disturbed areas. Increased impervious areas could also lead to erosion by increasing the rate and frequency of runoff.

Grading effects that could lead to soil disturbance would be reduced by the proposed grading design that includes mowing and rolling of vegetation over large areas (as opposed to major grading), which would minimize the required volume of earth movement. It is therefore anticipated that existing drainage patterns would not be substantially altered.

Although significant grading or ground-disturbing activities would not occur, parts of the solar facility including roads, laydown areas and structures would cause some form of ground disturbance from grading, compaction, or excavation.

Because of the proposed plan for minimal grading, alteration of the existing drainage pattern and any associated erosion or siltation, should be minimal. The Applicant's proposed layout of solar panels and other facilities (~~pending final design~~) would largely maintain major existing hydrologic patterns with respect to runoff, avoiding washes, stream beds, and stream banks, where feasible. This includes mostly avoiding the largest desert washes that cross the site from the southwest to northeast. However, the site plans are not yet final, and there remains a potential for ~~minor~~ alteration of drainage patterns and the potential for erosion. Drainage alterations could occur through diversions by the proposed security fences, placement of structures in drainage areas, or grading to control high flow concentrations.

As noted above and in Impact HWQ-1, alternation to drainages/streambeds mapped as unvegetated ephemeral dry washes and desert dry wash woodland and classified as RWQCB and CDFW jurisdictional waters of the State may occur. Changes and alterations to these washes could change the flow patterns across the site and result in increased flow velocities, increased erosion, and increased downstream siltation. Alterations to the RWQCB and CDFW jurisdictional waters would require the Applicant to obtain a LSAA from the CDFW and a WDR permit from the Colorado River Basin RWQCB. The LSAA and WDR would require avoidance and minimization measure to limit impacts to these areas and also may require compensatory mitigation for impacts to waters of the State. Impacts related to surface water degradation due to alterations to waters of the State would be minimized or prevented through compliance with CDFW and RWQCB regulations and permits, MM BIO-3 (Minimization of Vegetation and Habitat Impacts), MM BIO-5 (Vegetation Resources Management Plan), MM BIO-13 (Streambed and Watershed Protection), MM HWQ-1 (Drainage Erosion and Sedimentation Control Plan (DESCP)), and MM HWQ-5 (Project Drainage Plan). Implementation of these measures would ensure that impact HWQ-3A would be less than significant.

Erosion protection management would be required by adherence to a SWPPP that is required and the Applicant has committed to preparing. Compliance with these measures is generally sufficient to would substantially reduce erosion impacts to a minimum. A DESCP is proposed in MM HWQ-1 to further address potential Project-related water erosion impacts. This plan would include applicable measures, such as BMPs, to reduce erosion and siltation impacts. With ~~MM HWQ-1 in place~~ implementation of the above MMs, Impact HWQ-3a would be less than significant.

Impact HWQ-3B. Would the Project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner which would substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or offsite?

LESS THAN SIGNIFICANT WITH MITIGATION. There is a minor potential for the Project to increase the magnitude and frequency of runoff rates through the construction of impervious areas and by altering the ground surface characteristics through grading and removal of vegetation. Impervious areas would be minimal and limited to the foundations for the proposed solar panels, foundations for the transmission structures, the proposed buildings, BESS, substation equipment and switchyard. The proposed parking area and roadways would be compacted, which would increase the runoff potential. Together, these features are anticipated to be only a small portion (about 3 percent) of the 3,735-acre solar and BESS facility site. Additionally, drainage patterns would remain relatively intact. Therefore, the increase in overall site runoff is expected to be minimal (approximately 3 percent), though a local impact potential remains, especially in the vicinity of new impervious areas. Depending on final engineering analysis of postconstruction hydrology, retention basins may be necessary to reduce increased discharges created by the Project.

Alteration of the existing drainage pattern should be minimal because of the minimal grading proposed. Some alterations could occur through diversions by the proposed security fences, which could become barriers to flow by the accumulation of debris, in which case ~~substantial~~ diversions of off-site sheet flow could occur. Security fencing with desert tortoise fencing along the bottom would enclose the developed portions of the facility site, including ~~the~~ across the desert washes. Portions of the security fence may leave a 6- to 8-inch gap between the lower fence margin (rail or mesh) and the ground to allow for passage of desert tortoise and other animals. Structures placed in drainage areas, or grading to control high flow concentrations, could also lead to flow diversions which could adversely affect the flood potential within or outside the property.

Although minimal alteration of drainage patterns is expected, there remains a potential for the Project to cause flooding either of adjacent property or within the site itself. Mitigation Measure HWQ-1 requires the development of a DESCP which would address erosion-related impacts. The Westwood study (2023) presents a preliminary assessment of the flood potential in the Project area. As the site designs are completed, additional drainage information would be required to ensure that the designs address drainage and flooding conditions on the Project site. Mitigation Measure HWQ-5 (Project Drainage Plan) requires a Project drainage report and plan to address on-site flooding and the potential for the Project to induce flooding on adjacent property. With MMs HWQ-1 and MM HWQ-5 in place, Impact HWQ-3b would be less than significant.

Impact HWQ-3C. Would the Project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner which would create or contribute runoff water which would exceed the capacity of existing or planned storm water drainage systems or provide substantial additional sources of polluted runoff?

LESS THAN SIGNIFICANT WITH MITIGATION. There are no existing or planned stormwater drainage systems at or downstream of the Project site. Drainage in the area and downstream of the Project consists of natural desert with natural watercourses. Some increase in runoff potential is possible due to increased impervious area and compacted roadway surfaces, but a large increase is not anticipated due to the small amount of new impervious area and compacted roadways. Any increase in runoff would be addressed in the DESCP (MM HWQ-1) and detention regulations. With MMs HWQ-1 (Drainage Erosion and Sedimentation Control Plan [DESCP]) and MM HWQ-5 (Project Drainage Plan) in place, this potential impact from runoff would be less than significant.

Impact HWQ-3D. Would the Project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner which would impede or redirect flood flows?

LESS THAN SIGNIFICANT WITH MITIGATION. The Project would include perimeter security fencing which, if clogged with debris normally carried by natural flood flows in the desert, could divert flood flows and ~~substantially~~ increase the flood potential on other property. Fence-induced diversions along drainage entry points could cause flooding of adjacent properties. Fencing is not proposed across existing drainages and fencing would be a long linear element unlikely to become completely blocked by debris accumulations along the entire length of the fence.

The exact nature of fence-induced diversions is not determined at this time, though a qualitative assessment of their likely impact can be made. The flood depths described in the Westwood study (Westwood, 2023) are mostly minor for the Project, with depth estimated at up to 0.5 to 1 foot in most areas of the site. Since most major washes would be avoided, fencing at property entry points would be limited. Further, a 6-to-8-inch gap may be left at the bottom of the fence to allow tortoises to pass underneath. Fence-related flow diversion is therefore likely to be minimal. Mitigation Measure HWQ-5 (Project Drainage Plan) ~~is proposed to would~~ ensure that fence-related diversions of flow would be less than significant ~~by creating fence openings sufficient to allow pass through flow in places where there are no demonstrable existing flood diversions.~~

Most of the Project site would be subject to flooding at varying depths mostly less than one foot. Any structures placed in those areas would have the potential to redirect flood flows. The solar panels would be installed on posts/piles and at least 4 feet above the ground and would offer minimal obstruction to flows. The substation, BESS and O&M building are in an area that would be subject to flooding of

approximately 1 foot. These would be protected by berms or other drainage features which could redirect flood flows locally. The access roads, being at-grade, would offer minimal obstruction. The internal power lines would be protected from flooding by burying or being installed on poles, but if on poles would offer minimal obstruction to flow. The gen-tie line would have similar potential. Mitigation Measures HWQ-1 (Drainage Erosion and Sedimentation Control Plan [DESCP]) and MM HWQ-5 (Project Drainage Plan) would ensure that the site design include consideration of flood flows and diversions. With these mitigation measures in place, this potential impact from runoff would be less than significant.

Potential impact of impervious areas is addressed in Impact HWQ-3B.

Mitigation Measures for Impact HWQ-3

- MM BIO-3** **Minimization of Vegetation and Habitat Impacts.** See full text in Section 3.5 (Biological Resources).
- MM BIO-5** **Vegetation Resources Management Plan.** See full text in Section 3.5 (Biological Resources).
- MM BIO-13** **Streambed and Watershed Protection.** See full text in Section 3.5 (Biological Resources).
- MM HWQ-1** **Drainage Erosion and Sedimentation Control Plan (DESCP).** See full text in Section 3.11.9 (Mitigation Measures).
- MM HWQ-5** **Project Drainage Plan.** See full text in Section 3.11.9 (Mitigation Measures).

Significance After Mitigation

These impacts would be less than significant with the implementation of recommended mitigation measures.

Impact HWQ-4. Would the Project expose people or structures to a significant risk of loss, injury or death involving flooding, including flooding as a result of the failure of a levee or dam?

LESS THAN SIGNIFICANT WITH MITIGATION. Most of the Project would be subject to flooding at varying depths mostly less than one foot. Any structures placed in those areas would have the potential to be flooded. The solar panels would be installed on posts/piles and at least 4 feet above the ground and would be above the anticipated flood depth but would be subject to scour as the flood flows pass the support posts. The substation, BESS and O&M building are in an area that would be subject to flooding of up to 1 foot. These would be protected by berms or other drainage features. The access roads, being at-grade, would require maintenance after a flood event. The internal power lines would be protected from flooding by burying or being installed on poles, but if on poles could be subject to flood-related scour. The gen-tie line would have similar potential for flood-related scour.

As there would be few people on the site at most times, flow depths shallow, and the building structures and other Project features would be protected from flooding or not easily susceptible to flood damage, there would be little chance of flood-related injury or death, or substantial damage to structures. Mitigation Measures HWQ-1 (Drainage Erosion and Sedimentation Control Plan [DESCP]) and MM HWQ-5 (Project Drainage Plan) would ensure that the site design include consideration of flood flows. Mitigation Measure HWQ-6 (Flood Protection) is proposed to ensure that all structures are protected from flooding and flood-related scour.

Significance After Mitigation

This impact would be less than significant with the implementation of recommended mitigation measures.

*** The impact analyses for all Project alternatives have been moved to EIR Section 5. ***

3.11.7. Cumulative Impacts

3.11.7.1. Geographic Scope

Surface Water. The Project is in the Chuckwalla Hydrologic Unit which drains entirely to the Palen and Ford Dry Lakes. There is no natural outlet for this flow to other hydrologic units. Therefore, the area for cumulative hydrology and water quality analysis is confined to this hydrologic unit. Existing, proposed, and reasonably foreseeable projects from Tables 3.1-2 and located within this same hydrologic unit consist of eight solar energy projects (Desert Sunlight, Desert Harvest, Palen, Athos, Oberon, Victory Pass, Redonda and Arica), five power transmission projects (Red Bluff Substation, Devers-Palo Verde Transmission Line, Devers-Colorado River Transmission Line, Blythe Energy Project Transmission Line, and Desert Southwest Transmission Line), and two other projects (Eagle Mountain Pumped Storage Project and Skybridge-Eagle Mountain Hydrogen Project).

Groundwater. A cumulative impact scenario on groundwater was completed in the Project WSA. This cumulative impact scenario uses the CVGB baseline groundwater budget presented in the Project WSA using normal and reduced recharge assumptions (see Tables 3.11-1 and 3.11-2). The cumulative impact scenario accounts for all existing water and estimated water use from known qualifying projects and foreseeable cumulative projects. Pursuant to SB 610, the Project WSA is only required to consider existing water use and estimated water use from known qualifying projects within the CVGB. Qualifying projects included in the Project WSA cumulative impact scenario are displayed on Figure 3.1-1 and Project WSA Figure 3 in EIR Appendix G.

3.11.7.2. Cumulative Impact Analysis

Surface Water

Cumulative impacts to hydrology and water quality include the impacts of the Easley Project together with those listed above, most of which are similar solar power projects. These cumulative projects have the potential to contribute to cumulative hydrologic and water quality impacts in the Chuckwalla Valley Hydrologic Unit. These cumulative projects have the potential to introduce new or exacerbate existing pollutant generation associated with construction and operation. These projects could contribute to increased runoff due to increases in impervious surfaces. All cumulative projects are crossed by water-courses that could generate flooding, with similar flooding impacts as described for the proposed Project.

All foreseeable future projects in the Chuckwalla Valley Hydrologic Unit would be subject to similar measures as the proposed Project when obtaining the required permits ~~that implement compliance and complying~~ with state and federal clean water regulations and Riverside County floodplain development regulations. As ~~all these~~ projects would go through an environmental review process, they would be subject to similar mitigation measures as those proposed to address potential water quality impacts for the proposed Project. Many of the projects (Arica, Victory Pass, Palen, and Desert Harvest) do or would likely avoid major drainages that cross their sites. Because the Project is in a similar hydrologic setting and most of the cumulative projects are similar projects, individual project impacts are expected to be reduced to less than significant through compliance with regulations and mitigation. Therefore, the combined effects to water quality from the cumulative projects within the geographic scope would not be considered cumulatively significant and the proposed Project would not have a considerable contribution to the cumulative impact.

Groundwater

In June 2023, BLM issued a Proposed Rule to amend its existing ROW regulations, issued under authority of the Federal Land Policy and Management Act (FLPMA), and is considering issuing Right-of-Way (ROW) grants for durations of up to 50 years (BLM, 2023). To prepare for potential issuance of 50-year ROW Grant by the BLM and to determine whether there are sufficient supplies to sustain the Project, the Easley WSA conservatively extends the total projected period of the Project to 52-years. For the purpose of the CVGB water budget (see GSI, 2024 Section 6) and predictive Project water demand impacts analysis (see GSI, 2024 Sections 5.4 and 7) presented herein, 52 years is equivalent to the projected total duration of the Project, including construction (20 months), operations (48 years), and decommissioning (20 months).³⁵ The Project would use up to 1,000 AF during the planned 20-month construction period and up to 50 AFY during the Project's operational and decommissioning periods³⁶. As described above, the Project would result in less than significant impacts to groundwater supplies with implementation of mitigation.

A cumulative impact scenario on groundwater was completed in the Project WSA. As with the Project-level analysis, normal (average) conditions are considered the more accurate estimate; the annual groundwater deficit resulting from the use of the reduced recharge rates is inconsistent with reported groundwater levels in the CVGB, which indicate that the groundwater levels are generally stable, or in some areas in the CVGB, indicate an increasing trend, which would not occur if there were an ongoing

³⁵ Although the estimated Project construction period and decommissioning period described in the EIR Chapter 2 (Project Description) is 20 months, the water budgets (see GSI, 2024 Section 6) and Cone of Depression and Cumulative Drawdown Analysis (see GSI, 2024 Section 7), were developed in 1-year time steps, and therefore, assume the same overall water usage but over shorter Project construction and decommissioning periods of 2 years.

³⁶ As described in EIR Section 2.3.11, the Applicant has updated its construction water requirements in the Partially Recirculated Draft EIR based on water usage data obtained following construction of other projects in the area, such as the Oberon Renewable Energy Project. The analysis in EIR Section 3.11 (Hydrology and Water Quality) and EIR Appendix G (Water Supply Assessment) conservatively still assumes use of 1,000 AF during construction.

annual groundwater deficit. Additionally, the reduced recharge groundwater budget is inconsistent with previous studies, including USGS (2007), CEC (2010), and Fang et al. (2021).

The results indicate the Project contributes approximately 2 percent of the total cumulative operational extractions for all qualifying projects not already in place (cumulative projects; see GSI, 2024, Table 12). Development of a 52-year (equivalent to the total Project duration) groundwater budget projection, assuming average precipitation and the Project and all cumulative projects in place, indicates there would be an initial groundwater deficit of 6,960 AF in the year 2024 (first year of Project construction for all cumulative projects not already under construction or operational). The cumulative groundwater deficit would increase to approximately 118,420 AF by the end of the 52-year period. Without the Project and all other cumulative projects in place, there would be a surplus of 5,200 AF at the end of the 52-year period. The same analysis using the DWR (2020a) estimated annual groundwater pumping, assuming average precipitation, indicates the initial groundwater deficit would be 5,560 AF in 2024, increasing to a deficit of 45,620 by the end of the 52-year period.

The same analysis using reduced infiltration and underflow estimates results in a total cumulative project deficit of about 352,760 AF, to which the Project would contribute about 1 percent, or 3,500 AF. Using these inflow estimates, the CVGB would not recover the groundwater deficit with or without the Project.

Using the driest 52-year period recorded at the Blythe Airport meteorological station, with the Project and all cumulative projects in place, the CVGB total groundwater deficit at the end of the 52-year period would be approximately 112,560 AF. Using reduced recharge data, the 52-year deficit would total approximately 347,640 AF. Using the DWR (2020a) estimated annual pumping, at the end of the 52-year period the total groundwater deficit would be approximately 39,760 AF.

Notably, the estimated water demand of the Eagle Mountain Pump Storage (EMPS) Project is 4,460 AFY during the projected 4-year construction period and 2,050 AFY during the operational phase of the project. Comparatively, one year of construction water demand for the EMPS Project is more than the 52-year water demand for the Project. Further, during its operational phase, the EMPS Project is projected to use more than six times the groundwater of all other cumulative projects located in the CVGB. The inclusion of the EMPS Project drastically affects the cumulative project projected groundwater budgets. Without the EMPS Project, the cumulative groundwater deficit would be 2,180 AF at the end of the 52-year period under normal conditions. Under normal conditions using DWR (2020a) estimated annual pumping, there would be a cumulative groundwater surplus of 70,620 AF without the EMPS Project. Similarly, if the EMPS Project groundwater use was not included in the driest 52-year period cumulative project scenario, the cumulative groundwater surplus would be 3,680 AF at the end of the 52-year period. Using the DWR (2020a) estimated annual pumping, the cumulative groundwater surplus would be 76,480 AF at the end of the 52-year period.

Although the cumulative scenarios presented in the Project WSA (GSI, 2024) indicate a deficit over the 52-year period in some circumstances, the available water supplies during normal, single dry, and multiple dry water years from the CVGB, would meet the projected water demands of the cumulative project uses, in addition to existing uses and planned future uses. This is a result of the storage capacity and hydro-geologic properties of the CVGB, and the relatively low water demand of the cumulative projects. Further, the WSA also calculated the groundwater drawdown caused by groundwater use by the cumulative projects. Pursuant to BLM (BLM, 2016a and 2016b) requirements, a WSA must include an analysis of "estimates of the total cone of depression considering cumulative drawdown from all potential pumping in the basin, including the project, for the life of the project through the decommissioning phase." To evaluate the potential cone of depression induced by proposed Project groundwater pumping and cumulative drawdown from all cumulative projects (see GSI, 2024 Table 12), a predictive MODFLOW groundwater model (Model) was developed and projected for the 52-year duration of the Project. The Model incorporated estimated inflow and outflow terms consistent with the Project water budget presented in

Section 6 of GSI (2024) as well as hydrogeological properties used in the Fang et al. (2021) numerical groundwater model.

The Project impacts are discussed in terms of the zones of influence of the total cone of depression considering cumulative drawdown as a result of the Project, cumulative projects, and the CVGB projected agricultural, municipal, and domestic pumping. The zone of influence after 2 years of Project construction pumping (500 AFY) is an approximately 4.5-mile radius cone of depression out to 0.5 feet of drawdown. Project operational and decommissioning pumping (50 AFY) for 50 years has a cumulative drawdown with an approximately 15-mile radius out to 0.5 feet of drawdown. This zone of influence also includes pumping from cumulative projects.

The modeling results indicate that impacts to groundwater levels as a result of Project and cumulative project pumping are confined to the western part of the CVGB. Although most of the non-cumulative project pumping (see GSI, 2024 Section 5.8.2) in the CVGB occurs in the western part of the CVGB (the total agricultural, municipal, and domestic pumping is limited to approximately 7,900 AFY [CEC, 2010]), cumulative project pumping is not anticipated to adversely affect existing water users and water rights claimants in the CVGB due to the limited magnitude of the simulated drawdown (see the previous paragraph).

Thus, even with a potential deficit, the overall impact would be limited to the western part of the CVGB and any such impact would not adversely affect the existing water uses in that area. Further, even the higher estimated deficit (112,560 AF) is only 1.12 percent of the total assumed 10,000,000 AF capacity of the CVGB. Year to year groundwater use by cumulative projects also would be well below historical agricultural pumping, which was approximately 21,000 AFY in 1986 (GEI, 2010a). Current agricultural groundwater use is estimated at approximately 6,628 AFY, approximately three times the amount of yearly operational groundwater use for all cumulative projects (DWR, 2020a). Even with agricultural pumping, as well as municipal and domestic uses, groundwater levels in the CVGB have been relatively stable or, in some areas of the CVGB, increasing based on reported groundwater levels. There is no reported evidence of subsidence in the CVGB as a result of historical or present pumping (GEI, 2010a) and the Project and cumulative projects are not anticipated to cause subsidence, increase the rate of subsidence, or cause loss of aquifer storage capacity in the CVGB.

Thus, the addition of the cumulative projects likely would have a limited impact on the overall groundwater supplies in the CVGB. Like the Project, cumulative projects would be required to implement groundwater monitoring plans and ensure that pumping would not adversely impact existing users. Groundwater pumping from cumulative projects also would be limited by the Accounting Surface. However, because the cumulative scenario under normal conditions indicates a potential groundwater deficit, the County conservatively concludes that cumulative impacts would be potentially significant.

Although cumulative impacts would be potentially significant, the Project's incremental contribution is not considered cumulatively considerable. As noted above, the cumulative deficit is driven by the proposed EMPS Project, which accounts for the majority of groundwater use under the cumulative scenario. One year of construction water demand for the EMPS Project is more than the 52-year water demand for the Project. Further, during its operational phase, the EMPS Project is projected to use more than six times the groundwater of all other cumulative projects located in the CVGB and more than 33 times the groundwater of the Project during the 52-year period. Without the EMPS Project, the cumulative groundwater deficit would be 2,180 at the end of the 52-year period. Under normal conditions using DWR (2020a) estimated annual pumping, there would be a cumulative groundwater surplus of 70,620 AF without the EMPS Project. Similarly, if the EMPS Project groundwater use was not included in the driest 52-year period cumulative project scenario, the cumulative groundwater surplus would be 3,680 AF at the end of the 52-year period. Using the DWR (2020a) estimated annual pumping, the cumulative groundwater surplus would be 76,480 AF at the end of the 52-year period. The Project's contribution to cumulative project

pumping during the 52-year period is minor, accounting for 3 percent of the total cumulative demand. The Project also would implement various construction techniques designed to reduce overall water use during construction, including using “overland travel,” designating primary travel routes, limiting grading, utilizing small rubber-wheel vehicles, and phasing construction, as described in Chapter 2. Project-level impacts are less than significant, and the Project would comply with various mitigation measures that would minimize potential pumping impacts to nearby wells and the larger CVGB. Accordingly, the Project’s incremental contribution to cumulative impacts is not cumulatively considerable.

Further, based on the limited magnitude of the simulated drawdown due to Project and cumulative project pumping, groundwater levels would not be lowered to a level that would cause a degradation of groundwater quality that affect other beneficial uses. Additionally, groundwater levels would not be lowered to a level that causes pumping wells near the Project to begin to capture deeper/older groundwater within the CVGB. Deeper/older groundwater typically contains increased salts and nutrients as a result of prolonged exposure to the aquifer material (leaching of minerals from the host rock into groundwater) (USGS, 2019). In addition, there are no known point source plumes near the Project. Therefore, there are no known contaminant plumes Project pumping or cumulative pumping could potentially mobilize.

~~The Project’s contribution to cumulative impacts on groundwater would be actively monitored through the development and implementation of a GMRMP for the Project in coordination with the RWQCB and BLM to ensure that groundwater wells surrounding Project supply well(s) are not adversely affected (i.e., chronic lowering of groundwater levels and/or degradation of groundwater quality) by Project activities (MM HWQ-4). The Project’s contribution to cumulative impacts would also be monitored through the development of a Colorado River Water Supply Plan (CRWSP) to monitor groundwater extractions from the Project operated on- or off-site well(s) and prevent, replace, or mitigate Project impacts that deplete the PVMGB groundwater budget to prevent impacts (MM HWQ-3). The CRWSP would be submitted to the U.S. Bureau of Reclamation and BLM prior to commencement of any Project construction activities. The CRWSP would be based on the results of the Project GMRMP. The GMRMP for the Project would be developed in coordination with the RWQCB and BLM to ensure that groundwater wells surrounding Project supply well(s) are not adversely affected (i.e., chronic lowering of groundwater levels) by Project activities. With the implementation of these mitigation measures, the Project would not make a considerable contribution to potential cumulative reductions in groundwater supplies.~~

The proposed expansion of Joshua Tree National Park and creation of Chuckwalla National Monument, if adopted, would re-designate existing federal lands in the Project vicinity but would not create physical changes in the environment that would contribute to cumulative impacts. By excluding development within these areas, the potential need for a water supply for such development would be avoided.

Mitigation Measures for Cumulative Impacts

Mitigation Measures MM BIO-3, MM BIO-5, MM BIO-13, and MMs HWQ-1 through MM HWQ-6 would be implemented to address potential hydrology and water quality impacts for the proposed Project. No additional mitigation is required.

Significance After Mitigation

The Project’s incremental contribution to hydrology and water quality impacts would not be cumulatively considerable and is therefore considered less than significant with mitigation.

3.11.8. Mitigation Measures

- MM BIO-3** **Minimization of Vegetation and Habitat Impacts.** See full text in Section 3.5 (Biological Resources).
- MM BIO-5** **Vegetation Resources Management Plan.** See full text in Section 3.5 (Biological Resources).
- MM BIO-12** **Streambed and Watershed Protection.** See full text in Section 3.5 (Biological Resources).
- MM HWQ-1** **Drainage Erosion and Sedimentation Control Plan (DESCP).** At least 60 days prior to site mobilization, the Applicant shall submit to the Regional Water Quality Control Board, the BLM, and Riverside County for review and approval a DESCPC for managing stormwater during Project construction and operations and to prevent sediment or any other pollutants from moving offsite and into receiving waters. The DESCPC can be included in the Stormwater Pollution Prevention Plan (SWPPP) and must ensure proper protection of water quality and soil resources, address disturbed soil stabilization treatments in the Project area for both road and non-road surfaces, and identify all methods used for temporary and final stabilization of inactive areas. The plan must also cover all linear Project features such as the proposed gen-tie line and any other Project component subject to disturbance. The DESCPC shall contain, at a minimum, the elements presented below that outline site management activities and erosion and sediment-control Best Management Practices (BMPs) to be implemented during site mobilization, excavation, construction, and post-construction (operating) activities.
- *Vicinity Map.* A map(s), at a minimum scale 1 inch to 500 feet, shall be provided indicating the location of all Project elements with depictions of all significant geographic features including swales, storm drains, drainage concentration points and sensitive areas.
 - *Site Delineation.* All areas subject to soil disturbance (including mowing, grubbing, grading, excavation or any other soil disturbing activity) for the Project shall be delineated showing boundary lines of all construction areas and the location of all existing and proposed structures and drainage facilities.
 - *Clearing and Grading Plans.* The DESCPC shall provide a delineation of all areas to be cleared of vegetation and areas to be preserved. The plan shall provide elevations, slopes, locations, and extent of all proposed grading as shown by contours, cross sections, or other means. The locations of any disposal areas, fills, or other special features shall also be shown. Existing and proposed topography shall be illustrated by tying in proposed contours with existing topography.
 - *Clearing and Grading Narrative.* The DESCPC shall include a table with the estimated quantities of material excavated or filled for the site and all Project elements, whether such excavation or fill is temporary or permanent, and the amount of such material to be imported or exported. All areas subject to soil disturbance shall be included in the table.
 - *Erosion Control.* The plan shall address treatments to be used on exposed soil during construction and operation including specifically identifying all chemical-based dust palliatives, soil bonding, and weighting agents appropriate for use that would not cause adverse effects to vegetation. BMPs shall include measures designed to provide temporary stabilization of inactive disturbed areas and will be applied as soon as possible consistent with SCAQMD (Rule 403) and SWRCB Construction General Permit requirements. The timing of suppressant or binder application will occur as soon as possible

and consistent with dust and stormwater permit requirements. Any soil stabilizers proposed shall be approved for use by the Project's Restoration Specialist to ensure that the products shall not impede restoration goals.

- **Best Management Practices Plan.** The DESC shall identify on the topographic site map(s) the location of the site specific BMPs to be employed during each phase of construction (initial grading, Project element excavation and construction, and final grading/stabilization). BMPs shall include measures designed to control dust, stabilize construction access roads and entrances, and control stormwater runoff and sediment transport consistent with SCAQMD (Rule 403) and SWRCB Construction General Permit requirements.
- **Best Management Practices Narrative.** The DESC shall show the location, timing, and maintenance schedule of all erosion- and sediment-control BMPs to be used prior to initial grading, during excavations and construction, final grading/stabilization, and operation. Separate BMP implementation schedules shall be provided for each Project element for each phase of construction. The maintenance schedule shall include post-construction maintenance of structural-control BMPs, or a statement provided about when such information would be available.
- The DESC shall be prepared, stamped, and sealed by a professional engineer or Qualified SWPPP Developer. The DESC shall include copies of recommendations, conditions, and provisions from the Regional Board and/or BLM.
- The DESC may be part of the SWPPP and shall be kept onsite, kept updated, and readily available on request. The DESC and SWPPP must demonstrate compliance with other water quality permits (WDR and LSAA), which may have restrictions on types of erosion or sedimentation control materials used. SWPPP inspection reporting will be consistent with the requirements of the SWRCB Construction General Permit.

MM HWQ-2 Septic System Review and Permitting. Before the start of construction, the Applicant shall submit to Riverside County Department of Environmental Health an evaluation of the Project septic system to ensure that the proposed use of the system is consistent with federal, state, and local requirements for septic system design, including requirements for percolation, vertical distance from the groundwater table, and setback from the nearest groundwater well.

MM HWQ-3 Palo Verde Mesa Groundwater Basin (PVMGB) Protection. If water for the Project, to be obtained from on- or off-site well(s) within the Chuckwalla Valley Groundwater Basin (CVGB), is extracted from on- or off-site well(s) that is/are owned and/or operated by the Applicant, the Applicant shall develop a Colorado River Water Supply Plan (CRWSP) to monitor groundwater extractions from the Applicant owned and/or operated on- or off-site well(s) ~~and prevent, replace, or mitigate Project impacts that deplete the PVMGB groundwater budget to prevent impacts to the adjacent PVMGB related to groundwater extraction below the Colorado River Accounting Surface.~~

The CRWSP shall be submitted to the U.S. Bureau of Reclamation and BLM for review and approval at least 60 days prior to the initiation of construction ~~and is required to be implemented at any time during the life of the Project that groundwater withdrawals reach the Accounting Surface, based on the results of the Groundwater Monitoring, Reporting, and Mitigation Plan (required under MM HWQ 4).~~ No pumping of groundwater below the accounting surface shall occur ~~without compensatory mitigation according to the~~

~~approved CRWSP. A copy of the CRWSP shall also be submitted to the Metropolitan Water District of Southern California for review and comment.~~

~~The amount of PVMGB depletion requiring mitigation shall be equal to the amount of withdrawals from below the Colorado River Accounting Surface. Toward ensuring that no allocated water from the Colorado River is consumed without entitlement to that water, the CRWSP shall identify measures that will be taken to reduce and replace water on an acre-foot by acre-foot basis should the Project consume any water from within or below the Colorado River Accounting Surface.~~

- ~~(a) The CRWSP shall describe groundwater monitoring activities and quarterly data reports to be closely reviewed for depth to groundwater information, and proximity of the depth of Project-related groundwater pumping to the Colorado River Accounting Surface. To ensure that The CRWSP shall further describe that if Project-related groundwater pumping does not draws water from below the accounting surface, the following shall occur:~~
- ~~(b) Based on groundwater monitoring data, the quantity of groundwater pumped from below the Accounting Surface shall be recorded; and~~
- ~~(c) The Applicant shall implement water conservation/offset activities, including cessation of pumping, to reduce the amount of water withdrawn from on- or off-site well(s) that is/are owned and/or operated by the Applicant. within or below the Colorado River Accounting Surface and to replace Colorado River water on an acre-foot by acre-foot basis. To effectively implement this requirement, the CRWSP shall include the following information:~~
 - ~~(d) Identification of water conservation/offset activities that reduce/replace the quantity of water diverted from the Colorado River;~~
 - ~~(e) Identification of any required permits or approvals and compliance of conservation/offset activities with CEQA and NEPA;~~
 - ~~(f) An estimated schedule of completion for each identified activity;~~
 - ~~(g) Performance measures to evaluate the amount of water reduction and replacement by each identified activity; and~~
 - ~~(h) Monitoring and reporting protocol to ensure that water conservation/offset activities are effectively implemented and achieve the intended purpose of reducing and replacing Colorado River water diversions.~~
 - ~~(i) The Colorado River Accounting Surface is at an elevation between approximately 238 and 240 feet above mean sea level (amsl) in the Chuckwalla Valley (Argonne, 2013). Groundwater elevation in the Project area is approximately 489 feet amsl as of the first quarter of 2024. The numerical groundwater model developed for the Project Water Supply Assessment (GSI, 2024; discussed below) included estimates of the total cone of depression considering cumulative drawdown from all potential pumping in the CVGB, including the Project, for the life of the Project through the decommissioning phase. The estimated drawdown at the Project well after the planned 2-year construction period was less than 2 feet. The temporary drawdown at the well during pumping, however, would be greater.~~

- (ii) Assuming a conservatively-large temporary drawdown of 100 feet at the Project well (up to 80 feet of temporary drawdown has been recorded from a well-used for construction of a nearby solar project) during peak water demand during Project construction, the water levels in the Project well would be at least 150 feet above the Colorado River Accounting Surface. The water levels within the Project well would be monitored as part of the GMRMP (MM HWQ-4) per the DRECP LUPA Conservation and Management Action (CMA) Soil and Water (SW) 24. MM HWQ-3 ensures that the Project will not extract water from below the Accounting Surface, as it requires that pumping from Project wells be decreased or stopped well before water levels reached the Colorado River Accounting Surface.

MM HWQ-4 Groundwater Monitoring, Reporting, and Mitigation Plan (GMRMP). Before the Project uses groundwater pumped from any Applicant owned and/or operated well (on site or off site) that extracts water from the CVGB, the Applicant shall retain a BLM-approved qualified hydrogeologist to develop a GMRMP, in coordination with ~~the RWQCB-Riverside County~~ and BLM, to ensure that groundwater wells surrounding Project supply well(s) are not adversely affected by Project activities, i.e., chronic lowering of groundwater levels and degradation of groundwater quality. The Applicant shall submit the GMRMP to ~~the RWQCB-Riverside County~~ and BLM for review and approval. Additionally, although no Groundwater Sustainability Agencies (GSAs) have been established for the CVGB, in the event that such agencies have been established when the GMRMP is developed, the Applicant also shall submit the GMRMP to those GSAs. The Applicant shall implement the approved GMRMP throughout any Project phase that pumps groundwater for consumptive use.

The GMRMP shall provide a detailed methodology for monitoring site groundwater levels and comparisons for levels within the CVGB including identification of the closest private wells to the Project's well(s). Groundwater level data from wells at adjacent and nearby solar facilities and other Projects on BLM-administered public lands shall be provided by the BLM for review and comparison, to the extent available to the Applicant. Monitoring shall be performed during pre-construction, construction, and operation of the Project, to establish pre-construction and Project-related groundwater level and water quality trends that can be quantitatively compared against observed and simulated trends near the Project's pumping well(s) and near potentially impacted existing wells. The GMRMP shall include a schedule for submittal of quarterly data reports by the Applicant to the GMRMP designated agencies and the GSA(s) (if established), for the duration of the construction period. These quarterly data reports shall be prepared and submitted for review and shall include water level monitoring data and effect on the nearest off-site private wells. The designated agencies shall determine whether groundwater wells surrounding the Project supply well(s) are adversely affected (i.e., chronic lowering of groundwater levels and degradation of groundwater quality) by Project activities ~~in a way that requires additional mitigation and, if so, shall determine what measures are needed. Examples of additional mitigation, if approved by the designated agencies, could include and, if so, shall require one or more of the following:~~

- Cessation or reduction of pumping at the Project well(s) until groundwater levels return to levels that allow nearby wells to resume pre-Project pumping levels;
- Compensation for whatever additional equipment is necessary to lower nearby pumps to levels that can adequately continue pumping;

- Compensation to repair or replace wells found to be damaged or inoperable due to lowered groundwater levels; or
- Compensation for increased energy cost due to Project-related well drawdown.

After the completion of construction, the Applicant and the BLM shall jointly evaluate the effectiveness of the GMRMP and determine if monitoring and reporting frequencies or procedures should be revised or eliminated.

MM HWQ-5 Project Drainage Plan. The Applicant shall provide the RWQCB, Riverside County and BLM with a drainage plan for review and approval prior to construction, which includes the following information:

- Hydrologic assessment of flood discharges affecting each parcel.
- A detailed on-site hydraulic analysis utilizing FLO 2D or similar two-dimensional hydraulic model which models pre- and post-development flood conditions for the 10- and 100-year storm events. The post-development model must include all proposed Project features, contours, and drainage improvements. Graphical output must include depth and velocity mapping as well as mapping which graphically shows the changes in both parameters between the pre- and post-development conditions.
- The Drainage Plan shall show the location of all watercourses, drainage concentration points and drainage ditches as they enter, cross, and exit the site. It shall include pre-development and post-development peak flow estimates. It shall include hydraulic calculations to determine flood conditions, floodplain limits, flood depths and velocities. It shall show the relationship of drainage and flood features to the features of the Project, including buildings, fences, substations, access roads, culverts, linear features, and panel supports, demonstrating adequate design to protect from flooding, erosion and scour, and to do so without adversely affecting adjacent property, inducing erosion, or concentrating or diverting flows.
- The Plan shall show how drainage will be conveyed through the site without adversely affecting other property, either through increased flood hazard or increased potential for scour and erosion. Proposed fencing shall allow runoff to traverse the Project site unencumbered, as feasible. The Plan shall include an assessment of existing diversion berms and channels around parcel perimeters and the magnitude and frequency of flood that would be diverted by these existing features, and the probable integrity of these features to withstand flows. It shall show how those that are on the Project site will be affected by grading. It shall include an assessment of flows approaching proposed perimeter fences, whether or not adjacent to existing berms, and make design recommendations to avoid flow diversions by these fences while taking into account relevant biological mitigation measures. Design recommendations may include creating fence openings large enough to allow the passage of debris-laden flows without the potential for diversions to other property.
- The Plan shall have detailed design of flood retention features necessary to avoid any increase in downstream flood peak flow rates.
- Drainage of Project Site Narrative – The Plan shall include a narrative of the measures necessary to protect the site and Project features from flooding, erosion and sedimentation, and measures taken to prevent Project-induced erosion and flooding of adjacent property.

MM HWQ-6 Flood Protection. The O&M Building, BESS switchyard, and all other Project buildings shall either be situated outside of the 100-year floodplain or sufficiently protected against dislodgement by flooding where placement outside the floodplain is not practical. Flood protection shall consist of elevating the structures on fill to at least the highest anticipated adjacent flood level as measured from a horizontal stow position. Solar panels shall be situated at least one foot above the highest anticipated local flood level. All structures using posts or poles for foundations, including transmission poles or towers, shall be designed to protect against substantial scour from the 100-year flood event. The Project must comply with Riverside County Ordinance No. 458 for projects within a Special Flood Hazard Area or floodplain: electrical, heating, ventilation, plumbing, and air conditioning equipment and other service facilities must be designed or located to prevent water from entering or accumulating within the components during flooding.

3.12. Land Use and Planning

This section describes existing land uses and land use plans and policies in the Project area on private and public land. Land use can be assessed by analyzing current land activities, land ownership, zoning, and consistency with existing land use plans, ordinances, regulations, and policies.

3.12.1. Environmental Setting

The Easley Project site is in eastern Riverside County, north of Interstate 10 (I-10) and approximately 2 miles north of the town of Desert Center, California. The site includes both private and public land under the jurisdiction of Riverside County and the BLM, respectively. Of the site's approximately 3,735 acres, approximately 2,050 acres would be developed by the solar and BESS facility, with the balance left as open space. Solar arrays would be fenced, with open areas between them. The Project site is immediately north and east of the community of Lake Tamarisk Desert Resort (LTDR) in Desert Center and is south of Joshua Tree National Park. LTDR is a 55-plus 150-space mobile home and RV resort that includes a clubhouse, nine-hole golf course, pool, and lake as well as year-round homes. RV sites are available for rent. Other development in the area consists of active and fallow agricultural fields, residences, solar developments, and electrical transmission lines. Surrounding areas also include undeveloped desert land that is largely under federal jurisdiction and administered by the BLM.

Two operating solar projects, Desert Sunlight and Desert Harvest, are north of the proposed Easley Project site and the Athos Renewable Energy Project is to the east. Nearby solar projects recently constructed or under-finishing construction include the Oberon Renewable Energy Project to the immediate south and the Arica and Victory Pass solar projects to the southeast of the Easley site. The Sapphire Solar Project, proposed by EDF Renewables, is adjacent to the northern area of the Easley Project site. Figure 2-4 (Desert Center Solar Projects & DRECP Context) shows the proposed Easley Project in relation to existing, approved, and proposed solar facilities in the region.

The Project is located within the County's Desert Center Area Plan (DCAP), a subset of the Riverside County General Plan. County land surrounding the Area Plan is designated as Open Space Rural. According to the Area Plan, much of the land west and south of Kaiser Road is designated desert tortoise reserve. The proposed Project is east of Kaiser Road, and east of the reserve. Little new development is envisioned within the Area Plan, except for infill and/or revitalization of the Eagle Mountain Townsite and contiguous expansion of the Desert Center and Lake Tamarisk communities, which are located outside of the Project site. Where the proposed Project would be located on parcels under County jurisdiction, the DCAP land use designations are primarily Open Space Rural, with some designated as Agriculture. There are 8 parcels under WA contract that are designated as Agriculture in the DCAP (see discussion in Section 3.3, Agriculture and Forestry). These parcels were used for agriculture in the 1980s; however, they have been out of agricultural use since then and are not currently used for agriculture.

Under the Riverside County Zoning Ordinance, the lands within the Project site boundary subject to County jurisdiction are shown in Figure 3.12-1 County Zoning on Project Lands. The parcels subject to County jurisdiction in the project boundary are zoned as A-1-20 (Light Agriculture [20-acre minimum]), N-A (Natural Assets) or W-2 (Controlled Development Areas). Solar power plants on lots of 10 acres or larger are allowed in these zones under a Conditional Use Permit (Riverside County, 2023).

BLM-administered land comprises much of the Project site. These parcels are part of the lands designated as under the Desert Renewable Energy Conservation Plan (DRECP) as a Development Focus Area, which are areas with substantial energy generation potential, access to existing or planned transmission, and low resource conflicts.

Outside of the Project site boundary, a 500 kV gen-tie line from the proposed Easley Project substation would traverse the adjacent Oberon Project site in a transmission corridor on BLM-administered land, terminating at the existing Oberon substation, which is under construction Switchyard.

3.12.2. Regulatory Framework

3.12.2.1. Federal Laws, Regulations, and Policies

Federal Land Policy and Management Act, 1976 As Amended. The U.S. Congress passed the FLPMA in 1976. Title V, “Rights-of-Way (ROW),” of the FLPMA establishes public land policy and guidelines for administration, provides for management, protection, development, and enhancement of public lands, and provides the BLM authorization to grant ROWs. Authorization of systems for generation, transmission, and distribution of electric energy is addressed in Section 501(4) of Title v. In addition, Section 503 specifically addresses “Right of Way Corridors” and requires common ROWs “to the extent practical.” FLPMA, Title V, Section 501(a)(6) states, “[t]he Secretary, with respect to the public lands (including public lands, as defined in section 103(e) of this Act, which are reserved from entry pursuant to section 24 of the Federal Power Act (16 USC 818)) [P.L. 102-486, 1992] and, the Secretary of Agriculture, with respect to lands within the National Forest System (except in each case land designated as wilderness), are authorized to grant, issue, or renew rights-of-way over, upon, under, or through such lands for roads, trails, highways, railroads, canals, tunnels, tramways, airways, livestock driveways, or other means of transportation except where such facilities are constructed and maintained in connection with commercial recreation facilities on lands in the National Forest System.” The primary directive guiding all of BLM’s decisions under FLPMA is to put public lands to their highest and best use.

The Applicant is requesting a grant of ROW approval from the BLM (Palm Springs-South Coast Field Office) for the solar and energy storage facility, gen-tie line, and associated components that are located on land under the jurisdiction of the BLM.

California Desert Conservation Area Plan (CDCA), 1980 As Amended. Section 601 of the FLPMA required preparation of a long-range plan for the CDCA. The CDCA Plan was adopted in 1980 to provide for the use of public lands and resources of the CDCA in a manner that enhances, wherever possible, and does not diminish, on balance, the environmental, cultural, and aesthetic values of the Desert and its productivity. The CDCA Plan is a comprehensive, long-range plan covering 25 million acres. Approximately 12 million acres (about half) of this total are public lands administered by the BLM on behalf of the CDCA.

The CDCA Plan contains goals and specific actions for the management, use, development, and protection of the resources and public lands within the CDCA, and is based on the concepts of multiple use, sustained yield, and maintenance of environmental quality.

The Project’s gen-tie line would be partially located within BLM Designated Utility Corridor K, as identified in the CDCA Plan. The CDCA Plan designated utility Corridor K for “multi-modal use,” allowing for new electrical gen-tie towers and cables of 161 kV or above. Utility Corridor K is also designated as Section 368 Federal Energy Corridor 30-52 in the Record of Decision for the West-Wide Energy Corridor (WWEC) PEIS. Energy Corridor 30-52 is identified for “multi-modal use,” which allows for electricity transmission and distribution facilities. Section 368 corridors are identified with a numeric designation and are often overlain on locally designated corridors, as is the case with the east-west Section 368 two-mile-wide Corridor 30-52 overlying BLM Designated Utility Corridor K.

Desert Renewable Energy and Conservation Plan Land Use Plan Amendment to the CDCA. The Desert Renewable Energy Conservation Plan (DRECP) is a collaboration between the Bureau of Land Management, California Energy Commission, California Department of Fish and Game, and the U.S. Fish and Wildlife Service. The Record of Decision for the DRECP Land Use Plan Amendment (LUPA), Phase I of the larger collaboration, was signed in 2016 and is intended to facilitate the development of utility-scale

renewable energy and transmission projects on BLM-administered land in the Mojave and Colorado deserts in California to reach federal and state energy targets while conserving sensitive species and habitats as well as cultural, scenic, and social resources. The DRECP LUPA applies to nearly 10.8 million acres of BLM-managed federal lands in seven California counties. The portion of the Project that would be located on BLM land is designated as a Development Focus Area targeted for renewable energy development.

3.12.2.2. State Laws, Regulations, and Policies

There are no specific state laws, regulations, or policies that are applicable to land use and planning at the Project site. Planning is the responsibility of the agencies having jurisdiction over the land, i.e., Riverside County and the BLM, respectively.

3.12.2.3. Local Laws, Regulations, and Policies

Riverside County General Plan. The Riverside County General Plan (RCGP) was adopted on October 7, 2003. Through a series of resolutions, the Board of Supervisors adopted an update on December 8, 2015. The RCGP consists of a vision statement and the following elements: Land Use, Circulation, Multi-purpose Open Space, Safety, Noise, Housing, Air Quality, and Administration. The RCGP sets forth County land use policies and guidance for implementation. The RCGP is augmented by more detailed Area Plans covering specific selected areas within the County. Area Plans provide a clear and more focused opportunity to enhance community identity within the County and stimulate quality of life at the community level. The proposed Project is within the County's Desert Center Area Plan.

RCGP land use designation for the Project area is Open Space Rural. The Land Use Element of the RCGP states that the:

"Open Space-Rural (OS-RUR) land use designation is applied to remote, privately owned open space areas with limited access and a lack of public services. Single-family residential uses are permitted at a density of one dwelling unit per 20 acres. The extraction of mineral resources subject to an approved surface mining permit may be permissible, provided that the proposed Project can be undertaken in a manner that is consistent with maintenance of scenic resources and views from residential neighborhoods and major roadways and that the Project does not detract from efforts to protect endangered species." (Riverside County, 2021a)

Policies at the General Plan and Area Plan levels implement the vision and goals of Riverside County. The County of Riverside Vision details the physical, environmental, and economic qualities that the County aspires to achieve. Using that Vision as the primary foundation, the RCGP establishes policies for development and conservation within the entire unincorporated County territory. The General Plan's policy goals that are potentially relevant to land use for the Project are provided below.

Land Use Element:

- **Policy LU 2.1.c.** The County shall provide a broad range of land uses, including a range of residential, commercial, business, industry, open space, recreation and public facility uses.
- **Policy LU 2.1.g.** Prevent inappropriate development in areas that are environmentally sensitive or subject to severe natural hazards.
- **Policy LU 5.1.** Ensure that development does not exceed the ability to adequately provide supporting infrastructure and services, such as libraries, recreational facilities, educational and day care centers, transportation systems, and fire/police/medical services.

- **Policy LU 7.1.** Require land uses to develop in accordance with the Riverside County General Plan (RCGP) and area plans to ensure compatibility and minimize impacts.
- **Policy LU 8.1.** The County shall accommodate the development of a balance of land uses that maintain and enhance the County's fiscal viability, economic diversity and environmental integrity (General Plan LU-26).
- **Policy LU 9.1.** Provide for permanent preservation of open space lands that contain important natural resources, cultural resources, hazards, water features, watercourses including arroyos and canyons, and scenic and recreational values.
- **Policy LU 9.2.** Require that development protect environmental resources by compliance with the Multipurpose Open Space Element of the RCGP and federal and state regulations such as CEQA, NEPA, the Clean Air Act, and the Clean Water Act.
- **Policy LU 10.1.** Require that new development contribute their fair share to fund infrastructure and public facilities such as police and fire facilities.
- **Policy LU 14.1.** The County shall preserve and protect outstanding scenic vistas and visual features for the enjoyment of the traveling public.
- **Policy LU 14.5.** Require new or relocated electric or communication distribution lines, which would be visible from Designated and Eligible State and County Scenic Highways, to be placed underground.
- **Policy LU 17.2** Permit and encourage, in an environmentally and fiscally responsible manner, the development of renewable energy resources and related infrastructure, including but not limited to, the development of solar power plants in the County of Riverside.
- **Policy LU 26.3** Ensure that development does not adversely impact the open space and rural character of the surrounding area. (AI 3)
- **Policy LU 26.4** Encourage parcel consolidation. (AI 29)
- **Policy LU 26.5** Provide programs and incentives that allow Open Space-Rural areas to maintain and enhance their existing and desired character. (AI 9)

Multi-Purpose Open Space Element

- **Policy OS 11.1** Enforce the state Solar Shade Control Act, which promotes all feasible means of energy conservation and all feasible uses of alternative energy supply sources.
- **Policy OS 11.2** Support and encourage voluntary efforts to provide active and passive solar access opportunities in new developments.
- **Policy OS 11.3** Permit and encourage the use of passive solar devices and other state-of-the-art energy resources.
- **Policy OS 11.4** Encourage site-planning and building design that maximizes solar energy use/potential in future development applications.

Desert Center Area Plan. The Project is located within the Desert Center Area Plan (DCAP). The DCAP envisioned little new development for the planning horizon (through 2020), except for infill and/or revitalization of the Eagle Mountain Townsite and contiguous expansion of the Desert Center and Lake Tamarisk communities. The DCAP was written in 2010 before widespread development of utility-scale renewable projects and as a result is largely silent on such development.

Riverside County Land Use Ordinance. ~~Ordinance No. 348.4705 amends Ordinance No. 348 to~~ Section 17.120.010 of the ordinance authorizes solar power plants on lots 10 acres or larger, subject to a conditional use permit in particular zone classifications. Among others, these zones include Light Agriculture

(A-1), Controlled Development (W-2) and Natural Assets (N-A), which apply to County lands with the Project site.

The Development Standards of Zone N-A state that no building shall exceed 20 feet in height (Section 15.201). The Development Standards of Zones W2 and A-1 state that no structure shall exceed 105 feet in height unless a variance is approved pursuant to Section 18.27 of the Land Use Ordinance. However, under Chapter 17.208.010 of the County Code of Ordinances, a public use permit allows for facilities used for the storage or transmission of electrical energy and public utilities. As noted in the code chapter, facilities for the storage or transmission of electrical energy are not subject to the development standards of the zone classification in which they are located.

The Project would require the following discretionary actions by the County to implement the Project:

- **Conditional Use Permit (CUP 220021)** is required for the construction, operation, and decommissioning of the proposed solar facility, electrical storage equipment, and any portion of the gen-tie line within the County of Riverside's jurisdiction.
- **Public Use Permit (PUP 230002)** is required for the portions of the 34.5 kV medium voltage collector lines and 500 kV gen-tie line that would cross roadways and be located within County jurisdiction.
- ~~**Variance (VAR 230003)** may be necessary for any structures located within a Natural Assets (N-A) zone that would be higher than 20 feet, and in a Light Agriculture (A-1) or Controlled Development Area (W-2) zones that would exceed 105 feet.~~
- **Contiguous Parcel Mergers.** The Applicant is proposing to vacate the facility's interior roadways and merge contiguous Project parcels within the Project area into a contiguous area. Roads along the Project perimeter on the solar facility lands would remain dedicated public access.

Board of Supervisors Policy B-29/Development Agreement. Policy B-29 affects Land Use Element Policies LU 2.1.c, LU 5.1, LU 7.1, LU 8.1, LU 13.1, and LU 15.15. The purpose of Policy B-29 (Solar Power Plant Policy) is to ensure that the County does not disproportionately bear the burden of solar energy production and ensure the County is compensated in an amount it deems appropriate for the use of its real property. It requires a Development Agreement between the Board of Supervisors and solar power plant owners. The policy states that the solar power plant owner shall annually pay the County \$150 for each acre of land involved in the power production process, with the fee increasing 2 percent annually. It also lists requirements for solar power plant owners relating to sales and use taxes payable in connection with the construction of a solar power plant. The term of a development agreement under this policy shall be for a term coextensive with the operation of the solar power plant.

The proposed Project would be consistent with County policies, including the Desert Center Area Plan. The DCAP envisions limited development, with most of the area designated as Open Space-Rural. (173,530 acres out of 185,720 acres). However, most of the land thus designated is under the jurisdiction of the BLM and not subject to County plans and ordinances.

On lands under County jurisdiction, the Area Plan identifies a land use classification of Rural Desert – 10-acre minimum but does not assign acreage within the Plan Area to this classification. This designation allows renewable energy uses including solar, geothermal and wind energy uses, as well as associated uses required to develop and operate these renewable energy sources, and compatible resource development and governmental and utility uses.

Those areas within the proposed Project site that are under County jurisdiction are designated as Rural Residential (RR)– 5-acre minimum. Among the uses allowed in these RR areas are “compatible resource development” and “associated uses and governmental uses.”

Given the extensive existing solar development in the Project vicinity and the planned development of solar fields and associated equipment and facilities on BLM lands comprising most of the Project site, the use of the parcels under County jurisdiction for development solar facilities is considered a compatible resource development because such development would be similar in nature and intensity to the development proposed on adjoining BLM lands and already existing on nearby BLM lands.

3.12.3. Methodology for Analysis

Evaluation of potential land use conflicts of the proposed Project was based on a review of relevant planning documents, including, but not limited to, the RCGP, Riverside County Zoning Ordinance, the CDCA Plan, and a review of the proposed solar facility site and surrounding area. The focus of the land use analysis is on land use conflicts that would result from implementation of the Project. Land use conflicts are identified and evaluated based on existing or authorized land uses, land uses proposed as part of the Project, land use designations, and standards and policies related to land use. Land use compatibility is based on the intensity and patterns of land use to determine whether the Project would result in incompatible uses or nuisance issues. Potential land use conflicts or incompatibility (specifically during construction activities) are usually the result of other environmental effects, such as generation of noise or air quality issues resulting from grading activities. These types of conflicts are addressed in other sections of this document addressing various environmental resources. Land use conflicts that would result from the Project's construction, operation, maintenance, and decommissioning are evaluated in this section.

3.12.4. CEQA Significance Criteria

The criteria used to determine the significance of potential land use and planning impacts are based on Appendix G of the State CEQA Guidelines and the County of Riverside's Environmental Assessment Form.

The County of Riverside's Environmental Assessment Form includes significance criteria that are the same as CEQA Appendix G requirements.

Using these criteria, the Project would result in a significant impact to land use and planning if it would:

- *Cause a significant environmental impact due to a conflict with any land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect.*

The following CEQA significance criterion from the County's Environmental Assessment Form was not included in the analysis:

- *Physically divide an established community.*

The criterion was not included in the analysis because no part of the Project would divide an established community. The Project would be on undeveloped parcels and, while near the community of Lake Tamarisk Desert Resort, it would not physically divide a community.

3.12.5. Proposed Project Impact Analysis

The scoping effort conducted by the Riverside County Planning Department revealed several public concerns related to land use and planning that are outside of the scope of the CEQA analysis and have been addressed below. Concerns related to property values and a request for a solar moratorium are discussed in Section 4.5 (Other Public Concerns).

Land Use and Planning Scoping Concern #1, ACEC Protection. Commenters noted that the BLM's Area of Critical Environmental Concern (ACEC) west of Kaiser Road needs to remain protected.

The proposed Project is east of Kaiser Road and would not impinge on the ACEC, located on BLM-administered land to the west of the road. The ACEC is setback from the west side of Kaiser Road and will remain protected desert tortoise habitat.

Land Use and Planning Scoping Concern #2, Future Golf Course. It was noted that original plans for Lake Tamarisk included a second 9-hole golf course.

Regarding a second golf course, the original plans for the Lake Tamarisk community were not provided and no information has been found about a planned second golf course plan on the Lake Tamarisk Desert Resort website. Regardless, if there were such a plan, it is assumed that it would be located within the Lake Tamarisk property. There is no known reservation of land for a golf course on the lands that are within the Easley Project site.

Land Use and Planning Scoping Concern #3, DCAP and DRECP. One commenter cited the Desert Center Area Plan, noting that the plan focuses on preserving the unique features found in the Desert Center area. The commenter encouraged decisionmakers to move the Easley and Sapphire solar projects to the east. The commenter believes that the Project area is under Riverside County jurisdiction and the DCAP should apply, but that the DCAP is being ignored. The commenter believes that the DRECP LUPA states that project rights-of-way and permits can be denied if local planning and zoning conflicts with the proposed renewable project even if it is within a DFA.

Desert Center Area Plan. The DCAP includes statements about future visions for the Desert Center area. These are aspirational descriptions based on what was known and envisioned at the time the plan was prepared (see Section 3.12.2.3). The descriptive aspects of the DCAP are generalized and not tied to any specific location within the plan area. Being presented geographically on maps, the land use categories included in the plan are more specific. In turn, all non-federal properties within the plan area fall under the County zoning code, which identifies what are allowed uses of the parcels and under what conditions the uses are approved. As shown in the DCAP mapping, outside the limits of the existing communities most of the plan area is designated as “Open Space Rural” (173,530 acres of the 185,720 acres in the plan area). Although they are not distinguished in the DCAP’s land use designation map (DCAP Figure 3) most land within the DCAP is under BLM or National Park Service jurisdiction (as shown on DCAP Figure 6); these lands are not subject to local regulations and plans. In the Desert Center area, large-scale solar projects are allowed uses under both County zoning and BLM land use designations.

Desert Renewable Energy and Conservation Plan. Originally, the intent of the DRECP process was to include both federal and state lands in southeastern California under a single plan. However, the final DRECP LUPA and Record of Decision apply only to BLM-administered lands within the plan boundary. As required, a Governor’s Consistency Review was prepared on the LUPA that would implement the DRECP. The Governor’s Office did not identify any inconsistencies between the proposed LUPA and any state or local plans, policies, or programs. The counties continue to administer solar development processes on lands under their jurisdiction, separate from federal administration of projects on federal land.

Land Use and Planning Scoping Concern #4, Existing Easements/ROWs. The Metropolitan Water District (MWD) expressed concerns about the Project being adjacent to its ROW and noted that MWD must be allowed to maintain the ROW and have unobstructed access to its facilities. Permission to use MWD land is required. MWD provided a map showing ROW and the proposed Project. A major MWD ROW is located north of any areas planned for Project facilities, including solar arrays.

A main MWD drainage ROW crosses the Project site; however, all Project facilities, including solar arrays, are located south of the ROW and would not encroach on it. The Applicant is in negotiations with the MWD, as well as other existing ROW holders, to ensure that there are no conflicts with existing or proposed easements across the Easley Project site.

Land Use and Planning Scoping Concern #5, Alternative Sites. Several commenters suggested that solar projects planned for sites west of SR-177/Rice Road should be shifted to lands east of SR-177 and away from the Lake Tamarisk community.

BLM-administered lands included in the Easley Project site between Kaiser Road and SR-177 have been designated as DFA, suitable for solar project development. Lands under County jurisdiction that are within the Project site allow for solar development. In addition to engineering constraints, several large solar projects exist, are planned, or are under development east of SR-177, limiting the feasibility of the Easley Project to be relocated. Consideration of alternative sites farther from the community of Lake Tamarisk is discussed in Section 2.9 (Alternatives Considered and Eliminated from Further Analysis).

Impact LU-1. The Project would cause a significant environmental impact due to a conflict with applicable land use plan, policies, policy, or regulations adopted for the purpose of avoiding or mitigating an environmental effect.

Solar and BESS Facility

LESS THAN SIGNIFICANT. Construction, operations and maintenance, and decommissioning of the Project would be subject to the RCGP, Desert Center Area Plan, CDCA Plan as Amended, and County Ordinances. Table 3.12-1, Consistency with Regional and Local Land Use Plans, Policies, and Regulations, describes how the Project would be consistent with applicable local land use plans, policies, or regulations.

Table 3.12-1. Consistency with Regional and Local Land Use Plans, Policies, and Regulations

Policy/Regulations/ Goals	Description	Consistency Analysis
Land Use Element		
LU 2.1.c	Requires a broad range of land uses, including a range of residential, commercial, business, industry, open space, recreation and public facility uses.	Consistent. The Project would not limit the range of land uses.
LU 2.1.g	Prevent inappropriate development in areas that are environmentally sensitive or subject to severe natural hazards.	Consistent. Solar arrays and structures would be situated on areas of the Project site that are not environmentally sensitive. Sensitive areas would be undisturbed. The Project would comply with applicable conservation and management actions (CMAs) from the DRECP LUPA.
LU 5.1	Requires development does not exceed the ability to adequately provide supporting infrastructure and services	Consistent. The Project would not result in a permanent increase in population or associated infrastructure or services.
LU 7.1	Require land uses to develop in accordance with the RCGP and area plans to ensure compatibility and minimize impacts	Consistent. The Project would be consistent with the RCGP and Desert Center Area Plan. With a Conditional Use Permit, the Project is an allowed use under the zoning ordinance.
LU 8.1	Develop a balance of land uses that maintain and enhance the County's fiscal viability, economic diversity and environmental integrity	Consistent. The Project would help maintain and enhance the County's fiscal viability by increasing the revenue of the County with little need for services. Environmentally sensitive areas of the site would be undisturbed.
LU 9.1	Provide for permanent preservation of open space lands that contain important natural resources, cultural resources, hazards, water features, watercourses including arroyos and canyons, and scenic and recreational values.	Consistent. The Project is not within an area with important natural resources. Environmentally sensitive areas would not be disturbed.

Policy/Regulations/ Goals	Description	Consistency Analysis
LU 9.2	Require that development protect environmental resources by compliance with the Multipurpose Open Space Element of the RCGP and federal and state regulations such as CEQA, NEPA, the Clean Air Act, and the Clean Water Act	Consistent. The Project would comply with CEQA, NEPA, and other federal and local resource conservation laws and regulations.
LU 10.1	Require that new development contribute their fair share to fund infrastructure and public facilities such as police and fire facilities	Consistent. The Project is not anticipated to cause additional impacts to public facilities and would coordinate with the County for any additional public needs. Per acre annual fees would be paid to the County.
LU 14.1	Preserve and protect outstanding scenic vistas and visual features for the enjoyment of the traveling public	Consistent. The Project would be located on lands that are near existing solar projects and existing electrical facilities. See Section 3.2, Aesthetics, of this EIR for more information.
LU 14.5	Require new or relocated electric or communication distribution lines, which would be visible from Designated and Eligible State and County Scenic Highways, to be placed underground	Consistent. The Project gen-tie line would be visible from County-eligible scenic highway I-10; however, the gen-tie would parallel existing electrical lines and be located in an existing utility corridor.
LU 17.2	Permit and encourage, in an environmentally and fiscally responsible manner, the development of renewable energy resources and related infrastructure, including but not limited to, solar power plants in the County of Riverside	Consistent. The Project is a renewable energy project and will be reviewed under CEQA to reduce significant environmental impacts.
LU 26.3	Ensure that development does not adversely impact the open space and rural character of the surrounding area.	Consistent. The Project is located near existing solar projects. The nature of the use is compatible with open space, and it would not impair the rural character of the surrounding area.
LU 26.4	Encourage parcel consolidation.	Consistent. The Project includes parcel consolidation.
LU 26.5	Provide programs and incentives that allow Open Space-Rural areas to maintain and enhance their existing and desired character	Consistent. The Project would be located on near existing solar projects. Some open space areas will be impacted, open space areas not occupied by Project facilities would maintain their character.
Multi-Purpose Open Space Element		
OS 11.1	Enforce the state Solar Shade Control Act, which promotes all feasible means of energy conservation and all feasible uses of alternative energy supply sources	Consistent. The Project would be a renewable energy solar project.
OS 11.2	Support and encourage voluntary efforts to provide active and passive solar access opportunities in new developments	Consistent. The Project would be a renewable energy solar project.
OS 11.3	Permit and encourage the use of passive solar devices and other state-of-the-art energy resources	Consistent. The Project would be a renewable energy solar project.
OS 11.4	Encourage site-planning and building design that maximizes solar energy use/potential in future development applications	Consistent. The Project would be a renewable energy solar project.

Policy/Regulations/ Goals	Description	Consistency Analysis
Desert Center Area Plan		
Desert Center Area Plan (DCAP) 3.1	Protect farmland and agricultural resources in Desert Center through adherence to the Agricultural Resources section of the General Plan Multipurpose Open Space Element and the Agriculture section of the General Plan Land Use Element, as well as the provisions of the agriculture land use designation	Consistent. While the Project would be located on some parcels that could be available for agricultural use, most of the parcels have not been actively farmed. At the conclusion of the Project, the land could be returned to agricultural use.
DCAP 4.1	When outdoor lighting is used, require the use of fixtures that would minimize effects on the nighttime sky and wildlife habitat areas, except as necessary for security reasons.	Consistent. Security lights around the substation, and other locations would be motion sensitive and directional. All lighting would be shielded and directed downward to minimize the potential for glare or spillover onto adjacent properties.
DCAP 5.2	Maintain Riverside County's roadway Level of Service standards as described in the Level of Service section of the General Plan Circulation Element.	Consistent. Increase traffic during construction can affect LOS. With implementation of mitigation in Section 3.18 (Traffic and Transportation), the Project is not anticipated to impact the County roadway level of service.
DCAP 8.1	Protect the scenic highways within the Desert Center Area Plan from change that would diminish the aesthetic value of adjacent properties through adherence to the policies found in the Scenic Corridors sections of the General Plan Land Use, Multipurpose Open Space, and Circulation Elements.	Consistent. An approved solar facility is under development between the Project and I-10. The Easley Project gen-tie would parallel the I-10 in an existing utility corridor with existing electrical facilities. See Section 3.2, Aesthetics, of this EIR for more information.
DCAP 9.1	Encourage clustering of development for the preservation of contiguous open space.	Consistent. The Project would be located near existing solar projects and several proposed or approved solar projects. Environmentally sensitive areas within the Project site would remain open.
DCAP 9.2	Work to limit off-road vehicle use within the Desert Center Area Plan.	Consistent. The Project would not encourage off-road vehicle use.
DCAP 9.3	Require new development to conform with Desert Tortoise Critical Habitat designation requirements.	Consistent. The Project solar and BESS facilities would not be located in Desert Tortoise Critical Habitat. <u>Critical habitat within the Chuckwalla Desert Tortoise CHU, which is encompassed under Tortoise Conservation Areas (TCAs), is located near the Project site across Kaiser Road to the west.</u> <u>The gen-tie line would cross designated desert tortoise critical habitat in the southeastern portion of the adjacent Oberon Project site.</u> <u>Mitigation measures provide for restoration of habitats in coordination with CDFW, USFWS, and RWQCB.</u>
Riverside County Zoning Ordinance No. 348		
Section 13.1.d Uses Permitted in A-1 Zone (Light Agriculture)	This zone permits a solar power plant on lots 10 acres or larger upon issuance of a CUP.	Consistent. With approval of the CUP and a Variance , the Project would be an allowable use under this zone.

Policy/Regulations/ Goals	Description	Consistency Analysis
Section 15.1.d. (32) Uses Permitted in W-2 Zone (Controlled Development Areas)	This zone permits a solar power plant on lots 10 acres or larger upon issuance of a CUP.	Consistent. With approval of the CUP and a Variance, the Project would be an allowable use under this zone.
Section 15.200 Uses Permitted in N-A Zone (Natural Assets)	This zone permits a solar power plant on lots 10 acres or larger upon issuance of a CUP.	Consistent. With approval of the CUP and a height Variance, the Project would be an allowable use under this zone.

Riverside County General Plan

The Project would be a conditionally permitted use within consistent with the land use designation Open Space Rural (OS-RUR), Agriculture (AG), and Natural Assets (N-A) with approval of a conditional use permit (CUP) and completion of an environmental review. Table 3.12-1 above describes how the Project would be consistent with the Land Use and Multi-Purpose Open Space Elements.

The Applicant is also seeking to merge contiguous Project parcels. Roads along the Project perimeter of the solar facility lands (Rice Road and Kaiser Road) would remain dedicated public access. Access on existing unimproved roads to private and public lands not included in the Project site would remain unimpeded. This merger of parcels would be consistent with LU 26.4, encourage parcel consolidation, and because the perimeter roads and unimproved access roads would remain open to the public, it would not result in a loss of access.

The existing and known planned land uses surrounding the Project are similar in nature to those identified for the Project, primarily Open Space Rural. The parcels in the vicinity of the solar facility are zoned N-A, W-2-10, A-1-20 (Light Agriculture [20-acre minimum]), C-P-S (Scenic Highway Commercial), M-H (Manufacturing Heavy), all of which allows solar power development on a lot 10 acres or larger with a CUP.

Although the Project is consistent with the surrounding zoning and land use, nearby residences expressed concerns regarding impacts to their lifestyle from noise, traffic and access, night lighting, and dust, as well the potential for a loss of property value. Noise is addressed in Section 3.13 (Noise), traffic and access are addressed in Section 3.18 (Traffic and Transportation), night lighting is addressed in Section 3.2 (Aesthetics), and dust is addressed in Section 3.4 (Air Quality). Potential effects on property value are addressed above in the introduction to Section 3.12.5. Where appropriate, these sections include mitigation to reduce the concerns expressed by the public including dust abatement, public notification, and traffic plans.

Desert Center Area Plan and Riverside County Zoning Ordinance

The proposed Project would be is a conditionally permitted use under the A-1, W2, and N-A zones. The Project would not conflict with the Desert Center Area Plan and Riverside County Zoning Ordinance, see Table 3.121.

Board of Supervisors Policy B-29. The Project is subject to Policy B-29, and the developer would need to enter into a development agreement with the County following the guidelines noted in the regulatory setting. Once the agreement is enacted, the Project would comply with this policy.

Federal Policies, Regulations, and Goals

The solar and BESS facility would be largely located on federal land and would be subject to the federal policies, regulations, and goals. Some BLM-administered lands are designated as Development Focus Areas in the DRECP Land Use Plan Amendment (LUPA). These are areas where renewable energy generation is an allowable use, incentivized and could be streamlined under the DRECP LUPA. The Project would not conflict with this designation.

Existing or Planned Land Uses

The solar facility site would be crossed by or adjacent to a number of planned and existing land uses, including existing roads, existing distribution lines, a MWD property and rights-of-way, an existing Southern California Edison (SCE) 161 kV transmission line, and the proposed Eagle Mountain Project gen-tie line. By law, the Applicant would be required to coordinate with any legally existing rights-of-way or conflicting uses to ensure the Project does not adversely impact these uses, including bearing the cost of this coordination.

500 kV Generation-Tie Line

LESS THAN SIGNIFICANT. Most of the proposed gen-tie line between the proposed Easley Substation and the existing Oberon Substation-Switchyard would be within the adjacent Oberon Renewable Energy Project on BLM-administered land. The line would cross over SR-177 (Rice Road). Construction, operations and maintenance, and decommissioning of the gen-tie line would not conflict with the Desert Center Area Plan or Riverside County Zoning Ordinance, see Table 3.12-1. The gen-tie line would be on federal property except at the point where it crosses over SR-177 (Rice Road) enroute to the Oberon Substation-Switchyard. This crossing would require a Caltrans encroachment permit and would be required to comply with Caltrans requirements for line clearances and for motorist safety during construction. Any overhead medium voltage collector line crossings would also require a Caltrans encroachment permit.

Federal Policies, Regulations, and Goals

The gen-tie line to the Oberon Substation-Switchyard would cross BLM-administered land designated as Development Focus Area (DFA) in the DRECP LUPA to the CDCA. The DFA designation allows for the development of renewable energy facilities and associated infrastructure including gen-tie lines without requiring a land use plan amendment. The gen-tie would all be consistent with the DRECP LUPA and CDCA. Most of the gen-tie line would be within a designated utility corridor. Designated utility corridors allow for transmission infrastructure without requiring a land use plan amendment. Therefore, the gen-tie line would not conflict with federal policies, regulations, and goals.

Because the proposed Project (solar and BESS facility and gen-tie line) would not conflict with applicable land use plans, policies, and regulations, and would not result in an alteration of the present or planned land use of an area, or be inconsistent or incompatible with the site's existing, proposed or surrounding zoning or land use, there would be no impact~~impacts would be less than significant~~.

Mitigation Measures for Impact LU-1

No mitigation would be required.

Significance After Mitigation

There would be no conflict with applicable land use plans, policies, or regulations. ~~No impact would occur~~Impacts would be less than significant.

***** The impact analyses for all Project alternatives have been moved to EIR Section 5. *****

3.12.6. Cumulative Impacts

Geographic Scope

Impacts resulting from construction, operation, maintenance, and decommissioning of the Project could result in a cumulative effect on land use in combination with other past, present, or reasonably foresee-

able future actions. The geographic scope of the cumulative effects analysis for land use consists of eastern Riverside County. This is based on the jurisdictional boundaries within which the impacts of land use decisions of the Easley Project and other projects described in Tables 3.1-1 and 3.1-2 and shown on Figure 3.1-1 could be additive or synergistic.

The timeframe refers to the duration over which impacts associated with land use would occur short-term or long-term. Short-term impacts to land use would occur during the construction and decommissioning period. Long-term impacts associated with land use would result from developing a solar facility in the Project area and the associated change in land use over its operational life (35 to 50 years or more).

Cumulative Impact Analysis

Past and planned development has increased human use of land in the geographic scope of the Project site. ~~Because of the limited availability of water, human development in the geographic scope has been limited to small, scattered communities set among large tracts of undeveloped land.~~ Large tracts of federal land in the desert region are reserved for uses that preclude development. If adopted, the proposed expansion of Joshua Tree National Park and creation of Chuckwalla National Monument would redesignate existing federal lands in the Project vicinity but would not create physical changes in the environment that would contribute to cumulative impacts. If approved by Congress, the designated lands west, north, and south of the Project would not be available for development.

Past and present projects near the Project site on private lands primarily include agricultural operations with some rural residences. The resort community of Lake Tamarisk is to the immediate southwest of the Project. Past projects also include the Kaiser Mine, northwest of the Project. Public lands within the proposed Project site and in the vicinity have been designated as suitable for renewable energy development and have been, continue to be, and are planned to be primarily developed with large-scale solar projects. Many solar renewable projects and the Eagle Mountain Pumped Storage Project have been proposed on both BLM-administered land and private land (see Table 3.1-2). The projects on public land are in DFAs and the ones on private land are primarily on land designated as agriculture or open space.

With appropriate permitting, each project would not result in significant impacts on land use as they are allowed uses. ~~However, the Desert Center Area Plan did not anticipate the potential development of multiple solar projects within the plan area. If many of the projects are built, they could conflict with the goals of the Desert Center Area Plan and project development would result in the loss of current open space which the Area Plan and the General Plan strive to preserve. But this would not be considered a cumulatively significant impact on land use, as the solar projects are an allowed use and consistent with County and BLM policies which encourage their development.~~

Potential land use impacts require evaluation on a case-by-case basis. The Easley Project would be consistent with the goals and policies of the Riverside County General Plan, and other applicable local land use plans, policies, and regulations and with the federal plans. In addition, with approval of all discretionary requests, the Project would be an allowable use that would not conflict with the land use or zoning classifications for the site. Therefore, cumulative impacts would be less than significant and the Project's incremental contribution to cumulative impacts to land use would not be considerable.

The cumulative impacts of the gen-tie line would be the same as for the solar facility because the gen-tie line would be within a solar field underdevelopment and adjacent to existing or planned transmission lines and would not result in an additive or cumulative impact with the other renewable energy development in eastern Riverside County.

Mitigation Measures for Cumulative Impacts

No mitigation would be required.

Significance After Mitigation

Cumulative impacts would be less than significant. The Project's incremental contribution to impacts to land use would not be cumulatively considerable.

3.12.7. Mitigation Measures

All land use and planning impacts would be less than significant, and no mitigation would be required.

3.13. Noise and Vibration

This section evaluates the environmental impacts caused by the noise and ground-borne vibration levels resulting from implementation of the proposed Easley Project. The analysis in this section: presents the fundamentals of environmental noise; describes the applicable policies and ordinances; identifies the criteria used for determining the significance of environmental impacts; and describes the potential noise and vibration impacts of the proposed Project. An impact analysis and comparison of project alternatives is included in Section 5. Noise impacts to wildlife are separately addressed in this EIR in Section 3.5, Biological Resources.

3.13.1. Environmental Setting

3.13.1.1. Fundamentals of Community Noise

To describe environmental noise and to assess impacts on areas that are sensitive to community noise, a measurement scale that simulates human perception is used. The A-weighted scale of frequency sensitivity accounts for the sensitivity of the human ear, which is less sensitive to low frequencies, and correlates well with human perceptions of the annoying aspects of noise. The A-weighted decibel (dBA) is cited in most noise criteria. Decibels are logarithmic units that can be used to conveniently compare wide ranges of sound intensities.

Community noise levels can be highly variable from day to day as well as between day and night. For simplicity, sound levels are usually best represented by an equivalent level over a given time period (Leq) or by an average level occurring over a 24-hour day-night period (Ldn). The Leq, or equivalent sound level, is a single value (in dBA) for any desired duration, which includes all the time-varying sound energy in the measurement period, usually one hour. The L50, is the median noise level that is exceeded fifty percent of the time during any measuring interval. The Ldn, or day-night average sound level, is equal to the 24-hour A-weighted equivalent sound level with a 10-decibel penalty applied to nighttime sounds occurring between 10:00 p.m. and 7:00 a.m. Community Noise Equivalent Level (CNEL) is another metric that is the average equivalent A-weighted sound level during a 24-hour day, obtained after addition of five decibels to sound levels in the evening from 7:00 p.m. to 10:00 p.m. and after addition of 10 decibels to sound levels in the night from 10:00 p.m. to 7:00 a.m. To easily estimate the day-night level caused by any noise source emitting steadily and continuously over 24 hours, the Ldn is 6.4 dBA higher than the source's Leq. For example, if the expected continuous noise level from equipment is 50.0 dBA Leq for every hour, the day-night noise level would be 56.4 dBA Ldn.

Community noise levels are usually closely related to the intensity of human activity. Noise levels are generally considered low when below 45 dBA, moderate in the 45 to 60 dBA range, and high above 60 dBA. In small towns or wooded and lightly used residential areas, the Ldn is more likely to be around 50 or 60 dBA. Levels around 75 dBA are more common in busy urban areas, and levels up to 85 dBA occur near major freeways and airports (OPR, 2017). Although people often accept the higher levels associated with very noisy urban residential and residential-commercial zones, they nevertheless are considered to be adverse to public health.

Surrounding land uses dictate what noise levels would be considered acceptable or unacceptable. Lower levels are expected in rural or suburban areas than would be expected for commercial or industrial zones. Nighttime ambient levels in urban environments tend to be higher than the nighttime noise levels in rural areas away from roads and other human activity. Areas with full-time human occupation and residency are often considered incompatible with substantial nighttime noise because of the likelihood of disrupting sleep. Noise levels above 45 dBA at night can result in the onset of sleep interference. At 70 dBA, sleep interference effects become considerable (U.S. EPA, 1974).

3.13.1.2. Existing Noise Environment

Ambient noise measurements were not conducted for this analysis because the environmental setting can be described from information drawn from previous studies in the area. The noise environment of the Project area depends on the proximity of the receiver to noise from vehicular traffic on State Route 177 (SR-177) or Interstate 10 (I-10). Locations away from these highways experience very low levels of noise. Because few human-induced sources of noise occur around the Project area, the noise environment is generally serene and quiet apart from traffic on the area roadways. Based on population density in the Project area, the natural background day-night noise levels are likely 35 to 45 dBA, which corresponds to the range of levels in wilderness and rural areas (BLM, 2010).

Historically, noise surveys conducted for the Riverside County General Plan found locations along I-10 to be exposed to approximately 81.9 dBA Ldn near the edge of the highway and over 60 dBA Ldn for any location within approximately 2,000 feet of the I-10 centerline (Riverside County, 2015a). Locations along SR-177 are exposed to less noise due to lower levels of traffic. Traffic data collected for SR-177 near the Project site shows roughly 2,200 vehicles daily and approximately 14 percent of the baseline vehicles are trucks (Caltrans, 2023). With this mix of baseline traffic, baseline noise levels would be approximately 63 dBA Ldn at 100 feet from the centerline of SR-177. For any location more than 400 feet from SR-177, baseline noise levels would be less than 55 dBA Ldn. (Calculations appear in EIR Appendix K.)

3.13.1.3. Noise Sensitive Receptors

In the Riverside County Noise Ordinance and Noise Element, “noise-sensitive” land uses include but are not limited to residences, passive recreation areas, schools, hospitals, rest homes, places of worship and cemeteries (Riverside County, 2015b). Noise sensitive areas are places where quiet is necessary for the intended use of the land, such as residences where noise can interfere with sleep, concentration, and communication, and where excessive noise can cause physiological and psychological stress and hearing loss.

The description of noise-sensitive receptors focuses on noise sensitive land uses or inhabited dwellings within one-quarter mile of proposed activities because the County’s Ordinance No. 847 provides an exemption for construction noise that occurs one-quarter mile or more from the nearest inhabited dwelling.

The proposed Easley Project site is near the Lake Tamarisk community in unincorporated Riverside County and would develop land that is primarily used as open space. The site would be along the alignments of SR-177 or Rice Road and Kaiser Road.

The nearest sensitive land uses include the Lake Tamarisk community and occasional rural residences along SR-177 (Rice Road), such as near Black Binder Road. The Lake Tamarisk community and homes along Kaiser Road would be adjacent to the southwestern-most parcels of the proposed Easley Project. The nearest home in Lake Tamarisk on Shasta Drive would be approximately 0.05 miles (260 feet) from the boundaries of the Easley Project, although construction activity would be set back substantially, at least 200 meters (656 feet), from this residential land use.

3.13.1.4. General Information on Vibration

Vibration from objects in contact with the ground will propagate energy through the ground and can be perceptible by humans and animals in the form of perceptible movement or in the form of rumbling sound caused by the vibration of room surfaces. The latter is described as ground-borne noise. High levels of vibration can result in architectural damage and structural damage depending upon the amplitude of the vibration and the fragileness of the building or structure.

Vibration is an oscillatory motion through a solid medium, in which the motion's amplitude can be described in terms of displacement, velocity, or acceleration. When assessing damage potential, vibration is often measured and reported in terms of peak particle velocity (PPV) or ground acceleration. Vibration can be felt outdoors. However, the perception of vibration is much greater indoors, due to the shaking of the structure. Some of the most common sources of vibration come from trains and transit vehicles, construction equipment, airplanes, and large vehicles (Riverside County, 2015b).

3.13.2. Regulatory Framework

3.13.2.1. Federal Laws, Regulations, and Policies

Regulating environmental noise is generally the responsibility of local governments. The U.S. EPA published guidelines on recommended maximum noise levels to protect public health and welfare (U.S. EPA, 1974), and on-site noise levels are subject to federal protections for workers. To protect workers from excessive on-site noise levels, the Occupational Safety and Health Act of 1970 (OSHA) sets on-site occupational noise exposure levels, which are regulated in California via the California Occupational Safety and Health Administration (Cal/OSHA). The maximum time-weighted average noise exposure level of workers is 90 dBA over an eight-hour work shift (29 CFR § 1910.95).

3.13.2.2. State Laws, Regulations, and Policies

For the purpose of limiting population exposure to physically or psychologically significant noise levels, the State of California maintains recommendations for local jurisdictions in the General Plan Guidelines published by the Governor's Office of Planning and Research (OPR, 2017). The General Plan Guidelines suggest ranges of acceptability for a given land use within a range of noise exposures. For residences, an exterior noise level of up to 60 dBA CNEL is considered "normally acceptable," and a noise level of greater than 75 dBA CNEL is considered "clearly unacceptable." To protect the interiors of new multifamily residential units, State law requires the study of noise insulation measures when exterior noise levels exceed 60 dBA CNEL, according to the California building code (California Code of Regulations, Title 24).

3.13.2.3. Local Laws, Regulations, and Policies

Riverside County General Plan Noise Element

Policies for Noise Compatibility of Land Uses

The County's General Plan, Noise Element (2015) provides the guidelines on Land Use Compatibility for Community Noise Exposure, which are used to evaluate potential noise impacts and to set the criteria for environmental impact findings and conditions for project approval. Land use compatibility defines the acceptability of a land use in a specified noise environment. The land use compatibility criteria adopted by Riverside County as part of the Noise Element of the General Plan appear in Table 3.13-1.

Table 3.13-1. Riverside County Land Use Compatibility Standards (CNEL or Ldn Noise Level)

Land Use Category	Normally Acceptable	Conditionally Acceptable	Normally Unacceptable	Clearly Unacceptable
Residential – Low-density (single-family, duplex, mobile homes)	Up to 60 dBA	55–70 dBA	70–75 dBA	Over 75 dBA
Residential – Multiple-family	Up to 65 dBA	60–70 dBA	70–75 dBA	Over 75 dBA
Transient lodging, motels, hotels	Up to 65 dBA	60–70 dBA	70–80 dBA	Over 80 dBA
Schools, libraries, churches, hospitals, nursing homes	Up to 70 dBA	60–70 dBA	70–80 dBA	Over 80 dBA

Land Use Category	Normally Acceptable	Conditionally Acceptable	Normally Unacceptable	Clearly Unacceptable
Auditoriums, concert halls, amphitheaters	Category not used	Up to 70 dBA	Over 65 dBA	Category not used
Sports arenas, outdoor spectator sports	Category not used	Up to 75 dBA	Over 70 dBA	Category not used
Playgrounds, neighborhood parks	Up to 70 dBA	Category not used	67.5–75 dBA	Over 72.5 dBA
Golf courses, riding stables, water recreation, cemeteries	Up to 75 dBA	Category not used	70–80 dBA	Over 80 dBA
Office buildings, business commercial, professional	Up to 70 dBA	67.5–77.5 dBA	Category not used	Over 75 dBA
Industrial, manufacturing, utilities, agriculture	Up to 75 dBA	70–80 dBA	Category not used	Over 75 dBA

Source: General Plan, Noise Element Table N-1 (Riverside County, 2015b).

The following General Plan, Noise Element (2015) policies protect noise-sensitive land uses from noise emitted by outside sources and prevent new projects from generating adverse noise levels on adjacent properties.

- **Policy N 1.1.** Protect noise-sensitive land uses from high levels of noise by restricting noise-producing land uses from these areas. If the noise-producing land use cannot be relocated, then noise buffers such as setbacks, landscaping, or block walls shall be used.
- **Policy N 1.2.** Guide noise-tolerant land uses into areas irrevocably committed to land uses that are noise-producing, such as transportation corridors or within the projected noise contours of any adjacent airports.
- **Policy N 1.4.** Determine if existing land uses will present noise compatibility issues with proposed projects by undertaking site surveys.
- **Policy N 1.5.** Prevent and mitigate the adverse impacts of excessive noise exposure on the residents, employees, visitors, and noise-sensitive uses of Riverside County.
- **Policy N 1.6.** Minimize noise spillover or encroachment from commercial and industrial land uses into adjoining residential neighborhoods or noise-sensitive uses.
- **Policy N 1.8.** Limit the maximum permitted noise levels that cross property lines and impact adjacent land uses, except when dealing with noise emissions from wind turbines.
- **Policy N 3.2.** Require acoustical studies and subsequent approval by the Planning Department and the Office of Industrial Hygiene, to help determine effective noise mitigation strategies in noise-producing areas.
- **Policy N 3.3.** Ensure compatibility between industrial development and adjacent land uses. To achieve compatibility, industrial development projects may be required to include noise mitigation measures to avoid or minimize project impacts on adjacent uses.
- **Policy N 3.5.** Require that a noise analysis be conducted by an acoustical specialist for all proposed projects that are noise producers. Include recommendations for design mitigation if the project is to be located either within proximity of a noise-sensitive land use, or land designated for noise sensitive land uses.
- **Policy N 3.6.** Discourage projects that are incapable of successfully mitigating excessive noise.

- **Policy N 3.7.** Encourage noise-tolerant land uses such as commercial or industrial, to locate in areas already committed to land uses that are noise-producing.

Policies for Temporary Construction Noise

The Noise Element of the General Plan includes numerous policies intended to minimize noise-related conflicts between adjacent types of land uses. Policies addressing “temporary construction” activities include:

- **Policy N 13.1.** Minimize the impacts of construction noise on adjacent uses within acceptable practices.
- **Policy N 13.2.** Ensure that construction activities are regulated to establish hours of operation in order to prevent and/or mitigate the generation of excessive or adverse noise impacts on surrounding areas.
- **Policy N 13.4.** Require that all construction equipment utilize noise reduction features (e.g., mufflers and engine shrouds) that are no less effective than those originally installed by the manufacturer.

Policies for Mitigation of Stationary Sources of Noise

The Noise Element of the General Plan also identifies preferred noise standards for stationary noise sources that affect residential land uses and provides direction to mitigate stationary source noise. Policy N 4.1 of the Noise Element sets a stationary-source exterior noise limit to not to be exceeded for a cumulative period of more than ten minutes in any hour of 65 dBA Leq for daytime hours of 7:00 a.m. to 10:00 p.m., and 45 dBA Leq during the noise-sensitive nighttime hours of 10:00 p.m. to 7:00 a.m. For new stationary sources of noise, the Noise Element includes:

- **Policy N 2.3.** Mitigate exterior and interior noises to the levels listed in Table N-2 below to the extent feasible, for stationary sources. These standards are shown in Table 3.13-2.
- **Policy N 4.1.** Prohibit facility-related noise received by any sensitive use from exceeding the following worst-case noise levels:
 - (a) 45 dBA-10-minute Leq between 10:00 p.m. and 7:00 a.m.
 - (b) 65 dBA-10-minute Leq between 7:00 a.m. and 10:00 p.m.
- **Policy N 4.2.** Develop measures to control non-transportation noise impacts.
- **Policy N 4.3.** Ensure any use determined to be a potential generator of significant stationary noise impacts be properly analyzed and ensure that the recommended mitigation measures are implemented.

Table 3.13-2. Stationary Source Land Use Noise Standards

Land Use	Time of Day	Interior Noise Standard	Exterior Noise Standard
Residential	10:00 p.m. to 7:00 a.m.	40 Leq, 10 minute	45 Leq, 10 minute
Residential	7:00 a.m. to 10:00 p.m.	45 Leq, 10 minute	65 Leq, 10 minute

Source: General Plan, Noise Element Table N-2 (Riverside County, 2015b).

Note: The Noise Element of the General Plan indicates that these levels are preferred standards; final decision will be made by the Riverside County Planning Department and Office of Public Health.

Policies for Ground-borne Vibration

Ground-borne vibrations can be a source of annoyance to people or a source of structural damage to some types of buildings. The Noise Element of the Riverside County General Plan (2015) includes consideration of human reaction to ground-borne vibrations in terms of the peak particle velocity (PPV) measured in inches per second (in/sec). Residential areas, schools, and sensitive research operations are among the land uses that are vibration sensitive. Table 3.13-3 describes the typical human reaction in response to certain vibration levels.

Table 3.13-3. Human Reaction to Typical Vibration Levels

Vibration Level PPV (inches/second)	Human Reaction
0.0059–0.0188	Threshold of perception, possibility of intrusion
0.0787	Vibrations readily perceptible
0.0984	Continuous vibration begins to annoy people
0.1968	Vibrations annoying to people in buildings
0.3937–0.5905	Vibrations considered unpleasant when continuously subjected and unacceptable by some walking on bridges

Source: Caltrans data in General Plan, Noise Element Table N 3 (Riverside County, 2015b).

Riverside County Noise Ordinance

The County Noise Ordinance allows for different levels of acceptable noise depending upon land use. The Noise Ordinance or Ordinance No. 847 (Regulating Noise) is incorporated in the County Code as Chapter 9.52 (Noise Regulation). The standards in Chapter 9.52.040 (also Section 4 of Ordinance No. 847) limit noise sources on any property from causing excessive exterior noise on any other nearby occupied property. The maximum decibel level standards depend on the receiving land use, such that sound levels in a low-density “Rural Community” shall not exceed 55 dBA L_{max} during the daytime hours (7:00 a.m. to 10:00 p.m.) or 45 dBA L_{max} during the nighttime hours (10:00 p.m. to 7:00 a.m.). These County standards protect the noise-sensitive receptors within the very low-density rural areas near the Project site.

Exceptions to the noise standards can be requested for construction-related reasons. Section 2 of Ordinance No. 847 specifies that the following construction activities are exempt from the provisions of the noise ordinance:

- Private construction projects located 0.25 mile or more from the nearest inhabited dwelling; and
- Private construction projects located within 0.25 mile of an inhabited dwelling provided that construction activities are limited to 6:00 a.m. to 6:00 p.m. during the months of June through September and are limited to 7:00 a.m. to 6:00 p.m. during the months of October through May.

The proposed Project would be consistent with these County policies.

3.13.3. Methodology for Analysis

Analysis of noise and vibration levels was performed through quantitative estimates of expected noise levels, review of agency policies and regulatory requirements, and qualitative analyses for issues that do not readily lend themselves to quantitative evaluation. Quantitative analyses were prepared to address noise and vibration from use of construction equipment on site, noise from construction-related traffic, and noise from facility operations.

The area of interest for noise and vibration issues is typically localized. Airborne noise dissipates fairly rapidly with increasing distance from the noise source. The distances involved depend primarily on the intensity of the noise generated by the source, and partly on weather conditions such as wind speed and direction, the height and strength of temperature inversions, and the height of cloud cover. Sound is detectable somewhat further downwind than upwind of a noise source. Temperature inversions and cloud cover can reflect or refract sound that is radiated upwards; this effect can increase noise levels at locations that receive the reflected or refracted sound. Such reflection and refraction effects are important primarily for high intensity sounds. For noise sources such as construction activity and vehicle traffic, although potentially audible over large distances, the region of greatest influence is typically less than 0.25 miles (1,320 feet) from the noise source (County Noise Ordinance No. 847).

Ground-borne vibrations similarly dissipate rapidly with increasing distance from the vibration source. The distances involved depend primarily on the intensity of the vibrations generated by the source, and partly on soil and geologic conditions. Detectable vibrations will travel the greatest distance through solid rock and the least distance through loose, unconsolidated soils or saturated soils. For vibration sources such as construction activity and vehicle traffic, the region of influence is typically less than 200 feet from the vibration source (Caltrans, 2020).

3.13.4. CEQA Significance Criteria

The criteria used to determine the significance of potential noise and vibration impacts are based on Appendix G of the State CEQA Guidelines. The proposed Project would result in a significant impact under CEQA related to noise or vibration if the Project would result in:

- *Generation of a substantial temporary or permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies.*
- *Generation of excessive ground-borne vibration or ground-borne noise levels.*

Neither Riverside County General Plan nor Noise Ordinance establish numeric maximum acceptable construction source noise levels at potentially affected receivers, which would allow for a quantified determination of what CEQA constitutes a substantial temporary noise increase. Therefore, the County identifies a numerical construction threshold based on the Federal Transit Administration (FTA), *Transit Noise and Vibration Impact Assessment Manual*, for this analysis of daytime and nighttime construction impacts. The FTA considers an exterior construction noise level of 80 dBA Leq as a reasonable daytime threshold for noise sensitive residential land use with a nighttime exterior construction noise level of 70 dBA Leq (FTA, 2018).

The following CEQA significance criterion from Appendix G was not included in the analysis and is not discussed further beyond this summary:

- *For a project located within the vicinity of a private airstrip or an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?*

The Project site is not located within an airport land use plan. The Desert Center Airport is a private airstrip approximately one mile east of the nearest Project components. Because the proposed Project includes no noise-sensitive uses, no airport land use noise compatibility criteria would apply. None of the Project components could expose residential land uses to excessive noise levels due to a public airport or public use airport.

3.13.5. Proposed Project Impact Analysis

The scoping effort conducted by the Riverside County Planning Department revealed several public concerns related to noise and vibration. Public concerns expressed during the scoping process involved noise from construction, especially due to the close proximity of the proposed development to homes in the LTDR and nearby communities, as well as noise from increased traffic. As part of the effort to address scoping comments and disclose noise and vibration impacts, this analysis includes quantification noise levels attributable to the Project and construction traffic.

Some scoping comments identified possible increases in noise due to loss of vegetation and concerns about a constant “loud buzzing sound” that comes from solar developments. This analysis identifies the types of sources associated with the proposed solar facility, BESS, medium voltage collector and gen-tie lines, including the electrical equipment typical to these types of facilities.

The scoping comments raise the possibility of the proposed Project causing land use change on a large-enough scale to alter the natural effect of ground absorption. The effect could occur by removing vegetation and installing structures that may reflect noise from distant sources, such as highways, the Desert Center Airport, or Chuckwalla Valley Raceway. New structures in the setting of open space could also counter this effect by acting as barriers that shield receptors from distant noise sources or reflect noise unpredictably. To address this comment, this analysis quantifies sound propagation from Project sources to receivers by assuming that all sound propagation occurs over “hard” surfaces, which conservatively ignores the effects of ground absorption where, in fact, natural vegetation or revegetated areas may provide some attenuation over distance.

Applicant Proposed Measures

APM NOISE-1 Construction Timing. Applicant will avoid or minimize use of any impact hammer for pile driving or other equipment similarly capable of producing disruptive noise during construction activities within a one-mile radius from the residential parcel on the northeast corner of around the Lake Tamarisk Desert Resort community during the winter months of highest residency (November 1 to March 31). If based on the final construction schedule, use of such equipment is necessary within this geographic area during the aforementioned time period, the Applicant will avoid or minimize this construction activity prior to 7:00 a.m. and after 6:00 p.m. The Applicant will also avoid nighttime equipment deliveries between 10:00 p.m. and 7:00 a.m.

Impact N-1. Generation of a substantial temporary or permanent increase in ambient noise levels in the vicinity of the Project in excess of standards established in the local general plan, noise ordinance, or applicable standards of other agencies.

LESS-THAN-SIGNIFICANT WITH MITIGATION, CONSTRUCTION OF THE SOLAR AND ENERGY STORAGE FACILITY. Increased ambient noise would occur during construction of the proposed Project. Heavy-duty construction equipment would be used on the site of the solar and energy storage facility and along the 500 kV gen-tie line, and trucks and vehicles would travel through the surrounding area for transporting equipment and materials to the site.

Construction of the Project is estimated to occur over an approximately 20 months. During these months, the range of construction activities would include pre-construction surveys, establishing staging areas and access points, mobilizing construction equipment, crews, and materials, installing the PV arrays and other electric facilities, and stabilizing and restoring disturbed areas. The types of construction equipment used on the Project site would include trucks, light-duty vehicles, backhoes, loaders, excavators or trenchers, forklifts, cranes, compactors, and drill rigs or augers.

Table 3.13-4 summarizes the typical noise levels for individual pieces of construction equipment.

Table 3.13-4. Typical Noise Levels for Individual Construction Equipment

Equipment	Noise Level at 50 ft (dBA Lmax)	Noise Level at 50 ft (dBA Leq)
Mounted impact hammer (hoe ram)	90	83
Scraper	84	80
Dozer	82	78
Forklift, man lift	75	68
Crane	81	74
Backhoe, loader	79	75

Equipment	Noise Level at 50 ft (dBA Lmax)	Noise Level at 50 ft (dBA Leq)
Excavator	81	77
Compactor	83	76
Generator	81	78
Drill rig, auger	84	77
Dump truck, haul truck, concrete mixer truck	76 to 79	73 to 76
Pickup truck, crew truck	75	62 to 71

Source: FHWA, 2006.

Lmax: Maximum noise level from Actual Measured in Roadway Construction Noise Model (RCNM).

Leq: Equivalent noise level for 1 hour incorporating the Acoustical Usage Factor.

The activity likely to cause the highest noise levels at the site would be installation of steel piles for supporting the PV module structures. Steel piles (e.g., cylindrical pipes, H-beams, helical screws, or similar structures) would be driven into the soil using pneumatic techniques, such as a hydraulic rock hammer attachment on the boom of a rubber-tired backhoe excavator. The piles typically would be spaced 10 feet apart along the axis of the PV panel arrays. The hydraulic rock hammer would be light-duty to avoid excessive noise levels that could be associated with a heavy-duty impact pile driver. Maximum intermittent noise levels near steel pile installation activities be up to 90 dBA Lmax and 83 dBA Leq at 50 feet. For activities than pile installation, typical maximum intermittent noise levels near individual equipment would vary up to 84 dBA Lmax and 80 dBA Leq at 50 feet.

The noise levels caused by typical activities within the site would be substantially lower when experienced at locations distant from the site boundaries. Because sound fades over distance, on-site noise would diminish over the additional distances separating noise sensitive receptors from the proposed activities. Assuming the standard spherical spreading loss (reduction of 6 dB per doubling of distance) and the highest unmitigated construction noise source of 83 dBA Leq at 50 feet, the noise level caused by a typical spread of construction equipment would be 62 dBA Leq at the nearest occupied residences in the Lake Tamarisk community, 200 meters (656 feet) from the nearest proposed construction. This demonstrates that the nearest receiver locations would not be exposed to noise levels exceeding the reasonable daytime 80 dBA Leq or the nighttime 70 dBA Leq thresholds during construction activities. (Calculations appear in EIR Appendix K.)

With respect to construction-related traffic noise, development activities would also cause offsite noise, primarily due to trucks needed to deliver and remove materials and from the traffic of commuting workers. Haul trucks would make trips to bring equipment, water, and materials to the site and remove waste. Access to the site would be from SR-177 (Rice Road) and Kaiser Road.

The instantaneous peak noise levels from passing trucks and commuting worker vehicles would be approximately 70 to 76 dBA at 50 feet (see Table 3.13-4). This noise would be concentrated at staging areas, along access roads, and the thoroughfares used by Project traffic, primarily SR-177 and Kaiser Road. Along SR-177, the traffic from construction-related workers and haul trucks would increase SR-177 day-night noise levels by 3 dBA over the baseline levels, from 63 dBA to approximately 66 dBA Ldn within 100 feet of the centerline or from 64 dBA to 67 dBA CNEL.

The construction-related traffic noise impacts would occur primarily but not exclusively during daytime conditions. For evening or nighttime construction-related traffic, the effects on day-night noise levels would be more pronounced than traffic confined to daytime hours because of the increased sensitivity during the evening and nighttime hours (between 7:00 p.m. and 7:00 a.m.). The Project could conflict with Riverside County General Plan policies to minimize the impacts of construction noise, if Project construction traffic along SR-177 and Kaiser Road would cause day-night noise levels to substantially

increase during evening or nighttime hours. To reduce the impact of evening and nighttime construction traffic noise, this analysis recommends mitigation to restrict construction deliveries to daytime hours.

The Riverside County Noise Ordinance allows noise from construction activities, and designates this noise as exempt, when: (a) the construction project is located one-quarter (0.25) mile or more from the nearest inhabited dwelling, or (b) when the construction project is located within 0.25 mile of an inhabited dwelling and the activities are limited to certain daytime hours. The closest occupied residences in Desert Center would be within 0.25 mile of Project construction traffic and on-site construction activities within the proposed Project site.

The Project construction work schedule would involve evening and nighttime activity, and all activities would use best efforts to avoid or minimize impact hammer use for pile driving or other equipment similarly capable of producing disruptive noise, as described in APM NOISE-1.

The Riverside County Noise Ordinance allows construction noise to be exempt between the hours of 7:00 a.m. and 6:00 p.m. The work schedules of the proposed Project would need to adhere to the County exemption for construction noise where activities are within 0.25 miles of a sensitive receptor to comply with the ordinance. The Noise Element of the General Plan includes no threshold noise levels (in terms of dBA) for temporary construction, but the County's policies require the Project to follow established hours of operation and to implement acceptable practices to minimize the effects of adverse construction noise.

Mitigation Measure (MM) N-1 (Construction Restrictions) is recommended to ensure that any construction activities within 0.25 miles of a sensitive receptor outside of the schedule of the Noise Ordinance would be limited to light-duty equipment and vehicles.

Mitigation Measures N-2 (Public Notification Process) and N-3 (Noise Complaint Process) are also recommended to ensure that residents nearest to the Project site boundaries and access roads are provided advance notification of potentially adverse noise conditions and to ensure that complaints are resolved. With the recommended mitigation measures, construction would not result in a substantial increase in noise levels in excess of standards established in the local general plan or noise ordinance or applicable standards of other agencies. With the recommended mitigation measures, the impact of construction noise relative to applicable community noise standards would be less than significant.

In addition, the Applicant has stated in APM NOISE-1 that it will avoid or minimize use of any impact hammer for pile driving or other equipment similarly capable of producing disruptive noise during construction activities within a one-mile radius from the residential parcel on the northeast corner of the Lake Tamarisk Desert Resort community during the winter months of highest residency (November 1 to March 31). If based on the final construction schedule, use of such equipment is necessary within this geographic area during the aforementioned time period, the Applicant will avoid or minimize this construction activity in the early morning or late evening. Implementation of APM NOISE-1 will further reduce this less-than-significant impact.

LESS-THAN-SIGNIFICANT WITH MITIGATION, CONSTRUCTION OF THE 500 kV GEN-TIE LINE. Construction of the 500 kV gen-tie structures and installation of poles and conductors would involve a line truck, water truck, crane, backhoe, excavator, and helicopters. Gen-tie construction noise would result in a readily perceptible, but temporary, increase in daytime environmental noise. Gen-tie construction activities would only intermittently affect any one location as the construction crews move along the alignment.

Near each pole site, the equipment in the gen-tie construction spread and overhead helicopter operations would generate increase ambient noise during use of offroad equipment and during helicopter overflights, takeoffs, and landings. Helicopter operations could be expected to generate noise levels of approximately 92 dBA within about 100 feet to 450 feet of the source depending on payload capacity of the helicopter, and locations a few hundred feet from the source would experience less than 90 dBA (U.S. Forest Service,

2023). Using a helicopter for 15 minutes in a typical hour would result in approximately 83 dBA Leq at 200 meters (656 feet). (Calculations appear in EIR Appendix K.)

Gen-tie construction noise would occur along an alignment that is not within 0.25 mile of any inhabited dwellings. However, helicopter operations could conflict with Riverside County General Plan policies to minimize the impacts of construction noise if not limited to occur during daytime hours. Mitigation Measure N-1 (Construction Restrictions) would ensure that construction activities outside of the schedule of the Noise Ordinance would be limited to light-duty equipment and vehicles, and Mitigation Measures N-2 (Public Notification Process) and N-3 (Noise Complaint Process) would also ensure that nearby residents are provided advance notification of potentially adverse noise conditions and to ensure that complaints are resolved. For construction of the gen-tie, this impact with mitigation would be less than significant.

LESS-THAN-SIGNIFICANT IMPACT, OPERATIONS AND MAINTENANCE. Operations-related activities that could cause minor levels of noise in the areas of the proposed Project include upkeep, maintenance, inspections, vegetation management, solar module washing, fire safety, and site security. The proposed Project would also include stationary sources of noise in the form of PV panel tracking system motors, the inverter-transformer stations that operate when the solar panels produce electricity in the daytime, BESS, and the 500 kV gen-tie line.

Throughout the solar field, the equipment that could generate the most prominent stationary source noise would be the pad-mounted inverter-transformer stations. The off-site noise levels produced by the individual inverters and transformers would depend on the final equipment selected and the ultimate locations of the individual inverter stations. The inverter-transformer stations would be centrally located within each 2 to 5 MW increment of generation. Auxiliary equipment for inverter-transformer stations may include cooling fans and pumps that operate depending on the internal temperature of the transformer cooling oil. This type of noise would have a broad-band spectrum and would not include simple tones or a “hum.” The typical performance specification of a commercial or utility-scale inverter with cooling system and enclosure would be to achieve a design standard of 67 dBA at a distance of 32.8 feet (10 meters). With multiple units on each skid to achieve up to a 5,000 kilowatt output, the resulting noise level would be approximately 71 dBA at 50 feet and 45 dBA Leq at 1,000 feet from each inverter-transformer pad. (Calculations appear in EIR Appendix K.)

Within the solar field, other minor sources include tracker motors and mechanisms that allow the solar panels to tilt and track the path of the sun on a single axis throughout the day. Tracker motors and actuators would not operate on a continuous basis or in unison. For example, each set of actuators would operate for a few seconds and then pause for 5 minutes before operating again. This process would occur only during daylight hours, with a return to the starting position at sunrise. Although final design would determine the actual specifications for the motors, based on similar projects, noise from each motor and actuator would be about 62 or 63 dBA at the source or a distance of 3.28 feet (1 meter). Noise levels from the tracker motors throughout the solar field would not be discernable in the background conditions at any locations over 200 feet from the edges of the solar field.

The dominant stationary sources of noise near the proposed operation and maintenance (O&M) building would be related to the heating, ventilation, and air conditioning units (HVAC), if necessary for the O&M building and the BESS enclosures. The transformers and switchgear to within the onsite substation yards would also include cooling fans and pumps. Typical cooling systems for the BESS and transformers could generate 75 dBA at a distance of 32.8 feet (10 meters), which would result in 44 dBA Leq at 1,200 feet from the BESS equipment. (Calculations appear in EIR Appendix K.)

The proposed Project would also introduce the permanent stationary source of noise from the audible corona noise that occurs with normal and routine operation of the 500 kV gen-tie. Corona noise would occur along the alignments of the proposed gen-tie lines, and the typical resulting noise level near each

gen-tie line with wet conductors would about 45 dBA Leq at the edge of the right-of-way. The noise from the gen-tie would not cause a substantial permanent increase in ambient day-night noise levels and would be less than the most-stringent property line standards in the Noise Ordinance. Therefore, for operation of the gen-tie, this impact would be less than significant.

The proposed Project would be operated by up to 10 permanent staff on the site at any one time. Occasional vehicular noise would also be caused by crews for ongoing facility maintenance and repairs and for module washing and security patrols. These activities would normally involve only a small crew, and the Project-related O&M traffic would be sporadic.

The applicable standards in the Noise Ordinance (Chapter 9.52.040 and Section 4 of Ordinance No. 847) limits noise sources from causing excessive exterior noise on any nearby occupied property. The Noise Ordinance ensures that noise levels at any receiving land use that is a low-density "Rural Community" shall not exceed 55 dBA Lmax during the daytime hours (7:00 a.m. to 10:00 p.m.) or 45 dBA during the nighttime hours (10:00 p.m. to 7:00 a.m.). The stationary source noise standards set forth in the Noise Element, Policy N 2.3 and Policy N 4.1, of the General Plan are less stringent than those in the Noise Ordinance. All equipment within the Project site would be required to comply with the stationary source noise standards of the Noise Ordinance.

The solar generating facility would be primarily active and operational during daytime hours. However, the pad-mounted inverters-transformer stations' cooling systems and the battery storage equipment could operate outside of daylight hours. The overall noise levels caused by these units would be subject to the 45 dBA Lmax standard of the Noise Ordinance that applies at the boundary of any nearby occupied property. The proposed O&M building, BESS enclosures, and onsite substations would not be located within 1,200 feet of any occupied properties or residences and would not cause exterior noise of more than 45 dBA at any residential property boundary. As such, the noise from operation of the proposed Project would not exceed the Noise Ordinance standard of 45 dBA at night for any occupied "rural community" location. Likewise, the proposed Project operational noise levels of 44 dBA Leq at 1,200 feet from the BESS equipment would not exceed the General Plan Noise Element standard for stationary sources of 45 dBA Leq during the nighttime hours (10:00 p.m. to 7:00 a.m.). The impact of operation noise relative to applicable community noise standards would be less than significant.

LESS-THAN-SIGNIFICANT IMPACT, DECOMMISSIONING. Decommissioning impacts would likely be similar to those that would occur during construction. The actual impacts would depend on the proposed decommissioning action and final use of the site.

Mitigation Measures for Impact N-1

- MM N-1** **Construction Restrictions.** See full text in Section 3.13.9 (Mitigation Measures).
- MM N-2** **Public Notification Process.** See full text in Section 3.13.9 (Mitigation Measures).
- MM N-3** **Noise Complaint Process.** See full text in Section 3.13.9 (Mitigation Measures).

Significance After Mitigation

The increased noise levels that would occur with the proposed Project construction activities would be adverse after mitigation but not at significant levels. This impact would be less than significant during operation.

Impact N-2. Generation of excessive ground-borne vibration or ground-borne noise levels?

LESS-THAN-SIGNIFICANT IMPACT, CONSTRUCTION. Vibration from routine construction equipment and activities might be perceptible to people in the immediate vicinity of construction activities. Vibration sources that typically occur with construction activity or vehicle traffic have a region of influence that is limited to approximately 200 feet. During construction, the impact or vibratory pile drivers used for installing posts would have the greatest radius of potential ground-borne vibration impacts.

The level of ground-borne vibration that could reach sensitive receptors depends on the distance to the receptor, the equipment type that is creating vibration (e.g., the frequency being produced), and the soil conditions surrounding the construction site. Because the use of construction equipment generating ground-borne vibrations would be localized around Project components, and construction activity would be set back substantially from property boundaries, no vibration sensitive structures or land uses would be near construction equipment or sources of vibration. The nearest home in Lake Tamarisk on Shasta Drive would be approximately 0.05 miles (260 feet) from the boundaries of the Easley Project. Project construction activity would be set back substantially, at least 200 meters (656 feet), from this residential land use.

When necessary to install posts near the proposed Project site boundaries, use of pile drivers could result in vibration that would be perceptible and potentially annoying within 100 feet of the source. The typical level of ground-borne vibration from an impact pile driver could exceed 0.6 in/sec PPV near the source, but at a distance of 100 feet the level would attenuate to below 0.1 in/sec, which is below the County threshold level that would be annoying to occupants of a building (0.1968 in/sec). Other construction activities would create lower levels of vibration and would not have the potential to create annoyance at distances of 50 feet or more from the equipment in use. (Calculations appear in EIR Appendix K.)

Because offsite vibration levels would be low enough to avoid causing an annoyance, they would be unlikely to cause structural damage. Impacts from vibration would be localized and temporary (i.e., infrequently recurring at any single location), and therefore, would not be excessive, resulting in a less than significant impact.

LESS-THAN-SIGNIFICANT IMPACT, OPERATIONS AND MAINTENANCE. Operation of the proposed solar facility, BESS, and gen-tie would not generate perceptible levels of vibration in the surrounding area. There would be no permanent source or potential to change vibration levels, except during circumstances where Project components require unscheduled maintenance or repair activities, during which the impact would be brief but of similar intensity to that of construction. Because Project activities and facilities would not expose people to excessive ground-borne vibration, this impact would be less than significant.

LESS-THAN-SIGNIFICANT IMPACT, DECOMMISSIONING. Decommissioning impacts would likely be similar to those that would occur during construction. The actual impacts would depend on the proposed decommissioning action and final use of the site.

Mitigation Measures for Impact N-2

No mitigation would be required.

Significance After Mitigation

This impact would be less than significant.

*** The impact analyses for all Project alternatives have been moved to EIR Section 5. ***

3.13.6. Cumulative Impacts

Geographic Scope

The geographic scope for cumulative analysis of noise and vibration is generally localized. Noise sources attributable to cumulative projects may cause adverse effects within approximately one mile of a project site including truck routes, but the region of greatest influence is typically within 0.5 miles from the boundary of a project site. Similarly, vibration sources that typically occur with construction activity or vehicle traffic have a region of influence that is limited to approximately 200 feet.

This geographic scope for cumulative noise and vibration effects includes the West-wide Section 368 Energy Corridors and the development activities of existing, past, present, and reasonably foreseeable future projects in the Desert Center area, as described in Section 3.1.2.

Cumulative Impact Analysis

The cumulative projects that occur in the geographic scope for noise and vibration include planning documents and the existing and probable future solar energy projects that are similar in nature to the proposed Project. The planning efforts, proposed expansion of Joshua Tree National Park, and creation of Chuckwalla National Monument would not themselves create actions that increase noise or vibration levels. The noise and vibration effects of the equipment used for construction of other present and future cumulative projects would depend on the site-specific needs and schedules, and the impacts may or may not overlap spatially and temporally with those of the proposed Project.

Limited areas of cumulative project construction activities could be within 0.5 mile of the proposed Project. ~~Simultaneous construction activity would have the potential to cause overlapping construction noise impacts with construction of the proposed Project.~~ Active pieces of construction equipment normally cause no more than 85 dBA when measured 50 feet from the source. Construction-phase noise impacts would be short-term and limited in nature, with construction activities for all cumulative projects normally being limited to the daytime. Simultaneous cumulative project construction activity would have the potential to cause overlapping construction noise impacts with construction of the proposed Project. The potential for overlap depends on the distance and timing of the future projects. The boundaries of the cumulative project nearest to the existing residences are those for the Sapphire Solar Project, which would be over one mile from the existing residences at Lake Tamarisk Desert Resort. At this distance, active construction equipment generating noise within the Sapphire Solar Project site could contribute about 42 dBA at the residences. When compared with the construction effects of the proposed Project, which could cause 62 dBA Leq at the residences, the cumulative project construction noise would not substantially influence the localized noise levels experienced by nearby residences including Lake Tamarisk Desert Resort. (Calculations appear in EIR Appendix K.) Because substantial distances separate residences from the proposed Project and probable future projects, construction noise from the Sapphire Solar Project and other cumulative projects would attenuate to imperceptible levels prior to reaching residences and therefore would not be expected to combine with project construction noise in a way that would increase noise levels experienced by sensitive receptors.

The noise impact of cumulative project operations could also occur simultaneously with proposed Project construction, although no cumulative project operation noise would be likely to occur at a location that substantially influences the localized noise levels experienced by residences nearest to the proposed Project permanent noise sources. This is because the only cumulative projects with the reasonable potential to combine noise impacts with the Project are the Sapphire Solar Project, Oberon Solar Project, and Athos Solar Project. As described above, the Sapphire Solar Project would be located over one mile away from Lake Tamarisk Desert Resort. Distances of 0.5 miles or more separate Lake Tamarisk Desert Resort from the nearest noise-producing facilities for the Oberon project, and over one mile separates

Lake Tamarisk Desert Resort from the Athos project. At these distances, operational noise from these cumulative projects would be comparable to the noise from proposed Project operation, but at a greater distance. The cumulative project noise would attenuate to the point of being imperceptible for existing residences. As a result, operational noise from these projects would not be expected to combine with Project construction noise in a way that would cause significant cumulative noise impacts.

For the reasons described above and given that the nearest sensitive receptor would be at least 200 meters (656 feet) from proposed Project construction activities and at much greater distances from cumulative projects, cumulative noise impacts during Project construction would not be significant. Mitigation Measures MM N-1 through N-3 would minimize the Project's contribution to these already less-than-significant cumulative construction noise impacts.

The duration of construction work for the proposed Project would be approximately 20 months, and after that time, few notable permanent sources of noise would occur with the proposed solar facility, BESS, and gen-tie, and similarly, few noise sources occur with the cumulative projects.

All cumulative project operations would generate noise from employee vehicles accessing the sites, and solar energy projects include power inverters and other power system infrastructure that are minor sources of noise. These sources may cause localized cumulative effects where multiple projects or shared transportation routes occur adjacent to a sensitive receptor. However, as described above, cumulative projects with the potential to combine noise impacts with the project are located such that operational noise they generate would be expected to attenuate to the point of being imperceptible for existing residences. As a result, operational noise from these projects would not be expected to combine with proposed Project operations noise in a way that would cause significant cumulative noise impacts.

As described above, cumulative noise impacts would not be significant. These less-than-significant impacts would be further reduced through compliance with local laws and regulations and implementation of typical mitigation to protect sensitive receptors from noise and implement feasible noise controls. Cumulative renewable energy projects and other development that is subjected to the environmental permitting process would have a detailed analysis of noise and land use conflicts as part of the project-level environmental review. The permitting process normally requires each project to comply with local standards and to avoid noise-related land use conflicts. This means that all projects, even if unrelated to the proposed Project, would need to comply with the local community noise standards, such as the Riverside County Noise Ordinance. Additional mitigation may be applied to the cumulative projects through environmental permitting by lead agencies. Although sources of noise associated with cumulative project operations, including employee vehicles accessing the sites, power inverters, and other power system infrastructure could impact residences that are near the proposed Project, the mitigation recommended in this analysis would ensure that the Project's incremental contribution to the cumulative noise impact would not be considerable.

Cumulative effects due to ground-borne vibration would occur only if there were sources of the vibration within approximately 200 feet from the boundaries between the proposed Project site and cumulative project sites. Boundaries of cumulative projects occur within 200 feet of the proposed Project site, but these shared boundaries are not within 200 feet of existing residences. As a result, the areas of potential overlap of cumulative project construction-related vibration would not be likely to create a cumulative vibration impact at residences near the proposed Project, and no cumulative effects would be likely from ground-borne vibration.

Mitigation Measures for Cumulative Impacts

Mitigation Measures MM N-1 to MM N-3 would reduce the Project's contribution to the already less-than-significant cumulative noise and vibration impacts. ~~be implemented to address potential noise and vibration impacts for the proposed Project.~~ No additional mitigation is required.

Significance After Mitigation

Cumulative noise and vibration impacts would be less than significant. The Project's incremental contribution to noise and vibration impacts would not be cumulatively considerable.

3.13.7. Mitigation Measures and Applicant Proposed Measures

APM NOISE-1 Construction Timing. Applicant will avoid or minimize use of any impact hammer for pile driving or other equipment similarly capable of producing disruptive noise during construction activities within a one-mile radius from the residential parcel on the northeast corner of around the Lake Tamarisk Desert Resort community during the winter months of highest residency (November 1 to March 31). If based on the final construction schedule, use of such equipment is necessary within this geographic area during the aforementioned time period, the Applicant will avoid or minimize this construction activity prior to 7:00 a.m. and after 6:00 p.m. The Applicant will also avoid nighttime equipment deliveries between 10:00 p.m. and 7:00 a.m.

MM N-1 Construction Restrictions. Heavy equipment operation, noisy construction work relating to any Project features onsite, and truck trips associated with materials and equipment deliveries shall be restricted to the times delineated below, unless a special permit has been issued by the County of Riverside: during June through September, between 6 a.m. to 6 p.m.; and during October through May, between 7:00 a.m. to 6:00 p.m.

Haul truck engines and other engines powering fixed or mobile construction equipment shall be equipped with adequate mufflers. Haul trucks shall be operated in accordance with posted speed limits. Truck engine exhaust brake use shall be limited to emergencies.

The construction contractor shall locate equipment staging in areas to create the greatest distance between construction-related noise sources and noise sensitive receivers nearest the Project site during Project construction. Where feasible, the construction contractor shall place all stationary construction equipment so that emitted noise is directed away from the noise sensitive receptors nearest the Project site. No music or electronically reinforced speech from construction workers shall be audible at noise-sensitive properties.

MM N-2 Public Notification Process. At least 15 days prior to the start of ground disturbance, the Project owner shall notify all residents within one mile of the Project site and the linear facilities, by mail or by other effective means, of the commencement of Project construction. At the same time, the Project owner shall establish a telephone number for use by the public to report any undesirable noise conditions associated with the construction and operation of the Project. If the telephone is not staffed 24 hours a day, the Project owner shall include an automatic answering feature, with date and time stamp recording, to answer calls when the phone is unattended. This telephone number shall be posted at the Project site during construction where it is visible to passersby. This telephone number shall be maintained until the Project has been operational for at least one year.

MM N-3 Noise Complaint Process. Throughout the construction and operation of the Project, the Project owner shall document, investigate, evaluate, and attempt to resolve all Project-related noise complaints. The Project owner or authorized agent shall:

- (a) Use a Noise Complaint Resolution Form, or other documentation procedure acceptable to the County, to record and report the Project owner's response to resolving each noise complaint;
- (b) Attempt to contact the person(s) making the noise complaint within 24 hours;

- (c) Conduct an investigation to determine the source of noise in the complaint;
- (d) If the noise is Project-related, take all feasible measures to reduce the source of the noise; and
- (e) Submit a report to the County documenting the complaint and actions taken. The report shall include: a complaint summary, including the final results of noise reduction efforts and, if obtainable, a signed statement by the complainant stating that the noise problem has been resolved to the complainant's satisfaction.

3.14. Paleontological Resources

This section describes the existing local geology and paleontological resources, the regulatory framework for paleontological resources, and the possibility of discovery of paleontological resources within the area where the proposed Project and alternatives would be implemented. An impact analysis and comparison of project alternatives is included in Section 5.

The Project area relevant to the analysis of paleontological resources is the physical footprint of Project construction, operation and maintenance, and decommissioning activities. Paleontological resources are any fossilized remains, traces, or imprints of organisms that are preserved in the Earth's crust and are of paleontological interest and provide information about the history of life on Earth. Fossil remains may include bones, teeth, shells, leaves, and wood. They are found in geological deposits within which they were originally buried. Paleontological resources include not only the actual fossils, but also the collecting localities and the geological deposits that contain the fossils. Paleontological resources are considered nonrenewable resources because the organisms they represent no longer exist. Thus, once destroyed, these resources can never be replaced. The information in this section is based on the *Paleontological Resource Survey Report for the Easley Renewable Energy Project*, Riverside County, California, prepared by PaleoWest (2023) (Paleontological Report; EIR Appendix E).

3.14.1. Environmental Setting

3.14.1.1. Paleontological Resource Classifications

BLM Instruction Memorandum IM 2009 011 provides guidelines for assessment and mitigation of potential impacts to paleontological resources (BLM, 2008). The Memorandum defines a significant paleontological resource as:

Any paleontological resource that is considered to be of scientific interest, including most vertebrate fossil remains and traces, and certain rare or unusual invertebrate and plant fossils. A significant paleontological resource is considered to be scientifically important because it is a rare or previously unknown species, it is of high quality and well-preserved, it preserves a previously unknown anatomical or other characteristic, provides new information about the history of life on earth, or has identified educational or recreational value. Paleontological resources that may be considered to not have paleontological significance include those that lack provenience or context, lack physical integrity because of decay or natural erosion, or that are overly redundant or are otherwise not useful for research. Vertebrate fossil remains and traces include bone, scales, scutes, skin impressions, burrows, tracks, tail drag marks, vertebrate coprolites (feces), gastroliths (stomach stones), or other physical evidence of past vertebrate life or activities.

Due to the nature of the fossil record, paleontologists cannot know either the quality or the quantity of fossils present in a geologic unit prior to natural erosion or human-caused exposure. Therefore, in the absence of surface fossils, it is necessary to assess the sensitivity of rock units based on their known potential to produce scientifically significant fossils elsewhere within the same geologic unit (both within and outside of the study area) or a unit representative of the same depositional environment. The proposed Project is on both BLM-administered and private land with the largest portion on BLM-administered land; therefore, it follows the Potential Fossil Yield Classification (PFYC) system for assessing paleontological resources. The PFYC system provides baseline guidance for assessing paleontological resources on BLM-administered land (BLM, 2016).

Potential Fossil Yield Classification (PFYC)

The PFYC system is based on mapped geologic units which are assigned a paleontological sensitivity class based on the relative abundance and significance of paleontological resources and their sensitivity to adverse impacts. Initial PFYC assignments based only on geologic mapping are considered as only a first approximation of the potential presence of paleontological resources and are subject to changes based on ground verification. The PFYC class rankings are summarized below (BLM, 2016):

Class 1 – Very Low. Geologic units that are not likely to contain recognizable fossil remains. This class usually includes units that are igneous or metamorphic, excluding reworked volcanic ash units; or units that are Precambrian in age or older. Management concern for paleontological resources in Class 1 units is usually negligible or not applicable. Overall, the probability of impacting significant paleontological resources is very low and further assessment of paleontological resources is usually unnecessary.

Class 2 – Low. Geologic units that are not likely to contain palaeontologic resources. Class 2 geologic units have the following characteristics: field surveys have verified that palaeontologic resources not present or are very rare; geologic units are generally younger than 10,000 years before present (bp); and sediments that exhibit significant physical and chemical changes (i.e., diagenetic alteration) that make fossil preservation unlikely. Management concern for paleontological resources is generally low and further assessment or mitigation is usually unnecessary except in rare or isolated circumstances where localities containing paleontological resources are found.

Class 3 – Moderate (a) or Unknown (b). Sedimentary geologic units where fossil content varies in significance, abundance, and predictable occurrence. This class is often marine in origin with sporadic known occurrences of paleontological resources. Paleontological resources may occur intermittently, but abundance is known to be low. Significant paleontological resources may occur but would be widely scattered. The potential for authorized land use to impact significant paleontological resources is known to be low to moderate. Management concerns for paleontological resources are moderate. Management options could include record searches, pre-disturbance surveys, monitoring, mitigation, or avoidance. Surface-disturbing activities may require sufficient assessment to determine whether significant paleontological resources occur in the area of a proposed action and whether the action could affect the paleontological resources.

Class 4 – High. Geologic units that are known to contain a high occurrence of paleontological resources. Significant paleontological resources have been documented but may vary in occurrence and predictability. Surface disturbing activities may adversely affect paleontological resources. Rare or uncommon fossils, including nonvertebrate (such as soft body preservation) or unusual plant fossils, may be present. Illegal collecting activities may impact some areas. Management concern is moderate to high depending on the proposed action. A field survey by a qualified paleontologist is often needed to assess local conditions. On-site monitoring or spot checking may be necessary during land-disturbing activities. Avoidance of known paleontological resources may be necessary.

Class 5 – Very High. Highly fossiliferous geologic units that consistently and predictably produce significant paleontological resources. Significant paleontological resources have been documented and occur consistently. Paleontological resources are highly susceptible to adverse impacts from surface-disturbing activities. Unit is frequently the focus of illegal collecting activities. Management concern is high to very high. A field survey by a qualified paleontologist is almost always needed, and on-site monitoring may be necessary during land-use activities. Avoidance or resource preservation through controlled access, designation of areas of avoidance, or special management designations should be considered.

Class U – Unknown Potential. Geologic units that cannot receive an informed PFYC assignment. Geological units may exhibit features or preservational conditions that suggest significant paleontological resources could be present, but little information about the actual paleontological resources of the unit

or area is known. Geologic units represented on a map are based on lithologic character or basis of origin but have not been studied in detail. Scientific literature does not exist or does not reveal the nature of paleontological resources. Reports of paleontological resources are anecdotal or have not been verified. Area or geologic unit is poorly or understudied. BLM staff has not yet been able to assess the nature of the geologic unit. Until a provisional assignment is made, geologic units that have an unknown potential have medium to high management concerns, and lacking other information, field surveys are normally necessary, especially prior to authorizing a ground-disturbing activity.

Society of Vertebrate Paleontology Criteria

The Society of Vertebrate Paleontology (SVP) has developed standard procedures for the assessment and mitigation of adverse impacts to paleontological resources which are intended to be applicable to both private and public lands under the jurisdiction of local, city, county, regional, state, and federal agencies (SVP, 2010). Under the SVP criteria rock units are described as having (a) high, (b) undetermined, (c) low, or (d) no potential for containing significant paleontological resources (SVP, 2010).

The Project is located on both BLM-administered land and private land; however, much more of the proposed Project is located on BLM-administered land and therefore will use the BLM PYFC system for paleontological resource assessment. SVP has also established professional guidelines for paleontologists and provided definitions of significant paleontological resources (SVP, 2010). The SVP defines significant paleontological resources as consisting of identifiable vertebrate fossils, large or small, uncommon invertebrate, plant, and trace fossils, and other data that provide taphonomic, taxonomic, phylogenetic, paleoecologic, stratigraphic, and/or biochronologic information. Paleontological resources are considered to be older than recorded human history and/or older than middle Holocene (i.e., older than about 5,000 radiocarbon years).

Riverside County Criteria

Riverside County has been inventoried for geologic formations known to potentially contain paleontological resources. Lands with high, low, or undetermined potential for finding paleontological resources have been mapped in the County (Riverside County, 2015: Figure OS-8). Based on Riverside County Figure OS-8, the Project is underlain by areas mapped as unknown, low, and high (Ha) sensitivity (Riverside County, 2015). It should be noted that the map does not substitute for site-specific investigations, as deemed necessary.

High Potential. Sedimentary rock units with high potential for containing significant non-renewable paleontological resources include rock units in which vertebrate or significant invertebrate fossils have been found or determined likely to be present. These units include, but are not limited to, sedimentary formations which contain significant non-renewable paleontological resources anywhere within their geographical extent and sedimentary rock units temporally or lithologically suitable for the preservation of fossils. High sensitivity includes not only the potential for yielding abundant vertebrate fossils, but also for production of a few significant fossils that may provide new and significant data. High sensitivity areas are mapped as either “High A” or “High B,” according to the following criteria:

- **High Sensitivity A (Ha):** Based on geologic formations or mapped rock units that are known to contain or have the correct age and depositional conditions to contain significant paleontological resources. These include rocks of Silurian or Devonian age and younger that have potential to contain remains of fossil fish, and Mesozoic and Cenozoic rocks that contain fossilized body elements and trace fossils such as tracks, nests, and eggs.
- **High Sensitivity B (Hb):** Equivalent to High A but is based on the occurrence of fossils at a specified depth below the surface. This category indicates fossils that are likely to be encountered at or below 4 feet of depth and may be impacted during construction activities.

- **Low Potential.** Lands for which previous field surveys and documentation demonstrate as having a low potential for containing significant paleontological resources subject to adverse impacts. The mapping of low potential was determined based on actual documentation and was not generalized to cover all areas of a particular rock unit on a geologic map.
- **Undetermined Potential.** Areas underlain by sedimentary rocks for which literature or unpublished studies are not available have undetermined potential for containing significant paleontological resources. These areas need to be inspected by a qualified vertebrate paleontologist before a specific determination of high potential or low potential can be assigned.

3.14.1.2. Literature Review and Records Search

Paleontological resources are not found in “soil” but are contained within the geologic deposits or bedrock that underlies the soil layer. Therefore, in order to ascertain whether a particular study area has the potential to contain significant fossil resources at the subsurface, it is necessary to review relevant scientific literature and geologic mapping to determine the geology and stratigraphy of the area. Further, to delineate the boundaries of an area of paleontological sensitivity, it is necessary to determine the extent of the entire geologic unit because paleontological sensitivity is not limited to surface exposures of fossil material.

PaleoWest conducted a review of published geologic and paleontological literature and searches of pertinent local and regional museum repositories for paleontological localities at the Natural History Museum of Los Angeles County (NHMLAC), San Bernardino County Museum (SBCM), San Diego Natural History Museum (SDNHM), and Western Science Center (WSC) (PaleoWest, 2023).

The geologic literature review revealed that The Geologic Map of California – Salton Sea Sheet (Jennings, 1967) is the only published geological map covering the entire Project area; this is a regional scale map at a 1:250,000 scale and therefore less detailed than a larger scale, project area focused map. The Salton Sea Sheet identifies the Project site as primarily underlain by Quaternary alluvium (Qal), with approximately 30 acres of Quaternary nonmarine conglomerate (Qc, Qco) along the proposed gen-tie route. The Quaternary alluvial deposits of Chuckwalla Valley (Qal) are composed of late Pleistocene (2.6 million years ago to 11,700 years ago) to Holocene (11,700 years ago to present) terrestrial valley axis fill and valley margin deposits. The Quaternary alluvial deposits are widespread and are laterally and vertically variable with respect to lithology, grain size, and depositional environment. The nonmarine alluvial fan conglomerates (Qc and Qco) are described by Jennings (1967) as a coarse cobble conglomerate deposit derived from alluvial fans (PaleoWest, 2023). Recent excavations in the Chuckwalla Valley indicate that fine-grained Pleistocene playa deposits may underlie Quaternary alluvial fan valley axis deposits at shallow depth (PaleoWest, 2023).

The museum locality records searches from the NHMLAC, SDMHN, and the WSC did not identify any previously recorded vertebrate localities within the Project boundaries; however, the museums did identify several nearby localities from within similar Quaternary sedimentary deposits (PaleoWest, 2023). The nearby localities in the Chuckwalla Valley produced Quaternary vertebrate fossils of kangaroo rat, pocket mouse, rattlesnake, and horned lizard from Ford Dry Lake; horse, camel, bison, and muskox from near the Eagle Mountains and Coxcomb Mountains; and catfish, desert tortoise, gopher snake, horned lizard, desert iguana, finch, grebe, saber-toothed cat, bighorn sheep, mule deer, kit fox, camel, llama, rabbit, gopher, kangaroo rat, ground squirrel, harvest mouse, and pocket mouse from the Desert Harvest and Desert Sunlight solar projects (PaleoWest, 2023). The SBCM did not have record of fossil localities in the Project area or within a 5-mile buffer.

3.14.1.3. Field Survey

A pedestrian survey was conducted for the Project between April 3–6 and April 10–13, 2023, by a PaleoWest BLM-permitted Paleontological Field Director with assistance from PaleoWest Staff Paleontologists. The purpose of the field survey was to inspect the ground surface visually for exposed fossils, evaluate geologic exposures for their potential to contain buried fossils, and assist in determining where additional paleontological mitigation may be necessary prior to or during Project development. The survey was conducted for the entire Project site and along the gen-tie route, covering approximately 3,867 acres, using evenly spaced, 10–30-meter (m) parallel transects. Project areas obscured by heavy vegetation, agricultural mulch, or developed roads were not comprehensively examined because of lack of visibility of the underlying geological unit.

Based on the field survey, the Project area is underlain by moderately consolidated, light brown to light tan Quaternary alluvium consisting predominantly of clay, silt, and coarse-grained sand with both remnant and active alluvial surfaces, which include periodically inundated wash channels. The field observations of the Quaternary nonmarine conglomerate unit (Qc, Qco), observed locally along the proposed gen-tie route, indicate the unit is likely not a true conglomerate but rather a developing desert pavement surface composed of coarse angular metamorphic and igneous clasts on top of a finer-grained alluvial fan deposit (PaleoWest, 2023).

A total of 31 paleontological localities were identified on the surface of the Project area during fieldwork. Four significant vertebrate fossils were documented and collected for curation at the WSC during the paleontological survey of the Project area. The significant fossils include specimens of rabbit and turtle. Also, 27 nonsignificant fossils were observed during the paleontological field survey. The nonsignificant fossils were poorly preserved unidentifiable vertebrate bone and ubiquitous turtle shell; therefore, they were documented but not collected. All of the identified localities were found within the Quaternary alluvium (Qal) geologic unit (PaleoWest, 2023).

The occurrence of fossil remains in the Project area from rabbits/hares (*Lepus*, Leporidae) and tortoises (Testudinidae) is expected for the Desert Center area as both are endemic taxa, and their tendency to burrow underground would increase their chances of preservation should they die in their dens. Remains of these taxa are common in Pleistocene deposits in the Mojave Desert, though remains of *Lepus* are rare north of Interstate 10 (PaleoWest, 2023). The presence of burrowing as an agent of preservation suggests more fossils may be preserved in the subsurface of the Project area and may be encountered during ground-disturbing activities.

3.14.1.4. Paleontological Sensitivity

Fieldwork results confirmed surface fossils are present in the Project area. All visible surface fossils were identified during the field survey and the significant fossils were collected and curated. Additional surface or near-surface fossils may be exposed by ongoing eolian and alluvial processes that rework or remove thin layers of sediment that may obscure fossils (PaleoWest, 2023). The Quaternary alluvium throughout the Project area has proven conducive to the preservation of vertebrate remains and may contain an unknown number of buried fossil resources in the subsurface, particularly if fine-grained playa deposits are encountered at depth. As such, PaleoWest recommended the paleontological resource potential for Quaternary alluvium be assigned **PFYC 4 (High)**. The Quaternary nonmarine conglomerates (Qc, Qco of Jennings [1967]) have not produced any fossil resources in the Project area or vicinity; however, field observations indicate Quaternary nonmarine conglomerate (Qc, Qco) in the Project area is likely not a true conglomerate but rather a developing desert pavement surface on top of an alluvial fan deposit. The Quaternary deposits beneath the desert pavement are of an appropriate age to preserve fossil resources and similar lithologies have been known to yield significant paleontological resources elsewhere in the

Chuckwalla Valley (PaleoWest, 2023). PaleoWest recommended the areas mapped as Quaternary nonmarine conglomerates be assigned **PFYC 3a (Moderate)**.

3.14.2. Regulatory Framework

3.14.2.1. Federal Laws, Regulations, and Policies

Paleontological Resources Preservation Act (PRPA) of 2009. The PRP was part of the Omnibus Public Lands Management Act (OPLMA) of 2009. The PRPA requires the Secretary of the Interior to manage and protect paleontological resources on federal land using scientific principles and expertise and requires federal agencies to develop appropriate plans for inventorying, monitoring, and the scientific and educational use of paleontological resources, in accordance with applicable laws, regulations, and policies. Where possible, these plans should emphasize interagency coordination and collaborative efforts with non-federal partners, the scientific community, and the general public. The PRPA is the authority for federal land managing agencies for permits to collect paleontological resources, as well as curation of these resources in an approved repository. It provides authority for the protection of significant paleontological resources on federal lands including criminal and civil penalties for fossil theft and vandalism.

The PRPA defines a paleontological resource as any fossilized remains, traces, or imprints of organisms, preserved in or on the earth's crust, that are of paleontological interest and that provide information about the history of life on earth.

Antiquities Act of 1906. The Antiquities Act was the first law enacted to specifically establish that archaeological sites on public lands are important public resources. It obligated federal agencies that manage public lands to preserve the scientific, commemorative, and cultural values of such sites. This Act does not refer to paleontological resources specifically; however, the Act does provide for the protection of "objects of antiquity" (understood to include paleontological resources) by various federal agencies not covered by the PRPA.

The Federal Land Policy and Management Act of 1976. The Federal Land Policy and Management Act (FLPMA) (43 USC 1701 1782) authorizes inventories and monitoring surveys of paleontological resources on federal land managed by the BLM, which issues a permit for collecting paleontological resources. It also directs the BLM to develop management plans that include public education about paleontological resources and procedures for collection and minimization of impacts to resources.

The BLM defines a significant paleontological resource as any paleontological resource considered to be of scientific interest, including most vertebrate fossil remains and traces, and certain rare or unusual invertebrate and plant fossils. A significant paleontological resource is considered to be scientifically important because it is a rare or previously unknown species, it is of high quality and well preserved, it preserves a previously unknown anatomical or other characteristic, provides new information about the history of life on earth, or has identified educational or recreational value (BLM, 2008).

National Environmental Policy Act of 1969. The National Environmental Policy Act (NEPA) (USC § 4321 et seq.; 40 Code of Federal Regulations, § 1502.25), as amended, directs federal agencies to "Preserve important historic, cultural, and natural aspects of our national heritage (Section 101(b)(4))." The current interpretation of this language has included scientifically important paleontological resources among those resources that may require preservation.

3.14.2.2. State Laws, Regulations, and Policies

California Environmental Quality Act (CEQA) (Public Resources Code Division 13 – Environmental Quality) and CEQA Guidelines (California Code of Regulations Title 14, Division 6, Chapter 3). CEQA declares that it is state policy to: "take all action necessary to provide the people of this state with...historic

environmental qualities.” It further states that public or private projects financed or approved by the state are subject to environmental review by the state. All such projects, unless entitled to an exemption, may proceed only after this requirement has been satisfied. CEQA requires detailed studies that analyze the environmental effects of a proposed project. In the event that a project is determined to have a potential significant environmental effect, CEQA requires that alternative plans and mitigation measures be considered. The State CEQA Guidelines reflect the requirements set forth in the Public Resources Code, as well as court decisions interpreting the statute and practical planning considerations and define procedures, types of activities, persons, and public agencies that are required to comply with CEQA.

If paleontological resources are identified as being within a project study area, the sponsoring agency must take those resources into consideration when evaluating project effects. The level of consideration may vary with the importance of the resource.

California Public Resources Code - PRC § 5097.5 and § 30244. A person shall not knowingly and willfully excavate upon, or remove, destroy, injure, or deface, any historic or prehistoric ruins, burial grounds, archaeological or vertebrate paleontological site, including fossilized footprints, inscriptions made by human agency, rock art, or any other archaeological, paleontological or historical feature, situated on public lands, except with the express permission of the public agency having jurisdiction over the lands. The code includes rules for legal punishment and restitution. Where development would adversely impact archaeological or paleontological resources as identified by the State Historic Preservation Officer, reasonable mitigation measures shall be required.

3.14.2.3. Local Laws, Regulations, and Policies

Riverside County General Plan. The Multipurpose Open Space Element of the Riverside County General Plan identifies a number of policies intended to minimize impacts to paleontological resources. It also includes a Paleontological Sensitivity Resources map indicating lands with low, undetermined, or high potential for finding paleontological resources. The following policies apply to the portions of the Project area within County- and privately owned lands (Riverside County, 2015):

- **Policy OS 19.6.** Whenever existing information indicates that a site proposed for development has high paleontological sensitivity as shown on Figure OS-8, a paleontological resource impact mitigation program (PRIMP) shall be filed with the County Geologist prior to site grading. The PRIMP shall specify the steps to be taken to mitigate impacts to paleontological resources.
- **Policy OS 19.7.** Whenever existing information indicates that a site proposed for development has low paleontological sensitivity as shown on Figure OS-8, no direct mitigation is required unless a fossil is encountered during site development. Should a fossil be encountered, the County Geologist shall be notified and a paleontologist shall be retained by the project proponent. The paleontologist shall document the extent and potential significance of the paleontological resources on the site and establish appropriate mitigation measures for further site development.
- **Policy OS 19.8.** Whenever existing information indicates that a site proposed for development has undetermined paleontological sensitivity as shown on Figure OS-8, a report shall be filed with the County Geologist documenting the extent and potential significance of the paleontological resources on site and identifying mitigation measures for the fossil and for impacts to significant paleontological resources prior to approval of that department.
- **Policy OS 19.9.** Whenever paleontological resources are found, the County Geologist shall direct them to a facility within Riverside County for their curation, including the Western Science Center in the City of Hemet.

The proposed Project would comply with all federal, State, and County requirements regarding the development of applicable plans and reports and the recovery and curation of any paleontological resources found.

3.14.3. Methodology for Analysis

Due to the nature of the fossil record, paleontologists cannot know either the quality or the quantity of fossils present in a geologic unit prior to natural erosion or human-caused exposure. Therefore, in the absence of surface fossils, it is necessary to assess the sensitivity of rock units based on their known potential to produce scientifically significant fossils elsewhere within the same geologic unit (both within and outside of the study area) or a unit representative of the same depositional environment. The paleontological resources assessment is based on the paleontological sensitivity of the underlying geologic units as determined by: (1) records searches at the Natural History Museum of Los Angeles County (NHMLAC), San Bernardino County Museum (SBCM), San Diego Natural History Museum (SDNHM), and Western Science Center (WSC); (2) a review of the relevant geologic and paleontologic literature for the project area; and (3) a field survey of the Project site, as detailed in the Paleontological Resource Survey Report (PaleoWest, 2023). The Project site was identified with areas of high and moderate potential for paleontological resources and are evaluated for the amount and type of construction ground disturbance and construction and operational activities that would result in impacts to paleontological resources. No areas of very high potential for paleontological resources were identified within the Project site.

3.14.4. CEQA Significance Criteria

The criteria used to determine the significance of potential Paleontological Resources impacts are based on Appendix G of the State CEQA Guidelines. The proposed Project would result in a significant impact under CEQA related to Paleontological Resources if the Project would:

- Directly or indirectly destroy a unique paleontological resource or site or unique geologic feature (Impact PR 1).

The County of Riverside's Environmental Assessment Form includes Paleontological Resources significance criteria that are identical to the above-listed CEQA criteria and are thus not analyzed separately.

3.14.5. Proposed Project Impact Analysis

During the scoping effort conducted by the County of Riverside no concerns related to Paleontological Resources were raised.

Impact PR-1. The project would directly or indirectly destroy a unique paleontological resource or site or unique geologic feature.

LESS THAN SIGNIFICANT WITH MITIGATION. As defined, significant paleontological resources are determined to be fossils or assemblages of fossils that are unique, unusual, rare, uncommon, or diagnostically important. Most impacts on paleontological resources are direct impacts, resulting from ground-disturbing activities that would damage or destroy resources. The result of resource recovery is scientific net gains in the discovery of previously unrecorded paleontological resources. Indirect impacts include the potential for increased unauthorized collection of fossils and other paleontological resources resulting from larger numbers of people in the vicinity (i.e., personnel involved in construction and operation of the facilities).

Since most of the Project site has nearly level to gently sloping topography, no mass grading would be required; however, some areas of the solar site would be affected by some form of ground disturbance, including mowing, grubbing, minor grading, compaction, and excavation. Some of the areas where facilities and arrays would be located would require light grubbing for leveling and trenching. Construction

would require ground disturbance for construction of the solar arrays, substation, O&M building, septic system, BESS foundations, access roads, gen-tie line towers, and other features. This ground disturbance could result in direct impacts to the paleontologically sensitive geologic rock units that could adversely affect (damage or destroy) significant paleontological resources. The desktop paleontological assessment conducted for the Project by PaleoWest identified paleontological resources in the Project vicinity and the paleontological field survey identified paleontological resources on the Project site, including four significant vertebrate fossils from rabbits/hares (*Lepus*, Leporidae) and tortoises (Testudinidae) (PaleoWest, 2023). PaleoWest assigned PFYC classifications of High (PFYC 4) to the Quaternary alluvium (Qal) and Moderate (PFYC 3a) to the mapped Quaternary nonmarine conglomerates (Qc, Qco). Therefore, significant paleontological resources could be encountered and adversely impacted (damaged or destroyed) during ground disturbance associated with the Easley Project construction.

The moderate to high sensitivity of the formations and known and potential paleontological resources underlying the Project site necessitates the implementation of a Paleontological Resources Monitoring and Mitigation Plan (PRMP) and worker awareness training to minimize the impact of construction-related activities. Mitigation Measures PR-1 through PR-4 would require a PRMP, paleontological awareness training, paleontological monitoring where appropriate, and mitigation and monitoring reporting. With implementation of Mitigation Measures PR-1 through PR-4 that would require worker training, monitoring during ground disturbing activities, and mitigation and recovery procedures in the event of a discovery, potential adverse impacts on paleontological resources within the Project area during construction and operation of the solar facilities would be reduced to a less-than-significant level.

Indirect effects include the potential for increased unauthorized collection of fossils and other paleontological resources resulting from increased number of people in the vicinity during construction. Implementation of Mitigation Measures PR-1 through PR-4, and the installation of fencing around the perimeter of the Project facility, would minimize the potential for indirect impacts to paleontological resources by limiting unauthorized access to the site, putting in place a monitoring program to ensure fossil identification and recording during construction, and providing an educational program to workers so that paleontological resources are avoided or reported to qualified professionals.

Mitigation Measures for Impact PR-1

- MM PR-1** **Paleontological Resource Monitoring and Mitigation Plan (PRMP).** See Section 3.14.8 (Mitigation Measures) for full text.
- MM PR-2** **Worker Environmental Awareness Program (WEAP).** See Section 3.14.8 (Mitigation Measures) for full text.
- MM PR-3** **Paleontological Monitoring and Fossil Recovery.** See Section 3.14.8 (Mitigation Measures) for full text.
- MM PR-4** **Paleontological Resources Monitoring Report.** See Section 3.14.8 (Mitigation Measures) for full text.

Significance After Mitigation

The impact would be less than significant.

*** The impact analyses for all Project alternatives have been moved to EIR Section 5. ***

3.14.6. Cumulative Impacts

Geographic Scope

The geographic scope of cumulative impacts to paleontological resources is eastern Riverside County. Cumulative development in eastern Riverside County in the Desert Center region of Southern California has the potential to directly or indirectly destroy paleontological resources, particularly during earth moving activities such as grading and excavation in all areas of the Chuckwalla Valley underlain by the same geologic units as the proposed Project; in particular, areas of Quaternary alluvial sediments (Qal) that have a BLM PFYC of Class 4 (High) paleontological sensitivity, or underlain by other geologic units with high to very high paleontological sensitivity. In addition, collection of fossil materials, dislodging of fossils from their preserved environment, and/or physical damage of fossil specimens could also adversely affect paleontological resources. Together these potential direct and indirect impacts associated with development in the cumulative scenario could result in a cumulatively significant impact to paleontological resources.

Cumulative Impact Analysis

As discussed above, there is a potential for paleontological resources on the Project site to be affected during ground-disturbing activities associated with the Project construction (Impact PR-1). A significant cumulative impact would occur if the impacts of multiple projects combined to result in the loss of paleontological resources that could provide information about ancient life in the Chuckwalla Valley. The large amount of ground disturbance proposed from projects in this region is likely to result in some loss of fossil resources; particularly, if ground-disturbing projects do not implement measures to avoid or minimize impacts. This would result in a significant cumulative impact. The Easley Project, as well as the other solar development projects in eastern Riverside County, would be required to provide mitigation for any impacts to paleontological resources in accordance with provisions of CEQA, as well as with regulations currently implemented by the County and BLM, the PRP Act, and the proposed guidelines of the SVP. Implementation of Mitigation Measures PR-1 through PR-4 would ensure that the proposed Project would avoid and minimize impacts on paleontological resources to the maximum extent feasible. Therefore, the Easley Project's incremental contribution to cumulative impacts for paleontological resources would not be cumulatively considerable.

Mitigation Measures for Cumulative Impacts

- MM PR-1** **Paleontological Resource Monitoring and Mitigation Plan (PRMP)**
- MM PR-2** **Worker Environmental Awareness Program (WEAP)**
- MM PR-3** **Paleontological Monitoring and Fossil Recovery**
- MM PR-4** **Paleontological Resources Monitoring Report**

Significance After Mitigation

~~The impact would be less than significant. Cumulative impacts would be less than significant and the Project's contribution to those impacts would not be cumulatively considerable.~~

3.14.7. Mitigation Measures

- MM PR-1** **Paleontological Resource Monitoring and Mitigation Plan (PRMP).** Prior to the start of any Project-related construction activities, the Applicant shall retain a County- and BLM-approved paleontologist (Project Paleontologist) to prepare and implement a project-specific PRMP to be approved by the County and BLM. The Project Paleontologist shall hold a BLM-issued Paleontological Resource Use Permit and be responsible for implemen-

ting all the paleontological conditions of approval and for using qualified paleontologists to assist in work and field monitoring.

At a minimum, information to be contained in the PRMP, in addition to other information required under industry standard, Society of Vertebrate Paleontology standards, and BLM paleontology program policy and standards, is as follows:

- Identification (name) and qualifications of the Project Paleontologist and qualified paleontological monitors to be employed for grading operations monitoring.
- Identification of personnel with authority and responsibility to temporarily halt or divert grading equipment to allow for recovery of large specimens.
- Description of the project site and planned earthwork and excavation.
- A site-specific plan and map prepared by the Project Paleontologist which identifies construction impact areas with sediments of High (PFYC 4) and Moderate (PFYC 3a) sensitivity for encountering significant paleontological resources and the approximate depths at which those resources are likely to be encountered for each Project component.
- The PRMP shall require the qualified paleontological monitor(s) to monitor all construction-related earth-moving activities in sediments determined to have a High (PFYC 4) sensitivity.
- The PRMP shall define monitoring procedures and methodology and shall specify that sediments of Moderate (PFYC 3a) or undetermined sensitivity shall be monitored on a part-time basis (as determined by the Project Paleontologist). Sediments with very low or low potential will not require paleontological monitoring (PFYC 1 and 2).
- The PRMP shall detail methods of recovery, preparation, and analysis of specimens, the final curation location of specimens at the repository identified in the BLM-issued Paleontological Resource Use Permit, data analysis, and reporting. Where possible, recovery is preferred over avoidance in order to mitigate the potential for looting of paleontological resources.
- The PRMP shall specify that all paleontological work undertaken by the Applicant on public lands administered by BLM shall be carried out by qualified, permitted paleontologists with the appropriate current BLM Paleontological Resources Use Permit.
- Identification of personnel with authority and responsibility to temporarily halt or divert ground-disturbance activities to allow for recovery of large specimens.

The PRMP shall be submitted to the County and BLM for review and approval 60 days prior to start of Project construction. The PRMP must be approved by the County and BLM prior to the Notice To Proceed.

MM PR-2

Worker Environmental Awareness Program (WEAP). Prior to the start of Project-related construction activities, a paleontological component to the WEAP shall be developed by the Project Paleontologist. The WEAP shall address the potential to encounter paleontological resources in the field, the sensitivity and importance of these resources, and the legal obligations to preserve and protect such resources. The training program shall also include the set of reporting procedures that workers are to follow if paleontological resources are encountered during Project activities. The WEAP may be combined with other environmental training programs for the Project. All field personnel will receive WEAP training on paleontological resources prior to Project-related construction activities.

MM PR-3 Paleontological Monitoring and Fossil Recovery. The PRMP shall identify monitoring frequency and intensity of all areas of the Project site, particularly in areas underlain by geologic units assigned paleontological sensitivity of High (PFYC 4) or Moderate (PFYC 3a). Monitoring will entail the visual inspection of excavated or graded areas and trench sidewalls. If the Project Paleontologist determines full-time monitoring is no longer warranted, based on the geologic conditions at depth, he or she may recommend to the BLM Authorized Officer that monitoring be reduced or cease entirely.

In the event that a paleontological resource is discovered, the paleontological monitor will have the authority to temporarily divert the construction equipment around the find until it is assessed for scientific significance and, if appropriate, collected. If the resource is determined to be of scientific significance, the Project Paleontologist shall complete the following:

- **Salvage of Fossils.** If fossils are discovered, all work in the immediate vicinity shall be halted to allow the paleontological monitor, and/or Project Paleontologist to evaluate the discovery and determine if the fossil may be considered significant. If the fossils are determined to be potentially significant, the Project Paleontologist (or paleontological monitor) will recover them following standard field procedures for collecting paleontological as outlined in the PRMP prepared for the Project. The Project Paleontologist shall have the authority to temporarily direct, divert or halt construction activity to ensure that the potentially significant fossil(s) can be removed in a safe and timely manner.
- **Fossil Preparation and Curation.** The museum that has agreed to accept fossils that may be discovered during Project-related excavations will be identified on the Paleontological Resources Use Permit held by the Project Paleontologist and in the PRMP. Upon completion of Project ground-disturbing activities, all significant fossils collected shall be prepared in a properly equipped laboratory to a point ready for curation. Preparation may include the removal of excess matrix from fossil materials and stabilizing or repairing specimens. During preparation and inventory, the fossils specimens shall be identified to the lowest taxonomic level practical prior to curation at an accredited museum. The fossil specimens must be delivered to the County- and BLM-approved repository (identified on the permit and in the PRMP) and receipt(s) of collections submitted to the County and BLM no later than 60 days after all ground-disturbing activities are completed.

MM PR-4 Paleontological Resources Monitoring Report. The Applicant shall ensure preparation of a paleontological resource mitigation and monitoring report by the Project Paleontologist following completion of ground-disturbing activities. The contents of the report shall include, but not be limited to, a description and inventory list of recovered fossil materials (if any); a map showing the location of paleontological resources found in the field; determinations of scientific significance; proof of accession of fossil materials into the pre-approved museum or other repository; and a statement by the Project Paleontologist that Project impacts to paleontological resources have been mitigated. The report shall be certified by the professionally qualified Project Paleontologist responsible for the content of the report and submitted to the County and BLM. In addition, all appropriate fossil location information shall be submitted to the Western Information Center, San Bernardino County Museum, and Los Angeles County Museum of Natural History, at a minimum, for incorporation into their Regional Locality Inventories.

3.15. Population and Housing

This section evaluates the impacts on population and housing resulting from implementation of the Project. The analysis in this section: presents an overview of existing conditions that influence population and housing, describes the applicable regulations, identifies the criteria used for determining the significance of environmental impacts, and describes the potential impacts to population and housing. An impact analysis and comparison of project alternatives is included in Section 5.

3.15.1. Environmental Setting

3.15.1.1. Population

The proposed Project area is in Riverside County, which is the fourth most populous county in California (CA DOF, 2022). Table 3.15-1 provides a summary of the existing population, housing, and employment conditions for Desert Center, CA (the general location of the proposed Project) and Riverside County and San Bernardino County (counties where the construction workforce would largely be recruited).

Table 3.15-1. Year 2021 Existing Conditions – Population, Housing, and Employment: Desert Center, Riverside County, and San Bernardino County.

Location	Population	Housing Units		Employment	
		Total Units	Vacancy Rate	Total Employed ¹	Unemployment Rate
Desert Center	288	241	35.0%	268	0%
Riverside County	2,435,525	863,784	10.5%	1,130,500	3.7%
San Bernardino County	2,187,665	740,654	8.9%	990,100	3.6%

1: Accounts for population greater than 16 years of age and in Labor Force.

Source: CA DOF, 2022; CA EDD, 2022, US Census Bureau 2021a, 2021b, 2021c.

Population estimates, future projections, and average annual growth rates for Riverside County and San Bernardino County are summarized in Table 3.15-2. There was no data available for Desert Center regarding population projections, so it has not been included in Table 3.15-2. Populations from 2020 through 2050 are listed with an average annual growth number and rate for the communities within the study area. The population growth in both Riverside County and San Bernardino County are expected to increase slowly during the next three decades, with Riverside County projected to have a slightly higher annual growth rate than San Bernardino County.

Table 3.15-2. Population Estimates, Projections, and Average Annual Growth Rates

	Riverside County	San Bernardino County
Population, 2020	2,449,299	2,184,112
Projected Population, 2025	2,593,906	2,273,291
Average Annual Growth Rate, 2020-2025	1.18%	0.82%
Projected Population, 2030	2,728,068	2,368,002
Average Annual Growth Rate, 2025-2030	1.03%	0.83%
Projected Population, 2040	2,933,038	2,536,592
Average Annual Growth Rate, 2030-2040	0.75%	0.71%
Projected Population, 2050	3,059,095	2,681,796
Average Annual Growth Rate, 2040-2050	0.42%	0.57%

Source: CA DOF 2021.

3.15.1.2. Housing

The current occupied and vacant housing estimates are presented in Table 3.15-1 for communities and counties within the study area of Desert Center, Riverside County, and San Bernardino County. The vacancy rate of Desert Center is high with about 35 percent of the total housing units vacant. Riverside County and San Bernardino County have relatively low vacancy rates, with approximately 9 percent and 4 percent of the total housing units vacant, respectively.

3.15.2. Regulatory Framework

There are no federal, state, or local regulations, plans, and standards for population and housing that apply to the proposed Project.

3.15.3. Methodology for Analysis

The regulations implementing CEQA state that economic or social factors of a project may be included in a CEQA document but shall not be treated as significant effects on the environment. However, economic or social effects of a project may be used to determine the significance of physical changes caused by the Project. Additionally, economic, social, and housing factors should be considered by public agencies together with technological and environmental factors in deciding whether changes in a project are feasible to reduce or avoid the significant effects on the environment.

To determine whether the proposed Project would induce population growth, the availability of the local workforce and population in the region was analyzed. It was assumed that most construction workers would be drawn from communities located within Riverside County and San Bernardino County, which have the largest concentration of construction workers in proximity to the proposed Project area. It is anticipated that most projected construction workforce would likely seek housing closer to the proposed Project area (within an hour driving distance) or seek temporary housing (such as seasonal, recreational, or occasional use housing; long-term visitor areas; and hotel and motels) during the week and commute an average 150 miles round trip per day and commute home over the weekend.

3.15.4. CEQA Significance Criteria

The significance criteria listed below are from the Environmental Checklist Form in Appendix G of the State CEQA Guidelines. Under CEQA, the proposed Project and alternatives would have significant impacts on population and housing if they would result in:

- *Induce substantial unplanned population growth in an area, either directly (for example, by proposing new homes and businesses) or indirectly (for example, through extension of roads or other infrastructure) (see Impact PH-1).*

The following additional significance criteria from the County of Riverside Environmental Assessment form are used in this analysis. A project could have potentially significant impacts if it would:

- *Cumulatively exceed official regional or local population projections (see Section 3.14.9, Cumulative Impacts)*

The following CEQA significance criteria from Appendix G were not included in the analysis:

- *Displace substantial numbers of existing people or housing, necessitating the construction of replacement housing elsewhere.*

The proposed Project would be constructed on vacant desert land and would not remove any existing structures. The Project would not cause displacement of existing housing or people, and would not necessitate construction of replacement housing elsewhere.

The following CEQA significance criteria from the County's Environmental Assessment Form were not included in the analysis for the following reasons:

- *Create a demand for additional housing, particularly housing affordable to households earning 80% or less of the County's median income.*

The proposed Project would not create a demand for additional housing due to the temporary nature of Project construction activities and the nominal workforce required during Project operation. During construction, workers would commute to the Project site from nearby communities in Riverside County and San Bernardino County.

- *Displace substantial numbers of people, necessitating the construction of replacement housing elsewhere.*

Similar to the above, the proposed Project would not displace substantial existing housing or people due to the fact that there are no existing residential buildings on site, and no housing structures would be removed as part of the Project. As a result, the construction of replacement housing is not necessary. In addition, the Project workforce would be sourced locally, and the proposed Project does not contain a residential component.

- *Affect a County Redevelopment Project Area.*

The proposed Project area and its immediate vicinity would not be within a County Redevelopment Project Area.

3.15.5. Proposed Project Impact Analysis

The scoping effort conducted by the Riverside County Planning Department revealed several public concerns related to population and housing. Public concerns included a potential for decreased property values due to the proximity of the Project, which is an economic effect and, therefore, not a significant impact under CEQA (see Section 3.15.3). For informational purposes, concerns related to property values are addressed in Section 3.12, Land Use and Planning, and Section 4.7 (Other Public Concerns).

Impact PH-1. The Project could induce substantial unplanned population growth in an area, either directly (for example, by proposing new homes and businesses) or indirectly (for example, through extension of roads or other infrastructure).

LESS THAN SIGNIFICANT. During the 20-month construction period of the proposed Project, the on-site workforce is expected to reach peak of approximately 530 individuals with an average construction-related on-site workforce of 320 individuals. The construction workforce would largely be recruited from within Riverside and San Bernardino Counties. Riverside County has the largest concentration of construction workers close to the Project area. It is anticipated that many workers are likely to engage in weekly commuting or otherwise temporarily relocate to the Desert Center region while working at the Project area.

In 2021, Desert Center's unemployment rate averaged 0 percent, Riverside County's unemployment rate averaged 3.7 percent, and San Bernardino County's unemployment rate averaged 3.6 percent. Based on the most recent unemployment rates, it is anticipated that most construction, operation, and maintenance workforce would come from the existing labor pool in nearby communities in Riverside or San Bernardino Counties.

As illustrated in Table 3.15-1, Year 2021 Existing Conditions – Population, Housing, and Employment: Desert Center, Riverside County, and San Bernardino County, vacancy rates in the study areas are high, ranging from about 9 to 35 percent. Within the Desert Center area, there are approximately 115 vacant units. Riverside County as a whole has approximately 103,919 vacant units. There are sufficient vacant housing units within the local communities to support the number of construction workers to the extent that they are not only drawn from local communities. The proposed Project would not trigger the need for construction of new housing and would not induce substantial permanent growth to the regional population levels.

During operation of the proposed Project, up to 10 permanent staff members could be on the site at any one time for ongoing facility maintenance and repairs. ~~Alternatively, approximately 2 permanent staff and 8 Project operators would be located off site and would be on call to respond to alerts generated by the monitoring equipment at the Project site.~~ Security personnel would be on-call. These staff would also be sourced from nearby communities in Riverside County and San Bernardino County. The permanent staff are not anticipated to increase the local population and vacancy rates within the study area offer ample available housing to operational employees wishing to relocate within the local study area.

Decommissioning of the proposed Project would require removal of the solar equipment and facilities and transportation of all components off site. Decommissioning activities would require similar equipment and workforce as construction but would be substantially less intense.

Overall, the proposed Project's impact on population growth in the Project area and demand for additional housing from construction, operation, and decommissioning would be less than significant.

Similar to the solar and energy storage facility, workers for the gen-tie line (a peak of up to 530 workers for a 20-month period) would be sourced from nearby communities in Riverside County and San Bernardino County. Given the unemployment and vacancy rates in the Desert Center area and Riverside County and San Bernardino County as a whole, any potential population growth in the Project area would either be temporary or insubstantial during construction and operation of the proposed Project and the existing vacant housing units would be sufficient to support the Project. Impacts would be less than significant.

Mitigation Measures for Impact PH-1

No mitigation would be required.

Significance After Mitigation

This impact would be less than significant.

*** The impact analyses for all Project alternatives have been moved to EIR Section 5. ***

3.15.6. Cumulative Impacts

Geographic Scope

The geographic scope of the cumulative impacts analysis includes populated areas within a two-hour worker commute distance of the proposed Project site near Desert Center, which would extend out into the rest of Riverside County and into San Bernardino County. This geographic scope would include all projects listed in Tables 3.1-1 and 3.1-2.

Solar and Energy Storage Facility

Short-term cumulative impacts to population and housing would occur during the construction and decommissioning periods when overlapping construction schedules of multiple projects create a demand for

workers that may not be met by the local labor force, thereby inducing in-migration of non-local labor and their households. Operational cumulative population and housing impacts could occur when multiple projects cause a substantial increase in population in an area that leads to demand for housing that exceeds available capacity.

Construction of the present and reasonably foreseeable future development projects shown in Tables 3.1-1 and 3.1-2 may overlap with construction of the proposed Project. Under the conservative assumption that peak construction periods overlap for all reasonably foreseeable projects, there would be an increased demand for temporary housing units in the cumulative area. As discussed under Section 3.15.1, the vacancy rates for housing units are moderately high (35 percent in Desert Center) and there are a number of temporary housing options available as well. There is an ample supply of housing units to accommodate workers drawn from outside the two-hour commute area. Therefore, cumulative impacts in the cumulative scenario on housing are projected to be less than significant. The proposed Project would contribute an additional peak labor need of approximately 530 individuals. Given the availability of housing units, the incremental effects of the Project, when considered together with other past, present, and reasonably foreseeable future projects, would not result in a considerable contribution to cumulative population or housing impacts.

500 kV Gen-tie Line

Cumulative impacts of the gen-tie line would be the same as for the solar and energy storage facility with regards to impacts to population and housing in the study area. The gen-tie line would not make a considerable contribution to cumulative impacts because any potential population growth in the Project area due to the construction and operation of the Project gen-tie line would either be temporary or insubstantial during construction and operation of the proposed gen-tie line.

Mitigation Measures for Cumulative Impacts

No mitigation would be required.

Significance After Mitigation

The cumulative impact would be less than significant. The Project's incremental contribution to impacts to population and housing would not be cumulatively considerable.

3.15.7. Mitigation Measures

No mitigation would be required.

3.16. Public Services and Utilities

This section evaluates the impacts on public services and utilities resulting from implementation of the proposed Project. The analysis in this section: presents an overview of existing conditions that influence public services and utilities, describes the applicable regulations, identifies the criteria used for determining the significance of environmental impacts, and describes the potential impacts on public services and utilities of the proposed Project. An impact analysis and comparison of project alternatives is included in Section 5.

3.16.1. Environmental Setting

3.16.1.1. Fire Protection

Riverside County Fire Department, in cooperation with California Department of Forestry and Fire Protection (CAL FIRE), provides fire and emergency services to residents of unincorporated areas of Riverside County (Riverside County Fire Department, 2023a). The closest Riverside County Fire Department/CAL FIRE station to the proposed Project location in the Desert Center area is Station 49 – Lake Tamarisk Station, located at 43880 Lake Tamarisk, Desert Center, about 0.3 miles southwest of the Project (Riverside County Fire Department, 2023b).

The BLM Fire and Aviation Program is responsible for fire and fuels management and protection of federal lands, identified as Federal Responsibility Areas, within the United States. The Fire and Aviation program includes fire suppression, preparedness, predictive services, fuels management, fire planning, community assistance and protection, prevention and education, and public safety. BLM establishes fire prevention orders and restrictions to assist with wildland fire prevention efforts throughout the public lands within the California Desert District, which portions of Inyo, Imperial, Kern, Mono, Los Angeles, San Bernardino, San Diego, and Riverside Counties.

3.16.1.2. Police Protection

The Riverside County Sheriff's Department's Colorado River Station provides service to the unincorporated area from Red Cloud Road on the west, to the Arizona state line on the east, and county line to county line on the north and south, which includes the Desert Center area. The Colorado River Station is located at 260 North Spring Street, Blythe, CA (Riverside County Sheriff, 2023), approximately 45 miles east of the proposed Project area.

The California Highway Patrol (CHP) is the primary law enforcement agency for State highways and roads. The CHP division covering highways within the Desert Center area is the Border Division. The California Highway Patrol Blythe Area serves the East Riverside County Region and is located at 430 South Broadway, Blythe, CA. This office patrols Interstate 10, State Route 78, and U.S. Route 95, as well as 500 miles of unincorporated Riverside County roadways (CHP, 2023).

The BLM has approximately 200 law enforcement rangers on staff who promote safety, security, and environmental protection of public lands, public land users, and employees. The BLMs law enforcement program draws its authority from federal law under federal jurisdiction. BLM law enforcement officers enforce federal laws and do not have authority to enforce state laws without written authorization from a sheriff, other authorized state official, or state law (BLM, 2023).

3.16.1.3. Emergency Medical Services

The Palo Verde Hospital, located at 250 North 1st Street, Blythe, CA, is the closest hospital to the proposed Project area. It provides intensive care and radiology services as well as surgery. The hospital has 51 patient

beds, consisting of 4 intensive care beds, and 2 surgical suites (Palo Verde Hospital, 2023). It is located approximately 45 miles east of the proposed Project area.

Desert Regional Medical Center, located about 65 miles to the west of Desert Center at 1150 North Indian Canyon Drive in Palm Springs, CA, is the second closest hospital to the proposed Project area. The medical center is the only designated Level II trauma center in the Coachella Valley and is equipped with 385 beds. The facility includes tertiary acute care services, critical care services, and a skilled nursing unit (Desert Care Network, 2023).

3.16.1.4. Parks

There are no recreation facilities, developments, or specific recreational attractions on the Project site. However, the surrounding area offers multiple outdoor recreational opportunities, including off-highway vehicle use, camping, rock hounding, and hiking. The Project is east of the Joshua Tree National Park and is near other recreational areas, such as the Palen-McCoy Wilderness Area and the Chuckwalla Mountains Wilderness Area. No local parks or Riverside County regional parks are located in the vicinity of the Project area near Desert Center (Riverside County RPOSD, 2023).

See Section 3.17, Recreation, for more information about recreation resources near the Project area.

3.16.1.5. Schools

The Desert Center Unified School District serves the Desert Center area where the proposed Project is located. The closest school to the Project area is Eagle Mountain School, which serves kindergarten through eighth grade students (CDE, 2023) and is located approximately 6 miles northwest of the Project area.

3.16.1.6. Libraries

The Riverside County Library System serves all Riverside County. The closest library branch to the proposed Project area is the Lake Tamarisk Branch located at 43880 Tamarisk Drive, Desert Center, CA (Riverside County Library System, 2023), about 0.5 miles south of the Project area.

3.16.1.7. Solid Waste Services

The following Table 3.16-1 lists the capacities of the active landfills near the Desert Center area. The closest landfill to the Project area is the Desert Center Landfill, located at 17991 Kaiser Road, Desert Center, CA, approximately 0.2 miles west of the northwest corner of the Project area.

Table 3.16-1. Landfill Capacities

Landfill Name	Total Capacity (cu.yd.)	Remaining Capacity (cu.yd.)	Remaining Capacity (percent)	Maximum Throughput (tons/day)
Blythe Sanitary Landfill (Cease operation estimated 2047)	6,229,670	3,834,470	61.55	400
Desert Center Landfill (Cease operation estimated 2041)	409,112	127,414	31.14	60

Sources: CalRecycle, 2023a and 2023b.

3.16.1.8. Utilities

Water in the Desert Center area is primarily provided from well water or Riverside County Service Area 51 (CSA 51). Wastewater is generally collected in septic tanks and ~~are~~^{is} not conveyed through a sewer system and treated at a centralized treatment plant. Southern California Edison provides electricity to the Desert

Center and surrounding areas (CEC, 2020a). Southern California Gas provides natural gas to the area (CEC, 2020b). Telecommunications are provided by AT&T, T-Mobile, Verizon, and Sprint (CPUC, 2023).

3.16.2. Regulatory Framework

There are no federal or local regulations, plans, and standards for public services and utilities that apply to the proposed Project.

3.16.2.1. State Laws, Regulations, and Policies

2010 Strategic Fire Plan for California. The 2010 Strategic Fire Plan for California was developed in coordination with the State Board of Forestry and Fire Protection and CAL FIRE to reduce and prevent the impacts of fire in California. Goal 6 of the Plan sets objectives to determine the level of suppression resources (staffing and equipment) needed to protect private and public state resources. Specific objectives include, but are not limited to, maintaining an initial attack policy which prioritizes life, property, and natural resources; determining suppression resources allocation criteria; analyzing appropriate staffing levels and equipment needs in relation to the current and future conditions; increasing the number of CAL FIRE crews for fighting wildfires and other emergency response activities; maintaining cooperative agreements with local, state, and federal partners; and implementing new technologies to improve firefighter safety, where available (State Board of Forestry and Fire Protection). The standards outlined are applicable to the fire protection agency serving unincorporated Riverside County.

California Integrated Waste Management Act of 1989. Assembly Bill 939 codified the California Integrated Waste Management Act of 1989 in the Public Resources Code and established a hierarchy to help the California Integrated Waste Management Board (CIWMB) and local agencies implement three major priorities under the Integrated Waste Management Act: source reductions; recycling and composting; and environmentally safe transformation and land disposal. Waste diversion mandates are included under these priorities. The duties and responsibilities of the CIWMB have since been transferred to the California Department of Resources Recycling and Recovery (CalRecycle) after the abolishment of the CIWMB in 2010, but all other aspects of the Act remain unchanged.

The Act requires all local and county governments to adopt a waste reduction measure designed to manage and reduce the amount of solid waste sent to landfills. This Act established reduction goals of 25 percent by the year 1995 and 50 percent by the year 2000. Senate Bill 1016 (2007) streamlines the process of goal measurement related to Assembly Bill 939 by using a disposal-based indicator: the per capita disposal rate. The per capita disposal rate uses only two factors: the jurisdiction's population (employment can be considered in place of population in certain circumstances) and the jurisdiction's disposal as reported by disposal facilities. CalRecycle encourages reduction measures through the continued implementation of reduction measures, legislation, infrastructure, and support of local requirements for new developments to include areas for waste disposal and recycling on site.

California Code of Regulations (Title 27). Title 27 (Environmental Protection) of the California Code of Regulations defines regulations and minimum standards for the treatment, storage, processing, and disposal of solid waste at disposal sites. The State Water Resources Control Board maintains and regulates compliance with Title 27 (Environmental Protection) of the California Code of Regulations by establishing waste and site classifications and waste management requirements for solid waste treatment, storage, or disposal in landfills, surface impoundments, waste piles, and land treatment units. The compliance of the proposed Project would be enforced by the Colorado River RWQCB Region 7 and the California Department of Resources Recycling and Recovery (CalRecycle) (formerly the California Integrated Waste Management Board). Compost facilities are regulated under CCR Title 14, Division 7, Chapter 3.1 Section 17850 through 17895, by CalRecycle. Permit requests, Reports of Waste Discharge, and Reports and

Disposal Site Information are submitted to the RWQCB and CalRecycle, and are used by the two agencies to review, permit, and monitor these facilities.

California Fire Code (CFC). Chapter 12 of the CFC provides provisions related to the installation, operation and maintenance of energy systems used for generating or storing energy to safeguard the public health, safety and general welfare from the hazards of fire, explosion or dangerous conditions in new and existing buildings, structures and premises, and to provide safety and assistance to fire fighters and emergency responders during emergency operations. Section 1207 of the 2022 CFC provides requirements for Electrical ESS. Battery Energy Storage Systems (BESS) greater than 600 kWh are required by the CFC to be UL (Underwriter's Laboratory) listed and have full-scale testing using the testing standard UL9540A. UL9540A tests a variety of fire and life safety features on the battery including thermal runaway, gas venting, and fire propagation.

3.16.3. Methodology for Analysis

This section considers the potential impact to and disruption of public services and utilities in the Desert Center area during Project construction and operation. Many public services and utilities would experience minor impacts. However, because of the potential need to disrupt services for extended periods of time during construction, some of the impacts may be moderate. The metrics used to compare alternatives would be the length of time required for construction of the different alternatives and whether that would result in a longer disruption time. If an alternative required a substantially longer construction timeframe than others or required substantially more services than others, this would also be used to compare impacts to public services.

3.16.4. CEQA Significance Criteria

The criteria used to determine the significance of potential public services and utilities impacts are based on Appendix G of the State CEQA Guidelines. The proposed Project would result in a significant impact under CEQA related to public services and utilities if the Project would:

- *Result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities; and/or result in the need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for any of the public services, which include (see Impact PSU-1):*
 - *Fire Protection;*
 - *Police Protection;*
 - *Schools;*
 - *Parks; and*
 - *Other Public Facilities.*
- *Require or result in the relocation or construction of new or expanded water, wastewater treatment, or storm water drainage, electric power, natural gas, or telecommunications facilities, the construction or relocation of which could cause significant environmental issues (see Impact PSU-2).*
- *Have sufficient water supplies available to serve the project and reasonably foreseeable future development during normal, dry and multiple dry years (see Impact PSU-3).*
- *Generate solid waste in excess of State or local standards, or in excess of the capacity of local infrastructure, or otherwise impair the attainment of solid waste reduction goals (see Impact PSU-4).*

- *Not comply with federal, state, and local management and reduction statutes and regulations related to solid waste (see Impact PSU-4).*

The County of Riverside's Environmental Assessment Form includes additional significance criteria, which were also used in the analysis. The additional criteria indicate that a project could have potentially significant impacts if it would:

- *Result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities; and/or result in the need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for any of the public services, which include (See Impact PSU-1):*
 - *Sheriff Services;*
 - *Libraries; or*
 - *Health Services.*
- *Not comply with federal, state and local statutes and regulations related to solid wastes including the County Integrated Waste Management Plan (CIWMP) (see Impact PSU-4).*

The following CEQA significance criteria from Appendix G were not included in the analysis and are not discussed further beyond this summary:

- *Result in construction of new facilities or the expansion of the existing following facilities:*
 - *Electricity;*
 - *Natural gas;*
 - *Communications systems;*
 - *Storm water drainage;*
 - *Street lighting;*
 - *Maintenance of public facilities, including roads; or*
 - *Other governmental services.*

The proposed Project would generate renewable energy that would have an overall beneficial effect on the electricity supply. The Project would not use any sources of natural gas. The Project would not require expansion of existing or new street lighting, storm water drainage, or other public facilities, including roads.

- *Conflict with any adopted energy conservation plans.*

The proposed Project would further the goals of the California Renewable Portfolio Standard (RPS) and other similar renewable programs in the state. The Project operation would have an overall beneficial effect on the electricity supply to the grid and would help decrease reliance on coal power. No conflicts with adopted energy conservation plans would occur.

3.16.5. Proposed Project Impact Analysis

The scoping effort conducted by the Riverside County Planning Department revealed several public concerns related to public services and utilities. Public concerns related to public services and utilities that were identified in the scoping process involved the waste that batteries cause when they are no longer useful, and the potential for an increased need for law enforcement. Waste caused by batteries would be handled appropriately, as discussed in Section 3.10, Hazards and Hazardous Materials, and in Appendix W, Hazardous Materials Management Plan (HMMP).

A commenter noted that the Lake Tamarisk sewage settlement ponds are on BLM-administered land within the perimeter of the proposed Project and suggested the sewage pond land needs to be assigned to Riverside County in care of County Service Area (CSA) 51. The sewage ponds referenced in this comment are located on BLM-administered land within the Easley Project boundaries (APN 808-230-005). Water and sewer services are provided to Lake Tamarisk by the County. The sewage ponds are part of a County facility that contains wastewater evaporation ponds with underground pipes to service Lake Tamarisk. Currently, the ponds and the facility are not fully used, and the County has no plans to expand the ponds/facility. The Easley Project would not impact the sewage settlement pond facility. Ingress/egress to the facility and access to the underground sewer lines would be maintained. Assignment of the ponds to CSA 51 would be a matter between BLM and Riverside County that is outside of the scope of the Easley Project.

Impact PSU-1. The Project would result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities; and/or result in the need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for public services.

LESS THAN SIGNIFICANT. Construction is anticipated to occur over a 20-month period and require an average construction-related on-site workforce of 320 individuals, with the peak workforce reaching approximately 530 individuals. As discussed in Section 3.15, Population and Housing, it is anticipated that the construction workforce would be drawn from communities within Riverside County and San Bernardino County and would not induce substantial permanent growth to the regional population levels.

After the construction phase, up to 10 permanent staff could be on the site at any one time for ongoing facility maintenance and repairs. These 10 operation personnel would also come from local communities and would not contribute to a significant population increase.

Decommissioning is anticipated to require a workforce similar to or slightly less than that required for construction. The workforce would be drawn from communities within Riverside County and San Bernardino County and would not induce substantial permanent population growth at the regional or local level.

Fire Protection

The Project area is not within a designated area of very high or high fire hazard, according to the CAL FIRE Fire Hazard Severity Zones Map (Riverside County, 2021). In addition, no structures would be retained as residences or would be constructed as residences as part of the proposed Project.

During construction, there is the potential for both small fires and major structural fires. Electrical sparks, combustion of fuel oil, hydraulic fluid, mineral oil, or insulating fluid at substations, or flammable liquids, explosions, and over-heated equipment may cause small fires. The proposed Project could result in an increase in demand for fire protection services over existing levels during construction. ~~However, local fire protection services, along with the provisions in the Fire Protection Plan, are anticipated to be adequate enough to handle this potential increase in demand for fire services, and no construction of new fire protection facilities is proposed.~~

Construction of the proposed Project would not cause population growth sufficient to generate a need for new or expanded fire protection facilities. Impacts would be less than significant, and no mitigation would be required.

To further reduce this less than significant impact, the Fire Management and Prevention Plan for the Project, developed as part of the BLM Plan of Development (POD) and reviewed by Riverside County Fire Department (RCFD), will identify potential hazards and accident scenarios that would exist at the facility during

construction. The Fire Management and Prevention Plan would decrease the risk of fires and include fire response measures that employees would implement before emergency responders arrive on site.

Increases in long-term demand for fire protection services typically are associated with substantial permanent increases in population. Approximately 320 to 530 daily workers would be present on site during the 20-month construction period. As discussed in Section 3.15, Population and Housing, it is anticipated that the construction workforce will be drawn from communities within Riverside County and San Bernardino County, and therefore would not induce substantial growth even during the construction period such that the demand for fire protection services, aside from that mentioned for activities taking place at the construction project itself, would increase. After the construction phase, up to 10 permanent staff could be on the site at any one time for ongoing facility maintenance and repairs. These 10 operation personnel would not contribute to a significant population increase, resulting in an increase to the demand for fire protection services, or require new or altered facilities. Additionally, the proposed Project would include emergency access and other safety features and plans for fire protection, and impacts would be less than significant. No new public facilities would be needed to maintain acceptable service ratios, response times, or other performance objectives for fire protection. Overall, the Project's impact on the RCFD's ability to maintain acceptable service ratios, response times, or other performance objectives relating to technical rescue services would be less than significant.

Police Protection and Sheriff Services

The temporary increase of construction workers could increase demands on police services. Although an addition of up to 530 construction personnel would alter the current protection service ratio, because Project construction is not anticipated to permanently increase the local population, no new or expanded law enforcement facilities or increased staff levels within the Project regional or local study area would be required. In addition, during construction, on-site security would include trained, uniformed, and unarmed personnel whose primary responsibility would be to control ingress and egress of personnel and vehicles, perform fire and security watch during off hours, and perform security badge administration, all of which would minimize the potential need for assistance from the Riverside County Sheriff's Department or the CHP.

Construction of the proposed Project would generate truck and employee traffic along haul routes and at the Project area, which could temporarily increase the accident potential in these areas or affect response times or other service performance over the approximate 20-month construction period. The additional volume of traffic associated with workers commuting to the sites during construction would be temporary and it is anticipated that personnel and equipment from the Riverside County Sheriff's Department or the CHP would suffice to respond to incidents in the Project area. In addition, Project construction is not expected to adversely affect the CHP's ability to patrol the highways. Once operational, the Project area would include perimeter fencing, controlled access gates, and security cameras and lighting, which would minimize the potential need for the police assistance. The Project may also include infrared lighting on the tallest gen-tie structures at one crossing to ensure military low-level aircraft safety. Project decommissioning impacts would be the same as those described for Project construction.

Overall, Project construction, operations, and decommissioning would not result in the need for new or physically altered police or sheriff protection facilities to maintain acceptable service ratios, response times, or other performance objectives. Impacts would be less than significant.

Schools

As described above and in Section 3.15, Population and Housing, there are sufficient vacant housing units within the nearby communities to support the number of construction workers and the proposed Project would not trigger the need for new housing. Up to 10 permanent staff could be on the site at any one

time for ongoing facility maintenance and repairs. These 10 operation personnel would come from the local labor force and would not contribute to a significant population increase. The Project would not displace populations or existing housing, and it would not necessitate construction of replacement housing elsewhere. Therefore, the temporary addition of construction and decommissioning workers and the long-term addition of operational personnel to the Project area's population is not anticipated to increase school enrollment sufficiently to require new schools to be constructed or existing schools to be physically altered to allow for a Project-related increase in enrollment, where the physical alteration of the school could result in adverse environmental impacts. Impacts would be less than significant.

Parks

As discussed above, no local parks or Riverside County regional parks are in or near the vicinity of the Project area near Desert Center. The required construction and decommissioning workforce of the Project would be hired from the available regional workforce. There would be temporary in-migration that would increase the local population during construction; however, it would not warrant the need for new or expanded parks and recreational facilities within the Project regional or local study area. It is anticipated that some or most of the workforce would temporarily relocate to near the Project site and would commute home on the weekends so are unlikely to use the recreation facilities. Although some workers may use recreational areas during Project construction and operation, increased use would be minimal and/or temporary and would not contribute substantially to the physical deterioration of existing facilities. Less than significant impacts would occur. Park and other recreational facilities are discussed in detail in Section 3.17, Recreation.

Other Public Facilities

Health Services

The RCFD would provide first responder emergency medical care. The nearest RCFD fire stations are staffed full-time, 24 hours, 7 days a week, with a minimum three-person crew, including paramedics. Once a patient is transported, local area hospitals are available to provide emergency medical care.

While a high number of construction and decommissioning employees would be located on site, local area emergency medical facilities are expected to adequately handle any worksite accidents requiring their attention. Minor injuries could be treated at Palo Verde Hospital in Blythe. Injuries resulting in significant trauma would be treated at the Desert Regional Medical Center in Palm Springs. Project construction and operation would therefore not require new or physically altered hospital facilities or personnel or result in the increase in emergency responder staff levels within the Project regional or local study area; impacts would be less than significant.

Libraries

Consistent with the impacts previously discussed for other public facilities, although Project construction and decommissioning would temporarily increase the number of people within the Palo Verde Valley, it would not substantially increase the population. The permanent addition of 10 full-time staff and the operation- and maintenance-related demands of the Project would also not substantially increase the population. New or expanded library facilities within the area are not required and impacts would be less than significant.

Mitigation Measures for Impact PSU-1

No mitigation would be required.

Significance After Mitigation

This impact would be less than significant.

Impact PSU-2. The Project would require or result in the relocation or construction of new or expanded water, wastewater treatment, storm water drainage, electric power, natural gas, or telecommunications facilities, which could cause significant environmental effects.

LESS THAN SIGNIFICANT. The Project would not require or result in the relocation or construction of new water, wastewater treatment, or natural gas facilities during construction, operation, maintenance, or decommissioning because the Project would not be connected to a public water or sewer system and would not use natural gas.

The Project would construct a new electric solar power facility that includes a BESS, SCADA, and telecommunications system. The construction of the Project would cause potentially significant environmental effects as described in detail in Sections 3.2 through 3.19 of this Environmental Impact Report. The EIR includes mitigation measures to reduce the effects to the extent feasible ~~and complies~~ in accordance with CEQA.

Construction of the proposed Project would require ground-disturbing activities, including solar array installation, substation yards and O&M building construction, construction of access roads, and construction of the gen-tie, medium voltage collector, and distribution lines. Since most of the site has nearly level to gently sloping topography, no mass grading would be required; however, much of the solar and energy storage facility would be impacted by some form of ground disturbance, either from compaction, micro-grading, or disc-and-roll grading. Grading could alter naturally occurring drainage patterns and result in soil erosion, sedimentation, long-term siltation, and increased storm water runoff. Vegetation removal for road clearance and construction areas decreases the ability of the soil to absorb water, which also increases storm water runoff from such disturbed areas. Vegetation would be cleared for construction of the drainage controls, including berms if needed. Site preparation also would include construction of drainage components to capture and direct stormwater flow around the BESS facility.

As part of the Project, a Storm-water Pollution Prevention Plan (SWPPP) or SWPPP-equivalent document would be prepared by a qualified engineer or erosion control specialist and would be implemented before and during construction. The SWPPP would be designed to reduce potential impacts from storm water runoff and existing drainage patterns. In addition, the SWPPP would include best management practices (BMPs) for controlling runoff and reducing erosion. The BMPs would include storm water runoff quality control measures, concrete waste management, storm water detention, watering for dust control, and construction of perimeter silt fences, as needed. The SWPPP and associated BMPs are a regulatory requirement, thus, not considered to be a mitigation measure necessary to reduce the impact significance for Impact PSU-2. However, the implementation of the BMPs included in the SWPPP or a SWPPP-equivalent document would ensure that the proposed Project would not require or result in the construction of new storm water drainage facilities or expansion of existing facilities, the construction of which could cause potentially significant environmental effects, and impacts would be less than significant.

Mitigation Measures for Impact PSU-2

No mitigation would be required.

Significance After Mitigation

This impact would be less than significant.

Impact PSU-3. The Project would have insufficient water supplies available to serve the Project and reasonably foreseeable future development during normal, dry and multiple dry years.

LESS THAN SIGNIFICANT. During the construction phase of both the solar facility and generation-tie line, it is anticipated that a total of up to 1,000 acre-feet would be used over the 20-month construction timeframe for dust suppression, truck wheel washing, and other purposes. Restroom facilities for the construction workforce would be provided by portable units to be serviced by licensed providers.

During operation, water would be required for panel washing, maintenance, the BESS facility, and for sub-station restroom facilities. The proposed Project would require water for panel washing up to four times per year and other uses resulting in the use of approximately 50 acre-feet annually. Water used during panel washing would be absorbed into the surrounding soil or would evaporate. Water would also be used for fire safety and the implementation of BMPs and mitigation measures.

Water for operations, construction needs, and related dust control would be obtained from either an on-site groundwater well or purchased off site. Water tanks would likely be set up by any groundwater wells and near the O&M building. These water sources would tap into the Chuckwalla Valley Groundwater Basin (CVGB).

A Water Supply Assessment (EIR Appendix G, Water Supply Assessment) was conducted for the Project and concluded that the CVGB's current annual groundwater recharge and outflows are almost balanced, and all estimated groundwater demand for the Project may be sourced from the CVGB without resulting in a cumulative groundwater deficit under average climatic conditions using conservative groundwater recharge estimates.

During a normal year, the baseline groundwater budget for the CVGB indicates an annual groundwater surplus of 100 AF. There would be an initial groundwater deficit during the construction phase of the project, because the estimated water use for construction is greater than 100 AF, however, there would be a recovery of groundwater levels during the operational phase, because this phase uses less water.

~~For dry and multiple dry years, the Water Supply Assessment concluded that, including all cumulative projects, there would be a total groundwater deficit of approximately 102,900 AF. The Project would contribute 1,500 AF, approximately 1 percent to this deficit. At the end of the projected 37-year period analyzed in the water supply assessment, there would be some recovery of groundwater levels, but overall, there would be a deficit of approximately 126,500 AF.~~

As stated in Section 3.11, Hydrology and Water Quality, assuming normal recharge data and the available water supplies during normal, single, dry, and multiple dry water years from the CVGB, would meet the projected water demands of the Project, in addition to existing uses. Additionally, the water budget indicates the CVGB water balance would be in a state of surplus after the 52-year period under normal conditions with the Project in place. -Based on the adopted water budget components (primarily based on Fang et al. [2021]), the CVGB is not in overdraft. CVGB also is a very low priority basin. Additionally, DWR (2004) estimated the total groundwater storage capacity of the CVGB is 9,100,000 to 15,000,000 AF. Therefore, based on available historical data, storage capacity and hydrogeologic properties of the CVGB, the presented CVGB water budget, the modeled cone of depression from Project pumping, and the assumed water use of 3,500 AF (approximately 0.0004 percent of an assumed 10,000,000 AF CVGB groundwater storage capacity) over the life of the Project (52 years), the Project is not anticipated to negatively impact groundwater storage, nor cause substantial impact to the available quantity of groundwater in the CVGB that affects beneficial uses. Therefore, the available water supplies during normal, single dry, and multiple dry water years from the CVGB would meet the projected water demands of the Project, in addition to existing uses and foreseeable future development.

~~Although there would be a groundwater deficit, sufficient water supplies are available to serve the Project's needs. The CVGB would have sufficient water supplies for construction, operation, and decommissioning of the Project, along with future foreseeable development. Impacts would be less than significant.~~

Mitigation Measures for Impact PSU-3

No mitigation would be required.

Significance After Mitigation

This impact would be less than significant.

Impact PSU-4. The Project would generate solid waste in excess of State or local standards, or in excess of the capacity of local infrastructure, or otherwise impair the attainment of solid waste reduction goals.

LESS THAN SIGNIFICANT. The Project would generate solid waste during construction, operation, maintenance, and decommissioning. Riverside County must comply with the California Green Building Standards Code which includes mandatory recycling. Section 5.408 of the Code requires that 65 percent of the nonhazardous waste be recycled or salvaged for reuse. Section 5.408.3 (Excavated soil and land clearing debris) requires that 100 percent of trees, stumps, rocks, and associated vegetation and soils resulting from land clearing shall be reused or recycled.

The Project site consists of relatively flat topography. All required cut and fill soils associated with construction-related grading activities is anticipated to be approximately balanced; minimal import and export (to a landfill) would be necessary. Construction materials would be sorted on site throughout construction and transported to appropriate waste management facilities. Recyclable materials would be separated from non-recyclable items and stored until they could be transported to a designated recycling facility. It is anticipated that at least 20 percent of construction waste would be recyclable, and 50 percent of those materials would be recycled. Additionally, wooden construction waste (such as wood from wood pallets) would be sold, recycled, or chipped and composted.

Non-hazardous construction materials that cannot be reused or recycled would likely be disposed of at the county landfills. Hazardous waste and electronic waste would not be placed in a landfill, but rather would be transported to a hazardous waste handling facility (e.g., electronic-waste recycling). All contractors and workers would be educated about waste sorting, appropriate recycling storage areas, and how to reduce landfill waste.

Non-hazardous waste generated during Project operations would be limited to office uses associated with the proposed O&M building and include paper, aluminum, food, and plastic and would be managed similarly to during construction with non-hazardous items being recycled where possible or otherwise disposed of at the municipal county landfills.

The closest landfill to the Project area is the Desert Center Sanitary Landfill, with a remaining capacity of 127,414 cubic yards. It is estimated to operate until year 2041 (CalRecycle, 2023b). The other nearest landfill: Blythe Sanitary Landfill has over 3.8 million cubic yards of capacity remaining. The Project would comply with applicable federal, State, and local regulations related to solid waste and sufficient capacity is anticipated at the three nearest waste disposal sites. The Project would not generate solid waste in excess of State or local standards, or in excess of the capacity of local infrastructure, or otherwise impair the attainment of solid waste reduction goals. Overall, impacts related to solid waste would be less than significant and no mitigation would be required.

Mitigation Measures for Impact PSU-4

No mitigation would be required.

Significance After Mitigation

This impact would be less than significant.

*** The impact analyses for all Project alternatives have been moved to EIR Section 5. ***

3.16.6. Cumulative Impacts

Geographic Scope

The geographic scope of the cumulative impacts analysis includes the service areas of each of the providers serving the proposed Project. This geographic scope would include all projects listed in Tables 3.1-1 and 3.1-2. The proposed Project and other development projects in the cumulative scenario, together, could increase demand for public services and utilities in eastern Riverside County due to increases in workers within the area during construction; this has the potential to result in a significant cumulative impacts to public services and utilities. If adopted, the proposed expansion of Joshua Tree National Park and creation of Chuckwalla National Monument would re-designate existing federal lands in the Project vicinity but would not create physical changes in the environment that would affect public services and utilities or contribute to cumulative impacts.

Fire Protection, Law Enforcement, and Health Services

Construction of present and reasonably foreseeable future projects may overlap with construction of the Project. The other present and reasonably foreseeable cumulative projects that fall within the geographic scope for fire and law enforcement services are primarily made up of energy projects, including utility-scale solar and electric transmission projects. The greatest potential for fires and fire hazards would exist at these sites during construction because the on-site workforce would be at its peak, which would create human presence-related hazards, including with the variety of equipment used that could create sparks or other potential fire hazards. The combined effects of the increased cumulative demand for fire, law enforcement, and emergency medical services from the cumulative projects within the geographic scope of analysis could result in a significant cumulative impact. However, the implementation of the Project-specific Fire Management and Prevention Plan would reduce the Project-related demand for fire, law enforcement, and emergency medical services from construction, such that the residual demand would not exceed established service ratios or require new or physically altered facilities, the construction of which could cause environmental impacts. Other projects would be required to comply with similar standards and regulations to reduce the potential for fire risks. The incremental effects of the Project and cumulative projects would therefore be reduced to a less-than-significant level. The incremental effects of the proposed Project from up to 10 permanent staff during operations would also not be cumulatively considerable because the very low number of workers would also not lead to the exceedance of established service ratios or require new or physically altered facilities. Therefore, cumulative construction-related impacts would be less than significant, and Project construction would not make a considerable contribution to cumulative impacts on fire, law enforcement, and emergency medical services.

Cumulative operational and maintenance-related impacts to public services including fire, hazardous materials handling, and medical resources and facilities ~~related to the Project~~ would be less than related demands during construction and would not result in a ~~considerable contribution to significant~~ cumulative impacts due to the low number of employees required to support projects in the cumulative scenario.

At the end of the 30 to 50-year operational period of the proposed Project, the components would be decommissioned and deconstructed; the site would be restored to its pre-solar facility conditions and made available for agricultural use. Similar to construction (but to a lesser degree), the greatest potential need for public services would be associated with fire hazards. Fire hazards would be greatest during this time because the on-site workforce would be at its peak which could create a potential demand for fire and police services. Under cumulative conditions, implementation of the Project in the context of past projects and in conjunction with development of projects listed in Tables 3.1-1 and 3.1-2 are not anticipated to cause a demand on public services or utilities such that the construction of new or physical alteration of existing facilities would be required because the payment of development fees now and into the future is expected to substantially offset the public service-related demands of currently proposed and reasonably foreseeable future projects. Therefore, no significant adverse cumulative impact would result.

Schools and Libraries

Due to the temporary nature of construction, it is not likely that any of the workers and their families for any of the cumulative projects would relocate to the area. Any potential impact to schools and libraries from the minimal number of operations personnel for each solar project would be negligible especially as the workers would be sourced from local communities and would likely commute. There would be no significant cumulative impact to schools or public libraries.

Utilities

Cumulative operational impacts to utilities would not be ~~cumulatively considerable~~ significant. The proposed Project would utilize an on-site or off-site groundwater well or water trucked from an offsite water purveyor and would not generate wastewater. See Section 3.11.6 regarding cumulative groundwater impacts. There is no potential for the Project to contribute to cumulative impacts to water or wastewater systems. In addition, due to the existing and remaining capacity at existing landfills, the Project's incremental solid waste-related impact during construction and operation, when combined with the contributions of past, other present, and reasonably foreseeable future projects would not ~~be cumulatively considerable~~ result in significant cumulative impacts.

Mitigation Measures for Cumulative Impacts

No mitigation would be required.

Significance After Mitigation

Cumulative impacts would be less than significant. The Project's incremental contribution to impacts to public services and utilities would not be cumulatively considerable.

3.16.7. Mitigation Measures

No mitigation measures are required.

3.17. Recreation

This section describes the environmental setting and regulatory framework for recreational resources near the proposed Project. The study area for the recreation includes recreational areas and opportunities within 20 miles of the Project site. This is an appropriate study area for recreation because it captures all major recreation resources that contribute to baseline conditions and could be affected by activities related to the Project. An impact analysis and comparison of project alternatives is included in Section 5.

3.17.1. Environmental Setting

The Project site consists of both private and BLM land. The site is in eastern Riverside County surrounded primarily by BLM land with some scattered rural residences and farms. In the Desert Renewable Energy Conservation Plan (DRECP) Land Use Plan Amendment, the BLM-administered portions of the site are designated as a Development Focus Area (DFA), which is an area suitable for renewable energy project development. BLM land has traditionally been used for a range of recreation activities such as hiking, horseback riding, rockhounding, noncompetitive vehicle touring, and other events on “designated open” routes of travel. Additionally, the Project is near the Joshua Tree National Park.

3.17.1.1. Regional Recreation Areas and Opportunities

The Project is in the Desert Center area in the Chuckwalla Valley. Desert Center has no community parks and there are no regional or State parks in the Chuckwalla Valley. Lake Tamarisk Desert Resort (LTDR), located 2 miles north of Desert Center and immediately south and west of the Project, is a 55 member-owned community for active seniors with 150 mobile homes spaces, mobile home rentals, heated pool, and club house. LTDR has a 9-hole county golf course as well. The Chuckwalla Valley Raceway is located approximately 1 mile east of the Project and State Route 177 (SR-177) on private land. It was built in 2010 on over 1,100 acres, and has a 17-turn, 2.68-mile track for beginner to experienced racers. It also includes an area for camping and has 40 cabins and a private airport.

Locally, residents and visitors use the public and private lands around the LTDR community for informal recreation, including wildlife viewing, hiking, and all-terrain vehicle (ATV) use. The land around and near LTDR is mostly under BLM administration. Much of the BLM-administered land west of Kaiser Road and LTDR is protected desert tortoise habitat and is open land. East of Kaiser Road, extensive tracts of BLM lands have been designated as Development Focus Areas (DFAs) and are suitable for development of renewable energy projects. Certain conservation and management actions (CMAs) apply to projects in DFAs in order to protect valued resources. Implementation of CMAs results in portions of a Project site remaining open and accessible; areas with solar arrays and other Project facilities are fenced.

Within a 20-mile radius around the Project, the BLM administers wilderness areas; campgrounds, including long-term visitor areas; trails; interpretive sites; and an extensive network of backcountry-approved travel and off-highway vehicle (OHV) routes near the Project.

A coalition of environmental and community groups known as the Protect California Deserts campaign is proposing a new national monument south of Joshua Tree National Park, and south and west of the Project area outside of the DRECP DFA lands. While early in the process, if approved, the proposed “Chuckwalla National Monument” would recognize the area’s recreational and cultural significance and would encompass nearly 700,000 acres in both Riverside and Imperial counties. National monument status would require either a vote by Congress or a presidential designation under the Antiquities Act (Rode, 2023).

Much of the recreation activity occurs in the Chuckwalla Special Recreation Management Area (SRMA) located immediately south of Interstate 10 (I-10), which is its northern boundary. The SRMA extends approximately 15 miles south from I-10 and approximately 10 miles west and 22 miles east of Desert Center. The SRMA includes large sections of the Chuckwalla Mountains and Chuckwalla Valley. BLM-administered Areas of Critical Environmental Concern (ACECs) and BLM and NPS wilderness areas provide dispersed recreation opportunities in the region. In general, recreation use on BLM lands in the California desert is limited to the cooler months of September through May, with little use in the summer.

According to the BLM Recreation Management Information System (RMiS) Report 23(c) for the Palm Springs-South Coast Field Office, for the year October 1, 2019, through September 30, 2020, the Eastern Riverside County Recreation Management Area had 402,313 visitor days,³⁷ with most occurring as dispersed use. The Corn Springs campground (approximately 8 miles south of the Project) saw 6,946 visitor days, while the Desert Lily Preserve (approximately 3.3 miles east of the nearest Project elements) had 1,917 visitor days (BLM 2020). The most attractive recreational area in the region is Joshua Tree National Park, with the closest boundary approximately 4 miles from the Project site. The main recreational users of the Project Area and vicinity are local residents from Desert Center and Blythe, or visitors stopping for short periods while traveling on I-10 (BLM, 2018).

Recreation areas within 20 miles of the Project site are identified in Table 3.17-1 and discussed below. This information was adapted from the Palen Solar Project environmental review (BLM, 2018, updated with information on the BLM home website, visit menu (BLM 2023).

Table 3.17-1. Recreation Areas and Special Designations with Recreational Opportunities

Recreation Area	Direction from Project Site	Approx. Distance from Project Site (miles)	Approximate Size (acres)	Status
Chuckwalla Special Recreation Management Area	south	2	228,480	Designated in the DRECP
Palen-Ford Playa Dunes ACEC	east	3	41,370	Designated in the DRECP
Chuckwalla Desert Wildlife Management Area ACEC	south	2	514,400	Expanded under the DRECP
Palen Dry Lake ACEC	southeast	11	3,630	Designated
Chuckwalla Mountains Wilderness	south	3	112,326	Designated
Palen-McCoy Wilderness	east	12	259,009	Designated
Corn Springs ACEC	south	7	2,470	Designated
Alligator Rock ACEC	south	1.5	7,750	Designated
Desert Lily Preserve ACEC	east	2	2,060	Designated
Joshua Tree National Park	northeast	3	1,017,750	Designated
Joshua Tree Wilderness	northeast	3	549,500	Designated
Corn Springs Campground	southeast	7.6	9 camping units	Designated
Bradshaw Trail Back Country Byway	south	17	65 miles	Designated

Source: BLM, 2018, BLM 2023.

³⁷ A visitor day is defined as 12 visitor hours. A visitor hour is a unit of measure of the presence of one or more persons in an area for continuous, intermittent, or simultaneous periods totaling one hour (i.e., one person for one hour, two people for 30 minutes each; or 10 people for 6 minutes each).

Joshua Tree National Park

The National Park Service administers the Joshua Tree National Park (Park). The southeast end of the Park is located about 3 miles northeast of the Project. The Park comprises nearly 800,00 acres, mostly federally administered, and is used for hiking, mountain biking, and rock climbing, and includes nine campgrounds. Other recreational activities include wildflower viewing and birdwatching. The eastern part of the park, closest to the Project, is noted for its dark skies that draw stargazers and amateur astronomers, and the Park has been designated as an International Dark Sky Park by the International Dark Sky Association. The Park is open year-round, with peak visitation occurring from October through May. Over 3 million people visited the Park in 2021 (NPS, 2023).

Wilderness Areas

The Wilderness Act limits recreation on wilderness lands to those that are primitive and unconfined, depend on a wilderness setting, and do not degrade the wilderness character of the area. Motorized or mechanized vehicles or equipment for recreational purposes are not permitted in wilderness (916 USC 1133(c)). The BLM regulates such recreation on lands within its jurisdiction in accordance with the policies, procedures and technologies set forth in the Code of Federal Regulations (43 CFR 6300), BLM Manual 6340 (*Management of Designated Wilderness Areas*), and BLM's Principles for Wilderness Management in the California Desert.

Four wilderness areas are located within 20 miles of the Project site: the Chuckwalla Mountains Wilderness, Palen-McCoy Wilderness, Joshua Tree Wilderness, and Little Chuckwalla Mountains Wilderness. They have no developed trails, parking/trailheads, or other visitor use facilities. These areas are generally steep, rugged mountains, with no permanent natural water sources, thus limiting extensive hiking or backpacking opportunities. Visitor use within the wilderness areas is very light although the BLM has no visitor use counts. Five nearby mountain peaks are occasionally used by the Desert Peaks Section of the Sierra Club's Angeles Chapter (BLM, 2018). None of the peaks directly overlook the Project site, although the site may be visible from certain peaks, depending on elevation and topography.

Observations by staff and Law Enforcement Rangers indicate only 100 to 200 hikers per year within all the wilderness areas near the Project site. More popular is vehicle camping along roads that are adjacent to the wilderness areas. RV camping near wilderness areas, with associated hiking, OHV use, photography, sightseeing, etc., accounts for up to 2,000 visitors per year (BLM, 2018).

Areas of Critical Environmental Concern

Seven ACECs are located near the Project site: Chuckwalla Desert Wildlife Management Area ACEC, Palen Dry Lake ACEC, Corn Springs ACEC, Alligator Rock ACEC, Desert Lily Preserve ACEC, and Chuckwalla Valley Dune Thicket ACEC. The Palen-Ford Playa Dunes ACEC was most recently designated in the DRECP. Recreation activities allowed in ACECs are determined by the resources and values for which the ACECs were established, and by the associated ACEC Management Plan. Most ACECs allow low-intensity recreation that is compatible with protection of the relevant values (BLM, 2015).

The Alligator Rock ACEC and the Corn Springs ACEC primarily protect cultural resources. The Chuckwalla Desert Wildlife Management Area (DWMA) and Desert Lily ACEC protect sensitive wildlife and plant species, while Chuckwalla Valley Dune Thicket and Palen Dry Lake ACECs protect both natural and cultural resources. The Palen-Ford Playa Dunes ACEC maintains the integrity of essential fringe-toed lizard habitat and essential ecological processes. Only the Corn Springs and the Palen-Ford Playa Dunes ACECs have recreation use facilities; however, they are signed to inform visitors of the special values of the areas and associated protection measures.

Long Term Visitor Areas

The BLM manages seven Long Term Visitor Areas (LTVAs), where camping is available from September 15 to April 15. A seasonal individual special recreation permit is required allowing visitors to stay in any of the six LTVAs in California or two LTVAs in Arizona: Imperial Dam LTVA near Yuma and La Posa LTVA near Quartzsite. In California, camping is allowed in the LTVA between April 16 and September 14 at no cost with the standard 14-day camping limit. Mule Mountains LTVA is 2,805 acres, an estimated 35 miles east of the Project, and includes the Wiley's Well and Coon Hollow campgrounds. Mule Mountains LTVA received 20,537 visits in 2015-2016 (BLM, 2018). Midland LTVA is 135 acres, an estimated 47 miles east of the Project site, and received 17,964 visits in 2015-2016 (BLM, 2018).

Special Recreation Management Areas

A SRMA is an administrative unit where the existing or proposed recreation opportunities and recreation setting characteristics are recognized for their unique value, importance, or distinctiveness, especially compared to other areas used for recreation. SRMAs are units of public land identified for directing available recreation funding and personnel to specific, structured recreation opportunities. They are managed to protect and enhance a targeted set of activities, experiences, benefits, and desired recreation.

The DRECP LUPA has designated one SRMA south of the Project site on the south side of the I-10, the Chuckwalla SRMA. This area is to provide opportunities for area residents, visitors, and commercial recreation providers to engage in motorized and non-motorized recreation activities that are compatible with recovery efforts for the desert tortoise and other resource values. The primary activities for the Chuckwalla SRMA are motorized recreation touring and other recreational activities that rely on motorized vehicles to access public lands.

The Bradshaw Trail

The Bradshaw Trail is a 70-mile Back Country Byway in southeastern Riverside County, with a small segment in Imperial County. This east-west trail is located about 18 miles south of the Project site and extends from about 12 miles east of the community of North Shore near the Salton Sea State Recreation Area to about 14 miles southwest of Blythe near the Colorado River.

The Bradshaw Trail was the first road through Riverside County, blazed by William Bradshaw in 1862 as an overland stage route beginning in San Bernardino, California, and ending at Ehrenberg, Arizona. The trail was used extensively between 1862 and 1877 to transport miners and passengers. The trail is a dirt road that traverses mostly public land between the Chuckwalla Mountains and the Chocolate Mountain Aerial Gunnery Range. Four-wheel-drive vehicles are recommended due to stretches of soft sand. Recreational opportunities along the Bradshaw Trail include four-wheel driving, wildlife viewing, plant viewing, birdwatching, and scenic drives. All commercial activities require a land use or special recreation permit from the BLM. Fourteen-day camping limits apply on public lands.

Off-Highway Vehicle Routes

The California Desert Conservation Area (CDCA) Plan and Northern and Eastern Colorado Desert Coordinated Management (NECO) Plan Amendment state that vehicle access is among the most important recreation issues in the desert. A primary consideration of the recreation program is to ensure that access routes necessary for recreation enjoyment are provided. Under the CDCA Plan, as amended, BLM-administered public lands within the CDCA are designated as Open, Limited, or Closed. Within Open areas, motorized vehicles may travel anywhere; in Closed areas, such travel is prohibited. While there are no BLM-designated Open OHV areas in Riverside County, there are Open Routes suitable for OHV travel. In Limited areas, motorized-vehicle access is allowed only on certain routes of travel, defined to include roads,

ways, trails, and washes. The DRECP LUPA does not change the status of the routes within the Project area (BLM, 2015).

The BLM defines OHV routes as follows (BLM, 2018):

- *Open Route*: Access by all types of motorized vehicles is allowed generally without restriction.
- *Limited Route*: Access by motorized vehicles is allowed, subject to limitations on the number and types of vehicles allowed and restrictions on time or season and speed limits.
- *Closed Route*: Access by motorized vehicles is prohibited except for certain official, emergency, or otherwise authorized vehicles.

A route has high significance if it provides access to other routes, historical sites, or recreational areas such as the backcountry driving, photography, camping, rock hounding, and hiking opportunities in eastern Riverside County.

The Desert Center region has several OHV Open Routes. The BLM has no traffic counters or other means to determine accurate usership numbers of routes in the vicinity of the Project. Observations by BLM staff and Law Enforcement Rangers report that use is relatively low on routes within the vicinity of the Project site, not exceeding 300 visits per year (BLM, 2018). Recreation and vehicle use generally is limited to the cooler months of September through May. Use is nearly non-existent during the summer.

Washes Open Zones

Under the NECO Plan, all Multiple-use Class – Moderate Use (MUC-M) areas are considered “washes open zones” unless specifically designated Limited or Closed. The use of washes within “washes open zones” is restricted to those considered “navigable,” unless it is determined that vehicle use must be further limited. Navigable washes in “washes open zones” are designated “Open” as a class, that is, washes are not individually designated unless they are identified as specific routes in the NECO route inventory. In this context, the term “wash” is defined as a watercourse, either dry or with running or standing water, which by its physical nature, width, soil, slope, topography, vegetative cover, etc., permits the passage of motorized vehicles, thereby establishing its navigability (BLM, 2018).

The BLM has not inventoried or analyzed specific washes in the Project area as to their navigability, but by the above definition, all or portions of washes in the Desert Center area may be considered navigable. As is the case with designated routes, the BLM has no means to determine accurate use of “open wash zones” in the vicinity of the Project.

3.17.1.2. Solar Facility

None of the existing solar facility sites are used for recreation as they are all previously farmed parcels or undeveloped desert. However, much of the surrounding region is used for recreation as described above.

OHV routes cannot be officially designated on private land, but some routes cross private land and may be used by recreationists. Four designated BLM Open Routes are on or near the Project site: DC322; DC533; DC536-1; and DC540.

3.17.1.3. 500 kV Generation-Tie Line

The gen-tie line would be located on almost entirely BLM-administered land through the Oberon Renewable Energy Project site, which began commercial operation in fall 2023. The land is designated as a DFA (meaning not designated for recreation). The gen-tie line would connect to the Oberon ~~substation~~ Switchyard within the Oberon Renewable Energy Project site.

3.17.2. Regulatory Framework

3.17.2.1. Federal Laws, Regulations, and Policies

Wilderness Act of 1964. The Wilderness Act, signed into law in 1964, created the National Wilderness Preservation System and defined wilderness as “an area of undeveloped Federal land retaining its primeval character and influence without permanent improvements or human habitation, which is protected and managed so as to preserve its natural conditions....”

Designated wilderness is the highest level of conservation protection for federal lands. Only Congress may designate wilderness or change the status of wilderness areas. Wilderness areas are designated within existing federal public land. Congress has directed four federal land management agencies — U.S. Forest Service, Bureau of Land Management, U.S. Fish and Wildlife Service, and National Park Service — to manage wilderness areas to preserve and, where possible, to restore their wilderness character.

The Wilderness Act prohibits permanent roads and commercial enterprises, except commercial services that may provide for recreational or other purposes of the Wilderness Act. Wilderness areas generally do not allow motorized equipment, motor vehicles, mechanical transport, temporary roads, permanent structures or installations (with exceptions in Alaska). Wilderness areas are to be primarily affected by the forces of nature, though the Wilderness Act does acknowledge the need to provide for human health and safety, protect private property, control insect infestations, and fight fires within the area. Wilderness areas are managed under the direction of the Wilderness Act, subsequent legislation (such as the Alaska National Interest Lands Conservation Act), and agency policy.

Federal Land Policy and Management Act (FLPMA). FLPMA recognizes the value of public lands and includes the multiple use/sustained yield framework for management to provide for outdoor recreation for future generations. Title VI of FLPMA, *Designated Management Areas, California Desert Conservation Area*, acknowledges the recreational resources contained within the California desert environment and directs the BLM to develop a multiple use and sustained yield management plan to conserve the desert’s resources, particularly recreational use. The solar facility site is governed by these pieces of legislation, and its various alternatives would impact the recreational opportunities available in the vicinity.

California Desert Conservation Area (CDCA) Plan. The CDCA Plan establishes goals for management of recreation in the California Desert (BLM, 1999). As with the FLPMA, recreational opportunities in the study area are framed by the CDCA Plan. The goals are to provide for the use of the public lands and resources of the CDCA, including recreational uses, in a manner that enhances wherever possible — and that does not diminish — the environmental, cultural, and aesthetic values of the desert (BLM, 1999). The goals of the Recreation Element of the plan are to:

- *Provide for a wide range of quality recreation opportunities and experiences emphasizing dispersed undeveloped use;*
- *Provide a minimum of recreation facilities. Those facilities should emphasize resource protection and visitor safety;*
- *Manage recreation use to minimize user conflicts, provide a safe recreation environment, and protect desert resources;*
- *Emphasize the use of public information and education techniques to increase public awareness, enjoyment, and sensitivity to desert resources;*
- *Adjust management approach to accommodate changing visitor use patterns and preferences;*
- *Encourage the use and enjoyment of desert recreation opportunities by special populations, and provide facilities to meet the needs of those groups; and*

- *Provide for off-road vehicle recreation use where appropriate in conformance with FLPMA, Section 601, and Executive Orders 11644 and 11989.*

ACECs are also identified as special management areas in the CDCA Plan. These include areas where special management attention is required to protect important historic, cultural, scenic, biological, or other natural resources.

The CDCA Plan also contains a motorized-vehicle access element, which provides a system and a set of rules that governs access to the CDCA by motor vehicles. The rules include providing for constrained motor-vehicle access, while protecting desert resources (BLM, 1999). When the CDCA Plan was first adopted, the BLM designated a network of motorized vehicle routes on public lands within the northern and eastern Mojave Desert. The BLM designated routes for north-central and southern portions of the CDCA. The BLM manages OHV use so that the conditions of special-status species and other natural and cultural resources are maintained.

Northern and Eastern Colorado Desert Coordinated Management Plan. The NECO Plan, an amendment to the CDCA Plan, provides for management of recreation within the California Desert area of El Centro, Blythe, Needles, and cities in the Coachella Valley (BLM, 2002). The NECO Plan specifies the types of recreational activities allowed in Multiple-Use Classes on BLM-administered land. Under this plan, all routes outside closed and OHV open areas are designated as Open, Closed, or Limited. The NECO plan includes an off-highway vehicles (OHV) route inventory and designated routes of travel (approximately 95 percent of existing routes remained available for vehicle access under the plan). Open Routes through the solar facility area include DC 322, 533, 536-1, and 540. Special Recreation Permits (SRPs) are authorizations that allow for recreational uses of the public lands and related waters. They are issued as a means to control visitor use, protect recreational and natural resources, and provide for the health and safety of visitors.

Desert Renewable Energy Conservation Plan. The BLM published the Land Use Plan Amendment (LUPA) and Final EIS for the DRECP in November 2015. The DRECP amended the CDCA Plan with the signing of the Record of Decision in September of 2016. It designates SRMAs and Extensive Recreation Management Areas within the California Desert, including the study area (BLM, 2015). The DRECP includes additional conservation management actions for recreation that dictate the types of activities allowed near certain recreational features.

Off-Road Vehicles (43 CFR § 8340, et seq.) This regulation establishes criteria for designating public lands as open, limited, or closed to the use of OHVs and for establishing controls governing the use and operation of OHVs in such areas, while protecting resources, promoting safety, and minimizing user conflicts. Recreational use under Title VI “includes the use, where appropriate, of off-road recreational vehicles.”

3.17.2.2. State Laws, Regulations, and Policies

No State law, regulations, or policies were identified pertaining to recreation at or near the Project site.

3.17.2.3. Local Laws, Regulations, and Policies

Riverside County General Plan, and Desert Center Area Plan (DCAP). The Riverside County General Plan includes policy area locations, such as for Desert Center, that have a separate Area Plan for future development and growth. The Project falls within the DCAP, which is part of the General Plan. Under the DCAP, the Open Space Recreation designation is applied to the golf course at Lake Tamarisk. No other land under County jurisdiction in the Project area is designated for recreation. Local land use designations do not apply to the BLM land, but FLPMA requires the BLM to coordinate with local governments in land use planning in Title II, Section 202, (b)(9).

3.17.3. Methodology for Analysis

This section analyzes potential effects of the proposed Project related to recreation and assesses the impacts to known recreational uses. For the Project, this includes the use of Open Routes on or near the Project site. The CDCA Plan and NECO Plan Amendment, which includes a detailed inventory and designation of Open Routes for motorized-vehicle use, were reviewed to determine impacts to Open Routes.

3.17.4. CEQA Significance Criteria

The criteria used to determine the significance of potential recreation impacts are based on Appendix G of the State CEQA Guidelines. The proposed Project would result in a significant impact under CEQA related to recreation if the Project would:

- *Increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated (see Impact REC-1).*

The following CEQA significance criterion from Appendix G was not included in the analysis:

- *Include recreational facilities or require the construction or expansion of recreational facilities which might have an adverse physical effect on the environment.*

The proposed Project does not include recreational facilities nor require the construction or expansion of recreational facilities.

The County of Riverside's Environmental Assessment Form includes two additional significance criteria not in the CEQA Guidelines. They are:

- *Located within a Community Service Area (CSA) or recreation and park district with a Community Parks and Recreation Plan (Quimby fees).*
- *Include the construction or expansion of a trail system.*

The proposed Project site is located in unincorporated Riverside County and is adjacent to but not within Community Service Area No. 51. County CSAs collect special taxes and assessments to provide services to specific areas of the County. CSA 51 maintains the Lake Tamarisk Golf Course as well as a tot lot. The Project would not be located in a recreation and park district with a Community Parks and Recreation Plan. The Project would not include construction or expansion of a trail system. Therefore, the two above criteria related to recreation in the County's Environmental Assessment Form were not included in the analysis.

3.17.5. Proposed Project Impact Analysis

The scoping effort conducted by the Riverside County Planning Department revealed several public concerns related to recreation. Public concerns regarding recreation identified during the scoping process included concerns about the lower quality and decrease in availability of recreation due to: heat and wind and the presence of solar developments; preventing access for OHVs, hiking, or other recreational activities; and a decrease in the scenic value of the region.

Several commentors have stated that the Lake Tamarisk community has invested in equipment for recreational use in the desert, such as OHVs. Some commentors suggested allowing passages through Project to allow for easier access to recreational areas for OHV use and hiking.

These comments are addressed within the impact analysis provided below.

Impact REC-1. Increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated.

Solar and BESS Facility

LESS THAN SIGNIFICANT. The solar and energy storage facility is on BLM-administered land and on private land that was previously used for agriculture or undeveloped desert. Except for BLM Open Routes, there are no designated recreational uses of the land. However, the land is largely open and unoccupied and may be visited by hikers, birdwatchers, and others. Except as explained below for BLM Open Routes, the Project would have no direct impact that would result in the loss of designated recreational space or increase in the use of other recreational facilities.

BLM Open Route DC322 extends northwest through the Project site beginning at the west side of SR-177. It crosses both BLM and private land and continues northwest of the Project. Fenced solar panel arrays would be installed north and south of this route as it traverses the Project site, but it would remain open. It continues north and west from the Project site.

BLM Open Route DC533 is just north of the Project that extends east from BLM Open Route DC322 and would not be affected by the Project.

BLM Open Route DC540 extends from SR-177 east to the Chuckwalla Valley Raceway and airport and is adjacent to the easternmost array of solar panels near SR-177 but would be outside the fence line and remain open.

BLM Open Route DC536-1 extends northwest from SR-177 to BLM Open Route DC322, where it terminates. It traverses the Project site and is parallel to and approximately 0.8 miles north of BLM Open Route DC322. BLM Open Route DC536-1 is only partially on BLM-administered land. It would be blocked by fenced solar arrays in two locations. However, existing undesignated routes outside of the Project fence connect BLM Open Route DC 536-1 to DC322.

BLM Open Route DC536-1 is the only Open Route that would be blocked by the Project, which would install solar arrays within a fenced area across the route. However, BLM Open Route DC322, which parallels BLM Open Route DC536-1 would remain open, providing OHV access from SR-177 to BLM-administered lands west and north of the Project.

BLM Open Route DC536-1 is a short route (approximately 2.5 miles) that connects SR-177 and BLM Open Route DC533, as does the unaffected parallel route BLM Open Route DC322 to the south. Based on aerial imagery, BLM Open Route DC536-1 does not appear to be frequently used as it is difficult to find on the images. The route does not lead to a specific recreation destination, is not heavily used, is in an area with an alternative route (BLM Open Route DC322) nearby. BLM Open Route DC536-1 could remain accessible via an undesignated route visible on aerial imagery extending north from BLM Open Route DC322 outside the Project fence. The loss of approximately 1.2 miles of BLM Open Route DC536-1 would not be expected to result in a substantial use of other routes compared with current practice. The impact would be less than significant.

Indirect effects to recreational users of specially designated lands (including the Special Recreation Management Area, wilderness areas and ACECs, the Joshua Tree National Park) could occur due to the distant views of the construction work and dust. The wilderness areas and ACECs do not have maintained trails or trailheads and have a low number of public visitors. While the Joshua Tree National Park receives hundreds of thousands of visitors annually, the location closest to the Project is less heavily visited because of the difficulties in reaching that area.

Recreational users could be affected by construction, operation and decommissioning activities of the Project such as construction noise, fugitive dust, vehicle movement, and other “non-natural” construction activities. During operation, the visual change at the site could affect visitors seeking experiences in a natural setting. Night lighting for the solar PV Project is expected to be minimal, so little detrimental effect to night skies and star gazing would be anticipated. The area is used for military training flights. If aviation safety lighting is installed on any gen-tie line poles, the lighting would be infrared, and thus, would not be visible to the human eye and would not detract from the dark night sky for which the region is noted. Project decommissioning impacts would be the same as those described for Project construction. Upon the completion of decommissioning, the site would be returned to its pre-Project conditions or as agreed to by the landowner, and BLM may choose to reopen the affected BLM Open Routes across public lands.

Overall, these impacts could affect users’ perception of solitude, naturalness, and unconfined recreation. While the Project would result in indirect impacts to recreation, it is not anticipated that the Project would result in a significant change in use of the nearby recreation facilities that would increase the use of other regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated. Therefore, the impact would be less than significant. The associated indirect impacts are addressed in Sections 3.13 (Noise and Vibration), 3.4 (Air Quality), 3.18 (Traffic), and 3.2 (Aesthetics).

500 kV Generation-Tie Line

LESS THAN SIGNIFICANT. The gen-tie line would be on BLM-administered land designated as a Development Focus Area and would traverse the adjacent Oberon Renewable Energy Project in an existing transmission corridor not designated for recreation. The gen-tie line would not result in direct loss of recreation, nor would it result in permanent impacts to designated OHV routes. While it would introduce a new 500 kV transmission line and may temporarily close BLM Open Route DC379 in the corridor, the associated construction would be of short duration. Impacts to recreation due to the gen-tie line would be less than significant.

Mitigation Measures for Impact REC-1

No mitigation would be required.

Significance After Mitigation

This impact would be less than significant.

***** The impact analyses for all Project alternatives have been moved to EIR Section 5. *****

3.17.6. Cumulative Impacts

Geographic Scope

The cumulative geographic scope for recreation is the Desert Center region because the direct and indirect impacts to recreation would be additive within this area in that they could result in direct loss of recreation and indirect impacts to the same resources. Within this area there are existing utility-scale solar facilities (Desert Sunlight, Desert Harvest, Athos, Palen, and Oberon) as well as projects under construction (Victory Pass and Arica). Additional projects are under review (Sapphire, Eagle Mountain Pumped Storage, Redonda Solar, and Skybridge). See Tables 3.11 and 3.12. While other existing or proposed projects would add to the cumulative recreation impacts, the solar facilities would be the largest contributors.

Cumulative Impact Analysis

The cumulative solar projects would result in similar impacts to recreation as those described for the proposed Project in that they would affect Open Routes available to OHV users. However, each project is located either on private land or on BLM-administered land designated as development focus area under the DRECP LUPA. While some of the BLM-administered land may be used for recreation, the direct loss of recreational lands would be minimal compared with the land available for recreation in the region, most notably south of I-10.

If adopted, the proposed expansion of Joshua Tree National Park and creation of Chuckwalla National Monument would re-designate existing federal lands in the Project vicinity but could increase recreational visitation in these areas. Such visitation could create physical changes in the environment that would contribute to potential cumulative impacts; however, such impacts would be less than those that would be associated with potential development that is avoided.

If all the solar projects were developed, loss of the local Desert Center OHV routes would be significant substantial because many routes would be closed. However, extensive OHV recreational opportunities would continue to exist in the surrounding area, including within the SRMA south of I-10, thus ensuring that cumulative impacts related to the loss of OHV routes would not be significant. ~~The Easley Project's contribution to the cumulative loss of OHV routes this less-than-significant impact would not be cumulatively considerable because the Project would only result in the partial closure of only one route, would be partially closed, and would be users of that trail would have alternative access to a nearby Open Route. None of the routes in the Project site connect to specific recreation areas.~~

If all the solar projects were developed in the Chuckwalla Valley area, they would substantially change the region and the vistas from nearby recreational facilities that are prized for their isolation, especially wilderness areas. Recreationists looking for solitary experiences would potentially look for other areas to recreate ~~which would increase, thereby increasing~~ the use of these parks or wilderness areas. However, because of the large amount of wilderness and solitary recreational areas in Eastern Riverside County and in the California desert and the limited use of the recreational areas near the Project, it is unlikely that recreationists who leave the Desert Center area for elsewhere in California would noticeably increase the use of ~~such other~~ areas such that substantial physical deterioration of the region would occur or be accelerated. The recreational users in the Project vicinity are likely to visit nearby extensive recreational areas such as the BLM lands south of I-10. -Therefore, there would not be a significant cumulative impact in the region and the proposed Project would not make a considerable contribution to cumulative impacts.

Mitigation Measures for Cumulative Impacts

No mitigation would be required.

Significance After Mitigation

~~This impact~~ Cumulative impacts would be less than significant. The Project's incremental contribution to recreation impacts would not be cumulatively considerable.

3.17.7. Mitigation Measures

Impacts would be less than significant, and no mitigation would be required.

3.18. Traffic and Transportation

This section describes the environmental setting and regulatory framework with respect to traffic and transportation for the proposed Project, including applicable plans, policies, and regulations. Because the Project site is in a remote area, materials would have to be brought to the site from long distances and many workers would have to commute from communities elsewhere in Riverside County and nearby counties. An impact analysis and comparison of project alternatives is included in Section 5.

All Project-related traffic would use Interstate 10 (I-10) and State Route 177 (SR-177) for regional travel. The “Project area” or “study area” for the traffic and transportation analysis would be the existing roadways and intersections with the potential to experience a discernable increase in traffic volume during Project construction. Therefore, the study area for this analysis of traffic and transportation includes I-10, SR-177, and local roadways in the vicinity of the Project site.

A Transportation Impact Analysis for the Easley Project (David Evans and Associates, 2023) was prepared by David Evans and Associates to evaluate the potential transportation and traffic impacts of the Project with regard to congestion and is provided as Appendix H of this EIR.

3.18.1. Environmental Setting

The Project site is approximately 2 miles north of Desert Center in eastern Riverside County (refer to Figure 2-2). This site is north of I-10 and is situated primarily between SR-177 (Rice Road) on the east and County Route R2 (Kaiser Road) on the west. A small portion of the Project is east of SR-177, as is the Project’s gentie line. It is anticipated that most construction workers would be drawn from the Blythe/Palo Verde Valley region, with additional workers coming from the Imperial Valley and the greater Riverside County region. Workers and delivery trucks would access the Project site using entrances from SR-177 (Rice Road) approved by the California Department of Transportation (Caltrans) from Kaiser Road (County Road R2) approved by and Riverside County. It is anticipated that the I-10 interchange with SR-177 at Desert Center (Exit 192) would experience a substantial increase in traffic volume during AM and PM peak hours, when vehicles would be using SR-177 and Kaiser Road to reach Project access points.

3.18.1.1. Regional and Local Roadway Facilities

Roads in the vicinity of the Project site are shown in Figure 3.18-1. Easley Project Roads and Access. In addition to the principal through roads (I-10, SR-177/Rice Road, and Kaiser Road) local roads potentially affected by traffic include Ragsdale Road, Oasis Road, and Orion Road. Site access would be from both Rice Road and Kaiser Road, as indicated in Figure 3.18-1 (located at the end of the Traffic and Transportation section). The final location and design of Project access driveways would be determined in consultation with Caltrans and Riverside County, respectively, which have jurisdiction over these roads.

Regional roadway facilities in the Project area include:

Interstate 10: I10 is a major east/west interstate freeway connecting Southern California to Phoenix, Arizona and destinations further east. I10 is a four-lane freeway with a Desert Center interchange near the Project site at SR177 (Rice Road). The posted speed limit on I10 is 70 mph. In 2020 I10 carried roughly 28,000 average daily trips (ADT) with a peak hour ADT of approximately 3,400 at the I-10/SR-177 interchange.

- **State Route 177:** SR-177 (Rice Road) is a north/south highway between Desert Center/I-10 and SR-62, approximately 25 miles northeast of Desert Center. SR-177 is a two-lane road, and the posted speed limit is 65 mph. In 2020, at its junction with I-10, Rice Road carried had approximately 2,900 ADT with a peak hour ADT of 470.

Local roadways in the Project area include:

- **Ragsdale Road:** Ragsdale Road parallels the north side of I-10 in Desert Center and intersects with SR-177 (Rice Road) approximately 1,000 feet north of the freeway.
- **Kaiser Road (County R2):** Kaiser Road is a local county road that extends north for its intersection with SR-177 (Rice Road) approximately 400 feet north of Ragsdale Road. Kaiser Road provides access the Lake Tamarisk community and continues north along the western boundary of the Project site. The road continues northwest to the community of Eagle Mountain, where it terminates.
- **Oasis Road:** Oasis Road is a short local road connecting Kaiser Road and Rice Road along the south side of the community of Lake Tamarisk.
- **Orion Road:** Orion Road is a local road extending west from Rice Road and provides access to properties east of Rice Road.

There are no signalized intersections in the Project vicinity. Except for a stop sign on Kaiser Road southbound at SR-177, neither Kaiser Road nor SR-177 (Rice Road) have stop signs in the Project vicinity. The other local roads have stop signs where they intersect with Rice Road and Kaiser Road. Some movements on local intersecting roads, including crossing the major roadway or turns onto the major road, can be subject to delays, depend on the amount of through traffic on the main roadway; however, on the major roads through traffic and right turns would not experience any delays at these intersections.

As noted, SR-177 and Kaiser Road each provide access to the Project site.

SR-177 (Rice Road). In the Project vicinity, northbound and southbound traffic on SR-177 is free flowing with no stop signs between the I-10 freeway and the Project site. Traffic exiting the I-10 freeway at the I-10/SR-177 interchange has stop signs at the top of the eastbound and westbound I-10 offramps; eastbound and westbound traffic from SR-177 onto the freeway has no stops. North of the freeway, SR-177 intersects Ragsdale Road, which has stop signs controlling traffic entering or crossing SR-177. This is also the case at the T-intersections of Kaiser Road and Oasis Road, respectively, with SR-177. Traffic on the intersecting roads has stop signs while SR-177 is through traffic.

Kaiser Road (County R2). Traveling north from the I-10 interchange, Kaiser Road is reached by a left turn from northbound SR-177. There are no stop signs for northbound traffic on Kaiser Road. Near Lake Tamarisk, Oasis Road has a stop sign at its T-intersection with Kaiser Road. Southbound on Kaiser Road from the Project site toward the freeway there is one stop sign where Kaiser Road ends in a T-intersection with SR-177. Here traffic going toward the freeway would make a right turn onto southbound SR-177.

3.18.1.2. Project Site Access

Access to the Project vicinity from both the east and west is primarily via I-10. Secondary regional access from the northeast is via SR-177 (Rice Road). Most of the Project is situated between a State Highway (SR-177) and a County Road (Kaiser Road) and therefore subject to Caltrans and County requirements respectively for encroachment on these roadway rights-of-ways (ROWs). Encroachment permits would be needed for ingress/egress driveways or installation of any overhead/underground lines in or across the ROWs. Among the factors considered when permitting access points are the geometry and spacing of proposed ingress/egress points relative to each other and other existing road features and characteristics, the volume and speed of traffic on the affected road, and the ability to make safe turning movements in and out of the adjacent property.

Figure 3.18-1 shows approximate access locations. However, the final location and design features of temporary and permanent driveways between the roads and the site would be determined in consultation with the responsible agency and in compliance with their requirements. The volume of traffic to and from

a particular access point would vary during the course of construction, depending on where within the site construction activities occur and the number of workers required by those activities.

3.18.1.3. Public Transportation within the Project Vicinity

Pedestrian and Bicycle

Pedestrian facilities include sidewalks, crosswalks, curb ramps, pedestrian signals, and streetscape amenities. Pedestrian facilities currently do not exist in the Project study area. The existing pedestrian network does not currently provide sidewalks connecting adjoining land uses along SR-177 (Rice Road). No bicycle facilities (e.g., bicycle paths, lanes, or routes) currently exist in the area.

Public Transportation Service

The nearest public bus service is offered by the Palo Verde Valley Transit Agency, which serves the Blythe Area. Bus Route 6 travels along I-10 and serves the Desert Center Post Office once daily westbound and eastbound on Monday, Wednesday, and Friday (Palo Verde Valley Transit Agency, 2023).

Rail Service

There is no rail service in the vicinity of the Project. The Arizona and California Railroad runs from Cadiz, CA to Parker, AZ. A branch line that once served Blythe, California, has been abandoned.

Airports

Blythe Airport is the nearest public airport located approximately 40 miles east of the Project, serving Riverside County. The airport has two runways and is mostly used for general aviation, with an average 37 flights a day (AirNav, 2023a). Desert Center Airport is a private use airport owned by Chuckwalla Valley Associates. It is located approximately 1 mile east of SR-177 and the Project. Desert Center Airport has one runway and averaged less than 150 general aviation operations per year in 2006. Permission is required to land at this private use facility (AirNav, 2023b).

The Project site was compared to the military flight paths and airspace designations of the California Military Land Use Compatibility Analysis (CMLUCA) database. The site location is not within 4,000 feet of a military installation, within military special-use airspace, or beneath a military designated low-level flight path. Based on the CMLUCA, the Project site is located within military Visual Route (VR) flight paths (CMLUCA, 2023).

Impacts related to airports and aviation are addressed in Section 3.10, Hazards and Hazardous Materials.

3.18.2. Regulatory Framework

3.18.2.1. Federal Laws, Regulations, and Policies

CFR, Title 49, Subtitle B

This regulation includes procedures and regulations pertaining to interstate and intrastate transport (including hazardous materials program procedures) and provides safety measures for motor carriers and motor vehicles that operate on public highways.

3.18.2.2. State Laws, Regulations, and Policies

California Vehicle Code (CVC)

The CVC includes regulations pertaining to licensing, size, weight, and load of vehicles operated on highways; safe operation of vehicles; and the transportation of hazardous materials.

California Government Code

Sections 65352, 65404, 65940, and 65944, amended by Senate Bill 1462, requires local planning agencies to notify the military whenever a proposed development project or general plan amendment is located within 1,000 feet of a military installation, located within special use airspace, or is located beneath a low-level flight path.

California Department of Transportation

Local Development – Intergovernmental Review (LD-IGR). The Caltrans LD-IGR program uses the Transportation Impact Study Guide (TISG) during environmental review of land use projects and plans (Caltrans, 2020). The Caltrans LD-IGR program works with local jurisdictions early and throughout their land use planning and decision-making processes, consistent with the requirements of CEQA and state planning law. Caltrans seeks to reduce single occupancy vehicle trips, provide a safe transportation system, reduce per capita VMT (vehicle miles travelled), increase accessibility to destinations via cycling, walking, carpooling, and transit, and reduce GHG emissions. Those goals along with standard CEQA practice create the foundation of Caltrans review of proposed new land use projects.

The TISG replaces Caltrans' previous Traffic Impact Study Guidelines from 2002, which were based on vehicle delay and congestion. Based on the May 2020 TISG, for land use projects and plans, automobile delay is no longer considered a significant impact on the environment under CEQA per Senate Bill 743. Caltrans review of land use projects and plans is now based on a VMT metric, consistent with changes to the CEQA Guidelines (Cal. Code Regs. § 15064.3(b)(1)). This 2020 VMT-focused TISG provides a foundation for review of how lead agencies apply the VMT metric to CEQA project analysis.

As discussed later in Sections 3.18.5 through 3.18.8, the proposed Project would generate a large number of peak hour trips during construction. Most of these are worker vehicle trips. EIR Appendix H provides a transportation impact analysis prepared for the proposed Project. The analysis provided in Sections 3.18.5 through 3.18.8 compares the worst-case daily construction and operational trips against the existing volumes and capacities of study area roadways, including traffic volumes from other projects with construction and operation timelines overlapping that of the proposed Project.

3.18.2.3. Local Laws, Regulations, and Policies

Southern California Association of Governments

Connect SoCal – Regional Transportation Plan and Sustainable Communities Strategy (RTP/SCS). The 2020-2045 RTP/SCS Plan charts a path toward a more mobile, sustainable and prosperous region by making key connections: between transportation networks, between planning strategies and between the people. As part of the development of Connect SoCal, a set of ten high level goals were adopted. As requested by SCAG, the following presents a consistency analysis of the proposed Project with the ten Connect SoCal goals and demonstrates that the proposed Project would be consistent with the RTP/SCS Plan.³⁸

³⁸ Adopted Final Connect SoCal Plan Performance Measures. https://scag.ca.gov/sites/main/files/file-attachments/fconnect_socal_performance-measures.pdf.

1. Encourage regional economic prosperity and global competitiveness.

Consistency Analysis: Economic benefits, from the procurement of goods and services and worker wages, would occur both locally and regionally during Project construction and operation.

2. Improve mobility, accessibility, reliability, and travel safety for people and goods.

Consistency Analysis: The proposed Project would have no effect on the mobility, accessibility, or reliability of the transportation network. With respect to safety, Mitigation Measure TRA-2 (Repair Roadways and Transportation Facilities Damaged by Construction Activities) is proposed to ensure any damage and deterioration attributed to the Project would be repaired.

3. Enhance the preservation, security, and resilience of the regional transportation system.

Consistency Analysis: The proposed Project would have no effect on security of the transportation network. With respect to preservation and resilience, Mitigation Measure TRA-2 (Repair Roadways and Transportation Facilities Damaged by Construction Activities) is proposed to ensure any damage and deterioration attributed to the Project would be repaired.

4. Increase person and goods throughput and travel choices within the transportation system.

Consistency Analysis: While the Project would not be transit-friendly, it would include Mitigation Measure TRA-1 (Construction Traffic Carpool and Trip Reduction Plan), which would encourage carpooling of construction workers. During operation of the proposed Project, up to 10 permanent staff periodically could be on the site for ongoing facility maintenance and repairs, which would not affect the transportation system.

5. Reduce greenhouse gas emissions and improve air quality.

Consistency Analysis: The proposed Project is a solar generation and energy storage facility, which would reduce greenhouse gas emissions and improve air quality by offsetting the need for conventional power generation.

6. Support healthy and equitable communities.

Consistency Analysis: The proposed Project is a solar generation and energy storage facility, which would reduce greenhouse gas emissions and improve air quality by offsetting the need for conventional power generation. Economic benefits, from the procurement of goods and services and worker wages, would occur both locally and regionally during Project construction and operation.

7. Adapt to a changing climate and support an integrated regional development pattern and transportation network.

Consistency Analysis: The proposed Project would have no effect on regional development patterns of the transportation network. The proposed Project is a solar energy facility, which would reduce greenhouse gas emissions and improve air quality by offsetting the need for conventional power generation.

8. Leverage new transportation technologies and data-driven solutions that result in more efficient travel.

Consistency Analysis: While the Project would not be transit-friendly, it would include Mitigation Measure TRA-1 (Construction Traffic Carpool and Trip Reduction Plan), which would encourage carpooling of construction workers.

9. Encourage development of diverse housing types in areas well supported by multiple transportation options.

Consistency Analysis: The proposed Project would have no effect on housing and transportation networks supporting them (see Section 3.14, Population and Housing).

10. Promote conservation of natural and agricultural lands and restoration of critical habitats.

Consistency Analysis: The proposed Project would have no effect on designated critical habitat or active/operational agricultural lands. The Project does affect undeveloped private lands that are disturbed from past agricultural operations and impacts to Agricultural Resources are discussed in Section 3.3. Potential impacts to habitat are discussed in Section 3.4 (Biological Resources).

County of Riverside Congestion Management Plan

Riverside County's Congestion Management Plan (CMP) is part of the Riverside County Transportation Commission's (RCTC) Long Range Transportation Plan published in 2019. All state highways and principal arterials are CMP roadways. I-10 and SR177 are the only CMP roadways in the Project study area. Under the CMP all CMP roadways operate at a Level of Service (LOS) of "E" or better.

The ~~RCTC~~CMP's adopted minimum LOS threshold is LOS "E." Therefore, when a CMP street or highway segment falls to "F," a deficiency plan must be required. Preparation of a deficiency plan will be the responsibility of the local agency where the deficiency is located. Other agencies identified as contributors to the deficiency will also be required to coordinate with the development of the plan. The plan must contain ~~mitigation~~ measures, including consideration of Transportation Demand Management (TDM) strategies and transit alternatives, and a schedule for ~~mitigating~~ eliminating the deficiency.

Riverside County General Plan – Circulation Element & Land Use Element

The Riverside County General Plan is applicable to all unincorporated lands within Riverside County. Countywide policies that address traffic and transportation within the County boundaries are found in the Circulation Element (2020) and Land Use Element (2021) of the County General Plan, and include:

Circulation Element:

- **Policy C1.8:** Ensure that all development applications comply with the California Complete Streets Act of 2008 as set forth in California Government Code Sections 65040.2 and 65302.
- **Policy C2.1:** The following minimum target levels of service have been designated for the review of development proposals in the unincorporated areas of Riverside County with respect to transportation impacts on roadways designated in the Riverside County Circulation Plan (Figure C-1), which are currently County maintained, or are intended to be accepted into the County maintained roadway system:

LOS C shall apply to all development proposals in any area of the Riverside County not located within the boundaries of an Area Plan, as well those areas located within the following Area Plans: REMAP, Eastern Coachella Valley, Desert Center, Palo Verde Valley, and those non-Community Development areas of the Elsinore, Lake Mathews/Woodcrest, Mead Valley and Temescal Canyon Area Plans

...

Notwithstanding the forgoing minimum LOS targets, the Board of Supervisors may, on occasion by virtue of their discretionary powers, approve a project that fails to meet these LOS targets in order to balance congestion management considerations in relation to benefits, environmental impacts and costs, provided an Environmental Impact Report, or equivalent, has been completed to fully evaluate the impacts of such approval. Any such approval must incorporate all feasible mitigation measures, make specific findings to support the decision, and adopt a statement of overriding considerations.

- **Policy C2.2:** Require that new development prepare a traffic impact analysis as warranted by the Riverside County Traffic Impact Analysis Preparation Guidelines or as approved by the Director of Transportation. Apply level of service targets to new development per the Riverside County Traffic Impact

Analysis Preparation Guidelines to evaluate traffic impacts and identify appropriate mitigation measures for new development.

- **Policy C2.3:** Traffic studies prepared for development entitlements (tracts, plot plans, public use permits, conditional use permits, etc.) Shall identify project-related traffic impacts and determine the significance of such impacts in compliance with CEQA and the Riverside County Congestion Management Program Requirements.
- **Policy C2.4:** The direct project-related traffic impacts of new development proposals shall be mitigated via conditions of approval requiring the construction of any improvements identified as necessary to meet level of service targets.
- **Policy C2.8:** Riverside County shall coordinate with Caltrans, RCTC and adjacent local jurisdictions in conformance with the Riverside County Congestion Management Program to determine the appropriate LOS threshold for determining significance when reviewing development proposals that directly impact nearby State Highway facilities or city streets.
- **Policy C3.6:** Require private developers to be primarily responsible for the improvement of streets and highways that serve as access to developing commercial, industrial, and residential areas. These may include road construction or widening, installation of turning lanes and traffic signals, and the improvement of any drainage facility or other auxiliary facility necessary for the safe and efficient movement of traffic or the protection of road facilities.
- **Policy C3.8:** Restrict heavy duty truck through-traffic in residential and community center areas and plan land uses so that trucks do not need to traverse these areas.
- **Policy C3.9:** Design off-street loading facilities for all new commercial and industrial developments so that they do not face surrounding roadways or residential neighborhoods. Truck backing and maneuvering to access loading areas shall not be permitted on the public road system, except when specifically permitted by the Transportation Department.
- **Policy C3.10:** Require private and public land developments to provide all on-site auxiliary facility improvements necessary to mitigate any development-generated circulation impacts. A review of each proposed land development project shall be undertaken to identify project impacts to the circulation system and its auxiliary facilities. The Transportation Department may require developers and/or subdividers to provide traffic impact studies prepared by qualified professionals to identify the impacts of a development.
- **Policy C6.1:** Provide dedicated and recorded public access to all parcels of land, except as provided for under the statutes of the State of California.
- **Policy C6.2:** Require all-weather access to all new development.
- **Policy C7.1:** Work with incorporated cities to mitigate the cumulative impacts of incorporated and unincorporated development on the countywide transportation system.
- **Policy C7.9:** Review development applications in cooperation with RCTC and as appropriate, to identify the precise location of CETAP corridors and act to preserve such areas from any permanent encroachments, pending dedication or acquisition. Coordinate with RCTC to evaluate and update the CETAP corridors periodically as conditions warrant.

Land Use Element:

- **Policy LU 29.6:** Require that commercial projects abutting residential properties protect the residential use from the impacts of noise, light, fumes, odors, vehicular traffic, parking, and operational hazards.

Riverside County Municipal Code Title 10 Vehicles and Traffic, Chapter 10.08, Sections 10.08.010 – 10.08.180

Chapter 10.08 establishes requirements and permits for oversize and overweight vehicles.

Riverside County Ordinance No. 460

This ordinance specifies that all new access roads shall conform to the requirements of the Riverside County Transportation Department Subdivision Regulations.

Riverside County Ordinance No. 461

This ordinance specifies that all new access roads shall conform to the requirements of the Riverside County Transportation Department Road Improvement Standards and Specifications.

The proposed Project would be consistent with applicable policies and ordinances of the County related to traffic and transportation. This would be assured through Project design, requirements imposed under a CUP/PUP and Development Agreement, and County review of plans.

3.18.3. Methodology for Analysis

This analysis focuses on potential impacts related to the construction, operation and maintenance, and decommissioning of the Project on the surrounding transportation systems and roadways considering vehicle miles traveled (VMT), as required under CEQA. In addition, Riverside County has an additional impact criterion to be considered regarding congestion. However, level of service (LOS) is no longer a metric for determining the significance of traffic impacts under. Construction is a limited duration activity that does not generate vehicle miles over the life of the project. The proposed Project would have a large number of workers arriving and departing the site during the construction period, but thereafter the amount of traffic to the site would be minimal for the operation and maintenance needs. Construction-related traffic is evaluated qualitatively, as is allowed under CEQA. However, because concerns may arise over the level of construction traffic on local roads and how it affects levels of traffic, LOS was used to evaluate traffic in the Project vicinity. The *Transportation Impact Analysis* report (David Evans and Associates, 2023) found in EIR Appendix H- is the basis for also evaluating impacts to local transportation systems based on level of service determinations.

This assessment of transportation-related impacts is based on evaluations and technical analyses designed to compare the existing conditions (pre-Project), construction and operation of the Project, and cumulative impacts that consider the additional effects of other projects in the region. After construction, operation of the Project would not generate a substantial or significant number of trips above those already generated by existing land uses in the Project area. However, the construction phase of the Project would include trips generated by construction workers and supplies delivered by trucks to the Project area. Decommissioning activities are anticipated to be similar to construction, but less intense. This analysis considers the effects of transportation and traffic of the Project in the context of CEQA and Riverside County requirements. Caltrans is the agency responsible for permitting and regulation of the use of state-administered roadways within California, including I-10 and SR-177, and the County is the agency responsible for regulation of the use of roadways within its jurisdictional boundaries.

3.18.3.1. Trip Generation

Trip generation for the proposed Easley Project was developed for the construction phase of the Project using information provided by the Applicant. Another project, the Sapphire Solar Project, is proposed adjacent to the Easley Project. If approved, construction of this project could potentially overlap with the Easley Project construction period. Three projects in the vicinity of the Easley site are under construction.

They are the Oberon Renewable Energy Project (operational with site restoration underway), the Victory Pass Solar Project, and the Arica Solar Project. These are anticipated to have completed construction and be in operation prior to the start of Easley Project construction. To be conservative (and thereby identify the “worst case” scenario), traffic on roads in the vicinity during the Easley Renewable Energy Project construction period is assumed to include both Easley Project and Sapphire Solar Project construction traffic as projected at the time of the analysis (See Table 3.18-1), as well as operations-related traffic associated with the Oberon, Victory Pass, and Arica projects.

Average daily trips (ADT) and peak hour trips generated in the Project area during the construction period of the Easley Project are shown in Table 3.181. This includes construction trips associated with both the Easley Project and the proposed Sapphire Project, as well as ~~and~~ the O&M trips associated with operations of the three nearby solar projects.

Overall, the average number of workers on the Easley site during construction is projected to be 320, with a peak of 530. The higher number represents a “worst case” scenario and assumes 530 single occupant worker vehicles arriving and departing the construction site during the peak hours. Based on the distance between the Project and population centers where most workers live, many workers are expected to carpool from near their homes or from remote parking locations rather than drive alone to the Project site. Remote parking and carpooling would reduce the actual number of vehicles on roads in the Project vicinity during peak hours. As well, not all workers are expected to arrive/depart in a single peak AM or PM hour.

Table 3.18-1. Daily Construction Trip Generation During Construction Period

Description	Quantity	ADT	AM Peak Hour			PM Peak Hour		
			In	Out	Total	In	Out	Total
Easley Project Workers	530	1080	530	10	540	10	530	540
Easley Project Delivery Trucks	80**	160	3	3	6	3	3	6
<i>Daily Total Easley Project Trips</i>		1240	533	13	546	13	533	546
Sapphire Project Workers	322***	650	322	3	355	3	322	325
Sapphire Project Delivery Trucks	9	17	1	1	2	1	1	2
<i>Daily Total Sapphire Project Trips</i>		667	323	4	327	4	323	327
Nearby Solar Project O&M Workers*	30	60	30	0	30	0	30	30
Nearby Solar Project O&M Deliveries*	9	18	6	6	12	3	3	6
<i>Daily Total Nearby O&M Trips*</i>		78	36	6	42	3	33	36
Total Construction Period Workers	882	1790	882	13	925	43	852	895
Total Construction Period Trucks	98	195	10	10	20	7	7	14
<i>Daily Total Trips</i>		1985	892	23	915	20	889	909

* For Arica Solar, Victory Pass Solar, Oberon Renewable Energy Projects

** The assumption of 80 roundtrips per day in the Easley Traffic Impact Analysis Report (EIR Appendix H) is based on a larger Project MW output, and thus conservatively analyzes a worst-case scenario. The number of truck trips has been reduced to 60 roundtrips in EIR Section 2.4.8 to reflect the current up to 400 MW project.

*** After publication of the DEIR, Sapphire Project advised that its construction worker estimate is 250 employees, 72 less than used in estimating trip generation for the combined projects. No revision has been made to the analysis based on the revised number, thereby retaining the more conservative estimate.

Source: EIR Appendix H.

3.18.3.2. Vehicle Miles Traveled

Vehicle miles traveled (VMT) is a measure used in transportation planning for a variety of purposes. It measures the amount of travel for all vehicles in a geographic region over a given period. VMT is calculated by adding up all the miles driven by all the cars and trucks on all the roadways in a region. This metric plays an integral role in the transportation planning, policy-making, and revenue estimation processes due to its ability to indicate travel demand and behavior. Per CEQA Guidelines section 15064.3, subdivision (b), a VMT analysis under CEQA may be based on the following:

- *Qualitative Analysis:* If existing models or methods are not available to estimate the vehicle miles traveled for the particular project being considered, a lead agency may analyze the project's vehicle miles traveled qualitatively. Such a qualitative analysis would evaluate factors such as the availability of transit, proximity to other destinations, etc. For many projects, a qualitative analysis of construction traffic may be appropriate.
- *Methodology:* A lead agency has discretion to choose the most appropriate methodology to evaluate a project's vehicle miles traveled, including whether to express the change in absolute terms, per capita, per household or in any other measure. A lead agency may use models to estimate a project's vehicle miles traveled, and may revise those estimates to reflect professional judgement based on substantial evidence. Any assumptions used to estimate vehicle miles traveled and any revisions to model outputs should be documented and explained in the environmental document prepared for the project.

While the proposed Project would generate a substantial number of trips, this would be only during construction, which is anticipated to take approximately 20-months. Therefore, a qualitative analysis for VMT has been conducted.

VMT reduction is needed to achieve State climate goals as travel per capita and passenger vehicle emissions have continued to grow despite improvements in vehicle fuel efficiency and other strategies to reduce emissions. The more that travelers are able to make the same trips by walking, bicycling, using transit, or carpooling, the less VMT increases even as new development occurs.

The proposed Project would generate a large amount of traffic during the 20-month construction period but not thereafter. As the site is developed, workers and trucks would travel to and from the site. The remote location of the site limits the opportunity to improve how efficiently workers reach the site. Living locally or carpooling are two ways to reduce VMT in the region. However, there are few housing opportunities nearby. Workers could (and on other projects currently under construction workers do) carpool. Few if any alternative means to reach the Project site are available. The ability to use public transit is limited by ~~from~~ the distance from the nearest transit stop to the site and the very infrequent service; the same is true for walking and bicycling.

The VMT approach is useful when a project results in facilities or locations that generate trips year-in and year-out, such as office buildings and shopping centers. During construction, these and other projects generate temporary vehicle trips from workers and materials deliveries, which end with the end of construction. The principal concern during construction is the effect of worker and truck traffic on congestion in the Project vicinity. This is the case with the Easley Project. After construction, during operation, the Project would generate few trips – not enough to have a significant impact on congestion, air quality, noise, and similar concerns.

3.18.3.3. Level of Service

Level of Service (LOS) is a qualitative method to assess congestion (delay) at intersections and ranges across six levels, from LOS A to LOS F. The level of delay is measured in seconds. At unsignalized intersections, LOS A results in 10 seconds or less delay for a motorist; LOS F results in 50 seconds or greater

delay. In California, LOS is no longer a criterion for assessing project traffic impacts under CEQA. The focus has shifted from congestion, as measured by LOS, to broader traffic impacts on air quality, energy use, climate change, and other factors, as measured by Vehicle Miles Traveled (VMT). However, in addition to VMT, Riverside County planners are concerned about the effects of a project on local roads and the level of congestion that may occur. In situations such as those existing at and around the Easley Project site, LOS remains a useful tool for illustrating the construction-period congestion effects of a project on local roads and intersections. LOS is an indicator of operating conditions on a roadway or at an intersection and is defined in categories ranging from A to F. LOS A represents the best traffic flow conditions with very low delay, and LOS F represents poor conditions. LOS A indicates free-flowing traffic, and LOS F indicates substantial congestion with long delays at intersections.

Once the Easley Project is operational, traffic attributable to the Project would be minimal; therefore, the focus of this impact analysis is on the congestion that may occur on roadways during construction, when there would be a high volume of worker vehicles and delivery trucks accessing the Project site. Based on this consideration, the analysis of traffic and transportation impacts related to the Easley Project is focused on the level of service on local roads, where LOS is measured in terms of delay for motorists that results from the number of vehicles on the roadway and at intersections.

For the proposed Project, field observations of existing intersection turning movements (counts) were completed on Wednesday, February 15, 2023. This was a midweek day with clear weather. Table 3.18-2 presents existing LOS at the five studied intersections. As illustrated in Table 3.18-2, all of the intersections within the study area of the proposed Project are operating at an acceptable level of service (LOS A or LOS B) during both the morning and afternoon peak hours when Project-related traffic would be heaviest.

Table 3.18-2. Existing Intersection Levels of Service

Intersection	Peak Period	Existing	
		Delay	LOS
Rice Road (SR-177) / I-10 Eastbound Ramps	AM	9.5	A
	PM	9.4	A
Rice Road (SR-177) / I-10 Westbound Ramps	AM	9.3	A
	PM	9.4	A
Rice Road (SR-177) / Ragsdale Road	AM	9.7	A
	PM	11.5	B
Rice Road (SR-177) / Kaiser Road (County R2)	AM	8.9	A
	PM	9.7	A
Rice Road (SR-177) / Oasis Road	AM	8.8	A
	PM	9.5	A

Source: EIR Appendix H.

The LOS shown in Table 3.18-2 shows current conditions (February 2023), which included traffic associated with projects that under construction in the area on the day traffic counts were taken. If the Easley Renewable Project were not constructed, but the proposed Sapphire Project were built and the three nearby solar projects were in their post-construction O&M stage, the LOS at the intersections would be as shown in Table 3.18-3. All levels would be acceptable.

Table 3.18-3. Intersection Levels of Service with Sapphire Project Construction and O&M Projects

Intersection	Peak Period	Existing	
		Delay	LOS
Rice Road (SR-177) / I-10 Eastbound Ramps	AM	10.4	B
	PM	10.4	B
Rice Road (SR-177) / I-10 Westbound Ramps	AM	12.9	B
	PM	9.7	A
Rice Road (SR-177) / Ragsdale Road	AM	13.8	B
	PM	20.3	C
Rice Road (SR-177) / Kaiser Road (County R2)	AM	9.4	A
	PM	15.5	C
Rice Road (SR-177) / Oasis Road	AM	9.3	A
	PM	10.7	B

Source: EIR Appendix H.

When it is assumed that the Easley Project the proposed Sapphire Project have a simultaneous construction period and the three nearby solar projects are in their post-construction O&M stage, the LOS at intersections would be as shown in Table 3.18-4. This table includes the three driveways that are associated only with the Easley Project. Under this scenario, three intersections in the area were identified has potentially having LOS F, highlighted in bold in the table.

Table 3.18-4. Intersection LOS with Easley and Sapphire Construction and Projects in O&M

Intersection	Peak Period	Existing	
		Delay	LOS
Rice Road (SR-177) / I-10 Eastbound Ramps	AM	18.5	C
	PM	18.3	C
Rice Road (SR-177) / I-10 Westbound Ramps	AM	114.3	F
	PM	12.2	B
Rice Road (SR-177) / Ragsdale Road	AM	29.5	D
	PM	72.8	F
Rice Road (SR-177) / Kaiser Road (County R2)	AM	14.4	B
	PM	271.6	F
Rice Road (SR-177) / Oasis Road	AM	10.4	B
	PM	13.2	B
Oasis Road / Kaiser Road (County R2)	AM	13.9	B
	PM	12.8	B
Rice Road (SR-177) / Project Driveway #1	AM	17.3	C
	PM	17.5	C
Rice Road (SR-177) / Project Driveway #2	AM	17.3	C
	PM	17.5	C
Kaiser Road (County R2) / Project Driveway #3	AM	11.2	B
	PM	29.3	D

Source: EIR Appendix H.

These tables show the potential temporary effect of construction traffic on LOS at various local intersections. The analysis supporting Table 3.18-4 assumed that the Easley and Sapphire Projects have simultaneous construction periods, that the traffic on a particular day is the maximum for each of the two projects, and that workers arrive/depart during the peak AM/PM hours in single occupant vehicles.

LOS F would occur for AM Peak Hour traffic on the westbound I-10 ramp to Rice Road and PM Peak Hour traffic on Ragsdale Road at Rice Road and on Kaiser Road at Rice Road. Under this scenario, three intersections would be at LOS F. Under County standards intersections with LOS F would be unacceptable.

With the end of construction, the only traffic associated with solar projects would be that required for O&M operations, estimated to involve no more than 10 workers and 3 trucks arriving and departing each day per solar project site.

3.18.3.4. Ambient Growth and Cumulative Traffic

The ambient growth is a general rate of growth in traffic from overall regional growth (assumed to be 3% annually for the analysis presented in EIR Appendix H). Over 20 projects in Eastern Riverside County were identified that are either operational or are under construction but will be operational prior to construction of the Easley Project. Eight other potential future projects in the vicinity of the Easley are under review but not approved.

The traffic impact analysis presented in EIR Appendix H considered the development of adjacent and nearby large-scale solar energy projects, where the construction of those projects is expected to overlap with construction of the proposed Easley Project. As shown in Table 3-18-4, for the Easley Project this would involve simultaneous development of the proposed adjacent Sapphire Solar Project. Three projects in the vicinity of the Easley Project – Arica Solar, Victory Pass Solar, and Oberon Solar – are expected to be in operation prior to the construction phase of the Easley Project.

During the operations and maintenance of these three projects, each would ~~each~~ contribute daily traffic from an estimated 10 workers and 3 truck deliveries. This would result in an estimated 42 AM peak hour trips and 36 PM peak hour trips. When operational, the Easley Project would have a similar level of traffic (10 workers, 3 truck deliveries) as the other solar projects in the vicinity.

3.18.4. CEQA Significance Criteria

The criteria used to determine the significance of potential traffic and transportation impacts are based on Appendix G of the State CEQA Guidelines. Based on the Guidelines, the proposed Project would result in a significant impact under CEQA related to traffic and transportation if the Project would:

- Conflict with a program plan, ordinance or policy addressing the circulation system, including transit, roadway, bicycle and pedestrian facilities.
- Conflict or be inconsistent with CEQA Guidelines section 15064.3, subdivision (b).
- Substantially increase hazards due to a geometric design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment).
- Result in inadequate emergency access.

The County of Riverside's Environmental Assessment Form includes additional significance criteria. The additional criteria indicate that a project could have potentially significant impacts related to traffic and transportation if it would:

- Cause an effect, or a need for new or altered maintenance of roads (see Impact TRA-2);
- Cause an effect upon circulation during the project's construction (see Impact TRA-1);
- Result in inadequate emergency access or access to nearby uses (see Impact TRA-1).
- Include the construction of expansion of a bike system or bike lanes (omitted).

The County impact criterion regarding construction or expansion of bike facilities is omitted; the Project would not construct or expand bike facilities. The other Guidelines and County criteria are addressed in Section 3.18.5.

The County of Riverside's Environmental Assessment Form also includes significance criteria regarding airports. These are addressed in Section 3.10, Hazards and Hazardous Materials.

3.18.5. Proposed Project Impact Analysis

The scoping effort conducted by the Riverside County Planning Department revealed several public concerns related to traffic and transportation, including concerns about increased disturbance, dust, and noise created by construction vehicles and trucks, as well as the speed and presence of these vehicles impacting the safety of residents. Dust, noise, and similar nuisance impacts are discussed in the relevant resource topic areas in this EIR. It is presumed that vehicles would comply with posted speed limits and obey all traffic laws on public roads. Compliance with traffic laws would reduce any potential safety risk to residents.

A commentor also expressed concerns about coordination with the Department of Defense (DoD), as the Project is in a fly zone, which the military uses for training. The Department of Defense will receive notification of the Project and of the availability of the EIR and will be invited to comment. The height of Project facilities, such as the gen-tie line, would comply with requirements of the FAA to ensure aviation safety and any DoD restrictions that may apply. (See Section 3.18, Hazards and Hazardous Materials, Impact HAZ-1.)

Impact TRA-1. The Project would conflict with an applicable plan, ordinance, or policy addressing the circulation system, including transit, roadway, bicycle and pedestrian facilities.

Solar Facility

Road Network

LESS THAN SIGNIFICANT WITH MITIGATION. The County's Congestion Management Plan (CMP) predates revisions to CEQA, which changed the focus of traffic analysis from congestion (measured as level-of-service (LOS)) to vehicle miles traveled (VMT). The CMP still requires an analysis of congestion. Table 3.18-4 presents the potential level of service (LOS) at each study area intersection where the maximum daily construction trips were to occur for the Easley Project, the proposed Sapphire Project, and the three nearby solar projects in the O&M stage of operation. This represents the "worst case" scenario, with the highest number of workers working at each site and arriving/departing during the same peak hours.

As shown in Table 3.18-4, the addition of Easley Project-related construction trips to the ambient conditions (Sapphire Project plus three projects in O&M) could result in three intersections operating at LOS F, an unacceptable level:

- I-10 westbound ramp at SR-177 – LOS F (AM Peak Hour)
- Rice Road (SR-177) at Ragsdale Road – LOS F (PM Peak Hour)
- Rice Road (SR-177) at Kaiser Road (County Route R2) – LOS F (PM Peak Hour)

To ensure that impacts from temporary construction-related trips are reduced to a less than significant level, Mitigation Measure (MM) TRA-1 (Construction Traffic Control Plan) is proposed and would require the Applicant to prepare a Construction Traffic Control Plan for review and approval by Caltrans and Riverside County. This plan requires the Applicant to reduce construction-related trips during morning (7:00 a.m. to 9:00 a.m.) and afternoon (4:00 p.m. to 6:00 p.m.) peak hours on I-10, SR-177, and Kaiser Road. If the traffic conditions at the time of Project construction reflect the ambient conditions due to

overlapping construction, the measure requires the Applicant to install a temporary signal or use manual intersection control. The Easley Project in itself is not expected to result in an unacceptable LOS as it would generate fewer vehicle trips than the ambient conditions (which includes simultaneous construction at the Sapphire Project site). Therefore, the measure allows for adaptive management given the uncertain schedule for projects included in the ambient conditions.

Up to 10 permanent staff could be on the site at any one time for ongoing facility maintenance and repairs. Alternatively, approximately 2 permanent staff and 8 Project operators would be located off-site and would be on call to respond to alerts generated by the monitoring equipment at the Project site. The Project site maintenance program would be largely conducted on-site during daytime hours. Equipment repairs could take place in the early morning or evening when the plant would be producing the least amount of energy. Based on these expected operational and maintenance requirements, it is estimated average daily traffic volumes associated with Project operation would be approximately 15 daily round trips (30 total trips), with the majority being passenger vehicles. The addition of 30 daily trips would have a negligible effect on performance of the study area transportation system and less than significant impacts would occur.

Transit, Bicycle, and Pedestrian Use

LESS THAN SIGNIFICANT WITH MITIGATION. The only public transit stop in the Project vicinity is at Desert Center Post Office. The service is operated by the Palo Verde Valley Transit Agency, which serves the Blythe Area. Bus Route 6 travels along I-10 and serves the Desert Center Post Office once daily westbound and eastbound on Monday, Wednesday, and Friday. The Post Office stop is west of SR-177, south of the Project near I-10 and would not be affected by Project construction. There are no designated pedestrian and bicycle paths in the Project vicinity.

Construction of the solar facility is not expected to require any temporary lane closures that could restrict the movements of vehicles or pedestrians. However, construction of the Project would require large vehicles to travel on local roadways to access the Project site. MM TRA-1 (Construction Traffic Control Plan) requires the Construction Traffic Control Plan be reviewed and approved by Caltrans and Riverside County and includes provisions for ensuring detours or safe movement of traffic through all affected areas. With the implementation of this measure, impacts during construction would be less than significant.

Once constructed, maintenance activities would occur as needed at the solar facility but are not expected to require any temporary travel lane closures that could restrict the local circulation system. Impacts would be less than significant.

500 kV Generation-Tie Line

LESS THAN SIGNIFICANT WITH MITIGATION. The construction trip generation shown in Table 3-18-4 includes trips associated with both construction of the solar energy facility and the gen-tie line. Therefore, the trip analysis presented above for construction of the solar energy facility also evaluated trips associated with gen-tie construction. As discussed, the implementation of MM TRA-1 (Construction Traffic Control Plan) would eliminate any significant impact at the three affected study area intersections.

As presented in Chapter 2 (Description of the Proposed Project and Alternatives) construction of the gen-tie would require overhead conductors be strung across SR-177. Overhead gen-tie construction could require the short-term temporary closure lanes on SR-177. Also, where new poles would be installed adjacent to roads and where conductor would be strung on poles adjacent to roadways, temporary travel lane disruptions may also occur.

Mitigation Measure TRA-1 (Construction Traffic Control Plan) is proposed to provide specificity regarding the means to reduce potential impacts from any temporary travel lane disruptions and requires the Construction Traffic Control Plan be reviewed and approved by Caltrans and Riverside County. With the

incorporation of MM TRA-1 (Construction Traffic Control Plan), impacts to traffic flow resulting from temporary construction-related disruptions to the affected circulation system would be less than significant.

Once constructed, the gen-tie overhead facilities would require routine inspection via ground observation. Maintenance activities would occur as needed. Collector lines would not require routine inspection but may require some periodic maintenance over the life of the Project. Due to the limited duration and extent of these activities, minimal daily trips are necessary and would have a negligible effect on the LOS or other performance standard of the transportation system under existing conditions. Routine inspections and maintenance are not expected to require temporary lane closures. Impacts would be less than significant.

Mitigation Measures for Impact TRA-1

MM TRA-1 Construction Traffic Control Plan. See full text in Section 3.18.79 (Mitigation Measures).

Significance After Mitigation

With the implementation of MM TRA-1, potential impacts to traffic flows on the affected circulation system resulting from Project-related construction traffic trips and potential disruptions to travel lanes would be less than significant and would be consistent with applicable traffic-related plans and policies.

Impact TRA-2. Construction of the Project would conflict with or be inconsistent with CEQA Guidelines section 15064.3, subdivision (b) regarding transportation impacts.

LESS THAN SIGNIFICANT WITH MITIGATION. The proposed Project would result in traffic trips during construction. During construction, an average of 320 workers per day would commute to the Project site with a maximum of 530 workers during peak construction. In addition, an estimated worst-case scenario of 80 round trips per day would be required to deliver materials and equipment to the Project site. Truck trips associated with materials and equipment deliveries would likely come from within the Palm Springs, Blythe, and/or Riverside–San Bernardino area, with some materials trips likely originating from the Ports of Long Beach and Los Angeles. Many temporary workers needed for construction of the gen-tie would reside within a 60 to 90-minute drive time of the Project area. This assumption is based on observations regarding worker commute habits during construction monitoring efforts for recent similar renewable energy and transmission projects in the California desert. However, it is likely that some construction workers would come from outside this anticipated reasonable commute area and seek temporary housing proximate to the work area.

Per State CEQA Guidelines Section 15064.3(b)(3), a qualitative VMT analysis of construction trips is appropriate, given that the construction-related trips are not ongoing once construction is completed. Due to the remote location of the Project site, many construction truck trips may require high VMT to access the site. However, all construction-related truck trips would be temporary and only in volumes necessary to deliver equipment and materials to the site. Upon completion of construction, all truck trips and construction worker commute trips would cease. At this time, no known there are no applicable VMT thresholds of significance for temporary construction trips that may indicate a significant impact are known. MM TRA-1 (Construction Traffic Control Plan) requires the Applicant to prepare a Construction Traffic Control Plan, with the Plan providing means to encourage or provide ridesharing opportunities for construction workers. Therefore, while the proposed Project would include temporary construction trips that may include high VMT, they would not affect existing transit uses or corridors and are presumed to cause a less than significant transportation impact. Based on construction of other solar projects in the region, workers often carpool because of the distance travelled and the cost savings.

Once constructed, operation and maintenance of the Project would generate very few vehicle trips. It is assumed operational workers would either be located in, or seek permanent residence within, a reasonable commute distance. For example, Blythe is approximately 50 miles east of Desert Center and Indio is a similar distance to the west. This would require a 45-minute commute. The estimated commute time and VMT for operational workers is considered to be within a reasonable range typical of the remote desert communities nearest to the Project. Due to the remote location of the Project site, limited residential and transit opportunities to the site, and low number of daily trips (30 daily trips), Project operation is not considered to result in high VMTs that could adversely affect transit or transportation planning for the area. MM TRA-1 requires the Applicant to prepare a Construction Traffic Control Plan to affected jurisdictions, with the Plan providing means to encourage or provide ridesharing opportunities for operational workers as well. Therefore, operational-related trips would not affect existing transit uses or corridors and are presumed to cause a less-than-significant transportation impact.

Mitigation Measures for Impact TRA-2

MM TRA-1 Construction Traffic Control Plan. See full text in Section 3.18.9-7(Mitigation Measures).

Significance After Mitigation

This impact would be less than significant with implementation of MM TRA-1.

Impact TRA-3. Project activities would increase transportation hazards due to a geometric design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment).

Solar Facility and 500 kV Generation-Tie Line

LESS THAN SIGNIFICANT WITH MITIGATION. Most construction traffic would access the Project area via I-10 and SR-177, accessing private site entrances from SR-177 and Kaiser Road adjacent to the Project site. Due to the flat topography, both the freeway and local roadways accessing the site have a relatively straight horizontal alignment with good visibility in all directions. All access driveways to the site from SR-177 would comply with County and Caltrans requirements to ensure safe site ingress and egress. There would be no sharp curves or dangerous intersections. All new internal roads within the site would be private. During construction, all truck drivers would adhere to California Vehicle Code regulations pertaining to licensing, size, weight, and load of vehicles operated on highways and local roads; safe operation of vehicles; and the transport of any hazardous materials. Traffic on public freeways and roads would be of the same vehicle types (passenger vehicles and heavy trucks) that currently occur and are allowed. Construction-related traffic would be compatible with existing traffic. Therefore, no additional roadway hazards would occur from Project-related vehicle trips on transportation facilities. Additionally, MM TRA-1 (Construction Traffic Control Plan) requires the preparation of a Construction Traffic Control Plan to be reviewed and approved by Caltrans and Riverside County. This Plan includes provisions for ensuring detours or safe movement of local resident vehicles, pedestrians, and bicycles through all affected facilities. With the incorporation of this mitigation, hazard impacts from Project-related vehicle use of public roadways would be less than significant.

The movement of heavy trucks and equipment on public roads to Project work areas could potentially result in damage to road surfaces, shoulders, curbs, sidewalks, signs, and light standards. MM TRA-2 (Repair Roadways and Transportation Facilities Damaged by Construction Activities) is proposed to ensure any damage and deterioration attributed to the Project would be repaired. With the incorporation of this mitigation, hazard impacts from transportation facility damage demonstrable to the Project would be less than significant.

The 500 kV gen-tie line would cross SR-177 overhead, requiring temporary lane closures when the conduit is strung between towers east and west of the highway. Collector lines from the solar arrays located east of SR-177 would be installed under SR-177 using directional drilling. Traffic would not be affected.

During operations and maintenance, it is estimated average daily traffic volumes associated with the Project would be approximately 15 round trips (30 total trips), with the majority being passenger vehicles. This amount of operational daily trips would have a negligible effect on public roadway safety. During public scoping, concern was raised about an increase in traffic resulting in safety hazards on local roads. It is assumed that passenger vehicle and trucks associated with development of the Project would obey traffic laws with regard to speed limits and rights of way for vehicles and pedestrians. Mitigation Measure TRA-1 would reduce the number of vehicles on local roads by encouraging carpooling.

Mitigation Measures for Impact TRA-3

MM TRA-1 Construction Traffic Control Plan. See full text in Section 3.18.9-7 (Mitigation Measures).

MM TRA-2 Repair Roadways and Transportation Facilities Damaged by Construction Activities. See full text in Section 3.18.9-7 (Mitigation Measures).

Significance After Mitigation

This impact would be less than significant with implementation of MMs TRA-1 and TRA-2.

Impact TRA-4. Project activities would result in inadequate emergency response access or access to nearby properties.

Solar Facility

LESS THAN SIGNIFICANT WITH MITIGATION. Construction of the solar facility is not expected to require temporary lane closures that could restrict the movements of emergency vehicles. The Project site would have controlled access points for ingress and egress at the site. These access points would allow for emergency vehicle access into and through the site. The Project would not block access to nearby properties. Therefore, impacts during construction would be less than significant.

Once constructed, maintenance activities would occur as needed at the solar facility but are not expected to require any temporary travel lane closures that could restrict emergency vehicle movements. Emergency responders would have access to any locked gates into the site. Impacts would be less than significant.

500 kV Generation-Tie Line

LESS THAN SIGNIFICANT WITH MITIGATION. As discussed under Impact TRA-1, construction of the gen-tie line may require temporary closure or disruption to travel lanes during conductor stringing. MM TRA-1 (Construction Traffic Control Plan) is proposed to provide specificity regarding the means to reduce potential impacts from any temporary travel lane disruptions during construction of the gen-tie line. Additionally, MM TRA-1 requires the Construction Traffic Control Plan be reviewed and approved by Caltrans and Riverside County and would include plans to coordinate in advance with emergency service providers to avoid restricting the movements of emergency vehicles. With the incorporation of this mitigation, impacts from temporary construction-related disruptions to the affected circulation system would be less than significant.

Typical inspections and maintenance of the gen-tie line would not require temporary road or lane closures. Therefore, normal maintenance activities are not expected to restrict emergency service access or vehicle movements. Less than significant impacts would occur.

Mitigation Measures for Impact TRA-4

MM TRA-1 Construction Traffic Control Plan. See full text in Section 3.18.97 (Mitigation Measures).

Significance After Mitigation

This impact would be less than significant with implementation of MM TRA-1.

***** The impact analyses for all Project alternatives have been moved to EIR Section 5. *****

3.18.6. Cumulative Impacts**Geographic Scope**

The geographic scope of the cumulative analysis for the transportation and traffic vehicle trips analysis are the Project study area intersections identified in Table 3.18-2. This geographic area was selected because cumulative projects would increase impacts only if they used the same intersections and roads at the same time as the proposed Project. Therefore, the cumulative projects considered within the traffic and transportation geographic extent include the ambient projects, i.e., the proposed Sapphire Project and the three nearby solar projects that would be in their O&M phase.

Cumulative Impact Analysis

As discussed in Section 3.18.5, Project operations and maintenance would result in negligible daily trips to study area roadways. Therefore, the cumulative impact analysis focuses on traffic volumes generated during construction of the proposed Project. Impact TRA-1 and Impact TRA-2 consider the cumulative impacts of the Project by analyzing the effects of the Project plus the ambient conditions. Both impacts conclude that the cumulative impacts would be less than significant with implementation of MM TRA-1 (Construction Traffic Control Plan). Furthermore, Project construction and operation would not introduce trip VMT in excess of projects within the rural desert area and with implementation of MM TRA-1 would require the Applicant to ensure plans for carpooling are incorporated.

Several solar projects and associated gen-tie lines and the Eagle Mountain Project gen-tie line are located within 20,000 feet of the Desert Center Airport. As with the proposed Project, each project would check with the airport sponsor and the FAA to ensure there are no potential safety or navigational problems with a proposed solar facility, especially if it is a large facility (FAA, 2010). Each cumulative development project within 20,000 feet of Desert Center Airport would also have to be evaluated against FAA 7460 regulations pertaining to structures that may affect aviation and airspace safety. Because each project would need to comply with FAA determinations, the FAA will be able to ensure that the cumulative impacts to the Desert Center Airport are not significant.

The number of potential solar projects that could be under development at the same time would result in an increase in trips, VMT, and an increased risk of transportation hazards or damage to the roads. Cumulative impacts due to increased transportation hazards or damaged roads could be significant if simultaneous construction activities resulted in significant volumes of heavy truck trips that affected safe use of a roadway or damaged transportation facility surfaces. The Project's contribution to the potentially significant cumulative impact would be reduced to less than cumulatively considerable because MM TRA-1 (Construction Traffic Control Plan) requires the Applicant to define the methods to maintaining close coordination with Caltrans and Riverside County, prior to and during construction, to minimize cumulative impacts of multiple simultaneous construction projects affecting shared portions of the circulation system. MM TRA-1 also requires the Applicant to reduce temporary motorist hazards in a variety of ways, including ensuring the safe movement of pedestrians and bicycles through work areas. MM TRA-2 (Repair Roadways and Transportation Facilities Damaged by Construction Activities) is proposed to ensure any

damage and deterioration attributed to the Project would be repaired. With the incorporation of these measures, the Project would have a less than significant contribution to cumulative hazard impacts on transportation facilities.

Construction of gen-tie lines could result in a cumulative impact to temporary lane closures. This is because construction of the solar facilities is expected to require temporary lane closures for the stringing of gen-tie conductor across roadways. The Easley Project would only require lane closures on SR-177 during conductor installation. This is a short-term effect. Construction of the gen-tie lines for each cumulative project may require stringing the lines over local roads and the I-10, but each developer would be required to coordinate that work with Caltrans and the County to avoid any cumulative impacts.

Construction of the solar facility is not expected to require any temporary lane closures that could restrict the movements of buses. Similarly, the construction of the cumulative projects would also be unlikely to require temporary land closures because they would be built on public or private lands off of public roads. Construction of the proposed Project would require large vehicles travel on local roadways to access the site and includes MM TRA-1 (Construction Traffic Control Plan) that would include provisions for ensuring detours or safe movement of vehicles through all affected areas. The cumulative projects would also be required to abide by regulations regarding lane closures to reduce any potential impacts. Therefore, the Project would not result in a cumulative significant impact to public transportation.

If adopted, the proposed expansion of Joshua Tree National Park and creation of Chuckwalla National Monument would re-designate existing federal lands in the Project vicinity that could increase traffic from recreational uses and visitors. If this occurs, it would be after the proposed Project is constructed and in operation, when project-related traffic would be minimal. The Project's contribution to local traffic at that time would not be cumulatively considerable.

Mitigation Measures for Cumulative Impacts

Implementation of MM TRA-1 and MM TRA-2 would mitigate potential transportation and traffic impacts for the proposed Project. No additional mitigation is required.

Significance After Mitigation

With implementation of mitigation, the Project's incremental contribution to impacts from an increase in daily trips and transportation hazards would not be cumulatively considerable. There would be no cumulative impact to aviation safety, disruption of emergency response access, or public transportation.

3.18.7. Mitigation Measures

MM TRA-1 Construction Traffic Control Plan. Prior to the start of construction, the Project owner shall submit a Construction Traffic Control Plan for review and approval by Caltrans and Riverside County for affected roads and intersections that would be directly affected by the construction activities and/or would require permits and approvals. The Construction Traffic Control Plan shall include, but not be limited to:

- If multiple construction projects occur at the same time and conditions at the intersection warrant, plans for installation of a temporary signal or use of manual intersection control during the construction period at the I-10 westbound ramp at SR-177. Additionally, if conditions warrant, geometry changes shall be considered in coordination with Caltrans and Riverside County, and implemented, if necessary, in addition to signalization at the I-10 westbound ramp and SR-177. These geometry changes could include a turn pocket.

- The locations and use of flaggers, warning signs, barricades, delineators, cones, arrow boards, etc., according to standard guidelines outlined in the Manual on Uniform Traffic Control Devices, the Standard Specifications for Public Works Construction, and/or the California Joint Utility Traffic Control Manual.
- The locations of all road or traffic lane segments that would need to be temporarily closed or disrupted due to construction activities.
- The locations where guard poles, netting, or similar means to protect transportation facilities for any construction or conductor installation work requiring the crossing of a local street highway is proposed.
- The use of continuous traffic breaks operated by the California Highway Patrol on state highways (if necessary).
- Additional methods to reduce temporary traffic delays to the maximum extent feasible during morning (7:00 a.m. to 9:00 a.m.) and afternoon (4:00 p.m. to 6:00 p.m.) peak traffic periods, or as directed in writing by the affected public agency in encroachment or other permits). This should also include feasible ways to reduce construction-related trips on I-10, SR-177, and Kaiser Road during peak traffic periods.
- Plans to encourage or provide ridesharing/carpooling opportunities for construction and operational workers.
- Incorporation wildlife protection measures, as required in MM BIO-6.
- Plans to provide written notification to property owners and tenants at properties affected by access restrictions to inform them about the timing and duration of obstructions and to arrange for alternative access if necessary. The coordination shall occur at least one week prior to any blockages.
- Plans to coordinate in advance with emergency service providers to avoid restricting the movements of emergency vehicles. Police departments and fire departments shall be notified in advance by the Project owner of the proposed locations, nature, timing, and duration of any roadway disruptions, and shall be advised of any access restrictions that could impact their effectiveness. At locations where roads will be blocked, provisions shall be ready at all times to accommodate emergency vehicles, such as immediately stopping work for emergency vehicle passage, providing short detours, and developing alternate routes in conjunction with the public agencies.
- Define the method to maintaining close coordination, prior to and during construction, with Caltrans and Riverside County to minimize cumulative impacts of multiple simultaneous construction projects affecting shared portions of the circulation system. Coordination with adjacent development projects to spread work shifts into multiple hours (instead of peak hour) or the installation of additional temporary traffic signals or manual traffic control officers during peak hours to mitigate the temporary impacts.

MM TRA-2

Repair Roadways and Transportation Facilities Damaged by Construction Activities. If roadways, sidewalks, medians, curbs, shoulders, or other such transportation features are damaged by Project construction activities, as determined by the affected public agency, such damage shall be repaired and restored to their pre-Project condition by the Project owner. Prior to construction, the Project owner shall confer with Caltrans and Riverside County regarding the roads within 500 feet in each direction of Project access points (where heavy vehicles will leave public roads to reach Project sites) and regarding the roads to be crossed by the proposed gen-tie line. At least 30 days prior to construction,

or as requested by Riverside County or Caltrans, the Project owner shall photograph or video record all affected roadway segments and shall provide Riverside County and Caltrans with a copy of these images, if requested.

At the end of major construction, the Project owner shall coordinate with each affected jurisdiction to confirm whether repairs are required. Any damage demonstrable to the Project is to be repaired to the pre-construction condition within 60 days from the end of all construction, or on a schedule mutually agreed to by the Project owner and the affected jurisdiction. If multiple projects are using the transportation features, the Easley Project owner shall pay its fair share of the required repairs. the Project owner shall provide Riverside County and Caltrans (as applicable) proof when any necessary repairs have been completed.

3.19. Wildfire

This section evaluates the impacts relating to wildfire hazards resulting from implementation of the Project. It describes applicable regulations, existing conditions that influence risks associated with wildfire, the criteria used to determine the significance of environmental impacts, and the Project's potential impacts relating to wildfire. An impact analysis and comparison of project alternatives is included in Section 5.

3.19.1. Environmental Setting

The Project site is located in the central portion of Chuckwalla Valley in the Colorado Desert, east of Joshua Tree National Park. No major urbanized areas are located within 40 miles of this area; the Project site is considered a remote location.

The site and surrounding areas consist of land at varying elevation, ranging from less than 400 feet above mean sea level (amsl) at Ford Dry Lake (approximately 20 miles southeast of the Project) to over 3,000 feet amsl in the mountains that enclose the Chuckwalla Valley. The immediate Project site is relatively flat. Vegetation communities at the Project site are generally limited to scattered creosote brush scrub and desert dry wash woodland. Land uses near the Project include agriculture, the small community of Lake Tamarisk, scattered residences, renewable energy, energy transmission, historical military operations, and recreational development and use. Several solar farms exist in the vicinity of the Project. The existing Desert Sunlight and Desert Harvest solar facilities are located north, Athos Renewable Energy Project is located to the east, and Oberon is located to the southeast of the Project. Nearby solar projects that are under construction include the Arica and Victory Pass Solar Projects to the southeast. The Sapphire Solar Project, proposed by EDF Renewables, is adjacent to the northern area of the Easley Project.

The Riverside County General Plan Safety Element identifies areas with rugged topography and flammable vegetation as being susceptible to fire hazards. According to the California Department of Forestry and Fire Protection (CAL FIRE), the Project is located within both Local Responsibility Areas (LRAs) and Federal Responsibility Areas (FRAs) (CAL FIRE, 2023). According to the Wildfire Susceptibility Map in the Riverside County General Plan Safety Element (2019 version), Very High Fire Hazard Severity Zones (FHSZs) in Local, State, and Federal Responsibility Areas are concentrated in the western portions of Riverside County (Riverside County, 2019). The Project would be located in Moderate FHSZ in LRA and FRA. Since the Project is not located in a State Responsibility Area (SRA), CAL FIRE would not be responsible for fire management or suppression activities in this area. This responsibility falls to the U.S. Bureau of Land Management (BLM), although agencies cooperate in fire incident responses. Agencies that are likely to provide wildfire protection to the Project would be the Riverside County Fire Department (RCFD) and BLM Fire Program.

Climate change will result in a small but general increase in temperature, and higher temperatures, and droughts are likely to increase the severity, frequency, and extent of wildfires during operation, maintenance, and decommissioning of the Project (USEPA, 2023).

Riverside County Fire Department. RCFD, in cooperation with CAL FIRE, provides fire and emergency services to residents in Riverside County. There are 101 fire stations located throughout the County that serve unincorporated communities, partner cities, and the State of California under the California Master Mutual Aid Agreement (RCFD, 2023). RCFD Station 49 is the closest fire station to the Project site, located approximately 0.4 mile south at 43880 Tamarisk Drive, Desert Center.

Bureau of Land Management Fire Program. The BLM Fire Program is responsible for fire and fuels management and protection of federal lands, identified as Federal Responsibility Areas, within the United States. The Fire and Aviation program includes fire suppression, preparedness, predictive services, fuels

management, fire planning, community assistance and protection, prevention and education, and public safety (BLM, 2023a). BLM establishes fire prevention orders and restrictions to assist with wildland fire prevention efforts throughout the public lands within the California Desert District, which includes portions of Inyo, Imperial, Kern, Mono, Los Angeles, San Bernardino, San Diego, and Riverside Counties (BLM, 2023b).

3.19.2. Regulatory Framework

3.19.2.1. Federal Laws, Regulations, and Policies

Federal Wildland Fire Management Policy. On BLM-administered lands in the California Desert, the BLM implements Federal Wildland Fire Management policies and objectives in coordination with state and other federal agencies as part of the California Desert Interagency Fire Management Organization. The Federal Wildland Fire Management Policy was developed by a federal multi-agency group that establishes consistent and coordinated fire management policy across multiple federal jurisdictions. The policy acknowledges the essential role of fire in maintaining natural ecosystems, but also prioritizes firefighter and public safety first in every fire management activity and focuses on risk management as a foundation for all fire management activities. The policy promotes basing responses to wildland fires on approved Fire Management Plans and land management plans, regardless of ignition source or the location of the ignition.

National Electric Safety Code (NESC) and American National Standards Institute (ANSI) Guidelines. A variety of line and tower clearance standards are used throughout the electric transmission industry. Nationally, most transmission line owners follow the NESC rules or ANSI guidelines, or both, when managing vegetation around transmission system equipment. The NESC deals with electric safety rules, including transmission wire clearance standards, whereas the applicable ANSI code deals with the practice of pruning and removal of vegetation.

3.19.2.2. State Laws, Regulations, and Policies

California Fire Code. The California Fire Code governs code requirements to minimize the risk of fire and life safety hazards specific to battery energy storage systems used for standby or emergency power, uninterruptible power supply, and other grid services.

California Fire Plan. The Strategic California Fire Plan was finalized in June 2010 and directs each CAL FIRE Unit to prepare a specific Fire Management Plan for their areas of responsibility. These documents assess the fire situation within each of CAL FIRE's 21 units and six contract counties. The plans include stakeholder contributions and priorities and identify strategic areas for pre-fire planning and fuel treatment, as defined by the people who live and work with the local fire problem. The plans are required to be updated annually.

3.19.2.3. Local Laws, Regulations, and Policies

Riverside County General Plan. The intent of the Safety Element of the Riverside County General Plan is to reduce death, injuries, property damage, and economic and social impact from hazards. The following policies included in the Safety Element generally relate to the proposed Project with respect to natural hazards (Riverside County, 2021a).

- **Policy S 5.1.** Develop and enforce construction and design standards that ensure that proposed development incorporates fire prevention features through the following:
 - All proposed development and construction within Fire Hazard Severity Zones shall be reviewed by the Riverside County Fire and Building and Safety departments.

- All proposed development and construction shall meet minimum standards for fire safety as defined in the Riverside County Building or County Fire Codes, or by County zoning, or as dictated by the Building Official or the Transportation Land Management Agency based on building type, design, occupancy, and use.
 - In addition to the standards and guidelines of the California Building Code and California Fire Code fire safety provisions, continue to implement additional standards for high-risk, high occupancy, dependent, and essential facilities where appropriate under the Riverside County Fire Code (Ordinance No. 787) Protection Ordinance. These shall include assurance that structural and nonstructural architectural elements of the building will not impede emergency egress for fire safety staffing/personnel, equipment, and apparatus; nor hinder evacuation from fire, including potential blockage of stairways or fire doors.
 - Proposed development and construction in Fire Hazard Severity Zones shall provide secondary public access, in accordance with Riverside County Ordinances.
 - Proposed development and construction in Fire Hazard Severity Zones shall use single loaded roads to enhance fuel modification areas, unless otherwise determined by the Riverside County Fire Chief.
 - Proposed development and construction in Fire Hazard Severity Zones shall provide a defensible space or fuel modification zones to be located, designed, and constructed that provide adequate defensibility from wildfires.
- **Policy S 5.4.** Limit or prohibit development or activities in areas lacking water and access roads.
 - **Policy S 5.6.** Demonstrate that the proposed development can provide fire services that meet the minimum travel times identified in RCFD Fire Protection and EMS Strategic Master Plan.
 - **Policy S 7.14.** Regularly review and clarify emergency evacuation plans for dam failure, inundation, fire and hazardous materials releases.
 - **Policy S 7.15.** Develop a blueprint for managing evacuation plans, including allocation of buses, designation and protection of disaster routes, and creation of traffic control contingencies.

Desert Center Area Plan. The intent of the Wildland Fire section of the Hazards section of the Desert Center Area Plan (a part of the General Plan) is to address wildland fire susceptibility for improved public safety in the Desert Center area. The following policy included in the Desert Center Area Plan generally relates to the proposed Project with respect to hazards (Riverside County, 2021b).

- **Policy DCAP 10.1.** All proposed development located within High or Very High Fire Hazard Severity Zones shall protect life and property from wildfire hazards through adherence to policies identified in the Fire Hazards (Building Code and Performance Standards), Wind-Related Hazards and General and Long-Range Fire Safety Planning sections of the General Plan Safety Element.

Riverside County Fire Department Technical Policy (TP) 15 002. The RCFD TP 15 002, titled Solar Energy Generating System (SEGS) Fire Apparatus Access Roads, is a standard developed to assist with the design of fire apparatus access roads from public roadways to a SEGS (i.e., solar facility). It addresses secondary access road requirements, which shall be determined by the County Fire Marshal given the specific conditions of any given solar project (RCFD, 2020). Each SEGS project will be reviewed on a case-by-case basis to determine secondary fire apparatus access requirements to facilitate emergency operations and to minimize the possibility of an access point being subject to congestion or obstruction during an emergency incident. This standard states that the secondary access road shall not be less than 20 feet in width and shall have an unobstructed vertical clearance of no less than 13 feet, 6 inches. The grade of the access road shall not exceed 15 percent. The access road shall be designed, constructed, and maintained

to support the imposed load of fire apparatus weighing at least 75,000 pounds and constructed to Riverside County Transportation Standards. A registered engineer shall certify the design and construction of the access road based on the fire apparatus-imposed load of 75,000 pounds.

The proposed Project would be consistent with County policies and regulations related to wildfire through the design and construction of the Project and its subsequent operation, which would comply with the applicable requirements for design review/approval by the agencies having oversight.

3.19.3. Methodology for Analysis

Wildfire hazards associated with the Project are evaluated based on landscape characteristics and the Project's ability to start or exacerbate wildfires. Potential existing hazards are based on review of the location of the Project on CAL FIRE maps to determine its location within FHSZs. Although the Project would not be located in a Very High or High FHSZ, the potential for wildfires is still present due to the electrical components of the Project. This analysis identifies design features and compliance with existing safety procedures, standards, and regulations that would be part of the Project.

3.19.4. CEQA Significance Criteria

The criteria used to determine the significance of potential wildfire impacts are based on Appendix G of the State CEQA Guidelines. The proposed Project would result in a significant impact under CEQA related to Wildfire if the Project is located in or near State Responsibility Areas or lands classified as very high fire hazards severity zones and would:

- *Substantially impair an adopted emergency response plan or emergency evacuation plan.*
- *Due to slope, prevailing winds, and other factors, exacerbate wildfire risks, and thereby expose project occupants to pollutant concentrations from a wildfire or the uncontrolled spread of a wildfire.*
- *Require the installation or maintenance of associated infrastructure (such as roads, fuel breaks, emergency water sources, power lines or other utilities) that may exacerbate fire risk or that may result in temporary or ongoing impacts to the environment.*

The County of Riverside's Environmental Assessment Form includes additional significance criteria, which were also used in the analysis. The additional criteria indicate that a project could have potentially significant impacts if it would:

- *Expose people or structures either directly or indirectly, to a significant risk of loss, injury, or death involving wildland fires.*

The following CEQA significance criterion from Appendix G was not included in the analysis and is not discussed further beyond this summary:

- *Expose people or structures to significant risks, including downslope or downstream flooding or landslides, as a result of runoff, post-fire slope instability, or drainage changes.*

The Project would be located in a Moderate FHSZ in a remote desert area. The solar facility would be constructed and operated on nearly level ground and would require minimal grading, and areas with irregular topography would be avoided and be protected in place to preserve important hydrologic functions. Solar panels would not be installed in existing drainages or washes. Because the ground surface at the Project site is nearly level, and nonflammable solar panels would be installed, the Project would not pose a risk of landslides, post-fire slope instability, or drainage changes. As such, impacts regarding downslope or downstream flooding or landslides as a result of post-fire slope instability would be less than significant.

3.19.5. Proposed Project Impact Analysis

The scoping effort conducted by the Riverside County Planning Department revealed several public concerns related to wildfire. Public concerns brought up in the scoping process involved concerns about the increased risk of wildfires due to the increased presence of power lines. Although the proposed Project is not located in or near SRAs or lands classified as Very High FHSZ, the potential for wildfires is still present due to the electrical components of the Project.

Impact FIRE-1. The Project would substantially impair an adopted emergency response plan or emergency evacuation plan.

LESS THAN SIGNIFICANT WITH MITIGATION, CONSTRUCTION. The Easley Project would be constructed in a remote area with existing, approved, and proposed solar projects nearby. SR-177 would be the primary access road to the solar facility site, and several ingress/egress points would be established for construction access. An internal roadway system would be constructed to provide access within the Project site. Construction of the solar facility, battery energy storage system (BESS), and other components would not require any temporary lane closures on public roads. Although construction vehicles would be present on public roads to access the Project site, construction of the solar facility is not expected to restrict the movements of emergency vehicles. The new ingress and egress points at the Project site would allow for emergency vehicles access into and through the site, as well as provide controlled access for construction vehicles.

Construction of the gen-tie line would primarily occur within the 175-foot BLM right-of-way, but this disturbance would not obstruct any public rights-of-way. A small section of the gen-tie line would be strung across SR-177, potentially requiring temporary lane closures during stringing of the wire between towers east and west of SR-177. As discussed in Section 3.18, (Traffic and Transportation), Mitigation Measure (MM) TRA-1 (Construction Traffic Control Plan) is proposed to provide specificity to reduce potential impacts from any temporary travel lane disruptions during construction of the gen-tie line. MM TRA-1 (Construction Traffic Control Plan) requires the Construction Traffic Control Plan be reviewed and approved by Caltrans and Riverside County and would include plans to coordinate in advance with emergency service providers to avoid restricting the movements of emergency vehicles (see Impact TRA-4 in Section 3.18, Traffic and Transportation, for full text). With the incorporation of this mitigation measure, impacts from temporary construction-related traffic disruptions would be less than significant.

LESS THAN SIGNIFICANT, OPERATIONS AND MAINTENANCE. During Project operations, up to 10 permanent staff could be on site at the solar facility at any given time for as-needed maintenance and repairs. Maintenance activities for the solar arrays, BESS, gen-tie line, and other components are not expected to require any temporary lane closures that could restrict emergency vehicle movements due to the small number of employees that may travel to the site. Additionally, approximately two permanent staff, eight project operators, and security personnel would be located off site and would be on call to respond to alerts generated by the monitoring equipment at the Project site. Ingress and egress points established during Project construction would be available for operational and emergency access. All internal access roads and gates would comply with RCFD TP 15 002, California Building Code, and County requirements. Access roads would provide a fire buffer as well as facilitate on-site circulation for emergency vehicles. Impacts during Project operations would be less than significant.

LESS THAN SIGNIFICANT, DECOMMISSIONING. Decommissioning the Project would require similar equipment and workforce as Project construction but would be substantially less intense. Workers would travel to the site to dismantle all above-ground equipment (i.e., solar panels, BESS, and associated infrastructure), remove primary roads, break up concrete pads and foundations, remove the septic system and leach field, dismantle the gen-tie line, and scarify compacted areas. Similar to construction, decommissioning would

result in the presence of construction vehicles on public roads to transport workers and equipment and to haul away decommissioned materials. Vehicles used during decommissioning of the solar facility are not expected to restrict the movements of emergency vehicles. The ingress and egress points at the Project site would be maintained during the duration of decommissioning to allow for emergency vehicles access into and through the site, as well as provide controlled access for vehicles. After decommissioning activities are complete, the site would be restored to its pre-solar facility conditions, or such condition as appropriate in accordance with County and BLM policies at the time of decommissioning. Decommissioning activities would result in less-than-significant impacts associated with emergency response plans or evacuation plans.

Mitigation Measures for Impact FIRE-1

MM TRA-1 Construction Traffic Control Plan). See Section 3.18 (Traffic and Transportation) for full text.

Significance After Mitigation

This impact would be less than significant.

Impact FIRE-2. The Project would expose Project occupants to pollutant concentrations from a wildfire or the uncontrolled spread of a wildfire.

LESS THAN SIGNIFICANT WITH MITIGATION, CONSTRUCTION. According to the CAL FIRE FHSZ Viewer and the County of Riverside General Plan Safety Element, the Project is not located in a high or very high FHSZ, and thus would not be in an area prone to wildfires. The Project is in a remote, sparsely populated area approximately 40 miles from the nearest major development. The surrounding area includes active and fallow agricultural fields, the community of Lake Tamarisk, electrical transmission lines, and other solar facilities. Wildfires in California typically occur in heavily forested areas and vegetated grassy hillsides, and communities generally at highest risk of wildfire hazards are those located within these areas or in the wildland urban interface. Due to the presence of sparse vegetation, relatively flat topography, the remote location of the Project, and its desert setting, the potential for the Project to exacerbate wildfire risks and expose nearby residences to the hazards of wildfire is low.

The Project design includes fire safety precautions. While vegetation on the Project site is sparse, vegetation management would still be required as needed, particularly for drainage controls, work areas, and solar array areas, and all other areas where permanent structures would be constructed. Prior to construction, vegetation would be mowed, grubbed, rolled, cut, or cleared. The solar array areas would require mowing and rolling of woody vegetation to a height of 12 inches. Woody vegetation adjacent to non-solar array structures would be partially cut. Reduction of vegetation would reduce the availability of flammable fuels around the Project site.

Construction of the proposed solar facility, BESS, gen-tie line, and other components would involve preparation, installation, and testing of electrical components such as cables, inverters, wiring, modules, and a transformer. Wires would be buried at a minimum of 18 inches below grade, minimizing the potential for faulty wiring to ignite a fire. All electric inverters and the transformer would be constructed on concrete foundation structures or steel skids and tested prior to use to ensure safe operations and to minimize fire risks. Prior to wire setup, work areas would be cleared of vegetation to reduce the risk of ignition from any vehicles or equipment. Small quantities of hazardous chemicals such as fuels and greases would be stored at the site during construction. They would be stored in appropriate containers in an enclosed and secured location with secondary containment to prevent leakages and accidental fires.

During construction, a fire suppression system would be placed in service if required by the County or BLM Fire. Fire extinguishers and other portable firefighting equipment would be available on site, as well

as additional water for use at the operations and maintenance (O&M) facility. Fire extinguishers would be maintained in accordance with State and federal Occupational Safety and Health Administration (OSHA) requirements.

Furthermore, as described in Section 2.5.13 (Fire Safety During Construction), fire safety measures would be implemented as part of the Project to limit risk of personnel injury, property loss, and potential disruption of electrical generation. ~~Further, pursuant to MM FIRE-1, Additional measures would be added to the Project's Fire Management and Prevention Plan would be prepared for the Project and would include standards for construction. The plan would address fire-safe construction measures, including welding, reduction of ignition sources, control of fuel sources, availability of water, and property maintenance of firefighting systems. The plan would comply with applicable BLM and Riverside County regulations and would be developed in coordination with the BLM and the RCFD. To further reduce the risk of fire, Mitigation Measure FIRE-1 (Fire Safety) is recommended to specify what elements would need to be included in the Fire Management and Prevention Plan.~~ Implementation of MM FIRE-1 would ensure the impact is less than significant.

The following measures would be taken to identify and control fires and similar emergencies, and are specified in greater detail in MM FIRE-1:

- Electrical equipment that is part of the Project would be energized only after the necessary inspection and approval to minimize risk of any electrical fire during construction.
- Project staff would monitor fire risks during construction and operation to ensure that prompt measures are taken to mitigate identified risks.
- Transformers located on site would be equipped with coolant that is non-biodegradable and contains no polychlorinated biphenyls or other toxic compounds.

The Project's location, components, and safety measures would ensure the safe construction of the solar facility. Any fire hazards during construction of the solar facility would be minimal and further reduced with the Fire Management and Prevention Plan (MM FIRE-1). Security at the Easley solar facility, including solar arrays, substation, and BESS, would be provided by a 6-foot-tall chain-link fence topped with one-foot barbed wire to prevent vandalism, damage, or theft of Project components. As such, the proposed Project would not exacerbate wildfire risks or expose workers and residents to pollutant concentrations from a wildfire or the uncontrolled spread of wildfire. Construction of the solar facility and BESS would result in less-than-significant impacts with mitigation.

The gen-tie transmission structures would be constructed with either monopoles, lattice steel structures, or wooden H-frame poles and would not exacerbate fire risks, as foundations would be constructed with concrete foundations. Construction of the gen-tie transmission line and structures would use existing access roads where feasible. During construction, vegetation within the gen-tie corridor would be reduced or cleared as part of fire safety measures to reduce the likelihood of ignition from vehicles or equipment. As described previously, fire safety measures would be implemented to ensure that construction of the Project components, including the gen-tie line, are implemented in accordance with applicable fire protection and environmental, health, and safety requirements. As such, construction of the Project's gen-tie line would result in less-than-significant impacts.

LESS THAN SIGNIFICANT WITH MITIGATION, OPERATIONS AND MAINTENANCE. Once operational, up to 10 workers are anticipated to perform daily visual inspections and minor repairs to ensure all Project components are in good working condition. No heavy equipment would be used during normal operations. Due to the lower level of activity during operations, fewer vehicles would travel to the solar facility. The reduction in vehicle trips and workers would reduce the risk of on-site accidental fires caused by human activities such as smoking, hot work (i.e., welding), and improper vehicle operation. O&M would be limited to inspections and repairs and would not involve the handling, usage, or production of flammable materials. The Project

facility would be monitored by both on-site and remote O&M personnel. On-site vegetation would be trimmed approximately once every three years, as needed. Vegetation maintenance would ensure that flammable vegetation would not grow within access roads or electrical components. This would prevent ignition of vegetation from hot tailpipes of maintenance vehicles or sparks from faulty electrical components. Fire hazards during operation of the solar facility would be minimal and further reduced with the Fire Management and Prevention Plan ~~and~~ (MM FIRE-1 (Fire Safety)). MM FIRE-1 would include ~~additional~~ specific elements in the Fire Management and Prevention Plan to address fire safety during Project operations. Implementation of MM FIRE-1 would ensure the impact from operation of the solar facility is less than significant.

Solar arrays and photovoltaic modules are fire-resistant and would not be susceptible to ignition from fires. In a potential wildfire situation, the panels would be rotated and stowed in a panel-up position that could slow the spread of a fire. Security at the Easley solar facility would continue to be provided by a 6-foot-tall chain-link fence and barbed wire to prevent vandalism, damage, or theft of Project components during operations.

The Project includes operation of an up to 650-MW BESS. The BESS would be housed in electrical enclosures that would be installed on concrete foundations designed for secondary containment. Potential electrical fires would be contained within the enclosures and would not spread beyond them. The BESS would be installed following all applicable design, safety, and fires standard for the installation of energy storage systems, including, but not limited to, National Fire Protection Association (NFPA) 855 (Standard for the Installation of Stationary Energy Storage Systems) and the current California Fire Code (CFC). NFPA 855 includes criteria for fire prevention and suppression associated with BESS installations, and Section 1206 of the CFC includes requirements to minimize the risk of fire and life safety hazards specific to BESSs used for load shedding, load sharing, and other grid services (Chapter 12 Section 1206 of the ~~2019-2022~~ CFC). In accordance with the CFC, the battery enclosure and the site installation design are all required to be approved by the ~~State-County~~ Fire Marshal. Furthermore, MM FIRE-1 includes a measure to include information about the type of BESS technology on site, potential hazards, and procedures for disconnecting or shutting down the BESS in case of an accidental fire. Compliance with these design and safety regulations and implementation of MM FIRE-1 would reduce the likelihood of battery fires starting and spreading. The BESS's impact of exposure of people to pollutant concentrations from a wildfire or the uncontrolled spread of a wildfire to less than significant with mitigation.

Wildfire risk along the gen-tie corridor would be minimal due to the lack of substantial vegetation, and concrete foundations would further reduce the spread of fire. Portions of the gen-tie line could also be installed underground based on design constraints, existing utilities, and resources. Undergrounding portions of the gen-tie line would reduce the risk of fire. As described previously, fire safety measures would be implemented to ensure that operation of the Project components, including the gen-tie line, are implemented in accordance with applicable fire protection and environmental, health, and safety requirements, which require vegetation clearance, regular inspections and maintenance, and monitoring weather conditions such as high-wind conditions. As such, operation of the Project's gen-tie line would result in less-than-significant impacts.

LESS THAN SIGNIFICANT WITH MITIGATION, DECOMMISSIONING. Decommissioning of the solar facility, BESS, gen-tie line, and other Project components would require a similar workforce and equipment as Project construction, but at a lower intensity. The risk of fire during decommissioning would be lower than that of construction, as the site would have been maintained during its life, and vegetation would be appropriately managed. Decommissioning activities would follow the same fire safety measures as construction, including adherence to the Fire Management and Prevention Plan. Flammable chemicals such as fuels and greases stored on site would be in proper enclosed containers and secured throughout the duration of decommissioning. Fire extinguishers and other portable firefighting equipment would be on site and maintained in accordance with OSHA requirements. Implementation of MM FIRE-1 would include

additional measures to the Fire Management and Prevention Plan, such as fire prevention procedures and emergency response that would minimize the likelihood of a wildfire from starting or spreading. Impacts would be less than significant with mitigation.

Mitigation Measures for Impact FIRE-2

MM FIRE-1 Fire Safety. See Section 3.19.79 (Mitigation Measure) for full text.

Significance After Mitigation

This impact would be less than significant following implementation of mitigation.

Impact FIRE-3. The Project would require the installation and maintenance of infrastructure such as roads, fuel breaks, emergency water sources, power lines, or other utilities that may exacerbate the risk of fire.

LESS THAN SIGNIFICANT, CONSTRUCTION. The Project would construct a utility-scale solar photovoltaic electrical generation and storage facility that would deliver electricity to the statewide transmission grid. Construction of the solar facility would result in the installation of infrastructure to support the generation, delivery, and storage of electricity. Prior to construction, vegetation would be mowed, grubbed, rolled, cut, or cleared. The reduced amount of already-sparse vegetation would minimize the potential ignition of vegetation. Construction of all internal access roads and gates would comply with RCFD TP 15 002, California Building Code, and County requirements.

Construction activities would involve the use of heavy construction equipment and vehicles to install the solar facility's components over the course of approximately 20 months. If on-site fuel tanks are stored at the site for construction vehicles and equipment, they would be no larger than 1,000 gallons each and would comply with all applicable regulations. Flammable substances would be stored in appropriate containers in an enclosed and secured location with secondary containment to prevent leakages and accidental fires.

Although the solar facility is in a remote desert setting and is not within a High or Very High FHSZ, the electrical components could pose a small risk of fire if they become damaged or are tampered with. Electrical components that may pose a risk of fire include the electrical distribution line, transformers, batteries, substations, gen-tie line, and the switchyard. Because these components are located in a sparsely vegetated and remote location away from densely populated areas, the potential for faulty electrical equipment to exacerbate fire risks for populated areas is minimal. Additionally, assembly and installation of the electrical equipment would meet existing electrical and safety standards. Certified electricians and utility journeymen would be part of the construction workforce to ensure that all electrical equipment is assembled properly. Up to two substation yards would be secured with a barbed wire chain-link fence to comply with electrical codes and would include communication systems to comply with California Independent System Operator and SCE's monitoring and control requirements to ensure safe operation. Construction of the electrical components, including the BESS, would include preparation, installation, and testing. Wires would be buried at a minimum of 18 inches below grade, minimizing the potential for faulty wiring to ignite a fire. The majority of the solar facility's equipment would consist of solar PV panels and their mounting systems, which would be assembled from noncombustible, nonflammable materials. The solar PV panels would not ignite a potential wildfire or exacerbate the spread of wildfires.

Construction of the gen-tie line and structures would occur within an approximately 175-foot-wide corridor. Wire setup sites within this corridor would be cleared and graded to ensure enough clearance for large equipment used for the wire stringing operation. Removing potentially flammable materials and vegetation within the construction corridor would reduce the risk of wildfire during construction. The gen-

tie transmission structures would be composed of monopoles, lattice steel structures, or wooden H-frame poles and would not exacerbate fire risks due to the nonflammable nature of their concrete foundations. Construction of the gen-tie transmission line and structures would use existing access roads where feasible. The lack of substantial vegetation within the gen-tie corridor would create a minimal wildfire risk during construction of the gen-tie line. As described previously, fire safety measures would be implemented to ensure that construction of the Project components are implemented in accordance with applicable fire protection and environmental, health, and safety requirements. As such, construction of the Project's gen-tie line would result in less-than-significant impacts.

LESS THAN SIGNIFICANT WITH MITIGATION, OPERATIONS AND MAINTENANCE. Regular O&M of the solar facility would involve daily visual inspections and maintenance when needed to address damage or deterioration of equipment. O&M activities would ensure that all equipment is in good working order, thereby minimizing accidents and potential fires. Additionally, fire safety measures would be implemented during operations, including having portable firefighting equipment and extinguishers, sprinkler systems, and a fire suppression system on site as well as additional water for use at the O&M facility. These safety measures, along with the Fire Management and Prevention Plan, would provide safe operating conditions and fire response protocols to minimize the risk of wildfire. As such, operation of the solar facility would have a less-than-significant impact regarding the installation of utilities that may exacerbate fire risk and result in temporary impacts.

The BESS would be housed in enclosed storage containers constructed on level concrete foundations. The enclosures would contain potential accidental fires and prevent them from spreading and causing further damage. The BESS area would also be cleared of vegetation to further minimize the risk of fire spreading. Furthermore, to minimize the risk of batteries overheating within the enclosures, air conditioners or heat exchangers and inverters would be installed for temperature control. The enclosures would also have remote communication systems that monitor for internal conditions such as temperature and smoke ~~and have automatic fire suppression systems.~~ The BESS system would include live monitoring that would automatically start an emergency notification and response procedure if a fire were to occur. As described in Section 2.7.3 (Fire Safety During Operation), the BESS would be certified to UL 9540 (standard for control, detection, and suppression of fires in BESSs). Each battery would be tested to this standard, and results would support first responders by indicating that internal fires are contained and not spread to other parts of the facility. Additionally, a ~~150,000-gallon water tank would also be available for each BESS unit as a backup to the~~ to provide as-needed fire suppression systems. The BESS would comply with all requirements of the current CFC and would require approval by the State Fire Marshal. To further improve fire safety, MM FIRE-1 is recommended, which includes specific measures to be added to the Fire Management and Prevention Plan to include information about the type of BESS technology on site, potential hazards, and procedures for disconnecting or shutting down the BESS in case of an accidental fire. It also includes a training component for emergency first responders to prepare for incidents such as fire or explosion at or with the BESS. Therefore, impacts would be less than significant with mitigation.

Operation of the gen-tie transmission line has a low likelihood of causing or exacerbating a wildfire due to the sparsely vegetated areas immediately surrounding the gen-tie structures. However, sparks and resulting fires have historically occurred along transmission lines due to foreign objects (e.g., falling trees, birds, mylar balloons, flammable debris carried by wind, etc.) contacting conductors or insulators. This risk would be reduced by regular inspections and maintenance of electrical components as well as trimming vegetation as needed to reduce fuel load. No trees are located in the vicinity of the gen-tie lines that could ignite from contact with the gen-tie line structures. Due to the gen-tie line's remote location away from densely populated areas, foreign objects such as balloons or ~~bullets~~ flammable debris are unlikely to come into contact with conductors or insulators. Drones would be used to perform annual thermal and visual inspections of the gen-tie line in compliance with North American Electric Reliability Corporation (NERC) FAC-003-4 Transmission Vegetation Management to reduce risk of equipment malfunction or

failure. The use of drones would minimize the need for larger vehicles such that ground disturbance and potential tailpipe-ignited fires would be avoided. Therefore, gen-tie line inspections would ensure that gen-tie lines and structures are not damaged and would minimize the risk of electrical fires. Implementation of MM FIRE-1 would ensure activities such as vegetation clearing, idling restrictions, and worker training would further reduce the risk of fire associated with operation of the gen-tie line to a level of less than significant.

LESS THAN SIGNIFICANT, DECOMMISSIONING. The solar facility, BESS, gen-tie line, and other electrical infrastructure would be dismantled and removed from the Project site. As described previously, fire safety measures would be implemented to ensure that decommissioning of the Project components is implemented in accordance with applicable fire protection and environmental, health, and safety requirements. As such, decommissioning of the Project would result in less-than-significant impacts.

Once the Project is decommissioned, the solar facility would no longer generate electricity, and the BESS, gen-tie line, distribution lines, and other electrical components would not store or conduct electricity. The removal of solar panels, BESS, gen-tie line, power lines, and other electrical components during decommissioning would essentially eliminate fire risk associated with the electrical infrastructure. After the Project is decommissioned, no power lines, BESS, or other components with a fire risk would exist at the site and no impact would occur once the Project is decommissioned.

Mitigation Measures for Impact FIRE-3

MM FIRE-1 Fire Safety. See full text in Section 3.19.79 (Mitigation Measures).

Significance After Mitigation

This impact would be less than significant.

Impact FIRE-4. The Project would expose people and structures to risks of loss, injury, or death involving wildfires.

LESS THAN SIGNIFICANT WITH MITIGATION, CONSTRUCTION. As discussed under Impact FIRE-2, the proposed Project is not located in a high or very high FHSZ, and thus would not be in an area prone to wildfires. The Project is located in a moderate zone, which typically are wildland supporting areas of low fire frequency and relatively modest fire behavior. The Project site is surrounded by remote desert lands, active and fallow agricultural fields, and other solar facilities. Lake Tamarisk is the closest community to the Project, located adjacent to the southwest corner of the Project site. Due to the presence of sparse vegetation, relatively flat topography, the remote location of the Project, and its desert setting, the potential for the Project to expose people and structures to wildfire risks is low.

During construction of the solar facility, BESS, and gen-tie line, vegetation would be managed on site to reduce the risk of fire. Work areas would be cleared of vegetation so that construction activities such as welding would not ignite nearby vegetation. Woody vegetation would be trimmed to reduce the availability of dry fuels and slow down potential fires. All electrical components such as the gen-tie line, power lines, inverters, transformers, and BESS would be constructed on nonflammable concrete foundation structures or steel skids and tested prior to use for safe operations.

During construction, a fire suppression system would be placed in service if required by the County or BLM Fire. Fire extinguishers and other portable firefighting equipment would be available on site, as well as water for use at the O&M facility. Fire extinguishers would be maintained in accordance with State and federal OSHA requirements. Well-maintained firefighting equipment would increase the likelihood that any accidental fires that occur during construction would be effectively extinguished. MM FIRE-1 would include measures requiring fire prevention, emergency response, and evacuation to ensure the safety of

construction workers. All construction workers would receive training on fire prevention procedures, proper use of firefighting equipment, and procedures following the event of a fire. Fire prevention procedures would be included in the Project's Worker Environmental Awareness Program.

The Project is located in both LRAs and FRAs, and as such, RCFD and BLM Fire would be responsible for fighting fires at the Project site. RCFD Station 49 is located approximately 0.4 mile south of the Project site and would be the first responder for the Project in the event of a fire. As required in MM FIRE-1, the Project owner would coordinate with both BLM and RCFD to train emergency first responders to prepare for specialized emergency incidents at the site, including fire or explosion at or within the BESS area. Additionally, worker training records on fire prevention and firefighting procedures would be made available for BLM and RCFD to review. Coordination with the local fire department would ensure timely emergency response that would minimize the risk of loss, injury, or death during construction. Due to the Project's desert setting, scarce vegetation, fire safety measures, and coordination with RCFD and BLM FIRE, impacts would be less than significant with mitigation.

LESS THAN SIGNIFICANT WITH MITIGATION, OPERATIONS AND MAINTENANCE. Project operations would consist of a minimal number of on-site workers for daily inspections and as-needed repairs. No hazardous activities would be performed during operations that could spark a fire, as no heavy equipment would be used, and fewer vehicles would travel to the solar facility. O&M would be limited to inspections and repairs and would not involve the handling, usage, or production of flammable materials. The Project facility would be monitored by both on-site and remote O&M personnel. Inspections, repairs, and remote monitoring of the Project components would reduce the likelihood of electrical failures or faulty equipment that could spark a fire. Fire hazards during operation of the solar facility would be minimal and further reduced with the Fire Management and Prevention Plan (MM FIRE-1). MM FIRE-1 would include additional specific elements in the Fire Management and Prevention Plan to address fire safety during Project operations. Implementation of MM FIRE-1 would ensure the impact from operation of the solar facility is less than significant.

Solar arrays and photovoltaic modules are fire-resistant and would not be susceptible to ignition from fires. In a potential wildfire situation, the panels would be rotated and stowed in a panel-up position that could slow the spread of a fire. Therefore, during a potential wildfire event, operation of the solar facility would not exacerbate a fire or expose workers or nearby residents to fire hazards.

The BESS would be housed in electrical enclosures on concrete foundations designed for secondary containment. Potential electrical fires would be contained within the enclosures and would not spread beyond them. The BESS would be installed following all applicable design, safety, and fire standards for BESSs, including NFPA and CFC requirements. Furthermore, MM FIRE-1 includes a measure to include information about the type of BESS technology on site, potential hazards, and procedures for disconnecting or shutting down the BESS in case of an accidental fire. The enclosures would have air conditioners or heat exchangers and inverters. A 150,000-gallon water tank may also be required for each BESS area. Compliance with these design and safety regulations and implementation of MM FIRE-1 would reduce the danger of fires spreading uncontrollably and causing loss, injury, or death. Furthermore, MM FIRE-1 also includes training and coordination requirements so that emergency first responders are prepared to address battery fires or explosions at the BESS area and are knowledgeable of appropriate firefighting methods for BESS fires. The impact would be less than significant with mitigation.

The gen-tie line, like the solar facility and BESS, would be located in a desert setting with scattered low-growing vegetation. The gen-tie structures would be constructed on concrete foundations such that the areas immediately surrounding the poles would not be flammable. Portions of the gen-tie line may also be placed underground, which would further reduce the risk of fire. As discussed in Impact FIRE-3, regular inspections and maintenance of electrical components and trimming of vegetation would ensure all components are in good working order and that vegetation fuel load is minimal. Drone inspections in

compliance with NERC Transmission Vegetation Management requirements would ensure that gen-tie lines and structures are not damaged and would minimize the risk of electrical fires. Implementation of MM FIRE-1 would ensure that workers and emergency first responders are trained to properly handle accidental fires, and would further reduce the risks associated with fires to a level of less than significant.

LESS THAN SIGNIFICANT, DECOMMISSIONING. As discussed in Impact FIRE-3, the solar facility, BESS, gen-tie line, and other electrical infrastructure would be dismantled and removed from the Project site. Once the Project is decommissioned, the solar facility would no longer generate electricity, and the BESS, gen-tie line, distribution lines, and other electrical components would not store or conduct electricity. The removal of solar panels, BESS, gen-tie line, power lines, and other electrical components during decommissioning would essentially eliminate fire risk associated with the electrical infrastructure. After the Project is decommissioned, no power lines, BESS, or other components with a fire risk would exist at the site. The site would not pose a risk of loss, injury, or death involving wildfires. Therefore, no impact would occur once the Project is decommissioned.

Mitigation Measures for Impact FIRE-4

MM FIRE-1 Fire Safety. See full text in Section 3.19.79 (Mitigation Measures).

Significance After Mitigation

This impact would be less than significant.

***** The impact analyses for all Project alternatives have been moved to EIR Section 5. *****

3.19.6. Cumulative Impacts

Geographic Scope

The area of Desert Center is the geographic scope for the cumulative impact analysis of wildfire impacts. This area has a sparsely vegetated landscape and a low potential to ignite and facilitate wildfires, therefore, the greatest potential for cumulative impacts relating to wildfire impacts would primarily be during the construction phase of projects in close vicinity to the proposed Project. Tables 3.1-1 and 3.1-2 list existing and reasonably foreseeable projects in the region. These projects include the Desert Sunlight Solar Project, SCE Red Bluff Substation, Devers-Palo Verde No. 1 Transmission Line, Blythe Energy Project Transmission line, Desert Harvest Solar Project, Athos Renewable Energy Project, Oberon Renewable Energy Project, Arica and Victory Pass Solar Projects, Eagle Mountain Pumped Storage Project, Sapphire Solar Project, ~~and~~ Skybridge Eagle Mountain Hydrogen Project, Colorado River-Red Bluff 500 kV #1 Line Upgrade and Devers-Red Bluff 500 kV #1 and #2 Lines Upgrade in Riverside County. Recent CAL FIRE Incident Data from 2015 through 2022 was reviewed for the Desert Center region, and no incidents occurred in the span of five years (CAL FIRE, 2022). As such, this area does not have a high risk of wildfires.

Cumulative Impact Analysis

Cumulative impacts regarding wildfire hazards generally occur if multiple projects were to be constructed and operated in overlapping schedules in a High or Very High FHSZ. Additionally, cumulative wildfire impacts are more likely to occur if the projects involve construction of flammable structures, such as houses or other buildings. Combined with a geographic area prone to wildfires, such as a densely forested area or chaparral-dominated landscape, the wildfire effects of multiple developments could combine to be cumulatively considerable. None of these factors is present here.

If adopted, the proposed expansion of Joshua Tree National Park and creation of Chuckwalla National Monument would re-designate existing federal lands in the Project vicinity, which would reduce the opportunity for new development in the region that could contribute to cumulative impacts related to wildfire.

Short-term cumulative impacts would occur during construction and decommissioning if the Project schedule overlaps with multiple other nearby projects. However, projects in the cumulative scenario would be required to comply with local, State, and federal fire hazard policies, the CFC, and include their own fire management plans and best management practices. Furthermore, the proposed Project, as well as the surrounding projects, would all occur in a Moderate FHSZ with no dense vegetation to spread a potential fire. Therefore, there would not be a significant cumulative impact related to wildfire, and the Project, in combination with the nearby projects, would not make a cumulatively considerable contribution to impacts related to fire hazards.

Mitigation Measures for Cumulative Impacts

Mitigation Measures MM TRA-1 and MM FIRE-1 would reduce the Project's contribution to the already less-than-significant cumulative wildfire impacts ~~be implemented to address potential wildfire impacts for the proposed Project.~~ No additional mitigation would be required.

Significance After Mitigation

Cumulative impacts would be less than significant. The Project's incremental contribution to wildfire impacts would not be cumulatively considerable.

3.19.7. Mitigation Measures

MM TRA-1 **Construction Traffic Control Plan.** See full text in Section 3.18.9—7 (Traffic and Transportation).

MM FIRE-1 **Fire Safety.** The Fire Management and Prevention Plan prepared by the Project owner to ensure the safety of workers and the public and minimize fire risk during construction, operation and maintenance, and decommissioning for the Project shall include, but not be limited to, the following elements:

- Procedures for minimizing potential ignition, including, but not limited to, vegetation clearing, parking requirements/restrictions, idling restrictions, smoking restrictions, proper use of gas-powered equipment, and hot work restrictions.
- Work restrictions during Red Flag Warnings and High to Extreme Fire Danger days.
- All internal combustion engines used at the Project site shall be equipped with spark arrestors. Spark arrestors shall be in good working order.
- Once new access roads have been cut and initial fencing completed, light trucks and cars shall be used only on roads where the roadway is cleared of vegetation. Mufflers on all cars and light trucks shall be maintained in good working order.
- Fire rules shall be posted on the Project bulletin board at the contractor's field office and areas visible to employees.
- Equipment parking areas and small stationary engine sites shall be cleared of all flammable materials.
- Smoking shall be prohibited in all vegetated areas and within 50 feet of combustible materials storage and shall be limited to paved areas or areas cleared of all vegetation.

- Each construction site (if construction occurs simultaneously at various locations) shall be equipped with fire extinguishers and fire-fighting equipment sufficient to extinguish small fires.
- The Project owner shall coordinate with BLM and RCFD to create a training component for emergency first responders to prepare for specialized emergency incidents that may occur at the Project site, including incidents such as fire or explosion at or with the BESS.
- The plan shall include information about the type of BESS technology on site, potential hazards, and procedures for disconnecting or shutting down the BESS in case of fire or to reduce the chance of fire.
- All construction workers, plant personnel, and maintenance workers visiting the plant and/or transmission lines to perform maintenance activities shall receive training on fire prevention procedures, the proper use of firefighting equipment, and procedures to be followed in the event of a fire. Training records shall be maintained and be available for review by BLM and RCFD. Fire prevention procedures shall be included in the Project's Worker Environmental Awareness Program.
- Vegetation near all solar panel arrays, ancillary equipment, and access roads shall be controlled through periodic cutting and spraying of weeds, in accordance with the Weed Management Plan.
- BLM and RCFD shall be consulted during plan preparation and fire safety measures recommended by these agencies included in the plan.
- The plan shall list fire prevention procedures and specific emergency response and evacuation measures that shall be required to be followed during emergency situations.
- All on-site employees shall participate in annual fire prevention and response training exercises with the BLM and RCFD.
- The plan shall list all applicable wildland fire management plans and policies established by state and local agencies and demonstrate how the Project will comply with these requirements.
- The Project owner shall designate an emergency services coordinator from among the full-time on-site employees who shall perform routine patrols of the site during the fire season equipped with a portable fire extinguisher and communications equipment. The Project owner shall notify BLM and RCFD of the name and contact information of the current emergency services coordinator in the event of any change.
- Remote monitoring of all major electrical equipment (transformers and inverters) will screen for unusual operating conditions. Higher than nominal temperatures, for example, can be compared with other operational factors to indicate the potential for overheating which under certain conditions could precipitate a fire. Units could then be shut down or generation curtailed remotely until corrective actions are taken.
- Fires ignited on site shall be immediately reported to BLM and RCFD.
- The engineering, procurement, and construction contract(s) for the Project shall provide reference to or clearly state the requirements of this mitigation measure.
- The Project owner must provide the Fire Management and Prevention Plan to BLM for review and approval and to RCFD for review and comment before construction.

4. OTHER CEQA CONSIDERATIONS

Chapter 4 includes discussions of various topics required by CEQA. These topics include Section 4.1, significant and unavoidable impacts, which summarizes the conclusions presented in Chapter 3; Section 4.2, significant irreversible and irretrievable changes; Section 4.3, growth-inducing effects; Section 4.4, energy consumption; Section 4.5, Other Public Concerns; and Section 4.6, Caltrans CEQA Summary.

4.1. Significant and Unavoidable Environmental Impacts

4.1.1. Significant Direct Effects of the Solar Facility

As required by the CEQA Guidelines Section 15126.2(b), an EIR must describe any significant impacts that cannot be avoided, including those impacts that can be mitigated but not reduced to a less-than-significant level. Where there are impacts that cannot be alleviated without imposing an alternative design, their implications, and the reasons the Project is being proposed, notwithstanding their effect, should be described. Chapter 3 of this EIR describes the proposed Project's potential environmental impacts and recommends mitigation measures to reduce impacts, where feasible. Impacts to the following resources would be significant and unavoidable with construction and operation of the proposed Project, even with the incorporation of feasible mitigation measures that attempt to reduce impacts to the extent feasible.

Note that these conclusions apply to the Project as proposed, the No Project Alternative (A3: Other Renewable Energy Development within Existing Land Designations), and the Lake Tamarisk Alternative (Alternative B2), and the Further Reduced Footprint Alternative with Berms (Alternative C) (except for views from Lake Tamarisk Desert Resort), described in Chapter 2, but not to the No Project Alternative (A1 and A2), Offsite Alternative (Alternative D), or Distributed Commercial and Industrial Rooftop Solar Alternative (Alternative E), which would eliminate the significant and unavoidable visual impacts. However, the Offsite Alternative (Alternative D) would likely create new significant and unavoidable impacts to biological resources.

Aesthetics

- ~~Impact AES-1/AES-3. In non-urbanized areas, would the Project substantially degrade the existing visual character or quality of public views of the site and its surroundings? (Public views are those that are experienced from publicly accessible vantage points). If the Project is in an urbanized area, would the Project conflict with applicable zoning and other regulations governing scenic quality?~~

The Project could substantially degrade the existing visual character or quality of the site and its surroundings. The resulting visual change would be adverse and unavoidable even with implementation of mitigation, when viewed from all Key Observation Points (KOPs).

- Impact AES-3. Would the Project result in the creation of an aesthetically offensive site open to public view?

The Project's high visual change discussed under Impact AES-1 would result in a significant aesthetics impact under Impact AES-3 as well. Additionally, the O&M impacts would remain significant and unavoidable.

Agriculture and Forestry

- ~~Impact AG-1. The Project would conflict with existing zoning for agricultural use, a Williamson Act contract, or land within an agricultural preserve.~~

There are seven parcels within the Project site that are subject to a Williamson Act contract and related agricultural preserve program. The proposed solar Project is not an allowable use under the Williamson

~~Act program and, therefore, its construction and operation on lands would be a significant and unavoidable impact with lands in an agricultural preserve and related Williamson Act contract. Cancellation of the Williamson Act contract must occur prior to approval of the conditional use permit for the Project. If the Williamson Act contracts are cancelled at the time of the EIR certification, this impact would be avoided.~~

■ ~~**Impact AG-3. The Project would conflict with land within a Riverside County Agricultural Preserve.**~~

~~There are seven parcels within the Project site that are subject to a Williamson Act contract and related agricultural preserve program, which is incompatible with the Project; therefore, this conflict with an agricultural preserve would be significant and unavoidable. However, if the Williamson Act contracts are canceled prior to EIR certification, this impact would be avoided.~~

4.1.2. Significant Cumulative Effects

According to section 15355 of the State CEQA Guidelines, the term *cumulative impacts* “refers to two or more individual effects which, when considered together, are considerable or which compound or increase other environmental impacts.” Individual effects that may contribute to a cumulative impact may be from a single project or several separate projects. Individually, the impacts of a project may be relatively minor, but when considered along with impacts of other closely related or nearby projects, including newly proposed projects, the effects could be cumulatively considerable.

The cumulative scenario and analysis methodology is included in Section 3.1 of this EIR. This EIR has considered the potential cumulative effects of the Project for each issue area in Chapter 3 and for alternatives in Chapter 5. Impacts of these projects are cumulatively ~~considerable~~ when they are combined with impacts from past, present, and reasonable future projects. Impacts would be considered cumulatively significant for the following issue areas:

- **Aesthetics:** The cumulative scenario includes many large-scale solar plants and transmission lines whose scale and pervasiveness would have adverse cumulative effects to aesthetics. If all the projects were implemented, they would introduce substantial visual contrast associated with discordant geometric patterns in the landscape and large-scale, built facilities with prominent industrial character; create unnatural lines of demarcation in the valley floor landscape and inconsistent color contrasts; and add visible night lighting within the broader Chuckwalla Valley. As a result, the proposed Project, in combination with the 13 local energy projects, would contribute to significant cumulative visual impacts when viewed by sensitive viewing populations along Interstate 10 and SR-177/Rice Road, from nearby residences, from portions of JTNP, and in the surrounding mountains and wilderness. Effective implementation of Mitigation Measures AES-1 (Surface Treatment of Project Structures and Buildings), MM AES-2 (Project Design), MM AES-3 (Night Lighting Management), and MM BIO-5 (Vegetation Resources Management Plan) would reduce the severity of the Project’s contribution to the cumulative visual effects, though the Project’s contribution would still be considerable.
- **Cultural and Tribal Cultural Resources:** While the visual changes resulting from the Project would be in kind with the current nature and scale of existing visible developments, the addition of more industrial components to the Chuckwalla Valley, as a result of the Project in combination with past projects, other current projects, and probable future projects, would contribute to adverse visual impacts to the Prehistoric Trails Network Cultural Landscape (PTNCL), particularly from character defining features within the PTNCL. The Project would implement Mitigation Measures CUL-1 through MM CUL-6, MM TCR-1, MM TCR-2, AES-1 and AES-2, which would avoid and minimize impacts to archaeological resources and employ design elements that reduce the Project’s visual contrast to characteristics of the landscape, reducing project-level impacts to less than significant. Cumulative projects would likely be required to implement similar measures. However, cumulative visual impacts to the

PTNCL would remain significant, and the Project's incremental contribution would be cumulatively considerable.

4.2. Irreversible and Irretrievable Commitments of Resources

CEQA Guidelines Section 15126.2 requires a discussion of any irreversible or irretrievable commitments of resources that implementation of a proposed project or alternative would cause. CEQA Guidelines Section 15126.2(c) states “[u]ses of nonrenewable resources during the initial and continued phases of the project may be irreversible since a large commitment of such resources makes removal or nonuse thereafter unlikely.” Both primary and secondary impacts of a project generally commit future generations to similar uses. Also, irreversible damage can result from environmental accidents associated with a project. Irretrievable commitments of resources should be evaluated to assure that such current consumption is justified. Therefore, the purpose of this discussion is to identify any significant irreversible environmental changes brought about by the Project.

Resources irreversibly or irretrievably committed to a proposed Project are those used on a long-term or permanent basis. This includes the use of nonrenewable resources such as petroleum fossil fuel resources, petrochemical products, metals such as raw material for steel, aggregate minerals including sand and gravel, and other natural resources. These resources are considered irretrievable in that they would be used for a proposed project when they could have been conserved or used for other purposes. Another irreversible or irretrievable commitment of resources is the unavoidable destruction of natural resources that could limit the range of potential uses of that environment.

Construction of the proposed Project or alternative would commit nonrenewable resources during construction and ongoing utility services during operations. Recycling would be in accordance with application California state requirements.³⁹ The proposed Project would install solar PV panels manufactured from metals, such as thin-film panels (including cadmium telluride [CdTe or “cad tel”] and copper indium gallium diselenide [CIGS] technologies), crystalline silicon panels, bifacial panels, or any other commercially available PV technology. Some of these materials would consist of earthen minerals. During operation, oil, gas, and other nonrenewable resources would be consumed for maintenance purposes, although on a limited basis. See Section 3.7 (Energy) for more information.

At the end of its useful life, the Project would be decommissioned, and the land would be available for restoration to open space or other compatible uses. The Applicant would restore the site to the pre-solar facility conditions, or such condition as appropriate in accordance with project approvals and decommissioning plan.

Upon ultimate decommissioning, most components would be suitable for recycling or reuse, and decommissioning would be designed to optimize such salvage as circumstances allow and in compliance with all local, state, and federal laws and regulations as they exist at the time of decommissioning (see Section 2.6, Decommissioning and Repowering). If the Project is decommissioned and dismantled, some of the natural resources on site could be retrieved.

The Project is a renewable energy project intended to generate solar energy to reduce reliance on fossil fuels. Over the life of the Project, the renewable energy project would contribute incrementally to the reduction in demand for fossil fuel used to generate electricity, thereby resulting in a positive effect counteracting the commitment of nonrenewable resources to the Project. A full discussion on the Project's impacts related to energy consumption is provided in Section 3.6 (Energy).

³⁹ As of January 1, 2020, CALGreen requires covered projects to recycle and/or salvage for reuse a minimum 65% of the nonhazardous construction and demolition waste or meet a local construction and demolition waste management ordinance, whichever is more stringent.

4.3. Growth Inducing Impacts

CEQA Guidelines Section 15126.2(d) requires analysis of the growth-inducing impact of the project. The discussion should identify the ways in which a project could foster economic or population growth, or the construction of additional housing, either directly or indirectly, in the surrounding environment. This includes projects that remove obstacles to population growth, such as by extending public services into areas not previously served. Growth inducement can also result from actions that encourage development or encroachment into surrounding areas or encourage adjacent development. According to State CEQA Guidelines Section 15126.2(d), growth should not be assumed to be beneficial, detrimental, or of little significance to the environment.

This growth inducing impact analysis considers the following four criteria, and whether the Project would result in:

- Removal of an obstacle to growth, e.g., establishment of an essential public service or the provisions of new access to an area;
- Economic expansion or growth, e.g., changes in revenue base or employment expansion, that would require construction of new facilities that could cause significant environmental effects;
- Establishment of a precedent-setting action, e.g., a change in zoning, or general plan amendment approval; or
- Encouraging development or encroachment into an isolated area or open space.

Should a project meet any one of the criteria listed above, it can be considered growth-inducing.

Removal of an obstacle to growth. The proposed Project would result in the conversion of substantial open space to a developed land use. The Project would be located on private and BLM-administered lands designated as a DFA to allow for development of solar energy generation and appurtenant facilities on public lands in this specific area. The Project would not result in the establishment of an essential public service to lands not currently served by public services nor would it provide new access to previously inaccessible areas. As a result, the Project would not cause significant growth inducement under this criterion.

Economic expansion or growth. Short-term economic growth could occur during the construction and decommissioning periods because the proposed Project could create a demand for workers that may not be met by the local labor force, thereby inducing in-migration of non-local labor and their households. Given the number of solar projects proposed in the Desert Center area, workers may temporarily stay in the area. However, construction of the proposed Project alone, nor cumulatively with any of the proposed nearby projects which are also primarily solar projects, would create a significant number of long-term construction jobs that could result in significant population growth. Therefore, the construction phase of the Project is not considered to permanently result in economic expansion or growth, as it would be temporary by definition.

Following construction, up to 10 permanent staff could be on the site at any one time for ongoing solar facility maintenance and repairs. Alternatively, approximately 2 permanent staff and 8 Project operators would be located off site and would be on call to respond to alerts generated by the monitoring equipment at the Project site. The Project's workforce could contribute to an increase in tax revenues for the State of California and Riverside County; however, the limited permanent employment expansion would not result in the need for new or physically altered community-serving facilities. As a result, the proposed Project would not be growth-inducing for its effects on economic expansion or growth.

Establishment of a precedent-setting action. The Project would result in the development of a solar and energy storage facility and a gen-tie line in the vicinity of other existing and approved solar projects and

in an area identified by planning documents as appropriate for renewable development. The Project would be similar to the other cumulative projects in eastern Riverside County, many of which are identified as past and present projects or probable future projects (EIR Section 3.1.2, Cumulative Impact Scenario). The Project would not establish a precedent-setting action such as a change in zoning or general plan amendment. Therefore, the Project would not be growth inducing under this criterion.

Development or encroachment into an isolated area or open space. The proposed Project would result in a change to undeveloped land in an area surrounded by proposed, existing or under-construction solar projects. The proposed Project, as with a number of adjacent solar projects, would be located on private lands and BLM-administered lands designated as a DFA to allow for development of solar energy generation and appurtenant facilities on public lands in this specific area. The Project would not encroach into lands planned for future residential development. The Project is located approximately 750 feet from a residential development. Although the Project is within close proximity to a community, the Project is not considered to have the potential to encourage or push residential development into other open space areas, because the Project would not induce population growth or development. The Project site is remote and existing/planned land use patterns do not indicate that residential development was planned in the area. Therefore, the proposed Project would not result in growth inducement through development or encroachment into an isolated area or open space.

4.4. Energy Consumption

In order to assure that energy implications are considered in project decisions, CEQA requires that EIRs include a discussion of the potential energy impacts of proposed projects, with particular emphasis on avoiding or reducing the “wasteful, inefficient, and unnecessary consumption of energy” (see Public Resources Code section 21100(b)(3)). According to Appendix F: Energy Conservation, within the State CEQA Guidelines, the goal of conserving energy implies the wise and efficient use of energy including:

- Decreasing overall per capita energy consumption;
- Decreasing reliance on fossil fuels such as coal, natural gas and oil; and
- Increasing reliance on renewable energy sources.

Lead agency actions that are consistent with these goals would not be likely to cause an energy-related impact. For this analysis, an impact related to energy conservation would be considered potentially significant if the Project would cause inefficient, wasteful, and unnecessary consumption of energy.

Energy Implications of the Proposed Project. The proposed Easley Renewable Energy Project itself would develop a renewable source of power, which would help to offset the use of nonrenewable resources and contribute to an overall reduction of nonrenewable resources currently used to generate electricity.

The Project would produce up to nearly 860,000 megawatt-hours (MWh) of electricity annually, based on the generating capacity of 400 MW at a capacity factor of 26 percent, which would be achievable by a typical solar PV system in eastern Riverside County, minus transmission line losses.

Solar-powered production of electricity would further the energy goal of the State CEQA Guidelines by decreasing reliance on fossil fuel-fired electric generating facilities, primarily by decreasing use of natural gas in California, and by increasing reliance on renewable energy sources.

This EIR in Section 3.9 (Greenhouse Gas Emissions) describes additional effects on climate change/greenhouse gas (GHG) emissions that would be caused by implementation of the Easley Renewable Energy Project, such as the GHG emissions avoided by producing electricity from solar power.

Discussion of Potential Energy Impacts. This analysis addresses the following types of potential energy-related impacts, which are outlined in Appendix F of the State CEQA Guidelines:

- ***Would the Project result in substantial new energy requirements or significant energy use inefficiencies for any stage of Project construction, operation, maintenance, and/or removal?*** The proposed Project would produce electricity adding to California's supply of renewable energy resources. Each stage of proposed Project construction, operation, maintenance, and removal, including decommissioning, would require direct energy use through the consumption of fossil fuels in the form of petroleum products that fuel equipment and vehicles, and the use of electricity for powering onsite equipment and facilities. Indirect energy use would include the energy required to refine raw materials and manufacture the components used in construction of the Project. This would include energy used for extraction of raw materials, manufacturing, and transportation associated with manufacturing. Energy used during construction, operation, maintenance, and removal, including decommissioning would be necessary in the implementation of the proposed Project, which would become an electricity producer upon its operation. Accordingly, the proposed Project would not result in an inefficient, wasteful, or unnecessary consumption of energy, and the proposed Project energy requirements would not be substantial or result in significant energy use inefficiencies during any stage.
- ***Would the Project cause a significant adverse effect on local and regional energy supplies and on requirements for additional capacity?*** The development activities and O&M of the proposed Project would consume fossil fuels and some electricity for powering onsite equipment and facilities. Providing diesel and gasoline for Project-related consumption of transportation fuels would not require any additional capacity in the eastern Riverside County regional supply or distribution network. Upon entering commercial service, the proposed Project would become an electricity producer adding to California's supply of renewable energy resources. Because the proposed gen-tie line would provide the capacity to interconnect and ultimately deliver the electrical output of the solar facility, the proposed Project would not exceed local capacity to meet the demand for electricity.
- ***Would the Project cause a significant adverse effect on peak and base period demands for electricity and other forms of energy?*** Overall per capita energy consumption would not be expected to change as a result of the proposed Project. The proposed Project would involve no change in how retail electric service is provided and no change in energy efficiency or energy conservation programs implemented by the utilities serving the peak and base period demands for electricity. The proposed Project would result in no notable change in demand for peak-period or base period electricity from the grid.
- ***Would the Project disrupt compliance with existing energy standards?*** Development activities and O&M of the proposed Project would consume fossil fuels and some electricity for powering onsite equipment and facilities. Vehicles and equipment, and onsite buildings, would need to conform with fuel efficiency standards and building energy efficiency standards established by California's existing programs promoting energy conservation. Similarly, the end-users of electricity that is produced by the proposed Project would be subject to California's existing energy conservation programs. The proposed Project would not disrupt compliance with existing energy standards or have any adverse effect on potential compliance with energy conservation standards.
- ***Would the Project cause a significant adverse effect on energy resources?*** The proposed Project would add to California's supply of renewable energy resources by increasing the production of renewable energy for end-users of electricity in California. The proposed Project would not cause an adverse effect due to inefficient, wasteful, or unnecessary energy use.
- ***Would the Project result in significant adverse effects related to transportation energy use?*** Development activities and O&M of the proposed Project would use transportation fuels and providing diesel and gasoline for Project-related consumption of transportation fuels would not require any additional

capacity in the eastern Riverside County regional supply or distribution network. Due to the small permanent workforce and the limited need for deliveries or waste hauling during O&M of the solar facility, the transportation energy use would be minimal in comparison with the electricity produced. The proposed Project would not cause an adverse effect due to inefficient, wasteful, or unnecessary transportation fuel use.

4.5. Other Public Concerns

This section discusses issues raised in the scoping effort conducted by the Riverside County Planning Department, that are not discussed in Section 3 because the issues raised are outside of the scope of CEQA.

4.5.1. Property Values

A frequent scoping comment related to land use was concern over the potential loss of property value as a result of solar projects being developed nearby.

The Lake Tamarisk Desert Resort (LTDR) is a 55-plus, member-owned community 2 miles north of I-10 in Desert Center. In 1984, the property was acquired and an abandoned 1960s era manmade lake, golf course, and swimming pool on the property were restored. In addition to its community facilities and amenities, the Lake Tamarisk community includes individual homes and RV lots. The vicinity around LTDR has been identified as highly suitable for development of renewable energy projects, particularly solar projects. Several large-scale solar projects are now in operation in eastern Riverside County where LTDR is situated, and additional solar projects are under construction or planned.

LTDR and Desert Center residents have expressed their concerns about the potential effect of large solar projects on property values. A large study from Lawrence Berkeley National Laboratory (LBNL) found that houses within 0.5 mile of a utility-scale solar farm have resale prices that are, on average, less than houses that are a little farther away (Elmallah, 2023). In particular, homes within 0.5 mile of large-scale photovoltaic projects experienced an average home price reduction of 1.5 percent compared to homes 2 to 4 miles away; statistically significant effects were not measurable over 1 mile from a large-scale solar project.

The study's authors analyzed 1.8 million home sales between 2003 and 2020 near solar farms in six states. The study found diminished property values in three states: Minnesota (4 percent), North Carolina (5.8 percent) and New Jersey (5.6 percent). However, the three other states—California, Connecticut, and Massachusetts—had price changes that were within the margins of error for the study,⁴⁰ which means the price effects were too close to zero to be meaningful. The study reports that while large-scale photovoltaic projects have an average adverse effect on home prices, impacts are not uniform across geographies, land uses, or solar project size. The study concludes that the effect of renewable energy projects on property values is small on average, but it is not zero. The authors' research focused on property values and did not consider positive or off-setting impacts of solar development, such as local tax revenue and employment.

Overall, the LBNL study results suggest that for homes very close to a project and those predominantly in rural agricultural settings around larger projects, there are adverse property value impacts of large-scale photovoltaic solar project construction. However, most impacts fade at distances greater than 1 mile from a project. The study notes that although the authors found adverse impacts from large-scale solar projects on property values overall, they notably found no statistically significant evidence of impacts in three

⁴⁰ The LBNL study reports that the states where the authors observed no statistically significant difference in sales price (in CA, CT, and MA) are also the states with lower proportions of large-scale photovoltaic project development on agricultural land. In addition, California has very few transactions in rural areas.

states in their study area – including in California, which alone accounts for over half of the transactions in their dataset.

A smaller 2020 study by researchers at the University of Rhode Island looked at about 400,000 real-estate transaction in Rhode Island and Massachusetts within 3 miles of solar sites and found that the value of houses within 1 mile of a solar project decreased by an average of 1.7 percent following construction of the solar project (Gaur and Lang, 2020). The study sample consisted of 208 solar installations, 71,337 housing transactions within 1 mile, and 347,921 transactions between 1 and 3 miles distant.

Based on limited studies, it appears that there could be a small adverse effect on property values at Lake Tamarisk attributable to a solar project being located within 0.5 mile. The LBNL study found that for California property transactions any effect was within the margin of error of the study.

Economic effects, including effects on property value, are not a topic included in CEQA assessments of proposed projects. However, State CEQA Guidelines §15131 notes that “[e]conomic or social information may be included in an EIR or may be presented in whatever form the agency desires.” The Guidelines also note that “[e]conomic or social effects of a project are not to be treated as significant effects on the environment” (§15131(a)), although “[e]conomic or social effects of a project may be used to determine the significance of physical changes caused by the project” (§15131(b)). The Guidelines also note that “CEQA requires the decision-making agency to balance, as applicable, the economic, legal, social, technological, or other benefits, including region-wide or statewide environmental benefits, of a proposed project against its unavoidable environmental risks when determining whether to approve the project.” (§15093(a))

Although it is conceivable that there could be some reduction in property value owing to the proximity of a large-scale solar project, based on the LBNL study the effect on properties in California appears to be small, if any. Given the CEQA guidance, this would not be considered a significant effect on the environment.

4.5.2. Solar Moratorium

Commenters during scoping expressed a desire for a moratorium on permitting of solar projects with 5 miles of Lake Tamarisk Desert Resort until the 2012 BLM Western Solar Plan is revised and defines setbacks and exclusion zones around communities and that these are agreed upon by the Lake Tamarisk Community.

Establishing a moratorium or buffer is beyond the scope of the CEQA review for the proposed Project. That would require specific actions by the County for lands under its jurisdiction, and by BLM for lands under its jurisdiction. Since the 2012 Western Solar Plan was issued, the BLM has recognized that updating and expanding the Solar Energy Program would be appropriate to advance current and future renewable energy goals and to support conservation and climate priorities. On December 8, 2022, BLM issued a Notice of Intent (NOI) to prepare a Programmatic EIS to evaluate utility-scale solar energy planning and amend Resource Management Plans for renewable energy development. The comment period on the NOI closed on March 1, 2023.

After consideration, the BLM has chosen not to include the area under the DRECP (which includes BLM lands in eastern Riverside County) in the current effort as the BLM believes the DRECP supports an acceptable balance between conservation and renewable energy opportunities within its planning area boundary. The BLM has noted that the Solar Programmatic EIS will not interrupt the processing of existing or new solar energy development applications. BLM decisions to authorize solar energy development projects will continue to conform to the BLM’s approved resource management plans, including as those plans might be amended following the completion of the Solar Programmatic EIS.

Note that an alternative that incorporates a 1-mile buffer around the Lake Tamarisk community is described in Section 2.8 and has been analyzed in Chapter 3 the EIR under Alternative C, Further Reduced Footprint Alternative with Berms.

4.5.3. Nuisance Animal Encounters

The scoping effort revealed that several commentors were concerned about an increase in occurrence of termites and rattlesnakes. The commentors stated that residents of the nearby Lake Tamarisk Desert Resort have reported an increase in the amount of termite swarms and rattlesnake encounters and have attributed this to the increase in disturbance due to solar development in Desert Center.

4.5.3.1. Termites

Subterranean termites, the type of termite found in Desert Center, lives underground in family groups called colonies. During daylight hours of the spring months, large numbers of winged termites will emerge from soils to leave their parent colonies in order to mate and establish new colonies of their own. These are king and queen termites called swarmers, who will pair up and fly together to search for a place to begin a new nest. Once they land, their wings break off and they start their colony by excavating a small chamber where they mate, reproduce, and grow the colony. Mating continues by the king and queen termite, and the offspring begin creating exploratory tunnels to find wood, which they eat for food. These tubes used to travel underground can range from a few yards to the size of a football field (120 yards). Termites can travel above ground in tubes they build with mud and fecal material to protect themselves from predators and to retain their moisture (Miller, 2010).

Climate change increases the opportunities for the introduction, spread, and persistence of invasive species, such as termites. Termite ranges are expected to significantly increase globally in the following years, partly attributed to climate change and warming temperatures. Economic and ecological damage caused by termites will also increase as a result of this (Buczkowski and Bertelsmeier, 2017). The EPA determines that increasing temperatures and wetter or drier climates will favor increased populations in species such as termites, as they can flourish or expand in the changing climate (EPA, 2010).

The potential increase in termites at the Lake Tamarisk Desert Resort could be driven by climate change and warming temperatures, as described above. As stated above, a termite can travel up to 120 yards, or 360 feet underground. The Easley Project would be at least 750 feet from the Lake Tamarisk Desert Resort.

Methods for controlling subterranean termites include insecticides applied to the soil adjacent to the structure, directly to nests, or through bait stations. Termites can infest wood that is in contact with soil, so maintaining a barrier of inorganic material between the soil surface and structural wood is one recommendation. Other management strategies include using termite resistant wood or other materials, keeping wood away from structures, providing ventilation to substructures to keep them dry, and repairing foundation cracks and exterior defects. To facilitate control of subterranean termites, destroy their shelter tubes whenever possible to interrupt access to wooden substructures (Lewis, 2014).

4.5.3.2. Rattlesnakes

Scoping comments revealed that, along with termites, residents of Desert Center are experiencing an increase in rattlesnake sightings compared to the past. Some explanations include disturbance due to solar developments, or temperature changes due to climate change.

According to one study (Lomas et al. 2019), rattlesnakes in undisturbed areas had larger home ranges and longer home range lengths compared to individuals in disturbed areas. The study also found that rattlesnakes in highly disturbed areas did not move greater total distances or have higher movement rates.

Rattlesnakes are highly sensitive to temperature changes, due to their ectothermy which requires that they rely on ambient environmental temperatures to maintain critical physiological processes. Due to this sensitivity, rattlesnakes may have smaller ranges due to climate change (Olson and Saenz, 2013). One study by Putman and Clark (2017) showed that as climate change continues and mean daily air temperature rises, rattlesnakes decreased hunting activity at night, and increased movement and distance moved during the day.

Rattlesnake translocation is a method used to remove rattlesnakes from populated areas where they are a “nuisance” which is typically public and residential areas. This is an increasingly common management practice in the southwestern United States (Nowak, 2018). The Nowak study concluded that the survival rate of translocated rattlesnakes is low, however, the Brown study on short distance translocation found no evidence that translocation affected the mortality of rattlesnakes. Translocating rattlesnakes is not a successful long-term strategy, as the rattlesnakes have been shown to return to the location they were removed from (Brown et al. 2010). Both studies showed that rattlesnakes translocated at any distance increased their movement distances and the frequency at which they move. This phenomenon could potentially increase the activity range for snakes in the Desert Center area.

The increase in development in Desert Center contributes to a greater amount of ground disturbance. However, the Lomas study found that rattlesnakes in highly disturbed areas did not move greater total distances or have higher movement rates. Climate change may contribute to this issue by causing the rattlesnakes to be more active during the daytime, although climate change may contribute to smaller ranges. Translocation is a management strategy used during construction (and operation?) of solar projects in the Desert Center area, which could contribute to an increase in distance the snakes travel in this area, however, studies show that rattlesnakes generally return to where they were translocated from. Therefore, the increase in disturbance in Desert Center is likely not the cause of an increase in rattlesnake sightings in residential areas, but this cannot be confirmed. The increase in sightings of rattlesnakes could be a result of the snakes being more active during the daytime hours.

4.6. California Department of Transportation CEQA Summary

4.6.1. Introduction

The purpose of this section is to address Caltrans permit requirements and to aid in their environmental review with regards to biological resources, cultural and paleontological resources, and soil contamination. The improvements described herein are evaluated throughout the EIR as part of the Project. This analysis highlights the relevant analysis to assist Caltrans. Proposed Project access points and crossings of State Route (SR)-177/Rice Road are subject to Caltrans requirements including ingress/egress driveways or installation of any overhead/underground lines in or across the Caltrans right-of-way (ROW). Caltrans will require permitting for four features of the Easley Renewable Energy Project that would be located within the Caltrans’ ROW for SR-177/Rice Road. These include:

- Temporary Construction Access;
- Overhead or Underground Medium Voltage Line Crossing;
- 500 kV Overhead Crossing; and
- Permanent Operations Access.

SR-177/Rice Road is a two-lane north/south highway between Desert Center/I-10 and SR-62, approximately 25 miles northeast of Desert Center (Figure 3.18-1 in Appendix A). The posted speed limit is 65 mph. In 2020, at its junction with I-10, SR-177/Rice Road carried had approximately 2,900 Average Daily Travel (ADT) with a peak hour ADT of 470.

At this stage, the Project does not have final engineering completed, and therefore, the locations where encroachment permits from Caltrans are not finalized. Additionally, the locations may be different based on which alternative is approved by Riverside County and BLM. Therefore, this analysis considers all potential locations where improvements are proposed for the proposed Project and alternatives. This area covers approximately 5 miles of Rice Road, with a 500 feet buffer on either side of the ROW, as shown on Figure 3.18-1 and Figures 4-1A/B through 4-4A/B in EIR Appendix A.

4.6.2. Description of Project Features within Caltrans ROW

4.6.2.1. Temporary Construction Access

Access off of SR-177/Rice Road to the Project site would include two new construction access roads from SR-177/Rice Road. At each location, access roads would enter the project site from both sides of SR-177/Rice Road. Driveway approaches would conform to current and applicable Caltrans' specifications. Figure 4-1A in Appendix A provides the conceptual location of a Project construction access temporary roads. Construction of the access road segments would include compacting subsurface soils and placing a four-inch-thick layer of asphalt concrete over a 6-inch-thick layer of compacted aggregate base to prevent track-out onto public roads.

Flagging operations at site access points may be implemented during construction if/when traffic control needs are indicated through either monitoring traffic operations during construction or determined to be required during construction stage planning.

For Alternative B₂, the onsite substation and BESS locations would be moved at least 0.7 miles to the northeast (farther from the community of Lake Tamarisk), on either BLM-administered land (Substation Alternative A) or private land adjacent to SR-177/Rice Road (Substation Alternative B) (see EIR Section 2.8.3 and Figure 4-1B in Appendix A). For Alternative C, the onsite substation and BESS locations would also be located on private land adjacent to SR-177/Rice Road (see EIR Section 2.8.4 and Figure 2-15 in Appendix A). Under Alternative D (Offsite Alternative), the substation and BESS would be located on BLM-administered land to the east of SR-177/Rice Road, approximately 1 mile north of the Oberon Substation.

4.6.2.2. Overhead or Underground Medium Voltage Line Crossing

As described in Section 2.3.2, panels would be electrically connected into panel strings using wiring secured to the panel racking system. Underground cables would be installed to convey the direct current (DC) electricity from the panels via combiner boxes located throughout the PV arrays, to inverters located at the Power Conversion Station that would convert the DC to alternating current (AC) electricity. The output voltage of the inverters would be stepped up to the required collection system voltage at pad mount transformers located near the inverters within the Power Conversion Station and combined into 34.5 kV collection cables.

The 34.5 kV collection cables would be buried underground and/or installed overhead on wood poles to connect all of the solar facility development areas to the onsite substation, which would involve an overhead or underground crossing of SR-177/Rice Road to connect the solar panels located to the east of SR-177/Rice Road to the onsite substation. Underground collector lines from the solar arrays would be installed under SR-177 using directional drilling which would not affect traffic on the highway. If the collection system is installed overhead, wood poles would be located on either side of SR-177/Rice Road. The typical height of the poles would be approximately 30 to 60 feet, with diameters varying from 12 to 20 inches (see Figure 2-9, Typical 34.5 kV Medium Voltage Line Structures, in Appendix A). For overhead crossings, temporary guard structures would be installed during conductor wire stringing to prevent the conductor from falling on the roadway. These guard structures would be located outside of the Caltrans

ROW. Figures 4-2A and Figure 4-2B in Appendix A provide conceptual underground and overhead crossings of SR-177/Rice Road for the proposed Project and Alternative 2, respectively.

4.6.2.3. Gen-tie Overhead Crossing

The Project 500 kV gen-tie line would be located within a 175-foot ROW and start at the onsite substation on the west side of SR-177/Rice Road. The gen-tie line would exit the substation and travel approximately 0.2-mile to cross SR-177/Rice Road, where it would turn southwest to parallel the eastern side of SR-177/Rice Road for 1.1 miles before turning east (see EIR Section 2.3.4 and Figure 3.18-1 in Appendix A).

The Project gen-tie line would be constructed with either monopoles, lattice steel structures, or wooden H-frame poles. At the crossing of SR-177/Rice Road, one gen-tie support structure would be located on either side of SR-177/Rice Road outside of the Caltrans ROW. Conductor, pull and tensioning and temporary work areas required for stringing would also be located outside of the Caltrans ROW on either side of SR-177/Rice Road. For the gen-tie overhead crossing, temporary guard structures would be installed during conductor wire stringing to prevent the conductor from falling on the roadway. These guard structures would be located outside of the Caltrans ROW. Figure 4-3A in Appendix A provides the conceptual design of the gen-tie overhead crossing of SR-177/Rice Road.

Overhead gen-tie construction, including stringing conductor across Highway-177/Rice Road, could require the short-term temporary closure lanes on SR-177/Rice Road (see EIR Section 3.18). Helicopters would likely be used for wire stringing activities including hanging travelers, pulling conductor and optical ground wire (OPGW), dead-end activities, and the installation of bird diverters for the gen-tie line (see EIR Section 2.4.6.1). All helicopter operations would be in accordance with Riverside County and BLM approved Helicopter Use Plan, and all aircraft, pilots, linemen, and mechanics would be in full compliance with applicable FAA requirements and standards.

For Alternative 2, the 500 kV gen-tie line from the Alternative substation location would exit the substation to the south and would cross SR-177/Rice Road before turning to the southwest to parallel the roadway on BLM land within the Easley site to rejoin the proposed route where it would cross SR-177/Rice Road onto the Oberon Project (see EIR Section 2.7.3 and Figure 4-3B in Appendix A).

4.6.2.4. Permanent Operations Access

Upon commissioning, the Project would enter the operations phase. The solar modules at the site would operate during daylight 7 days a week, 365 days a year. Permanent operations access would be via locked gates located at two primary access points (see Figures 4-4A and Figure 4-4B in Appendix A for the proposed Project and Alternative 2, respectively). The Project access points off of SR-177/Rice Road would be turning lanes (or as dictated by Caltrans) to ensure safety. Turning lanes and driveways would be paved to prevent trackout.

4.6.3. Environmental Review

4.6.3.1. Biological Resources

The Biological Resources Technical Report (BRTR) discusses biological information that was used as the baseline for impact assessments for the Project, including those in the vicinity of SR-177/Rice Road (see Appendix C). The descriptions of the biological resources in the BRTR were the basis of the environmental analysis in the EIR (see EIR Section 3.5).

Vegetation. Vegetation communities in the Project site were mapped and classified by botanists, using Holland 1986 and cross-referencing with A Manual of California Vegetation, 2nd edition (Sawyer et al. 2009) and the National Vegetation Classification System (NVCS) referenced in the DRECP (CDFW and AIS 2022). Vegetation was mapped by drawing vegetation polygons on aerial images in the field. These field

maps were then digitized into GIS shapefiles using ArcGIS Pro and one-foot pixel aerial imagery on a diagonal flat screen monitor at the office. Most mapped vegetation boundaries are accurate to within approximately 10 feet (3 meters). Vegetation communities in the vicinity of the SR-177/Rice Road improvements include creosote bush scrub and man-made features that include deciduous orchard/fallow agriculture and urban/developed land (see Figures 4-5A and 4-5B in Appendix A). Vegetation types tend to be patchy. Small patches of one named type are often included within mapped polygons of another type. The size of these patches varies, depending on the minimum mapping units and scale of available aerial imagery.

Focused plant surveys were performed in spring 2020 and 2022 and included visual coverage across the entire Project site. Surveyors employed belt transects spaced at approximately 20 meters apart. Transects were spaced at 10-meters apart in areas not previously surveyed in the preceding fall season. Surveys along the gen-tie line within the Oberon Project site were conducted between fall 2019 and Spring 2020. Special-status plants observed in the vicinity of SR-177/Rice Road include *Proboscidea althaeifolia* (desert unicorn plant) and *Funastrum utahense* (Utah vine milkweed) (see Figures 4-5A and 4-5Bb). Desert unicorn plant was found throughout the Project area, primarily in desert dry wash woodland in the southern half of the site and in fallow agricultural lands directly along the western boundary of SR-177/Rice Road along the western boundary of the road. One individual Utah vine milkweed was observed in fallow agricultural lands on the east side of the Project, west of along the SR-177/Rice Road. Other special-status plants that were not observed, but that have potential to occur on the Project site based on the presence of suitable habitat are described in the BRTR (Appendix C, Section 4.2). One barrel cactus, protected by the CDNPA, was observed within 800 feet east of SR-177/Rice Road.

Wildlife. Ironwood Consulting conducted full-coverage wildlife surveys in the Project area between fall 2019 and summer 2022. Surveys of the Oberon Project site, where the gen-tie line is located, were performed between fall 2019 and summer 2020. Surveys were performed focusing on protocols for desert tortoise and burrowing owl. Wildlife surveys conducted in 2019-2022 conformed to full coverage desert tortoise protocol surveys with 10-meter transects on the Project site (Ironwood, 2023a; Ironwood, 2021a). Wildlife surveys were repeated for each site at 20-meter belt transects, consistent with 2012 CDFW burrowing owl protocol surveys. The surveys identified all burrows and all evidence of wildlife use, including use by desert tortoise, burrowing owl, and desert kit fox. During all wildlife surveys, biologists recorded all wildlife species observed, regardless of status. The BRTR provides a compilation of special-status wildlife with potential to occur in the Project vicinity and evaluates probability of occurrence for each species based on habitat, elevational and geographic ranges, and field survey results. The complete methods and results of the surveys are provided in the BRTR (see EIR Appendix C).

Special-status wildlife observed in the vicinity of the SR-177/Rice Road include black-tailed gnatcatcher, burrowing owl (candidate for State listing), loggerhead shrike, and desert kit fox (see Figures 4-6A and 4-6B, and BRTR, Figures 10 through 12 in Appendix C). There was one observation of an individual black-tailed gnatcatcher on the southern edge eastern side of the Project and one observation south of the Project, south of SR-177/Rice Road, although suitable foraging and potential nesting habitat for this species is provided throughout the Project site. One burrowing owl burrow was observed south of the Project site approximately 500 feet west of SR-177/Rice Road. One burrowing owl burrow with whitewash was observed along the northern portion of the gen-tie line on the Oberon Project site. Five loggerhead shrikes were observed in the Project site within 0.25 miles of SR-177/Rice Road. Many desert kit fox burrows observed within the Project site are part of a complex with multiple entrances. During surveys, twenty-one active desert kit fox burrows or complexes with dig marks, tracks, and/or scat were observed within the Easley Project site (Figure 3.5-8 in Appendix A). The closest burrows, whether inactive or active, are approximately 500 feet either east or west of SR-177/Rice Road (see Figures 4-6A and 4-6B).

Other special-status wildlife that were not observed, but that have potential to occur on the Project site based on the presence of suitable habitat are described in the BRTR (Appendix C, Section 4.1). No live individuals or active sign of desert tortoise, a federally and State threatened species, were observed; however, class 4 and 5 carcasses were observed in the southwest portion of the Project site over 0.5 mile from SR-177/Rice Road. Along the gen-tie line in the eastern portion of the Oberon Project site, desert tortoise tracks, burrows, and carcasses were observed in desert dry wash woodland approximately 2.5 miles southeast of SR-177/Rice Road. The gen-tie line overlaps with critical habitat for desert tortoise, located in the southern portion of the Oberon Project site. Suitable habitat for Crotch bumble bee, a candidate for State listing, is present, however they are unlikely to occur due to the presence of nearby anthropogenic uses. Other state listed species that have potential to occur are Gila woodpecker, Swainson's hawk, and elf owl. Federally listed migratory birds may briefly use the Project site as stopover habitat, including Yuma Ridgway's rail, yellow-billed cuckoo, and least Bell's vireo.

Construction and O&M activities may result in direct and indirect impacts to special-status plants and wildlife, including loss of individuals and their habitat, along SR-177/Rice Road. ~~No listed threatened or endangered plant species were observed or have the potential to occur on the Project site or in the vicinity. The gen-tie line overlaps with critical habitat for desert tortoise, located in the southern portion of the Oberon Project site, although no live tortoises were observed.~~ Impacts would be avoided, minimized, and mitigated with implementation of mitigation measures specified in EIR Section 3.5.9 for biological resources. Compliance with applicable CMAs on BLM lands would further minimize impacts of the proposed Project and alternatives.

4.6.3.2. Cultural and Paleontological Resources

The cultural resources impact analysis in this EIR was based on records of previously recorded cultural resources in the area (Dyste et al., 2023) and the Riverside County Phase I and BLM Class III survey reports completed by Chronicle Heritage (formerly PaleoWest) (Clark et al., 2023; Hinojosa et al., 2023). Three historic-era cultural resources were identified within the vicinity of the proposed permanent improvements to State Route 177 (SR-177)/Rice Road as part of the current Project. These include the road itself, SR-177/Rice Road (P-33-025150), a series of linear earthen berms (P-33-022247) and a mobile home park (HL-BE-004H). SR-177/Rice Road was previously determined eligible for the CRHR in 2019 for the Athos Renewable Energy Project (Riverside County, 2019). Portions of the resource were analyzed by Caltrans for the Athos and the Oberon renewable energy projects for a similar need, and it was determined the turnouts would not diminish the integrity of the resource (Tennyson, 2023). Additionally, any possible impacts to the resource would be avoided, minimized, and mitigated with implementation of mitigation measures specified in EIR Section 3.6.9 for cultural and tribal cultural resources. Compliance with applicable CMAs on BLM lands would further minimize impacts of the proposed Project and alternatives.

P-33-022247 and HL-BE-004H both abut the SR-177/Rice Road permanent improvements work areas. Resource P-33-022247, consisting of a series of linear earthen berms, was previously determined not eligible for the NRHP by the BLM in 2021 with SHPO concurrence (SHPO, 2021). The Phase I study completed for the current Project recommended the resource not eligible for listing on the CRHR. Resource HL-BE-004H, a mobile home park, was recommended not eligible for either the CRHR or NRHP during Phase I and Class III surveys for the current Project.

No paleontological resources were found on the surface during surveys on the Easley site. Paleontological monitoring will occur during construction and no resources have been identified in the vicinity of SR-177/Rice Road. Impacts would be avoided, minimized, and mitigated with implementation of mitigation measures specified in EIR Section 3.14.9 for paleontological resources.

4.6.3.3. Soil Contamination

The soil contamination impact analysis in this EIR was based on a desktop study of the State Water Resources Control Board (SWRCB) GeoTracker and Department of Toxic Substance Control (DTSC) EnviroStor websites. No known listed hazardous material or contaminated sites were found at the Project site or immediately adjacent to the site. Impacts would be avoided, minimized, and mitigated with implementation of mitigation measures specified in EIR Section 3.10.9 for hazards and hazardous materials.

4.6.3.4. Transportation and Traffic

EIR Section 3.18 (Transportation and Traffic) discusses potential impacts from construction with respect to traffic and transportation for the proposed Project. The analysis concludes that while SR-177/Rice Road would not be affected by underground directional drilling for the collection lines, overhead gen-tie construction would require the temporary installation of guard structures during conductor wire stringing to prevent the conductor from falling on the roadway. To reduce or avoid potential impacts from Project vehicle trips and gen-tie construction, Mitigation Measures MM TRA-1 (Construction Traffic Carpool and Trip Reduction Plan) and TRA-2 (Repair Roadways and Transportation Facilities Damaged by Construction Activities) are included as part of the Project. These measures include:

MM TRA-1 Construction Traffic Control Plan. Prior to the start of construction, the Project owner shall submit a Construction Traffic Control Plan for review and approval by Caltrans and Riverside County for affected roads and intersections that would be directly affected by the construction activities and/or would require permits and approvals. The Construction Traffic Control Plan shall include, but not be limited to:

- If multiple construction projects occur at the same time and conditions at the intersection warrant, plans for installation of a temporary signal or use of manual intersection control during the construction period at the I-10 westbound ramp at SR-177. Additionally, if conditions warrant, geometry changes shall be considered in coordination with Caltrans and Riverside County, and implemented, if necessary, in addition to signalization at the I-10 westbound ramp and SR-177. These geometry changes could include a turn pocket.
- The locations and use of flaggers, warning signs, barricades, delineators, cones, arrow boards, etc., according to standard guidelines outlined in the Manual on Uniform Traffic Control Devices, the Standard Specifications for Public Works Construction, and/or the California Joint Utility Traffic Control Manual.
- The locations of all road or traffic lane segments that would need to be temporarily closed or disrupted due to construction activities.
- The locations where guard poles, netting, or similar means to protect transportation facilities for any construction or conductor installation work requiring the crossing of a local street highway is proposed.
- The use of continuous traffic breaks operated by the California Highway Patrol on state highways (if necessary).
- Additional methods to reduce temporary traffic delays to the maximum extent feasible during morning (7:00 a.m. to 9:00 a.m.) and afternoon (4:00 p.m. to 6:00 p.m.) peak traffic periods, or as directed in writing by the affected public agency in encroachment or other permits). This should also include feasible ways to reduce construction-related trips on I-10, SR-177, and Kaiser Road during peak traffic periods.

- Plans to encourage or provide ridesharing/carpooling opportunities for construction and operational workers.
- Incorporation wildlife protection measures, as required in MM BIO-6.

Plans to provide written notification to property owners and tenants at properties affected by access restrictions to inform them about the timing and duration of obstructions and to arrange for alternative access if necessary. The coordination shall occur at least one week prior to any blockages.

Plans to coordinate in advance with emergency service providers to avoid restricting the movements of emergency vehicles. Police departments and fire departments shall be notified in advance by the Project owner of the proposed locations, nature, timing, and duration of any roadway disruptions, and shall be advised of any access restrictions that could impact their effectiveness. At locations where roads will be blocked, provisions shall be ready at all times to accommodate emergency vehicles, such as immediately stopping work for emergency vehicle passage, providing short detours, and developing alternate routes in conjunction with the public agencies.

Define the method to maintaining close coordination, prior to and during construction, with Caltrans and Riverside County to minimize cumulative impacts of multiple simultaneous construction projects affecting shared portions of the circulation system. Coordination with adjacent development projects to spread work shifts into multiple hours (instead of peak hour) or the installation of additional temporary traffic signals or manual traffic control officers during peak hours to mitigate the temporary impacts.

MM TRA-2 Repair Roadways and Transportation Facilities Damaged by Construction Activities. If roadways, sidewalks, medians, curbs, shoulders, or other such transportation features are damaged by Project construction activities, as determined by the affected public agency, such damage shall be repaired and restored to their pre-Project condition by the Project owner. Prior to construction, the Project owner shall confer with Caltrans and Riverside County regarding the roads within 500 feet in each direction of Project access points (where heavy vehicles will leave public roads to reach Project sites) and regarding the roads to be crossed by the proposed gen-tie line. At least 30 days prior to construction, or as requested by Riverside County or Caltrans, the Project owner shall photograph or video record all affected roadway segments and shall provide Riverside County and Caltrans with a copy of these images, if requested.

At the end of major construction, the Project owner shall coordinate with each affected jurisdiction to confirm whether repairs are required. Any damage demonstrable to the Project is to be repaired to the pre-construction condition within 60 days from the end of all construction, or on a schedule mutually agreed to by the Project owner and the affected jurisdiction. If multiple projects are using the transportation features, the Easley Project owner shall pay its fair share of the required repairs. the Project owner shall provide Riverside County and Caltrans (as applicable) proof when any necessary repairs have been completed.

With the incorporation of Mitigation Measures TRA-1 (Construction Traffic Control Plan) and MM TRA-2 (Repair Roadways and Transportation Facilities Damaged by Construction Activities), impacts resulting from temporary construction-related disruptions to the affected circulation system were determined to be less than significant.

While the addition of temporary construction worker commute trips on SR-177/Rice Road would significantly increase the amount of average daily trips compared to existing conditions (without the Project), they would not affect existing transit uses or corridors and are presumed to cause a less than significant transportation impact.

5. ANALYSIS AND COMPARISON OF ALTERNATIVES

5.1. CEQA Requirements for Alternatives

Section 15126.6(a) of the State California Environmental Quality Act (CEQA) Guidelines states that an Environmental Impact Report (EIR) “shall describe a range of reasonable alternatives to the project, or to the location of the project, which would feasibly attain most of the basic objectives of the project, but would avoid or substantially lessen any of the significant effects of the project, and evaluate the comparative merits of the alternatives.” Further, an EIR need not consider every conceivable alternative to a project. Rather, it must consider a reasonable range of potentially feasible alternatives that will foster informed decision making and public participation. An EIR is not required to consider alternatives that are infeasible. The CEQA Guidelines state that factors that may be considered when determining the feasibility of alternatives are “site suitability, economic viability, availability of infrastructure, general plan consistency, other plans or regulatory limitations, jurisdictional boundaries (projects with a regionally significant impact should consider the regional context) and whether the proponent can reasonably acquire, control, or otherwise have access to the alternative site (or the site is already owned by the proponent)” [CEQA Guidelines Section 15126.6(f)(1)].

Additionally, the No Project Alternative must be analyzed. The EIR must explain the rationale for selecting the alternatives to be discussed, identify those that were not carried forward because they were infeasible, and briefly explain why these were not carried forward. The “environmentally superior” alternative to the Project must be identified and discussed (see Section 5, Comparison of Alternatives). If the environmentally superior alternative is the No Project Alternative, the EIR must identify an additional “environmentally superior” choice among the other Project alternatives.

As presented below, a variety of alternatives to the Project were considered to determine potential alternatives which might produce fewer significant impacts, or reduce the severity of those significant impacts, than the proposed Project, including the No Project Alternative. Possible alternatives were assessed as to whether they would satisfy the following:

- The alternative is technically feasible;
- The alternative would avoid or substantially lessen any of the significant impacts of the proposed Project; and
- The alternative would attain most of the basic proposed Project objectives defined in Section 1.3.

Alternatives considered included the No Project Alternative and those associated with a revised configuration of the solar and BESS facility. The No Project Alternative and other alternatives carried forward for evaluation in Section 5.1 are presented in Section 2.8. An alternative comparison is provided in Section 5.2. Alternatives considered, but not carried forward for further analysis are presented in Section 2.9.

5.2. Alternatives Analyzed in Detail

5.2.1. Summary of Alternatives

This section includes detailed evaluations of the following action alternatives and an evaluation of a No Project Alternative, as required under CEQA.

- **No Project Alternatives A1, A2, and A3.** Under the No Project Alternative, the construction of a solar generating facility and associated infrastructure would not occur. This alternative discusses existing conditions as well as what would be reasonably expected to occur in the foreseeable future if the Project was not approved and does not take place. Three scenarios are considered: a no build alternative

(A1) and development of uses allowed by right within the existing zoning and land designations (A2), and development of other renewable energy within the existing zoning and land designations (A3).

- **Alternative B:** Reduced Footprint Alternative. Under the Reduced Footprint Alternative, the Project would be similar to the proposed Project but would move the onsite substation and BESS and would remove approximately 50 acres of solar panels closest to the community of Lake Tamarisk, such that the solar panels, substation, and BESS would be farther from the community of Lake Tamarisk compared to the proposed Project. The electrical output and energy storage capacity would be reduced by up to 10 MW compared to the proposed Project.
- **Alternative C:** Further Reduced Footprint Alternative with Berms. Alternative C would include a greater than one-mile buffer around the community of Lake Tamarisk, installation of 2 earthen berms, and relocation of the substation, BESS, and O&M building.
- **Alternative D:** Offsite Alternative. Under the Offsite Alternative, the Project would be constructed on BLM-administered lands located east of State Route 177/Rice Road. These alternative parcels were included in the Applicant's original development application to BLM.
- **Alternative E:** Distributed Commercial and Industrial Rooftop Solar Alternative. A Distributed Solar Alternative would consist of PV panels that would absorb solar radiation and convert it directly to electricity. The PV panels could be installed on residential, commercial, or industrial building rooftops, parking lots or areas adjacent to existing structures such as substations. To create a viable alternative to the proposed Project, there would have to be sufficient newly installed panels to generate up to 400 MW of capacity, which would be similar in size to the proposed Project.

5.2.2. No Project Alternative A1: No Build Alternative – Impact Analysis

5.2.2.1. Aesthetics

The ~~No Project-Build~~ Alternative would not develop the solar facility and gen-tie line or require new construction and/or operational activities. It would not conflict with any existing or future land use plans or zoning, nor would it conflict with the applicable VRM Class IV management objective, which allows for a high level of visual change. The ~~No Project-Build~~ Alternative would avoid the significant visual impacts that would occur along I-10 and SR-177, at Alligator Rock ACEC, and at Lake Tamarisk Desert Resort as documented in the analyses for KOPs 1 through 6. Therefore, the ~~No Project-Build~~ Alternative would not cause direct, indirect, or cumulative impacts to aesthetics.

5.2.2.2. Agriculture and Forestry

The ~~No Project-Build~~ Alternative would not result in any new construction and/or operational activities or any new associated ground-disturbing activities. The ~~No Project-Build~~ Alternative would not conflict with any agricultural activities or agricultural land. Therefore, the ~~No Project-Build~~ Alternative would not have direct, indirect, or cumulative impacts on agriculture and forestry resources. ~~Under the No Project Alternative, it is probable that other solar energy related projects would be implemented within the site in lieu of the proposed Project in the near or distant future. A different solar energy project would potentially result in similar impacts to those identified for the proposed Project. Under the No Project-Build Alternative, cancellation of the Williamson Act contract would not be required and the lands would no longer be under contract in 9 years from non-renewal due to recent filing of non-renewal notices. They could be available for solar development in the future, and they would be allowed within the current A-1 zoning for the subject parcels.~~

5.2.2.3. Air Quality

The No ~~Project-Build~~ Alternative would not result in any new construction and/or operational activities or any new associated ground-disturbing activities (solar panel installation, substation and O&M building, and construction of access roads and gen-tie line). The No ~~Project-Build~~ Alternative would cause no sources of air pollutant emissions from development activities. Accordingly, the No ~~Project-Build~~ Alternative would represent no change to the environmental setting. Because no new air pollutant emissions would occur with the No ~~Project-Build~~ Alternative, this alternative would have no direct, indirect, or cumulative impact related to air quality.

~~Under the No Project Alternative, it is probable that other solar energy-related projects would be implemented within the site in lieu of the proposed Project. A different solar energy project would potentially result in similar air quality impacts as those identified for the proposed Project.~~

5.2.2.4. Biological Resources

Under the No ~~Project-Build~~ Alternative, no construction or O&M would occur and there would be no Project-related impacts to biological resources. Vegetation, including special-status plants and sensitive communities, would not be removed, existing habitat areas would persist, and wildlife would not be displaced. Special-status species would not be impacted. Disturbance, injury, and mortality of wildlife would not occur as a result of Project activities. Wildlife movement within the Project area would not be limited; however, solar development in the vicinity of the Project area would continue through other projects and wildlife movement may still be affected within the DFA (see Tables 3.1-1 and 3.1-2, as well as Figure 2-4 in Appendix A).

5.2.2.5. Cultural and Tribal Cultural Resources

Under the No ~~Project-Build~~ Alternative, the Project would not be constructed so there would be no impact to historical or tribal cultural resources. ~~Other projects or linear facilities could potentially be developed at this location, because it is located on land designated as a DRECP Development Focus Area (DFA), but any future project(s) would be evaluated under separate CEQA and/or NEPA analyses.~~

5.2.2.6. Energy

The No ~~Project-Build~~ Alternative would not result in any new construction or new operational activities. Therefore, the No ~~Project-Build~~ Alternative would not affect energy resources in the Project area. However, the No ~~Project-Build~~ Alternative would also not contribute to meeting California's renewable energy goals and would not provide the renewable benefits of the Project. The No ~~Project-Build~~ Alternative would have no direct, indirect, or cumulative effect on energy resources, while the proposed Project would have adverse impacts related to energy that are less than significant, while generating beneficial renewable energy.

~~Under the No Project Alternative, it is probable that other solar energy-related projects would be implemented within the site in lieu of the proposed Project in order to fulfill State mandates for renewable energy. A different solar energy project would potentially result in similar impacts to energy resources as those identified for the proposed Project, although those impacts would vary based on location and the specific characteristics of another solar project proposal.~~

5.2.2.7. Geology, Soils, and Mineral Resources

The No ~~Project-Build~~ Alternative would not result in the development of the solar facility and gen-tie line nor require new construction and/or operational activities, as described in Section 2.8. As such, the envi-

ronmental impacts associated with the proposed Project, as described in Section 3.8.5, would not occur. The No ~~Project-Build~~ Alternative would not result in any ~~direct, or indirect, or cumulative~~ impacts to or related to geologic and seismic hazards, soils, or mineral resources. Therefore, the No ~~Project-Build~~ Alternative would not have impacts related to geology, soils, or mineral resources.

5.2.2.8. Greenhouse Gas Emissions

The No ~~Project-Build~~ Alternative would not result in any new construction and/or operational activities or any new associated ground-disturbing activities (solar panel installation, substation and O&M building, and construction of access roads and gen-tie line). The No ~~Project-Build~~ Alternative would cause no ~~direct, or indirect, or cumulative~~ emissions of GHG from development activities. No additional production of renewable power would occur, and there would be no new potential to displace fuel-burning by California's fossil fueled generating resources or electricity otherwise imported to California. Accordingly, the No ~~Project-Build~~ Alternative would also not contribute to meeting California's renewable energy goals. Because no new GHG emissions would occur with the No ~~Project-Build~~ Alternative, this alternative would have no impact related to GHG emissions.

5.2.2.9. Hazards and Hazardous Materials

The No ~~Project-Build~~ Alternative would not result in the development of the solar facility and gen-tie line nor require new construction and/or operational activities, as described in Section 2.8. As such, the direct, indirect, or cumulative environmental impacts associated with the proposed Project, as described in Section 3.10.5, would not occur. The No ~~Project-Build~~ Alternative would not result in any direct or indirect impacts related to hazardous materials, environmental contamination, triggering wildland fires, or aviation hazards. Therefore, the No ~~Project-Build~~ Alternative would not have impacts related to hazards and hazardous materials.

5.2.2.10. Hydrology and Water Quality

There would be no construction under the No ~~Project-Build~~ alternative. Therefore, no direct, indirect, or cumulative impacts to hydrology and water quality would result. The area's water quality would remain in the existing condition, as would flood patterns. There would be no potential for increasing flood potential either on-site or off-site. By comparison, the proposed Project would result in impacts that would be less than significant with mitigation.

5.2.2.11. Land Use and Planning

Under the No ~~Project-Build~~ Alternative, the Applicant would not develop the solar facility and gen-tie line nor require new construction and/or operational activities associated with such a facility. This alternative would not conflict with any existing or known future land use plans or zoning. Therefore, ~~as with the proposed Project,~~ the No ~~Project-Build~~ Alternative would not have direct, indirect, or cumulative significant impacts related to land use.

5.2.2.12. Noise and Vibration

The No ~~Project-Build~~ Alternative would not result in any new construction and/or operational activities or any new associated ground-disturbing activities (solar panel installation, substation and O&M building, and construction of access roads and gen-tie line). The No ~~Project-Build~~ Alternative would cause no new noise sources or noise-generating activities. Accordingly, the No ~~Project-Build~~ Alternative would represent no change to the environmental setting. Because no new sources of noise or vibration would occur with

the No ~~Project-Build~~ Alternative, this alternative would have no direct, indirect, or cumulative impact related to noise and vibration.

5.2.2.13. Paleontological Resources

The No ~~Project-Build~~ Alternative would not result in the development of the solar facility and gen-tie line nor require new construction and/or operational activities, as described in Section 2.8. As such, the environmental impacts associated with the proposed Project, as described in Section 3.14, would not occur. The No ~~Project-Build~~ Alternative would not result in any direct or indirect impacts to paleontological resources. Therefore, the No ~~Project-Build~~ Alternative would not have direct, indirect, or cumulative impacts related to paleontological resources.

5.2.2.14. Population and Housing

The No ~~Project-Build~~ Alternative would not result in any new construction and/or operational activities or any new associated ground-disturbing activities (solar panel installation, substation and O&M building, and construction of access roads and gen-tie line). The No ~~Project-Build~~ Alternative would not affect population growth or demand for additional housing in the Project area. Therefore, the No ~~Project-Build~~ Alternative would not have direct, indirect, or cumulative impacts to population and housing, while the proposed Project would have impacts that are less than significant to these resources.

5.2.2.15. Public Services and Utilities

The No ~~Project-Build~~ Alternative would not result in any new construction and/or operational activities or any new associated ground-disturbing activities (solar panel installation, BESS, and O&M building, and construction of access roads and gen-tie line). The No ~~Project-Build~~ Alternative would not ~~impact population growth or demand~~ require additional for additional housing in the Project area and therefore would not put any strain on the availability and performance of government facilities, including fire protection, police protection, schools, parks, medical facilities, and libraries. In addition, the No ~~Project-Build~~ Alternative would not require new storm water drainage facilities or expansion of existing facilities. The No ~~Project-Build~~ Alternative would not result in direct, indirect, or cumulative impacts to public services and utilities, while the proposed Project would have impacts to these resources that are less than significant.

5.2.2.16. Recreation

The No ~~Project-Build~~ Alternative would not result in the development of the solar facility and gen-tie line nor require new construction and/or operational activities. It would not result in any direct or indirect impacts to recreation and would not result in the closure or isolation of designated Open Routes on BLM-administered land. Therefore, the No ~~Project-Build~~ Alternative would not have direct, indirect, or cumulative impacts to recreation.

5.2.2.17. Traffic and Transportation

The transportation and traffic impacts associated with the proposed Project would not occur under the No ~~Project-Build~~ Alternative A1. Under this alternative there would be no ~~direct, or indirect, or cumulative~~ impacts associated with temporary vehicle trip generation, VMT, or temporary travel lane disruptions. There would be no physical features that could cause impacts to air navigation.

5.2.2.18. Wildfire

Under the No ~~Project-Build~~ Alternative, construction, operation, maintenance, and decommissioning of the proposed Project would not occur. Because construction would not occur, activities that could cause

a fire such as vehicles driving near vegetation, hot work, and storage and use of flammable materials would not occur at the Project site. The BESS, gen-tie line, power lines, and other electrical components would not be installed or operated, and thus, no potential electrical fires associated with such components could occur. The site would remain undeveloped, and public land within the site would remain an allocated DFA.

5.2.3. No Project Alternative A2: Uses Allowed by Right within Existing Land Designations – Impact Analysis

5.2.3.1. Aesthetics

Under No Project Alternative A2, construction, operation, maintenance, and decommissioning of the proposed project would not occur and the BLM-administered lands within the Project area would remain undeveloped and impacts would be as described under No Project Alternative A1 (No Build).

In the absence of the proposed Project and under the existing County zoning regulations, the private parcels in the Project area may be subject to an agricultural-related use and/or construction of scattered rural residences. In the context of the Lake Tamarisk community, existing rural residences, and existing solar facilities, the addition of one or more scattered rural residences would have less than significant direct, indirect, and cumulative impacts on aesthetics.

5.2.3.2. Agriculture and Forestry

Under No Project Alternative A2, construction, operation, maintenance, and decommissioning of the proposed project would not occur and the BLM-administered lands within the Project area would remain undeveloped and impacts would be as described under No Project Alternative A1 (No Build).

In the absence of the proposed Project and under the existing County zoning regulations, the private parcels in the Project area may be subject to an agricultural-related use and/or construction of a rural residence. An agricultural related use on the parcels under Williamson Act contracts would resolve any Williamson Act or agricultural preserve-related conflicts. Agriculture is also compatible with a family dwelling, so direct, indirect, and cumulative impacts to agriculture would be less than significant. There are no forestry resources on the proposed site or the surrounding area, so no impacts to forestry would occur.

5.2.3.3. Air Quality

Under No Project Alternative A2, construction, operation, maintenance, and decommissioning of the proposed project would not occur and the BLM-administered lands within the Project area would remain undeveloped and impacts would be as described under No Project Alternative A1 (No Build).

In the absence of the proposed Project and under the existing County zoning regulations, the private parcels in the Project area may be subject to an agricultural-related use and/or construction of a rural residence. The level of construction activities and ground disturbance, which could cause fugitive dust, would be much reduced compared to the proposed Project. Therefore, Alternative A2 would cause minor sources of air pollutant emissions from agriculture and/or residential development activities. Direct, indirect, and cumulative potential impacts to air quality would be less than significant.

5.2.3.4. Biological Resources

Under No Project Alternative A2, construction, operation, maintenance, and decommissioning of the proposed project would not occur and the BLM-administered lands within the Project area would remain undeveloped and impacts would be as described under No Project Alternative A1 (No Build).

In the absence of the proposed Project and under the existing County zoning regulations, the private parcels in the Project area may be subject to an agricultural-related use and/or construction of a rural residence. Agricultural use and residential development would not be subject to the Project mitigation measures designed to protect biological resources, but would be subject to laws designed to protect listed species. Because the private land parcels within the Project area are previously disturbed (low value habitat) and residential development would be subject to grading and building permit codes and regulations, impacts to biological resources under Alternative A2 would be less than significant.

5.2.3.5. Cultural and Tribal Cultural Resources

Under No Project Alternative A2, construction, operation, maintenance, and decommissioning of the proposed project would not occur and the BLM-administered lands within the Project area would remain undeveloped and impacts would be as described under No Project Alternative A1 (No Build).

In the absence of the proposed Project and under the existing County zoning regulations, the private parcels in the Project area may be subject to an agricultural-related use and/or construction of a rural residence.

While the level of ground disturbance on the private parcels would be reduced compared to the proposed Project, the Project site has the potential to contain previously unknown archaeological deposits that may underlie the ground surface. Agricultural use and residential development would not be subject to tribal consultation under Assembly Bill 52 nor the Project mitigation measures designed to protect cultural and Tribal Cultural Resources. Should buried archaeological deposits be uncovered during agricultural use or residential development, and should such resources qualify as historical resources under CEQA, they could be subject to significant impacts.

5.2.3.6. Energy

Alternative A2 would result in minimal new construction or new operational activities. Therefore, Alternative A2 would not significantly affect energy resources in the Project area. However, Alternative A2 would also not contribute to meeting California's renewable energy goals and would not provide the renewable benefits of the Project. Depending on the type and intensity of agricultural operations, Alternative A2 is expected to have minimal direct, indirect, or cumulative effect on energy resources, while the proposed Project would have adverse impacts related to energy that are less than significant, while generating beneficial renewable energy.

5.2.3.7. Geology, Soils, and Mineral Resources

Under No Project Alternative A2, construction, operation, maintenance, and decommissioning of the proposed project would not occur and the BLM-administered lands within the Project area would remain undeveloped and impacts would be as described under No Project Alternative A1 (No Build).

In the absence of the proposed Project and under the existing County zoning regulations, the private parcels in the Project area may be subject to an agricultural-related use and/or construction of rural residence(s). The level of ground disturbance compared to the Project would be much reduced under Alternative A2. Also, residential development is subject to County building codes and regulations as part of building and grading permits, which are designed to minimize impacts related to geology and soils. Direct, indirect, and cumulative impacts would be less than significant.

5.2.3.8. Greenhouse Gas Emissions

Under No Project Alternative A2, construction, operation, maintenance, and decommissioning of the proposed project would not occur and the BLM-administered lands within the Project area would remain undeveloped and impacts would be as described under No Project Alternative A1 (No Build).

In the absence of the proposed Project and under the existing County zoning regulations, the private parcels in the Project area may be subject to an agricultural-related use and/or construction of scattered rural residences, which would result in a much-reduced level of GHG emissions compared to construction of the Project. GHG emissions impacts under Alternative A2 would be less than significant.

However, no additional production of renewable power would occur, and there would be no new potential to displace fuel-burning by California's fossil fueled generating resources or electricity otherwise imported to California. Accordingly, the Alternative A2 would also not contribute to meeting California's renewable energy goals.

5.2.3.9. Hazards and Hazardous Materials

Under No Project Alternative A2, construction, operation, maintenance, and decommissioning of the proposed project would not occur and the BLM-administered lands within the Project area would remain undeveloped and impacts would be as described under No Project Alternative A1 (No Build).

In the absence of the proposed Project and under the existing County zoning regulations, the private parcels in the Project area may be subject to an agricultural-related use and/or construction of a rural residence. Residential construction would be permitted through compliance with local ordinances and permit requirements, no additional mitigation is assumed to be required. Permits would likely require some level of control of hazardous materials and post-installation inspections to ensure that site clean-up is completed. Potential impacts associated with soil contamination would increase compared to the proposed Project if herbicides and/or pesticides are used during agricultural operations.

5.2.3.10. Hydrology and Water Quality

Under No Project Alternative A2, construction, operation, maintenance, and decommissioning of the proposed project would not occur and the BLM-administered lands within the Project area would remain undeveloped and impacts would be as described under No Project Alternative A1 (No Build).

In the absence of the proposed Project and under the existing County zoning regulations, the private parcels in the Project area may be subject to an agricultural-related use and/or construction of rural residence(s). The level of groundwater usage and surface disturbance compared to construction of the Project would be much reduced under Alternative A2. Depending on the type and intensity of agricultural uses, operational water usage could be higher than with the proposed Project. Also, residential development is subject to County building codes and regulations as part of building and grading permits as well as California Drainage Law, which are designed to minimize impacts related to hydrology and water quality. Direct, Indirect, and cumulative potential impacts would be less than significant.

5.2.3.11. Land Use and Planning

Under No Project Alternative A2, construction, operation, maintenance, and decommissioning of the proposed project would not occur and the BLM-administered lands within the Project area would remain undeveloped and impacts would be as described under No Project Alternative A1 (No Build).

In the absence of the proposed Project and under the existing County zoning regulations, the private parcels in the Project area may be subject to an agricultural-related use and/or construction of a rural

residence. Agricultural use and residential development are allowed uses and thus consistent with current zoning as well as existing land use plans, policies, and regulations. Alternative A2 would not cause a significant direct, indirect, or cumulative impact due to a conflict with any land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect.

5.2.3.12. Noise and Vibration

Under No Project Alternative A2, construction, operation, maintenance, and decommissioning of the proposed project would not occur and the BLM-administered lands within the Project area would remain undeveloped and impacts would be as described under No Project Alternative A1 (No Build).

In the absence of the proposed Project and under the existing County zoning regulations, the private parcels in the Project area may be subject to an agricultural-related use and/or construction of a rural residence.

While noise related to agricultural use and scattered residential construction activities could impact sensitive receptors like residences, it is more likely that construction noise would not be noticeable as it would be required to comply with the County Noise Ordinance. The operational noise and vibration generated from these uses would be less than significant as well.

5.2.3.13. Paleontological Resources

Under No Project Alternative A2, construction, operation, maintenance, and decommissioning of the proposed project would not occur and the BLM-administered lands within the Project area would remain undeveloped and impacts would be as described under No Project Alternative A1 (No Build).

In the absence of the proposed Project and under the existing County zoning regulations, the private parcels in the Project area may be subject to an agricultural-related use and/or construction of rural residence(s). Agricultural use and residential development would not be subject to the Project mitigation measures designed to protect unknown paleontological resources and dictate fossil recovery. However, given past disturbance of the private parcels, it is unlikely that paleontological resources would be present onsite.

5.2.3.14. Population and Housing

Under No Project Alternative A2, construction, operation, maintenance, and decommissioning of the proposed project would not occur and the BLM-administered lands within the Project area would remain undeveloped and impacts would be as described under No Project Alternative A1 (No Build).

In the absence of the proposed Project and under the existing County zoning regulations, the private parcels in the Project area may be subject to an agricultural-related use and/or construction of rural residence(s). Construction of a few scatter rural residences under Alternative A2 would not affect population growth or demand for additional housing in the Project area. Therefore, Alternative A2 would not have direct, indirect, or cumulative impacts to population and housing.

5.2.3.15. Public Services and Utilities

Under No Project Alternative A2, construction, operation, maintenance, and decommissioning of the proposed project would not occur and the BLM-administered lands within the Project area would remain undeveloped and impacts would be as described under No Project Alternative A1 (No Build).

In the absence of the proposed Project and under the existing County zoning regulations, the private parcels in the Project area may be subject to an agricultural-related use and/or construction of scattered rural residence(s). Scattered development of single-family dwellings would not require additional govern-

ment facilities, including fire protection, police protection, schools, parks, medical facilities, and libraries. In addition, Alternative A2 would not require new storm water drainage facilities or expansion of existing facilities, and would not result in direct, indirect, or cumulative impacts to public services and utilities.

5.2.3.16. Recreation

Under No Project Alternative A2, construction, operation, maintenance, and decommissioning of the proposed project would not occur and the BLM-administered lands within the Project area would remain undeveloped and impacts would be as described under No Project Alternative A1 (No Build).

In the absence of the proposed Project and under the existing County zoning regulations, the private parcels in the Project area may be subject to an agricultural-related use and/or construction of a rural residence, which would not impact public recreational facilities or access.

5.2.3.17. Traffic and Transportation

Under No Project Alternative A2, construction, operation, maintenance, and decommissioning of the proposed project would not occur and the BLM-administered lands within the Project area would remain undeveloped and impacts would be as described under No Project Alternative A1 (No Build).

In the absence of the proposed Project and under the existing County zoning regulations, the private parcels in the Project area may be subject to an agricultural-related use and/or construction of a rural residence, which would have minimal direct, indirect, or cumulative impacts to traffic and transportation.

5.2.3.18. Wildfire

Under No Project Alternative A2, construction, operation, maintenance, and decommissioning of the proposed project would not occur and the BLM-administered lands within the Project area would remain undeveloped and impacts would be as described under No Project Alternative A1 (No Build).

In the absence of the proposed Project and under the existing County zoning regulations, the private parcels in the Project area may be subject to an agricultural-related use and/or construction of a rural residence. The potential risks associated with residential development are generally addressed in building codes and ordinances specific to fire safety and prevention, and the residual risk would be less than significant. The BESS, gen-tie line, power lines, and other electrical components would not be installed or operated, and thus, no potential electrical fires associated with such components could occur.

5.2.4. No Project Alternative A3: Other Renewable Energy Development within Existing Land Designations – Impact Analysis

5.2.4.1. Aesthetics

In Riverside County, BLM has designated some land under its jurisdiction at Desert Center and west and northwest of Blythe as DFA suitable for development of renewable energy projects. Under the No Project Alternative, the proposed Easley Project would not be developed. However, the DFA-designated land would remain available for development of other renewable energy projects, including a different solar project or, if conditions are suitable, a wind energy project or a geothermal energy project. Impacts to aesthetics from development of a different solar project would be similar to those identified for the Easley Project.

Visual impacts associated with a wind project would include the visual dominance of large wind turbine generators (towers and turbines) in excess of 400 feet tall, potential glint from turbine blades, required Federal Aviation Administration (FAA) obstruction lighting, and presence of on-site project facilities such

as a gen-tie line, a substation, a battery storage facility, access roads network between turbines, and an operations building.

Visual impacts related to a geothermal project include the presence of buildings and tanks, holding ponds, above ground pipe network, injection well heads, cooling towers or banks, and visible plumes.

The cumulative impacts would be significant when viewed by sensitive viewing populations along I-10 and SR-177, from nearby residences, from portions of Joshua Tree National Park, and in the surrounding mountains and wilderness. The alternative would make a considerable contribution to these visual impacts.

5.2.4.2. Agriculture and Forestry

In Riverside County, BLM has designated some land under its jurisdiction at Desert Center and west and northwest of Blythe as Development Focus Areas (DFAs) suitable for development of renewable energy projects, including solar, geothermal, or wind energy. The DFA lands are not currently used for agriculture or forestry and are not anticipated to be used for these uses. While development of facilities required for solar, wind, or geothermal projects may be primarily located on BLM-administered lands, development on the adjacent agricultural lands may also be required. If the Williamson Act parcels are developed for renewable energy, the cancellation of contracts would be required as it would be for the proposed Project, thereby resolving any Williamson Act or agricultural preserve-related conflicts. This would result in a less than significant impact, similar to the direct, indirect, and cumulative impact of the proposed Project.

5.2.4.3. Air Quality

In Riverside County, BLM has designated some land around Desert Center and west and northwest of Blythe as Development Focus Areas (DFAs) suitable for development of renewable energy projects. Under the No Project Alternative, the proposed Easley Project would not be developed. However, the DFA-designated land would remain available for development of other allowable renewable energy projects, including a different solar project or, if conditions are suitable, a wind energy project or a geothermal energy project. Impacts to air quality from development of a different solar project would be similar to those identified for the Easley Project.

Impacts to air quality associated with a wind project would include fugitive dust from development of turbine sites and access roads, and earthwork and grading need for installation of a gen-tie line, battery storage facility, and substation. Emissions would result from equipment operating during construction and from worker vehicles and material delivery vehicles.

Impacts related to construction of a geothermal project would be similar impacts to those of a wind or solar energy project. However, operational impacts of a geothermal project would be more severe due to continuous well drilling emissions, visible steam plumes from cooling towers, and from any vented or accidentally released gases from wells, piping, tanks, or ponds.

The cumulative air quality impacts of other renewable energy development would depend on the technology. Cumulative construction-phase emissions would not cause substantial long-term impacts, similar to those identified for the cumulative impacts of the Easley Project. Cumulative effects of operational emissions of other renewable energy development would also be similar to those identified for the Easley Project, except where the renewable technology could introduce new stationary sources of emissions. For example, geothermal project well drilling and vented emissions would be subject to SCAQMD permitting requirements, and these emissions sources would contribute to cumulative air quality impacts that would be worse than those identified for the Easley Project.

5.2.4.4. Biological Resources

In Riverside County, BLM has designated some land under its jurisdiction at Desert Center and west and northwest of Blythe as DFA suitable for development of renewable energy projects using solar, wind, or geothermal technology. Under the No Project Alternative, the proposed Easley Project would not be developed. However, the DFA-designated land would remain available for development of other renewable energy projects, including a different solar project or, if conditions are suitable, a wind energy project or a geothermal energy project. Impacts to biological resources from development of a different solar project would be similar to those identified for the Easley Project.

Biological resources impacts associated with a wind project would include the potential for significant impacts on birds and bats from striking the turbine blades. Similar to the proposed Project, there would be, loss of habitat and potential direct mortality from construction activities including grading and earthwork needed to install wind turbine generators, a gen-tie line, a substation, a battery storage facility, access roads network between turbines, and an operations building.

Biological impacts resulting from a geothermal project include construction of buildings and tanks, holding ponds, an above ground pipe network, injection well heads, and cooling towers or banks replacing existing habitat and vegetation. Above ground pipelines could disrupt the movement of wildlife species. Vibration and noise from operations may also disturb or displace species sensitive to these effects.

5.2.4.5. Cultural and Tribal Cultural Resources

BLM has designated some land around Desert Center and west and northwest of Blythe as Development Focus Areas (DFAs) suitable for development of renewable energy projects. Under the No Project Alternative, the proposed Easley Project would not be developed. However, the DFA-designated land would remain available for development of other renewable energy projects, including a different solar project or, if conditions are suitable, a wind energy project or a geothermal energy project. Impacts to cultural resources from development of a different solar project would be similar to those identified for the proposed Easley Project.

Cultural resource impacts resulting from a wind project would result from grading and earth work to install wind turbine generators, a gen-tie line, a substation, a battery storage facility, access roads network between turbines, and an operations building. These activities have the potential to affect known and unknown resources, and would be generally similar to those of the proposed Project.

Cultural resources impacts resulting from construction of a geothermal project would result from grading and earthwork to develop buildings and tanks, holding ponds, the above ground pipe network, injection well heads, and cooling towers or banks. These activities have the potential to affect known and unknown resources, and would be generally similar to those of the proposed Project.

5.2.4.6. Energy

BLM has designated some land around Desert Center and west and northwest of Blythe as Development Focus Areas (DFAs) suitable for development of renewable energy projects. Under the No Project Alternative A3, the proposed Easley Project would not be developed. However, the DFA-designated land would remain available for development of other renewable energy projects, including a different solar project or, if conditions are suitable, a wind energy project or a geothermal energy project. Impacts to energy use from development of a different solar project would be similar to those identified for the Easley Project.

Any renewable energy project developed on the DFA lands would provide power to the regional grid, thereby reducing the need for power to be generated using fossil fuels. Once in operation, a wind energy

project with associated storage and transmission facilities would be similar to a solar facility in terms of energy use by maintenance and operations staff. A geothermal facility is likely to have a large operating staff. No renewable energy facility is expected to be wasteful or inefficient in its consumption of energy and any energy required would be more than offset by the power generated by the facility.

5.2.4.7. Geology, Soils, and Mineral Resources

The proposed Project includes lands designated by BLM as DFAs, which are defined as being suitable for renewable energy development. In the absence of the proposed Project, another renewable energy generation project could be constructed on the Project site to meet the federal and state renewable energy generation goals. This could include a different solar project or, if conditions are favorable, a wind project or a geothermal project. Such a project would create construction and operational direct, indirect, and cumulative impacts related to geologic and seismic hazards, soils, and mineral resources similar to those of the proposed Project.

5.2.4.8. Greenhouse Gas Emissions

Under the No Project Alternative A3, it is probable that other solar-renewable energy-related projects would be implemented within the site in lieu of the proposed Project. A different solar energy project or a wind energy project would potentially likely result in similar direct, indirect, and cumulative impacts to GHG emissions as those identified for the proposed Project.

A geothermal energy project would likely have greater GHG emissions during operations because of the ongoing operational well drilling and venting of gases that may contain CO₂, which would increase GHG emissions. This impact would be offset by the amount GHG avoided by not relying on fossil-fuel generation to produce an amount of power equal to that generated by the geothermal project.

5.2.4.9. Hazards and Hazardous Materials

However, iThe BLM-administered lands in the Desert Center area are designated as Development Focus Areas (DFAs) in which solar, wind, or geothermal generation could be permitted. In the absence of the proposed Project or an alternative to the Project, the purposes and goals for renewable energy generation that would be met by the proposed Project (or an alternative) would not be achieved. As a result, it is possible that another, similar solar energy generation project would be constructed at the same site in the future to meet the state and federal renewable energy generation goals in the Desert Center area. Such a project would likely introduce similar impacts related to hazards and hazardous materials that would be introduced through the proposed Project or an alternative.

In the proposed Project is not approved or constructed, the land would could also be developed for other renewable energy projects. If conditions are suitable, a wind energy project or a geothermal energy project could be developed. Hazards and hazardous materials impacts from development of a wind energy project- would include use of solvents and other chemicals, as well as fuels, during construction and operation. Wind turbines would also pose a hazard to aircraft, such as those using the private Desert Center airport near SR-177, and military aircraft that follow training routes through the Desert Center area. In addition to creating physical obstructions, wind turbines can adversely affect radar.

The pPotential hazards and hazardous materials impacts associated with a geothermal energy project are more severe than those of the proposed Project. Geothermal processes include use of chemicals and fuels during construction and operation, potential release of hazardous materials and gases from pipe or tank leaks or venting, and land subsidence due to fluid withdrawals. Geothermal processes may use a closed-loop system that reinjects fluids and their contents into groundwater, or an open-loop system in which potential gas emissions can result, including hydrogen sulfide, carbon dioxide, ammonia, boron, and

methane. As a result, geothermal projects would have more severe direct, indirect, and cumulative impacts related to hazards and hazardous materials than the proposed Project.

5.2.4.10. Hydrology and Water Quality

BLM has designated some land under its jurisdiction at Desert Center as a Development Focus Area (DFA), suitable for development of renewable energy projects using solar, wind, or geothermal technologies. Under the No Project Alternative A3, the proposed Easley Project would not be developed, but the DFA-designated land would remain available for development of other renewable energy projects, including a different solar project or, if conditions are suitable, a wind energy project or a geothermal energy project. Impacts to hydrology from development of a different solar project would be similar to those identified for the Easley Project.

Impacts on hydrology and water quality associated with a wind project would be similar or less than for a solar project because less ground disturbance would be required and less water would be required for dust control.

Hydrology and water quality impacts from a geothermal project can include use of large quantities of water for well drilling and by cooling towers. Water consumption during operation of a geothermal facility depends on its technology and design but could be an ongoing high demand, much greater than that of the proposed Project. Impacts from geothermal generation would likely be significant and cumulatively considerable.

5.2.4.11. Land Use and Planning

Under this alternative, the proposed Easley Project would not be developed. However, the BLM land is designated for renewable energy development and it would remain available for use by other renewable energy projects. These projects may include a different solar project or, if conditions are suitable, a wind energy project or a geothermal energy project.

Impacts to land use and planning from development of a different solar project would be similar to those identified for the Easley Project.

A wind energy or geothermal energy project would have many components like those needed for a solar project, including a gen-tie line, a substation, a battery storage facility, access roads turbines, and an operations building. A wind project would disturb less land surface due to the spacing of wind generator towers. A geothermal project would create a major industrial presence in the Desert Center area, including the construction and use of steam turbines, tanks, cooling towers, and ponds. Both wind and geothermal generation facilities would be much more highly visible in the landscape, creating potential conflict with county policies relating to protection of scenic areas and vistas. Each of these facilities would have aspects that would affect land use and planning, such as the height and bulk of structures, the availability of water, and potential exposure of residents to disturbances like noise and pollutants, which may result in greater impacts than the proposed Project.

5.2.4.12. Noise and Vibration

Under the No Project Alternative A3, if the proposed Project is not approved or constructed, the BLM designation of a Development Focus Area may result in the development of other solar project or of wind or geothermal generation projects. ~~it is probable that other solar energy-related projects would be implemented within the site in lieu of the proposed Project.~~ A different solar energy project would potentially likely result in similar noise and vibration impacts as those identified for the proposed Project.

The DFA designation also allows development of wind energy or geothermal energy projects if developers determined that the resources are present for these technologies. Construction impacts of these technologies would be similar to those of the proposed Project, but operational impacts could be more severe. Wind turbine operation creates noise from the mechanical operations of the turbines as well as aerodynamic factors. These can be a nuisance or they may affect sleep. Geothermal projects are substantially noisier due to their industrial operation requirements. They would generate noise and vibration during well drilling, venting, and from the operation of facilities and equipment, such as fans in cooling towers and the use of pumps.

The cumulative noise impacts of other renewable energy development would depend on the technology. Cumulative construction-phase noise would not cause substantial long-term impacts, similar to those identified for the cumulative impacts of the Easley Project. Cumulative effects of operational noise from other renewable energy development would also be similar to those identified for the Easley Project, except where the renewable technology could introduce new industrial equipment such as geothermal project well drilling and venting. These noise sources would be subject to Riverside County noise limitations, but these additional sources would contribute to cumulative noise impacts that would be worse than those identified for the Easley Project.

5.2.4.13. Paleontological Resources

~~However, in the absence of the proposed Project or an alternative to the Project, the purposes and goals for renewable energy generation that would be met by the proposed Project (or an alternative) would not be achieved. As a result, Due to the BLM designation of much of its land in the Desert Center area as a Development Focus Area, the construction of solar, wind, or geothermal generation projects would be consistent with the land designation. Therefore, it is possible that another, similar energy generation project would be constructed in the future to meet the renewable energy generation goals in the Desert Center area. A solar project Such a project would likely introduce create similar impacts related to paleontological resources that as those of would be introduced through the proposed Project or an alternative.~~

Wind and geothermal renewable energy projects could also be located on the land now covered by the proposed Project if developers found resources to be available. Construction of these large-scale projects would have similar direct, indirect, and cumulative impacts to paleontological resources through ground disturbance as a solar project, as they would need foundations for structures (e.g., turbines, wells, cooling towers, etc.) and would require access roads, a gen-tie line, a BESS, and a substation.

5.2.4.14. Population and Housing

~~Under the No Project Alternative, the BLM's Development Focus Area (DFA) designation would allow it is probable that other solar energy-related projects would be implemented within the site in lieu of the proposed Project. A different solar energy project would potentially result in similar impacts to population and housing as those identified for the proposed Project.~~

The DFA would also allow development of wind or geothermal generation projects. These project types would likely have similar construction workforce needs as a solar project. Because of their mechanical needs, a geothermal projects would have a somewhat larger permanent workforce than a solar project, but not large enough to induce population growth. The direct, indirect, and cumulative impact would be less than significant.

5.2.4.15. Public Services and Utilities

~~Under the No Project Alternative, The existing BLM Development Focus Area (DFA) would allow solar, wind or geothermal generation in the Desert Center area. Therefore, it is probable that another solar~~

renewable energy-related project would be implemented within the site in lieu of the proposed Project. These generation technologies would result in direct, indirect, and cumulative impacts similar to those of the proposed Project to public services and utilities, and they would be less than significant. A different solar energy project would potentially result in similar impacts to public services and utilities as those identified for the proposed Project.

5.2.4.16. Recreation

BLM has designated much of the land under its jurisdiction at Desert Center as Development Focus Areas (DFAs) suitable for development of renewable energy projects using solar, wind, or geothermal technologies. Under the No Project Alternative A3, the proposed Easley Project would not be constructed. However, the land would remain available for other renewable energy projects, including a different solar project or, if conditions are suitable, a wind energy project or a geothermal energy project. Direct, indirect, and cumulative impacts to recreation from development of a different solar project would be similar to those identified for the Easley Project.

Recreation impacts associated with a wind project would include loss of access to lands required for project facilities and the wind generator turbines, with access limited for safety and security. These impacts would be similar to those of the proposed Project. For a geothermal project, similar access limitations would apply because of above ground pipelines and the need to secure facilities. However, the indirect effects of a geothermal generation facility, due to its industrial nature large mass, and operational noise and emissions, would have an increased level of impact compared with the proposed solar project.

5.2.4.17. Traffic and Transportation

Much of the proposed Project site is designated as a DFA and is suitable for solar-renewable energy generation, including solar, wind, or geothermal technologies. Under the No Project Alternative A3, it is probable possible that other solar energy-related projects would be implemented within the site in lieu of the proposed Project, because the demand for solar energy continues to increase for compliance with state and federal climate change goals, and the site offers excellent solar potential. A different solar energy project would potentially result in similar impacts to transportation and traffic as those identified for the proposed Project.

If a wind or geothermal energy project were to be constructed on the land, these would have similar direct, indirect, and cumulative impacts on traffic and transportation as the proposed Project, owing to the large workforce required for construction of facilities.

5.2.4.18. Wildfire

As such, if the The No Project Alternative A3 considers the potential for solar, wind, or geothermal generation projects to be constructed, because these technologies are consistent with the BLM Development Focus Area (DFA) designation.

Were selected, another solar project could be proposed in the same location and result in similar impacts. If a wind or geothermal project were to be developed on the DFA lands, they-it would require similar facilities industrial components as a solar project, including a BESS, a gen-tie line, a substation, and other electrical components. The construction of these components is would pose similar wildfire risks as a solar project.

5.2.5. **Alternative B: Reduced Footprint Alternative – Impact Analysis**

5.2.5.1. **Aesthetics**

The Lake Tamarisk Reduced Footprint Alternative would remove approximately 30-50 acres of solar panels closest to the Lake Tamarisk Desert Resort (LTDR) such that the nearest panels would be approximately 0.45 mile (2,350 feet) from the closest LTDR mobile home residence compared to approximately 750 feet under the proposed Project. In addition, the on-site substation and BESS would be moved approximately 0.7 mile to the northeast (farther away from the LTDR community). Also, with the relocation of the substation, the associated gen-tie line would extend approximately 0.8 mile farther northeast along the east side of SR-177 before spanning SR-177 to connect with the alternative substation location.

As a result of these changes in the Project layout under Alternative B2, the visual impacts on the resort would be reduced. Specifically, and as illustrated in the visual simulations presented in Figures 3.2-4C (KOP 3), 3.2-5C (KOP 4) and 3.2-8C (KOP 7), the closest arrays (to the immediate north and northeast of the resort) would be removed, and the remaining more distant arrays would be less visually prominent. The absence of these the northeast arrays is illustrated in the far-left portion of the Figure 3.2-5C (KOP 4) simulation. The absence of the north arrays is illustrated in the Figure 3.2-4C simulation and also in the Figure 3.2-8C (KOP 7) simulation, which shows that the remaining more distant arrays become even less noticeable given the presence of foreground to middleground vegetative screening. Also, the BESS, which previously appeared as a noticeable white, intermittent, linear feature along the valley floor to the east of the resort (see Figure 3.2-5B), but which was substantially screened by intervening vegetation, would now be relocated to the northeast away from the resort. Relocation of the BESS would eliminate visibility from KOP 4 and would result in minimal visibility from other viewing locations in the resort and would no longer be visible from KOP 4 and would have minimal visibility from other viewing locations in the resort due to screening by intervening vegetation and array panels. The BESS would still be visible from Alligator Rock (KOP 3) and SR-177 (no KOP in close enough proximity to view the relocated BESS).

The relocation of the substation to the northeast away from the resort would also reduce its visibility from the resort due to screening by intervening vegetation and solar panels as well as greater viewing distances (depending on viewing location within the resort). The relocation of the BESS (white in color) is apparent in a comparison of the KOP 3 Figures 3.2-4B (Project) and 3.2-4C (Alternative B). With the relocation of the substation, the gen-tie line would extend farther northeast along SR-177 resulting in the potential visibility of approximately seven additional structures that would not otherwise be visible with the proposed Project. However, the additional structures would: (a) be partially or completely screened from view by intervening vegetation; (b) be backdropped by the distant mountains such that they would not extend above the horizon (and thus, be less visually prominent); or (c) be seen at greater distance in the context of other utility poles along SR-177. Therefore, the additional gen-tie poles would not constitute visually significant features in the landscape as viewed from the Lake Tamarisk Desert Resort.

Although the visual impact on the resort would be reduced under Alternative B2, the overall Project visual impact would not be reduced to level that would be less than significant when viewed from the eastern portion of the resort (as illustrated in the KOP 4 simulation). Further, the visual impacts experienced at KOPs 1, 2, 3, 5, and 6, the other five representative KOPs, would also remain significant and unavoidable under Alternative B2. The line contrast that would be viewed from KOP 7 would be slightly reduced under Alternative B, and the resulting visual impact would remain less than significant.

In addition to the KOP 4 Figures 3.2-5A (Existing View) and 3.2-5C (Alternative B Simulation), both of which were based on imagery from December 2022 that was obtained with a 5.5-foot camera elevation (above the ground), an additional series of figures (Figures 3.2-5D and 3.2-5F in EIR Appendix I) was captured in October 2023 but with an 8-foot camera elevation (above the ground). As for the proposed Project, this slightly elevated view was obtained and evaluated because it was thought to be more

representative of the “porch-height” views that some of the private residences along the eastern resort perimeter experience. The Existing View image presented in Figure 3.2-5D captures essentially the same landscape features that are shown in the same frame of view presented in the original existing view presented in Figure 3.2-5A at a 5.5-foot camera elevation. However, the new Figure 3.2-5D was captured almost a year later following substantial rain events. As a result, some vegetation is noticeably greener, and some vegetation growth has occurred providing a very slight increase in screening in some portions of the image. Also, additional solar facilities have been installed in the landscape since the December 2022 set of images, which adds to the existing structural context.

~~Figure 3.2-5F presents a panoramic visual simulation of Alternative B2 as viewed with a camera height of 8 feet (i.e., approximate porch-height view). As with the proposed Project simulation, the Alternative B2 simulation illustrates an very slight increase in visibility of some project features due to the ability to “see over” some of the intervening screening vegetation with the elevated viewing perspective. However, in other cases, the increased camera (viewing) height has been offset somewhat by additional vegetation growth that has occurred over the past year. Similar to the proposed Project findings, the Alternative’s overall visual change captured by the two different camera (viewing) heights is similar to and the 8-foot-high viewing perspective would not change the overall impact conclusion. Although the KOP 4 viewpoint is considered reasonably the Project’s, and the 8-foot high viewing perspective would not change the overall impact conclusion. Although the KOP 4 viewpoint is considered representative of publicly available project views from the eastern portion of the resort, it is acknowledged that some public views and private residential views within the resort may be more or less visually affected by Alternative B2 due to the presence of lesser or greater vegetative screening.~~

The types of potential cumulative impacts would be as described for the proposed Project in Chapter 3 and would be significant when viewed by sensitive viewing populations along I-10 and SR-177, from nearby residences, from portions of JTNP, and in the surrounding mountains and wilderness. Like the proposed Project, the alternative would make a considerable contribution to these visual impacts.

5.2.5.2. Agriculture and Forestry

The ~~Lake Tamarisk~~Reduced Footprint Alternative (Alternative B2) would be located within the proposed Project application area. This alternative would be similar to the proposed Project but would remove approximately ~~30-50~~ acres of solar panels closest to the community of Lake Tamarisk. Under this alternative, the substation and BESS would be moved farther from Lake Tamarisk on either BLM-administered land or private land adjacent to SR-177/Rice Road. The location of the substation, portion of gen-tie line, and BESS under Alternative B2 would no longer be on land zoned as Agriculture or a parcel under a Williamson Act contract. The remaining Williamson Act lands of the proposed Project remain as part of Alternative ~~2B~~ and would need to be canceled and removed from agricultural preserves prior to Project development. Alternative B2 would have similar construction and operation activities as the proposed Project; ~~thereforetherefore~~, Alternative B2 would have similar impacts to agriculture ~~and forestry~~, which would remain less than significant and unavoidable. CEQA Appendix G places agriculture and forestry in one resource impact category. Since there are no forestry resources on the proposed site or the surrounding area, Alternative B would only affect agriculture as noted above.

The types of potential cumulative impacts would be as described for the proposed Project in Chapter 3, and the alternative’s contribution would not be cumulatively considerable.

5.2.5.3. Air Quality

Alternative B2 would remove approximately ~~30-50~~ acres of solar panels closest to the community of Lake Tamarisk. The reduction in acreage would increase the distances to sensitive receptors from the proposed Project sources of air pollutant emissions. The decrease in solar panel area would result in a slight decrease

in the potential for sensitive receptors to be exposed to emissions and pollutant concentrations near the existing community of LTDR when compared with the impacts of the proposed Project.

Alternative ~~B2~~ would reduce the emissions and pollutant concentrations levels experienced by sensitive receptors and reduce air quality impacts when compared to the proposed Project. Overall, the effects of Alternative ~~B2~~ would be slightly reduced from the proposed Project, and mitigation identified for the proposed Project would be the same ~~for~~ under this alternative.

The types of potential cumulative impacts would be as described for the proposed Project in Chapter 3, and the alternative's incremental contribution would not be cumulatively considerable.

5.2.5.4. Biological Resources

The ~~Lake Tamarisk~~ Reduced Footprint Alternative would remove approximately ~~30-50~~ acres of solar panels closest to the community of Lake Tamarisk. The onsite substation and BESS would be moved at least 0.7 miles to the northeast. The length of the 500 kV gen-tie line under the ~~Lake Tamarisk~~ Reduced Footprint Alternative would be approximately 0.8 miles longer than the proposed 500 kV gen-tie line. All other Project features would be the same as the proposed Project.

Impacts to biological resources would be qualitatively similar to the proposed Project, with ~~slightly~~ approximately 36 fewer acres of native habitat disturbance in desert scrub habitat near the Lake Tamarisk community. ~~Approximately 9 acres~~ Approximately 33.5 acres of desert pavement, 728.7 acres of desert dry wash woodland, and 962.8 of Sonoran creosote bush scrub, and a few occurrences of desert unicorn plant would be avoided on undeveloped lands by removing the solar panels closest to the community implementing the Reduced Footprint Alternative. The area where panels would be removed for this Alternative is also within relatively higher quality modeled desert tortoise habitat (see Figure 3.5-5 in EIR Appendix A). By avoiding an additional 36 acres of native habitat, the Reduced Footprint Alternative would result in slightly less impact to desert scrub communities and provide slightly greater opportunities for wildlife movement through the Project site than the proposed Project. A longer gen-tie line may result in relatively greater impact to birds due to collision and electrocution.

Mitigation Measures, as listed in Section 3.5.9, would be implemented and impact conclusions would be the same as for the proposed Project.

5.2.5.5. Cultural and Tribal Cultural Resources

Under this alternative, approximately ~~30-50~~ acres of land would be removed from development footprint in the area closest to the community of Lake Tamarisk and the length of the 500 kV gen-tie line would be extended 0.8 miles longer than the proposed Project. However, under the ~~Lake Tamarisk~~ Reduced Footprint Alternative, the number of CRHR eligible resources within the direct impact area would be the same as for the proposed Project, consisting of 3 archaeological resources, including P-33-023675 and the PTNCL and DTCCL historic districts. Results of the Phase I survey found no evidence of archaeological remains associated with any of these resources within the Project's direct impact area. As such, the direct impacts to cultural resources for this alternative would be the same as for the proposed Project.

Portions of the PTNCL, DTCCL, P-33-023675, and P-33-025150 are located within Alternative ~~2's B's~~ indirect impact area, similar to the proposed Project. Overall, the direct and indirect impacts of this alternative would be the same as the proposed Project and would be less than significant with mitigation implemented, as defined in Section 3.6. Therefore, the direct and indirect impacts of this alternative would be the same as the proposed Project, less than significant with mitigation implemented as defined above.

The types of potential cumulative impacts would be as described for the proposed Project in Chapter 3, and the alternative's contribution would be cumulatively considerable.

5.2.5.6. Energy

Alternative B2 would not result in any significant changes to the construction or operational activities as they relate to energy resources. Alternative B2 would remove approximately 30-50 acres of solar panels closest to the community of Lake Tamarisk. With this relatively small reduction in acreage, ~~neither the electrical output, nor consumption of energy resources, would not be appreciably reduced compared to the proposed Project.~~ However, the renewable energy generation capacity of the solar array field electrical output of in the Reduced Footprint Alternative would be up to 10 MW less than the proposed Project. The impacts of Alternative B2 would be similar to the proposed Project except for an up to 10 MW reduction of renewable energy generation.

The types of potential cumulative impacts would be as described for the proposed Project in Chapter 3, and the alternative's contribution would not be cumulatively considerable.

5.2.5.7. Geology, Soils, and Mineral Resources

Alternative 2-B would remove approximately 30-50 acres of solar panels closest to the Lake Tamarisk Desert Resort (LTDR) and relocate the onsite substation and BESS to a location 0.7 miles further north of the LTDR. This relocation of the onsite substation would result in the 500 kV gen-tie line for this alternative being approximately 0.8 miles longer than the proposed 500 kV gen-tie line. Despite the increased length of the gen-tie line, this alternative would lead to an overall decrease in ground disturbance due to the removal of solar panels. Operation of the project under Alternative 2B would be the same as for the proposed Project. Impacts related to slope stability, seismic hazards, expansive soils, mineral resources, topography, subsidence, and sand migration would be the same as for the proposed Project. Impacts related to disturbance of desert pavement would be approximately 9-6 fewer acres under Alternative 2B due to the decrease in ground disturbance northeast of the Lake Tamarisk Desert Resort. Impacts related to erosion would also be slightly decreased. Implementation of MM AQ-1, MM BIO-1, MM BIO-3, MM BIO-5, MM HWQ-1, and MM HWQ-5 would reduce any impacts to less than significant.

The types of potential cumulative impacts would be as described for the proposed Project in Chapter 3, and the alternative's contribution would not be cumulatively considerable.

5.2.5.8. Greenhouse Gas Emissions

Alternative B2 would not result in any significant changes to the construction or operational activities as they relate to GHG emissions. Alternative B2 would remove approximately 30-50 acres of solar panels closest to the community of Lake Tamarisk. With this relatively small reduction in acreage, the overall quantity of GHG emissions caused by construction activities would be slightly reduced. ~~–t~~The renewable energy generation capacity of the solar array field under Alternative B during lifetime operations would be up to 10 MW less than the proposed Project, resulting in a lesser quantity of electricity produced by the solar PV component. Because Alternative B would not change the capacity of the proposed BESS, the potential avoidance of GHG emissions would be the same as with the proposed Project. Other effects of the proposed Project on GHG emissions would not be appreciably changed compared to the proposed Project. The impacts of Alternative B2 would be similar to the proposed Project.

The types of potential cumulative impacts would be as described for the proposed Project in Chapter 3, and the alternative's contribution would not be cumulatively considerable.

5.2.5.9. Hazards and Hazardous Materials

Alternative B2 would remove approximately 30-50 acres of solar panels closest to the Lake Tamarisk Desert Resort and relocate the onsite substation and BESS to a location 0.7 miles further north of the

LTDR. This relocation of the onsite substation would result in the 500 kV gen-tie line for this alternative being approximately 0.8 miles longer than the proposed 500 kV gen-tie line. Construction and operation activities for Alternative ~~2B~~ would be the same as for the proposed Project. Impacts related to use and storage of hazardous materials, potential for spills or leaks of hazardous materials, and aviation hazards, would be the same as for the proposed Project and would be reduced to less than significant through compliance with local, State, and federal regulations.

The decrease in solar panel area would result in a slight decrease in construction activities and ground disturbance near the existing community of LTDR, resulting in a slight decrease in potential for wildland fires to impact the public, slightly decreased potential for exposure of the public to contracting Valley Fever, slightly decreased potential for workers and the public to be exposed to pesticides or herbicides, and slightly decreased potential for workers to encounter unexploded ordnance. These decreases would be slight and would be reduced to less than significant by implementing of the same mitigation measures as for the proposed Project (MM AQ-1, MM FIRE-1, MM HAZ-1, MM HAZ-2, MM HAZ-3), as appropriate, and compliance with applicable local, State, and federal regulations.

The types of potential cumulative impacts would be as described for the proposed Project in Chapter 3, and the alternative's contribution would not be cumulatively considerable.

5.2.5.10. Hydrology and Water Quality

The ~~Lake Tamarisk~~ Reduced Footprint Alternative would remove approximately ~~50~~ 30 acres of solar panels closest to the community of Lake Tamarisk. In addition, the onsite substation and BESS would be moved at least 0.7 miles to the northeast. The length of the 500 kV gen-tie line under the Reduced Footprint ~~Lake Tamarisk~~ Alternative would be approximately 0.8 miles longer than the proposed 500 kV gen-tie line. -All other Project features would be the same as the proposed Project. Surface water impacts would remain the same as for the proposed Project, but ~~slightly~~ reduced in magnitude due to the reduced Project footprint. The Reduced Footprint ~~Lake Tamarisk~~ Alternative would require the same mitigation measures to be implemented as would be required for the proposed Project, with the same impact significance. Therefore, because both the proposed Project and the Reduced Footprint Alternative ~~2~~ would result in less than significant impacts with adherence to all applicable regulations and mitigation measures, impacts related to hydrology and water quality from the Reduced Footprint Alternative ~~2~~ would be similar to those of the proposed Project.

~~The footprint of the proposed Project would be reduced by approximately 30 acres under the Lake Tamarisk Alternative; however, the corresponding reduction in estimated water demand for Project construction and operation is anticipated to be de minimis.~~

In June 2023, BLM issued a Proposed Rule to amend its existing ROW regulations, issued under authority of the Federal Land Policy and Management Act (FLPMA), and is considering issuing Right-of-Way (ROW) grants for durations of up to 50 years (BLM, 2023). To prepare for potential issuance of a 50-year ROW Grant by the BLM (outside of CEQA) and to determine whether there are sufficient supplies to sustain the Project, the Easley WSA conservatively extends the total projected period of the Project- to 52-years. For the purpose of the CVGB water budget (see GSI, 2024 Section 6) and predictive Project water demand impacts analysis (see GSI, 2024 Sections 5.4 and 7) presented herein, 52 years is equivalent to the projected total duration of the Project, including construction (20 months), operations (48 years), and decommissioning (20 months).⁴¹

⁴¹ Although the estimated Project construction period and decommissioning period described in the EIR Chapter 2 (Project Description) is 20 months, the water budgets (see GSI, 2024 Section 6) and Cone of Depression and Cumulative Drawdown Analysis (see GSI, 2024 Section 7), were developed in 1-year time steps, and therefore, assume the same overall water usage but over Project construction and decommissioning periods of 2 years.

The Project would use up to 1,000 AF during the planned 20-month construction period and up to 50 AFY during the Project's operational and decommissioning periods. The Project would use a total of approximately 3,500 AF over the assumed 52-year life of the Project. If the estimated water demand for the Project was used equally per acre (the Project is proposed on approximately 3,735 acres for the solar and BESS facility, plus 139-acre gen-tie line corridor), the Project would use approximately 0.27 AF per acre during construction and 0.01 AF per acre per year during the operational phase of the Project. Using the same AF per acre water use assumptions, the Reduced Footprint Alternative would require approximately 987 AF during the construction phase and 49 AFY during the operational phase of the Project. Therefore, due to the minimal reduction of groundwater use under the Reduced Footprint Alternative, the potential impacts on groundwater would be consistent with those discussed in Section 3.11 for the proposed Project. Assuming the equal water use per acre, the Lake Tamarisk Alternative would also require approximately 0.27 AF per acre during the construction phase and 0.01 AF per acre per year during the operational phase of the Project. Therefore, the potential impacts on groundwater under the Lake Tamarisk Alternative would be consistent with those discussed in Section 3.11.5 for the proposed Project.

The types of potential cumulative impacts would be as described for the proposed Project in Chapter 3, and the alternative's contribution would not be cumulatively considerable.

5.2.5.11. Land Use and Planning

The ~~Lake Tamarisk~~ Reduced Footprint Alternative would be developed within the proposed Project site and was developed in response to concerns expressed by the Lake Tamarisk community during scoping. The Alternative would be similar to the proposed Project but would remove approximately ~~350~~ acres of solar panels closest to the community of Lake Tamarisk, such that the closest solar panels to residential parcels would be 0.45 miles (2,350 feet) away. This would reduce land-use related impacts that might arise, such as loss of open space proximate to the community and moving construction disturbances farther from residences. ~~With this relatively small reduction in acreage, the electrical output would not be appreciably reduced compared to the proposed Project.~~ In addition, the onsite substation and BESS would be moved at least 0.7 mile to the northeast, on either BLM-administered land (Substation Alternative A) or private land (Substation Alternative B) closer to SR-177. The Applicant is in negotiations with all existing ROW holders, such as Metropolitan Water District and EDF Renewables, to ensure that there would be no conflicts with existing or proposed easements across the Easley Project site and gen-tie line ROW. At 7.5 miles, the length of the 500 kV gen-tie line under the ~~Lake Tamarisk~~ Reduced Footprint Alternative would be approximately 0.8 miles longer than the proposed 500 kV gen-tie line (6.7 miles).

As with the proposed Project, the ~~Lake Tamarisk~~ Reduced Footprint Alternative would not cause a significant impact due to a conflict with any land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect.

The types of potential cumulative impacts would be as described for the proposed Project in Chapter 3, and the alternative's contribution would not be cumulatively considerable.

5.2.5.12. Noise and Vibration

The ~~Lake Tamarisk~~ Reduced Footprint Alternative (Alternative B2) would remove approximately ~~5030~~ acres of solar panels closest to the community of Lake Tamarisk. The reduction in acreage would increase the distances to sensitive receptors from the proposed Project sources of noise and vibration. The decrease in solar panel area would result in a slight decrease in the potential for sensitive receptors to be exposed to noise and vibration near the existing community of LTDR when compared with the impacts of the proposed Project.

Alternative ~~2-B~~ would reduce the noise and vibration levels experienced by sensitive receptors and reduce the noise and vibration impacts when compared to the proposed Project. Overall, the effects of Alternative ~~2-B~~ would be slightly reduced from the proposed Project, and mitigation identified for the proposed Project would be the same for under this alternative.

The types of potential cumulative impacts would be as described for the proposed Project in Chapter 3, and the alternative's contribution would not be cumulatively considerable.

5.2.5.13. Paleontological Resources

Alternative ~~B2~~ would remove approximately ~~30-50~~ acres of solar panels closest to the Lake Tamarisk Desert Resort (LTDR) and relocate the onsite substation and BESS to a location 0.7 miles further north of the LTDR. This relocation of the onsite substation would result in the 500 kV gen-tie line for this alternative being approximately 0.8 miles longer than the proposed 500 kV gen-tie line. Despite the increased length of the gen-tie line, this alternative would lead to an overall decrease in ground disturbance due to the removal of solar panels. Operation of the project under Alternative ~~2-B~~ would be the same as for the proposed Project. Due to the decrease in ground disturbance, impacts related to damage or destruction of paleontological resources would be minimally less than for the proposed Project. Implementation of Mitigation Measures PR-1 through PR-4 would reduce potential adverse impacts on paleontological resources to a less-than-significant level.

The types of potential cumulative impacts would be as described for the proposed Project in Chapter 3, and the alternative's contribution would not be cumulatively considerable.

5.2.5.14. Population and Housing

The ~~Lake Tamarisk~~ Reduced Footprint Alternative would be similar to the proposed Project, but would remove approximately ~~30-50~~ acres of solar panels closest to the community of Lake Tamarisk, such that the Project solar panels would be approximately 0.45 miles (2,350 feet) from the closest residence compared to 750 feet under the proposed Project. The electrical output of the Alternative ~~B2~~ would not be appreciably reduced compared to the proposed Project. Alternative ~~B2~~ would have similar construction and operational activities as the proposed Project, and therefore, Alternative ~~B2~~ would have similar impacts to population and housing and impacts would be less than significant.

The types of potential cumulative impacts would be as described for the proposed Project in Chapter 3, and the alternative's contribution would not be cumulatively considerable.

5.2.5.15. Public Services and Utilities

The ~~Lake Tamarisk~~ Reduced Footprint Alternative would be similar to the proposed Project but would remove approximately ~~30-50~~ acres of solar panels closest to the community of Lake Tamarisk, such that the Project solar panels would be approximately 0.45 miles (2,350 feet) from the closest residence compared to 750 feet under the proposed Project. ~~The electrical output of the Alternative 2 would not be appreciably reduced compared to the proposed Project.~~ Alternative ~~B2~~ would have similar construction and operational activities as the proposed Project, and therefore, Alternative ~~B2~~ would have similar impacts to public services and utilities and impacts would be less than significant.

The types of potential cumulative impacts would be as described for the proposed Project in Chapter 3, and the alternative's contribution would not be cumulatively considerable.

5.2.5.16. Recreation

The ~~Lake Tamarisk~~Reduced Footprint Alternative would be similar to the proposed Project but would remove approximately ~~30-50~~ acres of solar panels closest to the community of Lake Tamarisk and move the substation and BESS to the northeast, on either BLM-administered land (Substation ~~Alternative Option A~~) or private land (Substation ~~Alternative Option B~~) closer to SR-177. The impact on BLM Open Routes would be the same as under the proposed Project and Alternative B2 (~~Lake Tamarisk Reduced Footprint~~ Alternative). Approximately ~~30-50~~ acres of solar panels closest to the community of Lake Tamarisk would be fenced under the proposed Project, but would be removed from development under Alternative B2, and thus, would remain open and available for informal recreational use. As with the proposed Project, the ~~Lake Tamarisk Reduced Footprint~~ Alternative would cause a less than significant impact to designated recreation areas or recreation facilities. The types of potential cumulative impacts would be as described for the proposed Project in Chapter 3, and the alternative's contribution would not be cumulatively considerable.

5.2.5.17. Traffic and Transportation

Under this alternative, approximately ~~30-50~~ acres of solar panels closest to the community of Lake Tamarisk would be removed from the Project and the location of some facilities moved farther from Lake Tamarisk. However, there would be no substantial change to the size of the solar facility proposed to be constructed and operated. Under the Reduced Footprint~~Lake Tamarisk~~ Alternative, construction- and operations-related traffic would be similar to that anticipated for the Project as proposed. Therefore, the traffic and transportation impacts for Alternative B2 would be virtually identical to those attributable to the proposed Project and require identical mitigation measures to ensure impacts to transportation and traffic would be reduced to less-than-significant levels. The types of potential cumulative impacts would be as described for the proposed Project in Chapter 3, and the alternative's contribution would not be cumulatively considerable.

5.2.5.18. Wildfire

Under the ~~Lake Tamarisk~~Reduced Footprint Alternative, approximately ~~30-50~~ acres of solar panels closest to the community of Lake Tamarisk would not be installed, and the onsite substation and proposed BESS would be moved at least 0.7 mile to the northeast farther away from the community of Lake Tamarisk. The slight reduction in solar panel area would result in a nominal decrease in construction activity, as construction would not occur in the approximately ~~30-50~~-acre area near the community of Lake Tamarisk. Thus, there would be a small decrease in fire hazards associated with installation of fewer solar panels, as construction duration and number of workers may be slightly reduced. ~~Although the solar panels would continue to be made of fire-resistant materials, the risk of fire spreading to the community of Lake Tamarisk would further decrease due to the increased distance from the community.~~

Likewise, the alternative substation and BESS options would be farther from the community of Lake Tamarisk but would result in similar construction impacts as the proposed Project, as the same construction activities and associated fire risks would still occur. During operations, the risk of a fire igniting at the substation or BESS and spreading to the community of Lake Tamarisk would decrease due to the increased distance from the community. Although a portion of the 500 kV gen-tie line would be slightly farther away from the community of Lake Tamarisk, the overall length would be approximately 0.8 mile longer than the gen-tie line under the proposed Project and would result in similar impacts as the proposed Project.

The types of potential cumulative impacts would be as described for the proposed Project in Chapter 3, and the alternative's contribution would not be cumulatively considerable.

5.2.6. Alternative C: Further Reduced Footprint Alternative with Berms– Impact Analysis

5.2.6.1. Aesthetics

Alternative C (see Figure 2-15) would reduce the Project developable footprint by 530 acres compared to the proposed Project, which is located immediately north and east of Lake Tamarisk Desert Resort and is intended to establish a greater than one-mile buffer around the resort. A second key element of this alternative would be the construction of two 10-foot-tall screening berms made of sand with a 1:1 slope and 20-feet across. The north berm would be positioned in an east-west direction north of the Resort and would generally parallel the existing drainage pattern in the area. The east berm would be positioned in a north-south direction at the east end of the one-mile buffer (see Figure 2-15).

Elimination of the arrays on BLM land immediately north and northeast of the Resort (affecting a greater than one-mile buffer) would substantially mitigate the significant aesthetics impacts that the northeast and east portions of the Lake Tamarisk Desert Resort would otherwise experience to a less than significant level, though the aesthetics impacts resulting from the gen-tie line would remain. The visual impact experienced along the northern perimeter of the resort (KOP 7) would be further reduced and would remain less than significant.

Elimination of those same solar arrays would reduce the aesthetics impacts on views from Alligator Rock ACEC, though not to a level that would be less than significant. However, the Further Reduced Footprint Alternative with Berms would not substantially mitigate the significant aesthetics impacts that would be experienced at other public viewing locations such as along SR-177.

Shifting the substation, BESS, and O&M building to a new location immediately adjacent to SR-177 (Rice Road) under this alternative would lessen the visual impact of the substation on views from the Lake Tamarisk Desert Resort due to the increased viewing distance. However, the visual contrast associated with the substation's structural complexity and industrial character would become highly visible in the immediate foreground of views from SR-177 (close proximity viewpoints), which in combination with the increased structural prominence of the additional gen-tie poles (a more circuitous gen-tie route would be required with substation relocation) would substantially increase Alternative C's aesthetic impacts on both northbound and southbound views from SR-177 compared to the Project.

The north berm would be effective in blocking views of solar arrays immediately north of the berm. Arrays extending east and west of the north berm would be substantially screened by intervening vegetation between the Lake Tamarisk Desert Resort and the arrays, as illustrated in the Alternative C simulation presented for KOP 7 in Figure 3.2-8D. The east berm would block views of some of the arrays immediately east of the berm, but the more distant arrays would remain visible depending on the presence of intervening vegetation between the Lake Tamarisk Desert Resort and the arrays. The east berm would also be effective in blocking the BESS and some of the lower components of the relocated substation, though the taller components would remain visible. At a viewing distance of just under two miles, however, it is not expected that the substation would substantially affect views from the Lake Tamarisk Desert Resort.

Taken in combination, Alternative C, with its buffer exclusion area, berm construction, and substation/BESS relocation would reduce the visual impact on views from the Lake Tamarisk Desert Resort to a level that would be less than significant, compared to the Project. However, Alternative C would increase the visual impact on close proximity views from SR-177 and would not, compared to the Project, reduce significant visual impacts on views from I-10 or Alligator Rock to a level that is less than significant, so visual impacts would remain significant and unavoidable from these viewpoints.

The types of potential cumulative impacts would be as described for the proposed Project in Chapter 3 and would be significant when viewed by sensitive viewing populations along I-10 and SR-177, from

nearby residences, from portions of JTNP, and in the surrounding mountains and wilderness. Alternative C would make a considerable contribution to these visual impacts.

5.2.6.2. Agriculture and Forestry

Alternative C would be located within the proposed Project application area. This alternative would be similar to the proposed Project but would reduce the developable footprint by approximately 530 acres compared to the proposed Project. Additionally, two berms would be constructed; one berm would be north of Lake Tamarisk and the other berm would be east of Lake Tamarisk. Neither berm would enter land zoned as agriculture or under a Williamson Act contract. Under this Alternative, the substation, BESS, and O&M building would be moved farther from Lake Tamarisk Desert Resort, northeast of the location under the proposed Project. The gen-tie line would extend from the western corner of the relocated substation area heading northwest then south along the eastern boundary of the Project to rejoin the Alternative B gen-tie line starting point. The location of the substation, portion of gen-tie line, and BESS under Alternative C would no longer be on land zoned as Agriculture or within a parcel under a Williamson Act contract. The remaining Williamson Act lands of the proposed Project remain as part of Alternative C and would need to be canceled and removed from agricultural preserves prior to Project development. Alternative C would have similar construction and operation activities as the proposed Project; therefore, Alternative C would have similar impacts to agriculture as the Project, which would remain less than significant.

CEQA Appendix G places agriculture and forestry in one resource impact category. Since there are no forestry resources on the proposed site or the surrounding area, Alternative B would only affect jojoba agriculture as noted above.

The types of potential cumulative impacts would be as described for the proposed Project in Chapter 3, and the alternative's contribution would not be cumulatively considerable.

5.2.6.3. Air Quality

Alternative C would remove approximately 530 acres from development, when compared to the Project. The reduction in acreage would increase the distances to sensitive receptors from the proposed Project sources of air pollutant emissions. The decrease in solar panel area would result in a slight decrease in the potential for sensitive receptors to be exposed to emissions and pollutant concentrations near the existing community of Lake Tamarisk when compared with the impacts of the proposed Project.

Alternative C would reduce the emissions and pollutant concentrations levels experienced by sensitive receptors and reduce air quality impacts when compared to the proposed Project. Overall, the effects of Alternative C would be reduced from the proposed Project, and mitigation identified for the proposed Project would be the same under this alternative.

The types of potential cumulative impacts would be as described for the proposed Project in Chapter 3, and the alternative's incremental contribution would not be cumulatively considerable.

5.2.6.4. Biological Resources

The Further Reduced Footprint Alternative with Berms would reduce the project developable footprint by 530 acres by removing proposed Project solar panels in a minimum 1-mile buffer surrounding the Lake Tamarisk community (development exclusion area). The Further Reduced Footprint Alternative with Berms would move the substation slightly farther northeast, along State Route 177/Rice Road, and proposes screening with berms at two locations to block views of the solar panels from the community. The length of the 500 kV gen-tie line under the Further Reduced Footprint Alternative with Berms would be 1.3 miles

longer than the proposed 500 kV gen-tie line. All other project features outside the development exclusion area (see Figure 2-15) would be the same as the proposed Project.

The berms are proposed to be constructed of sand, with dimensions 10 feet in height, 20 feet in depth, with a 1:1 slope. One berm would be positioned in an east-west orientation, approximately 1,060 feet long, north of Lake Tamarisk and generally parallel to the drainage pattern for the area. A rock riprap base may be constructed at the base of the berm to provide erosion protection. The second berm would be positioned to the east of the Lake Tamarisk community, approximately 2,920 feet long in a north-south orientation, extending to Rice Road. As necessary, drainage could be accommodated with metal culverts or gaps in the berm.

~~Impacts to biological resources would be qualitatively similar to those of the proposed Project, with 500 fewer acres of development and related habitat disturbance in a greater than 1-mile buffer surrounding the Lake Tamarisk community. Compared to the proposed Project, an additional approximately 10 acres of desert dry wash woodland and 6 acres of desert pavement would be avoided by removing the solar panels within the 1-mile buffer.~~

Approximately 1,227 acres of Sonoran creosote bush scrub, 738 acres of desert dry wash woodland, and 33.5 acres of desert pavement occur on the undeveloped lands within the buffer of the Further Reduced Footprint Alternative with Berms. Impacts to biological resources from construction and O&M activities would be qualitatively similar to those of the proposed Project, but Alternative C would disturb approximately 310 fewer acres of native habitat that is suitable desert tortoise habitat compared to the proposed Project, including reduced impacts to desert dry wash woodland by approximately 10 acres.

Impacts to habitat would still occur where the berms are built, and in any Project areas where fill from the berm is sourced.

The areas where panels would be excluded overlap with moderate to high quality desert tortoise habitat (0.4-0.7) (Nussear et al., 2009) and avoid areas where desert tortoise sign were found (See Figure 3.5-5 in Appendix A). However, the altered hydrology resulting from the berms could degrade desert tortoise habitat (Abella and Berry, 2016). Occurrences of desert unicorn plant, burrowing owls, active desert kit fox burrows, and burro deer would be avoided where development would be excluded. A longer gen-tie line may result in relatively greater impact to birds due to collision and electrocution.

~~By avoiding 530 acres of habitat compared to the proposed Project, the Further Reduced Footprint Alternative with Berms would provide more opportunities for wildlife movement through the Project site than the proposed Project. While generally the berms would be constructed adjacent to solar panel areas, which would be fenced and already pose a barrier to movement, 1:1 sloped berms would serve as an additional barrier to movement in the local area. By avoiding disturbance of 310 acres of native habitat compared to the proposed Project, the Further Reduced Footprint Alternative with Berms would provide greater opportunity for wildlife movement through the Project site and vicinity and a larger buffer for birds using Lake Tamarisk and the Pacific Flyway than the proposed Project. While generally the berms would be constructed adjacent to solar panel areas, which would be fenced and already pose a barrier to movement, 1:1 sloped berms would serve as an additional barrier to movement in the local area.~~

Mitigation Measures, as listed in Section 3.5, would be implemented and impact conclusions would be the same as for the proposed Project.

5.2.6.5. Cultural and Tribal Cultural Resources

Under this alternative, approximately 530 acres of land would be removed from development footprint compared to the Project in areas within a more than 1-mile buffer between the community of Lake Tamarisk and the proposed Project. Additionally, the alternative would result in the development of two 10-foot high, 20-foot long sand berms placed at the edges of the buffer to the east and north. However,

under Alternative C, the number of CRHR eligible resources within the direct impact area would be the same as for the proposed Project, consisting of 3 archaeological resources, including P-33-023675 and the PTNCL and DTCCL historic districts. Results of the Phase I survey found no evidence of archaeological remains associated with any of these resources within the Project's direct impact area. As such, the direct impacts to cultural resources for this alternative would be the same as for the proposed Project.

Portions of the PTNCL, DTCCL, P-33-023675, and P-33-025150 are located within Alternative C's indirect impact area, similar to the proposed Project. Overall, the direct and indirect impacts of this alternative would be the same as the proposed Project and would be less than significant with mitigation implemented, as defined in Section 3.6. Therefore, the direct and indirect impacts of this alternative would be the same as the proposed Project, less than significant with mitigation implemented as defined above.

The types of potential cumulative impacts would be as described for the proposed Project in Chapter 3, and the alternative's contribution would be cumulatively considerable.

5.2.6.6. Energy

Alternative C would not result in any significant changes to the construction or operational activities as they relate to Energy. Alternative C would reduce the overall quantity of energy consumed by construction activities, and the renewable energy generation capacity of the solar array field would be 300 to 320 MW, resulting in a lesser quantity of energy produced by the solar PV component. Because the Alternative C BESS relocation would not change the capacity of the proposed BESS, the amount of energy stored by the BESS would be the same as with the proposed Project. Other effects of the proposed Project on energy would not be appreciably changed compared to the proposed Project. The impacts of Alternative C would be similar to the proposed Project.

The types of potential cumulative impacts would be as described for the proposed Project in Chapter 3, and the alternative's contribution would not be cumulatively considerable.

5.2.6.7. Geology, Soils, and Mineral Resources

Alternative C includes a minimum 1-mile buffer setback from the Lake Tamarisk Desert Resort, two 10-foot-high earthen berms, and relocation of the onsite substation/BESS/O&M building and 500 kV gen-tie line. Alternative C would result in 530 acres that would not be developed as compared to the proposed Project and the gen-tie line being 1.3 to 1.45 miles longer than the proposed Project gen-tie line. Despite the addition of the earthen berms and longer gen-tie line, Alternative C would lead to a decrease in ground disturbance due to the large area of solar panels removed under this alternative. Operation of the project under Alternative C would be the same as described for the proposed Project in Section 3.8.

Impacts related to slope stability, seismic hazards, expansive soils, mineral resources, topography, sand migration, and subsidence would be the same as for the proposed Project. Impacts related to disturbance of desert pavement would be reduced due to the decrease disturbance of desert pavement (approximately 6 fewer acres of disturbed than for the proposed Project) with the decrease in ground disturbance northeast of the Lake Tamarisk Desert Resort. Impacts related to erosion would potentially be increased due to disruption of flow paths due to the presence of the berms, however due to the decrease in area disturbed due to the removal of a large solar panel development area, erosion impacts would be overall reduced. Implementation of MM AQ-1, MM BIO-1, MM BIO-3, MM BIO-5, MM HWQ-1, and MM HWQ-5 would reduce any impacts to less than significant.

The types of potential cumulative impacts would be as described for the proposed Project in Chapter 3, and the alternative's contribution would not be cumulatively considerable.

5.2.6.8. Greenhouse Gas Emissions

Alternative C would not result in any significant changes to the construction or operational activities as they relate to GHG emissions. Alternative C would remove approximately 530 acres from development, when compared to the proposed Project. With this reduction in acreage, the overall quantity of GHG emissions caused by construction activities would be reduced. The renewable energy generation capacity of the solar array field under Alternative C would be reduced by approximately 80 to 110 MW compared to the proposed Project, to result in a generation capacity for this alternative of 300 to 320 MW, resulting in a lesser quantity of electricity produced by the solar PV component compared to the Project. Because Alternative C would not change the capacity of the proposed BESS, the potential avoidance of GHG emissions would be the same as with the proposed Project. Other effects of the proposed Project on GHG emissions would be less compared to the proposed Project.

The types of potential cumulative impacts would be as described for the proposed Project in Chapter 3, and the alternative's contribution would not be cumulatively considerable.

5.2.6.9. Hazards and Hazardous Materials

Alternative C includes a minimum one-mile buffer from the Lake Tamarisk Resort borders, two 10-foot high by 20-foot-wide earthen berms, and relocation of the substation and a portion of the gen-tie line. Alternative C would reduce the project development area by approximately 530 acres as compared to the proposed Project, but would increase the length of 500 kV gen-tie line to 8.0 to 8.15 miles long, compared with 6.7 miles under the proposed Project and 7.5 miles under Alternative B. Construction and operation activities for Alternative C would be the same as for the proposed Project with the exception of the construction of the earthen berms. However, construction of the earthen berms would use similar types of construction equipment and construction practices as the proposed Project. Therefore, impacts related to use and storage of hazardous materials, potential for spills or leaks of hazardous materials, and aviation hazards, would be the same as for the proposed Project and would be reduced to less than significant through compliance with local, State, and federal regulations.

The decrease in solar panel area near to the Lake Tamarisk Desert Resort would result in a decrease in construction activities and ground disturbance near the existing community of Lake Tamarisk as compared to the proposed Project. This would result in decreases in potential for wildland fires to impact the public, potential for exposure of the public to contracting Valley Fever, potential for workers and the public to be exposed to pesticides or herbicides, and potential for workers to encounter unexploded ordnance. The potential for these impacts would be decreased as compared to the proposed Project- and would be reduced to less than significant by implementing of the same mitigation measures as for the proposed Project (MM AQ-1, MM FIRE-1, MM HAZ-1, MM HAZ-2, MM HAZ-3), as appropriate, and compliance with applicable local, State, and federal regulations.

The types of potential cumulative impacts would be as described for the proposed Project in Chapter 3, and the alternative's contribution would not be cumulatively considerable.

5.2.6.10. Hydrology and Water Quality

Alternative C would reduce the Project developable footprint by 530 acres compared to the proposed Project and include a Project setback from the Lake Tamarisk Community of more than 1 mile, the construction of two earthen berms, relocation of the onsite substation/BESS/O&M building, and rerouting of the gen-tie line. The Alternative C substation/BESS relocation would result in the 500 kV gen-tie line being 8.0 to 8.15 miles long, compared with 6.7 miles under the proposed Project. Installation of earthen berms would change stormwater flow on and offsite, which could adversely affect surface water flow on adjacent parcels (including and flooding of adjacent parcels) and could also alter vegetation patterns.

Other project features, such as the substation, buildings, access roads, and fences, also have the capacity to divert drainage.

Implementation of Mitigation Measure HWQ-5 (Project Drainage Plan) would require preparation of a drainage plan that demonstrates, among other things, adequate design to protect from flooding, erosion and scour, and to do so without adversely affecting adjacent property, inducing erosion, or concentrating or diverting flows. Any berms on the Project site also would be required to comply with MM HWQ-5.

The Westwood preliminary hydrology study shows that the westernmost berm is in an area of minimal and shallow flooding. This berm, which runs mostly parallel with the flow pattern, is unlikely to create a significant adverse flow diversion. The eastern berm is in line with one of the wide flood concentrations that could have depths of up to 1.5 feet. This berm is situated such that it would divert these flows to the north. However, the Westwood study shows that under existing conditions this flow is already mostly diverted to the north in the same manner a few hundred feet downstream of the berm location. The berm would therefore have little effect on drainage patterns as relates to other property. With implementation of MM-HWQ-5, design steps such as placing culverts under the berm to allow drainage through would be taken to reduce adverse impacts to a less-than-significant level.

The Alternative C gen-tie and substation locations are such that the proposed Project impact analysis applies to them as the drainage impacts.

Other Project features would be the same as the proposed Project. Surface water impacts would therefore remain the same as for the proposed Project, but reduced in magnitude due to the reduced Project footprint. The Further Reduced Footprint Alternative with Berms would require the same mitigation measures to be implemented as would be required for the proposed Project, with the same impact significance. Therefore, because both the proposed Project and Alternative C would result in less than significant impacts with adherence to all applicable regulations and mitigation measures, impacts related to hydrology and water quality from Alternative C would be similar to those of the proposed Project.

In June 2023, BLM issued a Proposed Rule to amend its existing ROW regulations, issued under authority of the Federal Land Policy and Management Act (FLPMA), and is considering issuing Right-of-Way (ROW) grants for durations of up to 50 years (BLM, 2023). To prepare for potential issuance of a 50-year ROW Grant by the BLM (outside of CEQA) and to determine whether there are sufficient supplies to sustain the Project, the Easley WSA conservatively extends the total projected period of the Project to 52-years. For the purpose of the CVGB water budget (see GSI, 2024 Section 6) and predictive Project water demand impacts analysis (see GSI, 2024 Sections 5.4 and 7) presented herein, 52 years is equivalent to the projected total duration of the Project, including construction (20 months), operations (48 years), and decommissioning (20 months).⁴²

The Project would use up to 1,000 AF of water during the planned 20-month construction period and up to 50 AFY during the Project's operational and decommissioning periods. The Project would use a total of approximately 3,500 AF over the assumed 52-year life of the Project. If the estimated water demand for the Project was used equally per acre (the Project solar and BESS facility site is proposed on approximately 3,735 acres), the Project would use approximately 0.27 AF per acre during construction and 0.01 AF per acre per year during the operational phase of the Project. Using the same AF per acre water use assumptions, Alternative C would require approximately 950 AF during the construction phase and 48 AFY during the operational phase of the Project. Therefore, due to the minimal reduction of groundwater use

⁴² Although the estimated Project construction period and decommissioning period described in the EIR Chapter 2 (Project Description) is 20 months, the water budgets (see GSI, 2024 Section 6) and Cone of Depression and Cumulative Drawdown Analysis (see GSI, 2024 Section 7), were developed in 1-year time steps, and therefore, assume the same overall water usage but over Project construction and decommissioning periods of 2 years.

under Alternative C, the potential impacts on groundwater would be consistent with those discussed in Section 3.11 for the proposed Project.

The types of potential cumulative impacts would be as described for the proposed Project in Chapter 3, and the alternative's contribution would not be cumulatively considerable.

5.2.6.11. Land Use and Planning

Alternative C would reduce the developable footprint of the Project by approximately 530 acres compared to the Project to allow establishment of a buffer between the Project and the Lake Tamarisk community. (See Figure 2-15) This alternative would also install two 10-foot-high berms along portions of the buffer boundary to shield views from Lake Tamarisk of some Project components. One berm would be at the northern edge of the buffer, adjacent to a planned solar array north of the buffer. The second berm would be on the eastern edge of the buffer, adjacent to a planned solar array east of the buffer. The berms would reduce visibility of some Project arrays and facilities for residents at Lake Tamarisk, as would the relocated substation, BESS, and O&M building. This would reduce land-use related impacts that might arise, such as loss of open space proximate to the community and would move construction disturbances farther from residences.

As with the proposed Project, the Further Reduced Footprint Alternative with Berms would not cause a significant impact due to a conflict with any land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect.

The types of potential cumulative impacts would be as described for the proposed Project in Chapter 3, and the alternative's contribution would not be cumulatively considerable.

5.2.6.12. Noise and Vibration

Alternative C would remove approximately 530 acres from development, when compared to the Project. While acreage would be reduced, additional construction noise would occur with the installation of earthen berms in this alternative. The reduction in acreage would increase the distances to sensitive receptors from the proposed Project sources of noise and vibration. The decrease in solar panel area would result in a slight decrease in the potential for sensitive receptors to be exposed to noise and vibration near the existing community of Lake Tamarisk Desert Resort when compared with the impacts of the proposed Project. Given the distances between the Lake Tamarisk Desert Resort community and earthen berms in this alternative, the berms could provide a minor level shielding or reflection of sound propagation between Project sources and receivers.

Alternative C would reduce the noise and vibration levels experienced by sensitive receptors and reduce the noise and vibration impacts when compared to the proposed Project. Overall, the effects of Alternative C would be reduced from the proposed Project, and mitigation identified for the proposed Project would be the same for under this alternative.

The types of potential cumulative impacts would be as described for the proposed Project in Chapter 3, and the alternative's contribution would not be cumulatively considerable.

5.2.6.13. Paleontological Resources

Alternative C includes a minimum 1-mile buffer setback from the Lake Tamarisk Desert Resort, two 10-foot-high earthen berms, and relocation of the onsite substation/BESS and 500 kV gen-tie line. Alternative C would result in 530 acres that would not be developed as compared to the proposed Project. The partially relocated 500 kV gen-tie line would be more than 0.5 mile longer than the proposed Project gen-tie line. Despite the addition of the earthen berms, Alternative C would lead to a decrease in ground

disturbance due to the large area of solar panels removed under this alternative. Operation of the project under Alternative C would be the same as for the proposed Project. Due to the decrease in ground disturbance, impacts related to damage or destruction of paleontological resources would be minimally less than for the proposed Project. Implementation of Mitigation Measures PR-1 through PR-4 would reduce potential adverse impacts on paleontological resources to a less-than-significant level.

The types of potential cumulative impacts would be as described for the proposed Project in Chapter 3, and the alternative's contribution would not be cumulatively considerable.

5.2.6.14. Population and Housing

Alternative C would reduce the developable footprint of the Project by approximately 530 acres to allow establishment of a greater than 1-mile buffer between the Project and the Lake Tamarisk community (See Figure 2-15). This alternative would also install two 10-foot-high berms along portions of the buffer boundary to shield views from Lake Tamarisk of some Project components. The Project substation and BESS would be relocated to lands by State Route 177 that would be developed with solar panels under the proposed Project. Alternative C would have similar construction and operational activities as the proposed Project, and therefore, Alternative C would have similar impacts to population and housing and impacts would be less than significant.

As with the proposed Project, the Further Reduced Footprint Alternative with Berms would not cause a significant impact due to directly or indirectly inducing substantial unplanned population growth.

The types of potential cumulative impacts would be as described for the proposed Project in Chapter 3, and the alternative's contribution would not be cumulatively considerable.

5.2.6.15. Public Services and Utilities

The Further Reduced Footprint Alternative with Berms would reduce the developable footprint of the Project by approximately 530 acres to allow establishment of a greater than 1-mile buffer between the Project and the Lake Tamarisk community (See Figure 2-15). This alternative would also install two 10-foot-high berms along portions of the buffer boundary to shield views from Lake Tamarisk of some Project components. The gen-tie line would be at least 1.3 to 1.45 miles longer than the proposed Project gen-tie line to connect to the relocated substation/BESS. As with the proposed Project, the Further Reduced Footprint Alternative with Berms would not cause a significant impact on public services and utilities.

Alternative C would have similar construction and operational activities as the proposed Project, and therefore, Alternative C would have similar impacts to public services and utilities, and impacts would be less than significant.

The types of potential cumulative impacts would be as described for the proposed Project in Chapter 3, and the alternative's contribution would not be cumulatively considerable.

5.2.6.16. Recreation

The Further Reduced Footprint Alternative with Berms would establish a buffer between the Project and the Lake Tamarisk community, thereby reducing the developable footprint of the Project by approximately 530 acres (see Figure 2-15 in Appendix A). The buffer would result in a large open space area around the community east of Kaiser Road. This alternative would also install two 10-foot-high berms along portions of the buffer boundary to shield views from Lake Tamarisk of some Project components. One berm would be at the northern edge of the buffer, adjacent to a solar array planned north of the buffer boundary. The second berm would be on the eastern edge of the buffer, adjacent to a planned solar array and BESS facility east of the buffer. The berms would reduce visibility of some Project arrays

and facilities for residents at Lake Tamarisk and recreational users accessing the buffer area. There are no designated BLM Open Routes (trails) within the buffer area. The Further Reduced Footprint Alternative with Berms would reduce recreation related impacts that might arise from Project development, such as the loss of open space proximate to the community. The alternative would move construction disturbances farther from residences. This would improve recreational access and use of the area as compared to the proposed Project, which would restrict access.

The types of potential cumulative impacts would be as described for the proposed Project in Chapter 3, and the alternative's contribution would not be cumulatively considerable.

5.2.6.17. Traffic and Transportation

The Further Reduced Footprint Alternative with Berms would remove approximately 530 acres from development around Lake Tamarisk to create a 1-mile buffer between the Project and the community. The balance of the proposed Project would be developed as planned. Access to areas to be developed under this alternative would be like access under the proposed Project. Vehicles and equipment would enter and exit the project site using Kaiser Road and SR-177 at ingress/egress points to be determined in consultation with Caltrans and Riverside County. Most traffic would use I-10 to reach the Project area. With a somewhat smaller project, the level of traffic would be slightly diminished. However, this would not be substantial and would likely be largely unnoticed by residents and users of these roads.

The types of potential cumulative impacts would be as described for the proposed Project in Chapter 3, and the alternative's contribution would not be cumulatively considerable.

5.2.6.18. Wildfire

The Further Reduced Footprint Alternative with Berms would establish a development exclusion area north and east of the community of Lake Tamarisk, reducing the Project's footprint by 530 acres. Two 10-foot-tall berms would be constructed on the northwest end and east end of the development exclusion area. Solar panels would not be constructed within the development exclusion area, and the substation and BESS would be moved northeast farther away from the community of Lake Tamarisk. Construction activities would not occur within the 500-acre exclusion area adjacent to the community of Lake Tamarisk; therefore, there would be a decrease in the risk of fire hazards associated with installation of fewer solar panels, as construction duration and number of workers would be reduced. The risk of fire spreading to the community of Lake Tamarisk would further decrease due to the increase distance between the Project site and the community. The gen-tie line would follow an alternative route and would preclude nearly 14 acres of solar panels along its 175-foot-wide right-of-way, which may result in increasing the ground cover ratio of solar panels, expanding the Project footprint, or reducing solar generation output.

The alternative substation and BESS would be farther from the community of Lake Tamarisk but would result in similar construction impacts as the proposed Project, as the same construction activities and associated fire risks would still occur. During operations, the risk of a fire igniting at the substation or BESS and spreading to the community of Lake Tamarisk would decrease due to the increased distance from the community. The gen-tie line under this alternative would be approximately 0.65 miles longer than that under the proposed Project. Therefore, the risk of fire hazards from operation of the longer gen-tie line may slightly increase.

The types of potential cumulative impacts would be as described for the proposed Project in Chapter 3, and the alternative's contribution would not be cumulatively considerable.

5.2.7. Alternative D: Offsite Alternative – Impact Analysis

5.2.7.1. Aesthetics

The Offsite Alternative would consist of approximately 4,620 acres and a gen-tie line connecting to the Oberon Switchyard or the Red Bluff Substation. As shown in Figure 2-16, this alternative would be located east and north of the existing Athos Project, north of the Clearway Arica and Clearway Victory Pass projects, and north of the Palen Project. Therefore, the Offsite Alternative's solar facilities and gen-tie line would be substantially obscured from view by other existing solar projects and, in the case of the gen-tie line if it connects into Red Bluff Substation, would be close to other gen-tie lines as it approaches I-10 to span the freeway and connect into Red Bluff Substation. As a result, the Offsite Alternative's visual impact on views from I-10 and SR-177 would be minimized. Equally important, with viewing distances ranging from approximately 4 to 10 miles, and several intervening existing solar projects and associated gen-tie lines, the Offsite Alternative would have minimal impacts on views from Lake Tamarisk Desert Resort. Therefore, in the context of the numerous existing solar facilities and gen-tie lines, the Offsite Alternative would cause adverse but less-than-significant visual effects.

The types of potential cumulative impacts would be as described for the proposed Project in Chapter 3, however, unlike the proposed Project, the alternative's contribution would not be cumulatively considerable. The Offsite Alternative would only contribute to cumulative impacts in northern views (Desert Lily Sanctuary). From at-grade views from the south, east, or west, it would have minimal impact due to screening by other solar projects and vegetation. Alternative D would contribute slightly to cumulative visual impacts when viewed from elevated views (Alligator Rock), but the incremental impacts would be less than significant and are not considered to be cumulatively considerable.

5.2.7.2. Agriculture and Forestry

The Offsite Alternative (Alternative D) would be located southeast of the proposed Project application area and would include a gen-tie line to connect to the existing Oberon Switchyard or SCE Red Bluff Substation. None of the facilities under Alternative D would be on land zoned as Agriculture or within a parcel under a Williamson Act contract. There would be no direct, indirect, or cumulative impact to agriculture and forestry under Alternative D.

5.2.7.3. Air Quality

Alternative D would locate project components, including solar panels, further east of the community of Lake Tamarisk Desert Resort. The alternative site would increase the distances to sensitive receptors from the proposed Project sources of air pollutant emissions. The increased separation would result in a slight decrease in the potential for sensitive receptors to be exposed to emissions and pollutant concentrations near the existing community of LTDR when compared with the impacts of the proposed Project. However, longer travel distances over unpaved roads to reach the alternative site would increase the risk of dust emissions from vehicles traveling on these routes. By retaining a similar development footprint, the construction phase and operational emissions of Alternative D would not be appreciably changed compared to the proposed Project.

Alternative D would reduce the pollutant concentrations experienced by sensitive receptors and reduce air quality impacts when compared to the proposed Project. Overall, the direct, indirect, and cumulative effects of Alternative D would be slightly reduced from the proposed Project, and mitigation identified for the proposed Project would be the same under this alternative.

The types of potential cumulative impacts would be as described for the proposed Project in Chapter 3, and the alternative's incremental contribution would not be cumulatively considerable.

5.2.7.4. Biological Resources

The Offsite Alternative is located 3 miles east of the proposed Project site, directly east of the Athos Solar Project and directly north of the Arica, Victory Pass, and Palen Solar Projects. This alternative is located on approximately 4,620 acres. A gen-tie line to the Oberon Switchyard or Red Bluff Substation would pass between the Athos and Victory Pass Solar Projects.

Construction activities and the resulting impacts to biological resources would be qualitatively similar to the proposed Project; however, much of the Offsite Alternative area is subject to biological constraints (Figure 3.5-11). Biological resources in the Offsite Alternative include desert dry wash woodland, Emory's crucifixion thorn, creosote bush rings, and occurrences of Harwood's eriastrum, which may be impacted by ground disturbance (Figure 3.5-11). Other rare plants, Harwood's wooly aster (*Eriastrum harwoodii*, CRPR 1B.2) and Harwood's milkvetch (*Astragalus insularis* var. *harwoodii*, CRPR 2B.2) have potential to occur.

The Offsite Alternative would be sited on BLM-administered public lands in a DFA and on private lands. The western portion of the Offsite Alternative Area would overlap with a BLM DRECP multi-species linkage area located north of the I-10 freeway. The Oberon, Athos, Arica, and Victory Pass solar projects also overlap some areas of the linkage. These projects were designed to maintain linkage connectivity function and associated habitat, as well as avoid desert dry wash woodlands, per BLM DRECP CMAs (e.g., CMAs LUPA-BIO-13, LUPA BIO IFS 2, LUPA-BIO-RIPWET-1, DFA-VPL-BIO-IFS-1), thereby helping to preserve habitat and linkage functionality for wildlife movement through these areas. Solar development in the linkage area under the Offsite Alternative area could contribute to fragmentation of habitat and restrict wildlife movement across the linkage. Similar to the proposed Project and other projects within the DFA, compliance with CMAs on BLM lands would restrict development in desert dry wash woodlands and a 200-foot buffer except for minor incursion, which would maintain a portion of the multi-species linkage in the area. Additionally, if wildlife-friendly fencing is installed within the linkage area, as is proposed on Easley and Oberon Projects, then wildlife-friendly fencing would allow desert tortoise movement throughout the area during operations.

The eastern half and northwestern portion of Offsite Alternative area supports active aeolian deposits, which are recognized as areas of higher biological value, and numerous Mojave fringe-toed lizards, which are a California species of special concern and BLM sensitive. Much of the Offsite Alternative area overlaps with the Mojave fringe-toed lizard species distribution model and impacts to this species would be significant. Construction in active aeolian sands would result in unstable soils and increased erosion throughout the Offsite Alternative area.

Several DRECP CMAs restrict development in aeolian sands on BLM-administered lands and require siting of projects in areas with least impact to sand dunes and associated species. Rare plants require a setback, creosote rings must be avoided, and desert dry wash woodlands require avoidance and setbacks. Mitigation Measures, as listed in Section 3.5.7, would be implemented to reduce impacts; however additional measures would be needed to address significant impacts to Mojave fringe-toed lizard and aeolian sands and it is unknown if mitigation is available to reduce impacts to a less than significant level; impacts may be significant and unavoidable.

5.2.7.5. Cultural and Tribal Cultural Resources

Under this alternative, an onsite substation would be constructed in the southern area of the site and an approximately 1 mile 500 kV gen-tie line would connect the onsite substation into the existing Oberon Switchyard or would connect directly into existing SCE Red Bluff Substation on the south side of Interstate 10 (approximately 1.8 miles). The gen-tie line would be at least 5 miles shorter than the gen-tie line under the proposed Project. However, under the Offsite Alternative, the number of CRHR eligible resources

within the direct impact area would be the same as for the proposed Project, consisting of 3 archaeological resources, including P-33-023675 and the PTNCL and DTCCL historic districts. Results of the Phase I survey found no evidence of archaeological remains associated with any of these resources within the Project's direct impact area. As such, the direct impacts to cultural resources for this alternative would be the same as for the proposed Project.

Portions of the PTNCL, DTCCL, P-33-023675, and P-33-025150 are located within Alternative D's indirect impact area, similar to the proposed Project. Overall, the direct and indirect impacts of this alternative would be the same as the proposed Project and would be less than significant with mitigation implemented, as defined in Section 3.6. Therefore, the direct and indirect impacts of this alternative would be the same as the proposed Project, less than significant with mitigation implemented as defined above.

The types of potential cumulative impacts would be as described for the proposed Project in Chapter 3, and the alternative's contribution would be cumulatively considerable.

5.2.7.6. Energy

Alternative D would not result in any significant changes to the construction or operational activities as they relate to energy. Because Alternative D would retain a renewable energy generation capacity of 400 MW and would not change the capacity of the proposed BESS, the quantity of electricity produced by the solar PV component and the amount of energy able to be stored would be the same as with the proposed Project. Other effects on energy would not be appreciably changed compared to the proposed Project. The impacts of Alternative D would be similar to the proposed Project. The types of potential cumulative impacts would be as described for the proposed Project in Chapter 3, and the alternative's contribution would not be cumulatively considerable.

5.2.7.7. Geology, Soils, and Mineral Resources

The Offsite Alternative (Alternative D) would be similar to the proposed Project in size and components but would be entirely located in an area east of SR-177/Rice Road and the 500 kV gen-tie line would be at least 5 miles shorter than the gen-tie for the proposed Project. Construction of the Alternative D would disturb an area similar to the proposed Project. Operation of the project under Alternative D would be the same as the proposed Project.

Impacts related to slope stability, seismic hazards, expansive soils, mineral resources, topography, and subsidence would be the same as for the proposed Project. Based on biological surveys conducted of the Offsite Alternative area in Fall 2021 (Ironwood, 2021), areas of desert pavement are located in the southwestern and eastern portions of Alternative D, with many of the areas within and adjacent to desert dry wash woodland. However, Alternative D would disturb less desert pavement than the proposed Project.

Most of the northern and eastern portions of Alternative D are located with the sand migration corridor for the Palen Lake dune system, which includes older stable dunes, active eolian sand and sand sheets, and active washes that are eolian sand sources (BLM, 2021). Ground disturbance for Alternative D could destabilize or destroy dunes and sand sheets which serve as critical habitat. Additionally, within the sand transport corridor, most sand transport occurs close to the ground through the processes of rolling and saltation (bouncing of sand particles), and solar project components may block this action, resulting in loss of or redirection the sand source for sand dunes and sand sheets (BLM, 2021). Alternative D construction and operation could result in the loss of onsite sand migration and active sand sheets and the loss of sand sources for offsite dunes which could cause the erosion of on- and offsite existing dunes without replacement from upwind sources (BLM, 2021). Design of Alternative D to minimize damage to dunes and sand sheets and interference and blocking of sand migration would reduce impacts to the sand migration corridor and sand migration zones, however based on the placement of the alternative within the sand

migration corridor impacts to sand migration and critical sand dune habitat would be unavoidable. Several DRECP CMAs restrict development and require sediment transport and deposition to be continued on BLM-administered land in these areas, including LUPA-BIO-DUNE-1, LUPA-BIO-DUNE-2, and LUPA-BIO-DUNE-3.

Due to most of Alternative D being with a sand transport corridor that contains soils with a high percentage of fine eolian sand, these soils are likely to be more erodible than the soils within the proposed Project site. However, implementation of MM AQ-1, MM BIO-1, MM BIO-3, MM BIO-5, MM HWQ-1, and MM HWQ-5, and applicable local, State, and federal regulations would reduce impacts to less than significant.

5.2.7.8. Greenhouse Gas Emissions

Alternative D would not result in any significant changes to the construction or operational activities as they relate to GHG emissions. Because Alternative D would retain a renewable energy generation capacity of 400 MW and would not change the capacity of the proposed BESS, the quantity of electricity produced by the solar PV component and the potential avoidance of GHG emissions would be the same as with the proposed Project. Other effects on GHG emissions would not be appreciably changed compared to the proposed Project. The direct, indirect, and cumulative impacts of Alternative D would be similar to the proposed Project.

5.2.7.9. Hazards and Hazardous Materials

The Offsite Alternative (Alternative D) would be of similar size as the proposed Project but would locate proposed Project components, including the solar arrays, in a location further from the LTDR and east of SR-177/Rice Road. The relocation of the proposed Project would result in the gen-tie line being at least 5 miles shorter than the gen-tie line under the proposed Project, Reduced Footprint Alternative (Alternative B), and Further Reduced Footprint Alternative with Berms (Alternative C). Construction, operation, and maintenance activities for Alternative D would be the same as for the proposed Project.

Impacts related to use and storage of hazardous materials, potential for spills or leaks of hazardous materials, and aviation hazards, would be the same as for the proposed Project and would be reduced to less than significant through compliance with local, State, and federal regulations. Alternative D is similar in size to the proposed Project and would have similar potential for wildland fires to impact the public, potential for exposure of the public to contracting Valley Fever, potential for workers and the public to be exposed to pesticides or herbicides, and potential for workers to encounter unexploded ordnance. The relocation of the proposed Project further from the LTDR would result in a slight decrease in the potential for residents of the LTDR to be exposed to these impacts as compared to the proposed Project, Alternative B, and Alternative C. However, hazards and hazardous materials impacts would be reduced to less than significant by implementing of the same mitigation measures as for the proposed Project (MM AQ-1, MM FIRE-1, MM HAZ-1, MM HAZ-2, MM HAZ-3), as appropriate, and compliance with applicable local, State, and federal regulations. The types of potential cumulative impacts would be as described for the proposed Project in Chapter 3, and the alternative's contribution would not be cumulatively considerable.

5.2.7.10. Hydrology and Water Quality

The Offsite Alternative includes a Project developable footprint of approximately 4,620 acres and a gen-tie to the Red Bluff Substation. Topography and existing drainage conditions on the site are similar to those of the proposed project. Project features are assumed to be similar to the proposed Project under the Offsite Alternative. Surface water impacts would therefore remain the same as for the proposed Project, but possibly increased in magnitude due to the enlarged Project application area. The Offsite Alternative would require the same mitigation measures to be implemented as would be required for the proposed Project, with the same impact significance. Therefore, because both the proposed Project and

the Offsite Alternative would result in less than significant impacts with adherence to all applicable regulations and mitigation measures, impacts related to hydrology and water quality from the Offsite Alternative would be similar to those of the proposed Project.

In June 2023, BLM issued a Proposed Rule to amend its existing ROW regulations, issued under authority of the Federal Land Policy and Management Act (FLPMA), and is considering issuing Right-of-Way (ROW) grants for durations of up to 50 years (BLM, 2023). To prepare for potential issuance of a 50-year ROW Grant by the BLM (outside of CEQA) and to determine whether there are sufficient supplies to sustain the Project, the Easley WSA conservatively extends the total projected period of the Project to 52-years. For the purpose of the CVGB water budget (see GSI, 2024 Section 6) and predictive Project water demand impacts analysis (see GSI, 2024 Sections 5.4 and 7) presented herein, 52 years is equivalent to the projected total duration of the Project, including construction (20 months), operations (48 years), and decommissioning (20 months).⁴³

The Project would use up to 1,000 AF during the planned 20-month construction period and up to 50 AFY during the Project's operational and decommissioning periods. The Project would use a total of approximately 3,500 AF over the assumed 52-year life of the Project. If the estimated water demand for the Project was used equally per acre (the Project solar and BESS facility site is proposed on approximately 3,735 acres), the Project would use approximately 0.27 AF per acre during construction and 0.01 AF per acre per year during the operational phase of the Project. Using the same AF per acre water use assumptions, the Offsite Requested Alternative would require approximately 1,240 AF during the construction phase and 62 AFY during the operational phase of the Project.

Although there would be an increase in groundwater use under the Offsite Alternative, the potential impacts on groundwater are anticipated to be consistent with those discussed in Section 3.11.6 for the proposed Project.

The Easley WSA (GSI, 2024; see EIR Appendix G) discusses the occurrence of potential groundwater dependent ecosystems within the CVGB. Groundwater dependent ecosystems (GDEs) are defined as ecological communities or species that depend on groundwater emerging from aquifers or on groundwater present near the ground surface. Principal plant types of the CVGB include palo verde (*Parkinsonia florida*), shrubby seepweed (*Suaeda moquinii*), honey mesquite (*Prosopis glandulosa*), desert lavender (*Condea emoryi*), creosote-bush (*Larrea tridentata*), iodine bush (*Allenrolfea occidentalis*), and ironwood (*Olneya tesota*). Screening for these potential GDEs in the CVGB (particularly near the Project) indicated their occurrence was primarily within or adjacent to Palen Dry Lake.

An analysis of depth to groundwater in the regional aquifer within the western portion of the CVGB was used to screen areas in which these GDEs could potentially gain access to groundwater from the regional aquifer. The groundwater model (used for the Easley WSA Cone of Depression and Cumulative Drawdown Analysis) was used to simulate changes in regional water levels in response to solar project development through expected project decommissioning in the year 2075. The modeling results show that only minor changes in regional groundwater levels (lowering of groundwater levels up 0.5 to 0.25 feet within the areas of the GDEs) would result from development of the planned cumulative solar projects compared to simulated 2075 baseline conditions and would not have an effect on the ability of the GDEs to access groundwater.

The Offsite Alternative would shift the Project location immediately south-southwest of Palen Dry Lake and Big Wash, coincident with the occurrence of some the potential GDEs discussed above (and identified in the Easley WSA). The drawdown of the regional aquifer in the western half of the CVGB from devel-

⁴³ Although the estimated Project construction period and decommissioning period described in the EIR Chapter 2 (Project Description) is 20 months, the water budgets (see GSI, 2024 Section 6) and Cone of Depression and Cumulative Drawdown Analysis (see GSI, 2024 Section 7), were developed in 1-year time steps, and therefore, assume the same overall water usage but over Project construction and decommissioning periods of 2 years.

opment of the planned cumulative solar projects under the Offsite Alternative is anticipated to be similar to the drawdown discussed above. However, because the Project's pumping well(s) would be located closer to the potential GDEs identified in the CVGB, there is an increased possibility of impact to any GDEs located in the Palen Dry Lake Area and Big Wash, adjacent to the Offsite Alternative proposed Project location, due to the proximity of the Project well's cone of depression to the GDEs.

The types of potential cumulative impacts would be as described for the proposed Project in Chapter 3, and the alternative's contribution would not be cumulatively considerable.

5.2.7.11. Land Use and Planning

The Offsite Alternative would develop a solar project east of SR-177 and east and south of the Desert Center Airport on lands not currently occupied by existing solar projects. At its closest, the Offsite Alternative would be over 3.5 miles from the Lake Tamarisk community. This alternative would require a new gen-tie line between the project and either the Oberon Switchyard or SCE's Red Bluff Substation south of I-10, crossing over the freeway rather than tying into the Oberon Switchyard north of I-10.

Approximately half of the Project site is within the Desert Center Area Plan (DCAP). Under DCAP the Project area is designated as open space/conservation, which is the designation applied to nearly all of the DCAP area. The County General Plan applies the same designation to the alternative project site outside of the DCAP. However, most of the land in the Offsite Alternative is under BLM rather than County jurisdiction. Development of a solar project at the Offsite Alternative site would abut several existing solar projects to the south.

As with the proposed Project, the Offsite Alternative would not cause a significant direct, indirect, or cumulative impact due to a conflict with any land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect.

5.2.7.12. Noise and Vibration

Alternative D would locate project components, including solar panels, further east of the community of Lake Tamarisk Desert Resort. The alternative site would increase the distances to sensitive receptors from the proposed Project sources of noise and vibration. The increased separation would result in a slight decrease in the potential for sensitive receptors to be exposed to noise and vibration near the existing community of LTDR when compared with the impacts of the proposed Project.

Alternative D would reduce the potential for noise and vibration experienced by sensitive receptors and reduce noise and vibration impacts when compared to the proposed Project. Overall, the direct, indirect, and cumulative effects of Alternative D would be reduced from the proposed Project, and mitigation identified for the proposed Project would be the same under this alternative.

The types of potential cumulative impacts would be as described for the proposed Project in Chapter 3, and the alternative's contribution would not be cumulatively considerable.

5.2.7.13. Paleontological Resources

The Offsite Alternative (Alternative D) would be similar to the proposed Project in size and components but would be entirely located in an area east of SR-177/Rice Road and the 500 kV gen-tie line would be at least 5 miles shorter than the gen-tie for the proposed Project. Construction of the Alternative D would disturb an area similar to the proposed Project. Operation of the project under Alternative D would be the same as the proposed Project.

The Offsite Alternative is underlain by Recent dune sand and Recent alluvium (BLM, 2021). The recent dune sand consists primarily of wind-blown (eolian) sand in the form of dunes and sheets that sometimes

has “blowouts” between the eolian sand features (area where the sand has blown away and the underlying sediment is exposed). The Recent alluvium (Qal) is described as alluvial sand, silt, clay, and gravel, including locally some older alluvium (BLM, 2021). The Paleontological Survey report conducted for the adjacent Arica Solar project (BLM, 2021) identified Pleistocene fossils within the areas mapped as Recent alluvium. The Arica Solar Paleontological Survey assigned the Recent dune sand a rating of PFYC 2 (Low), the intervening valley floor between the dunes and the “blowouts” was rated PYFC 4 (High), and the Recent alluvium (Qal) was rated as PFYC 3 (Moderate). Although the Offsite Alternative would disturb an approximately equivalent area, due to the large areas of dune sand underlying this alternative with low paleontological potential (PFYC 2), there is a minimally decreased potential to disturb or destroy paleontological resources as compared to the proposed Project. Similar to the proposed Project, implementation of Mitigation Measures PR-1 through PR-4 would reduce potential adverse impacts on paleontological resources to a less-than-significant level. The types of potential cumulative impacts would be as described for the proposed Project in Chapter 3, and the alternative’s contribution would not be cumulatively considerable.

5.2.7.14. Population and Housing

The Offsite Alternative would develop a solar project east of SR--177 and east and south of the Desert Center Airport on lands not currently occupied by existing solar projects. At its closest, the Offsite Alternative would be over 3.5 miles from the Tamarisk Lake community. This alternative would require a new gen-tie line between the project and either the Oberon Switchyard or SCE’s Red Bluff Substation south of I-10. Alternative D would have similar construction and operational activities as the proposed Project, and therefore, Alternative D would have similar impacts to population and housing and impacts would be less than significant.

As with the proposed Project, the Offsite Alternative would not cause a direct, indirect, or cumulative significant impact due to directly or indirectly inducing substantial unplanned population growth.

5.2.7.15. Public Services and Utilities

The Offsite Alternative would develop a solar project east of SR--177 and east and south of the Desert Center Airport on lands not currently occupied by existing solar projects. At its closest, the Offsite Alternative would be over 3.5 miles from the Tamarisk Lake community. This alternative would require a new gen-tie line between the project and the existing Oberon Switchyard or SCE’s Red Bluff Substation south of I-10, crossing over the freeway rather than tying into the Oberon substation north of I-10. As with the proposed Project, Alternative D would not cause a significant impact on public services and utilities. Alternative D would have similar construction and operational activities as the proposed Project, and therefore, Alternative D would have similar direct, indirect, and cumulative impacts to public services and utilities and impacts would be less than significant.

5.2.7.16. Recreation

The Offsite Alternative would develop a solar project east of SR-177 and over 3.5 miles from the Tamarisk Lake community. This alternative would be adjacent to and north of other existing solar projects located north of I-10 and southeast of the Desert Center Airport and Chuckwalla valley raceway. The alternative site overall is approximately 4,620 acres. This alternative would require a new gen-tie line between the Project and either the Oberon Switchyard or SCE’s Red Bluff Substation south of I-10, crossing over the freeway rather than tying into the Oberon Switchyard north of I-10.

Most of the land in the Offsite Alternative is under BLM rather than County jurisdiction. BLM Open Routes DC378 and DC511 are found in the southwest corner of the site. BLM Open Route DC378 has been truncated on the west and east by existing solar projects and no longer provides a through route.

BLM Open Route DC511 remains as an open route through the solar projects in the area and would be accommodated by the layout of any arrays under the Offsite Alternative. BLM Open Route DC502 is a BLM Open Route in the southeast quadrant of the alternative site that ends within the site. However, it has been truncated by existing solar projects south of the alternative. The Desert Lily Sanctuary is approximately 3.6 miles north of the site, near SR-177. Most of the land north of the alternative site is under BLM jurisdiction and open to recreational users.

The Offsite Alternative would limit recreational access immediately north of the existing solar projects. Assuming that the lands planned to be used for the proposed Project remain undeveloped, the Offsite Alternative would result in undiminished recreational access for users around the Lake Tamarisk community. The types of potential cumulative impacts would be as described for the proposed Project in Chapter 3, and the alternative's contribution would not be cumulatively considerable.

5.2.7.17. Traffic and Transportation

The Offsite Alternative would be in an area remote from existing paved roads. It would be north of existing solar projects previously developed north of I-10 and east of SR-177 (Rice Road). Access to the Offsite Alternative location would be by way of unpaved roads off of SR-177 and, possibly, Ragsdale Road. These would likely be roads used for the development of the existing solar project in the vicinity or routes along power lines. One point of access may via BLM Open Route DC322, a BLM Open Route near the Desert Center Airport. Using this route, the western edge of the Offsite Alternative is approximately 2.6 miles from SR-177. Also, BLM Open Route DC510 (Comanche Trail) extends east from SR-177 to a junction with DE322. This route is approximately 3.22 miles from SR-177 to the western edge of the alternative site. An unnamed dirt access road north from Ragsdale Road extends 4.7 miles to a point where a 0.5-mile spur road could be developed northward to access the alternative site. It may be feasible to develop a new road to the alternative site's eastern end from the Corn Springs Road exit on I-10, approximately 9.3 miles east of Desert Center, although such a route would be hampered by existing solar arrays, resulting in a circuitous route.

While the Offsite Alternative would eliminate project-related traffic from Kaiser Road, it is likely to simply shift the traffic to SR-177, thereby increasing traffic on this highway. Longer travel distances over unpaved roads to reach the alternative site would increase the dust emissions from vehicles traveling on these routes and would potentially limit access to the site during and after storm events when dirt roads may be impassable. The types of potential cumulative impacts would be as described for the proposed Project in Chapter 3, and the alternative's contribution would not be cumulatively considerable.

5.2.7.18. Wildfire

The Offsite Alternative would be located east of SR-177/Rice Road and east and north of existing developed solar projects, including Athos, Victory Pass, Arica, and Palen Solar Projects. The developable acreage is approximately 4,620 acres, and the gen-tie line under this alternative would be shorter than under the proposed Project. This alternative may result in slightly greater wildfire risks during construction compared to the proposed Project due to potential increase in the solar and BESS site application area (4,620 acres compared to 3,735 acres). However, this alternative would result in a reduced risk of wildfire spreading to the community of Lake Tamarisk due to the increased distance from the community and with existing solar facilities acting as potential buffers that may slow down the spread of a potential fire. Furthermore, the shorter gen-tie line length would result in a slight decrease in risk of fire hazards. The types of potential cumulative impacts would be as described for the proposed Project in Chapter 3, and the alternative's contribution would not be cumulatively considerable.

5.2.8. Alternative E: Distributed Commercial and Industrial Rooftop Solar Alternative – Impact Analysis

5.2.8.1. Aesthetics

The installation of small to medium solar PV systems on large commercial and industrial rooftops would be visually unobtrusive or not noticeable from receptors at ground level. While such systems may be visible from other vantage points, the installation of rooftop small to medium solar PV systems would not likely affect the visual character or quality of an area, because the character or quality of an area has already been altered as a result of the existing building's construction. Compliance with city or county ordinances and rooftop solar ordinances would ensure that aesthetics impacts would be less than significant.

More severe impacts may result if rooftop solar were proposed on historic buildings, because such installations could affect the historic character and integrity of the buildings. Implementation of this alternative would require historic surveys and investigations to evaluate the eligibility of potentially historic structures that are over 50 years old. Such structures would either have to be avoided, or there would have to be incorporation of design measures to minimize impacts on historic integrity of historically significant structures. The Distributed Commercial and Industrial Rooftop Solar Alternative would have less than significant direct, indirect, and cumulative impacts on aesthetics.

5.2.8.2. Agriculture and Forestry

Under the Distributed Commercial and Industrial Rooftop Solar Alternative, a number of geographically distributed small to medium solar PV systems would be developed, typically on the rooftops of existing commercial and industrial facilities. Since the solar PV systems proposed for this alternative would be constructed on existing structures, this alternative would not create any changes in the existing environment that would convert land that is designated Farmland or forest land to non-agricultural or non-forest uses. As such, no direct, indirect, or cumulative impacts to agriculture or forestry resources would occur.

5.2.8.3. Air Quality

Under the Distributed Commercial and Industrial Rooftop Solar Alternative, a number of geographically distributed small to medium solar PV systems would be developed, typically on the rooftops of existing commercial and industrial facilities. Under this alternative, no construction activities associated with ground disturbance would occur, reducing some temporary construction-related air quality impacts. However, depending on the availability and location of rooftops, this alternative may require a substantial number of truck trips to transport the solar panels, racking systems and associated electrical equipment to dispersed locations, potentially resulting in significant emissions. However, the construction associated with this alternative is unlikely to create dust during construction since installation of solar systems is assumed to take place in already paved and developed areas.

During operation, this alternative would have similar impacts on air quality as the project related to occasional vehicular visits for maintenance. As such, operational impacts would be less than significant.

5.2.8.4. Biological Resources

Under the Distributed Commercial and Industrial Rooftop Solar Alternative, a number of geographically distributed small to medium solar PV systems would be developed, typically on the rooftops of commercial and industrial facilities situated throughout Riverside County. The Project site would remain undeveloped and only developed areas, typically on the rooftops of commercial and industrial facilities would be modified.

Given that rooftops of existing commercial and industrial facilities would be used for solar PV system installation, these areas would be unlikely to provide habitat for special-status species. Development of this alternative would not disturb any land or remove habitat for special-status plants and wildlife or have a substantial adverse effect on any riparian habitat. As such, the requirement for mitigation measures would be unlikely, and impacts would be less than significant.

5.2.8.5. Cultural and Tribal Cultural Resources

Under the Distributed Commercial and Industrial Rooftop Solar Alternative, a number of geographically distributed small to medium solar PV systems would be developed, typically on the rooftops of commercial and industrial facilities situated throughout Riverside County. Given that development would occur on the rooftops of existing structures, there would be no potential for disturbance or damage to buried archaeological resources and human remains. If rooftop solar systems were proposed on historic buildings, this alternative could affect the historic character and integrity of these buildings, as well as the character and views of adjacent historical resources. However, historic surveys and investigations would be conducted prior to project construction to identify known eligible historical resources and to evaluate the eligibility of potentially historic structures that are 50 years or older; historic structures would be either avoided or the alternative would be required to incorporate mitigation and design measures to minimize the impact on these structures. In the case of eligible historical resources, design measures must be in accordance with the Secretary of the Interior standards and the impact must not affect the eligibility of such resources or adjacent resources. Therefore, unanticipated impacts to unknown or known cultural resources would not occur under this alternative. Impacts would be less than significant. With the appropriate mitigation measures in place to reduce impacts to historical resources, the potential to disturb or discover unknown cultural resources within the project area would be less than significant.

With respect to Tribal Cultural Resources, the Distributed Commercial and Industrial Rooftop Solar Alternative, it is unlikely that the proposed rooftop solar systems would have an impact. However, prior to construction of the components of this alternative, the Native American Heritage Commission would be contacted for a search of the Sacred Land Files for the areas surrounding each of the facilities that would be installed under Distributed Commercial and Industrial Rooftop Solar Alternative. In addition, the County would conduct additional consultation with California Native American tribes on the County's Master List for AB 52, apprising them of the alternative project description.

It is anticipated that the Sacred Land Files and consultation would not result in the identification of any tribal cultural resources that could be impacted by the alternative, either directly or indirectly; however, should it be determined the potential exists, this construction occurring under this alternative would avoid impacting any such resources through avoidance and re-design. Due to the nature of the Distributed Commercial and Industrial Rooftop Solar Alternative, it is very unlikely to have an impact on tribal cultural resources. As such, the Distributed Commercial and Industrial Rooftop Solar Alternative would have no direct, indirect, or cultural impact on tribal cultural resources and no mitigation would be required.

5.2.8.6. Energy

Under the Distributed Commercial and Industrial Rooftop Solar Alternative, a number of geographically distributed small to medium solar PV systems would be developed, typically on the rooftops of commercial and industrial facilities situated throughout Riverside County. Construction of this alternative may require a significant number of trucks trips to transport and install the solar panels on the rooftops of existing buildings in dispersed locations, although it would not require off-road driving or off-road construction equipment. Therefore, the Distributed Commercial and Industrial Rooftop Solar Alternative likely would have a less than significant impact related to wasteful, inefficient, or unnecessary consumption of energy resources and this alternative likely would not conflict with or obstruct a state or local plan

for renewable energy or energy efficiency. Likewise, the cumulative impact would be less than significant. The Project's incremental contribution to impacts to population and housing would not be cumulatively considerable.

5.2.8.7. Geology, Soils, and Mineral Resources

Under the Distributed Commercial and Industrial Rooftop Solar Alternative, a number of geographically distributed small to medium solar PV systems would be developed, typically on the rooftops of commercial and industrial facilities situated throughout Riverside County. Given that only developed areas would be modified and the systems would be installed on existing structures, there would be no potential for the Distributed Commercial and Industrial Rooftop Solar Alternative to directly or indirectly cause potential substantial adverse effects involving rupture of a known earthquake fault, strong seismic ground shaking, seismic-related ground failure, and landslides. Such a solar installation would not result in substantial soil erosion or loss of topsoil, create onsite or offsite landslides, or be located on expansive soil. Development of rooftop solar would require adherence to all requirements of the Riverside County Building Ordinances. Therefore, impacts would be less than significant.

Direct, indirect, and cumulative impacts to mineral resources would not be expected to occur, since this alternative would not create new ground disturbance.

5.2.8.8. Greenhouse Gas Emissions

Under the Distributed Commercial and Industrial Rooftop Solar Alternative, a number of geographically distributed small to medium solar PV systems would be developed, typically on the rooftops of existing commercial and industrial facilities. This alternative would not generate GHG emissions from off-road equipment, but a substantial number of truck trips may be required to transport solar panels to dispersed rooftop locations and to support installation personnel. Additionally, the distributed systems on rooftops would lack tracking systems and be less efficient, generating less energy per panel than those that would be installed as part of the proposed Project.

In addition, this alternative includes no energy storage, whereas the project would provide 650 MW of storage to maintain energy-generating capacity when sunlight is not available. As such, this alternative has a reduced ability to offset GHG emissions from fossil-fueled generation.

Therefore, the Distributed Commercial and Industrial Rooftop Solar Alternative likely would have less than significant impacts related to generating GHG emissions that may have a significant impact on the environment or consistency with an applicable plan, policy, or regulation adopted for the purpose of reducing the emissions of GHGs. However, impacts related to GHG emissions would be greater under this alternative compared to the proposed Project due to the lower efficiency of the distributed systems, which would not include solar tracking technology and battery energy storage.

5.2.8.9. Hazards and Hazardous Materials

Under the Distributed Commercial and Industrial Rooftop Solar Alternative, a number of geographically distributed small to medium solar PV systems would be developed, typically on the rooftops of existing commercial and industrial facilities situated throughout Riverside County. The installation of rooftop solar equipment on existing structures would involve few hazardous materials (such as chemicals and fuels that are used for construction on undeveloped sites).

Because the construction of rooftop solar would likely be permitted through compliance with local ordinances and permit requirements, no additional mitigation is assumed to be required. Permits would likely require some level of control of hazardous materials and post-installation inspections to ensure that site

clean-up is completed. Likewise, the cumulative impact would be less than significant. The Project's incremental contribution to impacts to population and housing would not be cumulatively considerable.

5.2.8.10. Hydrology and Water Quality

Under the Distributed Commercial and Industrial Rooftop Solar Alternative, a number of geographically distributed small to medium solar PV systems would be developed, typically on the rooftops of existing commercial and industrial facilities situated throughout Riverside County. No ground disturbance related to construction would be required under this alternative.

Compliance with the NPDES Construction General Permit and development and implementation of a SWPPP would not be required under the Distributed Commercial and Industrial Rooftop Solar Alternative. Construction would be authorized through permit requirements and compliance with local ordinances. Installation of small to medium rooftop solar PV systems on existing commercial and industrial facilities in Riverside County would have no effect on existing drainage patterns, and flow paths would not be altered.

Riverside County is located well inland and far from the ocean or any enclosed or semi-enclosed water body such that there would be no potential threat from tsunami or seiche hazards; these impacts would be less than significant. In addition, water demand for construction and operation phases under the Distributed Commercial and Industrial Rooftop Solar Alternative would be small, and likely provided by local municipal sources with no effect on groundwater. Therefore, implementation of this alternative would not conflict with groundwater management practices; potential impacts would be less than significant. Likewise, the cumulative impact would be less than significant. The Project's incremental contribution to impacts to population and housing would not be cumulatively considerable.

5.2.8.11. Land Use and Planning

Under the Distributed Commercial and Industrial Rooftop Solar Alternative, a number of geographically distributed small to medium solar PV systems would be developed, typically on the rooftops of existing commercial and industrial facilities situated throughout Riverside County. Installation of rooftop solar would be permitted only where consistent with current zoning as well as existing land use plans, policies, and regulations.

The Distributed Commercial and Industrial Rooftop Solar Alternative would also support County's goals and policies relative to accommodating renewable energy facilities. However, the placement of solar panels on other structures throughout the region would result in unknown entitlement requirements, depending on the project location, zoning, land use, and potential environmental impacts on the site and surrounding areas. Each project proponent would be required to comply with the specific entitlements needed to construct solar PV systems consistent with this alternative. As a result of anticipated compliance with existing requirements, impacts to land use and planning would be less than significant. Likewise, the cumulative impact would be less than significant. The Project's incremental contribution to impacts to land use would not be cumulatively considerable.

5.2.8.12. Noise and Vibration

Under the Distributed Commercial and Industrial Rooftop Solar Alternative, a number of geographically distributed small to medium solar PV systems would be developed, typically on the rooftops of existing commercial and industrial facilities. Rooftops of existing commercial and industrial buildings that would be developed under this alternative would be located in developed, and primarily industrial and commercial areas. As a result, while noise related to construction activities could impact sensitive receptors like residences, it is more likely that construction noise would not be noticeable. The operational noise

generated from these solar PV systems would be minor, because the inverters required for rooftop solar systems are small and relatively quiet.

With regard to vibration, construction of the Distributed Commercial and Industrial Rooftop Solar Alternative would not require the use of vibratory rollers or other construction equipment with high groundborne vibration levels. Therefore, it is likely that construction vibration would have a less than significant construction vibration impact. Similar to the proposed Project, operation of the Distributed Commercial and Industrial Rooftop Solar Alternative would require regular maintenance trucks and panel washing activities. Whether rooftop solar systems are proposed on historic buildings, which are more susceptible to vibration damage, or other types of newer buildings, this level of vibration would not exceed vibration thresholds and, as such, would result in less than significant impacts. Likewise, the cumulative impact would be less than significant. The Project's incremental contribution to impacts to population and housing would not be cumulatively considerable.

5.2.8.13. Paleontological Resources

Under the Distributed Commercial and Industrial Rooftop Solar Alternative, a number of geographically distributed small to medium solar PV systems would be developed, typically on the rooftops of commercial and industrial facilities situated throughout Riverside County. This development would occur on the rooftops of existing structures, and would not require ground disturbance. As a result, there would be no potential for direct, indirect, or cumulative disturbance or damage to buried paleontological resources.

5.2.8.14. Population and Housing

Under the Distributed Commercial and Industrial Rooftop Solar Alternative, a number of geographically distributed small to medium solar photovoltaic systems would be developed, typically on the rooftops of commercial and industrial facilities situated throughout Riverside County. Development would occur on the rooftops of existing structures, and would not require construction of new buildings or housing. Construction would be done by workers already employed by solar installation companies in the county. There would be no direct, indirect, or cumulative impacts driving increased population or the need for more housing.

5.2.8.15. Public Services and Utilities

Under the Distributed Commercial and Industrial Rooftop Solar Alternative, a number of geographically distributed small to medium solar PV systems would be developed, typically on the rooftops of existing commercial and industrial facilities situated throughout Riverside County and the project site would remain undeveloped. The Distributed Commercial and Industrial Rooftop Solar Alternative would not introduce structures into a currently undeveloped area and is not expected to temporarily or permanently increase the concentration of people in an area, driving the demand for additional services.

With regard to fire protection, it is expected that rooftop solar PV systems would be installed in urbanized areas with existing fire services. However, a large increase in rooftop solar could result in the need to expand electric distribution systems to accommodate flow of power in and out of local substation. This alternative would require any developer to pay applicable County fees to compensate for any permanent impacts to fire protection services and facilities resulting from the operation of this alternative. Implementation of permit conditions and conditions of local ordinances would result in impacts related to fire protection being less than significant.

With regard to police protection, because the proposed small to medium solar PV systems would be installed in developed areas on existing buildings, it is unlikely that construction and operation of the alternative would require additional police presence or attention. While there would be increased levels

of traffic with truck trips during construction and routine maintenance during operation of this alternative, these volumes would be minimal and would not likely have a significant and adverse effect on County protective service provision or CHP's ability to patrol the highways. Impacts would be less than significant.

With regard to water demand, the Distributed Commercial and Industrial Rooftop Solar Alternative would likely require minimal water as no dust suppression would be required during construction. This alternative would also result in minimal generation of wastewater and usage of electrical power, natural gas, and telecommunications. In addition, construction of the Distributed Commercial and Industrial Rooftop Solar Alternative would not substantially alter stormwater drainage.

With regard to operation, solar panel washing for rooftop solar facilities is infrequent, given the location of panels on rooftops of buildings throughout developed areas of Riverside County. As the Distributed Commercial and Industrial Rooftop Solar Alternative would not require construction in unpaved areas, this alternative would not result in new impervious surfaces.

Overall, impacts to public services, utilities, and service systems would be less than significant. Likewise, the cumulative impact would be less than significant. The Project's incremental contribution to impacts to population and housing would not be cumulatively considerable.

5.2.8.16. Recreation

Under the Distributed Commercial and Industrial Rooftop Solar Alternative, a number of geographically distributed small to medium solar PV systems would be developed, typically on the rooftops of existing commercial and industrial facilities situated throughout Riverside County and the project site would remain undeveloped. Because the facilities installed in the Distributed Commercial and Industrial Rooftop Solar Alternative would be installed in developed areas that would be typically industrial or commercial areas. These areas tend not to support recreational facilities because there is little residential population creating demand for recreational opportunities. As a result, the impact to recreation would be less than significant. Likewise, the cumulative impact would be less than significant. The Project's incremental contribution to impacts to population and housing would not be cumulatively considerable.

5.2.8.17. Traffic and Transportation

Under the Distributed Commercial and Industrial Rooftop Solar Alternative, a number of geographically distributed small to medium solar PV systems would be developed, typically on the rooftops of existing commercial and industrial facilities situated throughout Riverside County.

Construction of this alternative would require numerous vehicle trips during construction to transport and install the solar panels. However, the trips would be widely dispersed throughout the developed areas of the County, given the location of the existing facilities, thereby avoiding impacts on rural roadways. Due to dispersed locations of rooftop installations, roadways within Riverside County are not expected to operate at levels that would trigger a significant transportation impact during construction of this alternative.

During operation of this alternative, day-to-day operations and maintenance trips would be infrequent and would not substantially add to traffic in the county. However, as with construction, these maintenance trips would be dispersed given the location of the existing facilities. Due to the dispersed location of anticipated facilities, construction and operational impacts would be less than significant.

With regard to consistency with CEQA *Guidelines* Section 15064.3(b), the operation of the Distributed Commercial and Industrial Rooftop Solar Alternative would not increase vehicle trips or distances for the workforce already occupying the buildings that host the rooftop panels. There would be some increase in vehicle trips, but primarily during construction, so vehicle trips would not be ongoing. The occasional maintenance activities may be performed by workers already employed onsite. Therefore, impacts related

to vehicle miles traveled would be less than significant under the Distributed Commercial and Industrial Rooftop Solar Alternative. Likewise, the cumulative impact would be less than significant. The Project's incremental contribution to impacts to population and housing would not be cumulatively considerable.

5.2.8.18. Wildfire

Under the Distributed Commercial and Industrial Rooftop Solar Alternative, a number of geographically distributed small to medium solar PV systems would be developed, typically on the rooftops of existing commercial and industrial facilities situated throughout Riverside County. The addition of large amounts of rooftop solar generation facilities could require installation of expanded electric distribution facilities (lines or substations) in the developed areas. However, these facilities would be constructed in urban areas with little open space and wildfire risk. The potential risks associated with rooftop solar facilities are generally addressed in building codes and ordinances specific to installation of these systems, and the residual risk would be less than significant.

Development of the Distributed Commercial and Industrial Rooftop Solar Alternative would not require grading and excavation at each project site. As a result, there is little likelihood of construction-induced fire risk. Likewise, the cumulative impact would be less than significant. The Project's incremental contribution to impacts to population and housing would not be cumulatively considerable.

5.3. Comparison of Alternatives

This subsection summarizes and compares the environmental advantages and disadvantages of the proposed Project and the alternatives evaluated in this EIR. This comparison is based on the assessment of environmental impacts of the proposed Project and each alternative, as identified in Section 3 (Environmental Impacts of Proposed Project and Alternatives) and Section 5.2 (Alternatives Analyzed in Detail).

5.3.1. CEQA Requirements for Alternatives Comparison

CEQA requires the following for alternatives analysis and comparison:

The EIR shall include sufficient information about each alternative to allow meaningful evaluation, analysis, and comparison with the Proposed Project. A matrix displaying the major characteristics and significant environmental effects of each alternative may be used to summarize the comparison. If an alternative would cause one or more significant effects in addition to those that would be caused by the project as proposed, the significant effects of the alternative shall be discussed, but in less detail than the significant effects of the project as proposed. *State Guidelines Section 15126.6(d)*

If the environmentally superior alternative is the No Project Alternative, CEQA requires identification of an environmentally superior alternative among the other alternatives [State CEQA Guidelines Section 15126.6l(2)].

5.3.2. Comparison Methodology

The following methodology was used to compare alternatives in this EIR:

- **Step 1: Identification of Alternatives.** A screening process (described in Section 2.8, *Alternatives Analyzed in Detail*) was used to identify alternatives to the proposed Project. A No Project Alternative was also identified. This range of alternatives is sufficient to foster informed decision-making and public participation. No other feasible alternatives meeting most of the Project objectives were identified that would lessen or alleviate significant impacts.

- **Step 2: Determination of Environmental Impacts.** The environmental impacts of the proposed Project and alternatives were identified in Section 3 and Section 5.2, respectively, including the potential impacts of solar facility and gen-tie transmission line construction and operation. A summary of the significant impacts that cannot be mitigated (Class I impacts) are described in Section 5.3.3.3. Highlighting these areas of significant impacts that the proposed Project cannot avoid identifies the impact of concern when considering whether there is an alternative that would be capable of reducing these effects to a less than significant level compared to the proposed Project, and whether an alternative would create new significant impacts. This simplifies identification of the environmentally superior alternatives while considering all issue areas equally.
- **Step 3: Comparison of Proposed Project and Alternatives.** The environmental impacts of the proposed Project were compared to those of each alternative to determine the environmentally superior alternative. The environmentally superior alternative was then compared to the No Project Alternative.

Determining an environmentally superior alternative requires balancing many environmental factors. In order to identify the environmentally superior alternative, the most important impacts in each issue area were identified and compared in Table 5-1. Although this EIR identifies an environmentally superior alternative, it is possible that the decision-makers could balance the importance of each impact area differently and reach different conclusions. In other words, the lead agency is not required to select the environmentally superior alternative. CEQA's "substantive mandate" only requires the selection of one alternative over others if that alternative is feasible, based on a list of statutory factors, and if it will avoid one or more significant effects on the environment compared to other alternatives.

5.3.3. Comparison of the Proposed Project and Alternatives

5.3.3.1. Ability to Meet Project Objectives

The Applicant's purpose for the Project is to generate, store, and transmit renewable energy to the state-wide wholesale electricity grid. The Applicant's identified Project objectives are:

1. Support climate and clean energy goals of the Inflation Reduction Act of 2022 by helping to tackle the climate crisis and work towards achievement of President Biden's goal of a zero-carbon power sector by 2035 and zero-carbon economy by 2050 through development of clean electricity (power sector);
2. Assist the nation to meet its Nationally Determined Contribution commitments under Article 4 of the Paris Climate Agreement to achieve a 50 to 52 percent reduction in U.S. greenhouse gas pollution from 2005 levels by 2030, and to achieve 100 percent carbon pollution-free electricity by 2035 in the electricity sector;
3. Further the purpose of Secretarial Order 3285A1, establishing the development of environmentally responsible renewable energy as a priority for the Department of the Interior;
4. Deliver up to 400 MW of affordable, wholesale renewable energy to California ratepayers under long-term contracts with electricity service providers;
5. Assist with achieving California's renewable energy generation goals under the Clean Energy and Pollution Reduction Act of 2015 (Senate Bill 350) and the 100 Percent Clean Energy Act of 2018 (Senate Bill 100), as well as greenhouse gas (GHG) emissions reduction goals of the California Global Warming Solutions Act of 2006 (AB 32), as amended by Senate Bill 32 in 2016;

6. Enhance California's fossil-free resource adequacy capabilities and help to solve California's "duck curve" power production problem by installing up to 650 MW of 2-hour and/or 4-hour battery energy storage capacity;⁴⁴
7. Minimize environmental impacts and land disturbance associated with ~~solar~~ renewable energy development by siting the facility on relatively flat, contiguous lands with high solar insolation, in close proximity to established utility corridors, existing transmission lines with available capacity to facilitate interconnection, and road access;
8. Conform with the Desert Renewable Energy Conservation Plan, including Conservation Management Actions;
9. Bring living-wage jobs to Riverside County;
10. Bring sales tax revenues to Riverside County by establishing a point of sale in the County for the procurement of most major Project services and equipment.
11. Make the highest and best use of primarily disturbed, retired agricultural land in and around a federal "Solar Energy Zone" and "Development Focus Area" to generate, store, and transmit affordable, wholesale solar electricity.
12. Develop a commercially financeable renewable energy project.

5.3.3.2. Alternatives' Ability to Meet Project Objectives

Alternative ~~A1~~: No Project Alternative A1 – No Build Alternative. The No Project Alternative A1 would fail to meet any of the Project's objectives and would not achieve any of the environmental benefits of increasing renewable energy generation consistent with federal goals and the State of California's Renewable Portfolio Standard (RPS) and installation of energy storage to helping to alleviate the "duck curve" problem.

Alternative A2: Uses Allowed by Right within Existing Land Designations. The No Project Alternative A2 would fail to meet any of the Project's objectives and would not achieve any of the environmental benefits of increasing renewable energy generation consistent with federal goals and the State of California's Renewable Portfolio Standard (RPS) and installation of energy storage to help alleviate the "duck curve" problem.

Alternative A3: No Project Alternative A3 - Other Renewable Energy Development within Existing Land Designations. The DFA designation allows wind and geothermal development on the land that would be developed by the proposed Project. The renewable power generation that could occur with this alternative is consistent with the project objectives relating to climate change and renewable energy, but the wind component could generate only about 12% of the electricity of the proposed Project due to the larger land areas required for this technology. In addition, the geothermal and wind technologies that could be permitted on DFA-designated lands would have numerous significant impacts, conflicting with the objective of minimizing environmental impacts.

Alternative ~~2B~~: Lake Tamarisk Reduced Footprint Alternative. The Lake Tamarisk Reduced Footprint Alternative would meet nearly all of the proposed Project's objectives. This alternative would remove approximately 50 30-acres of solar panels closest to the community of Lake Tamarisk. This alternative would also move the onsite substation and BESS farther from the community of Lake Tamarisk, and the 500 kV gen-tie line would be approximately 0.8 miles longer than the proposed 500 kV gen-tie line. The

⁴⁴ Battery duration may be up to 8 hours depending on technology and final design.

electrical output would ~~not be appreciably~~ be reduced by up to 10 MW compared to the proposed Project, and the impacts would be similar, therefore, it would meet most of the Project objectives.

Alternative C: Further Reduced Project Footprint Alternative with Berms. This alternative would modify the proposed Project by establishing a minimum buffer zone setback of one mile from the resort border, installing earthen berms in two locations, and relocating the onsite substation and gen-tie line. Its electrical generation capacity would be reduced in comparison with the proposed Project, but most Project objectives would be met.

Specifically, Alternative C- with a 1-mile setback would meet the Project's objectives; however, it would achieve these objectives to a lesser extent compared with the proposed Project., including the loss of nearly 1100 MW ($\geq 25\%$ of the capacity of the proposed Project).

Alternative C would assist Californians in meeting their renewable energy generation goals under Objective #4 and would further the purpose of Secretarial Order 3285A1 regarding responsible renewable energy under Objective #3, support the climate and clean energy goals of the Inflation Reduction Act of 2022 under Objective #1, and the United States' commitments under Article 4 of the Paris Climate Agreement (Objective #2) but all to a lesser extent than the Project. Alternative C would generate and store a significantly smaller amount of renewable energy compared with the proposed Project. Therefore, it would assist Californians to a lesser degree in meeting their renewable energy generation goals (Objective #5) and BLM with meeting its renewable energy objectives of the Desert Renewable Energy Conservation Plan (DRECP) Land Use Plan Amendment (LUPA) (Objective #8).

The BLM DRECP LUPA designated 6.5 million acres of land for conservation and identified 388,000 acres as DFA suitable for renewable energy development. One DRECP objective is to promote renewable energy and transmission development, consistent with federal renewable energy and transmission goals and policies, and in consideration of State renewable energy targets. With a smaller project, Easley's contribution towards meeting these goals and the speed of the United States achieving these goals would be reduced. Likewise, Alternative C would generate, store, and transmit affordable wholesale solar electricity on primarily disturbed, retired agricultural land in and around a federal DFA (Objective #11), however, with an approximately 25% reduction compared with the proposed Project. Alternative C would create fewer jobs and tax revenues compared with the proposed Project (Objectives #9 and #10). Similar to the proposed Project, Alternative C would meet Objective #7 to minimize environmental impacts and land disturbance, because the alternative would also be on flat contiguous land in close proximity to established utility corridors, existing transmission lines with available capacity, and road access.

Finally, although Alternative C would make the highest and best use of land under Objective #11, it would not capture the same economies of scale as the proposed Project nor help as much to solve California's "duck curve" power production problem (Objective #6), because it would generate, store, and transmit less wholesale solar electricity, and the electricity would be less affordable.

Alternative D: Offsite Alternative. Commenters suggested consideration of installing solar panels on BLM-managed lands east of SR-177. This alternative would meet most Project objectives, but due to the substantially greater severity of impacts to biological resources and likely greater cultural resources impacts, it would not meet the objective of minimizing environmental impacts.

Alternative E: Distributed Commercial and Industrial Rooftop Solar Alternative. This alternative would involve the development of a large number of geographically distributed small to medium solar PV systems within existing developed areas throughout Riverside County. This alternative would meet most Project objectives, but it would not generate wholesale renewable energy to support California's rate-payers. Also, because this alternative would not include installation of 650 MW of battery storage that would be included with the proposed Project, it would not meet project objectives related to extending renewable energy availability into the evening hours.

5.3.3.3. Significant and Unavoidable Impacts

Section 3 of this EIR describes the potential environmental impacts of the proposed Project and recommends mitigation measures to reduce impacts, where feasible. Impacts in the following areas would be significant and unavoidable with construction and operation of the proposed Project, even with the incorporation of feasible mitigation measures that attempt to reduce impacts to the extent feasible.

■ Aesthetics:

- **Impact AES-31:** The proposed Project could substantially degrade the existing visual character or quality of the site and its surroundings. The resulting visual change would be adverse and unavoidable even with implementation of mitigation, when viewed from all KOPs.
- **Impact AES-3:** As with impacts discussed under Impact AES-1, the Project's high visual change would result in a significant aesthetics impact under significance criterion AES-3. Additionally, the O&M impacts would remain significant and unavoidable even with implementation of mitigation and DRECP CMA compliance.

■ ~~Agriculture and Forestry~~

- ~~**Impact AG-1:** The proposed Project would be constructed on 222 acres of land, 190 acres are a part of seven parcels, which are subject to a Williamson Act contract. Non renewals for the seven parcels were submitted and processed in late 2022; however, the parcels are subject to Williamson Act restrictions for nine more years. There is no feasible way to modify the Project to avoid the conflict with the Williamson Act contracts. The contracts will need to be cancelled prior to, or concurrent with the EIR certification to avoid this impact.~~
- ~~**Impact AG-3:** The Williamson Act contract lands within the Project area are within a Riverside County Agricultural Preserve, which is incompatible with the proposed Project.~~

The Project would also result in a cumulatively considerable contribution to a significant cumulative impact under Aesthetics and Cultural and Tribal Cultural Resources.

5.3.3.4. Summary Impacts of Alternatives

Alternative A1: No Project Alternative – No Build Alternative. No substantially adverse and long-term impacts would occur to the environment as a result of the No Project Alternative A1. However, the No Project Alternative A1 would not achieve any of the environmental benefits discussed in Section 5.3.3.1 (Ability to Meet Project Objectives).

Alternative A2: No Project Alternative – Uses Allowed by Right within Existing Land Designations. No substantially adverse and long-term impacts would occur to the environment as a result of the No Project Alternative A2. However, the No Project Alternative A2 would not achieve any of the environmental benefits discussed in Section 5.3.3.1 (Ability to Meet Project Objectives).

Alternative A3: No Project Alternative A3 – Other Renewable Energy Development within Existing Land Designations. The DFA designation of the BLM-administered land allows development of wind or geothermal generation, as well as solar. Wind generation would create severe aesthetic impacts from the presence of turbines and their night lighting. In addition, operation of wind turbines can create aviation conflicts, noise, and shadow flicker effects for nearby receptors. Geothermal generation is a major industrial operation, requiring drilling of wells for steam production and injection of geothermal fluids. It is visually significant in the desert setting, requires steam-driven turbines and cooling towers that emit noise and steam plumes, and requires steam and fluid pipelines running above ground across the site.

Alternative 2B: Lake Tamarisk Alternative Reduced Footprint Alternative. Alternative 2-B would have similar types of impacts to the proposed Project, but would disturb a slightly smaller area within the Project application area and would move solar panel development and associated construction disturbances farther from the community of Lake Tamarisk. This alternative would not reduce any of the Project's significant and unavoidable impacts to a less-than-significant level or result in a change to overall impact classifications or significance conclusions. The Reduced Footprint Alternative would generate approximately up to 10 MW less of renewable energy than the proposed Project.

Alternative C: Reduced Footprint Alternative with Berms. This alternative would modify the proposed Project by establishing a minimum buffer zone setback of one mile from the resort border, installing earthen berms in two locations, and relocating the onsite substation, BESS, O&M building, and gen-tie line. This alternative would eliminate the significant aesthetics impacts of the proposed Project from the resort residences, but it would increase the severity of public views from SR-177 (Rice Road) due to the substation/BESS location. In addition, constructing and maintaining the berms would be challenging given the anticipated level of erosion from wind and rainstorms, and the berms would redirect surface water flood flows in a manner that could create more severe erosion downstream.

Alternative D: Offsite Alternative. This alternative would require installing solar panels on BLM-managed lands east of SR-177. The location of this development would eliminate the significant visual impacts of the proposed Project and its visibility from the Lake Tamarisk Resort, and it would eliminate development within Williamson Act lands and the potentially significant impact related to agriculture. However, it would require development within the extremely sensitive habitats of the sand transport corridor, which supports special-status plant and wildlife species. In order to develop the full generation of the proposed Project, development of this alternative would likely require an amendment to the BLM DRECP Land Use Plan Amendment to modify the existing requirements preventing development within the sand transport corridor. Such an amendment would allow development, but would likely result in significant impacts to the species and habitats of the sand transport corridor. This alternative would also likely have more severe impacts to cultural resources due to its proximity to Palen Dry Lake, and it would result in severe dust and erosion due to disturbance of the sand transport corridor.

Alternative E: Distributed Commercial and Industrial Rooftop Solar Alternative. This alternative would involve the development of a large number of geographically distributed small to medium solar PV systems within existing developed areas throughout Riverside County. PV systems would be installed typically on the rooftops of commercial and industrial facilities. Because no new land would be developed or altered, this alternative would result in no habitat loss or grading, and aesthetics impacts would be minor in the context of existing development. Installation and maintenance would result in vehicle emissions and traffic increases similar to the proposed Project, but they would occur in a widely dispersed geographic area. Because this alternative would not include installation of 650 MW of battery storage that would be included with the proposed Project, it would not meet project objectives related to extending renewable energy availability into the evening hours.

5.3.3.5. Alternatives Comparison Summary

Table 5-1 compares the potential impacts of the proposed Project to the alternatives. The comparison focuses on the significant and unavoidable impacts of the proposed Project in the top rows of the table and then lists the Project's less than significant impacts as compared with the impacts of the alternatives.

Table 5-1. Comparison of Alternatives to the Proposed Project

<u>Environmental Resource</u>	<u>Alternative A1: No Build</u>	<u>Alternative A2: Uses Allowed by Right within Existing Land Designations</u>	<u>Alternative A3: Other Renewable Energy Development within Existing Land Designations</u>	<u>Alternative B: Reduced Footprint Alternative</u>	<u>Alternative C: Further Reduced Footprint Alternative with Berms</u>	<u>Alternative D: Offsite Alternative</u>	<u>Alternative E: Distributed Commercial and Industrial Rooftop Solar Alternative</u>

<u>Potential to Meet Project Objectives</u>							
<u>Potential to Meet Most Project Objectives?</u>	<u>NO</u>	<u>NO</u>	<u>YES</u>	<u>YES</u>	<u>YES</u>	<u>YES</u>	<u>YES</u>

* S/U = Significant and Unavoidable Impact. LTS = Less than Significant Impact

1 - "Fewer" indicates that the alternative would create reduced or fewer impacts that the Project would create. "Similar" indicates that impacts would be similar to those of the proposed Project. "Greater" indicates that the alternative would result in a greater level of impact than would the Project.

2 - Agricultural resources impacts related to parcels under Williamson Act contracts, and Aesthetic operational impacts and cumulative impacts would be significant and unavoidable for all alternatives, except the No Project-Build Alternative (A1), Offsite Alternative, and Distributed Commercial and Industrial Rooftop Solar Alternative. Cultural Resources/Tribal Cultural Resources cumulative impacts would be significant and unavoidable for all alternatives, except the No Build Alternative (A1) and Distributed Commercial and Industrial Rooftop Solar Alternative.

Environmental Resource	Alternative 1: No Project	Alternative 2: Lake Tamarisk Alternative
Aesthetics	Fewer	Fewer
Agriculture and Forestry	Fewer	Similar
Air Quality	Greater	Similar
Biological Resources	Fewer	Similar
Cultural and Tribal Cultural Resources	Fewer	Similar
Energy	Greater	Similar
Geology, Soils, and Mineral Resources	Fewer	Similar
Greenhouse Gas Emissions	Greater	Similar
Hazards and Hazardous Materials	Fewer	Similar
Hydrology and Water Quality	Fewer	Similar
Land Use and Planning	Fewer	Similar
Noise and Vibration	Fewer	Fewer
Paleontological Resources	Fewer	Similar
Population and Housing	Fewer	Similar
Public Services and Utilities	Fewer	Similar
Recreation	Fewer	Similar
Traffic and Transportation	Fewer	Similar
Wildfire	Fewer	Similar
Potential to Meet Most Project Objectives?	NO	YES

5.3.4. Comparison of the Proposed Project and No Project Alternative

There are three No Project Alternative scenarios considered. {Alternative A1} (the No Build Alternative) and Alternative A2 (Uses Allowed by Right within Existing Land Designations) would avoid impacts from the construction, operation, maintenance, and decommissioning of the proposed Project. This alternative would result in no impacts to aesthetics, agriculture, biological resources, cultural resources, geology and soils, hazards and hazardous materials, hydrology and water quality, land use and planning, noise, paleontological resources, population and housing, energy usage and under public services and utilities, recreation, and traffic and transportation, but would not realize the beneficial impacts of the Project relating to long-term to air quality and greenhouse gas emissions with the use of renewable energy generation. Additionally, site remediation of existing contamination would not occur under the No Project Alternative. The No Project Alternative does not have the potential to meet any of the Project objectives.

Alternative A3 (Other Renewable Energy Development within Existing Land Designations) would have solar, wind and/or geothermal development on the DFA lands, resulting in more significant impacts than the proposed Project.

5.3.5. Environmentally Superior Alternative

Section 15126.6 of the State CEQA Guidelines requires an EIR identify an “environmentally superior” alternative. If the “no project” alternative is the environmentally superior alternative, then the EIR must identify which of the other alternatives is environmentally superior.

Table 5-1 summarizes the comparison of impacts between the alternatives to and the proposed Project to help determine the Environmentally Superior Alternative. As presented in the comparative analysis above, the Environmentally Superior Alternative for the proposed Project evaluated in this EIR would be

the No Project Alternative A1 (No Build Alternative). No substantially adverse and long-term impacts would occur to the environment under the No Project Alternative. The No Project Alternative would also avoid the impacts of the Project, as analyzed in Section 3. However, it would not meet any Project objectives. It is possible that if the proposed Project were not approved, another solar project would be constructed, which would have impacts similar to the Project.

The Further Reduced Footprint Alternative with Berms would achieve most of the Project objectives and would be feasible to construct. In accordance with section 15126.6 of the State CEQA Guidelines, the Lake Tamarisk Alternative C, the Further Reduced Footprint Alternative with Berms, would be the Environmentally Superior Alternative since it would result in fewer impacts to aesthetics, fewer construction-related disturbance such as noise and vibration, and less ground disturbance than the proposed Project and would reduce the visual impacts of the Project on the Lake Tamarisk Desert Resort, although the visual impacts would remain significant and unavoidable and the impacts to viewers from SR-177 would be more severe.

While Alternative C is Environmentally Superior, it would result in a reduction of 80 to 110 MW of renewable energy compared to the proposed Project, which reduces its compliance with the most important project objectives (meeting State and federal renewable energy goals to counter climate change). Therefore, because Alternative B, the Reduced Footprint Alternative meets these critical project objectives and reduces impacts to the Lake Tamarisk community compared to the proposed Project, it is considered to be the next most Environmentally Superior Alternative and preferred overall.

The Lake Tamarisk Alternative would have a slightly reduced level of ground disturbance and would be a greater distance from the residences in Lake Tamarisk, which would reduce construction-related disturbances such as noise.

The Lake Tamarisk Alternative, like the proposed Project, would meet all of the Project objectives, would be feasible, would generate the same amount of renewable energy and would have the same energy storage capacity. Because the Lake Tamarisk Alternative would achieve the Project objectives and would have fewer impacts when compared to the proposed Project, the Lake Tamarisk Alternative is considered environmentally preferred.

6. LIST OF PREPARERS AND ORGANIZATIONS CONSULTED

An EIR is an interdisciplinary team effort. In addition, internal review of the document occurs throughout preparation at multiple levels. The County of Riverside was the CEQA Lead Agency. Aspen Environmental Group provided technical assistance in the preparation of this document. The preparers and technical reviewers of this document are presented below, along with a list of organizations consulted.

Table 6-1. List of Preparers and Reviewers

Name	Position	Primary Responsibility
County of Riverside – CEQA Lead Agency		
Tim Wheeler	Principal Planner	Project Planner
Darren Edgington	Environmental Project Manager	
Aspen Environmental Group		
Susan Lee	Principal-in-Charge	Quality Assurance/Quality Control
Hedy Koczwara	Project Manager	Quality Assurance/Quality Control
Brewster Birdsall, P.E.	Senior Associate	Air Quality; Greenhouse Gas Emissions; Energy; Noise and Vibration
Fritts Golden	Senior Associate	Land Use and Planning; Recreation; Traffic and Transportation; Policy Consistency
Hedy Koczwara	Senior Associate	Agriculture and Forestry Resources
Aurie Patterson, P.G.	Associate	Geology, Soils and Mineral Resources; Hazards and Hazardous Materials/Public Health and Safety; Paleontological Resources
Erin Jones	Biologist	Biological Resources
Stephanie Tang	Associate	Wildfire
Grace Weeks	Associate	Energy; Population and Housing; Public Services and Utilities; Project Description; Alternatives
Phil Lowe, P.E.	Senior Associate	Hydrology and Water Quality/ Water Resources (surface water)
Jon Davidson	Principal Associate	Technical Review and Editing
Christopher Notto	GIS Specialist	Graphics
Kati Simpson	Senior Graphic Designer	Graphics
Sharon Heesh	Associate	Document Production
Michael Clayton & Associates		
Michael Clayton	Visual Resources Specialist	Aesthetics
Chronicle Heritage		
Matt Tennyson	Principal	Cultural and Tribal Cultural Resources
Colin Recksieck	Senior Archaeologist	Cultural and Tribal Cultural Resources
GSI Water Solutions, Inc.		
Tim Thompson	Principal	Hydrology and Water Quality/Water Resources (groundwater)
Michael McAlpin	Managing Hydrogeologist	Hydrology and Water Quality/Water Resources (groundwater)

The following is a list of agencies consulted during preparation of the EIR:

- U.S. Bureau of Land Management, Palm Springs–South Coast Field Office
- U.S. Fish and Wildlife Service
- California Department of Fish and Wildlife
- U.S. Department of Defense

Appendix L

MITIGATION MONITORING AND REPORTING PROGRAM

L.1 MITIGATION MONITORING AND REPORTING TABLE

Aesthetics	
APPLICANT-PROPOSED MEASURE	<p>VIS-1: Weathering Coating of Security Fencing. To reduce operational visual impacts of the Project to the community of Lake Tamarisk, the Project owner will apply a weathering coating (Natina or substantially similar) to the Project security fencing located closest to the community. The coating would reduce reflectance, which would be visually distracting, and the earth-tone color of the coating would reduce the industrial character of the fencing and help it to blend more effectively with the surrounding landscape. The total length of fencing that will be coated is approximately one mile and may be contiguous or in separate sections, depending on the final Project design and the location(s) of most visible security fencing.</p>
Responsible Party:	Project Owner
Responsible Monitoring Party:	Riverside County and BLM
Monitoring Phase/Timing:	During Construction
Verification Approval Party:	Riverside County and BLM
MITIGATION MEASURE	<p>MM AES-1: Surface Treatment of Project Structures and Buildings. The Project owner shall treat the surfaces of all non-temporary, large Project structures and buildings (e.g., O&M building, substation components, inverters, electrical enclosures, gen-tie poles and conductors) visible to the public such that: (a) their colors minimize visual intrusion and contrast by blending with (matching) the existing characteristic landscape colors; (b) their colors and finishes do not create excessive glare from surface brightness; and (c) their colors and finishes are consistent with local policies and ordinances. The transmission line conductors shall be non-specular and non-reflective, and the insulators shall be non-reflective and non-refractive.</p> <p>Following a consultation with Riverside County and BLM visual resources specialists, and other representatives as deemed necessary, the Project owner shall submit for the County's and BLM's review, a specific Surface Treatment Plan that will satisfy these requirements. The consultation shall be in-field at the agencies' election, or as a desktop review if preferred by the agencies. The treatment plan shall include:</p> <ul style="list-style-type: none"> (a) A description of the overall rationale for the proposed surface treatment, including the selection of the proposed color(s) and finishes based on the characteristic landscape. Colors shall be field tested using the actual distances from the KOPs to the proposed structures, using the proposed colors painted on representative surfaces; (b) A list of each major Project structure and building, the transmission line towers and/or poles, and fencing, specifying the color(s) and finish proposed for each. Colors must be identified by vendor, name, and pantone number, or according to a universal designation system; (c) One set of color brochures or color chips showing each proposed color and finish; (d) A specific schedule for completion of the treatment; and (e) A procedure to ensure proper treatment maintenance for the life of the Project. The Project owner shall not specify to the vendors the treatment of any buildings or structures treated during manufacture or perform the final treatment on any buildings or structures treated in the field until the Project owner receives notification of approval of the treatment plan by Riverside County and the BLM. Subsequent modifications to the treatment plan are prohibited without the County's and BLM's

Aesthetics

approval for components under their respective authorities; however, the Project owner may consider the agencies' failure to respond to a request for review within 60 days an acceptance of the proposal.

Responsible Party: Project Owner

Responsible Monitoring Party: Riverside County and BLM

Monitoring Phase/Timing: Prior to Construction

Verification Approval Party: Riverside County and BLM

MITIGATION MEASURE **MM AES-2: Project Design.** The Project owner shall use proper design fundamentals to reduce the visual contrast to the characteristic landscape. These include proper siting and location; reduction of visibility; repetition of form, line, color, and texture of the landscape; and reduction of unnecessary disturbance. Design strategies to address these fundamentals shall be based on the following factors:

- (a) *Vegetation Manipulation:* Retain as much of the existing vegetation as possible including along roadsides to intercept sightlines from public vantage points. Use existing vegetation to screen the development from public viewing and lessen the visibility of structural contrast and glare. Use scalloped, irregular, cleared edges to reduce line contrast. Use irregular clearing shapes to reduce form contrast. Feather and thin the edges of cleared areas and retain a representative mix of plant species and sizes.
- (b) *Structures:* Minimize the number of structures and combine different activities in one structure. Use natural, self-weathering materials and chemical treatments on surfaces to reduce color contrast and the potential for reflectance (glare). Bury all or part of structures to the extent practical. Use natural-appearing forms to complement the characteristic landscape. Screen the structure from view by using natural landforms and vegetation. Reduce the line contrast created by straight edges.
- (c) *Linear Alignments:* Use existing topography to hide induced changes associated with roads, lines, and other linear features. Select alignments that follow landscape contours. Avoid fall-line cuts. Hug vegetation lines.
- (d) *Reclamation and Restoration:* Reduce the amount of disturbed area and blend the disturbed areas into the characteristic landscape. Where feasible, replace soil, brush, rocks, and natural debris over disturbed area. Newly introduced plant species should be of a form, color, and texture that blends with the landscape.

Responsible Party: Project Owner

Responsible Monitoring Party: Riverside County and BLM

Monitoring Phase/Timing: Prior to and During Construction

Verification Approval Party: Riverside County and BLM

MITIGATION MEASURE **MM AES-3: Night Lighting Management.** To the extent feasible, consistent with safety and security considerations, the Project owner shall design and install all permanent exterior lighting and all temporary construction lighting such that: (a) lamps and reflectors are not visible from beyond the Project site, including any off-site security buffer areas; (b) lighting does not cause excessive reflected glare; (c) direct lighting does not illuminate the nighttime sky, except for required FAA aircraft safety lighting; (d) illumination of the Project and its immediate area is minimized; and (e) it complies with local policies and ordinances.

Aesthetics

The Project owner shall also consult with the NPS Night Sky Program Manager in the development of the night lighting and comply with stricter standards for light intensity. All permanent light sources shall be below 3,500 Kelvin color temperature (warm white) and shall have cutoff angles not to exceed 45 degrees of nadir. The use of LED lighting with a Correlated Color Temperature (CCT) above 2,700 would introduce blue light into the environment that would have negative impacts on the night skies, wildlife, and visitors, and increase light pollution in that area. If LED light bulbs are used, they shall have a CCT of 2,700 or less. All lights, temporary and permanent, are to be fully shielded such that the emission of light above the horizontal is prevented. Prior to construction, the Project owner shall submit to BLM, Riverside County, and NPS JTNP for review a Night Lighting Management Plan that shall include the following:

- (a) Location and direction of light fixtures that take the lighting mitigation requirements into account;
- (b) Lighting that incorporates fixture hoods/shielding, with light directed downward or toward the area to be illuminated;
- (c) Light fixtures, which are visible from beyond the Project boundary, that have cutoff angles that are sufficient to prevent lamps and reflectors from being visible beyond the Project boundary, except where necessary for security;
- (d) All lighting that is of minimum necessary brightness consistent with operational safety and security;
- (e) Lights in high illumination areas not occupied on a continuous basis (such as maintenance platforms) that have (in addition to hoods) switches, timer switches, or motion detectors so that the lights operate only when the area is occupied;
- (f) Specification that LPS or amber LED lighting shall be emphasized, and that white lighting (metal halide) would: (a) only be used when necessitated by specific work tasks; (b) not be used for dusk-to-dawn lighting; and (c) would be less than 3500 Kelvin color temperature;
- (g) Specifications and mapping for of all lamp locations, orientations, and intensities, including security, roadway, and task lighting;
- (h) Specifications for each light fixture and each light shield;
- (i) Total estimated outdoor lighting footprint expressed as lumens or lumens per acre;
- (j) Specifications on the use of portable truck-mounted lighting;
- (k) Specifications for motion sensors and other controls to be used, especially for security lighting;
- (l) Surface treatment specifications that shall be employed to minimize glare and skyglow;
- (m) Documentation that the necessary coordination with the NPS Night Sky Program Manager has occurred; and
- (n) Exterior lighting that complies with current Title 24 regulations from the State of California and that shall be coordinated with the California Department of Transportation (Caltrans) to comply with exterior lighting regulations along I-10 and SR-177.

Responsible Party: Project Owner

Responsible Monitoring Party: Riverside County, BLM, and NPS JTNP (review party)

Monitoring Phase/Timing: Prior to Construction

Verification Approval Party: Riverside County and BLM

Air Quality

**MITIGATION
MEASURE**

MM AQ-1: Fugitive Dust Control Plan. The Project owner, its contractor, or its subcontractor shall prepare and implement a Fugitive Dust Control Plan to address fugitive dust emissions during Project construction, operation, maintenance, and decommissioning. The plan shall include measures to minimize fugitive dust emissions from the commencement of construction activities through operations, maintenance, and decommissioning. In the case where the contractor obtains permit coverage under SCAQMD Rule 403, that permit and associated plan will be incorporated into the final Fugitive Dust Control Plan prepared by the Project owner. During construction, the Project owner, its contractor, and subcontractors shall take every reasonable precaution to prevent all airborne fugitive dust plumes from leaving the Project site, to prevent visible particulate matter from being deposited upon public roadways, and shall adhere to the SCAQMD rules. The plan shall be subject to review and approval by the SCAQMD (Rule 403).

The following measures shall be included within the plan:

- Prior to commencing construction, the Project owner, its contractor, or its subcontractor shall designate and retain for the duration of construction a Dust Control Supervisor. The Dust Control Supervisor shall have successfully completed the SCAQMD Rule 403 dust control compliance training class. The Dust Control Supervisor shall have full access to all areas of construction on the Project site, gen-tie line, and other linear facilities and shall have the authority to stop any or all construction activities as warranted by applicable construction mitigation conditions.
- During construction, all unpaved roads, disturbed areas (e.g., areas of scraping, excavation, backfilling, grading, and compacting), and loose materials generated during construction activities shall be stabilized with a non-toxic soil stabilizer or soil weighting agent or watered two times daily or as frequently as necessary to minimize fugitive dust generation. Non-water-based soil stabilizers shall be as efficient as or more efficient for fugitive dust control than ARB-approved soil stabilizers and shall not increase any other environmental impacts, including loss of vegetation, adverse odors, or emissions of ozone precursor reactive organic gases (ROG) or volatile organic compounds (VOC). The proposed soil stabilizing products shall be listed in the Plan and are subject to review and approval by Riverside County, BLM, and CDFW. Any soil stabilizers proposed shall be consistent with those recommended in the Stormwater Pollution Prevention Plan (SWPPP) and shall also be approved for use by the project's Restoration Specialist to ensure that the products would not impede restoration goals.
- The main access roads through the site shall be either paved or stabilized using soil binders, or equivalent methods, to provide a stabilized surface that is similar for the purposes of dust control to paving, that may or may not include a crushed rock (gravel or similar material with fines removed) top layer, prior to commencing construction. Delivery, laydown, and staging areas for construction or operations and maintenance supplies shall be paved or stabilized prior to taking initial deliveries.
- Grading and earthwork activities, including vegetation removal, cut and fill movement, and soil compacting, shall be phased across the site to minimize the amount of exposed or disturbed area on any single day.
- No vehicle shall exceed 15 miles per hour on unpaved areas within the site, with the exception that vehicles may travel up to 25 miles per hour on stabilized unpaved roads as long as such speeds do not create visible dust emissions or conflict with other permit conditions.
- Visible speed limit signs shall be posted at the construction site entrances.

Air Quality

- All construction equipment vehicle tires shall be inspected and washed as necessary to be cleaned free of dirt prior to entering paved roadways.
- All unpaved exits from the construction site shall be graveled or treated to prevent track-out onto public roadways. No person shall allow track-out to extend 25 feet or more in cumulative length from the point of origin from an active operation. All track out from an active operation shall be removed immediately if it extends over 25 feet or if under 25 feet, at the end of each workday.
- All paved roads within the construction site shall be swept daily or as needed (less during periods of precipitation) on days when construction activity occurs to prevent the accumulation of dirt and debris.
- At least the first 500 feet of any paved public roadway exiting the construction site or exiting other unpaved roads to access the construction site or staging areas shall be swept as needed when dirt or runoff resulting from the construction activities is visible on the paved public roadway.
- Consistent with SCAQMD Rule 403(g)(2), regarding exemptions, contingency control measures may be implemented during “high wind” conditions, when instantaneous wind speeds exceed 25 miles per hour. The contingency measures for high wind events shall include: Cease all active operations; Stop all vehicular traffic; Apply water to soil not more than 15 minutes prior to moving such soil; Apply chemical stabilizers prior to wind event; and/or Apply water to all unstabilized disturbed areas 3 times per day, unless there is evidence of wind driven fugitive dust, then increase watering frequency to a minimum of four times per day.

Responsible Party: Project Owner

Responsible Monitoring Party: SCAQMD

Monitoring Phase/Timing: Prior to and during construction

Verification Approval Party: SCAQMD

MITIGATION MEASURE **MM AQ-2: Control On-Site Off-Road Equipment Emissions.** The Project owner, when entering into construction contracts or when procuring off-road equipment or vehicles for on-site construction or O&M activities, shall ensure that only new model year equipment or vehicles are obtained. The following measures shall be included with contract or procurement specifications:

- All construction diesel engines not registered under California Air Resources Board’s Statewide Portable Equipment Registration Program, with a rating of 50 hp or higher shall meet the Tier 4 California Emission Standards for Off-Road Compression-Ignition Engines, as specified in California Code of Regulations, Title 13, section 2423(b)(1).
- All diesel-fueled engines used in the construction of the facility shall have clearly visible tags showing that the engine meets the standards of this measure.
- All equipment and trucks used in the construction or O&M of the facility shall be properly maintained and the engines tuned to the engine manufacturer’s specifications.
- All diesel heavy construction equipment shall not idle for more than five minutes. Vehicles that need to idle as part of their normal operation (such as concrete trucks) are exempted from this requirement.

Responsible Party: Project Owner

Responsible Monitoring Party: Riverside County and BLM

Monitoring Phase/Timing: Prior to and during construction; during operations

Air Quality

Verification Approval Party: Riverside County and BLM

Biological Resources

**MITIGATION
MEASURE**

MM BIO-1: Biological Monitoring. Monitoring to ensure conformance with conditions of approval, including effective protection and avoidance of biological resources, shall be implemented by the Applicant as follows:

Biological Monitoring Team. During construction and decommissioning, the Applicant shall employ a biological monitoring team to oversee Project activities. Any activity that may impact vegetation, wildlife, and sensitive resources shall be monitored to ensure compliance with all mitigation measures for biological resources.

The biological monitoring team shall consist of:

- **Lead Biologist:** The Applicant shall assign a Lead Biologist, approved by Riverside County, BLM, CDFW, and USFWS as the primary point of contact for the BLM and resource agencies regarding biological resources mitigation and compliance. The Lead Biologist shall have an approved MOU with Riverside County prior to commencing work on the Project.
- **Biological Monitor:** Biological monitors shall be overseen by the Lead Biologist and shall perform any required surveys, ground disturbance and construction monitoring, wildlife monitoring, inspections, marking sensitive resource buffers, and revegetation monitoring during Project activities. Biological monitors shall include trained desert tortoise monitors (MM BIO-7) and nest monitors (MM BIO-8).
- **Authorized Desert Tortoise Biologist:** For desert tortoise protection measures (MM BIO-7), the Applicant shall nominate a qualified individual to serve as Authorized Desert Tortoise Biologist, for approval by the USFWS and CDFW.

The Applicant shall provide the resumes of the proposed Biological Monitoring Team to the BLM and Riverside County for approval prior to onset of ground-disturbing activities. The Biological Monitoring Team shall have demonstrated expertise with the biological resources within the Project region. The Biological Monitoring Team shall have authority to halt any activities in any area if it is determined that the activity, if continued, would cause an unauthorized adverse impact to biological resources.

The duties of the Biological Monitoring Team shall vary during the construction, O&M, and decommissioning phases, based on the biological monitoring tasks needed for compliance during each phase. During O&M, an Applicant staff member serving as a compliance manager may perform the duties of the Lead Biologist to ensure compliance with biological mitigation measures, such as performing inspections for entrapped wildlife and fence condition, reporting dead or injured wildlife, avoiding nesting birds, and inspections of panel washing. The Applicant's compliance manager, if serving as Lead Biologist during O&M, shall have an approved MOU with Riverside County prior to commencing Lead Biologist duties on the Project.

In general, the duties of the Lead Biologist shall include, but shall not be limited to:

- Regular, direct communication with representatives of the BLM, and other agencies, as appropriate. The Lead Biologist, or during O&M, the Applicant's compliance manager, shall immediately notify the BLM and applicable resource agencies in writing of dead or injured special-status species, or of any non-compliance with biological mitigation measures or permit conditions.
- Train and supervise Biological Monitors, including desert tortoise monitors, nest monitors, and construction monitors.

Biological Resources

- Conduct or oversee Worker Environmental Awareness Program (WEAP) training (MM BIO-2).
- During construction and decommissioning, clearly mark and inspect sensitive biological resource areas in compliance with regulatory terms and conditions.
- Oversee wildlife clearance surveys, ground disturbance and grading, and biological monitoring. Ensure that all biological monitoring is completed properly and on schedule.
- Conduct or oversee bi-weekly compliance inspections during ground-disturbing activities and communicate any remedial actions needed (i.e., trash, fence, weed maintenance; wildlife mortality) to maintain compliance with mitigation measures.

Reporting. The Lead Biologist, or during O&M, the Applicant's compliance manager, shall report regularly to the BLM and Riverside County to document the status of compliance with biological mitigation measures.

During construction and decommissioning:

- Provide weekly verbal or written updates to the BLM with any information pertinent to the BLM and Riverside County, to resource agencies, or to state or federal permits for biological resources.
- Prepare and submit monthly and annual compliance reports to include a summary of Project activities that occurred, biological resources surveys and monitoring that were performed, any sensitive or noteworthy species observed, weed infestations removed, and non-compliance issues and remedial actions that were implemented.

During O&M:

- Conduct quarterly compliance inspections and reporting, to be submitted to the BLM and Riverside County, to document the condition of exclusion fencing, wildlife mortality, and any biological resource issues of note.

Responsible Party:	Project Owner
Responsible Monitoring Party:	Riverside County and BLM
Monitoring Phase/Timing:	Prior to and during construction
Verification Approval Party:	Riverside County and BLM

MITIGATION MEASURE	<p>MM BIO-2: Worker Environmental Awareness Training. The Lead Biologist shall prepare and implement a Worker Environmental Awareness Program (WEAP). The Applicant shall be responsible for ensuring that all workers at the site receive WEAP training prior to beginning work on the Project and receive annual refresher trainings throughout construction, operations, and decommissioning. The WEAP shall be available in English and Spanish. The Applicant shall submit the WEAP to the lead agency and resource agencies for approval prior to implementation. The WEAP will:</p> <ul style="list-style-type: none"> ■ Be developed by or in consultation with the Lead Biologist and consist of an on-site or training center presentation with supporting written material and electronic media, including photographs of protected species, available to all participants. ■ Provide an explanation of the function of flagging that designates authorized work areas; specify the prohibition of soil disturbance or vehicle travel outside designated areas. ■ Discuss general safety protocols such as vehicle speed limits, hazardous substance spill prevention and containment measures, and fire prevention and protection measures.
---------------------------	---

Biological Resources

- Review mitigation and biological permit requirements.
- Explain the sensitivity of the vegetation and habitat within and adjacent to work areas, and proper identification of these resources.
- Discuss the federal and state Endangered Species Acts, Bald and Golden Eagle Protection Act, and the Migratory Bird Treaty Act and the consequences of non-compliance with these acts.
- Discuss the locations and types of sensitive biological resources on the Project site and adjacent areas and explain the reasons for protecting these resources.
- Inform participants that no snakes, other reptiles, birds, bats, or any other wildlife shall be harmed or harassed.
- Place special emphasis on species that may occur on the Project site and/or geologic lines, including special-status plants, Crotch bumble bee, desert tortoise, burrowing owl, golden eagle, nesting birds, desert kit fox, American badger, and burro deer.
- Specify guidelines for avoiding rattlesnakes and reporting rattlesnake observations to ensure worker safety and avoid killing or injuring rattlesnakes. Rattlesnakes should be safely removed from the work area using appropriate snake handling equipment, including a secure storage container for transport, or by calling local animal control.
- Describe workers' responsibilities for avoiding the introduction of invasive weeds onto the Project site and surrounding areas, describe the Integrated Weed Management Plan.
- Provide contact information for the Lead Biologist and instructions for notification of any vehicle-wildlife collisions or dead or injured wildlife species encountered during Project-related activities.
- Include a training acknowledgment form to be signed by each worker indicating that they received training and shall abide by the guidelines.
- Desert Tortoise Education Requirements: Prior to the start of construction activities, a desert tortoise education program shall be presented by the Lead Biologist to all personnel who will be present on Project work areas. Following the start of construction, any new employee shall be required to complete the tortoise education program prior to working on site. At a minimum, the tortoise education program shall cover the following topics:
 - (a) A detailed description of the desert tortoise, including color photographs;
 - (b) The distribution and general behavior of the desert tortoise;
 - (c) Sensitivity of the species to human activities;
 - (d) The protection the desert tortoise receives under the state and federal Endangered Species Acts, including prohibitions and penalties incurred for violation;
 - (e) The protective measures being implemented to conserve the desert tortoise during construction activities;
 - (f) Procedures and a point of contact if a desert tortoise is observed on site.

Responsible Party: Project Owner

Responsible Monitoring Party: Riverside County

Monitoring Phase/Timing: Prior to beginning work on the project and throughout construction and operations

Verification Approval Party: Riverside County and BLM

Biological Resources

MITIGATION MEASURE

MM BIO-3: Minimization of Vegetation and Habitat Impacts. Prior to ground-disturbing activities during construction, O&M, or decommissioning, authorized work areas shall be clearly delineated and sensitive resources that require avoidance would be flagged by the Lead Biologist. These areas shall include, but not be limited to, staging areas, access roads, and sites for temporary placement of construction materials and spoils. Delineation may be implemented with common orange vinyl “fencing” or staking to clearly identify the limits of work and will be verified by the Lead Biologist. No paint or permanent discoloring agents shall be applied to rocks or vegetation (to indicate surveyor construction activity limits or for any other purpose). Fencing/staking shall remain in place for the duration of construction. Spoils shall be stockpiled in disturbed areas. All disturbances, vehicles, and equipment shall be confined to the fenced/flagged areas.

Construction activities shall minimize soil and vegetation disturbance and onsite construction/vehicle trips to minimize impacts to soil and root systems. Erosion control shall be implemented as described in the Drainage Erosion and Sedimentation Control Plan (DESCP) (MM HWQ-1), which requires identification of erosion treatments for exposed soil, such as chemical-based dust pallatives, soil bonding, and weighting agents suitable for use around vegetation. Additional BMPs, as committed to by the Applicant and incorporated into the Project Description, are described in Section 2.7 and include designation of primary travel routes, limiting grading to specific areas, building racking material in laydown areas to minimize use of roads, using equipment with smaller rubber-wheeled vehicles, maintaining hydrologic flow patterns, and preserving propagule islands to support vegetation recovery.

Upon completion of construction activities in any given area, all unused materials, equipment, staking and flagging, and refuse shall be removed and properly disposed of, including wrapping material, cables, cords, wire, boxes, rope, broken equipment parts, twine, strapping, buckets, and metal or plastic containers. Any unused or leftover hazardous products shall be properly disposed of off-site in accordance with applicable legal requirements.

Hazardous materials shall be handled in accordance with applicable legal requirements, and spills or leaks shall be promptly corrected and cleaned up according to applicable legal requirements. Vehicles shall be properly maintained to prevent spills or leaks. Hazardous materials, including motor oil, fuel, antifreeze, hydraulic fluid, grease, shall not be allowed to enter drainage channels.

Low-Impact Site Preparation and O&M. Native vegetation shall be allowed to recover from rootstocks and seed bank wherever facilities do not require permanent vegetation removal (e.g., access roads, foundations, paved areas, or fire clearance requirements) within the perimeter fenceline of the solar facilities and under solar arrays. Project BMPs (Section 2.7.2) to minimize impacts during site preparation require that primary travel routes be designated through panel arrays to minimize disturbance between rows; that grading be limited to specific areas, including roads, substation, O&M facilities, laydown areas, some equipment pads, and in discrete areas within the arrays; and that small rubber-wheeled equipment be used.

During O&M, vegetation height and density shall be managed as needed for fire safety and operation of the solar panels. Onsite vegetation that re-establishes under the solar panels will be periodically trimmed to a height no more than 12 inches, to avoid interference with the panels. Vegetation may require trimming approximately once every three years, as needed. Revegetation of native habitat and protection of erosive

Biological Resources

soils shall be implemented in temporary impact areas, as described in MM BIO-4 and MM BIO-5.

Compensation for impacts to Desert Pavement. Compensatory mitigation for impacts to desert pavement shall be identified prior to disturbance of the features at a minimum 1:1 ratio, in coordination with BLM and CDFW.

Responsible Party: Project Owner

Responsible Monitoring Party: Riverside County

Monitoring Phase/Timing: Prior to ground disturbance and during construction

Verification Approval Party: Riverside County

MITIGATION MEASURE

MM BIO-4: Integrated Weed Management Plan. The Applicant shall prepare and implement an Integrated Weed Management Plan (IWMP) to minimize or prevent invasive weeds from infesting the site or spreading into surrounding habitat.

The IWMP must comply with existing relevant BLM plans and permits including the Vegetation Treatments Using Herbicides (BLM, 2007) and Vegetation Treatment Using Aminopyralid, Fluroxypyr, and Rimsulfuron (BLM, 2016b), and must be approved by BLM and Riverside County (or its designated representative). Use of any pesticides would conform with licensing and application requirements from the California Department of Pesticide Regulation.

Prior to herbicide use on BLM-administered lands, the BLM requires that a Pesticide Use Proposal (PUP) (BLM, 2019) be submitted to ensure that Projects follow herbicide use policies. If herbicides or pesticides will be used on BLM lands, the Applicant shall submit a Pesticide Use Proposal (PUP) form, to be approved by the BLM (also see Section 3.10.5 on hazardous materials). The PUP details which herbicides, pesticides, and associated adjuvants will be used for treatment, location of applications, responsible parties, time-line for treatment, application methods, application rates and maximum annual amounts, target species, and precautions for humans, sensitive resources, and non-target vegetation. Only a State of California and federally certified contractor will be permitted to perform herbicide applications. Only herbicides and adjuvants approved by the State of California and BLM for use on public lands will be used within or adjacent to the federal land segments of the Project.

The Applicant shall submit the BLM approved PUP to Riverside County and implement the requirements of the PUP on private lands.

The IWMP shall require that cover and density of non-native plants within temporarily disturbed areas will be no more than 25% of total cover, or no more than comparable adjacent undisturbed lands. Total cover on the Project site shall be calculated during the annual quantitative monitoring as required in the Vegetation Resources Management Plan (MM BIO-5), which shall complement the IWMP. Quantitative monitoring shall be performed using California Native Plant Society (CNPS) Combined Vegetation Rapid Assessment and Relevé Protocol (CNPS, 2022). Qualitative and quantitative vegetation monitoring will continue for a period of no less than three (3) years or until the defined success criteria are achieved (up to 5 years).

Biological Resources

PLAN REQUIREMENTS

Consistent with DRECP CMA LUPA-BIO-10 (Standard Practices for Weed Management), the Plan shall include:

- Plan objectives, including weed prevention, identification, and control via eradication, suppression, and containment;
- A list and discussion of weed species occurring or potentially occurring in the Project area, including Cal-IPC threat rankings;
- Role and responsibilities of a Weed Management Biologist, who will track, manage, and coordinate weed management activities;
- A discussion of methods to prevent introduction or spread of weeds, including worker training, vehicle cleaning and inspections, and use of weed-free seed, erosion control materials, and other construction material (gravel, sand, fencing);
- Requirements for annual monitoring of the Project site and 100-foot buffer in the early spring and late summer/early fall during construction, O&M, and decommissioning, and for 5 years after decommissioning;
- A description of monitoring methods to identify and map infestations;
- A description of manual and mechanical treatments that may be used to suppress, contain, or eradicate invasive weeds, such as use of hand or power tools, hand pulling, and soil solarization;
- A description of chemical treatments (herbicide) that may be used, including permitting and regulatory requirements for use, types of herbicides to be used such as pre-emergent, post-emergent, selective, and non-selective and the weeds they affect, application methods and rates, handling and cleanup procedures, and best practices to minimize impacts of herbicide use on wildlife and native vegetation, such as suspending treatments when winds are high or if precipitation is imminent, mixing herbicides over a drip pan at least 200 feet from open or flowing water, inspecting containers for leaks, and maintaining spill kits in vehicles and storage areas;
- A requirement for any herbicides used to meet the requirements of the BLM Vegetation Treatment guidelines (BLM, 2007; BLM, 2016b) and be implemented in accordance with the PUP (BLM, 2019);
- A description of reporting, to require management and monitoring reports during construction, O&M and decommissioning, and for 5 years after decommissioning;
- Annual reports shall include the location, species, extent, and density of weeds; a description of management efforts, dates, locations, types of treatment, and results; and a summary of preventative measures such as vehicle wash logs and facilities and success of measures.

Responsible Party:	Project Owner
Responsible Monitoring Party:	Riverside County and BLM
Monitoring Phase/Timing:	Prior to ground disturbance and during construction, operation, maintenance, and decommissioning
Verification Approval Party:	Riverside County, CDFW, and BLM
MITIGATION MEASURE	MM BIO-5: Vegetation Resources Management Plan. The Applicant shall prepare and implement a Vegetation Resources Management Plan (VRMP), to be reviewed and approved by USFWS, CDFW, BLM, and Riverside County (or its designated representative). The VRMP shall detail the methods to revegetate temporarily impacted sites and salvage

Biological Resources

special-status plants from the Project footprint; and outline long-term vegetation management within the solar facility during its operations. The Lead Biologist shall oversee implementation of the VRMP to meet success criteria and prevent further degradation of areas temporarily disturbed by Project activities.

The Plan shall require that total native vegetation cover will be no less than 80% of total vegetation cover on nearby undisturbed lands of comparable quality. Project sites previously disturbed by anthropogenic activities will be compared to nearby, similarly pre-disturbed sites.

As described below, total cover on the Project site shall be calculated during the annual quantitative monitoring as required in the VRMP, using California Native Plant Society (CNPS) Combined Vegetation Rapid Assessment and Relevé Protocol (CNPS, 2022).

Transplantation of cacti and ocotillo shall be considered successful with 75% survival after 3 years. If unsuccessful, remediation will be implemented to plant additional cacti at a 2:1 ratio.

PLAN REQUIREMENTS

Consistent with DRECP CMAs LUPA-BIO-7 (Restoration of Areas Disturbed by Construction Activities but Not Converted by Long-Term Disturbance), LUPA-BIO-VEG-1 (vegetation management for cactus, yucca, and other succulents under BLM policy), and LUPA-BIO-VEG-5 (adherence to BLM regulations and policies regarding salvage and transplants of cactus, yucca, other succulents, and BLM sensitive plants), the Plan shall include:

- *Revegetation of temporarily impacted sites.* The Plan shall specify methods to prevent or minimize further site degradation; stabilize soils; maximize the likelihood of vegetation recovery over time (for areas supporting native vegetation); and minimize soil erosion, dust generation, and weed invasions. The nature of revegetation will differ according to each site, its pre-disturbance condition, and the nature of the construction disturbance (e.g., drive and crush, vs. blading). Revegetation and monitoring will be performed in accordance with CNPS Combined Vegetation Rapid Assessment and Relevé Protocol (CNPS, 2022). Additional restoration guidance is provided in Abella and Berry 2016, and Abella et al. 2023, which describe techniques for restoring Mojave and western Sonoran habitats and desert tortoise habitat. New techniques, as available at the time of revegetation, will be integrated into vegetation management and adaptive management. The Plan shall include:
 - soil preparation measures, including locations of recontouring, decompacting, imprinting, or other treatments, as prescribed by the Lead Restoration Ecologist and consistent with CNPS Combined Vegetation Rapid Assessment and Relevé Protocol (CNPS, 2022);
 - (a) details for topsoil storage, as applicable;
 - (b) plant material collection and acquisition guidelines, including guidelines and methods for salvaging, storing, and handling seed and plants (including desert native species protected by the CDNPA and special-status plants) from the Project site, as well as obtaining replacement plants from outside the Project area (seed and plant palettes and materials shall be limited to locally occurring native species from local sources);
 - (c) a plan drawing or schematic depicting the temporary disturbance areas (drawing of “typical” gen-tie structure sites will be appropriate);
 - (d) time of year that the planting or seeding will occur and the methodology of the planting;

Biological Resources

- (e) maintenance details, including vegetation treatments; a description of the irrigation, if used; erosion control measures; and non-native weed management per the IWMP;
 - (f) quantitative success criteria for regrowth of vegetation, requiring at least 80% native cover and no more than 20% non-native cover;
 - (g) a monitoring program to measure project compliance with the success criteria, including annual quantitative monitoring in accordance with CNPS Combined Vegetation Rapid Assessment and Relevé Protocol (CNPS, 2022);
 - (h) contingency measures for failed revegetation efforts not meeting success criteria, which may include, but is not limited to, reseeding, re-planting, erosion repairs, modifications to irrigation, and repair or remediation of sites;
 - (i) annual monitoring reports to be submitted to BLM and Riverside County (or its designated representative), providing a summary of the restoration and adaptive management activities for the previous year.
- **Cactus Salvage.** The Applicant shall include salvaged or nursery stock yuccas (all species), and cacti (excluding cholla species, genus *Cylindropuntia*) in revegetation plans. The Plan shall include:
- (a) methods of salvage, including heavy equipment or hand tools, depending on plant size. For each plant, the microsite description will be recorded and the north-facing orientation will be identified and tagged.
 - (b) to the extent feasible, plants shall be salvaged during the fall or winter to minimize transplantation stress. If cacti must be salvaged during spring or summer, they shall be held over in a shade structure and protected from wind and heat until fall for transplantation. If cacti must be installed during spring or summer, shade structures or “vertical mulch” (branches cleared from the work sites) will be provided as shelter from sun and wind.
 - (c) guidelines for removing plants, such that plants are dug to avoid root damage. Roots shall be treated, as necessary, and plants shall be transported to avoid root damage.
 - (d) guidelines for storing plants, such that cacti and ocotillo shall be stored only when unavoidable. Plants shall be kept shaded and roots kept moist;
 - (e) specific replanting locations shall be identified within Project lands, such as revegetation areas on temporarily disturbed work sites, unless directed otherwise by BLM (for BLM land) or the County (for private land);
 - (f) methods for re-planting, ensuring that each salvaged plant shall be replanted in a microsite that resembles its salvage site and in the same north-facing orientation as the salvage site. Salvaged plants shall be covered deeply enough with soil to prevent root exposure and watered immediately after planting and at regular intervals thereafter based on needs of each species.
 - (g) quantitative success criteria for survival, requiring at least 75% survival after 3 years. If this criterion is not met, remediation shall be implemented to plant additional cacti at a 2:1 ratio or increase native vegetation cover and diversity at Project site.
 - (h) a monitoring program to measure Project compliance with the success criteria, including quarterly quantitative monitoring of survival status and identification of remedial actions needed, such as water, shade, or protection from wind, erosion,

Biological Resources

or wildlife. Results of monitoring shall be included in the annual monitoring report, as described above.

- (i) seeds from special-status plants, if found, would be salvaged for re-vegetation. CRPR 1 or 2 species that are found shall be experimentally salvaged. No quantitative success criteria are assigned for experimental salvage; however, monitoring data shall be provided to the CDFW, Riverside County, and BLM to inform future mitigation for those species.

Operations Phase On-Site Vegetation Management. The Plan shall include mowing methods and scheduling for on-site vegetation management during O&M. The Plan shall describe vegetation treatments to be implemented to minimize interference with the solar panels, fire hazard, soil disturbance, and disturbance of any bird nests. Vegetation shall be inspected annually to identify hazardous vegetation or barren areas prone to erosion that require repair. All mowed or cut plant material that contains invasive weeds will be transported to a licensed solid waste or composting facility. Mowed or cut native plant material may be used on site as mulch. Weed control during O&M will be conducted as described in the IWMP (MM BIO-4).

Responsible Party:	Project Owner
Responsible Monitoring Party:	Riverside County and BLM
Monitoring Phase/Timing:	Prior to ground disturbance and during construction and operation
Verification Approval Party:	Riverside County, CDFW, and BLM
MITIGATION MEASURE	<p>MM BIO-6: Wildlife Protection. The Applicant shall undertake the following measures during construction and O&M to avoid or minimize impacts to wildlife. Implementation of all measures shall be subject to review and approval by BLM and Riverside County (or its designated representative).</p> <ul style="list-style-type: none"> ■ <i>Wildlife avoidance.</i> Project activities shall minimize interference with wildlife (including ground-dwelling species, birds, bats) by allowing animals to escape from a work site prior to disturbance; conducting pre-construction surveys and exclusion measures for certain species as specified in other measures; checking existing structures (homes, trailers, etc.) for animals such as bats, barn owls, skunks, or snakes that may be present, and safely excluding them prior to removing the structures. ■ <i>Minimize traffic impacts.</i> The Applicant shall specify and enforce maximum vehicle speed limits as specified in the Traffic Control Plan, to minimize risk of wildlife collisions and fugitive dust. ■ <i>Minimize lighting impacts.</i> Night lighting, when in use, shall be designed, installed, and maintained to prevent side casting of light towards surrounding fish or wildlife habitat. ■ <i>Avoid use of toxic substances.</i> Soil bonding and weighting agents used for dust suppression on unpaved surfaces shall be non-toxic to wildlife and plants. ■ <i>Minimize noise and vibration impacts.</i> The Applicant shall conform to noise requirements specified in the noise analysis of this EIR to minimize noise to off-site habitat. ■ <i>Water.</i> Potable and non-potable water sources such as tanks, ponds, and pipes shall be covered or otherwise secured to prevent animals (including birds) from entering. Prevention methods may include storing water within closed tanks or covering open tanks with 2-centimeter netting. Dust abatement shall use the minimum amount of water on dirt roads and construction areas to meet safety and air quality standards. Water sources (e.g., hydrants, tanks, etc.) shall be checked periodically by biological monitors to ensure they do not create puddles.

Biological Resources

- *Trash.* All trash and food-related waste shall be contained in vehicles or covered trash containers inaccessible to ravens, coyotes, or other wildlife and removed from the site regularly.
- *Workers.* Workers shall not feed wildlife or bring pets to the Project site. Except for law enforcement personnel, no workers or visitors to the site shall bring firearms or weapons.
- *Wildlife exclusion.* The Applicant may install temporary or permanent exclusion fencing around equipment, work areas, or Project facilities to prevent wildlife exposure to hazards such as toxic materials or vehicle strikes. If fencing is not used, openings in stored equipment that would allow for entry of wildlife shall be secured with tape or other covering to prevent entrapment. The biological monitor shall perform inspections of equipment prior to use to ensure that no birds have nested on stored equipment and that no wildlife has become entrapped. The biological monitor will inspect exclusion fence (if installed) weekly.
- *Wildlife entrapment.* Project-related excavations, trenches, auger holes, and water tanks shall be secured or covered to prevent wildlife entry, entrapment, and drowning. Holes and trenches shall be backfilled, securely covered, or fenced. Open water tanks shall be covered or shall have other means of exit provided to prevent wildlife from drowning. Excavations that cannot be fully secured shall incorporate wildlife ramp or other means to allow trapped animals to escape. At the end of each workday, a biological monitor shall ensure that excavations and water tanks have been secured or provided with appropriate means for wildlife escape.
- *All pipes or other construction materials or supplies* shall be covered or capped in storage or laydown areas. Netting shall be installed over porta-potty vents. No pipes or tubing shall be left open either temporarily or permanently, except during use or installation. Any construction pipe, culvert, or other hollow materials shall be inspected for wildlife before it is moved, buried, or capped.
- *Dead or injured wildlife* shall be reported immediately to USFWS (for federally listed species and migratory birds) and CDFW (for all wildlife) and/or the local animal control agency, as appropriate, by the Lead Biologist (or the Applicant's compliance manager during O&M). Procedures for handling of dead or injured wildlife shall be outlined in a Wildlife Protection Plan, in coordination with CDFW. A Special Purpose Utility Permit (SPUT) would be acquired from the USFWS prior to collection of migratory bird carcasses. A biological monitor shall safely move the carcass out of the road or work area if needed and dispose of the animal as directed by the agency. If an animal is entrapped, a biological monitor shall free the animal if feasible, work with construction crews to free it in compliance with safety requirements, or work with animal control, USFWS, or CDFW to resolve the situation.
- *Pest control.* No anticoagulant rodenticides, such as Warfarin and related compounds (indandiones and hydroxycoumarins), may be used within the Project site, on off-site Project facilities and activities, or in support of any other Project activities.

Measures for Crotch bumble bee

- All on-site personnel shall be required to attend the Worker Environmental Awareness Training Program, as detailed in MM BIO-2, that includes education program on identification and avoidance of Crotch bumble bee and nests.

Biological Resources

- If a live individual is detected during pre-construction surveys, or incidentally, the Applicant shall take adaptive management actions in coordination with CDFW, considering CDFW guidance and best management practices at the time of the occurrence.
- Pre-construction surveys would include inspection for Crotch bumble bee nests. If any are located, CDFW would be notified and a no-disturbance buffer of at least 50 feet would be demarcated as determined by the Lead Biologist, in coordination with CDFW.

Responsible Party: Project Owner

Responsible Monitoring Party: Riverside County, USFWS, CDFW, and BLM

Monitoring Phase/Timing: During construction, operation, and maintenance

Verification Approval Party: Riverside County, CDFW, and BLM

MITIGATION MEASURE

MM BIO-7: Desert Tortoise Protection. No desert tortoise may be handled or relocated without authorization from USFWS and CDFW. The Applicant shall obtain incidental take authorization from both agencies to address any potential take of desert tortoise, including authorization to handle or translocate desert tortoise. In addition to implementing the actions to be taken during construction, the Applicant shall prepare and implement a Desert Tortoise Protection Plan and a Raven Management Plan, with contents as defined herein.

REQUIRED ACTIONS TO PROTECT TORTOISE DURING CONSTRUCTION

The following shall be implemented:

- *Inspect for tortoises under vehicles.* The ground beneath vehicles parked outside of desert tortoise exclusion fencing will be inspected immediately prior to the vehicle being moved. If a tortoise is found beneath a vehicle, the vehicle will not be moved until the desert tortoise leaves of its own accord.
- *Protect tortoises on roads.* The Applicant shall specify and enforce maximum vehicle speed limits as specified in the Traffic Control Plan, to minimize risk of vehicle strikes. If a tortoise is observed on or near the road accessing a work area, vehicles will stop to allow the tortoise to move off the road on its own.
- *Tortoise Observations.* Any time a tortoise is observed within or near a work site, Project work activities will proceed only at the site and within a suitable buffer area after the tortoise has either moved away of its own accord, or if it has been trans-located off the site under authorization by the USFWS and CDFW. If a tortoise is observed outside of exclusion fencing, construction will stop, and the tortoise shall be allowed to move out of the area on its own. If a tortoise or tortoise burrow is observed within the exclusion fencing, construction in the vicinity will stop, pending translocation of the tortoise or other action as authorized by USFWS and CDFW.
- *Reporting of dead or injured specimens.* Upon locating a dead or injured tortoise, the Applicant or its agent will immediately notify the Palm Springs Fish and Wildlife Office by email or telephone. Written notification must be made within five days of the finding, both to the appropriate USFWS field office and to the USFWS's Division of Law Enforcement. The information provided must include the date and time of the finding or incident (if known), location of the carcass or injured animal, a photograph, cause of death, if known, and other pertinent information.
- *Tortoise compensatory mitigation.* Compensatory mitigation for desert tortoise shall include suitable habitat at a minimum of 1:1 ratio for impacts to desert tortoise

Biological Resources

suitable habitat and a ratio of 5:1 for impacts to desert tortoise critical habitat, in coordination with USFWS, CDFW, and in compliance with any ITPs.

PREPARE DESERT TORTOISE PROTECTION AND RELOCATION PLAN

To ensure safe handling and translocation in accordance with applicable wildlife agency guidance, desert tortoises shall be handled or translocated according to a Desert Tortoise Protection and Relocation Plan, to be reviewed and approved by USFWS, CDFW, BLM, and Riverside County.

The Desert Tortoise Protection and Relocation Plan shall be developed in accordance with and be consistent with the Desert Tortoise (Mojave Population) Field Manual (USFWS, 2009); Revised Recovery Plan for the Mojave Population of the Desert Tortoise (USFWS, 2011a); Translocation of Mojave Desert Tortoises from Project Sites: Plan Development Guidance (USFWS, 2020), and Health Assessment Procedures for the Mojave Desert Tortoise (USFWS, 2019b).

Relocated and translocated tortoises will be transmittered and monitored, as described below. All relocated or translocated desert tortoises will be monitored once within 24 hours of release; twice weekly for the first two weeks after release; weekly during the more-active season; biweekly during the less-active season; and for a duration agreed upon by Riverside County, BLM, USFWS, and CDFW from date of release.

PLAN REQUIREMENTS

Consistent with DRECP CMAs LUPA-BIO-COMP-1: (Compensation); LUPA-BIO-IFS-1: (Individual Focus Species [IFS]: Desert Tortoise [activities within desert tortoise linkages]); LUPA-BIO-IFS-2: (new roads in Tortoise Conservation Areas [TCAs]), LUPA-BIO-IFS-3: (culvert sizing for desert tortoise), LUPA-BIO-IFS-4: (desert tortoise exclusion fencing), LUPA-BIO-IFS-5: (desert tortoise monitoring for initial clearing and grading), LUPA-BIO-IFS-6: (desert tortoise monitoring during geotechnical boring), LUPA-BIO-IFS-7: (desert tortoise monitoring during geotechnical testing), LUPA-BIO-IFS-8: (inspections for desert tortoise under vehicles), LUPA-BIO-IFS-9: (speed limits in desert tortoise habitat), LUPA-VPL-BIO-IFS-1: (site activities in previously disturbed areas in desert tortoise linkages and TCAs), DFA-BIO-IFS-1: Individual Focus Species (IFS) (protocol surveys in desert tortoise habitat), DFA-BIO-IFS-2 (setback requirements), DFA-BIO-IFS-3: Desert Tortoise (desert tortoise translocation), the Desert Tortoise Protection and Relocation Plan shall include:

Authorized personnel titles and roles. The Applicant shall designate a USFWS Authorized Biologist to implement the desert tortoise protection measures. The Authorized Biologist may (or may not) also serve as the Project's Lead Biologist.

The Applicant shall employ one or more desert tortoise monitors who are qualified to conduct desert tortoise clearance surveys and who will be on site during all construction. The desert tortoise monitors' qualifications will be subject to review and approval by Riverside County and the BLM. Qualifications may include work as a compliance monitor on a project in desert tortoise habitat, work on desert tortoise trend plot or transect surveys, conducting surveys for desert tortoise, or other research or field work on desert tortoise. Attendance at a training course endorsed by the agencies (e.g., Desert Tortoise Council tortoise training workshop) is a supporting qualification.

The Authorized Biologist shall direct one or more desert tortoise monitors to conduct pre-construction clearance surveys for each work area, watch for tortoises wandering into the construction areas, check under vehicles, and examine excavations and other potential pitfalls for entrapped animals.

Biological Resources

The Authorized Biologist shall be responsible for overseeing compliance with desert tortoise protective measures and for coordination with resource agencies. The Authorized Biologist will have the authority to halt any Project activities that may risk take of a desert tortoise or that may be inconsistent with adopted mitigation measures or permit conditions. Neither the Authorized Biologist nor any other Project employee or contractor may bar or limit any communications between Riverside County, BLM, CDFW, or USFWS staff and any Project biologist, biological monitor, or contracted biologist. Upon notification by the desert tortoise monitor or another biological monitor of any noncompliance the Authorized Biologist shall ensure that appropriate corrective action is taken.

The following incidents will require immediate cessation of any Project activities that could harm a desert tortoise: (1) location of a desert tortoise within a work area; (2) imminent threat of injury or death to a desert tortoise; (3) unauthorized handling of a desert tortoise, regardless of intent; (4) operation of construction equipment or vehicles outside a Project area cleared of desert tortoise, except on designated roads; and (5) conducting any construction activity without a biological monitor where one is required.

Worker training. Prior to the onset of construction activities, a desert tortoise education program will be presented by the Authorized Biologist to all personnel who will be present on Project work areas. Following the onset of construction, any new employee will be required to formally complete the tortoise education program prior to working on site. The following specifications will be incorporated into the WEAP training, identified in Mitigation Measure BIO-2. At a minimum, the tortoise education program will cover the following topics:

- (a) A detailed description of the desert tortoise, including color photographs;
- (b) The distribution and general behavior of the desert tortoise;
- (c) Sensitivity of the species to human activities;
- (d) The protection the desert tortoise receives under the state and federal Endangered Species Acts, including prohibitions and penalties incurred for violation;
- (e) The protective measures being implemented to conserve the desert tortoise during construction activities; and
- (f) Procedures and a point of contact if a desert tortoise is observed on site.

Plan requirements for pre-construction and clearance surveys and use of exclusion fencing. Prior to the construction of solar facilities, temporary or permanent desert tortoise exclusion fencing will be installed around the entirety of the approved solar field and storage facility construction areas, as well as parking and laydown areas. Fenced areas would be surveyed and monitored to ensure desert tortoise are avoided.

Construction phase tortoise exclusion fencing. Exclusion fencing will adhere to USFWS design guidelines in the Desert Tortoise Field Manual (USFWS, 2009), where applicable. The exact location of different fencing types shall be determined in coordination with the USFWS. Permanent fencing shall be constructed with durable materials (i.e., 16 gauge or heavier) suitable to resist desert environments, alkaline and acidic soils, wind, and erosion. Temporary fencing would be built with the same materials, however it would not be trenched or buried but bent inwards flush with the ground surface.

Tortoise exclusion fencing shall include a "cattle guard" or desert tortoise exclusion gate at each entry point. This gate shall remain closed at all times, except when vehicles are entering or leaving. If it is deemed necessary to leave the gate open for extended periods of time (e.g., during high traffic periods), the gate may be left open as long as a biological monitor is present to monitor for tortoise activity in the vicinity.

Biological Resources

Preconstruction surveys. No more than 10 days prior to the initiation of fence construction, a pre-activity tortoise survey shall be conducted along the fence line installation area using techniques that provide 100% visual coverage of the disturbance area. Transects will be spaced 15 feet (5 meters) apart, and within an additional buffer area of 100 feet (30 meters) transects would be spaced 10 meters apart.

Fence monitoring. A biological monitor shall be present during all fence installation activities to inspect the work area and under vehicles for desert tortoise prior to ground disturbance or vehicle access to ensure that no tortoises have moved into the work area. If a desert tortoise moves into the work area, activities will halt until it moves out of the work site on its own accord or is moved from harm's way by an Authorized Biologist.

Fence inspections. Exclusion fencing will be inspected daily for the first two weeks following installation, to monitor for desert tortoise exhibiting fence-walking behavior. If none are observed, exclusion fencing will be inspected weekly during desert tortoise active seasons (April 1 to May 31 and September 1 to October 31), at least monthly during non-active seasons (June to September, November to March), and following all rain events, and corrective action taken if needed to maintain it.

Unfenced work areas. As an alternative to exclusion fencing, any work conducted in an area that is not fenced to exclude desert tortoises (e.g., gen-tie tower sites) must be monitored by a biological monitor who will stop work if a tortoise enters the work area. Work activities will proceed only at the site and within a suitable buffer area after the tortoise has either moved away of its own accord, or if it has been translocated off the site under authorization by the USFWS and CDFW. Work sites with potential hazards to desert tortoise (e.g., auger holes, steep-sided depressions) that are outside of the desert tortoise exclusion fencing will be fenced by installing exclusionary fencing, covered, or will not be left unfilled overnight.

Clearance surveys. An Authorized Biologist shall direct a clearance survey before the tortoise fence is enclosed to ensure no tortoises are in the work area. After exclusion fencing is fully installed, a desert tortoise pre-construction clearance survey shall be conducted within each of the enclosed, fenced areas. Per the USFWS Field Manual (2009), clearance surveys must consist of at least 2 consecutive surveys of the site. Clearance will be considered complete after two successive 100 percent coverage surveys have been conducted without finding any desert tortoises. If active desert tortoise sign is observed during the second survey pass, a third pass may be required after consultation with the agencies. Surveys will be led by Authorized Biologists experienced with searching for desert tortoise, potential burrows, scat, and carcasses. Surveys will consist of 100 percent visual coverage using pedestrian belt transects spaced at 5-meter intervals. An additional 500-foot (150 meter) buffer outside the Project boundary will also be surveyed with pedestrian belt transects spaced at 10 meters apart to identify any potentially active burrows that may be indirectly affected by construction activities.

Clearance surveys must be conducted during the active season for desert tortoises (April 1 through May 31 or September 1 through October 31), unless authorized by CDFW and USFWS.

During the first survey pass, all sign (scat, carcasses, tracks, etc.) shall be removed from the clearance area, which will prevent reidentification of the same tortoise sign in proposed work areas. Desert tortoise carcasses may be returned to USFWS or CDFW, used for educational purposes, or relocated in the natural environment outside the work area fence line, as coordinated with resource agencies.

Biological Resources

If a tortoise is located during clearance surveys, work activities will proceed only after the tortoise has either moved away of its own accord, or if it has been relocated or translocated off the site under authorization by the USFWS and CDFW. The buffer distance for work activities shall be 100 feet during the non-active season and at least 250 feet during the active season (September-October and April-May), unless otherwise directed in the CDFW Incidental Take Permit (ITP).

Any potentially occupied burrows will be avoided until monitoring or field observations (e.g., with a motion-activated camera or fiber-optic mounted video camera) determines absence. The fence shall be either continuously monitored prior to closure, or clearance surveys shall be repeated prior to closure after tortoises are removed.

Plan requirements for handling of desert tortoise. Only persons permitted by the USFWS and CDFW under the Desert Tortoise Activity Form (i.e., streamlined Section 7 consultation process) or Incidental Take Permit shall handle desert tortoises. All desert tortoises will be handled by an Authorized Biologist in accordance with the Desert Tortoise Field Manual (2009) and the USFWS Revised Translocation Guidance (2020). Authorized Biologists shall handle tortoises in accordance with approved disinfection and sanitation techniques and procedures defined by the Desert Tortoise Health Assessment Procedures (USFWS, 2019a).

Tortoises shall be handled according to seasonal and temperature constraints, where any handling of desert tortoises would always be below the temperature of 95°F. During handling, the desert tortoise will be kept in a shaded environment that does not exceed 95°F and will not be released until ambient air temperatures fall below 95°F.

Biologists will maintain a record of all desert tortoises identified and handled on the Project site, including photographs, time and location of handling, temperature, condition and measurements of the individual, transmitter information, and information on nests, eggs, and voiding of bladder. Should a tortoise void or defecate between capture and release, it shall be thoroughly rehydrated and rinsed to remove any odors that could attract potential predators. Any desert tortoise handling event shall be completed within 30 minutes or less (not including rehydrating a desert tortoise that has voided).

The Plan shall detail methods for attaching transmitters to desert tortoises that will be relocated, translocated, or monitored. The Applicant will consult with the USFWS Desert Tortoise Recovery Office to coordinate transmitter frequencies. Radio transmitters and antennae must be mounted by an Authorized Biologist so as not to impede growth or the daily activities of the tortoise.

The Plan shall detail nest and egg handling procedures. Any nest that is found will be carefully excavated by hand by an Authorized biologist. A nest will be prepared at the release site with the same depth and location in relation to the burrow entrance as the original nest. The eggs will be transferred to the new nest, maintaining their original orientation and replaced so that they touch one another. Eggs will be gently covered with soil from which cobbles and pebbles have been removed so that all the air spaces around the eggs are filled.

To the greatest extent practicable, bromating (hibernating) tortoises will not be relocated or translocated. If a bromating desert tortoise cannot be avoided by Project activities or be passively relocated, the tortoise may be captured and released in coordination with USFWS and CDFW.

Procedures for relocation, passive exclusion, and translocation of desert tortoise and identification and description of translocation recipient sites.

Relocation. Desert tortoises less than 160 mm will be relocated as soon as possible after detection. Adult desert tortoises (more than 160 mm) identified for relocation will be transmittered and left in situ or within on-site pens following health assessments, data collection, and monitoring, until they can be transported. The Plan shall detail the construction of on-site pens, in accordance with USFWS guidance (USFWS, 2011). Relocation and monitoring of tortoises <100 mm will be coordinated with BLM, USFWS, and CDFW on a case-by-case basis at the time of detection. Desert tortoises will be relocated by an Authorized Biologist within 300 meters of their capture locations in suitable habitat, within adjacent BLM land or private land owned by the Applicant.

Passive exclusion. Passive exclusion shall be prioritized on all linear Project components and in unfenced work areas by using a biological monitor to accompany construction crews and equipment in the field. Construction or maintenance activities will cease if a desert tortoise is detected within the work area or if a tortoise is in imminent danger, until the tortoise moves a safe distance out of the work area. Desert tortoises would be relocated from unfenced work areas if a tortoise does not leave a work area and no other alternate work site is available for crews or an occupied burrow is located within or adjacent to a work area that cannot be avoided.

A Biological Monitor would monitor initial clearing and grading activities for any tortoises missed during the clearance survey. Excavations with steep walls shall have a wildlife escape ramp and be fully covered at the end of the workday to prevent entrapment. After vegetation is fully removed within fenced areas, weekly spot checks shall be conducted to ensure that there are no desert tortoises within the construction area for the duration of the construction phase.

Translocation. If a desert tortoise is found and is not in an area appropriate for relocation (i.e., suitable habitat does not occur within a 1.5-kilometer buffer surrounding the potential release point), the tortoise will be translocated. Translocations shall occur during the tortoise active season.

The Plan shall detail methods and procedures for translocation, including health assessments, transportation requirements, and identification of comparable release locations, in accordance with the Desert Tortoise Field Manual (USFWS, 2009). Per the USFWS Translocation Guidance (2020), a translocation review package, incorporating the penultimate health assessment in the month before the scheduled translocation, shall be submitted to Riverside County, BLM, USFWS, and CDFW for approval of the proposed disposition of each tortoise on the Project site.

Recipient sites shall be approved in consultation with BLM, USFWS, and CDFW, and shall be comprised of suitable desert tortoise habitat with modelled high desert tortoise occupancy (Nussear, 2009). The recipient site shall be sited within desert tortoise critical habitat, unless otherwise directed by the agencies.

Plan requirements for construction monitoring and reporting

Construction monitoring and reporting. During the construction phase, the Authorized Biologist shall prepare daily records of desert tortoise observations and site inspections. If at any time a desert tortoise is identified on the Project site, Riverside County, BLM, USFWS, and CDFW will immediately be notified.

Reporting for construction monitoring and implementation of the Plan shall be provided in weekly updates and monthly reporting to Riverside County, BLM and USFWS, as well as quarterly reporting to CDFW. Annual and final reports shall be submitted to Riverside County, BLM, USFWS, and CDFW, as required. Summaries of compliance tortoise surveys,

Biological Resources

relocation, translocation, and monitoring activities conducted during the previous calendar year will be included.

Translocation monitoring and reporting. Telemetry-based monitoring shall be implemented for at least six months to document short-term survival of small numbers of translocated tortoises. The Applicant will consult with Riverside County, BLM, USFWS, and CDFW to determine the appropriate monitoring duration and methodology. All relocated or translocated desert tortoises will be monitored once within 24 hours of release; twice weekly for the first two weeks after release; weekly during the more-active season; biweekly during the less-active season; and for a duration agreed upon by Riverside County, BLM, USFWS, and CDFW from date of release. Health assessments shall be performed twice-annually.

Reporting for translocation shall be provided in weekly updates and monthly reporting to Riverside County, BLM and USFWS, as well as quarterly reporting to CDFW. Annual and final reports will be submitted to Riverside County, BLM, USFWS, and CDFW. Summaries of all compliance tortoise translocation, and post-translocation, effectiveness, and health monitoring activities conducted during the previous calendar year will be included.

Plan requirements for O&M, decommissioning, and adaptive management

O&M. At the Applicant's discretion, and in consultation with resource agencies, permanent desert tortoise exclusion fencing may be installed around each solar facility site. If permanent desert tortoise exclusion fencing is not installed,

Tortoises observed by personnel within the fence line of the solar facility components during routine maintenance activities or along the main access road will be relocated or translocated by permitted biologists, in coordination with USFWS and CDFW. Relocated tortoises will be moved to suitable habitat within 300 meters of where it was found, outside of the fence line within adjacent BLM land or private land owned by the Applicant. Translocated tortoises will be moved to the approved recipient site.

For any routine maintenance or emergency/unexpected repairs that require surface disturbance or heavy equipment desert tortoise shall be allowed to move out of harm's way of its own accord, or the tortoise will be relocated by an Authorized Biologist.

In areas where wildlife-friendly fencing is implemented, temporary exclusion fencing may be removed only after vegetation is successfully re-established and habitat is suitable to support desert tortoise, in coordination with USFWS. If used, wildlife-friendly fencing will be installed around solar arrays in the Pinto Wash Linkage and areas adjacent to desert dry wash woodland that provide higher quality desert tortoise habitat. The security fence would leave a 6- to 8-inch gap between the lower fence margin (rail or mesh) and the ground and the bottom of the fence fabric (chain-link or similar material) would be wrapped upward so that no sharp edges are exposed along the lower fence margin. The fencing would be inspected at least once per quarter by a qualified biologist to identify areas of sand deposits at the fence line or damage to fencing. During the fall and spring quarter, inspections would be performed during active desert tortoise season.

Decommissioning. After decommissioning, fencing shall be removed. Desert tortoise conservation measures shall be in place and the decommissioning activities shall be monitored for the presence of desert tortoise and desert tortoise sign. Observations of desert tortoise shall be reported and protection measures shall be coordinated with USFWS and CDFW.

Adaptive management. Adaptive management measures would be implemented if there is evidence of Project-related disturbance to or increased risk to desert tortoise, and

Biological Resources

where initial protection methods have been deemed ineffective based on monitoring results. Remedial actions may include repairs or modifications to fencing, additional surveying, or additional monitoring and inspections. Adaptive management measures used shall be reported in the annual report.

PREPARE A RAVEN MANAGEMENT PLAN

The Applicant shall develop and implement a Raven Management Plan to address activities that may occur during the pre-construction, construction, decommissioning, and O&M phases of the Project that may attract common ravens (*Corvus corax*), a nuisance species that is a subsidized predator of desert tortoises and other sensitive species in the Project vicinity.

The Applicant will submit payment to the Project sub-account of the Renewable Energy Action Team (REAT) Account held by the National Fish and Wildlife Foundation (NFWF) to support the Service's Regional Raven Management Program. The one-time fee will be as described in the cost allocation methodology, or more current guidance as provided by the Service or CDFW. The contribution to the regional raven management plan will be \$105 per acre impacted.

The Plan shall be prepared in accordance with USFWS guidelines in Management of Conflicts Associated with Common Ravens in the United States (USFWS, 2023). If raven monitoring indicates an increase in local raven activity attributed to the Project, measures shall be implemented to deter ravens from the site, such as additional worker education, more stringent restrictions on water use or trash disposal, installation of nest-prevention or roost-prevention devices on Project facilities, or specific measures to "haze" ravens from Project facilities or subsidies in coordination with USFWS and CDFW.

PLAN REQUIREMENTS

Consistent with DRECP CMA LUPA-BIO-6 (Subsidized Predators Standards), the Raven Management Plan will be developed and implemented to:

- (a) Identify conditions associated with the Project that might provide raven subsidies or attractants, including water, anthropogenic food sources, roadkill for scavengers, trash, and perches.
- (b) Describe management practices and control measures to avoid or minimize conditions and subsidies that might increase raven numbers and predatory activities, such as proper and regular disposal of food waste and trash using raven proof containers; removing road-killed animals; securing water tanks from leaks; using the minimum amount of water needed for dust control, panel washing, and irrigation; and use of BMPs for perching and roosting per current standards and practices, including APLIC guidelines (2006, 2012).
- (c) Describe monitoring during construction and operations, including roles and responsibilities for monitoring biologists, monitoring requirements for food and water subsidies, monitoring requirements for raven presence and nesting, and methods to identify individual ravens that prey on desert tortoises.
- (d) Describe reporting requirements for monitoring results, including annual monitoring reports to be submitted to USFWS, CDFW, BLM, and Riverside County.

Responsible Party:	Project Owner
Responsible Monitoring Party:	Riverside County, USFWS, CDFW, and BLM
Monitoring Phase/Timing:	Prior to construction and during construction, operation, and maintenance
Verification Approval Party:	Riverside County, USFWS, CDFW, and BLM

Biological Resources

MITIGATION MEASURE

MM BIO-8: Bird and Bat Conservation Strategy (BBCS). Bird and bat fatality and injury monitoring is being performed at the neighboring Oberon, Arica, and Victory Pass Projects. The approved BBCS plans for these projects include mortality monitoring and sampling methods, sampling design, and survey and data collection protocols. The Applicant shall use the results of post-construction bird and bat monitoring at the Oberon, Arica, and Victory Pass Projects to inform actions to be taken at the Easley Project, focused on the development of adaptive management measures that would minimize impacts and mortality to avian and bat species.

The Applicant shall prepare and implement a BBCS that acknowledges the ongoing monitoring at other projects. The BBCS shall be focused on the implementation of adaptive management measures that may be required depending on monitoring results at the other projects. Adaptive management measures shall be developed in consultation with USFWS based on the results of on-going monitoring and current standards and guidelines. Available guidelines include USFWS Considerations for Avian and Bat Protection Plans (USFWS, 2010). These measures would avoid and minimize take of birds and bats on the Project site that may be vulnerable to injury or mortality on the Project site and/or collision with Project components (IP Easley, 2023).

The plan shall be crafted to meet the following standard: If impacts to avian species are documented at Oberon, Arica, Victory Pass, and Easley Projects and these impacts are shown to result in a substantial, long-term reduction in the demographic viability of the population of the species in question, then the Applicant would coordinate with USFWS and CDFW to determine if adaptive management, as described below, must be implemented to reduce Project related impacts. Over the course of construction and O&M, fatality thresholds and future conservation measures may be subject to revision in coordination with USFWS and CDFW as new information is obtained.

PLAN REQUIREMENTS

Consistent with DRECP CMAs LUPA-BIO-16 (Activity-Specific Bird and Bat CMAs) and LUPA-BIO-17 (Activity-Specific Bird and Bat CMAs BBCS), the Plan shall include:

- A description of bird and bat species in the Project area;
- A project-specific risk assessment that addresses potential for take, based on threats to birds and bats from the Project, including collision, electrocution, territory abandonment, nest and roost site disturbance, habitat loss and fragmentation, disturbance from human presence, and predator subsidies, in accordance with USFWS guidelines (USFWS, 2010);
- A description of the ongoing monitoring occurring at the Oberon, Arica, and Victory Pass Projects and the findings of these programs as of the date of Plan preparation.
- A description of the monitoring that will occur at the Project site. Monitoring efforts will be designed to ensure that birds and bats are identified and avoided on the Project site, and that Project related risks are managed to detect and avoid injury and mortality.
- A description of how the adaptive management actions would be developed and a list of potential adaptive management measures that could be implemented if impacts to any avian species are shown to be occurring at Oberon, Arica, Easley, and Victory Pass and these impacts appear likely to result in a substantial, long-term reduction in the demographic viability of the population of the species in question. Adaptive management measures may include passive avian diverter installations, the use of sound, light or other means to discourage site use consistent with legal requirements, on site

Biological Resources

habitat management or control measures consistent with applicable legal requirements, or modification to support structures to exclude nesting birds.

- A requirement that adaptive management measures be implemented until monitoring data indicates that mortality has not increased due to operation of the Project; and that there is not a substantial reduction in demographic viability for the species in question.

BIRD AND BAT COMPENSATION FEE

Consistent with CMA LUPA-BIO-COMP-2 and in coordination with BLM, compensation for mortality impacts to bird and bat focus and special-status species shall be determined based on bird and bat mortality monitoring at the Project and a fee reassessed every five years to fund compensatory mitigation. The fee is calculated based on bird-use and estimated mortality from the Project, per a Resource Equivalency Analysis as directed in CMA LUPA-BIO-COMP-2.

Responsible Party:	Project Owner
Responsible Monitoring Party:	Riverside County, CDFW, BLM, and USFWS
Monitoring Phase/Timing:	Prior to construction and during construction, operation, and maintenance
Verification Approval Party:	Riverside County, CDFW, and BLM

MITIGATION MEASURE **MM BIO-9: Nesting Bird Management Plan (NBMP).** The Applicant shall prepare and implement a Nesting Bird Management Plan (NBMP) that will provide a framework for surveying, management, and monitoring of bird nesting activities during the construction phase. The NBMP shall be prepared in conjunction with the BBCS.

The Project will either avoid vegetation clearing during the nesting season or conduct pre-construction nest surveys of potential habitat and implement no-disturbance buffer areas around active nests.

The plan shall ensure that impacts to nesting birds are avoided and minimized through establishment of adequate buffers around active nests, as determined by a qualified biological monitor. Nest surveys shall be conducted for all Project activities throughout the nesting season, (beginning January 1 for raptors and hummingbirds and February 1 for other species, and continuing through August). Nest buffers shall be species-specific, ranging from 100 feet for small passerines to 500 feet for raptors, as defined by the California Public Utilities Commission Nesting Bird Working Group (2015).

Default Buffers for Nests During Construction

Avian Group (nest type/location)	Species Potentially Nesting within Easley Solar Project Site	Minimum Buffers for Ground Construction per Disturbance Level (feet)*
Waterfowl and rails	Canada goose, wood duck, mallard, cinnamon teal, ruddy duck, Virginia rail, sora, American coot, pied-billed grebe	150
Quail	California quail, Gambel's quail	150
Herons	Great blue heron, great egret, snowy egret, cattle egret, black-crowned night-heron	250
Birds of prey (Category 1)	American kestrel, barn owl, western screech-owl	300
Birds of prey ² (Category 2)	Cooper's hawk, red-tailed hawk, red-shouldered hawk, great horned owl	300

Biological Resources

Birds of prey (Category 3)	Turkey vulture, red-tailed hawk, white-tailed kite, northern harrier, long-eared owl	500
Shorebirds	Killdeer	200
Pigeons	Band-tailed pigeon	150
Doves	Mourning dove, white-winged dove, common ground-dove	150
Roadrunners	Greater roadrunner	300
Nightjars	Lesser nighthawk, common poorwill	150
Swifts	White-throated swift	200
Hummingbirds	Anna's hummingbird, Costa's hummingbird	100
Woodpeckers	Acorn woodpecker, ladder-backed woodpecker, Nuttall's woodpecker, downy woodpecker, northern flicker	150
Passerines (bridge, culvert, and building nesters)	Black phoebe, Say's phoebe, Ash-throated flycatcher, northern rough-winged swallow, cliff swallow, barn swallow, house finch (3)	100
Passerines (ground nesters, open habitats)	Horned lark, rock wren, western meadowlark, orange-crowned warbler, lark sparrow, grasshopper sparrow	150
Passerines (understory and thicket nesters)	Bushtit, Bewick's wren, blue-gray gnatcatcher (2), black-throated gray warbler, yellow-breasted chat, spotted towhee, black-chinned sparrow, sage sparrow, song sparrow, black-headed grosbeak, blue grosbeak, lazuli bunting, American goldfinch	150
Passerines (shrub and tree nesters)	Pacific-slope flycatcher, Cassin's kingbird, western kingbird (2), loggerhead shrike (2)*, Hutton's vireo, western scrub-jay, American crow, common raven, verdin, bushtit, black-tailed gnatcatcher, blue-gray gnatcatcher (2), cactus wren (2)*, American robin, northern mockingbird, Le Conte's thrasher, phainopepla, yellow warbler, black-throated gray warbler, yellow-breasted chat, California towhee, black-throated sparrow, song sparrow, summer tanager, great-tailed grackle, hooded oriole, Bullock's oriole, house finch (3), Lawrence's goldfinch, lesser goldfinch	150 (300 for species marked with *)
Passerines (open scrub nesters)	Loggerhead shrike (2)*, verdin, cactus wren (2)*, black-tailed gnatcatcher, wren tit, northern mockingbird, California thrasher, Le Conte's thrasher, Phainopepla, orange-crowned warbler, southern rufous-crowned sparrow, California towhee, black-throated sparrow, Brewer's blackbird, lesser goldfinch	150 (300 for species marked with *)

Biological Resources		
Passerines (tower nesters)	Western kingbird (2), common raven, house finch (3)	150
Species not covered under MBTA	Domestic waterfowl, including domesticated mallards, feral (rock) pigeon, ring-necked pheasant, chukar, Eurasian collared dove, spotted dove, parrots, parakeets, European starling, house sparrow	NA

PLAN REQUIREMENTS

Consistent with DRECP CMAs LUPA-BIO-16 (Activity-Specific Bird and Bat CMAs), LUPA-BIO-17 (Activity-Specific Bird and Bat CMAs BBCS), DFA-BIO-IFS-1 (Individual Focus Species (IFS) (pre-construction/activity breeding season surveys for individual species – Bendire’s thrasher, burrowing owl, golden eagle), DFA-BIO-IFS-2 (Setbacks for individual species – Bendire’s thrasher, burrowing owl, golden eagle), LUPA-BIO-3 (Resource Setback Standards), LUPA-BIO-RIPWET-3 (BLM Special Status Riparian Bird Species (pre-construction/activity nesting bird surveys)), and LUPA-BIO-IFS-12 (Burrowing Owl (setbacks and monitoring for burrows)) the Plan shall include:

- A site description detailing the suitability of the Project site for nesting birds, the species that may be encountered, and potential impacts to nesting birds
- Identification of qualifications, roles, and responsibilities of the Lead Biologist, biological monitors, and avian biologists
- Methods for preconstruction nest surveys and “sweeps” for nesting activity during construction, including the following:
 - Pre-construction surveys for active nests shall be conducted by one or more qualified biological monitors at the direction of the Lead Biologist.
 - Nest surveys shall be conducted for all Project activities throughout the nesting season, identified here as beginning January 1 for raptors and hummingbirds and February 1 for other species, and continuing through August 15.
 - Any nesting surveys involving passerines shall be conducted within 4 days of the initiation of any vegetation clearance or grading. Surveys involving raptors shall be conducted 7 days prior. An additional preconstruction survey shall be conducted immediately prior to initial Project related, ground disturbing activities to confirm no new nests are found. Surveys shall be repeated regularly during nesting season in nesting habitat.
 - Survey methods shall follow standard nest-locating techniques such as those described in Martin and Guepel (1993). Surveys may be systematic transects, meandering transects, or other methods which are determined by the Lead Biologist based on site-specific characteristics, performed in the Project site and a 1,200-foot buffer for raptors and a 300-foot buffer for other species surrounding each work area. If adjacent properties are not accessible to the biological monitors, the off-site nest surveys may be conducted with binoculars.
 - Detection of nests shall be reported using an Avian Nest Reporting Form developed in coordination with USFWS and CDFW.

- Establishment of exclusion buffers surrounding active nests and procedures for reduction of buffers including the following:
 - At each active nest, the biological monitor shall establish and mark a buffer area surrounding the nest where construction activities that could disrupt nesting behavior will be excluded.
 - The default buffer distance established around a particular nest shall be species-specific, as developed by the California Public Utilities Commission Nesting Bird Working Group (2015), which ranges from 100 feet for passerines to 500 feet for raptors, in coordination with BLM, CDFW, and USFWS.
 - Construction shall not occur within the designated nest exclusion buffer until the nest is no longer active (i.e., the young fledge from the nest, or the nest is abandoned).
 - Buffer reductions for special-status species shall not occur beyond the default distances without notification to BLM, USFWS, or CDFW, as appropriate, at least 3 calendar business days prior to the proposed buffer reduction. Any threatened or endangered listed species would require agency approval prior to any buffer reduction.
- Procedures for active nest monitoring:
 - Active nest monitoring shall occur at a minimum of one to three times per week, depending on site-specific conditions.
 - Nests shall be monitored and mapped from a distance, and nest details will be recorded including species, nesting stage, and nesting outcome. Only the Lead Biologist or Avian Biologist/Monitor may enter the established buffer zone of a nest.
- Guidelines for nest removal:
 - If a bird nest must be removed during nesting season, the Applicant shall notify CDFW and USFWS and retain written documentation of the correspondence. Nests shall be removed only if they are inactive or if an active nest for a non-special status species presents a hazard to people or other wildlife. Removal of an active nest requires a permit from USFWS, which would be acquired, as needed. All nest removals shall be documented and described in the Annual Report.
- Reporting requirements:
 - A nest survey and monitoring log shall document all new and monitored nests, including date, species of bird, nest status (e.g., nest building, incubating, fledglings present, or inactive); unique identification number of each nest monitored and coordinates (easting and northing); estimated date of nest establishment; estimated fledge date; description of and distance to nearby construction activities; relative noise level; description of any nearby non-Project activities (e.g., publicly accessible roads or trails); exclusion buffer size; and description of additional measures taken to protect nests.
 - Logs and corresponding maps showing the disturbance limits, Project features, and current nest buffer data shall be updated weekly and made available to survey crews, construction personnel, and resource agencies.
 - During construction, the Applicant shall provide an Annual Report detailing a summary of nesting activities on the Project site and survey buffers. The Applicant shall provide the annual reports to Riverside County, BLM, CDFW, and the USFWS during the last quarter following each of season of construction that occurs during the nesting season.
- Adaptive Management:

Biological Resources

- Adaptive management measures shall be implemented if there is evidence of Project-related disturbance to nesting birds where initial protection methods (i.e., buffers) are determined to be ineffective. Triggers for adaptive management include agitation behavior (displacement, avoidance, and defense), increased vigilance behavior at nest sites, changes in foraging and feeding behavior, or nest site abandonment.
- Potential adaptive management measures shall be identified, which may include increased buffer width; additional worker education; modifying work intervals, or allowing specific work types that may be implemented on a case-by-case basis; cessation of construction activities that are the source of disturbance to the nesting bird; or installation of visual or sound barriers.

Responsible Party: Project Owner

Responsible Monitoring Party: Riverside County, CDFW, BLM, and USFWS

Monitoring Phase/Timing: Prior to construction and during construction, operation, and maintenance

Verification Approval Party: Riverside County, CDFW, and BLM

MITIGATION MEASURE **MM BIO-10: Gen-tie lines.** Gen-tie line support structures and other facility structures shall be designed in compliance with current standards and practices to discourage their use by raptors for perching or nesting (e.g., by use of anti-perching devices). This design also reduces the potential for increased predation of special-status species, such as the desert tortoise. Mechanisms to visually warn birds (permanent markers or bird flight diverters) shall be placed on gen-tie lines at regular intervals to prevent birds from colliding with the lines (APLIC, 2006, 2012). To the extent practicable, the use of guy wires shall be avoided because they pose a collision hazard for birds and bats. Necessary guy wires shall be clearly marked with bird flight diverters to reduce the probability of collision. Shield wires shall be marked with devices that have been scientifically tested and found to significantly reduce the potential for bird collisions. Gen-tie lines shall maintain sufficient distance between all conductors and grounded components to prevent potential for electrocution of the largest birds that may occur in the area (e.g., golden eagle and turkey vulture). They shall utilize non-specular conductors and non-reflective coatings on insulators.

Responsible Party: Project Owner

Responsible Monitoring Party: Riverside County and BLM

Monitoring Phase/Timing: Prior to and during construction

Verification Approval Party: Riverside County and BLM

MITIGATION MEASURE **MM BIO-11: Burrowing Owl Avoidance and Relocation.** Burrowing owl protection and relocation will meet the following requirements, in accordance with CDFW burrowing owl protocols (1993, 2012):

- Pre-construction surveys for burrowing owls, possible burrows, and sign of owls (e.g., pellets, feathers, whitewash) will be conducted throughout each work area. Survey schedules will be coordinated with constructing the desert tortoise exclusion fence and the pre-construction desert tortoise clearance surveys. As needed, follow-up surveys will be conducted no more than 14 days prior to construction.
- Pre-construction surveys shall consist of walking parallel transects 7 to 20 meters apart, adjusting for vegetation height and density as needed, and noting any potential burrows with fresh burrowing owl sign or presence of burrowing owls.

Biological Resources

If an active burrowing owl burrow is detected within any Project disturbance area, or within a 150-meter buffer of the disturbance area, a 150-meter (500-foot) exclusion buffer will be maintained while the burrow remains active or occupied. The buffer may be reduced to 50 meters (160 feet) during the non-breeding season (September 1 to January 31). The size of the buffer may be adjusted based on the time-of-year, and level of disturbance in the area, after consultation with CDFW. The following provides exclusion buffer guidelines for nesting sites (CDFW, 2012); which may be adjusted in the field by the Designated Biologist/Authorized Biologist, in consultation with agency personnel.

BUOW Buffer Distance (m) and Level of Disturbance*

Time of Year	Low	Medium	High
April 1 – Aug 15	200	500	500
Aug 16 – Oct 15	200	200	500
Oct 16 – Mar 31	50	100	500

* Levels of disturbance: Low = drive by, low use, once per week; Medium = 15 minutes to 2 hours of activity, less than 49 decibels, one or two passes per day; High = more than 2 hours of activity, more than 49 decibels

- Any unoccupied suitable burrows within the solar facility footprint will be excavated and filled in under the supervision of the Lead Biologist prior to site preparation. Any unoccupied burrows located outside the construction activity zones shall be left in their current condition.
- Passive relocation shall only be used during the non-breeding season, generally September 1 to February 1, to exclude burrowing owls from the Project site. Passive relocation shall be implemented to provide replacement burrows off site (if needed); collapse all unoccupied burrows within the construction site; and install a one-way door on the occupied burrow to evict the burrowing owl without handling it. Prior to any passive relocation, biologists shall survey nearby habitats to identify and inventory suitable unoccupied natural burrows for relocation. If none are available, artificial burrows shall be constructed based on the number of burrowing owls in need of relocation.
- Artificial burrows shall be located at least 50 meters outside any temporary or permanent Project impact areas, but as close as possible to the original burrow and no more than one mile from the original burrow location if possible. Artificial burrows will be designed, constructed, and installed following guidelines provided in CDFW (2012). All artificial burrows and mapped natural burrows shall be monitored for burrowing owl use at least once per quarter throughout the construction phase of the Project.
- Following the excavation of all suitable inactive burrows within the construction area and installation of artificial burrows, burrowing owls will be passively excluded from occupied burrows. Burrow exclusion will involve the installation of one-way doors in burrow openings during the non-breeding season. Following confirmation that passive exclusion burrows are unoccupied, the burrows shall be carefully excavated using hand tools, or small tracked equipment, and backfilled to ensure that they are no longer suitable for burrowing owl use.
- Compensatory mitigation for burrowing owl shall include suitable habitat for the species at a minimum of 1:1 ratio, as determined in coordination with CDFW.

Responsible Party: Project Owner

Biological Resources	
Responsible Monitoring Party:	Riverside County and BLM
Monitoring Phase/Timing:	Prior to construction
Verification Approval Party:	Riverside County and BLM
MITIGATION MEASURE	<p>MM BIO-12: Desert Kit Fox and American Badger Relocation. Desert kit fox and American badger protection and relocation will incorporate the following requirements:</p> <ul style="list-style-type: none"> ■ Under direction of the Lead Biologist, biological monitors shall conduct pre-construction surveys for desert kit fox and American badger. Surveys schedules will be coordinated with constructing the desert tortoise exclusion fence and the pre-construction desert tortoise clearance surveys. Surveys shall also consider the potential presence of dens within 100 feet of the Project boundary (including utility corridors and access roads). ■ If dens are detected each den shall then be classified as inactive, potentially active, or definitely active. <ul style="list-style-type: none"> • Inactive dens directly impacted by construction activities shall be excavated and backfilled to prevent reuse. Excavation and backfilling shall be conducted in accordance with standard approved desert tortoise burrow excavation and protocols. Excavation will use hand tools or a small driver-operated backhoe under close supervision of a qualified biologist, as there are no excavation standards and protocols for desert kit fox or badger. • All dens identified as potentially active or active within the Project footprint (solar facilities and gen-tie work sites) shall be monitored by a biological monitor for a minimum of 3 consecutive nights using a tracking medium such as diatomaceous medium or fire clay and/or infrared camera stations at the entrance. Each active or potentially active den shall be further classified as non-natal or natal (pups are present) based on tracks or photos observed after the initial 3 consecutive nights. • If after 3 nights of den monitoring, no desert kit fox/badger tracks are found at the burrow entrance and no photos of the target species using the den are observed, it will be determined that the desert kit fox/badger den or complex is inactive and will be excavated. If an active non-natal den is detected on the site, a 100-foot construction exclusion zone will be established until passive relocation is successfully completed. Passive relocation methods include spray deterrents, transistor radios, and ultrasonic emitters. Any kit fox hazing activities that include the use of animal repellents such as coyote urine must be cleared through the CDFW prior to use. With CDFW approval, the den may be blocked with natural materials or bag barriers. If these methods are unsuccessful, installation of one-way doors may be used. On the third day following one-way door installation, all den entrances will be inspected to ensure they are clear of sign and that desert kit fox or badger have vacated. Confirmed active dens may be excavated if passive relocation was successful. Dens shall be collapsed prior to construction of the perimeter fence, to allow animals the opportunity to move off site without impediment. • Potential natal dens shall be monitored for a minimum of 3 additional consecutive nights. If a den or complex is determined to be natal, the CDFW shall be notified via email within 24 hours. A 500-foot no disturbance buffer shall be maintained around all active natal dens. Passive relocation and excavation will not be implemented until monitoring confirms that the den is no longer in active use as a natal den. Active dens identified early in the pupping season, from February 1 to April 30, will not be passively relocated or excavated without prior approval from CDFW.

Biological Resources

- The biological monitor shall make weekly visits to the location of passive relocation to ensure that desert kit fox or badger do not re-excavate and reoccupy the area if no active ground disturbing construction is occurring within the vicinity.
- Any documented kit fox mortality shall be reported to the CDFW within 24 hours of identification. If a dead kit fox is observed, it shall be retained and protected from scavengers until the CDFW determines if the collection of necropsy samples is justified.

Responsible Party: Project Owner

Responsible Monitoring Party: Riverside County, BLM, and CDFW

Monitoring Phase/Timing: Prior to and during construction

Verification Approval Party: Riverside County, BLM, and CDFW

MITIGATION MEASURE

MM BIO-13 : Wildlife Protection and Relocation Plan. The Applicant shall prepare and implement a Wildlife Protection and Relocation Plan that incorporates the protection, buffer, and survey requirements for desert tortoise (MM BIO-7), burrowing owl (MM BIO-11), and desert kit fox and American badger (MM BIO-12). The Plan shall specify the requirements for each species and provide a framework for adaptive management and reporting of survey results. The Plan must be reviewed by Riverside County, BLM, CDFW, and USFWS prior to the start of ground-disturbing activities.

Desert tortoise, burrowing owl, desert kit fox, and American badger buffers shall be maintained as directed in MM BIO-7, MM BIO-10, and MM BIO-11.

PLAN REQUIREMENTS

Consistent with DRECP CMAs LUPA-BIO-6 (Subsidized Predators Standards), LUPA-BIO-9 (Water and Wetland Dependent Species Resources), LUPA-BIO-12 (Noise), LUPA-BIO-14 (General Standard Practices), LUPA-BIO-IFS-12 (Burrowing Owl), LUPA-BIO-IFS-13 (Burrowing Owl), DFA-BIO-IFS-1 (Individual Focus Species (IFS)), the Plan will include:

- A summary of wildlife survey methods and results;
- Detailed qualifications, roles, and responsibilities for the Lead Biologist and monitoring biologists;
- Procedures for pre-construction clearance surveys;
 - Prior to construction of solar facility, desert tortoise exclusion fencing will be installed around the entirety of the approved solar field construction areas, as well as parking and laydown areas. No more than 10 days prior to the initiation of fence construction, a pre-activity multi-species survey shall be conducted using techniques that provide 100% visual coverage of the disturbance area. If any burrow within the potential disturbance area for fence construction or inside the planned fence line is determined to be unoccupied, it will be carefully collapsed per guidelines from the Desert Tortoise Field Manual (USFWS, 2009).
 - If a burrow is potentially occupied by a target species, then further actions will be taken to passively exclude the animal during the appropriate season (as detailed in MM BIO-7, MM BIO-10, and MM BIO-11).
 - Once the fence is constructed, clearance surveys within fenced areas shall consist of 100% visual coverage using pedestrian belt transects spaced at 5-meter intervals. An additional 500-foot (150-meter) buffer outside the Project boundary shall also be surveyed with pedestrian belt transects spaced at 10 meters apart, where possible, to identify any potentially active burrows or complexes that may be indirectly

Biological Resources

affected by construction activities. Surveys shall focus on sign for desert tortoise, desert kit fox, American badger, and burrowing owl.

- Any burrows or den complexes identified shall be classified as inactive, possibly active, or active. Inactive dens that would be directly impacted by construction shall be excavated. All burrows and kit fox den complexes that are potentially active or active with live individuals inside will be further observed per the requirements of individual species as detailed in MM BIO-7 (desert tortoise), MM BIO-10 (burrowing owl), and MM BIO-11 (desert kit fox, American badger). Confirmed active dens may be excavated upon successful passive relocation. Excavations shall be photographed for reporting to demonstrate success and sufficiency.
- Methods for construction monitoring;
 - Biological Monitors shall be present during fence construction (security fencing, desert tortoise exclusion fencing, or both for the solar sites), vegetation removal, and ground disturbance to ensure that wildlife is not present. After vegetation is cleared, biological monitors will perform spot checks in fenced areas immediately prior to initiation of construction to ensure that no wildlife have re-entered the site.
 - Along the gen-tie line, biological monitors shall escort construction vehicles and inspect work areas prior to crews beginning any ground disturbance. All parked vehicles and equipment, and the ground beneath them, will be inspected for wildlife prior to being moved. Work activities shall be stopped by the Biological Monitor if any target species or other special-status species, such as desert tortoise, enters the work area. Work activities shall proceed at the site only after the animal has either moved away of its own accord or, is moved from harm's way by a biologist with state and federal authorization and according to any conditions identified in applicable authorizations.
- Detailed species-specific exclusion methods for special-status wildlife as follows:
 - Couch's spadefoot toad. Potential breeding habitat identified during wildlife surveys shall be inspected after sufficient rainfall for Couch's spadefoot toad. If Couch's spadefoot toads are found on the Project site, the permitting and wildlife agencies will be consulted in order to develop an avoidance strategy.
 - Desert tortoise. See MM BIO-7 for details on buffers, monitoring, exclusion, relocation, and translocation.
 - Burrowing owl. See MM BIO-10 for details on burrow buffers, monitoring, passive relocation, and excavation.
 - Desert kit fox and American badger. See MM BIO-11 for details on den buffers, monitoring, passive relocation, and excavation.
- Procedures for handling sick, injured, or dead wildlife;
 - Resource agencies would be immediately notified of sick, injured, or dead wildlife. Written follow-up notification via email will be submitted within 24 hours, including the location (GPS record), photographs (if available), and any relevant observations at the time of detection. The animal will be handled and transported only on direction from the wildlife agencies. Health and safety precautions will be used at all times when handling the animal.
- Description of adaptive management methods;
 - If there is evidence of Project-related disturbance or increased risk to special-status wildlife, where initial protection methods have been deemed ineffective, adaptive

Biological Resources

management would be implemented in coordination with resource agencies, such as additional surveying and monitoring, increased buffers, seasonal restrictions, additional artificial replacement burrows, or agency approved wildlife relocation.

- Description of reporting requirements;
 - During construction, reporting shall be provided in weekly, monthly, quarterly, and annual compliance reports to the permitting and wildlife agencies. During O&M, reports shall be provided quarterly, unless more frequent reporting is prudent based on species presence. Reports shall provide a summary of activities performed and the results for each species. Data recorded shall be submitted as appendices to each report.

Responsible Party: Project Owner

Responsible Monitoring Party: Riverside County, BLM, CDFW, and USFWS

Monitoring Phase/Timing: Prior to and during construction

Verification Approval Party: Riverside County, BLM, CDFW, and USFWS

MITIGATION MEASURE

MM BIO-14: Streambed and Watershed Protection. If jurisdictional features cannot be avoided, prior to ground disturbance activities that could impact these aquatic features, the Applicant shall file a complete Report of Waste Discharge with the RWQCB to obtain Waste Discharge Requirements (WDR) and shall consult with CDFW on the need for a streambed alteration agreement. If permits are required, they shall be obtained prior to disturbance of jurisdictional resources. Copies of the approved permit shall be submitted to Riverside County.

Compensatory mitigation for impacts to jurisdictional streambeds/washes shall be identified prior to disturbance of the features at a minimum 1:1 ratio, and a 5:1 ratio for minor incursions to desert dry wash woodland, as approved by RWQCB or CDFW, either through onsite or offsite mitigation, or purchasing credits from an approved mitigation bank. The Applicant shall comply with the compensatory mitigation required and provide proof of compliance, along with copies of permits obtained from the RWQCB and/or CDFW shall be provided to Riverside County.

A Stormwater Pollution Prevention Plan (SWPPP) or SWPPP-equivalent document shall be prepared by a qualified engineer or erosion control specialist and implemented before and during construction. The SWPPP shall include BMPs for stormwater runoff quality control measures, management for concrete waste, stormwater detention, watering for dust control, and construction of perimeter silt fences, as needed.

- The Applicant shall implement BMPs identified below to minimize adverse impacts to streambeds and watersheds.
 - Vehicles and equipment will not be operated in ponded or flowing water except as specified by resource agencies.
 - The Applicant will minimize road building, construction activities, and vegetation clearing within ephemeral drainages.
 - The Applicant will prevent water containing mud, silt, or other pollutants from grading or other activities from entering ephemeral drainages or being placed in locations that may be subjected to high storm flows.
 - Spoil sites will not be located within 30 feet from the boundaries of drainages or in locations that may be subjected to high storm flows, where spoils might be washed back into drainages.

Biological Resources

- Raw cement/concrete or washings thereof, asphalt, paint or other coating material, oil or other petroleum products, unapproved herbicides, or any other substances that could be hazardous to vegetation or wildlife resources, resulting from Project-related activities, will be prevented from contaminating the soil and/or entering ephemeral drainages. The Applicant shall ensure that safety precautions specified by this measure, as well as all other safety requirements of other measures and permit conditions are followed during all phases of the Project.
- When operations are completed, any excess materials or debris will be removed from the work area. No rubbish will be deposited within 150 feet of the high-water mark of any drainage during construction, operation, and decommissioning the Project.
- No equipment maintenance will occur within 150 feet of any wetland, Category 3, 4, or 5 streambed, or any streambed greater than 10 feet wide. No petroleum products or other pollutants from the equipment will be allowed to enter these areas or enter any off-site state jurisdictional waters under any flow.
- With the exception of the drainage control system installed for the Project, the installation of bridges, culverts, or other structures will be such that water flow (velocity and low flow channel width) is not impaired. Bottoms of temporary culverts will be placed at or below stream channel grade.
- No broken concrete, debris, soil, silt, sand, bark, slash, sawdust, rubbish, or other organic or earthen material from any construction or associated activity of whatever nature will be allowed to enter into or be placed where it may be washed by rainfall or runoff into, off-site state jurisdictional waters.
- Stationary equipment such as motors, pumps, generators, and welders located within or adjacent to a drainage will be positioned over drip pans. Stationary heavy equipment will have suitable containment to handle a catastrophic spill/leak. Clean up equipment such as brooms, absorbent pads, and skimmers will be on site prior to the start of construction.
- The cleanup of all spills will begin immediately. USFWS, SWRCB, CDFW, BLM, and Riverside County will be notified immediately by the Applicant of any spills and will be consulted regarding clean-up procedures.

Responsible Party: Project Owner

Responsible Monitoring Party: CDFW and Riverside County

Monitoring Phase/Timing: Prior to ground disturbance in jurisdictional waters of the state

Verification Approval Party: CDFW and Riverside County

Cultural and Tribal Cultural Resources

MITIGATION MEASURE **APM CULT-1: Native American Monitoring.** The Applicant will enter into an agreement with interested culturally-affiliated and/or consulting tribe(s) to employ at least one Native American Monitor per archaeological monitor. A Native American monitor will be called immediately upon discovery of a cultural resource if a Native American monitor is not already present. In conjunction with the County- and BLM-approved archaeologist(s), the Native American Monitor will be invited to monitor all initial ground disturbing activities and excavation of each portion of the Project site including clearing, grubbing, tree removals, grading and trenching, as outlined in the Project's Cultural Resource Monitoring Plan (see Mitigation Measures [MMs] CUL-1 and TCR-1), and attend meeting(s) to discuss the significance of unanticipated find(s) and appropriate treatment of unanticipated

Cultural and Tribal Cultural Resources

resources. The Applicant will immediately alert interested culturally-affiliated and consulting tribes in the event of an unanticipated discovery. "Native American Monitor" means an individual who is presented as a representative of a tribal government for one of the culturally-affiliated or consulting tribes for the Easley Project and who has received specialized training approved by that tribal government to serve as a monitor.

Responsible Party: Project Owner

Responsible Monitoring Party: Riverside County and BLM

Monitoring Phase/Timing: Prior to ground disturbance and during construction

Verification Approval Party: Riverside County and BLM

MITIGATION MEASURE **MM CUL-1: Project Archaeologist and Cultural Resource Monitoring Plan.** Prior to issuance of grading permits: The applicant/developer shall provide evidence to the County of Riverside Planning Department that a County certified professional archaeologist (Project Archaeologist) has been contracted to implement a Cultural Resource Monitoring Program (CRMP). A Cultural Resource Monitoring Plan shall be developed that addresses the details of all activities and provides procedures that must be followed in order to reduce the impacts to cultural and historic resources to a level that is less than significant as well as address potential impacts to undiscovered buried archaeological resources associated with this project. A fully executed copy of the contract and a wet-signed copy of the Monitoring Plan shall be provided to the County Archaeologist to ensure compliance with this condition of approval.

Working directly under the Project Archaeologist, an adequate number of qualified Archaeological Monitors shall be present to ensure that all earth moving activities are observed and shall be on-site during all grading activities for areas to be monitored including off-site improvements. Inspections will vary based on the rate of excavation, the materials excavated, and the presence and abundance of artifacts and features. The frequency and location of inspections will be determined by the Project Archaeologist.

Responsible Party: Project Owner

Responsible Monitoring Party: Riverside County and BLM

Monitoring Phase/Timing: Prior to issuing grading permits and during construction

Verification Approval Party: Riverside County and BLM

MITIGATION MEASURE **MM CUL-2: Develop and Implement Cultural Resources Environmental Awareness Training.** Prior to issuance of a Notice to Proceed by the County and for the duration of ground disturbance (as defined in MM TCR-1), the Applicant shall provide Worker Environmental Awareness Program (WEAP) training to all workers prior to or on their first day of employment at the Project site. The training shall be prepared by the Cultural Resources Specialist (CRS), may be conducted by any member of the archaeological team, and may be presented in the form of an annotated and narrated digital slide show. Tribal representatives will be given the opportunity to participate in the WEAP training. The training shall be prepared in consultation with culturally affiliated Native Americans to incorporate the tribal knowledge and perspectives from these Native American groups into the presentation. The CRS shall be available (by telephone or in person) to answer questions posed by employees. The training may be discontinued when ground disturbance is completed or suspended but must be resumed if ground disturbance resumes. Training shall include the following:

- A discussion of applicable laws and penalties under the law

Cultural and Tribal Cultural Resources

- Samples or visuals of artifacts that might be found in the Project vicinity.
- A brief review of the cultural sensitivity of the Project and the surrounding area
- A discussion of what such artifacts may look like when partially buried, or wholly buried and then freshly exposed.
- A discussion of what prehistoric and historical archaeological deposits look like at the surface and when exposed during construction, and the range of variation in the appearance of such deposits.
- Instruction that only the CRS, alternate CRS, and supervisory cultural resource field staff have the authority to halt ground disturbance in the area of a discovery to an extent sufficient to ensure that the resource is protected from further impacts, as determined by the CRS.
- Instruction that employees are to halt work on their own in the vicinity of a potential cultural resources discovery and shall contact their supervisor and the CRS or supervisory cultural resource field staff, and that redirection of work would be determined by the construction supervisor and the CRS.
- An informational brochure that identifies reporting procedures in the event of a discovery.
- An acknowledgment form signed by each worker indicating that they have received the training.
- A sticker that shall be placed on hard hats indicating that WEAP training has been completed.

This is a mandatory training, and all construction personnel must attend prior to beginning work on the Project site. A copy of the sign-in sheet shall be kept ensuring compliance with this measure. No ground disturbance shall occur prior to implementation of the WEAP training unless such activities are specifically approved by the County.

Responsible Party:	Project Owner
Responsible Monitoring Party:	Riverside County and Consulting Tribe Representative
Monitoring Phase/Timing:	Prior to construction and during any ground disturbing activities
Verification Approval Party:	Riverside County
MITIGATION MEASURE	<p>MM CUL-3: Archaeological Monitoring. A qualified lead archaeological monitor that meets the Secretary of the Interior's Professional Qualifications Standards (as defined in Title 36 Code of Federal Regulations Part 61), shall be present for initial grading activities in undisturbed soil. If additional archaeological monitors are needed, they do not need to have the same SOI qualifications but may work under the supervision of the lead archaeological monitor; in such cases the lead archaeological monitor must be on site. Any additional archaeological monitors will meet the qualifications of a bachelor's degree in anthropology/archaeology or completion of an archaeological field school and two or more years of archaeological project experience. Daily monitoring forms will be completed by the archaeological monitor(s) and the CRS will be responsible for retaining and/or editing them. The lead archaeological monitor will have the authority to increase or decrease the monitoring effort should the monitoring results indicate that a change is warranted.</p>
Responsible Party:	Project Owner
Responsible Monitoring Party:	Riverside County and BLM

Cultural and Tribal Cultural Resources	
Monitoring Phase/Timing:	During any ground disturbing activities
Verification Approval Party:	Riverside County and BLM
MITIGATION MEASURE	<p>MM CUL-4: Unanticipated Resources. The developer/permit holder or any successor in interest shall comply with the following for the life of this permit. If during ground disturbance activities, unanticipated cultural resources* are discovered, the following procedures shall be followed:</p> <p>All ground disturbance activities within 100 feet of the discovered cultural resource shall be halted and the Project archaeologist shall call the County Archaeologist immediately upon discovery of the cultural resource. A meeting shall be convened between the developer, the project archaeologist,** the Native American tribal representative, and the County Archaeologist to discuss the significance of the find. At the meeting with the aforementioned parties, a decision is to be made, with the concurrence of the County Archaeologist, as to the appropriate treatment (documentation, recovery, avoidance, etc.) for the cultural resource. Resource evaluations shall be limited to nondestructive analysis.</p> <p>Further ground disturbance shall not resume within the area of the discovery until the appropriate treatment has been accomplished.</p> <p>* A cultural resource site is defined, for this condition, as being a feature and/or three or more artifacts in close association with each other.</p> <p>** If not already employed by the project developer, a County approved archaeologist shall be employed by the project developer to assess the significance of the cultural resource, attend the meeting described above, and continue monitoring of all future site grading activities as necessary.</p>
Responsible Party:	Project Owner
Responsible Monitoring Party:	Riverside County and BLM
Monitoring Phase/Timing:	During grading or other construction, operation, or decommissioning activities
Verification Approval Party:	Riverside County and BLM
MITIGATION MEASURE	<p>MM CUL-5: Treatment of Human Remains. If human remains are found on this site, the developer/permit holder or any successor in interest shall comply with State Health and Safety Code Section 7050.5. .</p>
Responsible Party:	Project Owner
Responsible Monitoring Party:	Riverside County and BLM
Monitoring Phase/Timing:	During grading or other construction, operation, or decommissioning activities
Verification Approval Party:	Riverside County and BLM
MITIGATION MEASURE	<p>MM CUL-6: Phase IV Monitoring Report. Prior to Grading Permit Final Inspection, a Phase IV Cultural Resources Monitoring Report shall be submitted that complies with the Riverside County Planning Department's requirements for such reports for all ground disturbing activities associated with this grading permit. The report shall follow the County of Riverside Planning Department Cultural Resources (Archaeological) Investigations Standard Scopes of Work posted on the TLMA website. The report shall include results of any feature relocation or residue analysis required as well as evidence of the required cultural sensitivity training for the construction staff held during the required pre-grade</p>

Cultural and Tribal Cultural Resources	
meeting and evidence that any artifacts have been treated in accordance to procedures stipulated in the Cultural Resources Monitoring Plan.	
Responsible Party:	Project Owner
Responsible Monitoring Party:	Riverside County and BLM
Monitoring Phase/Timing:	Prior to Grading Permit Final Inspection
Verification Approval Party:	Riverside County and BLM
MITIGATION MEASURE	<p>MM TCR-1: Native American Monitor. Prior to the issuance of grading permits, the developer/permit applicant shall enter into an agreement with the consulting tribe(s) for a Native American Monitor. The Native American Monitor(s) shall be on-site during all initial ground disturbing activities and excavation of each portion of the Project site including clearing, grubbing, tree removals, grading and trenching. In conjunction with the Archaeological Monitor(s), the Native American Monitor(s) shall have the authority to temporarily divert, redirect or halt the ground disturbance activities to allow identification, evaluation, and potential recovery of cultural resources. The developer/permit applicant shall submit a fully executed copy of the agreement to the County Archaeologist to ensure compliance with this condition of approval. Upon verification, the Archaeologist shall clear this condition. This agreement shall not modify any condition of approval or mitigation measure.</p>
Responsible Party:	Project Owner
Responsible Monitoring Party:	Riverside County and Consulting Tribe Representative
Monitoring Phase/ Timing	Prior to and during all initial ground disturbing activities and excavation
Verification Approval Party:	Riverside County and Consulting Tribe Representative
MITIGATION MEASURE	<p>MM TCR-2: Artifact Disposition. Prior to Grading Permit Final Inspection,, the landowner(s) shall relinquish ownership of all cultural resources that are unearthed on the Project property during any ground-disturbing activities, including previous investigations and/or Phase III data recovery.</p> <p><i>Historic Resources</i> – all historic archaeological materials recovered during the archaeological investigations (this includes collections made during an earlier project, such as testing of archaeological sites that took place years ago), shall be curated at the Western Science Center, a Riverside County curation facility that meets State Resources Department Office of Historic Preservation Guidelines for the Curation of Archaeological Resources ensuring access and use pursuant to the Guidelines.</p> <p><i>Prehistoric Resources</i>- One of the following treatments shall be applied:</p> <ul style="list-style-type: none"> (a) Reburial of the resources on the Project property. The measures for reburial shall include, at least, the following: Measures to protect the reburial area from any future impacts. Reburial shall not occur until all required cataloguing, analysis and studies have been completed on the cultural resources, with an exception that sacred items, burial goods and Native American human remains are excluded. Any reburial processes shall be culturally appropriate. Listing of contents and location of the reburial shall be included in the confidential Phase IV Report. The Phase IV Report shall be filed with the County under a confidential cover and not subject to a Public Records Request. (b) If reburial is not agreed upon by the Consulting Tribes, then the resources shall be curated at a culturally appropriate manner at the Western Science Center, a Riverside County curation facility that meets State Resources Department Office of

Cultural and Tribal Cultural Resources

Historic Preservation Guidelines for the Curation of Archaeological Resources ensuring access and use pursuant to the Guidelines. The collection and associated records shall be transferred, including title, and are to be accompanied by payment of the fees necessary for permanent curation. Evidence of curation in the form of a letter from the curation facility stating that subject archaeological materials have been received and that all fees have been paid, shall be provided by the landowner to the County. There shall be no destructive or invasive testing on sacred items, burial goods and Native American human remains.

Responsible Party: Project Owner

Responsible Monitoring Party: Riverside County, BLM, and Consulting Tribe Representative

Monitoring Phase/Timing: Prior to Grading Permit Final Inspection

Verification Approval Party: Riverside County and BLM

Hazards and Hazardous Materials

MITIGATION MEASURE **MM HAZ-1: UXO Identification, Training, and Reporting Plan.** Where ground disturbance work is involved, contractor(s) shall be OSHA HAZWOPER-trained in accordance with standard 29CFR1910.120 and hold a current certification. The Applicant shall prepare a UXO Identification, Training, and Reporting Plan to properly train all site workers in the recognition, avoidance and reporting of military waste debris and ordnance. The Applicant shall submit the plan to the County and BLM for review and approval prior to the start of construction. The plan shall contain, at a minimum, the following:

- A description of the training program outline and materials, and the qualifications of the trainers; and
- Identification of available trained experts that will respond to notification of discovery of any ordnance (unexploded or not); and
- Work plan to recover and remove discovered ordnance, and complete additional field screening, possibly including geophysical surveys to investigate adjacent areas for surface, near surface or buried ordnance in all proposed land disturbance areas.

Responsible Party: Project Owner

Responsible Monitoring Party: Riverside County and BLM

Monitoring Phase/Timing: Prior to construction

Verification Approval Party: Riverside County and BLM

MITIGATION MEASURE **MM HAZ-2: Worker Environmental Awareness Program.** The WEAP prepared for the Project shall include a personal protective equipment (PPE) program, an Emergency Action Plan (EAP), and an Injury and Illness Prevention Program (IIPP) to address health and safety issues associated with normal and unusual (emergency) conditions. It will be reviewed and approved by the County and BLM prior to construction. Construction-related safety programs and procedures shall include a respiratory protection program, among other things. Construction Plan documents shall relate at least to the following:

- Environmental health and safety training (including, but not limited, to training on the hazards of Valley Fever, including the symptoms, proper work procedures, how to use PPE, and informing supervisor of suspected symptoms of work-related Valley Fever)
- Site security measures
- Site first aid training
- Site fire protection and extinguisher maintenance, guidance, and documentation

Hazards and Hazardous Materials

- Furnishing and servicing of sanitary facilities records
- Trash collection and disposal
- Disposal of hazardous materials and waste guidance in accordance with local, state, and federal regulations

Responsible Party: Project Owner

Responsible Monitoring Party: Riverside County and BLM

Monitoring Phase/Timing: During construction, operation, maintenance, and decommissioning

Verification Approval Party: Riverside County and BLM

MITIGATION MEASURE

MM HAZ-3: Soil Management Plan. Prior to issuance of demolition or grading permits, the Applicant shall prepare a Soil Management Plan (SMP) to guide activities during construction that will disturb potentially pesticide or petroleum hydrocarbon contaminated soils to ensure that potentially contaminated soils are identified, characterized, removed, and disposed of properly. The SMP shall be submitted to the County and BLM for approval prior to Project construction. The purpose of the SMP is to establish appropriate management practices for handling impacted soil or other materials that may be encountered during construction activities.

The SMP shall be implemented during Project construction and shall include, but shall not be limited to, the following components:

- Description of soil testing, which shall include (but not be limited to) the collection of shallow soil samples and analyses for pesticides to verify presence or absence of unknown pesticide soil contamination and the collection of soil samples at locations at and near onsite current and former fuel ASTs for analyses for petroleum hydrocarbons. This soil profiling shall be performed prior to initiation of Project construction.
- Protocols for sampling of in-place soil to facilitate the profiling of the soil for appropriate off-site disposal or reuse, and for construction worker safety, dust mitigation during demolition and construction and potential exposure of contaminated soil to future users of the site prior to Project construction.
- Procedures to be undertaken in the event that contamination is identified above action levels or previously unknown contamination is discovered prior to or during Project construction.
- Sampling and laboratory analyses of any excess soil requiring disposal at an appropriate off-site waste disposal facility.
- Procedures and protocols for the safe storage, stockpiling, and disposal of any contaminated soils.

If contaminants are identified at concentrations exceeding applicable screening levels, the Applicant shall submit the SMP sampling results to the County DEH and BLM and obtain oversight from the appropriate regulatory agencies. Copies of the approved SMP shall be kept at the Project site.

Any contaminated soils identified by testing conducted in compliance with the SMP and found in concentrations above established thresholds shall be removed and disposed of according to California Hazardous Waste Regulations. Contaminated soil excavated from the site shall be hauled off-site and disposed of at a licensed hazardous materials disposal site.

Responsible Party: Project Owner

Hazards and Hazardous Materials	
Monitoring Phase/Timing:	Prior to issuance of demolition or grading permits
Verification Approval Party:	Riverside County and BLM
Hydrology and Water Quality	
MITIGATION MEASURE	<p>MM HWQ-1: Drainage Erosion and Sedimentation Control Plan (DESCP). At least 60 days prior to site mobilization, the Applicant shall submit to the Regional Water Quality Control Board, the BLM, and Riverside County for review and approval a DESCPC for managing stormwater during Project construction and operations and to prevent sediment or any other pollutants from moving offsite and into receiving waters. The DESCPC can be included in the Stormwater Pollution Prevention Plan (SWPPP) and must ensure proper protection of water quality and soil resources, address disturbed soil stabilization treatments in the Project area for both road and non-road surfaces, and identify all methods used for temporary and final stabilization of inactive areas. The plan must also cover all linear Project features such as the proposed gen-tie line and any other Project component subject to disturbance. The DESCPC shall contain, at a minimum, the elements presented below that outline site management activities and erosion and sediment-control Best Management Practices (BMPs) to be implemented during site mobilization, excavation, construction, and post-construction (operating) activities.</p> <ul style="list-style-type: none"> ■ <i>Vicinity Map.</i> A map(s), at a minimum scale 1 inch to 500 feet, shall be provided indicating the location of all Project elements with depictions of all significant geographic features including swales, storm drains, drainage concentration points and sensitive areas. ■ <i>Site Delineation.</i> All areas subject to soil disturbance (including mowing, grubbing, grading, excavation or any other soil disturbing activity) for the Project shall be delineated showing boundary lines of all construction areas and the location of all existing and proposed structures and drainage facilities. ■ <i>Clearing and Grading Plans.</i> The DESCPC shall provide a delineation of all areas to be cleared of vegetation and areas to be preserved. The plan shall provide elevations, slopes, locations, and extent of all proposed grading as shown by contours, cross sections, or other means. The locations of any disposal areas, fills, or other special features shall also be shown. Existing and proposed topography shall be illustrated by tying in proposed contours with existing topography. ■ <i>Clearing and Grading Narrative.</i> The DESCPC shall include a table with the estimated quantities of material excavated or filled for the site and all Project elements, whether such excavation or fill is temporary or permanent, and the amount of such material to be imported or exported. All areas subject to soil disturbance shall be included in the table. ■ <i>Erosion Control.</i> The plan shall address treatments to be used on exposed soil during construction and operation including specifically identifying all chemical-based dust palliatives, soil bonding, and weighting agents appropriate for use that would not cause adverse effects to vegetation. BMPs shall include measures designed to provide temporary stabilization of inactive disturbed areas and will be applied as soon as possible consistent with SCAQMD (Rule 403) and SWRCB Construction General Permit requirements. The timing of suppressant or binder application will occur as soon as possible and consistent with dust and stormwater permit requirements. Any soil stabilizers proposed shall be approved for use by the Project's Restoration Specialist to ensure that the products shall not impede restoration goals.

Hydrology and Water Quality

- **Best Management Practices Plan.** The DESCOP shall identify on the topographic site map(s) the location of the site specific BMPs to be employed during each phase of construction (initial grading, Project element excavation and construction, and final grading/stabilization). BMPs shall include measures designed to control dust, stabilize construction access roads and entrances, and control stormwater runoff and sediment transport consistent with SCAQMD (Rule 403) and SWRCB Construction General Permit requirements.
- **Best Management Practices Narrative.** The DESCOP shall show the location, timing, and maintenance schedule of all erosion- and sediment-control BMPs to be used prior to initial grading, during excavations and construction, final grading/stabilization, and operation. Separate BMP implementation schedules shall be provided for each Project element for each phase of construction. The maintenance schedule shall include post-construction maintenance of structural-control BMPs, or a statement provided about when such information would be available.
- The DESCOP shall be prepared, stamped, and sealed by a professional engineer or Qualified SWPPP Developer. The DESCOP shall include copies of recommendations, conditions, and provisions from the Regional Board and/or BLM.
- The DESCOP may be part of the SWPPP and shall be kept onsite, kept updated, and readily available on request. The DESCOP and SWPPP must demonstrate compliance with other water quality permits (WDR and LSAA), which may have restrictions on types of erosion or sedimentation control materials used. SWPPP inspection reporting will be consistent with the requirements of the SWRCB Construction General Permit.

Responsible Party: Project Owner

Responsible Monitoring Party: Riverside County and BLM

Monitoring Phase/Timing: At least 60 days prior to site mobilization

Verification Approval Party: Riverside County and BLM

MITIGATION MEASURE **MM HWQ-2: Septic System Review and Permitting.** Before the start of construction, the Applicant shall submit to Riverside County Department of Environmental Health an evaluation of the Project septic system to ensure that the proposed use of the system is consistent with federal, state, and local requirements for septic system design, including requirements for percolation, vertical distance from the groundwater table, and setback from the nearest groundwater well.

Responsible Party: Project Owner

Responsible Monitoring Party: Riverside County DEH

Monitoring Phase/Timing: Prior to start of construction

Verification Approval Party: Riverside County DEH

MITIGATION MEASURE **MM HWQ-3: Palo Verde Mesa Groundwater Basin (PVMGB) Protection.** If water for the Project, to be obtained from on- or off-site well(s) within the Chuckwalla Valley Groundwater Basin (CVGB), is extracted from on- or off-site well(s) that is/are owned and/or operated by the Applicant, the Applicant shall develop a Colorado River Water Supply Plan (CRWSP) to monitor groundwater extractions from the Applicant owned and/or operated on- or off-site well(s) to prevent impacts to the adjacent PVMGB related to groundwater extraction below the Colorado River Accounting Surface.

The CRWSP shall be submitted to the U.S. Bureau of Reclamation and BLM for review and approval at least 60 days prior to the initiation of construction. No pumping of ground-

Hydrology and Water Quality

water below the accounting surface shall occur. A copy of the CRWSP shall also be submitted to the Metropolitan Water District of Southern California for review and comment.

- (a) The CRWSP shall describe groundwater monitoring activities and quarterly data reports to be closely reviewed for depth to groundwater information, and proximity of the depth of Project-related groundwater pumping to the Colorado River Accounting Surface. To ensure that Project-related groundwater pumping does not draw water from below the accounting surface, the Applicant shall implement water conservation activities, including cessation of pumping, to reduce the amount of water withdrawn from on- or off-site well(s) that is/are owned and/or operated by the Applicant.
 - (i) The Colorado River Accounting Surface is at an elevation between approximately 238 and 240 feet above mean sea level (amsl) in the Chuckwalla Valley (Argonne, 2013). Groundwater elevation in the Project area is approximately 489 feet amsl as of the first quarter of 2024. The numerical groundwater model developed for the Project Water Supply Assessment (GSI, 2024; discussed below) included estimates of the total cone of depression considering cumulative drawdown from all potential pumping in the CVGB, including the Project, for the life of the Project through the decommissioning phase. The estimated drawdown at the Project well after the planned 2-year construction period was less than 2 feet. The temporary drawdown at the well during pumping, however, would be greater.
 - (ii) Assuming a conservatively-large temporary drawdown of 100 feet at the Project well (up to 80 feet of temporary drawdown has been recorded from a well-used for construction of a nearby solar project) during peak water demand during Project construction, the water levels in the Project well would be at least 150 feet above the Colorado River Accounting Surface. The water levels within the Project well would be monitored as part of the GMRMP (MM HWQ-4) per the DRECP LUPA Conservation and Management Action (CMA) Soil and Water (SW) 24. MM HWQ-3 ensures that the Project will not extract water from below the Accounting Surface, as it requires that pumping from Project wells be decreased or stopped well before water levels reached the Colorado River Accounting Surface.

Responsible Party:	Project Owner
Responsible Monitoring Party:	United States Bureau of Reclamation and BLM
Monitoring Phase/Timing:	60 days prior to the initiation of construction and any time groundwater withdrawal will likely reach Accounting Surface during life of Project
Verification Approval Party:	United States Bureau of Reclamation and BLM
MITIGATION MEASURE	MM HWQ-4: Groundwater Monitoring, Reporting, and Mitigation Plan (GMRMP). Before the Project uses groundwater pumped from any Applicant owned and/or operated well (on site or off site) that extracts water from the CVGB, the Applicant shall retain a BLM-approved qualified hydrogeologist to develop a GMRMP, in coordination with Riverside County and BLM, to ensure that groundwater wells surrounding Project supply well(s) are not adversely affected by Project activities, i.e., chronic lowering of groundwater levels and degradation of groundwater quality. The Applicant shall submit the GMRMP to Riverside County and BLM for review and approval. Additionally, although no Groundwater Sustainability Agencies (GSAs) have been established for the CVGB, in the event that such agencies have been established when the GMRMP is developed, the Applicant

Hydrology and Water Quality

also shall submit the GMRMP to those GSAs. The Applicant shall implement the approved GMRMP throughout any Project phase that pumps groundwater for consumptive use.

The GMRMP shall provide a detailed methodology for monitoring site groundwater levels and comparisons for levels within the CVGB including identification of the closest private wells to the Project's well(s). Groundwater level data from wells at adjacent and nearby solar facilities and other Projects on BLM-administered public lands shall be provided by the BLM for review and comparison, to the extent available to the Applicant. Monitoring shall be performed during pre-construction, construction, and operation of the Project, to establish pre-construction and Project-related groundwater level and water quality trends that can be quantitatively compared against observed and simulated trends near the Project's pumping well(s) and near potentially impacted existing wells. The GMRMP shall include a schedule for submittal of quarterly data reports by the Applicant to the GMRMP designated agencies and the GSA(s) (if established), for the duration of the construction period. These quarterly data reports shall be prepared and submitted for review and shall include water level monitoring data and effect on the nearest off-site private wells. The designated agencies shall determine whether groundwater wells surrounding the Project supply well(s) are adversely affected (i.e., chronic lowering of groundwater levels and degradation of groundwater quality) by Project activities and, if so, shall require one or more of the following:

- Cessation or reduction of pumping at the Project well(s) until groundwater levels return to levels that allow nearby wells to resume pre-Project pumping levels;
- Compensation for whatever additional equipment is necessary to lower nearby pumps to levels that can adequately continue pumping;
- Compensation to repair or replace wells found to be damaged or inoperable due to lowered groundwater levels; or
- Compensation for increased energy cost due to Project-related well drawdown.

After the completion of construction, the Applicant and the BLM shall jointly evaluate the effectiveness of the GMRMP and determine if monitoring and reporting frequencies or procedures should be revised or eliminated.

Responsible Party:	Project Owner
Responsible Monitoring Party:	Riverside County and BLM
Monitoring Phase/Timing:	Prior to using any water pumped from any Applicant owned and/or operated well that extracts water from the CVGB
Verification Approval Party:	Riverside County and BLM

MITIGATION MEASURE	<p>MM HWQ-5: Project Drainage Plan. The Applicant shall provide the RWQCB, Riverside County and BLM with a drainage plan for review and approval prior to construction, which includes the following information:</p> <ul style="list-style-type: none"> ■ Hydrologic assessment of flood discharges affecting each parcel. ■ A detailed on-site hydraulic analysis utilizing FLO 2D or similar two-dimensional hydraulic model which models pre- and post-development flood conditions for the 10- and 100-year storm events. The post-development model must include all proposed Project features, contours, and drainage improvements. Graphical output must include depth and velocity mapping as well as mapping which graphically shows the changes in both parameters between the pre- and post-development conditions. ■ The Drainage Plan shall show the location of all watercourses, drainage concentration points and drainage ditches as they enter, cross, and exit the site. It shall include pre-
---------------------------	--

Hydrology and Water Quality

development and post-development peak flow estimates. It shall include hydraulic calculations to determine flood conditions, floodplain limits, flood depths and velocities. It shall show the relationship of drainage and flood features to the features of the Project, including buildings, fences, substations, access roads, culverts, linear features, and panel supports, demonstrating adequate design to protect from flooding, erosion and scour, and to do so without adversely affecting adjacent property, inducing erosion, or concentrating or diverting flows.

- The Plan shall show how drainage will be conveyed through the site without adversely affecting other property, either through increased flood hazard or increased potential for scour and erosion. Proposed fencing shall allow runoff to traverse the Project site unencumbered, as feasible. The Plan shall include an assessment of existing diversion berms and channels around parcel perimeters and the magnitude and frequency of flood that would be diverted by these existing features, and the probable integrity of these features to withstand flows. It shall show how those that are on the Project site will be affected by grading. It shall include an assessment of flows approaching proposed perimeter fences, whether or not adjacent to existing berms, and make design recommendations to avoid flow diversions by these fences while taking into account relevant biological mitigation measures. Design recommendations may include creating fence openings large enough to allow the passage of debris-laden flows without the potential for diversions to other property.
- The Plan shall have detailed design of flood retention features necessary to avoid any increase in downstream flood peak flow rates.
- Drainage of Project Site Narrative – The Plan shall include a narrative of the measures necessary to protect the site and Project features from flooding, erosion and sedimentation, and measures taken to prevent Project-induced erosion and flooding of adjacent property.

Responsible Party:	Project Owner

Responsible Monitoring Party:	Riverside County and BLM
--------------------------------------	--------------------------

Monitoring Phase/Timing:	Prior to construction
---------------------------------	-----------------------

Verification Approval Party:	Riverside County and BLM
-------------------------------------	--------------------------

MITIGATION MEASURE	MM HWQ-6: Flood Protection. The O&M Building, BESS switchyard, and all other Project buildings shall either be situated outside of the 100-year floodplain or sufficiently protected against dislodgement by flooding where placement outside the floodplain is not practical. Flood protection shall consist of elevating the structures on fill to at least the highest anticipated adjacent flood level as measured from a horizontal stow position. Solar panels shall be situated at least one foot above the highest anticipated local flood level. All structures using posts or poles for foundations, including transmission poles or towers, shall be designed to protect against substantial scour from the 100-year flood event. The Project must comply with Riverside County Ordinance No. 458 for projects within a Special Flood Hazard Area or floodplain: electrical, heating, ventilation, plumbing, and air conditioning equipment and other service facilities must be designed or located to prevent water from entering or accumulating within the components during flooding.

Hydrology and Water Quality

Verification Approval Party: Riverside County

Noise and Vibration

MITIGATION MEASURE **APM NOISE-1: Construction Timing.** Applicant will avoid or minimize use of any impact hammer for pile driving or other equipment similarly capable of producing disruptive noise during construction activities within a one-mile radius from the residential parcel on the northeast corner of around the Lake Tamarisk Desert Resort community during the winter months of highest residency (November 1 to March 31). If based on the final construction schedule, use of such equipment is necessary within this geographic area during the aforementioned time period, the Applicant will avoid or minimize this construction activity prior to 7:00 a.m. and after 6:00 p.m. The Applicant will also avoid nighttime equipment deliveries between 10:00 p.m. and 7:00 a.m.

Responsible Party: Project Owner

Responsible Monitoring Party: Riverside County and BLM

Monitoring Phase/Timing: During construction

Verification Approval Party: Riverside County and BLM

MITIGATION MEASURE **MM N-1: Construction Restrictions.** Heavy equipment operation, noisy construction work relating to any Project features onsite, and truck trips associated with materials and equipment deliveries shall be restricted to the times delineated below, unless a special permit has been issued by the County of Riverside: during June through September, between 6 a.m. to 6 p.m.; and during October through May, between 7:00 a.m. to 6:00 p.m. Haul truck engines and other engines powering fixed or mobile construction equipment shall be equipped with adequate mufflers. Haul trucks shall be operated in accordance with posted speed limits. Truck engine exhaust brake use shall be limited to emergencies. The construction contractor shall locate equipment staging in areas to create the greatest distance between construction-related noise sources and noise sensitive receivers nearest the Project site during Project construction. Where feasible, the construction contractor shall place all stationary construction equipment so that emitted noise is directed away from the noise sensitive receptors nearest the Project site. No music or electronically reinforced speech from construction workers shall be audible at noise-sensitive properties.

Responsible Party: Project Owner

Responsible Monitoring Party: Riverside County and BLM

Monitoring Phase/Timing: During construction

Verification Approval Party: Riverside County and BLM

MITIGATION MEASURE **MM N-2: Public Notification Process.** At least 15 days prior to the start of ground disturbance, the Project owner shall notify all residents within one mile of the Project site and the linear facilities, by mail or by other effective means, of the commencement of Project construction. At the same time, the Project owner shall establish a telephone number for use by the public to report any undesirable noise conditions associated with the construction and operation of the Project. If the telephone is not staffed 24 hours a day, the Project owner shall include an automatic answering feature, with date and time stamp recording, to answer calls when the phone is unattended. This telephone number shall be posted at the Project site during construction where it is visible to passersby. This

Noise and Vibration	
telephone number shall be maintained until the Project has been operational for at least one year.	
Responsible Party:	Project Owner
Responsible Monitoring Party:	Riverside County and BLM
Monitoring Phase/Timing:	At least 15 days prior to ground disturbance
Verification Approval Party:	Riverside County and BLM
MITIGATION MEASURE	<p>MM N-3: Noise Complaint Process. Throughout the construction and operation of the Project, the Project owner shall document, investigate, evaluate, and attempt to resolve all Project-related noise complaints. The Project owner or authorized agent shall:</p> <ul style="list-style-type: none"> (a) Use a Noise Complaint Resolution Form, or other documentation procedure acceptable to the County, to record and report the Project owner's response to resolving each noise complaint; (b) Attempt to contact the person(s) making the noise complaint within 24 hours; (c) Conduct an investigation to determine the source of noise in the complaint; (d) If the noise is Project-related, take all feasible measures to reduce the source of the noise; and (e) Submit a report to the County documenting the complaint and actions taken. The report shall include: a complaint summary, including the final results of noise reduction efforts and, if obtainable, a signed statement by the complainant stating that the noise problem has been resolved to the complainant's satisfaction.
Responsible Party:	Project Owner
Responsible Monitoring Party:	Riverside County and BLM
Monitoring Phase/Timing:	During construction and operation
Verification Approval Party:	Riverside County and BLM
Paleontological Resources	
MITIGATION MEASURE	<p>MM PR-1: Paleontological Resource Monitoring and Mitigation Plan (PRMP). Prior to the start of any Project-related construction activities, the Applicant shall retain a County- and BLM-approved paleontologist (Project Paleontologist) to prepare and implement a project-specific PRMP to be approved by the County and BLM. The Project Paleontologist shall hold a BLM-issued Paleontological Resource Use Permit and be responsible for implementing all the paleontological conditions of approval and for using qualified paleontologists to assist in work and field monitoring.</p> <p>At a minimum, information to be contained in the PRMP, in addition to other information required under industry standard, Society of Vertebrate Paleontology standards, and BLM paleontology program policy and standards, is as follows:</p> <ul style="list-style-type: none"> ■ Identification (name) and qualifications of the Project Paleontologist and qualified paleontological monitors to be employed for grading operations monitoring. ■ Identification of personnel with authority and responsibility to temporarily halt or divert grading equipment to allow for recovery of large specimens. ■ Description of the project site and planned earthwork and excavation. ■ A site-specific plan and map prepared by the Project Paleontologist which identifies construction impact areas with sediments of High (PFYC 4) and Moderate (PFYC 3a) sensitivity for encountering significant paleontological resources and the approximate

Paleontological Resources

depths at which those resources are likely to be encountered for each Project component.

- The PRMP shall require the qualified paleontological monitor(s) to monitor all construction-related earth-moving activities in sediments determined to have a High (PFYC 4) sensitivity.
- The PRMP shall define monitoring procedures and methodology and shall specify that sediments of Moderate (PFYC 3a) or undetermined sensitivity shall be monitored on a part-time basis (as determined by the Project Paleontologist). Sediments with very low or low potential will not require paleontological monitoring (PFYC 1 and 2).
- The PRMP shall detail methods of recovery, preparation, and analysis of specimens, the final curation location of specimens at the repository identified in the BLM-issued Paleontological Resource Use Permit, data analysis, and reporting. Where possible, recovery is preferred over avoidance in order to mitigate the potential for looting of paleontological resources.
- The PRMP shall specify that all paleontological work undertaken by the Applicant on public lands administered by BLM shall be carried out by qualified, permitted paleontologists with the appropriate current BLM Paleontological Resources Use Permit.
- Identification of personnel with authority and responsibility to temporarily halt or divert ground-disturbance activities to allow for recovery of large specimens.

The PRMP shall be submitted to the County and BLM for review and approval 60 days prior to start of Project construction. The PRMP must be approved by the County and BLM prior to the Notice To Proceed.

Responsible Party:	Project Owner
Responsible Monitoring Party:	Riverside County and BLM
Monitoring Phase/Timing:	Prior to the start of any project-related construction activities
Verification Approval Party:	Riverside County and BLM
MITIGATION MEASURE	MM PR-2: Worker Environmental Awareness Program (WEAP). Prior to the start of Project-related construction activities, a paleontological component to the WEAP shall be developed by the Project Paleontologist. The WEAP shall address the potential to encounter paleontological resources in the field, the sensitivity and importance of these resources, and the legal obligations to preserve and protect such resources. The training program shall also include the set of reporting procedures that workers are to follow if paleontological resources are encountered during Project activities. The WEAP may be combined with other environmental training programs for the Project. All field personnel will receive WEAP training on paleontological resources prior to Project-related construction activities.
Responsible Party:	Project Owner
Responsible Monitoring Party:	Riverside County and BLM
Monitoring Phase/Timing:	Prior to the start of any project-related construction activities
Verification Approval Party:	Riverside County and BLM
MITIGATION MEASURE	MM PR-3: Paleontological Monitoring and Fossil Recovery. The PRMP shall identify monitoring frequency and intensity of all areas of the Project site, particularly in areas underlain by geologic units assigned paleontological sensitivity of High (PFYC 4) or Moderate (PFYC 3a). Monitoring will entail the visual inspection of excavated or graded

Paleontological Resources

areas and trench sidewalls. If the Project Paleontologist determines full-time monitoring is no longer warranted, based on the geologic conditions at depth, he or she may recommend to the BLM Authorized Officer that monitoring be reduced or cease entirely.

In the event that a paleontological resource is discovered, the paleontological monitor will have the authority to temporarily divert the construction equipment around the find until it is assessed for scientific significance and, if appropriate, collected. If the resource is determined to be of scientific significance, the Project Paleontologist shall complete the following:

- **Salvage of Fossils.** If fossils are discovered, all work in the immediate vicinity shall be halted to allow the paleontological monitor, and/or Project Paleontologist to evaluate the discovery and determine if the fossil may be considered significant. If the fossils are determined to be potentially significant, the Project Paleontologist (or paleontological monitor) will recover them following standard field procedures for collecting paleontological as outlined in the PRMP prepared for the Project. The Project Paleontologist shall have the authority to temporarily direct, divert or halt construction activity to ensure that the potentially significant fossil(s) can be removed in a safe and timely manner.
- **Fossil Preparation and Curation.** The museum that has agreed to accept fossils that may be discovered during Project-related excavations will be identified on the Paleontological Resources Use Permit held by the Project Paleontologist and in the PRMP. Upon completion of Project ground-disturbing activities, all significant fossils collected shall be prepared in a properly equipped laboratory to a point ready for curation. Preparation may include the removal of excess matrix from fossil materials and stabilizing or repairing specimens. During preparation and inventory, the fossils specimens shall be identified to the lowest taxonomic level practical prior to curation at an accredited museum. The fossil specimens must be delivered to the County- and BLM-approved repository (identified on the permit and in the PRMP) and receipt(s) of collections submitted to the County and BLM no later than 60 days after all ground-disturbing activities are completed.

Responsible Party:	Project Owner
Responsible Monitoring Party:	Riverside County and BLM
Monitoring Phase/Timing:	During construction
Verification Approval Party:	Riverside County and BLM
MITIGATION MEASURE	<p>MM PR-4: Paleontological Resources Monitoring Report. The Applicant shall ensure preparation of a paleontological resource mitigation and monitoring report by the Project Paleontologist following completion of ground-disturbing activities. The contents of the report shall include, but not be limited to, a description and inventory list of recovered fossil materials (if any); a map showing the location of paleontological resources found in the field; determinations of scientific significance; proof of accession of fossil materials into the pre-approved museum or other repository; and a statement by the Project Paleontologist that Project impacts to paleontological resources have been mitigated. The report shall be certified by the professionally qualified Project Paleontologist responsible for the content of the report and submitted to the County and BLM. In addition, all appropriate fossil location information shall be submitted to the Western Information Center, San Bernardino County Museum, and Los Angeles County Museum of Natural History, at a minimum, for incorporation into their Regional Locality Inventories.</p>
Responsible Party:	Project Owner

Paleontological Resources	
Responsible Monitoring Party:	Riverside County and BLM
Monitoring Phase/Timing:	Following completion of ground disturbing activities
Verification Approval Party:	Riverside County and BLM
Traffic and Transportation	
MITIGATION MEASURE	<p>MM TRA-1: Construction Traffic Control Plan. Prior to the start of construction, the Project owner shall submit a Construction Traffic Control Plan for review and approval by Caltrans and Riverside County for affected roads and intersections that would be directly affected by the construction activities and/or would require permits and approvals. The Construction Traffic Control Plan shall include, but not be limited to:</p> <ul style="list-style-type: none"> ■ If multiple construction projects occur at the same time and conditions at the intersection warrant, plans for installation of a temporary signal or use of manual intersection control during the construction period at the I-10 westbound ramp at SR-177. Additionally, if conditions warrant, geometry changes shall be considered in coordination with Caltrans and Riverside County, and implemented, if necessary, in addition to signalization at the I-10 westbound ramp and SR-177. These geometry changes could include a turn pocket. ■ The locations and use of flaggers, warning signs, barricades, delineators, cones, arrow boards, etc., according to standard guidelines outlined in the Manual on Uniform Traffic Control Devices, the Standard Specifications for Public Works Construction, and/or the California Joint Utility Traffic Control Manual. ■ The locations of all road or traffic lane segments that would need to be temporarily closed or disrupted due to construction activities. ■ The locations where guard poles, netting, or similar means to protect transportation facilities for any construction or conductor installation work requiring the crossing of a local street highway is proposed. ■ The use of continuous traffic breaks operated by the California Highway Patrol on state highways (if necessary). ■ Additional methods to reduce temporary traffic delays to the maximum extent feasible during morning (7:00 a.m. to 9:00 a.m.) and afternoon (4:00 p.m. to 6:00 p.m.) peak traffic periods, or as directed in writing by the affected public agency in encroachment or other permits). This should also include feasible ways to reduce construction-related trips on I-10, SR-177, and Kaiser Road during peak traffic periods. ■ Plans to encourage or provide ridesharing/carpooling opportunities for construction and operational workers. ■ Incorporation wildlife protection measures, as required in MM BIO-6. ■ Plans to provide written notification to property owners and tenants at properties affected by access restrictions to inform them about the timing and duration of obstructions and to arrange for alternative access if necessary. The coordination shall occur at least one week prior to any blockages. ■ Plans to coordinate in advance with emergency service providers to avoid restricting the movements of emergency vehicles. Police departments and fire departments shall be notified in advance by the Project owner of the proposed locations, nature, timing, and duration of any roadway disruptions, and shall be advised of any access restrictions that could impact their effectiveness. At locations where roads will be blocked, provisions shall be ready at all times to accommodate emergency vehicles, such as imme-

Traffic and Transportation

diately stopping work for emergency vehicle passage, providing short detours, and developing alternate routes in conjunction with the public agencies.

- Define the method to maintaining close coordination, prior to and during construction, with Caltrans and Riverside County to minimize cumulative impacts of multiple simultaneous construction projects affecting shared portions of the circulation system. Coordination with adjacent development projects to spread work shifts into multiple hours (instead of peak hour) or the installation of additional temporary traffic signals or manual traffic control officers during peak hours to mitigate the temporary impacts.

Responsible Party: Project Owner

Responsible Monitoring Party: Caltrans or Riverside County

Monitoring Phase/Timing: Prior to the start of construction

Verification Approval Party: Caltrans or Riverside County

MITIGATION MEASURE

MM TRA-2: Repair Roadways and Transportation Facilities Damaged by Construction Activities. If roadways, sidewalks, medians, curbs, shoulders, or other such transportation features are damaged by Project construction activities, as determined by the affected public agency, such damage shall be repaired and restored to their pre-Project condition by the Project owner. Prior to construction, the Project owner shall confer with Caltrans and Riverside County regarding the roads within 500 feet in each direction of Project access points (where heavy vehicles will leave public roads to reach Project sites) and regarding the roads to be crossed by the proposed gen-tie line. At least 30 days prior to construction, or as requested by Riverside County or Caltrans, the Project owner shall photograph or video record all affected roadway segments and shall provide Riverside County and Caltrans with a copy of these images, if requested.

At the end of major construction, the Project owner shall coordinate with each affected jurisdiction to confirm whether repairs are required. Any damage demonstrable to the Project is to be repaired to the pre-construction condition within 60 days from the end of all construction, or on a schedule mutually agreed to by the Project owner and the affected jurisdiction. If multiple projects are using the transportation features, the Easley Project owner shall pay its fair share of the required repairs. the Project owner shall provide Riverside County and Caltrans (as applicable) proof when any necessary repairs have been completed.

Wildfire

Responsible Party: Project Owner

Responsible Monitoring Party: Caltrans or Riverside County

Monitoring Phase/Timing: Prior to the start of construction and at end of major construction

Verification Approval Party: Caltrans or Riverside County

MITIGATION MEASURE

MM FIRE-1: Fire Safety. The Fire Management and Prevention Plan prepared by the Project owner to ensure the safety of workers and the public and minimize fire risk during construction, operation and maintenance, and decommissioning for the Project shall include, but not be limited to, the following elements:

- Procedures for minimizing potential ignition, including, but not limited to, vegetation clearing, parking requirements/restrictions, idling restrictions, smoking restrictions, proper use of gas-powered equipment, and hot work restrictions.
- Work restrictions during Red Flag Warnings and High to Extreme Fire Danger days.

Wildfire

- All internal combustion engines used at the Project site shall be equipped with spark arrestors. Spark arrestors shall be in good working order.
- Once new access roads have been cut and initial fencing completed, light trucks and cars shall be used only on roads where the roadway is cleared of vegetation. Mufflers on all cars and light trucks shall be maintained in good working order.
- Fire rules shall be posted on the Project bulletin board at the contractor's field office and areas visible to employees.
- Equipment parking areas and small stationary engine sites shall be cleared of all flammable materials.
- Smoking shall be prohibited in all vegetated areas and within 50 feet of combustible materials storage and shall be limited to paved areas or areas cleared of all vegetation.
- Each construction site (if construction occurs simultaneously at various locations) shall be equipped with fire extinguishers and fire-fighting equipment sufficient to extinguish small fires.
- The Project owner shall coordinate with BLM and RCFD to create a training component for emergency first responders to prepare for specialized emergency incidents that may occur at the Project site, including incidents such as fire or explosion at or with the BESS.
- The plan shall include information about the type of BESS technology on site, potential hazards, and procedures for disconnecting or shutting down the BESS in case of fire or to reduce the chance of fire.
- All construction workers, plant personnel, and maintenance workers visiting the plant and/or transmission lines to perform maintenance activities shall receive training on fire prevention procedures, the proper use of firefighting equipment, and procedures to be followed in the event of a fire. Training records shall be maintained and be available for review by BLM and RCFD. Fire prevention procedures shall be included in the Project's Worker Environmental Awareness Program.
- Vegetation near all solar panel arrays, ancillary equipment, and access roads shall be controlled through periodic cutting and spraying of weeds, in accordance with the Weed Management Plan.
- BLM and RCFD shall be consulted during plan preparation and fire safety measures recommended by these agencies included in the plan.
- The plan shall list fire prevention procedures and specific emergency response and evacuation measures that shall be required to be followed during emergency situations.
- All on-site employees shall participate in annual fire prevention and response training exercises with the BLM and RCFD.
- The plan shall list all applicable wildland fire management plans and policies established by state and local agencies and demonstrate how the Project will comply with these requirements.
- The Project owner shall designate an emergency services coordinator from among the full-time on-site employees who shall perform routine patrols of the site during the fire season equipped with a portable fire extinguisher and communications equipment. The Project owner shall notify BLM and RCFD of the name and contact information of the current emergency services coordinator in the event of any change.

Wildfire

- Remote monitoring of all major electrical equipment (transformers and inverters) will screen for unusual operating conditions. Higher than nominal temperatures, for example, can be compared with other operational factors to indicate the potential for overheating which under certain conditions could precipitate a fire. Units could then be shut down or generation curtailed remotely until corrective actions are taken.
- Fires ignited on site shall be immediately reported to BLM and RCFD.
- The engineering, procurement, and construction contract(s) for the Project shall provide reference to or clearly state the requirements of this mitigation measure.
- The Project owner must provide the Fire Management and Prevention Plan to BLM for review and approval and to RCFD for review and comment before construction.

L.2. DRECP CONSERVATION AND MANAGEMENT ACTIONS

The Easley Renewable Energy Project will fully comply with all applicable Desert Renewable Energy Conservation Plan (DRECP) Conservation and Management Actions (CMAs) on lands administered by the U.S. Bureau of Land Management (BLM), and the Applicant has stated that the Easley Project will also voluntarily comply with all applicable DRECP CMAs on private lands, the requirements of which have been incorporated into CEQA mitigation measures (see Section L.1).

The applicable DRECP CMAs are listed below, and a detailed BLM Project consistency CMA analysis is provided in EIR Appendix CC.

DRECP CMAs - LUPA Wide			
Category	CMA #	CMA Text	Comments
Biological Resources			
Biological Resources	LUPA-BIO-1	<p>Conduct a habitat assessment (see Glossary of Terms) of Focus and BLM Special Status Species' suitable habitat for all activities and identify and/or delineate the vegetation types, rare alliances, and special features (e.g., Aeolian sand transport resources, Joshua tree, microphyll woodlands, carbon sequestration characteristics, seeps, climate refugia) present using the most current information, data sources, and tools (e.g., DRECP land cover mapping, aerial photos, DRECP species models, and reconnaissance site visits) to identify suitable habitat (see Glossary of Terms) for Focus and BLM Special Status Species. If required by the relevant species-specific CMAs, conduct any subsequent protocol or adequate presence/absence surveys to identify species occupancy status and a more detailed mapping of suitable habitat to inform siting and design considerations. If required by relevant species specific CMAs, conduct analysis of percentage of impacts to suitable habitat and modeled suitable habitat.</p> <p>BLM will not require protocol surveys in sites determined by the designated biologist to be unviable for occupancy of the species, or if baseline studies inferred absence during the current or previous active season.</p> <p>Utilize the most recent and applicable assessment protocols and guidance documents for vegetation types and jurisdictional waters and wetlands that have been approved by BLM, and the appropriate responsible regulatory agencies, as applicable.</p>	Biological resources surveys have been conducted. Survey protocols and the Survey Work Plan for Focus and BLM Special-Status Species were performed in compliance with BLM protocols and coordination, as described in the Biological Resources Technical Report; therefore, the Project would comply with the CMA.
	LUPA-BIO-2	<p>Designated biologist(s) (see Glossary of Terms), will conduct, and oversee where appropriate, activity-specific required biological monitoring during pre-construction, construction, and decommissioning to ensure that avoidance and minimization measures are appropriately implemented and are effective. The appropriate required monitoring will be determined during the environmental analysis and BLM approval process. The designated biologist(s) will submit monitoring reports directly to BLM.</p>	With implementation of mitigation measures to be developed during the NEPA process, the Project will comply with this CMA.
Resource Setback Standards	LUPA-BIO-3	<p>Resource setbacks (see Glossary of Terms) have been identified to avoid and minimize the adverse effects to specific biological resources. Setbacks are not considered additive and are measured as specified in the applicable CMA. Allowable minor incursions (see Glossary of Terms), as per specific CMAs do not affect the following setback measurement descriptions. Generally, setbacks (which range in distances for different biological resources) for the appropriate resources are measured from:</p> <ul style="list-style-type: none"> ■ The edge of each of the DRECP vegetation types, including but not limited to those in the riparian or wetland vegetation groups (as defined by alliances within the vegetation type descriptions and mapped based on the vegetation type habitat assessments described in LUPA-BIO-1). 	Except for minor incursion by gen-tie and collector lines and access roadways, the Project would avoid desert dry wash woodland with the required 200-foot buffer under LUPA-BIO-RIPWET-1, as well as all other applicable resource setbacks. The Project will comply with this CMA.

DRECP CMAs - LUPA Wide			
Category	CMA #	CMA Text	Comments
		<ul style="list-style-type: none"> ■ The edge of the mapped riparian vegetation or the Federal Emergency Management Agency (FEMA) 100-year floodplain, whichever is greater, for the Mojave River. ■ The edge of the vegetation extent for specified focus and BLM sensitive plant species. ■ The edge of suitable habitat or active nest substrates for the appropriate focus and BLM Special-Status Species. 	
Seasonal Restrictions	LUPA-BIO-4	<p>For activities that may impact Focus and BLM Special Status Species, implement all required species-specific seasonal restrictions on pre- construction, construction, operations, and decommissioning activities.</p> <p>Species-specific seasonal restriction dates are described in the applicable CMAs.</p> <p>Alternatively, to avoid a seasonal restriction associated with visual disturbance, installation of a visual barrier may be evaluated on a case-by-case basis that will result in the breeding, nesting, lambing, fawning, or roosting species not being affected by visual disturbance from construction activities subject to seasonal restriction. The proposed installation and use of a visual barrier to avoid a species seasonal restriction will be analyzed in the activity/project-specific environmental analysis.</p>	Seasonal restrictions and requirements are specified in the species-specific CMAs and will be further specified in the required mitigation plans. The Project will comply with this CMA.
Worker Education	LUPA-BIO-5	<p>All activities, as determined appropriate on an activity-by-activity basis, will implement a worker education program that meets the approval of the BLM. The program will be carried out during all phases of the project (site mobilization, ground disturbance, grading, construction, operation, closure/decommissioning or project abandonment, and restoration/reclamation activities). The worker education program will provide interpretation for non-English speaking workers, and provide the same instruction for new workers prior to their working on site. As appropriate based on the activity, the program will contain information about:</p> <ul style="list-style-type: none"> ■ Site-specific biological and nonbiological resources. ■ Information on the legal protection for protected resources and penalties for violation of federal and state laws and administrative sanctions for failure to comply with LUPA CMA requirements intended to protect site-specific biological and nonbiological resources. ■ The required LUPA and project-specific measures for avoiding and minimizing effects during all project phases, including but not limited to resource setbacks, trash, speed limits, etc. ■ Reporting requirements and measures to follow if protected resources are encountered, including potential work stoppage and requirements for notification of the designated biologist. <p>Measures that personnel can take to promote the conservation of biological and nonbiological resources.</p>	With implementation of mitigation measures to be developed during the NEPA process, the Project will comply with this CMA.

DRECP CMAs - LUPA Wide			
Category	CMA #	CMA Text	Comments
Subsidized Predators Standards	LUPA-BIO-6	<p>Subsidized predator standards, approved by BLM, in coordination with the U.S. Fish and Wildlife Service (USFWS) and California Department of Fish and Wildlife (CDFW), will be implemented during all appropriate phases of activities, including but not limited to renewable energy activities, to manage predator food subsidies, water subsidies, and breeding sites including the following:</p> <ul style="list-style-type: none"> Common Raven management actions will be implemented for all activities to address food and water subsidies and roosting and nesting sites specific to the Common Raven. These include identification of monitoring reporting procedures and requirements; strategies for refuse management; as well as design strategies and passive repellent methods to avoid providing perches, nesting sites, and roosting sites for Common Ravens. The application of water and/or other palliatives for dust abatement in construction areas and during project operations and maintenance will be done with the minimum amount of water necessary to meet safety and air quality standards and in a manner that prevents the formation of puddles, which could attract wildlife and wildlife predators. Following the most recent national policy and guidance, BLM will take actions to not introduce, dispose of, or release any non-native species into areas of native habitat, suitable habitat, and natural or artificial waterways/ water bodies containing native species. <p>All activity work areas will be kept free of trash and debris. Particular attention will be paid to “micro-trash” (including such small items as screws, nuts, washers, nails, coins, rags, small electrical components, small pieces of plastic, glass or wire, and any debris or trash that is colorful or shiny) and organic waste that may subsidize predators. All trash will be covered, kept in closed containers, or otherwise removed from the project site at the end of each day or at regular intervals prior to periods when workers are not present at the site.</p> <p>In addition to implementing the measures above on activity sites, each activity would provide compensatory mitigation that contributes to LUPA-wide raven management.</p>	A Raven Management Plan (POD Appendix J) will detail methods to implement subsidizing predator standards in accordance with LUPA-BIO-6 and will meet requirements established by the USFWS and CDFW. The Project will comply with this CMA.
Restoration of Areas Disturbed by Construction Activities But Not Converted by Long-Term Disturbance	LUPA-BIO-7	Where DRECP vegetation types or Focus or BLM Special Status Species habitats may be affected by ground- disturbance and/or vegetation removal during pre-construction, construction, operations, and decommissioning related activities but are not converted by long-term (i.e., more than two years of disturbance, see Glossary of Terms) ground disturbance, restore these areas following the standards, approved by BLM authorized officer, following the most recent BLM policies and procedures for the vegetation	The solar and energy storage facility will avoid desert dry wash woodland with a 200-foot buffer. A Revegetation and Salvage Plan (POD Appendix L) will be prepared to address habitat restoration, local genetically appropriate seed, and cacti and crucifixion thorn salvage, as needed. The Project will comply with this CMA.

DRECP CMAs - LUPA Wide			
Category	CMA #	CMA Text	Comments
		<p>community or species habitat disturbance/impacts as appropriate, summarized below:</p> <ul style="list-style-type: none"> ■ Implement site-specific habitat restoration actions for the areas affected including specifying and using: <ul style="list-style-type: none"> – The appropriate seed (e.g., certified weed-free, native, and locally and genetically appropriate seed) – Appropriate soils (e.g., topsoil of the same original type on site or that was previously stored by soil type after being salvaged during excavation and construction activities) – Equipment – Timing (e.g., appropriate season, sufficient rainfall) – Location – Success criteria – Monitoring measures – Contingency measures, relevant for restoration, which includes seeding that follows BLM policy when on BLM administered lands. – Salvage and relocate cactus, nolina, and yucca from the site prior to disturbance using BLM protocols. To the maximum extent practicable for short-term disturbed areas, the cactus and yucca will be re-planted back to the original site. ■ Restore and reclaim short-term disturbed areas, including pipelines, transmission projects, staging areas, and short-term construction-related roads immediately, or during the most biologically appropriate season as determined in the activity/project specific environmental analysis and decision following completion of construction activities to reduce the amount of habitat converted at any one time and promote recovery to natural habitats and vegetation as well as climate refugia and ecosystem services such as carbon storage. 	
General Closure and Decommissioning Standards	LUPA-BIO-8	<p>All activities that are required to close and decommission the site (e.g., renewable energy activities) will specify and implement project-specific closure and decommissioning actions that meet the approval of BLM, and that at a minimum address the following:</p> <ul style="list-style-type: none"> ■ Specifying and implementing the methods, timing (e.g., criteria for triggering closure and decommissioning actions), and criteria for success (including quantifiable and measurable criteria). ■ Recontouring of areas that were substantially altered from their original contour or gradient and installing erosion control measures in disturbed areas where potential for erosion exists. ■ Restoring vegetation as well as soil profiles and functions that will support and maintain native plant communities, associated carbon sequestration and nutrient cycling processes, and native wildlife species. 	A draft Closure and Decommissioning Plan has been developed (POD Appendix Y). The decommissioning plan will be finalized when the Project is near the end of its permit. The Project will comply with this CMA.

DRECP CMAs - LUPA Wide			
Category	CMA #	CMA Text	Comments
		<ul style="list-style-type: none"> ■ Vegetation restoration actions will identify and use native vegetation composition, native seed composition, and the diversity to values commensurate with the natural ecological setting and climate projections. 	
Water and Wetland Dependent Species Resources	LUPA-BIO-9	<p>Implement the following general LUPA CMA for water and wetland dependent resources:</p> <ul style="list-style-type: none"> ■ Implement construction site standard practices to prevent toxic chemicals, hazardous materials, and other fluids from entering vegetation type streams, washes, and tributary networks through water runoff, erosion, and sediment transport by, at a minimum, implementing the following: <ul style="list-style-type: none"> – On project sites, vehicles and other equipment will be maintained in proper working condition and only stored in designated containment areas where runoff is collected or controlled and that are located outside of streams, washes, and distributary networks to minimize accidental fluids and hazardous materials spills. – Hazardous material leaks, spills, or releases will be immediately cleaned and equipment will be repaired upon identification. Removal and disposal of spill and related clean-up materials will occur at an approved off-site landfill. – Maintenance and operations vehicles will carry the appropriate equipment and materials to isolate, clean up, and repair any hazardous material leaks, spills, or releases. ■ Activity-specific drainage, erosion, and sedimentation control actions, which meet the approval of BLM and the applicable regulatory agencies, will be carried out during all appropriate phases of the approved project. These actions, as needed, will address measures to ensure the proper protection of water quality, site-specific stormwater and sediment retention, and design of the project to minimize site disturbance, including the following: <ul style="list-style-type: none"> – Identify site-specific surface water runoff patterns and implement measures to prevent excessive and unnatural soil deposition and erosion. – Implement measures to maintain natural drainages and to maintain hydrologic function in the event drainages are disturbed. – Reduce the amount of area covered by impervious surfaces through use of permeable pavement or other pervious surfaces. Direct runoff from impervious surfaces into retention basins. – Stabilize disturbed areas following grading in the manner appropriate to the soil type so that wind or water erosion is minimized. – Minimize irrigation runoff by using low or no irrigation native vegetation landscaping for landscaped retention basins. – Conduct regular inspections and maintenance of long-term erosion control measures to ensure long-term effectiveness. – Project applicants for sites that may affect intermittent and perennial streams, springs, swales, ephemeral washes, wetland vegetation, other 	The Applicant will adhere to the specifics in the Hazardous Materials Management and Oil Spill Response Plan (POD Appendix W). Coupled with implementation of mitigation measures to be developed during the NEPA process, the Project will comply with this CMA.

DRECP CMAs - LUPA Wide			
Category	CMA #	CMA Text	Comments
		<p>DRECP water land covers, or sites occupied by aquatic or riparian focus and BLM Special-Status Species due to groundwater or surface water extraction will conduct hydrologic studies during project planning to determine the potential effect of groundwater and surface water extraction on the hydrologic unit. These studies will include both watershed effects as well as effects on perched, alluvial, and regional aquifers. Projects that are likely to affect groundwater resources in a manner that would result in substantial loss of riparian or wetland communities or habitat for riparian or aquatic Focus and BLM Special-Status Species are prohibited.</p> <ul style="list-style-type: none"> – The use of evaporation ponds for water management will be avoided when the water could harm birds or other terrestrial wildlife due to constituents of concern present in the wastewater (e.g., selenium, hypersalinity, etc.). – Evaporation ponds will be configured to minimize attractiveness to shorebirds (e.g., maintain water depths over two feet; maintain steep slopes along edge; enclose evaporation ponds in long-term structures; or obscure evaporation ponds from view using materials that blend in with the natural surroundings). ■ Ramps that allow the egress of wildlife from ponds or other water management infrastructure will be installed. 	
Standard Practices for Weed Management	LUPA-BIO-10	<p>Consistent with BLM state and national policies and guidance, integrated weed management actions, will be carried out during all phases of activities, as appropriate, and at a minimum will include the following:</p> <ul style="list-style-type: none"> ■ Thoroughly clean the tires and undercarriage of vehicles entering or reentering the project site to remove potential weeds. ■ Store project vehicles on site in designated areas to minimize the need for multiple washings whenever vehicles re-enter the project site. ■ Properly maintain vehicle wash and inspection stations to minimize the introduction of invasive weeds or subsidy of invasive weeds. ■ Closely monitor the types of materials brought onto the site to avoid the introduction of invasive weeds and non-native species. ■ Reestablish native vegetation quickly on disturbed sites. ■ Monitor and quickly implement control measures to ensure early detection and eradication of weed invasions to avoid the spread of invasive weeds and non-native species on site and to adjacent off-site areas. ■ Use certified weed-free mulch, straw, hay bales, or equivalent fabricated materials for installing sediment barriers. 	With the implementation of mitigation measures to be developed during the NEPA process, and as described in the Vegetation Management Plan (POD Appendix O) and Integrated Weed Management Plan (POD Appendix N), the Project will comply with this CMA.
Nuisance Animals and Invasive Species	LUPA-BIO-11	<p>Implement the following CMAs for controlling nuisance animals and invasive species:</p> <ul style="list-style-type: none"> ■ No fumigate, treated bait, or other means of poisoning nuisance animals including rodenticides will be used in areas where Focus and BLM Special-Status Species are known or suspected to occur. 	The Applicant will apply to BLM for a Pesticide Use Permit prior to application of any pesticides on the Project site. In addition, with implementation of biological resources mitigation measures to be developed during the NEPA process,

DRECP CMAs - LUPA Wide			
Category	CMA #	CMA Text	Comments
		<ul style="list-style-type: none"> Manage the use of widely spread herbicides and do not apply herbicides effective against dicotyledonous plants within 1,000 feet from the edge of a 100-year floodplain, stream and wash channels, and riparian vegetation or to soils less than 25 feet from the edge of drains. Exceptions will be made when targeting the base and roots of invasive riparian species such as tamarisk and <i>Arundo donax</i> (giant reed). Manage herbicides consistent with the most current national and California BLM policies. Minimize herbicide, pesticide, and insecticide treatment in areas that have a high risk for groundwater contamination. Clean and dispose of pesticide containers and equipment following professional standards. Avoid use of pesticides and cleaning containers and equipment in or near surface or subsurface water. When near surface or subsurface water, restrict pesticide use to those products labeled safe for use in/near water and safe for aquatic species of animals and plants. 	the Project will control nuisance animals and invasive species and comply with this CMA.
Noise	LUPA-BIO-12	<p>For activities that may impact Focus or BLM Special Status Species, implement the following LUPA CMA for noise:</p> <ul style="list-style-type: none"> To the extent feasible, and determined necessary by BLM to protect Focus and BLM sensitive wildlife species, locate stationary noise sources that exceed background ambient noise levels away from known or likely locations of focus and BLM sensitive wildlife species and their suitable habitat. Implement engineering controls on stationary equipment, buildings, and work areas including sound-insulation and noise enclosures to reduce the average noise level, if the activity will contribute to noise levels above existing background ambient levels. Use noise controls on standard construction equipment including mufflers to reduce noise. 	The only potential stationary noise source would be the battery energy storage system units, depending on technology. IP Easley, LLC, will implement noise control as appropriate with implementation of noise mitigation measures to be developed during the NEPA process. The Project will comply with this CMA.
General Siting and Design	LUPA-BIO-13	<p>Implement the following CMA for project siting and design:</p> <ul style="list-style-type: none"> To the maximum extent practicable site and design projects to avoid impacts to vegetation types, unique plant assemblages, climate refugia as well as occupied habitat and suitable habitat for Focus and BLM Special-Status Species (see “avoid to the maximum extent practicable” in Glossary of Terms). The siting of projects along the edges (i.e. general linkage border) of the biological linkages identified in Appendix D (Figures D-1 and D-2) will be configured (1) to maximize the retention of microphyll woodlands and their constituent vegetation type and inclusion of other physical and biological features conducive to Focus and BLM Special-Status Species’ dispersal, and (2) informed by existing available information on modeled focus and BLM Special-Status Species habitat and element occurrence data, mapped delineations of vegetation types, and based on available empirical data, including radio telemetry, wildlife tracking sign, and road-kill information. Additionally, projects will be sited and designed to 	The Easley Project will avoid impacts to unique plant assemblages and climate refugia to the maximum extent practicable. That is, the solar and energy storage facility will avoid desert dry wash woodland with a 200-foot buffer and it is not located within a listed wildlife connectivity corridor. The Project will comply with this CMA.

		<p>maintain the function of focus and BLM Special-Status Species connectivity and their associated habitats in the following linkage and connectivity areas:</p> <ul style="list-style-type: none"> – Within a 5-mile-wide linkage across Interstate 10 centered on Wiley’s Well Road to connect the Mule and McCoy mountains (the majority of this linkage is within the Chuckwalla ACEC and Mule-McCoy Linkage ACEC). – Within a 3-mile-wide linkage across Interstate 10 to connect the Chuckwalla and Palen mountains. – Within a 1.5-mile-wide linkage across Interstate 10 to connect the Chuckwalla Mountains to the Chuckwalla Valley east of Desert Center. – The confluence of Milpitas Wash and Colorado River floodplain within 2 miles of California State Route 78 (this linkage is entirely within the Chuckwalla ACEC). <ul style="list-style-type: none"> ■ Delineate the boundaries of areas to be disturbed using temporary construction fencing and flagging prior to construction and confine disturbances, project vehicles, and equipment to the delineated project areas to protect vegetation types and focus and BLM Special-Status Species. ■ Long-term nighttime lighting on project features will be limited to the minimum necessary for project security, safety, and compliance with Federal Aviation Administration requirements and will avoid the use of constant-burn lighting. ■ All long-term nighttime lighting will be directed away from riparian and wetland vegetation, occupied habitat, and suitable habitat areas for focus and BLM Special-Status Species. Long-term nighttime lighting will be directed and shielded downward to avoid interference with the navigation of night-migrating birds and to minimize the attraction of insects as well as insectivorous birds and bats to project infrastructure. ■ To the maximum extent practicable (see Glossary of Terms), restrict construction activity to the use existing roads, routes, and utility corridors to minimize the number and length/size of new roads, routes, disturbance, laydown, and borrow areas. ■ To the maximum extent practicable (see Glossary of Terms), confine vehicular traffic to designated open routes of travel to and from the project site, and prohibit, within project boundaries, cross-country vehicle and equipment use outside of approved designated work areas to prevent unnecessary ground and vegetation disturbance. ■ To the maximum extent practicable (see Glossary of Terms), construction of new roads and/or routes will be avoided within focus and BLM Special-Status Species suitable habitat within identified linkages for those focus and BLM Special-Status Species, unless the new road and/or route is beneficial to minimize net impacts to natural or ecological resources of concern. These areas will have a goal of “no net gain” of project roads and/or routes. 	

DRECP CMAs - LUPA Wide			
Category	CMA #	CMA Text	Comments
		<ul style="list-style-type: none"> ■ To the maximum extent practicable (see Glossary of Terms), any new road and/or route considered within focus and BLM Special-Status Species suitable habitat within identified linkages for those focus and BLM Special-Status Species will not be paved so as not to negatively affect the function of identified linkages. ■ Use nontoxic road sealants and soil stabilizing agents. 	
Biology: General Standard Practices	LUPA-BIO-14	<p>Implement the following general standard practices to protect Focus and BLM Special-Status Species:</p> <ul style="list-style-type: none"> ■ Feeding of wildlife, leaving of food or trash as an attractive nuisance to wildlife, collection of native plants, or harassing of wildlife on a site is prohibited. ■ Any wildlife encountered during the course of an activity, including construction, operation, and decommissioning will be allowed to leave the area unharmed. ■ Domestic pets are prohibited on sites. This prohibition does not apply to the use of domestic animals (e.g., dogs) that may be used to aid in official and approved monitoring procedures/protocols, or service animals (dogs) under Title II and Title III of the American with Disabilities Act. ■ All construction materials will be visually checked for the presence of wildlife prior to their movement or use. Any wildlife encountered during the course of these inspections will be allowed to leave the construction area unharmed. ■ All steep-walled trenches or excavations used during the project will be covered, except when being actively used, to prevent entrapment of wildlife. If trenches cannot be covered, they will be constructed with escape ramps, following up-to-date design standards to facilitate and allow wildlife to exit, or wildlife exclusion fencing will be installed around the trench(s) or excavation(s). Open trenches or other excavations will be inspected by a designated biologist immediately before backfilling, excavation, or other earthwork. ■ Minimize natural vegetation removal through implementation of crush and drive or cut or mow vegetation rather than removing entirely. 	As described in the Plan of Development and with the implementation of biological resources mitigation measures to be developed during the NEPA process, the Project will comply with this CMA.
	LUPA-BIO-15	Use state-of-the-art, as approved by BLM, construction and installation techniques, appropriate for the specific activity/project and site, that minimize new site disturbance, soil erosion and deposition, soil compaction, disturbance to topography, and removal of vegetation.	Within the application area, the project has been designed to minimize impacts to sensitive habitat and resources to the extent feasible. With the implementation of biological resources mitigation measures to be developed during the NEPA process, the Project will comply with this CMA.
Activity-Specific Bird and Bat CMAs	LUPA-BIO-16	For activities that may impact focus and BLM sensitive birds, protected by the Endangered Species Act (ESA) and/or Migratory Bird Treaty Act of 1918, and bat species, implement appropriate measures as per the most up-to-date BLM state and national policy and guidance, and data on birds and bats, including but not limited to activity-specific plans and actions. The goal of the activity-	Portions of the 34.5 kV medium voltage collector lines may be installed underground, and project design will reduce effects to birds and bats to the maximum extent feasible. A Project-specific Bird and Bat Conservation Strategy (BBCS),

		<p>² Setback is from managed wetlands including USFWS Refuges, state managed wetlands, and duck clubs in Imperial Valley. See specifications for the Salton Sea below.</p> <p>³ Setback is measured from the edge of mapped riparian or edge of Federal Emergency Management Agency (FEMA) 100 year floodplain of the Mojave River, whichever is further from the center line of the Mojave River channel.</p> <p>⁴ Undifferentiated "Riparian" land cover includes portions of major river courses (Mojave River and Colorado River) within the main channels where riparian vegetation groups were not mapped.</p> <p>For minor incursion (see "minor incursion" in the Glossary of Terms) to the DRECP riparian vegetation types, wetland vegetation types, or encroachments on the setbacks listed in Table 17, the hydrologic function of the avoided riparian or wetland communities will be maintained.</p> <p>Minor incursions in the riparian and wetland vegetation types or other features including the setbacks listed in Table 17 will occur outside of the avian nesting season, February 1 through August 31, or otherwise determined by BLM, USFWS, and CDFW if the minor incursion(s) is likely to result in impacts to nesting birds.</p>	
BLM Special Status Riparian Bird Species	LUPA-BIO-RIPWET-3	<p>For activities that occur within 0.25 mile of a riparian or wetland DRECP vegetation type and may impact BLM Special Status riparian and wetland birds species, conduct a pre-construction/activity nesting bird survey for BLM Special Status riparian and wetland birds according to agency-approved protocols.</p> <p>Based on the results of the nesting bird survey above, setback activities that are likely to impact BLM Special Status riparian and wetland bird species), including but not limited to pre-construction, construction and decommissioning, 0.25 miles from active nests of BLM Special-Status riparian and wetland bird species during the breeding season (February 1 through August 31 or otherwise determined by BLM, USFWS, and CDFW). For activities in these areas covered by this provision that occur during the breeding season and that last no longer than one week, nesting bird surveys may need to be repeated, as determined by BLM, in coordination with USFWS and CDFW, as appropriate. No pre-activity nesting bird surveys are necessary for activities occurring outside of the breeding season.</p>	The Applicant will perform a pre-construction/activity nesting bird survey and will establish setbacks as necessary. With implementation of mitigation measures to be developed during the NEPA process and the Project-specific Bird and Bat Conservation Strategy (POD Appendix M), the Project will comply with this CMA.
Bat Species (BAT)	LUPA-BIO-BAT-1	Activities, except wind projects, will not be sited within 500 feet of any occupied maternity roost or presumed occupied maternity roost as described below. Refer to CMA DFA-VPL-BIO-BAT-1 for distances within DFAs and VPLs.	No active bat maternity roosts have been identified within the survey area; no caves or similar roosting habitat occurs on or near the site. The Project will comply with this CMA.

DRECP CMAs - LUPA Wide

Plant Species (PLANT): Plant Focus and BLM Special Status Species CMAs	LUPA-BIO-PLANT-1	Conduct properly timed protocol surveys in accordance with the BLM's most current (at time of activity) survey protocols for plant Focus and BLM Special Status Species.	Protocol surveys have been completed. The methodologies and results are included in the Biological Resources Technical Report. The Project will comply with this CMA.
Special Vegetation Features (SVF)	LUPA-BIO-SVF-1	For activity-specific NEPA analysis, a map delineating potential sites and habitat assessment of the following special vegetation features is required: Yucca clones, creosote rings, Saguaro cactus, Joshua tree woodland, microphyll woodland, Crucifixion thorn stands. BLM guidelines for mapping/surveying cactus, yuccas, and succulents shall be followed.	Protocol surveys have been performed, which mapped these features as observed within the survey area, including desert dry wash microphyll woodland and creosote rings. No Joshua tree woodland, Saguaro cactus, or crucifixion thorn stands with greater than 100 individuals were found. The survey results and mapping are included in the Biological Resources Technical Report. The Project will comply with this CMA.
	LUPA-BIO-SVF-6	Microphyll woodland: impacts to microphyll woodland (see Glossary of Terms) will be avoided, except for minor incursions (see Glossary of Terms).	The riparian vegetation type on the site is the Sonoran-Coloradan Semi-Desert Wash Woodland (mapped as desert dry wash woodland). Desert dry wash woodland will be avoided with a 200-foot buffer on BLM administered land. The Project will comply with this CMA.
General Vegetation Management (VEG)	LUPA-BIO-VEG-1	Management of cactus, yucca, and other succulents will adhere to current up-to-date BLM policy.	Data collected during field surveys has mapped all cactus, yucca, and succulent occurrences in the Biological Resources Technical Report. The Applicant will comply with this CMA if cactus, yucca, and other succulents are found on the site.
	LUPA-BIO-VEG-2	Promote appropriate levels of dead and downed wood on the ground, outside of campground areas, to provide wildlife habitat, seed beds for vegetation establishment, and reduce soil erosion, as determined appropriate on an activity-specific basis.	The Applicant will allow appropriate levels of wood on the ground taking into consideration that it is a solar project and vegetation must be cleared to a certain extent. The Project will comply with this CMA.
	LUPA-BIO-VEG-3	Allow for the collection of plant material consistent with the maintenance of natural ecosystem processes.	Prior to Project fencing, plant material could be collected as necessary. After fencing, this CMA is not feasible within the solar facility fenceline. The Project will comply with this CMA prior to the fencing of the site.
	LUPA-BIO-VEG-5	All activities will follow applicable BLM state and national regulations and policies for salvage and transplant of cactus, yucca, other succulents, and BLM Sensitive plants.	No BLM sensitive plants have been identified on the site. Data collected during field surveys has been mapped in the Biological Resources Technical Report and includes all cactus, yucca, and succulent occurrences. The Applicant will comply with this CMA if cacti, yucca, and/or other succulents require salvage and transplantation.
	LUPA-BIO-VEG-6	BLM may consider disposal of succulents through public sale, as per current up-to-date state and national policy.	Resource occurs on the project site. BLM may consider disposal of succulents through public sale, as per current up-to-date state and national policy.

Category	CMA #	CMA Text	Comments
Individual Focus Species (IFS): Desert Tortoise	LUPA-BIO-IFS-1	Activities within desert tortoise linkages, identified in Appendix D, that may have a negative impact on the linkage will require an evaluation, in the environmental document(s), of the effects on the maintenance of long-term viable desert tortoise populations within the affected linkage. The analysis will consider the amount of suitable habitat, including climate refugia, required to ensure long-term viability within each linkage given the linkage's population density, long-term demographic and genetic needs, degree of existing habitat disturbance/impacts, mortality sources, and most up-to-date population viability modeling. Activities that would compromise the long-term viability of a linkage population or the function of the linkage, as determined by the BLM in coordination with USFWS and CDFW, are prohibited and will require reconfiguration or re-siting.	<p>The Easley solar facility footprint is located within the Pinto Wash Desert Tortoise Linkages identified in DRECP Appendix D, but does not overlap the Area of Critical Environmental Concern within the linkage. Impacts to the Pinto Wash Desert Tortoise Linkage will be assessed within the Biological Resources Technical Report and in the Environmental Documents in compliance with the National Environmental Policy Act. Should the BLM, in coordination with USFWS and CDFW, determine the project compromises the long-term viability of a linkage population or the function of the linkage the project will require reconfiguration or re-siting to be located outside of the linkage.</p> <p>The Easley Project 500 kV gen-tie line would cross the Oberon site to connect into the Oberon Substation. Within the Oberon Project site, the 500 kV gen-tie line would cross a 1.5-mile-wide wildlife linkage that connects the Chuckwalla Mountains and the Chuckwalla Valley. Upon completion of construction, the gen-tie line would not impede desert tortoise movement within the linkage. The Project will comply with this CMA.</p>
	LUPA-BIO-IFS-2	<p>Construction of new roads and/or routes will be avoided to the maximum extent practicable (see Glossary of Terms) within desert tortoise habitat in tortoise conservation areas (TCAs) or tortoise linkages identified in Appendix D, unless the new road and/or route is beneficial to minimize net impacts to natural or ecological resources of concern for desert tortoise. TCAs and identified linkages should have the goal of "no net gain" of road density.</p> <p>Any new road considered within a TCA or identified linkage will not be paved and will be designed and sited in order to minimize the effect to the function of identified linkages or local desert tortoise populations and shall have a maximum speed limit of 25 miles per hour.</p> <p>Roads requiring the installation of long-term desert tortoise exclusion fencing for construction or operation will incorporate wildlife underpasses (e.g., culverts) to reduce population fragmentation</p>	<p>The Easley Project 500 kV gen-tie line would cross the Oberon site to connect into the Oberon Substation. Within the Oberon Project site, the Easley gen-tie line would be located within a portion of an identified linkage area and TCA that overlaps with critical habitat. The Easley Project will utilize existing access roads (e.g., BLM Open Route DC379) where feasible for construction of the gen-tie line. The Project will comply with this CMA</p>
	LUPA-BIO-IFS-3	All culverts for access roads or other barriers will be designed to allow unrestricted access by desert tortoises and will be large enough that desert tortoises are unlikely to use them as shelter sites (e.g., 36 inches in diameter or larger). Desert tortoise exclusion fencing may be utilized to direct tortoise use of culverts and other passages.	If culverts are needed in areas where desert tortoise would access, the Applicant will follow this CMA. Desert tortoise fence and shade structures will be utilized during construction. The Project will comply with this CMA.
	LUPA-BIO-IFS-4	In areas where protocol and clearance surveys are required (see Appendix D), prior to construction or commencement of any long-term activity that is likely to adversely affect desert tortoises, desert tortoise exclusion fencing shall be	Desert tortoise protocol surveys have been performed, desert tortoise fence installation will occur prior to construc-

Category	CMA #	CMA Text	Comments
		<p>installed around the perimeter of the activity footprint (see Glossary of Terms) in accordance with the Desert Tortoise Field Manual (USFWS, 2009) or most up-to-date USFWS protocol. Additionally, short-term desert tortoise exclusion fencing will be installed around short-term construction and/or activity areas (e.g., staging areas, storage yards, excavations, and linear facilities), as appropriate, per the Desert Tortoise Field Manual (USFWS, 2009) or most up-to-date USFWS protocol.</p> <ul style="list-style-type: none"> ■ Exemption from desert tortoise protocol survey requirements can be obtained from BLM, in coordination with USFWS, and CDFW as applicable, on a case-by-case basis if a designated biologist determines the activity site does not contain the elements of desert tortoise habitat, is unviable for occupancy, or if baseline studies inferred absence during the current or previous active season. ■ Construction of desert tortoise exclusion fences will occur during the time of year when tortoise are less active in order to minimize impacts and to accommodate subsequent desert tortoise surveys. Any exemption or modification of desert tortoise exclusion fencing requirements will be based on the specifics of the activity and the site-specific population and habitat parameters. Sites with low population density and disturbed, fragmented, or poor habitat are likely to be candidates for fencing requirement exemptions or modifications. Substitute measures, such as on-site biological monitors in the place of the fencing requirement, may be required, as appropriate. ■ After an area is fenced, and until desert tortoises are removed, the designated biologist is responsible for ensuring that desert tortoises are not being exposed to extreme temperatures or predators as a result of their pacing the fence. Remedies may include the use of shelter sites placed along the fence, immediate translocation, removal to a secure holding area, or other means determined by the BLM, USFWS, and CDFW, as applicable. ■ Modification or elimination of the above requirement may also be approved if the activity design will allow retention of desert tortoise habitat within the footprint. If such a modification is approved, modified protective measures may be required to minimize impacts to desert tortoises that may reside within the activity area. ■ Immediately prior to desert tortoise exclusion fence construction, a designated biologist (see Glossary of Terms) will conduct a clearance survey of the fence alignment to clear desert tortoises from the proposed fence line's path. ■ All desert tortoise exclusion fencing will incorporate desert tortoise proof gates or other approved barriers to prevent access of desert tortoises to work sites through access road entry points. 	<p>tion, and clearance surveys will be conducted after fence installation. The Project will comply with this CMA.</p>

DRECP CMAs - LUPA Wide			
Category	CMA #	CMA Text	Comments
		<ul style="list-style-type: none"> Following installation, long-term desert tortoise exclusion fencing will be inspected for damage quarterly and within 48 hours of a surface flow of water due to a rain event that may damage the fencing. All damage to long-term or short-term desert tortoise exclusion fencing will be immediately blocked to prevent desert tortoise access and repaired within 72 hours. 	
	LUPA-BIO-IFS-5	<p>Following the clearance surveys (see Glossary of Terms) within sites that are fenced with long-term desert tortoise exclusion fencing a designated biologist (see Glossary of Terms) will monitor initial clearing and grading activities to ensure that desert tortoises missed during the initial clearance survey are moved from harm's way.</p> <p>A designated biologist will inspect construction pipes, culverts, or similar structures: (a) with a diameter greater than 3 inches, (b) stored for one or more nights, (c) less than 8 inches aboveground and (d) within desert tortoise habitat (such as, outside the long-term fenced area), before the materials are moved, buried, or capped.</p> <p>As an alternative, such materials shall be capped before storing outside the fenced area or placing on pipe racks. Pipes stored within the long-term fenced area after completing desert tortoise clearance surveys will not require inspection.</p>	With implementation of mitigation measures for biological monitoring to be developed during the NEPA process and the specifics in the Project-specific Desert Tortoise Protection and Translocation Plan (POD Appendix I), the Project will comply with this CMA.
	LUPA-BIO-IFS-6	When working in areas where protocol or clearance surveys are required (see Appendix D), biological monitoring will occur with any geotechnical boring or geotechnical boring vehicle movement to ensure no desert tortoises are killed or burrows are crushed.	Biological monitoring will occur with any geotechnical boring or geotechnical boring vehicle movement. The Project will comply with this CMA.
	LUPA-BIO-IFS-7	A designated biologist (see Glossary of Terms) will accompany any geotechnical testing equipment to ensure no tortoises are killed and no burrows are crushed.	A designated biologist will accompany any geotechnical testing equipment. The Project will comply with this CMA.
	LUPA-BIO-IFS-8	Inspect the ground under the vehicle for the presence of desert tortoise any time a vehicle or construction equipment is parked in desert tortoise habitat outside of areas fenced with desert tortoise exclusion fencing. If a desert tortoise is seen, it may move on its own. If it does not move within 15 minutes, a designated biologist may remove and relocate the animal to a safe location.	With implementation of mitigation measures to be developed during the NEPA process and the specifics in the Project-specific Desert Tortoise Protection and Translocation Plan, the Project will comply with this CMA.
	LUPA-BIO-IFS-9	Vehicular traffic will not exceed 15 miles per hour within the areas not cleared by protocol level surveys where desert tortoise may be impacted.	With implementation of mitigation measures to be developed during the NEPA process, the Project will comply with this CMA.
Bendire's Thrasher	LUPA-BIO-IFS-11	If Bendire's thrasher is present, conduct appropriate activity-specific biological monitoring (see Glossary of Terms) to ensure that Bendire's thrasher individuals are not directly affected by operations (i.e., mortality or injury, direct impacts on nest, eggs, or fledglings).	Conservation measures to avoid impacts to birds will be implemented during construction and operations. If Bendire's thrasher are observed during clearance surveys and construction, the Project will comply with this mitigation CMA.

DRECP CMAs - LUPA Wide			
Category	CMA #	CMA Text	Comments
Burrowing Owl	LUPA-BIO-IFS-12	If burrowing owls are present, a designated biologist (see Glossary of Terms) will conduct appropriate activity-specific biological monitoring (see Glossary of Terms) to ensure avoidance of occupied burrows and establishment of the 656 feet (200 meter) setback to sufficiently minimize disturbance during the nesting period on all activity sites, when practical.	Burrowing owls were found during the Easley surveys. With implementation of mitigation measures to be developed during the NEPA process and the Easley Wildlife Protection and Relocation Plan (POD Appendix K), the Project will comply with this CMA.
	LUPA-BIO-IFS-13	If burrows cannot be avoided on-site, passive burrow exclusion by a designated biologist (see Glossary of Terms) through the use of one-way doors will occur according to the specifications in Appendix D or the most up-to-date agency BLM or CDFW specifications. Before exclusion, there must be verification that burrows are empty as specified in Appendix D or the most up-to-date BLM or CDFW protocols. Confirmation that the burrow is not currently supporting nesting or fledgling activities is required prior to any burrow exclusions or excavations.	Burrowing owls were found during the Easley surveys. With implementation of mitigation to be developed during the NEPA process and the Easley Wildlife Protection and Relocation Plan (POD Appendix K), the Project will comply with this mitigation CMA.
	LUPA-BIO-IFS-14	Activity-specific active translocation of burrowing owls may be considered, in coordination with CDFW.	The Easley Project does not propose active translocation of burrowing owls. If burrowing owls are present on the sites, passive relocation may occur in conformance with CDFW Guidelines.
	LUPA-BIO-IFS-25	Cumulative loss of golden eagle foraging habitat within a 1 to 4 mile radius around active or alternative golden eagle nests (as identified or defined in the most recent USFWS guidance and/or policy) will be limited to less than 20%. See CONS-BIO-IFS-5 for the requirement in Conservation Lands.	The nearest golden eagle nests are located in the Chuckwalla Mtns (south of I-10) and in or near Joshua Tree National Park (northwest and northeast of the site). All these nests have substantial areas of protected foraging habitat surrounding them. The Project would not cause loss of foraging habitat within approximately 2 miles of any nest. It would contribute to some loss of foraging habitat between 2 and 4 miles of nest sites but given the potential area available for foraging, cumulative losses would be less than 20% to the available foraging habitat. The Project will comply with this CMA.
Compensation	LUPA-BIO-COMP-1	<p>Impacts to biological resources, identified and analyzed in the activity specific environmental document, from activities in the LUPA Decision Area will be compensated using the standard biological resources compensation ratio, except for the biological resources and specific geographic locations listed as compensation ratio exceptions, specifics in CMAs LUPA-BIO-COMP-2 through -4, and previously listed CMAs. Compensation acreage requirements may be fulfilled through non-acquisition (i.e., restoration and enhancement), land acquisition (i.e., preserve), or a combination of these options, depending on the activity specifics and BLM approval/authorization.</p> <p>Compensation for the impacts to desert tortoise critical habitat will be in the same critical habitat unit as the impact (see Table 18). Compensation for impacts to desert tortoise will be in the same recovery unit as the impact.</p> <p>Refer to CMA LUPA-COMP-1 and 2 for the timing requirements for initiation or completion of compensation.</p>	The Applicant will develop a proposed mitigation package to mitigate impacted biological resources that will be reviewed through the NEPA process. This includes any impacts to desert tortoise habitat, designated critical desert tortoise habitat (500 kV gen-tie line), desert tortoise linkage, and desert riparian woodland vegetation (minor incursion). Impacts to the Pinto Wash Desert Tortoise Linkage outside of ACEC designations are mitigated at the standard mitigation ratio. The Project will comply with this CMA.

	LUPA-BIO-COMP-2	<p>Birds and Bats – The compensation for the mortality impacts to bird and bat Focus and BLM Special Status Species from activities will be determined based on monitoring of bird and bat mortality and a fee re-assessed every 5 years to fund compensatory mitigation. The initial compensation fee for bird and bat mortality impacts will be based on pre-project monitoring of bird use and estimated bird and bat species mortality from the activity. The approach to calculating the operational bird and bat compensation is based on the total replacement cost for a given resource, a Resource Equivalency Analysis. This involves measuring the relative loss to a population (debt) resulting from an activity and the productivity gain (credit) to a population from the implementation of compensatory mitigation actions. The measurement of these debts and gains (using the same “bird years” metric as described in Appendix D) is used to estimate the necessary compensation fee.</p> <p>Each activity, as determined appropriate by BLM in coordination with USFWS, and CDFW as applicable, will include a monitoring strategy to provide activity-specific information on mortality effects on birds and bats in order to determine the amount and type of compensation required to offset the effects of the activity, as described above and in detail in Appendix D. Compensation may also be satisfied by non-restoration actions that reduce mortality risks to birds and bats (e.g., increased predator control and protection of roosting sites from human disturbance).</p> <p>Compensation will be consistent with the most up to date Department of the Interior (DOI) mitigation policy.</p>	The Project will create and implement an agency-approved Bird and Bat Conservation Strategy that will consider the actions addressed here (see POD Appendix M). Implementation of the Project-specific Bird and Bat Conservation Strategy will comply with this CMA.																	
Air Resources																				
Air Resources	LUPA-AIR-1	<p>All activities must meet the following requirements:</p> <ul style="list-style-type: none">■ Applicable National Ambient Air Quality Standards (Section 109)■ State Implementation Plans (Section 110)	The Project will comply with this CMA and meet all federal, state, and local laws and regulations.

Cultural Resources and Tribal Interests			
Cultural Resources and Tribal Interests	LUPA-CUL-3	Identify places of traditional cultural and religious importance to federally recognized Tribes and maintain access to these locations for traditional use.	The intent of this CMA is accomplished through compliance with NEPA, EX13175, EX13007 and all other applicable laws, regulations, and policies. The Project will comply with this CMA.
Cultural Resources and Tribal Interests	LUPA-CUL-4	Design activities to minimize impacts on cultural resources including places of traditional cultural and religious importance to federally recognized Tribes.	The intent of this CMA is accomplished through compliance with NEPA, National Historic Preservation Act (NHPA), EX13175, EX13007 and all other applicable laws, regulations, and policies. The Project will comply with this CMA.
Cultural Resources and Tribal Interests	LUPA-CUL-7	Coordinate with visual resources staff to ensure VRM Classes consider cultural resources and tribal consultation to include landmarks of cultural significance to Native Americans (TCPs, trails, etc.).	The analysis of the VRM Classes will consider all applicable resources in the analysis. The Project will comply with this CMA.
Cultural Resources and Tribal Interests	LUPA-CUL-8	Conduct regular contact and consultation with federally recognized Tribes and individuals, consistent with statute, regulation and policy.	This is an agency requirement so would be fulfilled by BLM through compliance with NEPA, Section 106 of the NHPA, EX13175, and all other applicable laws, regulations, and policies. The Project will comply with this CMA.
Cultural Resources and Tribal Interests	LUPA-CUL-9	Promote DRECP desert vegetation types/communities by avoiding them where possible, then use required compensatory mitigation, off-site mitigation, and other means to ensure Native American vegetation collection areas and practices are maintained.	This is accomplished through NEPA, EX13175 and EX13007 and all other applicable laws, regulations, and policies. The Project will comply with this CMA.
Cultural Resources and Tribal Interests	LUPA-CUL-11	Promote and protect desert microphyll woodland vegetation type/communities to ensure Native American cultural values are maintained.	The intent of this CMA is accomplished through compliance with NEPA, EX13175, EX13007 and all other applicable laws, regulations, and policies. The Easley Project will avoid microphyll woodland except for minor incursion. The Project will comply with this CMA.
Lands and Realty			
Lands and Realty	LUPA-LANDS-4	Nonfederal lands within the boundaries of BLM LUPA land use allocations are not affected by the LUPA.	The Project parcels located on federal land are designated as DFA.
Lands and Realty	LUPA-LANDS-5	The MUCs used to determine land tenure in the CDCA Plan will be replaced by areas listed in the CMAs below.	The Project is located in a DFA and will comply with this CMA.
Lands and Realty	LUPA-LANDS-8	The CDCA Plan requirement that new transmission lines of 161kV or above, pipelines with diameters greater than 12 inches, coaxial cables for interstate communications, and major aqueducts or canals for interbasin transfers of water will be located in designated utility corridors, or considered through the plan amendment process outside of designated utility corridors, remains unchanged. The only exception is that transmission facilities may be located outside of designated corridors within DFAs without a plan amendment. This CMA does not apply the Bishop and Bakersfield RMPs.	The Project is located in a DFA and will comply with this CMA.

Category	CMA #	CMA Text	Comments
Paleontology			
Paleontology	LUPA-PALEO-1	If not previously available, prepare paleontological sensitivity maps consistent with the Potential Fossil Yield Classification for activities prior to NEPA analysis.	Paleontological sensitivity maps have been included in POD Appendix F (Paleontological Resources Technical Report). The Project will comply with this CMA.
Paleontology	LUPA-PALEO-2	Incorporate all guidance provided by the Paleontological Resources Protection Act.	With implementation of paleontological resources mitigation measures to be developed during the NEPA process, the Project will comply with the CMA.
Paleontology	LUPA-PALEO-3	Ensure proper data recovery of significant paleontological resources where adverse impacts cannot be avoided or otherwise mitigated.	With implementation of mitigation measures to be developed during the NEPA process, the Project will comply with the CMA.
Paleontology	LUPA-PALEO-4	Paleontological surveys and construction monitors are required for ground disturbing activities that require an EIS.	A paleontological survey has been performed for the Project and will implement mitigation measures (to be developed during the NEPA process) to require that a qualified paleontological monitor(s) will monitor all construction-related earth-moving activities in sediments determined to have a moderate (PFYC 3 or higher) sensitivity. The Project does not require an EIS but will nonetheless comply with this CMA.
Recreation			
Recreation and Visitor Services	LUPA-REC-1	Maintain, and where possible enhance, the recreation setting characteristics – physical components of remoteness, naturalness and facilities; social components of contact, group size and evidence of use; and operational components of access, visitor services and management controls.	The Project is surrounded by recreational opportunities and by built environment, including existing and approved renewable energy projects. The Project would be located in a DFA and the area does not experience high levels of recreation. The Project would not maintain or enhance the setting but would be consistent with the existing setting and with the DFA designation
Recreation and Visitor Services	LUPA-REC-6	Limit signage to that necessary for recreation facility/area identification, interpretation, education and safety/regulatory enforcement.	The Project does not anticipate signs other than for temporary detours on existing access roads, if necessary. Signs would be limited to what is necessary. The Project will comply with this CMA.
Soil and Water Resources			
Soil and Water General	LUPA-SW-1	Stipulations or conditions of approval for any activity will be imposed that provide appropriate protective measures to protect the quantity and quality of all water resources (including ephemeral, intermittent, and perennial water bodies) and any associated riparian habitat (see biological CMAs for specific riparian habitat CMAs). The water resources to which this CMA applies will be identified through the activity-specific NEPA analysis.	With implementation of mitigation measures to be developed during the NEPA process, the Project will comply with the CMA.
Soil and Water General	LUPA-SW-2	Buffer zones, setbacks, and activity limitations specifically for soil and water (ground and surface) resources will be determined on an activity/site-specific basis through the environmental review process, and will be consistent with the soil and water resource goals and objectives to protect these resources.	The Project will comply with this CMA and minimize long-term facilities in buffers or protected zones for soil and water resources.

DRECP CMAs - LUPA Wide			
Category	CMA #	CMA Text	Comments
		Specific requirements, such as buffer zones and setbacks, may be based, in part, on the results of the Water Supply Assessment defined below. In general, placement of long-term facilities within buffers or protected zones for soil and water resources is discouraged, but may be permitted if soil and water resource management objectives can be maintained.	
Soil and Water General	LUPA-SW-3	Where a seeming conflict between CMAs within or between resources arises, the CMA(s) resulting in the most resource protection apply.	No conflicts between CMAs have been identified for the Project.
Soil and Water General	LUPA-SW-4	Nothing in the "Exceptions" below applies to or takes precedence over any of the CMAs for biological resources.	The Project would comply with the CMAs for biological resources.
Groundwater Resources	LUPA-SW-5	Exceptions to any of the specific soil and water stipulations contained in this section, as well as those listed below under the subheadings "Soil Resources," "Surface Water," and "Groundwater Resources," may be granted by the authorized officer if the applicant submits a plan, or, for BLM-initiated actions, the BLM provides documentation, that demonstrates: <ul style="list-style-type: none"> ■ The impacts are minimal (e.g., no predicted aquifer drawdown beyond existing annual variability in basins where cumulative groundwater use is not above perennial yield and water tables are not currently trending downward) or can be adequately mitigated. 	The CMA does not require actions but allows for some flexibility on how to comply with other CMAs.
Soil Resources	LUPA-SW-6	In addition to the applicable required governmental safeguards, third party activities will implement up-to-date standard industry construction practices to prevent toxic substances from leaching into the soil.	The Applicant will ensure that its third-party contractor adheres to LUPA-SW-6 and the specifics in Hazardous Materials Management and Oil Spill Response Plan (POD Appendix W). The Project will comply with this CMA.
	LUPA-SW-7	Prepare an emergency response plan, approved by the BLM contaminant remediation specialist, that ensures rapid response in the event of spills of toxic substances over soils.	A Health, Safety, and Noise Plan, which addresses emergency response is included in POD Appendix T. The Project will comply with this CMA.
	LUPA-SW-8	As determined necessary on an activity specific basis, prepare a site plan specific to major soil types present (≥5% of footprint or laydown surfaces) in Wind Erodibility Groups 1 and 2 and in Hydrology Soil Class D as defined by the USDA Natural Resource Conservation Service to minimize water and air erosion from disturbed soils on activity sites.	The Project will take the erosion potential into consideration during engineering to avoid areas of high erodibility or to minimize water and air erosion through the use of BMPs. No site-specific plan is required.
	LUPA-SW-9	The extent of desert pavement within the proposed boundary of an activity shall be mapped if it is anticipated that the activity may create erosional or ecologic impacts. Mapping will use the best available data and standards, as determined by BLM. Disturbance of desert pavement within the boundary of an activity shall be limited to the extent possible. If disturbance from an activity is likely to exceed 10% of the desert pavement mapped within the activity boundary, the BLM will determine whether the erosional and ecologic impacts of exceeding the 10% cap by the proposed amount would be insignificant and/or whether the activity should be redesigned to minimize desert pavement disturbance.	<p>The Easley Project has small patches of mapped the desert pavement within the Project footprint and may disturb desert pavement.</p> <p>The extent that the Project could create erosional or ecological impacts will be evaluated in the NEPA document. Implementation of dust control and soil and water resources mitigation measures and compliance with the Project SWPPP would reduce erosion impacts related to disturbance of desert pavement. Biological resources mitigation would require compensation for habitat impacts including ensuring that the habitat value of the compensation lands is</p>

DRECP CMAs - LUPA Wide			
Category	CMA #	CMA Text	Comments
			comparable to the impacts. With implementation of the mitigation measures to be developed during the NEPA process, the effects to desert pavement would be insignificant and meet CMA LUPA-SW-9. The Project would comply with this CMA.
	LUPA-SW-10	The extent of additional sensitive soil areas (cryptobiotic soil crusts, hydric soils, highly corrosive soils, expansive soils, and soils at severe risk of erosion) shall be mapped if it is anticipated that an activity will impact these resources. To the extent possible, avoid disturbance of desert biologically intact soil crusts, and soils highly susceptible to wind and water erosion.	The Project will comply with this CMA if sensitive soils are documented onsite.
	LUPA-SW-11	Where possible, side casting shall be avoided where road construction requires cut- and-fill procedures.	The Project will comply with this CMA and will avoid side casting where road construction requires cut-and-fill procedures.
	LUPA-SW-13	BLM will manage all riparian areas to be maintained at, or brought to, proper functioning condition.	The CMA is specific to BLM actions.
	LUPA-SW-16	The 100-year floodplain boundaries for any surface water feature in the vicinity of the project will be identified. If maps are not available from the Federal Emergency Management Agency (FEMA), these boundaries will be determined via hydrologic modeling and analysis as part of the environmental review process. Construction within, or alteration of, 100-year floodplains will be avoided where possible, and permitted only when all required permits from other agencies are obtained.	FEMA flood insurance rate maps have not been prepared for the Project site or surrounding lands and the site does not lie within a federally mapped floodplain. The Project will comply with this CMA.
Groundwater	LUPA-SW-17	An activity's groundwater extraction shall not contribute to exceeding the estimated perennial yield for the basin in which the extraction is taking place. Perennial yield is that quantity of groundwater that can be withdrawn from the groundwater basin without exceeding the long-term recharge of the basin or unreasonably affecting the basin's physical, chemical, or biological integrity. It is further clarified arithmetically below.	A Water Supply Assessment is included in POD Appendix P. Groundwater Monitoring and Reporting and any potential impacts to the Chuckwalla Valley Groundwater Basin will be addressed with implementation of mitigation measures to be developed during the NEPA process. The Project will comply with this CMA.
	LUPA-SW-18	Water extracted or consumptively used for the construction, operation, maintenance, or remediation of the project shall be solely for the beneficial use of the project or its associated mitigation and remediation measures, as specified in approved plans and permits.	The Project will comply with this CMA and follow all plan and permit stipulations regarding Project water use
	LUPA-SW-19	Water flow meters shall be installed on all extraction wells permitted by BLM.	The Project will comply with this CMA and install a water flow meter if a water well is drilled at the Project site and permitted by BLM.
	LUPA-SW-21	Consideration shall be given to design alternatives that maintain the existing hydrology of the site or redirect excess flows created by hardscapes and reduced permeability from surface waters to areas where they will dissipate by percolation into the landscape.	The Project would substantially maintain the existing hydrology of the area; minimal additional impermeable surfaces are proposed. Therefore, the Project would comply with this CMA.

Category	CMA #	CMA Text	Comments
	LUPA-SW-22	All hydrologic alterations shall be avoided that could reduce water quality or quantity for all applicable beneficial uses associated with the hydrologic unit in the project area, or specific mitigation measures shall be implemented that will minimize unavoidable water quality or quantity impacts, as determined by BLM in coordination with USFWS, CDFW, and other agencies, as appropriate. These beneficial uses may include municipal, domestic, or agricultural water supply; groundwater recharge; surface water replenishment; recreation; water quality enhancement; flood peak attenuation or flood water storage; and wildlife habitat.	With implementation of mitigation measures to be developed during the NEPA process, the Project will comply with the CMA.
	LUPA-SW-23	<p>A Water (Groundwater) Supply Assessment shall be prepared in conjunction with the activity's NEPA analysis and prior to an approval or authorization. This assessment must be approved by the BLM in coordination with USFWS, CDFW, and other agencies, as appropriate, prior to the development, extraction, injection, or consumptive use of any water resource. The purpose of the Water Supply Assessment is to determine whether over-use or over-draft conditions exist within the project basin(s), and whether the project creates or exacerbates these conditions. The Assessment shall include an evaluation of existing extractions, water rights, and management plans for the water supply in the basin(s) (i.e., cumulative impacts), and whether these cumulative impacts (including the proposed project) can maintain existing land uses as well as existing aquatic, riparian, and other water-dependent resources within the basin(s). This assessment shall identify:</p> <ul style="list-style-type: none"> ■ All relevant groundwater basins or sub-basins and their relationships. ■ All known aquifers in the basin(s), including their dimensions, whether confined or unconfined, estimated hydraulic conductivity and transmissivity, groundwater surface elevations, and direction and movement of groundwater. ■ All surface water basin(s) related to water runoff, delivery, and supply, if different from the groundwater basin(s). ■ All sites of surface outflow (springs or seeps) contained within the basin(s), including historic sites. ■ All other surface water bodies in the basins(s), including rivers, streams, ephemeral washes/drainages, lakes, wetlands, playas, and floodplains. ■ The water requirements of the proposed project and the source(s) of that water. ■ An analysis demonstrating that water of sufficient quantity and quality is available from identified source(s) for the life of the project. ■ An analysis of potential project-related impacts on water quality and quantity needed for beneficial uses, reserved water rights, existing groundwater users, or habitat management within or down gradient of the groundwater basin within which the project would be constructed. ■ The above analyses shall be in the form of a numerical groundwater model. The model extent shall encompass the groundwater basin within which the 	The Easley Project will complete a Water Supply Assessment. Per LUPA-SW-5, an exception to the CMA can be made if impacts are minimal; therefore, it is anticipated that the Water Supply Assessment satisfies this CMA and meets the intent of the DRECP resource management goals.

DRECP CMAs - LUPA Wide			
Category	CMA #	CMA Text	Comments
		<p>project would be constructed, and any groundwater-dependent resources within or down gradient of that basin.</p> <p>The primary product of the Water Supply Assessment shall be a baseline water budget, which shall be established based on the best-available data and hydrologic methods for the identified basin(s). This water budget shall classify and describe all water inflow and outflow to the identified basin(s) or system using best-available science and the following basic hydrologic formula or a derivation: $P - R - E - T - G = \Delta S$</p> <p>where P is precipitation and all other water inflow or return flow, R is surface runoff or outflow, E is evaporation, T is transpiration, G is groundwater outflow (including consumptive component of existing pumping), and ΔS is the change in storage. The volumes in this calculation shall be in units of either acre-feet per year or gallons per year. The water budget shall quantify the existing perennial yield of the basin(s). Perennial yield is defined arithmetically as that amount such that $P - R - E - T - G$ is greater than or equal to 0</p> <p>Water use by groundwater-dependent resources is implicitly included in the definition of perennial yield. For example, in many basins the transpiration component (T) includes water use by groundwater-dependent vegetation. Similarly, groundwater outflow (G) includes discharge to streams, springs, seeps, and wetlands. If one or more budget components is altered, then one or more of the remaining components must change for the hydrologic balance to be maintained. For example, an increase in the consumptive component of groundwater pumping can lower the water table and reduce transpiration by groundwater-dependent vegetation. The groundwater that had been utilized by the groundwater-dependent vegetation would then be considered "captured" by groundwater pumping. Similarly, increased groundwater consumption can capture groundwater that discharges to streams, springs, seeps, wetlands and playas. These changes can occur slowly over time, and may require years or decades before the budget components are fully adjusted. Accordingly, the water/groundwater supply assessment requires that the best-available data and hydrologic methods be employed to quantify these budgets, and that groundwater consumption effects on groundwater-dependent ecosystems be identified and addressed.</p> <p>The Water Supply Assessment shall also address:</p> <ul style="list-style-type: none"> ■ Estimates of the total cone of depression considering cumulative draw-down from all potential pumping in the basin(s), including the project, for the life of the project through the decommissioning phase ■ Potential to cause subsidence and loss of aquifer storage capacity due to groundwater pumping ■ Potential to cause injury to other water rights, water uses, and land owners ■ Changes in water quality and quantity that affect other beneficial uses

Category	CMA #	CMA Text	Comments
	LUPA-SW-26	Groundwater pumping mitigation shall be imposed if groundwater monitoring data indicate impacts on water-dependent resources that exceed those anticipated and otherwise mitigated for in the NEPA analysis and ROD, even if the basin's perennial yield is not exceeded. Water-dependent resources include riparian or phreatophytic vegetation, springs, seeps, streams, and other approved domestic or industrial uses of groundwater. Mitigation measures may include changes to pumping rates, volume, or timing of water withdrawals; coordinating and scheduling groundwater pumping activities in conjunction with other users in the basin; acquisition of project water from outside the basin; and/or replenishing the groundwater resource over a reasonably short timeframe. For permitted activities, permittees may also be required to contribute funds to basin-wide groundwater monitoring networks in basins such as those encompassed by the East Riverside DFA or in the Calvada Springs/South Pahrump Valley area, and to cooperate in the compilation and analysis of groundwater data.	A Water Supply Assessment is included in POD Appendix P. Groundwater Monitoring and Reporting and any potential impacts to the Chuckwalla Valley Groundwater Basin will be addressed with implementation of mitigation measures to be developed during the NEPA process. The Project will comply with this CMA.
	LUPA-SW-27	Water-conservation measures shall be required in basins where current groundwater demand is high and has the future potential to rise above the estimated perennial yield (e.g., Pahrump Valley). These measures may include the use of specific technology, management practices, or both. A detailed discussion and analysis of the effectiveness of mitigation measures must be included. Application of these measures shall be detailed in the Groundwater Water Monitoring and Mitigation Plan.	A Water Supply Assessment is included in POD Appendix P. Groundwater Monitoring and Reporting and any potential impacts to the Chuckwalla Valley Groundwater Basin will be addressed with implementation of mitigation measures to be developed during the NEPA process. The Project will comply with this CMA.
	LUPA-SW-30	Activities shall comply with local requirements for any long term or short-term domestic water use and wastewater treatment.	The Project will comply with this CMA by adhering to any applicable local requirements regarding domestic water use and wastewater treatment.
	LUPA-SW-31	The siting, construction, operation, maintenance, remediation, and abandonment of all wells shall conform to specifications contained in the California Department of Water Resources Bulletins #74-81 and #74-90 and their updates.	Should a well be drilled on the Project site, the Project will comply with this CMA and its stated specification.
	LUPA-SW-32	Colorado River hydrologic basin - The concepts, principles and general methodology used in the Colorado River Accounting Surface Method, as defined in U.S. Geological Survey Scientific Investigations Report 2008-5113 (USGS 2009), and existing and future updates or a similar methodology, are considered the best available data for assessing activity/project related ground water impacts in the Colorado River hydrologic basin. The best available data and methodology shall be used to determine whether activity/project-related pumping would result in the extracted water being replaced by water drawn from the Colorado River. If activity/project-related groundwater pumping results in the static groundwater level at the well being near (within 1 foot), equal to, or below the Accounting Surface in a basin hydrologically connected to the Colorado River, that consumption shall be considered subject to the Law of the River (Colorado River Compact of 1922 and amendments). In such	A Water Supply Assessment is included in POD Appendix P. Mitigation measures to be developed during the NEPA process will state that, if water for the Project is to be obtained from onsite wells, the Applicant shall develop a Colorado River Water Supply Plan to monitor groundwater extractions and prevent, replace, or mitigate Project impacts that deplete the PVMGB groundwater budget. Mitigation measures will include groundwater monitoring and mitigation. The Project will comply with this CMA.

		<p>circumstances, BLM shall require the applicant to offset or otherwise mitigate the volume of water causing drawdown below the Accounting Surface. Details of such mitigation measures and the right to the use of water shall be described in the Groundwater Water Monitoring and Mitigation Plan.</p>	
	LUPA-SW-35	<p>Stipulations for activities in the vicinity of Death Valley National Park, Joshua Tree National Park, or Mojave National Preserve: The NEPA for activities involving groundwater extraction that are in the vicinity of Death Valley National Park, Joshua Tree National Park, or the Mojave National Preserve shall analyze and address any potential impacts of groundwater extraction on Death Valley National Park, Joshua Tree National Park, or Mojave National Preserve. BLM will consult with the National Park Service on this process. The analysis or analyses shall include:</p> <ul style="list-style-type: none"> ■ Potential impacts on the water balances of groundwater basins within these parks and preserves ■ A map identifying all potentially impacted surface water resources in the vicinity of the project, including a narrative discussion of the delineation methods used to discern those surface waters in the field ■ Any project-related modifications to surface water resources, both temporary and permanent ■ Analysis of any potential impacts on perennial streams, intermittent streams, and ephemeral drainages that could negatively impact natural riparian buffers ■ Impacts of any project proposed truncation, realignment, channelization, lining, or filling of surface water resources that could change drainage patterns, reduce available riparian habitat, decrease water storage capacity, or increase water flow velocity or sediment deposition, in particular where stormwater diverted around or through the project site is returned to natural drainage systems downslope of the project ■ Any potential indirect project-related causes of hydrologic changes that could exacerbate flooding, erosion, scouring, or sedimentation in stream channels ■ Alternatives and mitigation measures proposed to reduce or eliminate such impacts 	<p>The NEPA review will consider potential effects of groundwater pumping for the Project on nearby wells. The Project would not have an impact on surface or groundwater within Joshua Tree National Park, which is underlain by a different groundwater basin, the Pinto Valley Groundwater Basin.</p>
Visual Resources Management			
Visual Resources Management	LUPA-VRM-1	Manage Visual Resources in accordance with the VRM classes shown on Figure 9.	Under the DRECP LUPA, the DFA where the Easley Project are located is classified as VRI Class IV, which allow for a high level of change. The Project will comply with this CMA.
Visual Resources Management	LUPA-VRM-2	Ensure that activities within each of the VRM Class polygons meets the VRM objectives described above, as measured through a visual contrast rating process.	Under the DRECP LUPA, the DFA where the Easley Project is located is classified as VRI Class IV, which allow for a high level of change. The NEPA analysis will consider the visual contrast rating process. The Project will comply with this CMA.

DRECP CMAs - LUPA Wide			
Category	CMA #	CMA Text	Comments
Visual Resources Management	LUPA-VRM-3	Ensure that transmission facilities are designed and located to meet the VRM Class objectives for the area in which they are located. New transmission lines routed through designated corridors where they do not meet VRM Class Objectives will require RMP amendments to establish a conforming VRM Objective. All reasonable effort must be made to reduce visual contrast of these facilities in order to meet the VRM Class before pursuing RMP amendments. This includes changes in routing, using lattice towers (vs. monopole), color treating facilities using an approved color from the BLM Environmental Color Chart CC-001 (dated June 2008, as updated on April 2014, or the most recent version) (vs. galvanized) on towers and support facilities, and employing other BMPs to reduce contrast. Such efforts will be retained even if an RMP amendment is determined to be needed. Visual Resource BMPs that reduce adverse visual contrast will be applied in VRM Class conforming situations. For a reference of BMPs for reducing visual impacts see the “Best Management Practices for Reducing Visual Impacts of Renewable Energy Facilities on BLM-Administered Lands”, available at http://www.blm.gov/style/medialib/blm/wo/MINERALS_REALTY_AND_RESOURCE_PROTECTION/_energy/renewable_references.Par.1568.File.dat/RenewableEnergyVisualImpacts_BMPs.pdf , or the most recent version of the document or BMPs for VRM, as determined by BLM.	Under the DRECP LUPA, the DFA where the Easley Project is located is classified as VRI Class IV, which allow for a high level of change. The Project will implement BMPs as necessary to comply with this CMA.

DRECP CMAs - DFAs and VPLs			
Category	CMA #	CMA Text	Comments
		impacts of the project. Refer to the Programmatic Agreement for details regarding the mitigation fee.	
	DFA-VPL-CUL-3	For renewable energy activities and transmission, the management fee rate will be determined through the NHPA programmatic Section 106 consultation process that will be completed as part of the DRECP land use plan amendment.	This may be accomplished through mitigation measures developed through the Section 106 or NEPA process. The Project will comply with this CMA.
	DFA-VPL-CUL-4	For renewable energy activities and transmission, demonstrate that results of cultural resources sensitivity, based on the DRECP geodatabase, and other sources, are used as part of the initial planning pre-application process and to select of specific footprints for further consideration.	The CMA is an action to be taken by the BLM.
	DFA-VPL-CUL-5	For renewable energy activities and transmission, provide a statistically significant sample survey as part of the pre-application process, unless the BLM determines the DRECP geodatabase and other sources are adequate to assess cultural resources sensitivity of specific footprints.	A BLM Class III archaeological survey will be completed for the Easley Project prior to the NEPA review, which exceeds the requirements of this CMA. The Project will comply with this CMA.
	DFA-VPL-CUL-6	For renewable energy activities and transmission, provide justification in the application why the project considerations merit moving forward if the specific footprint lies within an area identified or forecast as sensitive for cultural resources by the BLM.	Mitigation measures developed during the NEPA process will require reducing impacts of the Easley Project to cultural resources to the extent feasible. The Project will comply with this CMA.
	DFA-VPL-CUL-7	For renewable energy activities and transmission, complete the NHPA Section 106 Process as specified in 36 CFR Part 800, or via an alternate procedure, allowed for under 36 CFR Part 800.14 prior to issuing a ROD or ROW grant on any utility-scale renewable energy or transmission project. For utility-scale solar energy developments, the BLM may follow the Solar Programmatic Agreement.	NHPA Section 106 will be completed for the Project consistent with the DRECP PA Section 106 compliance will be completed prior to the issuance of a Decision Record for the Project. Mitigation measures developed during the NEPA process will require reducing impacts of the Easley Project to cultural resources to the extent feasible. The Project will comply with this CMA.
Visual Resources Management			
Visual Resources Management	DFA-VPL-VRM-1	Encourage development in a planned fashion within DFAs (e.g., similar to the planned unit development concept used for urban design—i.e., in-fill vs. scattered development, use of common road networks, Generator Tie Lines etc., use of similar support facility designs materials and colors etc.) to avoid industrial sprawl.	The Easley Project is located in close proximity to other renewable development and an existing electric substation. The Easley Project will share access roads and utilize existing roads to the extent feasible. In addition, the Easley Project will interconnect to the Oberon Substation and utilize the Oberon gen-tie line to the Red Bluff Substation. The Project will comply with this CMA.
	DFA-VPL-VRM-2	Development in DFAs and VPLs are required to incorporate visual design standards and include the best available, most recent BMPs, as determined by BLM (e.g. Solar, Wind, West Wide Energy Corridor, and Geothermal PEISs, the “Best Management Practices for Reducing Visual Impacts of Renewable Energy Facilities on BLM-Administered Lands”, and other programmatic BMP documents).	The Project will implement BMPs, as necessary, to comply with this CMA.

DRECP CMAs - DFAs and VPLs			
Category	CMA #	CMA Text	Comments
	DFA-VPL-VRM-3	<p>Required Visual Resource BMPs. All development within the DFAs and VPLs will abide by the BMPs addressed in the most recent version of the document “<i>Reducing Visual Impacts of Renewable Energy Facilities on BLM-Administered Lands</i>”, or its replacement, including, but not limited to the following:</p> <ul style="list-style-type: none"> ■ Transmission: <ul style="list-style-type: none"> – Color-treat monopoles Shadow Gray per the BLM Environmental Color Chart CC001 unless a more effective color choice is selected by the local Field Office VRM specialist. – Lattice towers and conductors will have non-specular qualities. – Lattice Towers will be located a minimum of 3/4 miles away from Key Observation Points such as roads, scenic overlooks, trails, campgrounds, navigable rivers and other areas people tend to congregate and located against a landscape backdrop when topography allows. ■ Solar – Color treat all facilities Shadow Gray from the BLM Environmental Color Chart CC001 unless a more effective color is selected by the Field Office VRM specialist, including but not limited to: <ul style="list-style-type: none"> – Concentrated solar thermal parabolic trough panel backs – Solar power tower heliostats – Solar power towers – Cooling towers – Power blocks ■ Wind – Color treat all facilities Shadow Gray with the exception of the wind turbine and towers 200 vertical feet or more. ■ Night Sky – BMPs to minimize impacts to night sky including light shielding will be employed 	The Project will implement BMPs, as necessary, to comply with this CMA.

DRECP CMAs - Development Focus Areas			
Category	CMA #	CMA Text	Comments
Renewable Energy	DFA-RE-1	<p>In order to use the DRECP’s BLM LUPA streamlined process for renewable energy in DFAs and transmission, project proponents must first consult with appropriate representatives of the Department of Defense to ensure the proposed renewable energy and/or transmission activity will not cause an unacceptable risk to national security. Refer to additional detail in LUPA Section IV.4 and Appendix E. Specifically, the following process will be implemented:</p> <ul style="list-style-type: none"> ■ For renewable energy and transmission activities proposed in red areas (see Appendix E), the DRECP BLM LUPA streamlined process will not be available unless a letter is obtained from the Department of Defense Siting Clearing-house stating that military impacts have been mitigated. 	The DRECP LUPA Appendix E states that solar PV present little to no conflict to military operations. The Project will comply with this CMA.

DRECP CMAs - Development Focus Areas																													
Category	CMA #	CMA Text	Comments																										
		<ul style="list-style-type: none">For renewable energy and transmission activities proposed in orange or yellow areas (see Appendix E), the DRECP BLM LUPA streamlined process will not be available until Department of Defense representatives at the regional level have been consulted and have been provided a minimum of 30 days to assess potential mission impacts. If the regional representatives conclude within the 30-day period that there is a significant possibility that a proposed activity presents an unacceptable risk to national security, the BLM will not streamline the proposed activity process and will require additional environmental analysis regarding Department of Defense impacts, unless a letter is obtained from the Department of Defense Siting Clearinghouse stating that military impacts have been mitigated.																											
Biological Resources	DFA-BIO-IFS-1	Conduct the following surveys as applicable in the DFAs as shown in Table 21 .	Wildlife surveys have been completed as dictated in DFA-BIO-IFS-1 for the applicable species. The methodologies and surveys results are included in the Biological Resources Technical Report. The Project will comply with this CMA.

DRECP CMAs - Development Focus Areas			
Category	CMA #	CMA Text	Comments
Desert Tortoise	DFA-BIO-IFS-3	<p>Protocol surveys, as described in DFA-BIO-IFS-1 and shown in Table 21, are required for development in the desert tortoise survey areas (see Appendix D). Based on the results of the protocol surveys the identified desert tortoises will be translocated, or the activity will be redesigned/relocated as described below:</p> <ul style="list-style-type: none"> ■ If protocol surveys identify 35 or fewer desert tortoises in potential impact areas on an activity site, the USFWS and CDFW (for third party activities) will be contacted and provided with the protocol survey results and information necessary for the translocation of identified desert tortoises. Pre-construction and construction, and other activities will not begin until the clearance surveys for the site have been completed and the desert tortoises have been translocated. Translocation will be conducted in coordination with the USFWS and CDFW, as appropriate, per the protocols in the Desert Tortoise Field Manual (USFWS, 2009) and the most up-to-date USFWS protocol. ■ If protocol surveys identify an adult desert tortoise density (i.e., individuals 160 millimeters or more) of more than 5 per square mile or more than 35 individuals total on a project site, the project will be required to be redesigned, re-sited, or relocated to avoid and minimize the impacts of the activity on desert tortoise 	The Project will comply with this CMA and the protocol survey requirements. Wildlife surveys have been completed. The methodologies and surveys results are included in the Biological Resources Technical Report.
Recreation	DFA-REC-1	Retain, to the extent possible, the identified recreation setting characteristics: physical components of remoteness, naturalness and facilities; social components of contact, group size and evidence of use; and operational components of access, visitor services and management controls (see recreation setting characteristics matrix).	The Project is surrounded by recreational opportunities and by built environment, including existing and approved renewable energy projects. The Project would be located in a DFA and the area does not experience high levels of recreation. It would not maintain or enhance the setting but would be consistent with the existing setting and with the DFA designation.
	DFA-REC-4	When considering large-scale development in DFAs, retain to the extent possible existing, approved recreation activities.	The Project is in a DFA, but would not impact approved, recreation activities.
	DFA-REC-5	For displacement of dispersed recreation opportunities, commensurate compensation in the form of enhanced recreation operations, recreation facilities or opportunities will be required. If recreation displacement results in resource damage due to increased use in other areas, mitigate that damage through whatever measures are most appropriate as determined by the Authorized Officer.	The Project would not displace recreation opportunities as the Project area is infrequently used for recreation.
	DFA-REC-7	If designated vehicle routes are directly impacted by activities (includes modification of existing route to accommodate industrial equipment, restricted access or full closure of designated route, pull outs, and staging area's to the public, etc.), mitigation will include the development of alternative routes to allow for continued vehicular access with proper signage, with a similar recreation experience. In addition, mitigation will also include the construction of an "OHV touring route" which circumvents the activity area and allows for interpretive	The Project would close some existing open routes. These routes do not lead to a specific recreational area so alternative routes would not be feasible. However, the Applicant could contribute funds if necessary to enhancing an existing OHV touring route, such as within the Chuckwalla SRMA which would allow for a similar recreation experience. The Project will comply with this CMA.

DRECP CMAs - Development Focus Areas			
Category	CMA #	CMA Text	Comments
		signing materials to be placed at strategic locations along the new touring route, if determined to be appropriate by BLM.	
	DFA-LANDS-7	Transmission facilities are an allowable use and will not require a plan amendment within DFAs.	The gen-tie line would be located within a DFA and does not require a plan amendment
Visual Resources Management	DFA-VRM-1	Manage all DFAs as VRM Class IV to allow for industrial scale development. Employ best management practices to reduce visual contrast of facilities.	The Project will implement BMPs, as necessary, to comply with this CMA.
	DFA-VRM-2	<p>Regional mitigation for visual impacts is required in DFAs . Mitigation is be based on the VRI class and the underlying visual values (scenic quality, sensitivity, and distance zone) for the activity area as it stands at the time the ROD is signed for the DRECP LUPA. Compensatory mitigation may take the form of reclamation of other BLM lands to maintain (neutral) or enhance (beneficial) visual values on VRI Class II and III lands. Other considerations may include acquisition of conservation easements to protect and sustain visual quality within the viewshed of BLM lands. The following mitigation ratios will be applied in DFAs:</p> <ul style="list-style-type: none"> ■ VRI Class II 1:1 ratio ■ VRI Class III ½ (0.5): 1 ratio ■ VRI Class IV, no mitigation required <p>Additional mitigation will be required where activities affect viewsheds of specially designated areas (e.g., National Scenic and Historic Trails).</p>	The Project is located on land with VRI Class IV, so no mitigation is required. The Project will comply with this CMA.

Board of Supervisors**County of Riverside****RESOLUTION NO. 2024-205**

**ENVIRONMENTAL IMPACT REPORT STATE CLEARINGHOUSE NO. 2022-11-0240
(SCH2022110240), CONDITIONAL USE PERMIT NO. 220021 (CUP220021), PUBLIC USE
PERMIT NO. 230002 (PUP230002), DEVELOPMENT AGREEMENT NO. 2200016 (DAN2200016)**

WHEREAS, pursuant to the provisions of Government Code Section 65350 et. seq., public hearings were held before the Riverside County Board of Supervisors in Riverside, California on August 27, 2024, to consider Conditional Use Permit No. 220021 (CUP220021), Public Use Permit No. 230002 (PUP230002), Development Agreement No. 2200016 (DAN2200016), Environmental Impact Report State Clearinghouse No. 2022-11-0240 (SCH2022110240); and,

WHEREAS, all procedures of the California Environmental Quality Act (CEQA) and Riverside County Rules to Implement CEQA have been followed, and Environmental Impact Report State Clearinghouse No. 2022-11-0240 (SCH2022110240), which is denying the proposed project and adopting the Alternative B: Reduced Footprint Alternative as the preferred project, prepared to consider Conditional Use Permit No. 220021 (CUP220021), Public Use Permit No. 230002 (PUP230002), Development Agreement No. 2200016 (DAN2200016) and related cases (referred to alternatively herein as "the Project"), is sufficiently detailed so that all of the potentially significant effects of the Project on the environment and measures necessary to avoid or substantially lessen such effects have been evaluated in accordance with CEQA and the above-referenced Rules; and,

WHEREAS, pursuant to State CEQA Guidelines section 15151, the evaluation of environmental effect is to be completed in light of what is reasonably feasible; and,

WHEREAS, the Mitigation Monitoring and Reporting Plan (MMRP) required to be adopted by this Board upon approval of the Project pursuant to State CEQA Guidelines section 15091(d) is attached hereto as Exhibit "A" and incorporated herein by reference. The MMRP lists the potential significant impacts of the Project, the Applicant-proposed measures and mitigation measures to be imposed on the Easley

FORM APPROVED COUNTY COUNSEL
BY:  8-21-24
DATE
AARON C. GETTIS

Renewable Energy Project, all of which are applicable to the preferred project, and the agency or entity responsible for compliance or enforcement of said measures; and,

WHEREAS, the Riverside County Planning Department first circulated a Notice of Preparation (NOP) for a greater than 30-day public review period commencing November 14, 2022, and held one public scoping meeting on December 5, 2022. The County prepared a Draft EIR (State Clearinghouse No. 2022-11-0240) to address the consideration of Conditional Use Permit No. 220021 (CUP220021), Public Use Permit No. 230002 (PUP230002), and Development Agreement No. 2200016 (DAN2200016). The Draft EIR was circulated for public review and comment as specified in the State CEQA Guidelines for a 45-day period (January 26, 2024, to March 11, 2024).

The County determined that new or clarified information required recirculation of certain chapters of the original Draft EIR in accordance with Section 15088.5 of the State CEQA Guidelines. In compliance with CEQA, the County prepared and circulated for public review and comment a Partially Recirculated Draft EIR for the Easley Project for a 45-day period (May 24, 2024, to July 8, 2024).

Public comments were received by the County and have been responded to by the County in accordance with CEQA requirements. The Project Final EIR Responses to Comments document was published prior to the August 27, 2024, Board of Supervisors hearing (the "Responses"),

WHEREAS the matter was discussed fully with testimony and documentation presented by the public and affected government agencies; now, therefore,

BE IT RESOLVED, FOUND, DETERMINED, AND ORDERED by the Board of Supervisors of the County of Riverside, in regular session assembled on August 27, 2024, that:

A. The Project includes Conditional Use Permit No. 220021 (CUP220021), Public Use Permit No. 230002 (PUP230002), Development Agreement No. 2200016 (DAN2200016) which were all considered concurrently at the public hearings before the Board of Supervisors.

B. An EIR was prepared that evaluates CUP220021 and PUP230002. The EIR analyzed the Project's potential significant effects on the environment and made the required findings in compliance with the State CEQA Guidelines and Riverside County CEQA implementing procedures based on the proposed project as well as Alternative B: Reduced Footprint Alternative, which is the chosen preferred project. Based on the findings and conclusions in

the EIR and the conditions of approval applied to the Project by the County of Riverside, CUP220021 and PUP230002 will not be detrimental to the health, safety, or general welfare of the community.

BE IT FURTHER RESOLVED by the Board of Supervisors that the following environmental impacts associated with EIR No. SCH2022110240 are determined to be less than significant in consideration of existing regulations and Project Design Features, with no need for mitigation. EIR No. SCH2022110240 evaluated impacts of the proposed Project as defined in Section ES.3 and Chapter 2 of the EIR, as well as the impacts related to Alternative B: Reduced Footprint Alternative. The Applicant's Preferred Alternative is now Alternative B: Reduced Footprint Alternative, as described in Section 2.8.3 of the EIR ("Alternative B"). Alternative B is similar to the Proposed Project but would remove approximately 50 acres of solar panels, move the onsite substation and BESS at least 0.7 mile to the northeast and farther from the Lake Tamarisk community, and would increase the length of the gen-tie line by approximately 0.8 mile to 7.5 miles long. Because Alternative B has a smaller footprint but otherwise similar characteristics and impacts as described in Table 5-1 of the EIR, the following findings with respect to the proposed Project are also applicable to Alternative B.

A. Agriculture and Forestry Resources

Impact: *Converting Farmland to Non-Agriculture use (AG-1)*

Threshold: *The Project would not conflict with existing zoning for agricultural use, a Williamson Act contract, or land within an agricultural preserve.*

Findings of Fact, Less Than Significant:

The proposed Project would be constructed on approximately 220 acres of land zoned as Light Agriculture (A-1). Under Ordinance No. 348.4705, solar power plants are permitted in zone A-1 land on a lot 10 acres or larger, provided a conditional use permit is granted. All A-1 parcels that are part of the Project area are greater than 10 acres. Therefore, the Project would not conflict with existing zoning for agricultural use.

Project development would conflict with the Williamson Act contracts recorded against

1 parcels within the Project site and with the inclusion of those parcels in the agricultural
2 preserves within which they currently reside. Cancellation of Williamson Act contracts and
3 removal of project lands from County Agricultural preserves would be required prior to
4 Project development, thereby resolving any agricultural preserve- or Williamson Act-related
5 conflicts. If the Williamson Act contracts are cancelled and lands within the Project site are
6 removed from County Agricultural Preserves at the time of Project approval, this impact
7 would be avoided. (EIR pp. 3.3-7 and 3.3-8).

8 ***Impact: Development of non-agricultural use (AG-2)***

9 ***Threshold: The Project would not result in an impact due to development of non-***
10 ***agricultural uses within 300 feet of agriculturally zoned property (Ordinance No. 625,***
11 ***"Right-to-Farm").***

12 **Findings of Fact, Less Than Significant:**

13 The proposed Project would not result in the conversion of adjacent farmland properties to
14 non-agricultural use during the Project's minimum 35-year existence. The proposed Project
15 would not introduce a non-agricultural use that is incompatible with agricultural operations
16 that would occur nearby. The construction and operation of the proposed Project would not
17 cause substantial changes to the existing environment such as changes to air quality, water
18 supply, drainage, shading of adjacent lands, increased heat or other resources that could
19 impact adjacent agriculture uses or lands. (EIR p. 3.3-8 and 3.3-9).

20 ***Impact: Conflict with existing agricultural uses or preserves (AG-3)***

21 ***Threshold: The Project would not conflict with land within a Riverside County Agricultural***
22 ***Preserve.***

23 **Findings of Fact, Less Than Significant:**

24 A portion of the Project area with solar facilities, substation, switchyard, BESS, and the gen-
25 tie line occur within a Riverside County Agricultural Preserve under the Williamson Act,
26 which is incompatible with the Project. Cancellation of Williamson Act contracts and
27 removal of Project lands from County Agricultural Preserves would be required prior to
28

Project development, thereby resolving any agricultural preserve- or Williamson Act-related conflicts. (EIR pp. 3.3-9).

B. Air Quality

Impact: *Air Quality Standards(AQ-1)*

Threshold: *The proposed Project would not conflict with or obstruct implementation of the applicable air quality plan.*

Findings of Facts, Less Than Significant:

Regional air quality plans anticipate a baseline level of construction activity and some permanent population growth, and air quality attainment planning anticipates growth that includes the construction of some new infrastructure, such as the solar facility. A project could be inconsistent with the applicable air quality management plan or attainment plan if it causes population and/or employment growth or growth in vehicle-miles traveled in excess of the growth forecasts included in the attainment plan. The Project would employ up to 10 permanent staff and the construction workforce would involve short-term employment. Accordingly, Project construction and operation would not result in activities. Therefore, the Project would not conflict with or obstruct implementation of the applicable air quality plan.

(EIR p. 3.4-7)

Impact: *Odors (AQ-4)*

Threshold: *The Project would not result in other emissions (such as those leading to odors) adversely affecting a substantial number of people.*

Findings of Facts, Less Than Significant:

The proposed solar facility and gen-tie lines would not include any notable source of odors or other emissions that could adversely affect people, because the nearest residential land use to the Project site would be more than 200 meters (656 feet) away from all onsite activity, therefore odors would not negatively affect a substantial number of people. (EIR p. 3.4-14).

C. Energy

Impact: *Energy Efficiency (E-1)*

Threshold: *The Project would not result in a significant environmental impact due to*

1 *wasteful, inefficient, or unnecessary consumption of energy resources during construction*
2 *or operation.*

3 Findings of Fact, Less Than Significant:

4 The construction of the Project would consume fossil fuels, however, statewide requirements
5 for minimizing emissions from off-road equipment and limitations on idling would ensure
6 that activity levels are not wasteful. Further, construction is temporary and would cease upon
7 the completion of construction. Once operational, the Project would require minimal
8 maintenance activities and therefore would require up to 10 permanent staff to perform daily
9 inspections, maintenance, and minor repairs. Due to the small workforce and limited number
10 of vehicles and equipment required, there would be minimal energy use at the site.
11 Additionally, the Project would generate renewable energy, which reduces the use of fossil
12 fuels for electrical generation by conventional power plants. The Project would produce up
13 to 1.4 million megawatt-hours (MWh) of electricity each year, which equates to 527,800 MT
14 of CO2 emissions avoided per year. Furthermore, the battery storage component would have
15 a beneficial effect of providing power during peak demand. (EIR p. 3.7-4).

16 **D. Geology, Soils, and Mineral Resources**

17 *Impact: Geologic Hazards (GEO-1)*

18 *Threshold: The Project would not directly or indirectly cause substantial adverse effects,*
19 *including the risk of loss, injury, or death, involving strong seismic ground shaking.*

20 Findings of Fact, Less Than Significant:

21 The Project site is not located on or near any known active or potentially active faults.
22 However, seismically induced ground shaking due to earthquakes along the active faults in
23 the region could occur and result in damage to Project structures. The Project would comply
24 with applicable regulations and standards, and established engineering practices. A
25 geotechnical investigation and report would be required and would include
26 recommendations regarding design. The regulatory requirements put in place prior to final
27 Project design and construction would minimize any potential impacts related to seismic
28 effects. (EIR p. 3.8-13 to 3.8-14).

Impact: Geologic Hazards (GEO-2)

Threshold: *The Project would not directly or indirectly cause substantial adverse effects, including the risk of loss, injury, or death, involving seismic related ground failure, including liquefaction.*

Findings of Fact, Less Than Significant:

The Project site may be subject to strong ground shaking, and is mapped by the County of Riverside to have moderate susceptibility to liquefaction. However, liquefaction usually occurs in areas with young, saturated unconsolidated sediments with groundwater levels of 50 feet or less. The Project is in an area with expected groundwater levels greater than 70 feet below ground surface, which results in a low potential for liquefaction. Additionally, all structures would be designed in compliance with applicable regulations and standards, geotechnical recommendations, and established engineering procedures, so the impact would be less than significant. **(EIR pp. 3.8-14).**

Impact: Geologic Hazards (GEO-4)

Threshold: *The Project would not be located on a geological unit or soil that is unstable, or that would become unstable as a result of the Project, potentially resulting in on or off-site landslide, lateral spreading, subsidence, liquefaction, or collapse.*

Findings of Fact, Less Than Significant:

The Project site is in an area that has no landslide, lateral spreading, or rockfall hazard due to the flat to gentle slope and a low liquefaction potential. The Project is in an area mapped as susceptible to subsidence, however, given the local and regional setting, the potential for subsidence is considered to be very low and not significant, and therefore, the site is unlikely to become unstable as a result of subsidence and impacts would be less than significant. **(EIR p. 3.8-17).**

Impact: Geologic Hazards (GEO-5)

Threshold: *The Project would not be located on expansive soil creating direct or indirect risks to life and property.*

Findings of Fact, Less Than Significant:

1 The soils in the Project area contain high percentages of sand and have a low potential to be
2 expansive. Therefore, the potential for expansive soils to create direct or indirect risks to life
3 or property are less than significant. (EIR p. 3.8-17).

4 ***Impact: Soil Resources (GEO-6)***

5 ***Threshold:*** *The Project would not have soils incapable of supporting the use of septic tanks*
6 *or alternative wastewater disposal systems where sewers are not available for the disposal*
7 *of wastewater.*

8 Findings of Fact, Less Than Significant:

9 During construction, portable restroom facilities would be provided for the construction
10 crew. During operations, restroom facilities would be located adjacent to the O&M building
11 and a self-contained septic system or a septic system and leach field would be used to serve
12 the sanitary wastewater treatment needs. Soils in the Project area are somewhat excessively
13 drained and contain high percentages of sand. Percolation testing and design of the septic
14 system would be conducted to meet applicable County septic system requirements. The
15 impact would be less than significant. (EIR p. 3.8-18).

16 ***Impact: Mineral Resources (MR-1)***

17 ***Threshold:*** *The Project would not result in the loss of availability of a known mineral*
18 *resource that would be of value to the region and the residents of the state.*

19 Findings of Fact, Less Than Significant:

20 No known mineral sites or mines are located on the Project site, and it is not under a
21 claim, lease, or permit for the production of locatable, leasable, or saleable mineral or
22 mineral materials. The site is located within MRZ 4, where there is not enough information
23 available to determine the presence or absence of mineral deposits. As such, the Project
24 would not result in the loss of availability of a known mineral resource of value to the region
25 or residents of the state. Furthermore, the use of the site as a solar facility would restrict
26 mineral exploration on this land only for the life of the Project, but it would not change the
27 mineral content of the area. The Project site is underlain by alluvial materials that may
28 contain aggregate resources but the Project would not appreciably reduce or restrict the

availability of aggregate resources from outside the Project site and any potential on-site aggregate resources would become available again following decommissioning of the Project. (EIR p. 3.8-18)

E. Greenhouse Gas Emissions

Impact: Greenhouse Gas Emissions (GHG-1)

Threshold: The Project would not generate greenhouse gas emissions that may have a significant impact on the environment.

Findings of Fact, Less Than Significant:

Construction, operations, and eventual decommissioning activities would cause greenhouse gases (GHG) emissions as a result of fossil-fuel combustion in the engines of construction equipment and the vehicles carrying construction materials and workers to and from the site. Diesel fuel or gasoline is used in mobilizing the heavy-duty construction equipment, site development and preparation, facility construction, and roadway construction, and eventual decommissioning. Installation of the Project would result in ground disturbance that would disturb soils and remove some vegetation that naturally provide carbon uptake. Ground disturbance and vegetation removal during construction accordingly adds to the GHG impact because a portion of the soils and vegetation onsite would no longer be present to sequester CO₂.

However, the production of renewable power would displace power produced by carbon-based fuels that would otherwise be used to meet electricity demand. The power displaced is incremental power provided by generators elsewhere on the grid, typically from natural gas power plants. Additionally, the proposed energy storage component would allow the solar facilities to shift the solar output to the grid-wide system during peak (evening) hours when the solar production has the most benefits (or is most valuable in deferring use of natural gas elsewhere). The combined direct and indirect effects of offsetting emissions from conventional power generation sources by implementing the proposed solar and energy storage facility indicates that a net GHG reduction in the region would occur with the proposed Project. (EIR pp. 3.9-5 to 3.9-7)

Impact: Greenhouse Gas Emissions (GHG-2)

Threshold: *The Project would not conflict with any applicable plan, policy or regulation of an agency adopted for the purpose of reducing the emissions of greenhouse gases.*

Findings of Fact, Less Than Significant:

Electricity from the solar facility would be used to serve the needs of customers and would facilitate compliance with the renewable portfolio standards (RPS), as set forth by Senate Bill (SB) 350 and SB 100. The GHG emissions avoided by producing electricity would be consistent with and would not conflict with the California's GHG emissions reduction targets, as set forth by Assembly Bill (AB) 32, SB 32, and the Climate Change Scoping Plan. Overall, the electricity produced by the Project would contribute to the continued reduction of GHG emissions in California's power supply. As the total GHG emissions generated by construction and operation of the proposed Project would be considerably less than the GHG emissions avoided, the solar facility would lead to a net reduction in GHG emissions across the State's electricity system, which would contribute to meeting the State's GHG reduction goals under AB 32 and subsequent targets for 2030 and beyond. The proposed Project would not conflict with any applicable GHG management plan, policy, or regulation. (EIR pp. 3.9-7 and 3.9-8).

F. Hazards and Hazardous Materials

Impact: Aviation Hazards (HAZ-4)

Threshold: *The Project is located within 2 miles of a public use airport and would not result in a safety hazard or excessive noise for people residing or working in the Project area.*

Findings of Fact, Less Than Significant:

The proposed Project is located within 2 miles of the Desert Center Airport, which is now owned by the Chuckwalla Valley Raceway and is no longer included in the Riverside County Circulation Element. The Project site is not located within the Airport Influence Area Boundary nor any of the airport Compatibility Zones. The gen-tie line structures are the only components of the solar facility that would be potentially over 100 feet tall. The gen-tie

1 structures would be on average 120 feet tall, with a maximum height of 199 feet and located
2 approximately 2 to 2.5 miles south and southwest of the single east-west trending runway.
3 The closest Project element would be approximately 1 mile northwest from the runway. Low
4 level military training flight paths are located crossing and in the vicinity of the Project and
5 the gen-tie line structures could potentially represent an aviation hazard to low level training
6 flights. Depending on the outcome of the BLM-DoD consultation, infrared obstruction
7 lighting may be installed on structures over 180 feet high that are located in areas where the
8 new structures would be taller than existing nearby structures. Compliance with BLM-DoD
9 required lighting would reduce potential impacts to low level training flights to less than
10 significant.

11 The PV solar panels for the proposed Project would not create significant adverse impacts
12 from reflection and glare. Glint and glare from solar projects to pilots on final approach is
13 similar to glint and glare pilots routinely experience from water bodies, glass facade
14 buildings, parking lots, and similar features. According to the model results for the Project,
15 the flight path receptors on the Desert Center Runway Approach would not be impacted by
16 glare from the solar panels and some portions of the ground-level routes and military training
17 routes may have a low potential of being impacted by green glare. The Project would not be
18 a substantial source of glare for pilots in the area. The proposed Project would not include
19 residential or commercial uses that would be affected by operations at the Desert Center
20 Airport. Impacts to the airport due to the Project structures or glare would be less than
21 significant, and impacts to the safety of people residing or working in the Project area would
22 be less than significant. (EIR pp. 3.10-20 and 3.10-21).

23 **Impact:** *Emergency Response (HAZ-5)*

24 **Threshold:** *The Project would not impair implementation of or physically interfere with an*
25 *adopted emergency response plan or emergency evacuation plan.*

26 Findings of Fact, Less Than Significant:

27 Construction of the solar facility is not expected to require any temporary lane closures that
28 could restrict the movements of emergency vehicles.

1 The Project site would have controlled access points for ingress and egress through up to
2 five primary and three secondary driveway entrances, none of which are near the Lake
3 Tamarisk Desert Resort community, and therefore, would not cause an interference of
4 emergency access. These access points would allow for emergency vehicle access into and
5 through the site. Once constructed, maintenance activities would occur as needed at the solar
6 facility but are not expected to require any temporary travel lane closures that could restrict
7 emergency vehicle movements. (EIR p. 3.10-21).

8 **G. Land Use and Planning**

9 *Impact: Land Use Consistency (LU-1)*

10 *Threshold: The Project would not cause a significant environmental impact due to conflict*
11 *with applicable land use plans, policies, or regulations.*

12 Findings of Fact, Less Than Significant:

13 Construction, operations and maintenance, and decommissioning of the Project would be
14 consistent with the Riverside County General Plan, Desert Center Area Plan, CDCA Plan as
15 Amended, and County Ordinances.

16 The Project would be a conditionally permitted use within the land use designation Open
17 Space Rural (OS-RUR) and Natural Assets (N-A) with approval of a conditional use permit
18 (CUP) and completion of an environmental review. Table 3.12-1 of the Final EIR describes
19 how the Project would be consistent with the Land Use and Multi-Purpose Open Space
20 Elements.

21 The Applicant is also seeking to merge contiguous Project parcels. Roads along the Project
22 perimeter of the solar facility lands (Rice Road and Kaiser Road) would remain dedicated
23 public access. Access on existing unimproved roads to private and public lands not included
24 in the Project site would remain unimpeded. This merger would be consistent with LU 26.4,
25 encourage parcel consolidation, and because the perimeter roads and unimproved access
26 roads would remain open to the public, it would not result in a loss of access.

27 The existing and known planned land uses surrounding the Project are similar in nature to
28 those identified for the Project, primarily Open Space Rural. The parcels in the vicinity of

the solar facility are zoned N-A, W-2-10, A-1-20 (Light Agriculture [20-acre minimum]), C-P-S (Scenic Highway Commercial), M-H (Manufacturing Heavy), all of which allows solar power development on a lot 10 acres or larger with a CUP.

The Project would be consistent with all applicable General Plan policies and goals. The Project is subject to Policy B29, and the developer would need to enter into a development agreement with the County following the guidelines noted in the regulatory setting. Once the agreement is approved, the Project would comply with this policy. **(EIR pp. 3.12-8 to 3.12-12).**

H. Noise

Impact: Vibration (N-2)

Threshold: The Project would not result in excessive groundborne vibration or groundborne noise levels.

Findings of Fact, Less Than Significant:

Vibration from routine construction equipment and activities, and vehicle traffic might be perceptible to people in the immediate vicinity of construction activities, usually limited to a region of influence of approximately 200 feet. The nearest home in the Lake Tamarisk Desert Resort is approximately 260 feet away from the boundaries of the Project. During construction, the impact or vibratory pile drivers used for installing posts would have the greatest radius of potential ground-borne vibration impacts, however, this construction activity would be set back substantially from property boundaries. When necessary to install posts near the proposed Project site boundaries, use of pile drivers could result in vibration that would be perceptible and potentially annoying within 100 feet of the source, however, at a distance of 100 feet the level would attenuate to below 0.1 in/sec, which is below the County threshold level that would be annoying to occupants of a building. Because offsite vibration levels would be low enough to avoid causing an annoyance, they would be unlikely to cause structural damage. Impacts from vibration would be localized and temporary (i.e., infrequently recurring at any single location), and therefore, would not be excessive, resulting in a less than significant impact. **(EIR pp. 3.13-12 and 3.13-13).**

1 **I. Population and Housing**

2 *Impact: Population Growth (PH-1)*

3 *Threshold: The Project would not induce substantial unplanned population growth in an*
4 *area, either directly (for example, by proposing new homes and businesses) or indirectly*
5 *(for example, through extension of roads or other infrastructure).*

6 Findings of Fact, Less Than Significant:

7 During the 20-month construction period of the proposed Project, the on-site workforce is
8 expected to reach a peak of approximately 530 individuals with an average construction-
9 related on-site workforce of 320 individuals. The construction workforce would largely be
10 recruited from within Riverside and San Bernardino Counties. It is anticipated that many
11 workers are likely to engage in weekly commuting or otherwise temporarily relocate to the
12 Desert Center region while working at the Project area. There are sufficient vacant housing
13 units within the local communities to support the number of construction workers to the
14 extent that they are not drawn from local communities. During operation of the proposed
15 Project, up to 10 permanent staff could be on the site at any one time for ongoing facility
16 maintenance and repairs. The permanent staff are not anticipated to increase the local
17 population and vacancy rates within the study area offer ample available housing to
18 operational employees wishing to relocate within the local study area. **(EIR pp. 3.15-3 and**
19 **3.15-4).**

20 **J. Public Services and Utilities**

21 *Impact: Public Service Levels (PSU-1)*

22 *Threshold: The Project would not result in substantial adverse physical impacts associated*
23 *with the provision of new or physically altered governmental facilities; and/or result in the*
24 *need for new or physically altered governmental facilities, the construction of which could*
25 *cause significant environmental impacts, in order to maintain acceptable service ratios,*
26 *response times or other performance objectives for public services.*

27 Findings of Fact, Less Than Significant:

During construction, there is the potential for both small fires and major structural fires. Electrical sparks, combustion of fuel oil, hydraulic fluid, mineral oil, or insulating fluid at substations, or flammable liquids, explosions, and over-heated equipment may cause small fires. However, this would be temporary and the proposed Project would not result in a permanent increase in demand for fire protection services over existing levels during construction. Additionally, a Fire Prevention Plan was developed and would decrease the risk of fires and include fire response measures to be implemented on-site. During construction, on-site security would include trained, uniformed, and unarmed personnel whose primary responsibility would be to control ingress and egress of personnel and vehicles, perform fire and security watch during off hours, and perform security badge administration, all of which would minimize the potential need for assistance from the Riverside County Sheriff's Department. The proposed Project would not cause population growth sufficient to generate a need for new or expanded public service facilities, such as schools, parks, or other public facilities. (EIR pp. 3.15-6 to 3.16-8).

Impact: Utility Service Levels (PSU-2)

Threshold: The Project would not require or result in the relocation or construction of new or expanded water, wastewater treatment, storm water drainage, electric power, natural gas, or telecommunications facilities, which could cause significant environmental effects.

Findings of Fact, Less Than Significant:

The proposed Project would not cause population growth sufficient to generate a need for new or expanded utilities. Grading could alter naturally occurring drainage patterns and result in soil erosion, sedimentation, long-term siltation, and increased storm water runoff. As part of the Project, a Storm Water Pollution Prevention Plan (SWPPP) would be prepared and implemented before and during construction. The SWPPP would be designed to reduce potential impacts from storm water runoff and existing drainage patterns, and would include BMPs which would ensure that the proposed Project would not require or result in the construction of new storm water drainage facilities or expansion of existing facilities. (EIR pp. 3.16-9).

Impact: Water Supply (PSU-3)

Threshold: *The Project would not have insufficient water supplies available to serve the Project and reasonably foreseeable future development during normal, dry and multiple dry years.*

Findings of Fact, Less Than Significant:

Water for operations, construction needs, and related dust control would be obtained from either an on-site groundwater well or purchased off site. Water tanks would likely be set up by any groundwater wells and near the O&M building. These water sources would tap into the Chuckwalla Valley Groundwater Basin (CVGB). A Water Supply Assessment was conducted, included in the EIR as Appendix G, and concluded that the CVGB's current annual groundwater recharge and outflows are almost balanced, and all estimated groundwater demand for the Project may be sourced from the CVGB without resulting in a groundwater deficit under average climatic conditions using conservative groundwater recharge estimates. Using normal recharge data, the available water supplies during normal, single, dry, and multiple dry water years from the CVGB would meet the projected water demands of the Project, in addition to existing uses. Additionally, the water budget indicates the CVGB water balance would be in a state of surplus after the 52-year period under normal conditions with the Project in place. Based on available historical data, storage capacity and hydrogeologic properties of the CVGB, the presented CVGB water budget, and the modeled cone of depression from Project pumping, the Project is not anticipated to negatively impact groundwater storage, nor cause substantial impact to the available quantity of groundwater in the CVGB that affects beneficial uses. Therefore, the available water supplies during normal, single dry, and multiple dry water years from the CVGB would meet the projected water demands of the Project, in addition to existing uses and foreseeable future development. (EIR p. 3.16-10).

Impact: Solid Waste (PSU-4)

Threshold: *The Project would not generate solid waste in excess of State or local standards,*

1 *or in excess of the capacity of local infrastructure, or otherwise impair the attainment of*
2 *solid waste reduction goals.*

3 Findings of Fact, Less Than Significant:

4 Construction materials would be sorted on-site throughout construction and transported to
5 appropriate waste management facilities. Recyclable materials would be separated from
6 non-recyclable items and stored until they could be transported to a designated recycling
7 facility. All contractors and workers would be educated about waste sorting, appropriate
8 recycling storage areas, and how to reduce landfill waste. Non-hazardous waste generated
9 during Project operations would be limited to office uses associated with the proposed O&M
10 building and include paper, aluminum, food, and plastic and would be managed similarly to
11 during construction with non-hazardous items being recycled where possible or otherwise
12 disposed of at the municipal-county landfills. The Project would comply with applicable
13 federal, State, and local regulations related to solid waste and sufficient capacity is
14 anticipated at the two nearest waste disposal sites. **(EIR p. 3.16-11).**

15 **K. Recreation**

16 ***Impact: Recreational Facilities (REC-1)***

17 ***Threshold:*** *The Project would not increase the use of existing neighborhood and regional*
18 *parks or other recreational facilities such that substantial physical deterioration of the*
19 *facility would occur or be accelerated.*

20 Findings of Fact, Less Than Significant:

21 The proposed Project would not cause population growth sufficient to generate a need for
22 new or expanded recreational facilities. Several BLM Open Routes would be near the
23 Project, with most unaffected. One BLM Open Route (DC536-1) one would be blocked by
24 the Project, resulting in a loss of 1.2 miles of this route. However, there is a parallel route
25 which would maintain connectivity, and the blockage of one route would not substantially
26 increase the use of other routes. The visual change at the site could affect visitors seeking
27 experiences in a natural setting. Night lighting for the solar PV project is expected to be
28 minimal, so little detrimental effect to night skies and star gazing would be anticipated. The

1 area is used for military training flights. If aviation safety lighting is installed on any gen-tie
2 line poles, the lighting would be infrared, and thus, would not be visible to the human eye
3 and would not detract from the dark night sky for which the region is noted. Overall, these
4 impacts could affect users' perception of solitude, naturalness and unconfined recreation.
5 While the Project would result in indirect impacts to recreation, it is not anticipated that the
6 Project would result in a significant change in use of the nearby recreation facilities that
7 would increase the use of other regional parks or other recreational facilities such that
8 substantial physical deterioration of the facility would occur or be accelerated. The impact
9 would be less than significant. **(EIR pp. 3.17-9 and 3.17-10).**

10 **BE IT FURTHER RESOLVED** by the Board of Supervisors that the following environmental
11 impacts associated with the EIR No. SCH2022110240 are potentially significant unless otherwise indicated,
12 but each of these impacts will be avoided or substantially lessened to a level of less than significant through
13 existing regulations, Project Design Features, and/or, with respect to the portion of the Project on private
14 land, mitigation measures specified in Attachment A (Mitigation Monitoring and Reporting Program)
15 which is incorporated herein by this reference, and/or, with respect to the portion of the Project on BLM-
16 administered land, implementation of the DRECP Conservation and Management Actions (CMAs), which
17 are detailed in EIR Appendix CC. DRECP CMAs identify a specific set of avoidance, minimization, and
18 compensation measures, and allowable and non-allowable actions for siting, design, pre-construction,
19 construction, maintenance, implementation, operation, and decommissioning activities for renewable
20 energy projects developed within the DRECP. The CMAs are identified within the DRECP and are intended
21 to provide certainty regarding the avoidance and minimization measures, design features, and
22 compensation/ mitigation measures required for renewable energy development within the DRECP. As
23 such, it is reasonable to conclude the BLM will require the Project to comply with CMAs during the
24 construction, operation, maintenance and decommissioning of the Project.

25 Accordingly, with respect to the portion of the Project on private land, the County makes the
26 following finding as to each of the following impacts pursuant to State CEQA Guidelines section 15091(a):
27 "Changes or alterations have been required in, or incorporated into, the Project which avoid or substantially
28 lessen the significant environmental effect as identified in the final EIR." With respect to the portion of the

Project on BLM-administered land, the County makes the following finding as to each of the following impacts pursuant to State CEQA Guidelines section 15091(a): “Changes or alterations that will avoid or substantially lessen these significant effects are within the responsibility and jurisdiction of another public agency and not the County making the finding. The other public agency (in this case the BLM) can and should adopt these changes; therefore, the impact is reduced to less than significant.”

EIR No. SCH2022110240 evaluated impacts of the Proposed Project as defined in Section ES.3 and Chapter 2 of the EIR. The Applicant’s preferred project is Alternative B: Reduced Footprint Alternative, as described in Section 2.8.3 of the EIR (“Alternative B”). Alternative B is similar to the Proposed Project but would remove approximately 50 acres of solar panels, move the on-site substation and BESS at least 0.7 mile to the northeast and farther from the Lake Tamarisk community, and would increase the length of the gen-tie line by approximately 0.8 mile. Because Alternative has a smaller footprint but otherwise similar characteristics and impacts as described in Table 5-1 of the EIR, the following findings with respect to the Proposed Project are also applicable to Alternative B.

A. Aesthetics

Impact: Visual Quality (AES-1)

Threshold: The Project would not substantially degrade the existing visual character or quality of public views of the site and its surroundings with implementation of mitigation measures.

Findings of Fact, Construction and Decommissioning: Less Than Significant with Mitigation Measures:

Project construction and decommissioning activities could cause short-term direct and indirect aesthetic impacts from visible presence of equipment and construction activities. The Project’s visible contrast associated with temporary ground disturbance and vegetation removal, temporary fugitive dust during construction, and temporary uncontrolled night lighting during construction can be reduced to levels that would be less than significant through the implementation of Biological Resources Mitigation Measure (MM) BIO-5, MM AQ-1, and MM AES-3, respectively and the applicable DRECP CMAs detailed in EIR Appendix CC, including LUPA-AIR-5 (fugitive dust management), and LUPA-BIO-13

(night lighting plan). MM BIO-5 would include revegetation of disturbed areas and retention of existing vegetation such that visual contrast and visual access is reduced, MM AQ-1 would include the reduction of fugitive dust emission through stabilization of soils, and MM AES-3 would include lighting management and control systems that would result in reduced night lighting impacts. With implementation of the mitigation measures and DRECP CMAs identified in the FEIR's analysis of impacts to aesthetics, the Project's impacts would be less than significant. (EIR pp. 3.2-17 to 3.2-19).

Mitigation Measures:

MM AES-3 (Night Lighting Management Plan). To the extent feasible, consistent with safety and security considerations, the Project owner shall design and install all permanent exterior lighting and all temporary construction lighting such that: (a) lamps and reflectors are not visible from beyond the Project site, including any off-site security buffer areas; (b) lighting does not cause excessive reflected glare; (c) direct lighting does not illuminate the nighttime sky, except for required FAA aircraft safety lighting; (d) illumination of the Project and its immediate area is minimized; and (e) it complies with local policies and ordinances.

The Project owner shall also consult with the NPS Night Sky Program Manager in the development of the night lighting and comply with stricter standards for light intensity. All permanent light sources shall be below 3,500 Kelvin color temperature (warm white) and shall have cutoff angles not to exceed 45 degrees of nadir. The use of LED lighting with a Correlated Color Temperature (CCT) above 2,700 would introduce blue light into the environment that would have negative impacts on the night skies, wildlife, and visitors, and increase light pollution in that area. If LED light bulbs are used, they shall have a CCT of 2,700 or less. All lights, temporary and permanent, are to be fully shielded such that the emission of light above the horizontal is prevented. Prior to construction, the Project owner shall submit to BLM, Riverside County, and NPS JTNP for review a Night Lighting Management Plan that shall include the following:

A. Location and direction of light fixtures that take the lighting mitigation requirements into

1 account;

2 B. Lighting that incorporates fixture hoods/shielding, with light directed downward or
3 toward the area to be illuminated;

4 C. Light fixtures, which are visible from beyond the Project boundary, that have cutoff
5 angles that are sufficient to prevent lamps and reflectors from being visible beyond the
6 Project boundary, except where necessary for security;

7 D. All lighting that is of minimum necessary brightness consistent with operational safety
8 and security;

9 E. Lights in high illumination areas not occupied on a continuous basis (such as
10 main-tenance platforms) that have (in addition to hoods) switches, timer switches, or
11 motion detectors so that the lights operate only when the area is occupied;

12 F. Specification that LPS or amber LED lighting shall be emphasized, and that white
13 lighting (metal halide) would: (a) only be used when necessitated by specific work tasks;
14 (b) not be used for dusk-to-dawn lighting; and (c) would be less than 3500 Kelvin color
15 temperature;

16 G. Specifications and mapping for of all lamp locations, orientations, and intensities,
17 including security, roadway, and task lighting;

18 H. Specifications for each light fixture and each light shield;

19 I. Total estimated outdoor lighting footprint expressed as lumens or lumens per acre;

20 J. Specifications on the use of portable truck-mounted lighting;

21 K. Specifications for motion sensors and other controls to be used, especially for security
22 lighting;

23 L. Surface treatment specifications that shall be employed to minimize glare and skyglow;

24 M. Documentation that the necessary coordination with the NPS Night Sky Program
25 Manager has occurred; and

26 N. Exterior lighting that complies with current Title 24 regulations from the State of
27 California and that shall be coordinated with the California Department of
28 Transport-a-tion (Caltrans) to comply with exterior lighting regulations along I-10 and

1 SR-177.

3 **MM BIO-5 (Vegetation Resources Management Plan) Full Text under Biological**
4 **Resources.**

5 **MM AQ-1 (Fugitive Dust Control Plan) Full Text under Air Quality.**

6
7 **DRECP CMAs:**

8 Applicable CMAs are detailed in EIR Appendix CC, which provides a list of CMAs, an
9 explanation of their applicability, and demonstration of compliance with the CMA. CMAs
10 specifically applicable under Impact AES-1 are detailed at FEIR pp., 3.2-18 through 3.2-20.

11 ***Impact: Light and Glare (AES-2)***

12 ***Threshold:** The Project would not create a new source of substantial light or glare which*
13 *would adversely affect day or nighttime views in the area with implementation of mitigation*
14 *measures.*

15 **Findings of Fact, Less Than Significant with Mitigation Measures:**

16 Because permanent lighting would not be required for the arrays of photovoltaic panels,
17 operational lighting would be confined to a small portion of the Project site that contains
18 O&M facilities and the switchyard and is unlikely to be out of character with other existing
19 lighting sources found scattered throughout the Chuckwalla Valley. Further, MM AES-3
20 includes standards that light intensity must be the minimum necessary to ensure worker
21 safety and facility security, that direct lighting not illuminate the nighttime sky, and that
22 Project night lighting does not adversely affect the dark sky viewing program at JTNP
23 because it requires review and approval of the Project Lighting Mitigation Plan prepared
24 under MM AES-3 by the NPS Night Sky Program Manager. This review would ensure that
25 the Project meets the stricter night lighting specifications of the NPS Night Sky Viewing
26 Program, and that lighting exposure levels (based on a Lumen Analysis) do not exceed the
27 action threshold for NPS lands nor adversely affect JTNP's Night Sky Viewing Program.
28 Additionally, hazard lighting may be required for the tallest gen-tie structures at crossing

locations due to safety concerns with low-level military flights in the area. If installed, these lights would be infrared, and therefore, not visible to the human naked eye, and thus, would not create night lighting or Dark Sky impacts. (EIR pp. 3.2-29 and 3.2-30).

Green glare is predicted at various levels along area roadways, and for some low-level military training routes that intersect the airspace above the Project. With implementation of MMs AES-1 (Surface Treatment of Project Structures and Buildings) and AES-2 (Project Design) and compliance with DRECP CMAs LUPA BIO-7, DFA-VPL-VRM-2, and DFA-VPL-VRM-3, any potentially significant glare impacts would be reduced to less than significant. These mitigation measures would reduce glare through the use of glare-reducing surface treatments and retention of vegetation to screen the Project and reduce visible reflectance. The Project would not be a substantial source of glare for travelers, including pilots in the area. Based on the modeling results along Kaiser Road, it is expected that any glare to the Lake Tamarisk community would be along the immediate western edge of the solar facility array field that is located northeast of the community. Since the community is set back farther from panels compared to modeled portions of Kaiser Road, glare impacts would be less than along Kaiser Road and similarly less than significant. The impact of daytime glare to views from Desert Center and the Lake Tamarisk Desert Resort would not be significant. It is expected that such glare impacts would be substantially less than that associated with other solar technologies because photovoltaic panels are less reflective, and it is anticipated that the resulting visual impact would be less than significant. With implementation of the mitigation measures and DRECP CMAs identified in the FEIR's analysis of impacts to aesthetics, the Project's impacts would be less than significant. (EIR pp. 3.2-28 and 3.2-29).

Mitigation Measures:

MM AES-1 (Surface Treatment of Project Structures and Buildings). The Project owner shall treat the surfaces of all non-temporary, large Project structures and buildings (e.g., O&M building, substation components, inverters, electrical enclosures, gen-tie poles and conductors) visible to the public such that: (a) their colors minimize visual intrusion and

1 contrast by blending with (matching) the existing characteristic landscape colors; (b) their
2 colors and finishes do not create excessive glare from surface brightness; and (c) their colors
3 and finishes are consistent with local policies and ordinances. The transmission line
4 conduc-tors shall be non-specular and non-reflective, and the insulators shall be non-
5 reflective and non-refractive.

6 Following a consultation with Riverside County and BLM visual resources specialists, and
7 other representatives as deemed necessary, the Project owner shall submit for the County's
8 and BLM's review, a specific Surface Treatment Plan that will satisfy these requirements.
9 The consultation shall be in-field at the agencies' election, or as a desktop review if preferred
10 by the agencies. The treatment plan shall include:

11 • A description of the overall rationale for the proposed surface treatment,
12 including the selection of the proposed color(s) and finishes based on the characteristic
13 land-scape. Colors shall be field tested using the actual distances from the KOPs to the
14 proposed structures, using the proposed colors painted on representative surfaces;

15 • A list of each major Project structure and building, the transmission line
16 towers and/or poles, and fencing, specifying the color(s) and finish proposed for each.
17 Colors must be identified by vendor, name, and pantone number, or according to a
18 univer-sal designation system;

19 • One set of color brochures or color chips showing each proposed color and
20 finish;

21 • A specific schedule for completion of the treatment; and

22 • A procedure to ensure proper treatment maintenance for the life of the
23 Project. The Project owner shall not specify to the vendors the treatment of any buildings
24 or structures treated during manufacture or perform the final treatment on any build-ings
25 or structures treated in the field until the Project owner receives notification of approval
26 of the treatment plan by Riverside County and the BLM. Subsequent modi-fications to
27 the treatment plan are prohibited without the County's and BLM's approval for
28

components under their respective authorities; however, the Project owner may consider the agencies' failure to respond to a request for review within 60 days an acceptance of the proposal.

MM AES-2 (Project Design – Retention of Roadside Vegetation) The Project owner shall use proper design fundamentals to reduce the visual contrast to the characteristic landscape. These include proper siting and location; reduction of visibility; repetition of form, line, color, and texture of the landscape; and reduction of unnecessary disturbance. Design strategies to address these fundamentals shall be based on the following factors:

- **Vegetation Manipulation:** Retain as much of the existing vegetation as possible including along roadsides to intercept sightlines from public vantage points. Use existing vegetation to screen the development from public viewing and lessen the visibility of structural contrast and glare. Use scalloped, irregular, cleared edges to reduce line contrast. Use irregular clearing shapes to reduce form contrast. Feather and thin the edges of cleared areas and retain a representative mix of plant species and sizes.

- **Structures:** Minimize the number of structures and combine different activities in one structure. Use natural, self-weathering materials and chemical treatments on surfaces to reduce color contrast and the potential for reflectance (glare). Bury all or part of structures to the extent practical. Use natural-appearing forms to complement the characteristic landscape. Screen the structure from view by using natural landforms and vegetation. Reduce the line contrast created by straight edges.

- **Linear Alignments:** Use existing topography to hide induced changes associated with roads, lines, and other linear features. Select alignments that follow landscape contours. Avoid fall-line cuts. Hug vegetation lines.

- **Reclamation and Restoration:** Reduce the amount of disturbed area and blend the disturbed areas into the characteristic landscape. Where feasible, replace soil, brush, rocks, and natural debris over disturbed area. Newly introduced plant species should be of a form, color, and texture that blends with the landscape.

MM AES-3 (Night Lighting Management) Full text under Aesthetic Resources.

DRECP CMAs:

Applicable CMAs are detailed in EIR Appendix CC, which provides a list of CMAs, an explanation of their applicability, and demonstration of compliance with the CMA. CMAs specifically applicable under Impact AES-2 are detailed at FEIR pp., 3.2-28 through 3.2-29.

Impact: Visual Quality (AES-3)

Threshold: *The Project would not result in the creation of an aesthetically offensive site open to public view with implementation of mitigation measures.*

Findings of Fact, Construction and Decommissioning: Less Than Significant with Mitigation Measures:

For the reasons described in Impact AES-1, above, the Project's visible appearance associated with temporary construction can be reduced to levels that would be less than significant through the implementation of Biological Resources Mitigation Measure (MM) BIO-5, MM AQ-1, and MM AES-3, respectively, and the applicable DRECP CMAs detailed in EIR Appendix CC. With implementation of the mitigation measures and DRECP CMAs identified in the FEIR's analysis of impacts to aesthetics, the Project's impacts would be less than significant. (EIR pp. 3.2-17 to 3.2-19, 3.2-30).

Mitigation Measures:

DRECP CMAs:

Applicable CMAs are detailed in EIR Appendix CC, which provides a list of CMAs, an explanation of their applicability, and demonstration of compliance with the CMA. CMAs specifically applicable under Impact AES-1 are detailed at FEIR pp., 3.2-18 through 3.2-19

and 3.2-30.

Impact: Light and Glare (AES-4)

Threshold: The Project would not expose residential property to unacceptable light levels with implementation of mitigation measures.

Findings of Fact, Less Than Significant with Mitigation Measures:

For the reasons described in Impact AES-2, operational lighting would be confined to a small portion of the Project site and is unlikely to be out of character with other existing lighting sources found scattered throughout the Chuckwalla Valley. MM AES-3 includes standards to reduce light intensity and illumination of the night sky and impacts to the dark sky viewing program at JTNP. (EIR pp. 3.2-27 through 3.2-28 and 3.2-30).

Green glare is predicted at various levels along area roadways, and for some low-level military training routes that intersect the airspace above the Project. With implementation of MMs AES-1 (Surface Treatment of Project Structures and Buildings) and AES-2 (Project Design) and compliance with DRECP CMAs LUPA BIO-7, DFA-VPL-VRM-2, and DFA-VPL-VRM-3, any potentially significant impacts to light levels would be reduced to less than significant. With implementation of the mitigation measures and DRECP CMAs identified in the FEIR's analysis of impacts to aesthetics, the Project's impacts would be less than significant. (EIR pp. 3.2-28 through 3.2-29 and 3.2-30).

Mitigation Measures:

MM AES-3 (Night Lighting Management) Full text under Aesthetic Resources.

DRECP CMAs:

Applicable CMAs are detailed in EIR Appendix CC, which provides a list of CMAs, an

1 explanation of their applicability, and demonstration of compliance with the CMA. CMAs
2 specifically applicable under Impact AES-2 are detailed at FEIR pp., 3.2-29 through 3.2-30.

3
4 ***Impact: Policy Consistency (AES-5)***

5 ***Threshold:*** *The Project would not result in an inconsistency with regulatory plans, policies,*
6 *and standards applicable to the protection of aesthetic with implementation of mitigation*
7 *measures.*

8 Findings of Fact, Less Than Significant with Mitigation Measures:

9 The Project will comply with federal and local regulatory plans, policies, and standards
10 applicable to the protection of aesthetics. Further, implementation of MMs AES-1 and AES-
11 3, as well as compliance with DRECP CMAs, LIPA BIO-7, LUPA-AIR-5, LUPA-BIO-13,
12 DFA-VPL-VRM-2, and DFA-VPL-VRM-3 would mitigate the Project's aesthetic impacts
13 and help to ensure the Project's consistency with Riverside County General Plan Land Use
14 Element Policy LU 4.1 and Desert Center Area Plan Policy DCAP 4.1. (EIR pp. 3.2-30 to
15 3.2-35)

16 **Mitigation Measures:**

17 **MM AES-1 (Surface Treatment of Project Structures and Buildings) Full text under**
18 **Aesthetic Resources.**

19 **MM AES-2 (Project Design) Full text under Aesthetic Resources.**

20 **MM AES-3 (Night Lighting Management Plan) Full text under Aesthetic Resources.**

21 **DRECP CMAs:**

22 Applicable CMAs are detailed in EIR Appendix CC, which provides a list of CMAs, and
23 explanation of their applicability, and demonstrative of compliance with the CMA. CMAs
24 specifically applicable under Impact AES-5 are detailed at FEIR pp. 3.2-35.

25
26 **B. Air Quality**

27 ***Impact: Emission Compliance (AQ-2)***

28 ***Threshold:*** *The Project would not result in a cumulatively considerable net increase of any*

criteria pollutant for which the Project region is nonattainment with implementation of mitigation measures.

Findings of Fact, Less Than Significant with Mitigation Measures:

The Project site is in an area designated as non-attainment for State-level ozone and PM10 standards. Emissions during the temporary 20-month duration of construction would include criteria air pollutants that could exceed quantitative thresholds for regional ozone precursors or PM10. Emissions exceeding the thresholds would represent a cumulatively considerable net increase of nonattainment pollutants that could contribute to existing or projected violations of the ambient air quality standards. Implementing mitigation would reduce construction-related NOx and PM10 due to the designation of the area as non-attainment for the State-level ozone and PM10 standards. As discussed in the EIR, with implementation of mitigation for dust control practices (MM AQ-1) and off-road equipment engine standards (MM AQ-2), as well as compliance with applicable DRECP CMAs, the maximum daily emissions of all pollutants during construction would be reduced to levels below the SCAQMD thresholds. The impact of increased criteria air pollutant emissions during construction would not be significant with mitigation. (EIR pp. 3.4-9 to 3.4-12).

Emissions during O&M would be minor and would not exceed the SCAQMD thresholds. With minimal direct emissions during operation, operation of the Project would not result in a cumulatively considerable net increase of any criteria pollutant, and this impact of air pollutant emissions during Project operations would be less than significant, with no operational-phase mitigation required. (EIR p. 3.4-11).

Mitigation Measures:

MM AQ-1 (Fugitive Dust Control Plan) The Project owner, its contractor, or its subcontractor shall prepare and implement a Fugitive Dust Control Plan to address fugitive dust emissions during Project construction, operation, maintenance, and decommissioning. The plan shall include measures to minimize fugitive dust emissions from the commencement of construction activities through operations, maintenance, and

decommissioning. In the case where the contractor obtains permit coverage under SCAQMD Rule 403, that permit and associated plan will be incorporated into the final Fugitive Dust Control Plan prepared by the Project owner. During construction, the Project owner, its contractor, and subcon-tractors shall take every reasonable precaution to prevent all airborne fugitive dust plumes from leaving the Project site, to prevent visible particulate matter from being deposited upon public roadways, and shall adhere to the SCAQMD rules. The plan shall be subject to review and approval by the SCAQMD (Rule 403).

The following measures would be included within the plan:

- During construction, all unpaved roads, disturbed areas (e.g., areas of scraping, excavation, backfilling, grading, and compacting), and loose materials generated during construction activities shall be stabilized with a non-toxic soil stabilizer or soil weighting agent or watered two times daily or as frequently as necessary to minimize fugitive dust generation. Non-water-based soil stabilizers shall be as efficient as or more efficient for fugitive dust control than ARB-approved soil stabilizers and shall not increase any other environmental impacts, including loss of vegetation, adverse odors, or emissions of ozone precursor reactive organic gases (ROG) or volatile organic compounds (VOC). The proposed soil stabilizing products shall be listed in the Plan and are subject to review and approval by Riverside County, BLM, and CDFW. Any soil stabilizers proposed shall be consistent with those recommended in the Stormwater Pollution Prevention Plan (SWPPP) and shall also be approved for use by the project's Restoration Specialist to ensure that the products would not impede restoration goals.
- The main access roads through the site shall be either paved or stabilized using soil binders, or equivalent methods, to provide a stabilized surface that is similar for the purposes of dust control to paving, that may or may not include a crushed rock (gravel or similar material with fines removed) top layer, prior to commencing construction. Delivery, laydown, and staging areas for construction or operations and maintenance

supplies shall be paved or stabilized prior to taking initial deliveries.

- Grading and earthwork activities, including vegetation removal, cut and fill movement, and soil compacting, shall be phased across the site to minimize the amount of exposed or disturbed area on any single day.
- No vehicle shall exceed 15 miles per hour on unpaved areas within the site, with the exception that vehicles may travel up to 25 miles per hour on stabilized unpaved roads as long as such speeds do not create visible dust emissions or conflict with other permit conditions.
- Visible speed limit signs shall be posted at the construction site entrances.
- All construction equipment vehicle tires shall be inspected and washed as necessary to be cleaned free of dirt prior to entering paved roadways.
- All unpaved exits from the construction site shall be graveled or treated to prevent track-out onto public roadways. No person shall allow track-out to extend 25 feet or more in cumulative length from the point of origin from an active operation. All track out from an active operation shall be removed immediately if it extends over 25 feet or if under 25 feet, at the end of each workday.
- All paved roads within the construction site shall be swept daily or as needed (less during periods of precipitation) on days when construction activity occurs to prevent the accumulation of dirt and debris.
- At least the first 500 feet of any paved public roadway exiting the construction site or exiting other unpaved roads to access the construction site or staging areas shall be swept as needed when dirt or runoff resulting from the construction activities is visible on the paved public roadway.

MM AQ-2 (Control On-Site Off-Road Equipment Emissions) The Project owner, when

entering into construction contracts or when procuring off-road equipment or vehicles for on-site construction or O&M activities, shall ensure that only new model year equipment or vehicles are obtained. The following measures would be included with contract or procurement specifications:

- All construction diesel engines not registered under California Air Resources Board's Statewide Portable Equipment Registration Program, with a rating of 50 hp or higher shall meet the Tier 4 California Emission Standards for Off-Road Compression-Ignition Engines, as specified in California Code of Regulations, Title 13, section 2423(b)(1), unless a good faith effort demonstrates that such engine is not available for a particular item of equipment. In the event that a Tier 4 engine is not available for any off-road equipment larger than 100 hp, a Tier 3 engine shall be used or that equipment shall be equipped with retrofit controls to reduce exhaust emissions of nitrogen oxides (NOx) and diesel particulate matter (DPM) to no more than Tier 3 levels unless certified by the engine manufacturers that the use of such devices is not practical for specific engine types.
- All diesel-fueled engines used in the construction of the facility shall have clearly visible tags showing that the engine meets the standards of this measure.
- All equipment and trucks used in the construction or O&M of the facility shall be properly maintained and the engines tuned to the engine manufacturer's specifications.
- All diesel heavy construction equipment shall not idle for more than five minutes. Vehicles that need to idle as part of their normal operation (such as concrete trucks) are exempted from this requirement.

DRECP CMAs:

Applicable CMAs are detailed in the EIR Appendix CC, which provides a list of CMAs, an explanation of their applicability, and demonstration of compliance with the CMA. CMAs specifically applicable under Impact AIR-2 are detailed at Appendix CC, pp., CC-22 through CC-

1 25.

2
3 ***Impact: Point Source Emissions (AQ-3)***

4 ***Threshold:** The proposed Project would not expose sensitive receptors to substantial*
5 *pollutant concentrations.*

6 Findings of Fact, Less Than Significant with Mitigation Measures:

7 **Criteria Air Pollutants.** Construction-related emissions sources would be spread across the
8 site and off-site. Particles of airborne fugitive dust may pose a health risk if inhaled because
9 minerals such as silica or organic components present in the soils. All nearby residences
10 would be more than 200 meters (656 feet) away from the nearest construction on the site.
11 With implementation of dust control practices (MM AQ-1), and off-road equipment engine
12 standards (MM AQ-2), as well as applicable DRECP CMAs, the maximum daily
13 construction emissions with mitigation (shown in Table 3.4-9 in the EIR) would not exceed
14 the recommended Localized Significance Thresholds (LSTs) for any pollutant for receptors
15 that are located 200 meters or more from sources of construction air pollutants. The localized
16 impact to ambient air quality would be less than significant, and Project construction would
17 not be likely to locally exceed the ambient air quality standards. Daily emissions during
18 operation would mostly be caused by mobile source activity occurring off-site and less likely
19 than construction to contribute to substantial pollutant concentrations. **(EIR pp. 3.4-15-16).**

20 **Toxic Air Contaminants.** Proposed construction sources of DPM would be set back from
21 the nearest occupied residences by more than 200 meters (656 feet), and most construction
22 emissions would occur more than 1,000 feet away from all sensitive receptors. Accordingly,
23 there would be little potential to expose sensitive receptors to substantial pollutant
24 concentrations of carcinogenic DPM. The impact of localized ground level concentrations
25 and incremental health effects of toxic air contaminants would not be significant with
26 mitigation to reduce construction dust (MM AQ-1) and reduce engine exhaust emissions
27 (MM AQ-2) and compliance with applicable DRECP CMAs. **(EIR pp. 3.4-16).**

1 **Valley Fever.** Mandatory dust controls applicable to project construction activities
2 (including SCAQMD Rule 403) and compliance with applicable DRECP CMAs, would
3 avoid exposing construction workers and the off-site population to substantial concentrations
4 of dust, which would ensure that the impact of potential exposure to Valley Fever would be
5 less than significant. **(EIR pp. 3.4-16 to 3.4-17).**

6 **Visibility and Federal Class I Areas.** The nearest boundary of the JTNP Class I area is
7 located 3 miles (4.8 kilometers) from the Project boundary. Ambient air quality impacts of
8 the Project including increased concentrations of airborne dust, including PM10 and PM2.5,
9 and NOx emissions could impact visibility. Controlling construction emissions as required
10 by local rules and regulations and through mitigation measures MM AQ-1 and MM AQ-2,
11 as well as compliance with DRECP CMAs, ensures that users of the JTNP would not
12 experience substantial concentrations of pollutants, and the impact to visibility would be less
13 than significant. **(EIR pp. 3.4-17).**

14 During operation and maintenance, site activities and the operations-related emissions from
15 upkeep, maintenance, inspections, security, and panel washing would occur more than 200
16 meters (656 feet) away from the closest residence or inhabitable dwellings. Therefore, there
17 would be no potential to expose sensitive receptors to substantial pollutant concentrations,
18 and this impact would be less than significant. **(EIR pp. 3.4-17).**

19 **Mitigation Measures:**

20 **MM AQ-1 (Fugitive Dust Control Plan) Full text under Air Quality.**

21 **MM AQ-2 (Control On-Site Off-Road Equipment Emissions) Full text under Air**
22 **Quality.**

23 **DRECP CMAs:**

24 Applicable CMAs are detailed in EIR Appendix CC, which provides a list of CMAs, an
25 explanation of their applicability, and demonstration of compliance with the CMA. CMAs
26 specifically applicable under Impact AIR-2 are detailed at at Appendix CC, pp., CC-22
27 through CC-25
28

C. **Biological Resources**

Impact: Habitat and Species (BIO-1)

Threshold: The Project would not cause substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Wildlife or U.S. Wildlife Service with implementation of mitigation measures.

Findings of Fact. Less Than Significant with Mitigation Measures:

Construction and operation of the Project could adversely affect special-status plant and wildlife species by removing and degrading their habitat or from direct disturbance, mortality, or injury. Adverse effects could result from such activities as crushing, mowing, grubbing, trimming, grading using mowing and rolling methods for vegetation in the solar array areas, and compaction. Altered hydrology could affect habitats by increasing stormwater runoff, increasing erosion, and degrading habitat conditions. Dust accumulation could affect special-status plants. Spread and infestation of weed species could degrade habitat and outcompete special-status plants. Vehicles and equipment could crush plants and wildlife and destroy wildlife burrows, dens, or nests. Increased noise, lighting, opportunistic predators, and human activity could disturb wildlife in and near Project areas. Project operation may result in impacts to plants and wildlife from the “heat island effect”, and may impact birds and bats through collision with PV panels or electrocution from gen-tie lines.

Vegetation and habitat. The Project would permanently impact native habitats in creosote bush scrub, desert dry wash woodland, and desert pavement on the Project site. All affected habitats may support certain special-status plants or wildlife. Vegetation, including special-status plants, would be trimmed, cut, or removed. Soils would be disturbed, which may result in erosion or compaction. Direct impacts may include direct crushing, burial, or uprooting of vegetation and root damage. The potential indirect introduction of invasive

1 weeds could degrade plant and wildlife habitat on the site and beyond the site boundaries if
2 the weeds spread. During operations, increased temperatures from a “heat island effect” may
3 impact the success of re-vegetation.

4 Without mitigation, the loss of vegetation and natural habitat on the Project site
5 would significantly affect special-status species on the site or vicinity. Impacts would be
6 minimized by implementing mitigation measures (MMs), listed below with the full text
7 provided in Appendix L, MMRP. Compliance with applicable DRECP CMAs detailed in
8 Appendix CC would minimize impacts of the Project on special-status species on BLM
9 lands.

10
11 MMs BIO-1 to MM BIO-5 require use of qualified biologists for surveying and
12 monitoring (MM BIO-1 Biological Monitoring), training of construction personnel on
13 identifying and avoiding sensitive plant and wildlife resources (MM BIO-2 Worker
14 Environmental Awareness Training), clear demarcation of vegetation for removal and low
15 impact site preparation (MM BIO-3 Minimization of Vegetation and Habitat Impacts),
16 managing non-natives in disturbance areas (MM BIO-4 Integrated Weed Management Plan),
17 and revegetating disturbance areas with native habitat (MM BIO-5 Vegetation Resources
18 Management Plan).

19 The Project has been designed to avoid desert dry wash woodland (except for minor
20 incursions). Compensatory mitigation for desert dry wash woodland at a ratio of 5:1 (MM
21 BIO-14), desert pavement at a ratio of 1:1 (MM BIO-3), creosote bush scrub (suitable desert
22 tortoise habitat) at a ratio of 1:1 (MM BIO-7), and desert tortoise critical habitat at a ratio of
23 5:1 (MM BIO-7) would require permanent protection of comparable off-site habitat to offset
24 the Project’s impacts to native habitat, sensitive habitats, and designated critical habitat. The
25 compensation lands identified are much higher quality habitat than the designated critical
26 habitat on the Project site.

27
28 The Project will also comply with all applicable DRECP CMAs as detailed in Appendix CC.

1 These include LUPA-BIO-1 (habitat assessments and protocol surveys), LUPA-BIO-2
2 (biological monitoring), LUPA-BIO-3 (resource setbacks), LUPA-BIO-5, LUPA-BIO-7
3 (construction restoration), LUPA-BIO-10 (weed management), LUPA BIO-11 (nuisance
4 animals and invasive species), LUPA-BIO-13 (siting and design), LUPA-BIO-RIPWET-1
5 (riparian and wetland setbacks), LUPA-BIO-SVF-6 (avoidance of microphyll woodland),
6 LUPA-BIO-COMP-1 and LUPA-VPL-BIO-COMP-1 (compensatory mitigation).

7 Collectively, these measures ensure that impacts to vegetation and habitat for special-
8 status species would be less than significant with mitigation.

9
10 Special-status plants. Four special-status plants were observed on the Project site:
11 Emory's crucifixion thorn; California ditaxis; desert unicorn-plant; and Utah milkvine. One
12 Emory's crucifixion thorn was observed along the northern boundary of the site and would
13 be avoided outside the development footprint. California ditaxis was observed primarily
14 along or outside Project boundaries, and impacts would be minimal. Desert unicorn-plant is
15 located primarily in desert dry wash woodland habitat that would be avoided outside the
16 development footprint, and impacts would be minimal. Utah milkvine was observed in one
17 location. Protected native desert plants and cacti were observed in the Project area.

18 Special-status plants would be crushed, trimmed, cut, buried, uprooted, or removed,
19 and supporting soils would be disturbed, eroded, or compacted. Special-status plants would
20 be indirectly impacted from introduction and spread of invasive weeds that outcompete
21 native species. During operations, increased temperatures from a "heat island effect" may
22 impact re-establishment of special-status plant species.

23
24 Without mitigation, the loss of special-status plants on the Project site could be
25 significant. Impacts would be minimized by implementing mitigation measures (MMs),
26 listed below with the full text provided in Appendix L, MMRP and applicable DRECP
27 CMAs detailed in Appendix CC.

1 MMs BIO-1 to MM BIO-5 require use of qualified biologists for surveying and
2 monitoring (MM BIO-1 Biological Monitoring), training of construction personnel on
3 identifying and avoiding sensitive plant resources (MM BIO-2 Worker Environmental
4 Awareness Training), clear demarcation of vegetation for removal and low impact site
5 preparation (MM BIO-3 Minimization of Vegetation and Habitat Impacts), managing non-
6 natives in disturbance areas (MM BIO-4 Integrated Weed Management Plan), and salvaging
7 seed and plants from the project site (including special-status species and protected native
8 desert species) and revegetating disturbance areas from rootstock and with native species
9 (MM BIO-5 Vegetation Resources Management Plan).

10
11 Compensatory mitigation, as described above for vegetation and habitat, would
12 require permanent protection of comparable off-site habitat to offset the Project's impacts to
13 native habitats, including desert dry wash woodland (MM BIO-14), desert pavement (MM
14 BIO-3), and desert tortoise habitat (MM BIO-7). The compensation lands identified are
15 much higher quality habitat than the designated critical habitat on the Project site.

16
17 The Project will also comply with all applicable DRECP CMAs as detailed in
18 Appendix CC. These include LUPA-BIO-1 (habitat assessments and protocol surveys),
19 LUPA-BIO-2 (biological monitoring), LUPA-BIO-5 (worker education), LUPA-BIO-7
20 (construction restoration), LUPA-BIO-10 (weed management), LUP-BIO-11 (nuisance
21 animals and invasive species), LUPA-BIO-13 (siting and design), LUPA-BIO-SVF-1
22 (special vegetation features), LUPA-VEG-1 to -3 and LUPA-BIO-VEG-5 to -6 (vegetation
23 managements), LUPA-BIO-3 (setbacks), LUPA-BIO-RIPWET-1 (riparian and wetland
24 setbacks), LUPA-BIO-SVF-6 (avoidance of microphyll woodland), LUPA-BIO-COMP-1
25 and LUPA-VPL-BIO-COMP-1 (compensatory mitigation). Additionally, LUPA-BIO-
26 PLANT-1 would require properly timed protocol surveys for BLM special-status plant
27 species and marking for avoidance or salvage. Collectively, these measures ensure that
28 impacts to special-status plants would be less than significant with mitigation.

Special-status wildlife. Impacts to special-status wildlife are discussed below and are minimized and avoided by implementation of MM BIO-6 (Wildlife Protection), which identifies numerous requirements to minimize or avoid wildlife injury and entrapment such as site and vehicle inspections; management and covering of stored project materials; ramps to ensure escape from excavations, trenches, auger holes, and water tanks; prevention of attractants for opportunistic predators such as trash or water; hazardous material management; and vehicle speed limits. Impacts to wildlife due to disturbance, degradation, and removal of habitat would be minimized and avoided with MMs BIO-1 to BIO-5, as previously discussed for vegetation and habitat. The Project will also comply with all applicable DRECP CMAs as detailed in Appendix CC. These include LUPA-BIO-1 (habitat assessments and protocol surveys), LUPA-BIO-2 (biological monitoring), LUPA-BIO-5 (worker education), LUPA-BIO-7 (construction restoration), LUPA-BIO-10 (weed management), LUPA-BIO-13 (siting and design), LUPA-BIO-3 (setbacks), LUPA-BIO-RIPWET-1 (riparian and wetland setbacks), LUPA-BIO-SVF-6 (avoidance of microphyll woodland), LUPA-BIO-COMP-1 and LUPA-VPL-BIO-COMP-1 (compensatory mitigation). Additionally the following CMAs would be implemented to minimize impacts to special-status wildlife: LUPA-BIO-4 (seasonal restrictions); LUPA-BIO-6 (subsidized predators management); LUPA-BIO-12 (noise); LUPA-BIO-14 (best management practices); LUPA-BIO-15 (construction best management practices); and LUPA-BIO-IFS-1 to -3 (protocol surveys and setback buffers).

The following paragraphs summarize additional species-specific impacts and mitigation measures. Collectively, these measures ensure that impacts to special-status wildlife would be less than significant with mitigation.

- Couch's spadefoot toad. Couch's spadefoot toad was not observed during surveys, but eight areas were identified as potential breeding habitat where water may accumulate after rainfall. While suitable breeding habitat has not yet been detected at the Project site, impacts to Couch's spadefoot toad, if present, may include direct loss of habitat;

1 mortality from entrapment, crushing, or vehicle collision; increased predation by
2 opportunistic predators; or contamination of waterways from hazardous fuels or herbicides.
3 Noise, lighting, or vibrations could disturb or displace individuals. MMs would minimize
4 adverse impacts to native vegetation and habitat and offset the permanent habitat loss
5 through off-site habitat compensation. MM BIO-6 (Wildlife Protection) would minimize
6 mortality and injury as described above. MM BIO-14 would require best management
7 practices to protect water resources. In addition to the DRECP CMAs previously listed,
8 LUPA-BIO-9 requires that best management practices be implemented to prevent toxic and
9 hazardous materials from entering streams and washes. Compensatory mitigation for
10 impacts to jurisdictional waters that may provide habitat for Crouch's spadefoot toad would
11 also be required pursuant to CMA LUPA-BIO-COMP-1. These measures would effectively
12 minimize adverse impacts to Couch's spadefoot toad.

13 • Native and special-status birds. Native birds are protected under the
14 California Fish and Game Code and federal Migratory Bird Treaty Act (MBTA). The Project
15 site and surrounding area provides suitable nesting habitat for numerous resident and
16 migratory bird species. Bird nests including eggs and nestlings are vulnerable to construction
17 activities that may disrupt nesting behavior or destroy nests, birds, or eggs.

18
19 Impacts to native birds may include direct loss of habitat; mortality from entrapment,
20 crushing, or vehicle collision; and increased predation by opportunistic predators. Indirect
21 impacts would include increased noise, dust, light, and activity, which may affect migratory
22 or foraging behavior. After completion of construction and throughout the life of the Project,
23 the solar facilities and other Project components may present a collision or electrocution risk
24 to birds.

25 Mitigation measures MM BIO-1 through BIO-5, previously described, would
26 minimize adverse impacts to native bird habitat and offset permanent habitat loss through
27 off-site habitat compensation. MM BIO-6 (Wildlife Protection) would minimize Project
28

1 impacts to native birds through a series of requirements to minimize or avoid wildlife injury,
2 such as site inspections; prevention of opportunistic predator attractants such as trash or
3 water; prevention of entrapment; management of hazardous materials, and vehicle speed
4 limits.

5
6 MM BIO-8 requires a Bird and Bat Conservation Strategy (BBCS) that specifies
7 measures to recognize, minimize, and avoid hazards such as collisions and electrocution;
8 describe procedures for reporting and handling dead or injured wildlife; and describe post-
9 construction monitoring and adaptive management for bird and bat mortality.

10 MM BIO-9 (Nesting Bird Management Plan) requires performing pre-construction
11 nest surveys and implementing buffers and monitoring around active nests, which would
12 protect nesting burrowing owls from disturbance due to increased noise, dust, vibration, and
13 human presence and from direct destruction of nests, eggs, and young.

14
15 Structures that have been empirically demonstrated to result in elevated collision risk
16 at various types of facilities (e.g., tall buildings, communication towers, wind turbines, or
17 concentrating solar thermal towers) would not be required for the Project, which consists of
18 low height PV arrays. For taller structures, such as the gen-tie, the Project will be designed
19 in accordance with Avian Power Line Interaction Committee (APLIC) guidelines and best
20 management practices to protect birds from electrocution.

21 MM BIO-10 (Gen-tie Lines) requires mechanisms in accordance with APLIC
22 standards to visually warn birds such as permanent markers or bird flight diverters; avoid or
23 minimize use of guy wires; and maintain sufficient distance between all conductors and
24 grounded components to prevent electrocution of large birds.

25
26 In addition to the DRECP CMAs previously detailed for all special-status wildlife
27 species, the following CMAs would be implemented to minimize impacts to native birds on
28 BLM land in the Project site: LUPA-BIO-16 to -17 (bird and bat conservation strategy);

1 LUPA-BIO-RIPWET-3 (special-status riparian bird surveys and monitoring); LUPA-BIO-
2 COMP-2 (bird compensatory mitigation); and LUPA-BIO-IFS-11 (Bendire's Thrasher
3 monitoring).

4 Together these measures would effectively minimize adverse impacts to native birds.

5
6 • Burrowing owl. Burrowing owls, burrows, and sign have been observed at
7 the Project site and suitable habitat is present. Potential direct project impacts to burrowing
8 owls include mechanical crushing of individuals or burrows by vehicles and construction
9 equipment, habitat loss, and noise and disturbance to surrounding habitat. MMs BIO-1
10 through BIO-6, listed above, would minimize adverse impacts to native vegetation and offset
11 the permanent habitat loss through off-site habitat compensation.

12 MMs BIO-6 (Wildlife Protection), BIO-8 (Bird and Bat Conservation Strategy), MM
13 BIO-9 (Nesting Bird Management Plan), and BIO-11 (Burrowing Owl Avoidance and
14 Relocation) would prevent or minimize potential injury to burrowing owl by managing work
15 site hazards, adaptively managing bird mortality, surveying and buffering bird nests,
16 surveying and identifying occupied and active burrows, and safely excluding the owls
17 through passive relocation. MM BIO-13 (Wildlife Protection and Relocation Plan) directs
18 the development and implementation of a Wildlife Protection and Relocation Plan to identify
19 and describe species-specific procedures for burrowing owl, desert tortoise, desert kit fox,
20 and American badger.

21
22 In addition to the CMAs previously described for all special-status wildlife species,
23 the following CMAs would be implemented on BLM land within Project site to minimize
24 impacts to western burrowing owl: LUPA-BIO-IFS-12 to -14 (monitoring, setbacks and
25 passive translocation).

26 These measures are expected to effectively avoid lethal take of burrowing owls by
27 identifying individuals and burrows, excluding them from the project area, or if active nests
28

are present, by avoiding disturbance in surrounding buffer areas.

- Golden eagle. Golden eagles are protected under federal law as well as the MBTA and California Fish and Game Code. The Project site does not provide suitable golden eagle nesting habitat. However, the site provides suitable foraging habitat, and is within potential foraging distance of known golden eagle nesting territories. Golden eagles may be at risk of collision with gen-tie lines due to their large size. Foraging habitat loss may affect golden eagles during nesting, winter, or migratory seasons. Impacts to golden eagle foraging habitat would be offset through protection of off-site compensation lands, which would mitigate impacts to vegetation and habitat, including golden eagle foraging habitat (MM BIO-3 for desert pavement; MM BIO-7 for creosote bush scrub (suitable desert tortoise habitat); MM BIO-14 for desert dry wash woodland).

MMs BIO-6 (Wildlife Protection), BIO-8 (Bird and Bat Conservation Strategy), MM BIO-9 (Nesting Bird Management Plan), and MM BIO-10 (Gen-tie lines) would prevent or minimize potential injury to golden eagle by managing work site hazards, adaptively managing bird mortality, surveying and buffering bird nests, and designing and marking gen-tie lines to prevent electrocution.

In addition to the CMAs previously described for all special-status wildlife species, the following CMA would be implemented on BLM land within the Project site to minimize impacts to golden eagle: LUPA-BIO-IFS-25 (habitat loss restriction).

Together these measures would effectively minimize adverse impacts to golden eagle.

- Other Special-Status Raptors. Several other special-status raptors have been reported on or near the Project site or are likely to occur in the area seasonally. Impacts to raptor foraging habitat would be minimized by implementing MM BIO-1 to BIO-5, previously described for vegetation and habitat. Impacts to habitat would be offset through

1 protection of off-site compensation lands, which would mitigate impacts to vegetation and
2 habitat, including golden eagle foraging habitat (MM BIO-3 for desert pavement; MM BIO-
3 7 for creosote bush scrub (suitable desert tortoise habitat); MM BIO-14 for desert dry wash
4 woodland).

5 MMs BIO-6 (Wildlife Protection), BIO-8 (Bird and Bat Conservation Strategy), MM
6 BIO-9 (Nesting Bird Management Plan), and MM BIO-10 (Gen-tie lines) would prevent or
7 minimize potential injury to raptors by managing work site hazards, adaptively managing
8 bird mortality, surveying and buffering bird nests, and designing and marking gen-tie lines
9 to prevent electrocution.

10
11 The Project would comply with the CMAs previously described for all special-status
12 wildlife species, which would minimize impacts to raptors.

13 Together these measures would effectively minimize adverse impacts to special-
14 status raptors.

15
16 • Special-Status Passerine Birds. The desert vegetation and adjacent mountains
17 provide foraging, cover, or breeding habitat for resident and migratory special-status birds.
18 Potential impacts to these species would be the same as those described for other nesting or
19 migratory birds. These impacts can be mitigated by implementing MM BIO-1 to BIO-5,
20 previously described for vegetation and habitat. Impacts to habitat would be offset through
21 protection of off-site compensation lands, which would mitigate impacts to vegetation and
22 habitat, including bird habitat (MM BIO-3 for desert pavement; MM BIO-7 for creosote
23 bush scrub (suitable desert tortoise habitat); MM BIO-14 for desert dry wash woodland).

24 MMs BIO-6 (Wildlife Protection), BIO-8 (Bird and Bat Conservation Strategy), and
25 MM BIO-9 (Nesting Bird Management Plan) would prevent or minimize potential injury to
26 passerine birds by managing work site hazards, adaptively managing bird mortality, and
27 surveying and buffering bird nests.
28

1 In addition to the CMAs previously described for all special-status wildlife species,
2 the following CMAs would be implemented on BLM land in the Project site to minimize
3 impacts to passerine birds: LUPA-BIO-16 to –17 (bird and bat conservation study).

4 Together these measures would effectively minimize adverse impacts to special-
5 status passerine birds.

6
7 • Desert kit fox and American badger. Active and inactive desert kit fox
8 burrows and dig marks, tracks, and scat were observed on the Project site, and active and
9 inactive American badger burrows and dig marks and tracks were identified. Potential direct
10 impacts to American badger and desert kit fox include mechanical crushing of individuals
11 or burrows by vehicles and construction equipment, eviction from burrows, habitat loss, loss
12 of burrows, and noise, vibration, and disturbance in surrounding habitat. Exclusion or
13 security fencing could entrap desert kit foxes or badgers in the construction area. MM BIO-
14 1 through MM BIO-5, noted above, would minimize adverse impacts to native vegetation.
15 Impacts to habitat would be offset through protection of off-site compensation lands, which
16 would mitigate impacts to vegetation and habitat, including golden eagle foraging habitat
17 (MM BIO-3 for desert pavement; MM BIO-7 for creosote bush scrub (suitable desert tortoise
18 habitat); MM BIO-14 for desert dry wash woodland).

19 MM BIO-6 (Wildlife Protection), MM BIO-12 (Desert Kit Fox and American
20 Badger Relocation), and MM BIO-13 (Wildlife Protection and Relocation Plan) would
21 prevent or minimize potential injury and mortality to desert kit fox and American badger.
22 MM BIO-6 identifies practices and requirements to prevent or minimize wildlife injury and
23 mortality from work site hazards. MM BIO-12 specifies details for pre-construction surveys,
24 exclusion of animals from dens, passive relocation from the site, and avoidance of natal dens.
25 MM BIO-13 directs the development and implementation of a Wildlife Protection and
26 Relocation Plan to identify and describe species-specific procedures for burrowing owl,
27 desert tortoise, desert kit fox, and American badger.
28

1 The Project would comply with the CMAs previously described for all special-status
2 wildlife species, which would minimize impacts to desert kit fox and American badger.

3 Together these measures would effectively minimize adverse impacts to desert kit
4 fox and American badger.

5
6 • Burro deer. Nearby active agricultural areas provide a water source for burro
7 deer. Additionally, desert dry wash woodland habitat may provide seasonal foraging or cover
8 habitat for burro deer. Potential impacts of the Project could include loss of habitat and
9 restriction of movement to water sources. Burro deer are expected to avoid project-related
10 disturbance during construction and O&M, and no special measures are necessary to exclude
11 them from work areas. MMs BIO-1 through BIO-5, listed above, would minimize adverse
12 impacts to native vegetation, including burro deer habitat. Impacts to habitat would be offset
13 through protection of off-site compensation lands, which would mitigate impacts to
14 vegetation and habitat, including burro deer habitat. Potential impacts to burro deer
15 movement are addressed under Impact BIO 4, below.

16
17 The Project would comply with the CMAs previously described for all special-status
18 wildlife species, which would minimize impacts to burro deer.

19 Together these measures would effectively minimize adverse impacts to burro deer.

20
21 • Special-status bats. Several special-status bats could use the Project site for
22 foraging, but only minimal suitable roosting habitat is available. Project construction could
23 adversely impact special-status bats through the elimination of desert shrubland foraging
24 habitat and roosting trees and disturbance from noise, vibration, lighting, and dust. Common
25 bats and special-status bats may roost in desert dry wash woodland habitat on the site, which
26 would be mostly avoided. After construction, bats may continue to use desert dry wash
27 woodland habitat that is avoided by the Project.

28 Ongoing studies have shown that bats are susceptible to collisions with moving

1 structures such as wind turbines, but infrequently collide with stationary structures. Bat
2 carcasses were rarely detected at utility-scale PV solar energy facilities that have been
3 monitored. It is anticipated very few bat fatalities will occur during the life of the project
4 based on the absent to very low bat fatalities discovered at regional projects.

5 MM BIO-1 through MM BIO-5 would minimize adverse impacts to native
6 vegetation. Impacts to habitat would be offset through protection of off-site compensation
7 lands, which would mitigate impacts to vegetation and habitat, including golden eagle
8 foraging habitat (MM BIO-3 for desert pavement; MM BIO-7 for creosote bush scrub
9 (suitable desert tortoise habitat); MM BIO-14 for desert dry wash woodland). MM BIO-6
10 (Wildlife Protection) includes a condition to inspect structures prior to demolition and
11 remove wildlife or allow wildlife to escape. MM BIO-8 (Bird and Bat Conservation
12 Strategy) would describe a strategy for post-construction adaptive management for bird and
13 bat mortality associated with the Project.

14
15 In addition to the CMAs previously described for all special-status wildlife species,
16 the following CMAs would be implemented on BLM land within the Project site to minimize
17 impacts to bats: LUPA- BIO-16 to -17 (bird and bat conservation strategy); LUPA-BIO-
18 BAT-1 (maternity roost setbacks); and LUPA-BIO-COMP-2 (compensatory mitigation).

19 Together these measures would effectively minimize adverse impacts to special-
20 status bats. (EIR pp. 3.5-23 to 3.5-55).

21 22 **Mitigation Measures:**

23 **MM BIO-1 (Biological Monitoring)** Monitoring to ensure conformance with conditions of
24 approval, including effective protection and avoidance of biological resources, shall be
25 imple-men-ted by the Applicant as follows:

26 Biological Monitoring Team. During construction and decommissioning, the Applicant shall
27 employ a biological monitoring team to oversee Project activities. Any activity that may
28 impact vegetation, wildlife, and sensitive resources shall be monitored to ensure compliance

1 with all mitigation measures for biological resources.

2 The biological monitoring team shall consist of:

- 3 • Lead Biologist: The Applicant shall assign a Lead Biologist, approved by
4 Riverside County, BLM, CDFW, and USFWS as the primary point of contact for the
5 BLM and resource agencies regarding biological resources mitigation and compliance.
6 The Lead Biologist shall have an approved MOU with Riverside County prior to
7 commencing work on the Project.
- 8 • Biological Monitor: Biological monitors shall be overseen by the Lead Biologist and
9 shall perform any required surveys, ground disturbance and construction monitoring,
10 wild-life monitoring, inspections, marking sensitive resource buffers, and revegetation
11 monitoring during Project activities. Biological monitors shall include trained desert
12 tortoise monitors (MM BIO-7) and nest monitors (MM BIO-8).
- 13 • Authorized Desert Tortoise Biologist: For desert tortoise protection measures (MM BIO-
14 7), the Applicant shall nominate a qualified individual to serve as Authorized Desert
15 Tortoise Biologist, for approval by the USFWS and CDFW.

16 The Applicant shall provide the resumes of the proposed Biological Monitoring Team to the
17 BLM and Riverside County for approval prior to onset of ground-disturbing activities. The
18 Biological Monitoring Team shall have demonstrated expertise with the biological resources
19 within the Project region. The Biological Monitoring Team shall have authority to halt any
20 activities in any area if it is determined that the activity, if continued, would cause an
21 unauthorized adverse impact to biological resources.

22 The duties of the Biological Monitoring Team shall vary during the construction, O&M, and
23 decommissioning phases, based on the biological monitoring tasks needed for compliance
24 during each phase. During O&M, an Applicant staff member serving as a compliance
25 manager may perform the duties of the Lead Biologist to ensure compliance with biological
26 mitigation measures, such as performing inspections for entrapped wild-life and fence
27 condition, reporting dead or injured wildlife, avoiding nesting birds, and inspections of panel
28

1 washing. The Applicant's compliance manager, if serving as Lead Biologist during O&M,
2 shall have an approved MOU with Riverside County prior to commencing Lead Biologist
3 duties on the Project.

4 In general, the duties of the Lead Biologist shall include, but shall not be limited to:

- 5 • Regular, direct communication with representatives of the BLM, and other agencies, as
6 appropriate. The Lead Biologist, or during O&M, the Applicant's compliance manager,
7 shall immediately notify the BLM and applicable resource agencies in writing of dead
8 or injured special-status species, or of any non-compliance with biological mitigation
9 measures or permit conditions.
- 10 • Train and supervise Biological Monitors, including desert tortoise monitors, nest
11 monitors, and construction monitors.
- 12 • Conduct or oversee Worker Environmental Awareness Program (WEAP) training (MM
13 BIO-2).
- 14 • During construction and decommissioning, clearly mark and inspect sensitive biological
15 resource areas in compliance with regulatory terms and conditions.
- 16 • Oversee wildlife clearance surveys, ground disturbance and grading, and biological
17 monitoring. Ensure that all biological monitoring is completed properly and on schedule.
- 18 • Conduct or oversee bi-weekly compliance inspections during ground-disturbing
19 activities and communicate any remedial actions needed (i.e., trash, fence, weed
20 maintenance; wildlife mortality) to maintain compliance with mitigation measures.

21 Reporting. The Lead Biologist, or during O&M, the Applicant's compliance manager, shall
22 report regularly to the BLM and Riverside County to document the status of compliance
23 with biological mitigation measures.

24 During construction and decommissioning:

- 25 • Provide weekly verbal or written updates to the BLM with any information pertinent to
26 the BLM and Riverside County, to resource agencies, or to state or federal permits for
27 biological resources.
- 28 • Prepare and submit monthly and annual compliance reports to include a summary of

Project activities that occurred, biological resources surveys and monitoring that were performed, any sensitive or noteworthy species observed, weed infestations removed, and non-compliance issues and remedial actions that were implemented.

During O&M:

- Conduct quarterly compliance inspections and reporting, to be submitted to the BLM and Riverside County, to document the condition of exclusion fencing, wildlife mortality, and any biological resource issues of note.

MM BIO-2 (Worker Environmental Awareness Training) The Lead Biologist shall prepare and implement a Worker Environmental Awareness Program (WEAP). The Applicant shall be responsible for ensuring that all workers at the site receive WEAP training prior to beginning work on the Project and receive annual refresher trainings throughout construction, operations, and decommissioning. The WEAP shall be available in English and Spanish. The Applicant shall submit the WEAP to the lead agency and resource agencies for approval prior to implementation. The WEAP will:

- Be developed by or in consultation with the Lead Biologist and consist of an on-site or training center presentation with supporting written material and electronic media, including photographs of protected species, available to all participants.
- Provide an explanation of the function of flagging that designates authorized work areas; specify the prohibition of soil disturbance or vehicle travel outside designated areas.
- Discuss general safety protocols such as vehicle speed limits, hazardous substance spill prevention and containment measures, and fire prevention and protection measures.
- Review mitigation and biological permit requirements.
- Explain the sensitivity of the vegetation and habitat within and adjacent to work areas, and proper identification of these resources.
- Discuss the federal and state Endangered Species Acts, Bald and Golden Eagle Protection Act, and the Migratory Bird Treaty Act and the consequences of non-compliance with these acts.
- Discuss the locations and types of sensitive biological resources on the Project site and

adjacent areas and explain the reasons for protecting these resources.

- Inform participants that no snakes, other reptiles, birds, bats, or any other wildlife shall be harmed or harassed.
- Place special emphasis on species that may occur on the Project site and/or gen-tie lines, including special-status plants, Crotch bumble bee, desert tortoise, burrowing owl, golden eagle, nesting birds, desert kit fox, American badger, and burro deer.
- Specify guidelines for avoiding rattlesnakes and reporting rattlesnake observations to ensure worker safety and avoid killing or injuring rattlesnakes. Rattlesnakes should be safely removed from the work area using appropriate snake handling equipment, including a secure storage container for transport, or by calling local animal control.
- Describe workers' responsibilities for avoiding the introduction of invasive weeds onto the Project site and surrounding areas, describe the Integrated Weed Management Plan.
- Provide contact information for the Lead Biologist and instructions for notification of any vehicle-wildlife collisions or dead or injured wildlife species encountered during Project-related activities.
- Include a training acknowledgment form to be signed by each worker indicating that they received training and shall abide by the guidelines.
- Desert Tortoise Education Requirements: Prior to the start of construction activities, a desert tortoise education program shall be presented by the Lead Biologist to all personnel who will be present on Project work areas. Following the start of construction, any new employee shall be required to complete the tortoise education program prior to working on site. At a minimum, the tortoise education program shall cover the following topics:
 - A detailed description of the desert tortoise, including color photographs;
 - The distribution and general behavior of the desert tortoise;
 - Sensitivity of the species to human activities;
 - The protection the desert tortoise receives under the state and federal Endangered Species Acts, including prohibitions and penalties incurred for violation;

1 • The protective measures being implemented to conserve the desert tortoise
2 during construction activities;

3 • Procedures and a point of contact if a desert tortoise is observed on site.

4 **MM BIO-3 (Minimization of Vegetation and Habitat Impacts)** Prior to ground-
5 disturbing activities during construction, O&M, or decommissioning, authorized work areas
6 shall be clearly delineated and sensitive resources that require avoidance would be flagged
7 by the Lead Biologist. These areas shall include, but not be limited to, staging areas, access
8 roads, and sites for temporary placement of construction materials and spoils. Delineation
9 may be implemented with common orange vinyl “fencing” or staking to clearly identify the
10 limits of work and will be verified by the Lead Biologist. No paint or permanent discoloring
11 agents shall be applied to rocks or vegetation (to indicate surveyor construction activity
12 limits or for any other purpose). Fencing/staking shall remain in place for the duration of
13 construction. Spoils shall be stockpiled in disturbed areas. All disturbances, vehicles, and
14 equipment shall be confined to the fenced/flagged areas.

15 Construction activities shall minimize soil and vegetation disturbance and onsite
16 construc-tion/vehicle trips to minimize impacts to soil and root systems. Erosion control
17 shall be implemented as described in the Drainage Erosion and Sedimentation Control Plan
18 (DESCP) (MM HWQ-1), which requires identification of erosion treatments for exposed
19 soil, such as chemical-based dust pallatives, soil bonding, and weighting agents suitable for
20 use around vegetation. Additional BMPs, as committed to by the Applicant and
21 incor-porated into the Project Description, are described in Section 2.7 and include
22 designation of primary travel routes, limiting grading to specific areas, building racking
23 material in laydown areas to minimize use of roads, using equipment with smaller rubber-
24 wheeled vehicles, maintaining hydrologic flow patterns, and preserving propagule islands to
25 support vegetation recovery.

26 Upon completion of construction activities in any given area, all unused materials,
27 equip-ment, staking and flagging, and refuse shall be removed and properly disposed of,
28 including wrapping material, cables, cords, wire, boxes, rope, broken equipment parts,

1 twine, strapping, buckets, and metal or plastic containers. Any unused or leftover hazardous
2 products shall be properly disposed of off-site in accordance with applicable legal
3 requirements.

4 Hazardous materials shall be handled in accordance with applicable legal requirements, and
5 spills or leaks shall be promptly corrected and cleaned up according to applicable legal
6 requirements. Vehicles shall be properly maintained to prevent spills or leaks. Hazardous
7 materials, including motor oil, fuel, antifreeze, hydraulic fluid, grease, shall not be allowed
8 to enter drainage channels.

9 Low-Impact Site Preparation and O&M. Native vegetation shall be allowed to recover from
10 rootstocks and seed bank wherever facilities do not require permanent vegetation removal
11 (e.g., access roads, foundations, paved areas, or fire clearance requirements) within the
12 perimeter fenceline of the solar facilities and under solar arrays. Project BMPs (Section
13 2.7.2) to minimize impacts during site preparation require that primary travel routes be
14 designated through panel arrays to minimize disturbance between rows; that grading be
15 limited to specific areas, including roads, substation, O&M facilities, laydown areas, some
16 equipment pads, and in discrete areas within the arrays; and that small rubber-wheeled
17 equipment be used.

18 During O&M, vegetation height and density shall be managed as needed for fire safety and
19 operation of the solar panels. Onsite vegetation that re-establishes under the solar panels will
20 be periodically trimmed to a height no more than 12 inches, to avoid interference with the
21 panels. Vegetation may require trimming approximately once every three years, as needed.
22 Revegetation of native habitat and protection of erosive soils shall be implemented in
23 temporary impact areas, as described in MM BIO-4 and MM BIO-5.

24 Compensation for impacts to Desert Pavement. Compensatory mitigation for impacts to
25 desert pavement shall be identified prior to disturbance of the features at a minimum 1:1
26 ratio, in coordination with BLM and CDFW.

27 **MM BIO-4 (Integrated Weed Management Plan)** The Applicant shall prepare and
28 implement an Integrated Weed Management Plan (IWMP) to minimize or prevent invasive

1 weeds from infesting the site or spreading into surrounding habitat.

2 The IWMP must comply with existing relevant BLM plans and permits including the
3 Vegetation Treatments Using Herbicides (BLM, 2007) and Vegetation Treatment Using
4 Aminopyralid, Fluroxypyr, and Rimsulfuron (BLM, 2016b), and must be approved by BLM
5 and Riverside County (or its designated representative). Use of any pesticides would
6 conform with licensing and application requirements from the California Department of
7 Pesticide Regulation.

8 Prior to herbicide use on BLM-administered lands, the BLM requires that a Pesticide Use
9 Proposal (PUP) (BLM, 2019) be submitted to ensure that Projects follow herbicide use
10 policies. If herbicides or pesticides will be used on BLM lands, the Applicant shall submit a
11 Pesticide Use Proposal (PUP) form, to be approved by the BLM (also see Section 3.10.5 on
12 hazardous materials). The PUP details which herbicides, pesticides, and associated adjuvants
13 will be used for treatment, location of applications, responsible parties, time-line for
14 treatment, application methods, application rates and maximum annual amounts, target
15 species, and precautions for humans, sensitive resources, and non-target vegeta-tion. Only a
16 State of California and federally certified contractor will be permitted to perform herbicide
17 applications. Only herbicides and adjuvants approved by the State of California and BLM
18 for use on public lands will be used within or adjacent to the federal land segments of the
19 Project.

20 The Applicant shall submit the BLM approved PUP to Riverside County and implement the
21 requirements of the PUP on private lands.-

22 The IWMP shall require that cover and density of non-native plants within temporarily
23 disturbed areas will be no more than 25% of total cover, or no more than comparable adjacent
24 undisturbed lands. Total cover on the Project site shall be calculated during the annual
25 quantitative monitoring as required in the Vegetation Resources Management Plan (MM
26 BIO-5), which shall complement the IWMP. Quantitative monitoring shall be performed
27 using California Native Plant Society (CNPS) Combined Vegetation Rapid Assessment and
28 Relevé Protocol (CNPS, 2022). Qualitative and quantitative vegetation monitoring will

continue for a period of no less than three (3) years or until the defined success criteria are achieved (up to 5 years).

PLAN REQUIREMENTS

- Consistent with DRECP CMA LUPA-BIO-10 (Standard Practices for Weed Management), the Plan shall include:
- Plan objectives, including weed prevention, identification, and control via eradication, suppression, and containment;
- A list and discussion of weed species occurring or potentially occurring in the Project area, including Cal-IPC threat rankings;
- Role and responsibilities of a Weed Management Biologist, who will track, manage, and coordinate weed management activities;
- A discussion of methods to prevent introduction or spread of weeds, including worker training, vehicle cleaning and inspections, and use of weed-free seed, erosion control materials, and other construction material (gravel, sand, fencing);
- Requirements for annual monitoring of the Project site and 100-foot buffer in the early spring and late summer/early fall during construction, O&M, and decommissioning, and for 5 years after decommissioning;
- A description of monitoring methods to identify and map infestations;
- A description of manual and mechanical treatments that may be used to suppress, contain, or eradicate invasive weeds, such as use of hand or power tools, hand pulling, and soil solarization;
- A description of chemical treatments (herbicide) that may be used, including permitting and regulatory requirements for use, types of herbicides to be used such as pre-emergent, post-emergent, selective, and non-selective and the weeds they affect, application methods and rates, handling and cleanup procedures, and best practices to minimize impacts of herbicide use on wildlife and native vegetation, such as suspending treatments when winds are high or if precipitation is imminent, mixing herbicides over a drip pan at least 200 feet from open or flowing water, inspecting containers for leaks, and

maintaining spill kits in vehicles and storage areas;

- A requirement for any herbicides used to meet the requirements of the BLM Vegetation Treatment guidelines (BLM, 2007; BLM, 2016b) and be implemented in accordance with the PUP (BLM, 2019);
- A description of reporting, to require management and monitoring reports during construction, O&M and decommissioning, and for 5 years after decommissioning;
- Annual reports shall include the location, species, extent, and density of weeds; a description of management efforts, dates, locations, types of treatment, and results; and a summary of preventative measures such as vehicle wash logs and facilities and success of measures.

MM BIO-5 (Vegetation Resources Management Plan) The Applicant shall prepare and implement a Vegetation Resources Management Plan (VRMP), to be reviewed and approved by USFWS, CDFW, BLM, and Riverside County (or its designated representative). The VRMP shall detail the methods to revegetate temporarily impacted sites and salvage special-status plants from the Project footprint; and outline long-term vegetation management within the solar facility during its operations. The Lead Biologist shall oversee implementation of the VRMP to meet success criteria and prevent further degradation of areas temporarily disturbed by Project activities.

The Plan shall require that total native vegetation cover will be no less than 80% of total vegetation cover on nearby undisturbed lands of comparable quality. Project sites previously disturbed by anthropogenic activities will be compared to nearby, similarly pre-disturbed sites.

As described below, total cover on the Project site shall be calculated during the annual quantitative monitoring as required in the VRMP, using California Native Plant Society (CNPS) Combined Vegetation Rapid Assessment and Relevé Protocol (CNPS, 2022).

Transplantation of cacti and ocotillo shall be considered successful with 75% survival after 3 years. If unsuccessful, remediation will be implemented to plant additional cacti at a 2:1 ratio.

PLAN REQUIREMENTS

Consistent with DRECP CMAs LUPA-BIO-7 (Restoration of Areas Disturbed by Construction Activities but Not Converted by Long-Term Disturbance), LUPA-BIO-VEG-1 (vegetation management for cactus, yucca, and other succulents under BLM policy), and LUPA-BIO-VEG-5 (adherence to BLM regulations and policies regarding salvage and transplants of cactus, yucca, other succulents, and BLM sensitive plants), the Plan shall include:

- Revegetation of temporarily impacted sites. The Plan shall specify methods to prevent or minimize further site degradation; stabilize soils; maximize the likelihood of vegetation recovery over time (for areas supporting native vegetation); and minimize soil erosion, dust generation, and weed invasions. The nature of revegetation will differ according to each site, its pre-disturbance condition, and the nature of the construction disturbance (e.g., drive and crush, vs. blading). Revegetation and monitoring will be performed in accordance with CNPS Combined Vegetation Rapid Assessment and Relevé Protocol (CNPS, 2022). Additional restoration guidance is provided in Abella and Berry 2016, and Abella et al. 2023, which describe techniques for restoring Mojave and western Sonoran habitats and desert tortoise habitat. New techniques, as available at the time of revegetation, will be integrated into vegetation management and adaptive management. The Plan shall include:
 - soil preparation measures, including locations of recontouring, decompacting, imprinting, or other treatments, as prescribed by the Lead Restoration Ecologist and consistent with CNPS Combined Vegetation Rapid Assessment and Relevé Protocol (CNPS, 2022);
 - details for topsoil storage, as applicable;
 - plant material collection and acquisition guidelines, including guidelines and methods for salvaging, storing, and handling seed and plants (including desert native species protected by the CDNPA, special-status plants, and Crotch bumble bee) from the Project site,

- Guidelines for obtaining replacement plants from outside the Project area (seed and plant palettes and materials shall be limited to locally occurring native species from local sources);
- a plan drawing or schematic depicting the temporary disturbance areas (drawing of “typical” gen-tie structure sites will be appropriate);
- time of year that the planting or seeding will occur and the methodology of the planting;
- maintenance details, including vegetation treatments; a description of the irrigation, if used; erosion control measures; and non-native weed management per the IWMP;
- quantitative success criteria for regrowth of vegetation, requiring at least 80% native cover and no more than 20% non-native cover;
- a monitoring program to measure project compliance with the success criteria, including annual quantitative monitoring in accordance with CNPS Combined Vegetation Rapid Assessment and Relevé Protocol (CNPS, 2022);
- contingency measures for failed revegetation efforts not meeting success criteria, which may include, but is not limited to, reseeding, re-planting, erosion repairs, modifications to irrigation, and repair or remediation of sites;
- annual monitoring reports to be submitted to BLM and Riverside County (or its designated representative), providing a summary of the restoration and adaptive management activities for the previous year.
- Cactus Salvage. The Applicant shall include salvaged or nursery stock yuccas (all species), and cacti (excluding cholla species, genus *Cylindropuntia*) in revegetation plans. The Plan shall include:
 - methods of salvage, including heavy equipment or hand tools, depending on plant size. For each plant, the microsite description will be recorded and the north-facing orientation will be identified and tagged.
 - to the extent feasible, plants shall be salvaged during the fall or winter to

mini-mize transplantation stress. If cacti must be salvaged during spring or summer, they shall be held over in a shade structure and protected from wind and heat until fall for transplantation. If cacti must be installed during spring or summer, shade structures or “vertical mulch” (branches cleared from the work sites) will be provided as shelter from sun and wind.

- guidelines for removing plants, such that plants are dug to avoid root damage. Roots shall be treated, as necessary, and plants shall be transported to avoid root damage.

- guidelines for storing plants, such that cacti and ocotillo shall be stored only when unavoidable. Plants shall be kept shaded and roots kept moist;

- specific replanting locations shall be identified within Project lands, such as revegetation areas on temporarily disturbed work sites, unless directed otherwise by BLM (for BLM land) or the County (for private land);

- methods for re-planting, ensuring that each salvaged plant shall be replanted in a microsite that resembles its salvage site and in the same north-facing orientation as the salvage site. Salvaged plants shall be covered deeply enough with soil to prevent root exposure and watered immediately after planting and at regular intervals thereafter based on needs of each species.

- quantitative success criteria for survival, requiring at least 75% survival after 3 years. If this criterion is not met, remediation shall be implemented to plant additional cacti at a 2:1 ratio or increase native vegetation cover and diversity at Project site.

- a monitoring program to measure Project compliance with the success criteria, including quarterly quantitative monitoring of survival status and identification of remedial actions needed, such as water, shade, or protection from wind, erosion, or wildlife. Results of monitoring shall be included in the annual monitoring report, as described above.

- seeds from special-status plants, if found, would be salvaged for revegetation. CRPR 1 or 2 species that are found shall be experimentally salvaged. No quantitative success criteria are assigned for experimental salvage; however, monitoring

1 data shall be provided to the CDFW, Riverside County, and BLM to inform future
2 mitigation for those species.

3 • Operations Phase On-Site Vegetation Management. The Plan shall include
4 mowing methods and scheduling for on-site vegetation management during O&M. The
5 Plan shall describe vegetation treatments to be implemented to minimize interference
6 with the solar panels, fire hazard, soil disturbance, and disturbance of any bird nests.
7 Vegetation shall be inspected annually to identify hazardous vegetation or barren areas
8 prone to erosion that require repair. All mowed or cut plant material that contains
9 invasive weeds will be transported to a licensed solid waste or composting facility.
10 Mowed or cut native plant material may be used on site as mulch. Weed control during
11 O&M will be conducted as described in the IWMP (MM BIO-4).--

12 **MM BIO-6 (Wildlife Protection)** The Applicant shall undertake the following measures
13 during construction and O&M to avoid or minimize impacts to wildlife. Implementation
14 of all measures shall be subject to review and approval by BLM and Riverside County (or
15 its designated representative).

16 Wildlife avoidance. Project activities shall minimize interference with wildlife (including
17 ground-dwelling species, birds, bats) by allowing animals to escape from a work site prior
18 to disturbance; conducting pre-construction surveys and exclusion measures for certain
19 species as specified in other measures; checking existing structures (homes, trailers, etc.) for
20 animals such as bats, barn owls, skunks, or snakes that may be present, and safely excluding
21 them prior to removing the structures.

22 Minimize traffic impacts. The Applicant shall specify and enforce maximum vehicle speed
23 limits as specified in the Traffic Control Plan, to minimize risk of wildlife collisions and
24 fugitive dust.

25 Minimize lighting impacts. Night lighting, when in use, shall be designed, installed, and
26 maintained to prevent side casting of light towards surrounding fish or wildlife habitat.

27 Avoid use of toxic substances. Soil bonding and weighting agents used for dust suppression
28 on unpaved surfaces shall be non-toxic to wildlife and plants.

1 Minimize noise and vibration impacts. The Applicant shall conform to noise requirements
2 specified in the noise analysis of this EIR to minimize noise to off-site habitat.

3 Water. Potable and non-potable water sources such as tanks, ponds, and pipes shall be
4 covered or otherwise secured to prevent animals (including birds) from entering. Prevention
5 methods may include storing water within closed tanks or covering open tanks with 2-
6 centimeter netting. Dust abatement shall use the minimum amount of water on dirt roads and
7 construction areas to meet safety and air quality standards. Water sources (e.g., hydrants,
8 tanks, etc.) shall be checked periodically by biological monitors to ensure they do not create
9 puddles.

10 Trash. All trash and food-related waste shall be contained in vehicles or covered trash
11 containers inaccessible to ravens, coyotes, or other wildlife and removed from the site
12 regularly.

13 Workers. Workers shall not feed wildlife or bring pets to the Project site. Except for law
14 enforcement personnel, no workers or visitors to the site shall bring firearms or weapons.

15 Wildlife exclusion. The Applicant may install temporary or permanent exclusion fencing
16 around equipment, work areas, or Project facilities to prevent wildlife exposure to hazards
17 such as toxic materials or vehicle strikes. If fencing is not used, openings in stored equipment
18 that would allow for entry of wildlife shall be secured with tape or other covering to prevent
19 entrapment. The biological monitor shall perform inspections of equipment prior to use to
20 ensure that no birds have nested on stored equipment and that no wildlife has become
21 entrapped. The biological monitor will inspect exclusion fence (if installed) weekly.

22 Wildlife entrapment. Project-related excavations, trenches, auger holes, and water tanks
23 shall be secured or covered to prevent wildlife entry, entrapment, and drowning. Holes and
24 trenches shall be backfilled, securely covered, or fenced. Open water tanks shall be covered
25 or shall have other means of exit provided to prevent wildlife from drowning. Excavations
26 that cannot be fully secured shall incorporate wildlife ramp or other means to allow trapped
27 animals to escape. At the end of each workday, a biological monitor shall ensure that
28 excavations and water tanks have been secured or provided with appropriate means for

wildlife escape.

All pipes or other construction materials or supplies shall be covered or capped in storage or laydown areas. Netting shall be installed over porta-potty vents. No pipes or tubing shall be left open either temporarily or permanently, except during use or installation. Any construction pipe, culvert, or other hollow materials shall be inspected for wildlife before it is moved, buried, or capped.

Dead or injured wildlife shall be reported immediately to USFWS (for federally listed species and migratory birds) and CDFW (for all wildlife) and/or the local animal control agency, as appropriate, by the Lead Biologist (or the Applicant's compliance manager during O&M). Procedures for handling of dead or injured wildlife shall be outlined in a Wildlife Protection Plan, in coordination with CDFW. A Special Purpose Utility Permit (SPUT) would be acquired from the USFWS prior to collection of migratory bird carcasses. A biological monitor shall safely move the carcass out of the road or work area if needed and dispose of the animal as directed by the agency. If an animal is entrapped, a biological monitor shall free the animal if feasible, work with construction crews to free it in compliance with safety requirements, or work with animal control, USFWS, or CDFW to resolve the situation.

Pest control. No anticoagulant rodenticides, such as Warfarin and related compounds (indandiones and hydroxycoumarins), may be used within the Project site, on off-site Project facilities and activities, or in support of any other Project activities.

Measures for Crotch bumble bee

- All on-site personnel shall be required to attend the Worker Environmental Awareness Training Program, as detailed in MM BIO-2, that includes education program on identification and avoidance of Crotch bumble bee and nests.
- If a live individual is detected during pre-construction surveys, or incidentally, the Applicant shall take adaptive management actions in coordination with CDFW, considering CDFW guidance and best management practices at the time of the occurrence.

- Pre-construction surveys would include inspection for Crotch bumble bee nests. If any are located, CDFW would be notified and a no-disturbance buffer of at least 50 feet would be demarcated as determined by the Lead Biologist, in coordination with CDFW.

MM BIO-7 (Desert Tortoise Protection) No desert tortoise may be handled or relocated without authorization from USFWS and CDFW. The Applicant shall obtain incidental take authoriza--tion from both agencies to address any potential take of desert tortoise, including auth-orization to handle or translocate desert tortoise. In addition to implementing the actions to be taken during construction, the Applicant shall prepare and implement a Desert Tortoise Protection Plan and a Raven Management Plan, with contents as defined herein.

REQUIRED ACTIONS TO PROTECT TORTOISE DURING CONSTRUCTION

The following shall be implemented:

- Inspect for tortoises under vehicles. The ground beneath vehicles parked outside of desert tortoise exclusion fencing will be inspected immediately prior to the vehicle being moved. If a tortoise is found beneath a vehicle, the vehicle will not be moved until the desert tortoise leaves of its own accord.

- Protect tortoises on roads. The Applicant shall specify and enforce maximum vehicle speed limits as specified in the Traffic Control Plan, to minimize risk of vehicle strikes. If a tortoise is observed on or near the road accessing a work area, vehicles will stop to allow the tortoise to move off the road on its own.

- Tortoise Observations. Any time a tortoise is observed within or near a work site, Pro-ject work activities will proceed only at the site and within a suitable buffer area after the tortoise has either moved away of its own accord, or if it has been trans-located off the site under authorization by the USFWS and CDFW. If a tortoise is observed outside of exclusion fencing, construction will stop, and the tortoise shall be allowed to move out of the area on its own. If a tortoise or tortoise burrow is observed within the exclu-sion fencing, construction in the vicinity will stop, pending translocation of the tortoise or other action as authorized by USFWS and CDFW.

- Reporting of dead or injured specimens. Upon locating a dead or injured

tortoise, the Applicant or its agent will immediately notify the Palm Springs Fish and Wildlife Office by email or telephone. Written notification must be made within five days of the finding, both to the appropriate USFWS field office and to the USFWS's Division of Law Enforcement. The information provided must include the date and time of the finding or incident (if known), location of the carcass or injured animal, a photograph, cause of death, if known, and other pertinent information.

- Tortoise compensatory mitigation. Compensatory mitigation for desert tortoise shall include suitable habitat at a minimum of 1:1 ratio for impacts to desert tortoise suitable habitat and a ratio of 5:1 for impacts to desert tortoise critical habitat, in coordination with USFWS, CDFW, and in compliance with any ITPs.

PREPARE DESERT TORTOISE PROTECTION AND RELOCATION PLAN

To ensure safe handling and translocation in accordance with applicable wildlife agency guidance, desert tortoises shall be handled or translocated according to a Desert Tortoise Protection and Relocation Plan, to be reviewed and approved by USFWS, CDFW, BLM, and Riverside County.

The Desert Tortoise Protection and Relocation Plan shall be developed in accordance with and be consistent with the Desert Tortoise (Mojave Population) Field Manual (USFWS, 2009); Revised Recovery Plan for the Mojave Population of the Desert Tortoise (USFWS, 2011a); Translocation of Mojave Desert Tortoises from Project Sites: Plan Development Guidance (USFWS, 2020a), and Health Assessment Procedures for the Mojave Desert Tortoise (USFWS, 2019b).

Relocated and translocated tortoises will be transmittered and monitored, as described below. All relocated or translocated desert tortoises will be monitored once within 24 hours of release; twice weekly for the first two weeks after release; weekly during the more-active season; biweekly during the less-active season; and for a duration agreed upon by Riverside County, BLM, USFWS, and CDFW from date of release.

PLAN REQUIREMENTS

Consistent with DRECP CMAs LUPA-BIO-COMP-1: (Compensation); LUPA-BIO-IFS-1:

(Individual Focus Species [IFS]: Desert Tortoise [activities within desert tortoise linkages]); LUPA-BIO-IFS-2: (new roads in Tortoise Conservation Areas [TCAs]), LUPA-BIO-IFS-3: (culvert sizing for desert tortoise), LUPA-BIO-IFS-4: (desert tortoise exclusion fencing), LUPA-BIO-IFS-5: (desert tortoise monitoring for initial clearing and grading), LUPA-BIO-IFS-6: (desert tortoise monitoring during geotechnical boring), LUPA-BIO-IFS-7: (desert tortoise monitoring during geotechnical testing), LUPA-BIO-IFS-8: (inspections for desert tortoise under vehicles), LUPA-BIO-IFS-9: (speed limits in desert tortoise habitat), LUPA-VPL-BIO-IFS-1: (site activities in previously disturbed areas in desert tortoise linkages and TCAs), DFA-BIO-IFS-1: Individual Focus Species (IFS) (protocol surveys in desert tortoise habitat), DFA-BIO-IFS-2 (setback requirements), DFA-BIO-IFS-3: Desert Tortoise (desert tortoise translocation), the Desert Tortoise Protection and Relocation Plan shall include:

Authorized personnel titles and roles. The Applicant shall designate a USFWS Authorized Biologist to implement the desert tortoise protection measures. The Authorized Biologist may (or may not) also serve as the Project's Lead Biologist.

The Applicant shall employ one or more desert tortoise monitors who are qualified to conduct desert tortoise clearance surveys and who will be on site during all construction. The desert tortoise monitors' qualifications will be subject to review and approval by Riverside County and the BLM. Qualifications may include work as a compliance monitor on a project in desert tortoise habitat, work on desert tortoise trend plot or transect surveys, conducting surveys for desert tortoise, or other research or field work on desert tortoise. Attendance at a training course endorsed by the agencies (e.g., Desert Tortoise Council tortoise training workshop) is a supporting qualification.

The Authorized Biologist shall direct one or more desert tortoise monitors to conduct pre-construction clearance surveys for each work area, watch for tortoises wandering into the construction areas, check under vehicles, and examine excavations and other potential pitfalls for entrapped animals.

The Authorized Biologist shall be responsible for overseeing compliance with desert tortoise protective measures and for coordination with resource agencies. The Authorized

1 Biologist will have the authority to halt any Project activities that may risk take of a desert
2 tortoise or that may be inconsistent with adopted mitigation measures or permit con-ditions.
3 Neither the Authorized Biologist nor any other Project employee or contractor may bar or
4 limit any communications between Riverside County, BLM, CDFW, or USFWS staff and
5 any Project biologist, biological monitor, or contracted biologist. Upon notifica-tion by the
6 desert tortoise monitor or another biological monitor of any noncompliance the Authorized
7 Biologist shall ensure that appropriate corrective action is taken.

8 The following incidents will require immediate cessation of any Project activities that could
9 harm a desert tortoise: (1) location of a desert tortoise within a work area; (2) immi-nent
10 threat of injury or death to a desert tortoise; (3) unauthorized handling of a desert tortoise,
11 regardless of intent; (4) operation of construction equipment or vehicles outside a Project
12 area cleared of desert tortoise, except on designated roads; and (5) con-ducting any
13 construction activity without a biological monitor where one is required.

14 Worker training. Prior to the onset of construction activities, a desert tortoise education
15 program will be presented by the Authorized Biologist to all personnel who will be present
16 on Project work areas. Following the onset of construction, any new employee will be
17 required to formally complete the tortoise education program prior to working on site. The
18 following specifications will be incorporated into the WEAP train-ing, identified in
19 Mitigation Measure BIO-2. At a minimum, the tortoise education program will cover the
20 following topics:

- 21 • A detailed description of the desert tortoise, including color photographs;
- 22 • The distribution and general behavior of the desert tortoise;
- 23 • Sensitivity of the species to human activities;
- 24 • The protection the desert tortoise receives under the state and federal
25 Endan-gered Species Acts, including prohibitions and penalties incurred for violation;
- 26 • The protective measures being implemented to conserve the desert tortoise
27 during construction activities; and
28

- Procedures and a point of contact if a desert tortoise is observed on site.

Plan requirements for pre-construction and clearance surveys and use of exclusion fencing. Prior to the construction of solar facilities, temporary or permanent desert tortoise exclusion fencing will be installed around the entirety of the approved solar field and storage facility construction areas, as well as parking and laydown areas. Fenced areas would be surveyed and monitored to ensure desert tortoise are avoided.

Construction phase tortoise exclusion fencing. Exclusion fencing will adhere to USFWS design guidelines in the Desert Tortoise Field Manual (USFWS, 2009), where applicable. The exact location of different fencing types shall be determined in coordination with the USFWS. Permanent fencing shall be constructed with durable materials (i.e., 16 gauge or heavier) suitable to resist desert environments, alkaline and acidic soils, wind, and erosion. Temporary fencing would be built with the same materials, however it would not be trenched or buried but bent inwards flush with the ground surface. Tortoise exclusion fencing shall include a "cattle guard" or desert tortoise exclusion gate at each entry point. This gate shall remain closed at all times, except when vehicles are entering or leaving. If it is deemed necessary to leave the gate open for extended periods of time (e.g., during high traffic periods), the gate may be left open as long as a biological monitor is present to monitor for tortoise activity in the vicinity.

Preconstruction surveys. No more than 10 days prior to the initiation of fence construction, a pre-activity tortoise survey shall be conducted along the fence line installation area using techniques that provide 100% visual coverage of the disturbance area. Transects will be spaced 15 feet (5 meters) apart, and within an additional buffer area of 100 feet (30 meters) transects would be spaced 10 meters apart.

Fence monitoring. A biological monitor shall be present during all fence installation activities to inspect the work area and under vehicles for desert tortoise prior to ground disturbance or vehicle access to ensure that no tortoises have moved into the work area. If a desert tortoise moves into the work area, activities will halt until it moves out of the work site on its own accord or is moved from harm's way by an Authorized Biologist.

1 Fence inspections. Exclusion fencing will be inspected daily for the first two weeks
2 following installation, to monitor for desert tortoise exhibiting fence-walking behavior. If
3 none are observed, exclusion fencing will be inspected weekly during desert tortoise active
4 seasons (April 1 to May 31 and September 1 to October 31), at least monthly during non-
5 active seasons (June to September, November to March), and following all rain events, and
6 corrective action taken if needed to maintain it.

7 Unfenced work areas. As an alternative to exclusion fencing, any work conducted in an area
8 that is not fenced to exclude desert tortoises (e.g., gen-tie tower sites) must be monitored by
9 a biological monitor who will stop work if a tortoise enters the work area. Work activities
10 will proceed only at the site and within a suitable buffer area after the tortoise has either
11 moved away of its own accord, or if it has been translocated off the site under authorization
12 by the USFWS and CDFW. Work sites with potential hazards to desert tortoise (e.g., auger
13 holes, steep-sided depressions) that are outside of the desert tortoise exclusion fencing will
14 be fenced by installing exclusionary fencing, covered, or will not be left unfilled overnight.

15 Clearance surveys. An Authorized Biologist shall direct a clearance survey before the
16 tortoise fence is enclosed to ensure no tortoises are in the work area. After exclusion fencing
17 is fully installed, a desert tortoise pre-construction clearance survey shall be conducted
18 within each of the enclosed, fenced areas. Per the USFWS Field Manual (2009), clearance
19 surveys must consist of at least 2 consecutive surveys of the site. Clearance will be
20 considered complete after two successive 100 percent coverage surveys have been
21 conducted without finding any desert tortoises. If active desert tortoise sign is observed
22 during the second survey pass, a third pass may be required after consultation with the
23 agencies. Surveys will be led by Authorized Biologists experienced with searching for desert
24 tortoise, potential burrows, scat, and carcasses. Surveys will consist of 100 percent visual
25 coverage using pedestrian belt transects spaced at 5-meter intervals. An additional 500-foot
26 (150 meter) buffer outside the Project boundary will also be surveyed with pedestrian belt
27 transects spaced at 10 meters apart to identify any potentially active burrows that may be
28 indirectly affected by construction activities.

1 Clearance surveys must be conducted during the active season for desert tortoises (April 1
2 through May 31 or September 1 through October 31), unless authorized by CDFW and
3 USFWS.

4 During the first survey pass, all sign (scat, carcasses, tracks, etc.) shall be removed from the
5 clearance area, which will prevent reidentification of the same tortoise sign in proposed work
6 areas. Desert tortoise carcasses may be returned to USFWS or CDFW, used for educational
7 purposes, or relocated in the natural environment outside the work area fence line, as
8 coordinated with resource agencies.

9 If a tortoise is located during clearance surveys, work activities will proceed only after the
10 tortoise has either moved away of its own accord, or if it has been relocated or translocated
11 off the site under authorization by the USFWS and CDFW. The buffer distance for work
12 activities shall be 100 feet during the non-active season and at least 250 feet during the active
13 season (September-October and April-May), unless otherwise directed in the CDFW
14 Incidental Take Permit (ITP). Any potentially occupied burrows will be avoided until
15 monitoring or field observations (e.g., with a motion-activated camera or fiber-optic
16 mounted video camera) determines absence. The fence shall be either continuously
17 monitored prior to closure, or clearance surveys shall be repeated prior to closure after
18 tortoises are removed.

19 Plan requirements for handling of desert tortoise. Only persons permitted by the USFWS
20 and CDFW under the Desert Tortoise Activity Form (i.e., streamlined Section 7
21 consulta-tion process) or Incidental Take Permit shall handle desert tortoises. All desert
22 tortoises will be handled by an Authorized Biologist in accordance with the Desert Tortoise
23 Field Manual (2009) and the USFWS Revised Translocation Guidance (2020). Authorized
24 Biologists shall handle tortoises in accordance with approved disinfection and sanitation
25 techniques and procedures defined by the Desert Tortoise Health Assessment Procedures
26 (USFWS, 2019a).

27 Tortoises shall be handled according to seasonal and temperature constraints, where any
28 handling of desert tortoises would always be below the temperature of 95°F. During

1 handling, the desert tortoise will be kept in a shaded environment that does not exceed 95°F
2 and will not be released until ambient air temperatures fall below 95°F.

3 Biologists will maintain a record of all desert tortoises identified and handled on the Project
4 site, including photographs, time and location of handling, temperature, condition and
5 measurements of the individual, transmitter information, and information on nests, eggs, and
6 voiding of bladder. Should a tortoise void or defecate between capture and release, it shall
7 be thoroughly rehydrated and rinsed to remove any odors that could attract potential
8 predators. Any desert tortoise handling event shall be completed within 30 minutes or less
9 (not including rehydrating a desert tortoise that has voided).

10 The Plan shall detail methods for attaching transmitters to desert tortoises that will be
11 relocated, translocated, or monitored. The Applicant will consult with the USFWS Desert
12 Tortoise Recovery Office to coordinate transmitter frequencies. Radio transmitters and
13 antennae must be mounted by an Authorized Biologist so as not to impede growth or the
14 daily activities of the tortoise.

15 The Plan shall detail nest and egg handling procedures. Any nest that is found will be
16 carefully excavated by hand by an Authorized biologist. A nest will be prepared at the release
17 site with the same depth and location in relation to the burrow entrance as the original nest.
18 The eggs will be transferred to the new nest, maintaining their original orientation and
19 replaced so that they touch one another. Eggs will be gently covered with soil from which
20 cobbles and pebbles have been removed so that all the air spaces around the eggs are filled.
21 To the greatest extent practicable, bromating (hibernating) tortoises will not be relocated or
22 translocated. If a bromating desert tortoise cannot be avoided by Project activities or be
23 passively relocated, the tortoise may be captured and released in coordination with USFWS
24 and CDFW.

25 Procedures for relocation, passive exclusion, and translocation of desert tortoise and
26 identification and description of translocation recipient sites.

27 Relocation. Desert tortoises less than 160 mm will be relocated as soon as possible after
28 detection. Adult desert tortoises (more than 160 mm) identified for relocation will be

transmitted and left in situ or within on-site pens following health assessments, data collection, and monitoring, until they can be transported. The Plan shall detail the construction of on-site pens, in accordance with USFWS guidance (USFWS, 2011). Relocation and monitoring of tortoises <100 mm will be coordinated with BLM, USFWS, and CDFW on a case-by-case basis at the time of detection. Desert tortoises will be relocated by an Authorized Biologist within 300 meters of their capture locations in suitable habitat, within adjacent BLM land or private land owned by the Applicant.

Passive exclusion. Passive exclusion shall be prioritized on all linear Project components and in unfenced work areas by using a biological monitor to accompany construction crews and equipment in the field. Construction or maintenance activities will cease if a desert tortoise is detected within the work area or if a tortoise is in imminent danger, until the tortoise moves a safe distance out of the work area. Desert tortoises would be relocated from unfenced work areas if a tortoise does not leave a work area and no other alternate work site is available for crews or an occupied burrow is located within or adjacent to a work area that cannot be avoided.

A Biological Monitor would monitor initial clearing and grading activities for any tortoises missed during the clearance survey. Excavations with steep walls shall have a wildlife escape ramp and be fully covered at the end of the workday to prevent entrapment. After vegetation is fully removed within fenced areas, weekly spot checks shall be conducted to ensure that there are no desert tortoises within the construction area for the duration of the construction phase.

Translocation. If a desert tortoise is found and is not in an area appropriate for relocation (i.e., suitable habitat does not occur within a 1.5-kilometer buffer surrounding the potential release point), the tortoise will be translocated. Translocations shall occur during the tortoise active season.

The Plan shall detail methods and procedures for translocation, including health assessments, transportation requirements, and identification of comparable release locations, in accordance with the Desert Tortoise Field Manual (USFWS, 2009). Per the

1 USFWS Translocation Guidance (2020), a translocation review package, incorporating the
2 penultimate health assessment in the month before the scheduled translocation, shall be
3 submitted to Riverside County, BLM, USFWS, and CDFW for approval of the proposed
4 disposition of each tortoise on the Project site.

5 Recipient sites shall be approved in consultation with BLM, USFWS, and CDFW, and shall
6 be comprised of suitable desert tortoise habitat with modelled high desert tortoise
7 occupancy (Nussear, 2009). The recipient site shall be sited within desert tortoise critical
8 habitat, unless otherwise directed by the agencies.

9 Plan requirements for construction monitoring and reporting

10 Construction monitoring and reporting. During the construction phase, the Authorized
11 Biologist shall prepare daily records of desert tortoise observations and site inspections. If
12 at any time a desert tortoise is identified on the Project site, Riverside County, BLM,
13 USFWS, and CDFW will immediately be notified.

14 Reporting for construction monitoring and implementation of the Plan shall be provided in
15 weekly updates and monthly reporting to Riverside County, BLM and USFWS, as well as
16 quarterly reporting to CDFW. Annual and final reports shall be submitted to Riverside
17 County, BLM, USFWS, and CDFW, as required. Summaries of compliance tortoise surveys,
18 relocation, translocation, and monitoring activities conducted during the previous calendar
19 year will be included.

20 Translocation monitoring and reporting. Telemetry-based monitoring shall be implemented
21 for at least six months to document short-term survival of small numbers of translocated
22 tortoises. The Applicant will consult with Riverside County, BLM, USFWS, and CDFW to
23 determine the appropriate monitoring duration and methodology. All relocated or
24 translocated desert tortoises will be monitored once within 24 hours of release; twice weekly
25 for the first two weeks after release; weekly during the more-active season; biweekly during
26 the less-active season; and for a duration agreed upon by Riverside County, BLM, USFWS,
27 and CDFW from date of release. Health assessments shall be performed twice-annually.

28 Reporting for translocation shall be provided in weekly updates and monthly reporting to

1 Riverside County, BLM and USFWS, as well as quarterly reporting to CDFW. Annual and
2 final reports will be submitted to Riverside County, BLM, USFWS, and CDFW. Summaries
3 of all compliance tortoise translocation, and post-translocation, effectiveness, and health
4 monitoring activities conducted during the previous calendar year will be included.

5 Plan requirements for O&M; decommissioning, and adaptive management

6 O&M. At the Applicant's discretion, and in consultation with resource agencies, perma-nent
7 desert tortoise exclusion fencing may be installed around each solar facility site. If
8 permanent desert tortoise exclusion fencing is not installed,

9 Tortoises observed by personnel within the fence line of the solar facility components during
10 routine maintenance activities or along the main access road will be relocated or translocated
11 by permitted biologists, in coordination with USFWS and CDFW. Relocated tortoises will
12 be moved to suitable habitat within 300 meters of where it was found, outside of the fence
13 line within adjacent BLM land or private land owned by the Applicant. Translocated
14 tortoises will be moved to the approved recipient site.

15 For any routine maintenance or emergency/unexpected repairs that require surface
16 disturbance or heavy equipment desert tortoise shall be allowed to move out of harm's way
17 of its own accord, or the tortoise will be relocated by an Authorized Biologist.

18 In areas where wildlife-friendly fencing is implemented, temporary exclusion fencing may
19 be removed only after vegetation is successfully re-established and habitat is suitable to
20 support desert tortoise, in coordination with USFWS. If used, wildlife-friendly fencing will
21 be installed around solar arrays in the Pinto Wash Linkage and areas adjacent to desert dry
22 wash woodland that provide higher quality desert tortoise habitat. The security fence would
23 leave a 6- to 8-inch gap between the lower fence margin (rail or mesh) and the ground and
24 the bottom of the fence fabric (chain-link or similar material) would be wrapped upward so
25 that no sharp edges are exposed along the lower fence margin. The fencing would be
26 inspected at least once per quarter by a qualified biologist to identify areas of sand deposits
27 at the fence line or damage to fencing. During the fall and spring quarter, inspections would
28 be performed during active desert tortoise season.

Decommissioning. After decommissioning, fencing shall be removed. Desert tortoise con-ser-vation measures shall be in place and the decommissioning activities shall be moni-tored for the presence of desert tortoise and desert tortoise sign. Observations of desert tortoise shall be reported and protection measures shall be coordinated with USFWS and CDFW.

Adaptive management. Adaptive management measures would be implemented if there is evidence of Project-related disturbance to or increased risk to desert tortoise, and where initial protection methods have been deemed ineffective based on monitoring results. Remedial actions may include repairs or modifications to fencing, additional sur-vey-ing, or additional monitoring and inspections. Adaptive management measures used shall be reported in the annual report.

PREPARE A Raven Management Plan

The Applicant shall develop and implement a Raven Manage-ment Plan to address activi-ties that may occur during the pre-construction, construc-tion, decommissioning, and O&M phases of the Project that may attract common ravens (*Corvus corax*), a nuisance species that is a subsidized predator of desert tortoises and other sensitive species in the Project vicinity.

The Applicant will submit payment to the Project sub-account of the Renewable Energy Action Team (REAT) Account held by the National Fish and Wildlife Foundation (NFWF) to support the Service's Regional Raven Management Pro-gram. The one-time fee will be as described in the cost allocation methodol-ogy, or more current guidance as provided by the Service or CDFW. The contribution to the regional raven management plan will be \$105 per acre impacted.

The Plan shall be prepared in accordance with USWFS guidelines in Management of Conflicts Associated with Common Ravens in the United States (USFWS, 2023). If raven monitoring indicates an increase in local raven activity attributed to the Project, measures shall be implemented to deter ravens from the site, such as additional worker education, more stringent restrictions on water use or trash disposal, installation of nest-prevention or

roost-prevention devices on Project facilities, or specific measures to “haze” ravens from Project facilities or subsidies in coordination with USFWS and CDFW.

PLAN REQUIREMENTS

Consistent with DRECP CMA LUPA-BIO-6 (Subsidized Predators Standards), the Raven Management Plan will be developed and implemented to:

- (a) Identify conditions associated with the Project that might provide raven subsidies or attractants, including water, anthropogenic food sources, roadkill for scavengers, trash, and perches.
- (b) Describe management practices and control measures to avoid or minimize conditions and subsidies that might increase raven numbers and predatory activities, such as proper and regular disposal of food waste and trash using raven proof containers; removing road-killed animals; securing water tanks from leaks; using the minimum amount of water needed for dust control, panel washing, and irrigation; and use of BMPs for perching and roosting per current standards and practices, including APLIC guidelines (2006, 2012).
- (c) Describe monitoring during construction and operations, including roles and responsibilities for monitoring biologists, monitoring requirements for food and water subsidies, monitoring requirements for raven presence and nesting, and methods to identify individual ravens that prey on desert tortoises.
- (d) Describe reporting requirements for monitoring results, including annual monitoring reports to be submitted to USFWS, CDFW, BLM, and Riverside County.

MM BIO-8 (Bird and Bat Conservation Strategy (BBCS)) Bird and bat fatality and injury monitoring is being performed at the neighboring Oberon, Arica, and Victory Pass Projects. The approved BBCS plans for these projects include mortality monitoring and sampling methods, sampling design, and survey and data collection protocols. The Applicant shall use the results of post-construction bird and bat monitoring at the Oberon, Arica, and Victory Pass Projects to inform actions to be taken at the Easley Project, focused on the development of adaptive management measures that would minimize impacts and mortality to avian and

bat species.

The Applicant shall prepare and implement a BBCS that acknowledges the ongoing monitoring at other projects. The BBCS shall be focused on the implementation of adaptive management measures that may be required depending on monitoring results at the other projects. Adaptive management measures shall be developed in consultation with USFWS based on the results of on-going monitoring and current standards and guidelines. Available guidelines include USFWS Considerations for Avian and Bat Protection Plans (USFWS, 2010). These measures would avoid and mini-mize take of birds and bats on the Project site that may be vulnerable to injury or mortality on the Project site and/or collision with Project components (IP Easley, 2023).

The plan shall be crafted to meet the following standard: If impacts to avian species are documented at Oberon, Arica, Victory Pass, and Easley Projects and these impacts are shown to result in a substantial, long-term reduction in the demographic viability of the population of the species in question, then the Applicant would coordinate with USFWS and CDFW to determine if adaptive management, as described below, must be implemented to reduce Project related impacts. Over the course of construction and O&M, fatality thresholds and future conservation measures may be subject to revision in coordination with USFWS and CDFW as new information is obtained.

PLAN REQUIREMENTS

Consistent with DRECP CMAs LUPA-BIO-16 (Activity-Specific Bird and Bat CMAs) and LUPA-BIO-17 (Activity-Specific Bird and Bat CMAs BBCS), the Plan shall include:

- A description of bird and bat species in the Project area;
- A project-specific risk assessment that addresses potential for take, based on threats to birds and bats from the Project, including collision, electrocution, territory abandon-ment, nest and roost site disturbance, habitat loss and fragmentation, disturbance from human presence, and predator subsidies, in accordance with USFWS guidelines (USFWS, 2010);

1 • A description of the ongoing monitoring occurring at the Oberon, Arica, and
2 Victory Pass Projects and the findings of these programs as of the date of Plan
3 preparation.

4 • A description of the monitoring that will occur at the Project site. Monitoring
5 efforts will be designed to ensure that birds and bats are identified and avoided on the
6 Project site, and that Project related risks are managed to detect and avoid injury and
7 mortality.

8 • A description of how the adaptive management actions would be developed
9 and a list of potential adaptive management measures that could be implemented if
10 impacts to any avian species are shown to be occurring at Oberon, Arica, Easley, and
11 Victory Pass and these impacts appear likely to result in a substantial, long-term
12 reduction in the demographic viability of the population of the species in question.
13 Adaptive management measures may include passive avian diverter installations, the
14 use of sound, light or other means to discourage site use consistent with legal
15 requirements, on site habitat management or control measures consistent with applicable
16 legal requirements, or modification to support structures to exclude nesting birds.

17 • A requirement that adaptive management measures be implemented until
18 monitoring data indicates that mortality has not increased due to operation of the Project;
19 and that there is not a substantial reduction in demographic viability for the species in
20 question.
21

22 **BIRD AND BAT COMPENSATION FEE**

23 Consistent with CMA LUPA-BIO-COMP-2 and in coordination with BLM, compensation
24 for mortality impacts to bird and bat focus and special-status species shall be determined
25 based on bird and bat mortality monitoring at the Project and a fee reassessed every five
26 years to fund compensatory mitigation. The fee is calculated based on bird-use and estimated
27 mortality from the Project, per a Resource Equivalency Analysis as directed in CMA LUPA-
28 BIO-COMP-2.

MM BIO-9 (Nesting Bird Management Plan [NBMP]) The Applicant shall prepare and implement a Nesting Bird Management Plan (NBMP) that will provide a framework for surveying, management, and monitoring of bird nesting activities during the construction phase. The NBMP shall be prepared in conjunction with the BBCS.

The Project will either avoid vegetation clearing during the nesting season or conduct pre-construction nest surveys of potential habitat and implement no-disturbance buffer areas around active nests.

The plan shall ensure that impacts to nesting birds are avoided and minimized through establishment of adequate buffers around active nests, as determined by a qualified biological monitor. Nest surveys shall be conducted for all Project activities throughout the nesting season, (beginning January 1 for raptors and hummingbirds and February 1 for other species, and continuing through August). Nest buffers shall be species-specific, ranging from 100 feet for small passerines to 500 feet for raptors, as defined by the California Public Utilities Commission Nesting Bird Working Group (2015).

Default Buffers for Nests During Construction

Avian Group (nest type/location)	Species Potentially Nesting Within Easley Solar Project Site	Minimum Buffers for Ground Construction per Disturbance Level (feet)*
Waterfowl and rails	Canada goose, wood duck, mallard, cinnamon teal, ruddy duck, Virginia rail, sora, American coot, pied-billed grebe	150
Quail	California quail, Gambel's quail	150
Hérons	Great blue heron, great egret, snowy egret, cattle egret, black-crowned night-heron	250
Birds of prey (Category 1)	American kestrel, barn owl, western screech-owl	300
Birds of prey ² (Category 2)	Cooper's hawk, red-tailed hawk, red-shouldered hawk, great horned owl	300
Birds of prey (Category 3)	Turkey vulture, red-tailed hawk, white-tailed kite, northern harrier, long-eared owl	500
Shorebirds	Killdeer	200
Pigeons	Band-tailed pigeon	150

1	Doves	Mourning dove, white-winged dove, common ground-dove	150
2	Roadrunners	Greater roadrunner	300
3	Nightjars	Lesser nighthawk, common poorwill	150
4	Swifts	White-throated swift	200
5	Hummingbirds	Anna's hummingbird, Costa's hummingbird	100
6	Woodpeckers	Acorn woodpecker, ladder-backed woodpecker, Nuttall's woodpecker, downy woodpecker, northern flicker	150
7	Passerines (bridge, culvert, and building nesters)	Black phoebe, Say's phoebe, Ash-throated flycatcher, northern rough-winged swallow, cliff swallow, barn swallow, house finch (3)	100
8	Passerines (ground nesters, open habitats)	Horned lark, rock wren, western meadowlark, orange-crowned warbler, lark sparrow, grasshopper sparrow	150
9	Passerines (understory and thicket nesters)	Bushtit, Bewick's wren, blue-gray gnatcatcher (2), black-throated gray warbler, yellow-breasted chat, spotted towhee, black-chinned sparrow, sage sparrow, song sparrow, black-headed grosbeak, blue grosbeak, lazuli bunting, American goldfinch	150
10	Passerines (shrub and tree nesters)	Pacific-slope flycatcher, Cassin's kingbird, western kingbird (2), logger-head shrike (2)*, Hutton's vireo, western scrub-jay, American crow, common raven, verdin, bushtit, black-tailed gnatcatcher, blue-gray gnatcatcher (2), cactus wren (2)*, American robin, northern mocking-bird, Le Conte's thrasher, phainopepla, yellow warbler, black-throated gray warbler, yellow-breasted chat, California towhee, black-throated sparrow, song sparrow, summer tanager, great-tailed grackle, hooded oriole, Bullock's oriole, house finch (3), Lawrence's goldfinch, lesser goldfinch	150 (300 for species marked with *)
11	Passerines (open scrub nesters)	Loggerhead shrike (2)*, verdin, cactus wren (2)*, black-tailed gnat-catcher, wren tit, northern mockingbird, California thrasher, Le Conte's thrasher, Phainopepla, orange-crowned warbler, southern rufous- crowned sparrow, California towhee, black-throated sparrow, Brewer's blackbird, lesser goldfinch	150 (300 for species marked with *)

Passerines (tower nesters)	Western kingbird (2), common raven, house finch (3)	150
Species not covered under MBTA	Domestic waterfowl, including domesticated mallards, feral (rock) pigeon, ring-necked pheasant, chukar, Eurasian collared dove, spotted dove, parrots, parakeets, European starling, house sparrow	NA

PLAN REQUIREMENTS

Consistent with DRECP CMAs LUPA-BIO-16 (Activity-Specific Bird and Bat CMAs), LUPA-BIO-17 (Activity-Specific Bird and Bat CMAs BBBS), DFA-BIO-IFS-1 (Individual Focus Species (IFS) (pre-construction/activity breeding season surveys for individual species – Bendire’s thrasher, burrowing owl, golden eagle), DFA-BIO-IFS-2 (Setbacks for individual species – Bendire’s thrasher, burrowing owl, golden eagle), LUPA-BIO-3 (Resource Setback Standards), LUPA-BIO-RIPWET-3 (BLM Special Status Riparian Bird Species (pre-construction/activity nesting bird surveys)), and LUPA-BIO-IFS-12 (Burrowing Owl (setbacks and monitoring for burrows)) the Plan shall include:

- A site description detailing the suitability of the Project site for nesting birds, the species that may be encountered, and potential impacts to nesting birds
- Identification of qualifications, roles, and responsibilities of the Lead Biologist, biological monitors, and avian biologists
- Methods for preconstruction nest surveys and “sweeps” for nesting activity during construction, including the following:
 - Pre-construction surveys for active nests shall be conducted by one or more qualified biological monitors at the direction of the Lead Biologist.
 - Nest surveys shall be conducted for all Project activities throughout the nesting season, identified here as beginning January 1 for raptors and hummingbirds and February 1 for other species, and continuing through August 15.
 - Any nesting surveys involving passerines shall be conducted within 4 days of the initiation of any vegetation clearance or grading. Surveys involving raptors shall be conducted 7 days prior. An additional preconstruction survey shall be conducted

1 immediately prior to initial Project related, ground disturbing activities to confirm no
2 new nests are found. Surveys shall be repeated regularly during nesting season in nesting
3 habitat.

4 • Survey methods shall follow standard nest-locating techniques such as those
5 described in Martin and Guepel (1993). Surveys may be systematic transects,
6 mean-dering transects, or other methods which are determined by the Lead Biologist
7 based on site-specific characteristics, performed in the Project site and a 1,200-foot
8 buffer for raptors and a 300-foot buffer for other species surrounding each work area. If
9 adjacent properties are not accessible to the biological monitors, the off-site nest surveys
10 may be conducted with binoculars.

11 • Detection of nests shall be reported using an Avian Nest Reporting Form
12 developed in coordination with USFWS and CDFW.

13 • Establishment of exclusion buffers surrounding active nests and procedures
14 for reduction of buffers including the following:

15 • At each active nest, the biological monitor shall establish and mark a buffer
16 area surrounding the nest where construction activities that could disrupt nesting
17 behavior will be excluded.

18 • The default buffer distance established around a particular nest shall be species-
19 specific, as developed by the California Public Utilities Commission Nesting
20 Bird Working Group (2015), which ranges from 100 feet for passerines to 500
21 feet for raptors, in coordination with BLM, CDFW, and USFWS.

22 • Construction shall not occur within the designated nest exclusion buffer until the
23 nest is no longer active (i.e., the young fledge from the nest, or the nest is
24 abandoned).

25 • Buffer reductions for special-status species shall not occur beyond the default
26 distances without notification to BLM, USFWS, or CDFW, as appropriate, at
27 least 3 calendar business days prior to the proposed buffer reduction. Any
28

1 threatened or endangered listed species would require agency approval prior to
2 any buffer reduction.

3 • Procedures for active nest monitoring:

4 • Active nest monitoring shall occur at a minimum of one to three times per
5 week, depending on site-specific conditions.

6 • Nests shall be monitored and mapped from a distance, and nest details will be
7 recorded including species, nesting stage, and nesting outcome. Only the Lead
8 Biologist or Avian Biologist/Monitor may enter the established buffer zone of a
9 nest.

10 • Guidelines for nest removal:

11 • If a bird nest must be removed during nesting season, the Applicant shall
12 notify CDFW and USFWS and retain written documentation of the correspondence.
13 Nests shall be removed only if they are inactive or if an active nest for a non-special
14 status species presents a hazard to people or other wildlife. Removal of an active nest
15 requires a permit from USFWS, which would be acquired, as needed. All nest removals
16 shall be documented and described in the Annual Report.

17 • Reporting requirements:

18 • A nest survey and monitoring log shall document all new and monitored
19 nests, including date, species of bird, nest status (e.g., nest building, incubating,
20 fledglings present, or inactive); unique identification number of each nest monitored and
21 coordinates (easting and northing); estimated date of nest establishment; estimated
22 fledge date; description of and distance to nearby construction activities; relative noise
23 level; description of any nearby non-Project activities (e.g., publicly accessible roads or
24 trails); exclusion buffer size; and description of additional measures taken to protect
25 nests.

26 • Logs and corresponding maps showing the disturbance limits, Project
27 features, and current nest buffer data shall be updated weekly and made available to
28

survey crews, construction personnel, and resource agencies.

- During construction, the Applicant shall provide an Annual Report detailing a summary of nesting activities on the Project site and survey buffers. The Applicant shall provide the annual reports to Riverside County, BLM, CDFW, and the USFWS during the last quarter following each of season of construction that occurs during the nesting season.

- Adaptive Management:

- Adaptive management measures shall be implemented if there is evidence of Project-related disturbance to nesting birds where initial protection methods (i.e., buffers) are determined to be ineffective. Triggers for adaptive management include agitation behavior (displacement, avoidance, and defense), increased vigilance behavior at nest sites, changes in foraging and feeding behavior, or nest site abandonment.

- Potential adaptive management measures shall be identified, which may include increased buffer width; additional worker education; modifying work intervals, or allowing specific work types that may be implemented on a case-by-case basis; cessation of construction activities that are the source of disturbance to the nesting bird; or installation of visual or sound barriers.

MM BIO-10 (Gen-tie Lines) Gen-tie line support structures and other facility structures shall be designed in compliance with current standards and practices to discourage their use by raptors for perching or nesting (e.g., by use of anti-perching devices). This design also reduces the potential for increased predation of special-status species, such as the desert tortoise. Mechanisms to visually warn birds (permanent markers or bird flight diverters) shall be placed on gen-tie lines at regular intervals to prevent birds from colliding with the lines (APLIC, 2006, 2012). To the extent practicable, the use of guy wires shall be avoided because they pose a collision hazard for birds and bats. Necessary guy wires shall be clearly marked with bird flight diverters to reduce the probability of collision. Shield wires shall be marked with devices that have been scientifically tested and found to significantly reduce the potential for bird collisions. Gen-tie lines shall maintain sufficient distance between all

conductors and grounded components to prevent potential for electrocution of the largest birds that may occur in the area (e.g., golden eagle and turkey vulture). They shall utilize non-specular conductors and non-reflective coatings on insulators.

MM BIO-11 (Burrowing Owl Avoidance and Relocation)

Burrowing owl protection and relocation will meet the following requirements, in accordance with CDFW burrowing owl protocols (1993, 2012):

- Pre-construction surveys for burrowing owls, possible burrows, and sign of owls (e.g., pellets, feathers, whitewash) will be conducted throughout each work area. Survey schedules will be coordinated with constructing the desert tortoise exclusion fence and the pre-construction desert tortoise clearance surveys. As needed, follow-up surveys will be conducted no more than 14 days prior to construction.

- Pre-construction surveys shall consist of walking parallel transects 7 to 20 meters apart, adjusting for vegetation height and density as needed, and noting any potential burrows with fresh burrowing owl sign or presence of burrowing owls. If an active burrowing owl burrow is detected within any Project disturbance area, or within a 150-meter buffer of the disturbance area, a 150-meter (500-foot) exclusion buffer will be maintained while the burrow remains active or occupied. The buffer may be reduced to 50 meters (160 feet) during the non-breeding season (September 1 to January 31).-- The size of the buffer may be adjusted based on the time-of-year, and level of disturbance in the area, after consultation with CDFW. The following provides exclusion buffer guidelines for nesting sites (CDFW, 2012); which may be adjusted in the field by the Designated Biologist/Authorized Biologist, in consultation with agency personnel.

Time of Year	BUOW Buffer Distance (m) and Level of Disturbance*		
	Low	Medium	High
April 1 – Aug 15	200	500	500

Aug 16 – Oct 15	200	200	500
Oct 16 – Mar 31	50	100	500

*Levels of disturbance: Low =drive by, low use, once per week; Medium = 15 minutes to 2 hours of activity, less than 49 decibels, one or two passes per day; High = more than 2 hours of activity, more than 49 decibels

- Any unoccupied suitable burrows within the solar facility footprint will be excavated and filled in under the supervision of the Lead Biologist prior to site preparation. Any unoccupied burrows located outside the construction activity zones shall be left in their current condition.

- Passive relocation shall only be used during the non-breeding season, generally September 1 to February 1, to exclude burrowing owls from the Project site. Passive relocation shall be implemented to provide replacement burrows off site (if needed); collapse all unoccupied burrows within the construction site; and install a one-way door on the occupied burrow to evict the burrowing owl without handling it. Prior to any passive relocation, biologists shall survey nearby habitats to identify and inventory suitable unoccupied natural burrows for relocation. If none are available, artificial burrows shall be constructed based on the number of burrowing owls in need of relocation.

- Artificial burrows shall be located at least 50 meters outside any temporary or permanent Project impact areas, but as close as possible to the original burrow and no more than one mile from the original burrow location if possible. Artificial burrows will be designed, constructed, and installed following guidelines provided in CDFW (2012). All artificial burrows and mapped natural burrows shall be monitored for burrowing owl use at least once per quarter throughout the construction phase of the Project.

- Following the excavation of all suitable inactive burrows within the

1 construction area and installation of artificial burrows, burrowing owls will be passively
2 excluded from occupied burrows. Burrow exclusion will involve the installation of one-
3 way doors in burrow openings during the non-breeding season. Following confirmation
4 that passive exclusion burrows are unoccupied, the burrows shall be carefully excavated
5 using hand tools, or small tracked equipment, and backfilled to ensure that they are no
6 longer suitable for burrowing owl use.

- 7 • Compensatory mitigation for burrowing owl shall include suitable habitat for
8 the species at a minimum of 1:1 ratio, as determined in coordination with CDFW.

9 **MM BIO-12 (Desert Kit Fox and American Badger Relocation)** Desert kit fox and
10 American badger protection and relocation will incorporate the following requirements:

- 11 • Under direction of the Lead Biologist, biological monitors shall conduct pre-
12 construc-tion surveys for desert kit fox and American badger. Surveys schedules will be
13 coor-dinated with constructing the desert tortoise exclusion fence and the pre-
14 construction desert tortoise clearance surveys. Surveys shall also consider the potential
15 presence of dens within 100 feet of the Project boundary (including utility corridors and
16 access roads).

- 17 • If dens are detected each den shall then be classified as inactive, potentially
18 active, or definitely active.

- 19 • Inactive dens directly impacted by construction activities shall be excavated
20 and backfilled to prevent reuse. Excavation and backfilling shall be conducted in
21 accor-dance with standard approved desert tortoise burrow excavation and protocols.
22 Excavation will use hand tools or a small driver-operated backhoe under close
23 supervision of a qualified biologist, as there are no excavation standards and proto-cols
24 for desert kit fox or badger.

- 25 • All dens identified as potentially active or active within the Project footprint
26 (solar facilities and gen-tie work sites) shall be monitored by a biological monitor for a
27 mini-mum of 3 consecutive nights using a tracking medium such as diatomaceous
28

1 medium or fire clay and/or infrared camera stations at the entrance. Each active or
2 potentially active den shall be further classified as non-natal or natal (pups are present)
3 based on tracks or photos observed after the initial 3 consecutive nights.

4 • If after 3 nights of den monitoring, no desert kit fox/badger tracks are found
5 at the burrow entrance and no photos of the target species using the den are observed, it
6 will be determined that the desert kit fox/badger den or complex is inactive and will be
7 excavated. If an active non-natal den is detected on the site, a 100-foot construction
8 exclusion zone will be established until passive relocation is successfully completed.
9 Passive relocation methods include spray deterrents, transistor radios, and ultrasonic
10 emitters. Any kit fox hazing activities that include the use of animal repellents such as
11 coyote urine must be cleared through the CDFW prior to use. With CDFW approval, the
12 den may be blocked with natural materials or bag barriers. If these methods are
13 unsuccessful, installation of one-way doors may be used. On the third day following one-
14 way door installation, all den entrances will be inspected to ensure they are clear of sign
15 and that desert kit fox or badger have vacated. Confirmed active dens may be excavated
16 if passive relocation was successful. Dens shall be collapsed prior to construction of the
17 perimeter fence, to allow animals the opportunity to move off site without impediment.

18 • Potential natal dens shall be monitored for a minimum of 3 additional
19 consecutive nights. If a den or complex is determined to be natal, the CDFW shall be
20 notified via email within 24 hours. A 500-foot no disturbance buffer shall be maintained
21 around all active natal dens. Passive relocation and excavation will not be implemented
22 until monitoring confirms that the den is no longer in active use as a natal den. Active
23 dens identified early in the pupping season, from February 1 to April 30, will not be
24 passively relocated or excavated without prior approval from CDFW.

25 • The biological monitor shall make weekly visits to the location of passive
26 relocation to ensure that desert kit fox or badger do not re-excavate and reoccupy the
27 area if no active ground disturbing construction is occurring within the vicinity.
28

- Any documented kit fox mortality shall be reported to the CDFW within 24 hours of identification. If a dead kit fox is observed, it shall be retained and protected from scavengers until the CDFW determines if the collection of necropsy samples is justified.

MM BIO-13 (Wildlife Protection and Relocation Plan) The Applicant shall prepare and implement a Wildlife Protection and Relocation Plan that incorporates the protection, buffer, and survey requirements for desert tortoise (MM BIO-7), burrowing owl (MM BIO-11), and desert kit fox and American badger (MM BIO-12). The Plan shall specify the requirements for each species and provide a framework for adaptive management and reporting of survey results. The Plan must be reviewed by Riverside County, BLM, CDFW, and USFWS prior to the start of ground-disturbing activities.

Desert tortoise, burrowing owl, desert kit fox, and American badger buffers shall be main-tained as directed in MM BIO-7, MM BIO-10, and MM BIO-11.

PLAN REQUIREMENTS

Consistent with DRECP CMAs LUPA-BIO-6 (Subsidized Predators Standards), LUPA-BIO-9 (Water and Wetland Dependent Species Resources), LUPA-BIO-12 (Noise), LUPA-BIO-14 (General Standard Practices), LUPA-BIO-IFS-12 (Burrowing Owl), LUPA-BIO-IFS-13 (Burrowing Owl), DFA-BIO-IFS-1 (Individual Focus Species (IFS)), the Plan will include:

- A summary of wildlife survey methods and results;
- Detailed qualifications, roles, and responsibilities for the Lead Biologist and monitoring biologists;
- Procedures for pre-construction clearance surveys;
- Prior to construction of solar facility, desert tortoise exclusion fencing will be installed around the entirety of the approved solar field construction areas, as well as parking and laydown areas. No more than 10 days prior to the initiation of fence construction, a pre-activity multi-species survey shall be conducted using techniques that

1 provide 100% visual coverage of the disturbance area. If any burrow within the potential
2 disturbance area for fence construction or inside the planned fence line is determined to
3 be unoccupied, it will be carefully collapsed per guidelines from the Desert Tortoise
4 Field Manual (USFWS, 2009).

- 5 • If a burrow is potentially occupied by a target species, then further actions will
6 be taken to passively exclude the animal during the appropriate season (as
7 detailed in MM BIO-7, MM BIO-10, and MM BIO-11).
- 8 • Once the fence is constructed, clearance surveys within fenced areas shall consist
9 of 100% visual coverage using pedestrian belt transects spaced at 5-meter
10 intervals. An additional 500-foot (150-meter) buffer outside the Project boundary
11 shall also be surveyed with pedestrian belt transects spaced at 10 meters apart,
12 where possible, to identify any potentially active burrows or complexes that may
13 be indirectly affected by construction activities. Surveys shall focus on sign for
14 desert tortoise, desert kit fox, American badger, and burrowing owl.
- 15 • Any burrows or den complexes identified shall be classified as inactive, possibly
16 active, or active. Inactive dens that would be directly impacted by construction
17 shall be excavated. All burrows and kit fox den complexes that are potentially
18 active or active with live individuals inside will be further observed per the
19 requirements of individual species as detailed in MM BIO-7 (desert tortoise),
20 MM BIO-10 (burrowing owl), and MM BIO-11 (desert kit fox, American
21 badger). Confirmed active dens may be excavated upon successful passive
22 relocation. Excavations shall be photographed for reporting to demonstrate
23 success and sufficiency.
- 24 • Methods for construction monitoring;
- 25 • Biological Monitors shall be present during fence construction (security
26 fencing, desert tortoise exclusion fencing, or both for the solar sites), vegetation removal,
27 and ground disturbance to ensure that wildlife is not present. After vegetation is cleared,
28

biological monitors will perform spot checks in fenced areas immediately prior to initiation of construction to ensure that no wildlife have re-entered the site.

- Along the gen-tie line, biological monitors shall escort construction vehicles and inspect work areas prior to crews beginning any ground disturbance. All parked vehicles and equipment, and the ground beneath them, will be inspected for wildlife prior to being moved. Work activities shall be stopped by the Biological Monitor if any target species or other special-status species, such as desert tortoise, enters the work area. Work activities shall proceed at the site only after the animal has either moved away of its own accord or, is moved from harm's way by a biologist with state and federal authorization and according to any conditions identified in applicable authorizations.

- Detailed species-specific exclusion methods for special-status wildlife as follows:

- Couch's spadefoot toad. Potential breeding habitat identified during wildlife surveys shall be inspected after sufficient rainfall for Couch's spadefoot toad. If Couch's spade-foot toads are found on the Project site, the permitting and wildlife agencies will be consulted in order to develop an avoidance strategy.

- Desert tortoise. See MM BIO-7 for details on buffers, monitoring, exclusion, relocation, and translocation.

- Burrowing owl. See MM BIO-10 for details on burrow buffers, monitoring, passive relocation, and excavation.

- Desert kit fox and American badger. See MM BIO-11 for details on den buffers, monitoring, passive relocation, and excavation.

- Procedures for handling sick, injured, or dead wildlife;

- Resource agencies would be immediately notified of sick, injured, or dead wildlife. Written follow-up notification via email will be submitted within 24 hours, including the location (GPS record), photographs (if available), and any relevant

1 observations at the time of detection. The animal will be handled and transported only
2 on direction from the wildlife agencies. Health and safety precautions will be used at all
3 times when handling the animal.

4 • Description of adaptive management methods;
5 • If there is evidence of Project-related disturbance or increased risk to special-
6 status wildlife, where initial protection methods have been deemed ineffective, adaptive
7 management would be implemented in coordination with resource agencies, such as
8 additional surveying and monitoring, increased buffers, seasonal restrictions, additional
9 artificial replacement burrows, or agency approved wildlife relocation.

10 • Description of reporting requirements;
11 • During construction, reporting shall be provided in weekly, monthly,
12 quarterly, and annual compliance reports to the permitting and wildlife agencies. During
13 O&M, reports shall be provided quarterly, unless more frequent reporting is prudent
14 based on species presence. Reports shall provide a summary of activities performed and
15 the results for each species. Data recorded shall be submitted as appendices to each
16 report.

17 **MM BIO-14 (Streambed and Watershed Protection)** If jurisdictional features cannot be
18 avoided, prior to ground disturbance activities that could impact these aquatic features, the
19 Applicant shall file a complete Report of Waste Discharge with the RWQCB to obtain Waste
20 Discharge Requirements (WDR) and shall consult with CDFW on the need for a streambed
21 alteration agreement. If permits are required, they shall be obtained prior to disturbance of
22 jurisdictional resources. Copies of the approved permit shall be submitted to Riverside
23 County.

24 Compensatory mitigation for impacts to jurisdictional streambeds/washes shall be
25 identified prior to disturbance of the features at a minimum 1:1 ratio, and a 5:1 ratio for
26 minor incursions to desert dry wash woodland, as approved by RWQCB or CDFW, either
27 through onsite or offsite mitigation, or purchasing credits from an approved mitigation bank.
28 The Applicant shall comply with the compensatory mitigation required and provide proof of

1 compliance, along with copies of permits obtained from the RWQCB and/or CDFW shall
2 be provided to Riverside County.

3 A Stormwater Pollution Prevention Plan (SWPPP) or SWPPP-equivalent document shall
4 be prepared by a qualified engineer or erosion control specialist and implemented before
5 and during construction. The SWPPP shall include BMPs for storm-water runoff quality
6 control measures, management for concrete waste, storm-water detention, watering for dust
7 control, and construction of perimeter silt fences, as needed.

8 • The Applicant shall implement BMPs identified below to minimize adverse
9 impacts to streambeds and watersheds.

10 • Vehicles and equipment will not be operated in ponded or flowing water
11 except as specified by resource agencies.

12 • The Applicant will minimize road building, construction activities, and
13 vegetation clearing within ephemeral drainages.

14 • The Applicant will prevent water containing mud, silt, or other pollutants
15 from grading or other activities from entering ephemeral drainages or being placed in
16 locations that may be subjected to high storm flows.

17 • Spoil sites will not be located within 30 feet from the boundaries of drainages
18 or in locations that may be subjected to high storm flows, where spoils might be washed
19 back into drainages.

20 • Raw cement/concrete or washings thereof, asphalt, paint or other coating
21 material, oil or other petroleum products, unapproved herbicides, or any other substances
22 that could be hazardous to vegetation or wildlife resources, resulting from Project-related
23 activities, will be prevented from contaminating the soil and/or entering ephemeral
24 drainages. The Applicant shall ensure that safety precautions specified by this measure,
25 as well as all other safety requirements of other measures and permit conditions are
26 followed during all phases of the Project.

27 • When operations are completed, any excess materials or debris will be
28

1 removed from the work area. No rubbish will be deposited within 150 feet of the high-
2 water mark of any drainage during construction, operation, and decommissioning the
3 Project.

4 • No equipment maintenance will occur within 150 feet of any wetland,
5 Category 3, 4, or 5 streambed, or any streambed greater than 10 feet wide. No petroleum
6 products or other pollutants from the equipment will be allowed to enter these areas or
7 enter any off-site state jurisdictional waters under any flow.

8 • With the exception of the drainage control system installed for the Project,
9 the installation of bridges, culverts, or other structures will be such that water flow
10 (velocity and low flow channel width) is not impaired. Bottoms of temporary culverts
11 will be placed at or below stream channel grade.

12 • No broken concrete, debris, soil, silt, sand, bark, slash, sawdust, rubbish, or
13 other organic or earthen material from any construction or associated activity of
14 whatever nature will be allowed to enter into or be placed where it may be washed by
15 rainfall or runoff into, off-site state jurisdictional waters.

16 • Stationary equipment such as motors, pumps, generators, and welders located
17 within or adjacent to a drainage will be positioned over drip pans. Stationary heavy
18 equipment will have suitable containment to handle a catastrophic spill/leak. Clean up
19 equipment such as brooms, absorbent pads, and skimmers will be on site prior to the start
20 of construction.

21 • The cleanup of all spills will begin immediately. USFWS, SWRCB, CDFW,
22 BLM, and Riverside County will be notified immediately by the Applicant of any spills
23 and will be consulted regarding clean-up procedures.

24
25 **DRECP CMAs:**

26 Applicable CMAs are described in EIR Appendix CC, which provides a list of CMAs, an
27 explanation of their applicability, and demonstration of compliance with the CMA. CMAs
28 specifically applicable under Impact BIO-1 are detailed at pp. 3.5-23 through 3.5-59.

Impact: Threatened and Endangered Species (BIO-2)

Threshold: *The Project would not have a substantial adverse effect, either directly or through habitat modifications, on any endangered, or threatened species, as listed in Title 14 of the California Code of Regulations (Sections 670.2 or 670.5) or in Title 50, Code of Federal Regulations (Sections 17.11 or 17.12).*

Findings of Fact, Less Than Significant with Mitigation Measures:

Construction and operation of the Project could adversely affect threatened and endangered species by removing and degrading their habitat or from direct disturbance, mortality, or injury, as described for Impact BIO-1. Adverse effects could result from such activities as crushing, mowing, grubbing, trimming, grading, and compaction. Altered hydrology could affect habitats. Dust accumulation could affect threatened and endangered species. Spread and infestation of weed species could degrade habitat. Vehicles and equipment could crush plants and wildlife and destroy wildlife burrows, dens, or nests. Increased noise, lighting, opportunistic predators, and human activity could disturb wildlife in and near Project areas. Project operation may result in impacts to plants and wildlife from the “heat island effect”, and may impact threatened and endangered birds through collision with PV panels or electrocution from gen-tie lines.

Vegetation and habitat. The Project would permanently impact native habitats in creosote bush scrub, desert dry wash woodland, and desert pavement on the Project site. All affected habitats may support threatened and endangered species. Vegetation and soils would be disturbed or directly crushed, buried, or uprooted, as described in Impact BIO-1. Invasive weeds may spread into disturbed areas and degrade habitat. During operations, increased temperatures from a “heat island effect” may impact the success of re-vegetation.

Without mitigation, the loss of vegetation and natural habitat on the Project site would significantly affect threatened and endangered species on the site or vicinity. Impacts would be minimized by implementing mitigation measures (MMs) BIO-1 to BIO-5 as

1 previously described and as listed in Appendix L, MMRP, which requires use of qualified
2 biologists for surveying and monitoring, training of construction personnel on identifying
3 and avoiding sensitive plant and wildlife resources, clear demarcation of vegetation for
4 removal and low impact site preparation, managing non-natives in disturbance areas, and
5 revegetating disturbance areas with native habitat.

6 The Project has been designed to avoid desert dry wash woodland (except for minor
7 incursions). Compensatory mitigation for desert dry wash woodland at a ratio of 5:1 (MM
8 BIO-14), desert pavement at a ratio of 1:1 (MM BIO-3), creosote bush scrub (suitable desert
9 tortoise habitat) at a ratio of 1:1 (MM BIO-7), and desert tortoise critical habitat at a ratio of
10 5:1 (MM BIO-7) would require permanent protection of comparable off-site habitat to offset
11 the Project's impacts to native habitat, sensitive habitats, and designated critical habitat. The
12 compensation lands identified are much higher quality habitat than the designated critical
13 habitat on the Project site.

14 The Project is required to comply with DRECP CMAs for all project activities and
15 development on BLM land. Compliance with the following CMAs would mitigate impacts
16 to less than significant impacts: LUPA-BIO-1 (habitat assessments and protocol surveys);
17 LUPA-BIO-2 (biological monitoring); LUPA-BIO-5 (worker education); LUPA-BIO-7
18 (construction restoration); LUPA-BIO-10 (weed management); LUPA-BIO-11 (nuisance
19 animals and invasive species); LUPA-BIO-13 (siting and design); LUPA-BIO-13 (siting and
20 design); LUPA-BIO-SVF-1 (habitat assessment for special vegetation features); LUPA-
21 BIO-VEG-1 to -3 (vegetation management). The following CMAs describe protection for
22 desert dry wash woodland: LUPA-BIO-3 (setbacks), LUPA-BIO-RIPWET-1 (riparian and
23 wetland setbacks), LUPA-BIO-SVF-6 (avoidance of microphyll woodland), LUPA-BIO-
24 COMP-1 and LUPA-VPL-BIO-COMP-1 (compensatory mitigation) The Project would
25 avoid desert dry wash woodland with a 200-foot setback buffer, except for minor incursions,
26 consistent with the CMAs. Collectively, these measures ensure that impacts to vegetation and
27 habitat for special-status species would be less than significant with mitigation.
28

1 Threatened and endangered plants. The project would not affect state or federally listed
2 threatened or endangered plants.

3 Threatened and endangered wildlife. Impacts to specific threatened and endangered wildlife
4 species are discussed below and are minimized and avoided by implementation of MM BIO-
5 6 (Wildlife Protection), which identifies numerous requirements to minimize or avoid
6 wildlife injury and entrapment such as site and vehicle inspections; management and
7 covering of stored project materials; ramps to ensure escape from excavations, trenches,
8 auger holes, and water tanks; prevention of attractants for opportunistic predators such as
9 trash or water; hazardous material management; and vehicle speed limits. Impacts to wildlife
10 due to disturbance, degradation, and removal of habitat would be minimized and avoided
11 with MMs BIO-1 to BIO-5, as previously discussed for vegetation and habitat. MMs BIO-
12 3, BIO-7, and BIO-14 would offset the permanent habitat loss by requiring off-site habitat
13 compensation. Avoidance of desert dry wash woodland (except for minor incursions), per
14 the Project Description, and compensatory mitigation for protected habitats would preserve
15 habitat values and offset habitat loss.

16
17 The Project is required to comply with DRECP CMAs for all Project activities on
18 BLM land. The following CMAs, previously listed for vegetation and habitat, would also
19 reduce impacts to wildlife habitat used by threatened or endangered species for the same
20 reasons: LUPA-BIO-1 (habitat assessments and protocol surveys); LUPA-BIO-2 (biological
21 monitoring); LUPA-BIO-5 (worker education); LUPA-BIO-7 (construction restoration);
22 LUPA-BIO-10 (weed management); LUPA-BIO-11 (nuisance animals and invasive
23 species); LUPA-BIO-13 (siting and design); LUPA-BIO-13 (siting and design); LUPA-
24 BIO-3 (setbacks); LUPA-BIO-RIPWET-1 (riparian and wetland setbacks); LUPA-BIO-
25 SVF-6 (avoidance of microphyll woodland); LUPA-BIO-COMP-1 and LUPA-VPL-BIO-
26 COMP-1 (compensatory mitigation). In addition to CMAs that protect wildlife habitat, the
27 following CMAs would be implemented to minimize impacts to threatened and endangered
28 wildlife that may be present: LUPA-BIO-4 (seasonal restrictions); LUPA-BIO-6 (subsidized

1 predator measures); LUPA-BIO-12 (noise); LUPA-BIO-14 (general standard practices);
2 LUPA-BIO-15 (general construction standards); and DFA-BIO-IFS-1 to -3 (protocol
3 surveys and setback buffers).

4 The following paragraphs summarize additional species-specific impacts and
5 mitigation measures. Collectively, these measures ensure that impacts to threatened and
6 endangered wildlife would be less than significant with mitigation.

- 7
- 8 • *Crotch bumble bee*. The Project site supports potentially suitable habitat for Crotch
9 bumble bee; however, no bees have been observed and the Project site is located east
10 of the current range. The easternmost portion of the gen-tie line on the Oberon Project
11 site overlaps with the historic range. If present, Crotch bumble bee may be at risk of
12 disturbance or mortality from loss of forage plants, destruction of burrows and nests,
13 and disturbance from noise and increased human activity. MMs BIO-1 to BIO-5,
14 previously discussed, would minimize adverse impacts to native vegetation. MMs
15 BIO-3, BIO-7, and BIO-14 would offset the permanent habitat loss. MM BIO-6
16 would minimize mortality and injury of wildlife by managing work site hazards and
17 implementing pre-construction inspections for nests. The Project would comply with
18 the CMAs previously described for all special-status wildlife species, which would
19 minimize impacts to Crotch bumble bee.

- 20
- 21 • *Desert tortoise*. As a state and federally listed threatened species, take (such as injury
22 or mortality, as well as handling of a desert tortoise) may only be authorized through
23 consultation with the USFWS and CDFW. A desert tortoise on the Project site during
24 construction or O&M would be vulnerable to impacts such as mortality or injury due
25 to vehicle collision, crushing by site preparation equipment, loss of burrows and
26 suitable burrowing soils, or increased predation by opportunistic predators such as
27 common ravens that may be attracted to the Project site. If project activities cause
28 injury or mortality to a desert tortoise, this would be a significant adverse impact. If

the site is a part of a desert tortoise's home range, land use conversion could reduce local habitat availability. MMs BIO-1 to BIO-5, previously discussed, would minimize adverse impacts to native vegetation and desert tortoise habitat. MMs BIO-3, BIO-7, and BIO-14 would offset the permanent habitat loss by requiring off-site habitat compensation. MM BIO-6 would minimize mortality and injury to desert tortoise. MM BIO-7 (Desert Tortoise Protection) would minimize impacts to and avoid lethal take of desert tortoise during construction and O&M. MM BIO-7 requires pre-construction clearance surveys and monitoring, exclusion, or translocation of desert tortoises from active work areas, vehicle inspections to prevent any potential fatality or injury of desert tortoise, and implementation of a Raven Management Plan to manage predators and subsidies. In addition to CMAs previously detailed for all special-status wildlife species, the following CMAs would be implemented on BLM land within the Project site to minimize impacts to desert tortoise: LUPA-BIO-IFS-1 to -9 (desert tortoise protective measures); LUPA-BIO-COMP-1 and DFA-VPL-BIO-COMP-1 (compensatory mitigation); DFA-VPL-BIO-IFS-1 (desert tortoise protection siting)

- *Desert tortoise critical habitat.* On BLM-administered lands, USFWS acknowledged that approximately 11,290 acres of modeled desert tortoise habitat within the DRECP DFAs would eventually be developed for renewable energy. USFWS concluded that the DRECP LUPA was not likely to jeopardize the continued existence of the desert tortoise and would benefit its recovery. The proposed solar plants were primarily located outside of critical habitat and areas of critical environmental concern, which contain most of the land base required for recovery of the species, and the projects included numerous measures intended to protect desert tortoise, consistent with the recommendations of the USFWS desert tortoise recovery plan. The gen-tie route 175-foot ROW overlaps with approximately 28.2 acres of critical habitat for desert tortoise in the southern portion of the Oberon Project site.

Up to 7 gen-tie structures (approximately 15 acres) would be installed within critical habitat for the desert tortoise. MM BIO-7 (Desert Tortoise Protection) would require vehicle inspections for tortoise and vehicle speed limits, which would increase detection of desert tortoise that require avoidance to prevent injury or mortality. If a tortoise is observed within or near a work site, Project work activities will proceed only within a suitable buffer area after the tortoise has either moved away of its own accord, or if it has been translocated off the site under authorization by the USFWS and CDFW, which would avoid tortoise injury and mortality. Compensatory mitigation for desert tortoise will include a minimum of 1:1 ratio for impacts to desert tortoise suitable habitat (creosote bush scrub) and a ratio of 5:1 for impacts to desert tortoise critical habitat, in coordination with USFWS, CDFW, and in compliance with any ITPs. Compensatory mitigation would offset loss of desert tortoise habitat. The Desert Tortoise Protection and Relocation Plan (MM BIO-7) (Appendix P) would require a USFWS Authorized Biologist during construction to conduct or direct pre-construction clearance surveys for each work area and direct Biological Monitors to watch for tortoises wandering into the construction areas, check under vehicles, and examine excavations and other potential pitfalls for entrapped animals. The Authorized Biologist will have the authority to halt all Project activities that are in violation of these measures or that may result in take of a desert tortoise. Desert tortoises would not be handled or moved without incidental take authorization from the USFWS and CDFW. Any desert tortoise handling or translocation would be performed according to the permits and the Desert Tortoise Relocation Plan, pending approval by both agencies. These measures would ensure that desert tortoise are identified and avoided in work areas prior to construction, and safely excluded from burrows and relocated out of harm's way. By following agency protocols for tortoise surveying, handling, and relocating, and by using qualified and permitted biological staff, individual desert tortoise would be detected for avoidance and monitoring, and mortality and injury during construction and relocation would be reduced. MM BIO-

7 further requires a Raven Management Plan (EIR Appendix Q), which would be developed to minimize opportunistic predation related to Project subsidies such as trash, food, water, perches, and roadkill. By reducing attractants to the site, desert tortoise predation would be minimized. With implementation of the mitigation measures described above on private land within the Project site and implementation of the CMAs described above for threatened and endangered wildlife on BLM land within the Project site, impacts to desert tortoise would be mitigated to less than significant.

- *Birds.* Direct removal of vegetation and habitat on the Project site would reduce availability of foraging, cover, and nesting habitat for threatened and endangered birds and their prey. During construction, if present, threatened and endangered birds may be disturbed or deterred from the Project site due to loss of foraging, nesting, or sheltering habitat and increased human presence, noise, vibrations, and lighting. In most cases, adult birds would fly away from the disturbance, but bird nests (including eggs or nestlings, if present) could be destroyed, resulting in injury or mortality of individuals. There is no suitable nesting habitat on or near the Project site for the four federally listed riparian bird species known from the vicinity (western yellow-billed cuckoo, southwestern willow flycatcher, least Bell's vireo, and Yuma Ridgway's rail); therefore, there would be no direct or indirect effects to nests, nest success, or nesting habitat. No Gila woodpecker or elf owl observations were made during surveys, and there is a low probability that they may nest in desert wash woodland habitat due to a low number of suitable nesting trees. The Project site provides potential migration season foraging habitat for Swainson's hawk; none were observed during surveys and the site is outside the nesting range. Disturbance and loss of foraging habitat would be minimized and mitigated, as previously described, with implementation of MMs BIO-1 to BIO-5. MMs BIO-3, BIO-7, and BIO-14 would offset permanent habitat loss by requiring off-site habitat compensation. MM

BIO-6 would minimize mortality and injury to birds from work site hazards. Protective measures for wildlife in MM BIO-6 and the requirements of protective measures for birds in MM BIO-8, -9, and -10 would ensure that injury and mortality of birds associated with operational hazards and risks would be managed and avoided and that bird nests are protected from destruction. In addition to the CMAs previously detailed for all threatened and endangered wildlife species, the following CMAs would be implemented on BLM land within the Project site to minimize impacts to threatened and endangered birds: LUPA-BIO-16 to -17 (bird and bat conservation strategy); LUPA-BIO-RIPWET-3 (riparian bird surveys and monitoring); LUPA-BIO-COMP-2 (compensatory mitigation). (EIR pp. 3.5-56 and 3.5-81).

Mitigation Measures:

MM BIO-7 (Desert Tortoise Protection) Full text under Biological Resources.

MM BIO-8 (Bird and Bat Conservation Strategy) Full text under Biological Resources.

MM BIO-9 (Nesting Bird Management Plan) Full text under Biological Resources.

MM BIO-10 (Gen-tie lines) Full text under Biological Resources.

MM BIO-13 (Wildlife Protection and Relocation Plan) Full text under Biological Resources.

DRECP CMAs:

1 Applicable CMAs are detailed in EIR Appendix CC, which provides a list of CMAs, an
2 explanation of their applicability, and demonstration of compliance with the CMA. CMAs
3 specifically applicable under Impact BIO-2 are detailed at FEIR pp. 3.5-59 through 3.5-86.

4 ***Impact: Wildlife Corridors (BIO-3)***

5 ***Threshold:*** *The Project would not interfere substantially with the movement of any native*
6 *resident or migratory fish or wildlife species or with established native resident or migratory*
7 *wildlife corridors, or impede the use of native wildlife nursery sites.*

8 **Findings of Fact, Less Than Significant with Mitigation Measures:**

9 Wildlife movement through the area to the north, east, and south is compromised by
10 the existing pattern of land use, including solar projects either planned, in-construction, or
11 operational; lands west of the Project site, across Kaiser Road, are designated as Tortoise
12 Conservation Area (TCA). The Desert Harvest and Desert Sunlight Solar Projects are
13 adjacent to the north, and the Athos and Oberon Solar Projects are adjacent to the east and
14 south. The Arica and Victory Pass Solar Projects and the I-10 freeway are located in the
15 vicinity to the east and south. The proposed solar facility would further interrupt potential
16 wildlife movement routes through the area, primarily for movement across undisturbed
17 desert scrub and desert dry wash woodland habitat and anthropogenically disturbed land
18 (agriculture).

19 The northern portion of the Project area overlaps with a BLM DRECP wildlife
20 linkage (Pinto Wash linkage); however, since the Project site is within a BLM DRECP DFA
21 (EIR Figure 2-4), development for renewable energy was targeted for this area and solar
22 development already existed within this linkage area prior to development of the DRECP
23 (Desert Sunlight) (EIR Figure 3.5-10). Under the DRECP, the Pinto Wash linkage occupies
24 a vast area over 32,500 acres. The DRECP FEIS notes that up to 6,000 acres of desert linkage
25 network could be impacted by solar development in the Cadiz Valley and Chocolate
26 Mountains area. Additionally, this portion of the linkage is categorized by the DRECP as
27 non-habitat or low-quality habitat.
28

1 This linkage area also overlaps with the adjacent Athos, Arica, Victory Pass, and
2 Oberon Solar Project sites. Construction of these projects is complete. The Athos Project is
3 located on private lands administered by Riverside County; the Arica and Victory Pass
4 Projects are located on BLM lands; the Oberon Project is located on BLM lands.
5 Development within the linkage area would further reduce the available wildlife movement
6 habitat for many species, including desert tortoise and burro deer.

7
8 Projects on BLM land are subject to DRECP CMAs and therefore would avoid or
9 minimize development in desert dry wash woodland vegetation and leave a portion of the
10 multiple-species linkage area open to wildlife movement. Avoidance of desert dry wash
11 woodland on these project sites, except for minor incursions in accordance with DRECP
12 CMAs, and avoidance of a portion of native habitat in the Pinto Wash linkage, would
13 preserve habitat for wildlife movement in the linkage.

14 In coordination with USFWS, the Project could include a wildlife-friendly fencing
15 design for a portion of the project fence line that overlaps with the Pinto Wash Linkage,
16 providing a gap along the bottom of the fence that would allow small wildlife, including
17 desert tortoise and desert kit fox, to pass through. Use of wildlife-friendly fencing would be
18 determined in coordination with USFWS, based on success of revegetation, habitat
19 suitability for wildlife, wildlife use at the site, and success of its use at other sites.
20 Revegetated areas within the wildlife-friendly fence would provide marginal habitat to
21 support movement within and through the site.

22 Mitigation measure requirements include the acquisition of conservation lands at a
23 5:1 ratio for impacts to desert dry wash woodlands and desert tortoise critical habitat, and at
24 a ratio of 1:1 for impacts to creosote bush scrub and desert pavement habitats, to compensate
25 for impacts to wildlife and habitat. The Project design and the implementation of Mitigation
26 Measures MM BIO-1 through MM BIO-14 and any other conditions imposed by BLM,
27 USFWS, and/or CDFW will result in less than significant impacts with mitigation.
28

1 Mitigation measures MM BIO-3 (Minimization of Vegetation and Habitat Impacts),
2 MM BIO-7 (Desert Tortoise Protection), and MM BIO-14 (Streambed and Watershed
3 Protection) would require acquisition and management of comparable off-site vegetation
4 and habitat in perpetuity to offset the permanent loss of natural vegetation and habitat on the
5 Project site. This measure would offset the Project's impacts to wildlife movement habitat.

6 Wildlife "nursery sites" such as bird nests or suitable breeding habit for other species
7 may be found throughout the Project site. MM BIO-1 through MM BIO-5 would minimize
8 and offset habitat impacts for common wildlife and special-status species. MM BIO-6
9 through BIO-13 would prevent or offset adverse effects to special-status wildlife nesting or
10 breeding sites, including for desert tortoise, native birds and bats, burrowing owls, desert kit
11 fox, and American badger, by requiring specific pre-construction surveys, passive
12 translocation of certain species away from the area, avoidance of buffer areas while bird
13 nests are active, and other related requirements. MM BIO-14 would protect jurisdictional
14 waters and desert dry wash woodlands that provide important habitat for wildlife movement.

15
16 Gen-tie construction activities could dissuade wildlife from approaching
17 construction areas due to noise and disturbance. This effect would be temporary (limited to
18 the construction phase). Once completed, the gen-tie lines would have minimal effects on
19 terrestrial wildlife movement. However, the gen-tie towers and conductors would present a
20 collision hazard for birds. As discussed in Impact BIO-1, Mitigation Measure MM BIO-8
21 (Bird and Bat Conservation Strategy) would require the identification of potential hazard to
22 birds and bats during construction and post-construction adaptive management. Adaptive
23 management measures would be developed in accordance consultation with USFWS based
24 on the results of on-going monitoring and current standards and guidelines. Mitigation
25 Measure MM BIO-9 would require pre-construction surveys to identify active bird nests and
26 avoid disturbance or disruption of nesting behavior. MM BIO-10 (Gen-tie Lines) would
27 require mechanisms to visually warn birds with permanent markers or bird flight diverters;
28 avoid or minimize use of guy wires; and maintain sufficient distance between all conductors

and grounded components to prevent electrocution. These measures would effectively minimize impacts to wildlife movement across the proposed gen-tie routes.

The Project is required to comply with DRECP CMAs for all Project activities on BLM land. The following CMAs, previously listed for vegetation and habitat in Impact BIO-1, would also reduce impacts to habitat in wildlife movement corridors for the same reasons: LUPA-BIO-1 (habitat assessments and protocol surveys); LUPA-BIO-2 (biological monitoring); LUPA-BIO-5 (worker education); LUPA-BIO-7 (construction restoration); LUPA-BIO-10 (weed management); LUPA-BIO-11 (nuisance animals and invasive species); LUPA-BIO-SVF-1 (special vegetation features); LUPA-VEG-1 to -3 and LUPA-BIO-VEG-5 to -6 (vegetation management); LUPA-BIO-3 (setbacks); LUPA-BIO-RIPWET-1 (riparian and wetland setbacks); LUPA-BIO-SVF-6 (avoidance of microphyll woodland); LUPA-BIO-COMP-1 and LUPA-VPL-BIO-COMP-1 (compensatory mitigation). (EIR pp. 3.5-82 and 3.5-89).

Mitigation Measures:

MM BIO-1 (Biological Monitoring) Full text under Biological Resources.

MM BIO-2 (Worker Environmental Awareness Training) Full text under Biological Resources.

MM BIO-3 (Minimization of Vegetation and Habitat Impacts) Full text under Biological Resources.

MM BIO-4 (Integrated Weed Management Plan) Full text under Biological Resources.

MM BIO-5 (Vegetation Resources Management Plan) Full text under Biological Resources.

MM BIO-6 (Wildlife Protection) Full text under Biological Resources.

MM BIO-7 (Desert Tortoise Protection) Full text under Biological Resources.

MM BIO-8 (Bird and Bat Conservation Strategy) Full text under Biological Resources.

MM BIO-9 (Nesting Bird Management Plan) Full text under Biological Resources.

MM BIO-10 (Gen-tie lines) Full text under Biological Resources.

MM BIO-13 (Wildlife Protection and Relocation Plan) Full text under Biological Resources.

DRECP CMAs:

Applicable CMAs are detailed in EIR Appendix CC, which provides a list of CMAs, an explanation of their applicability, and demonstrative of compliance with the CMA. CMAs specifically applicable Under Impact BIO-3 are detailed at FEIR pp. 3.5-86 through 3.5-94.

Impact: Riparian Habitat (BIO-4)

Threshold: *The Project would not have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, and regulations or by the California Department of Fish and Game or U. S. Fish and Wildlife Service.*

Findings of Fact, Less Than Significant with Mitigation Measures:

Desert dry wash woodland (DDWW) is a BLM sensitive vegetation community and is recognized with a state rarity rank of S4. It is a xeric riparian community characteristic of desert washes and is likely to be regulated by the California Department of Fish and Wildlife (CDFW) as jurisdictional State waters. The BLM DRECP includes it as one of the microphyll woodland communities. Desert dry wash woodland provides greater opportunities for food, nesting, and cover, and its wildlife diversity is generally greater than in the surrounding desert. The associated seasonal washes transport water, seeds, and other nutrients to desert ecosystems miles away.

Desert pavement, a unique habitat type that stabilizes fine sediments and increases infiltration, was identified on the Project site.

Except for minor incursions of linear features and where there is existing intervening infrastructure on private land, construction of the Project would avoid the desert dry wash woodland on the Project site with a 200-foot setback buffer, consistent with DRECP CMA LUPA-BIO-RIPWET-1 and LUPA-BIO-SVF-6. While the associated sensitive vegetation

community was not identified on site, desert pavement impacted by the Project is treated as sensitive.

Low impact site preparation (crushing and mowing) (MM BIO-3) would preserve rootstocks wherever facilities do not require permanent vegetation removal and BMPs would be implemented to limit grading and minimize disturbance. MMs BIO-1 through BIO-5, described in detail in Impact BIO-1, protect native vegetation by restricting disturbance to work areas, promoting low impact construction methods, preserving vegetation under solar panels, and improving post-construction habitat values. These measures require biological monitoring; worker environmental training; flagging and protection of non-target vegetation; weed management; re-vegetation of temporarily disturbed areas; monitoring and management of re-vegetation; and compensation for natural habitat impacts. Impacts to desert dry wash woodland would be compensated at a ratio of 5:1, per MM BIO-14 (Streambed and Watershed Protection) and consistent with CMA LUPA-BIO-COMP-1. Impacts to desert pavement would be compensated at a ratio of 1:1, per MM BIO-3 (Minimization of Vegetation and Habitat Impacts).

The Project is required to comply with DRECP CMAs for all Project activities on BLM land. The following CMAs, previously listed for vegetation and habitat in Impact BIO-1, would also reduce impacts to sensitive natural communities and riparian habitats for the same reasons: LUPA-BIO-1 (habitat assessments and protocol surveys); LUPA-BIO-2 (biological monitoring); LUPA-BIO-3 (setbacks); LUPA-BIO-5 (worker education); LUPA-BIO-7 (construction restoration); LUPA-BIO-10 (weed management); LUPA-BIO-11 (nuisance animals and invasive species); LUPA-BIO-13 (siting and design); LUPA-BIO-RIPWET-1 (riparian and wetland setbacks); LUPA-BIO-SVF-6 (avoidance of microphyll woodland); LUPA-BIO-COMP-1 and LUPA-VPL-BIO-COMP-1 (compensatory mitigation)

Collectively, these measures would reduce impacts to riparian habitat or other

sensitive natural communities to a less than significant level with mitigation. (EIR pp. 3.5-89 to 3.5-94).

Mitigation Measures:

MM BIO-1 (Biological Monitoring) Full text under Biological Resources.

MM BIO-2 (Worker Environmental Awareness Training) Full text under Biological Resources.

MM BIO-3 (Minimization of Vegetation and Habitat Impacts) Full text under Biological Resources.

MM BIO-4 (Integrated Weed Management Plan) Full text under Biological Resources.

MM BIO-5 (Vegetation Resources Management Plan) Full text under Biological Resources.

DRECP CMAs:

Applicable CMAs are detailed in EIR Appendix CC, which provides a list of CMAs, an explanation of their applicability, and demonstration of compliance with the CMA. CMAs specifically applicable under Impact BIO-4 are detailed at FEIR pp. 3.5-95 through 3.5-100.

Impact: Wetlands (BIO-5)

Threshold: *The proposed project would not have a substantial adverse effect on State or federally protected wetlands (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means.*

Findings of Fact, Less Than Significant with Mitigation Measures:

No wetlands would be affected by the Project. State-regulated jurisdictional waters are found along unvegetated ephemeral washes and desert dry wash woodlands (see Impact BIO-4) throughout the Project site and along the gen-tie line. The Project site is not subject to federal regulation due to its location within the Colorado River Hydrologic Region (HR), in the Big Wash and Hayfield Lake-Lake Tamarisk HUC 10 Hydrologic Areas, which flow to closed basins, not connected with the Colorado River or other traditional navigable waters

(TNW). Except for minor incursions of linear features and where there is existing intervening infrastructure on private land, construction of the Project would avoid the desert dry wash woodland on the Project site with a 200-foot setback buffer, except for minor incursions, consistent with DRECP CMAs.

Impacted state jurisdictional waters on the site include a small acreage (less than 2.5 acres) of native desert dry wash woodland habitat, addressed in detail under Impact BIO-1 and Impact BIO-4, and unvegetated ephemeral dry washes crossing creosote bush scrub. Active channels within the lower alluvial fan, where the Project is situated, showed signs of frequent avulsion (changes in flow direction following surface water flow events) due to patterns of brief, intense surface water flow, resulting in a network of active and inactive (abandoned) channels. Two wetland areas were identified as anthropogenic wetlands created by adjacent agricultural activities, from artificial water sources and berms; these wetlands would be avoided.

Impacts to State jurisdictional streambeds would require the Applicant to obtain a Lake and Streambed Alteration Agreement (LSAA) from the CDFW. For the Project, Regional Water Board jurisdiction includes unvegetated ephemeral dry wash measured to the ordinary highwater mark, and desert dry wash woodland on public and private lands; CDFW jurisdictional waters include unvegetated ephemeral dry wash measured bank-to-bank, and desert dry wash woodland on public and private lands.

Construction would involve minor changes to on-site topography and alteration of the existing drainage pattern should be minimal because of the minimal grading proposed. The Project plans to maintain natural drainage to the maximum extent feasible and the proposed layout of solar panels would avoid major existing hydrologic patterns with respect to runoff, avoiding washes, stream beds, stream banks, where feasible. The Project may include diversions at security fencing and require detention basins, but no other substantial alteration to the existing surface hydrology would occur. Additionally, the preservation of

1 vegetation under the solar panels would mitigate impacts of erosion and increased runoff.

2 After construction, water and sediment on the Project site would be conveyed
3 downslope, across the site, by sheet flow or within channels. However, surface flow patterns,
4 velocities, and sediment loads may be altered throughout the site by solar panel foundations
5 and piles, access roads, fencing, BESS, substation yards, O&M building, and other Project
6 features.

7
8 Potential impacts to jurisdictional waters from Project activities could include
9 decoupling of flows due to installation of Project facilities or components, increased
10 siltation, fluvial transport of silts or pollutants through the ephemeral channels, and altered
11 flows resulting in erosion or elimination of natural sediment transport to downstream habitat
12 areas.

13 These impacts would be addressed by MM BIO-1 through MM BIO-5 related to
14 protection of vegetation and habitat, described under Impact BIO-1, and by MM BIO-14
15 (Streambed and Watershed Protection), which requires a series of Best Management
16 Practices (BMPs) to prevent or minimize adverse effects to streambed function and off-site
17 habitats. The Applicant would be required to obtain a LSAA from the CDFW prior to
18 initiating construction in jurisdictional waters of the State.

19
20 The Project is required to comply with DRECP CMAs for all Project activities on
21 BLM land. The following CMAs, previously listed for vegetation and habitat in Impact BIO-
22 1, would also reduce impacts to jurisdictional waters, stream channels, and habitats for the
23 same reasons: LUPA-BIO-1 (habitat assessments and protocol surveys); LUPA-BIO-2
24 (biological monitoring); LUPA-BIO-5 (worker education); LUPA-BIO-7 (construction
25 restoration); LUPA-BIO-10 (weed management); LUPA-BIO-11 (nuisance animals and
26 invasive species); LUPA-BIO-13 (nuisance animals and invasive species); LUPA-BIO-3
27 (setbacks); LUPA-BIO-RIPWET-1 (riparian and wetland setbacks); LUPA-BIO-SVF-6
28 (avoidance of microphyll woodland); LUPA-BIO-COMP-1 and LUPA-VPL-BIO-COMP-1

(compensatory mitigation). (EIR pp. 3.5-94 to 3.5-101).

Mitigation Measures:

MM BIO-1 (Biological Monitoring) Full text under Biological Resources.

MM BIO-2 (Worker Environmental Awareness Training) Full text under Biological Resources.

MM BIO-3 (Minimization of Vegetation and Habitat Impacts) Full text under Biological Resources.

MM BIO-4 (Integrated Weed Management Plan) Full text under Biological Resources.

MM BIO-14 (Streambed and Watershed Protection) Full text under Biological Resources.

DRECP CMAs:

Applicable CMAs are detailed in EIR Appendix CC, which provides a list of CMAs, an explanation of their applicability, and demonstration of compliance with the CMA. CMAs specifically applicable under Impact BIO-5 are detailed at FEIR pp. 3.5-100 through 3.5-107.

Impact: Local Policies and Ordinances (BIO-6)

Threshold: *The proposed project would not conflict with local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance.*

Findings of Fact, Less Than Significant with Mitigation Measures:

The Project is located primarily on federal land that is not subject to local policies and ordinances.

Riverside County policies encourage permanent preservation of important open space lands, protection of environmental resources through compliance with the Multipurpose Open Space Element of the General Plan, , cooperation with resource agencies for the voluntary protection or restoration of significant habitats, and preservation of multi-species habitat resources. The Desert Center Area plan encourages the preservation of open space and calls

1 for new development to conform with Desert Tortoise Critical Habitat designation
2 requirements. The BLM Desert Renewable Energy Conservation Project (DRECP) requires
3 compliance with Conservation Management Actions (CMAs) on BLM lands in the DRECP
4 area to reduce effects of development on sensitive resources.

5 The solar facilities and gen-tie lines would impact biological resources protected by the
6 General Plan provisions and the DRECP, including special-status plants and animals,
7 sensitive habitats, and waters of the State, as described under Impacts BIO-1 through BIO-
8 5. With implementation of the mitigation measures and DRECP CMAs identified in the
9 FEIR's analysis of impacts to biological resources, the Project would be consistent with the
10 County's General Plan and Desert Center Area Plan, and the DRECP. (EIR p. 3.5-110 to
11 3.5-113).

11

12 **D. Cultural Resources and Tribal Cultural Resources**

13 *Impact: Historical or Archaeological Sites (CUL-1)*

14 *Threshold: The proposed project would not cause substantial adverse change in the*
15 *significance of a historical resource as defined in California Code of Regulations, Section*
16 *15064.5, with implementation of mitigation measures.*

17 Findings of Fact, Less Than Significant with Mitigation Measures:

18 **Direct Effects.** There are no known CRHR-eligible historical resources (i.e., historic built-
19 environment resources) in the Project's direct impact area for construction, operations,
20 maintenance, and decommissioning. Therefore, the Project would not alter or destroy a
21 historical resource. The Project site has the potential to contain previously unknown
22 archaeological deposits that may underlie the ground surface. Should buried archaeological
23 deposits be uncovered during project implementation, and should such resources qualify as
24 historical resources under CEQA, they could be subject to direct impacts as a result of
25 Project construction. Direct effects to any newly identified resources would be addressed by
26 the implementation of Mitigation Measures (MM) CUL-1 through MM CUL-6, which
27 would reduce these impacts to less-than-significant levels by requiring cultural resources
28 training for construction workers, archaeological monitoring during construction, and

appropriate treatment of unearthed archaeological resources during construction.

Indirect Effects. One CRHR-eligible historical resource, SR-177/Rice Road (P-33-025150; also recorded as P-33-023788/CA-RIV-11683), lies adjacent to the Project in the indirect impact area. The historic roadway has been determined eligible for inclusion in the CRHR under Criterion 1, 3, and 4. The Project would be clearly visible from this historical resource. However, the visual changes would be in kind with the current nature and scale of existing visible developments. Visual impacts to the setting would be addressed by DRECP CMAs and the following measures: Mitigation Measures AES-1 and AES-2, which would employ design elements that reduce the visual contrast to characteristics of the landscape. With implementation of these mitigation measures, the proposed Project would not compromise the integrity of the resource or materially alter in an adverse manner the characteristics of the resource that convey its historical significance and justify its eligibility for inclusion in the CRHR. As such, SR-177/Rice Road is not subject to significant indirect impacts from the construction, operation, maintenance, or the decommissioning of the solar and BESS facility and gen-tie line. **(EIR pp. 3.6-45 and 3.6-46).**

With implementation of mitigation measures on private land and CMAs on BLM land, impacts would be less than significant.

Mitigation Measures:

MM AES-1 (Surface Treatment of Project Structures and Buildings) Full text under Aesthetic Resources.

MM AES-2 (Project Design) Full text under Aesthetic Resources.

DRECP CMAs:

Applicable CMAs are detailed in EIR Appendix CC, which provides a list of CMAs, an explanation of their applicability, and demonstration of compliance with the CMA.

Impact: Archaeological Resources (CUL-2)

***Threshold:** The proposed project would not cause a substantial adverse change in the significance of an archaeological resource, pursuant to California Code of Regulations, Section 15064.5, with implementation of mitigation measures.*

Findings of Fact, Less Than Significant with Mitigation Measures:

Direct Effects. There are 3 known CRHR-eligible archaeological resources in the Project's direct impact area. The entirety of the Project area lies within the boundaries of two CRHR-eligible historic districts (PTNCL and DTCCL). No PTNCL trail segments have been documented or known to exist within the Project area of direct impacts. No character defining features of the PTNCL have been documented or are known to exist with the Project area of direct impacts. Prehistoric archaeological remains identified in the Project's direct impact area would be associated with the PTNCL if they were trail-associated sites or features. The prehistoric remains identified include isolated lithics and ceramics, and sparse lithic scatters that are not indicative of projectile point or diagnostic tool manufacture. While lithic and ceramic remains broadly relate to PTNCL themes surrounding resource procurement and manufacture, these resource types are ubiquitous throughout the Chuckwalla Valley. The prehistoric sites and isolates located within the Project's direct impact area are not associated with any character defining archaeological resources such as petroglyphs, pot drops, or webs of intersecting trails (CEC 2014). The archaeological resources are not individually CRHR-eligible and do not contribute to the historical significance of the PTNCL. Due to the widespread occurrences of the archaeological resource types and because of their lack of association with character defining features of the PTNCL, removal of these sites and isolates would not alter the PTNCL's ability to convey its historical significance and would not constitute an adverse impact to the PTNCHL. No PTNCL trail segments have been documented or known to exist within the Project area of direct impacts. No character defining features of the PTNCL have been documented or are known to exist with the Project area of direct impacts. Prehistoric archaeological remains identified in the Project's direct impact area would be associated with the PTNCL if they were trail-associated sites or features. The prehistoric remains identified include isolated

1 lithics and ceramics, and sparse lithic scatters that are not indicative of projectile point or
2 diagnostic tool manufacture. While lithic and ceramic remains broadly relate to PTNCL
3 themes surrounding resource procurement and manufacture, these resource types are
4 ubiquitous throughout the Chuckwalla Valley. The prehistoric sites and isolates located
5 within the Project's direct impact area are not associated with any character defining
6 archaeological resources such as petroglyphs, pot drops, or webs of intersecting trails (CEC
7 2014). The archaeological resources are not individually CRHR-eligible and do not
8 contribute to the historical significance of the PTNCL. Due to the widespread occurrences
9 of the archaeological resource types and because of their lack of association with character
10 defining features of the PTNCL, removal of these sites and isolates would not alter the
11 PTNCL's ability to convey its historical significance and would not constitute an adverse
12 impact to the PTNCL.

13 The Project site has the potential to contain previously unknown archaeological deposits that
14 may underlie the ground surface. Should buried archaeological deposits be uncovered during
15 project implementation, and should such resources qualify as historical resources under
16 CEQA, they could be subject to significant impacts. Direct effects to any newly identified
17 resources would be addressed by the implementation of Mitigation Measures (MM) CUL-1
18 through MM CUL-6 and DRECP CMAs, which would reduce these impacts to less-than-
19 significant levels.

20 **Indirect Effects.** Portions of the PTNCL, DTCCL, and P-33-023675 are located within the
21 Project's indirect impact area. The Project would be a prominent element on the landscape
22 and would be clearly visible from these resources. However, the visual changes would be in
23 kind with the current nature and scale of existing visible developments. Further, the PTNCL
24 is primarily associated with destinations, trails, and trail-associated sites or features that
25 relate to travel, trade, ritual, and resource exploitation, particularly the collection of stone
26 tool and ground stone raw materials. The historical significance of those characteristics
27 primarily relates to travelers going to or from a destination and is linear in nature. The closest
28 documented constituents in clear association with the PTNCL lie 5 meters south of the

Project gen-tie, outside the area of direct impacts, and include rock rings, rock cairns, and cleared circles. The Project elements closest to them (namely, the gen-tie line) would be in kind with existing infrastructure and, thus, views of the Project from these locations would not affect their historical significance or the historical significance of use associated with the PTNCL beyond the current conditions. There are no other documented character defining features associated with the PTNCL near the Project site which would be adversely impacted by views of the Project. Visual impacts to the setting would be addressed by DRECP CMAs and the following measures: Mitigation Measures AES-1 and AES-2, which would employ design elements that reduce the visual contrast to characteristics of the landscape. Therefore, the proposed Project would not compromise the integrity of the resources or materially alter in an adverse manner any characteristics of the resources that convey their historical significance. As such, these archaeological resources would not be subject to significant indirect impacts from the construction, operation, maintenance, or the decommissioning of the BESS and solar facility and gen-tie line.

With implementation of mitigation measures on private land and CMAs on BLM land, impacts would be less than significant. (EIR p. 3.6-46 and 3.6-47).

Mitigation Measures:

MM AES-1 (Surface Treatment of Project Structures and Buildings) Full text under Aesthetic Resources.

MM AES-2 (Project Design) Full text under Aesthetic Resources.

MM CUL-1 (Project Archaeologist and Cultural Resource Monitoring Plan) Prior to issuance of grading permits: The applicant/developer shall provide evidence to the County of Riverside Planning Department that a County certified professional archaeologist (Project Archaeologist) has been contracted to implement a Cultural Resource Monitoring Program (CRMP). A Cultural Resource Monitoring Plan shall be developed that addresses the details of all activities and provides procedures that must be followed in order to reduce the impacts to cultural and historic resources to a level that is less than significant as well as address

1 potential impacts to undiscovered buried archaeological resources associated with this
2 project. A fully executed copy of the contract and a wet-signed copy of the Monitoring Plan
3 shall be provided to the County Archaeologist to ensure compliance with this condition of
4 approval.

5 Working directly under the Project Archaeologist, an adequate number of qualified
6 Archaeo--logical Monitors shall be present to ensure that all earth moving activities are
7 observed and shall be on-site during all grading activities for areas to be monitored including
8 off-site improvements. Inspections will vary based on the rate of excavation, the materials
9 excavated, and the presence and abundance of artifacts and features. The frequency and
10 location of inspections will be determined by the Project Archaeologist.

11 **MM CUL-2 (Develop and Implement Cultural Resources Environmental Awareness**
12 **Training)** Prior to issuance of a Notice to Proceed by the County and for the duration of
13 ground disturbance (as defined in MM TCR-1), the Applicant shall provide Worker
14 Environmental Awareness Program (WEAP) training to all workers prior to or on their first
15 day of employment at the Project site. The training shall be prepared by the Cultural
16 Resources Specialist (CRS), may be conducted by any member of the archaeological team,
17 and may be presented in the form of an annotated and narrated digital slide show. Tribal
18 representatives will be given the opportunity to participate in the WEAP training. The
19 training shall be prepared in consultation with culturally affiliated Native Americans to
20 incorporate the tribal know-ledge and perspectives from these Native American groups into
21 the presentation. The CRS shall be available (by tele-phone or in person) to answer questions
22 posed by employees. The training may be discontinued when ground disturbance is
23 completed or suspended but must be resumed if ground disturbance resumes. Training shall
24 include the following:

- 25 • A discussion of applicable laws and penalties under the law
- 26 • Samples or visuals of artifacts that might be found in the Project vicinity.
- 27 • A brief review of the cultural sensitivity of the Project and the surrounding
- 28

area

- A discussion of what such artifacts may look like when partially buried, or wholly buried and then freshly exposed.
- A discussion of what prehistoric and historical archaeological deposits look like at the surface and when exposed during construction, and the range of variation in the appearance of such deposits.
- Instruction that only the CRS, alternate CRS, and supervisory cultural resource field staff have the authority to halt ground disturbance in the area of a discovery to an extent sufficient to ensure that the resource is protected from further impacts, as determined by the CRS.
- Instruction that employees are to halt work on their own in the vicinity of a potential cultural resources discovery and shall contact their supervisor and the CRS or supervisory cultural resource field staff, and that redirection of work would be determined by the construction supervisor and the CRS.
- An informational brochure that identifies reporting procedures in the event of a discovery.
- An acknowledgment form signed by each worker indicating that they have received the training.
- A sticker that shall be placed on hard hats indicating that WEAP training has been completed.

This is a mandatory training, and all construction personnel must attend prior to beginning work on the Project site. A copy of the sign-in sheet shall be kept ensuring compliance with this measure. No ground disturbance shall occur prior to implementation of the WEAP training unless such activities are specifically approved by the County.

MM CUL-3 (Archaeological Monitoring) A qualified lead archaeological monitor that meets the Secretary of the Interior's Professional Qualifications Standards (as defined in Title 36 Code of Federal Regulations Part 61), shall be present for initial grading activities

1 in undis-turbed soil. If additional archaeological monitors are needed, they do not need to
2 have the same SOI qualifications but may work under the supervision of the lead
3 archaeo-lo-gical monitor; in such cases the lead archaeological monitor must be on site. Any
4 additional archaeological monitors will meet the qualifications of a bachelor's degree in
5 anthro-pology/archaeology or completion of an archaeological field school and two or more
6 years of archaeological project experience. Daily monitoring forms will be completed by the
7 archaeological monitor(s) and the CRS will be responsible for retaining and/or editing them.
8 The lead archaeological monitor will have the authority to increase or decrease the
9 monitoring effort should the monitoring results indicate that a change is warranted.

10 **MM CUL-4 (Unanticipated Resources)** The developer/permit holder or any successor in
11 interest shall comply with the following for the life of this permit. If during ground
12 disturbance activi-ties, unanticipated cultural resources* are discovered, the following
13 procedures shall be followed:

14 All ground disturbance activities within 100 feet of the discovered cultural resource shall be
15 halted and the Project archaeologist shall call the County Archaeologist immediately upon
16 discovery of the cultural resource. A meeting shall be convened between the developer, the
17 project archaeologist,** the Native American tribal representative, and the County
18 Archaeologist to discuss the significance of the find. At the meeting with the aforementioned
19 parties, a decision is to be made, with the concurrence of the County Archaeologist, as to the
20 appropriate treatment (documentation, recovery, avoidance, etc.) for the cultural resource.
21 Resource evaluations shall be limited to nondestructive analysis.

22 Further ground disturbance shall not resume within the area of the discovery until the
23 appropriate treatment has been accomplished.

24 * A cultural resource site is defined, for this condition, as being a feature and/or three
25 or more artifacts in close association with each other.

26 ** If not already employed by the project developer, a County approved archaeologist
27 shall be employed by the project developer to assess the significance of the cultural resource,
28 attend the meeting described above, and continue monitoring of all future site grading

activities as necessary.

MM CUL-5 (Treatment of Human Remains) If human remains are found on this site, the developer/permit holder or any successor in interest shall comply with State Health and Safety Code Section 7050.5.

MM CUL-6 (Phase IV Monitoring Report) Prior to Grading Permit Final Inspection, a Phase IV Cultural Resources Monitoring Report shall be submitted that complies with the Riverside County Planning Department's requirements for such reports for all ground disturbing activities associated with this grading permit. The report shall follow the County of Riverside Planning Department Cultural Resources (Archaeological) Investigations Standard Scopes of Work posted on the TLMA website. The report shall include results of any feature relocation or residue analysis required as well as evidence of the required cultural sensitivity training for the construction staff held during the required pre-grade meeting and evidence that any artifacts have been treated in accordance to procedures stipulated in the Cultural Resources Monitoring Plan.

DRECP CMAs:

Applicable CMAs are detailed in EIR Appendix CC, which provides a list of CMAs, an explanation of their applicability, and demonstration of compliance with the CMA.

Impact: Archaeological Resources (CUL-3)

Threshold: The proposed project would not cause an adverse change in the significance of a unique archaeological resource pursuant to California Code of Regulations, Section 15064.5, with implementation of mitigation measures.

Findings of Fact, Less Than Significant with Mitigation Measures:

No unique archaeological resources have been identified to date in the Project's direct or indirect impact areas. Therefore, the Project would not cause an adverse change in the significance of any known unique archaeological resources. Should a unique archaeological resource be identified during construction, operations, maintenance, and decommissioning

of the Project, direct effects to any newly identified unique archaeological resources would be addressed by the implementation of Mitigation Measures CUL-1 through MM CUL-6 and DRECP CMAs, which would reduce potential impacts to a less-than-significant level. (EIR p. 3.6-34).

Mitigation Measures:

MM CUL-1 (Project Archaeologist and Cultural Resource Monitoring Plan) Full text under Cultural and Tribal Cultural Resources.

MM CUL-2 (Develop and Implement Cultural Resources Environmental Awareness Training) Full text under Cultural and Tribal Cultural Resources.

MM CUL-3 (Archaeological Monitoring) Full text under Cultural and Tribal Cultural Resources.

MM CUL-4 (Unanticipated Resources) Full text under Cultural and Tribal Cultural Resources.

MM CUL-5 (Treatment of Human Remains) Full text under Cultural and Tribal Cultural Resources.

MM CUL-6 (Phase IV Monitoring Report) Full text under Cultural and Tribal Cultural Resources.

DRECP CMAs:

Applicable CMAs are detailed in EIR Appendix CC, which provides a list of CMAs, an explanation of their applicability, and demonstration of compliance with the CMA.

Impact: Human Remains (CUL-4)

Threshold: The proposed project would not disturb any human remains, including those interred outside of dedicated cemeteries with implementation of mitigation measures.

Findings of Fact, Less Than Significant with Mitigation Measures:

A review of the archaeological record searches and results of recent Phase I survey did not identify any human remains in the Project's direct or indirect impact areas. However, previously unidentified human remains could be found and potentially impacted (directly or

indirectly) during Project construction and decommissioning. If human remains or related resources are discovered, such resources shall be treated in accordance with state and local regulations and guidelines that govern the disclosure, recovery, relocation, and preservation of human remains (14 CCR 15064.5[e]). With incorporation of MM CUL-5 and compliance with Health and Safety Code section 7050.5, any potential impacts on human remains would be less than significant. (EIR p. 3.6-48).

Mitigation Measures:

MM CUL-5 (Treatment of Human Remains) Full text under Cultural and Tribal Cultural Resources.

***Impact:** Tribal Cultural Resources (TCR-1)*

***Threshold:** The proposed project would not cause adverse change in the significance of a Tribal Cultural Resource determined by the Lead Agency with implementation of mitigation measures.*

Findings of Fact, Less Than Significant with Mitigation Measures:

The direct and indirect impacts of solar and BESS facility and gen-tie line construction, operations, maintenance, and decommissioning, could potentially cause disturbance or damage to tribal cultural resources. However, impacts are not anticipated because no tribal cultural resources have been found in the Project area or identified through tribal consultation that are listed in the CRHR or have been determined to be eligible for such listed nor is there evidence on which the County could in its discretion determine that there are tribal cultural resources impacted by the Project. Should buried archaeological deposits be uncovered during project implementation, and should such resources qualify as tribal cultural resources under CEQA, they could be subject to significant impacts under criterion TCR-1 (adverse change in the significance of a tribal cultural resources identified through tribal consultation). Direct effects to any newly identified resources would be addressed by the implementation of Mitigation Measures (MM) CUL-1 through MM CUL-6, MM TCR-1, and MM TCR-2 and DRECP CMAs, which would reduce these impacts to less-than-

significant levels. (EIR p. 3.6-49).

Applicant Proposed Measures:

APM CULT-1 (Native American Monitoring) The Applicant will enter into an agreement with interested culturally-affiliated and/or consulting tribe(s) to employ at least one Native American Monitor per archaeological monitor. A Native American monitor will be called immediately upon discovery of a cultural resource if a Native American monitor is not already present. In conjunction with the County- and BLM-approved archaeologist(s), the Native American Monitor will be invited to monitor all initial ground disturbing activities and excavation of each portion of the Project site including clearing, grubbing, tree removals, grading and trenching, as outlined in the Project's Cultural Resource Monitoring Plan (see Mitigation Measures [MMs] CUL-1 and TCR-1), and attend meeting(s) to discuss the significance of unanticipated find(s) and appropriate treatment of unanticipated resources. The Applicant will immediately alert interested culturally-affiliated and consulting tribes in the event of an unanticipated discovery. "Native American Monitor" means an individual who is presented as a representative of a tribal government for one of the culturally-affiliated or consulting tribes for the Easley Project and who has received specialized training approved by that tribal government to serve as a monitor.

Mitigation Measures:

MM CUL-1 (Project Archaeologist and Cultural Resource Monitoring Plan) Full text under Cultural and Tribal Cultural Resources.

MM CUL-2 (Develop and Implement Cultural Resources Environmental Awareness Training) Full text under Cultural and Tribal Cultural Resources.

MM CUL-3 (Archaeological Monitoring) Full text under Cultural and Tribal Cultural Resources.

MM CUL-4 (Unanticipated Resources) Full text under Cultural and Tribal Cultural Resources.

1 **MM CUL-5 (Treatment of Human Remains) Full text under Cultural and Tribal**
2 **Cultural Resources.**

3 **MM CUL-6 (Phase IV Monitoring Report) Full text under Cultural and Tribal**
4 **Cultural Resources.**

5 **MM TCR-1 (Native American Monitor)** Prior to the issuance of grading permits, the
6 developer/permit applicant shall enter into an agreement with the consulting tribe(s) for a
7 Native American Monitor. The Native American Monitor(s) shall be on-site during all initial
8 ground distur-bing activities and excavation of each portion of the Project site including
9 clearing, grubbing, tree removals, grading and trenching. In conjunction with the
10 Archaeological Monitor(s), the Native American Monitor(s) shall have the authority to
11 temporarily divert, redirect or halt the ground disturbance activities to allow identification,
12 evaluation, and potential recovery of cultural resources. The developer/permit applicant shall
13 submit- a fully executed copy of the agreement to the County Archaeologist to ensure
14 compliance with this condition of approval. Upon verification, the Archaeologist shall clear
15 this con-dition. This agreement shall not -modify- any condition of approval or mitiga-tion
16 measure.

17 **MM TCR-2 (Artifact Disposition)** Prior to Grading Permit Final Inspection,, the
18 landowner(s) shall relinquish ownership of all cultural resources that are unearthed on the
19 Project property during any ground-disturbing activities, including previous investigations
20 and/or Phase III data recovery.

21 Historic Resources – all historic archaeological materials recovered during the
22 archaeolo-gical investigations (this includes collections made during an earlier project, such
23 as testing of archaeological sites that took place years ago), shall be curated at the Western
24 Science Center, a Riverside County curation facility that meets State Resources Depart-ment
25 Office of Historic Preservation Guidelines for the Curation of Archaeological Resources
26 ensuring access and use pursuant to the Guidelines.

27 Prehistoric Resources- One of the following treatments shall be applied:

- 28 • Reburial of the resources on the Project property. The measures for reburial

1 shall include, at least, the following: Measures to protect the reburial area from any future
2 impacts. Reburial shall not occur until all required cataloguing, analysis and studies have
3 been completed on the cultural resources, with an exception that sacred items, burial
4 goods and Native American human remains are excluded. Any reburial processes shall
5 be culturally appropriate. Listing of contents and location of the reburial shall be
6 included in the confidential Phase IV Report. The Phase IV Report shall be filed with
7 the County under a confidential cover and not subject to a Public Records Request.

8 • If reburial is not agreed upon by the Consulting Tribes, then the resources
9 shall be curated at a culturally appropriate manner at the Western Science Center, a
10 River-side County curation facility that meets State Resources Department Office of
11 Historic Preservation Guidelines for the Curation of Archaeological Resources ensuring
12 access and use pursuant to the Guidelines. The collection and associated records shall be
13 transferred, including title, and are to be accompanied by payment of the fees necessary
14 for permanent curation. Evidence of curation in the form of a letter from the curation
15 facility stating that subject archaeological materials have been received and that all fees
16 have been paid, shall be provided by the landowner to the County. There shall be no
17 destructive or invasive testing on sacred items, burial goods and Native American human
18 remains.
19

20 **DRECP CMAs:**

21 Applicable CMAs are detailed in EIR Appendix CC, which provides a list of CMAs, an
22 explanation of their applicability, and demonstration of compliance with the CMA.

23 **Impact:** *Tribal Cultural Resources (TCR-2)*

24 **Threshold:** *The proposed project would not cause adverse change in the significance of a*
25 *Tribal Cultural Resource eligible for or listed on the CRHR or in a local register of historical*
26 *resources as defined in Public Resources Code section 5020.1 (k), with implementation of*
27 *mitigation measures.*

28 Findings of Fact, Less Than Significant with Mitigation Measures:

No PTNCL trail segments have been documented or are known to exist within the Project area of direct impacts. Additionally, no other character defining features of the PTNCL have been documented or known to exist with the Project area of direct impacts. The prehistoric archaeological resources identified on the Project site include isolated lithics and ceramics, and sparse lithic scatters. While these prehistoric archaeological resources broadly relate to the time period of the PTNCL, they are ubiquitous throughout the Chuckwalla Valley and are not associated with any destination sites or character defining features of the PTNCL. The resources are not individually CRHR-eligible and do not contribute to the significance of the PTNCL. Due to their widespread occurrences, removal of these sites and isolates would not alter the PTNCL's ability to convey its historical significance and would not constitute an adverse impact to the PTNCL. The Project would not demolish or materially alter in an adverse manner any characteristics of the PTNCL that convey its historical significance and justify its eligibility for inclusion in the CRHR. Should a tribal cultural resource be identified during construction, operations, maintenance, and decommissioning of the Project, direct effects to the newly identified resource would be addressed by the implementation of Mitigation Measures CUL-1 through MM CUL-6, MM TCR-1, and MM TCR-2 and DRECP CMAs, which would reduce potential impacts to a less-than-significant level. (EIR p. 3.6-50).

Applicant Proposed Measures:

1. **APM CULT-1 (Native American Monitoring) Full text under Cultural and Tribal Cultural Resources.**

Mitigation Measures:

MM CUL-1 (Project Archaeologist and Cultural Resource Monitoring Plan) Full text under Cultural and Tribal Cultural Resources.

MM CUL-2 (Develop and Implement Cultural Resources Environmental Awareness Training) Full text under Cultural and Tribal Cultural Resources.

MM CUL-3 (Archaeological Monitoring) Full text under Cultural and Tribal Cultural Resources.

MM CUL-4 (Unanticipated Resources) Full text under Cultural and Tribal Cultural Resources.

MM CUL-5 (Treatment of Human Remains) Full text under Cultural and Tribal Cultural Resources.

MM CUL-6 (Phase IV Monitoring Report) Full text under Cultural and Tribal Cultural Resources.

MM TCR-1 (Native American Monitor) Full text under Cultural and Tribal Cultural Resources.

MM TCR-2 (Artifact Disposition) Full text under Cultural and Tribal Cultural Resources.

DRECP CMAs:

Applicable CMAs are detailed in EIR Appendix CC, which provides a list of CMAs, an explanation of their applicability, and demonstration of compliance with the CMA.

E. Geology, Soils and Mineral Resources

Impact: Soil Erosion (GEO-3)

Threshold: The proposed project would not result in substantial soil erosion or the loss of topsoil with implementation of mitigation measures.

Findings of Fact, Less Than Significant with Mitigation Measures:

Construction would require ground disturbance for construction of the solar arrays, substation, O&M building, septic system, BESS foundations, access roads, gen-tie line towers, and other features. These activities would expose soil and increase the potential for wind and water erosion and also could disturb desert pavement, resulting in the ecological loss of this soil characteristic. Disturbed soils and desert pavement can cause or accelerate erosion, the generation of fugitive dust, and increase sediment in stormwater runoff to ephemeral streams and playa lakes, causing increased turbidity and sedimentation.

The increase in erosion due to Project construction would result in a significant impact

without mitigation. Implementation of MM AQ-1 (Fugitive Dust Control Plan) and the Applicant-prepared Dust Control Plan, identifies Best Available Control Measures (BACMs) implemented during construction to reduce fugitive dust emissions, and identifies contingency control measures implemented if the BACMs are not adequately controlling fugitive dust. Implementation of MM HWQ-1 Drainage Erosion and Sedimentation Control Plan [DESCP]) and MM HWQ-5 (Project Drainage Plan) would ensure proper protection of water quality and soil resources, and ensure that erosion does not leave the site and impact adjacent landowners or nearby water features, along with identifying all monitoring and maintenance activities. Implementation of MM BIO-1 (Biological Monitoring), MM BIO-3 (Minimization of Vegetation and Habitat Impacts), and MM BIO-5 (Vegetation Resources Management Plan) would reduce impacts related to soil erosion to less than significant. Additionally, the Applicant has committed to preparing a SWPPP (or equivalent document) that would include BPMs to reduce potential erosion.

Soils in desert environments and vegetation are involved in carbon sequestration, so the disturbance of soils and removal of vegetation during project Construction would result in the release of CO₂ into the atmosphere. However, implementation of MM BIO-3 and MM BIO-5, would require minimization of soil and vegetation disturbance, and would require re-vegetation of disturbed areas. Additionally, areas of important hydrologic functions and areas of dry desert wash woodland would be avoided by the Project design. Due to Project design and implementation of the mitigation measure, impacts related to damage to carbon sequestering materials and release of CO₂ into the atmosphere would be less than significant.

Operation and maintenance activities would include daily operations and routine maintenance activities, such as PV panel washing, up to four times per year, to optimize output. MM AQ-1 (Fugitive Dust Control Plan) restricts vehicular access during O&M to established unpaved travel paths and ensure the paths remain stabilized and MM HWQ-5 (Project Drainage Plan) requires a Project Drainage Plan. With implementation of the

mitigation measures, impacts related to soil erosion during Project operation and maintenance would be less than significant.

The Project does not include any sand transport or migration zones so would not result in a loss of sand transport from development of a solar project, and large portions of the Project area along the washes would not be developed to avoid direct impacts to desert dry wash woodland and the Project would be designed to allow water to flow through the Project site. Therefore, the Project would continue to allow sand and stabilizing moisture to reach their destination. Impacts would be less than significant.

With implementation of mitigation measures on private land and CMAs on BLM land, impacts would be less than significant.

(EIR p. 3.8-15 to 3.8-17).

Mitigation Measures:

MM AQ-1 (Fugitive Dust Control Plan) Full text under Air Quality.

MM BIO-1 (Biological Monitoring) Full text under Biological Resources.

MM BIO-2 (Minimization of Vegetation and Habitat Plans) Full text under Biological Resources.

MM BIO-5 (Vegetation Resources Management Plan) Full text under Biological Resources.

MM HWQ-1 (Drainage Erosion and Sedimentation Control Plan [DESCP]) Full text under Hydrology and Water Quality.

MM HWQ- (Project Drainage Plan) Full text under Hydrology and Water Quality.

DRECP CMAs:

Applicable CMAs are detailed in EIR Appendix CC, which provides a list of CMAs, an explanation of their applicability, and demonstration of compliance with each CMA.

F. Hazards and Hazardous Materials

1 ***Impact: Hazardous Materials (HAZ-1)***

2 ***Threshold:** The proposed project would not create a significant hazard to the public or the*
3 *environment through the routine transport, use, or disposal of hazardous materials with*
4 *implementation of mitigation measures.*

5 Findings of Fact, Less Than Significant with Mitigation Measures:

6 Construction of the Project would involve the use of small amounts of hazardous materials.
7 The use, storage, transport, and disposal of hazardous materials used in construction of the
8 facility would be carried out in accordance with current applicable regulations and the
9 Project-specific HMMP. Implementation of these procedures and plans and compliance with
10 applicable local, state, and federal regulations would minimize the risk of adverse effects
11 from use, disposal, and transport of hazardous materials to less-than-significant levels.

12 At the end of the Project's useful life, solar panels would be decommissioned and dismantled
13 per an agency-approved Closure and Decommissioning Plan. Project decommissioning
14 would be designed to optimize recycling or reuse of panels, as circumstances allow and in
15 compliance with all local, State, and federal laws and regulations in effect at the time of
16 decommissioning.

17 During construction, herbicides may be applied to control weed growth, and would be
18 performed in accordance with an approved Weed Management Plan. Use of herbicides
19 would occur in accordance with all recommended application procedures as identified on
20 product labels as well as under the direct supervision of a licensed Certified Pesticide
21 Applicator. The proposed Project would not contain a residential or commercial component
22 that would expose people to potential pesticides or herbicides; as a result, application of
23 herbicides during construction would have a less than significant impact.

24
25 The Project site is within the historic World War II DTC/C AMA training camp/maneuver
26 area where military exercises with tanks and troops were conducted. During construction,
27 maintenance, and closure and decommissioning activities associated with the proposed
28 Project, ground disturbance could unearth unexploded World War II-era munitions (UXO

and MEC). Implementation of the project's Hazardous Materials Management Plan and MM HAZ-1 (UXO Identification, Training and Reporting Plan) would ensure compliance with OSHA requirements related to unexploded ordnance and munition, formalize UXO training, investigation, removal, and disposal to ensure that potential UXO impacts would be less than significant.

During operation and maintenance the small quantities of hazardous materials used would be transported, stored, and disposed of as required by the HMMP. Preparation and compliance with the required SPCC and HMBP, if necessary, implementation of the HMMP, and compliance with applicable state and federal regulations would minimize the risk of damage or injury from use, disposal, and transport of hazardous materials ensure that impacts remain less than significant during the Project's operation and maintenance.

With implementation of mitigation measures and compliance with OSHA requirements related to unexploded ordnance and munitions, impacts would be less than significant. (EIR pp. 3.10-16 to 3.10-18).

Mitigation Measures:

MM HAZ-1 (UXO Identification, Training and Reporting Plan) Where ground disturbance work is involved, contractor(s) should be OSHA HAZWOPER-trained in accordance with standard 29CFR1910.120 and hold a current certification. The Applicant shall prepare a UXO Identification, Training and Reporting Plan to properly train all site workers in the recognition, avoidance and reporting of military waste debris and ordnance. The Applicant shall submit the plan to the County and BLM for review and approval for their respective jurisdictions prior to the start of construction. The plan shall contain, at a minimum, the following:

- A description of the training program outline and materials, and the qualifications of the trainers;

- 1 ▪ Identification of available trained experts that will respond to notification of discovery of
- 2 any ordnance (unexploded or not); and
- 3
- 4 ▪ Work plan to recover and remove discovered ordnance, and complete additional field
- 5 screening, possibly including geophysical surveys to investigate adjacent areas for
- 6 surface, near surface or buried ordnance in all proposed land disturbance areas.
- 7

8 ***Impact:** Hazardous Materials and Risk of Upset (HAZ-2)*

9 ***Threshold:** The proposed project would not create a significant hazard to the public or the*

10 *environment through reasonably foreseeable upset and accident conditions involving the*

11 *release of hazardous materials into the environment with implementation of mitigation*

12 *measures.*

13 Findings of Fact, Less Than Significant with Mitigation Measures:

14 The use of hazardous materials, such as fuels and greases to fuel and service construction

15 equipment, could result in the accidental release of these materials if not managed

16 appropriately. As there would be regulated hazardous materials onsite, storage procedures

17 would be dictated by a Hazardous Materials Management Plan. Additionally, spill

18 prevention measures and secondary containment would be implemented as part of the

19 Project where warranted. A Storm water Pollution Prevention Plan (SWPPP) or SWPPP

20 equivalent document would be prepared by a qualified engineer or erosion control specialist

21 and would be implemented before and during construction. The SWPPP would be designed

22 to reduce potential impacts related to erosion and surface water quality during construction

23 activities and throughout the life of the Project. It would include Project information and

24 best management practices (BMP). The BMPs would include storm water runoff quality

25 control measures, concrete waste management, storm water detention, watering for dust

26 control, and construction of perimeter silt fences, as needed.

27 There is a potential that construction activities such as grading, excavation, and construction

28 vehicle traffic, could loosen and stir up soil containing *Coccidioides* fungus spores, exposing

workers and the public to contracting Valley Fever. Construction activities for the Project would be subject to stringent dust control requirements (including SCAQMD Rules 402 and 403). Implementation of DRECP CMAS and Mitigation Measures AQ-1 (Fugitive Dust Control Plan) and HAZ-2, (Worker Environmental Awareness Program) would reduce the potential for workers and the public to contract Valley Fever due to exposure to substantial concentrations of dust which may contain Coccidioides fungus spores to a less-than-significant level.

If regulatory thresholds are exceeded for storage of hazardous materials during Project operation, a SPCC would be prepared and implemented, as required by the SPPC Rule. BMPs would be employed in the use and storage of all hazardous materials within the Project, including the use of containment systems in appropriate locations. The Project would include operation of a BESS which could cause hazards such as fire, gaseous build up, explosion and release of hazardous materials. However, the BESS would be designed, packaged, constructed, and operated in accordance with applicable industry best practices and regulatory requirements, including, but not limited to, National Fire Protection Association 855 (Standard for the Installation of Stationary Energy Storage Systems) and Section 1206 of the California Fire Code and if applicable, certified to UL 9540. Additionally, implementation of DRECP CMAs, the project's Hazardous Materials Management Plan, and MM FIRE-1 (Fire Safety) would require components specific to fire response and safety at the BESS be included in the proposed Fire Management and Prevention Plan for the Project, which would reduce the impact to a less-than-significant level. (EIR pp. 3.10-18 to -20.).

With implementation of mitigation measures on private land and CMAs on BLM land, impacts would be less than significant.

Mitigation Measures:

MM AQ-1 (Fugitive Dust Control Plan) Full text under Air Quality.

MM FIRE-1 (Fire Safety) Full text under Wildfire.

MM HAZ-2 (Worker Environmental Awareness Program) The WEAP prepared for the Project shall include a personal protective equipment (PPE) program, an Emergency Action Plan (EAP), and an Injury and Illness Prevention Program (IIPP) to address health and safety issues associated with normal and unusual (emergency) conditions. It will be reviewed and approved by the County and BLM prior to construction. Construction-related safety programs and procedures shall include a respiratory protection program, among other things. Construction Plan documents shall relate at least to the following:

- Environmental health and safety training (including, but not limited, to training on the hazards of Valley Fever, including the symptoms, proper work procedures, how to use PPE, and informing supervisor of suspected symptoms of work-related Valley Fever)
- Site security measures
- Site first aid training
- Site fire protection and extinguisher maintenance, guidance, and documentation
- Furnishing and servicing of sanitary facilities records
- Trash collection and disposal
- Disposal of hazardous materials and waste guidance in accordance with local, state, and federal regulations

DRECP CMAs:

Applicable CMAs are detailed in EIR Appendix CC, which provides a list of CMAs, an explanation of their applicability, and demonstration of compliance with each CMA.

Impact: Hazardous Materials Sites (HAZ-3)

Threshold: The proposed project would not be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would create a significant hazard to the public or the environment with implementation of mitigation measures.

Findings of Fact, Less Than Significant with Mitigation Measures:

The Project site is located within the WWII DTC/C AMA where maneuvers included weapons training, firing exercises, and laying out and removing landmine fields. Therefore, there is a potential to encounter UXO, MEC, or MD during construction activities. Implementation of the Project's Hazardous Materials Management Plan and Mitigation Measure HAZ-1 (UXO Identification, Training, and Reporting Plan) would ensure compliance with OSHA requirements related to unexploded ordnance and munitions and would require UXO training, investigation, removal, and disposal to ensure that potential UXO impacts would be less than significant. No known hazardous material or environmentally contaminated sites have been identified at the site. However, there is current and historical agricultural use on properties immediately adjacent to the Project site, and therefore, pesticides used at these adjacent sites may have spread to the nearby Project areas. Pesticide-contaminated soil may be encountered during Project ground-disturbing activities. Additionally, petroleum hydrocarbon contaminated soil may be encountered near current and former fuel ASTs. Implementation of mitigation measures HAZ-2 (Worker Environmental Awareness Program) and HAZ-3 (Soil Management Plan) would ensure that workers and the public are not adversely affected by pesticide or petroleum hydrocarbon contaminated soil.

Operation and maintenance activities would not involve significant ground disturbance or excavation activities and would therefore have no potential to encounter UXO, MEC, or MD nor pesticide contaminated soils. **(EIR pp. 3.10-20 to -21.)** With implementation of mitigation measures on private land and CMAs on BLM land, impacts would be less than significant.

Mitigation Measures:

MM HAZ-1 (UXO Identification, Training, and Reporting Plan) Full text under Hazards and Hazardous Materials.

MM HAZ-2 (Worker Environmental Awareness Program) Full text under Hazards and Hazardous Materials.

MM HAZ-3 (Soil Management Plan) Prior to issuance of demolition or grading permits, the Applicant shall prepare a Soil Management Plan (SMP) to guide activities during construction that will disturb potentially pesticide contaminated soils to ensure that potentially contaminated soils are identified, characterized, removed, and disposed of properly. The SMP shall be submitted to the County and BLM for approval prior to Project construction. The purpose of the SMP is to establish appropriate management practices for handling impacted soil or other materials that may be encountered during construction activities.

The SMP shall be implemented during Project construction and shall include, but shall not be limited to, the following components:

- Description of soil testing, which shall include (but not be limited to) the collection of shallow soil samples and analyses for pesticides to verify presence or absence of unknown pesticide soil contamination. This soil profiling shall be performed prior to initiation of Project construction.
- Protocols for sampling of in-place soil to facilitate the profiling of the soil for appropriate off-site disposal or reuse, and for construction worker safety, dust mitigation during demolition and construction and potential exposure of contaminated soil to future users of the site prior to Project construction.
- Procedures to be undertaken in the event that contamination is identified above action levels or previously unknown contamination is discovered prior to or during Project construction.

- Sampling and laboratory analyses of any excess soil requiring disposal at an appropriate off-site waste disposal facility.
- Procedures and protocols for the safe storage, stockpiling, and disposal of any contaminated soils.

If contaminants are identified at concentrations exceeding applicable screening levels, the Applicant shall submit the SMP sampling results to the County DEH and BLM and obtain oversight from the appropriate regulatory agencies. Copies of the approved SMP shall be kept at the Project site.

Any contaminated soils identified by testing conducted in compliance with the SMP and found in concentrations above established thresholds shall be removed and disposed of according to California Hazardous Waste Regulations. Contaminated soil excavated from the site shall be hauled off-site and disposed of at a licensed hazardous materials disposal site.

DRECP CMAs:

Applicable CMAs are detailed in EIR Appendix CC, which provides a list of CMAs, an explanation of their applicability, and demonstration of compliance with each CMA.

Impact: Fire Hazards (HAZ-6)

Threshold: *The proposed project would not expose people or structures, either directly or indirectly, to a significant risk of loss, injury, or death involving wildland fires with implementation of mitigation measures.*

Findings of Fact, Less Than Significant with Mitigation Measures:

During construction and decommissioning, fires could be caused by a variety of factors, including vehicle exhaust, sparks associated with grading activities, welding activities, parking on dry vegetation, and the overall temporary increase in human activity. Pursuant to the Code of Federal Regulations, Title 29, Part 1926.24 (29 Code of Federal Regulations [CFR] 1926.24), the Project operator would be responsible for the development and

1 maintenance of an effective fire protection and prevention program through all phases of
2 construction, repair, alteration, or demolition work for the solar facility, BESS, Project
3 substation, gen-tie line, and associated components. The Project would implement the Fire
4 Management and Prevention Plan (FMPP), which includes procedures for minimizing
5 potential ignition, work restrictions on high fire hazard days, requirements for spark
6 arrestors, prohibition of smoking near vegetated areas or near combustible materials, and
7 requirements for firefighting equipment suitable for extinguishing small fires.
8 Implementation of DRECP CMAs and Mitigation Measure FIRE-1 (Fire Safety) which
9 provides additional required procedures and information to be included in the FMPP, and of
10 a WEAP, as required under Mitigation Measure HAZ-2, would further reduce wildfire risks.
11 Accordingly, construction and decommissioning of the proposed Project is not expected to
12 expose people or structures, directly or indirectly, to a significant risk of loss, injury, or death
13 involving wildland fires during Project construction. Therefore, impacts would be less than
14 significant with mitigation.

15 The Project is located within both LRA and FRA areas of moderate fire severity. The Project
16 site is not located within a high/very high fire hazard area, as determined by CAL FIRE. The
17 solar facility would be designed and constructed to industry safety design standards (i.e.,
18 Institute of Electrical and Electronic Engineers, National Electric Code) and Riverside
19 County Building and Safety Department requirements to reduce the risk of electrical fires at
20 the site. Solar arrays are fire-resistant, as they are constructed largely out of steel, glass,
21 aluminum, or components housed within steel enclosures. Wires would be buried at a
22 minimum of 18 inches below grade, minimizing the potential for faulty wiring to ignite a
23 fire. All electric inverters and the transformer would be constructed on concrete foundation
24 structures or steel skids and tested prior to use to ensure safe operations and avoid fire risks.
25 In the event of higher-than-normal temperatures (from events that could start a fire or during
26 a fire events) units could be remotely shut down or generation curtailed remotely until
27 corrective actions (i.e., inspections and repairs) are taken. In a wildfire situation, the panels
28

would be rotated and stowed in a panel-up position. Fire safety and suppression measures, such as smoke detectors and extinguishers, would be installed and available at the O&M facility.

Implementation of DRECP CMAs and MM FIRE-1 (Fire Safety) which provides additional required procedures and information to be included in the FMPP, in addition to compliance with applicable regulations, would reduce wildfire risks to less-than-significant levels. Thermal runaway or other system failures could lead to fire or explosion of the BESS. In order to minimize hazards related to fire and explosion, the BESS would be designed and constructed per all applicable design, safety, and fires standards for the installation of energy storage systems, including, but not limited to, National Fire Protection Association 855 (Standard for the Installation of Stationary Energy Storage Systems) and Section 1207 of the 2022 California Fire Code. These standards would require installation of fire suppression systems, thermal management, ventilation, and exhaust and deflagration venting systems in the BESS. A fire safety system would be provided within each on-site battery enclosure. Additionally, MM FIRE-1 would require components specific to fire response and safety at the BESS be included in the proposed Fire Management and Prevention Plan for the Project. (EIR p. 3.10-23 to 3.10-24).

With implementation of mitigation measures on private land and CMAs on BLM land, impacts would be less than significant.

Mitigation Measures:

MM FIRE-1 (Fire Safety) Full text under Wildfire.

DRECP CMAs:

Applicable CMAs are detailed in EIR Appendix CC, which provides a list of CMAs, an explanation of their applicability, and demonstration of compliance with each CMA.

G. Hydrology and Water Quality

Impact: *Water Quality Standards and Plans (HWQ-1)*

Threshold: *The proposed project would not violate water quality standard or waste discharge requirements or otherwise substantially degrade surface or groundwater quality, or conflict with the implementation of a water quality control plan with implementation of mitigation measures.*

Findings of Fact, Less Than Significant with Mitigation Measures:

Surface Water. Project development could result in soil erosion and lowered water quality through increased turbidity and sediment deposition into local ephemeral streams, and Accidental spills or disposal of harmful materials used during construction of the Project could wash into and pollute surface waters. Downstream beneficial uses could be adversely affected through violation of RWQCB water quality standards and objectives for suspended solids, total dissolved solids, sediment, and turbidity, or through violation of RWQCB water quality objectives for toxicity and chemical constituents. Alterations to site topography due to the site preparation would affect both RWQCB and CDFW jurisdictional waters of the State that traverse the Project site.

The dry nature of most of the surface streams is such that should harmful material spills occur during construction, these could easily be cleaned up prior to surface water being contaminated. Storage procedures for hazardous materials during construction would be dictated by the Hazardous Materials Plan (HMP) that would be prepared prior to construction. Trucks and construction vehicles would be serviced from off-site facilities. The use, storage, transport, and disposal of hazardous materials used in construction of the facility would be carried out in accordance with federal, state, and county regulations.

Development and adherence to a Stormwater Pollution Prevention Plan (SWPPP) or SWPPP-equivalent document will require best management practices to prevent and control erosion and siltation during construction, prevent, contain and mitigate accidental spills during construction, and prevent violation of water quality objectives or damaging beneficial uses identified in the water quality control plan. Construction of the Project would avoid

1 most desert dry wash woodland in accordance with BLM's CMA LUPA-BIO-RIPWET 1.
2 Changes to streambeds classified as RWQCB and CDFW jurisdictional waters of the State
3 would require the Applicant to obtain a LSAA from the CDFW and a waste discharge
4 (WDR) permit from the Colorado River Basin RWQCB. The LSAA and WDR will require
5 the Project to avoid and minimize impacts to surface waters (through conditions of approval
6 and BMPs) and may require compensatory mitigation for impacts to waters of the State.
7 Impacts related to surface water degradation due to alterations to waters of the State would
8 be minimized or prevented through compliance with CDFW and RWQCB regulations and
9 permits and implementation of Mitigation Measures (MM) BIO-3 (Minimization of
10 Vegetation and Habitat Impacts), MM BIO-5 (Vegetation Resources Management Plan),
11 MM BIO-14 (Streambed and Watershed Protection), MM HWQ-1 (Drainage Erosion and
12 Sedimentation Control Plan [DESCP]), and MM HWQ-5 (Project Drainage Plan).

13 Although mass grading is not proposed, some ground disturbance is expected, and some of
14 the solar panels and other proposed structures would be placed in areas that are subject to
15 flooding, creating a potential for erosion and sedimentation leading to potential water
16 quality impacts during operations. Mitigation Measure HWQ-1 requires the development of
17 a Drainage Erosion and Sedimentation Plan that would address and mitigate erosion impacts
18 during construction and operations.

19
20 Decommissioning of the Project is expected to result in adverse impacts related to water
21 resources similar to construction impacts. Work could result in potential increases in
22 sediment loads to adjacent streams and washes and/or accidental spills of hydrocarbon fuels
23 and greases and other materials associated with motorized equipment and construction work.
24 However, decommissioning activities would be subject to the same state and federal water
25 quality regulations discussed above, as well as the mitigation measures applicable during
26 construction of the Project, which would minimize potential water quality impacts.
27 Accordingly, impacts related to surface water quality would be less than significant with
28 mitigation.

1 **Groundwater.** Groundwater quality impacts could occur during construction if
2 contaminated or hazardous materials used during construction were to be released and
3 allowed to migrate to the groundwater table. Given adherence to the Project Hazardous
4 Materials Business Plan and the NPDES General Permit for Construction Activities, the
5 potential for such impacts to groundwater quality are low.

6 The Project would produce sanitary wastewater from the O&M building, which would be
7 treated and disposed of at the Project using a septic disposal system. The federal (EPA), state
8 (RWQCB) and local (Riverside County Department of Environmental Health) governments
9 have requirements for septic system design, including requirements for percolation, vertical
10 distance from the groundwater table, and setback from the nearest groundwater well. The
11 use and application of septic fields is an established practice as a method of wastewater
12 treatment. The use of a septic system within the designed system capacity is not anticipated
13 to cause groundwater quality degradation.

14 DWR has categorized the CVGB as a very low priority basin under the SGMA (DWR,
15 2020a). Per SGMA, due to the CVGB classification as a very low priority basin, a
16 Groundwater Sustainability Plan (GSP) is not required to be developed for the CVGB.

17 Groundwater modeling was completed for the project. The Project's modeled zone of
18 influence after 2 years of Project construction pumping (500 AFY) is an approximately 4.5-
19 mile radius cone of depression out to 0.5 feet of drawdown. Project operational and
20 decommissioning pumping (50 AFY) for 50 years has a cumulative drawdown with an
21 approximately 15-mile radius out to 0.5 feet of drawdown. This zone of influence also
22 includes pumping from cumulative projects. Cumulative project pumping is not anticipated
23 to adversely affect existing water users and water rights claimants in the CVGB due to the
24 limited magnitude of the simulated drawdown. Based on the limited magnitude of the
25 simulated drawdown due to Project pumping, groundwater levels would not be lowered to a
26 level that would cause a degradation of groundwater quality that affects other beneficial uses.
27
28

1 Additionally, groundwater levels would not be lowered to a level that causes pumping wells
2 near the Project to begin to capture deeper/older groundwater within the CVGB.
3 Deeper/older groundwater typically contains increased salts and nutrients as a result of
4 prolonged exposure to the aquifer material (leaching of minerals from the host rock into
5 groundwater) (USGS; 2019). In addition, there are no known point source plumes near the
6 Project. Therefore, there are no known contaminant plumes Project pumping could
7 potentially mobilize. As discussed for impact HWQ-2 below, the Project would not
8 adversely impact the sustainable management of the CVGB.

9
10 MM HWQ-1 (Drainage Erosion and Sedimentation Plan) and MM HWQ-2 (Septic System
11 Review and Permitting) which would enable the Riverside County Department of
12 Environmental Health to ensure that the Project is compliant with Riverside County,
13 RWQCB, and EPA regulations and protective of water quality. Mitigation Measure HWQ 3
14 (Palo Verde Mesa Groundwater Basin Protection) includes the development of a Colorado
15 River Water Supply Plan (CRWSP) to monitor groundwater extractions from the Applicant
16 owned and/or operated on-or off-site well(s) to ensure that groundwater extractions do not
17 go below the Colorado River Accounting Surface. HWQ-4 (Groundwater Monitoring,
18 Reporting, and Mitigation Plan [GMRMP] would be implemented for the Project in
19 coordination with the RWQCB and BLM to ensure that groundwater wells surrounding
20 Project supply well(s) are not adversely affected (i.e., chronic lowering of groundwater
21 levels and degradation of groundwater quality) by Project activities. Thus, with
22 implementation of mitigation measures and DRECP CMAs, impacts would be less than
23 significant. (EIR pp. 3.11-21 and 3.11-24).

24 **Mitigation Measures:**

25 **MM BIO-3 (Minimization of Vegetation and Habitat Impacts) Full text under**
26 **Biological Resources.**

27 **MM BIO-5 (Vegetation Resources Management Plan) Full text under Biological**
28

Resources.

MM BIO-14 (Streambed and Watershed Protection) Full text under Biological Resources.

MM HWQ-1 (Drainage Erosion and Sedimentation Control Plan [DESCP]). At least 60 days prior to site mobilization, the Applicant shall submit to the Regional Water Quality Control Board, the BLM, and Riverside County for review and approval a DESC for managing stormwater during Project construction and operations and to prevent sediment or any other pollutants from moving offsite and into receiving waters. The DESC can be included in the Stormwater Pollution Prevention Plan (SWPPP) and must ensure proper protection of water quality and soil resources, address disturbed soil stabilization treatments in the Project area for both road and non-road surfaces, and identify all methods used for temporary and final stabilization of inactive areas. The plan must also cover all linear Project features such as the proposed centerline and any other Project component subject to disturbance. The DESC shall contain, at a minimum, the elements presented below that outline site management activities and erosion and sediment-control Best Management Practices (BMPs) to be implemented during site mobilization, excavation, construction, and post-construction (operating) activities.

- **Vicinity Map.** A map(s), at a minimum scale 1 inch to 500 feet, shall be provided indicating the location of all Project elements with depictions of all significant geographic features including swales, storm drains, drainage concentration points and sensitive areas.

- **Site Delineation.** All areas subject to soil disturbance (including mowing, grubbing, grading, excavation or any other soil disturbing activity) for the Project shall be delineated showing boundary lines of all construction areas and the location of all existing and proposed structures and drainage facilities.

- **Clearing and Grading Plans.** The DESC shall provide a delineation of all

1 areas to be cleared of vegetation and areas to be preserved. The plan shall provide
2 elevations, slopes, locations, and extent of all proposed grading as shown by contours,
3 cross sec-tions, or other means. The locations of any disposal areas, fills, or other special
4 features shall also be shown. Existing and proposed topography shall be illustrated by
5 tying in proposed contours with existing topography.

6

- 7 • Clearing and Grading Narrative. The DESCP shall include a table with the
8 estimated quantities of material excavated or filled for the site and all Project elements,
9 whether such excavation or fill is temporary or permanent, and the amount of such
10 material to be imported or exported. All areas subject to soil disturbance shall be included
11 in the table.

12

- 13 • Erosion Control. The plan shall address treatments to be used on exposed soil
14 during construction and operation including specifically identifying all chemical-based
15 dust palliatives, soil bonding, and weighting agents appropriate for use that would not
16 cause adverse effects to vegetation. BMPs shall include measures designed to provide
17 tem-porary stabilization of inactive disturbed areas and will be applied as soon as
18 possible consistent with SCAQMD (Rule 403) and SWRCB Construction General
19 Permit require-ments. The timing of suppressant or binder application will occur as soon
20 as possible and consistent with dust and stormwater permit requirements. Any soil
21 stabilizers pro-posed shall be approved for use by the Project's Restoration Specialist to
22 ensure that the products shall not impede restoration goals.

23

- 24 • Best Management Practices Plan. The DESCP shall identify on the
25 topographic site map(s) the location of the site specific BMPs to be employed during
26 each phase of construction (initial grading, Project element excavation and construction,
27 and final grading/stabilization). BMPs shall include measures designed to control dust,
28 stabilize construc-tion access roads and entrances, and control stormwater runoff and
sediment transport consistent with SCAQMD (Rule 403) and SWRCB Construction
General Permit requirements.

1 • Best Management Practices Narrative. The DESCP shall show the location,
2 timing, and maintenance schedule of all erosion- and sediment-control BMPs to be used
3 prior to initial grading, during excavations and construction, final grading/stabilization,
4 and operation. Separate BMP implementation schedules shall be provided for each
5 Project element for each phase of construction. The maintenance schedule shall include
6 post-construction maintenance of structural-control BMPs, or a statement provided about
7 when such information would be available.

8 • The DESCP shall be prepared, stamped, and sealed by a professional
9 engineer or Qualified SWPPP Developer. The DESCP shall include copies of
10 recommendations, con-ditions, and provisions from the Regional Board and/or BLM.

11 • The DESCP may be part of the SWPPP and shall be kept onsite, kept updated,
12 and readily available on request. The DESCP and SWPPP must demonstrate compliance
13 with other water quality permits (WDR and LSAA), which may have restrictions on
14 types of erosion or sedimentation control materials used. SWPPP inspection reporting
15 will be consistent with the requirements of the SWRCB Construction General Permit.
16

17
18 **MM HWQ-2 (Septic System Review and Permitting)**

19 Before the start of construction, the
20 Applicant shall submit to Riverside County Department of Environmental Health an
21 evaluation of the Project septic system to ensure that the proposed use of the system is
22 consistent with federal, state, and local requirements for septic system design, including
23 requirements for percolation, vertical distance from the groundwater table, and setback from
24 the nearest groundwater well.

25 **MM HWQ-3 (Palo Verde Mesa Groundwater Basin [PVMGB] Protection)**

26 If water for
27 the Project, to be obtained from on- or off-site well(s) within the Chuckwalla Valley
28 Groundwater Basin (CVGB), is extracted from on- or off-site well(s) that is/are owned
and/or operated by the Applicant, the Applicant shall develop a Colorado River Water

1 Supply Plan (CRWSP) to monitor groundwater extractions from the Applicant owned and/or
2 operated on- or off-site well(s) to prevent impacts to the adjacent PVMGB related to
3 groundwater extraction below the Colorado River Accounting Surface.

4
5 The CRWSP shall be submitted to the U.S. Bureau of Reclamation and BLM for review and
6 approval at least 60 days prior to the initiation of construction. No pumping of ground-water
7 below the accounting surface shall occur. A copy of the CRWSP shall also be sub-mitted to
8 the Metropolitan Water District of Southern California for review and comment.

9
10 (a) The CRWSP shall describe groundwater monitoring activities and quarterly data reports
11 to be closely reviewed for depth to groundwater information, and proximity of the depth
12 of Project-related groundwater pumping to the Colorado River Accoun-ting Surface. To
13 ensure that Project-related groundwater pumping does not draw water from below the
14 accounting surface, the Applicant shall implement water con-servation activities,
15 including cessation of pumping, to reduce the amount of water withdrawn from on- or
16 off-site well(s) that is/are owned and/or operated by the Applicant.

17 i. The Colorado River Accounting Surface is at an elevation between approxi-mately
18 238 and 240 feet above mean sea level (amsl) in the Chuckwalla Valley (Argonne,
19 2013). Groundwater elevation in the Project area is approximately 489 feet amsl as
20 of the first quarter of 2024. The numerical groundwater model developed for the
21 Project Water Supply Assessment (GSI, 2024; discussed below) included estimates
22 of the total cone of depression considering cumula-tive drawdown from all potential
23 pumping in the CVGB, including the Project, for the life of the Project through the
24 decommissioning phase. The estimated drawdown at the Project well after the
25 planned 2-year construction period was less than 2 feet. The temporary drawdown at
26 the well during pumping, however, would be greater.

27 ii. Assuming a conservatively-large temporary drawdown of 100 feet at the Project well
28 (up to 80 feet of temporary drawdown has been recorded from a well-used for

1 construction of a nearby solar project) during peak water demand during Project
2 construction, the water levels in the Project well would be at least 150 feet above the
3 Colorado River Accounting Surface. The water levels within the Project well would
4 be monitored as part of the GMRMP (MM HWQ-4) per the DRECP LUPA
5 Conservation and Management Action (CMA) Soil and Water (SW) 24. MM HWQ-
6 3 ensures that the Project will not extract water from below the Accounting Surface,
7 as it requires that pumping from Project wells be decreased or stopped well before
8 water levels reached the Colorado River Accounting Surface.

9 **MM HWQ-4 (Groundwater Monitoring, Reporting, and Mitigation Plan [GMRMP])**

10
11 Before the Project uses groundwater pumped from any Applicant owned and/or operated
12 well (on site or off site) that extracts water from the CVGB, the Applicant shall retain a
13 BLM-approved qualified hydrogeologist to develop a GMRMP, in coordination with
14 Riverside County and BLM, to ensure that groundwater wells surrounding Project supply
15 well(s) are not adversely affected by Project activities, i.e., chronic lowering of groundwater
16 levels and degradation of groundwater quality. The Applicant shall submit the GMRMP to
17 Riverside County and BLM for review and approval. Additionally, although no
18 Groundwater Sustainability Agencies (GSAs) have been established for the CVGB, in the
19 event that such agencies have been established when the GMRMP is developed, the
20 Applicant also shall submit the GMRMP to those GSAs. The Applicant shall implement the
21 approved GMRMP throughout any Project phase that pumps groundwater for consumptive
22 use.

23 The GMRMP shall provide a detailed methodology for monitoring site groundwater levels
24 and comparisons for levels within the CVGB including identification of the closest private
25 wells to the Project's well(s). Groundwater level data from wells at adjacent and nearby solar
26 facilities and other Projects on BLM-administered public lands shall be provided by the
27 BLM for review and comparison, to the extent available to the Applicant. Monitoring shall
28 be performed during pre-construction, construction, and operation of the Project, to

1 establish pre-construction and Project-related groundwater level and water quality trends
2 that can be quantitatively compared against observed and simulated trends near the Project's
3 pumping well(s) and near potentially impacted existing wells. The GMRMP shall include a
4 schedule for submittal of quarterly data reports by the Applicant to the GMRMP designated
5 agencies and the GSA(s) (if established), for the duration of the construction period. These
6 quarterly data reports shall be prepared and submitted for review and shall include water
7 level monitoring data and effect on the nearest off-site private wells. The designated agencies
8 shall determine whether groundwater wells surrounding the Project supply well(s) are
9 adversely affected (i.e., chronic lowering of groundwater levels and degradation of
10 groundwater quality) by Project activities and, if so, shall require one or more of the
11 following:

- 12
13 • Cessation or reduction of pumping at the Project well(s) until groundwater
14 levels return to levels that allow nearby wells to resume pre-Project pumping levels;
- 15 • Compensation for whatever additional equipment is necessary to lower
16 nearby pumps to levels that can adequately continue pumping;
- 17 • Compensation to repair or replace wells found to be damaged or inoperable
18 due to lowered groundwater levels; or
- 19 • Compensation for increased energy cost due to Project-related well
20 drawdown.

21 After the completion of construction, the Applicant and the BLM shall jointly evaluate the
22 effectiveness of the GMRMP and determine if monitoring and reporting frequencies or
23 procedures should be revised or eliminated.

24 **MM HWQ-5 (Project Drainage Plan)**

25 The Applicant shall provide the RWQCB, Riverside
26 County and BLM with a drainage plan for review and approval prior to construction, which
27 includes the following information:

- 28 • Hydrologic assessment of flood discharges affecting each parcel.

1 • A detailed on-site hydraulic analysis utilizing FLO 2D or similar two-
2 dimensional hydraulic model which models pre- and post-development flood conditions
3 for the 10- and 100-year storm events. The post-development model must include all
4 proposed Project features, contours, and drainage improvements. Graphical output must
5 include depth and velocity mapping as well as mapping which graphically shows the
6 changes in both parameters between the pre- and post-development conditions.

7 • The Drainage Plan shall show the location of all watercourses, drainage
8 concentration points and drainage ditches as they enter, cross, and exit the site. It shall
9 include pre-development and post-development peak flow estimates. It shall include
10 hydraulic calculations to determine flood conditions, floodplain limits, flood depths and
11 velocities. It shall show the relationship of drainage and flood features to the features of
12 the Project, including buildings, fences, substations, access roads, culverts, linear
13 features, and panel supports, demonstrating adequate design to protect from flooding,
14 erosion and scour, and to do so without adversely affecting adjacent property, inducing
15 erosion, or concentrating or diverting flows.

16 • The Plan shall show how drainage will be conveyed through the site without
17 adversely affecting other property, either through increased flood hazard or increased
18 potential for scour and erosion. Proposed fencing shall allow runoff to traverse the
19 Project site unencumbered, as feasible. The Plan shall include an assessment of existing
20 diversion berms and channels around parcel perimeters and the magnitude and frequency
21 of flood that would be diverted by these existing features, and the probable integrity of
22 these features to withstand flows. It shall show how those that are on the Project site will
23 be affected by grading. It shall include an assessment of flows approaching proposed
24 perimeter fences, whether or not adjacent to existing berms, and make design
25 recommendations to avoid flow diversions by these fences while taking into account
26 relevant biological mitigation measures. Design recommendations may include creating
27 fence openings large enough to allow the passage of debris-laden flows without the
28

potential for diversions to other property.

- The Plan shall have detailed design of flood retention features necessary to avoid any increase in downstream flood peak flow rates.

- Drainage of Project Site Narrative – The Plan shall include a narrative of the measures necessary to protect the site and Project features from flooding, erosion and sedimentation, and measures taken to prevent Project-induced erosion and flooding of adjacent property.

DRECP CMAs:

Applicable CMAs are detailed in EIR Appendix CC, which provides a list of CMAs, an explanation of their applicability, and demonstration of compliance with each CMA.

Impact: Groundwater (HWQ-2)

Threshold: *The proposed project would not substantially decrease groundwater supplies or interfere substantially with groundwater recharge such that the project may impede sustainable groundwater management of the basin with implementation of mitigation measures.*

Findings of Fact, Less Than Significant with Mitigation Measures:

Water for construction, operation, and decommissioning would be obtained from several potential sources, including an on-site groundwater well, an off-site groundwater well, and trucked from an off-site water purveyor. However, it is assumed all Project water needs would be sourced from the CVGB, which has been characterized by DWR as a very low priority basin, and which is not in a state of overdraft.

Based on groundwater modeling completed for the project, the CVGB under average-year conditions would have a surplus of 5,200 AF at the end of the 52-year period. The net CVGB surplus with the Project in place would therefore be 1,700 AF, or 33 percent of the surplus that would exist without the Project. Using the DWR (2020a) estimated annual groundwater pumping, the net CVGB surplus with the Project in place would be 74,500 AF, or 96 percent

1 of the surplus that would exist without the Project. Thus, with the Project in place,
2 groundwater in storage and ground-water levels in the CVGB would be expected to increase
3 over the life of the Project.

4 For a single dry year and single critical dry year with the Project in place, the worst-case
5 scenario is for one of those year types, dry or critical dry, to occur during the construction
6 period of the Project (assumed to be 2024 to 2025) in which the Project would increase the
7 dry year and critical dry year deficit by 8 and 7 percent, respectively. Assuming normal
8 precipitation returns, this total deficit (dry year, or critical dry year, plus Project use) would
9 not be recovered during the 52-year period (with or without the Project). The likelihood that
10 a dry or critical dry year would occur during Project construction is 10 percent and 3 percent,
11 respectively. If a dry year or critical dry year were to occur during Project construction, it
12 would not result in groundwater overdraft of the CVGB, which is defined as the condition
13 of a groundwater basin in which the amount of water withdrawn by pumping exceeds the
14 amount of water that recharges the basin over a period of many years during which water
15 supply conditions approximate average conditions. The deficit associated with a dry or
16 critical dry year during construction does not approximate average conditions and, further,
17 would be limited to those years, after which average conditions (resulting in an annual
18 groundwater surplus, as discussed above) would be expected to return.

19 If a dry year or critical dry year occurs during the Project construction period, using the
20 DWR (2020a) estimated annual groundwater pumping, the CVGB annual deficit would be
21 approximately 5,000 AF and 6,200 AF, respectively. increase the dry year and critical dry
22 year deficit by 11 and 9 percent, respectively. Assuming normal precipitation returns, this
23 total deficit (dry year plus Project use and critical day year plus Project use) would be
24 recovered in less than 4 years and 5 years, respectively, with the Project in place. The Project
25 also would implement various construction techniques designed to reduce overall water use
26 during construction, including using "overland travel," designating primary travel routes,
27 limiting grading, utilizing small rubber-wheel vehicles, and phasing construction.

28 Historically, dry and critical dry years do not occur over multiple consecutive years. Rather,

1 the precipita-tion record indicates that a series of dry years has typically been followed by a
2 series of years with above-average precipitation. Using the driest 52-year period recorded at
3 the Blythe Airport meteorological station, the WSA indicates there would be a 21,060 AF
4 surplus in the CVGB if there were a repeat of this 52-year period under current conditions.
5 With the Project in place, there would be a total groundwater surplus of approximately
6 17,530 AF at the end of 52 years. Using the DWR (2020a) estimated annual pumping, at the
7 end of the 52-year period the total groundwater surplus would be approximately 90,330 AF
8 with the Project in place.

9 The Project has a limited overall water demand and, further, would require very little water
10 each year for operation. Modeling completed for the project indicates the zone of influence
11 after 2 years of Project construction pumping (500 AFY) is an approximately 4.5-mile radius
12 cone of depression out to 0.5 feet of drawdown. Project operational and decommissioning
13 pumping (50 AFY) for 50 years has a cumulative drawdown with an approximately 15-mile
14 radius out to 0.5 feet of drawdown. This zone of influence also includes pumping from
15 cumulative projects.

16 The modeling results indicate that impacts to groundwater levels as a result of Project and
17 cumulative project pumping are confined to the western part of the CVGB. Although most
18 of the non-cumulative project pumping (see GSI, 2024 Section 5.8.2) in the CVGB occurs
19 in the western part of the CVGB (the total agricultural, municipal, and domestic pumping
20 is limited to approximately 7,900 AFY [CEC, 2010]), cumulative project pumping is not
21 anticipated to adversely affect existing water users and water rights claimants in the CVGB
22 due to the limited magnitude of the simulated drawdown (see the previous paragraph).

23 The Colorado River Accounting Surface is at an elevation between approximately 238 and
24 240 feet above mean sea level (amsl) in the Chuckwalla Valley (Argonne, 2013). According
25 to modeling completed for the project, the estimated drawdown at the Project well after the
26 planned 2-year construction period was less than 2 feet, approximately 247 to 249 feet above
27 the Accounting Surface. The temporary drawdown at the well during pumping, however,
28 would be greater. Assuming a conservatively large temporary drawdown of 100 feet at the

1 Project well (up to 80 feet of temporary drawdown has been recorded from a well used for
2 construction of a nearby solar project) during peak water demand during Project
3 construction, the water levels in the Project well would be at least 150 feet above the
4 Accounting Surface. Further, the water levels within the Project well would be monitored as
5 part of the GMRMP (MM HWQ-4) per the DRECP CMA Soil and Water (SW) 24. Pumping
6 from the Project well would be decreased or stopped well before water levels reached the
7 Accounting Surface, pursuant to MM HWQ-3 (PVMGB Protection). Thus, the Project will
8 not extract water from below the Accounting Surface.

9 The Project would not substantially decrease groundwater supplies or interfere substantially
10 with groundwater recharge such that the Project may impede sustainable groundwater
11 management of the CVGB. Based on the adopted water budget components (primarily based
12 on Fang et al. [2021]) in the Project WSA (GSI, 2024), under normal conditions (see Table
13 3-11.1) the CVGB is not in overdraft. The CVGB is a low priority basin and DWR (2004)
14 estimated the total groundwater storage capacity of the CVGB is 9,100,000 to 15,000,000
15 AF. The Project's water use of 3,500 AF over the 52-year life of the Project represents
16 approximately 0.0004 percent of the assumed 10,000,000 AF of groundwater storage
17 capacity in the CVGB. Under conservative recharge and pumping assumptions, there would
18 be an annual and net surplus of groundwater in the CVGB over the Project's 52-year life
19 with Project groundwater pumping in place. Only during the unlikely event that a dry or
20 critical dry year overlaps with Project construction (10 percent and 3 percent chance of
21 occurring, respectively) would there be an annual groundwater deficit. However, Project
22 groundwater use would not result in long term deficits or overdraft of the CVGB. Indeed, if
23 the driest 52-year period recorded for the CVGB were to repeat during the Project's
24 operational life, the WSA indicates there would be between a 17,530 AF and 90,330 AF
25 surplus in the CVGB with the Project in place. Overall Project pumping would be limited
26 by both MM HWQ-3 and HWQ 4, which would minimize potential pumping impacts to
27 nearby wells and the larger CVGB. Thus, with mitigation measures and DRECP CMAs,
28 impacts would be less than significant. **(EIR p. 3.11-25 to 3.11-28).**

Mitigation Measures:

MM HWQ-3 (Palo Verde Mesa Groundwater Basin [PVMGB] Protection) Full text under Hydrology and Water Quality.

MM HWQ-4 (Groundwater Monitoring, Reporting, and Mitigation Plan [GMRMP]) Full text under Hydrology and Water Quality.

DRECP CMAs:

Applicable CMAs are detailed in EIR Appendix CC, which provides a list of CMAs, an explanation of their applicability, and demonstration of compliance with each CMA.

Impact: Drainage (HWQ-3A)

Threshold: The proposed project would not substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner which would result in substantial erosion or siltation on- or off-site. with implementation of mitigation measures.

Findings of Fact, Less Than Significant with Mitigation Measures:

Earthwork for Project construction would require the use of heavy machinery for vegetation grubbing, grading, and installation of roads, solar fields, transmission facilities, the O&M building, the BESS, the energy storage systems, and other facilities, potentially loosen existing surface soils and sediments, increasing the potential for erosion during storm events, along with associated effects such as increased downstream sediment yields from on-site disturbed areas. Increased impervious areas could also lead to erosion by increasing the rate and frequency of runoff. Parts of the solar facility including roads, laydown areas and structures would also cause some form of ground disturbance from grading, compaction, or excavation.

Because of the proposed plan for minimal grading, alteration of the existing drainage pattern and any associated erosion or siltation, should be minimal. The Applicant's proposed layout of solar panels and other facilities would largely maintain major existing hydrologic patterns

1 with respect to runoff, avoiding washes, stream beds, and stream banks, where feasible. This
2 includes mostly avoiding the largest desert washes that cross the site from the southwest to
3 northeast. However, the site plans are not yet final, and there remains a potential for
4 alteration of drainage patterns and the potential for erosion. Drainage alterations could occur
5 through diversions by the proposed security fences, placement of structures in drainage
6 areas, or grading to control high flow concentrations.

7 Changes and alterations to these washes could change the flow patterns across the site and
8 result in increased flow velocities, increased erosion, and increased downstream siltation.
9 Erosion protection management would be required by adherence to a SWPPP which would
10 substantially reduce erosion impacts. A DESCP is proposed in MM HWQ-1 to further
11 address potential Project-related water erosion impacts. Alterations to the RWQCB and
12 CDFW jurisdictional waters would require the Applicant to obtain a LSAA from the CDFW
13 and a WDR permit from the Colorado River Basin RWQCB. Impacts related to surface water
14 degradation due to alterations to waters of the State would be minimized or prevented
15 through compliance with CDFW and RWQCB regulations and permits, MM BIO-3
16 (Minimization of Vegetation and Habitat Impacts), MM BIO-5 (Vegetation Resources
17 Management Plan), MM BIO-13 (Streambed and Watershed Protection), MM HWQ-1
18 (Drainage Erosion and Sedimentation Control Plan [DESCP]), and MM HWQ-5 (Project
19 Drainage Plan). Implementation of these measures and DRECP CMAs would ensure that
20 this impact is less than significant. (EIR p. 3.11-30 and 3.11-31).

21 **Mitigation Measures:**

22 **MM HWQ-1 (Drainage Erosion and Sedimentation Control Plan [DESCP]) Full text**
23 **under Hydrology and Water Quality.**

24 **MM HWQ-5 (Project Drainage Plan) Full text under Hydrology and Water Quality.**

25 **MM BIO-3 (Minimization of Vegetation and Habitat Impacts) Full text under**
26 **Hydrology and Water Quality.**

1 **MM BIO-5 (Vegetation Resources Management Plan) Full text under Hydrology and**
2 **Water Quality.**

3 **MM BIO-1 (Streambed and Watershed Protection) Full text under Biological**
4 **Resources.**

5 **DRECP CMAs:**

6 Applicable CMAs are detailed in EIR Appendix CC, which provides a list of CMAs, an
7 explanation of their applicability, and demonstration of compliance with each CMA.

8 ***Impact: Drainage (HWQ-3B)***

9 ***Threshold:** The proposed project would not substantially alter the existing drainage pattern*
10 *of the site or area, including through the alteration of the course of a stream or river or*
11 *through the addition of impervious surfaces, or substantially increase the rate or amount of*
12 *surface runoff in a manner which would result in flooding on- or off-site with implementation*
13 *of mitigation measures.*

14 **Findings of Fact, Less Than Significant with Mitigation Measures:**

15 There is a minor potential for the Project to increase the magnitude and frequency of runoff
16 rates through the construction of impervious areas and by altering the ground surface
17 characteristics through grading and removal of vegetation. However, drainage patterns
18 would remain relatively intact, and the increase in overall site runoff is expected to be
19 minimal (approximately 3 percent), though a local impact potential remains, especially in
20 the vicinity of new impervious areas. Depending on final engineering analysis of
21 postconstruction hydrology, retention basins may be necessary to reduce increased
22 discharges created by the Project.

23 Alteration of the existing drainage pattern should be minimal because of the minimal grading
24 proposed. Some alterations could occur through diversions by the proposed security fences,
25 which could become barriers to flow by the accumulation of debris, in which case diversions
26 of off-site sheet flow could occur. Security fencing with desert tortoise fencing along the
27 bottom would enclose the developed portions of the facility site, including across the desert
28

1 washes. Portions of the security fence may leave a 6- to 8-inch gap between the lower fence
2 margin (rail or mesh) and the ground to allow for passage of desert tortoise and other
3 animals. Structures placed in drainage areas, or grading to control high flow concentrations,
4 could also lead to flow diversions which could adversely affect the flood potential within or
5 outside the property.

6 Although minimal alteration of drainage patterns is expected, there remains a potential for
7 the Project to cause flooding either of adjacent property or within the site itself. Mitigation
8 Measure HWQ-1 requires the development of a DESCPC which would address erosion-
9 related impacts. The Westwood study (2023) presents a preliminary assessment of the flood
10 potential in the Project area. As the site designs are completed, additional drainage
11 information would be required to ensure that the designs address drainage and flooding
12 conditions on the Project site. Mitigation Measure HWQ-5 (Project Drainage Plan) requires
13 a Project drainage report and plan to address on-site flooding and the potential for the Project
14 to induce flooding on adjacent property. Impacts would be less than significant with
15 implementation of mitigation measures and DRECP CMAs. (EIR p. 3.11-31 and 3.11-32).

16 **Mitigation Measures:**

17 **MM HWQ-1 (Drainage Erosion and Sedimentation Control Plan [DESCPC]) Full text**
18 **under Hydrology and Water Quality.**

19 **MM HWQ-5 (Project Drainage Plan) Full text under Hydrology and Water Quality.**

20 **DRECP CMAs:**

21 Applicable CMAs are detailed in EIR Appendix CC, which provides a list of CMAs, an
22 explanation of their applicability, and demonstration of compliance with each CMA.
23

24 ***Impact: Drainage (HWQ-3C)***

25 ***Threshold:*** *The proposed project would not substantially alter the existing drainage pattern*
26 *of the site or area, including through the alteration of the course of a stream or river or*
27 *through the addition of impervious surfaces, in a manner which would create or contribute*
28

runoff water which would exceed the capacity of existing or planned storm water drainage systems or provide substantial additional sources of polluted runoff with implementation of mitigation measures.

Findings of Fact, Less Than Significant with Mitigation Measures:

There are no existing or planned stormwater drainage systems at or downstream of the Project site. Drainage in the area and downstream of the Project consists of natural desert with natural watercourses. Some increase in runoff potential is possible due to increased impervious area and compacted roadway surfaces, but a large increase is not anticipated due to the small amount of new impervious area and compacted roadways. Any increase in runoff would be addressed in the DESCP (MM HWQ-1) and detention regulations. With implementation of DRECP CMAs and MMs HWQ-1 (Drainage Erosion and Sedimentation Control Plan [DESCP]) and MM HWQ-5 (Project Drainage Plan) in place, this potential impact from runoff would be less than significant. (EIR p. 3.11-32).

Mitigation Measures:

MM HWQ-1 (Drainage Erosion and Sedimentation Control Plan [DESCP]) Full text under Hydrology and Water Quality.

MM HWQ-5 (Project Drainage Plan) Full text under Hydrology and Water Quality.

DRECP CMAs:

Applicable CMAs are detailed in EIR Appendix CC, which provides a list of CMAs, an explanation of their applicability, and demonstration of compliance with each CMA.

Impact: Drainage (HWQ-3D)

Threshold: The proposed project would not substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner which would impede or redirect flood flows with implementation of mitigation measures.

Findings of Fact, Less Than Significant with Mitigation Measures:

1 The Project would include perimeter security fencing which, if clogged with debris normally
2 carried by natural flood flows in the desert, could divert flood flows and increase the flood
3 potential on other property. Fence-induced diversions along drainage entry points could
4 cause flooding of adjacent properties. Fencing is not proposed across existing drainages and
5 fencing would be a long linear element unlikely to become completely blocked by debris
6 accumulations along the entire length of the fence.

7
8 Mitigation Measure HWQ-5 (Project Drainage Plan) would ensure that fence-related
9 diversions of flow are less than significant by ensuring that the site design includes
10 consideration of flood flows and diversions. Most of the Project site would be subject to
11 flooding at varying depths mostly less than one foot. Any structures placed in those areas
12 would have the potential to redirect flood flows. The solar panels would be installed on
13 posts/piles and at least 4 feet above the ground and would offer minimal obstruction to flows.
14 The substation, BESS and O&M building are in an area that would be subject to flooding of
15 approximately 1 foot. These would be protected by berms or other drainage features which
16 could redirect flood flows locally. Mitigation Measures HWQ-1 (Drainage Erosion and
17 Sedimentation Control Plan [DESCP]) and MM HWQ-5 (Project Drainage Plan) would
18 ensure that the site design include consideration of flood flows and diversions. With these
19 mitigation measures DRECP CMAs in place, this potential impact from runoff would be less
20 than significant. (EIR pp. 3.11-32 and 3.11-33).

21 **Mitigation Measures:**

22 **MM HWQ-1 (Drainage Erosion and Sedimentation Control Plan [DESCP]) Full text**
23 **under Hydrology and Water Quality.**

24 **MM HWQ-5 (Project Drainage Plan) Full text under Hydrology and Water Quality.**

25 **MM BIO-3 (Minimization of Vegetation and Habitat Impacts) Full text under**
26 **Biological Resources.**

1 **MM BIO-5 (Vegetation Resources Management Plan) Full text under Biological**
2 **Resources.**

3 **MM BIO-13 (Streambed and Watershed Protection) Full text under Biological**
4 **Resources.**

5 **DRECP CMAs:**

6 Applicable CMAs are detailed in EIR Appendix CC, which provides a list of CMAs, an
7 explanation of their applicability, and demonstration of compliance with each CMA.

8 ***Impact: Flooding (HWQ-4)***

9 ***Threshold:*** *The proposed project would not expose people or structures to a significant risk*
10 *of loss, injury or death involving flooding, including flooding as a result of the failure of a*
11 *levee or dam with implementation of mitigation measures.*

12 Findings of Fact, Less Than Significant with Mitigation Measures:

13 Most of the Project would be subject to flooding at varying depths mostly less than one foot.
14 Any structures placed in those areas would have the potential to be flooded. The solar panels
15 would be installed on posts/piles and at least 4 feet above the ground and would be above
16 the anticipated flood depth but would be subject to scour as the flood flows pass the support
17 posts. The substation, BESS and O&M building are in an area that would be subject to
18 flooding of up to 1 foot. These would be protected by berms or other drainage features. The
19 access roads, being at-grade, would require maintenance after a flood event. The internal
20 power lines would be protected from flooding by burying or being installed on poles, but if
21 on poles could be subject to flood-related scour. The gen-tie line would have similar potential
22 for flood-related scour. As there would be few people on the site at most times, flow depths
23 shallow, and the building structures and other Project features would be protected from
24 flooding or not easily susceptible to flood damage, there would be little chance of flood-
25 related injury or death, or substantial damage to structures. Mitigation Measures HWQ-1
26 (Drainage Erosion and Sedimentation Control Plan [DESCP]) and MM HWQ-5 (Project
27 Drainage Plan) would ensure that the site design include consideration of flood flows.
28

Mitigation Measure HWQ-6 (Flood Protection) is proposed to ensure that all structures are protected from flooding and flood-related scour. (EIR pp. 3.11-33.). With implementation of DRECP CMAs and mitigation measures, impacts would be less than significant.

Mitigation Measures:

MM HWQ-1 (Drainage Erosion and Sedimentation Control Plan [DESCP]) Full text under Hydrology and Water Quality.

MM HWQ-5 (Project Drainage Plan) Full text under Hydrology and Water Quality.

MM HWQ-6 (Flood Protection) The O&M Building, BESS switchyard, and all other Project buildings shall either be situated outside of the 100-year floodplain or sufficiently protected against dislodgement by flooding where placement outside the floodplain is not practical. Flood protection shall consist of elevating the structures on fill to at least the highest anticipated adjacent flood level as measured from a horizontal stow position. Solar panels shall be situated at least one foot above the highest anticipated local flood level. All structures using posts or poles for foundations, including transmission poles or towers, shall be designed to protect against substantial scour from the 100-year flood event. The Project must comply with Riverside County Ordinance No. 458 for projects within a Special Flood Hazard Area or floodplain: electrical, heating, ventilation, plumbing, and air conditioning equipment and other service facilities must be designed or located to prevent water from entering or accumulating within the components during flooding.

DRECP CMAs:

Applicable CMAs are detailed in EIR Appendix CC, which provides a list of CMAs, an explanation of their applicability, and demonstration of compliance with each CMA.

H. Noise

Impact: Noise (N-1)

Threshold: The proposed project would not generate a substantial temporary or permanent

1 *increase in ambient noise levels in the vicinity of the project in excess of established*
2 *standards with implementation of mitigation measures.*

3 Findings of Fact, Less Than Significant with Mitigation Measures:

4 Increased ambient noise would occur during the approximately 20 months of construction
5 of the proposed Project. The construction activity likely to cause the highest noise levels at
6 the site would be installation of steel piles for supporting the PV module structures. The
7 noise levels caused by typical activities within the site would be substantially lower when
8 experienced at locations distant from the site boundaries. Assuming the standard spherical
9 spreading loss (reduction of 6 dB per doubling of distance) and the highest unmitigated
10 construction noise source of 83 dBA Leq at 50 feet, the noise level caused by a typical spread
11 of construction equipment would be 62 dBA Leq at the nearest occupied residences in the
12 Lake Tamarisk community, 200 meters (656 feet) from the nearest proposed construction.
13 Therefore, the nearest receiver locations would not be exposed to noise levels exceeding the
14 reasonable daytime 80 dBA Leq or the nighttime 70 dBA Leq thresholds during construction
15 activities.

16 Along SR-177, the traffic from construction-related workers and haul trucks would increase
17 SR-177 day-night noise levels by 3 dBA over the baseline levels, from 63 dBA to
18 approximately 66 dBA Ldn within 100 feet of the centerline or from 64 dBA to 67 dBA
19 CNEL. Construction-related traffic noise impacts would occur primarily but not exclusively
20 during daytime conditions. To reduce the impact of evening and nighttime construction
21 traffic noise, MM N-1 (Construction Restrictions) would be implemented to ensure that any
22 construction activities within 0.25 miles of a sensitive receptor outside of the schedule of the
23 Noise Ordinance would be limited to light-duty equipment and vehicles. Mitigation
24 Measures N-2 (Public Notification Process) and N-3 (Noise Complaint Process) would
25 ensure that residents nearest to the Project site boundaries and access roads are provided
26 advance notification of potentially adverse noise conditions and to ensure that complaints
27 are resolved. With the recommended mitigation measures, construction would not result in
28

1 a substantial increase in noise levels in excess of standards established in the local general
2 plan or noise ordinance or applicable standards of other agencies and the impact of
3 construction noise relative to applicable community noise standards would be less than
4 significant. Implementation of APM NOISE-1 will further reduce this less-than-significant
5 impact because it will avoid or minimize use of any impact hammer within a one-mile radius
6 of residents.

7 Gen-tie construction noise would result in a readily perceptible, but temporary, increase in
8 daytime environmental noise. Near each pole site, the equipment in the gen-tie construction
9 spread and overhead helicopter operations would generate increase ambient noise during use
10 of offroad equipment and during helicopter overflights, takeoffs, and landings. Gen-tie
11 construction noise would occur along an alignment that is not within 0.25 mile of any
12 inhabited dwellings. However, helicopter operations could conflict with Riverside County
13 General Plan policies to minimize the impacts of construction noise if not limited to occur
14 during daytime hours. Mitigation Measure N-1 (Construction Restrictions) would ensure
15 that construction activities outside of the schedule of the Noise Ordinance would be limited
16 to light-duty equipment and vehicles, and Mitigation Measures N-2 (Public Notification
17 Process) and N-3 (Noise Complaint Process) would also ensure that nearby residents are
18 provided advance notification of potentially adverse noise conditions and to ensure that
19 complaints are resolved. For construction of the gen-tie, this impact with mitigation would
20 be less than significant.

21
22 Once operational, throughout the solar field, the equipment that could generate the most
23 prominent stationary source noise would be the pad-mounted inverter-transformer stations.

24 The dominant stationary sources of noise near the proposed operation and maintenance
25 (O&M) building would be related to the heating, ventilation, and air conditioning units
26 (HVAC), if necessary for the O&M building and the BESS enclosures. The proposed Project
27 would also introduce the permanent stationary source of noise from the audible corona noise
28

1 that occurs with normal and routine operation of the 500 kV gen-tie.

2 The overall noise levels caused by the solar facility would be subject to the 45 dBA Lmax
3 standard of the Noise Ordinance that applies at the boundary of any nearby occupied
4 property. The noise from operation of the proposed Project would not exceed the Noise
5 Ordinance standard of 45 dBA at night for any occupied "rural community" location.
6 Therefore, the impact of operational noise relative to applicable community noise standards
7 would be less than significant.
8

9 With implementation of DRECP CMAs and mitigation measures, impacts would be less
10 than significant. (EIR pp. 3.13-8 to 3.13-12).
11

12 **Applicant Proposed Measures:**

13 **APM NOISE-1 (Construction Timing)** Applicant will avoid or minimize use of any impact
14 hammer for pile driving or other equipment similarly capable of producing disruptive noise
15 during construction activities within a one-mile radius from the residential parcel on the
16 northeast corner of around the Lake Tamarisk Desert Resort community during the winter
17 months of highest residency (November 1 to March 31). If based on the final construction
18 schedule, use of such equipment is necessary within this geographic area during the
19 aforementioned time period, the Applicant will avoid or minimize this construction activity
20 prior to 7:00 a.m. and after 6:00 p.m. The Applicant will also avoid nighttime equipment
21 deliveries between 10:00 p.m. and 7:00 a.m.

22 **Mitigation Measures:**

23 **MM N-1 (Construction Restrictions)** Heavy equipment operation, noisy construction work
24 relating to any Project features onsite, and truck trips associated with materials and
25 equipment deliveries shall be restricted to the times delineated below, unless a special permit
26 has been issued by the County of Riverside: during June through September, between 6 a.m.
27 to 6 p.m.; and during October through May, between 7:00 a.m. to 6:00 p.m.
28

1 Haul truck engines and other engines powering fixed or mobile construction equipment shall
2 be equipped with adequate mufflers. Haul trucks shall be operated in accordance with posted
3 speed limits. Truck engine exhaust brake use shall be limited to emergencies.

4 The construction contractor shall locate equipment staging in areas to create the greatest
5 distance between construction-related noise sources and noise sensitive receivers nearest the
6 Project site during Project construction. Where feasible, the construction contractor shall
7 place all stationary construction equipment so that emitted noise is directed away from the
8 noise sensitive receptors nearest the Project site. No music or electronically reinforced
9 speech from construction workers shall be audible at noise-sensitive properties.

10
11 **MM N-2 (Public Notification Process)** At least 15 days prior to the start of ground
12 disturbance, the Project owner shall notify all residents within one mile of the Project site
13 and the linear facilities, by mail or by other effective means, of the commencement of Project
14 construction. At the same time, the Project owner shall establish a telephone number for use
15 by the public to report any undesirable noise conditions associated with the construction and
16 operation of the Project. If the telephone is not staffed 24 hours a day, the Project owner
17 shall include an automatic answering feature, with date and time stamp recording, to answer
18 calls when the phone is unattended. This telephone number shall be posted at the Project site
19 during construction where it is visible to passersby. This telephone number shall be
20 maintained until the Project has been operational for at least one year.

21 **MM N-3 (Noise Complaint Process)** Throughout the construction and operation of the
22 Project, the Project owner shall document, investigate, evaluate, and attempt to resolve all
23 Project-related noise complaints. The Project owner or authorized agent shall:
24

- 25 1. Use a Noise Complaint Resolution Form, or other documentation procedure acceptable
26 to the County, to record and report the Project owner's response to resolving each noise
27 complaint;
28

2. Attempt to contact the person(s) making the noise complaint within 24 hours;
3. Conduct an investigation to determine the source of noise in the complaint;
4. If the noise is Project-related, take all feasible measures to reduce the source of the noise; and
5. Submit a report to the County documenting the complaint and actions taken. The report shall include: a complaint summary, including the final results of noise reduction efforts and, if obtainable, a signed statement by the complainant stating that the noise problem has been resolved to the complainant's satisfaction.

DRECP CMAs:

Applicable CMAs are detailed in EIR Appendix CC, which provides a list of CMAs, an explanation of their applicability, and demonstration of compliance with each CMA.

I. Paleontological Resources

Impact: Paleontological Resources (PR-1)

Threshold: *The proposed project would not directly or indirectly destroy a unique paleontological resource or site or unique geologic feature with implementation of mitigation measures.*

Findings of Fact, Less Than Significant with Mitigation Measures:

Significant paleontological resources are determined to be fossils or assemblages of fossils that are unique, unusual, rare, uncommon, or diagnostically important. Most impacts on paleontological resources are direct impacts, resulting from ground-disturbing activities that would damage or destroy resources. No mass grading would be required; however, some areas of the solar site would be affected by some form of ground disturbance, including mowing, grubbing, minor grading, compaction, and excavation.

The desktop paleontological assessment conducted for the Project identified paleontological resources in the Project vicinity and the paleontological field survey identified

paleontological resources on the Project site, including four significant vertebrate fossils. Significant paleontological resources could be encountered and adversely impacted (damaged or destroyed) during ground disturbance associated with Project construction.

The moderate to high sensitivity of the formations and known and potential paleontological resources underlying the Project site necessitates the implementation of a Paleontological Resources Monitoring and Mitigation Plan (PRMP) and worker awareness training to minimize the impact of construction-related activities. Mitigation Measures PR-1 through PR-4 would require a PRMP, paleontological awareness training, paleontological monitoring where appropriate, and mitigation and recovery procedures in the event of a discovery. Implementation of Mitigation Measures PR-1 through PR-4, and the installation of fencing around the perimeter of the Project facility, would minimize the potential for indirect impacts, such as unauthorized collection of resources, to paleontological resources by limiting unauthorized access to the site, putting in place a monitoring program to ensure fossil identification and recording during construction, and providing an educational program to workers so that paleontological resources are avoided or reported to qualified professionals. With implementation of DRECP CMAs and Mitigation Measures PR-1 through PR-4, potential adverse impacts on paleontological resources within the Project area during construction and operation of the solar facilities would be reduced to a less-than-significant level. (EIR pp. 3.14-8 and 3.14-9).

Mitigation Measures:

MM PR-1 (Paleontological Resource Monitoring and Mitigation Plan [PRMP]) Prior to the start of any Project-related construction activities, the Applicant shall retain a County- and BLM-approved paleontologist (Project Paleontologist) to prepare and implement a project-specific PRMP to be approved by the County and BLM. The Project Paleontologist shall hold a BLM-issued Paleontological Resource Use Permit and be responsible for implementing all the paleontological conditions of approval and for using qualified paleontologists to assist in work and field monitoring.

At a minimum, information to be contained in the PRMP, in addition to other information

1 required under industry standard, Society of Vertebrate Paleontology standards, and BLM
2 paleontology program policy and standards, is as follows:

- 3 • Identification (name) and qualifications of the Project Paleontologist and
4 qualified paleontological monitors to be employed for grading operations monitoring.
- 5 • Identification of personnel with authority and responsibility to temporarily
6 halt or divert grading equipment to allow for recovery of large specimens.
- 7 • Description of the project site and planned earthwork and excavation.
- 8 • A site-specific plan and map prepared by the Project Paleontologist which
9 identifies construction impact areas with sediments of High (PFYC 4) and Moderate
10 (PFYC 3a) sensitivity for encountering significant paleontological resources and the
11 approximate depths at which those resources are likely to be encountered for each Project
12 component.
- 13 • The PRMP shall require the qualified paleontological monitor(s) to monitor
14 all construction-related earth-moving activities in sediments determined to have a High
15 (PFYC 4) sensitivity.
- 16 • The PRMP shall define monitoring procedures and methodology and shall
17 specify that sediments of Moderate (PFYC 3a) or undetermined sensitivity shall be
18 monitored on a part-time basis (as determined by the Project Paleontologist). Sediments
19 with very low or low potential will not require paleontological monitoring (PFYC 1 and
20 2).
- 21 • The PRMP shall detail methods of recovery, preparation, and analysis of
22 specimens, the final curation location of specimens at the repository identified in the
23 BLM-issued Paleontological Resource Use Permit, data analysis, and reporting. Where
24 possible, recovery is preferred over avoidance in order to mitigate the potential for
25 looting of paleontological resources.
- 26 • The PRMP shall specify that all paleontological work undertaken by the
27 Applicant on public lands administered by BLM shall be carried out by qualified,
28

permitted paleontologists with the appropriate current BLM Paleontological Resources Use Permit.

- Identification of personnel with authority and responsibility to temporarily halt or divert ground-disturbance activities to allow for recovery of large specimens.
- The PRMP shall be submitted to the County and BLM for review and approval 60 days prior to start of Project construction. The PRMP must be approved by the County and BLM prior to the Notice To Proceed.

MM PR-2 (Worker Environmental Awareness Program (WEAP)) Prior to the start of Project-related construction activities, a paleontological component to the WEAP shall be developed by the Project Paleontologist. The WEAP shall address the potential to encounter paleontological resources in the field, the sensitivity and importance of these resources, and the legal obligations to preserve and protect such resources. The training program shall also include the set of reporting procedures that workers are to follow if paleontological resources are encountered during Project activities. The WEAP may be combined with other environmental training programs for the Project. All field personnel will receive WEAP training on paleontological resources prior to Project-related construction activities.

MM PR-3 (Paleontological Monitoring and Fossil Recovery) The PRMP shall identify monitoring frequency and intensity of all areas of the Project site, particularly in areas underlain by geologic units assigned paleontological sensitivity of High (PFYC 4) or Moderate (PFYC 3a). Monitoring will entail the visual inspection of excavated or graded areas and trench sidewalls. If the Project Paleontologist determines full-time monitoring is no longer warranted, based on the geologic conditions at depth, he or she may recommend to the BLM Authorized Officer that monitoring be reduced or cease entirely.

In the event that a paleontological resource is discovered, the paleontological monitor will have the authority to temporarily divert the construction equipment around the find until it is assessed for scientific significance and, if appropriate, collected. If the resource is determined to be of scientific significance, the Project Paleontologist shall complete the

following:

- Salvage of Fossils. If fossils are discovered, all work in the immediate vicinity shall be halted to allow the paleontological monitor, and/or Project Paleontologist to evaluate the discovery and determine if the fossil may be considered significant. If the fossils are determined to be potentially significant, the Project Paleontologist (or paleontological monitor) will recover them following standard field procedures for collecting paleontological as outlined in the PRMP prepared for the Project. The Project Paleontologist shall have the authority to temporarily direct, divert or halt construction activity to ensure that the potentially significant fossil(s) can be removed in a safe and timely manner.

- Fossil Preparation and Curation. The museum that has agreed to accept fossils that may be discovered during Project-related excavations will be identified on the Paleontological Resources Use Permit held by the Project Paleontologist and in the PRMP. Upon completion of Project ground-disturbing activities, all significant fossils collected shall be prepared in a properly equipped laboratory to a point ready for curation. Preparation may include the removal of excess matrix from fossil materials and stabilizing or repairing specimens. During preparation and inventory, the fossils specimens shall be identified to the lowest taxonomic level practical prior to curation at an accredited museum. The fossil specimens must be delivered to the County- and BLM-approved repository (identified on the permit and in the PRMP) and receipt(s) of collections submitted to the County and BLM no later than 60 days after all ground-disturbing activities are completed.

MM PR-4 (Paleontological Resources Monitoring Report)

The Applicant shall ensure preparation of a paleontological resource mitigation and monitoring report by the Project Paleontologist following completion of ground-disturbing activities. The contents of the report shall include, but not be limited to, a description and inventory list of recovered fossil materials (if any); a map showing the location of paleontological resources found in the field;

determinations of scientific significance; proof of accession of fossil materials into the pre-approved museum or other repository; and a statement by the Project Paleontologist that Project impacts to paleontological resources have been mitigated. The report shall be certified by the professionally qualified Project Paleontologist responsible for the content of the report and submitted to the County and BLM. In addition, all appropriate fossil location information shall be submitted to the Western Information Center, San Bernardino County Museum, and Los Angeles County Museum of Natural History, at a minimum, for incorporation into their Regional Locality Inventories.

DRECP CMAs:

Applicable CMAs are detailed in EIR Appendix CC, which provides a list of CMAs, an explanation of their applicability, and demonstration of compliance with each CMA.

J. Traffic and Transportation

***Impact:** Compliance with Transportation Plans (TRA-1)*

***Threshold:** The proposed project would not conflict with an applicable plan, ordinance, or policy addressing the circulation system, including transit, roadway, bicycle and pedestrian facilities with implementation of mitigation measures.*

Findings of Fact, Less Than Significant with Mitigation Measures:

The addition of Easley Project-related construction trips to the ambient conditions (Sapphire Project plus three projects in O&M) could result in three intersections operating at LOS F, an unacceptable level: (1) I-10 westbound ramp at SR-177 – LOS F (AM Peak Hour), (2) Rice Road (SR-177) at Ragsdale Road – LOS F (PM Peak Hour), and (3) Rice Road (SR-177) at Kaiser Road (County Route R2) – LOS F (PM Peak Hour).

To ensure that impacts from temporary construction-related trips are reduced to the extent feasible, Mitigation Measure TRA-1 (Construction Traffic Control Plan) is proposed and would require the applicant prepare a Construction Traffic Control Plan for review and approval by Caltrans and Riverside County. This plan requires the applicant to reduce

1 construction-related trips during morning (7:00 a.m. to 9:00 a.m.) and afternoon (4:00 p.m.
2 to 6:00 p.m.) peak hours on I-10 and SR-177. If the traffic conditions at the time of Project
3 construction reflect the ambient conditions due to overlapping construction, the measure
4 requires the applicant to install a temporary signal or use manual intersection control, and
5 geometry changes at the I-10 westbound ramp at SR-177. Without the cumulative trips, the
6 Project is not expected to result in an unacceptable LOS as it would result in fewer vehicle
7 trips than the ambient conditions. The measure allows for adaptive management given the
8 uncertain schedule for some projects included in the ambient conditions. With the
9 implementation of Mitigation Measure TRA-1, impacts from temporary construction-related
10 vehicle trips to the performance of Project area roadways would be less than significant.

11
12 During project operations, it is estimated average daily traffic volumes associated with
13 Project operation would be approximately 15 daily round trips (30 total trips), with the
14 majority being passenger vehicles. The addition of 30 daily trips would have a negligible
15 effect on performance of the study area transportation system and less than significant
16 impacts would occur.

17 Construction of the solar facility is not expected to require any temporary lane closures that
18 could restrict the movements of vehicles or pedestrians. However, construction of the Project
19 would require large vehicles to travel on local roadways to access the Project site. MM TRA-
20 1 (Construction Traffic Control Plan) requires the Construction Traffic Control Plan be
21 reviewed and approved by Caltrans and Riverside County and includes provisions for
22 ensuring detours or safe movement of traffic through all affected areas. With the
23 implementation of this measure, impacts related to transit, bicycle, and pedestrian use during
24 construction would be less than significant.

25
26 Once constructed, maintenance activities would occur as needed at the solar facility but are
27 not expected to require any temporary travel lane closures that could restrict the local
28 circulation system. Impacts related to transit, bicycle, and pedestrian use during project

operations would be less than significant. (EIR pp. 3.18-14 to -15).

Mitigation Measures:

MM TRA-1 (Construction Traffic Control Plan) Prior to the start of construction, the Project owner shall submit a Construction Traffic Control Plan for review and approval by Caltrans and Riverside County for affected roads and intersections that would be directly affected by the construction activities and/or would require permits and approvals. The Construction Traffic Control Plan shall include, but not be limited to:

- If multiple construction projects occur at the same time and conditions at the intersection warrant, plans for installation of a temporary signal or use of manual intersection control during the construction period at the I-10 westbound ramp at SR-177. Additionally, if conditions warrant, geometry changes shall be considered in coordination with Caltrans and Riverside County, and implemented, if necessary, in addition to signalization at the I-10 westbound ramp and SR-177. These geometry changes could include a turn pocket.
- The locations and use of flaggers, warning signs, barricades, delineators, cones, arrow boards, etc., according to standard guidelines outlined in the Manual on Uniform Traffic Control Devices, the Standard Specifications for Public Works Construction, and/or the California Joint Utility Traffic Control Manual.
- The locations of all road or traffic lane segments that would need to be temporarily closed or disrupted due to construction activities.
- The locations where guard poles, netting, or similar means to protect transportation facilities for any construction or conductor installation work requiring the crossing of a local street or highway is proposed.
- The use of continuous traffic breaks operated by the California Highway Patrol on state highways (if necessary).

- 1 ▪ Additional methods to reduce temporary traffic delays to the maximum extent feasible
2 during morning (7:00 a.m. to 9:00 a.m.) and afternoon (4:00 p.m. to 6:00 p.m.) peak traffic
3 periods, or as directed in writing by the affected public agency in encroachment or other
4 permits). This should also include feasible ways to avoid construction-related trips on I-
5 10 and SR-177 during peak traffic periods.
- 6 ▪ Plans to encourage or provide ridesharing/carpooling opportunities for construction and
7 operational workers.
- 8 ▪ Plans to provide written notification to property owners and tenants at properties affected
9 by access restrictions to inform them about the timing and duration of obstructions and to
10 arrange for alternative access if necessary. The coordination shall occur at least one week
11 prior to any blockages.
- 12 ▪ Plans to coordinate in advance with emergency service providers to avoid restricting the
13 movements of emergency vehicles. Police departments and fire departments shall be
14 notified in advance by the Project owner of the proposed locations, nature, timing, and
15 duration of any roadway disruptions, and shall be advised of any access restrictions that
16 could impact their effectiveness. At locations where roads will be blocked, provisions shall
17 be ready at all times to accommodate emergency vehicles, such as immediately stopping
18 work for emergency vehicle passage, providing short detours, and developing alternate
19 routes in conjunction with the public agencies.
- 20 ▪ Define the method to maintaining close coordination, prior to and during construction,
21 with Caltrans and Riverside County to minimize cumulative impacts of multiple
22 simultaneous construction projects affecting shared portions of the circulation system.
23 Coordination with adjacent development projects to spread work shifts into multiple hours
24 (instead of peak hour) or the installation of additional temporary traffic signals or manual
25 traffic control officers during peak hours to mitigate the temporary impacts.

26 *Impact: Vehicle Miles Travelled (TRA-2)*

Threshold: The proposed project would not conflict or be inconsistent with CEQA Guidelines section 15064.3, subdivision (b) regarding transportation impacts with implementation of mitigation measures.

Findings of Fact, Less Than Significant with Mitigation Measures:

Construction of the Project would average 320 workers per day who would commute to the Project site with a maximum of 530 workers during peak construction. In addition, an estimated 80 round trips per day would be required to deliver materials and equipment to the Project site. Per State CEQA Guidelines Section 15064.3(b)(3), a qualitative VMT analysis of construction trips is appropriate, given that the construction-related trips are not ongoing once construction is completed. Due to the remote location of the Project site, many construction truck trips may require high VMT to access the site. However, all construction-related truck trips would be temporary and only in volumes necessary to deliver equipment and materials to the site. Upon completion of construction, all truck trips and construction worker commute trips would cease. At this time, no known applicable VMT thresholds of significance for temporary construction trips that may indicate a significant impact are known. MM TRA-1 (Construction Traffic Control Plan) requires the Applicant to prepare a Construction Traffic Control Plan, with the Plan providing means to encourage or provide ridesharing opportunities for construction workers. Therefore, while the proposed Project would include temporary construction trips that may include high VMT, they would not affect existing transit uses or corridors and are presumed to cause a less than significant transportation impact.

Once constructed, operation and maintenance of the Project would generate very few vehicle trips. Project operation is not considered to result in high VMTs that could adversely affect transit or transportation planning for the area. Therefore, operational-related trips would not affect existing transit uses or corridors and are presumed to cause a less-than-significant transportation impact. (EIR p. 3.18-16 to -17).

Mitigation Measures:

MM TRA-1 (Construction Traffic Control Plan) Full text under Traffic and Transportation.

Impact: Roadway Safety (TRA-3)

Threshold: *The proposed project would not increase transportation hazards due to a geometric design feature or incompatible use with implementation of mitigation measures.*

Findings of Fact, Less Than Significant with Mitigation Measures:

Most construction traffic would access the Project area via I-10 and SR-177, accessing private site entrances from SR-177 and Kaiser Road adjacent to the Project site. Due to the flat topography, both the freeway and local roadways accessing the site have a relatively straight horizontal alignment with good visibility in all directions. All access driveways to the site from SR-177 would comply with County and Caltrans requirements to ensure safe site ingress and egress. Traffic on public freeways and roads would be of the same vehicle types (passenger vehicles and heavy trucks) that currently occur and are allowed. Construction-related traffic would be compatible with existing traffic. Therefore, no additional roadway hazards would occur from Project-related vehicle trips on transportation facilities. Additionally, MM TRA-1 (Construction Traffic Control Plan) requires the preparation of a Construction Traffic Control Plan to be reviewed and approved by Caltrans and Riverside County. This Plan includes provisions for ensuring detours or safe movement of local resident vehicles, pedestrians, and bicycles through all affected facilities. With the incorporation of this mitigation, hazard impacts from Project-related vehicle use of public roadways would be less than significant.

The movement of heavy trucks and equipment on public roads to Project work areas could potentially result in damage to road surfaces, shoulders, curbs, sidewalks, signs, and light standards. MM TRA-2 (Repair Roadways and Transportation Facilities Damaged by Construction Activities) is proposed to ensure any damage and deterioration attributed to the Project would be repaired. With the incorporation of this mitigation, hazard impacts from

1 transportation facility damage demonstrable to the Project would be less than significant.

2
3 The 500 kV gen-tie line would cross SR-177 overhead, requiring temporary lane closures
4 when the conduit is strung between towers east and west of the highway. Collector lines
5 from the solar arrays located east of SR-177 would be installed under SR-177 using
6 directional drilling. Traffic would not be affected.

7 During operations and maintenance, it is estimated average daily traffic volumes associated
8 with the Project would be approximately 15 round trips (30 total trips), with the majority
9 being passenger vehicles. This amount of operational daily trips would have a negligible
10 effect on public roadway safety, and MM TRA-1 would encourage carpooling. Therefore,
11 impacts would be less than significant with mitigation. (EIR p. 3.18-17).

12 **Mitigation Measures:**

13 **MM TRA-1 (Construction Traffic Control Plan) Full text under Traffic and**
14 **Transportation.**

15 **MM TRA-2 (Repair Roadways and Transportation Facilities Damaged by**
16 **Construction Activities)** If roadways, sidewalks, medians, curbs, shoulders, or other such
17 transportation features are damaged by Project construction activities, as determined by the
18 affected public agency, such damage shall be repaired and restored to their pre-Project
19 condition by the Project owner. Prior to construction, the Project owner shall confer with
20 Caltrans and Riverside County regarding the roads within 500 feet in each direction of
21 Project access points (where heavy vehicles will leave public roads to reach Project sites)
22 and regarding the roads to be crossed by the proposed gen-tie line. At least 30 days prior to
23 construction, or as requested by Riverside County or Caltrans, the Project owner shall
24 photograph or video record all affected roadway segments and shall provide Riverside
25 County and Caltrans with a copy of these images, if requested.

26
27 At the end of major construction, the Project owner shall coordinate with each affected
28 jurisdiction to confirm whether repairs are required. Any damage demonstrable to the Project

1 is to be repaired to the pre-construction condition within 60 days from the end of all
2 construction, or on a schedule mutually agreed to by the Project owner and the affected
3 jurisdiction. If multiple projects are using the transportation features, the Easley Project
4 owner shall pay its fair share of the required repairs. the Project owner shall provide
5 Riverside County and Caltrans (as applicable) proof when any necessary repairs have been
6 completed.

7
8 ***Impact: Emergency Response (TRA-4)***

9 ***Threshold:*** *The proposed project would not result in inadequate emergency response access*
10 *or access to nearby properties with implementation of mitigation measures.*

11 Findings of Fact, Less Than Significant with Mitigation Measures:

12 Construction of the solar facility is not expected to require temporary lane closures that
13 could restrict the movements of emergency vehicles. The Project site would have controlled
14 access points for ingress and egress at the site. These access points would allow for
15 emergency vehicle access into and through the site. The Project would not block access to
16 nearby properties. Therefore, impacts during construction would be less than significant.

17 Once constructed, maintenance activities would occur as needed at the solar facility but are
18 not expected to require any temporary travel lane closures that could restrict emergency
19 vehicle movements. Emergency responders would have access to any locked gates into the
20 site. Impacts would be less than significant.

21 Construction of the gen-tie line may require temporary closure or disruption to travel lanes.
22 Mitigation Measure TRA-1 (Construction Traffic Control Plan) is proposed to provide
23 specificity regarding the means to reduce potential impacts from any temporary travel lane
24 disruptions during construction of the gen-tie line. Additionally, Mitigation Measure TRA-
25 1 (Construction Traffic Control Plan) requires the Construction Traffic Control Plan be
26 reviewed and approved by Caltrans and Riverside County and would include plans to
27 coordinate in advance with emergency service providers to avoid restricting the movements
28 of emergency vehicles. With the incorporation of this mitigation, impacts from temporary

1 construction-related disruptions to the affected circulation system would be less than
2 significant. Once operational, there would be no impacts to emergency access or vehicle
3 movement. (EIR pp. 3.18-18 to -19).

4 **Mitigation Measures:**

5 **MM TRA-1 (Construction Traffic Control Plan) Full text under Traffic and**
6 **Transportation.**

7
8 **K. Wildfire**

9 ***Impact:** Emergency Response Plan (FIRE-1)*

10 ***Threshold:** The proposed project would not substantially impair an adopted emergency*
11 *response plan or emergency evacuation plan with implementation of mitigation measures.*

12 **Findings of Fact, Less Than Significant with Mitigation Measures:**

13 The Project would be constructed in a remote area with existing, approved, and proposed
14 solar projects nearby. SR-177 would be the primary access road to the solar facility site, and
15 several ingress/egress points would be established for construction access. An internal
16 roadway system would be constructed to provide access within the Project site. Construction
17 of the solar facility, battery energy storage system (BESS), and other components would not
18 require any temporary lane closures on public roads. Although construction vehicles would
19 be present on public roads to access the Project site, construction of the solar facility is not
20 expected to restrict the movements of emergency vehicles. The new ingress and egress points
21 at the Project site would allow for emergency vehicles access into and through the site, as
22 well as provide controlled access for construction vehicles. Mitigation Measure (MM) TRA-
23 1 (Construction Traffic Control Plan) is proposed to provide specificity to reduce potential
24 impacts from any temporary travel lane disruptions during construction of the gen-tie line,
25 reducing the impacts from temporary construction-related traffic disruptions to less than
26 significant.

27
28 Construction of the gen-tie line would primarily occur within the 175-foot BLM right-of-

1 way, but this disturbance would not obstruct any public rights-of-way. A small section of
2 the gen-tie line would be strung across SR-177, potentially requiring temporary lane closures
3 during stringing of the wire between towers east and west of SR-177. Mitigation Measure
4 (MM) TRA-1 (Construction Traffic Control Plan) is proposed to provide specificity to
5 reduce potential impacts from any temporary travel lane disruptions during construction of
6 the gen-tie line. MM TRA-1 (Construction Traffic Control Plan) requires the Construction
7 Traffic Control Plan be reviewed and approved by Caltrans and Riverside County and would
8 include plans to coordinate in advance with emergency service providers to avoid restricting
9 the movements of emergency vehicles (see Impact TRA-4 in Section 3.18, Traffic and
10 Transportation, for full text). With the incorporation of this mitigation measure, impacts
11 from temporary construction-related traffic disruptions would be less than significant

12 Maintenance activities are not expected to require any temporary lane closures that could
13 restrict emergency vehicle movements due to the small number of employees (up to 10
14 permanent staff) that may travel to the site. Additionally, staff would be located off site and
15 would be available to respond to alerts generated by the monitoring equipment at the Project
16 site. Access roads would provide a fire buffer as well as facilitate on-site circulation for
17 emergency vehicles. Impacts during Project operations would be less than significant.

18 Decommissioning the Project would require similar equipment and workforce as Project
19 construction but would be substantially less intense, and therefore, would result in less-than-
20 significant impacts associated with emergency response plans or evacuation plans. (EIR pp.
21 3.19-5 and 3.19-6)

22
23 **Mitigation Measures:**

24 **MM TRA-1 (Construction Traffic Control Plan) Full text under Traffic and**
25 **Transportation.**

26
27 *Impact: Emergency Response Plan (FIRE-2)*

28 *Threshold: The proposed project would not expose Project occupants to pollutant*

1 *concentrations from a wildfire or the uncontrolled spread of a wildfire with implementation*
2 *of mitigation measures.*

3 Findings of Fact, Less Than Significant with Mitigation Measures:

4 The Project is not located in a high or very high FHSZ, and thus would not be in an area
5 prone to wildfires. Wildfires in California typically occur in heavily forested areas and
6 vegetated grassy hillsides, and communities generally at highest risk of wildfire hazards are
7 those located within these areas or in the wildland urban interface. Due to the presence of
8 sparse vegetation, relatively flat topography, the remote location of the Project, and its desert
9 setting, the potential for the Project to exacerbate wildfire risks and expose nearby residences
10 to the hazards of wildfire is low. Prior to construction, vegetation would be mowed, grubbed,
11 rolled, cut, or cleared. Reduction of vegetation would reduce the availability of flammable
12 fuels around the Project site. Wires would be buried at a minimum of 18 inches below grade,
13 minimizing the potential for faulty wiring to ignite a fire, and prior to wire setup, work areas
14 would be cleared of vegetation to reduce the risk of ignition from any vehicles or equipment.
15 All electric inverters and the transformer would be constructed on concrete foundation
16 structures or steel skids and tested prior to use to ensure safe operations and to minimize fire
17 risks. Small quantities of hazardous chemicals such as fuels and greases would be stored in
18 appropriate containers in an enclosed and secured location with secondary containment to
19 prevent leakages and accidental fires. During construction, a fire suppression system would
20 be placed in service if required by the County or BLM Fire. Fire extinguishers and other
21 portable firefighting equipment would be available on site and would be maintained in
22 accordance with State and federal Occupational Safety and Health Administration (OSHA)
23 requirements.

24 As described in EIR section 2.5.13, fire safety measures would be implemented as part of
25 the Project to limit risk of personnel injury, property loss, and potential disruption of
26 electrical generation. The project's Fire Management and Prevention Plan would includes
27 standards for construction, would comply with applicable BLM and Riverside County
28

1 regulations, and would be developed in coordination with the BLM and the RCFD.
2 Implementation of DRECP CMAs and MM FIRE-1 (Fire Safety) would further reduce the
3 risk of fire and would specify Fire Management and Prevention Plan elements to address
4 fire-safe construction measures, including welding, reduction of ignition sources, control of
5 fuel sources, availability of water, and property maintenance of firefighting systems. The
6 Project's location, components, safety measures, and implementation of MMs would ensure
7 the safe construction of the solar facility. As such, the proposed Project would not exacerbate
8 wildfire risks or expose workers and residents to pollutant concentrations from a wildfire or
9 the uncontrolled spread of wildfire. Construction of the solar facility and BESS would result
10 in less-than-significant impacts with mitigation.

11 The gen-tie transmission structures would be constructed with either monopoles, lattice steel
12 structures, or wooden H-frame poles and would not exacerbate fire risks, as foundations
13 would be constructed with concrete foundations. Construction of the gen-tie transmission
14 line and structures would use existing access roads where feasible. During construction,
15 vegetation within the gen-tie corridor would be reduced or cleared as part of fire safety
16 measures to reduce the likelihood of ignition from vehicles or equipment. As described
17 previously, fire safety measures would be implemented to ensure that construction of the
18 Project components, including the gen-tie line, are implemented in accordance with
19 applicable fire protection and environmental, health, and safety requirements. As such,
20 construction of the Project's gen-tie line would result in less-than-significant impacts

21
22 Once operational, up to 10 workers are anticipated to perform daily visual inspections and
23 minor repairs to ensure all Project components are in good working condition. Due to the
24 reduction vehicle trips and workers, the risk of on-site accidental fires caused by human
25 activities such as smoking, hot work (i.e., welding), and improper vehicle operation would
26 be reduced. The Project facility would be monitored by both on-site and remote O&M
27 personnel. Vegetation maintenance would ensure that flammable vegetation would not grow
28 within access roads or electrical components. Fire hazards during operation of the solar

1 facility would be reduced with implementation of DRECP CMAS, the Fire Management and
2 Prevention Plan and MM FIRE-1 (Fire Safety) and would ensure the impact from operation
3 of the solar facility is less than significant.

4 Solar arrays and photovoltaic modules are fire-resistant and would not be susceptible to
5 ignition from fires. In a potential wildfire situation, the panels would be rotated and stowed
6 in a panel-up position that could slow the spread of a fire. Security at the Easley solar facility
7 would continue to be provided by a 6-foot-tall chain-link fence and barbed wire to prevent
8 vandalism, damage, or theft of Project components during operations.

9
10 The Project includes operation of an up to 650-MW BESS. Potential electrical fires would
11 be contained within the BESS enclosures and would not spread beyond them. The BESS
12 would be installed following all applicable design, safety, and fires standard for the
13 installation of energy storage systems. Furthermore, MM FIRE-1 includes a measure to
14 include information about the type of BESS technology on site, potential hazards, and
15 procedures for disconnecting or shutting down the BESS in case of an accidental fire. The
16 BESS's impact of exposure of people to pollutant concentrations from a wildfire or the
17 uncontrolled spread of a wildfire to less than significant with implementation of mitigation
18 measures and DRECP CMAs

19 Wildfire risk along the gen-tie corridor would be minimal due to the lack of substantial
20 vegetation, and concrete foundations would further reduce the spread of fire. As described
21 previously, fire safety measures would be implemented to ensure that operation of the
22 Project components, including the gen-tie line, are implemented in accordance with
23 applicable fire protection and environmental, health, and safety requirements, which require
24 vegetation clearance, regular inspections and maintenance, and monitoring weather
25 conditions such as high-wind conditions. As such, operation of the Project's gen-tie line
26 would result in less-than-significant impacts.

27
28 Decommissioning of the solar facility, BESS, gen-tie line, and other Project components

1 would require a similar workforce and equipment as Project construction, but at a lower
2 intensity. Decom-mis-sion-ing activities would follow the same DRECP CMAs and fire
3 safety measures as construction, including adherence to the Fire Management and
4 Prevention Plan. Implementation of MM FIRE-1 would include additional measures to the
5 Fire Management and Prevention Plan, such as fire prevention procedures and emergency
6 response that would minimize the likelihood of a wildfire from starting or spreading. Impacts
7 would be less than significant with mitigation. (EIR pp. 3.19-6 to 3.19-9)

8
9 **Mitigation Measures:**

10 **MM FIRE-1 (Fire Safety)** The Fire Management and Prevention Plan prepared by the
11 Project owner to ensure the safety of workers and the public and minimize fire risk during
12 construction, operation and maintenance, and decommissioning for the Project shall include,
13 but not be limited to, the following elements:

- 14 • Procedures for minimizing potential ignition, including, but not limited to,
15 vegetation clearing, parking requirements/restrictions, idling restrictions, smoking
16 restrictions, proper use of gas-powered equipment, and hot work restrictions.
- 17 • Work restrictions during Red Flag Warnings and High to Extreme Fire
18 Danger days.
- 19 • All internal combustion engines used at the Project site shall be equipped
20 with spark arrestors. Spark arrestors shall be in good working order.
- 21 • Once new access roads have been cut and initial fencing completed, light
22 trucks and cars shall be used only on roads where the roadway is cleared of vegetation.
23 Mufflers on all cars and light trucks shall be maintained in good working order.
- 24 • Fire rules shall be posted on the Project bulletin board at the contractor's field
25 office and areas visible to employees.
- 26 • Equipment parking areas and small stationary engine sites shall be cleared of
27 all flam-mable materials.
28

1 • Smoking shall be prohibited in all vegetated areas and within 50 feet of
2 combustible materials storage and shall be limited to paved areas or areas cleared of all
3 vegetation.

4 • Each construction site (if construction occurs simultaneously at various
5 locations) shall be equipped with fire extinguishers and fire-fighting equipment
6 sufficient to extinguish small fires.

7 • The Project owner shall coordinate with BLM and RCFD to create a training
8 com-ponent for emergency first responders to prepare for specialized emergency
9 incidents that may occur at the Project site, including incidents such as fire or explosion
10 at or with the BESS.

11 • The plan shall include information about the type of BESS technology on
12 site, potential hazards, and procedures for disconnecting or shutting down the BESS in
13 case of fire or to reduce the chance of fire.

14 • All construction workers, plant personnel, and maintenance workers visiting
15 the plant and/or transmission lines to perform maintenance activities shall receive
16 training on fire prevention procedures, the proper use of firefighting equipment, and
17 procedures to be followed in the event of a fire. Training records shall be maintained and
18 be available for review by BLM and RCFD. Fire prevention procedures shall be included
19 in the Project's Worker Environmental Awareness Program.

20 • Vegetation near all solar panel arrays, ancillary equipment, and access roads
21 shall be controlled through periodic cutting and spraying of weeds, in accordance with
22 the Weed Management Plan.

23 • BLM and RCFD shall be consulted during plan preparation and fire safety
24 measures recommended by these agencies included in the plan.

25 • The plan shall list fire prevention procedures and specific emergency
26 response and evac-uation measures that shall be required to be followed during
27 emergency situations.
28

1 • All on-site employees shall participate in annual fire prevention and response
2 training exercises with the BLM and RCFD.

3 • The plan shall list all applicable wildland fire management plans and policies
4 estab-lished by state and local agencies and demonstrate how the Project will comply
5 with these requirements.

6 • The Project owner shall designate an emergency services coordinator from
7 among the full-time on-site employees who shall perform routine patrols of the site
8 during the fire season equipped with a portable fire extinguisher and communications
9 equipment. The Project owner shall notify BLM and RCFD of the name and contact
10 information of the current emergency services coordinator in the event of any change.

11 • Remote monitoring of all major electrical equipment (transformers and
12 inverters) will screen for unusual operating conditions. Higher than nominal
13 temperatures, for exam-ple, can be compared with other operational factors to indicate
14 the potential for over-heating which under certain conditions could precipitate a fire.
15 Units could then be shut down or generation curtailed remotely until corrective actions
16 are taken.

17 • Fires ignited on site shall be immediately reported to BLM and RCFD.

18 • The engineering, procurement, and construction contract(s) for the Project
19 shall pro-vide reference to or clearly state the requirements of this mitigation measure.

20 • The Project owner must provide the Fire Management and Prevention Plan
21 to BLM for review and approval and to RCFD for review and comment before
22 construction.
23

24
25 **DRECP CMAs:**

26 Applicable CMAs are detailed in EIR Appendix CC, which provides a list of CMAs, an
27 explanation of their applicability, and demonstration of compliance with each CMA.
28

Impact: *Emergency Response Plan (FIRE-3)*

Threshold: *The proposed project would not require the installation and maintenance of infrastructure such as roads, fuel breaks, emergency water sources, power lines, or other utilities that may exacerbate the risk of fire with implementation of mitigation measures.*

Findings of Fact, Less Than Significant with Mitigation Measures:

Construction of the solar facility would result in the installation of infrastructure to support the generation, delivery, and storage of electricity. Prior to construction, vegetation would be mowed, grubbed, rolled, cut, or cleared. The reduced amount of already-sparse vegetation would minimize the potential ignition of vegetation. Construction activities would involve the use of heavy construction equipment and vehicles to install the solar facility's components over the course of approximately 20 months. Electrical components that may pose a risk of fire include the electrical distribution line, transformers, batteries, substations, gen-tie line, and the switchyard. Because these components are located in a sparsely vegetated and remote location away from densely populated areas, the potential for faulty electrical equipment to exacerbate fire risks for populated areas is minimal. Additionally, assembly and installation of the electrical equipment would meet existing electrical and safety standards. The solar PV panels be assembled from noncombustible, nonflammable materials and would not ignite a potential wildfire or exacerbate the spread of wildfires. Removing potentially flammable materials and vegetation within the gen-tie construction corridor would reduce the risk of wildfire during construction. The gen- tie transmission structures would not exacerbate fire risks due to the nonflammable nature of their concrete foundations. Therefore, impacts are less than significant.

Regular O&M activities would ensure that all equipment is in good working order, thereby minimizing accidents and potential fires. Additionally, fire safety measures would be implemented during operations, including having portable firefighting equipment and extinguishers, sprinkler systems, and a fire suppression system on site as well as additional water for use at the O&M facility. These safety measures, along with the Fire Management

1 and Prevention Plan, would provide safe operating conditions and fire response protocols to
2 minimize the risk of wildfire. As such, operation of the solar facility would have a less-than-
3 significant impact regarding the installation of utilities that may exacerbate fire risk and
4 result in temporary impacts.

5 The BESS would be housed in enclosures that would contain potential accidental fires and
6 prevent them from spreading and causing further damage. The enclosures would also have
7 remote communication systems that monitor for internal conditions such as temperature and
8 smoke and have automatic fire suppression systems. The BESS would be certified to UL
9 9540, comply with all requirements of the current CFC, and would require approval by the
10 State Fire Marshal. The Project would comply with DRECP CMAs related to fire safety. To
11 further improve fire safety, MM FIRE-1 would specify measures to be added to the Fire
12 Management and Prevention Plan to include information about the type of BESS technology
13 on site, potential hazards, and procedures for disconnecting or shutting down the BESS in
14 case of an accidental fire. It also includes a training component for emergency first
15 responders to prepare for incidents such as fire or explosion at or with the BESS. Therefore,
16 impacts would be less than significant with mitigation.

17
18 Operation of the gen-tie transmission line has a low likelihood of causing or exacerbating a
19 wildfire due to the sparsely vegetated areas immediately surrounding the gen-tie structures.
20 However, sparks and resulting fires have historically occurred along transmission lines due
21 to foreign objects (e.g., falling trees, birds, mylar balloons, flammable debris carried by
22 wind, etc.) contacting conductors or insulators. During operations, gen-tie line inspections
23 would ensure that gen-tie lines and structures are not damaged and would minimize the risk
24 of electrical fires. Implementation of DRECP CMAs and MM FIRE-1 would ensure
25 activities such as vegetation clearing, idling restrictions, and worker training would further
26 reduce the risk of fire associated with operation of the gen-tie line to a level of less than
27 significant.
28

1 Fire safety measures would be implemented to ensure that decommissioning of the Project
2 components is implemented in accordance with applicable fire protection and
3 environmental, health, and safety requirements. As such, decommissioning of the Project
4 would result in less-than-significant impacts. After the Project is decommissioned, no power
5 lines, BESS, or other components with a fire risk would exist at the site and no impact would
6 occur once the Project is decommissioned. (EIR pp. 3.19-9 to 3.19-11)

7 **Mitigation Measures:**

8 **MM FIRE-1 (Fire Safety) Full text under Wildfire.**

9 **DRECP CMAs:**

10 Applicable CMAs are detailed in EIR Appendix CC, which provides a list of CMAs, an
11 explanation of their applicability, and demonstration of compliance with each CMA.

12 ***Impact: Emergency Response Plan (FIRE-4)***

13 ***Threshold:*** The proposed project would not expose people and structures to risks of loss,
14 injury, or death involving wildfires with implementation of mitigation measures.

15 **Findings of Fact, Less Than Significant with Mitigation Measures:**

16 The proposed Project is not located in a high or very high FHSZ, and thus would not be in
17 an area prone to wildfires. The Project is located in a moderate zone, which typically are
18 wildland supporting areas of low fire frequency and relatively modest fire behavior. Due to
19 the presence of sparse vegetation, relatively flat topography, the remote location of the
20 Project, and its desert setting, the potential for the Project to expose people and structures to
21 wildfire risks is low. During construction of the solar facility, BESS, and gen-tie line,
22 vegetation would be managed on site to reduce the risk of fire. All electrical components
23 such as the gen-tie line, power lines, inverters, transformers, and BESS would be constructed
24 on nonflammable concrete foundation structures or steel skids and tested prior to use for
25 safe operations. During construction, a fire suppression system would be placed in service if
26 required by the County or BLM Fire. Fire extinguishers and other portable firefighting
27
28

1 equipment would be available on site, as well as water for use at the O&M facility. Well-
2 maintained firefighting equipment would increase the likelihood that any accidental fires
3 that occur during construction would be effectively extinguished. MM FIRE-1 would
4 include measures requiring fire prevention, emergency response, and evacuation to ensure
5 the safety of construction workers.

6 The Project is located in both LRAs and FRAs; and as such, RCFD and BLM Fire would be
7 responsible for fighting fires at the Project site. RCFD Station 49 is located approximately
8 0.4 mile south of the Project site and would be the first responder for the Project in the event
9 of a fire. As required in MM FIRE-1, the Project owner would coordinate with both BLM
10 and RCFD to train emergency first responders to prepare for specialized emergency
11 incidents at the site, including fire or explosion at or within the BESS area. Coordination
12 with the local fire department would ensure timely emergency response that would minimize
13 the risk of loss, injury, or death during construction. Due to the Project's desert setting,
14 scarce vegetation, fire safety measures, and coordination with CRFD and BLM FIRE,
15 impacts would be less than significant with implementation of mitigation and DRECP
16 CMAs.

17
18 Project operations would consist of a minimal number of on-site workers for daily
19 inspections and as-needed repairs. The Project facility would be monitored by both on-site
20 and remote O&M personnel. Fire hazards during operation of the solar facility would be
21 minimal and further reduced with the Fire Management and Prevention Plan, DRECP
22 CMAs, and MM FIRE-1. Implementation of MM FIRE-1 would ensure the impact from
23 operation of the solar facility is less than significant. During a potential wildfire event,
24 operation of the solar facility would not exacerbate a fire or expose workers or nearby
25 residents to fire hazards.

26 Solar arrays and photovoltaic modules are fire-resistant and would not be susceptible to
27 ignition from fires. In a potential wildfire situation, the panels would be rotated and stowed
28

1 in a panel-up position that could slow the spread of a fire. Therefore, during a potential
2 wildfire event, operation of the solar facility would not exacerbate a fire or expose workers
3 or nearby residents to fire hazards.

4 The BESS would be housed in electrical enclosures on concrete foundations designed for
5 secondary con-tain-ment. Potential electrical fires would be contained within the enclosures
6 and would not spread beyond them. The BESS would be installed following all applicable
7 design, safety, and fire standards for BESSs. Compliance with design and safety regulations
8 and implementation of MM FIRE-1 would reduce the danger of fires spreading
9 uncontrollably and causing loss, injury, or death. MM FIRE-1 includes a measure to include
10 infor-ma-tion about the type of BESS technology on site, potential hazards, and procedures
11 for discon-necting or shutting down the BESS in case of an accidental fire. The enclosures
12 would have air conditioners or heat exchangers and inverters MM FIRE-1 also includes
13 training and coordination requirements so that emergency first responders are prepared to
14 address battery fires or explosions at the BESS area and are knowledgeable of appropriate
15 firefighting methods for BESS fires. The impact would be less than significant with
16 implementation of mitigation and DRECP CMAs.

17
18 The gen-tie line, like the solar facility and BESS, would be located in a desert setting with
19 scattered low-growing vegetation. The gen-tie structures would be constructed on concrete
20 foundations such that the areas immediately surrounding the poles would not be flammable.
21 Portions of the gen-tie line may also be placed underground, which would further reduce the
22 risk of fire. Regular inspections and maintenance of electrical components and trimming of
23 vegetation would ensure all components are in good working order and that vegetation fuel
24 load is minimal. Drone inspections in compliance with NERC Transmission Vegetation
25 Management requirements would ensure that gen-tie lines and structures are not damaged
26 and would minimize the risk of electrical fires. Implementation of DRECP CMAs and MM
27 FIRE-1 would ensure that workers and emergency first responders are trained to properly
28 handle accidental fires, and would further reduce the risks associated with fires to a level of

less than significant.

Once the Project is decommissioned, no power lines, BESS, or other components with a fire risk would exist at the site. The site would not pose a risk of loss, injury, or death involving wildfires. Therefore, no impact would occur once the Project is decommissioned.

(EIR pp. 3.19-11 to 3.19-13)

Mitigation Measures:

MM FIRE-1 (Fire Safety) Full text under Wildfire.

DRECP CMAs:

Applicable CMAs are detailed in EIR Appendix CC, which provides a list of CMAs, an explanation of their applicability, and demonstration of compliance with each CMA.

BE IT FURTHER RESOLVED by the Board of Supervisors that no feasible mitigation measures have been identified that will mitigate the following impacts to a level of less than significant. Specific economic, legal, social, technological, or other considerations make infeasible other mitigation measures or project alternatives identified in the Final EIR for the reasons set forth below in the Project Alternatives. Thus, the following impacts are considered to be significant and unavoidable. These significant and unavoidable impacts are overridden by Project benefits as set forth in the Statement of Overriding Considerations.

EIR No. SCH2022110240 evaluated impacts of the Proposed Project as defined in Section ES.3 and Chapter 2 of the EIR. The Applicant's preferred project is Alternative B: Reduced Footprint Alternative, as described in Section 2.8.3 of the EIR ("Alternative B"). Alternative B is similar to the Proposed Project but would remove approximately 50 acres of solar panels, move the on-site substation and BESS at least 0.7 mile to the northeast and farther from the Lake Tamarisk community, and would increase the length of the gen-tie line by approximately 0.8 mile. Because Alternative has a smaller footprint but otherwise similar characteristics and impacts as described in Table 5-1 of the EIR, the following findings with respect to the Proposed Project are also applicable to Alternative B.

1 **A. Aesthetics**

2 *Impact: Visual Quality (AES-1)*

3 *Threshold: The Project would substantially degrade the existing visual character or quality*
4 *of public views of the site and its surroundings with implementation of mitigation measures.*

5 Findings of Fact, Operations and Maintenance: Significant and Unavoidable:

6 During Operations and Maintenance, the Project's visible contrast associated with visually
7 discordant structural features and industrial character would substantially degrade the
8 existing visual character or quality of the site and its surroundings as follows:

- 9 • Seven representative KOPs were selected from the identified sensitive viewpoints. The
10 Project was determined to have a moderate to high range of visual change for each
11 viewpoint, aside from KOP 7, which has a low to moderate rating for visual change.
- 12 • The resulting visual change would be adverse and unavoidable in the immediate vicinity
13 of the Project, including viewpoints from Alligator Rock ACEC and the Lake Tamarisk
14 Desert Resort, as well as from travelers on I-10 and SR-177.
- 15 • The Project would constitute a visually co-dominant feature in the landscape and would
16 attract the attention of observers from all viewpoints, except KOP 7. View blockage of
17 higher value landscape features (e.g., valley floor and vegetation) would vary from
18 moderate to high. The visual changes would result in a significant aesthetics impact under
19 significance criterion AES-1. Implementation of MMs AES1 (Surface Treatment of
20 Project Structures and Buildings) and AES2 (Project Design) and compliance with
21 DRECP CMAs LUPA BIO-7, DFA-VPL-VRM-2, and DFA-VPL-VRM-3 would reduce
22 the visual contrast associated with visually discordant structural features and industrial
23 character, though not sufficiently to reduce the aesthetic impact to a level that would be
24 less than significant. Therefore, the resulting visual impact would remain significant and
25 unavoidable. (EIR pp. 3.2-17 to 3.2-27).

26 **Mitigation Measures:**

MM AES-3 (Night Lighting Management Plan) Full text under Aesthetic Resources.

DRECP CMAs:

Applicable CMAs are detailed in EIR Appendix CC, which provides a list of CMAs, an explanation of their applicability, and demonstration of compliance with the CMA. CMAs specifically applicable under AES-1 are detailed at FEIR p 3.2-28.

Impact: Visual Quality (AES-3)

Threshold: *The Project would result in the creation of an aesthetically offensive site open to public view with implementation of mitigation measures.*

Findings of Fact, Operations and Maintenance: Significant and Unavoidable:

As with operation and maintenance impacts discussed under Impact AES-1, above, the Project's high visual change would result in a significant aesthetics impact under significance criterion AES-3. Additionally, the O&M impacts would remain significant and unavoidable even with implementation of mitigation and DRECP CMA compliance. See finding above for Impact AES-1

Mitigation Measures:

DRECP CMAs:

Applicable CMAs are detailed in EIR Appendix CC, which provides a list of CMAs, an explanation of their applicability, and demonstration of compliance with the CMA. CMAs specifically applicable under AES-3 are detailed at FEIR p 3.2-32.

BE IT FURTHER RESOLVED by the Board of Supervisors that it has considered, consistent with CEQA's requirements, the impacts of the Project together with all other pending or approved projects within the affected area for each resource area, and makes the following findings. EIR No. SCH2022110240 evaluated impacts of the Proposed Project as defined in Section ES.3 and Chapter 2 of the EIR. The Applicant's preferred project is Alternative B: Reduced Footprint Alternative, as described in Section 2.8.3 of the EIR ("Alternative B"). Alternative B is similar to the Proposed Project but would remove approximately 50 acres of solar panels, move the on-site substation and BESS at least 0.7 mile to the northeast and farther from the Lake Tamarisk community, and would increase the length of the gen-tie line by approximately 0.8 mile. Because Alternative has a smaller footprint but otherwise similar characteristics and impacts as described in Table 5-1 of the EIR, the following findings with respect to the Proposed Project are also applicable to Alternative B.

A. Aesthetics Cumulative Impacts

Cumulative Impact Finding: Cumulatively Considerable.

Although numerous existing cultural modifications are visible along the I 10 corridor and in the Desert Center area of the Chuckwalla Valley (transmission lines; substations; pipelines; solar projects; communication towers; 4 wheel drive tracks; widely scattered commercial buildings, dilapidated structures, and roadside signs; and a few agricultural operations), the grand scale of the open desert panoramas impart an overall general impression of a historically natural-appearing desert landscape that is now in transition to that of a developed energy zone characterized by numerous solar energy facilities, either existing or under construction. The cumulative scenario includes many large solar projects and transmission lines whose scale and pervasiveness are having adverse cumulative effects. If all the projects are implemented, they

1 would substantially degrade the visual character and general scenic appeal of the existing
2 landscape, resulting in the conversion of a relatively undeveloped desert landscape into a more
3 industrialized appearance.

4 In some viewing cases, the visibility and apparent scale of the projects is (for existing and under
5 construction), or would be (for probable future), diminished somewhat by favorable topographic
6 relationships and vegetative screening. For other viewing opportunities, some projects appear
7 (existing and under construction), or would appear (probable future), reduced in visual
8 prominence due to their viewing distances and low angle of view. In still other cases, projects
9 blend (existing and under construction), or would blend (probable future) in with the vegetation
10 or horizon line of the valley floor, and the rugged mountains would remain the dominant visual
11 features in the landscape.

12 KOP 3 on Alligator Rock provides a slightly elevated view overlooking the broader Chuckwalla
13 Valley and numerous solar projects. From KOP 3, the Oberon project, which began commercial
14 operation in fall 2023, is located south and southeast of the Project and appears in the foreground
15 of views toward the Project. The impact assessment from this location would also be applicable
16 to the lower elevations of the Chuckwalla Mountains that would be encompassed by the
17 Chuckwalla NM. Also, from various elevated locations within JTNP, the proposed Project
18 would be visible along with one or more of the cumulative projects. For example, from the
19 Buzzard Springs area and adjacent wilderness, the Project would be visible along with the
20 existing (and under construction) Desert Sunlight, Desert Harvest, Oberon, Athos, Victory Pass,
21 Arica, and Palen solar projects, and the probable future Sapphire, Lycan, and Redonda solar
22 projects, as well as the SCE Colorado River-Red Bluff 500 kV #1 Line Upgrade and Devers-
23 Red Bluff 500 kV #1 and #2 Line Upgrade (depending on work required for the line upgrades).
24 Similarly, the proposed Project, along with multiple cumulative projects, would be visible from
25 portions of the Eagle and Coxcomb mountains in JTNP, the Palen-McCoy Wilderness to the
26 east, the Sheephole Valley Wilderness to the north, and the Chuckwalla Mountains Wilderness
27
28

1 to the south. However, it should be noted that these cumulative impacts would be experienced
2 at greater viewing distances ranging from seven to 25 miles.

3 As a result, the proposed Project, in combination with the 13 past and present local energy
4 projects, would contribute to significant cumulative visual impacts when viewed by sensitive
5 viewing populations along I-10 and SR- 177, from nearby residences, from portions of JTNP,
6 and in the surrounding mountains and wilderness. The Project's contribution to the impacts
7 would be from the introduction of substantial visual contrast associated with discordant
8 geometric patterns in the landscape; the introduction of large-scale, built facilities with
9 prominent industrial character; the creation of unnatural lines of demarcation in the valley floor
10 landscape and inconsistent color contrasts; and from the addition of visible night lighting within
11 the broader Chuckwalla Valley. For many travelers along I-10, the scenic experience would be
12 substantially degraded due to the perceived "industrialization" of the landscape. The impacts
13 from the adjacent solar projects would be similar to those of the Proposed Project and the
14 applicable mitigation measures would be similar or the same. However, in all cases, the
15 implementation of these mitigation measures, individually or collectively, would be insufficient
16 to reduce the resulting impacts to levels that would be less than significant.

17 Effective implementation of MM AES-1 (Surface Treatment of Project Structures and
18 Buildings), MM AES-2 (Project Design), MM AES-3 (Night Lighting Management), and MM
19 BIO-5 (Vegetation Resources Management Plan) would reduce the severity of the Project's
20 contribution to the cumulative visual effects, though the Project's contribution would still be
21 cumulatively considerable. MM AES-1 would reduce structural surface glare and help the
22 Project structures blend better with the surrounding landscape. MM AES-2 would help to retain
23 vegetative screening, which would reduce overall Project visibility and would reduce structural
24 contrast and glare. MM AES-3 would result in better management and control of night lighting
25 and would reduce night lighting impacts on Dark Sky viewing, nearby and adjacent roads
26 (motorists), and nearby residences. Compliance with DRECP CMAs LUPA BIO-7, LUPA-AIR-
27 5, LUPA BIO-13, DFA-VPL-VRM-2, and DFA-VPL-VRM-3 would place substantially similar
28

requirements on Project development on BLM-administered land as those included in MMs AES-1, AES-2, AES-3, and BIO-5, and would therefore, similarly reduce impacts. Even with implementation of mitigation measures, there would be significant cumulative visual impacts when viewed by sensitive viewing populations along I-10 and SR-177, from nearby residences, from portions of JTNP, and in the surrounding mountains and wilderness. The Project would make a considerable contribution to these visual impacts. (EIR pp. 3.2-36 and 3.2-37).

Mitigation Measures:

MM AES-1 (Surface Treatment of Project Structures and Buildings) Full text under Aesthetic Resources.

MM AES-2 (Project Design) Full text under Aesthetic Resources.

MM AES-3 (Night Lighting Management Plan) Full text under Aesthetic Resources.

MM BIO-5 (Vegetation Resources Management Plan) Full text under Biological Resources.

DRECP CMAs:

Applicable CMAs are detailed in EIR Appendix CC, which provides a list of CMAs, an explanation of their applicability, and demonstration of compliance with the CMA. CMAs specifically applicable under cumulative aesthetic impacts are detailed at FEIR p 3.2-40.

B. Agriculture and Forestry Resources Cumulative Impacts

Cumulative Impact Finding: Not Cumulatively Considerable.

Implementation of the proposed Project, in combination with other projects in the Desert Center area, could include land zoned for agricultural uses that would be utilized for non-agricultural uses or would cause development of non-agricultural uses within 300 feet of agriculturally zoned property. However, with the issuance of a CUP, developments under the cumulative scenario constitute allowed uses within Agricultural zones that have been found to be consistent with zoning. The cancellation of the Williamson Act contracts and removal of lands within the project site from County agricultural preserves would alleviate any potential conflicts between proposed

1 project uses of land and Williamson Act or County Agricultural Preserve requirements. The
2 proposed Project would not involve other changes in the existing environment that may result
3 in the conversion of other agricultural lands to non-agricultural uses. Further, because Project
4 parcels zoned for agricultural use have not actually been used for agricultural purposes for many
5 years, the Project also would not result in any change in current use from agriculture to non-
6 agricultural uses. In addition, there are no forest lands or timber resources in the Project area.
7 Neither the proposed Project nor the cumulative projects would convert any designated
8 Farmland to non-agricultural uses. After the Project and surrounding cumulative projects are
9 decommissioned, the sites would be available to be returned to agricultural uses. As shown in
10 Figure 3.1-1, many of the current and reasonably foreseeable projects are in land identified as
11 Development Focus Areas (DFAs) under the DRECP. Acknowledging that the overall trend for
12 development of solar projects in the Desert Center area could lead to cumulative impacts on
13 agriculture, the region has been designated a DRECP DFA. Current agricultural uses could be
14 impaired by new renewable energy developments with related transmission lines. However, the
15 impairment or potential loss of farmland would not be a significant cumulative impact because
16 the Desert Center region is not classified under recognized agricultural land evaluation
17 approaches such as the DOC FMMP's Important Farmland Map series. Further, active
18 agriculture in the Desert Center area is already quite limited due to reductions in agriculture that
19 have occurred over the last several decades. Overall, the proposed Project's impacts combined
20 with those of nearby projects would not result in a cumulatively significant impact to agricultural
21 resources. The Project's incremental contribution to agriculture and forestry impacts would not
22 be cumulatively considerable. No mitigation is required. (EIR p. 3.3-10 and 3.3-11).
23
24

25 C. Air Quality Cumulative Impacts

26 Cumulative Impact Finding: Not Cumulatively Considerable.

27 The analysis of project impacts for Impact AQ-2, above, is inherently a cumulative analysis.
28 The analysis considers the cumulative effects of past projects as contributing to existing

1 nonattainment conditions and addresses whether the Project would result in a cumulatively
2 considerable net increase of any criteria pollutant for which the Project region ins non-attainment
3 under an applicable federal or state ambient air quality standard. The analysis in Impact AQ-2
4 follows the methodology recommended by SCAQMD for that evaluation. The Project would
5 increase the generation of criteria air pollutants in the region consistent with population, housing,
6 and employment trends (Impact AQ-1). Individual projects are required to implement feasible
7 mitigation measures for criteria air pollutants emissions if the project emissions exceed the
8 thresholds of significance adopted by the SCAQMD. The Project includes mitigation measures
9 to reduce short-term construction of criteria air pollutants and precursors. Operational emissions
10 from the Project would not exceed SCAQMD thresholds, and no mitigation would be required.
11 The Project, as well as all related projects, would also be subject to SCAQMD regulations and
12 regulations promulgated by the State of California that are intended to reduce air quality
13 emissions. The construction-phase emissions related to the proposed Project would likely occur
14 concurrently with other related projects in the Mojave Desert Air Basin and would contribute to
15 the adverse effects with other related projects to result in a cumulative impact to air quality that
16 is significant. The incremental contribution of the proposed Project to the cumulative impact
17 would be reduced by implementing MM AQ-1 (Fugitive Dust Control Plan) and MM AQ-2
18 (Control On-Site Off-Road Equipment Emissions) and applicable DRECP CMAs, as mitigation
19 for the project-specific effects described in Impact AQ-2 and Impact AQ-3. Because
20 construction-related air pollutant emissions would be mitigated below SCAQMD thresholds and
21 would entirely cease after construction, within approximately 20 months, the construction
22 emissions would not cause substantial long-term cumulative impacts. The incremental
23 contribution of the proposed Project to the cumulative air quality impact would be reduced to
24 the extent feasible during construction and would not be cumulatively considerable. (EIR p.
25 3.4-15).
26

27 **Mitigation Measures:**
28

1 **MM AQ-1 (Fugitive Dust Control Plan)** Full text under Air Quality.

2 **MM AQ-2 (Control On-Site Off-Road Equipment Emissions)** Full text under Air Quality.

3
4 **DRECP CMAs:**

5 Applicable CMAs are detailed in EIR Appendix CC, which provides a list of CMAs, an
6 explanation of their applicability, and demonstration of compliance with the CMA.

7
8 **D. Biological Resources Cumulative Impacts**

9 **Cumulative Impact Finding: Not Cumulatively Considerable.**

10 Cumulative effects for biological resources apply to both plant and wildlife species and consider
11 distribution, habitat availability, designated critical habitat, local rarity or commonness, and
12 likely responses to a projects' effects for each species. Impacts from individual projects include
13 construction, operation, and decommissioning and the timeframe for these activities will vary
14 by project and may or may not overlap. The Project could contribute to cumulative effects to
15 biological resources with the initiation of on-site activities and continuing throughout the O&M
16 phase, through final decommissioning.

17 As the number of solar projects and other development increase and land use changes occur in
18 the region, the cumulative impacts to biological resources, such as habitat loss also increase.
19 The analysis of cumulative effects considered the current and foreseeable future projects as
20 identified in the FEIR and cumulative impacts of the projects on biological resources identified
21 in the cumulative scenario would be cumulatively significant. This analysis presumed that
22 Mitigation Measures MM BIO-1 through BIO-14 would be implemented on private land within
23 the Project site and that the Project would implement DRECP CMAs on BLM lands. With
24 avoidance through Project design, mitigation measures, and CMAs, the Project's contribution
25 to cumulative impacts would not be cumulatively considerable.

26 Vegetation and Habitat. Construction-related impacts of the cumulative projects would
27 temporarily increase noise and activities, dust, and other habitat disturbances throughout the
28

1 region. Longer-term land use conversion would contribute to reduced habitat availability and
2 increased habitat fragmentation. The effects of the Project would contribute incrementally to the
3 cumulative significant impacts to vegetation and habitat.

4 Direct and indirect impacts to vegetation and habitat would be minimized by implementing MMs
5 BIO-1 through BIO-5, which minimize direct disturbance, loss, degradation, and contamination
6 of habitat by using qualified and trained staff, keeping work activities within designated work
7 areas, and implementing low-impact site preparation, re-vegetation, and invasives management.

8 Avoidance of desert dry wash woodland with a 200-foot buffer (except for minor incursions for
9 linear features and where there is existing intervening infrastructure on private land), per the
10 Project Description, and compensatory mitigation for desert dry wash woodland at a ratio of 5:1
11 (MM BIO-14), desert pavement at a ratio of 1:1 (MM BIO-3), creosote bush scrub (suitable
12 desert tortoise habitat) at a ratio of 1:1 (MM BIO-7), and desert tortoise critical habitat at a ratio
13 of 5:1 (MM BIO-7) would preserve habitat values and offset habitat loss.

14 The project is required to comply with DRECP CMAs for all project activities and development
15 on BLM land. The BLM is expected to ensure project-specific CMA compliance through
16 imposition of NEPA mitigation measures and stipulations of the ROW Grant issued for the
17 Project. Compliance with CMAs, which would be required on BLM lands and are described in
18 detail in Impact BIO-1, would mitigate impacts to less than significant.

19 Similar to the requirements of the MMs that would be implemented on private land within the
20 Project site, CMAs require qualified biological staff to perform species and pre-construction
21 surveys, worker training, and monitoring to detect and identify biological resources for
22 demarcation and avoidance. Implementation of plant and seed salvage, re-vegetation, and weed
23 management would improve post-construction habitat values. Avoidance of desert dry wash
24 woodland with a 200-foot buffer, except for minor incursions as allowed by CMAs, would
25 prevent direct removal of vegetation and habitat and prevent degradation from disturbance in
26 adjacent areas. Compensation for impacts to native habitats would offset loss.
27
28

1 With implementation of the mitigation measures on private lands and CMAs on BLM land, the
2 proposed Project's contribution to cumulative impacts to vegetation and habitat would not be
3 cumulatively considerable.

4 Sensitive Habitat and Jurisdictional Waters of the State. Some of the cumulative projects would
5 impact desert dry wash woodland with minor incursions and desert pavement. The proposed
6 Project would was designed to avoid desert dry wash woodland, except for minor incursions.
7 Indirect effects from the Easley Project in adjacent habitats would be minimized with a 200-foot
8 setback buffer (except for minor incursion or where there is existing intervening infrastructure
9 on private land) from desert dry wash woodland habitat on both private and public lands.

10 The Project would impact unvegetated ephemeral dry wash, which meets criteria as
11 jurisdictional waters of the State. The cumulative projects would have qualitatively similar
12 impacts to unvegetated ephemeral dry wash, due to the nature of the area and the large washes
13 that cross it, resulting in a significant cumulative impact. The effects of the proposed Project
14 would contribute incrementally to the cumulative impacts to jurisdictional waters of the State.
15 This incremental contribution would not be considerable as the Project has been designed to
16 avoid, minimize, and offset impacts to jurisdictional waters. Direct and indirect impacts during
17 construction would be minimized by implementing MMs BIO-1 through BIO-5 and MM BIO-
18 14.
19

20 The Project is required to comply with DRECP CMAs for all Project activities and development
21 on BLM land. The BLM is expected to ensure project-specific CMA compliance through
22 imposition of NEPA mitigation measures and stipulations of the ROW Grant issued for the
23 Project. Compliance with the CMAs, which would be required on BLM lands, as described in
24 Impact BIO-1 and Impact BIO-5, would mitigate impacts to less than significant.

25 Similar to the requirements of the MMs that would be implemented on private land within the
26 Project site, CMAs require qualified biological staff to perform species and pre-construction
27 surveys, worker training, and monitoring to detect and identify biological resources for
28 demarcation and avoidance. Implementation of plant and seed salvage, re-vegetation, and weed

1 management would improve post-construction habitat values. Avoidance of desert dry wash
2 woodland with a 200-foot buffer, except for minor incursions as allowed by CMAs, would
3 prevent direct removal of sensitive habitat and jurisdictional features, and prevent degradation
4 of habitat and waters in adjacent areas. CMA requirements for compensation for impacts to
5 native habitats, including sensitive habitats and jurisdictional waters, would offset loss. BMPs
6 for fueling, vehicle and equipment maintenance, spill cleanup, erosion control, and stabilizing
7 disturbed areas would prevent sediment and toxic and hazardous materials from entering and
8 degrading streams and washes and sensitive habitats.

9 With implementation of the mitigation measures on private lands and CMAs on BLM land, the
10 proposed Project's contribution to cumulative impacts to sensitive habitats and jurisdictional
11 waters would not be cumulatively considerable.

12 Special-status plants. The Project could affect several special-status plants identified under
13 Impact BIO-1. No threatened or endangered plants were identified on the site. The past, present,
14 and future projects in the region would have similar or greater impacts to special-status plants
15 which would result in a cumulatively significant impact to regional special-status plants. The
16 contribution of the Project itself would not be considerable because of the limited number of
17 special-status plant species on site, and the implementation of mitigation measures on private
18 lands and DRECP CMAs on BLM lands.

19 Direct and indirect impacts to special-status plants on private land in the Project site would be
20 minimized by implementing MMs BIO-1 through BIO-5, which minimize direct disturbance,
21 loss, degradation, and contamination of habitat by using qualified and trained staff, keeping
22 work activities within designated work areas, and implementing re-vegetation and invasives
23 management. By implementing seed and plant salvage, seeding and revegetation, soil
24 decompaction, erosion control, and non-native control in disturbance areas, soils would be
25 stabilized, native vegetation would be re-established, and post-construction habitat values would
26 be improved in the Project area to support recovery of special-status plants.
27
28

1 The Project is required to comply with DRECP CMAs for all project activities and development
2 on BLM land. The BLM is expected to ensure project-specific CMA compliance through
3 imposition of NEPA mitigation measures and stipulations in any ROW Grant issued for the
4 Project. Compliance with the CMAs, which would be required on BLM lands and are described
5 in detail in Impact BIO-1, would mitigate impacts to less than significant.

6 With implementation of the mitigation measures on private lands and CMAs on BLM-
7 administered land, the proposed Project's contribution to cumulative impacts to special-status
8 plants would not be cumulatively considerable.

9 Special-status wildlife. Cumulative projects could result in direct impacts to special-status
10 wildlife including injury or mortality resulting from crushing; displacement; loss of suitable
11 habitat, burrows, dens, or nests; attraction of predators to food and water subsidies; encounters
12 with work site hazards such as store materials, trenches, pits, or water tanks; vehicle strikes; and
13 collision or electrocution from Project components. Noise and lighting could affect wildlife in
14 adjacent habitats by disrupting foraging, breeding, sheltering, and other activities; or may cause
15 wildlife to avoid otherwise suitable habitat surrounding the site. Habitat degradation would
16 result in loss of suitable habitat for wildlife species. Herbicides that persist on site could injure
17 wildlife that ingest target plants or come into contact with herbicides (e.g., by digging or rolling
18 in treated soil).

19 Direct and indirect impacts to special-status wildlife on private land in the Project site would be
20 minimized by implementing MMs BIO-1 through BIO-5, which minimize direct disturbance,
21 loss, degradation, and contamination of habitat by using qualified and trained staff, keeping
22 work activities within designated work areas, and implementing re-vegetation and invasives
23 management. By implementing seed and plant salvage, seeding and revegetation, soil
24 decompaction, erosion control, and non-native control in disturbance areas, soils would be
25 stabilized, native vegetation would be re-established, and post-construction habitat values would
26 be improved in the Project area to support recovery of special-status wildlife. MM BIO-6 would
27 increase detection of wildlife that require avoidance in Project areas by requiring site inspections
28

1 and managing hazards. Managing food and water subsidies would prevent attraction of predators
2 to the Project site where there is increased likelihood of disturbance.

3 The Project has been designed to avoid desert dry wash woodland (except for minor incursions),
4 per the Project Description, and compensatory mitigation for desert dry wash woodland at a ratio
5 of 5:1 (MM BIO-14), desert pavement at a ratio of 1:1 (MM BIO-3), creosote bush scrub
6 (suitable desert tortoise habitat) at a ratio of 1:1 (MM BIO-7), and desert tortoise critical habitat
7 at a ratio of 5:1, which would preserve habitat values for special-status wildlife and offset habitat
8 loss.

9 The Project is required to comply with DRECP CMAs for all project activities and development
10 on BLM land. The BLM is expected to ensure project-specific CMA compliance through
11 imposition of NEPA mitigation measures and stipulations in any ROW Grant issued for the
12 Project. Compliance with the CMAs, which would be required on BLM lands, as described in
13 Impacts BIO-1 and BIO-2, would mitigate impacts to less than significant. Similar to the
14 requirements of the MMs that would be implemented on private land within the Project site,
15 these CMAs reduce impacts to wildlife and habitat by requiring qualified biological staff to
16 perform species and pre-construction surveys, worker training, and monitoring to detect and
17 identify biological resources for demarcation and avoidance. Implementation of plant and seed
18 salvage, re-vegetation, and weed management would improve post-construction habitat values
19 for wildlife. Avoidance of desert dry wash woodland with a 200-foot setback buffer would
20 prevent direct removal of sensitive habitat used by many wildlife species for foraging, shelter,
21 breeding, and movement through the Project vicinity. A 200-foot setback would reduce
22 degradation from disturbance in adjacent areas.

23 With implementation of the mitigation measures on private lands and CMAs on BLM land, the
24 proposed Project's contribution to cumulative impacts to special-status wildlife would not be
25 cumulatively considerable.

26 Crotch bumble bee. Suitable habitat for Crotch bumble bee is present on the Project site;
27 however, the Easley site is east of the current range. The easternmost portion of the gen-tie line
28

on the Oberon Project site overlaps with the historic range. Cumulative projects would impact similar desert scrub habitat, which may have potentially suitable habitat near the historic range. In addition to MMs BIO-1 to MM BIO-5 previously listed to minimize impacts to Vegetation and Habitat, MM BIO-6 (Wildlife Protection) includes specific measures to protect Crotch bumble bee, including worker training on identifying individuals, and adaptive management in coordination with CDFW if individuals or nests are detected during pre-construction surveys. Any nests detected would be buffered by the Lead Biologist and avoided until coordination with CDFW is completed. These measures would identify potential instances of Crotch bumble bee in the Project area and protect individuals from disturbance.

No additional species-specific CMAs are applicable to Crotch bumble bee beyond those previously described for all special-status wildlife species.

With implementation of the mitigation measures on private lands and CMAs on BLM land, the proposed Project's contribution to cumulative impacts to Crotch bumble bee would not be cumulatively considerable.

Monarch butterfly. Suitable foraging and breeding habitat for monarch butterfly is present on the Project site; no overwintering habitat is present. Cumulative projects would impact similar desert scrub habitat, which may provide potentially suitable habitat for monarchs. However, the site is not known to serve a significant role in breeding or migration for the species, and the surrounding Chuckwalla Valley provides vast stretches of desert land with similar or higher quality habitat the species may use. As a result, impacts to the species are not expected to be significant. MMs BIO-1 to BIO-5, previously listed for Vegetation and Habitat, would minimize impacts to suitable habitat and would re-vegetate disturbance areas with seed from the Project site, including monarch host plants. MM BIO-6 (Wildlife Protection) includes specific measures to protect wildlife from work site hazards. With implementation of the mitigation measures on private lands and CMAs on BLM land, the already less-than-significant cumulative impacts to the species would be further reduced, and the proposed Project's contribution to cumulative impacts to monarch butterfly would not be cumulatively considerable.

1 Desert tortoise. Suitable habitat is present throughout the southwestern portion of the Project
2 area. The gen-tie line crosses through the adjacent Oberon Project site, which overlaps with a
3 fragmented portion of USFWS-designated critical habitat. Desert tortoise sign (Class 4, Class 5
4 carcasses) were observed in and around desert dry wash woodland on the Project site. Most of
5 the past, present, and foreseeable future projects in the vicinity would impact similar desert
6 tortoise habitat and many of them could directly affect desert tortoises. Due to the number and
7 size of the cumulative projects they would result in a cumulatively significant impact. Mitigation
8 measures identified in this EIR under Impact BIO-2, implementation of DRECP CMAs on
9 BLM-administered land, and other permitting requirements would prevent lethal take of desert
10 tortoise and avoid and minimize impacts to its habitat on the Easley Project site.

11 The surrounding projects would be subject to similar CEQA and/or NEPA mitigation measures
12 and permitting requirements, which would have been developed to minimize impacts to habitat
13 and prevent lethal take of desert tortoise. In addition, if any live desert tortoises are found on
14 the Easley and or Oberon sites, they would be relocated or translocated in accordance with the
15 Easley Desert Tortoise Protection and Translocation Plan (MM BIO-7) (EIR Appendix P) and
16 the Oberon Desert Tortoise Protection and Translocation Plan (Aspen, 2022). Desert tortoises
17 would be moved offsite when encountered during both construction and operation if suitable
18 habitat is not available nearby. Compensation for impacts to suitable desert tortoise habitat
19 (creosote bush scrub) at a minimum ratio of 1:1, and compensation for impacts to desert tortoise
20 habitat at a ratio of 5:1, would offset habitat loss (MM BIO-7). Implementation of a Wildlife
21 Protection and Relocation Plan (MM BIO-13) would protect individuals and burrows with
22 buffers to avoid direct injury and mortality. Passive exclusion of individuals would prevent
23 entrapment during construction, avoid the need for handling, and avoid direct injury and
24 mortality. Collapsing inactive burrows prevents further use to avoid future risk to the species
25 from construction in the Project area. By following agency protocols for tortoise surveying,
26 handling, and relocating, and by using qualified and permitted biological staff, individual desert
27 tortoise would be detected for avoidance and monitoring, and mortality and injury during
28

1 construction, handling, and relocation would be reduced. By implementing the associated Raven
2 Management Plan (MM BIO-7) (Appendix Q), attractants for opportunities predators, such as
3 food, water, trash, roadkill, and perching opportunities, would be identified, managed, and
4 reduced.

5 The Project is required to comply with DRECP CMAs for all project activities and development
6 on BLM land. The BLM is expected to ensure project-specific CMA compliance through
7 imposition of NEPA mitigation measures and stipulations in any ROW Grant issued for the
8 Project. Similar to the mitigation measures on private lands, these measures are expected to
9 effectively avoid lethal take of desert tortoise by avoiding disturbance of individuals, protecting
10 them from work site hazards, identifying and collapsing empty burrows, and passively excluding
11 them from the Project area.

12 In compliance with the BLM DRECP CMAs, the Easley, Oberon, Arica, and Victory Pass
13 Projects will avoid suitable desert dry wash woodland habitat with a 200-foot buffer throughout
14 the Project sites, except for minor incursion (LUPA-BIO-3 (Resource Setback Standards),
15 LUPA-BIO-RIPWET-1 (Other Riparian & Wetland Focus Species), LUPA-BIO-SVF-6
16 (Special Vegetation Features). Future projects on BLM-administered land in the Desert Center
17 area would likewise be subject to the same DRECP CMAs to protect the hydrologic function
18 and species habitat in desert dry wash woodland areas. If approved, the proposed expansion of
19 Joshua Tree National Park and creation of the Chuckwalla National Monument would strengthen
20 and expand protection of critical habitat to the west of Kaiser Road and south of I-10.

21 With implementation of the mitigation measures on private lands and CMAs on BLM land, and
22 for the reasons provided above, the proposed Project's contribution to cumulative impacts to
23 desert tortoise would not be cumulatively considerable.

24 Native birds, including special-status passerine birds. Migratory birds are expected to occur
25 throughout the area during construction and O&M. Land use conversion for the Project and any
26 of the cumulative projects would result in habitat loss and degradation, displacement, decreased
27 foraging opportunities, potential disruption or failure of nesting, increased predation, and/or
28

1 mortality. Taken together, the projects would result in a cumulatively significant impact for
2 native birds.

3 In addition to MMs previously listed for all special-status wildlife, to mitigate effects to native
4 birds on the Easley site, MM BIO-8 (BBCS) requires the development a BBCS Plan that would
5 identify potential hazards to birds and bats during construction and O&M. The Plan (see
6 Appendix M) specifies measures to recognize, minimize, and avoid hazards, describe procedures
7 for reporting and handling dead or injured wildlife, and describe post-construction monitoring
8 and adaptive management for bird and bat mortality. Hazards may include collision,
9 electrocution, territory abandonment, nest and roost site disturbance, habitat loss and
10 fragmentation, disturbance from human presence, and predator subsidies, in accordance with
11 USFWS guidelines (USFWS, 2010). The plan requires provisions for adaptive management to
12 evaluate the death and injury of birds that are detected, based on the results of similar monitoring
13 at other solar project sites in the vicinity. By implementing the requirements of the BBCS, injury
14 and mortality from work site and Project related risks, and operation of the solar facilities, such
15 as collision and electrocution, would be adaptively managed and reduced.

16
17 MM BIO-9 would protect nesting birds by implementing a Nesting Bird Management Plan
18 (NBMP) (Appendix O), which requires pre-construction nest surveys and sweeps, establishment
19 of exclusion buffers around active nests and nest monitoring, and agency reporting and adaptive
20 management. Surveys, exclusion buffers, and monitoring would protect nesting birds from direct
21 mortality or injury; avoid direct destruction of nests, eggs, and young; and minimize disturbance
22 of nesting behaviors from construction noise, vibrations, dust, lighting, and increased human
23 presence, which could otherwise result in nest abandonment.

24 MM BIO-10 (Gen-tie Lines) would require mechanisms in accordance with APLIC standards
25 (APLIC 2006, 2012) to visually warn birds such as permanent markers or bird flight diverters;
26 avoid or minimize use of guy wires; and maintain sufficient distance between all conductors and
27 grounded components to prevent electrocution of large birds. By implementing these design
28 features, injury and mortality from electrocution would be minimized.

1 In addition to CMAs previously detailed for all special-status wildlife species, CMAs would be
2 implemented to minimize impacts to native birds on BLM land in the Project site (see EIR p.
3 3.5-130). By identifying potential hazards to birds and bats during construction and O&M, and
4 monitoring for injury and mortality from work site and Project related hazards such as collision
5 and electrocution, implementation of these CMAs on BLM land would ensure that impacts are
6 adaptively managed and reduced. Protecting nesting birds would avoid direct mortality or injury,
7 destruction of nests, eggs, and young, and disturbance of nesting behaviors from construction.

8 With implementation of the Project's mitigation measures on private lands and CMAs on BLM
9 lands, the contribution to cumulative impacts to native bird populations from the proposed solar
10 facilities would not be cumulatively considerable.

11 Burrowing owl. Potential impacts of the solar facilities to burrowing owl include habitat loss or
12 degradation and possible injury or mortality if they are present. Other projects in the vicinity
13 include several transmission lines and solar energy projects with similar habitat for burrowing
14 owl. Effects of the other projects would be similar to potential effects of the Project. Together
15 these projects would result in significant impacts including habitat loss and mortality to
16 burrowing owls. In addition to MMs previously listed for all special-status wildlife, MM BIO-
17 11 (Burrowing Owl Avoidance and Relocation) and MM BIO-13 (Wildlife Protection and
18 Relocation Plan) are expected to effectively avoid lethal take of burrowing owls by surveying
19 for individuals according to established protocols, avoiding disturbance of individuals and nests
20 in the Project site and surrounding buffer areas, protecting them from work site hazards, and
21 passively excluding them from the Project area. In addition to the CMAs previously listed for
22 all special-status wildlife species, burrowing owl CMAs would be implemented on BLM land
23 within the Project site to minimize impacts to western burrowing owl which, similar to the
24 mitigation measures implemented on private lands, are expected to avoid take of burrowing owls
25 by surveying per protocols, avoiding disturbance, managing work site hazards, and passively
26 excluding them from the Project area.
27
28

1 The incremental contribution of the proposed Project to the cumulative impacts to burrowing
2 owls, including habitat loss, construction-related mortality, or collision mortality, would not be
3 considerable because mitigation measures would be implemented on private lands and CMAs
4 would be implemented on BLM lands, individuals would be relocated to an off-site location
5 prior to construction, and potential collision would be mitigated as described above for native
6 birds.

7 Special-status raptors, including golden eagle. Marginal nesting habitat for elf owl is present.

8 The site provides suitable seasonal or year-round foraging habitat for several raptor species,
9 including Swainson's hawk, and is within potential foraging distance of known golden eagle
10 nesting territories. Several raptors are likely to forage infrequently on the solar facility site at
11 any time of year, including winter and migration seasons.

12 Effects of the other projects in the vicinity would be similar to potential effects of the Project.
13 Cumulatively, these projects could result in significant impact due to habitat loss. In addition to
14 MMs previously listed for all special-status wildlife, MM BIO-8 (Bird and Bat Conservation
15 Strategy), as previously described, requires implementation of a BBCS (Appendix M) to
16 identify, minimize, and avoid Project related hazards to birds and bats, provide procedures for
17 handling and reporting dead and injured wildlife, and describe a strategy for post-construction
18 adaptive management for bird and bat mortality associated with the Project. By implementing
19 the requirements of the BBCS, instances of raptor injury and mortality associated with solar
20 facilities would be adaptively managed and impacts would be minimized. MM BIO-9 (Nesting
21 Bird Management Plan) (Appendix O) requires performing pre-construction nest surveys and
22 implementing buffers and monitoring around active nests, which would protect nesting raptors
23 from disturbance due to increased noise, dust, vibration, and human presence and from direct
24 destruction of nests, eggs, and young.

25 MM BIO-10 (Gen-tie Lines) would require mechanisms in accordance with APLIC standards
26 (APLIC 2006, 2012) to visually warn birds such as permanent markers or bird flight diverters;
27 avoid or minimize use of guy wires; and maintain sufficient distance between all conductors and
28

grounded components to prevent electrocution of large birds. By implementing these design features, injury and mortality from electrocution would be minimized.

In addition to the CMAs previously described for all special-status wildlife species, additional CMAs would be implemented on BLM land within the Project site to minimize impacts to raptors. By identifying potential hazards to birds and bats during construction and O&M, and monitoring for injury and mortality from work site and Project related hazards such as entrapment, collision, and electrocution, implementation of these CMAs on BLM land would ensure that impacts are adaptively managed and reduced. Protecting nesting birds would avoid direct mortality or injury, destruction of nests, eggs, and young, and disturbance of nesting behaviors from construction. Species-specific setbacks would ensure that protected raptors are appropriately buffered to avoid disturbance, injury, or mortality.

The incremental contribution of the proposed Project to the cumulative impacts to special-status raptors would not be considerable, because mitigation measures would be implemented on private lands and CMAs would be implemented on BLM lands, native habitat loss would be minimized and potential hazards would be adaptively managed and mitigated.

Desert kit fox and American badger. Active desert kit fox burrows and American badger burrows occur on the Project site. Both species could use native habitats, wherever prey animals may be present. Both species are expected to occur on the cumulative project sites and loss of the habitat and prey species could result in a significant cumulative impact.

Mitigation measures identified under Impact BIO-1 would minimize habitat loss and prevent or minimize wildlife injury and mortality. In addition to MMs previously listed for all special-status wildlife, MM BIO-12 (Desert Kit Fox and American Badger Relocation) and MM BIO-13 (Wildlife Protection and Relocation Plan) are expected to effectively avoid lethal take of desert kit fox and American badger by performing pre-construction surveys for individuals according to established protocols, avoiding disturbance of individuals and nests in the Project site and surrounding buffer areas, protecting them from work site hazards, and passively excluding them from the Project area. Identification of individuals and avoidance of active dens

1 would minimize disturbance of American badger and desert kit fox. Passive exclusion of
2 individuals from dens would prevent entrapment during construction and avoid direct injury and
3 mortality. No additional species-specific CMAs are applicable to desert kit fox and American
4 badger beyond those previously listed for all special-status wildlife species.

5 The incremental contribution of the proposed Project to the cumulative impacts to these species
6 would not be considerable because mitigation measures would be implemented on private lands
7 and CMAs would be implemented on BLM lands, individuals would be relocated out of harm's
8 way to an off-site location and native habitat loss would be minimized.

9 Burro deer. The principal potential impacts to burro deer would be reduced access to dependable
10 irrigation water at agricultural sites. Burro deer are expected to occur on the cumulative projects
11 and loss of the habitat and access to water sources could result in a significant cumulative impact.
12 Mitigation measures previously listed for Vegetation and Habitat (MM BIO-1 to MM BIO-5),
13 avoidance of desert dry wash woodland (except for minor incursions), and compensatory
14 mitigation (MMs BIO-3, MM BIO-7, and MM BIO-14) would minimize habitat loss and
15 impacts to wildlife movement by restricting disturbance to work areas and improving post-
16 construction habitat values. No additional species-specific CMAs are applicable to burro deer
17 beyond those previously listed for all special-status wildlife species. The incremental
18 contribution of the proposed Project to the cumulative impacts to burro deer would not be
19 considerable because mitigation measures would be implemented on private lands and CMAs
20 would be implemented on BLM lands, no take would occur, and desert dry wash woodland used
21 for wildlife movement would be avoided.

22 Special-status bats. Construction of the Project could adversely impact special-status bats
23 through the conversion of desert shrubland foraging habitat. Desert dry wash woodland that may
24 support limited roosting sites would be avoided. Removal of those features could disturb, injure,
25 or kill bats. Mitigation measures identified under Impact BIO-1 would minimize habitat loss,
26 inspect structures and remove wildlife or allow wildlife to escape prior to demolition, and require
27 pre-construction surveys or scheduling of tree removal outside the bat maternal roosting season.
28

1 In addition to MMs previously listed for all special-status wildlife, MM BIO-8 (Bird and Bat
2 Conservation Strategy) requires a project-specific risk assessment to address potential for take
3 of birds and bats due to Project related threats including collision, electrocution, territory
4 abandonment, nest and roost site disturbance, habitat loss and fragmentation, disturbance from
5 human presence, and predator subsidies. The plan further describes a strategy for post-
6 construction adaptive management for bird and bat mortality associated with the Project. By
7 implementing the requirements of the BBCS, instances of bat injury and mortality associated
8 with solar facilities would be adaptively managed and impacts would be minimized.

9 In addition to the CMAs previously listed for all special-status wildlife species, CMAs would
10 be implemented on BLM land within the Project site to minimize impacts to bats. These
11 measures would minimize and avoid disturbance, injury, and mortality of bats by identifying,
12 monitoring, and managing project related risks and are expected to effectively minimize
13 potential impacts to special-status bats.

14 Cumulative projects would also convert desert shrubland foraging habitat and remove roost
15 sites, resulting in a significant cumulative impact to special-status bats. These projects would
16 implement mitigation measures and DRECP CMAs, as applicable, similar to those identified for
17 the proposed Project, including offsite compensation for native habitats, avoidance of active
18 roosts, avoidance of desert dry wash woodland, and Bird and Bat Conservation Strategies. The
19 incremental contribution of the proposed Project to the cumulative impacts to special-status bats
20 would not be considerable because mitigation measures would be implemented on private lands
21 and CMAs would be implemented on BLM lands, desert dry wash woodland habitat would
22 persist on the Project site, native habitat loss would be minimized, and potential collision would
23 be adaptively managed as described above for native birds.

24 Wildlife movement. Cumulative impacts for wildlife movement consider projects within 5 miles
25 that could impact multi-species linkages. Together with the other solar projects in the
26 surrounding area, wildlife movement in the vicinity of the Project would be inhibited and
27 cumulative impacts would be significant.
28

1 The southernmost portion of the DRECP Pinto Wash multi-species linkage overlaps the northern
2 Project area, a portion of which would be impacted by the proposed Project. The avoided portion
3 of the linkage on the Easley Project site supports desert dry wash woodland. Avoidance of this
4 habitat would help maintain movement opportunities east-west through the southern portion of
5 the linkage. Undeveloped lands would persist in the remainder of the multi-species linkage to
6 the north, in ACECs located east and south of the Project site, and if approved by Congress, in
7 the areas of the proposed expansion of Joshua Tree National Park and the Chuckwalla National
8 Monument to the west and south. In combination with avoidance of desert dry wash woodland
9 on BLM lands under the DRECP, and at other cumulative projects, limited wildlife movement
10 through and around the Project would be maintained.

11 On private lands, MMs BIO-1 through BIO 5, described in detail in Impact BIO-1, would
12 minimize significant impacts to native vegetation, including corridor habitat, by restricting
13 disturbance to work areas, promoting low impact development and preserving vegetation under
14 solar panels, and improving post-construction habitat values. MM BIO-6 (Wildlife Protection)
15 identifies numerous requirements to manage hazards to wildlife in work areas and report dead
16 or injured wildlife. These measures would increase detection of wildlife in Project areas that
17 require avoidance and would prevent attraction to the Project site where there is increased
18 likelihood of disturbance.

19 MMs BIO7 through BIO13 would prevent significant impacts to specific special-status wildlife
20 species and nesting or breeding sites by requiring specific pre-construction surveys and nesting
21 surveys, species protection plans, passive exclusion of wildlife from work areas or relocation or
22 translocation of certain species away from the area, and avoidance of buffer areas while bird
23 nests and occupied burrows and dens are active.

24 These measures ensure that work areas would be inspected and surveyed, and that special-status
25 wildlife would be identified, monitored, buffered and avoided, or properly excluded or relocated,
26 which is expected to reduce the likelihood and severity of injury, and the likelihood of mortality
27
28

1 of wildlife with potential to move through the Project areas or use the site for breeding or rearing
2 of young.

3 The Project has been designed to avoid desert dry wash woodland (except for minor incursions),
4 per the Project Description, and compensatory mitigation (desert dry wash woodland at a ratio
5 of 5:1 (MM BIO-14), desert pavement at a ratio of 1:1 (MM BIO-3), creosote bush scrub
6 (suitable desert tortoise habitat) at a ratio of 1:1 (MM BIO-7), and desert tortoise critical habitat
7 at a ratio of 5:1 (MM BIO-7)) would preserve habitat values and corridors for wildlife movement
8 and would offset habitat loss, consistent with CMAs LUPA-BIO-RIPWET-1 and LUPA-BIO-
9 COMP-1.

10 Long-term night lighting that could affect nocturnal and other wildlife and wildlife movement
11 would be managed per MM VIS-1 (see EIR Section 3.2, Aesthetics).

12 The project is required to comply with DRECP CMAs for all project activities and development
13 on BLM land. The BLM is expected to ensure project-specific CMA compliance through
14 imposition of NEPA mitigation measures and stipulations of the ROW Grant issued for the
15 Project. Compliance with the CMAs, which would be required on BLM lands, as described in
16 Impact BIO-3, would mitigate impacts to less than significant.

17 Similar to the requirements of the MMs that would be implemented on private land within the
18 Project site, these CMAs reduce impacts to wildlife and habitat by requiring qualified biological
19 staff to perform species and pre-construction surveys, worker training, and monitoring to detect
20 and identify biological resources for demarcation and avoidance. Implementation of plant and
21 seed salvage, re-vegetation, and weed management would improve post-construction habitat
22 values. Avoidance of desert dry wash woodland with a 200-foot setback buffer would prevent
23 direct removal of wildlife and corridor habitat.

24 Per LUPA-BIO-13 (General Siting and Design) projects along the edges of the biological
25 linkages are required to maximize the retention of microphyllous woodlands in order to maintain
26 the function of the connectivity area. By avoiding desert dry wash woodland with a setback
27
28

1 buffer, consistent with CMAs, Project areas would be left open to wildlife movement and the
2 Project would not threaten the long-term viability and function of the corridor.

3 The Project's contribution to cumulative impacts to wildlife movement would not be
4 considerable.

5 Local policies and ordinances. All cumulative projects are subject to environmental review and
6 approval by federal, State, or local agencies. During that process, the agencies review the
7 applicable policies and ensure that each project complies with policies and ordinances, and
8 impose conditions as appropriate to ensure compliance. Therefore, there is no significant
9 cumulative conflict with local policies and ordinances. The proposed Project does not conflict
10 with local policies or ordinances and thus has no contribution to any cumulative conflict.
11 Cumulative impacts to policies and ordinances would be less than significant.

12 (EIR pp. 3.5-35 to 3.5-39).

12
13 Applicable CMAs are detailed in EIR Appendix CC, which provides a list of CMAs, an
14 explanation of their applicability, and demonstration of compliance with the CMA. CMAs
15 specifically applicable under cumulative biological resources impacts are detailed at FEIR p 3.5-
16 136.

17
18 **E. Cultural Resources and Tribal Cultural Resources Cumulative Impacts**

19 **Cumulative Impact Finding: Cumulatively Considerable (Visual Impacts to PTNCL);**
20 **Not Cumulatively Considerable (All Other Impacts).**

21 The Project would not alter or destroy a historical resource, either directly or indirectly. There
22 are no known CRHR-eligible historical resources in the Project's direct impact area. Because
23 the visual changes resulting from the Project would be in kind with the current nature and scale
24 of existing visible developments, the portion of SR-177/Rice Road (P-33-025150) within the
25 indirect impact area would also not be impacted by the Project. Cumulative projects similarly
26 would be in kind with the current nature and scale of existing visible developments and would
27 be subject to similar measures designed to avoid and minimize impacts to historical resources.
28

1 Therefore, cumulative impacts to historical resources would be less than significant, and the
2 Project would not make a cumulatively considerable contribution to cumulative impacts on
3 historical resources.

4 The Project would not alter or destroy any CRHR-eligible archaeological resources, either
5 directly or indirectly. No evidence of P-33-023675 or the PTNCL were identified within the
6 Project's direct impact area. Archaeological resources located within the Project's direct impact
7 area are not associated with any sites or trail segments of the PTNCL and do not contribute to
8 the historical significance of the PTNCL. Due to their widespread occurrences, removal of these
9 sites and isolates would not alter the PTNCL's ability to convey its historical significance.
10 However, while the visual changes resulting from the Project would be in kind with the current
11 nature and scale of existing visible developments, the addition of more industrial components to
12 the Chuckwalla Valley, as a result of the Project in combination with past projects, other current
13 projects, and probable future projects, would contribute to adverse visual impacts to the PTNCL,
14 particularly from character defining features within the PTNCL.

15 The Project would implement Mitigation Measures CUL-1 through MM CUL-6, MM TCR-1,
16 MM TCR-2, AES-1 and AES-2, and applicable DRECP CMAs, which would avoid and
17 minimize impacts to archaeological resources and employ design elements that reduce the
18 Project's visual contrast to characteristics of the landscape, reducing project-level impacts to
19 less than significant. Cumulative projects would likely be required to implement similar
20 measures. However, cumulative visual impacts to the PTNCL would remain significant, and the
21 Project's incremental contribution would be cumulatively considerable.

22 The Project would not alter or destroy a unique archaeological resource, either directly or
23 indirectly. There are no known unique archaeological resources in the Project's direct or indirect
24 impact areas. Cumulative projects would be subject to measures designed to avoid and minimize
25 impacts to archaeological resources. Therefore, cumulative impacts would be less than
26 significant, and the Project would not contribute to cumulative impacts to any unique
27 archaeological resource.
28

1 The Project would not disturb any human remains, including those interred outside of dedicated
2 cemeteries. A review of the archaeological record search and results of recent surveys did not
3 identify any human remains, burial sites, or cemeteries in the Project area. If human remains or
4 related resources are discovered, such resources shall be treated in accordance with state and
5 local regulations and guidelines that govern the disclosure, recovery, relocation, and
6 preservation of human remains (14 CCR 15064.5[e]) and in accordance with relevant mitigation
7 measures and DRECP CMAs. Cumulative projects would be subject to the same requirements.
8 Therefore, cumulative impacts would be less than significant, and the Project's impacts
9 combined with those of nearby projects would not result in a cumulatively considerable impact
10 on human remains, including those interred outside of dedicated cemeteries.

11 The Project would not cause adverse change in the significance of a tribal cultural resource
12 determined by a lead agency or eligible for or listed on the CRHR or local register of historic
13 resources and would be subject to various mitigation measures and CMAs to avoid, minimize,
14 or mitigate impacts to any tribal cultural resources identified during construction, operations,
15 maintenance, and decommissioning of the Project. Cumulative projects would be subject to
16 similar measures designed to avoid and minimize impacts to tribal cultural resources. However,
17 as discussed above, the Project in combination with past projects, other current projects, and
18 probable future projects would contribute to adverse visual impacts to the PTNCL, particularly
19 from character defining features within the PTNCL. Cumulative visual impacts to the PTNCL
20 would remain significant, and the Project's incremental contribution would be cumulatively
21 considerable.
22

23 In sum, cumulative visual impacts to the PTNCL would be significant and unavoidable, and the
24 Project's incremental contribution to those visual impacts would be cumulatively considerable.
25 All other cumulative cultural and tribal cultural resource impacts would be less than significant,
26 and the Project's incremental contribution would not be cumulatively considerable. (EIR pp.
27 **3.6-51 to 3.6-53**).

DRECP CMAs:

Applicable CMAs are detailed in EIR Appendix CC, which provides a list of CMAs, an explanation of their applicability, and demonstration of compliance with the CMA.

F. Energy Resources Cumulative Impacts

Cumulative Impact Finding: Not Cumulatively Considerable.

The Project's energy use would contribute to the construction and operation of a solar facility that would increase the availability of renewable energy, thus reducing the use of fossil fuel for electrical generation by conventional power plants. Most of the cumulative projects identified in the EIR are renewable energy facilities and the remainder include projects such as a battery storage project, line capacity increase, or transmission lines and substations. Although construction activities associated with cumulative projects would require the use of fossil fuels, it is assumed each project would initiate best management practices and comply with applicable policies and regulations as part of project approval to reduce wasteful, inefficient, or unnecessary use of energy resources. Furthermore, most of the cumulative projects would also contribute renewable energy to the California electrical transmission system, reducing the State's overall reliance on fossil fuels. Cumulative impacts would be less than significant, and the proposed Project would not contribute to cumulatively considerable energy impacts and would make a beneficial cumulative contribution to supporting federal, state, and local plans for renewable energy development. (EIR pp. 3.7-5 and 3.7-6).

G. Geology, Soils and Mineral Resources Cumulative Impacts**Cumulative Impact Finding: Not Cumulatively Considerable.**

The geologic and seismic impacts of the Project are minimal and would not combine to result in a cumulatively significant geologic impact and the Project's contribution to such impacts would not be cumulatively considerable.

The proposed Project is adjacent to two large solar projects that would require substantial ground disturbance, the Oberon Renewable Energy Project (operational) and the Sapphire Solar Project (proposed). While each project's soil disturbance could result in off-site water and wind erosion, the Oberon and Sapphire Projects have or would also undergo an environmental review under NEPA and CEQA and would be required to abide by existing regulations and Applicant commitments such that they would have a DESCP, Drainage Plan, and SWPPP, and plans to

1 stabilize and/or revegetate disturbed areas that that would reduce wind and water erosion and
2 minimize its potential to leave its project site, similar to the Easley Project. Because wind and
3 water erosion of disturbed soil would be minimized by implementation of plans required by
4 regulations, mitigation measures and CMAs, it would not combine with the potential erosion
5 from nearby projects to create a cumulatively significant impact due to erosion. These same
6 plans, regulations, and measures would ensure that the proposed Project's contribution to
7 erosion would not be cumulatively considerable. **(EIR pp. 3.8-20).**

18
19 **DRECP CMAs:**

20 Applicable CMAs are detailed in EIR Appendix CC, which provides a list of CMAs, an
21 explanation of their applicability, and demonstration of compliance with the CMA.

22 **H. Greenhouse Gas Emissions Cumulative Impacts**

23 **Cumulative Impact Finding: Not cumulatively considerable.**

24 Because the direct environmental effect of GHG emissions is to influence global climate change,
25 GHG emissions are inherently a cumulative concern.

26 The main contribution of GHG emissions from the Project would be from construction
27 equipment usage during the construction phase and motor vehicles trips by employees and
28 maintenance vehicles during Project operations. The Project's emissions would, therefore,

1 contribute to the increase in emissions in the transportation sector. Construction emissions
2 would be finite and temporary and would cease at the end of construction activities.

3 Although the Project would result in a short-term contribution to cumulative GHG emissions in
4 California, operation of the Project would offset emissions from the electricity generation sector.
5 Therefore, the total GHG construction emissions that would be associated with the Project would
6 be offset by Project operations. Overall, the Project would not contribute to cumulative GHG
7 emissions in California because operation of the Project would provide electric power with
8 negligible operational GHG emissions over the long term when compared to traditional fossil-
9 fueled generation technologies. Thus, the Project would not have a cumulatively considerable
10 impact on global climate change, and cumulative impacts would therefore be less than
11 significant. (EIR p. 3.9-9).
12

13 **I. Hazards and Hazardous Materials Cumulative Impacts**

14 **Cumulative Impact Finding: Not Cumulatively Considerable.**

15 The cumulative effect of transport, use, and disposal of hazardous materials during construction
16 would be limited to the areas where concurrent construction is occurring or where concurrent
17 roads are being used for construction traffic. Operation and maintenance of the proposed Project,
18 including the proposed substations, shared switchyard, and O&M buildings, would involve
19 periodic and routine transport, use, and disposal of minor amounts of hazardous materials,
20 primarily petroleum products (fuels and lubricating oils) and motor vehicle fuel. The
21 implementation of Mitigation Measure HAZ-2 (Worker Environmental Awareness Program),
22 applicable CMAs, and agency regulations that address the handling of hazardous materials
23 would ensure that the Project would not create a significant hazard to the public or the
24 environment related to the handling or accidental release of hazardous materials. Past, present,
25 and reasonably foreseeable future projects are also subject to existing agency regulations that
26 address the handling and accidental release of hazardous materials, and all of the solar projects
27 would have their own WEAPs for construction and operations. Therefore, existing regulations
28

1 would ensure that the combined effects related to hazards and hazardous materials from the
2 cumulative projects within the geographic scope of analysis would not be cumulatively
3 significant, and that the proposed Project would not make a cumulatively considerable
4 contribution to these effects. Construction of the Project could encounter previously documented
5 and un-documented hazardous materials sites within the Project area. Since the proposed site is
6 located within an area with a history of WWII military use, there is a potential for UXO, MEC,
7 and MD. The Project would be required to implement an UXO Identification, Training, and
8 Reporting Plan (MM HAZ-1) which addresses the identification and treatment of UXO and
9 munitions debris, a WEAP (MM HAZ-2) which addresses hazardous materials handling and
10 disposal training and information, and a SMP (MM HAZ-3) to address potential pesticide
11 contaminated soil, as well as applicable DRECP CMAs on BLM land. The cumulative projects
12 would also be located on former military land with a history of UXO and munitions debris, so
13 would also likely require similar measures to minimize impacts on and off the site. Cumulative
14 impacts would be less than significant, and implementation of the Project would not make a
15 cumulatively considerable contribution to public health and safety hazards.

16 Implementation of stringent dust control regulations, Mitigation Measures HAZ-2 (Worker
17 Environmental Awareness Program) and AQ-1 (Fugitive Dust Control Plan) minimizes the risk
18 of workers or the public contracting Valley Fever. Past, present, and reasonably foreseeable
19 future projects are also subject to existing agency regulations that address fugitive dust and
20 would likely have similar mitigation to prepare a fugitive dust control plan. Therefore, existing
21 regulations, mitigation, and applicable CMAs would ensure that cumulative impacts are less
22 than significant and the proposed Project would not make a considerably contribution to the
23 potential for contracting Valley Fever.

24 Impacts from the storage, use, disposal, and transportation of hazardous materials would not
25 result significant cumulative impacts, nor would the Project result in a considerable contribution
26 to cumulative impact because hazardous materials are extensively regulated by various federal,
27 state, and local laws, regulations, and policies.
28

The proposed Project would be required to comply with applicable federal, state, and Riverside County requirements relating to fire safety and fire hazards, the FMPP, and Mitigation Measures FIRE-1, minimizing the risk of wildland fire occurring. Projects in the cumulative scenario would be required to comply with the same or similar requirements. Therefore, cumulative impacts would be less than significant, and implementation of the Project would not make a cumulatively considerable contribution to potential wildland fire impacts. In addition, the proposed Project would not make a considerable contribution to impact related to impairment of the implementation of or physical interference with an adopted emergency response plan or emergency evacuation plan because no aspect of the Project would interfere with emergency response (e.g., construction is not expected to require any temporary lane closures that could restrict the movements of emergency vehicles).. (EIR p. 3.10-24 and 3.10-25).

Applicable CMAs are detailed in EIR Appendix CC, which provides a list of CMAs, an explanation of their applicability, and demonstration of compliance with the CMA.

J. Hydrology and Water Quality Cumulative Impacts

Cumulative Impact Finding: Not Cumulatively Considerable.

Surface Water. All foreseeable future projects in the Chuckwalla Valley Hydrologic Unit would

1 be subject to similar measures as the proposed Project when obtaining the required permits and
2 complying with state and federal clean water regulations and Riverside County floodplain
3 development regulations. As these projects would go through an environmental review process,
4 they would be subject to similar mitigation measures as those proposed to address potential
5 water quality impacts for the proposed Project. Many of the projects (Arica, Victory Pass, Palen,
6 and Desert Harvest) do or would likely avoid major drainages that cross their sites. Because the
7 Project is in a similar hydrologic setting and most of the cumulative projects are similar projects,
8 individual project impacts are expected to be reduced to less than significant through compliance
9 with regulations and mitigation. Therefore, the combined effects to water quality from the
10 cumulative projects within the geographic scope would not be considered cumulatively
11 significant and the proposed Project would not have a considerable contribution to the
12 cumulative impact.

13
14 Groundwater. The Project would result in less than significant impacts to groundwater supplies
15 with implementation of mitigation and applicable CMAs. A cumulative impact scenario on
16 groundwater was completed in the Project WSA. As with the Project-level analysis, normal
17 (average) conditions are considered the more accurate estimate; the annual groundwater deficit
18 resulting from the use of the reduced recharge rates is inconsistent with reported groundwater
19 levels in the CVGB, which indicate that the groundwater levels are generally stable, or in some
20 areas in the CVGB, indicate an increasing trend, which would not occur if there were an ongoing
21 annual groundwater deficit. Additionally, the reduced recharge groundwater budget is
22 inconsistent with previous studies, including USGS (2007), CEC (2010), and Fang et al. (2021).
23 Development of a 52-year (equivalent to the total Project duration) groundwater budget
24 projection, assuming average precipitation and the Project and all cumulative projects in place,
25 indicates there would be an initial groundwater deficit of 6,960 AF in the year 2024 (first year
26 of construction for all cumulative projects not already under construction or operational). The
27 cumulative groundwater deficit would increase to approximately 118,420 AF by the end of the
28 52-year period. Development of a 52-year (equivalent to the total Project duration) groundwater

1 budget projection, assuming average precipitation and the Project and all cumulative projects in
2 place, indicates there would be an initial groundwater deficit of 6,960 AF in the year 2024 (first
3 year of Project construction for all cumulative projects not already under construction or
4 operational). The cumulative groundwater deficit would increase to approximately 118,420 AF
5 by the end of the 52-year period. Using the driest 52-year period recorded at the Blythe Airport
6 meteorological station, with the Project and all cumulative projects in place, the CVGB total
7 groundwater deficit at the end of the 52-year period would be approximately 112,560 AF. Using
8 the DWR (2020a) estimated annual pumping, at the end of the 52-year period the total
9 groundwater deficit would be approximately 39,760 AF.

10
11 Notably, the estimated water demand of the Eagle Mountain Pump Storage (EMPS) Project is
12 4,460 AFY during the projected 4-year construction period and 2,050 AFY during the
13 operational phase of the project. Comparatively, one year of construction water demand for the
14 EMPS Project is more than the 52-year water demand for the Project. Further, during its
15 operational phase, the EMPS Project is projected to use more than six times the groundwater of
16 all other cumulative projects located in the CVGB. The inclusion of the EMPS Project drastically
17 affects the cumulative project projected groundwater budgets. Without the EMPS Project, the
18 cumulative groundwater deficit would be 2,180 AF at the end of the 52-year period under normal
19 conditions. Under normal conditions using DWR (2020a) estimated annual pumping, there
20 would be a cumulative groundwater surplus of 70,620 AF without the EMPS Project. Similarly,
21 if the EMPS Project groundwater use was not included in the driest 52-year period cumulative
22 project scenario, the cumulative groundwater surplus would be 3,680 AF at the end of the 52-
23 year period. Using the DWR (2020a) estimated annual pumping, the cumulative groundwater
24 surplus would be 76,480 AF at the end of the 52-year period.

25 Although the cumulative scenarios presented in the Project WSA (GSI, 2024) indicate a deficit
26 over the 52-year period in some circumstances, the available water supplies during normal,
27 single dry, and multiple dry water years from the CVGB, would meet the projected water
28 demands of the cumulative project uses, in addition to existing uses and planned future uses.

1 This is a result of the storage capacity and hydrogeologic properties of the CVGB, and the
2 relatively low water demand of the cumulative projects. Further, the WSA also calculated the
3 groundwater drawdown caused by groundwater use by the cumulative projects. The Project
4 impacts are discussed in terms of the zones of influence of the total cone of depression
5 considering cumulative drawdown as a result of the Project, cumulative projects, and the CVGB
6 projected agricultural, municipal, and domestic pumping. The zone of influence after 2 years of
7 Project construction pumping (500 AFY) is an approximately 4.5-mile radius cone of depression
8 out to 0.5 feet of drawdown. Project operational and decommissioning pumping (50 AFY) for
9 50 years has a cumulative drawdown with an approximately 15-mile radius out to 0.5 feet of
10 drawdown. This zone of influence also includes pumping from cumulative projects.

11
12 The modeling results indicate that impacts to groundwater levels as a result of Project and
13 cumulative project pumping are confined to the western part of the CVGB. Although most of
14 the non-cumulative project pumping (see GSI, 2024 Section 5.8.2) in the CVGB occurs in the
15 western part of the CVGB (the total agricultural, municipal, and domestic pumping is limited to
16 approximately 7,900 AFY [CEC, 2010]), cumulative project pumping is not anticipated to
17 adversely affect existing water users and water rights claimants in the CVGB due to the limited
18 magnitude of the simulated drawdown (see the previous paragraph).

19 Thus, even with a potential deficit, the overall impact would be limited to the western part of
20 the CVGB and any such impact would not adversely affect the existing water uses in that area.
21 Further, even the higher estimated deficit (112,560 AF) is only 1.12 percent of the total assumed
22 10,000,000 AF capacity of the CVGB. Year to year groundwater use by cumulative projects also
23 would be well below historical agricultural pumping, which was approximately 21,000 AFY in
24 1986 (GEI, 2010a). Current agricultural groundwater use is estimated at approximately 6,628
25 AFY, approximately three times the amount of yearly operational groundwater use for all
26 cumulative projects (DWR, 2020a). Even with agricultural pumping, as well as municipal and
27 domestic uses, groundwater levels in the CVGB have been relatively stable or, in some areas of
28 the CVGB, increasing based on reported groundwater levels. There is no reported evidence of

1 subsidence in the CVGB as a result of historical or present pumping (GEI, 2010a) and the Project
2 and cumulative projects are not anticipated to cause subsidence, increase the rate of subsidence,
3 or cause loss of aquifer storage capacity in the CVGB.
4

5 Thus, the addition of the cumulative projects likely would have a limited impact on the overall
6 groundwater supplies in the CVGB. Like the Project, cumulative projects would be required to
7 implement groundwater monitoring plans and ensure that pumping would not adversely impact
8 existing users. Groundwater pumping from cumulative projects also would be limited by the
9 Accounting Surface. However, because the cumulative scenario under normal conditions
10 indicates a potential groundwater deficit, the County conservatively concludes that cumulative
11 impacts would be potentially significant.

12 Although cumulative impacts would be potentially significant, the Project's incremental
13 contribution is not considered cumulatively considerable. As noted above, the cumulative deficit
14 is driven by the proposed EMPS Project, which accounts for the majority of groundwater use
15 under the cumulative scenario. One year of construction water demand for the EMPS Project is
16 more than the 52-year water demand for the Project. Further, during its operational phase, the
17 EMPS Project is projected to use more than six times the groundwater of all other cumulative
18 projects located in the CVGB and more than 33 times the groundwater of the Project during the
19 52-year period. Without the EMPS Project, the cumulative groundwater deficit would be 2,180
20 at the end of the 52-year period. Under normal conditions using DWR (2020a) estimated annual
21 pumping, there would be a cumulative groundwater surplus of 70,620 AF without the EMPS
22 Project. Similarly, if the EMPS Project groundwater use was not included in the driest 52-year
23 period cumulative project scenario, the cumulative groundwater surplus would be 3,680 AF at
24 the end of the 52-year period. Using the DWR (2020a) estimated annual pumping, the
25 cumulative groundwater surplus would be 76,480 AF at the end of the 52-year period. The
26 Project's contribution to cumulative project pumping during the 52-year period is minor,
27 accounting for 3 percent of the total cumulative demand. The Project also would implement
28 various construction techniques designed to reduce overall water use during construction,

1 including using “overland travel,” designating primary travel routes, limiting grading, utilizing
2 small rubber-wheel vehicles, and phasing construction, as described in Chapter 2. Project-level
3 impacts are less than significant, and the Project would comply with various mitigation measures
4 and CMAs that would minimize potential pumping impacts to nearby wells and the larger
5 CVGB. Accordingly, the Project’s incremental contribution to cumulative impacts is not
6 cumulatively considerable.

7
8 Further, based on the limited magnitude of the simulated drawdown due to Project and
9 cumulative project pumping, groundwater levels would not be lowered to a level that would
10 cause a degradation of groundwater quality that affect other beneficial uses. Additionally,
11 groundwater levels would not be lowered to a level that causes pumping wells near the Project
12 to begin to capture deeper/older groundwater within the CVGB. Deeper/older groundwater
13 typically contains increased salts and nutrients as a result of prolonged exposure to the aquifer
14 material (leaching of minerals from the host rock into groundwater) (USGS, 2019). In addition,
15 there are no known point source plumes near the Project. Therefore, there are no known
16 contaminant plumes Project pumping or cumulative pumping could potentially mobilize. (EIR
17 pp. 3.11-35 to 3.11-38).

7
8 **DRECP CMAs:**

9 Applicable CMAs are detailed in EIR Appendix CC, which provides a list of CMAs, an
10 explanation of their applicability, and demonstration of compliance with the CMA.

11 **K. Land Use and Planning Cumulative Impacts**

12 **Cumulative Impact Finding: Not Cumulatively Considerable.**

13 Potential land use impacts require evaluation on a case-by-case basis. The Easley Project would
14 be consistent with the goals and policies of the Riverside County General Plan, and other
15 applicable local land use plans, policies, and regulations and with the federal plans. In addition,
16 with approval of all discretionary requests, the Project would be an allowable use that would not
17 conflict with the land use or zoning classifications for the site. Therefore, cumulative impacts
18 would be less than significant, and the Project's incremental contribution to cumulative impacts
19 to land use would not be considerable. **(EIR pp. 3.12-13).**

20
21 **L. Noise Cumulative Impacts**

22 **Cumulative Impact Finding: Not Cumulatively Considerable.**

23 Limited areas of cumulative project construction activities could be within 0.5 mile of the
24 proposed Project. Active pieces of construction equipment normally cause no more than 85 dBA
25 when measured 50 feet from the source. Construction-phase noise impacts would be short-term
26 and limited in nature, with construction activities for all cumulative projects normally being
27 limited to the daytime. Simultaneous cumulative project construction activity would have the
28 potential to cause overlapping construction noise impacts with construction of the proposed

1 Project. The potential for overlap depends on the distance and timing of the future projects. The
2 boundaries of the cumulative project nearest to the existing residences are those for the Sapphire
3 Solar Project, which would be over one mile from the existing residences at Lake Tamarisk
4 Desert Resort. At this distance, active construction equipment generating noise within the
5 Sapphire Solar Project site could contribute about 42 dBA at the residences. When compared
6 with the construction effects of the proposed Project, which could cause 62 dBA Leq at the
7 residences, the cumulative project construction noise would not substantially influence the
8 localized noise levels experienced by nearby residences including Lake Tamarisk Desert Resort.
9 (Calculations appear in EIR Appendix K.) Because substantial distances separate residences
10 from the proposed Project and probable future projects, construction noise from the Sapphire
11 Solar Project and other cumulative projects would attenuate to imperceptible levels prior to
12 reaching residences and therefore would not be expected to combine with project construction
13 noise in a way that would increase noise levels experienced by sensitive receptors.

14 The noise impact of cumulative project operations could also occur simultaneously with
15 proposed Project construction, although no cumulative project operation noise would be likely
16 to occur at a location that substantially influences the localized noise levels experienced by
17 residences nearest to the proposed Project permanent noise sources. This is because the only
18 cumulative projects with the reasonable potential to combine noise impacts with the Project are
19 the Sapphire Solar Project, Oberon Solar Project, and Athos Solar Project. As described above,
20 the Sapphire Solar Project would be located over one mile away from Lake Tamarisk Desert
21 Resort. Distances of 0.5 miles or more separate Lake Tamarisk Desert Resort from the nearest
22 noise-producing facilities for the Oberon project, and over one mile separates Lake Tamarisk
23 Desert Resort from the Athos project. At these distances, operational noise from these
24 cumulative projects would be comparable to the noise from proposed Project operation, but at a
25 greater distance. The cumulative project noise would attenuate to the point of being
26 imperceptible for existing residences. As a result, operational noise from these projects would
27
28

1 not be expected to combine with Project construction noise in a way that would cause significant
2 cumulative noise impacts.

3 For the reasons described above and given that the nearest sensitive receptor would be at least
4 200 meters (656 feet) from proposed Project construction activities and at much greater distances
5 from cumulative projects, cumulative noise impacts during Project construction would not be
6 significant. Mitigation Measures MM N-1 through N-3 and applicable DRECP CMAs would
7 minimize the Project's contribution to these already less-than-significant cumulative
8 construction noise impacts.

9 The duration of construction work for the proposed Project would be approximately 20 months,
10 and after that time, few notable permanent sources of noise would occur with the proposed solar
11 facility, BESS, and gen-tie, and similarly, few noise sources occur with the cumulative projects.
12 All cumulative project operations would generate noise from employee vehicles accessing the
13 sites, and solar energy projects include power inverters and other power system infrastructure
14 that are minor sources of noise. These sources may cause localized cumulative effects where
15 multiple projects or shared transportation routes occur adjacent to a sensitive receptor. However,
16 as described above, cumulative projects with the potential to combine noise impacts with the
17 project are located such that operational noise they generate would be expected to attenuate to
18 the point of being imperceptible for existing residences. As a result, operational noise from these
19 projects would not be expected to combine with proposed Project operations noise in a way that
20 would cause significant cumulative noise impacts.

21 As described above, cumulative noise impacts would not be significant. These less-than-
22 significant impacts would be further reduced through compliance with local laws and regulations
23 and implementation of typical mitigation to protect sensitive receptors from noise and
24 implement feasible noise controls. Cumulative renewable energy projects and other
25 development that are subjected to the environmental permitting process would have a detailed
26 analysis of noise and land use conflicts as part of the project-level environmental review. The
27 permitting process normally requires each project to comply with local standards and to avoid
28

1 noise-related land use conflicts. This means that all projects, even if unrelated to the proposed
2 Project, would need to comply with the local community noise standards, such as the Riverside
3 County Noise Ordinance.

4 Cumulative effects due to ground-borne vibration would occur only if there were sources of the
5 vibration within approximately 200 feet from the boundaries between the proposed Project site
6 and cumulative project sites. Boundaries of cumulative projects occur within 200 feet of the
7 proposed Project site, but these shared boundaries are not within 200 feet of existing residences.
8 As a result, the areas of potential overlap of cumulative project construction-related vibration
9 would not be likely to create a cumulative vibration impact at residences near the proposed
10 Project, and no cumulative effects would be likely from ground-borne vibration. (EIR pp. 3.13-
11 14 and 3.13-15).

21 Applicable CMAs are detailed in EIR Appendix CC, which provides a list of CMAs, an
22 explanation of their applicability, and demonstration of compliance with the CMA.

23
24 **M. Paleontological Resources Cumulative Impacts**

25 **Cumulative Impact Finding: Not Cumulatively Considerable.**

26 A significant cumulative impact would occur if the impacts of multiple projects combined to
27 result in the loss of paleontological resources that could provide information about ancient life
28

1 in the Chuckwalla Valley. The large amount of ground disturbance proposed from projects in
2 this region is likely to result in some loss of fossil resources; particularly, if ground-disturbing
3 projects do not implement measures to avoid or minimize impacts. The Easley Project, as well
4 as the other solar development projects in eastern Riverside County, would be required to
5 provide mitigation for any impacts to paleontological resources in accordance with provisions
6 of CEQA, as well as with regulations currently implemented by the County and BLM, the PRP
7 Act, and the proposed guidelines of the SVP. Implementation of Mitigation Measures PR-1
8 through PR-4 and applicable DRECP CMAs would ensure that the proposed Project would avoid
9 and minimize impacts on paleontological resources to the maximum extent feasible. Therefore,
10 the Easley Project's incremental contribution to cumulative impacts for paleontological
11 resources would not be cumulatively considerable. (EIR p. 3.14-10).

21 Resources.

22
23 **DRECP CMAs:**

24 Applicable CMAs are detailed in EIR Appendix CC, which provides a list of CMAs, an
25 explanation of their applicability, and demonstration of compliance with the CMA.

26
27 **N. Population and Housing Cumulative Impacts**

28 **Cumulative Impact Finding: Not Cumulatively Considerable.**

1 Construction of the present and reasonably foreseeable future development projects may overlap
2 with construction of the proposed Project. Under the conservative assumption that peak
3 construction periods overlap for all reasonably foreseeable projects, there would be an increased
4 demand for temporary housing units in the cumulative area. The vacancy rates for housing units
5 are moderately high (35 percent in Desert Center) and there are a number of temporary housing
6 options available as well. There is an ample supply of housing units to accommodate workers
7 drawn from outside the two-hour commute area. Therefore, cumulative impacts in the
8 cumulative scenario on housing are projected to be less than significant. The proposed Project
9 would contribute an additional peak labor need of approximately 530 individuals. Given the
10 availability of housing units, the incremental effects of the Project, when considered together
11 with other past, present, and reasonably foreseeable future projects, would not result in a
12 cumulatively significant impact. (EIR p. 3.15-5).

13
14 **O. Public Services and Utilities Cumulative Impacts**

15 **Cumulative Impact Finding: Not Cumulatively Considerable.**

16 The implementation of Project-specific Fire Prevention Plan would reduce the Project-
17 related demand for fire, law enforcement, and emergency medical services from construction,
18 such that the residual demand would not exceed established service ratios or require new or
19 physically altered facilities, the construction of which could cause environmental impacts. Other
20 projects would be required to comply with similar standards and regulations to reduce the
21 potential for fire risks. The incremental effects of the Project and cumulative projects would
22 therefore be reduced to less than significant level. The incremental effects of the proposed
23 Project from up to 10 permanent staff during operations would also not be cumulatively
24 considerable because the very low number of workers would also not lead to the exceedance of
25 established service ratios or require new or physically altered facilities. Cumulative operational
26 and maintenance-related impacts to public services including fire, hazardous materials handling,
27 and medical resources and facilities would be less than related demands during construction and
28

1 would not result in significant cumulative impacts due to the low number of employees required
2 to support projects in the cumulative scenario. At the end of the 30 to 50-year operational period
3 of the proposed Project, the components would be decommissioned and deconstructed; the site
4 would be restored to its pre-solar facility conditions and made available for agricultural use.
5 Similar to construction (but to a lesser degree), the greatest potential need for public services
6 would be associated with fire hazards. Fire hazards would be greatest during this time because
7 the on-site workforce would be at its peak which could create a potential demand for fire and
8 police services. Under cumulative conditions, implementation of the Project in the context of
9 past projects and in conjunction with development of projects listed in Tables 3.11 and 3.12 are
10 not anticipated to cause a demand on public services or utilities such that the construction of
11 new or physical alteration of existing facilities would be required because the payment of
12 development fees now and into the future is expected to substantially offset the public service-
13 related demands of currently proposed and reasonably foreseeable future projects. Therefore, no
14 significant adverse cumulative impact would result.

15 Due to the temporary nature of construction, it is not likely that any of the workers and their
16 families for any of the cumulative projects would relocate to the area. Any potential impact to
17 schools and libraries from the minimal number of operations personnel for each solar project
18 would be negligible especially as the workers would be sourced from local communities and
19 would likely commute. There would be no significant cumulative impact to schools or public
20 libraries.

21 The proposed Project would utilize an on-site or off-site groundwater well or water trucked from
22 an offsite water purveyor and would not generate wastewater. There is no potential for the
23 Project to contribute to cumulative impacts to water or wastewater systems. In addition, due to
24 the existing and remaining capacity at existing landfills, the Project's incremental solid waste-
25 related impact during construction and operation, when combined with the contributions of past,
26 other present, and reasonably foreseeable future projects would not result in significant
27 cumulative impacts. (EIR pp. 3.16-12 and 3.16-13).
28

1 **P. Recreation Cumulative Impacts**

2 **Cumulative Impact Finding: Not Cumulatively Considerable.**

3 If all the solar projects were developed, loss of the local Desert Center OHV routes would be
4 substantial because many routes would be closed. However, extensive OHV recreational
5 opportunities would continue to exist in the surrounding area, including within the SRMA south
6 of I-10, thus ensuring that cumulative impacts related to the loss of OHV routes would not be
7 significant. The contribution to the less than significant impact by the Project would be less than
8 cumulatively considerable because the Project would only result in the partial closure of one
9 route and would-be users of that trail would have alternative access to a nearby Open Route.
10 None of the routes in the Project site connect to specific recreation areas. Because of the large
11 amount of wilderness and solitary recreational areas in Eastern Riverside County and in the
12 California desert and the limited use of the recreational areas near the Project, it is unlikely that
13 recreationists who leave the Desert Center area for elsewhere in California would noticeably
14 increase the use of others areas such that substantial physical deterioration of the region would
15 occur or be accelerated. Impacts would not result in a cumulatively significant impact. (EIR p.
16 3.17-11).

17
18 **Q. Traffic and Transportation Cumulative Impacts**

19 **Cumulative Impact Finding: Not Cumulatively Considerable.**

20 Project operations and maintenance would result in negligible daily trips to study area roadways.
21 Therefore, the cumulative impact analysis focuses on traffic volumes generated during
22 construction of the proposed Project. Impact TRA1 and Impact TRA2 consider the cumulative
23 impacts of the Project by analyzing the effects of the Project plus the ambient conditions. Both
24 impacts conclude that the cumulative impacts would be less than significant with
25 implementation of MM TRA-1 (Construction Traffic Control Plan). Furthermore, Project
26 construction and operation would not introduce trip VMT in excess of projects within the rural
27 desert area and with implementation of MM TRA-1 would require the Applicant to ensure plans
28

1 for carpooling are incorporated.

2 Several solar projects and associated gen-tie lines and the Eagle Mountain Project gen-tie line
3 are located within 20,000 feet of the Desert Center Airport. As with the proposed Project, each
4 project would check with the airport sponsor and the FAA to ensure there are no potential safety
5 or navigational problems with a proposed solar facility, especially if it is a large facility (FAA,
6 2010). Each cumulative development project within 20,000 feet of Desert Center Airport would
7 also have to be evaluated against FAA 7460 regulations pertaining to structures that may affect
8 aviation and airspace safety. Because each project would need to comply with FAA
9 determinations, the FAA will be able to ensure that the cumulative impacts to the Desert Center
10 Airport are not significant.

11 Cumulative impacts due to increased transportation hazards or damaged roads could be
12 significant if simultaneous construction activities resulted in significant volumes of heavy truck
13 trips that affected safe use of a roadway or damaged transportation facility surfaces. The
14 Project's contribution to the potentially significant cumulative impact would be reduced to less
15 than cumulatively considerable because MM TRA-1 (Construction Traffic Control Plan)
16 requires the Applicant to define the methods to maintaining close coordination with Caltrans
17 and Riverside County, prior to and during construction, to minimize cumulative impacts of
18 multiple simultaneous construction projects affecting shared portions of the circulation system.
19 MM TRA-1 also requires the Applicant to reduce temporary motorist hazards in a variety of
20 ways, including ensuring the safe movement of pedestrians and bicycles through work areas.
21 MM TRA-2 (Repair Roadways and Transportation Facilities Damaged by Construction
22 Activities) is proposed to ensure any damage and deterioration attributed to the Project would
23 be repaired. With the incorporation of these measures, the Project would have a less than
24 significant contribution to cumulative hazard impacts on transportation facilities.

25 Construction of gen-tie lines could result in a cumulative impact to temporary lane closures.
26 This is because construction of the solar facilities is expected to require temporary lane closures
27 for the stringing of gen-tie conductor across roadways. Construction of the gen-tie lines for each
28 cumulative project may require stringing the lines over local roads and the I-10, but each

1 developer would be required to coordinate that work with Caltrans and the County to avoid any
2 cumulative impacts.

3 Construction of the solar facility is not expected to require any temporary lane closures that
4 could restrict the movements of buses. Similarly, the construction of the cumulative projects
5 would also be unlikely to require temporary land closures because they would be built on public
6 or private lands off of public roads. Construction of the proposed Project would require large
7 vehicles travel on local roadways to access the site and includes MM TRA-1 (Construction
8 Traffic Control Plan) that would include provisions for ensuring detours or safe movement of
9 vehicles through all affected areas. The cumulative projects would also be required to abide by
10 regulations regarding lane closures to reduce any potential impacts. Therefore, the Project would
11 not result in a cumulative significant impact to public transportation. **(EIR pp. 3.18-19 and**
12 **3.18-20).**

13
14 **Mitigation Measures:**

15 **MM TRA-1 (Construction Traffic Control Plan)** Full text under Traffic and Transportation.

16 **MM TRA-2 (Repair Roadways and Transportation Facilities Damaged by Construction**
17 **Activities)** Full text under Traffic and Transportation.

18
19 **R. Wildfire Cumulative Impacts**

20 **Cumulative Impact Finding: Not Cumulatively Considerable.**

21 Cumulative impacts regarding wildfire hazards generally occur if multiple projects were to be
22 constructed and operated in overlapping schedules in a High or Very High FHSZ. Additionally,
23 cumulative wildfire impacts are more likely to occur if the projects involve construction of
24 flammable structures, such as houses or other buildings. Combined with a geographic area prone
25 to wildfires, such as a densely forested area or chaparral-dominated landscape, the wildfire
26 effects of multiple developments could combine to be cumulatively considerable. None of these
27 factors is present here.
28

Short-term cumulative impacts would occur during construction and decommissioning if the Project schedule overlaps with multiple other nearby projects. However, projects in the cumulative scenario would be required to comply with local, State, and federal fire hazard policies, the CFC, and include their own fire management plans and best management practices. Furthermore, the proposed Project, as well as the surrounding projects, would all occur in a Moderate FHSZ with no dense vegetation to spread a potential fire. Therefore, there would not be a significant cumulative impact related to wildfire, and the Project would not make a cumulatively considerable contribution to impacts related to fire hazards. (EIR pp. 3.19-14).

Mitigation Measures:

MM TRA-1 (Construction Traffic Control Plan) Full text under Traffic and Transportation.

MM FIRE-1 (Fire Safety) Full text under Wildfire.

DRECP CMAs:

Applicable CMAs are detailed in EIR Appendix CC, which provides a list of CMAs, an explanation of their applicability, and demonstration of compliance with the CMA.

BE IT FURTHER RESOLVED by the Board of Supervisors that it has considered the following alternatives identified in EIR No. SCH2022110240 in light of the environmental impacts which cannot be avoided or substantially lessened and has rejected those alternatives as failing to meet most of the Project's objectives, as failing to reduce or avoid the Project's significant impacts or as infeasible for the reasons hereinafter stated:

- A. Pursuant to Public Resources Code Section 21002 and the State CEQA Guidelines section 15126.6(a), an EIR must assess a reasonable range of alternatives to the project action or location. Section 15126.6(a) places special emphasis on focusing the discussion on alternatives which provide opportunities for eliminating any significant adverse environmental impacts, or reducing them to a level of insignificance, even if the alternative would impede to some degree the attainment of the project objectives, or would be more costly. In this regard, the EIR must identify an environmentally superior alternative among

1 the other alternatives. The discussion of alternatives is governed by the "rule of reason."
2 The EIR need not consider an alternative whose effect cannot be reasonably ascertained, or
3 does not contribute to an informed decision-making and public participation process. As
4 directed by State CEQA Guidelines section 15126.6(a), an EIR shall include alternatives to
5 the project that could feasibly accomplish most of the basic objectives of the project.

6 B. The Project has been developed to achieve the following objectives:

- 7 1. Support climate and clean energy goals of the Inflation Reduction Act of 2022 by
8 helping to tackle the climate crisis and work towards achievement of President
9 Biden's goal of a zero-carbon power sector by 2035 and zero-carbon economy by
10 2050 through development of clean electricity (power sector);
- 11 2. Assist the nation to meet its Nationally Determined Contribution commitments under
12 Article 4 of the Paris Climate Agreement to achieve a 50 to 52 percent reduction in
13 U.S. greenhouse gas pollution from 2005 levels by 2030, and to achieve 100 percent
14 carbon pollution-free electricity by 2035 in the electricity sector;
- 15 3. Further the purpose of Secretarial Order 3285A1, establishing the development of
16 environmentally responsible renewable energy as a priority for the Department of
17 the Interior;
- 18 4. Deliver up to 400 MW of affordable, wholesale renewable energy to California
19 ratepayers under long-term contracts with electricity service providers;
- 20 5. Assist with achieving California's renewable energy generation goals under the
21 Clean Energy and Pollution Reduction Act of 2015 (Senate Bill 350) and the 100
22 Percent Clean Energy Act of 2018 (Senate Bill 100), as well as greenhouse gas
23 (GHG) emissions reduction goals of the California Global Warming Solutions Act
24 of 2006 (AB 32), as amended by Senate Bill 32 in 2016;
- 25 6. Enhance California's fossil-free resource adequacy capabilities and help to solve
26 California's "duck curve" power production problem by installing up to 650 MW of
27 2-hour and/or 4-hour battery energy storage capacity;
- 28

7. Minimize environmental impacts and land disturbance associated with renewable energy development by siting the facility on relatively flat, contiguous lands with high solar insolation, in close proximity to established utility corridors, existing transmission lines with available capacity to facilitate interconnection, and road access;
8. Conform with the Desert Renewable Energy Conservation Plan, including Conservation Management Actions;
9. Bring living-wage jobs to Riverside County;
10. Bring sales tax revenues to Riverside County by establishing a point of sale in the County for the procurement of most major project services and equipment.
11. Make the highest and best use of primarily disturbed, retired agricultural land in and around a federal "Solar Energy Zone" and "Development Focus Area" to generate, store, and transmit affordable, wholesale solar electricity.
12. Develop a commercially financeable renewable energy project.

These Project objectives (**EIR p. 1-3**) were defined consistent with the development proposal for this location. As directed in State CEQA Guidelines section 15126.6(a), an EIR shall include alternatives to the project that could avoid or substantially reduce one or more of the significant effects. Because not all significant effects can be substantially reduced to a less-than-significant level, either by adoption of mitigation measures with respect to the portion of the Project on private land and/or implementation of the DRECP CMAs with respect to the portion of the Project on BLM-administered land, Project Design Features, existing regulations, or by standard conditions of approval, the following section considers the feasibility of the Project alternatives as compared to the proposed Project. As explained below, these findings describe and reject, for reasons documented in the EIR No. SCH2022110240 and summarized below, each one of the Project alternatives, except for Alternative B: Reduced Footprint Alternative, as described in Section 2.8.3 of the EIR ("Alternative B"). With respect to Alternative B, the Board of Supervisors finds that the alternative would result in similar impacts for most impact categories, but reduced impacts

1 for Noise and Vibration as compared to the Proposed Project. Aesthetics impacts under
2 Alternative B would be significant and unavoidable, but would be reduced compared to the
3 Proposed Project. Further, Alternative B meets these critical project objectives and has been
4 determined to be acceptable by the Applicant. Accordingly, the Board of Supervisors has
5 determined it should approve Alternative B instead of approving the originally Proposed
6 Project or one of the other alternatives. The significant and unavoidable impacts of
7 Alternative B are overridden by Project benefits as set forth within the Statement of
8 Overriding Considerations below and the Board hereby denies the original Proposed Project
9 in favor of Alternative B: Reduced Footprint Alternative.

10 The evidence supporting these findings is presented in Chapters 3.02 through 3.19 and
11 Chapter 5 of the EIR and elsewhere in the administrative record as a whole.

12 C. Alternative A1, A2, and A3: No Project Alternative -No Development Alternative

13 13. This alternative evaluated the environmental impacts under three scenarios: a no
14 build alternative (A1), development of uses allowed by right within the existing
15 zoning and land designations (A2), and development of other renewable energy
16 within the existing zoning and land designations (A3).

17 14. With respect to the Alternative A1: No Project Alternative-No Build Alternative, the
18 construction of a solar generating facility and associated infrastructure would not
19 occur. Project objectives are not attained because no development is included as a
20 part of this alternative. With respect to the significant unavoidable impacts of the
21 Project (project-level and cumulative aesthetics impacts and cumulative cultural
22 resources impacts), this alternative would avoid all the unavoidable significant
23 impacts of the Project; however, it would not achieve any of the environmental
24 benefits of increasing renewable energy generation and it would not generate
25 substantial benefits to the County and local economy, by providing new jobs and
26 additional tax revenues. None of the Project objectives would be met under this
27 alternative.
28

15. The Board of Supervisors rejects as infeasible Alternative A1, the No Project Alternative-No Development Alternative on the following ground, which individually provides sufficient justification for rejection of this alternative: (1) Alternative A1 fails to meet any of the Project objectives. Therefore, Alternative A1 is eliminated from further consideration.
16. With respect to Alternative A2, No Project Alternative-Uses Allowed by Right within Existing Land Designations, the only uses that may occur on both Federal and County land would not require discretionary approvals from either jurisdiction. Given this limitation, BLM lands would not be developed under Alternative A2, since any development on BLM lands requires a discretionary decision from the agency. In contrast, lands under County jurisdiction have various allowed uses as identified in the zoning code that do not require discretionary approval by the County, such as one-family dwellings, water works, a wide range of agricultural activities and structures, parks and playgrounds, mining, outside storage of farming equipment, and employee housing. Under Alternative A2, no substantially adverse and long term impacts would occur; however, Alternative A2 would not achieve any of the environmental benefits of renewable energy generation or any of the other Project objectives.
17. The Board of Supervisors rejects as infeasible Alternative A2, the No Project Alternative-Uses Allowed by Right within Existing Land Designations Alternative on the following ground, which individually provides sufficient justification for rejection of this alternative: (1) Alternative A2 fails to meet any of the Project objectives. Therefore, Alternative A2 is eliminated from further consideration.
18. With respect to Alternative A3, Other Renewable Energy Development within Existing Land Designations, the DFA designation of the BLM-administered land allows development of wind or geothermal generation, as well as solar. Wind development would cause a severe aesthetic impact from the presence of turbines and night lighting. Geothermal development would require intensive drilling of

1 wells, which would also be visually significant. Both of these alternative
2 technologies would have greater impacts when compared to the Proposed Project
3 related to Biological Resources, Hazards and Hazardous Materials, Hydrology and
4 Water Quality, Land Use and Planning, Noise and Vibration, and Population and
5 Housing. Alternative A3 would have a significant and unavoidable aesthetic impact,
6 greater than the Proposed Project.

- 7
8 19. The Board of Supervisors rejects as infeasible Alternative A3, Other Renewable
9 Energy Development within Existing Land Designations, on the following grounds,
10 which provides sufficient justification for rejection of this alternative: (1) although
11 the renewable power generation that could occur with this alternative is consistent
12 with the project objectives relating to climate change and renewable energy, the wind
13 component could generate only about 12% of the electricity of the proposed Project
14 due to the larger land areas required for this technology and, therefore, fails to meet
15 the Project Objectives to the same extent as the Project; (2) the geothermal and wind
16 technologies that could be permitted on DFA-designated lands would have numerous
17 significant impacts, conflicting with the objective of minimizing environmental
18 impacts. Therefore, Alternative A3 is eliminated from further consideration.

19 D. Alternative C: Further Reduced Footprint Alternative with Berms

- 20 1. This alternative would modify the proposed Project by establishing a minimum buffer
21 zone setback of one mile from the Lake Tamarisk Desert Resort border, installing earthen
22 berms in two locations, and relocating the onsite substation, BESS, O&M building, and
23 gen-tie line. This alternative would eliminate the significant aesthetics impacts of the
24 proposed Project from the Lake Tamarisk Desert Resort residences, but it would increase
25 the severity of public views from State Route 177 (Rice Road) due to the
26 substation/BESS location, such that aesthetics impacts would remain significant and
27 unavoidable. In addition, constructing and maintaining the berms would be challenging
28 given the anticipated level of erosion from wind and rainstorms, and the berms would

1 redirect surface water flood flows in a manner that could create more severe erosion
2 downstream.

3 2. The loss of 530 acres of development under Alternative C would result in a loss of 80
4 MW to 110 MW of energy generation, as compared to the proposed Project, for a total
5 maximum output between 290 MW to 320 MW.

6 3. Although the impacts would be largely similar, the aesthetic impacts would be fewer
7 than the Proposed Project, specifically reducing the significant impact on the Lake
8 Tamarisk Desert Resort; however, visual impacts would remain significant and
9 unavoidable and the impacts to viewers from State Route 177 would be more severe.
10 There would be fewer impacts on biological resources due to the buffer/reduction in
11 ground disturbance by 530 acres compared to the proposed Project, but the alternative
12 would have greater impacts on surface water flows due to the berms.

13 4. The Board of Supervisors rejects Alternative C, the Further Reduced Footprint
14 Alternative with Berms, on the following grounds which provides sufficient justification
15 for rejection of this alternative: (1) Alternative C would not avoid the significant and
16 unavoidable aesthetic impacts and cumulative tribal cultural and cultural resources
17 impacts that would occur under the proposed Project, (2) Alternative C would result in
18 a reduction of 80 to 110 MW of renewable energy compared to the proposed Project,
19 which reduces its compliance with the most important project objectives (meeting State
20 and federal renewable energy goals to counter climate change) (**EIR Section 5.3.3.2 and**
21 **5.3.5**), (3) Alternative C would achieve most of the project objectives, which include the
22 provision of environmental benefits, to a lesser extent compared with the proposed
23 Project, as it would generate and store a significantly smaller amount of renewable
24 energy compared with the proposed Project, the energy would be less affordable, and
25 because of its smaller size, it would create fewer jobs and tax revenues. Therefore,
26 Alternative C is eliminated from further consideration.

27 E. Alternative D: Offsite Alternative.
28

1 5. This alternative would require installing solar panels on BLM-managed lands east of
2 State Route 177. The location of this development would eliminate the significant visual
3 impacts of the proposed Project and its visibility from the Lake Tamarisk Desert Resort.
4 However, it would require development within the extremely sensitive habitats of the
5 sand transport corridor and within a BLM DRECP-designated wildlife linkage, which
6 support special-status plant and wildlife species. In order to develop the full generation
7 of the proposed Project, development of this alternative would likely require an
8 amendment to the BLM DRECP Land Use Plan Amendment to modify the existing
9 requirements preventing development within the sand transport corridor. Such an
10 amendment would allow development but would likely result in significant impacts to
11 the species and habitats. This alternative would also likely have more severe impacts to
12 cultural resources due to its proximity to Palen Dry Lake, and it would result in severe
13 dust and erosion due to disturbance of the sand transport corridor.

14 6. The Board of Supervisors rejects Alternative D on the grounds that Alternative D would
15 create substantially greater impacts to biological resources and greater impacts to
16 cultural and tribal cultural resources, air quality, and erosion compared to the proposed
17 Project and other alternatives. **(EIR Sections 5.2.7 and 5.3.3.4).**

18 F. Alternative E: Distributed Commercial and Industrial Rooftop Solar Alternative.

19 7. This alternative would involve the development of a large number of geographically
20 distributed small to medium solar PV systems within existing developed areas
21 throughout Riverside County. PV systems would be installed typically on the rooftops
22 of commercial and industrial facilities. Because no new land would be developed or
23 altered, this alternative would result in no habitat loss or grading, and aesthetics impacts
24 would be minor in the context of existing development. Installation and maintenance
25 would result in vehicle emissions and traffic increases similar to the proposed Project,
26 but they would occur in a widely dispersed geographic area. Because this alternative
27 would not include installation of 650 MW of battery storage that would be included with
28

the proposed Project, it would not meet project objectives related to extending renewable energy availability into the evening hours.

8. Alternative E would reduce aesthetics and cultural and tribal cultural resources impacts.

9. The Board of Supervisors rejects Alternative E on the grounds that Alternative E would not generate wholesale renewable energy to support California's ratepayers. Further, because this alternative would not include installation of 650 MW of battery storage that would be included with the proposed Project, it would not meet project objectives related to extending renewable energy availability into the evening hours. Given the distributed nature of such a network of facilities, construction, management, and maintenance would not be as efficient, and total capital costs would likely be higher. The Project proponent also does not have immediate control or access to potential urban sites that could accommodate facilities to generate the solar power, and a distributed system on the scale of the 400 MW project would be practically infeasible for one developer to implement due to the need to arrange a suitable assemblage of participating commercial and industrial properties. It is impractical and infeasible for the Project proponent to assemble such a disparate range of properties and to construct a distributed generation project of this scale and still proceed within a reasonably similar timeframe. **(EIR Sections 5.3.3.2).**

G. Environmentally Superior Alternative.

Section 15126.6(e)(2) of the State CEQA Guidelines indicates that an analysis of alternatives to a proposed Project shall identify an environmentally superior alternative among the alternatives evaluated in an EIR. This issue is evaluated in Chapter 5.3 of the EIR. Here, Alternative A1, the No Build Alternative is the environmentally superior alternative. However, CEQA Guidelines. Section 15126.6(e)(2) states that if the environmentally superior alternative is the "no project" alternative, the EIR shall also identify an environmentally superior alternative among the other alternatives. Aside from the No Build Alternative, Alternative C, the Further Reduced Footprint Alternative with Berms is the environmentally superior alternative. While the proposed Project and Further Reduced

Footprint Alternative with Berms -would both create significant visual impacts from the solar facility to travelers along SR177, the Further Reduced Footprint Alternative with Berms includes a minimum 1-mile buffer to minimize visual impacts to the Lake Tamarisk Desert Resort residences, and the impact would be less than significant for these viewers. The Further Reduced Footprint Alternative with Berms would result in fewer impacts to aesthetics, fewer impacts due to construction noise, and less ground disturbance than the proposed Project. However, when compared to the proposed Project, this alternative would create more severe impacts to viewers from SR-177, and would reduce the amount of energy that could be generated by the project by approximately 80 to 110 MW. The reduction in energy generation would reduce the Project's compliance with the most important project objectives of meeting the State and federal renewable energy goals, as it would generate and store a significantly smaller amount of renewable energy compared with the proposed Project. The energy generated under Alternative C would be less affordable, and the alternative would create fewer jobs and tax revenues. The next most Environmentally Superior Alternative would be Alternative B, Reduced Footprint Alternative, because it meets the critical project objectives, and reduces impacts to the Lake Tamarisk Desert Community compared to the proposed Project.

The EIR also considered alternatives that were rejected from further analysis on grounds they were infeasible.

First, an alternative located entirely on BLM lands was considered in the EIR but then rejected from further analysis because it is likely to have more severe biological, cultural, and visual resource impacts, as it would likely be located on undisturbed lands and may be a greater distance to existing transmission infrastructure required for interconnection. Also, it may not be feasible to find an alternative site on BLM-managed lands, because most of the land within the DFA is in use, proposed for other solar energy projects, or within mountainous areas and areas with hydrological concerns. Site control is also an issue, given that the DRECP and BLM Rents and Bonds Policy require a competitive auction to secure land within DFAs and BLM has yet to conduct one for sites in Riverside County. Other

1 alternative BLM lands east of the Lycan Project are not designated as DFA in the DRECP
2 LUPA. These lands are within the Palen Ford Area of Critical Environmental Concern
3 (ACEC) and the Chuckwalla ACEC, both of which preclude development of solar facilities.
4 In addition, a site east of the Lycan Project would require an additional or relocated 500 kV
5 gen-tie line that would be over 20 miles long, which would create significant visual impacts
6 along the Interstate 10 corridor.

7 Second, an all private land project alternative was considered in the EIR but then rejected
8 from further analysis because it is considered speculative and infeasible based on the number
9 of landowners whose agreement would be required. An alternative site option, that is
10 currently an operating fish farm was considered, but the Applicant was unable to obtain site
11 control by the landowner. In addition, another site would likely have environmental impacts
12 equal to or greater than the proposed site, which is located primarily on disturbed land and
13 is surrounded by BLM-administered land that is within the DRECP DFA, and thus, targeted
14 for renewable energy development.

15 Additionally, alternative solar technologies and renewable energy technologies were
16 considered in the EIR but then rejected from further analysis because they are not within the
17 Applicant's area of expertise and so would not be technically or economically feasible for
18 the Applicant to implement. These other technologies also would not result in a substantial
19 reduction in impacts and visual impacts would likely be greater for some technologies (e.g.,
20 solar power tower, solar parabolic through technology, wind turbines). Furthermore, energy
21 conservation and demand-side management alternatives were considered in the EIR but then
22 rejected from further analysis because they are not technically feasible as a replacement for
23 the proposed Project as California utilities are required to achieve aggressive energy
24 efficiency goals. Affecting consumer choice to the extent that would be necessary for a
25 conservation and demand-side management solution would be beyond the County, BLM
26 and/or the Applicant's control. Even if additional energy efficiency beyond that occurring in
27 the baseline condition may be technically possible, it is speculative to assume that energy
28 efficiency alone would achieve the necessary greenhouse gas reduction goals. With

1 population growth and increasing demand for energy, conservation and demand
2 management alone is not sufficient to address all of California's energy needs. Furthermore,
3 conservation and demand-side management would not by themselves provide the renewable
4 energy required to meet the California renewable energy goals, a stated Project objective.
5 Therefore, conservation and demand-side management has been eliminated from detailed
6 analysis because it is considered remote or speculative and would not meet the stated Project
7 objectives. Finally, an underground 500-kV gen-tie lines was considered but rejected from
8 further analysis, as underground construction and trenching would involve much greater
9 ground disturbance and construction-related impacts (traffic, air quality and dust, and noise),
10 as well as greater potential to encounter contaminated soils and cultural resources, and to
11 impact biological resources and cultural resources due to the greater ground disturbance. The
12 dust and equipment emissions associated from installation of a 500 kV underground line also
13 would greatly exceed the emissions of overhead tower construction.

14 No other reasonable and feasible alternatives were identified during the environmental
15 review process for consideration.

16 **BE IT FURTHER RESOLVED** by the Board of Supervisors that it has, pursuant to State CEQA
17 Guidelines section 15093, balanced the "economic, legal, social, technological, and other benefits" of
18 Alternative B: Reduced Footprint Alternative, as described in Section 2.8.3 of the EIR ("Alternative B")
19 against the unavoidable adverse environmental effects described herein, and has determined that each and
20 every one of the following benefits individually outweigh and render acceptable each and every one of
21 those environmental effects:

- 22 B. While Alternative B would create significant visual impacts and result in cumulatively
23 considerable visual impacts to cultural and tribal cultural resources, Alternative B has been
24 located to minimize environmental impacts and land disturbance associated with solar
25 development by siting the facility on relatively flat, contiguous lands with high solar
26 insolation, in close proximity to established utility corridors, existing transmission lines with
27 available capacity to facilitate interconnection and road access. Alternative B also removes
28 approximately 50 acres of solar panels closest to the Lake Tamarisk community and moves

1 the on-site substation and BESS at least 0.7 mile to the northeast and farther from the Lake
2 Tamarisk community to reduce visual impacts. The surrounding federal lands are designated
3 as a "Development Focus Area" in order to allow for development of solar energy generation
4 and appurtenant facilities on public lands in this specific area. Furthermore, construction and
5 operation of Alternative B would bring jobs to eastern Riverside County and would assist
6 California with achieving its renewable energy generation goals. Given the location of
7 Alternative B on disturbed land in an area identified for solar generation, Alternative B's
8 renewable energy and economic benefits would outweigh the unavoidable adverse
9 environmental impacts on visual resources and cultural and tribal cultural resources.

10 C. Alternative B includes up to 650 MW of battery energy storage that will have the beneficial
11 effect of shifting a portion of the renewable energy generation into the evening hours,
12 reducing the output of fossil fuel-burning resources that would otherwise be used to meet
13 demand during peak load periods. Although the result will vary depending on how the
14 storage is dispatched, the relative scale of greenhouse gas (GHG) emissions avoided with
15 Alternative B would be greater than the scale of the other Alternative B effects on GHG
16 emissions. Alternative B's renewable energy generation would, overall, result in a reduction
17 in net GHG emissions over its life. The approval of Alternative B will contribute to the
18 state's ability to reach its climate goals.

19 D. Alternative B would provide local employment and economic opportunities for residents of
20 Riverside County, thereby serving to increase economic opportunities. During the 20-month
21 construction period, the on-site workforce is expected to reach peak of approximately 530
22 individuals with an average construction-related on-site workforce of approximately 320
23 individuals. Riverside County has the largest concentration of construction workers close
24 to the Project area. During operations, up to 10 permanent staff could be on the site at any
25 one time for ongoing facility maintenance and repairs. These staff would also likely be
26 sourced from Riverside County. Riverside County overall is housing rich/jobs poor, with an
27 even greater housing rich/jobs poor condition in the unincorporated areas. It is expected that
28 the majority of the new long-term jobs as well as the short-term construction jobs would be

1 filled by the existing labor force available in the County of Riverside, as the County has a
2 shortage of jobs.

3 E. Alternative B will maximize the use of a currently underutilized site and promote the
4 efficient use of land, while still providing natural open space consistent with the rural identity
5 of the community.

6 F. Alternative B will bring significant tax and other revenues to Riverside County, contributing
7 sales tax revenue and development impact fees for use by the Board to benefit the residents
8 of the County.

9 G. Alternative B will enhance existing electrical distribution infrastructure and provide greater
10 support to existing and future customer loads to ensure Southern California Edison can
11 provide power to all customers, including customers in Riverside County.

12 **BE IT FURTHER RESOLVED** by the Board of Supervisors that the State CEQA Guidelines
13 section 15126(g) requires an EIR to discuss how a proposed project could directly or indirectly lead to
14 economic, population, or housing growth. A project may be growth inducing if it removes obstacles to
15 growth, taxes, community service facilities, or encourages other activities which cause significant
16 environmental effect. EIR No. SCH2022110240 evaluated impacts of the Proposed Project as defined in
17 Section ES.3 and Chapter 2 of the EIR. The Applicant's Preferred Project is now Alternative B: Reduced
18 Footprint Alternative, as described in Section 2.8.3 of the EIR ("Alternative B"). Alternative B is similar to
19 the originally Proposed Project but would remove approximately 50 acres of solar panels, move the on-site
20 substation and BESS at least 0.7 mile to the northeast and farther from the Lake Tamarisk community, and
21 would increase the length of the gen-tie line by approximately 0.8 mile. Because Alternative B has a smaller
22 footprint but otherwise similar characteristics and impacts as described in Table 5-1 of the EIR, the
23 following findings with respect to the Proposed Project are also applicable to Alternative B. The discussion
24 is as follows:

25 A. The Project does not include the development of housing and therefore, would not directly induce
26 population growth. The proposed Project would result in the conversion of substantial land areas to
27 a new type of land use. The proposed Project would be constructed within an area covered by the
28 Riverside County General Plan and Desert Center Area Plan, and the proposed Project would be a

1 conditionally permitted use. The proposed Project would not result in the establishment of an
2 essential public service, and it would not provide new access to a previously inaccessible area. As a
3 result, the proposed Project would not cause significant growth inducement.

4 Short-term economic growth could occur during the construction and decommissioning periods
5 because the proposed Project and the construction schedules of multiple overlapping projects could
6 create a demand for workers that may not be met by the local labor force, thereby inducing in-
7 migration of non-local labor and their households. Construction of the proposed Project alone would
8 not create long-term jobs, however; therefore, the construction phase of the project is not considered
9 to be growth inducing. Given the number of solar projects proposed in the Desert Center area,
10 workers may stay on and continue to work in the area following construction of the proposed Project
11 if jobs on other solar projects are available. Following construction, up to 10 permanent staff could
12 be on the site at any one time for ongoing solar facility maintenance and repairs, and no new per-
13 manent personnel are anticipated to be added to operate and maintain the gen-tie line. The Project
14 workforce could contribute to an increase in tax revenues for the State of California and Riverside
15 County; however, the limited permanent employment expansion would not result in the need for
16 new or physically altered community-serving facilities. As a result, the proposed Project would not
17 be growth-inducing for its effects on economic expansion or growth.

18 B. The proposed Project would be a conditionally permitted use, resulting in the development of a solar
19 facility and gen-tie line in the vicinity of other existing and approved solar projects. The Project
20 would be similar to other cumulative projects in eastern Riverside County, many of which are
21 identified as past and present projects or probable future projects (**EIR Section 3.1.2**, Cumulative
22 Impact Scenario). The Project would not establish a precedent-setting action such as a change in
23 zoning or general plan amendment. Therefore, the proposed Project would not be growth inducing.

24 C. The proposed Project would result in a change to undeveloped land in an area surrounded by
25 proposed, existing or under-construction solar projects. The proposed Project, as with a number of
26 adjacent solar projects, would be located on private lands and BLM-administered lands designated
27 as a DFA to allow for development of solar energy generation and appurtenant facilities on public
28 lands in this specific area. The Project would not encroach into lands planned for future residential

development. The proposed Project does not involve the development of a residential component that would result in direct population growth in the area. Additionally, the Project would not involve the development of new roadways, water systems, or sewer systems. Infrastructure improvements to serve the Project would be limited and would not be available to serve surrounding areas. Therefore, the proposed Project would not result in growth inducement through development or encroachment into an isolated area or open space.

BE IT FURTHER RESOLVED by the Board of Supervisors that Alternative B: Reduced Footprint Alternative will implement applicable elements of the Riverside County General Plan as follows:

A. Land Use Element.

Analysis of applicable policies of the Land Use Element is presented throughout EIR No. SCH2022110240 and concludes that the Project would not conflict with any applicable policy of the General Plan Land Use Element (EIR Chapter 3.12, Land Use and Planning). Alternative B is similar to the Proposed Project but would remove approximately 50 acres of solar panels, move the on-site substation and BESS at least 0.7 mile to the northeast and farther from the Lake Tamarisk community, and would increase the length of the gen-tie line by approximately 0.8 mile. Because Alternative has a smaller footprint but otherwise similar characteristics and impacts as described in Table 5-1 of the EIR, Alternative B also would not conflict with any applicable policy of the General Plan Land Use Element. Furthermore, Alternative B complies with all design standards for the proposed land use designation and considers the unique characteristics and features of the Project site and surrounding community. Alternative B is consistent with the General Plan Land Use Element and is therefore consistent with the General Plan.

B. Circulation Element.

Alternative B will construct or contribute its fair share of the costs associated with the repair of roadways, as needed. Alternative B will implement mitigation measures that address project-specific and cumulative transportation and traffic impacts, and based thereon, the Board of Supervisors finds that Alternative B is consistent with the General Plan Circulation Element. All required improvements that are directly attributable to Alternative B would be

constructed as part of the project, and fair share costs would be contributed through payment of the TUMF, and the County's Development Impact Fee. Alternative B is consistent with the General Plan Circulation Element and is therefore consistent with the General Plan.

C. Multipurpose Open Space Element.

The Multipurpose Open Space Element of the General Plan describes an open space system which includes methods for the acquisition, maintenance, and operation of a variety of open spaces. The County's open spaces are utilized for visual relief, natural resources protection, habitat protection, recreational uses, and protection from natural hazards for public health and safety. Alternative B would be a conditionally permitted use within the land use designation Open Space Rural (OS-RUR), and Natural Assets (N-A), with approval of a CUP and completion of an environmental review. Table 3.12-1 of the EIR describes how the Project would be consistent with the Land Use and Multi-Purpose Open Space Elements. Alternative B is similar to the Proposed Project but would remove approximately 50 acres of solar panels, move the on-site substation and BESS at least 0.7 mile to the northeast and farther from the Lake Tamarisk community, and would increase the length of the gen-tie line by approximately 0.8 mile. Because Alternative has a smaller footprint but otherwise similar characteristics and impacts as described in Table 5-1 of the EIR, Alternative B also would be consistent with the Land Use and Multi-Purpose Open Space Elements.

The applicant is also seeking to vacate interior roadways and merge contiguous Project parcels. Roads along the Project perimeter on the solar facility lands would remain dedicated public access. This merger would be consistent with LU 26.4, encourage parcel consolidation, and because the perimeter roads would remain open to the public, it would not result in a loss of access.

The existing and known planned land uses surrounding Alternative B are similar in nature to those identified for the project, primarily Open Space Rural. The parcels in the vicinity of the solar facility are zoned N-A, W-2-10, A-1-20 (Light Agriculture [20-acre minimum]), C-P-S (Scenic Highway Commercial), M-H (Manufacturing Heavy), all of which allows solar power development on a lot 10 acres or larger with a CUP. Therefore, Alternative B is

found consistent with the General Plan's Multipurpose Open Space Element and is therefore consistent with the General Plan.

D. Safety Element.

Alternative B shall comply with all applicable building codes, County Ordinances, and State and Federal laws. Alternative B complies with all applicable provisions of the Alquist-Priolo Earthquake Fault Zoning Act. A geotechnical investigation and report would be required and would include recommendations regarding geotechnical and engineering design. Structures would be designed in accordance with the County of Riverside Building Code and the most recent CBC and would be consistent with the recommendations outlined in the geotechnical report to be prepared for the project. Compliance with existing regulatory requirements and implementation of geotechnical design recommendations in the project's final engineering design would reduce potential safety hazards to a less than significant level. In addition, the project would not be subject to significant flood or dam inundation. The project also would comply with all applicable standards for fire safety and be consistent with the Riverside County Fire Protection Master Plan. Furthermore, the project would not conflict with any disaster preparedness plans nor subject individuals to significant risk of loss, injury, or death involving wildland fires, erosion, seismic activity, blow-sand, or flooding. Alternative B is consistent with the General Plan Safety Element and is therefore consistent with the General Plan.

E. Noise Element.

The impacts with regards to temporary and permanent noise of Alternative B will be reduced to less than significant levels with implementation of Mitigation Measures MM N-1 through MM N-3 and compliance with applicable DRECP CMAs. With implementation of the recommendations provided in the noise impact analysis and the required mitigation measures and CMAs, Alternative B would be consistent with the General Plan Noise Element and is therefore consistent with the General Plan.

F. Air Quality Element.

The project-specific evaluation of emissions demonstrates that construction-phase maximum daily emissions would be above the SCAQMD regional thresholds of significance for NOx and PM10 if no project-specific mitigation measures are implemented. Because construction emissions without mitigation would be below the thresholds for CO and SO2, the project would not violate any air quality standard or contribute substantially to an existing or projected air quality violation for these pollutants. Concurrent construction of other projects in close proximity to the proposed site could result in increased local air quality impacts for the limited duration of simultaneous construction activities.

With implementation of Mitigation Measures MM AQ-1 (Fugitive Dust Control Plan) and MM AQ-2 (Control On-Site Off-Road Equipment Emissions) and compliance with applicable DRECP CMAs, the incremental contribution of the project to the cumulative air quality impact would be reduced to less than significant during construction and would not be cumulatively considerable. Additionally, after considering the feasible mitigation, the project-related NOx emissions levels as an ozone precursor pollutant would not contribute substantially to existing violations of the California ambient air quality standard for ozone, and this impact during construction would be less than significant; ensuring that Alternative B would be consistent with the Air Quality Element and General Plan, by reducing potential air emissions to the lowest achievable level.

G. Housing Element.

The purpose of the General Plan Housing Element is to meet the needs of existing and future residents in Riverside County through the establishment of policies to guide County decision-making and to establish an action plan to meet the County's housing goals in the next seven years. Alternative B would not construct new dwellings and would not induce substantial population growth in the area. The project and the new jobs it would create would help balance the housing/jobs ratio in the area, and Alternative B would be consistent with the General Plan Housing Element and General Plan.

H. Administration Element.

The Administration Element contains information regarding the structure of the General Plan as well as general planning principles and a statement regarding the vision for Riverside County. Alternative B would be consistent with the Administration Element policies as the project would help to achieve the purposes of the General Plan through compliance with applicable General Plan policies.

I. Healthy Communities Element.

The Healthy Communities Element provides a framework for translating the General Plan vision for a healthy Riverside County into reality by identifying policies to achieve that vision. The Healthy Communities Element addresses areas where public health and planning intersect, including transportation and active living, access to health care, mental health, quality of life, and environmental health. Alternative B would be consistent with the Healthy Communities Element policies governing Overall Health, Land Use and Community Design, Transportation System, Social Capital, Complete Communities, Parks, Trails, and Open Space, as the project would help to achieve the purposes of the General Plan through compliance with applicable General Plan policies.

BE IT FURTHER RESOLVED by the Board of Supervisors that the Final EIR also discusses, pursuant to State CEQA Guidelines sections 15126(c) and 15126.2(c), significant irreversible environmental changes. EIR No. SCH2022110240 evaluated impacts of the Proposed Project as defined in Section ES.3 and Chapter 2 of the EIR. The Applicant's Preferred Alternative is now Alternative B: Reduced Footprint Alternative, as described in Section 2.8.3 of the EIR ("Alternative B"). Alternative B is similar to the Proposed Project but would remove approximately 50 acres of solar panels, move the on-site substation and BESS at least 0.7 mile to the northeast and farther from the Lake Tamarisk community, and would increase the length of the gen-tie line by approximately 0.8 mile. Because Alternative has a smaller footprint but otherwise similar characteristics and impacts as described in Table 5-1 of the EIR, the following findings with respect to the Proposed Project are also applicable to Alternative B. As provided in **EIR Sections 4.1 and 4.2:**

A. An "Energy Analysis" of the proposed Project was prepared and is included in EIR Sections 3.7 and

1 4.4.

2 B. The following summary of findings relating to energy use and efficiency, was provided in the
3 analysis in EIR Sections 3.7 and 4.4.

4 While construction would require the temporary use of energy resources, the Project would not
5 result in potentially significant environmental impact due to wasteful, inefficient, or unnecessary
6 consumption of energy resources, during project construction. Furthermore, implementation of
7 Mitigation Measures AQ-2 (Control On-Site Off-Road Equipment Emissions) and applicable
8 DRECP CMAs requires the Project to minimize unnecessary use of construction equipment so
9 activity levels are not wasteful, for example, by requiring equipment to be properly maintained and
10 limiting construction equipment idling, and would ensure that impacts would be less than
11 significant.

12 Although the battery storage component would require the use of some energy, the output of the
13 storage component would occur at hours of peak demand, which would have a beneficial effect of
14 shifting the types of fuel-burning generating units on the grid that could be displaced. The energy
15 generated by the proposed Project would be many times greater than the amount used. As such,
16 operation of the proposed Project would result in a less-than-significant impact with respect to the
17 inefficient consumption of energy.

18 Maintenance and inspection of proposed Project components would require use of fossil fuel
19 resources. However, this limited use of fossil fuel by operational worker commutes and use of
20 vehicles and equipment during maintenance is not considered wasteful, inefficient, or unnecessary.
21 The proposed Project would increase the use of renewable energy, thus reducing the use of fossil
22 fuel for electrical generation by conventional power plants. Beneficial impacts related to state or
23 local plans for renewable energy or energy efficiency would occur.

24 **BE IT FURTHER RESOLVED** by the Board of Supervisors that Condition Use Permit No.
25 220021 (CUP220021), Public Use Permit No. 230002 (PUP230002), and Development Agreement No.
26 2200016 (DAN2200016), which collectively authorize development of Alternative B on private lands under
27 the jurisdiction of the County, are consistent with the Riverside County General Plan.
28

1 **BE IT FURTHER RESOLVED** by the Board of Supervisors that it has reviewed and considered
2 EIR No. SCH2022110240 in evaluating Condition Use Permit No. 220021 (CUP220021), Public Use
3 Permit No. 230002 (PUP230002), and Development Agreement No. 2200016 (DAN2200016); and, that
4 EIR No. SCH2022110240 is an accurate and objective statement that complies with the California
5 Environmental Quality Act and reflects the County's independent judgment, and that EIR No.
6 SCH2022110240 is incorporated herein by this reference.

7 **BE IT FURTHER RESOLVED** by the Board of Supervisors that it **ADOPTS** the statement of
8 overriding consideration for Alternative B: Reduced Footprint Alternative, **CERTIFIES** EIR No.
9 SCH022110240, and **ADOPTS** the Mitigation Monitoring and Reporting Plan attached as Attachment A
10 hereto. To the extent that there are any inconsistencies between the mitigation measures as set forth in EIR
11 No. SCH2022110240, and those set forth in the Mitigation Monitoring and Reporting Program, whichever
12 measure is deemed more protective of the environment shall control.

13 **BE IT FURTHER RESOLVED** by the Board of Supervisors that copies of Condition Use Permit
14 No. 220021 (CUP220021), Public Use Permit No. 230002 (PUP230002), and Development Agreement No.
15 2200016 (DAN2200016); shall be placed on file in the Office of the Clerk of the Board, in the Office of the
16 County Planning Department, and the Office of the Building and Safety Director.

17 **BE IT FURTHER RESOLVED** by the Board of Supervisors that the custodian of the documents
18 upon which this decision is based are the Clerk of the Board of Supervisors and the County Planning
19 Department and that such documents are located at 4080 Lemon Street, Riverside, California.

Intersect Power, LLC License Agreement

Item 7-9

March 11, 2025

Overview of the License Agreement

Subject

Review and consider the County of Riverside Final Environmental Impact Report certified by the Lead Agency, adopt the Lead Agency's findings, and authorize the General Manager to execute a thirty-year license agreement with Intersect Power, LLC for renewable energy infrastructure purposes on Metropolitan fee-owned property in the County of Riverside

Purpose

Establish rights to construct and operate renewable energy infrastructure

Service Area & CRA Map

General Location Map

Site Map

Key Provisions

- Subject to Metropolitan's paramount rights provision
- License area of 12,862 sq. ft.
- Term of 30 Years
- One-time processing fee of \$8,000
- Nominal license fee of \$2,500 per year
- Reappraisal every 5 Years
- Annual fee increases of 4%

Board Options

Option No. 1

Review and consider the County of Riverside Final Environmental Impact Report certified by the Lead Agency, adopt the Lead Agency's findings, and authorize the General Manager to execute a thirty-year license agreement with Intersect Power, LLC for renewable energy infrastructure purposes on Metropolitan fee-owned property in the County of Riverside

Option No. 2

Do not approve the new license agreement.

Board Options

Staff Recommendation

- Option No. 1

- **Board of Directors**
Legal and Claims Committee

3/11/2025 Board Meeting

7-11

Subject

Authorize an increase of \$100,000, to an amount not to exceed \$600,000, for a contract for legal services with Hanson Bridgett LLP to provide legal advice on deferred compensation plans, other employee benefits, taxes, and CalPERS matters; the General Manager has determined that the proposed action is exempt or otherwise not subject to CEQA

Executive Summary

The General Counsel entered into a contract with the law firm of Hanson Bridgett LLP (Hanson Bridgett), as special counsel, on November 1, 2017, for the amount of \$100,000 to provide Metropolitan with legal, tax, and benefits advice on Metropolitan's deferred compensation plans and other employee benefits. The firm has specialized expertise and has assisted Metropolitan in the operation of its deferred compensation program and advised on related tax issues. The Board authorized contract increases in 2018, 2020, 2021, and 2022, bringing the current not-to-exceed amount to \$500,000. The firm's assistance will be required going forward to assist with legally required changes to the plans, and review of various procedures relating to deferred compensation and other employee benefits. Staff's experience is that the workload remains constant and the current cost incurred is approximately \$70,000 per year.

Proposed Action(s)/Recommendation(s) and Options

Staff Recommendation: Option #1

Option #1

Authorize the General Counsel to increase the amount payable under its contract with Hanson Bridgett LLP by \$100,000 to an amount not to exceed \$600,000.

Fiscal Impact: \$100,000 for the provision of the authorized legal services

Business Analysis: Metropolitan will obtain specialized legal expertise for its deferred compensation plans.

Option #2

Do not authorize an increase in the maximum amount payable under this contract with Hanson Bridgett LLP.

Fiscal Impact: No known fiscal impact

Business Analysis: Metropolitan will not obtain specialized legal expertise for its deferred compensation plans.

Alternatives Considered

Not applicable

Applicable Policy

Metropolitan Water District Administrative Code Section 6430: General Counsel Powers and Duties

Metropolitan Water District Administrative Code Section 6810: Employee Deferred Compensation and Savings Plans

Metropolitan Water District Administrative Code Section 11104: Delegation of Responsibilities

Related Board Action(s)/Future Action(s)

Not applicable

California Environmental Quality Act (CEQA)

CEQA determination for Option #1:

The proposed action is not defined as a project under CEQA because it will not result in either a direct physical change in the environment, or a reasonably foreseeable indirect physical change in the environment. (State CEQA Guidelines Section 15378(a)).

CEQA determination for Option #2:

None required

Details and Background

Background

The General Counsel entered into a contract with the law firm of Hanson Bridgett LLP (Hanson Bridgett), as special counsel, on November 1, 2017, for the amount of \$100,000 to provide Metropolitan with legal, tax, and benefits advice on Metropolitan's deferred compensation plans and other employee benefits. Because it is an area of specialized expertise, Metropolitan has regularly retained special counsel for its deferred compensation plans. Hanson Bridgett has expertise and experience in public agency deferred compensation programs. The firm also has expertise in and provides advice on other tax, employee benefits, and CalPERS matters. The firm also provides Metropolitan with current legislative and regulatory guidance on new laws, IRS rules, and U.S. Treasury regulations.

In 2018, Metropolitan selected a new record keeper and amended its deferred compensation plans. Hanson Bridgett assisted in these efforts, including review of record keeper related agreements and the incorporation of numerous changes to the plans requested by the participants.

In 2019, Metropolitan further updated its deferred compensation plans to expand plan features for participants and streamline plan administration. Hanson Bridgett assisted in these efforts and advised on several issues, such as de minimis account forfeitures, plan rollovers and deferral contributions. The firm also assisted with the development of a managed account services agreement to offer online and personal account management advice to plan participants.

In 2020, Metropolitan enhanced its plans' operations to make the plans' features more convenient for participants. Hanson Bridgett assisted in these efforts and advised on many topics, such as automated loan payments, electronic signatures on plan forms, and unified beneficiary designation rules and procedures. The firm also advised Metropolitan on the incorporation of COVID-19 loans and hardship distribution rules for qualified participants.

In 2021 and 2022, Metropolitan automated its required minimum distribution procedures and drafted plan amendments to allow qualified birth and adoption distributions and lower the 457(b) plan in-service distribution age limit to age 59½. As requested by participants, it also added environmental social governance funds to its fund lineup and provided non pro rata options for partial distributions. Hanson Bridgett assisted in these efforts and advised on other issues, such as plan loan offsets, death benefits determinations, and after-tax Roth deferrals.

for participants. They also advised on employee benefits matters, such as employer tax credits for family and sick leave coverage.

In 2023 and 2024, Metropolitan restructured and streamlined plan governance, including amending the Administrative Code and establishing an investment committee with governing bylaws. It also implemented Roth deferral accounts and provided retirees the option to consolidate plan accounts. Hanson Bridgett assisted in these efforts and advised on the mandatory and optional provisions of Secure Act 2.0, on properly designating trust and wills as beneficiaries, and on how the plan expense account may be applied, for example, to provide fiduciary training.

In September 2018, March 2020, March 2021, and December 2022, the Board authorized increases of \$100,000 for a current not-to-exceed amount of \$500,000. Upcoming efforts will include amending the plans under Secure Act 2.0, which will, among other things, streamline operations by eliminating inadvertent overpayment recovery and expanding the use of IRS self-correction rules to make minor corrections, will clarify rules that allow charitable remainders, and will allow for the adoption of new plan features that simplify federal disaster relief and lower penalties for failing to timely take required distributions. Hansen Bridgett will assist in these plan amendments.

Staff requests authority to increase the maximum amount payable pursuant to this contract by \$100,000 to an amount not to exceed \$600,000 so that Hanson Bridgett may continue to assist Metropolitan with its deferred compensation plans and related legal services.

While the rate of expenditure is dependent upon the need for expert assistance, it is anticipated that the proposed increase will be adequate for up to one additional year.

None required

Details and Background

A. Past Actions Recommended by the Chair and Approved by the Board on February 11, 2025, in Board Letter Item 6B Modifying Committee Structures and Functions.

The following changes to Standing Committee and to Ad Hoc Committees were recommended by the Chair and approved by the Board.

Board-Approved Standing Committee Changes

- The Audit Subcommittee of the Executive Committee will become the Audit Committee.
- The Ethics, Organization and Personnel Committee will become the Organization, Personnel and Effectiveness Committee, focusing on personnel matters, bargaining unit negotiations, oversight of training programs, and recruitment programs.
- The Equity, Inclusion and Affordability Committee will become the Community and Workplace Culture Committee.
- The Finance and Asset Management Committee will become the Finance, Affordability, Asset Management, and Efficiency Committee, assuming oversight of affordability and efficiency in addition to oversight of previously assigned financial and asset management activities.
- The One Water and Stewardship Committee will become the One Water and Adaptation Committee.

Board-Approved Ad Hoc Committee Changes

- Eliminate the Ad Hoc Committee on Bay-Delta Negotiations and the Ad Hoc Committee on Colorado River whose duties are transferred to the Subcommittee on Imported Water under the One Water and Adaptation Committee.
- Eliminate the Ad Hoc Committee on San Diego Litigation and the Ad Hoc Committee on Policy Impacts of Third-Party Changes to Member Agency boundaries because their tasks are completed.
- Create an Ad Hoc Committee on Executive Performance.
- Create an Ad Hoc Committee on Equal Employment Opportunity Investigations.
- Create an Ad Hoc Committee on Ag and Tribal Partnerships to focus on potential interstate conservation and initiatives to increase ground-storage and transfers.
- The Ad Hoc Committee on Facility Naming will become the Ad Hoc Committee on Communications and Facility Naming.

B. Present Action Based on Board-approved Actions on February 11, 2025 in Board Letter Item 6B Modifying Committee Structures and Functions and Which Require Amendments to the Administrative Code.

The following proposed code amendments are based on the Board-approved actions of February 11, 2025 in Board Letter Item 6B which require amendments to Metropolitan's Administrative Code. The proposed amendments are to Division II, Chapters 2, 3, and 4, Division IV, Chapters 3 and 5, Division V, Chapters 1 and 3, Division VI, Chapters 1, 2, 3 and 4, Division VII, Chapter 4, and Division VIII, Chapter 2. These amendments modify the structure and functions of various committees and the roles of specified board and committee officers to provide greater clarity and operational flexibility and conform the committee structure to the current workload and priorities of the Board. The Administrative Code is proposed to be amended as follows:

1. Section 2204 is amended to delete the oversight by Board Vice Chairs over fixed portfolios and to clarify their duty to act in the absence of the Board Chair. It further clarifies their ex officio membership duties on committees to which they are designated by the Board Chair. Conforming amendments are provided at Sections 2401(c) and (d).
2. Section 2311 is amended to require Ad Hoc Committees to provide reports to the Executive Committee as well as committees where the subjects are relevant.
3. Section 2400 is amended to insert the new committees, with added abbreviations, to the resulting list of Standing Committees.
 - i. Audit Committee. Conforming amendment to change the name from Audit Subcommittee is provided at Section 6450(f). New Article 3 of Division II, Chapter 4 is added for the Audit Committee. Consequently Articles 3, 4, 5, 6, 7, 8 and 9 are renumbered Articles 4, 5, 6, 7, 8, 9, and 10.
 - ii. Finance, Affordability, Asset Management, and Efficiency Committee. Conforming amendments to change the name from Finance and Asset Management Committee are provided at Sections 4304(a), (b), (c), and (d), 4305(a) and (b), 4507(g)(3), 5104(b), 5105(b), 5107(a), 5305, 8248(b) and 8257.
 - iii. Organization, Personnel and Effectiveness Committee. Conforming amendments to change the name from Ethics, Organization and Personnel Committee are provided at Sections 2470 and 2471, 6113(a) and (b), 6121, 6208(h) and 6209(a).
 - iv. One Water and Adaptation. Conforming amendments to change the name from One Water and Stewardship Committee are provided at Sections 2480 and 2481.
 - v. Community and Workplace Culture Committee. Conforming amendment change the name from Equity, Inclusion and Affordability Committee is provided at Section 2490. Conforming amendments to change the name from Ethics, Organization and Personnel Committee are provided at Sections 6304, 6416, 6436 (b), 6450(b), 6470(a), (e), and (i), 6471(d), 6472(a) and (b), 7405(a) and (b), 7411(b), and 7412(e).

This Section 2400 is also amended to delete committees being eliminated: the Finance and Asset Management Committee and the Ethics, Organization and Personnel Committee.

4. Section 2402 is amended to provide greater flexibility by allowing Standing Committees with fixed meeting schedules, as specified, to meet on Monday before the regular Board meeting or on the second or fourth Tuesday of each month. Conforming amendments are provided at Sections 2430 (Engineering, Operations and Technology), 2440 (Finance, Affordability, Asset Management, and Efficiency), 2450 (Legal and Claims), 2460 (Legislation and Communications), 2470 (Organization, Personnel and Effectiveness), 2480 (One Water and Adaptation) and 2490 (Community and Workplace Culture).
5. Section 2410 is amended to clarify the duty of a committee's Vice Chair as an alternate on the Executive Committee for an absent committee Chair.

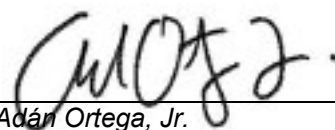

6. Sections 2420 and 2421 are amended to create the Audit Committee. Accordingly, the listed duties of the Audit Subcommittee at Section 2416(f)(6) are deleted and transferred to the Audit Committee at Section 2421(a) through (e) and the duties from the preamble to engage in the annual evaluation process of the General Auditor and monitor compliance with the state audit are added at Section 2421(f) and (g). Also, Section 2420 specifies the regular meetings of this standing committee shall be on a quarterly basis.
7. Section 2462 is added for the Board Chair to designate two committee Vice Chairs for the Legislation and Communications Committee, one to preside over legislative affairs, the other over communications matters.
8. Section 2471 is amended to add to the duties of the Organization, Personnel and Effectiveness Committee the oversight of workforce training programs at subsection (h), the recruitment of top-tier talent at subsection (i) and personnel matters at subsection (j).
9. Section 2491 is amended to create the Community and Workplace Culture Committee. Accordingly, the ethics-related duties of the Ethics, Organization and Personnel Committee at Section 2471(i) through (m) are deleted and transferred to the Community and Workplace Culture Committee at Section 2491(a)(1) through (5). Section 2491(b) is created and former subsections (a) through (f) renumbered underneath it with respect to the equal employment opportunity, and diversity equity and inclusion duties of the Community and Workplace Culture Committee.

C. Future Actions Recommended in the February 11, 2025, Board Letter Item 6B Modifying Subcommittee Structures and Functions That Will Require Standing Committees to Review and Approve.

Based on Administrative Code 2311, the following changes to subcommittee structures and functions will require separate action by their standing committees:

- Eliminate the Subcommittee on Pure Water and Regional Conveyance under the Engineering, Operations and Technology Committee.
- Eliminate the Subcommittee on Demand Management and Conservation Programs and Priorities under the One Water and Adaptation Committee.
- Create a Subcommittee on Imported Water under the One Water and Adaptation Committee with membership to consist of Metropolitan representatives to the key District-engaged entities concerned with Colorado River water usage and the Bay-Delta project, as well as interested committee members, as selected by the committee Chair.

The proposed amendments, and the amendments authorized by the Board at the February 11, 2025 meeting are set forth in **Attachment 1**, with overstrikes reflecting deletions and underlining reflecting additions. **Attachment 2** sets forth the sections as they will appear in the Administrative Code if the changes are approved.

 Adán Ortega, Jr.

~~(a) Legislation and Communications Committee.~~

~~———(3) Vice Chair for Finance and Planning will provide guidance to the following committees:~~

~~(a) Finance and Asset Management Committee and the Subcommittee on Long-Term Regional Planning Processes and Business Modeling.~~

~~———(4) Vice Chair for Organizational Integrity and Accountability will provide guidance to the following committees:~~

~~(a) Ethics, Organization and Personnel Committee;~~

~~(b) Legal and Claims Committee; and~~

~~(c) Equity, Inclusion, and Affordability Committee.~~

Chapter 3

RULES GOVERNING COMMITTEES

§ 2310. Ad Hoc Committees.

Ad Hoc Committees may be created by the Board to undertake special assignments on behalf of the Board. An ad hoc committee shall exist for a specified term or until its special assignments are completed, whichever comes first, but its existence may be extended for an added term or added assignments by action of the Board. Unless otherwise specified, members of an ad hoc committee shall be appointed by the Chair of the Board and shall serve at the Chair's pleasure. Ad Hoc Committees shall provide reports to the Executive Committee as well as committees where the subjects are relevant.

GENERAL

Sec.

2400. Identification of Standing Committees

2401. Officers and Members of Standing Committees

2402. Regular Meetings

§ 2400. Identification of Standing Committees.

The Standing Committees of the Board of Directors are:

- ~~_____~~ Executive Committee (EXEC)
- Audit Committee
- ~~_____~~ Engineering, Operations and Technology Committee (EOT)
- ~~_____~~ ~~Finance and Asset Management Committee~~ Legal and Claims Committee Finance, Affordability, Asset Management, and Efficiency Committee (FAAME)
- ~~_____~~ Legal and Claims Committee (LC)
- ~~_____~~ ~~Le~~ Legislation and Communications Committee ~~Ethics, Organization and Personnel Committee~~ (LEG)
- ~~_____~~ ~~Ethics, Organization and Personnel~~ Organization, Personnel and Effectiveness Committee (OPE)
- ~~_____~~ One Water and Adaptation Stewardship Committee (OWA)
- Community and Workplace Culture Committee (CWC)

§ 2401. Officers and Members of Standing Committees.

(a) Members, Chair, and Vice Chairs of standing committees with the exception of the Executive Committee shall be appointed subject to the approval of the Executive Committee and the Board on the basis that each director, with the exception of the Chair of the Board, serve on at least one standing committees, in addition to the Executive Committee. Such appointment shall be made by the Chair of the Board unless a new Chair-elect has been selected by the Board to take office on the next January 1, in which event appointment of Chair and Vice-Chairs of standing committees shall be made by the Chair-elect.

(b) Chair and Vice Chairs of standing committees with the exception of the Executive Committee are to be appointed in even-numbered years at the December meeting of the Board for a two-year term commencing on January 1 of odd-numbered years. No director shall be appointed to the same committee office for more than two consecutive full terms and a partial term immediately prior to the first term.

(c) The Chair of the Board or the Vice Chair ~~to whom the Chair has assigned the Chair's membership pursuant to Section 2204 acting in the Chair's absence per Section 2204,~~ is a member ex-officio, with right to vote, of all standing committees, subcommittees, and special committees of the Board. However, the Chair (or the Vice Chair) ~~to whom the Chair's membership has been assigned~~ shall not be considered a member of any committee of which the officer is a member ex-officio for the purpose of determining whether a quorum of the committee is present unless the Chair or Vice Chair is actually present at the meeting of the committee.

(d) The committee Chair's duties include presiding over meetings of the committee, with the exception that the committee may, by a majority vote, overrule parliamentary rulings of the Chair. Any Vice Chair of that committee may serve as the alternate presiding officer of committee meetings when the committee Chair is absent.

§ 2402. Regular Meetings.

- The regular meetings of standing committees shall be held on the Monday preceding regular board meetings or on the second or fourth Tuesday of each month. Executive Committee

The Audit Committee shall meet on a quarterly basis. If a scheduled meeting falls on a holiday designated in Section 1106, the meeting will be rescheduled to the next business day unless the Board selects an alternative date. Staff will adjust its schedule accordingly.

Article 2

EXECUTIVE COMMITTEE

§ 2410. Membership.

The Executive Committee shall consist of the Chair, Vice Chairs of the Board, Secretary, all past Chairs of the Board who are directors of the District, and the Chairs of the standing committees in addition to the Executive Committee, and four (4) additional directors as nonofficer members. In the absence of a committee Chair, a committee's Vice Chair shall serve as the alternate on the Executive Committee for the absent committee Chair.

§ 2416. Duties and Functions. [Executive Committee]

(a) The Executive Committee shall study, advise, and make recommendations with regard to:

(1) Public information for governmental and other entities and officials, and for the citizens of California regarding matters affecting the District's interests;

(2) Official dealings with the United States Government, the State of California or other states, member public agencies or their sub-agencies, foreign governments and other entities or persons in matters of public policy or other activities as deemed appropriate;

(3) Policies and procedures to be considered by the Board or committees thereof, except for policy matters within the jurisdiction of a specific standing committee;

(4) Matters relating to the Colorado River Board of California;

(5) Major policy issues to be considered by the Board, including proposed amendments to the Metropolitan Water District Act;

(6) Questions raised by the officers and staff in intervals between meetings of the Board and in unexpected situations and emergencies.

(7) The terms and conditions of employment of all consultants and advisors not within the jurisdiction of other committees;

(8) Resolution of conflicting committee recommendations pursuant to Section 2314;

(9) The progress of, and propose modifications to, the Board's goals in light of then existing and projected future conditions; and

(10) Such other matters as may be required by Division II of this Code.

(b) The Executive Committee shall:

(1) Review and approve board and committee agendas and, notwithstanding the jurisdiction of the other standing committees in the Code, have the authority to direct which committee shall consider an item;

(2) Review and approve the scheduling of board and committee meetings;

(3) Be responsible for the oversight and management of the organization including, but not limited to, the form of the District's organization and the flow of the authority and responsibility. This includes monitoring and overseeing the duties and responsibilities of management; and

(4) Consider the effectiveness of the District's internal control system, including information technology security and control.

(c) The Executive Committee shall retain ultimate responsibility for those duties as are specifically assigned to the subcommittees of the Executive Committee.

(d) The Executive Committee shall be responsible for reviewing and approving the annual business plan containing the General Manager's key priorities for the coming year.

(e) As part of the Department Head annual evaluation process, the Executive Committee shall be responsible for engaging in periodic performance expectations discussions, including progress checks, with the General Manager.

(f) The Executive Committee shall also:

(1) Act on behalf of the Board in unexpected situations and emergencies, subject to subsequent approval or ratification of the actions taken whenever such approval or ratification is required by law.

(2) Provide policy guidance where appropriate to those directors and District staff members who are associated with organizations in which the District has membership.

(3) Conduct hearings on appeals of protest denials involving Purchasing Contracts and Professional and Technical Services Contracts pursuant to Section 8150(b).

(i) Hearings shall be held by the committee at its next regular meeting to be held at least 72 hours after the filing of the notice of appeal of the General Manager's determination under Section 8150(b). The decision of the committee shall be final unless the committee chooses to refer the notice of protest to the Board.

(ii) The Chair of the Executive Committee may re-delegate duties provided for under subparagraph (i) above to a minimum of three members of the Executive Committee who shall act in place of the committee.

(4) Resolve disputes over inspection dates and monitor conduct of inspection trips to assure maximum effectiveness.

(5) Address substantiated allegations of discrimination, harassment, and retaliation against directors, the General Manager, General Counsel, General Auditor, and Ethics Officer:

(i) The Executive Committee shall create an ad hoc subcommittee of three members and two alternates that will serve for a period of one year to address substantiated findings of violations determined as a result of Equal Employment Opportunity (EEO) investigations conducted for alleged violations of Section 2131 made against a director and for alleged violations of Section 6305 made against the General Manager, General Counsel, General Auditor, or Ethics Officer. If any director serving on the three-member subcommittee is an involved party to an EEO investigation, or has a conflict of interest with any involved party, the conflicted director shall recuse themselves from the matter. The Chief EEO Officer (EEO Officer) will select an alternate director to fulfill all subcommittee duties related to the particular matter. If the EEO Officer has a conflict of interest in the same matter, the Ethics Officer and/or General Counsel will select an alternate director. Directors serving as alternates will not participate in ad hoc committee matters unless or until called to serve.

(ii) The Executive Committee will also select an external law firm to serve as counsel to the ad hoc subcommittee to provide guidance, as needed, for post investigation actions.

(iii) The ad hoc subcommittee shall delegate to the EEO Officer the responsibility to designate an external investigator to conduct a fact-finding EEO

investigation pursuant to this section. ALL EEO investigations will be fair, impartial, timely, and promptly initiated and completed by qualified personnel. Detailed EEO investigative procedures, pursuant to this section can be found in *EEO Investigative Procedures for the Board and its Direct Reports*. The EEO Officer shall refer substantiated findings of EEO investigations to the ad hoc subcommittee to determine recommended appropriate action. At its discretion, the ad hoc subcommittee may consult with the EEO Officer, Ethics Officer, and/or General Counsel on appropriate action regarding a director or department head. The ad hoc subcommittee shall report a substantiated finding of an EEO violation by a director or department head and recommend appropriate action for the Board's consideration. Appropriate action for directors may include, but is not limited to, counseling, training, a private warning letter, public censure, temporary or permanent removal from committee assignments, or referral to the Director's appointing authority requesting appropriate action. Appropriate action for department heads may include, but is not limited to, counseling, training, performance review, or the imposition of discipline, as deemed appropriate under the circumstances.

(iv) When the General Manager is a party to the complaint or when in the judgment of the EEO Officer that matter should be handled differently to avoid real or perceived conflicts of interest, or to avoid potential bias or threats to impartiality, the EEO Officer shall delegate to the Ethics Officer the responsibility to retain an external investigator to conduct a fact-finding EEO investigation pursuant to this section. If the Ethics Officer has a conflict of interest in the particular case, the EEO Officer would delegate to the General Counsel the responsibility to retain an external investigator to conduct a fact-finding investigation pursuant to this section. Substantiated EEO findings under this subsection shall be referred directly to the ad hoc subcommittee to determine recommended appropriate action for the Board's consideration.

(v) A deviation of this investigation protocol by the EEO Officer may occur, in certain circumstances, with a written justification and approval of the ad hoc subcommittee responsible for EEO investigations of directors and department heads

(vi) On a quarterly basis, the Chief EEO Officer will report to the Executive Committee EEO case statistics regarding EEO complaints filed against the Board and its direct reports.

~~(6) Audit Subcommittee. The Executive Committee shall create an Audit Subcommittee, whose membership shall include the at-large members of the Executive Committee. This committee shall have the responsibility to monitor compliance with the recommendations of the California State Audit (April 2022) and, with respect to the duties and functions of the General Auditor, shall be responsible to:~~

~~(i) Study, advise, and make recommendations with regard to:~~

~~a. All reports of the General Auditor and external auditors, including the audited financial statements of the District;~~

~~b. The Audit Department's annual business plan and biennial budget; and,~~

~~c. Requests from other committees of the Board and individual Board members for audits and review not included in the Audit Department's annual business plan.~~

~~(ii) Monitor and oversee the duties and responsibilities of the Audit Department and the external auditors as those duties and responsibilities relate to the effectiveness of the District's internal control system.~~

~~(iii) Review and approve, in advance of the July Board meeting, the Audit Department annual business plan containing the key priorities of the General Auditor and the Audit Department.~~

~~(iv) As part of the Department Head annual evaluation process, be responsible for engaging in periodic performance expectations discussions, including progress checks, with the General Auditor.~~

Article 3

AUDIT COMMITTEE

§ 2420. Day of Regular Meeting

The regular meetings of the Audit Committee shall be held on a quarterly basis in the months of March, June, September and December.

§ 2421. Duties and Functions

(6) Audit Subcommittee. The Executive Committee shall create an Audit Subcommittee, whose membership shall include the at-large members of the Executive Committee. This committee shall have the responsibility to monitor compliance with the recommendations of the California State Audit (April 2022) and, with respect to the duties and functions of the General Auditor, shall be responsible to:

The Audit Committee shall _____ (i) Study, advise, and make recommendations with regard to:

~~(a)~~ a. All reports of the General Auditor and external auditors, including the audited financial statements of the District;

(a) _____

(b) b. The Audit Department's annual business plan and biennial budget; and,

(c) e-Requests from other committees of the Board and individual Board members for audits and review not included in the Audit Department's annual business plan.

(d) (ii)-Monitor and oversee the duties and responsibilities of the Audit Department and the external auditors as those duties and responsibilities relate to the effectiveness of the District's internal control system.

(e) (iii)-Review and approve, in advance of the July Board meeting, the Audit Department annual business plan containing the key priorities of the General Auditor and the Audit Department.

(f) (iv)-As part of the Department Head annual evaluation process, be responsible for engaging in periodic performance expectations discussions, including progress checks, with the General Auditor.

(g) Monitor compliance with the recommendations of the California State Audit (April 2022).

The Finance and Asset Management Committee shall study, advise and make recommendations with regard to:

- (a) Preparation of budgets;
- (b) Policies and procedures related to budget development and cost containment;
- (c) Sale of bonds and borrowing and repayment of money;
- (d) Disposition and investment of funds;
- (e) Authorization of appropriations, except appropriations for capital projects;
- (f) The determination of revenues to be obtained through water transactions, including, but not limited to, sales, exchanges, and wheeling of water, water standby or availability of service charges, and the levying of taxes;
- (g) The financial impact and requirements of policies concerning annexation;
- (h) The financial aspects of the District's risk management program;
- (i) Questions pertaining to insurance coverage and self-insurance;
- (j) The selection of financial and insurance consultants and the determination of the scope of their assignments;
- (k) Form and contents of accounts, financial reports, and financial statements;
- (l) Proposed amendments to the Metropolitan Water District Act affecting the finance and asset management functions of the District;
- (m) Goals and objectives related to financial planning for Metropolitan, including but not limited to revenues, operating expenses, reserve policies, internally funded construction, debt management, investments and capital financing strategies;
- (n) The prices and conditions governing water transactions, including, but not limited to, sales, exchanges, and wheeling sales of water;

(o) Costs and accounting procedures relating to the District's and other state water service contracts;

(p) Policies regarding water transactions, including, but not limited to, the sale, exchange, and wheeling of water for various uses;

(q) Policies regarding allocation of water standby or availability of service revenue requirements among member public agencies;

(r) Water standby or availability of service charges within the District;

(s) Determinations by the General Manager with respect to appeals concerning charges for water service, including readiness-to-serve charges and capacity charges, and report its recommendations, as appropriate, to affirm or reverse the General Manager's determinations;

(t) Appeals from determinations by the General Manager to deny or qualify an application for exemption from the water standby charge, and report its recommendations, as appropriate, to affirm or reverse the General Manager's determinations;

(u) The purchase, management and disposition of personal property assets such as equipment and vehicles;

(v) Facility master plans, including budgeting for capital improvements and long-term facilities commitments;

(w) Proposed rules and proposals regarding business development opportunities for real property;

(x) Policies for the acquisition of rights-of-way;

(y) The purchase, sale, and leasing of land and buildings, including the District's various office and garage space needs;

(z) The incidental use of land in farming operations and otherwise;

(aa) The operation and maintenance of buildings;

(bb) The development, oversight, and coordination of recreational facilities at Diamond Valley Lake and Lake Skinner;

(cc) The use of proceeds from the sale or disposition of surplus property related to Diamond Valley Lake and Lake Skinner for recreational purposes;

(dd) Annexations and annexation policies including the requirements, procedures, terms and conditions for annexation.

ONE WATER AND **STEWARDSHIP-ADAPTATION** COMMITTEE

Sec.

2480. Day of Regular Meeting

2481. Duties and Functions

§ 2480. Day of Regular Meeting

The regular meetings of the One Water and Stewardship-Adaptation Committee (OWA) shall ~~hold regular meetings on an as-needed basis.~~ be held on the Monday preceding regular board meetings or on the second or fourth Tuesday of each month.

§ 2481. Duties and Functions

The ~~One Water and Stewardship~~OWA Committee shall have oversight over the planning, prioritization, and funding of any current or future regional demand management or any regional or local supply projects within the Metropolitan service area receiving funding from Metropolitan, such as the Regional Recycling Project and local projects funded through Metropolitan's Local Resources Program. The ~~c~~Committee shall review and consider:

(a) Establishing policies and programs regarding water conservation and reuse, watershed management, storm water capture and management, recycling, sustainable groundwater management and protection, underground storage, and use thereof;

(b) Seawater desalination, recycling and reuse, and brackish water issues in Metropolitan's service area, and use thereof;

(c) Overseeing development and implementation of Metropolitan's Local Resources Program and Conservation Program and other efforts to meet local supply and water use efficiency goals;

(d) The effect of existing and proposed federal, state and local environmental, water supply and water management statutes and regulations on supplies produced or that may be produced within the District's region;

(e) Recommendations for comprehensive solutions to regional supply problems with the intent to increase water reliability, cost effectiveness, and environmental benefit;

(f) Expanding Metropolitan's understanding of regional water supply issues by inviting informational presentations and feedback from external representatives;

(g) Recommendations to the Board on policies and programs that will strengthen relationships with other agencies in furthering Metropolitan's objectives for increased regional self-reliance and greater water use efficiency;

(h) Creating opportunities for collaboration to advance the development of local supplies and achieving greater water use efficiency;

(i) Coordinating and aligning new water supplies, local resources projects and programs, and investments with other Metropolitan strategic priorities and initiatives;

(j) Developing criteria for the prioritization of investments in new water supplies;

(k) Policies, sources, and means of importing and distributing water, transferring water, and wheeling water as required by the District;

(l) Policies and procedures regarding the delivery and exchange of water for various uses;

(m) Metropolitan Water Supply Planning including the Integrated Resources Planning Process and completion of the Urban Water Management Plan and related policies; and

(n) Environmental compliance and requirements, and informing the technical aspects and science factors in providing comments to regulatory agencies and legislation affecting the regulation of water supply operational facilities and the conditions that they operate under.

Article 109

COMMUNITY AND WORKPLACE CULTURE COMMITTEE

Sec.

2490 Day of Regular Meeting

2491 Duties and Functions

§ 2490. Day of Regular Meeting

The regular meetings of the ~~Equity, Inclusion and Affordability~~ Community and Workplace Culture (CWC) Committee shall ~~hold regular meetings on an as-needed basis~~ be held on the Monday preceding regular board meetings on the second or fourth Tuesday of each month.

§ 2491 Duties and Functions

The CWC Committee shall study, advise and make recommendations, as follows:

(a) With regards to ethics matters:

(1) Periodic performance expectations discussions, including progress checks, with the Ethics Officer.

(2) Monitoring and overseeing the duties and responsibilities of the Ethics Officer to ensure the independence of the Ethics Officer.

(3) Receive and review bi-monthly status reports of pending investigations by the Ethics Officer. The reports shall include the general nature and status of the investigation, how long the investigation has been pending, when the investigation is expected to be completed and, when completed, resolution of the investigation.

(4) Receive and review quarterly reports from the Ethics Officer on any engagement of professional and technical consultants.

(5) Review and approval of the business plan containing the key priorities for the coming year for the Ethics Office. It shall review and approve the business plan in advance of the July Board meeting.

(b) With respect to matters of equal employment opportunity and of diversity, equity and inclusion:

(1a) Direct and receive reports from, and be the home committee for Metropolitan's Diversity, Equity and Inclusion Officer, and Metropolitan's Chief Equal Employment Opportunity Officer;

(2b) Receive input, policy and procedure recommendations from the Diversity, Equity and Inclusion Officer;

(3e) Study diversity, equity, and inclusion issues within Metropolitan to recommend ways to enhance and promote equal opportunity, affirmative action, increased diversity of the workforce and a culture of inclusion within Metropolitan;

(4d) Monitor performance of efforts to Promote workforce development programs, including training and advancement opportunities at Metropolitan to increase diversity, equity and inclusion within Metropolitan and benefit the communities within Metropolitan's service area; and

(5e) Study areas of special concern to the District and its employees, including, but not limited to, equal employment opportunity and affirmative action.

(6f) Study, advise and make recommendations on the ways the District can:

(i1) Better serve the disadvantaged and underserved communities within Metropolitan's service area, and mitigate issues of affordability;

(ii2) Improve the access of disadvantaged and underserved communities to reliable, high-quality drinking water supplies;

(iii3) Increase participation of currently underserved communities in Metropolitan's rebate, conservation, and other local resources programs; and

(iv4) Assist and support member agency programs and advocate for underserved communities, including providing communications, operational and technical assistance, with focus on consumer confidence in drinking water.

(7) Monitor Metropolitan's compliance with laws governing equal opportunities and employment and the manner in which investigations are conducted in compliance with such laws.

Division IV

WATER SERVICE POLICIES

Chapter 3

WATER TRANSACTIONS REVENUE

§ 4304. Apportionment of Revenues and Setting of Water Rates.

(a) Not later than at its February meeting the General Manager shall present to the ~~Finance and Asset Management~~ Finance, Affordability, Asset Management, and Efficiency (FAAME) Committee of the Board:

(1) Determinations of the revenue requirements and cost of service analysis supporting the rates and charges required during the biennial period beginning the following July 1, as determined by the General Manager in accordance with current Board policies, and,

(2) Recommendations of rates including, but not limited to, the System Access Rate, Water Stewardship Rate, System Power Rate, Treatment Surcharge, and the Supply Rates for the various classes of water service to become effective each January 1 of the biennial period. These recommended rates shall be the General Manager's determination, made in accordance with current Board policies, of the rates necessary to produce substantially the revenues to be derived from water transactions, including, but not limited to, sales, exchanges, and wheeling, during the biennial period beginning the following July 1.

(b) Not later than at its February meeting, the General Manager shall also present to the ~~Finance and Asset Management~~ FAAME Committee -recommendations regarding the continuation of a water standby charge or the imposition of an availability of service charge (such as the readiness-to-serve charge and capacity charge), which shall be the General Manager's determination, made in accordance with current Board policies, of the charge necessary to produce substantially the revenues to be derived from fixed revenue sources, if any, exclusive of taxes, during the biennial period beginning the following July 1 which ~~the Finance and Asset Management~~ said committee has determined to be necessary.

(c) Not later than its February meeting the ~~Finance and Asset Management~~ FAAME Committee shall set a time or times for, and shall thereafter hold, one or more meetings of ~~the Finance and Asset Management Committee~~ said committee, to be held prior to its regular April meeting, at which interested parties may present their views regarding the proposed water rates and availability of service charges to ~~said~~ the committee. The ~~Finance and Asset Management~~

cCommittee shall direct the General Manager to cause the publication of a notice of such public hearing to be published in newspapers of general circulation within the District's service area. Such notice shall be published not less than 10 days prior to the public hearing.

(d) Not later than its regular April meeting the ~~Finance and Asset Management~~ FAAME Committee shall make its determination regarding the revenue requirement to be paid from water rates and the water rates to become effective each January 1 of the biennial period and shall recommend said water rates to the Board no later than the Board's regular April meeting.

(e) Not later than its April meeting, the Board shall establish water rates for deliveries beginning each January 1 of the biennial period.

(f) Proposals for changes in water rates to become effective at times other than on January 1 shall require adequate notice to the public and a hearing before such proposals are acted upon by the Board, unless the Board finds that an immediate change in water rates is urgent.

§ 4305. Setting of Charges to Raise Fixed Revenue.

(a) Not later than its regular May meeting each year, the ~~Finance and Asset Management~~ FAAME Committee shall make its final determination regarding the water standby charge or other fixed revenue charge, if any, for the fiscal year beginning the following July 1, and shall recommend such charge, if any, to the Board at its regular May meeting.

(b) Not later than such May meeting, the Board shall consider and take action upon the recommendations, if any, of the ~~Finance and Asset Management~~ FAAME cCommittee regarding a fixed revenue source, exclusive of taxes, to become effective the following January 1 or for the fiscal year beginning the following July 1, as determined by the Board for each fixed revenue source.

Chapter 5

WATER SERVICE REGULATIONS - GENERAL

§ 4507. Billing and Payment for Water Deliveries.

(a) **Timeframe for Billing and Payment.** Except as noted herein below, invoices shall be mailed electronically, or, if requested by the member agency, by hardcopy via United States mail, not later than the tenth day of the month following delivery to a member public agency. Each such invoice shall indicate the date of mailing and the date on which the payment thereunder becomes delinquent and shall show the total amount of water delivered for each class of service, the charges for water sold and delivered for each class, the readiness-to-serve and capacity charges, as applicable, and the total amount due and owing, all as determined by the General Manager. Payment of the amount shown on any such invoice shall be due on the last business day of that month and shall be delinquent if not received by the Treasurer of the District before the close of crediting activity on the last business day of the first month following such

date of mailing. When making any such payment the member public agency shall specify the invoice or invoices to which the payment shall be credited by the District.

(1) For purposes of Section 4507(a), "business day" shall mean any day other than a Saturday, a Sunday, or a Holiday (as defined in Section 1106).

(2) For purposes of Section 4507(a), "received by the Treasurer of the District" shall mean receipt either (1) in the office of the Treasurer or (2) by crediting pursuant to advance agreement with the Treasurer to the District's general demand account at the District's principal depository bank, in such form that the funds are immediately available for investment or other use or disposal by the District.

(3) For purposes of Section 4507(a), "crediting activity" shall mean either (1) 2:00 p.m. if payment is delivered to the office of the Treasurer, or (2) the cutoff time for crediting by the District's principal depository bank of that day's transactions if payment is initiated by wire transfer, automated clearinghouse transfer, interbranch transfer, direct deposit, or by other means pursuant to advance agreement with the Treasurer.

If, under advance agreement with the Treasurer, a member agency has authorized payment of any invoice by automated clearinghouse transfer initiated by the Treasurer, the Treasurer shall initiate such transfer for processing two business days prior to the business day on which such payment shall be delinquent. Failure of such transfer shall not relieve such member agency from liability for such payment or charges in the event such payment should become delinquent, except as specifically provided under advance agreement with the Treasurer.

(b) Full Service and Emergency Storage Program Facility. In cases where water through a particular facility is delivered during any month for full service or Emergency Storage Program Service, the bill for water delivered in such month will be prepared by applying the rates for water sold and delivered in full service to the total quantity of water delivered. If the member public agency desires to receive credit for water used in Emergency Storage Program Service, the facts concerning the quantities of water so used must be certified to the District via the District's electronic certification and billing system by an authorized user for the member public agency purchasing such water as provided for in Section 4507 (c). The amount of such credits shall be based on the difference in water rates in effect at the time the water is used.

(c) Late Certifications. Based on available information, the District will notify a member agency for any certification that it has not received, if known, three months from the end of the month for which the agency would normally certify. No certification received after six months following the end of any month in which such a credit is claimed will be accepted. Certifications must be received by Metropolitan before 3:30 p.m. on the third working day after the end of the month to receive credit for any preceding month on the next bill, subject to the provisions with respect to late certifications in this Section. This Section applies to all cases where a certification is required to receive a credit, whether or not specifically named in this Section, unless otherwise provided by this Code.

(d) **Determination by General Manager as to Type of Delivery.** In the event the respective quantities of water sold and delivered in any month on order of any member public agency for use therein in any water program or contract requiring certification, are not determinable to the satisfaction of the General Manager in time for preparing regular monthly bills, then billing and payment for all water sold and delivered in such month to such member public agency shall be made at the rates prescribed for water used in full service in Section 4401(a)(1) hereof. Upon the determination by the General Manager of the correct quantities of water sold and delivered and used in any water program or contract requiring certification, any adjustment which is necessary to give effect to the applicable credit for the water used in any water program or contract requiring certification, shall be made by application of credits on subsequent purchases of water from the District by such member public agency. Such adjustments shall not be made in cases where a claim for the applicable credit is not submitted within the period provided in Section 4507(c).

(e) **Obligation to Pay for Appropriate Class of Service.** If water has been sold and delivered at the rates prescribed for water sold in any water program or contract and appropriate certifications have been submitted for the water so used, but the water has in fact been used in full service or another class of service, the member public agency shall be obligated to pay the difference between the rates prescribed for water sold for the applicable water program or contract and the rates prescribed for the class of service actually used.

(f) **Submission of Documentation by Member Agency.** With respect to water sold and delivered at the rates prescribed for water sold under water programs or contract (unless otherwise specified in an agreement with the District), original documentation supporting the use of such water as certified must be submitted no later than December 31 following the end of the fiscal year for which a certification is submitted, unless otherwise specified in an agreement with the District. If the documentation is not submitted by December 31 following the end of the fiscal year for which a certification was submitted, an agency will receive a late penalty of \$2,500. If the agency does not submit documentation by February 28/29 following the end of the fiscal year for which a certification was submitted, it shall be conclusively presumed that:

(1) The water sold from the District was used for full service, and the District's next monthly billing shall reflect such adjustment; or

(2) The yield was not produced as certified and the District's next monthly billing shall reflect such adjustment.

This provision will apply individually to each program or agreement that an agency or sub-agency participates in separately.

(g) **Review Process.** With respect to water sold and delivered at the rates prescribed for water sold under water programs or contract (unless otherwise specified in an agreement with the District) the District will complete its review within twelve months from date of receipt of the original supporting documentation.

(1) Should the District not complete its review within twelve months of the submittal of all source documentation, the review will be considered complete and the certifications final.

(2) When the review is completed, the District will notify the member agency of its initial findings for its comments. The member agency will provide its comments within 60 days. Metropolitan staff and the agency will work together to reconcile any differences.

(3) If the member agency and Metropolitan staff cannot reconcile the differences, Metropolitan's Water System Operations' Group Manager has the responsibility to consult with the member agency and make a final ruling, subject to the General Manager's oversight. If the ruling is unsatisfactory to the agency, it can be appealed to Metropolitan's ~~Finance and Asset Management~~ Finance, Affordability, Asset Management, and Efficiency Committee.

(4) If the member agency does not provide further documentation correcting Metropolitan staff findings within the 60-day comment period as specified in (g) (2), then it shall be conclusively presumed that the District's findings are correct and the District's next monthly billing shall reflect such adjustment.

(h) Discovery of Mistakes or Errors. In the event a mistake or error is discovered in a District water sales record, the General Manager shall initiate appropriate corrective action. No mistake or error made more than three years prior to its discovery shall be corrected unless otherwise specified in an agreement with the District. In the event a mistake or error is discovered by a member agency in its water sales record or certifications, no mistake or error made more than three years prior to its discovery shall be corrected unless otherwise specified in an agreement with the District.

(1) A District water sales record shall include a water billing invoice, or district invoice for other water-related charges.

(2) If the District finds the mistake or error, the discovery of the mistake or error shall be documented in writing to the member agency. The date of discovery for corrective action purposes shall be the date notice is sent to the member agency.

(3) If the member agency discovers the mistake or error, the discovery of the mistake or error shall be documented in writing to the District by either a revised certification form or letter, whichever is applicable. The date of discovery for corrective action purposes shall be the date the certification or letter is received by the District.

(4) If an incorrect invoice has been issued to a member public agency, the General Manager shall notify the affected agency of any adjustment and the manner of making any required credit or charge, neither of which shall bear interest.

(5) Mistakes or errors shall also include but are not limited to mistakes or errors in metering or recording deliveries to member agencies, entry or calculation errors in fixed charges, discovery of errors in either a member agency or sub-agency submitted certification(s), or processing of a certification(s) for the Local Projects Program, the Local Resources Program, the Groundwater Recovery Program, Conservation Credit Program, or any other water management program or storage programs or agreements unless specified otherwise in the contract.

(6) Any mistakes or error for a fiscal year period that is less than five acre-feet cumulative by agency or sub-agency, by program or agreement, shall be waived.

(i) **Rate Change.** In the event that deliveries of water are made by the District to member public agencies over a billing period during which the District's water rates change, the General Manager may cause the meters recording deliveries of water during such period to be read at the end of the period and the statement of charges for such deliveries of water may be based on a proration between the previous and new water rates for the periods of time during which each were in effect as determined by the General Manager.

Division V

FINANCIAL MATTERS

Chapter 1

ADMINISTRATIVE MATTERS

§ 5104. Payment After Loss of Bond Interest Coupon.

(a) The Treasurer of the District is authorized to effectuate payment, without action of the Board, of a claim arising from the loss of a bond interest coupon that has been detached from a District bond or from the destruction of a bond interest coupon at any time after the date of its maturity, and the Treasurer has received:

(1) An affidavit or affidavits establishing the ownership of the coupon and reciting therein the circumstances under which it was lost or destroyed; and

(2) An indemnity bond in a penal sum which is at least the amount of the claim, said sum being specifically stated in said bond, said bond to be approved by the General Counsel and then filed with the Treasurer. The indemnity bond must include a rider substantially in the form hereinafter set forth:

(i) Rider.

This Rider is attached to and is a part of the Bond of Indemnity executed by the (enter name of insurance company) respecting the loss of coupons due

coupons at \$ per coupon - total \$, detached from \$ Bonds of THE METROPOLITAN WATER DISTRICT OF SOUTHERN CALIFORNIA, numbered to , %, maturing , at \$ each bond in bearer form.

It is understood and agreed that in the event the balance in the coupon account respecting the above-described issue of bonds, maintained by the Treasurer of said District, should hereafter not be sufficient as a result of the payment of coupon(s) to provide for outstanding unpaid coupons, (enter name of insurance company) will reimburse The Metropolitan Water District of Southern California, up to the face amount of the coupon(s) paid under this indemnity contingent upon presentation by said District of (a) evidence that said District has paid the afore-described coupon(s) or (b) a certificate from the Treasurer of said District that there is a deficiency in said coupon account balance.

It is understood that within the first year after the due date of the afore-described coupon(s) that (enter name of insurance company) may request that the Treasurer of said District search the District's records to ascertain if in fact the afore-described coupon(s) have been paid, but any such request shall only be honored by said Treasurer upon payment by (enter name of insurance company) of any fee required by said Treasurer to cover costs of such search.

Executed this day of , 20 .

(enter name of insurance company)

(b) The Treasurer shall report to the ~~Finance and Asset Management~~ Finance, Affordability, Asset Management, and Efficiency Committee all payments made pursuant to this Section 5104.

§ 5105. Lost or Destroyed Bonds.

(a) The Treasurer of the District is authorized to issue a new District bond or bonds similar to the original to replace it if the Treasurer has received:

(1) Proof satisfactory to the Treasurer that the bond has been lost or destroyed; and

(2) Security approved by the Treasurer and the General Counsel from the owner indemnifying the District against any loss incurred on account of the bond, such security to be equal to the principal amount of the bond and plus the aggregate amount of any attached interest coupons; and

(3) The costs for issuance of the new bond.

(b) The Treasurer shall report to the ~~Finance, Audit, Insurance and Real Property~~FAAME Committee of the Board all issuances of duplicate bonds made pursuant to this Section 5105.

§ 5107. Biennial Budget Process.

(a) There shall be prepared each even-numbered year, under the direction of the General Manager, a proposed biennial budget covering District operations for the following two fiscal years. The proposed biennial budget shall be submitted to the Board no later than the date of the regular Board meeting in June immediately preceding the first fiscal year of the biennium to which the budget applies. The proposed biennial budget shall indicate by fund all anticipated expenses and required reserves and the source of revenues to be used to meet such expenses and provide such reserves. The proposed biennial budget will at a minimum include a five-year financial forecast. At least one Board Workshop on the proposed biennial budget will be conducted prior to submission of the proposed biennial budget for Board approval. The ~~Finance and Asset Management~~FAAME Committee shall review the proposed biennial budget in its entirety, together with the recommendations from the Board workshop, and report its recommendations to the Board.

(b) After considering the proposed biennial budget and making any revisions thereto that it may deem advisable, the Board shall adopt the biennial budget before the beginning of the biennial period to which the budget applies. The amounts provided in the adopted budget for the biennial period for total expenses for operations and maintenance, including minimum and variable operations and maintenance charges under water or power contracts with the State, for capital charges under such contracts, and for debt service shall be deemed to be appropriated from the funds indicated in the budget.

(c) The adoption of the budget shall have no effect upon appropriations for capital projects and continuing expenditures not susceptible to immediate direct allocation, as described in Section 5108 hereof, and shall not establish any limitations on expenditures for such purposes.

(d) The total operations and maintenance budget shall be measured against the regional rate of inflation as measured by the five-year rolling average change in the Consumer Price Index (CPI) for the Los Angeles-Riverside-range County area, not seasonally adjusted, for all items as reported by the U. S. Bureau of Labor Statistics. The budget will include explanations of increases greater than the CPI due to unique conditions, growth or expansion of services.

Chapter 3

SHORT-TERM REVENUE CERTIFICATES

§ 5305. Report of Exercise of Authority.

The General Manager shall report to the next following meeting of the ~~Finance and Asset Management~~Finance, Affordability, Asset Management, and Efficiency Committee of the Board any exercise of authority pursuant to this Chapter.

Division VI**PERSONNEL MATTERS****Chapter 1****EMPLOYEE RELATIONS****Article 2****REPRESENTATION PROCEEDINGS****§ 6113. Appeals.**

(a) An employee organization aggrieved by an appropriate unit determination of the Employee Relations Officer; or an employee organization aggrieved by a determination of the Employee Relations Officer that a Recognition Petition (Section 6105), Challenging Petition (Section 6107), Decertification Petition (Section 6109), Unit Modification Petition (Section 6111) --- or employees aggrieved by a determination of the Employee Relations Officer that a Decertification Petition (Section 6109) --- has not been filed in compliance with the applicable provisions of this Article, may, within twenty (20) days of notice of the Employee Relations Officer's final decision request to submit the matter to mediation by the State Mediation and Conciliation Service, or may, in lieu thereof or thereafter, appeal such determination to the ~~Ethics, Organization and Personnel~~Organization, Personnel and Effectiveness (OPE) -Committee for final decision within fifteen (15) days of notice of the Employee Relations Officer's determination or the termination of mediation proceedings, whichever is later.

(b) Appeals to the ~~Ethics, Organization and Personnel~~OPE Committee shall be filed in writing with the Board's Executive Secretary, and a copy thereof served on the Employee Relations Officer. The ~~Ethics, Organization and Personnel~~said cCommittee shall commence to consider the matter within thirty (30) days of the filing of the appeal. The ~~Ethics, Organization and Personnel~~cCommittee may, in its discretion, refer the dispute to a third-party hearing process. Any decision of the ~~Ethics, Organization and Personnel~~cCommittee on the use of such procedures, and/or any decision of the ~~Ethics, Organization and Personnel~~cCommittee determining the substance of the dispute shall be final and binding.

Article 5**MISCELLANEOUS PROVISIONS****§ 6121. Interpretation and Administration.**

The General Manager shall have authority to interpret and administer provisions of this Chapter, subject to appeal to the ~~Ethics, Organization and Personnel~~ Organization, Personnel and Effectiveness Committee.

Chapter 2

PERSONNEL REGULATIONS

§ 6208. Pay Rate Administration.

(a) Pay rate schedules, as approved by the Board, shall include pay rate grades and pay rate ranges consisting of minimum and maximum rates of pay for each position. Except by action of the Board, or as provided in Section 6208(d), the hourly pay rate paid each employee shall be at least the minimum but not in excess of the maximum hourly pay rate prescribed for the applicable position. Notwithstanding any other provision of this section, the salaries of the department heads shall be fixed as a flat rate.

(b) Pay rates for Department Heads shall be individually fixed by the Board. Pay rates for all employees shall be fixed by their respective Department Heads within the ranges fixed by the Board for such positions in accordance with practices, policies and procedures promulgated by the General Manager. The Board at its August meeting will review each Department Head's salary and compensation after determining an overall performance rating for each Department Head, and make adjustments as appropriate, if any, based on salary comparisons, pay rate survey and/or performance, with any change to be effective at the beginning of the pay period that includes the prior July 1.

(c) Job descriptions in terms of duties and responsibilities shall be prepared by the Director of Human Resources for each position. Job descriptions for positions requiring appointment or approval of appointment by the Board shall be submitted to the Board for approval. Job descriptions for positions peculiar to the Legal or Audit Departments or Ethics Office shall be subject to approval of the General Counsel, General Auditor, or Ethics Officer as appropriate. It shall be the duty of Human Resources to insure that all employees are properly classified.

(d) The General Manager is authorized to provide for payment at a "Y" rate to any employee whose position is reclassified to a position in a lower pay rate or the pay rate of whose position is reduced and the General Manager may maintain the employee at a "Y" rate until such time as the General Manager deems the "Y" rate to be no longer justified. As used herein, "Y" rate means a pay rate higher than the highest rate applicable to the employee's position.

(e) New employees, upon entering District service, will be placed by the Director of Human Resources at a salary grade and step within the salary range appropriate for the position available and the applicant's qualifications. -Employees who are promoted to a position in a higher range shall be paid at least the minimum of such range but not more than four steps over their prior rate or the fifth step of the higher pay rate range, whichever is higher, but not in excess of the maximum rate specified for the position to which promoted. New employees are

eligible for a merit increase after completion of a six-month probationary period. The eligibility date for subsequent merit reviews shall be 12 months from the most recent merit increase, promotion or demotion, whichever is later. Employees at the top step of the pay range will not be eligible for any merit increase. Merit increases will be awarded as provided for by Section 6211.

(f) Pay rates for temporary employees in District service are the rates paid to regular employees in the same classifications.

(g) Subject to Section 6211, the performance of regular employees other than Department Heads, will be annually reviewed by their Department Heads to determine eligibility for merit increases under evaluation procedures, guidelines and rules developed by the General Manager. Changes in pay rate ranges approved by the Board have no effect upon these limitations.

(h) Pay Rate Survey.

(1) As needed, the General Manager has the authority to cause a survey to be made of rates of pay and benefits of employees of other organizations specified by the Board, and may thereafter recommend to the Board revisions in the pay rate structure and benefits for employees. The survey need not include positions for which pay rates are established pursuant to a memorandum of understanding approved by the Board which is in effect for the entire calendar year. Action, if any, on the pay rate survey may be taken at the same meeting the survey information is presented or at a subsequent meeting. The General Counsel, General Auditor and Ethics Officer may also recommend to the ~~Ethics, Organization and Personnel~~Organization, Personnel and Effectiveness Committee revisions regarding positions peculiar to their own departments.

(2) The list of agencies to be used in the District's pay rate survey may include the following:

County of Los Angeles
East Bay Municipal Utility District
Los Angeles Metropolitan Transportation Authority
Los Angeles County Sanitation District
Los Angeles Department of Water & Power
Orange County Water District
San Diego County Water Authority
San Francisco Public Utilities Commission
State Department of Water Resources

The nine comparator agencies were selected by comparing the following factors: Industry (type of utility), total number of units managed, population served, total number of employees, total assets, net operating income, gross revenue, and total service area (square miles).

(i) For temporary construction personnel employed under authority of Section 6207(c), the General Manager is authorized to fix the hourly rates of pay at least equal to, but not more

than 20 percent higher than, those so determined by the Board to be prevailing in the county in which such personnel primarily will be engaged.

§ 6209. Discharge.

(a) Unclassified employees, other than executive officers and their principal assistants, may be removed by their respective Department Heads, but may appeal such removal to the ~~Ethics, Organization and Personnel~~OPE Committee. The decision of the Committee will be final unless the Committee chooses to refer the appeal to the Board.

(b) Probationary employees serve at the pleasure of their respective Department Heads. Classified employees may be discharged, for cause, immediately by their respective Department Heads. When immediate discharge is not deemed appropriate, written notice shall be given at least 14 calendar days in advance of discharge for probationary employees and at least 30 calendar days in advance of discharge for other classified employees.

(c) Regular non-probationary classified employees who are discharged are afforded the due process rights provided under Section 6218 of this Code or as provided in the applicable memorandum of understanding.

Chapter 3

GENERAL EMPLOYEE MATTERS

Article 1

EQUAL EMPLOYMENT OPPORTUNITY AND AFFIRMATIVE ACTION

§ 6304. General Manager's Report on Equal Employment Opportunity Policy and Affirmative Action Program.

Annually, the General Manager shall report to the ~~Equity, Inclusion and Affordability~~Community and Workplace Culture Committee on the status of the equal employment opportunity policy and affirmative action program.

Chapter 4

OFFICERS

Article 2

GENERAL MANAGER

§ 6416. Annual Report to Executive Committee

The General Manager shall annually submit to the Executive Committee a business plan containing the General Manager's key priorities for the coming year. The business plan shall be submitted in conjunction with similar plans by the General Auditor to the Executive Committee and the Ethics Officer to the ~~Ethics, Organization and Personnel~~ Community and Workplace Culture Committee and the General Counsel to the Legal and Claims Committee.

Article 3

GENERAL COUNSEL

§ 6436. Annual and Quarterly Reports to Legal and Claims Committee.

(a) The General Manager and General Counsel shall report quarterly to the Legal and Claims Committee the exercise of any power delegated to them by Sections 6433 and 6434. The General Counsel shall report quarterly to the Legal and Claims Committee the exercise of any power delegated to them by Section 6431.

(b) The General Counsel shall annually, in advance of the July Board meetings, submit to the Legal and Claims Committee a business plan containing the Legal Department's key priorities for the coming year for review and approval. The business plan shall be submitted in conjunction with similar plans by the General Manager to the Executive Committee and the General Auditor to the Executive Committee, and the Ethics Officer to the ~~Ethics, Organization and Personnel~~ Community and Workplace Culture Committee.

Article 4

GENERAL AUDITOR

§ 6450. Powers and Duties.

(a) The District's independent internal auditing function is governed by provisions of the California Government Code and by policies established by the Board of Directors. The Executive Committee is responsible for the oversight of the internal auditing function, approving the Audit Department charter (subject to review and approval of the Board of Directors), selecting and overseeing the work of external auditors, and reviewing reports issued by both the internal and external auditors.

(b) The General Auditor manages the District's Audit Department and is responsible for formulating departmental policies and procedures; directing and evaluating the performance of work done by employees within the department, administering the internal records of the department; and administering the District's contract for external audit services. The General Auditor shall, annually in advance of the July Board meetings, submit to the Executive Committee an Audit business plan containing key priorities for the coming year for review and approval. The business plan shall be submitted in conjunction with similar plans by the General Manager to the Executive Committee, the General Counsel to the Legal and Claims Committee

and Ethics Officer to the ~~Ethics, Organization, and Personnel~~ Community and Workplace Culture Committee.

(c) The General Auditor shall report the findings, opinions, and recommendations which result from the performance of the duties outlined in paragraph 6450(b) to the General Manager, General Counsel and Ethics Officer for their information and appropriate actions. Whenever an audit report contains recommendations for corrective actions or changes in current practices, the General Manager, General Counsel, Ethics Officer or their designees shall respond to the General Auditor in an appropriate manner and within a reasonable time, indicating their views on the recommendations and proposed actions to be taken, if any.

(d) The General Auditor's reports on internal audit assignments shall be addressed to the Executive Committee. The General Auditor shall have the discretion to determine the form and content of such audit reports, subject to guidance by the Executive Committee. With the exception of those reports which the General Auditor deems to be urgent or confidential in nature, copies of all audit reports addressed to the Executive Committee shall be submitted to the General Manager and General Counsel for review and comment simultaneously to their submittal to the Executive Committee.

(e) The General Auditor shall transmit all reports issued by the District's external auditors to the Executive Committee and any other committees of the Board as may be applicable. Such transmittal letters should include any comments on the external auditor's reports that the General Auditor deems necessary.

(f) The General Auditor may receive requests from time to time from the other executive officers or committees of the Board to perform audit assignments which are not included in the approved annual Audit Business Plan. Similarly, the General Auditor may identify a need to include new assignments in the Audit Business Plan during the year. The General Auditor shall have sufficient latitude and discretion to include those new assignments in the annual Audit Business Plan as the General Auditor deems necessary based upon their professional judgement and available resources. Requests from other committees of the Board and individual Board members desiring specific audit assignments shall be submitted to the Audit ~~Subcommittee~~ Committee for study, advise, and recommendation, or if such subcommittee is not currently in place, the Executive Committee. Once the audit assignment is approved by the Board, the General Auditor reserves the right to determine how to best fit the directed audit assignment into the Audit Business Plan. The reporting process for assignments requested by either executive management, by committees of the Board, or by individual Board members shall generally follow the process outlined in paragraphs 6450(c) or (d) previously.

(g) The General Auditor shall manage the work of the Audit Department in accordance with the Audit Department Charter. The General Auditor shall assess annually whether the purpose, authority and responsibility, as defined in this Charter, continue to be adequate to enable the Audit Department to accomplish its objectives.

Article 5

ETHICS OFFICER

Sec.

6470. Powers and Duties

6471. Authority to Obtain Professional Services

6472. Reports to ~~Ethics, Organization and Personnel~~ Community and Workplace Culture Committee

§ 6472. Reports to ~~Ethics, Organization and Personnel~~ Community and Workplace Culture Committee.

(a) The Ethics Officer shall annually, in advance of the July Board meetings, submit to the ~~Ethics, Organization and Personnel~~ Community and Workplace Culture (CWC) Committee a business plan for the Ethics Office containing key priorities for the coming year for review and approval.

(b) The Ethics Officer shall prepare quarterly reports to the ~~Ethics, Organization and Personnel~~ CWC Committee on activities concerning agreements executed pursuant to the authority given to the Ethics Officer in Section 6471, and bi-monthly reports related to pending investigations as specified in Section 6470.

§ 6470. Powers and Duties.

The powers and duties of the Ethics Officer shall be as follows:

(a) The Ethics Officer shall report to the Board, through the ~~Ethics, Organization and Personnel~~ CWC Committee.

(b) The Ethics Officer shall oversee an Ethics Office staffed with professional, qualified persons.

(c) The Ethics Officer shall be free from political interference in fulfilling the responsibilities detailed in this article and in Division VII.

(d) The Ethics Officer shall have sole authority to interpret Metropolitan's ethics rules.

(e) The Ethics Officer shall propose amendments to the Administrative Code to the ~~Ethics, Organization and Personnel~~ CWC Committee for approval and adoption by the Board, relating to:

- (1) Regulation of lobbying activities;
- (2) Conflicts of interest and financial disclosure;
- (3) Public notice and approval procedures for contracts of \$50,000 or more;
- (4) Disclosure of campaign contributions related to potential conflicts of interest;
- (5) Such other ethics rules for application to board members, officers, employees, lobbyists, lobbying firms, and contractors as deemed appropriate.

(f) The Ethics Officer shall educate, train, provide advice and seek compliance from board members, officers, applicable employees, lobbyist, lobbying firms, and Metropolitan contractors and subcontractors concerning:

- (1) The rules prescribed in Division VII;
- (2) The Political Reform Act of 1974, as amended and applicable regulations;
- (3) The conflict of interest rules of Government Code section 1090.

(g) The Ethics Officer shall investigate potential violations of ethics rules in Division VII by board members, officers, applicable staff, lobbyists, lobbying firms, and contractors consistent with the rules specified in Division VII. The Ethics Officer shall prepare status reports of pending investigations on a bi-monthly basis. The reports shall include the general nature and status of the investigation, how long the investigation has been pending, when the investigation is expected to be completed and, when completed, the resolution of the investigation.

(h) The Ethics Officer shall be the filing officer on behalf of the District to receive and file Statements of Economic Interest pursuant to the California Government Code and Section 7501 of this Administrative Code.

(i) The Ethics Officer shall have the authority to confer with the Chair of the Board and the Chair and Vice Chair of the ~~Ethics, Organization and Personnel~~CWC Committee for the purpose of seeking advice and feedback on any policy and operational matters, or feedback on investigative matters, subject to the confidentiality requirements in section 7412 of the Administrative Code.

(j) The Ethics Officer shall have the authority to obtain, and have unrestricted access to all functions, documents, records, property, personnel and other information requested as part of an Ethics Office complaint or investigation without waiving any privileges that may apply.

§ 6471. Authority to Obtain Professional Services.

(a) The Ethics Officer is authorized to contract for independent legal counsel as they deem necessary in fulfilling duties and responsibilities of the Ethics Office. The Ethics Officer may contract with one or more attorneys or law firms depending on the areas of expertise needed. The amount to be expended in fees, costs and expenses under any one contract in any one-year period shall not exceed \$100,000. The General Counsel shall review such contracts solely for consistency with Metropolitan's contract requirements. The General Counsel shall not have the authority to deny the Ethics Officer's ability to contract with any given party.

(b) The Ethics Officer is authorized to contract for professional services of outside investigators and investigation firms to conduct investigations under the Ethics Officer's purview. The amount to be expended in fees, costs, and expenses under any one contract in any one-year period shall not exceed \$250,000.

(c) The Ethics Officer is authorized to employ the services of other professional or technical consultants for advice and assistance in performing the duties assigned as may be

required or as deemed necessary, provided that the amount to be expended in fees, costs and expenses under any one contract in any one year shall not exceed \$50,000.

(d) The Ethics Officer shall inform the ~~Ethics, Organization and Personnel~~CWC Committee whenever the authority granted under this section is exercised, and shall further report quarterly on activities concerning any agreements entered into under this section. Any such contracts shall be consistent with Metropolitan contract requirements and shall be reviewed by the General Counsel.

§ 6472. Reports to ~~Ethics, Organization and Personnel Committee~~Community and Workplace Culture Committee.

(a) The Ethics Officer shall annually, in advance of the July Board meetings, submit to the ~~Ethics, Organization and Personnel~~CWC Committee a business plan for the Ethics Office containing key priorities for the coming year for review and approval.

(b) The Ethics Officer shall prepare quarterly reports to the ~~Ethics, Organization and Personnel~~CWC Committee on activities concerning agreements executed pursuant to the authority given to the Ethics Officer in Section 6471, and bi-monthly reports related to pending investigations as specified in Section 6470.

Division VII

GOVERNMENTAL ETHICS

Chapter 4

INVESTIGATION BY THE ETHICS OFFICER

Article 1

AUTHORITY TO INVESTIGATE AND JURISDICTION

§ 7405. Investigations of Directors, General Manager, General Counsel, General Auditor, or Ethics Officer.

(a) The Ethics Officer shall retain an outside counsel or investigator to conduct any investigation of alleged violations of Metropolitan ethics rules by a Director, General Manager, General Counsel or General Auditor. The investigation shall be conducted in consultation with the Ethics Officer. The Ethics Officer shall, based on the results of the investigation, make the final determination as to whether a violation has occurred. Prior to retaining the outside counsel or investigator, the Ethics Officer shall notify the ~~Ethics, Organization and Personnel~~Community and Workplace Culture (CWC) Committee Chair, unless the Chair is the subject of the investigation, in which case the Vice Chair shall be notified.

(b) The Ethics Officer shall refer to the General Counsel any complaint of alleged violations of Metropolitan ethics rules by the Ethics Officer or any member of the Office staff. The General Counsel shall retain an outside counsel or investigator to conduct the investigation in consultation with the General Counsel. The General Counsel shall, based on the results of the investigation, make the final determination as to whether a violation has occurred. Prior to retaining the outside counsel or investigator, the General Counsel shall notify the CWC Committee ~~Ethics, Organization and Personnel Committee~~ Chair.

(c) The General Counsel shall review any contract with an outside counsel or investigator to ensure compliance with Metropolitan contracting requirements.

Article 2

PROCEDURES FOR INVESTIGATIONS

§ 7411. Investigation Timeframe.

(a) Investigations shall be conducted expeditiously and completed within 180 calendar days, except as provided in subparagraph (b). An investigation commences upon the Ethics Officer's determination to open an investigation, but in no event later than 30 calendar days from receipt of the complaint or referral.

(b) For good cause, an investigation may extend beyond 180 calendar days; provided, however, the Ethics Officer shall provide written notice to the subject of the investigation with an expected completion date. The Ethics Officer shall also notify the ~~Ethics, Organization and Personnel~~ CWC Committee Chair whenever an investigation extends beyond 180 calendar days and provide periodic updates on the status of the investigation thereafter.

(c) For purposes of the 180_-calendar day period specified in this section, an investigation terminates upon service of the Ethics Officer's report upon the subject of the investigation, or upon notice of no violation given to the subject of the investigation, pursuant to section 7416.

§ 7412. Confidentiality of Investigations.

(a) Investigations by the Ethics Officer shall be confidential to the fullest extent possible.

(b) The Ethics Officer has the discretion to disclose information related to investigations for significant operational or safety reasons.

(c) The Ethics Officer shall not unnecessarily disclose the identity of the subject of a complaint, except as needed in furtherance of the investigation or otherwise provided by Article 3 of this chapter.

(d) During the investigation, the Ethics Officer shall advise the subject of the investigation, the complainant, and any witnesses of the confidentiality of the investigation.

(e) The Ethics Officer may confer with the Chair of the Board and the Chair and Vice Chair of the ~~Ethics, Organization and Personnel~~CWC Committee on any investigative matter subject to the following:

- (1) The communications shall be for the purpose of feedback.
- (2) The communications shall be confidential.
- (3) The restrictions on interference with investigations in section 7129(d).

(f) The Ethics Officer shall, to the extent possible, protect the identity of any complainant.

Division VIII

CONTRACTS/DISTRICT PROPERTY

Chapter 2

DISTRICT PROPERTY

Article 4

DISPOSITION OF REAL PROPERTY

§ 8248. Disposal of Unnecessary Improvements.

(a) The General Manager is authorized to dispose of, in the manner the General Manager deems to be in the best interest of the District, any improvements that must be removed to make land acquired for District operations suitable for District use.

(b) The General Manager shall report quarterly to the ~~Finance and Asset Management~~Finance, Affordability, Asset Management, and Efficiency (FAAME) Committee the details of any transactions during the preceding quarter in which an improvement was disposed of in such a manner as to make the improvement available for subsequent use by a party other than the District.

§ 8257. Quarterly Reports.

The General Manager shall report to the ~~Finance and Asset Management~~FAAME Committee quarterly on any real property sold pursuant to this Article.

Division II

PROCEDURES PERTAINING TO BOARD, COMMITTEES AND DIRECTORS

Chapter 2

BOARD OFFICERS

§ 2204. Delegation of Duties to Vice Chairs.

The Vice Chairs selected by the Chair shall act in the Chair's absence, failure or inability to act. The Vice Chairs shall have ex officio membership and may vote to break a tie and maintain a quorum. If the committee Chair and Vice Chair(s) of the committee are not present in person the Vice Chair may preside over the meeting.

Chapter 3

RULES GOVERNING COMMITTEES

§ 2310. Ad Hoc Committees.

Ad Hoc Committees may be created by the Board to undertake special assignments on behalf of the Board. An ad hoc committee shall exist for a specified term or until its special assignments are completed, whichever comes first, but its existence may be extended for an added term or added assignments by action of the Board. Unless otherwise specified, members of an ad hoc committee shall be appointed by the Chair of the Board and shall serve at the Chair's pleasure. Ad Hoc Committees shall provide reports to the Executive Committee as well as committees where the subjects are relevant.

Article 1**GENERAL**

Sec.

2400. Identification of Standing Committees

2401. Officers and Members of Standing Committees

2402. Regular Meetings

§ 2400. Identification of Standing Committees.

The Standing Committees of the Board of Directors are:

- Executive Committee (EXEC)
- Audit Committee
- Engineering, Operations and Technology Committee (EOT)
- Finance, Affordability, Asset Management, and Efficiency Committee (FAAME)
- Legal and Claims Committee (LC)
- Legislation and Communications Committee (LEG)
- Organization, Personnel and Effectiveness Committee (OPE)
- One Water and Adaptation Committee (OWA)
- Community and Workplace Culture Committee (CWC)

§ 2401. Officers and Members of Standing Committees.

(a) Members, Chair, and Vice Chairs of standing committees with the exception of the Executive Committee shall be appointed subject to the approval of the Executive Committee and the Board on the basis that each director, with the exception of the Chair of the Board, serve on at least one standing committees, in addition to the Executive Committee. Such appointment shall be made by the Chair of the Board unless a new Chair-elect has been selected by the Board to take office on the next January 1, in which event appointment of Chair and Vice-Chairs of standing committees shall be made by the Chair-elect.

(b) Chair and Vice Chairs of standing committees with the exception of the Executive Committee are to be appointed in even-numbered years at the December meeting of the Board for a two-year term commencing on January 1 of odd-numbered years. No director shall be appointed to the same committee office for more than two consecutive full terms and a partial term immediately prior to the first term.

(c) The Chair of the Board or the Vice Chair acting in the Chair's absence per Section 2204, is a member ex-officio, with right to vote, of all standing committees, subcommittees, and special committees of the Board. However, the Chair (or the Vice Chair) shall not be considered a member of any committee of which the officer is a member ex-officio for the purpose of determining whether a quorum of the committee is present unless the Chair or Vice Chair is actually present at the meeting of the committee.

(d) The committee Chair's duties include presiding over meetings of the committee, with the exception that the committee may, by a majority vote, overrule parliamentary rulings of the Chair. Any Vice Chair of that committee may serve as the alternate presiding officer of committee meetings when the committee Chair is absent.

§ 2402. Regular Meetings.

The regular meetings of standing committees shall be held on the Monday preceding regular board meetings or on the second or fourth Tuesday of each month. The Audit Committee shall meet on a quarterly basis. If a scheduled meeting falls on a holiday designated in Section 1106, the meeting will be rescheduled to the next business day unless the Board selects an alternative date. Staff will adjust its schedule accordingly.

Article 2

EXECUTIVE COMMITTEE

§ 2410. Membership.

The Executive Committee shall consist of the Chair, Vice Chairs of the Board, Secretary, all past Chairs of the Board who are directors of the District, and the Chairs of the standing committees in addition to the Executive Committee, and four (4) additional directors as nonofficer members. In the absence of a committee Chair, a committee's Vice Chair shall serve as the alternate on the Executive Committee for the absent committee Chair.

§ 2416. Duties and Functions. [Executive Committee]

(a) The Executive Committee shall study, advise, and make recommendations with regard to:

(1) Public information for governmental and other entities and officials, and for the citizens of California regarding matters affecting the District's interests;

(2) Official dealings with the United States Government, the State of California or other states, member public agencies or their sub-agencies, foreign governments and other entities or persons in matters of public policy or other activities as deemed appropriate;

(3) Policies and procedures to be considered by the Board or committees thereof, except for policy matters within the jurisdiction of a specific standing committee;

(4) Matters relating to the Colorado River Board of California;

(5) Major policy issues to be considered by the Board, including proposed amendments to the Metropolitan Water District Act;

(6) Questions raised by the officers and staff in intervals between meetings of the Board and in unexpected situations and emergencies.

(7) The terms and conditions of employment of all consultants and advisors not within the jurisdiction of other committees;

(8) Resolution of conflicting committee recommendations pursuant to Section 2314;

(9) The progress of, and propose modifications to, the Board's goals in light of then existing and projected future conditions; and

(10) Such other matters as may be required by Division II of this Code.

(b) The Executive Committee shall:

(1) Review and approve board and committee agendas and, notwithstanding the jurisdiction of the other standing committees in the Code, have the authority to direct which committee shall consider an item;

(2) Review and approve the scheduling of board and committee meetings;

(3) Be responsible for the oversight and management of the organization including, but not limited to, the form of the District's organization and the flow of the authority and responsibility. This includes monitoring and overseeing the duties and responsibilities of management; and

(4) Consider the effectiveness of the District's internal control system, including information technology security and control.

(c) The Executive Committee shall retain ultimate responsibility for those duties as are specifically assigned to the subcommittees of the Executive Committee.

(d) The Executive Committee shall be responsible for reviewing and approving the annual business plan containing the General Manager's key priorities for the coming year.

(e) As part of the Department Head annual evaluation process, the Executive Committee shall be responsible for engaging in periodic performance expectations discussions, including progress checks, with the General Manager.

(f) The Executive Committee shall also:

(1) Act on behalf of the Board in unexpected situations and emergencies, subject to subsequent approval or ratification of the actions taken whenever such approval or ratification is required by law.

(2) Provide policy guidance where appropriate to those directors and District staff members who are associated with organizations in which the District has membership.

(3) Conduct hearings on appeals of protest denials involving Purchasing Contracts and Professional and Technical Services Contracts pursuant to Section 8150(b).

(i) Hearings shall be held by the committee at its next regular meeting to be held at least 72 hours after the filing of the notice of appeal of the General Manager's determination under Section 8150(b). The decision of the committee shall be final unless the committee chooses to refer the notice of protest to the Board.

(ii) The Chair of the Executive Committee may re-delegate duties provided for under subparagraph (i) above to a minimum of three members of the Executive Committee who shall act in place of the committee.

(4) Resolve disputes over inspection dates and monitor conduct of inspection trips to assure maximum effectiveness.

(5) Address substantiated allegations of discrimination, harassment, and retaliation against directors, the General Manager, General Counsel, General Auditor, and Ethics Officer:

(i) The Executive Committee shall create an ad hoc subcommittee of three members and two alternates that will serve for a period of one year to address substantiated findings of violations determined as a result of Equal Employment Opportunity (EEO) investigations conducted for alleged violations of Section 2131 made against a director and for alleged violations of Section 6305 made against the General Manager, General Counsel, General Auditor, or Ethics Officer. If any director serving on the three-member subcommittee is an involved party to an EEO investigation, or has a conflict of interest with any involved party, the conflicted director shall recuse themselves from the matter. The Chief EEO Officer (EEO Officer) will select an alternate director to fulfill all subcommittee duties related to the particular matter. If the EEO Officer has a conflict of interest in the same matter, the Ethics Officer and/or General Counsel will select an alternate director. Directors serving as alternates will not participate in ad hoc committee matters unless or until called to serve.

(ii) The Executive Committee will also select an external law firm to serve as counsel to the ad hoc subcommittee to provide guidance, as needed, for post investigation actions.

(iii) The ad hoc subcommittee shall delegate to the EEO Officer the responsibility to designate an external investigator to conduct a fact-finding EEO investigation pursuant to this section. ALL EEO investigations will be fair,

impartial, timely, and promptly initiated and completed by qualified personnel. Detailed EEO investigative procedures, pursuant to this section can be found in *EEO Investigative Procedures for the Board and its Direct Reports*. The EEO Officer shall refer substantiated findings of EEO investigations to the ad hoc subcommittee to determine recommended appropriate action. At its discretion, the ad hoc subcommittee may consult with the EEO Officer, Ethics Officer, and/or General Counsel on appropriate action regarding a director or department head. The ad hoc subcommittee shall report a substantiated finding of an EEO violation by a director or department head and recommend appropriate action for the Board's consideration. Appropriate action for directors may include, but is not limited to, counseling, training, a private warning letter, public censure, temporary or permanent removal from committee assignments, or referral to the Director's appointing authority requesting appropriate action. Appropriate action for department heads may include, but is not limited to, counseling, training, performance review, or the imposition of discipline, as deemed appropriate under the circumstances.

(iv) When the General Manager is a party to the complaint or when in the judgment of the EEO Officer that matter should be handled differently to avoid real or perceived conflicts of interest, or to avoid potential bias or threats to impartiality, the EEO Officer shall delegate to the Ethics Officer the responsibility to retain an external investigator to conduct a fact-finding EEO investigation pursuant to this section. If the Ethics Officer has a conflict of interest in the particular case, the EEO Officer would delegate to the General Counsel the responsibility to retain an external investigator to conduct a fact-finding investigation pursuant to this section. Substantiated EEO findings under this subsection shall be referred directly to the ad hoc subcommittee to determine recommended appropriate action for the Board's consideration.

(v) A deviation of this investigation protocol by the EEO Officer may occur, in certain circumstances, with a written justification and approval of the ad hoc subcommittee responsible for EEO investigations of directors and department heads

(vi) On a quarterly basis, the Chief EEO Officer will report to the Executive Committee EEO case statistics regarding EEO complaints filed against the Board and its direct reports.

Article 3

AUDIT COMMITTEE

§ 2420. Day of Regular Meeting

The regular meetings of the Audit Committee shall be held on a quarterly basis in the months of March, June, September and December.

§ 2421. Duties and Functions

The Audit Committee shall study, advise, and make recommendations with regard to:

- (a) All reports of the General Auditor and external auditors, including the audited financial statements of the District;
- (b) The Audit Department's annual business plan and biennial budget;
- (c) Requests from other committees of the Board and individual Board members for audits and review not included in the Audit Department's annual business plan.
- (d) Monitor and oversee the duties and responsibilities of the Audit Department and the external auditors as those duties and responsibilities relate to the effectiveness of the District's internal control system.
- (e) Review and approve, in advance of the July Board meeting, the Audit Department annual business plan containing the key priorities of the General Auditor and the Audit Department.
- (f) As part of the Department Head annual evaluation process, be responsible for engaging in periodic performance expectations discussions, including progress checks, with the General Auditor.
- (g) Monitor compliance with the recommendations of the California State Audit (April 2022).

2441. Duties and Functions

§ 2440. Day of Regular Meetings.

The regular meetings of the Finance, Affordability, Asset Management, and Efficiency (FAAME) Committee shall be held on the Monday preceding regular board meetings or on the second or fourth Tuesday of each month.

§ 2441. Duties and Functions.

The Finance and Asset Management Committee shall study, advise and make recommendations with regard to:

- (a) Preparation of budgets;
- (b) Policies and procedures related to budget development and cost containment;
- (c) Sale of bonds and borrowing and repayment of money;
- (d) Disposition and investment of funds;
- (e) Authorization of appropriations, except appropriations for capital projects;
- (f) The determination of revenues to be obtained through water transactions, including, but not limited to, sales, exchanges, and wheeling of water, water standby or availability of service charges, and the levying of taxes;
- (g) The financial impact and requirements of policies concerning annexation;
- (h) The financial aspects of the District's risk management program;
- (i) Questions pertaining to insurance coverage and self-insurance;
- (j) The selection of financial and insurance consultants and the determination of the scope of their assignments;
- (k) Form and contents of accounts, financial reports, and financial statements;
- (l) Proposed amendments to the Metropolitan Water District Act affecting the finance and asset management functions of the District;

(m) Goals and objectives related to financial planning for Metropolitan, including but not limited to revenues, operating expenses, reserve policies, internally funded construction, debt management, investments and capital financing strategies;

(n) The prices and conditions governing water transactions, including, but not limited to, sales, exchanges, and wheeling sales of water;

(o) Costs and accounting procedures relating to the District's and other state water service contracts;

(p) Policies regarding water transactions, including, but not limited to, the sale, exchange, and wheeling of water for various uses;

(q) Policies regarding allocation of water standby or availability of service revenue requirements among member public agencies;

(r) Water standby or availability of service charges within the District;

(s) Determinations by the General Manager with respect to appeals concerning charges for water service, including readiness-to-serve charges and capacity charges, and report its recommendations, as appropriate, to affirm or reverse the General Manager's determinations;

(t) Appeals from determinations by the General Manager to deny or qualify an application for exemption from the water standby charge, and report its recommendations, as appropriate, to affirm or reverse the General Manager's determinations;

(u) The purchase, management and disposition of personal property assets such as equipment and vehicles;

(v) Facility master plans, including budgeting for capital improvements and long-term facilities commitments;

(w) Proposed rules and proposals regarding business development opportunities for real property;

(x) Policies for the acquisition of rights-of-way;

(y) The purchase, sale, and leasing of land and buildings, including the District's various office and garage space needs;

(z) The incidental use of land in farming operations and otherwise;

(aa) The operation and maintenance of buildings;

(bb) The development, oversight, and coordination of recreational facilities at Diamond Valley Lake and Lake Skinner;

(cc) The use of proceeds from the sale or disposition of surplus property related to Diamond Valley Lake and Lake Skinner for recreational purposes;

(dd) Annexations and annexation policies including the requirements, procedures, terms and conditions for annexation.

Article 6

LEGAL AND CLAIMS COMMITTEE

Sec.

2450. Day of Regular Meetings

2451. Duties and Functions

§ 2450. Day of Regular Meeting.

The regular meetings of the Legal and Claims Committee (LC) shall be held on the Monday preceding regular board meetings or on the second or fourth Tuesday of each month.

Article 7

THE LEGISLATION AND COMMUNICATIONS COMMITTEE

Sec.

2460. Day of Regular Meeting

2461. Duties and Functions

2462. Vice Chairs.

§ 2460. Day of Regular Meeting.

The regular meetings of the Legislation and Communications (LEG) Committee shall be on the Monday preceding regular board meetings or on the second or fourth Tuesday of each month.

§ 2461. Duties and Functions.

The Legislation and Communications Committee shall study, advise and make recommendations to the Board with regard to:

(a) Proposals of the General Manager, other committees, and board members concerning State and Federal legislation or amendments thereto, that may affect the District;

(b) Recommendations for new legislation identified by members of the Board or the General Manager;

(c) Opportunities for members of the Board to assist in outreach activities, including efforts to inform members of the Legislature or the Congress of the District's position with regard to proposed legislation;

(d) The effectiveness of legislative and administrative advocacy efforts by staff and members of the Board;

(e) The development and implementation of Directors' inspection trips, including the expectations and goals for these trips;

(f) The development and implementation of school education programs, including the expectations and goals for these programs;

(g) The effectiveness of Metropolitan's external affairs programs and general communications efforts directed at member agencies and the general public; and

(h) The selection of public information consultants and the scope of their assignments.

§ 2462. Vice-Chairs.

The Board Chair shall designate two Vice Chairs for the committee, one to preside over legislative affairs, the other over communications matters.

Article 8

ORGANIZATION, PERSONNEL AND EFFECTIVENESS COMMITTEE

Sec.

2470. Day of Regular Meeting

2471. Duties and Functions

§ 2470. Day of Regular Meeting.

The regular meetings of the Organization, Personnel and Effectiveness (OPE) Committee shall be held on the Monday preceding regular board meetings or on the second or fourth Tuesday of each month.

§ 2471. Duties and Functions.

The OPE Committee shall study, advise and make recommendations with regard to:

(a) The form of the District's organization and the flow of authority and responsibility;

(b) Periodic independent reviews and studies of the organization, classification of positions, job duties, salaries, and salary ranges;

(c) Relations between the District and its employees, including all matters affecting wage, hours, pension plans and other employee benefits, and other terms and conditions of employment, as well as the district's negotiation of such matters with employee bargaining units and selection of negotiators;

(d) Areas of special concern to the District and its employees, including, but not limited to work rules pertaining to the health and safety of employees;

(e) Policies and rules regarding employment, discipline and discharge of District officers and employees;

(f) Proposed amendments to the Metropolitan Water District Act and Administrative Code affecting contract procedures and policies, the organization and personnel policies of the District and to the Public Employees' Retirement Law;

(g) Information technology strategies, projects and activities, including information technology asset management and the budgeting and tracking of information technology resources; and

(h) Oversight of workforce training programs, including strategic planning, needs assessment, program design and development, and metric-based evaluation.

(i) Recruitment of top-tier talent throughout the District and securing leaders with exceptional skills, qualities, and abilities.

(j) Policies and procedures concerning District personnel matters.

Article 9

ONE WATER AND ADAPTATION COMMITTEE

Sec.

2480. Day of Regular Meeting

2481. Duties and Functions

§ 2480. Day of Regular Meeting

The regular meetings of the One Water and Adaptation Committee (OWA) shall be held on the Monday preceding regular board meetings or on the second or fourth Tuesday of each month.

§ 2481. Duties and Functions

The OWA Committee shall have oversight over the planning, prioritization, and funding of any current or future regional demand management or any regional or local supply projects within the Metropolitan service area receiving funding from Metropolitan, such as the Regional

Recycling Project and local projects funded through Metropolitan's Local Resources Program. The committee shall review and consider:

(a) Establishing policies and programs regarding water conservation and reuse, watershed management, storm water capture and management, recycling, sustainable groundwater management and protection, underground storage, and use thereof;

(b) Seawater desalination, recycling and reuse, and brackish water issues in Metropolitan's service area, and use thereof;

(c) Overseeing development and implementation of Metropolitan's Local Resources Program and Conservation Program and other efforts to meet local supply and water use efficiency goals;

(d) The effect of existing and proposed federal, state and local environmental, water supply and water management statutes and regulations on supplies produced or that may be produced within the District's region;

(e) Recommendations for comprehensive solutions to regional supply problems with the intent to increase water reliability, cost effectiveness, and environmental benefit;

(f) Expanding Metropolitan's understanding of regional water supply issues by inviting informational presentations and feedback from external representatives;

(g) Recommendations to the Board on policies and programs that will strengthen relationships with other agencies in furthering Metropolitan's objectives for increased regional self-reliance and greater water use efficiency;

(h) Creating opportunities for collaboration to advance the development of local supplies and achieving greater water use efficiency;

(i) Coordinating and aligning new water supplies, local resources projects and programs, and investments with other Metropolitan strategic priorities and initiatives;

(j) Developing criteria for the prioritization of investments in new water supplies;

(k) Policies, sources, and means of importing and distributing water, transferring water, and wheeling water as required by the District;

(l) Policies and procedures regarding the delivery and exchange of water for various uses;

(m) Metropolitan Water Supply Planning including the Integrated Resources Planning Process and completion of the Urban Water Management Plan and related policies; and

(n) Environmental compliance and requirements, and informing the technical aspects and science factors in providing comments to regulatory agencies and legislation affecting the regulation of water supply operational facilities and the conditions that they operate under.

Article 10

COMMUNITY AND WORKPLACE CULTURE COMMITTEE

Sec.

2490 Day of Regular Meeting

2491 Duties and Functions

§ 2490. Day of Regular Meeting

The regular meetings of the Community and Workplace Culture (CWC) Committee shall be held on the Monday preceding regular board meetings on the second or fourth Tuesday of each month.

§ 2491 Duties and Functions

The CWC Committee shall study, advise and make recommendations, as follows:

(a) With regards to ethics matters:

(1) Periodic performance expectations discussions, including progress checks, with the Ethics Officer.

(2) Monitoring and overseeing the duties and responsibilities of the Ethics Officer to ensure the independence of the Ethics Officer.

(3) Receive and review bi-monthly status reports of pending investigations by the Ethics Officer. The reports shall include the general nature and status of the investigation, how long the investigation has been pending, when the investigation is expected to be completed and, when completed, resolution of the investigation.

(4) Receive and review quarterly reports from the Ethics Officer on any engagement of professional and technical consultants.

(5) Review and approval of the business plan containing the key priorities for the coming year for the Ethics Office. It shall review and approve the business plan in advance of the July Board meeting.

(b) With respect to matters of equal employment opportunity and of diversity, equity and inclusion:

(1) Direct and receive reports from, and be the home committee for Metropolitan's Diversity, Equity and Inclusion Officer, and Metropolitan's Chief Equal Employment Opportunity Officer;

(2) Receive input, policy and procedure recommendations from the Diversity, Equity and Inclusion Officer;

(3) Study diversity, equity, and inclusion issues within Metropolitan to recommend ways to enhance and promote equal opportunity, affirmative action, increased diversity of the workforce and a culture of inclusion within Metropolitan;

(4) Monitor performance of efforts to promote workforce development programs, including training and advancement opportunities at Metropolitan to increase diversity, equity and inclusion within Metropolitan and benefit the communities within Metropolitan's service area; and

(5) Study areas of special concern to the District and its employees, including, but not limited to, equal employment opportunity and affirmative action.

(6) Study, advise and make recommendations on the ways the District can:

(i) Better serve the disadvantaged and underserved communities within Metropolitan's service area, and mitigate issues of affordability;

(ii) Improve the access of disadvantaged and underserved communities to reliable, high-quality drinking water supplies;

(iii) Increase participation of currently underserved communities in Metropolitan's rebate, conservation, and other local resources programs; and

(iv) Assist and support member agency programs and advocate for underserved communities, including providing communications, operational and technical assistance, with focus on consumer confidence in drinking water.

(7) Monitor Metropolitan's compliance with laws governing equal opportunities and employment and the manner in which investigations are conducted in compliance with such laws.

Division IV

WATER SERVICE POLICIES

Chapter 3

WATER TRANSACTIONS REVENUE

§ 4304. Apportionment of Revenues and Setting of Water Rates.

(a) Not later than at its February meeting the General Manager shall present to the Finance, Affordability, Asset Management, and Efficiency (FAAME) Committee of the Board:

(1) Determinations of the revenue requirements and cost of service analysis supporting the rates and charges required during the biennial period beginning the following July 1, as determined by the General Manager in accordance with current Board policies, and,

(2) Recommendations of rates including, but not limited to, the System Access Rate, Water Stewardship Rate, System Power Rate, Treatment Surcharge, and the Supply Rates for the various classes of water service to become effective each January 1 of the biennial period. These recommended rates shall be the General Manager's determination, made in accordance with current Board policies, of the rates necessary to produce substantially the revenues to be derived from water transactions, including, but not limited to, sales, exchanges, and wheeling, during the biennial period beginning the following July 1.

(b) Not later than at its February meeting, the General Manager shall also present to the FAAME Committee recommendations regarding the continuation of a water standby charge or the imposition of an availability of service charge (such as the readiness-to-serve charge and capacity charge), which shall be the General Manager's determination, made in accordance with current Board policies, of the charge necessary to produce substantially the revenues to be derived from fixed revenue sources, if any, exclusive of taxes, during the biennial period beginning the following July 1 which said committee has determined to be necessary.

(c) Not later than its February meeting the FAAME Committee shall set a time or times for, and shall thereafter hold, one or more meetings of said committee, to be held prior to its regular April meeting, at which interested parties may present their views regarding the proposed water rates and availability of service charges to the committee. The committee shall direct the General Manager to cause the publication of a notice of such public hearing to be published in newspapers of general circulation within the District's service area. Such notice shall be published not less than 10 days prior to the public hearing.

(d) Not later than its regular April meeting the FAAME Committee shall make its determination regarding the revenue requirement to be paid from water rates and the water rates to become effective each January 1 of the biennial period and shall recommend said water rates to the Board no later than the Board's regular April meeting.

(e) Not later than its April meeting, the Board shall establish water rates for deliveries beginning each January 1 of the biennial period.

(f) Proposals for changes in water rates to become effective at times other than on January 1 shall require adequate notice to the public and a hearing before such proposals are

acted upon by the Board, unless the Board finds that an immediate change in water rates is urgent.

§ 4305. Setting of Charges to Raise Fixed Revenue.

(a) Not later than its regular May meeting each year, the FAAME Committee shall make its final determination regarding the water standby charge or other fixed revenue charge, if any, for the fiscal year beginning the following July 1, and shall recommend such charge, if any, to the Board at its regular May meeting.

(b) Not later than such May meeting, the Board shall consider and take action upon the recommendations, if any, of the FAAME committee regarding a fixed revenue source, exclusive of taxes, to become effective the following January 1 or for the fiscal year beginning the following July 1, as determined by the Board for each fixed revenue source.

Chapter 5

WATER SERVICE REGULATIONS - GENERAL

§ 4507. Billing and Payment for Water Deliveries.

(a) **Timeframe for Billing and Payment.** Except as noted herein below, invoices shall be mailed electronically, or, if requested by the member agency, by hardcopy via United States mail, not later than the tenth day of the month following delivery to a member public agency. Each such invoice shall indicate the date of mailing and the date on which the payment thereunder becomes delinquent and shall show the total amount of water delivered for each class of service, the charges for water sold and delivered for each class, the readiness-to-serve and capacity charges, as applicable, and the total amount due and owing, all as determined by the General Manager. Payment of the amount shown on any such invoice shall be due on the last business day of that month and shall be delinquent if not received by the Treasurer of the District before the close of crediting activity on the last business day of the first month following such date of mailing. When making any such payment the member public agency shall specify the invoice or invoices to which the payment shall be credited by the District.

(1) For purposes of Section 4507(a), "business day" shall mean any day other than a Saturday, a Sunday, or a Holiday (as defined in Section 1106).

(2) For purposes of Section 4507(a), "received by the Treasurer of the District" shall mean receipt either (1) in the office of the Treasurer or (2) by crediting pursuant to advance agreement with the Treasurer to the District's general demand account at the District's principal depository bank, in such form that the funds are immediately available for investment or other use or disposal by the District.

(3) For purposes of Section 4507(a), "crediting activity" shall mean either (1) 2:00 p.m. if payment is delivered to the office of the Treasurer, or (2) the cutoff time for crediting by the District's principal depository bank of that day's transactions if payment is initiated by wire

transfer, automated clearinghouse transfer, interbranch transfer, direct deposit, or by other means pursuant to advance agreement with the Treasurer.

If, under advance agreement with the Treasurer, a member agency has authorized payment of any invoice by automated clearinghouse transfer initiated by the Treasurer, the Treasurer shall initiate such transfer for processing two business days prior to the business day on which such payment shall be delinquent. Failure of such transfer shall not relieve such member agency from liability for such payment or charges in the event such payment should become delinquent, except as specifically provided under advance agreement with the Treasurer.

(b) Full Service and Emergency Storage Program Facility. In cases where water through a particular facility is delivered during any month for full service or Emergency Storage Program Service, the bill for water delivered in such month will be prepared by applying the rates for water sold and delivered in full service to the total quantity of water delivered. If the member public agency desires to receive credit for water used in Emergency Storage Program Service, the facts concerning the quantities of water so used must be certified to the District via the District's electronic certification and billing system by an authorized user for the member public agency purchasing such water as provided for in Section 4507 (c). The amount of such credits shall be based on the difference in water rates in effect at the time the water is used.

(c) Late Certifications. Based on available information, the District will notify a member agency for any certification that it has not received, if known, three months from the end of the month for which the agency would normally certify. No certification received after six months following the end of any month in which such a credit is claimed will be accepted. Certifications must be received by Metropolitan before 3:30 p.m. on the third working day after the end of the month to receive credit for any preceding month on the next bill, subject to the provisions with respect to late certifications in this Section. This Section applies to all cases where a certification is required to receive a credit, whether or not specifically named in this Section, unless otherwise provided by this Code.

(d) Determination by General Manager as to Type of Delivery. In the event the respective quantities of water sold and delivered in any month on order of any member public agency for use therein in any water program or contract requiring certification, are not determinable to the satisfaction of the General Manager in time for preparing regular monthly bills, then billing and payment for all water sold and delivered in such month to such member public agency shall be made at the rates prescribed for water used in full service in Section 4401(a)(1) hereof. Upon the determination by the General Manager of the correct quantities of water sold and delivered and used in any water program or contract requiring certification, any adjustment which is necessary to give effect to the applicable credit for the water used in any water program or contract requiring certification, shall be made by application of credits on subsequent purchases of water from the District by such member public agency. Such adjustments shall not be made in cases where a claim for the applicable credit is not submitted within the period provided in Section 4507(c).

(e) Obligation to Pay for Appropriate Class of Service. If water has been sold and delivered at the rates prescribed for water sold in any water program or contract and appropriate

certifications have been submitted for the water so used, but the water has in fact been used in full service or another class of service, the member public agency shall be obligated to pay the difference between the rates prescribed for water sold for the applicable water program or contract and the rates prescribed for the class of service actually used.

(f) Submission of Documentation by Member Agency. With respect to water sold and delivered at the rates prescribed for water sold under water programs or contract (unless otherwise specified in an agreement with the District), original documentation supporting the use of such water as certified must be submitted no later than December 31 following the end of the fiscal year for which a certification is submitted, unless otherwise specified in an agreement with the District. If the documentation is not submitted by December 31 following the end of the fiscal year for which a certification was submitted, an agency will receive a late penalty of \$2,500. If the agency does not submit documentation by February 28/29 following the end of the fiscal year for which a certification was submitted, it shall be conclusively presumed that:

(1) The water sold from the District was used for full service, and the District's next monthly billing shall reflect such adjustment; or

(2) The yield was not produced as certified and the District's next monthly billing shall reflect such adjustment.

This provision will apply individually to each program or agreement that an agency or sub-agency participates in separately.

(g) Review Process. With respect to water sold and delivered at the rates prescribed for water sold under water programs or contract (unless otherwise specified in an agreement with the District) the District will complete its review within twelve months from date of receipt of the original supporting documentation.

(1) Should the District not complete its review within twelve months of the submittal of all source documentation, the review will be considered complete and the certifications final.

(2) When the review is completed, the District will notify the member agency of its initial findings for its comments. The member agency will provide its comments within 60 days. Metropolitan staff and the agency will work together to reconcile any differences.

(3) If the member agency and Metropolitan staff cannot reconcile the differences, Metropolitan's Water System Operations' Group Manager has the responsibility to consult with the member agency and make a final ruling, subject to the General Manager's oversight. If the ruling is unsatisfactory to the agency, it can be appealed to Metropolitan's Finance, Affordability, Asset Management, and Efficiency Committee.

(4) If the member agency does not provide further documentation correcting Metropolitan staff findings within the 60-day comment period as specified in (g) (2), then

it shall be conclusively presumed that the District's findings are correct and the District's next monthly billing shall reflect such adjustment.

(h) **Discovery of Mistakes or Errors.** In the event a mistake or error is discovered in a District water sales record, the General Manager shall initiate appropriate corrective action. No mistake or error made more than three years prior to its discovery shall be corrected unless otherwise specified in an agreement with the District. In the event a mistake or error is discovered by a member agency in its water sales record or certifications, no mistake or error made more than three years prior to its discovery shall be corrected unless otherwise specified in an agreement with the District.

(1) A District water sales record shall include a water billing invoice, or district invoice for other water-related charges.

(2) If the District finds the mistake or error, the discovery of the mistake or error shall be documented in writing to the member agency. The date of discovery for corrective action purposes shall be the date notice is sent to the member agency.

(3) If the member agency discovers the mistake or error, the discovery of the mistake or error shall be documented in writing to the District by either a revised certification form or letter, whichever is applicable. The date of discovery for corrective action purposes shall be the date the certification or letter is received by the District.

(4) If an incorrect invoice has been issued to a member public agency, the General Manager shall notify the affected agency of any adjustment and the manner of making any required credit or charge, neither of which shall bear interest.

(5) Mistakes or errors shall also include but are not limited to mistakes or errors in metering or recording deliveries to member agencies, entry or calculation errors in fixed charges, discovery of errors in either a member agency or sub-agency submitted certification(s), or processing of a certification(s) for the Local Projects Program, the Local Resources Program, the Groundwater Recovery Program, Conservation Credit Program, or any other water management program or storage programs or agreements unless specified otherwise in the contract.

(6) Any mistakes or error for a fiscal year period that is less than five acre-feet cumulative by agency or sub-agency, by program or agreement, shall be waived.

(i) **Rate Change.** In the event that deliveries of water are made by the District to member public agencies over a billing period during which the District's water rates change, the General Manager may cause the meters recording deliveries of water during such period to be read at the end of the period and the statement of charges for such deliveries of water may be based on a proration between the previous and new water rates for the periods of time during which each were in effect as determined by the General Manager.

Division V

FINANCIAL MATTERS

Chapter 1

ADMINISTRATIVE MATTERS

§ 5104. Payment After Loss of Bond Interest Coupon.

(a) The Treasurer of the District is authorized to effectuate payment, without action of the Board, of a claim arising from the loss of a bond interest coupon that has been detached from a District bond or from the destruction of a bond interest coupon at any time after the date of its maturity, and the Treasurer has received:

(1) An affidavit or affidavits establishing the ownership of the coupon and reciting therein the circumstances under which it was lost or destroyed; and

(2) An indemnity bond in a penal sum which is at least the amount of the claim, said sum being specifically stated in said bond, said bond to be approved by the General Counsel and then filed with the Treasurer. The indemnity bond must include a rider substantially in the form hereinafter set forth:

(i) Rider.

This Rider is attached to and is a part of the Bond of Indemnity executed by the (enter name of insurance company) respecting the loss of coupons due coupons at \$ per coupon - total \$, detached from \$ Bonds of THE METROPOLITAN WATER DISTRICT OF SOUTHERN CALIFORNIA, numbered to , %, maturing , at \$ each bond in bearer form.

It is understood and agreed that in the event the balance in the coupon account respecting the above-described issue of bonds, maintained by the Treasurer of said District, should hereafter not be sufficient as a result of the payment of coupon(s) to provide for outstanding unpaid coupons, (enter name of insurance company) will reimburse The Metropolitan Water District of Southern California, up to the face amount of the coupon(s) paid under this indemnity contingent upon presentation by said District of (a) evidence that said District has paid the afore-described coupon(s) or (b) a certificate from the Treasurer of said District that there is a deficiency in said coupon account balance.

It is understood that within the first year after the due date of the afore-described coupon(s) that (enter name of insurance company) may request that the Treasurer of said District search the District's records to

ascertain if in fact the afore-described coupon(s) have been paid, but any such request shall only be honored by said Treasurer upon payment by (enter name of insurance company) of any fee required by said Treasurer to cover costs of such search.

Executed this day of , 20 .

(enter name of insurance company)

(b) The Treasurer shall report to the Finance, Affordability, Asset Management, and Efficiency Committee all payments made pursuant to this Section 5104.

§ 5105. Lost or Destroyed Bonds.

(a) The Treasurer of the District is authorized to issue a new District bond or bonds similar to the original to replace it if the Treasurer has received:

(1) Proof satisfactory to the Treasurer that the bond has been lost or destroyed; and

(2) Security approved by the Treasurer and the General Counsel from the owner indemnifying the District against any loss incurred on account of the bond, such security to be equal to the principal amount of the bond and plus the aggregate amount of any attached interest coupons; and

(3) The costs for issuance of the new bond.

(b) The Treasurer shall report to the FAAME Committee of the Board all issuances of duplicate bonds made pursuant to this Section 5105.

§ 5107. Biennial Budget Process.

(a) There shall be prepared each even-numbered year, under the direction of the General Manager, a proposed biennial budget covering District operations for the following two fiscal years. The proposed biennial budget shall be submitted to the Board no later than the date of the regular Board meeting in June immediately preceding the first fiscal year of the biennium to which the budget applies. The proposed biennial budget shall indicate by fund all anticipated expenses and required reserves and the source of revenues to be used to meet such expenses and provide such reserves. The proposed biennial budget will at a minimum include a five-year financial forecast. At least one Board Workshop on the proposed biennial budget will be conducted prior to submission of the proposed biennial budget for Board approval. The FAAME Committee shall review the proposed biennial budget in its entirety, together with the recommendations from the Board workshop, and report its recommendations to the Board.

(b) After considering the proposed biennial budget and making any revisions thereto that it may deem advisable, the Board shall adopt the biennial budget before the beginning of the

biennial period to which the budget applies. The amounts provided in the adopted budget for the biennial period for total expenses for operations and maintenance, including minimum and variable operations and maintenance charges under water or power contracts with the State, for capital charges under such contracts, and for debt service shall be deemed to be appropriated from the funds indicated in the budget.

(c) The adoption of the budget shall have no effect upon appropriations for capital projects and continuing expenditures not susceptible to immediate direct allocation, as described in Section 5108 hereof, and shall not establish any limitations on expenditures for such purposes.

(d) The total operations and maintenance budget shall be measured against the regional rate of inflation as measured by the five-year rolling average change in the Consumer Price Index (CPI) for the Los Angeles-Riverside-range County area, not seasonally adjusted, for all items as reported by the U. S. Bureau of Labor Statistics. The budget will include explanations of increases greater than the CPI due to unique conditions, growth or expansion of services.

Chapter 3

SHORT-TERM REVENUE CERTIFICATES

§ 5305. Report of Exercise of Authority.

The General Manager shall report to the next following meeting of the Finance, Affordability, Asset Management, and Efficiency Committee of the Board any exercise of authority pursuant to this Chapter.

Division VI

PERSONNEL MATTERS

Chapter 1

EMPLOYEE RELATIONS

Article 2

REPRESENTATION PROCEEDINGS

§ 6113. Appeals.

(a) An employee organization aggrieved by an appropriate unit determination of the Employee Relations Officer; or an employee organization aggrieved by a determination of the Employee Relations Officer that a Recognition Petition (Section 6105), Challenging Petition (Section 6107), Decertification Petition (Section 6109), Unit Modification Petition (Section 6111) --- or employees aggrieved by a determination of the Employee Relations Officer that a Decertification Petition (Section 6109) --- has not been filed in compliance with the

applicable provisions of this Article, may, within twenty (20) days of notice of the Employee Relations Officer's final decision request to submit the matter to mediation by the State Mediation and Conciliation Service, or may, in lieu thereof or thereafter, appeal such determination to the Organization, Personnel and Effectiveness (OPE) Committee for final decision within fifteen (15) days of notice of the Employee Relations Officer's determination or the termination of mediation proceedings, whichever is later.

(b) Appeals to the OPE Committee shall be filed in writing with the Board's Executive Secretary, and a copy thereof served on the Employee Relations Officer. The said committee shall commence to consider the matter within thirty (30) days of the filing of the appeal. The committee may, in its discretion, refer the dispute to a third-party hearing process. Any decision of the committee on the use of such procedures, and/or any decision of the committee determining the substance of the dispute shall be final and binding.

Article 5

MISCELLANEOUS PROVISIONS

§ 6121. Interpretation and Administration.

The General Manager shall have authority to interpret and administer provisions of this Chapter, subject to appeal to the Organization, Personnel and Effectiveness Committee.

Chapter 2

PERSONNEL REGULATIONS

§ 6208. Pay Rate Administration.

(a) Pay rate schedules, as approved by the Board, shall include pay rate grades and pay rate ranges consisting of minimum and maximum rates of pay for each position. Except by action of the Board, or as provided in Section 6208(d), the hourly pay rate paid each employee shall be at least the minimum but not in excess of the maximum hourly pay rate prescribed for the applicable position. Notwithstanding any other provision of this section, the salaries of the department heads shall be fixed as a flat rate.

(b) Pay rates for Department Heads shall be individually fixed by the Board. Pay rates for all employees shall be fixed by their respective Department Heads within the ranges fixed by the Board for such positions in accordance with practices, policies and procedures promulgated by the General Manager. The Board at its August meeting will review each Department Head's salary and compensation after determining an overall performance rating for each Department Head, and make adjustments as appropriate, if any, based on salary comparisons, pay rate survey and/or performance, with any change to be effective at the beginning of the pay period that includes the prior July 1.

(c) Job descriptions in terms of duties and responsibilities shall be prepared by the Director of Human Resources for each position. Job descriptions for positions requiring appointment or approval of appointment by the Board shall be submitted to the Board for approval. Job descriptions for positions peculiar to the Legal or Audit Departments or Ethics Office shall be subject to approval of the General Counsel, General Auditor, or Ethics Officer as appropriate. It shall be the duty of Human Resources to insure that all employees are properly classified.

(d) The General Manager is authorized to provide for payment at a "Y" rate to any employee whose position is reclassified to a position in a lower pay rate or the pay rate of whose position is reduced and the General Manager may maintain the employee at a "Y" rate until such time as the General Manager deems the "Y" rate to be no longer justified. As used herein, "Y" rate means a pay rate higher than the highest rate applicable to the employee's position.

(e) New employees, upon entering District service, will be placed by the Director of Human Resources at a salary grade and step within the salary range appropriate for the position available and the applicant's qualifications. Employees who are promoted to a position in a higher range shall be paid at least the minimum of such range but not more than four steps over their prior rate or the fifth step of the higher pay rate range, whichever is higher, but not in excess of the maximum rate specified for the position to which promoted. New employees are eligible for a merit increase after completion of a six-month probationary period. The eligibility date for subsequent merit reviews shall be 12 months from the most recent merit increase, promotion or demotion, whichever is later. Employees at the top step of the pay range will not be eligible for any merit increase. Merit increases will be awarded as provided for by Section 6211.

(f) Pay rates for temporary employees in District service are the rates paid to regular employees in the same classifications.

(g) Subject to Section 6211, the performance of regular employees other than Department Heads, will be annually reviewed by their Department Heads to determine eligibility for merit increases under evaluation procedures, guidelines and rules developed by the General Manager. Changes in pay rate ranges approved by the Board have no effect upon these limitations.

(h) Pay Rate Survey.

(1) As needed, the General Manager has the authority to cause a survey to be made of rates of pay and benefits of employees of other organizations specified by the Board, and may thereafter recommend to the Board revisions in the pay rate structure and benefits for employees. The survey need not include positions for which pay rates are established pursuant to a memorandum of understanding approved by the Board which is in effect for the entire calendar year. Action, if any, on the pay rate survey may be taken at the same meeting the survey information is presented or at a subsequent meeting. The General Counsel, General Auditor and Ethics Officer may also recommend to the Organization, Personnel and Effectiveness Committee revisions regarding positions peculiar to their own departments.

(2) The list of agencies to be used in the District's pay rate survey may include the following:

County of Los Angeles
East Bay Municipal Utility District
Los Angeles Metropolitan Transportation Authority
Los Angeles County Sanitation District
Los Angeles Department of Water & Power
Orange County Water District
San Diego County Water Authority
San Francisco Public Utilities Commission
State Department of Water Resources

The nine comparator agencies were selected by comparing the following factors: Industry (type of utility), total number of units managed, population served, total number of employees, total assets, net operating income, gross revenue, and total service area (square miles).

(i) For temporary construction personnel employed under authority of Section 6207(c), the General Manager is authorized to fix the hourly rates of pay at least equal to, but not more than 20 percent higher than, those so determined by the Board to be prevailing in the county in which such personnel primarily will be engaged.

§ 6209. Discharge.

(a) Unclassified employees, other than executive officers and their principal assistants, may be removed by their respective Department Heads, but may appeal such removal to the OPE Committee. The decision of the Committee will be final unless the Committee chooses to refer the appeal to the Board.

(b) Probationary employees serve at the pleasure of their respective Department Heads. Classified employees may be discharged, for cause, immediately by their respective Department Heads. When immediate discharge is not deemed appropriate, written notice shall be given at least 14 calendar days in advance of discharge for probationary employees and at least 30 calendar days in advance of discharge for other classified employees.

(c) Regular non-probationary classified employees who are discharged are afforded the due process rights provided under Section 6218 of this Code or as provided in the applicable memorandum of understanding.

Chapter 3

GENERAL EMPLOYEE MATTERS

Article 1

EQUAL EMPLOYMENT OPPORTUNITY AND AFFIRMATIVE ACTION**§ 6304. General Manager's Report on Equal Employment Opportunity Policy and Affirmative Action Program.**

Annually, the General Manager shall report to the Community and Workplace Culture Committee on the status of the equal employment opportunity policy and affirmative action program.

Chapter 4**OFFICERS****Article 2****GENERAL MANAGER****§ 6416. Annual Report to Executive Committee**

The General Manager shall annually submit to the Executive Committee a business plan containing the General Manager's key priorities for the coming year. The business plan shall be submitted in conjunction with similar plans by the General Auditor to the Executive Committee and the Ethics Officer to the Community and Workplace Culture Committee and the General Counsel to the Legal and Claims Committee.

Article 3**GENERAL COUNSEL****§ 6436. Annual and Quarterly Reports to Legal and Claims Committee.**

(a) The General Manager and General Counsel shall report quarterly to the Legal and Claims Committee the exercise of any power delegated to them by Sections 6433 and 6434. The General Counsel shall report quarterly to the Legal and Claims Committee the exercise of any power delegated to them by Section 6431.

(b) The General Counsel shall annually, in advance of the July Board meetings, submit to the Legal and Claims Committee a business plan containing the Legal Department's key priorities for the coming year for review and approval. The business plan shall be submitted in conjunction with similar plans by the General Manager to the Executive Committee and the General Auditor to the Executive Committee, and the Ethics Officer to the Community and Workplace Culture Committee.

Article 4

GENERAL AUDITOR

§ 6450. Powers and Duties.

(a) The District's independent internal auditing function is governed by provisions of the California Government Code and by policies established by the Board of Directors. The Executive Committee is responsible for the oversight of the internal auditing function, approving the Audit Department charter (subject to review and approval of the Board of Directors), selecting and overseeing the work of external auditors, and reviewing reports issued by both the internal and external auditors.

(b) The General Auditor manages the District's Audit Department and is responsible for formulating departmental policies and procedures; directing and evaluating the performance of work done by employees within the department, administering the internal records of the department; and administering the District's contract for external audit services. The General Auditor shall, annually in advance of the July Board meetings, submit to the Executive Committee an Audit business plan containing key priorities for the coming year for review and approval. The business plan shall be submitted in conjunction with similar plans by the General Manager to the Executive Committee, the General Counsel to the Legal and Claims Committee and Ethics Officer to the Community and Workplace Culture Committee.

(c) The General Auditor shall report the findings, opinions, and recommendations which result from the performance of the duties outlined in paragraph 6450(b) to the General Manager, General Counsel and Ethics Officer for their information and appropriate actions. Whenever an audit report contains recommendations for corrective actions or changes in current practices, the General Manager, General Counsel, Ethics Officer or their designees shall respond to the General Auditor in an appropriate manner and within a reasonable time, indicating their views on the recommendations and proposed actions to be taken, if any.

(d) The General Auditor's reports on internal audit assignments shall be addressed to the Executive Committee. The General Auditor shall have the discretion to determine the form and content of such audit reports, subject to guidance by the Executive Committee. With the exception of those reports which the General Auditor deems to be urgent or confidential in nature, copies of all audit reports addressed to the Executive Committee shall be submitted to the General Manager and General Counsel for review and comment simultaneously to their submittal to the Executive Committee.

(e) The General Auditor shall transmit all reports issued by the District's external auditors to the Executive Committee and any other committees of the Board as may be applicable. Such transmittal letters should include any comments on the external auditor's reports that the General Auditor deems necessary.

(f) The General Auditor may receive requests from time to time from the other executive officers or committees of the Board to perform audit assignments which are not included in the approved annual Audit Business Plan. Similarly, the General Auditor may identify a need to include new assignments in the Audit Business Plan during the year. The General Auditor shall

have sufficient latitude and discretion to include those new assignments in the annual Audit Business Plan as the General Auditor deems necessary based upon their professional judgement and available resources. Requests from other committees of the Board and individual Board members desiring specific audit assignments shall be submitted to the Audit Committee for study, advise, and recommendation, or if such subcommittee is not currently in place, the Executive Committee. Once the audit assignment is approved by the Board, the General Auditor reserves the right to determine how to best fit the directed audit assignment into the Audit Business Plan. The reporting process for assignments requested by either executive management, by committees of the Board, or by individual Board members shall generally follow the process outlined in paragraphs 6450(c) or (d) previously.

(g) The General Auditor shall manage the work of the Audit Department in accordance with the Audit Department Charter. The General Auditor shall assess annually whether the purpose, authority and responsibility, as defined in this Charter, continue to be adequate to enable the Audit Department to accomplish its objectives.

Article 5

ETHICS OFFICER

Sec.

6470. Powers and Duties

6471. Authority to Obtain Professional Services

6472. Reports to Community and Workplace Culture Committee

§ 6472. Reports to Community and Workplace Culture Committee.

(a) The Ethics Officer shall annually, in advance of the July Board meetings, submit to the Community and Workplace Culture (CWC) Committee a business plan for the Ethics Office containing key priorities for the coming year for review and approval.

(b) The Ethics Officer shall prepare quarterly reports to the CWC Committee on activities concerning agreements executed pursuant to the authority given to the Ethics Officer in Section 6471, and bi-monthly reports related to pending investigations as specified in Section 6470.

§ 6470. Powers and Duties.

The powers and duties of the Ethics Officer shall be as follows:

(a) The Ethics Officer shall report to the Board, through the CWC Committee.

(b) The Ethics Officer shall oversee an Ethics Office staffed with professional, qualified persons.

(c) The Ethics Officer shall be free from political interference in fulfilling the responsibilities detailed in this article and in Division VII.

(d) The Ethics Officer shall have sole authority to interpret Metropolitan's ethics rules.

(e) The Ethics Officer shall propose amendments to the Administrative Code to the CWC Committee for approval and adoption by the Board, relating to:

- (1) Regulation of lobbying activities;
- (2) Conflicts of interest and financial disclosure;
- (3) Public notice and approval procedures for contracts of \$50,000 or more;
- (4) Disclosure of campaign contributions related to potential conflicts of interest;
- (5) Such other ethics rules for application to board members, officers, employees, lobbyists, lobbying firms, and contractors as deemed appropriate.

(f) The Ethics Officer shall educate, train, provide advice and seek compliance from board members, officers, applicable employees, lobbyist, lobbying firms, and Metropolitan contractors and subcontractors concerning:

- (1) The rules prescribed in Division VII;
- (2) The Political Reform Act of 1974, as amended and applicable regulations;
- (3) The conflict of interest rules of Government Code section 1090.

(g) The Ethics Officer shall investigate potential violations of ethics rules in Division VII by board members, officers, applicable staff, lobbyists, lobbying firms, and contractors consistent with the rules specified in Division VII. The Ethics Officer shall prepare status reports of pending investigations on a bi-monthly basis. The reports shall include the general nature and status of the investigation, how long the investigation has been pending, when the investigation is expected to be completed and, when completed, the resolution of the investigation.

(h) The Ethics Officer shall be the filing officer on behalf of the District to receive and file Statements of Economic Interest pursuant to the California Government Code and Section 7501 of this Administrative Code.

(i) The Ethics Officer shall have the authority to confer with the Chair of the Board and the Chair and Vice Chair of the CWC Committee for the purpose of seeking advice and feedback on any policy and operational matters, or feedback on investigative matters, subject to the confidentiality requirements in section 7412 of the Administrative Code.

(j) The Ethics Officer shall have the authority to obtain, and have unrestricted access to all functions, documents, records, property, personnel and other information requested as part of an Ethics Office complaint or investigation without waiving any privileges that may apply.

§ 6471. Authority to Obtain Professional Services.

(a) The Ethics Officer is authorized to contract for independent legal counsel as they deem necessary in fulfilling duties and responsibilities of the Ethics Office. The Ethics Officer may contract with one or more attorneys or law firms depending on the areas of expertise needed. The amount to be expended in fees, costs and expenses under any one contract in any

one-year period shall not exceed \$100,000. The General Counsel shall review such contracts solely for consistency with Metropolitan's contract requirements. The General Counsel shall not have the authority to deny the Ethics Officer's ability to contract with any given party.

(b) The Ethics Officer is authorized to contract for professional services of outside investigators and investigation firms to conduct investigations under the Ethics Officer's purview. The amount to be expended in fees, costs, and expenses under any one contract in any one-year period shall not exceed \$250,000.

(c) The Ethics Officer is authorized to employ the services of other professional or technical consultants for advice and assistance in performing the duties assigned as may be required or as deemed necessary, provided that the amount to be expended in fees, costs and expenses under any one contract in any one year shall not exceed \$50,000.

(d) The Ethics Officer shall inform the CWC Committee whenever the authority granted under this section is exercised, and shall further report quarterly on activities concerning any agreements entered into under this section. Any such contracts shall be consistent with Metropolitan contract requirements and shall be reviewed by the General Counsel.

§ 6472. Reports to Community and Workplace Culture Committee.

(a) The Ethics Officer shall annually, in advance of the July Board meetings, submit to the CWC Committee a business plan for the Ethics Office containing key priorities for the coming year for review and approval.

(b) The Ethics Officer shall prepare quarterly reports to the CWC Committee on activities concerning agreements executed pursuant to the authority given to the Ethics Officer in Section 6471, and bi-monthly reports related to pending investigations as specified in Section 6470.

Division VII

GOVERNMENTAL ETHICS

Chapter 4

INVESTIGATION BY THE ETHICS OFFICER

Article 1

AUTHORITY TO INVESTIGATE AND JURISDICTION

§ 7405. Investigations of Directors, General Manager, General Counsel, General Auditor, or Ethics Officer.

(a) The Ethics Officer shall retain an outside counsel or investigator to conduct any investigation of alleged violations of Metropolitan ethics rules by a Director, General Manager,

General Counsel or General Auditor. The investigation shall be conducted in consultation with the Ethics Officer. The Ethics Officer shall, based on the results of the investigation, make the final determination as to whether a violation has occurred. Prior to retaining the outside counsel or investigator, the Ethics Officer shall notify the Community and Workplace Culture (CWC) Committee Chair, unless the Chair is the subject of the investigation, in which case the Vice Chair shall be notified.

(b) The Ethics Officer shall refer to the General Counsel any complaint of alleged violations of Metropolitan ethics rules by the Ethics Officer or any member of the Office staff. The General Counsel shall retain an outside counsel or investigator to conduct the investigation in consultation with the General Counsel. The General Counsel shall, based on the results of the investigation, make the final determination as to whether a violation has occurred. Prior to retaining the outside counsel or investigator, the General Counsel shall notify the CWC Committee Chair.

(c) The General Counsel shall review any contract with an outside counsel or investigator to ensure compliance with Metropolitan contracting requirements.

Article 2

PROCEDURES FOR INVESTIGATIONS

§ 7411. Investigation Timeframe.

(a) Investigations shall be conducted expeditiously and completed within 180 calendar days, except as provided in subparagraph (b). An investigation commences upon the Ethics Officer's determination to open an investigation, but in no event later than 30 calendar days from receipt of the complaint or referral.

(b) For good cause, an investigation may extend beyond 180 calendar days; provided, however, the Ethics Officer shall provide written notice to the subject of the investigation with an expected completion date. The Ethics Officer shall also notify the CWC Committee Chair whenever an investigation extends beyond 180 calendar days and provide periodic updates on the status of the investigation thereafter.

(c) For purposes of the 180 calendar day period specified in this section, an investigation terminates upon service of the Ethics Officer's report upon the subject of the investigation, or upon notice of no violation given to the subject of the investigation, pursuant to section 7416.

§ 7412. Confidentiality of Investigations.

(a) Investigations by the Ethics Officer shall be confidential to the fullest extent possible.

(b) The Ethics Officer has the discretion to disclose information related to investigations for significant operational or safety reasons.

(c) The Ethics Officer shall not unnecessarily disclose the identity of the subject of a complaint, except as needed in furtherance of the investigation or otherwise provided by Article 3 of this chapter.

(d) During the investigation, the Ethics Officer shall advise the subject of the investigation, the complainant, and any witnesses of the confidentiality of the investigation.

(e) The Ethics Officer may confer with the Chair of the Board and the Chair and Vice Chair of the CWC Committee on any investigative matter subject to the following:

(1) The communications shall be for the purpose of feedback.

(2) The communications shall be confidential.

(3) The restrictions on interference with investigations in section 7129(d).

(f) The Ethics Officer shall, to the extent possible, protect the identity of any complainant.

Division VIII

CONTRACTS/DISTRICT PROPERTY

Chapter 2

DISTRICT PROPERTY

Article 4

DISPOSITION OF REAL PROPERTY

§ 8248. Disposal of Unnecessary Improvements.

(a) The General Manager is authorized to dispose of, in the manner the General Manager deems to be in the best interest of the District, any improvements that must be removed to make land acquired for District operations suitable for District use.

(b) The General Manager shall report quarterly to the Finance, Affordability, Asset Management, and Efficiency (FAAME) Committee the details of any transactions during the preceding quarter in which an improvement was disposed of in such a manner as to make the improvement available for subsequent use by a party other than the District.

§ 8257. Quarterly Reports.

The General Manager shall report to the FAAME Committee quarterly on any real property sold pursuant to this Article.

Legal and Claims Committee

Chair's Amendments to the Administrative Code

Item 7-12

March 11, 2025

Item # 7-12

Modify Committees and Officers' Roles

Subject

Approve amendments to the Metropolitan Water District Administrative Code to modify the structure and duties of various committees and the roles of specified board and committee officers

Amendments based on Board approval of Chair's recommendations, February 11, 2025, Item 6B

Committee Changes

- Organization, Personnel and Effectiveness
- Finance, Affordability, Asset Management, and Efficiency
- Community and Workplace Culture
- One Water and Adaptability
- Audit Committee

Other Committee Changes

- Create an Imported Water Subcommittee
- Eliminate Ad Hoc Committees re:
 - Bay-Delta Negotiations
 - Colorado River
 - San Diego Litigation
 - Boundary Changes

Standing Committees

More flexible monthly meeting schedules

- Monday Before Board
- Second Tuesdays
- Fourth Tuesday – added

Audit will meet quarterly.

Board Vice Chairs

No more fixed “portfolios”

Vice Chairs shall act ex officio in the Chair’s absence at committees.

Vice Chairs may:

- Vote to break ties
- Maintain a quorum, if present

Vice Chairs may preside in absences

Ad Hoc Committees

Providing reports

To provide reports to Executive Committee and other committees where the subjects are relevant

Committee Vice Chairs

Alternate on Executive Committee

To act as an alternate on the Executive Committee for absent committee Chairs

Legislation and Communications

Two Vice Chairs

The Board Chair shall designate two Vice Chairs for the committee

- One to preside over legislative affairs
- The other over communications matters

Changes in Committee Roles

Effectiveness and Efficiency

- Community and Workplace Culture Committee
 - Ethics and EEO oversight

Organization, Personnel and Effectiveness

- Workforce training
- Top-tier recruitment
- Personnel

One Water and Adaptation Committee

3/11/2025 Board Meeting

8-1

Subject

Authorize an increase of the maximum amount payable under the contract with Richardson & Company LLP for auditing services related to State Water Project charges from \$5,125,000 to an amount not to exceed \$8,900,000 and extend the term by three years to March 31, 2028; the General Manager has determined that the proposed action is exempt or otherwise not subject to CEQA

Executive Summary

This letter seeks authorization to increase the maximum amount payable under a contract with Richardson & Company LLP (Richardson) by \$3,775,000 and extend the term for three years to March 31, 2028, for the purpose of auditing Metropolitan's annual State Water Project (SWP) charges from the California Department of Water Resources (DWR). Additionally, this would allow Richardson to continue supporting staff in the recovery of claimed overcharges. The SWP audit benefits Metropolitan with cost savings, expenditure insight, and technical support.

Richardson & Company LLP and the predecessor firm Richardson and Company have audited Metropolitan's SWP charges for the last 34 years and, therefore, have a deep understanding of Metropolitan's operations and SWP contract. During that time, Richardson has identified errors and adjustments that reduced Metropolitan's charges by approximately \$304 million. Metropolitan is currently negotiating additional unresolved errors of \$234 million with DWR, including an estimated \$170 million Water Systems Revenue Bond Surcharge item. Richardson also delivers detailed reports on the changes in Metropolitan's charges, the expenditures causing the changes, and provides technical support for protested charges and dispute resolution discussions.

Proposed Action(s)/Recommendation(s) and Options

Staff Recommendation: Option #1

Option #1

Authorize an increase in the maximum amount payable under a contract with Richardson & Company LLP for auditing services related to State Water Project charges from \$5,125,000 to an amount not to exceed \$8,900,000 and extend the term by three years to March 31, 2028.

Fiscal Impact: Professional and technical services costs of up to \$3,775,000 over a three-year period. These annual expenditures have been included in the approved budgets for FY 2024/25 and FY 2025/26.

Business Analysis: The auditing services provided by the consultant with expertise in auditing SWP contract charges assists staff in evaluating the accuracy of the charges and managing costs of Metropolitan's second largest annual expenditure.

Option #2

Do not authorize the contract increase with Richardson & Company LLP and instead direct staff to issue a Request for Proposals (RFP) for State Water Project charges audit services and return to the Board for authorization.

Fiscal Impact: Dependent on new contract

Business Analysis: This option would require issuance of an RFP and delay processing a new contract for SWP audit services, and could potentially result in higher audit costs.

Alternatives Considered

Staff evaluated if it is cost-effective to have the audit completed by internal audit staff or continue to use Richardson. Factors that were considered during the evaluation included an additional six to eight permanent full-time internal audit staff in Sacramento for approximately seven to nine months each year and the steep learning curve necessary to become proficient with the compliance review of a unique and technically complex computational process. The Office of the General Auditor voiced concurrence with the staff recommendation of Option #1.

Applicable Policy

Metropolitan Water District Administrative Code Section 8121: General Authority of the General Manager to Enter Contracts

Metropolitan Water District Administrative Code Section 8140: Competitive Procurement

Metropolitan Water District Administrative Code Section 11104: Delegation of Responsibilities

Related Board Action(s)/Future Action(s)

Not applicable

California Environmental Quality Act (CEQA)

CEQA determination for Option #1:

The proposed action is not defined as a project under CEQA because it will not result in either a direct physical change in the environment, or a reasonably foreseeable indirect physical change in the environment. (State CEQA Guidelines Section 15378(a).)

CEQA determination for Option #2:

None required

Details and Background

Background

Metropolitan contracts with an independent certified public accounting firm to audit each year's SWP charges billed by the DWR. The audit provides Metropolitan with an independent third-party opinion regarding the consistency of actual charges with the terms of the SWP Water Supply contract.

The audit is atypical for audited financial statements and requires a highly specialized contractual compliance review of a unique and technically complex computational process. The work location is in Sacramento, with the audit process requiring 6,300 to 6,700 hours per year, and a variable workload during the year. During the peak period, an experienced staff of 6 to 12 individuals perform the audit work.

Currently, there are only two consulting firms that have the SWP contractual and technical accounting knowledge to complete the audit, EY (formerly Ernst and Young) and Richardson. In 1990, as a result of a merger, EY completed the review for the audit charges for Metropolitan and the other State Water Contractors. However, in 1991, EY decided not to compete for Metropolitan's audit work due to the conflict-of-interest clause in the contract agreement. EY continues to audit the charges for other State Water Contractors through the Independent Audit Association. EY assisted Metropolitan in transitioning to a new firm. The new firm was Richardson & Company LLP.

Between 1991 and 2001, Metropolitan's consulting agreements were annual rollover agreements with a six-month termination notice. The agreements were consistent with Metropolitan's Administrative Code Section 8140(1)(h), which provides that all contracts estimated to cost \$75,000 or more shall be made upon a competitive procurement method of either competitive sealed bidding or best value procurement, except contracts for insurance or for services of a professional, artistic, scientific, or technical nature, among others. From 2001 through 2019, Metropolitan sought audit services through four RFPs and one Request for Qualifications (RFQ). During each contracting cycle, the solicitation was broadened. The four RFPs and one RFQ did not result in identifying any accounting firms, other than Richardson, that are professionally and technically qualified, and have an interest in performing the Metropolitan SWP charges audit. In the 2009 solicitation process, Richardson was the only final respondent. In the 2012 and 2019 solicitation processes, Richardson was the only respondent.

There are a number of factors that reduce interest in responding to the SWP charges audit RFP. The most significant are the costs and risks associated with acquiring the specialized knowledge required to gain technical competency in the water resource industry. The conflict-of-interest clause within our agreements with Richardson prevents the consultant from leveraging its investment in knowledge by doing similar work for other water contractors and DWR. The large size of the audit, peak staffing requirements, and Sacramento location are also factors.

Given the ongoing protest and other disputed items, some related to cost reallocation among the SWP Contractors, it is crucial to maintain continuity with Richardson as the auditor. A loss of continuity with Richardson would slow the resolution process. A new consultant would require significant time and resources to reach the same level of competency.

Before an audit service RFP is released, staff evaluates if it is better to have the audit completed by Metropolitan's internal audit staff or continue to use an external consultant. The Office of the General Auditor concurs that the use of an external consultant is the preferred choice.

Summary

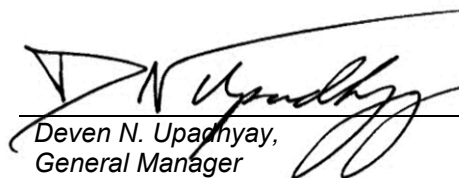

The benefits of extending Metropolitan's consultant contract with Richardson include reduced staff costs associated with the RFP process, continued support for claims against DWR for errors in the calculation of the SWP charges, and continuation of reliable and efficient, low-cost audit services. The proposed contract amendment is consistent with Metropolitan's Administrative Code Section 8140(1)(h) because it involves the services of a professional and technical nature.

Authorize Increase in the Richardson Contract Maximum Amount Payable & Extend Term

Item 8-1

March 10, 2025

Item 8-1 Authorize on contract with Richardson & Company

Subject

To increase the maximum amount payable under the contract with Richardson & Company, LLP for auditing services related to State Water Project charges from \$5.1 million to an amount not to exceed \$8.9 million and extend the term by three years to March 31, 2028

Purpose

Request authorization to increase the maximum amount payable and extend the Richardson contract term for the State Water Project auditing services

Recommendation

Authorize an amount payable of \$3.8 million for a three-year contract extension with Richardson

Fiscal and Budget Impact

Cost of up to \$3,775,000 over a three -year period. These annual expenditures have been included in the approved budgets for FY 2024/25 and FY 2025/26

Background
Richardson
& Company
LLP

Richardson Contract Audits the Accuracy of our State Water Project Charges

- Audits annual charges for over 30 years
 - Specialized contractual audit
 - Summary and detailed audit reports
 - Substantial cost savings over time
 - Provides expert technical support
- Current five-year contract ends March 31, 2025

Alternatives Considered

New Request for Proposal

- 2009, 2012, and 2019: Richardson was the final respondent
- New RFP: 4-6 months
- Steep learning curve

MWD General Auditor

- 6 to 8 full-time staff for ~ 7-9 months
- Steep learning curve

Extend Existing Contract

- Selected through the 2019 RFP process
- Industry experience
- Cost effective

Proposed Extension and Amount

- Three-year contract extension
 - April 1, 2025 to March 31, 2028
 - Increase of approximately \$3.8 million
 - Cost includes inflationary rate increase
- Additional scope:
 - Resolution of Water System Revenue Bond Surcharge claim
 - Settlement of other claims

THE METROPOLITAN WATER DISTRICT OF SOUTHERN CALIFORNIA

FIRST AMENDMENT TO AGREEMENT NO. 195314

REVIEW OF THE ANNUAL STATE WATER PROJECT WATER SUPPLY CONTRACT CHARGES

This amendment to Agreement No. 195314, hereinafter referred to as First Amendment, is between THE METROPOLITAN WATER DISTRICT OF SOUTHERN CALIFORNIA, a public agency of the State of California, organized and existing under the Metropolitan Water District Act of the State of California, hereinafter referred to as Metropolitan, and RICHARDSON AND COMPANY LLP, hereinafter referred to as Consultant.

Summary

- Request amending existing contract to increase the maximum amount payable and extend the agreement for three years
- Richardson is highly experienced, cost-effective, and an acknowledged industry expert
- The General Auditor concurs with the extension

Details and Background

Background

Pursuant to the action taken at the Special Board meeting of January 29, 2025, the Chair of the Board has negotiated terms and conditions of an employment contract with Mr. Deven N. Upadhyay as General Manager. The following compensation and benefits are recommended for the Board's authorization for Mr. Upadhyay:

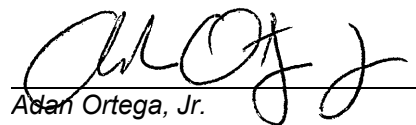

- Annual salary: \$495,000.
- Agreement term: Commencing January 29, 2025, and continuing until December 31, 2025. The Board and the General Manager may, by mutual agreement, extend the term through Board-approved amendment.
- Transition support: Upon the expiration of the Agreement on December 31, 2025, the General Manager shall be placed on paid administrative leave for a period of six (6) months, provided that he remains available to assist the successor General Manager in ensuring a smooth transition.
- Car allowance: \$700 per month as authorized by Metropolitan's policy.
- Annual leave accrual: Five (5) weeks per year, using an accumulation factor of .0957854 per hour worked, consistent with his tenure at Metropolitan.
- Involuntary severance: For involuntary severance unrelated to misconduct, twelve months' compensation, and benefits to be received, at Mr. Upadhyay's option, as paid administrative leave or lump sum payment.
- Other benefits: All other compensation and benefits as provided to other Unrepresented Metropolitan employees.
- Additionally, authorize payment of the approved salary retroaction to the date of the appointment, January 29, 2025.

Attachment 1 – Executive Officer Employment Agreement DEVEN UPADHYAY

Ref# sri12697833

**The Metropolitan Water District
of Southern California
General Manager Employment Agreement
Deven N. Upadhyay, General Manager**

I. RECITALS

1.1 This Employment Agreement (“Agreement”) is entered into as of January 29, 2025, between The Metropolitan Water District of Southern California, a public corporation of the State of California (“Metropolitan” or “MWD”), organized and existing under the Metropolitan Water District Act (Statutes 1969, ch.209, as amended), and Deven N. Upadhyay (“General Manager”).

1.2 On January 29, 2025, Metropolitan’s Board of Directors (“Board”) selected Deven N. Upadhyay as its General Manager, subject to the approval of this Agreement by the Board.

1.3 In consideration of the above recitals and the mutual promises and conditions below, Metropolitan and Deven N. Upadhyay agree as follows.

II. TERM

2.1 Metropolitan shall employ Deven N. Upadhyay as its General Manager commencing January 29, 2025, and continuing until December 31, 2025. The Board and the General Manager may, by mutual agreement, extend the term of this Agreement through an amendment approved by the Board.

2.2 The General Manager shall devote his scheduled work time and exercise his best efforts in the performance of duties as described in Section 6 of this Agreement, in his job classification description pursuant to Division VI, Chapter 4, Article 2 of the MWD Administrative Code, and as assigned. The General Manager shall have no employment outside of Metropolitan employment, except as approved in writing by the Board.

2.3 The General Manager shall perform the services required by this Agreement at Metropolitan’s headquarters located at 700 North Alameda Street, Los Angeles, California, or as directed by the Board.

III. COMPENSATION AND BENEFITS

3.1 Salary. Metropolitan shall pay the General Manager an annual base salary of \$495,000, subject to legally permissible or required withholdings, pro-rated and paid on Metropolitan’s normal paydays. This salary shall be entitled to the same across-the-board salary adjustment as unrepresented employees. In addition, this salary is subject to adjustment by the Board pursuant to MWD Administrative Code Section 6208, *Pay Rate Administration*, but may

not be reduced except in conjunction with a pro rata reduction of salaries for all other unrepresented employees at Metropolitan.

3.2 Benefits. General Manager shall continue to receive benefits consistent with those afforded to unrepresented employees under the MWD Administrative Code, including but not limited to:

3.2.1 Leave Accumulation. General Manager shall accrue annual leave at a rate of five (5) weeks per year, using an accumulation factor of .0957854 per hour worked, consistent with his tenure at Metropolitan.

3.2.2 Car Allowance. General Manager shall receive a car allowance of \$700 per month, consistent with the previous General Manager's contract and operating policy J-08.

3.2.3 Retirement Benefits. General Manager shall be entitled to continue to participate in the same Public Employees' Retirement System (PERS) as unrepresented employees.

3.2.3.1 Exclusion from Gross Income. Metropolitan shall pay to the Public Employee Retirement System ("PERS") on behalf of General Manager an amount equal to the required employee contribution to PERS, not to exceed seven percent of General Manager's salary. The contribution shall be treated as an employer contribution (made pursuant to Section 414(h)(2) of the United States Internal Revenue Code) in determining the tax treatment of the contribution. Such contributions shall be paid from the same source as funds as used to pay wages to the General Manager. The General Manager does not have the option to receive the Metropolitan-contributed amount paid pursuant to this Section directly instead of having it paid to PERS. This Section shall be operative only so long as the Metropolitan pick-up of the retirement contributions continues to be excluded from the gross income of the General Manager under the United States Internal Revenue Code.

3.2.3.2 Inclusion in Gross Income. If the Metropolitan pick-up of retirement contributions is subject to inclusion in the gross income of General Manager under the United States Internal Revenue Code, Metropolitan shall cease making contributions pursuant to Section 3.2.2.1 and, provided that Metropolitan may do so pursuant to applicable law and without increasing Metropolitan's or General Manager's other costs attributable to the PERS program, shall increase General Manager's salary by an amount equivalent to the amount that otherwise would be paid to PERS on behalf of General Manager pursuant to Section 3.2.2.1. If applicable law provides that Metropolitan may not so increase General Manager's salary, General Manager's compensation shall not be subject to increase pursuant to this Section to the extent not permitted by law. If Metropolitan may not so increase General Manager's salary without increasing

Metropolitan's other General Managers' costs attributable to PERS, General Manager's compensation shall be increased only in an amount equal to the amount that would otherwise be paid to PERS on behalf of the General Manager, less such increased costs attributable to PERS.

3.2.3.3 Retiree Medical Benefits. The General Manager shall be eligible to receive retiree medical benefits consistent with those provided to unrepresented employees under Metropolitan's employer contributions established pursuant to Resolution No. 9348 (Fixing the Employer Contribution Under the Public Employees' Medical and Hospital Care Act) and Resolution No. 9349 (Fixing the Employer Contribution for Public Agency Vesting Under Section 22893 of the Public Employees' Medical and Hospital Care Act), as those resolutions may be amended or replaced from time to time by Metropolitan. The General Manager acknowledges that such benefits, including the level of employer contributions, are subject to change at the sole discretion of the Board of Directors. Such retiree medical benefits may not be reduced except in conjunction with a reduction for all other unrepresented employees at Metropolitan.

3.2.4 Deferred Compensation and 401(k). General Manager shall continue to participate in the same deferred compensation and 401(k) plan as unrepresented employees.

3.2.5 Medical, Dental, and Vision Insurance. General Manager shall continue to be provided the same medical, dental, and vision insurance benefits as unrepresented employees, paid by Metropolitan for the General Manager and his qualified dependents.

3.2.6 Other Benefits. General Manager shall continue to receive all other benefits available to unrepresented employees under the MWD Administrative Code, including but not limited to disability insurance, term life insurance, wellness benefits, professional development reimbursements, cell phone allowance, and leave provisions.

IV TERMINATION

4.1 The General Manager serves at the pleasure of the Board and may be terminated, with or without cause, at any time upon receipt of written notice from the Board.

4.2 The General Manager may terminate his employment by providing at least four (4) weeks' written notice of resignation or retirement to Metropolitan.

4.3 Upon termination of employment at the end of the contract term or upon proper receipt of written notice from the Board, the General Manager may use accumulated leave balances to extend the paid service time, consistent with standard employee practices and the MWD Administrative Code.

4.4 Upon termination, the General Manager is prohibited from disclosing Metropolitan confidential and/or proprietary information unless legally required. Violation of this provision may subject the General Manager to liquidated damages of \$25,000 per instance.

4.5 Transition Assistance and Paid Administrative Leave. Upon the expiration of this Agreement on December 31, 2025, the General Manager shall be placed on paid administrative leave for a period of six (6) months, provided he remains available to assist the successor General Manager in ensuring a smooth transition. During this period, the General Manager shall continue to receive his base salary and benefits (except Wellness, Professional Development, and Car Allowance) as set forth in Section 3 of this Agreement but shall not be required to perform regular day-to-day duties. Instead, his responsibilities shall be limited to providing advice, institutional knowledge, and transition support as reasonably requested by the Board or the successor General Manager. If the General Manager fails to remain available during this transition period or declines reasonable requests for assistance, Metropolitan reserves the right to terminate the administrative leave and corresponding salary and benefits upon written notice.

4.6 Waiver of Property Interest in Continued Employment. The General Manager acknowledges and agrees that, prior to the execution of this Agreement, he may have held a property interest in continued employment with Metropolitan. By signing this Agreement, the General Manager expressly waives any such property interest and acknowledges that his employment is entirely at-will, as set forth in Section 4.1 of this Agreement. The General Manager further acknowledges that this Agreement supersedes any prior policies, practices, agreements, or understandings, whether written or implied, that may have created an expectation of continued employment beyond the term of this Agreement. The General Manager understands and agrees that he has no right to continued employment beyond the term specified herein, except as may be agreed to in a subsequent written amendment approved by the Board.

V. SEVERANCE PAY/CASH SETTLEMENT

5.1 Should the General Manager retire under the provisions of the Public Employees' Retirement Law, resign, or otherwise voluntarily terminate under this agreement, the General Manager shall be eligible for the severance pay provided to Metropolitan employees in MWD Administrative Code Section 6248, *Severance Pay*.

5.2 Except for voluntary resignation or retirement, death, or disability of 90 days or more, General Manager shall, as soon as reasonably practicable after the effective date of termination pursuant to Section 4.1 above, be placed on paid administrative leave for a period of twelve months, or, at General Manager's option, receive the lump sum equivalent to 100% percent of General Manager's annual base salary and benefits (excluding Wellness, Professional Development, Car Allowance, and Cell Phone Allowance). In the event the General Manager elects to receive a lump sum payment or is placed on paid administrative leave pending an investigation for an alleged crime involving abuse of his office or position, any such lump sum or paid leave must be fully reimbursed by the General Manager to Metropolitan if the General Manager is convicted of a crime involving abuse of his office or position.

5.3 General Manager shall not be entitled to severance pay pursuant to Section 5.2 if General Manager is terminated for a material act of dishonesty, gross carelessness in the performance of duties, gross misconduct or an unjustifiable neglect of duties.

5.4 All severance payments are subject to the limitations in Government Code sections 53260 - 53264, and sections 53243 - 53243.4.

VI. GENERAL DUTIES

6.1 The General Manager executes the policies and strategic initiatives set by the Board with a commitment to integrity, respect, transparency, fiscal and ratepayer responsibility, sustainability, and equity. In this capacity, the General Manager is responsible for managing Metropolitan's assets and water resources to ensure a reliable, sustainable, and resilient water supply for its member agencies in an environmentally and fiscally responsible manner, including incorporating the impacts of climate change and water initiatives to reduce costs and create new forms of revenue.

6.2 The General Manager's duties are also as outlined in Division VI, Chapter 4, Article 5 of the MWD Administrative Code, Sections 6410 - 6416.

VII. MISCELLANEOUS

7.1 This Agreement, together with the provisions of the MWD Administrative Code and other Metropolitan policies, contains the entire agreement between the parties. In the event of a conflict between this Agreement and the MWD Administrative Code, this Agreement shall control.

7.2 The validity, interpretation, and performance of this Agreement shall be governed by the laws of the State of California.

7.3 Any notice required under this Agreement shall be sent via Metropolitan's email system. Notices from General Manager to Metropolitan shall be sent to the Chair of the Board, while notices from Metropolitan to General Manager shall be sent to his Metropolitan email inbox.

7.4 If any provision in this Agreement is held to be invalid or unenforceable, the remainder shall remain in full force and effect.

WHEREFORE, the parties have executed this Agreement as of the date first written above.

Human Resources

HR Priorities

Partner with Metropolitan leadership to support learning, development, and adaptive workforce planning initiatives.

The Organizational Development & Training facilitated a Team Building for Weymouth's Laboratory Services Unit. Twenty-six employees were in attendance for training on Resilience Building, Stress Management, and Positivity in the Workplace. OD&T Unit were also in the Sacramento office for a Communication Skills training. In addition, 580 employees attended virtual and in-person trainings on topics ranging from E-Mail Etiquette, Excel Dashboards, Microsoft Project, OneNote, Advanced PowerPoint, Advanced SharePoint, Excel Formulas & Functions, and Cybersecurity Awareness. LinkedIn Learning, MWD's e-learning platform, was accessed for topics like HR Comp & Benefits, Windows 11 Troubleshooting, and Construction Safety.

Recruitment Unit filled 20 positions in the month of February. There are 53 recruitments that are in the final stages which includes hiring recommendations being made. Seventeen new staffing requisitions were received resulting in 167 positions being recruited for. Staff continues to work with All-Star Talent in an outreach campaign targeted towards hard-to-fill positions in the Desert, Environmental Planning, and Information Technology. This effort is aimed at making qualified candidates aware of the exciting opportunities available at Metropolitan. In addition, staff continues to make site visits which have included Jensen, Diamond Valley Lake, Lake Mathews, La Verne, and Carson Reuse Facility.

HR Core Business: Provide Excellent Human Resources Services

Objective #1: Administer all HR services with efficiency and a focus on customer service excellence, consistency, and flexibility.

The Business Support Team planned, organized, and coordinated a "Taking Care of Your Heart" wellness webinar. The live webcast was held on February 5, 2025, and hosted by Kaiser Permanente. The webinar provided employees with the opportunity to learn about heart disease and identify associated risk factors. The Mediterranean and plant-based meal plans were highlighted in relationship with keeping a healthy heart.

Date of Report: March 11, 2025

Office of Safety, Security & Protection

Key Activities Report for January and February 2025

Project Highlights

Security and Emergency Management

Security and Emergency Response

Metropolitan Security Specialists played an integral role in the emergency response efforts to the catastrophic wildfires that battered the Los Angeles service area in January, including one that came within a mile of a critical pressure control facility.

Security personnel became aware of the fire within minutes of its start and were pre-emptively deployed to the location as emergency responders and took the following protective actions:

- Assessed potential threats to Magazine Canyon structures based on wind directions/speeds (60-80 mph)
- Coordinated with Jensen OCC staff and contract security personnel for safety, PPE, communications, command, and control guidance
- Immediately issued phone notifications up the chain of command, waking key managers around midnight.
- Input critical information and initial reports into WebEOC for situational awareness
- Liaisoned with LAFD ICS command staff posted at Fire Station 18 in Granada Hills
- Provided critical on-the-ground real-time information on power outages, loss of traffic lights in the area, street closures, firefighting efforts, access control, and photo/video documentation of the fire's progress and direction
- Posted at Sepulveda PCS 24/7 to monitor the Palisades Fire threat to infrastructure and expedite access control through law enforcement barricades

Office of Safety, Security & Protection

Metropolitan's Security and Emergency Management Unit co-hosted a two-day California Water Security Summit at Union Station alongside the FBI and CISA. The event brought together federal, state, and local law enforcement agencies, water security associations, and member agencies to discuss emerging threats, trends, and regulatory developments in the water sector.

Key topics included:

- Current cyber threats and case studies
- Foreign malign influence and insider threats
- Physical security challenges
- Industry and fusion center panel discussions
- Threats from drones and WMDs
- Dams sector security briefings
- AWIA and PFAS regulatory updates
- The evolving water security landscape

The summit provided a critical forum for collaboration and knowledge-sharing to strengthen the security and resilience of California's water infrastructure.

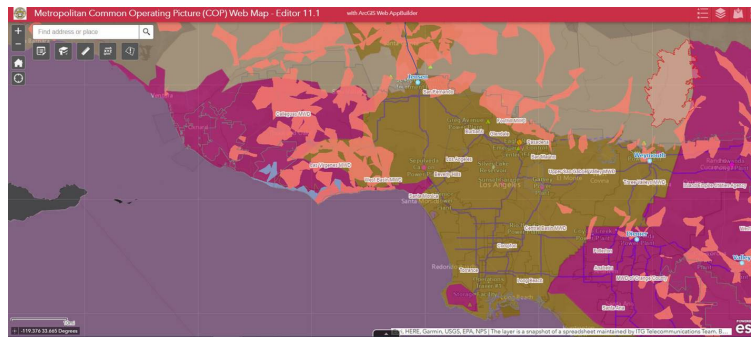

Metropolitan hosts CISA, DHS, FBI, EPA, WaterISAC, and member agencies at Union Station Headquarters for 2-day Water Security Summit

Office of Safety, Security & Protection

Emergency Management Program Update

January Wildfire Response

Metropolitan staff spent a significant portion of January 2025 responding to multiple wildfires that erupted in Metropolitan's service areas and were fanned by "life-threatening" Santa Ana Winds. The Eaton and Palisades Fires were the most significant wildfires during this time, burning over 30,000 acres, destroying over 10,000 structures, and devastating numerous lives. An extensive number of Public Safety Power Shut-Offs (PSPS) and wind-caused power outages added to this complex and dangerous situation.

Map of Red Flag Warnings and SCE PSPS monitored circuits

Metropolitan Emergency Management Prep

Metropolitan staff started monitoring reports from the National Weather Service (NWS) and Southern California Edison (SCE) of a strong Santa Ana Wind condition in the forecast for the week of January 6. NWS increased the intensity of their warnings to a "Particularly Dangerous Situation (PDS)" on January 7, and SCE continued warning of numerous potential PSPS events in the region. Metropolitan management was advised, and emergency management staff prepared for possible field deployments.

Metropolitan Emergency Operations Center (EOC) and Incident Command Post Activations

On January 7, the Metropolitan EOC was activated to a low-level (Level III) in response to the fast-moving Palisades, Eaton, and Hurst Fires. The Hurst Fire burned close to the Jensen Water Treatment Plant, and the other two fires could have been a threat to Metropolitan employees and facilities if they continued to burn.

The EOC was elevated to a mid-level activation level (Level II) the next day due to the rapid spread of the current fires and the extreme threat of additional fires in the Metropolitan service area due to extremely dangerous fire weather.

Office of Safety, Security & Protection

EOC activation was virtual due to the threat to Eagle Rock Facilities

The Jensen Plant, Weymouth Plant, and Western C&D Incident Command Posts (ICPs) were also activated during this incident to coordinate field assets included in the response.

Mutual Assistance

As the Eaton Fire continued to burn in the Altadena/Pasadena area, Foothill Municipal Water District reached out to Metropolitan management to request support for a number of their mutual agencies which had sustained significant damage. Metropolitan provided immediate fuel and generator support to these agencies and continued to work with them to support future needs. Metropolitan also supported them as they worked with the Los Angeles County EOC, Cal WARN (Water/Wastewater Response Network), Public Water Agency Group (PWAP), and the California Utilities Emergency Association (CUEA).

Map of the impacted mutual agencies associated with Foothill Municipal Water District

Agency Representatives Sent to the Los Angeles County EOC and Fire Command Posts

Metropolitan sent agency representatives to the Los Angeles County EOC, as well as the Eaton Fire Command Post (Rose Bowl) and Palisades Fire Command Post (Zuma Beach) to provide a direct line of communications with County emergency operations and first responders in the field.

Agency reps maintained a regular presence at these sites for over two weeks and provided a valuable connection between Metropolitan, impacted agencies, and first responders.

Office of Safety, Security & Protection

**Los Angeles County Emergency
Operations Center (CEOC)**

**Metropolitan staff in command trailer
at the Eaton Fire Command Post**

Metropolitan Direct Impacts

Metropolitan operations were not impacted significantly during these fires, but several precautionary actions were taken. Staff were evacuated from the Eagle Rock Operations Control Center (OCC), Security Watch Center (SWC), and Emergency Operations Center (EOC) due to the rapid spread of the Eaton Fire. OCC, SWC and EOC staff all worked from remote locations during the fire emergency.

When the Palisades Fire threatened the Sepulveda Pressure Control Structure (PCS), staff were deployed to monitor its operations, clear nearby brush, and water-down hillsides. A Metropolitan agency rep was also dispatched to the Palisades Fire Command Post at Zuma Beach to facilitate direct communications with first responders.

Multiple “Met-Alert” messages were sent to employees’ phones and emails referring to memos from the General Manager regarding safety and fire information.

Metropolitan Post-Response Actions

The Metropolitan EOC officially de-activated on January 22 and transitioned mutual assistance operations to the newly formed *Eaton Fire Water Utility Mutual Assistance* group, which included participation by Foothill MWD and the impacted mutual agencies in the Altadena/Pasadena area.

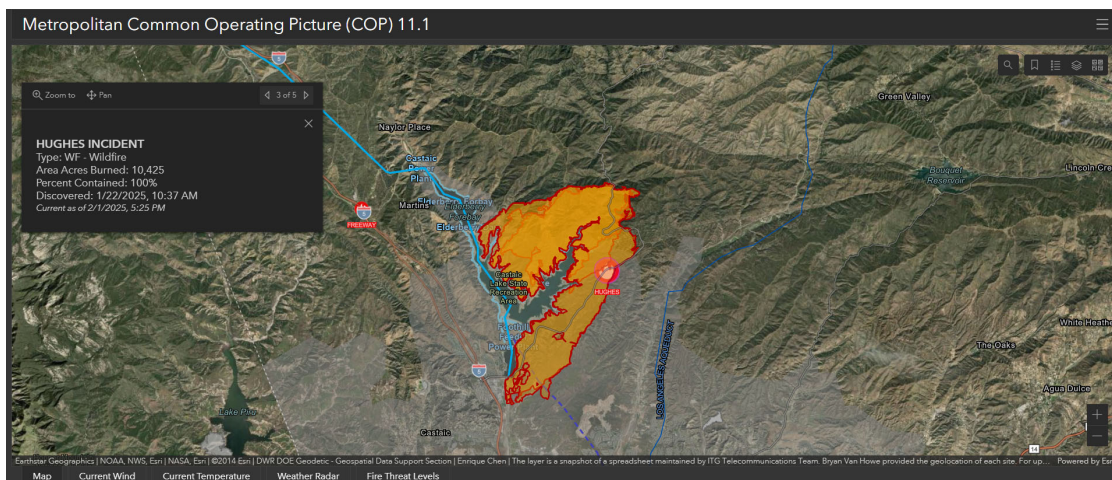

Office of Safety, Security & Protection

**Representatives from impacted mutual agencies
meeting at Foothill Municipal Water District facility**

All Metropolitan Agency Reps were released from the Los Angeles County EOC and Eaton and Palisade Fire Command Posts.

Finally, on January 23, Metropolitan staff monitored the Hughes Fire near Lake Castaic, which threatened the Foothill Pressure Control Structure (PCS). A Metropolitan agency rep was deployed to the Fire Command Post and remained in contact with the Fire Department until the fire threat had subsided.

Hughes Fire near Lake Castaic threatened Metropolitan Foothill Pressure Control Structure for a time

Staff will conduct after action reviews to gather lessons-learned that highlight successes and identify areas of improvement for future disaster responses.

Office of Safety, Security & Protection

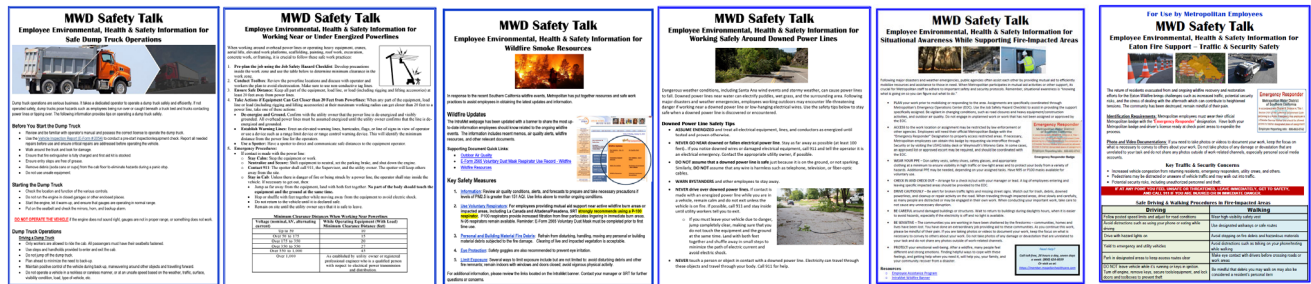

Project Highlights

Safety, Regulatory, and Training

SRT Health and Safety Programs

Safety Talks

Staff prepared six new Safety Talks on various topics, including dump truck operations, energized or downed powerline safety, wildfire smoke prevention, and situational awareness while supporting impacted fire areas.

New Safety Talks

Lead Management Program

In response to Cal/OSHA's adoption of new Lead in Construction Standard amendments effective January 1, 2025, staff met with affected Metropolitan coatings teams to review the recent regulatory updates to Metropolitan's Lead Management Program. The updates included lower permissible exposure limits, increased medical surveillance, signage, and other lead work safety procedures.

SRT Environmental Programs

Hazardous Materials

Staff completed the annual hazardous materials business plan submittals for 5 facilities and are preparing 19 additional facility business plan submittals, due the first quarter of 2025 to the respective Certified Unified Program Agencies (CUPAs). Additionally, staff completed a hazardous waste pump out of caustic soda from Mills' chlorine scrubber system to facilitate necessary fiberglass tank repairs.

Waste Water and Tanks

Staff completed 18 compliance reports for various facilities throughout the District and submitted a flood control permit for discharging of standing water on the Garvey Reservoir cover. Staff submitted an unplanned dewatering notification for the unplanned release at Weymouth and provided the advance notification for the AMP line shutdown.

Air Quality

Staff requested SCAQMD to extend the Permit to Construct/Operate of the MSU Plasma Arc Cutter and received verbal confirmation the permit will be extended. Staff completed the notification requirements for the Pleasants Peak emergency generator engine once it reached 200 hours of operation. The SCAQMD Rule 118.1 allows critical facilities to exclude operating hours that occurred before and during a Public Safety Power Shutoff (PSPS) event if the operator notifies SCAQMD within 48 hours of exceeding the annual limit.

SRT Apprenticeship Programs

SRT Apprenticeship Programs prepare apprentices to become certified mechanics and electricians responsible for maintaining Metropolitan's water treatment and distribution systems. Apprenticeship began 2025 with recruitment efforts to hire apprentices for the Desert Region. The job announcement posted in early January. The announcement provided information about the program and details for application and testing, including a candidate preparation manual. Applications opened in February. Testing and interviews are scheduled March through May. The recruitment would hire four desert apprentices in 2025 and establish a multi-year eligibility list for future hiring.

Location:
Gene Camp, Parker Dam, CA

STARTING HOURLY SALARY: \$22.54 Per Hr.

Desert Pre-Apprentice Job Announcement

SRT Safety and Technical Training Programs

The Safety and Technical Training staff collaborated with Fleet Services to develop an online electric vehicle (EV) training module. This short, multimedia training will cover basic vehicle operation, charging procedures, and tips for planning trips with an EV.

With the arrival of the new year, staff began delivering advanced System Operating Orders Manual (SOOM) training, featuring new exercises and activities. This year, SOOM training will focus on the safe isolation of work areas and the clearance process for the Conveyance and Distribution systems. The field activities will focus on the Water Treatment Plant and its associated switchyards. Staff also developed exercises and online testing for the Desert SOOM High Voltage Switching program.

The Safety and Technical Training staff collaborated with Health & Safety Programs to incorporate the above-mentioned updates into the Lead training programs. While SRT published a new safety talk, lead training offerings now include updates from 2025, such as the new lower permissible exposure limits, trigger task levels, hygiene practices, and medical testing frequencies.
