Engineering and Operations Committee

Meeting with Board of Directors *

May 10, 2022

9:30 a.m.

Tuesday, May 10, 2022 Meeting Schedule
08:30 a.m. L&C
09:30 a.m. E&O
11:30 a.m. Break
12:00 p.m. BOD

Teleconference meetings will continue until further notice. Live streaming is available for all board and committee meetings on mwdh2o.com (Click Here)

A listen only phone line is also available at 1-800-603-9516; enter code: 2176868#. Members of the public may present their comments to the Board on matters within their jurisdiction as listed on the agenda via teleconference only. To participate call (404) 400-0335 and enter Code: 9601962.

MWD Headquarters Building • 700 N. Alameda Street • Los Angeles, CA 90012

* The Metropolitan Water District's meeting of this Committee is noticed as a joint committee meeting with the Board of Directors for the purpose of compliance with the Brown Act. Members of the Board who are not assigned to this Committee may participate as members of the Board, whether or not a quorum of the Board is present. In order to preserve the function of the committee as advisory to the Board, members of the Board who are not assigned to this Committee will not vote on matters before this Committee.

1. Opportunity for members of the public to address the committee on matters within the committee's jurisdiction (As required by Gov. Code Section 54954.3(a))

**** CONSENT CALENDAR ITEMS -- ACTION ****

2. CONSENT CALENDAR OTHER ITEMS - ACTION

A. Approval of the Minutes of the Engineering and Operations Committee held April 11, 2022 **21-1139**

Attachments: 05102022 EO 2A Minutes

3. CONSENT CALENDAR ITEMS - ACTION

Zoom Online

7-2 Certify the Final Program Environmental Impact Report for the Climate Action Plan and take related CEQA actions; adopt the Climate Action Plan; and authorize an increase of $1.2 million to an agreement with Rincon Consultants, Inc. for a new not-to-exceed total of $2.2 million for Climate Action Plan implementation support **21-1101**

Attachments: 05102022 EO 7-2 B-L
05102022 EO 7-2 Presentation

7-3 Adopt the CEQA determination that the proposed action was previously addressed in the certified Program Environmental Impact Report and related CEQA actions and (1) award an $18,930,000 contract to Woodcliff Corporation for improvements to the La Verne Shops; and (2) authorize an agreement with Richard Brady & Associates for a not-to-exceed amount of $650,000 **21-1104**

Attachments: 05102022 EO 7-3 B-L
05102022 EO 7-3 Presentation

7-4 Award a $3,143,592 contract to Blois Construction, Inc. for upgrades at three Sepulveda Feeder structures; the General Manager has determined that the proposed action is exempt or otherwise not subject to CEQA **21-1105**

Attachments: 05102022 EO 7-4 B-L
05102022 EO 7-4 Presentation

7-5 Review and consider Addendum No. 1 to the certified 2015 Final Environmental Impact Report for the Weymouth Plant Improvements; award a $93,840,000 contract to J. F. Shea Construction, Inc. for rehabilitation of Basins Nos. 5-8 and Filter Building No. 2 at the F. E. Weymouth Water Treatment Plant; and authorize an agreement with Carollo Engineers, Inc., for an amount not to exceed $495,000 for engineering support during construction **21-1106**

Attachments: 05102022 EO 7-5 B-L
05102022 EO 7-5 Presentation

7-6 Award $2,654,000 contract to MMC Inc. for replacement of chillers at OC-88 Pump Station; the General Manager has determined that the proposed action is exempt or otherwise not subject to CEQA **21-1107**

Attachments: 05102022 EO 7-6 B-L
05102022 EO 7-6 Presentation

7-7 Review and consider Addendum No. 5 to the certified 2017 Programmatic Environmental Impact Report for the Prestressed Concrete Cylinder Pipe Rehabilitation Program; and award an $11,884,700 contract to J. F. Shea Construction, Inc. to rehabilitate a portion of the Second Lower Feeder **21-1108**

Attachments: 05102022 EO 7-7 B-L
05102022 EO 7-7 Presentation

**** END OF CONSENT CALENDAR ITEMS ****

9. FUTURE AGENDA ITEMS

10. ADJOURNMENT

Zoom Online

NOTE: This committee reviews items and makes a recommendation for final action to the full Board of Directors. Final action will be taken by the Board of Directors. Agendas for the meeting of the Board of Directors may be obtained from the Board Executive Secretary. This committee will not take any final action that is binding on the Board, even when a quorum of the Board is present.

Writings relating to open session agenda items distributed to Directors less than 72 hours prior to a regular meeting are available for public inspection at Metropolitan's Headquarters Building and on Metropolitan's Web site http://www.mwdh2o.com.

Requests for a disability related modification or accommodation, including auxiliary aids or services, in order to attend or participate in a meeting should be made to the Board Executive Secretary in advance of the meeting to ensure availability of the requested service or accommodation.

Zoom Online

THE METROPOLITAN WATER DISTRICT OF SOUTHERN CALIFORNIA

MINUTES

ENGINEERING AND OPERATIONS COMMITTEE

April 11, 2022

Chair Smith called the teleconference meeting to order at 10:08 a.m.

Members present: Chair Smith, Directors Blois, Camacho, De Jesus, Dick, Faessel, Fong-Sakai, Lefevre, Morris, Peterson, and Williams

Members absent: Directors Apodaca and Repenning

Other Board members present: Directors Abdo, Ackerman, Atwater, Cordero, Dennstedt, Erdman, Fellow, Gray, McCoy, Miller, Record, and Tamaribuchi

Committee staff present: Bednarski, Chapman, Hagekhalil, Burrola, Rohen, Scully, Upadhyay, and Yamasaki

1. OPPORTUNITY FOR MEMBERS OF THE PUBLIC TO ADDRESS THE COMMITTEE ON MATTERS WITHIN THE COMMITTEE'S JURISDICTION

None

CONSENT CALENDAR ITEMS -- ACTION

2. CONSENT CALENDAR OTHER ITEMS - ACTION

A. Approval of the Minutes of the Engineering and Operations Committee held March 7, 2022

3. CONSENT CALENDAR ITEMS – ACTION

Director Smith announced that Item 7-5 would be voted on separately.

7-4 Subject: Authorize an agreement with Stantec Consulting Services, Inc. for a not-to-exceed amount of $8.5 million to replace the control system at the Mills Water Treatment Plant and amend an existing agreement with CH2M Hill Engineers, Inc. for a not-to exceed amount of $4.435 million; the General Manager has determined that this proposed action is exempt or otherwise not subject to CEQA

Presented by: Mike Claisse, Team Manager, Engineering Services Group

Motion: a. Authorize an agreement with Stantec Consulting Services, Inc. for a not-to-exceed amount of $8.5 million for design and equipment procurement to upgrade the control system at the Mills plant.
b. Authorize an increase of $1.95 million to an agreement with CH2M Hill Engineers, Inc for a new not-to-exceed amount of $4.435 million to provide specialized technical support for the upgrade

The following Directors provided comments or asked questions:

1. Faessel
2. Camacho
3. Miller
4. Peterson

Staff responded to the Directors' comments or questions.

7-6 Subject: Adopt the CEQA determination that the proposed project was previously addressed in the approved 2014 Mitigated Negative Declaration and related CEQA action and (1) award a $17,226,250 contract to Spiniello Infrastructure West, Inc. to replace the lining in a portion of the Orange County Feeder; and (2) authorize the General Manager to enter into a new 24-month lease agreement, with an 18-month option to extend, at 2750 Bristol Street in Costa Mesa, CA (Assessor's Parcel No. 418 182-05) in an amount not to exceed $360,000 for use as a construction staging and storage site

Presented by: Sam Mouawad, Principal Engineer, Engineering Services Group

Motion: Adopt CEQA determination that the proposed project was previously addressed in the approved 2014 Mitigated Negative Declaration and related CEQA documentation, and that no further environmental analysis or documentation is required and a. Award a $17,226,250 contract to Spiniello Infrastructure West, Inc. to reline a portion of the Orange County Feeder. b. Authorize General Manager to enter into a new 24-month lease agreement with an 18-month option to extend at 2750 Bristol Street in Costa Mesa, CA (Assessor's Parcel No. 418 182-05) in an amount not to exceed $360,000

The following Directors provided comments or asked questions:

1. Faessel
2. Miller
3. Dick
4. Camacho
5. Morris

Staff responded to the Directors' comments or questions.

Director Camacho made a motion, seconded by Director Blois, to approve the consent calendar consisting of items 2A, 7-4, and 7-6.

The vote was:

Ayes:	Directors Blois, Camacho, De Jesus, Dick, Faessel, Fong-Sakai, Lefevre, Morris, Peterson, Smith, and Williams
Noes:	None
Abstentions:	None
Absent:	Apodaca and Repenning

The motion for Items 2A, 7-4, and 7-6 passed by a vote of 11 ayes, 0 noes, 0 abstentions, and 2 absent.

7-5 Subject: Appropriate $600 million for projects identified in the Capital Investment Plan for Fiscal Years 2022/23 and 2023/24 and authorize the General Manager to initiate or proceed with work on capital projects identified in the Capital Investment Plan for Fiscal Years 2022/23 and 2023/24 and Minor Capital Projects to be identified during the biennial period, subject to any limits on the General Manager's authority and CEQA requirements; the General Manager has determined that the proposed actions are exempt or otherwise not subject to CEQA

Presented by: James Hong, Principal Engineer, Engineering Services Group

Motion: a. Appropriate $600 million for projects identified in the CIP appendix for FYs 2022/23 and 2023/24.
b. Authorize the General Manager to initiate or continue work on the capital projects described in the CIP Appendix for FYs 2022/23 and 2023/24 and Minor Capital Projects to be identified during the biennial period, subject to any limits on the General Manager's authority and CEQA requirements.

The following Directors provided comments or asked questions:

1. Faessel
2. Fong-Sakai
3. Blois
4. Peterson

Staff responded to the Directors' comments or questions.

Director Peterson made a motion, seconded by Director Morris, to approve the consent calendar consisting of item 7-5.

The vote was:

Ayes:	Directors Blois, De Jesus, Dick, Faessel, Lefevre, Morris, Peterson, and Williams
Noes:	None
Abstentions:	Fong-Sakai and Smith
Absent:	Apodaca and Repenning
Not Voting:	Camacho

The motion for Item 7-5 passed by a vote of 8 ayes, 0 noes, 2 abstentions, 2 absent, and 1 not voting.

**** END OF CONSENT CALENDAR ITEMS ****

6. COMMITTEE ITEMS

a. Subject: Overview of Arc Flash Safety Planning

Deferred to May

7. MANAGEMENT REPORTS

a. Subject: Water System Operations Manager's report

Presented by: Brent Yamasaki, Water System Operations, Group Manager

Mr. Yamasaki reported on the following:

- Continuing operational actions to address the record drought
- Extending CRA 8-pump flow in 2022 for additional water reliability
- MWD PFAS monitoring update
- Innovative powerplant repair to preserve $1.5M of hydropower revenue

b. Subject: Engineering Services Manager's report

Presented by: John Bednarski, Engineering Services Group, Chief Engineer and Group Manager

Mr. Bednarski reported on the following:

- Price escalation Trends for Public Works Contracts
- Alternative Project Delivery legislation testimony
- Garvey Reservoir
  - Drainage & Erosion Control project
  - Hypochlorite System upgrade project
- SWP Dependent Area Solutions Update
  - Drought Action Planning and Development Workshop

5/10/2022 Board Meeting

7-2

Subject

Certify the Final Program Environmental Impact Report for the Climate Action Plan and take related CEQA actions; adopt the Climate Action Plan; and authorize an increase of $1.2 million to an agreement with Rincon Consultants, Inc. for a new not-to-exceed total of $2.2 million for Climate Action Plan implementation support

Executive Summary

The Metropolitan Water District of Southern California Climate Action Plan (CAP) is a comprehensive programmatic document that identifies energy and greenhouse gas (GHG) reduction actions from past, current, and future programs to reduce our carbon footprint in the face of climate change and to offset GHG emissions from future projects, such as the proposed Regional Recycled Water Program. The CAP would streamline California Environmental Quality Act (CEQA) GHG analysis and substantially reduce costs to Metropolitan resulting from project-by-project mitigation for GHG impacts. This action certifies the Final Program Environmental Impact Report (PEIR) for the CAP, adopts the CAP, and provides funding for implementation of the CAP program.

Details

Background

The Global Warming Solutions Act of 2006 (Assembly Bill 32) established a statewide target to reduce GHG emissions to 1990 levels by the year 2020. In 2016, Governor Jerry Brown signed Senate Bill (SB) 32, which furthered California's efforts to reduce climate change impacts by establishing a new, more stringent GHG reduction target of 40 percent below 1990 levels by the year 2030. In response to SB 32, the California Air Resources Board developed California's 2017 Climate Change Scoping Plan (Scoping Plan), which charts a path to the 2030 target. Since the release of the Scoping Plan in 2017, Governor Brown has signed Executive Order (EO) B-55-18, which set an even more aggressive goal of carbon neutrality by 2045.

A CAP is a comprehensive program that streamlines CEQA GHG impact analysis and reduces mitigation costs associated with impacts resulting from future projects. A CAP allows Metropolitan to obtain multiple benefits from existing water and energy conservation programs, capturing GHG savings from programs such as turf removal, solar power, hydroelectric plants, rideshare, and electric vehicle charging. The CAP also provides Metropolitan with an opportunity to demonstrate its longstanding and continuing commitment to environmental stewardship in California, and to participate in the global effort to curtail climate change. The CAP will also serve as a launching pad for Metropolitan's new Sustainability, Resiliency and Innovation Office, which will lead CAP implementation and identify the next steps for this effort.

Metropolitan's Board of Directors authorized the development of a CAP in October 2018. In November 2019, staff provided an oral report on Metropolitan's past and current emissions profile, as well as a forecast of future emissions. In March 2020, staff provided an oral report on a recommended emissions quantification and tracking protocol that will meet the needs of Metropolitan, meet local and statewide GHG reduction goals, and ensure compliance with CEQA. Finally, in June 2020, staff provided an oral report recommending adoption of a GHG reduction target consistent with the state's goal of carbon neutrality by 2045.

In the fall of 2021, prior to the public release of the document, staff released an advance copy of the draft CAP for peer review to the six county planning departments within Metropolitan's service area and two analogous water

agencies. Peer review comments were incorporated into the draft CAP before it was released for the required CEQA public review process. The public review process is complete, and staff has revised and finalized the CAP and CEQA document based on comments received during the public comment period.

Certification of Final Program Environmental Impact Report

On November 18, 2021, Metropolitan released the Draft PEIR for a 45-day public review period as required by CEQA and the State CEQA Guidelines. Staff filed the Notice of Completion with the State Clearinghouse, and the Notice of Availability of the Draft PEIR was mailed to contiguous property owners, federal, state, and local agencies, and individuals that may have an interest in the CAP and projects covered under the CAP. An electronic copy of the Draft PEIR was posted on Metropolitan's website, while hard copies were made available at Metropolitan's Headquarters Building and nine public libraries within the Plan Area. The 45-day public review period ended on January 7, 2022. Metropolitan received thirteen comment letters pertaining to the CAP and Draft PEIR: six from governmental agencies, five from non-governmental organizations, and two from individuals. Individual comments in each letter were identified, and a response to each comment was prepared. Overall, commenters were supportive of Metropolitan's decision to prepare a CAP. Several comments recommended the inclusion of State Water Project (SWP) emissions into Metropolitan's CAP planning process to provide a clearer picture of the embedded energy associated with all water delivered to Metropolitan's service area. In response to these comments, a detailed discussion of the SWP emissions was included in an appendix to the CAP. Other comments supported Metropolitan's water efficiency program but encouraged the expansion of stormwater capture and the incorporation of vegetated nature-based solutions into all projects moving forward. While most comments received were centered on the CAP, one comment raised concerns about the Alternatives Analysis in the Draft PEIR, and one comment recommended that Metropolitan pursue project-level EIRs for projects proposed in the CAP. Metropolitan explained its decision to proceed with a PEIR and the variety of alternatives considered in its analysis in the PEIR and the response to comments. All public comment letters received and responses to individual comments are included in Volume 1 of the Final PEIR.

CEQA requires that Metropolitan's Board certify that the Final PEIR was completed in compliance with CEQA and the State CEQA Guidelines; that the Board has reviewed and considered the information presented in the Final PEIR; and that the Final PEIR reflects the Board's independent judgment and analysis. CEQA also requires that public agencies adopt a Mitigation Monitoring and Reporting Program (MMRP) when they approve a project that contains mitigation measures to reduce or avoid significant environmental impacts. The Final PEIR identified potentially significant environmental impacts and proposed feasible mitigation measures, which are included in the MMRP. In addition, CEQA requires Metropolitan's Board adopt the Findings of Fact (FOF or Findings), which contain: (1) conclusions about each significant impact; (2) substantial evidence supporting Metropolitan's conclusions; and (3) an explanation of how the evidence supports the conclusions. Findings must be made at the time the Final PEIR is certified. The Final PEIR concluded that air quality, cultural resources, and noise impacts could not be mitigated to less-than-significant levels. Finally, the Board must adopt a Statement of Overriding Considerations (SOC) for these impacts. The SOC concludes that the benefits of the proposed program substantially outweigh the unavoidable significant adverse impacts that would result from project implementation.

CAP Adoption

Metropolitan's CAP is a comprehensive programmatic planning document designed to streamline the environmental analysis of GHG impacts from future capital projects by identifying GHG reduction actions and programs that offset future GHG emissions. To be used to offset future GHG emissions, the CAP must meet the requirements of Section 15183.5(b)(1) of the State CEQA Guidelines for a "Qualified GHG Reduction Plan" (Qualified CAP). Metropolitan's CAP is consistent with California GHG reduction legislation and includes a baseline GHG emissions inventory from Metropolitan's operations from 1990 through 2020; an emissions forecast modelled using published water supply scenarios through 2045; an established emissions reduction target of carbon neutrality by 2045; actions and policies that Metropolitan can implement to achieve the necessary GHG reductions to meet this target; a monitoring and reporting program to ensure the goals are met; and an implementation roadmap. Once adopted by the Board, Metropolitan's CAP will satisfy the CEQA requirements for a Qualified CAP.

Amendment to an Agreement for Environmental Support (Rincon Consultants, Inc.)

In October 2018, the Board authorized a new agreement with Rincon Consultants, Inc. (Rincon) for environmental support to develop the CAP and associated CEQA document. In September 2021, the Board authorized an increase to the agreement for public outreach and peer review support. Rincon completed the scope of work identified under the agreement, including the development of a CAP and supporting CEQA document.

This action authorizes an increase of $1.2 million to an existing agreement with Rincon for a new not-to-exceed total of $2.2 million for environmental services associated with CAP implementation. The scope of services will include developing and preparing annual progress reports; designing and implementing an online reporting tool to support Metropolitan's goal of transparency; developing an equitable community engagement strategy; preparing annual GHG inventories; and preparing Metropolitan's five-year update to the CAP and necessary CEQA documentation.

Summary

This action certifies the Final PEIR for the CAP, adopts the MMRP, FOF, and SOC, and adopts the CAP in accordance with CEQA, and authorizes an increase of $1.2 million to an existing agreement with Rincon for services related to implementation of the CAP. **See Attachment 1** for the Location Map; **Attachment 2** for the Draft PEIR; **Attachment 3** for the Final PEIR (including Responses to Comments, FOF, SOC, and MMRP); and **Attachment 4** for the Final CAP.

Policy

By Minute Item 44813, dated March 12, 2002, the Board adopted policy principles on global climate change and water resources planning, expressing Metropolitan's support for further research into the potential water resource and quality effects of global climate change, and support for reasonable, economically-viable, and technologically-feasible management strategies and efforts for reducing the potential impacts of global climate change to water resources.

By Minute Item 51350, dated October 9, 2018, the Board authorized the development of a CAP.

By Minute Item 52579, dated November 9, 2021, the Board adopted legislative policy principles on climate changes and the environment to help California reach its climate goals while adapting to a rapidly changing environmental landscape. The Board also expressed its support for policies and funding that encourage sustainable practices and environmental compliance, reduce greenhouse gas emissions, and improve energy sustainability.

California Environmental Quality Act (CEQA)

CEQA determination for Option #1:

Certify that the Final PEIR was completed in compliance with CEQA and the State CEQA Guidelines; certify that the Board has reviewed and considered the information presented in the Final PEIR; certify that the Final PEIR reflects the Board's independent judgment and analysis; adopt the FOF, SOC, and the MMRP; and adopt the CAP for the purposes of CEQA.

CEQA determination for Option #2:

None required

Board Options

Option #1

Certify the Final Program Environmental Impact Report for the Climate Action Plan and take related CEQA actions; adopt the Climate Action Plan; and authorize an increase of $1.2 million to an agreement with Rincon Consultants, Inc for a new not-to-exceed amount of $2.2 million for Climate Action Plan implementation support.

Fiscal Impact: Expenditure of $1.2 million in O&M funds over the next five years. Approximately $250,000 will be incurred in the first fiscal year to develop tracking tools and provide implementation support.

Business Analysis: The option would leverage existing and planned water, energy, and other conservation measures to help offset GHG impacts from future projects and mitigate the effect of GHG-related climate change.

Option #2

Do not certify the Final Program Environmental Impact Report; do not adopt the Climate Action Plan; and do not authorize an increase to the agreement with Rincon Associates, Inc. at this time.

Fiscal Impact: Unknown

Business Analysis: Under this option, staff would continue to apply project-specific GHG reduction measures to individual projects. This option would forego a cost-saving opportunity to utilize existing programs to offset emissions from future capital projects.

Staff Recommendation

Option #1

Executive Summary

This document is a draft Program Environmental Impact Report (PEIR) analyzing the potential environmental effects of The Metropolitan Water District of Southern California's (Metropolitan) proposed Climate Action Plan (CAP or proposed program). This section summarizes the characteristics of the proposed program, the environmental impacts and mitigation measures associated with implementation of the proposed program, and alternatives to the proposed program considered in this draft PEIR.

ES.1 Lead Agency Contact Person

Ms. Malinda Stalvey, Senior Environmental Specialist
The Metropolitan Water District of Southern California
Environmental Planning Section
700 North Alameda Street
Los Angeles, California 90012

ES.2 Program Summary

Climate Action Planning

In response to mounting urgency surrounding global climate change and mandated emissions reductions, entities in California and around the world have developed CAPs. While the content of such plans varies depending on the specific emissions reduction objectives of the lead agency, CAPs generally include a baseline inventory of greenhouse gas (GHG) emissions, a forecast of future GHG emissions, a GHG reduction goal consistent with applicable reduction targets, and a series of policies, measures, or actions intended to achieve the reduction goal.

As Metropolitan's service population has grown, continued and increasing efforts to reduce the environmental and economic impact of Southern California's water supply have contributed to Metropolitan's resiliency and opportunities for neutralizing its carbon footprint. Metropolitan furthers this commitment to sustainability and efficiency by proposing to adopt a CAP to establish an emissions reduction target and describe in detail reduction activities and policies Metropolitan may implement to achieve its reduction targets over time.

Plan Area

The proposed CAP includes GHG emissions reduction measures for Metropolitan's construction, operation, and maintenance activities. It is anticipated that most reduction measures would be implemented throughout a six-county Southern California region comprising Los Angeles, Orange, Riverside, San Bernardino, San Diego, and Ventura counties. These counties include all of Metropolitan's service area and most of its infrastructure facilities. The proposed CAP may also involve implementation of GHG emissions reduction measures or programs at Metropolitan land holdings in Imperial County, specifically within the Palo Verde Valley; as well as Bacon Island,

Bouldin Island, Holland Tract, and Webb Tract in the Sacramento-San Joaquin Delta region (San Joaquin County and Contra Costa counties).

While environmental emissions influence climate change at a global scale, the analysis in this PEIR focuses on potential impacts associated with implementation of the proposed CAP in California, and more specifically, the Plan Area, consistent with the requirements and applicability of CEQA.

Program Components

Emissions Inventory

The proposed CAP contains an inventory of Metropolitan's GHG emissions from 1990 to 2020 Due to the geographically disparate nature of Metropolitan's operations, emissions reported in the inventory are based on activities over which Metropolitan has direct operational control. The inventory delineates emissions by Scope, as defined in the Local Governments for Sustainability reporting frameworks and detailed below. The emissions inventory reports Metropolitan's GHG emissions in metric tons of carbon dioxide equivalent or CO_2e.

- **Scope 1 Emissions**. Scope 1 emissions are those associated with direct emissions from sources owned or controlled by Metropolitan. This includes emissions from direct fuel combustion, including natural gas, propane, welding gasses, and gasoline and diesel used to power Metropolitan's vehicle fleet.
- **Scope 2 Emissions**. Scope 2 emissions are those associated with indirect emissions associated with the consumption of Metropolitan's purchased electricity use. Specifically, emissions generated at power plants that supply electricity for Metropolitan operations. Metropolitan purchases electricity from power generated from within California and from outside of California in the southwestern United States, which includes electricity generated from hydropower at the Hoover Dam. Scope 2 emissions also include transmission and distribution losses that occur as electricity is delivered to Metropolitan facilities.
- **Scope 3 Emissions**. Scope 3 emissions are other indirect emissions that occur as a result of Metropolitan's operations, including emissions associated with waste generation, water consumption and wastewater generation from Metropolitan-owned buildings, employee commutes, and construction activities.

The proposed CAP also includes an emissions forecast through 2045 to account for potential changes in hydrology, climate, climate and air quality regulations, population growth, operations, and future construction projects that may affect Metropolitan's emissions in the future. Furthermore, the emissions forecast allows for comparison between forecasted GHG emissions and reduction targets to understand the reductions necessary to achieve Metropolitan's GHG reduction goals.

Reduction Target

The proposed CAP establishes a GHG reduction target aligned with applicable state GHG reduction policies. The CAP considers various reduction levels, target methodologies, and tracking mechanisms to quantify and measure progress toward GHG emissions reductions. Ultimately, a linear per capita target or "Linear Reduction to Carbon Neutral by 2045 – Per Capita Target" with a Carbon Budget tracking mechanism, described in greater detail in Chapter 2, *Project Description*, was utilized.

GHG Reduction Measures

In order to achieve the proposed CAP's emissions reduction target, GHG emissions reduction measures would need to be implemented. The CAP includes 39 proposed GHG emissions reduction measures that, if implemented, could help Metropolitan reduce its Scope 1, Scope 2, and Scope 3 emissions. Reduction measures for each Scope are grouped into nine strategies that could be employed at Metropolitan's various facility types during facility maintenance activities and future expansion and construction activities, as well as policies and projects to explore new technologies and practices to conserve resources. The reduction measures do not include actions taken by Metropolitan to date that have resulted in GHG emissions reductions, such as Metropolitan's early adoption of hybrid-electric vehicles for its operational fleet and Leadership in Energy Efficiency and Design (LEED) certification for several of its facilities. However, the measures may build or expand upon these past actions. Most measures within the nine categories are either administrative (e.g., studies, investigations) in nature or involve replacement of existing infrastructure with newer, more efficient infrastructure at the same location and, therefore, would not have physical impacts to the environment. Measures with the potential to result in physical impacts to the environment are described in detail in Chapter 2, *Project Description*.

ES.3 Alternatives

This draft PEIR examines alternatives to the proposed program in Chapter 7, *Alternatives*. Section 15126.6(a) of the *State CEQA Guidelines* states that an EIR shall describe "a range of reasonable alternatives to the project, or to the location of the project, which would feasibly attain most of the basic objectives of the project but would avoid or substantially lessen any of the significant effects of the project," as well as provide an evaluation of "the comparative merits of the alternatives." Under Section 15126.6(a), an EIR does not need to consider alternatives that are not feasible, nor need it address every conceivable alternative to the project. As discussed in greater detail in Chapter 7, *Alternatives*, several alternatives were considered but rejected, including alternative locations and alternative methods, as these alternatives would not be feasible, accomplish the basic objectives of the proposed program, or substantially lessen environmental effects.

This draft PEIR considers a No Program Alternative to determine whether environmental impacts would be similar to, less than, or greater than those of the proposed CAP. The No Program Alternative, as well as all alternatives considered but rejected, are described in greater detail in Chapter 7, *Alternatives*.

ES.4 Areas of Known Controversy

Section 15123(b)(2) of the *State CEQA Guidelines* requires that an EIR identify areas of controversy which are known to the lead agency, including issues raised by other agencies and the public. Areas of controversy associated with the proposed program are made known through comments received during the Notice of Preparation (NOP) process, as well as input solicited during public scoping meetings and an understanding of the community issues in the study area.

The comments on the NOP for the draft PEIR for the proposed CAP generally expressed concern over the following issues: alternatives analysis and impacts to biological species and jurisdictional habitats (California Department of Fish and Wildlife [CDFW]), air quality impacts from construction or operation of projects implemented under the proposed program (San Joaquin Valley Unified Air Pollution Control District [SJVAPCD], Mojave Desert Air Quality Management District [MDAQMD], South Coast Air Quality Management District [SCAQMD], and Ventura County Air

Pollution Control District [VCAPCD]), impacts to tribal cultural resources (Native American Heritage Commission [NAHC]), and watershed management (Ventura County Public Works). Appendix A contains a copy of the NOP and the comment letters received during the NOP scoping period.

ES.5 Issues to be Resolved

*State CEQA Guideline*s Section 15123(b)(3) requires that an EIR contain a discussion of issues to be resolved, including the choice among alternatives and whether or how to mitigate significant effects. Issues to be resolved for the proposed CAP include:

- How to address impacts from individual projects under the proposed CAP given that specific details for implementation of all GHG emissions reduction measures are not sufficient to prepare a project-level analysis at this time; and
- How best to implement programmatic mitigation measures identified in this draft PEIR at the project-level to reduce potential environmental impacts associated with implementation of the proposed CAP to the degree feasible.

ES.6 Summary of Impacts and Mitigation Measures

Table 1 includes a brief description of the identified environmental impacts associated with each threshold analyzed in detail in the draft PEIR, proposed mitigation measures, and the level of significance after mitigation.

This document is a PEIR. Section 15168(a) of the *State CEQA Guidelines* states that:

> A Program EIR is an EIR which may be prepared on a series of actions that can be characterized as one large project and are related either: (1) geographically; (2) as logical parts in a chain of contemplated actions; (3) in connection with issuance of rules, regulations, plans, or other general criteria, to govern the conduct of a continuing program; or (4) as individual activities carried out under the same authorizing statutory or regulatory authority and having generally similar environmental effects which can be mitigated in similar ways.

As a programmatic document, this draft PEIR presents a regional assessment of the impacts of the proposed CAP prepared by Metropolitan. Analysis of site-specific impacts of individual projects is not the focus of a PEIR. Many specific projects are not currently defined at a level that would allow for such an analysis. The appropriate level of project-specific environmental analysis of individual projects would be undertaken, as necessary, by Metropolitan prior to each project being considered for approval. This draft PEIR serves as a first-tier CEQA document that will support second-tier CEQA documents for individual projects to be implemented under the proposed CAP.

This draft PEIR evaluates potential impacts against existing conditions, which are generally conditions existing at the time of the release of the NOP (June 23 to July 22, 2020). Mitigation identified in this draft PEIR, as listed in Table 1, shall be implemented by Metropolitan for individual CAP projects under its jurisdiction, as applicable and necessary. Project-specific environmental documents may adjust these mitigation measures as necessary to respond to site-specific conditions at the time of implementation.

As summarized in Table 1, this draft PEIR identifies significant and unavoidable impacts in the resource categories of air quality, cultural resources, and noise. Significant and unavoidable impacts identified in this draft PEIR are a result of the potential for construction activities associated with individual projects to exceed air quality emissions thresholds, impact historical or archaeological resources, or exceed noise or vibration thresholds. Because construction specifics such as project

footprint, construction schedules, and equipment usage are not known at this time, such impacts are presumed to be significant and unavoidable. However, such impacts may be reduced once individual project details are known and project-level analysis occurs. All other potentially significant impacts identified would be reduced to less than significant levels with the implementation of mitigation measures.

Table 1 Summary of Environmental Impacts, Mitigation Measures and Impacts After Mitigation

Impact	Mitigation Measure(s)	Significance After Mitigation
Air Quality		
Impact AQ-A. Implementation of the individual projects proposed under the CAP would potentially conflict with or obstruct implementation of the applicable air quality plan due to construction emissions. This impact would be potentially significant.	**MM AQ-1 Construction Air Quality Assessment** For individual projects to be implemented under the CAP that involve construction activities with an intensity (i.e., size, schedule, equipment, demolition, import/export of soil, architectural coating) greater than the sample program activity, an air quality assessment shall be prepared to evaluate construction emissions in light of the applicable air district thresholds. **MM AQ-2 Implement Emission Reduction Measures** If construction emissions would exceed any of the applicable thresholds, emission reduction measures shall be implemented to reduce emissions below the thresholds. Measures may include, but would not be limited to: • All construction equipment shall be equipped with Tier 4 certified engines or CARB-certified Level 3 diesel particulate filters. All diesel particulate filters shall be kept in working order and maintained in operable condition according to manufacturer's specifications, as applicable. • Construction equipment with lower horsepower ratings shall be utilized, as applicable and practicable. • Ultra-low-sulfur diesel fuel shall be used for stationary construction equipment, as applicable. • Low-emission on-site stationary equipment shall be used, as applicable. • Alternatively-fueled construction equipment (e.g., renewable diesel, natural gas, electric) shall be utilized instead of diesel-fueled construction equipment, as applicable. • The schedule for soil import and/or export shall be extended to reduce the number of daily haul truck trips, as applicable. • The schedule for the coating/painting phase shall be extended to reduce the square footage coated/painted each day, as applicable. • Architectural coatings with a VOC content of less than 250 grams per liter shall be utilized.	Significant and unavoidable.
Impact AQ-B. Construction impacts related to criteria air pollutant emissions resulting from implementation of individual projects proposed under the CAP would be potentially significant.	**MM AQ-1** and **MM AQ-2**.	Significant and unavoidable.
Impact AQ-C. Neither construction nor operation of individual projects proposed under the CAP would expose sensitive receptors to substantial pollutant concentrations. This impact would be less than significant.	This impact would be less than significant. No mitigation is required.	Less than significant. No mitigation required.

Impact	Mitigation Measure(s)	Significance After Mitigation
Impact AQ-D. Neither construction nor operation of individual projects implemented under the proposed CAP would result in other emissions (such as those leading to odors) adversely affecting a substantial number of people. This impact would be less than significant.	This impact would be less than significant. No mitigation is required.	Less than significant. No mitigation required.
Biological Resources		
Impact BIO-A. Implementation of individual projects under the proposed CAP would potentially have a substantial adverse effect, either directly or through habitat modifications, on species identified as candidate, sensitive, or other special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Wildlife or U.S. Fish and Wildlife Service. This impact would be potentially significant.	**MM BIO-1 Special Status Plant Species Surveys** If completion of the project-specific biological resources assessment determines that special status plant species have potential to occur on site, surveys for special status plants shall be completed prior to any vegetation removal, grubbing, or other construction activity of each program activity (including staging and mobilization). The surveys shall be floristic in nature and shall be seasonally timed to coincide with the target species identified in the program activity-specific biological resources assessment. All plant surveys shall be conducted by a qualified biologist no more than one year prior to project implementation (annual grassland habitats may require yearly surveys). Surveys shall be conducted in accordance with current protocols established by the CDFW, USFWS and the local jurisdictions if said protocols exist. If special status plant species are identified, Mitigation Measure BIO-2 shall apply. **MM BIO-2 Special Status Plant Species Avoidance, Minimization, and Mitigation** If state- or federally-listed special status and/or CRPR 1 and 2 plant species are identified during the project-specific biological assessment, the activity shall be re-designed to avoid impacting these plant species to the maximum extent feasible. If CRPR 3 and 4 species are found, the biologist shall evaluate if they meet criteria to be considered special status, and if so, the same process as identified for CRPR 1 and 2 species shall apply. If special status plant species cannot be avoided and would be impacted by a program activity implemented under the proposed CAP, all impacts shall be mitigated at an appropriate ratio (minimum ratio of 1:1) to fully offset program activity impacts, as determined by a qualified biologist for each species. A restoration plan shall be prepared and implemented, as applicable. **MM BIO-3 Endangered/Threatened Animal Species Habitat Assessment and Protocol Surveys** If the results of the project-specific biological resources assessment determine suitable habitat may be present for any federally and/or state endangered or threatened animal species, habitat assessments and/or protocol surveys shall be completed in accordance with CDFW and/or USFWS/NMFS protocols prior to construction. Alternatively, in lieu of conducting protocol surveys, Metropolitan may choose to assume presence within the activity footprint and proceed with implementing appropriate avoidance measures, consultation, and permitting, as applicable.	Less than significant with mitigation incorporated.

Impact	Mitigation Measure(s)	Significance After Mitigation
	If the target species are detected during protocol surveys, or protocol surveys are not conducted and presence is assumed based on suitable habitat, Mitigation Measure BIO-4 shall apply. **MM BIO-4 Endangered/Threatened Animal Species Avoidance and Mitigation** If habitat is occupied or presumed occupied by federal and/or state-listed species and would be impacted by program activities, the program activity shall be redesigned in coordination with a qualified biologist to avoid impacting occupied/presumed occupied habitat to the maximum extent feasible. If occupied or presumed occupied habitat cannot be avoided, Metropolitan shall consult with USFWS, NMFS, and/or CDFW in order to determine the appropriate course of action, which may include a Biological Opinion (BO) or HCP/ITP issued by the USFWS/NMFS (relevant to federally listed species) and/or the ITP issued by the CDFW (relevant to state listed species). If occupied or presumed occupied habitat cannot be avoided, compensatory mitigation shall be provided (minimum ratio of 1:1) to fully offset impacts to habitat prior to the construction. Compensatory mitigation may be provided through purchase of mitigation bank credits, in-lieu fee, or permittee-responsible habitat restoration/establishment/enhancement/preservation. Compensatory mitigation may be combined/nested with special status plant species and sensitive natural community restoration, where applicable. Temporary impact areas shall be restored to similar pre-project conditions. If on and/or off-site habitat restoration/conservation is identified, a Habitat Mitigation and Monitoring Plan (HMMP) shall be prepared to ensure the success of compensatory mitigation sites. The HMMP shall identify long-term site management needs, routine monitoring techniques, and performance standards for determining that the conservation site has met the necessary criteria to function as a suitable mitigation site. **MM BIO-5 Endangered/Threatened Species Avoidance and Minimization During Construction** The following measures shall be applied to aquatic and terrestrial species, where appropriate. Metropolitan shall select from these measures as appropriate depending on site conditions, the species with potential for occurrence, and the results of the project-specific biological resources assessment (Mitigation Measure BIO-1). Pre-construction surveys for federal and/or state listed species with potential to occur shall be conducted where suitable habitat is present by a qualified biologist not more than 72 hours prior to the start of construction activities. The survey area shall include the proposed disturbance area and all proposed ingress/egress routes, plus a species-specific buffer. If any life stage of federal and/or state listed species is found within the survey area, the appropriate measures in the BO or HCP/ITP issued by the USFWS/NMFS (relevant to federally listed species) and/or the ITP issued by the CDFW (relevant to state listed species) shall be implemented; or if such guidance is not in place for the activity, the qualified biologist shall recommend an appropriate course of action, which may include consultation with USFWS, NMFS, and/or CDFW.	

Impact	Mitigation Measure(s)	Significance After Mitigation
	• The activity limits of disturbance shall be flagged. Areas of special biological concern within or adjacent to the limits of disturbance shall have Environmental Sensitive Area fencing installed between said area and the limits of disturbance. • All activities occurring within or adjacent to sensitive habitats that may support federally and/or state endangered/threatened species shall have a qualified biologist present during all initial ground disturbing/vegetation clearing activities. Once initial ground disturbing/vegetation clearing activities have been completed, the biologist shall conduct pre-activity clearance surveys, as needed to ensure protection of endangered/threatened species. • If pumps are used for dewatering activities, all intakes shall be completely screened with wire mesh not larger than five millimeters to prevent animals from entering the pump system. • If at any time during construction of the program activity an endangered/threatened species enters the construction site or otherwise may be impacted by the program activity, all program activities shall cease. At that point, a qualified biologist shall recommend an appropriate course of action, which may include consultation with USFWS, NMFS, and/or CDFW. Alternatively, the appropriate measures shall be implemented in accordance with the BO or HCP/ITP issued by the USFWS (relevant to federal listed species) and/or the ITP issued by the CDFW (relevant to state listed species) and work can then continue as guided by those documents and the agencies, as appropriate. • All trenches, pipes, culverts or similar structures shall be inspected for animals prior to burying, capping, moving, or filling. • Upon completion of the program activity, a qualified biologist shall prepare a final compliance report documenting all compliance activities implemented for the activity, including the pre-construction survey results. **MM BIO-6 Non-Listed Special Status Animal Species Avoidance and Minimization** Depending on the species identified in the project-specific biological resource assessment , the following applicable measures shall be implemented to reduce the potential for impacts to non-listed special status animal species: • Pre-construction clearance surveys shall be conducted by a qualified biologist within 14 days prior to the start of construction (including staging and mobilization). The surveys shall cover the entire disturbance footprint plus a minimum 100-foot buffer and shall identify all special status animal species that may occur on-site. The qualified biologist shall make recommendations for avoidance of non-listed special status species, such as through the use of exclusion fencing, buffer zones, etc. • A qualified biologist shall be present during all initial ground disturbing activities, including vegetation removal, to recover special status animal species encountered during construction activities.	

Impact	Mitigation Measure(s)	Significance After Mitigation
	• Upon completion of the program activity, a qualified biologist shall prepare a final compliance report documenting all compliance activities implemented for the program activity, including the pre-construction survey results. • If special status bat species may be present and impacted by the program activity, within 30 days of the start of construction a qualified biologist shall conduct presence/absence surveys for special status bats where suitable roosting habitat is present. Surveys shall be conducted using acoustic detectors and by searching tree cavities, crevices and other areas where bats may roost. If active bat roosts or colonies are present, the biologist shall evaluate the type of roost to determine the next step. o If a maternity colony is present, all construction activities shall be postponed within a 250-foot buffer around the maternity colony until it is determined by a qualified biologist that the young have dispersed. Once it has been determined that the roost is clear of bats, the roost shall be removed immediately. o If a roost is determined by a qualified biologist to be used by a large number of bats (large hibernaculum), alternative roosts, such as bat boxes if appropriate for the species, shall be designed and installed near the program activity site. The number and size of alternative roosts installed will depend on the size of the hibernaculum and shall be determined by a qualified biologist. o If other active roosts are located, exclusion devices shall be installed such as valves, sheeting or flap-style one-way devices that allow bats to exit but not re-enter roosts to discourage bats from occupying the site.	
Impact BIO-B. Individual projects implemented under the proposed CAP could result in significant impacts to riparian habitats wetlands and/or sensitive natural communities. This impact would be potentially significant. **Impact BIO-C.** Individual projects implemented under the proposed CAP may result in significant impacts to state or federally protected wetlands. This impact would be potentially significant.	**MM BIO-7 Jurisdictional Delineation and Impact Avoidance** If the results of Mitigation Measure BIO-1 indicate program activities implemented under the proposed CAP would impact wetlands, drainages, riparian habitats, or other areas that may fall under the jurisdiction of the CDFW, USACE, and/or RWQCB, a qualified biologist shall complete a jurisdictional delineation. The jurisdictional delineation shall determine the extent of the jurisdiction for each of these agencies within the program activity site and shall be conducted in accordance with the requirement set forth by each agency. The results shall be provided in a jurisdictional delineation report submitted to Metropolitan, USACE, RWQCB, and CDFW, as appropriate, for review and approval. The program activity shall be designed to avoid or minimize impacts to jurisdictional areas to the maximum extent feasible. **MM BIO-8 Wetlands, Drainages and Riparian Habitat Restoration** If impacts to jurisdictional drainages, wetlands, riparian habitat, and sensitive vegetation communities cannot be avoided, impacts shall be mitigated at an appropriate ratio to fully offset project-specific impacts (minimum ratio of 1:1). Where feasible, temporarily impacted areas shall be restored to pre-project conditions. An HMMP shall be developed by a qualified biologist and submitted to the agency overseeing the program activity for approval. Alternatively, mitigation shall be accomplished through purchase of credits from an approved mitigation bank or in-lieu fee program.	Less than significant with mitigation incorporated.

Impact	Mitigation Measure(s)	Significance After Mitigation
	MM BIO-9 Sensitive Natural Community Avoidance and Mitigation If the results of Mitigation Measure BIO-1 indicate program activities implemented under the proposed CAP would impact sensitive natural communities, impacts shall be avoided through final program activity design modifications. If Metropolitan determines sensitive communities cannot be avoided, impacts shall be mitigated on-site or off-site at an appropriate ratio to fully offset program activity impacts (minimum ratio of 1:1). Temporarily impacted areas shall be restored to pre-project conditions. An HMMP shall be developed by a qualified biologist and submitted to the agency overseeing the program activity for approval.	
Impact BIO-D. Neither construction nor operation of individual projects implemented under the proposed CAP would interfere with movement of native resident or migratory fish or wildlife species or established wildlife corridors. This impact would be less than significant.	This impact would be less than significant. No mitigation is required.	Less than significant. No mitigation required.
Impact BIO-E. Neither construction nor operation of individual projects implemented under the proposed CAP would impact protected trees and, as such, would not conflict with local policies or ordinances protecting biological resources. This impact would be less than significant.	This impact would be less than significant. No mitigation is required.	Less than significant. No mitigation required.
Impact BIO-F. Individual projects implemented under the proposed CAP would not conflict with a Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan area. This impact would be less than significant.	This impact would be less than significant. No mitigation is required.	Less than significant. No mitigation required.
Cultural Resources		
Impact CUL-A. Individual projects implemented under the proposed CAP would have the potential to cause a substantial adverse change in the significant of a historical resource. This impact would be potentially significant.	**MM CUL-1(a) Built Environment Investigation** A historic resources evaluation shall be prepared for any future proposed project facilitated by the CAP involving a property which includes buildings, structures, objects, landscape/site plans, or other features that are 45 years of age or older. The evaluation shall be prepared by a qualified architectural historian or historian who meets the Secretary of the Interior's (SOI) Professional Qualifications Standards (PQS) in architectural history or history. The qualified architectural historian or historian shall conduct an evaluation in accordance with the guidelines and best practices promulgated by the State Office of Historic Preservation to identify any potential historical resources within the proposed	Significant and unavoidable

Impact	Mitigation Measure(s)	Significance After Mitigation
	project area. The evaluation of the potential resource within its historic context shall be documented. All evaluated properties shall be documented on Department of Parks and Recreation Series 523 Forms. If a property is identified as an eligible historical resource under CEQA, Mitigation Measure CUL-1(b) shall be implemented. **MM CUL-1(b) Built Environment Documentation Program** If eligible built environment historical resources are identified for a future proposed project implemented under the CAP, efforts shall be made to the extent feasible to ensure that impacts are avoided. If avoidance is not possible, a Built Environment Documentation Program shall be implemented. Measures may include but are not limited to, compliance with the Secretary of the Interior's Standards for Treatment of Historic Properties and documentation of the historical resource in the form of a Historic American Building Survey (HABS)- report or HABS-Like report. The HABS or HABS-Like report shall comply with the Secretary of the Interior's Standards for Architectural and Engineering Documentation and shall generally follow the HABS Level III requirements, including digital photographic recordation, detailed historic narrative report, and compilation of historic research. Application of mitigation shall generally be overseen by a qualified architectural historian or historic architect meeting the PQS, unless unnecessary in the circumstances (e.g., preservation in place). **MM CUL-3 Previously Unidentified Resources Encountered During Construction** In the event that any potentially significant cultural resources are unexpectedly encountered during construction, work will be immediately halted and the discovery shall be protected in place. A 50-foot buffer around the exposed resource shall be established until a qualified cultural resources specialist evaluates the discovery. If the qualified cultural resources specialist determines that the discovery represents a potentially significant cultural resource, including a potential historical resource, additional investigations may be required to mitigate adverse impacts from project implementation. This additional work may include avoidance, testing, and evaluation or data recovery excavation. Work shall be prohibited in the restricted area until Metropolitan provides written authorization.	
Impact CUL-B. Individual projects implemented under the proposed CAP may cause a substantial adverse change in the significance of an archaeological resource. This impact would be potentially significant.	**MM CUL-2(a) Phase 1 Archaeological Resource Investigation** If archaeological resources are identified during project-specific analysis that may be adversely affected by any future proposed project implemented under the CAP, Metropolitan shall retain a qualified archaeologist meeting the Secretary of the Interior standards in archaeology to complete a Phase 1 cultural resources assessment of the site. A Phase 1 cultural resources assessment will include an archaeological pedestrian survey of the site, if feasible, and sufficient background archival research to determine whether subsurface prehistoric or historic remains may be present. Archival research should include a current records search from the appropriate California Historical Resources Information System information center and a Sacred Lands File search conducted with the Native American Heritage Commission. A Phase 1 report or results documentation shall be submitted to Metropolitan prior to any ground disturbing activities. Recommendations contained therein shall be implemented throughout all ground disturbance activities.	Significant and unavoidable.

Impact	Mitigation Measure(s)	Significance After Mitigation
	MM CUL-2(b) Extended Phase 1 Investigation For any projects proposed within 100 feet of a known archaeological site and/or in areas identified as sensitive by the Phase 1 study, an Extended Phase 1 (XPI) study shall be conducted to determine the presence/absence and extent of archaeological resources on the project site. XPI testing should comprise a series of shovel test pits and/or hand augured units and/or mechanical trenching intended to establish the horizontal and vertical boundaries of archaeological site(s) on the project site. No archaeological resources would be collected during the XPI Investigation. If an archaeological site is identified, Mitigation Measure CUL-2(c) or CUL-2(d) shall be implemented. **MM CUL-2(c) Avoidance of Archaeological Resources** Identified prehistoric or historic archaeological resources shall be avoided and preserved in place, where feasible. Where avoidance and preservation in place is not feasible, additional measures shall be applied as identified in Mitigation Measure CUL-2(d) through CUL-2(g). **MM CUL-2(d) Phase 2 Archaeological Resources Investigation and Evaluation** Where preservation is not feasible, each resource shall be evaluated for significance and eligibility for listing in the CRHR through a Phase 2 archaeological resource evaluation. A Phase 2 evaluation shall include any necessary archival research to identify significant historical associations as well as mapping of surface artifacts, collection of functionally or temporally diagnostic tools and debris, and excavation of a sample of the cultural deposit to characterize the nature of the sites, define the artifact and feature contents, determine horizontal boundaries and depth below surface, and retrieve representative samples of artifacts and other remains. A final Phase 2 Testing and Evaluation report shall be submitted to Metropolitan prior to any ground disturbing activities. Recommendations contained therein shall be implemented throughout all ground disturbance activities. **MM CUL-2(e) Phase 3 Archaeological Data Recovery Program** If an archaeological resource meets the CRHR eligibility and cannot be avoided, Metropolitan shall implement a Phase 3 Archaeological Data Recovery Program, conducted to exhaust the data potential of significant archaeological sites. The Phase 3 Archaeological Data Recovery Program shall follow a research design prepared by a qualified archaeologist meeting the SOI PQS standards for archaeology and approved by Metropolitan in advance of Phase 3 fieldwork and excavations. The Phase 3 Data Recovery research design will use appropriate archaeological field and laboratory methods consistent with the California Office of Historic Preservation Planning Bulletin 5 (1991), Guidelines for Archaeological Research Design, or the latest edition thereof. The final Phase 3 Data Recovery report shall be submitted to Metropolitan prior to and any ground disturbing activities. Recommendations contained therein shall be incorporated into project design and implemented throughout all ground disturbance activities. **MM CUL-2(f) Processing and Curation of Archaeological Materials** Archaeological materials collected from the sites during the implementation of Mitigation Measures CUL-2(d) through CUL-2(e) shall be processed and analyzed in the laboratory according to standard archaeological procedures. The age of the materials shall be	

Impact	Mitigation Measure(s)	Significance After Mitigation
	determined using radiocarbon dating and/or other appropriate procedures; lithic artifacts, faunal remains, and other cultural materials shall be identified and analyzed according to current professional standards. The significance of the sites shall be evaluated according to the criteria of the CRHR. The results of the investigations shall be presented in a technical report following the standards of the California Office of Historic Preservation publication "Archaeological Resource Management Reports: Recommended Content and Format (1990 or latest edition)". Upon completion of the work, all artifacts, other cultural remains, records, photographs, and other documentation shall be curated an appropriate established curation facility based on the location of the fieldwork and/or repatriated to local Native Americans as appropriate. All fieldwork, analysis, report production, and curation shall be fully funded by Metropolitan. **MM CUL-2(g) Cultural Resources Monitoring** If recommended by Phase 1 (Mitigation Measure CUL-2(a)), XPI (Mitigation Measure CUL-2(b)), Phase 2 (Mitigation Measure CUL-2(d)), or Phase 3 (Mitigation Measure CUL-2(e)) studies, Metropolitan shall retain a qualified archaeologist to monitor project-related, ground-disturbing activities. **MM CUL-3**	
Impact CUL-C. Individual projects implemented under the proposed CAP would be required to comply with all applicable regulations pertaining to the discovery of human remains. This impact would be less than significant.	This impact would be less than significant. No mitigation is required.	Less than significant. No mitigation required.
Noise		
Impact NOI-A. Individual projects implemented under the proposed CAP may result in generation of a substantial temporary or permanent increase in ambient noise levels. This impact would be potentially significant.	**MM NOI-1 Locate Excavation Sites Away from Noise-Sensitive Receivers, Where Feasible** Construction staging and activities shall be located in areas as far as practicable from sensitive receivers or in areas where receivers can be shielded from construction noise. **MM NOI-2(a) Conduct Project-Level Noise Studies for Construction Activities Where Noise-Sensitive Receivers are Present** Project-level construction noise studies shall be conducted for project activities that would exceed the screening criteria for a less-than-significant impact, as summarized in Table 30 and Table 32 of the draft PEIR. Such noise studies shall identify the existing ambient noise levels, characterize the nearest sensitive receivers, estimate the noise levels receivers will experience during construction of individual projects, compare estimated noise levels to the local jurisdiction's noise limits or to the construction noise criteria in the FTA (2018) *Transit Noise and Vibration Impact Assessment Manual* for those that do not have quantitative construction noise level limits, outline any measures that may be used to reduce noise levels, and determine the amount of noise reduction that would occur with	Significant and unavoidable

Impact	Mitigation Measure(s)	Significance After Mitigation
	implementation of these measures. If the project-level noise study concludes that noise reduction measures are required, Mitigation Measure NOI-2(b) shall be implemented. **MM-NOI-2(b) Implement Noise Reduction Measures** If the results of the noise study determine noise reduction measures are required, noise reduction measures shall be implemented. Construction noise reduction measures may include, but would not be limited to, the use of mufflers, sound blankets/barriers, and/or enclosures and scheduling construction activities to minimize simultaneous operation of noise-producing equipment. Construction noise measures shall be implemented to reduce noise levels to FTA (2018) construction noise criteria, as feasible. If the individual project would be constructed concurrently with development projects located within a 0.5-mile radius of the individual project location, the noise study shall also consider the cumulative impact of construction noise on sensitive receivers. If applicable, construction noise reduction measures shall be implemented to reduce cumulative noise levels to local jurisdiction or FTA (2018) construction noise criteria, as feasible. **MM NOI-2(c) Conduct Project-Level Noise Studies for Post-Construction Activities Where Noise Sensitive Receivers are Present** Prior to the commencement of construction activities for individual projects that may be implemented under the CAP where sensitive receivers are located within 1,000 feet of the individual project sites, project-level post-construction noise studies shall be conducted. Such noise studies shall identify the ambient noise levels, characterize the nearest sensitive receivers, estimate the noise levels receivers will experience during operation of individual projects during the post-construction period, compare estimated noise levels to the noise level standards of the applicable jurisdiction, outline any measures that may be used to reduce noise levels, and determine the amount of noise reduction that would occur with implementation of these measures. Noise reduction measures may include, but would not be limited to, alternative site design, alternative orientation of noise sources, and construction of berms and/or barriers. Noise reduction measures shall be implemented to reduce noise levels to the noise level standards of the applicable jurisdiction, as feasible.	

Impact	Mitigation Measure(s)	Significance After Mitigation
Impact NOI-B. Construction activities associated with implementation of individual projects under the proposed CAP may result in generation of excessive groundborne vibration or groundborne noise levels, depending on the nature and location of such projects. This impact would be potentially significant.	**NOI-3 (a) Locate Excavation Sites Away from Vibration-Sensitive Receivers, Where Feasible** Whenever practicable, vibration-generating equipment including bulldozers, loaded trucks, pile drivers/pneumatic post drivers, bore/drill rigs, vibratory rollers, and jackhammers shall operate outside the minimum distances specified in Table 33 of the draft PEIR for historic sites, other structures, and vibration-sensitive receivers during program construction activities. Furthermore, whenever practicable, vibration-generating equipment including bulldozers, loaded trucks, pile drivers/pneumatic post drivers, bore/drill rigs, vibratory rollers, and jackhammers shall not be operated concurrently with vibration-generating equipment associated with cumulative development projects located within 600 feet of program construction sites. **NOI-3(b) Conduct Project-Level Vibration Analysis for Construction Activities Where Vibration-Sensitive Receivers are Present** If operation of construction equipment outside the specified buffer distances is not practicable, a detailed study of vibration impacts shall be conducted prior to the commencement of construction for that project. Such vibration studies shall characterize the nearest historic sites, structures, and/or sensitive receivers; estimate the vibration levels receivers will experience during construction of individual projects; compare estimated vibration levels to applicable Caltrans (2020) standards for vibration impacts related to structural damage and human annoyance; outline any measures that may be used to reduce vibration levels; and determine the amount of vibration reduction that would occur with implementation of these measures. Vibration reduction measures may include, but would not be limited to, the use of non-vibratory equipment, vibration monitoring, and repair of structural damage. Construction vibration reduction measures shall be implemented to reduce vibration levels to Caltrans (2020) construction vibration thresholds as feasible. If the individual project would be constructed concurrently with cumulative development projects located within a 600-foot radius of the activity location, the vibration study shall also consider the cumulative impact of combined vibration levels at the nearest sensitive receivers by estimating the combined vibration levels receivers will experience during construction of individual projects and cumulative development; compare estimated vibration levels to applicable standards for vibration impacts related to structural damage and human annoyance described in the Caltrans (2020) *Transportation and Construction Vibration Guidance Manual* (CT-HWANP-RT-20-365.01.01); identify whether the individual project's contribution to any identified cumulative impact would be cumulatively considerable; outline any measures that may be used to reduce the project's contribution to combined vibration levels; and determine the amount of vibration reduction that would occur with implementation of these measures. Such measures may include, but are not limited to, the installation of wave barriers, maximization of the distance between vibratory equipment and receivers, restriction of vibration-generating activities to daytime hours, or temporary relocation of affected residents Construction vibration reduction measures shall be implemented to reduce cumulative vibration levels to Caltrans construction vibration thresholds as feasible.	Significant and unavoidable

Impact	Mitigation Measure(s)	Significance After Mitigation
Impact NOI-C. One individual project to be implemented under the proposed CAP is located within the vicinity of a private airstrip or within an airport land use plan. However, projects implemented under the proposed CAP would not expose people residing or working in the area to excessive noise levels. This impact would be less than significant.	This impact would be less than significant. No mitigation is required.	Less than significant. No mitigation required.
Tribal Cultural Resources		
Impact TCR-A. Implementation of projects under the proposed CAP would not cause a substantial adverse change in the significance of a tribal cultural resource as defined in Public Resources Code Section 5020.1(k), as Native American consultation completed pursuant to Assembly Bill (AB) 52 identified no resources that may be impacted by the proposed program. This impact would be less than significant.	This impact would be less than significant. No mitigation is required.	Less than significant. No mitigation required.
Impact TCR-B. Implementation of projects under the proposed CAP would not cause a substantial adverse change in the significance of a tribal cultural resource determined to be significant pursuant to criteria set forth in subdivision (c) of Public Resources Code Section 5024.1. Native American consultation completed pursuant to AB 52 identified no resources that may be impacted by the proposed program. This impact would be less than significant.	This impact would be less than significant. No mitigation is required.	Less than significant. No mitigation required.

1 Introduction

1.1 Overview of the Proposed Program

The Metropolitan Water District of Southern California (Metropolitan) is proposing a Climate Action Plan (CAP or proposed program) to identify strategies to reduce greenhouse gas (GHG) emissions and achieve the proposed GHG reduction targets. The CAP includes a baseline GHG emissions inventory of Metropolitan's operations from 1990 through 2017, emissions forecast through 2045, emissions reduction targets consistent with Senate Bill (SB) 32 and Executive Order B- 55-18, actions and policies that Metropolitan could implement to achieve GHG reductions, and an implementation roadmap. The CAP would apply to Metropolitan's operations throughout the state within a six-county Southern California region comprised of Los Angeles, Orange, Riverside, San Bernardino, San Diego, and Ventura counties, and Metropolitan-owned facilities located in the Sacramento-San Joaquin Delta and Palos Verdes Valley, Imperial County, defined as the "Plan Area."

1.2 Purpose of the Program Environmental Impact Report

This Program Environmental Impact Report (PEIR) assesses the potential environmental effects of Metropolitan's proposed CAP. This PEIR has been prepared in accordance with the California Environmental Quality Act (CEQA) of 1970 (Public Resources Code [PRC] Section 21000 et seq.) and the Guidelines for Implementation of CEQA (*State CEQA Guidelines*) published by the Public Resources Agency of the State of California (California Code of Regulations [CCR], Title 14, Section 15000 et seq.). Metropolitan is the Lead Agency under CEQA (PRC Section 21067, as amended), is responsible for the preparation of the PEIR, and will use this document to objectively review and assess the proposed program prior to approval or disapproval.

An EIR is intended to: (1) inform decision-makers and the public about the potentially significant environmental effects of the proposed activities; (2) identify the ways that significant environmental effects can be avoided or reduced; (3) prevent significant, avoidable damage to the environment by requiring changes in the proposed program through the use of alternatives or mitigation measures, to the extent that Metropolitan determines the changes to be feasible (*State CEQA Guidelines* Section 15002; PRC Section 21002.1). Further, a PEIR can be prepared for a series of actions that can be characterized as one large project and are related either geographically, as logical parts in contemplated actions, or in the connection with issuance of rules, regulations, plans of other general criteria to govern the conduct of a continuing program (*State CEQA Guidelines* Section 15268; PRC Section 21002.1).

Subsequent activities covered under the proposed program must be examined in the light of the PEIR to determine whether an additional environmental document must be prepared. If a later activity would have effects that were not examined in the PEIR, a new Initial Study would need to be

prepared leading to either an EIR or a Negative Declaration (Section 15168 of the *State CEQA Guidelines)*. If the agency finds that pursuant to Section 15162 of the *State CEQA Guidelines*, no new effects could occur or no new mitigation measures would be required, the agency can approve the activity as being within the scope of the project covered by the PEIR, and no new environmental document would be required. An agency must incorporate those feasible mitigation measures and alternatives developed in the PEIR into subsequent actions in the program where such actions would result in similar significant impacts. Where the subsequent activities involve site-specific operations, the agency should use a written checklist or similar device to document the evaluation of the site and the activity to determine whether the environmental effects of the operation were covered in the PEIR. A PEIR will be most helpful in dealing with subsequent activities if it deals with the effects of the program as specifically and comprehensively as possible. With a good and detailed analysis of the proposed program, many subsequent activities could be found to be within the scope of the project described in the PEIR, and no further environmental documents would be required.

1.3 Scope of the Program Environmental Impact Report

This draft PEIR focuses on impacts identified to be potentially significant after impact analysis. The following environmental resource areas were found to include potentially significant impacts and have been studied in-depth in this PEIR:

- Air Quality
- Biological Resources
- Cultural Resources
- Noise

Resource areas identified as having no impacts or less than significant impacts after impact analysis include the following:

- Aesthetics
- Agriculture and Forestry Resources
- Energy
- Geology and Soils
- Greenhouse Gas Emissions
- Hazards and Hazardous Materials
- Hydrology and Water Quality
- Land Use and Planning
- Mineral Resources
- Population and Housing
- Public Services
- Recreation
- Transportation
- Tribal Cultural Resources
- Utilities and Service Systems
- Wildfire

Additionally, this draft PEIR contains a Tribal Cultural Resources section describing Native American tribal outreach efforts conducted by Metropolitan pursuant to the requirements of Assembly Bill (AB) 52.

1.4 Format of the Program Environmental Impact Report

This draft PEIR is organized as follows:

- ***Executive Summary***. The summary includes a brief program description, a summary of environmental impacts and a list of proposed mitigation measures that would reduce or avoid impacts, discussion of alternatives considered, description of areas of controversy known to the lead agency, and any issues to be resolved (*State CEQA Guidelines* Section 15123).
- **Chapter 1, *Introduction***. This chapter introduces the program and describes the scope and purpose of the PEIR, provides a brief summary of the CEQA process, and establishes the document format.
- **Chapter 2, *Project Description***. This chapter provides background information on Metropolitan, a brief discussion on GHG emissions and climate change, the need for the CAP, the objectives of the CAP, the geographic area covered by the CAP, components of the CAP, and a description of the proposed emissions reduction measures.
- **Chapter 3, *Environmental Setting***. This chapter provides a general overview of the environmental setting for the Plan Area, including a regional setting, sub-regional setting, and a description of major Metropolitan facilities and land holdings. This chapter also outlines the PEIR baseline and approach to both program-level and cumulative impact analyses.
- **Chapter 4, *Environmental Impact Analysis***. This chapter constitutes the main body of the PEIR and includes the detailed impact analysis for each environmental resource area listed in Section 1.3, *Scope of the PEIR*. Sections 4.1 to 4.5 include a discussion of methods of analysis, existing conditions, the thresholds identified for the determination of significant impacts, and an evaluation of the impacts associated with the proposed program for each resource area. Where the impact analysis demonstrates the potential for the proposed program to have a significant impact on the environment, mitigation measures are provided that would minimize the significant effects. The PEIR indicates if the proposed mitigation measures would reduce impacts to less-than-significant levels. The cumulative impacts that would result from implementation of the proposed program in combination with other past, present, and reasonably foreseeable or probable future projects are discussed in each resource section. While enough project data exists to make reasonable assumptions about the potential level of significance for each project, additional project-level analysis will be completed when specific, project-level information becomes available for each project proposed in the CAP. The PEIR identifies the additional environmental analysis will be necessary at the project level.
- **Chapter 5, *Effects Found Not to be Significant.*** This chapter discusses the environmental resource areas indicated in Section 1.3, *Scope of the PEIR*, that would not be significantly impacted by the proposed program. Brief descriptions of why impacts would be less than significant in each of these resource areas are provided in this chapter.
- **Chapter 6, *Other Required CEQA Discussion*.** This chapter discusses additional topics required by CEQA, including unavoidable adverse impacts, growth inducement, and irreversible environmental changes.
- **Chapter 7, *Alternatives***. This chapter provides a description of alternatives to the proposed program and an evaluation of their potential to reduce or avoid the CAP's significant impacts.
- **Chapter 8, *References and Preparers***. This chapter contains references for all citations included in the draft PEIR, as well as a list of preparers and contributors.

1.5 Notice of Preparation

Development of the proposed program is subject to the requirements of CEQA, because it is an action subject to discretionary approval by a public agency (in this case, Metropolitan) that has the potential to result in a physical change in the environment. Pursuant to Section 15082 of the *State CEQA Guidelines*, a Notice of Preparation (NOP) of a Draft PEIR, dated June 23 to July 22, 2020, was prepared and circulated to interested agencies, organizations, and individuals to afford them an opportunity to respond with specific comments and/or questions regarding the scope and content of the PEIR. The NOP was also sent to the State Clearinghouse (SCH) at the California Governor's Office of Planning and Research. The SCH number assigned to this PEIR is SCH No. 2020060450. Pursuant to Section 15082 of the *State CEQA Guidelines*, recipients of the NOP for the proposed program were requested to provide responses within 30 days after their receipt of the NOP.

All comments received during the public review period were considered during the preparation of this PEIR. Metropolitan received letters from ten agencies in response to the NOP during the public review period. Written comments are addressed, as appropriate, in the analysis contained in the various subsections of Chapter 4, *Environmental Impact Analysis*, and Chapter 5, *Effects Found Not to be Significant*. The NOP is presented in Appendix A of this PEIR, along with the NOP responses received.

1.6 Availability of Draft Program Environmental Impact Report

This draft PEIR has been distributed to various federal, state, regional, county, and city agencies as well as interested parties for a 45-day public review period in accordance with Section 15087 of the *State CEQA Guidelines*. In addition, this draft PEIR, including supporting technical documentation, is available by appointment to the general public for review during normal operating hours at Metropolitan's offices at 700 North Alameda Street, Los Angeles, California, and can be viewed on Metropolitan's website at the following address: http://www.mwdh2o.com/CEQA.

Agencies and other interested parties may provide written comments on the draft PEIR before the end of the 45-day public review and comment period. Written comments on the draft PEIR must be received by 5 p.m. on the last day of the public review and comment period indicated in the Notice of Availability of a Draft PEIR and submitted to:

Ms. Malinda Stalvey
Senior Environmental Specialist
The Metropolitan Water District of Southern California
Environmental Planning Unit
P.O. Box 54153
Los Angeles, California 90054-0153

Comments may also be emailed to EP@mwdh2o.com (reference "Metropolitan CAP PEIR" in the subject line). Written comments should include the name, mailing address, telephone number, and email address, if available, of a contact person. Following the 45-day public review and comment period for the draft PEIR, Metropolitan will prepare a written response for each written comment received on the draft PEIR. The written comments and responses to those comments, as well as PEIR changes, if any, will be incorporated into a Final PEIR. Pursuant to Section 15092 of the *State CEQA Guidelines*, Metropolitan's Board of Directors will consider the following actions: certify the Final PEIR; adopt the findings of fact, statement of overriding considerations, and mitigation monitoring and reporting program; and approve the proposed program.

2 Project Description

The Metropolitan Water District of Southern California (Metropolitan), the lead agency under the California Environmental Quality Act (CEQA), is proposing a Climate Action Plan (CAP; proposed program) to identify strategies to reduce greenhouse gas (GHG) emissions and achieve the proposed GHG reduction targets. This chapter describes the CAP background and objectives, proposed project components, and the Plan Area. The chapter also provides a detailed summary of Metropolitan's emissions inventory and forecast, proposed emissions reduction targets, proposed emissions reduction measures, and a description of individual projects proposed under the CAP.

2.1 Background and Project Need

2.1.1 The Metropolitan Water District of Southern California

Metropolitan is a regional wholesaler that provides water for 26 member agencies to deliver either directly or through their sub-agencies to nearly 19 million people across a 5,200-square mile service area in six counties (Los Angeles, Orange, Riverside, San Bernardino, San Diego and Ventura) in Southern California. On average, Metropolitan conveys approximately 1.7 billion gallons of water daily throughout its distribution system. Metropolitan imports water from the State Water Project (SWP) and from the Colorado River via the Colorado River Aqueduct (CRA). Approximately 45 percent of Southern California's water supply comes from these two sources. In addition to imported water, Metropolitan invests in local resource development along with its member agencies and utilizes groundwater banking and transfer programs. Metropolitan also manages water demands by promoting and investing in conservation and water use efficiency projects. Water supplies are conveyed through Metropolitan's extensive distribution system, which includes the CRA, 16 small hydroelectric facilities, nine reservoirs, 819 miles of large-scale pipes, and five water treatment plants.

Due to the large-scale water delivery services supplied by Metropolitan, large amounts of energy are required to bring the water from it source to its ultimate purchasing agency for delivery to the residents of Southern California. Metropolitan's activities include operation and maintenance of water infrastructure, offices, and other facilities throughout Southern California. Such activities require consumption of energy created from coal, hydrocarbon gas liquids, natural gas, petroleum, and renewable sources, many of which result in emissions of GHGs.

2.1.2 Greenhouse Gas Emissions and Global Climate Change

Greenhouse Gases

GHGs are gases that absorb and re-emit infrared radiation in the atmosphere, a process known as the greenhouse effect. As these gases accumulate in the atmosphere, the continued re-emission of radiation contributes to a warming of the planet, known as global warming or global climate change. While GHGs are emitted by both natural processes and human activities, emissions resulting from human activities have increased substantially since the Industrial Revolution during the 18th and 19th centuries, exacerbating the greenhouse effect and resulting in human-induced (or anthropogenic) climate change. GHGs that are widely seen as the principal contributors to human-induced climate change include carbon dioxide, methane, nitrous oxides, fluorinated gases such as hydrofluorocarbons and perfluorocarbons, and sulfur hexafluoride. While a potent GHG, water vapor is excluded from the list of GHGs because it is short-lived in the atmosphere, and its atmospheric concentrations are largely determined by natural processes, such as oceanic evaporation.

As described above, GHGs are emitted by both natural processes and human activities. Of these gases, carbon dioxide and methane are emitted in the greatest quantities from human activities. Emissions of carbon dioxide are largely by-products of fossil fuel combustion, whereas methane results from off-gassing associated with agricultural practices and landfills.[1]

Human-made GHGs, many of which have greater heat-absorption potential than carbon dioxide, include fluorinated gases and sulfur hexafluoride (United States Environmental Protection Agency [U.S. EPA] 2018). Different types of GHGs have varying global warming potentials (GWP). The GWP of a GHG is the potential of a gas or aerosol to trap heat in the atmosphere over a specified timescale (generally 100 years). Because GHGs absorb different amounts of heat, a common reference gas (carbon dioxide) is used to relate the amount of heat absorbed to the amount of the individual GHG emission, referred to as "carbon dioxide equivalent" (CO_2e), which is the amount of a GHG emitted multiplied by its GWP. Carbon dioxide has a 100-year GWP of one. By contrast, methane has a 100-year GWP of 25, meaning its global warming effect is 25 times greater than carbon dioxide on a molecule per molecule basis over a 100-year timescale (Intergovernmental Panel on Climate Change [IPCC] 2007).

Climate Change

Globally, climate change has the potential to affect numerous environmental resources through potential impacts related to future air temperatures and precipitation patterns. Scientific modeling predicts that continued GHG emissions at or above current rates would induce more extreme climate changes during the 21st century than were observed during the 20th century. Long-term trends have found that each of the past three decades (from 1990 to 2020) has been warmer than all the previous decades in the instrumental record, and the decade from 2000 through 2010 has been the warmest.

The observed global mean surface temperature for the 10-year period from 2006 to 2015 was approximately 0.87 degrees Celsius (°C) higher than the average global mean surface temperature over the period from 1850 to 1900. Furthermore, several independently analyzed data records of global and regional Land-Surface Air Temperature (LSAT) obtained from station observations demonstrate that LSAT as well as sea surface temperatures have increased. Due to past and current activities, anthropogenic GHG emissions are increasing global mean surface temperature at a rate of 0.2°C per decade. In addition to these findings, there are identifiable signs that global warming is

[1] Off-gassing refers to production and emissions of methane, produced when animal waste and municipal solid waste is broken down by bacteria.

currently taking place, including substantial ice loss in the Arctic from 1996 to 2019 (National Aeronautics and Space Administration 2020; IPCC 2014, 2018).

While global in nature, climate change has the potential to result in unique and concentrated regional and localized impacts in California. According to *California's Fourth Climate Change Assessment*, statewide temperatures from 1986 to 2016 were approximately 1 degree Fahrenheit (°F) to 2°F higher than those recorded from 1901 to 1960. Potential impacts of climate change in California may include loss in water supply from snowpack, sea level rise, more extreme heat days per year, more large forest fires, and more drought years (State of California 2019). While there is growing scientific consensus about the possible effects of climate change at a global and statewide level, current scientific modeling tools are unable to predict what local impacts may occur with a similar degree of accuracy. In addition to statewide projections, *California's Fourth Climate Change Assessment* includes regional reports that summarize climate impacts and adaptation solutions for nine regions of the state as well as regionally-specific climate change case studies (State of California 2019).

2.1.3 Greenhouse Gas Emissions Reduction Policies and Climate Action Planning

California Emissions Reduction Regulations

California continues to lead the global effort of mitigating and adapting to climate change through progressive legislative and executive direction. Such actions have established a series of increasingly stringent GHG emissions reduction goals and targets intended to help reduce and reverse the effects of global climate change. These goals and targets include the following:

- **Executive Order S-3-05.** In recognition of California's vulnerability to the effects of climate change, former Governor Schwarzenegger established Executive Order S-3-05 in 2005, which sets forth targets to reduce GHG emissions to 1990 levels by 2020 and to 80 percent below 1990 levels by 2050.
- **Assembly Bill (AB) 32.** Signed into law in 2006, the California Global Warming Solutions Act codifies a statewide goal of reducing GHG emissions to 1990 levels by 2020.
- **Senate Bill (SB) 32.** SB 32 serves as an update to the emissions reduction target codified under AB 32. Signed into law in 2016, SB 32 establishes a statewide emissions reduction target of 40 percent below 1990 levels by 2030.
- **Executive Order B-55-18.** On September 10, 2018, the governor issued Executive Order B-55-18, which established a new statewide goal of achieving carbon neutrality by 2045 and maintaining net negative emissions thereafter.

Additionally, while it does not establish an emissions reduction target, SB 100 supports the reduction of GHG emissions from the electricity sector by accelerating the state's Renewables Portfolio Standard Program, which requires electricity providers to increase procurement from eligible renewable energy resources to 33 percent of total retail sales by 2020, 60 percent by 2030, and 100 percent by 2045.

Climate Action Planning

In response to mounting urgency surrounding global climate change and mandated emissions reductions, entities in California and around the world have developed CAPs. While the content of such plans varies depending on the specific emissions reduction objectives of the entity, CAPs generally include an inventory of baseline emissions, a forecast of future emissions, a GHG reduction

goal consistent with applicable reduction targets, and a series of policies, measures, or actions intended to achieve the reduction goal.

Metropolitan's core mission of supplying its service area with adequate and reliable supplies of high-quality water is inextricably linked to the effects of global climate change, as changes in temperature and precipitation patterns create uncertainty around water supply availability and demand throughout Metropolitan's service area. Since its formation in 1928, Metropolitan's goal of securing water to meet the population demands in Southern California has evolved from meeting water needs, to providing this water delivery in an environmentally and economically responsible way. As Metropolitan's service population has grown, continued and increasing efforts to reduce the environmental and economic impact of Southern California's water supply have contributed to Metropolitan's resiliency and opportunities for neutralizing its carbon footprint.

Metropolitan furthers this commitment to sustainability and efficiency by proposing to adopt a CAP to establish an emissions reduction target and describe in detail reduction activities and policies Metropolitan may implement to achieve its reduction targets over time. Each of these core components of the CAP is described further in the following sections.

2.2 Proposed Program Objectives

This Program Environmental Impact Report (PEIR) analyzes potential environmental impacts associated with implementation of the proposed program, the CAP. Pursuant to Section 15124(b) of the *State CEQA Guidelines*, an EIR shall contain a statement of objectives sought by the proposed program. The objectives of the proposed program, the CAP, include the following:

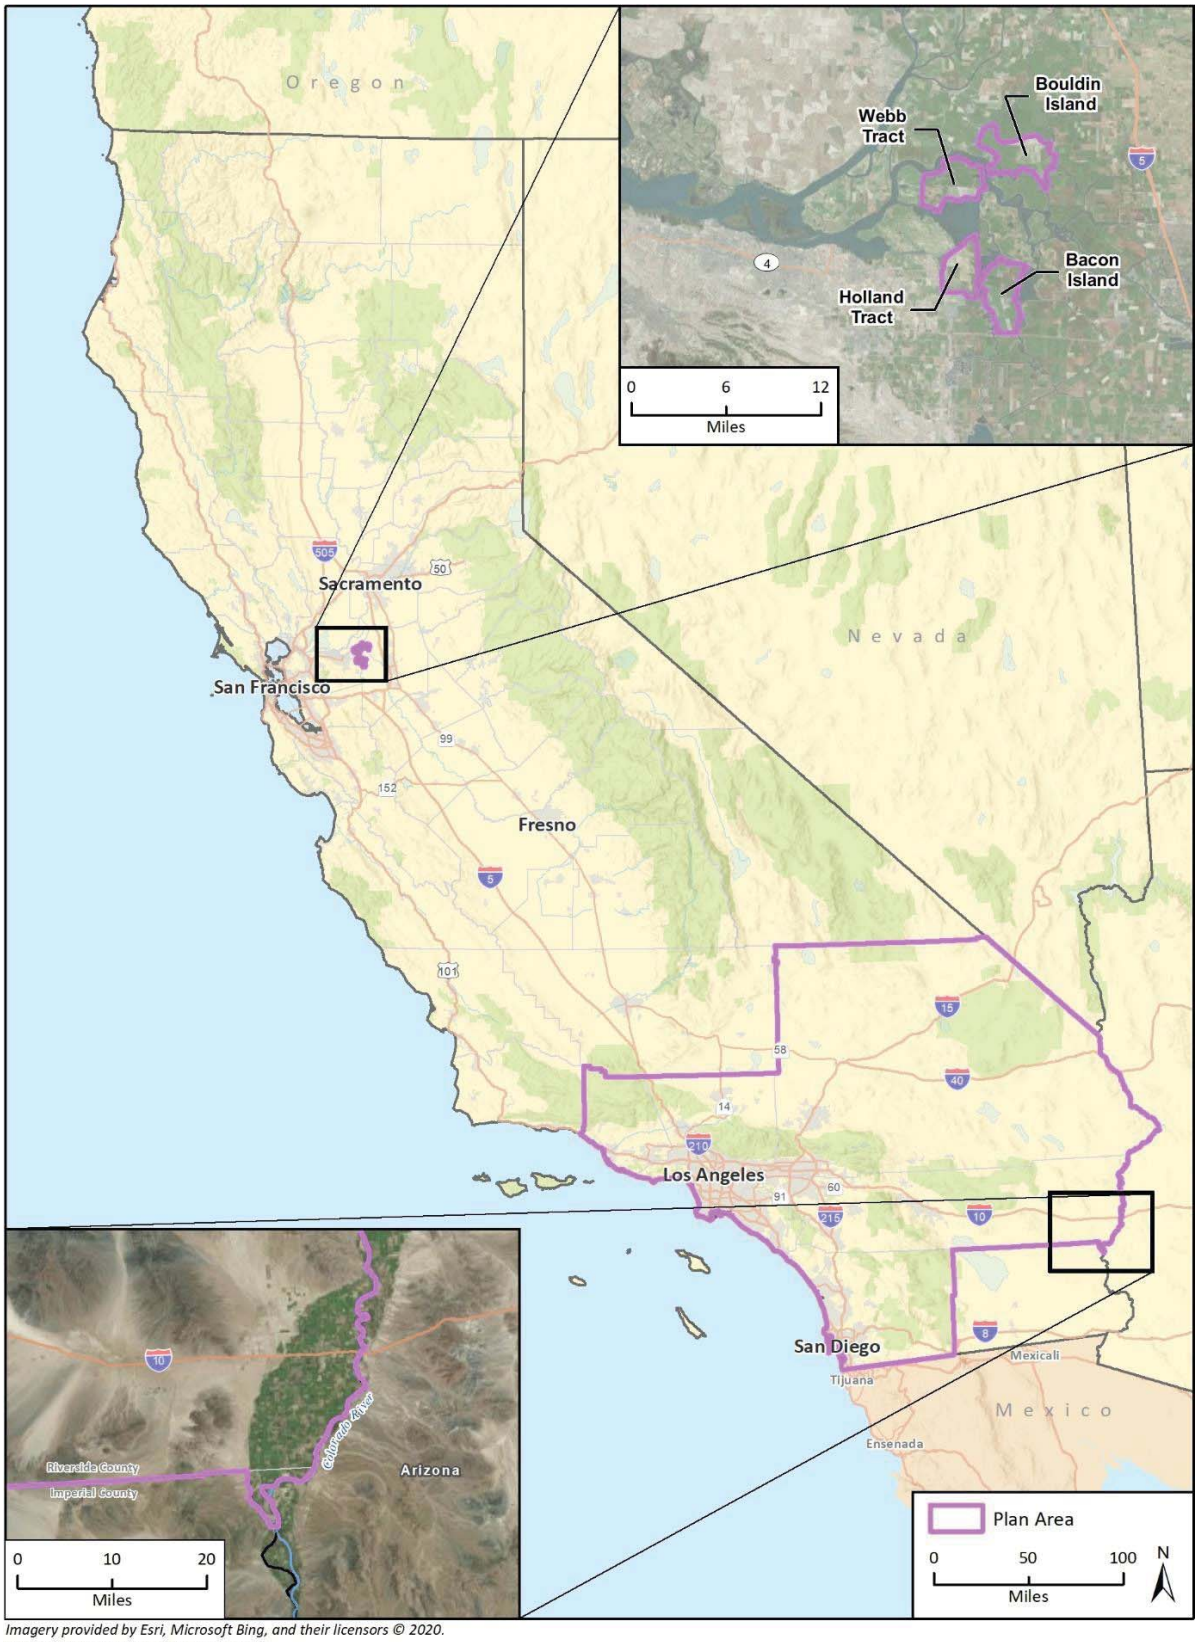
- Identify and quantify emissions associated with Metropolitan operations to prepare a baseline GHG emissions inventory in order to track emissions reduction progress over time
- Adopt an emissions reduction target that is both consistent with existing state emissions reduction targets while preparing Metropolitan to meet future state targets
- Identify and quantify specific reduction actions and policies that Metropolitan may implement to achieve the goal of reducing GHG emissions from its construction and operational activities
- Provide a roadmap for future activities to achieve consistency with the CAP and use CEQA streamlining tools for analysis of GHG emissions pursuant to the requirements of *State CEQA Guidelines* Section 15183.5

2.3 Climate Action Plan Area and Member Agencies

Plan Area

The CAP includes GHG emissions reduction measures for Metropolitan's construction, operation, and maintenance activities. It is anticipated that most reduction measures would be implemented throughout a six-county Southern California region comprising Los Angeles, Orange, Riverside, San Bernardino, San Diego, and Ventura counties. These counties include all of Metropolitan's service area and most of its infrastructure facilities. The CAP may also involve implementation of GHG emissions reduction measures or programs at Metropolitan land holdings in Imperial County, specifically within the Palo Verde Valley; as well as Bacon Island, Bouldin Island, Holland Tract, and Webb Tract in the Sacramento-San Joaquin Delta region (San Joaquin County and Contra Costa County). Figure 1 shows the Plan Area for the CAP.

Figure 1 Plan Area



Imagery provided by Esri, Microsoft Bing, and their licensors © 2020.
Additional data provided by USGS, 2017.

While environmental emissions influence climate change at a global scale, the analysis in this PEIR focuses on potential impacts associated with implementation of the CAP in California—and specifically, the Plan Area—consistent with the requirements and applicability of CEQA.

Member Agencies

As described in Section 2.1, *Background and Project Need*, Metropolitan is comprised of 26 member agencies, including 14 cities and 12 water agencies, located throughout Southern California. These include:

- City of Anaheim
- City of Burbank
- City of Fullerton
- City of Long Beach
- City of Pasadena
- City of San Marino
- City of Santa Monica
- Calleguas Municipal Water District
- Eastern Municipal Water District
- Inland Empire Utilities Agency
- Municipal Water District of Orange County
- Three Valleys Municipal Water District
- West Basin Municipal Water District
- City of Beverly Hills
- City of Compton
- City of Glendale
- City of Los Angeles
- City of San Fernando
- City of Santa Ana
- City of Torrance
- Central Basin Municipal Water District
- Foothill Municipal Water District
- Las Virgenes Municipal Water District
- San Diego County Water Authority
- Upper San Gabriel Valley Municipal Water District
- Western Municipal Water District of Riverside County

All member agencies' jurisdictions and/or service areas are located within the Plan Area.

2.4 Project Components

2.4.1 Emissions Inventory

Metropolitan's operations inherently result in GHG emissions. Understanding the processes that generate these emissions is essential to identifying strategies to reduce GHG emissions.

Metropolitan's operational activities can be categorized into the following GHG emissions-generating sectors:

- **Water Conveyance and Treatment.** This sector comprises the majority of Metropolitan's emissions, which are a direct result of the purchase of energy consumed and delivered to pump, treat, and deliver water throughout Metropolitan's extensive service area.
- **Buildings/Infrastructure.** This sector includes emissions generated by energy consumed to power the command center/operational buildings, supporting infrastructure (including offices, facilities, control buildings, lighting, computers, and air conditioners), and other equipment required to support the treatment and delivery of water.
- **Transportation.** This sector includes the transportation of employees and equipment to and from offices and worksites. Emissions stem from both Metropolitan's fleet vehicles, which it

owns and operates, and vehicles owned by Metropolitan employees and used for commuting to work.

- **Waste Disposal.** The waste sector falls into three categories: mixed solids waste, mixed recycle, and organics. Metropolitan generates waste from various sources, ranging from employee lunches to office waste, which results in indirect GHG emissions as it decomposes in landfills.
- **Water Use.** Water sector GHG emissions by Metropolitan result from water use in facilities and irrigation. This sector includes indirect emissions associated with energy required to extract, convey, treat, and deliver water.
- **Construction.** As Metropolitan's infrastructure ages, there is a continued need for construction of new facilities and infrastructure or rehabilitation of existing facilities and infrastructure. Construction activities result in direct GHG emissions from fuel combustion associated with construction equipment usage, construction waste generation, and transportation of workers and materials.

The CAP inventories Metropolitan's emissions from 1990 to 2020. The inventory for 2017 is the most recent year for which complete Scope 3 data was available; inventories for 2018 through 2020 were included for carbon budget tracking purposes using estimated Scope 3 data. Due to the geographically disparate nature of Metropolitan's operations, emissions reported in the inventory are based on activities over which Metropolitan has direct operational control. The inventory delineates emissions by Scope, as defined in the Local Governments for Sustainability reporting frameworks and detailed below.[2] The emissions inventory reports Metropolitan's GHG emissions in metric tons (MT) of CO_2e.

Scope 1 Emissions

Scope 1 emissions are those associated with direct emissions from sources owned or controlled by Metropolitan. This includes emissions from direct fuel combustion, including natural gas, propane, welding gasses, and gasoline and diesel used to power Metropolitan's vehicle fleet. The CAP calculates Scope 1 emissions based on data reported by Metropolitan to The Climate Registry, such as therms[3] of natural gas or pounds of propane used at Metropolitan facilities.

Scope 2 Emissions

Scope 2 emissions are indirect emissions associated with the consumption of purchased electricity. Metropolitan purchases electricity from power generated from within California and from outside of California in the southwestern United States, which includes electricity generated from hydropower at the Hoover Dam. The CAP calculates Scope 2 emissions based on annually updated emissions factors, which are dependent on the specific mix of power purchased. For example, hydropower from the Hoover Dam has an emission factor of zero, while power purchased from other sources may have a higher emission factor based on the source. Scope 2 emissions also include transmission and distribution losses that occur as electricity is delivered to Metropolitan facilities.

Scope 3 Emissions

Scope 3 emissions are other indirect emissions resulting from Metropolitan's operations, including emissions associated with waste generation, water consumption, and wastewater generation from Metropolitan-owned buildings, employee commutes, and construction activities. The emissions inventory calculates emissions from water, wastewater, and solid waste based on utility invoices and appropriate energy intensity and emissions factors. Employee commute emissions are estimated based

[2] Emissions Scopes are delineated based on the emissions source in question, whether that source is under the control or ownership of the entity, and whether or not the emissions result directly or indirectly from the entity's operations and activities.
[3] A unit of heat equivalent to 100,000 Btu or 1.055 × 108 joules.

on Metropolitan's Employee Commute Survey and VanPool ridership data and emissions factor data from the California Air Resources Board's (CARB) EMissions FACtor 2017 (EMFAC2017) model (the latest emissions inventory model that calculates emissions inventories for motor vehicles operating on roads in California) and the Los Angeles County Metropolitan Transportation Authority. Construction emissions are estimated in the inventory based on GHG studies contained in CEQA documentation for Metropolitan projects and/or emissions factors from the U.S. EPA, the California Emissions Estimator Model (CalEEMod), and EMFAC2017.

Figure 2 depicts Scope 1, Scope 2, and Scope 3 emissions associated with Metropolitan's operations.

Table 2 summarizes the results of the emissions inventory for 1990 (the baseline year used by state legislation) and 2017, which is the most recent inventory year for which a complete Scope 3 analysis was completed. These dates are key to establishing an AB 32- and SB 32-compliant reduction target and measuring progress over time.

Table 2 1990 and 2017 Emissions by Scope and Sector

	1990		2017	
Scope	**GHG Emissions (MT of CO_2e)**	**Percent of Total Emissions**	**GHG Emissions (MT of CO_2e)**	**Percent of Total Emissions**
Scope 1	**8,482**	**1%**	**8,876**	**4%**
Stationary Combustion	1,082	<1%	1,918	1%
Fugitive Emissions	0	0%	71	<1%
Mobile Combustion	7,400	1%	6,886	3%
Scope 2	**739,845**	**96%**	**194,480**	**86%**
Electricity Consumption	726,994	94%	192,511	85%
T&D Losses	12,851	2%	1,969	1%

Construction Emissions	12,081	2%	12,081	5%
Total Emissions	**771,514**	**100%**	**226,036**	**100%**

MT = metric tons; CO_2e = carbon dioxide equivalent; T&D = transmission and distribution
Note: Totals may not sum exactly due to rounding.
Source: Metropolitan 2020

As described in Table 2, Scope 2 emissions constitute the majority of Metropolitan's overall emissions, comprising approximately 96 percent of Metropolitan's emissions in 1990 and 86 percent in 2017. Scope 1 emissions constitute 4 percent of Metropolitan's overall emissions in 2017, with the majority of Scope 1 emissions associated with mobile combustion. Scope 3 emissions constitute the remaining approximately 10 percent of Metropolitan's overall emissions in 2017.

The emissions inventory estimates that Metropolitan's GHG emissions have declined steadily from approximately 772,000 MT CO_2e in 1990 to approximately 226,000 MT CO_2e in 2017 (71 percent), despite Metropolitan's increasing service population. However, Metropolitan's annual emissions exhibit variability due to increases in CRA pumping during periods of drought, as water sourced via the CRA requires substantially higher electricity usage than water imported via the SWP.

Figure 2 Metropolitan Emissions by Scope

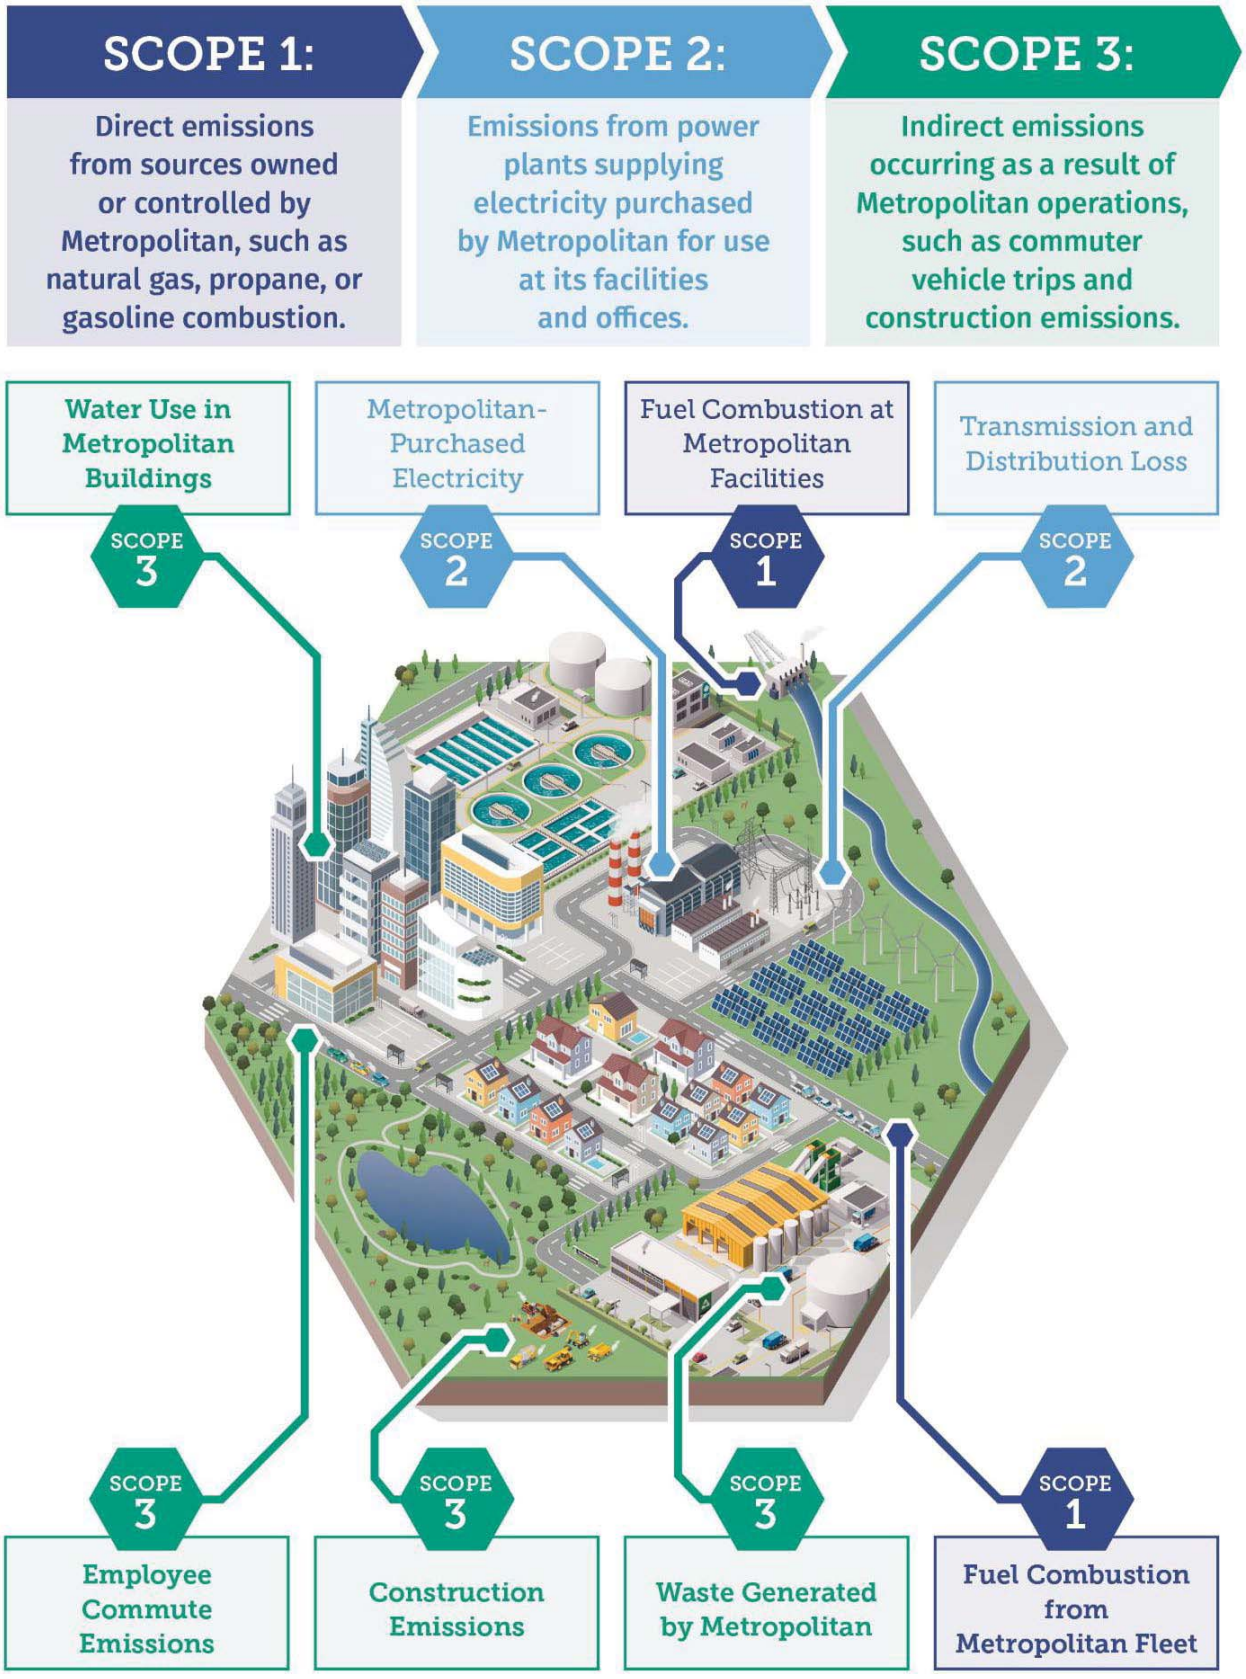

Figure 3 characterizes the nature and trend of Metropolitan's GHG emissions over time. The years of 2018, 2019 and 2020 were added to the inventories as data became available. However, 2017 remains the most recent year for which all Scope 3 data was available and therefore, was used for the GHG emissions forecast. A complete description of all inventory years, methodologies, and results can be found in the *Greenhouse Gas Inventory and Forecast Methodology* prepared for the CAP (Metropolitan 2021).

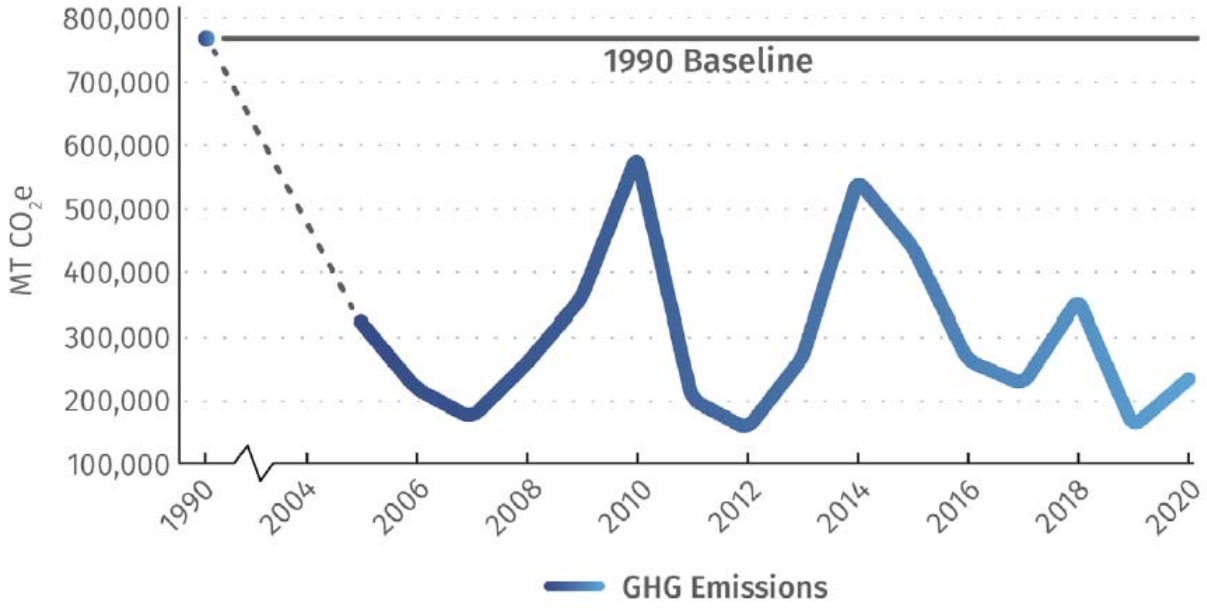
Figure 3 GHG Annual Emissions 1990 through 2020



2.4.2 Emissions Forecast

While the GHG emissions inventory described above provides reference points for emissions levels in past years, the CAP also includes an emissions forecast to account for how changes in hydrology, climate, climate and air quality regulations, population growth, operations, and future construction projects may affect Metropolitan's emissions into the future. Furthermore, the emissions forecast allows for comparison between forecasted GHG emissions and reduction targets to understand the reductions necessary to achieve Metropolitan's GHG reduction goals.

Forecast Scenarios

As described in Section 2.4.1, *Emissions Inventory*, Metropolitan's overall emissions vary substantially based on the amount of CRA pumping required in a given year because water sourced via the CRA requires substantially higher electricity usage than water imported via the SWP. The emissions forecast in the CAP accounts for this variability by forecasting emissions under the following scenarios:

- **High Emissions Scenario: Dry-year SWP with High CRA Pumping**. This scenario forecasts emissions based on the multiple dry-year water delivery demand defined in Metropolitan's 2020 Urban Water Management Plan (Metropolitan 2021) and the highest per acre-foot emissions[4]

[4] Quantified emissions per acre-foot of water conveyed by Metropolitan. One acre-foot is equivalent to approximately 325,850 gallons.

calculated in the emissions inventory from 2005[5] to 2017, which occurred in 2010. This scenario provides the highest potential GHG emissions forecast under the driest conditions.

- **Average Emissions Scenario: Average-year SWP with Average CRA Pumping.** This scenario forecasts emissions based on the single dry-year water delivery demand defined in Metropolitan's 2020 Urban Water Management Plan (Metropolitan 2021) and the average per acre-foot emissions calculated in the emissions inventory from 2005 to 2017. This scenario provides the emissions forecast under average conditions.
- **Low Emissions Scenario: Wet-year SWP with Low CRA Pumping.** This scenario forecasts emissions based on the average rainfall year water delivery demand defined in Metropolitan's 2020 Urban Water Management Plan (Metropolitan 2021) and the lowest per-acre emissions calculated in the emissions inventory from 2005 to 2017, which occurred in 2012. This scenario provides the emissions forecast under the rainiest conditions.

Proposed Regional Recycled Water Program

In addition to forecasting GHG emissions associated with ongoing operations and Capital Investment Plan construction projects, the emissions forecast in the CAP includes anticipated construction and operational emissions from the proposed Regional Recycled Water Program (RRWP). The RRWP is a partnership program with the Sanitation Districts of Los Angeles County intended to use an advanced purification process to produce high-quality water for reuse within Metropolitan's service area.

Emissions associated with RRWP construction include those required to construct the advanced water treatment plant (AWTP), and a conveyance and distribution system, which includes pipelines, pump stations, and groundwater injection wells. Construction emissions, which include a five-year construction schedule, include emissions from equipment use and fuel consumption, labor and material travel, and temporary electric power usage. Table 3 summarizes proposed RRWP construction emissions anticipated in the emissions forecast.

Table 3 Proposed Regional Recycled Water Program Construction Emissions

System	Construction Emissions (MT CO_2e)*
Advanced Water Treatment Plant	11,000
Pipelines	71,000
Pump Stations	630
Well Facilities	380
Total	**82,000**
5 Year Annual	**14,000**

MT = metric tons; CO_2e = carbon dioxide equivalent

*Values are rounded.

The emissions forecast in the CAP also quantifies anticipated operational GHG emissions from the proposed RRWP, including both process emissions and emissions associated with electricity consumption. Process emissions include nitrous oxide generation and emissions associated with consumption of carbon source additives used to facilitate denitrification and phosphorus removal during the water purification process. Electricity demand emissions would result from Metropolitan's purchase of electricity to power the AWTP and pump stations. The emissions forecast assumes

[5] 2005 is the first year in which Metropolitan's emissions were reported to The Climate Registry and the year in which detailed GHG emissions inventories were started.

electricity for the AWTP and pump stations would be supplied entirely from the retail market and, as such, emissions would decline over time as electricity providers incorporate more renewable energy supplies consistent with the requirements of the Renewables Portfolio Standard and SB 100. Table 4 summarizes overall RRWP emissions from 2025 through 2045.[6]

Table 4 Overall Estimated Proposed Regional Recycled Water Program Emissions

Year	Emissions (MT CO2e)*
2025 (construction)	14,000
2030 (construction)	14,000
2035 (operational)	88,000
2040 (operational)	58,000
2045 (operational)	28,000

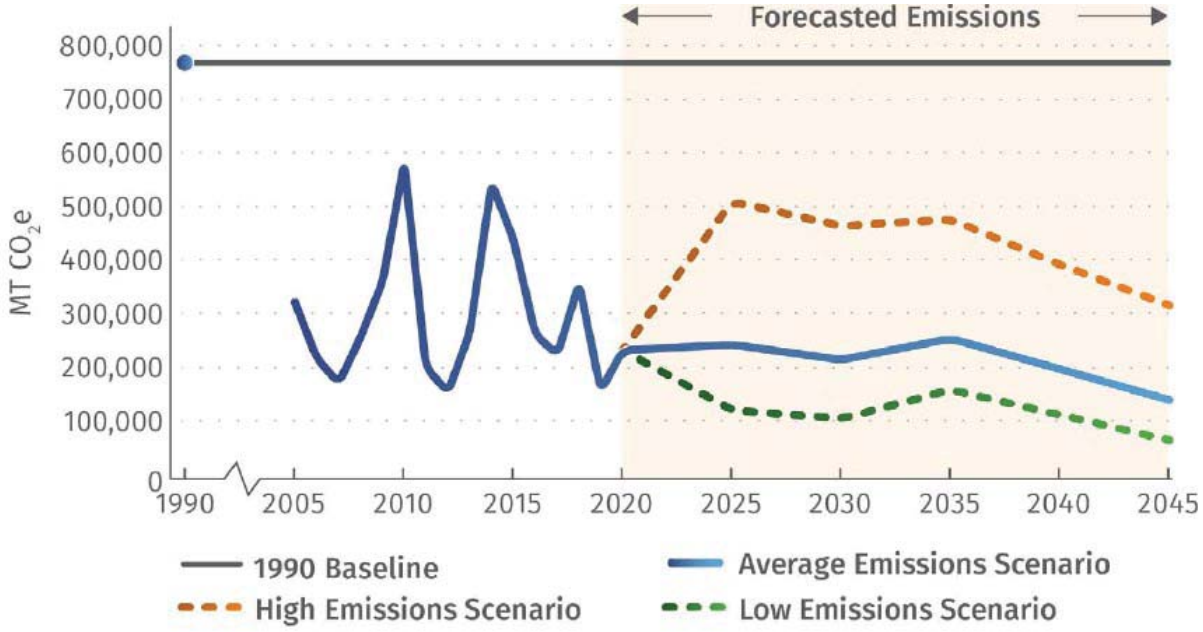
MT = metric tons; CO_2e = carbon dioxide equivalent
*Values are rounded.
Source: Metropolitan 2020

Forecast Results

The CAP emissions forecast includes the implementation of state regulations that would assist in reducing Metropolitan's emissions over time, such as increasing procurement of renewable retail energy pursuant to SB 100 and increasing water conservation pursuant to the Water Conservation Act of 2009 (SB X7-7). The CAP forecasts both mass emissions (Figure 4) and per capita emissions based on Metropolitan's service population (Figure 5). Based on the analysis in the CAP and depending on the emissions scenario assessed, Metropolitan's mass emissions would decrease between 40 to 86 percent below 1990 levels by 2030. By 2045, Metropolitan's mass emissions are expected to decrease between 59 to 91 percent below 1990 levels, depending on the emissions scenario evaluated. Figure 4 summarizes mass emissions forecasts through 2045 under the low, average, and high emissions scenarios. Though conservative, mass emissions analysis does not scale for population increases in Metropolitan's service area.

[6] SB 100 mandates that 100 percent of electricity supplied to the grid be procured from renewable sources by 2045. This is also the target year by which Metropolitan intends to achieve carbon neutrality, based on the emissions reduction target included in the CAP and described in detail in Section 2.4.3, *Reduction Target.*

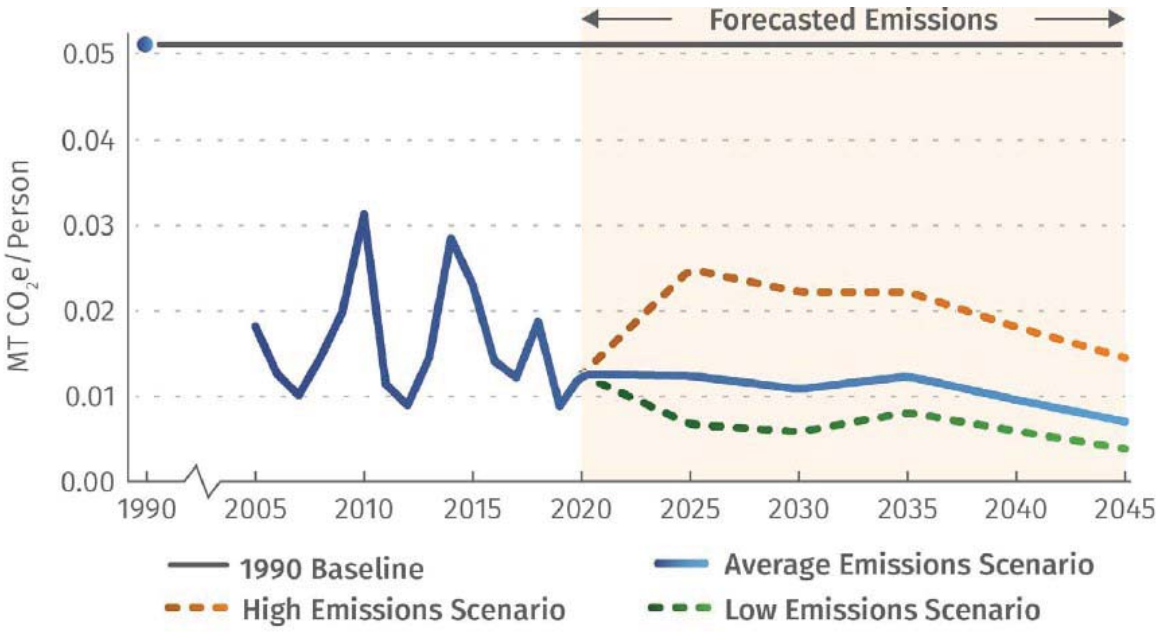
Figure 4 Historical and Forecasted Mass Emissions 1990-2045



The per capita emissions calculation uses Metropolitan's mass emissions and divides by the service area population. Metropolitan's service population is anticipated to reach just over 20.6 million people by 2030 and just over 22 million people by 2045.[7] Despite a growing service population, Metropolitan's emissions are anticipated to decrease steadily below 1990 levels under all emissions scenarios. Figure 5 shows Metropolitan's past and projected per capita emissions under all emissions scenarios. According to the CAP, Metropolitan's per capita emissions are expected to decrease between 56 and 90 percent below 1990 levels by 2030 and between 72 and 94 percent below 1990 levels by 2045, depending on the emissions scenario assessed.

[7] Service population is based on projections from the Southern California Association of Governments Regional Transportation Plan/Sustainable Communities Strategy and San Diego County Association of Governments Series 13 Forecasts. Service population forecasts are included in Appendix B of the CAP, *GHG Inventory and Forecast Methodology* prepared for the CAP (Metropolitan 2021).

Figure 5 Historical and Forecasted Per Capita Emissions 1990-2045



Using the per capita emissions forecast is a more accurate representation of Metropolitan's emission reductions over time because it recognizes how the substantial investments in water conservation have led to a reduction in water consumption in spite of a growing population in the service area.

2.4.3 Reduction Target

The CAP establishes a GHG reduction target aligned with applicable state GHG reduction policies. The CAP considers various reduction levels, target methodologies, and tracking mechanisms to quantify and measure progress toward GHG emissions reductions beyond those anticipated in the emissions forecast described above. Ultimately, the CAP utilizes a linear per capita target or "Linear Reduction to Carbon Neutral by 2045 – Per Capita Target" with a Carbon Budget tracking mechanism, described in greater detail later in this section.

Reduction Level

The CAP considers three reduction level options, all of which are consistent with current state GHG-reduction goals established by SB 32, California's most recent codified GHG reduction target.

However, the CAP utilizes a reduction level based on a linear reduction in emissions from baseline 1990 levels to carbon neutrality (zero emissions) in 2045. This strategy would reduce Metropolitan's emissions to approximately 73 percent below 1990 levels by 2030, a substantially more aggressive reduction than the 40 percent below 1990 levels by 2030 identified in SB 32. The CAP goals and policies are not only intended to demonstrate consistency with the statewide SB 32 target, but also achieve consistency with the carbon neutrality by 2045 goal established by Executive Order B-55-18.[8]

[8] As noted in Section 2.1, *Background and Project Need*, Metropolitan is not subject to the requirements of Executive Orders, and emissions reduction goals established by Executive Orders are not codified into state law. Nevertheless, the reduction level selected in the CAP demonstrates consistency with the emissions reduction goal established pursuant to Executive Order B-55-18 by achieving carbon neutrality (zero emissions) by 2045.

Target Methodology

There are three main approaches (target methodologies) the CAP examines to demonstrate progress towards meeting the established goal of carbon neutrality by 2045:

- **Mass Emissions Targets.** Mass emissions targets involve reducing total GHG emissions to a specified level (or lower) by a specific target year. An example of mass emissions reductions would be reducing to 200,000 MT CO_2e per year in 2030 (i.e., 26 percent of 1990 levels) and 0 MT CO_2e per year in 2045.
- **Per Capita Emissions Targets.** A per capita emissions target creates a per person emissions level based on Metropolitan's service population, such as reducing emissions to 0.02 MT CO_2e per capita by 2045.
- **Efficiency Targets.** Efficiency targets aim to reduce the emissions associated with each unit of production, such as reducing emissions to 0.1 MT CO_2e per acre-foot of water supplied by Metropolitan by 2045.

As mentioned above, Metropolitan's service population is projected to be over 22 million people by 2045. Therefore, to capture the substantial growth expected in the service area, the CAP establishes a per capita emissions reduction target approach, which accounts for population growth in the Metropolitan service area while capturing the reduction in emissions associated with water delivery and treatment from its past and ongoing water conservation efforts and other emissions reducing projects.

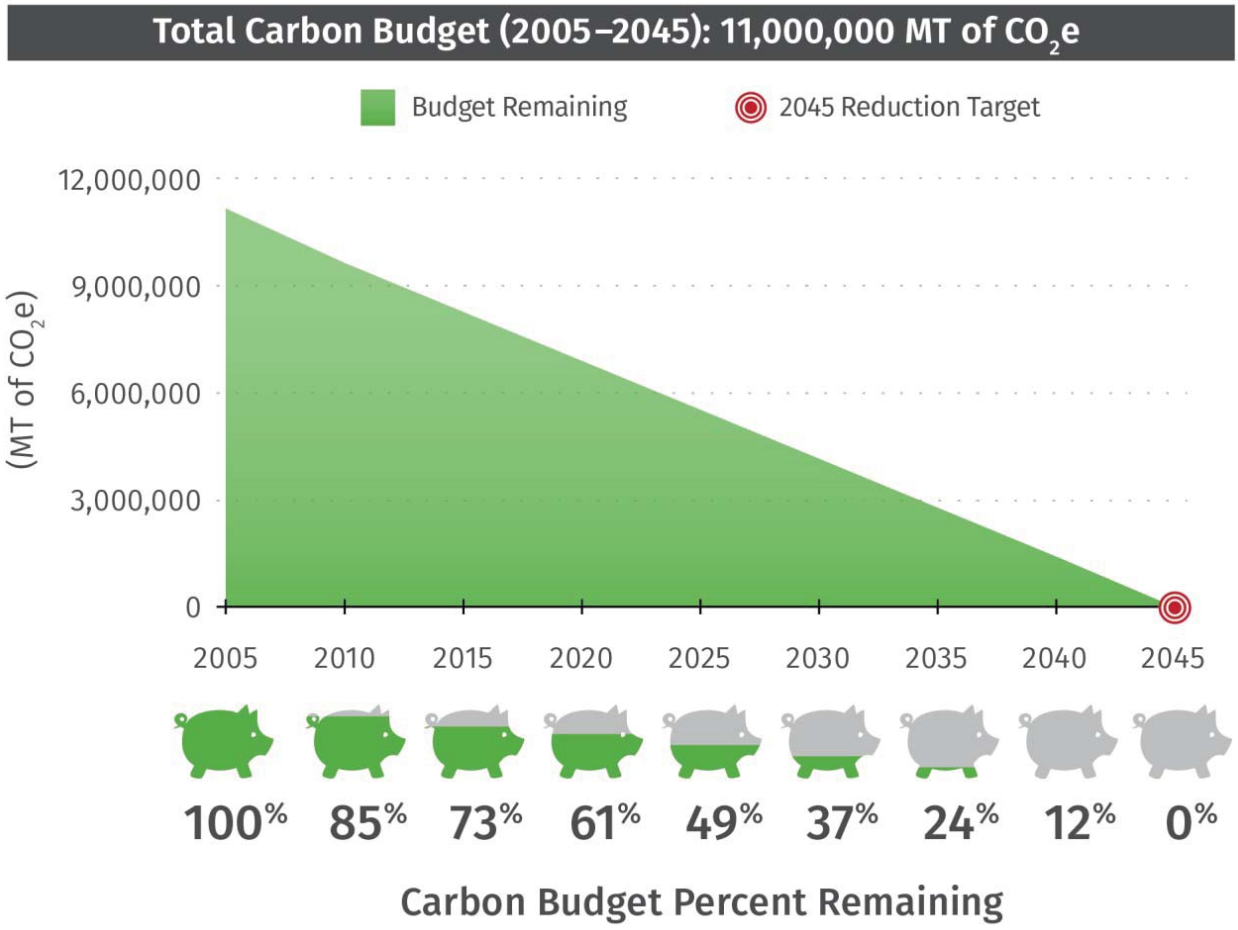
Tracking Mechanism

For most cities and other jurisdictions in California, emissions increase and decrease in a steady fashion along with population growth and in response to marginal GHG reduction actions.

Metropolitan's emissions, by contrast, can fluctuate widely year-to-year in response to CRA pumping levels, but generally track with wet years and drought years. This means emissions in any given year are not necessarily a good indicator of overall GHG reduction progress. As a result, the CAP proposes tracking GHG emissions reduction progress using a Carbon Budget methodology.

Simply put, the Carbon Budget acts as a debit account, wherein the cumulative amount of emissions allowed for Metropolitan over a given time period are calculated. Annually, Metropolitan's emissions will be debited from the total emissions "budget" and total emissions will be tracked over time to ensure Metropolitan is meeting its goal. Specifically, based on the Linear Reduction to Carbon Neutrality by 2045 reduction level described previously, Metropolitan could emit a total of 14,660,475 MT CO_2e between 2005 (the year in which detailed GHG emissions inventories were started) and 2045 under the Average Emissions forecast scenario. Figure 6 describes the Carbon Budget methodology conceptually, demonstrating a hypothetical Carbon Budget scenario and diminishing budget remaining as emissions cumulate over time.

Figure 6 Carbon Budget Conceptual Graph



The Carbon Budget is a more conservative and accurate approach to tracking GHG emissions reductions compared to simply calculating emissions in a single target year to determine if the target has been achieved because it tracks the total amount of CO_2e that enters the atmosphere that contributes to climate change rather than just total GHG emissions in the target year. This method ensures that Metropolitan is continually monitoring its emissions and provides an early warning system to ensure Metropolitan will meet its GHG reduction goals.

2.4.4 Emissions Reduction Measures

In order to achieve carbon neutrality by 2045, GHG emissions reductions measures would need to be implemented. As discussed under Section 2.4.1, *Emissions Inventory*, GHG emissions fall under three scopes. Scope 1 includes direct emissions sources owned or controlled by Metropolitan. Scope 2 includes indirect emissions from power plants that supply electricity to Metropolitan. Scope 3 includes other indirect emissions that occur as a result of Metropolitan's operations, such as from waste generation and employee commutes. The CAP includes 39 GHG emissions reduction measures that, if implemented, could help Metropolitan reduce its Scope 1, Scope 2, and Scope 3 emissions.

Reduction measures for each scope are grouped into strategies, which are described in more detail below.

The reduction measures do not include actions taken by Metropolitan to date that have resulted in GHG emissions reductions, such as Metropolitan's early adoption of hybrid-electric vehicles (EV) for

its operational fleet and Leadership in Energy Efficiency and Design (LEED) certification for several of its facilities. However, the measures may build or expand upon these past actions. Most reduction measures are either administrative in nature or involve replacement of existing infrastructure with newer, more efficient infrastructure and, therefore, would not have physical impacts to the environment. Table 5 details the GHG reduction measures under consideration in the CAP and identifies whether each has the potential to impact the environment. Those that may have the potential to impact the environment are analyzed further in this PEIR.

Scope 1: Direct Emissions

Scope 1 reduction measures can be categorized into three main strategies: Direct Combustion (DC), Vehicle and Equipment Fleet (FL), and Alternative Fuels (AF). The DC strategy includes measures to reduce GHG emissions from natural gas combustion at Metropolitan facilities by phasing out natural gas-powered equipment. The FL strategy includes reduction measures to reduce Metropolitan's reliance on gasoline- and diesel-powered fleet vehicles. The AF category includes measures to increase the use of cleaner fuel sources, such as biodiesel for equipment that cannot be electrified. Measures addressing Scope 1 emissions are described in Table 5.

Scope 2: Indirect Emissions from Electricity Use

Scope 2 reduction measures fall into two main strategies: Electricity (E) and Energy Efficiency (EE). The E category includes measures to reduce GHG emissions by transitioning to cleaner sources of electricity, such as low-carbon and carbon-free electricity and expanding deployment of renewable energy generation at Metropolitan facilities. Measures in the EE category seek to increase the efficiency of Metropolitan's operations, for example, through energy efficient lighting upgrades and retrofitting older pumps and motors. Measures addressing Scope 2 emissions are described in Table 5.

Scope 3: Other Indirect Emissions and Carbon Sequestration

Scope 3 includes a broad range of GHG emissions sources and includes reduction measures across four main strategies. The Employee Commute (EC) strategy includes measures to reduce GHG emissions by encouraging ridesharing, public transit use, and EV charging options for employees and vanpool fleets. The Waste (WA) strategy seeks to reduce GHG emissions by reducing the waste produced at Metropolitan's facilities and increasing waste diversion. The Water Conservation and Local Water Supply (WC) strategy includes measures to increase water conservation in Metropolitan's operations and by its customer base, as well as measures to increase the local water supply through water recycling and reduced water loss. Lastly, the Carbon Sequestration (CS) strategy is comprised of measures that aim to improve the capacity to sequester carbon at Metropolitan-owned lands. Measures addressing Scope 3 emissions are described in Table 5.

Implementation Phase

The intent of the CAP is to achieve the 2030 GHG reduction target and demonstrate substantial progress toward the long-term state reduction goal of carbon neutrality by 2045. New opportunities are anticipated to emerge that could yield additional reductions beyond those identified in the CAP. At this time, Metropolitan has developed two implementation phases for the GHG reduction measures considered in the CAP, Phase 1 and Phase 2.

Phase 1 measures are ready for implementation over the next ten years based on their cost, available technology, and certainty about future conditions. Phase 1 measures would be implemented between now and 2030. Phase 2 measures would require more research, new technologies, or different financial conditions before they could be implemented. These measures are expected to be

implemented between 2030 and 2045. The implementation phase for each measure is shown in Table 5.

Table 5 CAP GHG Reduction Measures with Potential Physical Impacts on the Environment

Measure Number	Measure Description	No Potential for Physical Impacts to the Environment	Potential to Result in Physical Impacts	Implementation Phase[1]
Scope 1: Direct Emissions				
Strategy 1 – Phase out Natural Gas Combustion at Facilities				
DC-1	Conduct a survey of all natural gas consuming devices in offices, control buildings, and residential structures and establish a schedule to replace natural gas equipment with electric by 2025.	X		1
DC-2	Reduce natural gas emissions by 50 percent by 2030 and 100 percent by 2045 through electrification.		X	1-2
DC-3	Update Metropolitan building standards to require all-electric construction for new buildings and retrofits.	X		1
Strategy 2 – Zero Emission Vehicle Fleet				
FL-1	Conduct a zero emission vehicle (ZEV)/electric vehicle (EV) Feasibility Study to determine which fleet vehicles can be converted, what chargers/fueling stations are required, and where they should be located by the end of 2022.	X		1
FL-2	Adopt an ZEV/EV first policy for fleet vehicles to obtain ZEVs when technological, operational, or cost effectiveness parameters are met.	X		1
FL-3	Replace fossil fuel passenger fleet vehicles as identified in the ZEV/EV Feasibility Study (Measure FL-1).	X		1
FL-4	Install EV charging and/or ZEV infrastructure at facilities pursuant to the findings of the ZEV/EV Feasibility Study (Measure FL-1).		X	1
Strategy 3 – Alternative Fuels to Bridge the Technology Gap to Zero Emission Vehicles and Equipment				
AF-1	Complete a pilot project on the use of renewable diesel rather than conventional diesel for all stationary equipment by 2025.	X		1
AF-2	Conduct a pilot project of renewable diesel use in on-road and off-road vehicles by providing at least one renewable diesel tank at Metropolitan-owned fueling depots in 2021.	X		1

Measure Number	Measure Description	No Potential for Physical Impacts to the Environment	Potential to Result in Physical Impacts	Implementation Phase[1]
AF-3	Based on the results of the study in AF-2, Metropolitan will begin using renewable diesel fuel in 100 percent of Metropolitan's diesel-consuming on-road and off-road vehicles by 2025.	X		1
Scope 2: Electricity				
Strategy 4: Utilize Carbon-Free Electricity				
E-1	Analyze marginal emissions rates and evaluate the feasibility of shifting energy use to lower emission periods.	X		1
E-2	Connect the Yorba Linda Hydroelectric Power Plant (YLHEP) behind Metropolitan's Southern California Edison (SCE) electricity meter to directly utilize carbon-free electricity at Metropolitan's Diemer facility by 2025.		X	1
E-3	In markets where available, Metropolitan will switch its retail accounts to green tariff options offered by power providers by 2025 to reduce the Scope 2 GHG emissions associated with retail electricity use.	X		1
E-4	Install 3.5 megawatt (MW) battery storage systems at the Jensen, Skinner, and Weymouth treatment plants. Investigate the use of a software system to track and optimize GHG emissions reduction due to time-of-use strategies by 2025.		X	1
E-5	Manage Metropolitan's energy purchases to ensure cost-effective energy supply while achieving the required GHG emissions objective.	X		1
Strategy 5 – Improve Energy Efficiency				
EE-1	Convert all interior and exterior lighting at 50 percent of Metropolitan facilities to light emitting diode (LED) technologies by 2030 and 100 percent by 2045.		X	1
EE-2	Continue programs to analyze CRA pump efficiency and replace or refurbish pumps when cost effective.	X		1
EE-3	Investigate feasibility of a large scale (100 MW) battery storage system for the CRA.	X		2
EE-4a	Replace pump impellers at the Iron Mountain pumping plant if directed by findings of the pump assessment (Measure EE-2).		X	2
EE-4b	Replace pump impellers at the Eagle Mountain or Hinds pumping plants if directed by findings of the pump assessment (Measure EE-2).		X	2
EE-4c	Refurbish motors at Iron Mountain if applicable based on the findings of the pump assessment (Measure EE- 2).		X	2

Measure Number	Measure Description	No Potential for Physical Impacts to the Environment	Potential to Result in Physical Impacts	Implementation Phase[1]
EE-4d	Refurbish motors at Eagle Mountain or Hinds pumping plants if directed by findings of the pump assessment (Measure EE-2).		X	2
EE-5	If the proposed RRWP is ultimately constructed, install an inter-stage pumping system on the reverse osmosis brine stream to reduce energy use.		X	2
Scope 3: Indirect Emissions and Sequestration				
Strategy 6 – Incentivize More Sustainable Commutes				
EC-1	Expand subsidized transit commute program to reduce employee commute miles.	X		1
EC-2	Expand employee use of carbon-free and low carbon transportation by providing education programs on the benefits of commute options including public transportation, EV/ ZEV options, and vanpools.	X		1
EC-3	Install ZEV and/or EV infrastructure as directed by the ZEV/EV Feasibility Study to support at least a 15 percent transition of employee-owned vehicles to ZEVs/EVs by 2025.		X	1
EC-4	Continue to offer benefits to employees who use alternative modes of transportation (e.g., public transportation, bikes).	X		1
EC-5	Allow 50 percent of employees located at Metropolitan's headquarters to telecommute or utilize flexible schedules through 2030 to reduce travel time, vehicle miles traveled (VMT), and GHG emissions.	X		1
EC-6	Replace all Metropolitan vanpool vehicles with ZEVs. Start with a pilot study (Measure FL-1) to evaluate the best approach.	X		2
Strategy 7 – Increase Waste Diversion to Achieve Zero Waste				
WA-1	Develop and implement net zero waste policies and programs at all facilities to reduce landfilled waste by 30 percent by 2030 and achieve zero landfilled waste by 2045.	X		1
WA-2	Implement a program to reduce organic waste at Metropolitan's Union Station building. Contract or team with local organizations and waste disposal companies to route organic waste to anaerobic digestion or composting facilities and edible food-to-food recovery centers.	X		1
WA-3	Develop and implement a sustainable procurement policy.	X		1

Measure Number	Measure Description	No Potential for Physical Impacts to the Environment	Potential to Result in Physical Impacts	Implementation Phase[1]
WA-4	Partner with municipal agencies, like the City of Los Angeles, to create programs that will allow Metropolitan to provide its fair share of diversion and help local jurisdictions meet the goals of SB 1383 for organics diversion, including food waste and composting.	X		2
Strategy 8 – Increase Water Conservation and Local Water Supply				
WC-1	Expand programs which educate customers on water conservation initiatives through workshops and speaking engagements.	X		1
WC-2	Continue to implement innovative water use efficiency programs.	X		1
WC-3	Continue Turf Removal Program to install an average of 1,500,000 square feet (sq. ft.) of water efficient landscapes per year through 2030 through the use of a rebate program.	X		1
WC-4	Provide funding for the development and monitoring of local stormwater recharge and use projects to evaluate the water supply benefit of stormwater.	X		1
WC-5	Continue to promote water efficiency technologies and innovative practices that can be adopted into future water conservation program updates.	X		1
WC-6	Implement advanced technology systems to increase Metropolitan- owned recycled and groundwater recovery systems to maintain local water supply (e.g., proposed RRWP).		X	2
Strategy 9 – Investigate and Implement Carbon Capture and Sequestration Opportunities				
CS-1	Study carbon capture protocols in the Sacramento-San Joaquin River Delta.	X		1
CS-2	Conduct a five-year research program to increase Metropolitan's knowledge of regenerative agriculture and carbon sequestration opportunities on Metropolitan properties in the Palo Verde Valley.		X	1
CS-3	Establish baseline soil carbon quantities through science based approaches then develop pilot projects to enhance carbon sequestration and implement larger scale carbon sequestration projects as deemed feasible.		X	2

[1] Phase 1 measures are planned for 2021-2030. Phase 2 measures are planned for 2031-2045

2.5 Description of Covered Projects with Potential for Physical Impacts

As mentioned above, most emission reduction measures are either administrative in nature or involve upgrades to existing infrastructure to improve function, which will reduce emissions (e.g., replacement or refurbishment of pump impellors). Activities with the potential for environmental impacts are analyzed at a program-level in the PEIR. Project-level CEQA analysis will be conducted and future environmental documentation prepared, as necessary, when additional site-specific project information becomes available for each of the proposed projects included in the proposed CAP. Updates to the proposed CAP are scheduled every five years. The CEQA documents for those updates will include the status of projects included in the proposed program, as well as analysis of any new projects that may be added to ensure progress towards meeting the proposed CAP GHG reduction goals. Future CEQA documents for the CAP updates will be prepared and made available for comment, as required. Project description information that is currently known for each of the projects that has potential to have physical impacts on the environmental is discussed below.

Project Locations

The precise locations of all proposed projects that may be implemented under the CAP are not known at this time. However, it is anticipated that construction of planned projects would occur at Metropolitan facilities or within Metropolitan rights-of-way. Specifically, the following Metropolitan-owned locations have been identified as potential project sites for projects that would be implemented under the CAP:

- **Robert B. Diemer (Diemer) Water Treatment Plant (WTP), Yorba Linda, California.** Proposed site for connection to the Yorba Linda Hydroelectric Power Plant (YLHEP) pursuant to CAP measure E-2.
- **Joseph Jensen (Jensen) WTP, Granada Hills, California.** Proposed site for battery energy storage system (BESS) facility pursuant to CAP measure E-4.
- **Robert A. Skinner (Skinner) WTP, Winchester, California.** Proposed site for BESS facility, pursuant to CAP measure E-4.
- **F.E. Weymouth (Weymouth) WTP, La Verne, California.** Proposed site for BESS facility, pursuant to CAP measure E-4.
- **Eagle Mountain Pump Plant, Unincorporated Riverside County, California.** Proposed site for pump rehabilitation projects pursuant to CAP measure EE-4b, EE-4d.
- **Iron Mountain Pump Plant Unincorporated San Bernardino County, California.** Proposed site for pump rehabilitation projects pursuant to CAP measure EE-4a, EE-4c.
- **Julian Hinds Pump Plant, Unincorporated Riverside County, California.** Proposed site for pump rehabilitation projects pursuant to CAP measure EE-4b, EE-4d.
- **Metropolitan-owned agricultural land at southwest corner of 35th Avenue and Keim Boulevard, unincorporated Riverside County, California.** Proposed site for regenerative agriculture pilot project pursuant to CAP measure CS-2.
- **Webb Tract, Holland Tract, Bouldin Island, and Bacon Island, San Joaquin/Contra Costa Counties, California.** Proposed sites for carbon sequestration and carbon capture projects pursuant to CAP measure CS-3.

Figure 7 shows the locations of these identified potential project sites within the Plan Area.

Figure 7 Potential Project Locations within Plan Area

Project Descriptions

For currently planned projects, specific construction details associated with implementation of the emissions reduction measures, such as specific location, disturbance area, and schedule, are not known at this time. Every effort has been made to ensure a thorough impact analysis and, where necessary, impacts from similar projects have been used to conservatively estimate impacts that may change depending on circumstance (e.g., air quality or biological impacts). For example, exact construction equipment for a project may not yet be known, but a conservative estimate based on similar projects can be used. These covered activities form the basis for the environmental impact analysis in this PEIR. While enough project data exists to make reasonable assumptions about the potential level of significance for each project, additional project-level analysis will be completed when specific, project-level information becomes available for each project proposed in the CAP.

The following covered projects are analyzed in the PEIR:

- *DC-2 – Reduce natural gas emissions by 50 percent by 2030 and 100 percent by 2045 through electrification.*

  Metropolitan would replace natural gas and propane consuming equipment at its facilities with electrically powered equivalents at the end of their useful life or in an order that replaces the oldest and most antiquated pieces of equipment first. Some upgrades to existing electrical systems may be required to ensure proper function.

- *FL-4 – Install electric vehicle (EV) charging and/or zero emission vehicle (ZEV) infrastructure at facilities pursuant to the findings of a ZEV/EV Feasibility Study (CAP Measure FL-1).*

  Based on the results of a ZEV/EV study, which would analyze the existing fleet and develop a plan to replace fossil-fuel vehicles with ZEVs/EVs, this measure would install electric vehicle or other zero emissions infrastructure at Metropolitan facilities to ensure a smooth transition to clean fuel fleet vehicles. As the technology becomes available for large trucks and equipment, Metropolitan would transition to the newer technology to meet state requirements and ensure the success of the CAP.

  Installation of EV charging stations would include chargers, grid equipment, software, and communication networks. EV charging stations would be used by Metropolitan's fleet, both passenger vehicles and, as technology allows, larger fleet vehicles. Infrastructure would likely be required at Union Station Headquarters, the five treatment plants, pumping stations, and Metropolitan-owned housing, and other facilities. Minor trenching to install electrical lines or alternate fuel tanks may be required. All construction would be within existing Metropolitan-owned facilities. Though exact locations and timing of installation at each facility would be determined by the ZEV/EV study, construction is expected to begin at some locations before 2025.

- *E-2 – Connect the Yorba Linda Hydroelectric Power Plant (YLHEP) behind Metropolitan's Southern California Edison (SCE) electricity meter to directly utilize carbon-free electricity at Metropolitan's Diemer facility by 2025.*

  The YLHEP currently generates carbon-free electricity and sells the energy produced to the wholesale market through California Independent System Operator (CAISO). The Diemer WTP purchases energy from the retail utility SCE that has a GHG emission factor greater than zero. This measure would reconfigure the YLHEP to serve the Diemer WTP load behind the SCE meter, so that the electricity it generates would become directly available to the Diemer Plant enabling the Diemer Plant to fully meet its energy demands with carbon-free hydropower when the hydroelectric plant is running. Excess energy generated from YLHEP would continue to be sold to the wholesale market (CAISO). Work would occur entirely within the Diemer WTP

boundary (Figure 8). The construction duration is estimated to be 12 to 18 months. The project would include:

- Installation of new 4.16 kilovolt (kV) underground electrical feeder(s) to connect the YLHEP to Diemer switchgear. Excavation would only be required if existing spare underground conduits are not available. This would be determined during the design phase.
- Modification of switchgears (YLHEP and Diemer).
- Installation of new breakers at the existing switchgears, if required.
- Modification/installation of auxiliary equipment.
- Replacement of existing SCE and CAISO meters.

Figure 8 Location of YLHEP work at the Robert B. Diemer WTP in Yorba Linda, California

- *E-4 – Install 3.5 megawatt (MW) battery energy storage systems (BESS) at the Jensen, Skinner, and Weymouth treatment plants. Investigate the use of a software system to track and optimize GHG emissions reduction due to time-of-use strategies by 2025.*

  Energy storage systems store energy produced during peak renewable power generation periods in order to power systems during periods when renewable power is not produced. The BESS is proposed to store energy generated by the solar generation system (Jensen, Skinner, Weymouth WTPs). The battery system will remain behind-the-meter and in a non-exporting state. The BESS size at each location is as follows:

  - 1,000 kW/4,000 kWh BESS at Jensen WTP in Granada Hills, California,
  - 1,000 kW/4,000 kWh BESS at Skinner WTP in Winchester, California, and
  - 1,000 kW/4,000 kWh BESS at Weymouth WTP in La Verne, California.

In August 2020, Metropolitan received a conditional reservation letter for participation in the California Public Utilities Commission's Self-Generation Incentive Program (SGIP). SGIP's conditional reservation letter covers the BESS at Jensen WTP and Skinner WTP under the SGIP's Equity Resiliency budget. The BESS at the Weymouth WTP has been placed on the waitlist. As such, Metropolitan initiated design for the BESS at the Jensen WTP and Skinner WTP. Design for the Weymouth WTP BESS will begin at a later time.

Figure 9 illustrates an example BESS facility similar in size to those proposed. Each site will consist of cast-in-place concrete pads supported on 18 inches of ¾ sized crushed aggregate base rock. Grading and paving will be limited to minor incidental adjustments to the existing grade and pavement, as needed, to accommodate the new equipment slabs. The infrastructure of a BESS contains the following major and ancillary components:

- Battery system as storage medium;
- Power conversion system (inverter);
- Power transformers and switchgear;
- Various power electronics control and monitoring and the related thermal management systems;
- Fire detection and suppression systems;
- System control and monitoring system; and
- Connections with the grid, the solar generation and backup emergency power generator.

Figure 9 Example BESS Facility

Proposed locations were selected based on specific criteria, including proximity to existing infrastructure (e.g., manholes, ductbanks, solar generation equipment), accessibility for maintenance activities and avoidance of design and construction conflicts with existing infrastructure. Three locations were considered at the Jensen WTP (Figure 10). Site 3 has been

identified as the preferred location due to its proximity to existing electrical infrastructure. Two locations were considered at the Skinner WTP (Figure 11). Currently, Site 2 has been identified as the preferred alternative due to its proximity to the Substation Control Unit (SCU) Substation, existing solar facilities, and ease of access. Three locations were considered at the Weymouth WTP (Figure 12). Currently, no location has been identified as the preferred alternative.

Should the Jensen and Skinner projects be approved by the Board, construction could be expected to begin late 2021 with an expected construction duration for each site of approximately eight months. For the purposes of this PEIR, all construction is expected to occur concurrently.

Figure 10 Proposed BESS Locations at the Joseph Jensen WTP, Granada Hills, California

Figure 11 Proposed BESS Locations at the Robert A. Skinner WTP, Winchester, California

Figure 12 Proposed BESS Locations at the F.E. Weymouth WTP, La Verne, California

- *EE-1 – Convert all interior and exterior lighting at 50 percent of Metropolitan facilities to light emitting diode (LED) technologies by 2030 and 100 percent by 2045.*

  Metropolitan's facilities include extensive lighting systems. LED lights use only 20 to 25 percent of the energy of traditional incandescent lights and last 15 to 25 times longer. This measure would ensure that all incandescent lights are replaced at all Metropolitan facilities by 2045. This measure is limited to replacing lights and does not include the addition of new fixtures.

- *EE-4a-d – Implement findings of the CRA pump assessment (CAP Measure EE-2) to either refurbish or replace pumps at Eagle Mountain, Iron Mountain or Hinds pumping plants.*

  Based on the findings of the pump plant assessment, Metropolitan would replace impellers or refurbish pumps at the Iron Mountain, Eagle Mountain, or Hinds Pump Plants. All construction would occur inside the pump house buildings at the identified pump plants. As a Phase II measure, construction would not be expected until 2030 – 2045.

- *EE-5 – If the proposed RRWP is ultimately constructed, install an inter-stage pumping system on the reverse osmosis brine stream to reduce energy use.*

  This measure would ensure that if the proposed RRWP is constructed, an inter-stage pumping system would be installed on the reverse osmosis brine stream to reduce energy use. Construction of this measure would occur during construction of the RRWP, if construction of the facility is approved by the Board.

- *EC-3 – Install ZEV and/or EV infrastructure as directed by the ZEV/EV Feasibility Study (Measure FL-1) to support at least a 15 percent transition of employee-owned vehicles to ZEVs/EVs by 2025.*

  Currently Metropolitan has EV charging for employees at its Union Station Headquarters and the Weymouth and Diemer WTPs. Metropolitan would install or expand electric vehicle charging infrastructure for employee and visitor use at its facilities as recommended in the Feasibility Study from CAP Measure FL-1. The proposed measure would require upgrades to electrical systems, trenching for new duct banks, depending on the locations, and modifications to existing parking lot striping to accommodate EV vehicles parking only.

- *WC-6 – Implement advanced technology systems to increase Metropolitan-owned recycled and groundwater recovery systems to maintain local water supply (e.g., proposed RRWP).*

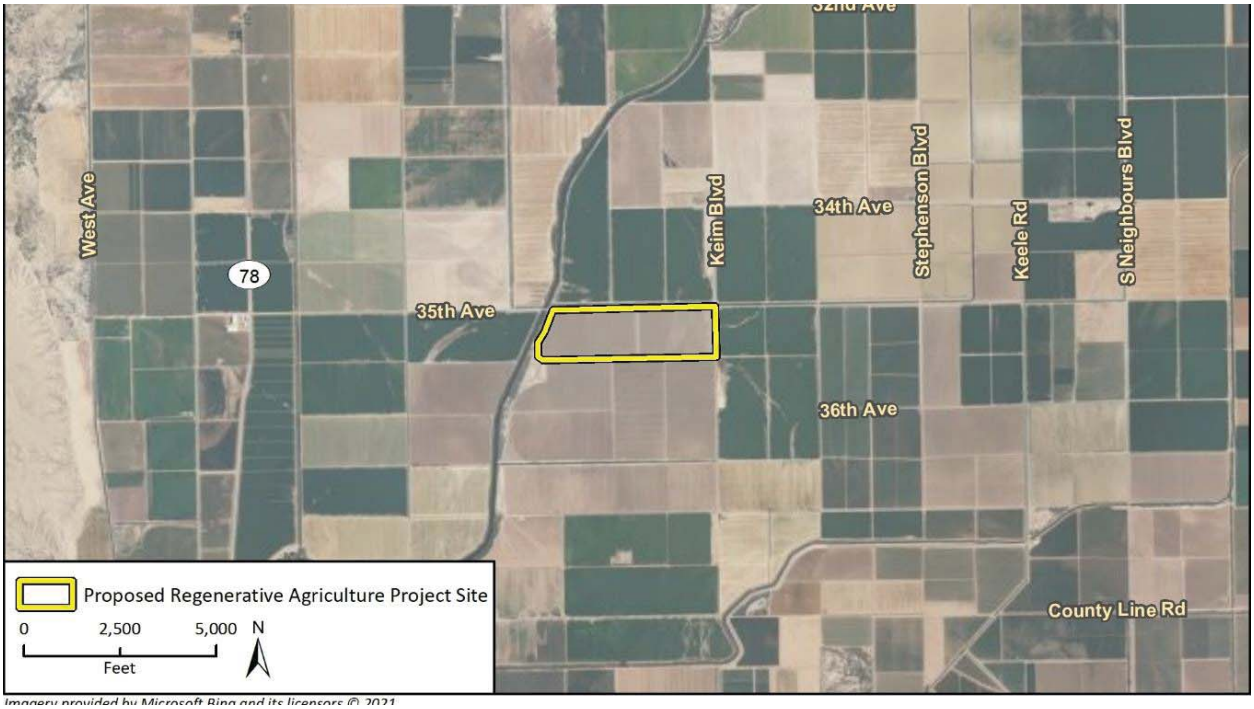
  This proposed measure would treat wastewater to potable water quality and send treated water to groundwater injection wells within the Los Angeles area. The development and operation of this facility would substantially increase the amount of local water available and potentially reduce the amount of imported water, reducing operational GHG emissions. The increased GHG emissions associated with the proposed RRWP have already been included in the GHG emissions forecast and the projected GHG savings are associated with estimates of reduced imported water pumping. Actual GHG emissions savings would depend on changes observed after RRWP implementation. The proposed RRWP is currently being considered by Metropolitan and is not a Board-approved project. The RRWP would undergo its own CEQA analysis. If the project is approved, implementation of the measure would not be expected until 2030-2045.

- *CS-2 – Conduct a five-year research program to increase Metropolitan's knowledge of regenerative agriculture and carbon sequestration opportunities on Metropolitan properties in the Palo Verde Valley.*

  Metropolitan would conduct a five-year research program with the California State University Chico Center for Regenerative Agriculture and Resilient Systems designed to increase Metropolitan's knowledge of regenerative agriculture and carbon sequestration opportunities.

The project would analyze impacts of traditional fallowing practices and investigate the effects of various cover crops and no-till practices. The proposed project would occur on plots of Metropolitan-owned land in the Palo Verde Valley designated for research purposes (Figure 13).

Figure 13 Proposed Regenerative Agriculture Project Site, Riverside County, California



- *CS-3 – Establish baseline soil carbon quantities through science based approaches then develop pilot projects to enhance carbon sequestration and implement larger scale carbon sequestration projects as deemed feasible.*

  This Phase II measure would study carbon sequestration and carbon capture opportunities on Metropolitan-owned properties within the Sacramento-San Joaquin River Delta. Implementation of carbon capture projects would be aligned with CARB's Approved Carbon Capture and Sequestration Protocol if projects are deemed feasible and would comply with existing laws and regulations.

Environmental Requirements for Construction

Metropolitan has established environmental protocols and requirements for contractors and Metropolitan staff engaging in construction, including specialized requirements for desert locations and guidelines for projects in the public right-of-way. Environmental requirements for construction activities are evaluated and implemented for every construction project and operations and maintenance activity. These requirements are intended to ensure best practices are in place during all construction phases and to reduce and/or avoid environmental impacts. In addition, Metropolitan's engineering project specification package also specifies design practices for contractors during construction to reduce or avoid impacts to the environment.

Some of these construction requirements are summarized below:

- Obtain and comply with the applicable local, state, and federal environmental permits.

- Flag and/or fence any environmentally sensitive areas (ESAs) and abide by any conditions and measures implemented to protect ESAs.
- Implement best management practices (BMPs) to protect water quality, such as the use of drip pans below stationary equipment, proper storage and covering of stockpiled debris and soils, and proper cleanup of spills in accordance with environmental regulations.
- Use low sulfur fuels for construction vehicles and equipment, prohibit idling of vehicles and equipment, and comply with the applicable air district's fugitive dust control measures, such as South Coast Air Quality Management District's (SCAQMD) Rules 401 (Visible Emissions), 402 (Nuisance), 403 (Fugitive Dust) and 403.1 (Supplemental Fugitive Dust Control Requirements for Coachella Valley Sources).
- Comply with the Migratory Bird Treaty Act, California Fish Game Code 3503, including conducting pre-construction nesting bird surveys and implementation of avoidance measures, where applicable.
- Comply with applicable local tree ordinances.
- Protect any sensitive cultural and paleontological resources by halting work within 50 feet of an unanticipated discovery for evaluation of the find by a qualified professional, require archaeological and/or paleontological monitoring for sites with high sensitivity, and comply with California Health and Safety Code Section 7050.5 and Public Resources Code Section 5097.98 in the event that human remains are discovered.
- Properly store hazardous materials pursuant to state and federal regulations.
- Use spark arrestors and ensure availability of fire containment equipment to reduce fire risks.
- Use mufflers on construction vehicles and equipment to reduce noise impacts.
- Prepare and implement an approved Storm Water Pollution Prevention Plan (SWPPP) or Water Pollution Control Plan.
- All workers must attend a site-specific Worker's Environmental Awareness Training before being allowed on site.

Environmental Requirements for Desert Locations

In addition to the general environmental requirements discussed above, construction activities occurring in the desert locations must comply with special environmental requirements to protect sensitive desert habitat. These additional requirements include the following:

- All workers must attend a Desert Tortoise and Environmental Awareness Training before being allowed on site.
- Conduct preconstruction surveys for desert tortoise.
- Contract a qualified biologist to monitor for desert tortoise and other sensitive species, as needed.
- Limit vehicle speeds on all unpaved roadways.
- Check for desert tortoises beneath vehicles and equipment prior to operation.
- Use raven-proof containers for food and trash items to avoid attracting desert tortoise predators.

2.6 Permits and Approvals

Federal, state, and local agencies may rely on information in this PEIR to inform their decision-making regarding issuance of specific permits related to construction or operation of individual projects to be implemented under the proposed program. To the degree feasible, this PEIR identifies federal, state, and local permits and authorizations that may be required prior to construction for future projects envisioned as part of the proposed program, as well as the agencies that Metropolitan will likely need to coordinate with regarding these future program activities. These may include, but are not limited to, the following:

- CARB portable equipment registration and/or regional Air Pollution Control Districts (APCD) permit to operate for construction equipment.
- Encroachment permits, tree trimming/removal permits, and traffic control plans from local jurisdictions.
- California Department of Fish and Wildlife (CDFW) Lake and Streambed Alteration Agreement (Section 1602 Permit) and Regional Water Quality Control Board (RWQCB) Waste Discharge Requirements for impacts to Waters of the State.
- United States Army Corps of Engineers Clean Water Act Section 404 authorization for impacts to Waters of the United States.
- Federal Incidental Take Permit (ITP) from United States Fish and Wildlife Service for federally listed species or state ITP from CDFW for state listed species.
- Conformance with applicable State Water Resources Control Board National Pollutant Discharge Elimination System and/or Municipal Separate Storm Sewer System requirements.
- Review and approval by individual airport(s) and/or the Federal Aviation Administration.
- Regional Flood Control District permits.

3 Environmental Setting

This chapter provides a general overview of the environmental setting for the Plan Area, including a regional setting, sub-regional setting, and a description of major Metropolitan facilities and land holdings. This chapter also outlines the PEIR baseline and approach to both direct and cumulative impact analyses. More detailed descriptions of the environmental setting for each environmental resource area can be found in Chapter 4, *Environmental Impact Analysis*.

3.1 Regional Setting

As described in the Project Description, Section 2.3, *Climate Action Plan Area and Member Agencies*, the Plan Area consists of the following six counties in Southern California: Los Angeles, Orange, Riverside, San Bernardino, San Diego, and Ventura. Portions of northeastern Imperial County within the Palo Verde Valley, as well as four islands in the Sacramento-San Joaquin River Delta area[9], are also included in the Plan Area. The Plan Area includes all of Metropolitan's service area and its member agencies' jurisdictions, as well as all areas where Metropolitan owns land or facilities.

The Plan Area spans approximately 38,213 square miles across six ecoregions, including Southern California Mountains and Valley, Southern California Coast, Sonoran Desert, Mojave Desert, Colorado Desert, and California Central Valley (Great Valley) (United States Department of Agriculture 2007)[10]. The Plan Area contains a population[11] of approximately 22,176,450 across 202 incorporated cities and unincorporated county regions (California Department of Finance [DOF] 2020; United States Census Bureau 2020). The Plan Area includes over 220 miles of Pacific Ocean coastline, ranges in elevation from 234 feet below mean sea level to approximately 11,503 feet above mean sea level, and contains a national park, all or portions of four national forests, and three United States Census Bureau-designated Metropolitan Statistical Areas.

3.1.1 Sub-Regional Descriptions

Los Angeles County

Los Angeles County encompasses 4,058 square miles and is bounded by Ventura and Kern counties to the north, San Bernardino County to the east, Orange County to the south, and the Pacific Ocean to

[9] The Sacramento-San Joaquin River Delta area is made up of a series of branching waterways, which form islands and isolated tracts of land surrounded by rivers, streams, and channels. For simplicity, these features are referred to as islands in this document. The Webb Tract is surrounded by the San Joaquin River, Old River, and Fishermans Cut. Bouldin Island is surrounded by the South Mokelumne River and Little Potato Slough. The Holland Tract is surrounded by Roosevelt Cut, Holland Cut, Old River, Rock Slough, and Sand Mound Slough. Finally, Bacon Island is surrounded by Old River and Middle River.

[10] The portion of the Plan Area in the California Central Valley ecoregion is limited to four Metropolitan-owned islands in the Sacramento-San Joaquin River Delta region.

[11] Population includes 2020 population estimate for Los Angeles, Orange, Riverside, San Bernardino, San Diego, and Ventura counties, as well as population for the census-designated place of Palo Verde, Imperial County, California. Islands owned by Metropolitan in the Sacramento-San Joaquin River Delta region are largely uninhabited.

the west. Approximately 2,638 square miles of the county are unincorporated, with the remaining area consisting of the 88 incorporated cities within the county's boundaries (County of Los Angeles 2020a). An estimated 10,172,951 people live in Los Angeles County, accounting for approximately 45.9 percent of the population within the Plan Area (DOF 2020). The largest city within Los Angeles County is the city of Los Angeles, which encompasses 503 square miles and is home to 4,010,684 residents (DOF 2020). Other major population centers within the county include Long Beach, with 472,217 residents, Santa Clarita, with 221,932 residents, and Glendale, with 205,331 residents (DOF 2020).

The county contains a wide array of geological features. To the west, the county stretches along 75 miles of the Pacific Coast. In the northeastern portion of the county, large swathes of land are covered by the Angeles National Forest. In addition, the county contains portions of several mountain ranges, including the Santa Monica Mountains along the coast, the San Gabriel Mountains within the Angeles National Forest, the Peninsular Mountain Range in the south of the county, as well as desert areas within the Antelope Valley to the east (County of Los Angeles 2020b). The Los Angeles River is the largest river in the county and traverses 51 miles from Canoga Park to its terminus at the Pacific Ocean in Long Beach (Mountains Recreation and Conservation Authority 2020). Ecoregions present in the county include the Southern California Coast, Mojave Basin and Range, and Southern California Mountains (Griffith et al. 2016). The county is characterized by a Mediterranean climate, with hot, dry summers and mild, wet winters (County of Los Angeles 2015).

Metropolitan member agencies within the county include the Central Basin Municipal Water District, West Basin Municipal Water District, Upper San Gabriel Valley Municipal Water District, Las Virgenes Municipal Water District, Foothill Municipal Water District, Three Valleys Municipal Water District, the City of Beverly Hills, City of Burbank, City of Compton, City of Glendale, City of Long Beach, City of Los Angeles, City of Pasadena, City of Santa Monica, City of San Fernando, City of San Marino, and City of Torrance. Metropolitan facilities in Los Angeles County include the Weymouth WTP, Jensen WTP (Metropolitan's largest treatment plant), Live Oak Reservoir, Palos Verdes Reservoir, and Garvey Reservoir.

Orange County

Orange County covers 791 square miles and is bounded to the north by Los Angeles County, to the east by San Bernardino and Riverside counties, to the south by San Diego County, and to the west by the Pacific Ocean. There are 34 incorporated cities within the county, with 321 square miles of unincorporated territory (County of Orange 2005). The county has a population of 3,194,332, accounting for approximately 14.4 percent of the population within the Plan Area (DOF 2020).

Anaheim is the most populous city within the county, with 357,325 residents. Other major population centers include Santa Ana, with 335,052 residents, Irvine, with 281,707 residents, and Huntington Beach, with 201,281 residents (DOF 2020).

Orange County lies within an alluvial plain that is semi-enclosed by the Santiago Foothills and Santa Ana Mountains to the east, the Puente and Chino Hills to the north, and the San Joaquin Hills to the south. To the west, the county stretches along 40 miles of the Pacific coast. The Santa Ana River is the largest river within the county; it spans nearly 100 miles from the San Bernardino Mountains, enters Orange County between the Santa Ana Mountains and Chino Hills, and flows to the coast near Huntington Beach, where it empties into the Pacific Ocean (California Coastal Conservancy 2020). Climate in the county is influenced by its proximity to the ocean. The county lies within the Southern California Coast ecoregion (Griffith et al. 2016). Orange County has a Mediterranean climate with generally warm temperatures and light winds (County of Orange 2005).

The Municipal Water District of Orange County, City of Anaheim, City of Fullerton, and City of Santa Ana are the Metropolitan member agencies within the county. Metropolitan facilities in Orange County include the Diemer WTP, YLHEP, and Orange County Reservoir.

Riverside County

Riverside County encompasses 7,206 square miles within the eastern portion of Southern California. It is bordered by San Bernardino County to the north, the state of Arizona to the east, San Diego and Imperial counties to the south, and Orange County to the west. There are 28 incorporated cities within Riverside County, with approximately 6,416 square miles of unincorporated county land (County of Riverside 2019; DOF 2020). The county has a population of 2,442,304 which accounts for approximately 11.0 percent of the population within the Plan Area (DOF 2020). The city of Riverside is the most populous city within the county, with 328,155 residents. Other major population centers include Moreno Valley, with 208,838 residents, Corona, with 168,248 residents, and Murrieta, with 115,561 residents (DOF 2020).

The county contains mountainous areas, deserts, forests, rivers, and lakes. Major mountain ranges in the county include the Santa Ana, San Jacinto, and Santa Rosa mountain ranges in the western portion of the county and numerous desert ranges in the eastern portion of the county. The Cleveland National Forest and San Bernardino National Forest span mountainous regions of Riverside County. The southeastern part of the county lies within the Colorado Desert ecoregion, while a portion of north-central Riverside County is within the Mojave Desert ecoregion (County of Riverside 2015).

Portions of Joshua Tree National Park are also located in the eastern portion of the county. Major rivers that pass through the county include the Santa Ana, San Jacinto, and Whitewater rivers, the latter of which empties into the Salton Sea in the southeastern Coachella Valley, one of the largest inland seas in the world. In addition, the Colorado River runs along the eastern border of the county. There are also numerous lakes within the county, several of which are Metropolitan reservoirs that store water as part of the CRA system. Ecoregions present within Riverside County include the Southern California Coast, Mojave Basin and Range, Southern California Mountains, and Sonoran Basin and Range (Griffith et al. 2016). The county contains a variety of microclimates. Desert portions of the county are semi-arid to arid in climate with hot, dry summers and cool to cold winters depending on the elevation. In the western portion of the county, the climate is mild, with hot dry summers and wet winters (County of Riverside 2015).

Metropolitan member agencies within Riverside County include Eastern Municipal Water District and Western Municipal Water District. Metropolitan facilities in Riverside County include portions of the CRA, the Skinner WTP, Mills WTP, Diamond Valley Lake Reservoir, Lake Matthews Reservoir (CRA Western Terminus), Lake Skinner Reservoir, Eagle Mountain Pumping Plant, and Julian Hinds Pumping Plant.[12]

San Bernardino County

San Bernardino is the largest county in the Plan Area at 20,057 square miles (approximately 13 million acres). It is bordered by Inyo County to the north, the states of Nevada and Arizona to the east, Riverside and Orange counties to the south, and Los Angeles and Kern counties to the west. Approximately 78 percent of the land within San Bernardino County is under state or federal ownership; six million acres are controlled by the United States Bureau of Land Management, 1.9 million acres are owned by the United States Department of Defense, and 2.6 million acres are owned by the state. There are 24 incorporated cities within San Bernardino County, which account for 7

[12] The majority of Metropolitan's reservoirs are located within Riverside County.

percent of the land within the county (County of San Bernardino 2007). The county has a population of 2,180,537, accounting for approximately 9.8 percent of the Plan Area's population (DOF 2020).

The city of San Bernardino is the most populous city in the county, with 217,946 residents. Other major population centers include Fontana, with 213,000 residents, Ontario, with 182,871 residents, and Rancho Cucamonga, with 175,522 residents (DOF 2020).

The majority of San Bernardino County is comprised of desert areas, with mountain and valley regions in the southwest corner of the county (County of San Bernardino 2007). The San Bernardino Mountains and the eastern end of the San Gabriel Mountains run through the southwestern portion of the county and include the San Bernardino National Forest. Key riverine and lake resources within the county's mountains include Big Bear Lake, Baldwin Lake, the upper reaches of the Santa Ana River, Deep Creek, and Bear Creek. To the west of the mountains lies the valley region of the county, which is also the most urbanized part of the county. The Mojave Desert and Mojave Desert National Preserve are located in the northeastern portion of the county, while the Colorado Desert and portions of Joshua Tree National Park are located in the southeastern portion of the county. The Colorado River runs along the county's eastern boundary. Ecoregions present within San Bernardino County include Southern California Coast, Mojave Basin and Range, Southern California Mountains, and Sonoran Basin and Range (Griffith et al. 2016). The county contains a variety of microclimates.

Desert portions of the county are arid with hot, dry summers and mild to cold winters. The mountainous regions of the county are characterized by dry summers and wet, snowy winters. The valley regions exhibit a Mediterranean climate with hot, dry summers and cool winters (County of San Bernardino 2019).

The Inland Empire Utilities Agency is Metropolitan's only member agency within San Bernardino County. Metropolitan facilities in San Bernardino County include the Copper Basin Reservoir, Gene Wash Reservoir, Whitsett Intake (starting point of the CRA), Gene Pumping Plant, Iron Mountain Pumping Plant, portions of the CRA, and Etiwanda Reservoir.

San Diego County

San Diego County is the southernmost county in the Plan Area. It covers 4,207 square miles and is bordered by Riverside and Orange counties to the north, Imperial County to the east, the country of Mexico to the south; and the Pacific Ocean to the west. There are 18 incorporated cities within the county, all located within the western portion of San Diego County (County of San Diego 2011a). The county has a population of 3,343,355, accounting for approximately 15.1 percent of the Plan Area's total population (DOF 2020). The most populous city in the county is the city of San Diego, with 1,430,489 residents. Other major population centers include Chula Vista, with 272,202 residents, Oceanside, with 177,335 residents, and Escondido, with 153,008 residents (DOF 2020).

Urban land uses are concentrated in the westernmost portion of the county, while the eastern portions are largely undeveloped with mountains and desert landscapes. To the west, the landscape is characterized by low-lying coastal plains. To the east of the plains the mountains form the Peninsular Ranges. The easternmost portion of the county is characterized by desert, including the Anza-Borrego Desert State Park. Most of the land in the eastern, unincorporated portion of the county includes large areas of federal and state land, regional parks, and agricultural production (San Diego County 2011a). There are several federal and state protected lands within the county, including portions of the Cleveland National Forest, the San Diego National Wildlife Refuge, Tijuana Slough National Wildlife Reserve, Sweetwater Marsh Wildlife Refuge, Cuyamaca Rancho State Park, and Palomar Mountain State Park (County of San Diego 2011b). Major rivers within the county include the San Diego, San Dieguito, Sweetwater, and Otay rivers (Danskin 2010). Ecoregions present within the county include Southern California Coast, Southern California Mountains, and Sonoran Basin and Range (Griffith et al. 2016). The western portion of the county is characterized by a Mediterranean,

semi-arid climate, while the eastern portion of the county is arid and has a desert climate (County of San Diego 2011b).

The San Diego County Water Authority is Metropolitan's only member agency within San Diego County.

Ventura County

Ventura County is a coastal county encompassing 1,843 square miles in the northwestern portion of the Plan Area. The county is bounded by Santa Barbara County to the west, Kern County to the north, Los Angeles County to the east, and the Pacific Ocean to the southwest (County of Ventura 2020).

There are 10 incorporated cities within the county, which account for approximately 10 percent of Ventura County's land area. Approximately 47 percent of the county's land area is comprised of the Los Padres National Forest. Unincorporated county land comprises 43 percent of the county (County of Ventura 2020). The county's population is 842,886, accounting for about 3.8 percent of the Plan Area's total population (DOF 2020). The most populous city within the county is Oxnard, with 206,352 residents. Other major population centers include Thousand Oaks, with 126,484 residents, Simi Valley, with 125,115 residents, and San Buenaventura (Ventura), with 106,276 residents (DOF 2020).

The county includes approximately 42 miles of Pacific Coast to the west-southwest, with coastal marshes and habitat, and mountains and forested areas to the north. The Transverse Ranges, including the Topatopa Mountains, cross the county within the Los Padres National Forest (County of Ventura 2020). There are three major rivers in the county, which run from the mountains to the coast: the Ventura and Santa Clara rivers, and Calleguas Creek (County of Ventura 2020). Protected lands within the county include the Los Padres National Forest, the Santa Monica Mountains National Recreation Area, the Channel Islands National Park, Coldwater Canyon Ecological Reserve, Lake Casitas Recreation Area, and Hopper National Wildlife Refuge. Ecoregions present within the county include Southern California Coast and Southern California Mountains (Griffith et al. 2016). The county's climate is mild, with mean annual precipitation varying from 15 to 35 inches (County of Ventura 2020).

The Calleguas Municipal Water District is Metropolitan's only member agency within the County and there are no major Metropolitan infrastructure facilities in the County.

Imperial County (Palo Verde Valley)

An approximately 18-square mile portion of the Plan Area is located in northeastern Imperial County. This portion of the Plan Area is within the Palo Verde Valley and is bordered by Riverside County to the north, the Colorado River and Arizona to the east, and desert regions of Imperial County to the south and west. The region is characterized by extensive agriculture and sparse population. The unincorporated community of Palo Verde, a census-designated place, is located in northeastern Imperial County within the Plan Area and has a population of approximately 85 (United States Census Bureau 2020). The Palo Verde Mountains are situated immediately west of the Imperial County portion of the Plan Area. The Palo Verde Valley lies within the Sonoran Basin and Range ecoregion and is characterized by an arid, desert climate (Griffith et al. 2016). A network of irrigation canals conveying Colorado River water extends throughout the Palo Verde Valley. There are no Metropolitan member agencies in Imperial County. While there are no major Metropolitan infrastructure facilities in northeastern Imperial County, Metropolitan owns land in the Palo Verde Valley in both Riverside and Imperial counties. Specifically, Metropolitan owns 21,079 acres of irrigated or available-to-irrigate farmland, as well as an additional 1,474 acres of rights of way, roads, and non-irrigated lands, and an additional 6,741 acres in the Palo Verde Valley but outside of the Palo Verde Irrigation District boundary.

San Joaquin and Contra Costa Counties (Delta Islands)

The Plan Area includes four Metropolitan-owned islands in the Sacramento-San Joaquin Delta region. Bacon Island (approximately 5,600 acres) and Bouldin Island (approximately 6,020 acres) are located in San Joaquin County, while Holland Tract (approximately 4,250 acres) and Webb Tract (approximately 5,500 acres) are located in Contra Costa County. These sparsely populated islands and tracts are characterized by extensive agriculture and marshland. The Sacramento and San Joaquin Rivers flow through the Delta region, with tributaries such as the Mokelumne, Old, and Middle Rivers surrounding the islands and tracts described above. An extensive network of canals and levees spans the islands and tracts. Most islands and tracts are relatively flat, and elevations are generally around or just below mean sea level. The Delta Islands are within the Central California Valley ecoregion (Griffith et al. 2016). The region is part of California's Central Valley, with temperatures regularly exceeding 100 degrees Fahrenheit (°F) in the summer, dropping to around 30 °F in the winter, and annual rainfall averaging approximately 14 inches (City of Stockton 2016). There are no Metropolitan member agencies in this portion of the Plan Area. There are no major Metropolitan infrastructure facilities on the islands or tracts, but the region includes numerous pumping stations, reservoirs, and conveyance channels associated with the State Water Project and Central Valley Project.

3.1.2 Approach for Program-Level and Cumulative Analyses

Baseline Conditions

Section 15125 of the *State CEQA Guidelines* states that an EIR "must include a description of the physical environmental conditions in the vicinity of the project." Section 15125 states that this description, or environmental setting, "normally constitute[s] the baseline physical conditions by which a lead agency determines whether an impact is significant." Furthermore, Section 15125(a)(1) of the *State CEQA Guidelines* states that, "Generally, the lead agency should describe the physical environmental conditions as they exist at the time the notice of preparation [NOP] is published."

This PEIR evaluates impacts against existing conditions at the time of the release of the NOP (2020). It was determined that a comparison to current, existing baseline conditions would provide the most relevant information for the public and Metropolitan decision-makers. For certain issue areas (including air quality, greenhouse gas [GHG] emissions/climate change, energy, noise and transportation/circulation), the impact analysis may discuss how changes in baseline conditions resulting from background population growth, urbanization, or increase in traffic volume may occur over time, with or without implementation of the proposed program. However, all impact determinations are based on a comparison to existing baseline conditions. General existing baseline conditions for the Plan Area are described above in Section 3.1.1, *Sub-Regional Descriptions*. Existing baseline conditions specific to each environmental resource area are described at the beginning of each impact analysis section.

Approach for Program-Level Impact Analysis

The programmatic nature of the CAP necessitates a general approach to the evaluation of existing conditions and impacts associated with the proposed program. As a programmatic document, this PEIR presents a regionwide assessment of the impacts of the CAP. The analyzed impacts would potentially result from implementation of the GHG reduction measures proposed in the CAP. The analysis considers both construction-related and post-construction (operational) impacts. Because the CAP is a long-term document intended to guide actions necessary to meet Metropolitan's 2045

emissions reduction target, a high-level, program-level or qualitative evaluation is included, where available When project-specific information is available, project-level analysis would be completed and the appropriate level of project-specific CEQA review would be, as needed. For analytical purposes, the baseline year examined throughout this PEIR is 2020.

Approach for Cumulative Impact Analysis

CEQA defines cumulative impacts as "two or more individual effects which, when considered together, are considerable, or which compound or increase other environmental impacts." Section 15130 of the *State CEQA Guidelines* requires that an EIR evaluate environmental impacts that are individually limited but cumulatively considerable. These impacts can result from the proposed project alone, or together with other projects. The *State CEQA Guidelines* state: "The cumulative impact from several projects is the change in the environment which results from the incremental impact of the project when added to other closely related past, present and reasonably foreseeable probable future projects" (*State CEQA Guidelines*, Section 15355). A cumulative impact of concern under CEQA occurs when the net result of combined individual impacts compounds or increases other overall environmental impacts (*State CEQA Guidelines*, Section 15355). In other words, cumulative impacts can result from individually minor but collectively significant projects or programs taking place over a period of time. CEQA does not require an analysis of incremental effects that are not cumulatively considerable nor is there a requirement to discuss impacts which do not result in part from the project or program evaluated in the PEIR.

When evaluating cumulative impacts, CEQA allows the use of either a list of past, present and probable future projects, including projects outside the control of the lead agency, or a summary of projections in an adopted planning document, or a combination of the two approaches. The cumulative analysis used in this PEIR uses a projections-based approach (see *State CEQA Guidelines* Section 15130(b)(1)(A) and Section 15130(b)(1)(B)). Land use and growth projections for the Plan Area are described in Table 6.

Table 6 Population, Household, and Employment Projections for the Plan Area (2020-2045)

County	Area (square miles)[1]	Population		Households		Jobs	
		2020[2]	2045[3]	2020[2]	2045[3]	2020[4]	2045[3]
Los Angeles	4,058	10,172,951	11,677,000	3,590,574	4,125,000	4,589,500	5,383,000
Orange	791	3,194,332	3,535,000	1,111,421	1,154,000	1,664,700	1,980,000
Riverside	7,206	2,442,304	3,252,000	856,124	1,086,000	779,700	1,103,000
San Bernardino	20,057	2,180,537	2,815,000	726,680	875,000	797,700	1,064,000
San Diego	4,207	3,343,355	4,275,000[5]	1,226,879	1,500,000[5]	1,512,700	1,800,000[5]
Ventura	1,843	842,886	947,000	291,210	306,000	334,500	389,000

[5] San Diego Association of Governments 2011

[6] Includes northeastern Imperial County and sparsely populated islands and tracts in the Sacramento-San Joaquin Delta region. These areas are not anticipated to account for a substantial amount of growth in population, households, or jobs in the Plan Area.

[7] Based on United States Census Bureau population estimate for the census-designated community of Palo Verde.

[8] Based on an average household size of 3.56 persons per household in Imperial County (California Department of Finance 2020).

[9] Due to their sparsely populated nature, these portions of the Plan Area are not anticipated to account for a substantial amount of current or future jobs in the Plan Area.

As shown in Table 6, the Plan Area is anticipated to experience an approximately 19.5 percent growth in population, 15.9 percent growth in households, and 21.1 percent growth in jobs by 2045, resulting in increased population, household, and employment density throughout the region. These projections are accounted for in planning documents adopted by regional planning agencies within the Plan Area. These growth projections, in conjunction with the potential impacts of the proposed program, form the basis of the cumulative impact analysis presented in this PEIR. Cumulative impacts are analyzed at the end of the impact analysis section for each environmental resource area.

4 Environmental Impact Analysis

Introduction

This chapter introduces the organization of the environmental resource sections, which contain the various impact analyses, as well as the methodology and terminology used throughout this PEIR. It explains the overall methodology used to analyze impacts, along with the methodology for the cumulative analysis.

Environmental Analysis Scope and Organization

Resource Sections

Sections 4.1 through 4.5 of this chapter contain discussions on the potentially significant impacts of the proposed program. Each of these sections corresponds with a specific environmental resource area. To assist the reader in comparing information about the various environmental issues, each section of this chapter is organized in the following manner.

- **Existing Conditions**. Describes the existing or baseline conditions in each resource study area for the proposed program.
- **Regulatory Framework**. Provides the federal, state, regional, and local regulations for each resource area that apply to the proposed program.
- **Thresholds and Methodology**. Identifies the thresholds for determining whether a significant impact would occur with implementation of the proposed program, based on California Environmental Quality Act (CEQA) guidance and, in some cases, resource-specific guidance. Describes the methods used for the analysis of impacts and any assumptions that were made in the analysis of impacts.
- **Impacts Analysis**. Presents the evaluation of impacts that would result from implementation of the proposed program, and any mitigation measures that would be necessary to reduce these impacts. Includes the analysis of cumulative impacts for each environmental resource area, evaluated by considering the impacts of the proposed program when combined with impacts of other projects and programs within the resource study area, and a discussion on the level of significance after mitigation.

The impact analysis compares the proposed program to the existing conditions, also known as the CEQA baseline.

The analysis contained in this PEIR addresses both construction and post-construction (i.e., operational) impacts associated with implementation of the proposed program. When considering the existing conditions and potential project-level impacts for each resource area, sufficient information about the location and intensity of program activities is not available. To facilitate impact analysis, impacts were estimated by referencing a “typical,” reasonable construction schedule and equipment mix that could be expected to be required for construction of individual projects described in

Chapter 2, *Project Description*. The sample program activity includes parameters based on reasonable, conservative assumptions that are anticipated to encompass most or all individual projects. The analysis is compared to local, regional, and statewide regulations to develop a conservative scenario against which supplemental environmental analysis would be compared to make a significance determination and to determine if feasible mitigation is available to reduce these impacts to less-than-significant levels. However, the lack of project- specific details, such as the location of construction sites and proposed construction methods, limits the ability of this PEIR to determine the severity of impacts of specific project-level activities covered by the proposed program. Supplemental environmental analysis for individual covered projects would be required when project-specific details are known and projects are further defined.

Methodology and Terminology Used in the Analysis

In evaluating the potential impacts of the proposed program, the level of significance is determined by applying the thresholds of significance presented for each resource area. The environmental analyses in Sections 4.1 through 4.5 include a detailed discussion and final impact determination for the proposed program.

To determine significance, the environmental conditions with implementation of the proposed program are compared to a baseline condition. The difference between the environmental conditions with implementation of the proposed program and the baseline is then compared to a threshold to determine if the difference is significant. Section 15125 of the *State CEQA Guidelines* requires that an EIR include a description of the physical environmental conditions in the vicinity of a proposed action that exist at the time the Notice of Preparation is published (the NOP was published for public review from June 23 to July 22, 2020). This environmental setting serves as the baseline by which the lead agency determines whether an impact is significant. The lead agency may also consider a baseline condition that better reflects fluctuations resulting from cyclical trends, such as drought and wet weather. The baseline to which the proposed program is compared is described in each resource section to determine the significance of impacts.

The following terms are used to describe the level of impact in each resource section.

- **No impact.** A designation of no impact is given when no adverse changes to the environment are expected.
- **Less-than-significant impact.** A less-than-significant impact is identified when the proposed program would cause no substantial adverse change to the environment (i.e., the impact would not reach the threshold of significance).
- **Significant impact.** A significant impact is identified when the proposed program would create a substantial adverse change in any of the physical conditions within the affected resource area. Such an impact would exceed the applicable significance threshold established by CEQA but would be reduced to a less-than-significant level with incorporation of one or more mitigation measures.
- **Mitigation.** Mitigation refers to measures that would be implemented to avoid or lessen potentially significant impacts. Mitigation includes:
    - Avoiding the impact altogether by not taking a certain action or parts of an action.
    - Minimizing the impact by limiting the degree or magnitude of the action and its implementation.
    - Rectifying the impact by repairing, rehabilitating, or restoring the affected environment.

- Reducing or eliminating the impact over time by preservation and maintenance operations during the life of the action.
- Compensating for the impact by replacing or providing substitute resources or environments.

Mitigation measures would be required as conditions of program approval and would be monitored to ensure compliance and implementation.

- **Significant and unavoidable impact.** A significant and unavoidable impact is identified when an impact that would cause a substantial adverse effect on the environment could not be reduced to a less-than-significant level through implementation of any feasible mitigation measure(s).

In some cases, a significant and unavoidable impact determination is made because project-specific detail is not available to ensure that the proposed mitigation could reduce the impact to a less-than-significant level. In such cases, program-level impacts are considered to be potentially significant and unavoidable. Additional analysis and CEQA documentation would identify whether project-specific mitigation would be required and whether the proposed mitigation would avoid or lessen any potentially significant impacts.

- **Level of Significance After Mitigation.** Level of Significance After Mitigation is the determination of the level of impact after the implementation of mitigation measures. The level of significance after mitigation would be expressed as no impact, less-than-significant impact, less-than-significant impact with mitigation incorporated, or significant and unavoidable impact, as defined above.

Cumulative Analysis Methodology

The *State CEQA Guidelines* define cumulative impacts as "two or more individual effects which, when considered together, are considerable or which compound or increase other environmental impacts" (*State CEQA Guidelines* Section 15355). According to *State CEQA Guidelines* Section 15130, an EIR shall discuss cumulative impacts of a project when the project's incremental effect is cumulatively considerable. A cumulative impact analysis must include either: (1) a list of past, present, and reasonably anticipated future projects ("list approach"); or (2) a summary of projections contained in adopted plans designed to evaluate regional or area-wide conditions ("plan approach"). A cumulative impact analysis considers the collective impacts posed by individual plans and projects. Cumulative impacts can result from individually minor, but collectively substantial, impacts taking place within a study area and/or over a period of time.

At the program level, the list approach is not possible because the specific location and timing of individual projects to be implemented under the program is not known, so the potential for the impacts of the proposed program components to combine with other specific projects is also not known. Instead, this document uses a plan approach, looking at ongoing and planned growth patterns in the Plan Area to identify where there would be the potential for program component impacts to combine with the impacts from other projects or programs to result in cumulative impacts. For more detailed discussion of the plan approach to cumulative analysis and growth projections within the Plan Area, refer to Chapter 3, *Environmental Setting*.

4.1 Air Quality

4.1.1 Introduction

This section describes the existing conditions of the Plan Area for air quality, the regulatory framework associated with air quality, the impacts on air quality that would result from implementation of the proposed program, and the mitigation measures that would reduce these impacts. Impacts related to greenhouse gas emissions are evaluated in Chapter 5, *Effects Found Not to Be Significant*.

4.1.2 Existing Conditions

California is divided geographically into 15 air basins for managing the air resources of the state on a regional basis. Air basin boundaries were created by the CARB [13] largely by reviewing areas with similar geographical and meteorological characteristics; however, political boundaries are also accounted for in these boundaries. Some air basins are relatively small, while others are quite large (CARB 2014). Areas within each air basin are considered to share the same air masses and, therefore, are expected to have similar ambient air quality. The Plan Area includes five air basins in Southern California (South Coast, Mojave Desert, San Diego, Salton Sea, and South Central Coast) and two in Northern California (San Joaquin Valley and San Francisco Bay Area) that encompass all or portions of Los Angeles, Orange, Riverside, San Bernardino, San Diego, Ventura, Imperial, San Joaquin, Contra Costa, and Solano counties. Table 7 and Figure 14 detail the air basins and the associated counties within the Plan Area.

Local air quality management control and planning is provided through 35 regional air districts established by CARB for the 15 individual basins. CARB is responsible for control of mobile emission sources, while the local air districts are responsible for control of stationary sources and enforcing regulations. The seven air basins listed above fall within the jurisdictional areas of the eight air districts listed below in Table 7 and shown in Figure 15. They include SCAQMD, Mojave Desert Air Quality Management District (MDAQMD), Imperial County Air Pollution Control District (ICAPCD), Ventura County Air Pollution Control District (VCAPCD), San Joaquin Valley Unified Air Pollution Control District (SJVAPCD), Antelope Valley Air Quality Management District (AVAQMD), San Diego Air Pollution Control District (SDAPCD) and the Bay Area Air Quality Management District (BAAQMD). Combined, the eight air districts have jurisdiction over an area of approximately 38,275 square miles, which encompasses 26 counties. All the known locations of proposed CAP projects are within the jurisdictional boundaries of the eight regional air districts listed in Table 7.

[13] CARB is the state agency designated to administer air quality regulations

4.1.2.1 Criteria Pollutants

The following discussion provides an introduction to air pollutants that are emitted into the ambient air by various stationary and mobile sources and are regulated by federal and state law. These regulated air pollutants are known as criteria air pollutants and are categorized either as primary pollutants or secondary pollutants. Primary air pollutants are those pollutants that are emitted directly from the various stationary and mobile sources, including carbon monoxide, volatile organic compounds (VOCs), nitrogen oxides, sulfur dioxide, and most fine particulate matter (particulate matter 10 microns or less in diameter [PM_{10}], particulate matter 2.5 microns or less in diameter [$PM_{2.5}$] such as lead and fugitive dust). Of these, carbon monoxide, sulfur dioxide, PM_{10}, and $PM_{2.5}$ are criteria pollutants. VOCs and nitrogen oxides are precursors that form secondary criteria pollutants, such as ozone and nitrogen dioxide, through chemical and photochemical reactions in the atmosphere. Presented below is a description of each of the primary and secondary criteria air pollutants and their known health effects.

Ozone

Ozone, a colorless toxic gas, is found in two regions of the Earth's atmosphere: at ground level and in the upper regions of the atmosphere. Ozone is produced by a photochemical reaction (triggered by sunlight) between nitrogen oxides and VOCs. Nitrogen oxides are formed during the combustion of fuels, while VOCs are formed during incomplete combustion of fuels as well as evaporation of organic solvents. Both types of ozone have the same chemical composition (O_3). Although upper atmospheric ozone protects the Earth from the sun's harmful rays, ground-level ozone is the main component of smog (U.S. EPA 2018). It enters the bloodstream and interferes with the transfer of oxygen, depriving sensitive tissues in the heart and brain of oxygen. It also damages vegetation by inhibiting growth. Although ozone is not directly emitted, it forms in the atmosphere through a photochemical reaction between VOCs and nitrogen oxides in the presence of sunlight (i.e., smog). The damaging effects of photochemical smog are generally related to the concentration of ozone, which is present in relatively high concentrations in the Plan Area's seven air basins. Meteorology and terrain play major roles in ozone formation. Ideal smog conditions typically occur during summer and early autumn on days with low wind speeds or stagnant air, warm temperatures, and cloudless skies; however, smog conditions can also occur during the winter months in high-elevation areas in

the western United States when snow is on the ground and temperatures are near or below freezing if high levels of local VOC and nitrogen oxide emissions are present (U.S. EPA 2016).

Organic Gases – Precursors to Ozone

There are several subsets of organic gases, including reactive organic gases and VOCs. Hydrocarbons are organic gases that are formed solely of hydrogen and carbon. Reactive organic gases include all hydrocarbons except those exempted by CARB. Therefore, reactive organic gases are a set of organic gases based on state rules and regulations. VOCs are similar to reactive organic gases in that they include all organic gases except those exempted by federal law. Both VOCs and reactive organic gases are emitted from incomplete combustion of hydrocarbons or other carbon-based fuels. Combustion engine exhaust, oil refineries, and oil-fueled power plants are the primary sources of hydrocarbons. Another source of hydrocarbons is evaporation from petroleum fuels, solvents, dry-cleaning solutions, and paint. In general, reactive organic gases and VOCs are used interchangeably to refer to the hydrocarbons that are a precursor to ozone formation. However, to avoid confusion, the following analysis only uses the term VOCs to denote organic gases.

The primary health effects of hydrocarbons result from the formation of ozone and its related health effects. High levels of hydrocarbons in the atmosphere can interfere with oxygen intake by reducing the amount of available oxygen through displacement. Carcinogenic forms of VOCs are considered to be toxic air contaminants (TACs) (described later in this section).

Carbon Monoxide

Carbon monoxide is a colorless, odorless gas that can interfere with the transfer of oxygen to the brain. It can cause dizziness and fatigue and impair central nervous system functions. Carbon monoxide is emitted almost exclusively from incomplete combustion of fossil fuels. In urban areas, carbon monoxide is emitted by motor vehicles, power plants, refineries, industrial boilers, ships, aircraft, and trains. Automobile exhaust is the largest carbon monoxide contributor in urban areas. Carbon monoxide is a non-reactive air pollutant that dissipates relatively quickly; therefore, ambient carbon monoxide concentrations generally follow the spatial and temporal distributions of vehicular traffic. Carbon monoxide concentrations are influenced by local meteorological conditions, primarily wind speed, topography, and atmospheric stability. Carbon monoxide from motor vehicle exhaust can become locally concentrated when surface-based temperature inversions are combined with calm atmospheric conditions, a typical situation at dusk in urban areas between November and February.

Nitrogen Dioxide

Nitrogen dioxide is a brownish gas that irritates the lungs. It can cause breathing difficulties at high concentrations. Similar to ozone, nitrogen dioxide is not directly emitted but is formed through a reaction between nitric oxide and atmospheric oxygen. Nitric oxide and nitrogen dioxide are collectively referred to as nitrogen oxides and are major contributors to ozone formation. Nitrogen dioxide also contributes to the formation of PM_{10} (see discussion of PM_{10} later in this section). At atmospheric concentrations, nitrogen dioxide is only potentially irritating. At high concentrations, the result is a brownish-red cast to the atmosphere and reduced visibility. There is some indication of a relationship between nitrogen dioxide and chronic pulmonary fibrosis. Some increase in bronchitis in children (2 to 3 years old) has also been observed at concentrations below 0.3 part per million (ppm) (SCAQMD 1993).

Particulate Matter

Particulate matter pollution consists of very small liquid and solid particles floating in the air, including smoke, soot, dust, salts, acids, and metals. Particulate matter also forms when gases emitted

from industries and motor vehicles undergo chemical reactions in the atmosphere. PM_{10} and $PM_{2.5}$ represent fractions of particulate matter. PM_{10} refers to particulate matter 10 microns or less in diameter, about 1/7th the thickness of a human hair. $PM_{2.5}$ refers to particulate matter that is 2.5 microns or less in diameter, roughly 1/28th the diameter of a human hair. Major sources of PM_{10} include motor vehicles; wood burning stoves and fireplaces; dust from construction, landfills, and agriculture; wildfires and brush/waste burning; industrial sources; windblown dust from open lands; and atmospheric chemical and photochemical reactions. $PM_{2.5}$ results from fuel combustion (from motor vehicles, power generation, and industrial facilities), residential fireplaces, and wood stoves. In addition, PM_{10} and $PM_{2.5}$ can be formed in the atmosphere from gases such as sulfur dioxide, nitrogen oxides, and VOCs.

Both PM_{10} and $PM_{2.5}$ pose a greater health risk than larger size particles because when inhaled, these tiny particles can penetrate the human respiratory system's natural defenses and damage the respiratory tract. PM_{10} and $PM_{2.5}$ can increase the number and severity of asthma attacks, cause or aggravate bronchitis and other lung diseases, and reduce the body's ability to fight infections. Very small particles of substances, such as lead, sulfates, and nitrates, can cause lung damage directly. These substances can be absorbed into the bloodstream and cause damage elsewhere in the body; they can also transport adsorbed contaminants such as chlorides or ammonium into the lungs and cause injury. Particles measuring 2.5 to 10 microns in diameter tend to collect in the upper portion of the respiratory system, and $PM_{2.5}$ are so tiny that they can penetrate deeper into the lungs and damage lung tissues. Suspended particulates also damage and discolor surfaces on which they settle and contribute to haze and reduce regional visibility (SCAQMD 1993).

Sulfur Dioxide

Sulfur dioxide is a product of high-sulfur fuel combustion. The main source of sulfur dioxide is combustion of coal and oil used in power stations, industries, and domestic heating. Industrial chemical manufacturing is another source of sulfur dioxide. Sulfur dioxide is an irritant gas that attacks the throat and lungs. It can cause acute respiratory symptoms and diminished ventilator function in children. Sulfur dioxide can also cause plant leaves to turn yellow and erode iron and steel. In recent years, sulfur dioxide concentrations have been reduced by the increasingly stringent controls placed on stationary-source emissions of sulfur dioxide and limits on the sulfur content of fuels.

Lead

Lead is a metal found naturally in the environment, as well as in manufacturing products. Lead occurs in the atmosphere as particulate matter. Leaded gasoline has been regulated by the U.S. EPA since the early 1970s, which has resulted in dramatic reductions of lead found in the environment. As a result of those reductions, metal processing currently is the primary source of lead emissions. The highest level of lead in the air is generally found near lead smelters. Other stationary sources include waste incinerators, utilities, and lead-acid battery manufacturers. Lead may cause a range of health effects, including anemia, kidney disease, and, in severe cases, neuromuscular and neurological dysfunction.

Toxic Air Contaminants

With respect to criteria pollutants, federal and/or state ambient air quality standards represent the exposure level (with an adequate margin of safety) deemed safe for humans. No ambient air quality standards exist for TACs because no exposure level has been deemed safe for humans. Pollutants are identified as TACs because of their potential to increase the risk of developing cancer or their acute or chronic health risks. For TACs that are known or suspected carcinogens, CARB has consistently found that there are no levels or thresholds below which exposure is risk-free. Individual TACs vary

greatly in the risk they present. At a given level of exposure, one TAC may pose a hazard that is many times greater than another. For certain TACs, a unit risk factor can be developed to evaluate cancer risk. For acute and chronic health risks, a similar factor, called a Hazard Index, is used to evaluate risk. In the early 1980s, CARB established a statewide comprehensive air toxics program to reduce exposure to air toxics.

To date, CARB has identified 21 TACs and adopted the U.S. EPA's list of hazardous air pollutants as TACs. In August 1998, CARB identified diesel exhaust particulate matter (DPM) emissions as a TAC. According to CARB, diesel engine emissions are believed to be responsible for about 70 percent of California's estimated known cancer risk attributable to toxic air contaminants and comprise about eight percent of outdoor $PM_{2.5}$ (CARB 2020). DPM accounts for a greater fraction of overall cancer risk in some regions, such as in the SCAB where 80 percent of overall cancer risk from TACs is attributed to DPM (SCAQMD 2015). In September 2000, CARB approved a comprehensive diesel risk reduction plan to reduce emissions from both new and existing diesel-fueled engines and vehicles. The goal of the plan is to reduce DPM emissions and the associated health risk by 75 percent by 2010 and by 85 percent by 2020 (CARB 2000). CARB estimates that DPM emissions in 2035 will be less than half of those in 2010 (CARB 2020).

4.1.2.2 Climate and Meteorological Conditions

The following subsections detail the location, climate, and metrological influences of each air basin in the Plan Area. Air quality in each basin is primarily influenced by its unique meteorology, its interactions with neighboring air basins, and a wide range of emissions sources, such as dense population centers, substantial vehicular traffic, and industry. All seven air basins are also influenced by the semi-permanent Pacific High subtropical pressure system off the coast. This pressure system consists of warm air from the low latitudes (i.e., the tropics) that is circulated to the North Pacific via atmospheric currents. As this air descends along the coast, the air warms and dries, which typically results in sunny and dry weather (National Oceanic and Atmospheric Administration 2020). The specific influences of the Pacific High subtropical pressure system in each air basin are discussed below. In addition, several air basins are influenced by regional "Santa Ana" conditions in which the prevailing westerly wind pattern is sometimes interrupted. Santa Ana conditions occur when a strong high pressure develops over the Nevada–Utah area and overcomes the prevailing westerly coastal winds, sending strong, steady, hot, dry northeasterly winds over the mountains and out to sea. The high pressure and strong Santa Ana winds tend to blow pollutants out over the ocean, thus producing clear days. However, at the onset or during breakdown of Santa Ana conditions, or if the Santa Ana is weak, dispersion of pollutants can be impeded. The specific influences of the Sana Ana conditions in some air basins are discussed below.

South Coast Air Basin

The South Coast Air Basin (SCAB) consists of all of Orange County and the non-desert portions of Los Angeles, Riverside, and San Bernardino counties, in addition to the San Gorgonio Pass area in Riverside County. The SCAB is bordered by the Pacific Ocean to the west and the San Gabriel, San Bernardino, and San Jacinto Mountains to the north and east.

The regional climate in the SCAB is semi-arid and is characterized by warm summers, mild winters, infrequent seasonal rainfall, moderate daytime onshore breezes, and moderate humidity (SCAQMD 1993 and 2016). Most of the annual rainfall in the SCAB occurs between November and April with annual precipitation ranging from 12 to 15 inches along the coast and decreasing to less than 10 inches inland (CARB 2011). Summer rainfall is minimal and is generally limited to scattered thundershowers in coastal regions and slightly heavier showers in the eastern portion of the SCAB and along the coastal side of the mountains. Average temperatures vary widely throughout the SCAB

from lows in the mid-50 degrees Fahrenheit (°F) and highs in the mid-70°F along the coast to average summertime highs in the mid- to high-90°F in the inland regions. The mountainous regions of the SCAB experience temperatures below freezing in the winter and precipitation in the form of snow (CARB 2011).

The SCAB experiences a persistent temperature inversion (warmer air on top of cooler air) as a result of the Pacific High subtropical pressure system. This inversion limits the vertical dispersion of air contaminants, holding them relatively near the ground. As the sun warms the ground and the lower air layer, the temperature of the lower air layer approaches the temperature of the base of the inversion (upper) layer until the inversion layer finally breaks, allowing vertical mixing with the lower layer. This phenomenon is observed in mid- to late afternoons on hot summer days. Winter inversions frequently break by midmorning. The combination of stagnant wind conditions and low inversions produces the greatest pollutant concentrations. On days of no inversion or high wind speeds, ambient air pollutant concentrations are lowest. During periods of low inversions and low wind speeds, air pollutants generated in urbanized areas are transported predominantly onshore into Riverside and San Bernardino counties. In the winter, the greatest pollution problem is the accumulation of carbon monoxide and nitrogen oxides due to low inversions and air stagnation during the night and early morning hours. Longer daylight hours and brighter sunshine in the summer result in greater frequency of reactions between sunlight, hydrocarbons, and nitrogen oxides, which forms photochemical smog (SCAQMD 2017).

Mojave Desert Air Basin

The Mojave Desert Air Basin (MDAB) consists of the desert portions of Los Angeles, San Bernardino, Riverside, and Kern counties and is an assemblage of mountain ranges interspersed with long broad valleys that often contain dry lakes. The MDAB is separated from the southern California coastal and central California valley regions by the Tehachapi Mountains to the west and by the San Gabriel Mountains to the south. The mountains in the lower region generally reach heights of 1,000 to 4,000 feet above the valley floor.

The MDAB averages three to seven inches of rain annually. Thus, it is classified as a dry-hot desert climate where temperatures can be in excess of 95°F for 60 to 70 days per year with almost no precipitation. Prevailing winds in the MDAB come from the west and southwest and are produced by a combination of the proximity of the MDAB to coastal and central regions and the location of the Sierra Nevada Mountains to the north, which prevent air from passing through. During summer, the MDAB is normally influenced by the Pacific High subtropical pressure cell off the coast that prevents cloud formation and encourages daytime solar heating. Cold air masses moving south from Canada and Alaska do not generally influence the MDAB because the frontal systems are weak and diffuse before they reach the desert. Therefore, desert moisture is created through warm, moist, unstable air masses from the south (Eastern Kern Air Pollution Control District 2017).

San Diego Air Basin

The San Diego Air Basin (SDAB) consists of San Diego County and is bordered by the Pacific Ocean to the west, Orange and Riverside Counties to the north, Imperial County to the east, and the United States/Mexico border to the south. Temperature and precipitation can vary widely within the SDAB, where average annual precipitation ranges from approximately 10 inches in the coastal and inland areas to over 30 inches in the mountains. In general, milder annual temperatures are experienced in the maritime and coastal areas, whereas the interior and desert areas experience warmer summers and cooler winters. Regional wind patterns are dominated by onshore sea breezes during the day, and winds generally slow or reverse direction toward the sea at night.

High air pollution levels in the coastal portion of the SDAB can often occur when polluted air from the SCAB, particularly from the Los Angeles region, travels southwest over the Pacific Ocean at night and travels onshore into the SDAB via the sea breeze during the day (SDAPCD 2015). Ozone and its precursor emissions (VOCs and nitrogen oxides) are also transported to the SDAB during relatively mild Santa Ana weather conditions. During strong Santa Ana weather conditions, air pollutants are pushed away from the SDAB farther west to the Pacific Ocean.

Salton Sea Air Basin

The Salton Sea Air Basin (SSAB) consists of Imperial County and most of the low desert areas of central Riverside County and is bordered by the San Jacinto Mountains to the west, the Little San Bernardino Mountains and the Mojave Desert to the north and east, the Arizona border to the east, and the United States/Mexico border to the south. The SSAB is located in the Colorado Desert; although there are some mountainous regions, most of the SSAB lies below 1,000 feet above mean sea level.

Annual precipitation in the SSAB ranges from three to seven inches. Daytime temperatures in the winter average 70°F, and high temperatures in the summer frequently exceed 100°F (CARB 2011). The dominant meteorological feature affecting the SSAB is the Pacific High subtropical pressure system, which produces prevailing westerly to northwesterly winds. These winds tend to blow pollutants away from coastal regions of the SCAB, including Los Angeles, Orange, San Bernardino, and Riverside counties, and through the San Gorgonio Pass to the SSAB. As a result, air quality in the SSAB is affected by both local air emissions and air emissions from the coastal regions. Similar to the SDAB, the prevailing westerly wind pattern is sometimes interrupted by regional Santa Ana wind conditions.

The SSAB is susceptible to air inversions which trap a layer of stagnant air near the ground where it can be further loaded with pollutants. Due to local climactic conditions, inversions generally occur 6,000 to 8,000 feet above the desert ground surface. These occasional inversions create conditions of haziness caused by moisture, suspended dust, and a variety of chemical aerosols emitted by trucks and automobiles, furnaces and other sources. Increasing air emissions from nearby air basins, particularly the SCAB, have also led to poorer air quality in the SSAB.

South Central Coast Air Basin

The South Central Coast Air Basin (SCCAB) consists of San Luis Obispo, Santa Barbara, and Ventura counties and is bordered by the San Gabriel Mountains to the south, the Pacific Ocean to the west, Monterey County to the north, and the San Joaquin Valley to the east.

The climate of the SCCAB is strongly influenced by its proximity to the Pacific Ocean and the location of the Pacific High subtropical pressure system. The Mediterranean climate of the SCCAB produces moderate average temperatures along the coast with average minimums in the 40s °F and 50s °F and average maximums in the 60s °F and 70s °F. Average precipitation along the coast is between 15 and 25 inches per year. The inland regions of the SCCAB experience similar average minimum temperatures; however, average maximum temperatures are often in the high 70s and can exceed 100°F on some days. Precipitation in the inland regions is typically less than 15 inches per year (CARB 2011). The SCCAB is also subject to seasonal Santa Ana winds, which are particularly strong in the mountain passes and at the mouths of canyons.

Two types of temperature inversions are created in the SCCAB: subsidence and radiational. The subsidence inversion is a regional effect created by the Pacific High subtropical pressure system in which air is heated when it flows from high-pressure areas to the low-pressure areas inland and is compressed. This type of inversion generally forms at about 1,000 to 2,000 feet above mean sea level and can occur throughout the year, but it is most evident during the summer months. Radiational, or

surface, inversions are formed by the more rapid cooling of air near the ground at night, especially during winter. This type of inversion is typically lower and is generally accompanied by stable air. Both types of inversions limit the dispersal of air pollutants within the regional airshed because more stable air conditions (i.e., low wind speeds and uniform temperatures) result in lower rates of pollutant dispersion.

San Joaquin Valley Air Basin

The San Joaquin Valley Air Basin (SJVAB) consists of all of San Joaquin, Stanislaus, Merced, Madera, Fresno, Kings, and Tulare counties as well as a portion of Kern County. The SJVAB is bordered by the Sierra Nevada Mountain Range to the east, the Coastal Ranges to the west, the Transverse Mountains to the south, and the Sacramento Valley to the north.

The SJVAB is generally considered to have a Mediterranean climate, characterized by cool, wet winters, sparse rainfall, and hot, dry summers. Average temperatures increase from north to south with summertime maximum temperatures often exceeding 100°F through the valley while average annual precipitation decreases from an average of 14 inches in Stockton to six inches in Bakersfield (CARB 2011). With an average of over 260 sunny days per year, the SJVAB provides favorable conditions for ozone formation. While precipitation and fog during the winter block sunlight and reduce ozone concentrations, wintertime fog provides favorable conditions for the formation of particulate matter (SJVAPCD 2015).

The surrounding topographic features restrict air movement through and out of the SJVAB and, as a result, the SJVAB is highly susceptible to pollutant accumulation over time. Inversion layers are formed in the SJVAB throughout the summer and winter. During the summer, the San Joaquin Valley experiences daytime temperature inversions at elevations from 2,000 to 2,500 feet above the valley floor. During the winter months, inversions occur from 500 to 1,000 feet above mean sea level (SJVAPCD 2015). According to the U.S. EPA, the San Joaquin Valley has some of the nation’s worst air quality. Poor air quality in the SJVAB is the result of several major air pollution sources including heavy truck traffic on Interstate 5 and State Route 99; diesel-burning locomotives, tractors and irrigation pumps; and wood-burning stoves and fireplaces, as well as the surrounding mountain ranges, which trap air pollution in the valley (U.S. EPA 2019).

San Francisco Bay Area Air Basin

The San Francisco Bay Area Air Basin (SFBAAB) is comprised of all of Alameda, Contra Costa, Marin, Napa, San Francisco, San Mateo, and Santa Clara counties, the southern portion of Sonoma County, and the southwestern portion of Solano County. The SFBAAB is characterized by coastal mountain ranges, inland valleys, and bays, and the topography distorts normal wind flow patterns. The coastal mountain range splits, resulting in a western coast gap (the Golden Gate) and an eastern coast gap (Carquinez Strait). These gaps allow air to flow in and out of the SFBAAB and the Central Valley. The greatest distortion occurs when low-level inversions are present and the air beneath the inversion flows independently of air above the inversion, a condition that is common in the summertime.

The SFBAAB is characterized by moderately wet winters and dry summers. Winter rains account for about 75 percent of the average annual rainfall. The amount of annual precipitation can vary greatly from one part of the SFBAAB to another even within short distances. In general, total annual rainfall can reach 40 inches in the mountains, but it is often less than 16 inches in sheltered valleys.

The climate of the SFBAAB is dominated by the strength and location of the North Pacific High, a subtropical pressure system. During the summer, the North Pacific High is centered over the northeastern Pacific Ocean resulting in stable meteorological conditions and a steady northwesterly wind flow. Upwelling of cold ocean water from below to the surface because of the northwesterly

flow produces a band of cold water off the coast. The cool and moisture-laden air approaching the coast from the Pacific Ocean is further cooled by the presence of the cold water band resulting in condensation and the presence of fog and stratus clouds. In the winter, the Pacific High cell weakens and shifts southward resulting in offshore wind flow, the absence of upwelling, and the occurrence of storms. Weak inversions coupled with moderate winds result in a low air pollution potential. The normal northwest wind pattern carries air onshore. Bay breezes push cool air onshore during the daytime and draw air from the land offshore at night. Winds are predominantly out of the northwest during the summer months (BAAQMD 2017a).

Regional and Localized Air Quality

Existing ambient air quality conditions in the Plan Area are a function of the number and type of pollutant sources located in each air basin, such as motor vehicles, industrial sources, and agricultural activities. Table 8 presents ambient air quality data for each of the seven air basins.

Sensitive Receptors

Certain population groups are considered more sensitive to air pollution than others, particularly children, the elderly, and acutely ill and chronically ill persons, especially those with cardio-respiratory diseases. Sensitive receptors include residences, schools and schoolyards, parks and playgrounds, day care centers, nursing homes, and hospitals (CARB 2005). Sensitive receptors are located throughout the Plan Area, however proposed projects would occur either within Metropolitan facilities, on Metropolitan-owned islands in the Sacramento-San Joaquin Delta or on agricultural lands in the Palo Verde Valley and The following list provides a summary of the nearest sensitive receptors to the known potential locations of proposed projects under the CAP that are described in Chapter 2, *Project Description*:

- YLHEP/Diemer WTP: residences located approximately 500 feet west and 1,000 feet southeast of the facility.
- Jensen WTP: residences located immediately to the west and south and the Van Gogh Charter School located approximately 1,000 feet southwest of the facility.
- Mills WTP: residences located immediately north and west and approximately 200 feet to the south of the facility.
- Skinner WTP: residences located approximately 600 feet west of the facility.
- Weymouth WTP: residences located immediately to the south, west, north, and east; Grace Miller Elementary School located immediately to the east; Calvary Baptist Schools located immediately to the west; and Joan Macy School located 800 feet south of the facility.
- Julian Hinds Pump Plant: Metropolitan residences located immediately west of the facility.
- Eagle Mountain Pump Plant: Metropolitan residences located immediately northeast of the facility.
- Iron Mountain Pump Plant: Metropolitan residences located immediately southwest of the facility.
- Gene Pump Plant: Metropolitan residences located immediately to the northwest and south of the facility.

4.1.3 Regulatory Framework

This section describes the plans, policies, and regulations related to air quality that are applicable to the proposed program.

4.1.3.1 Federal

Federal Clean Air Act

The federal Clean Air Act regulates the emission of airborne pollutants from various mobile and stationary sources. The U.S. EPA is the federal agency designated to administer air quality regulation and has established national ambient air quality standards (NAAQS) for major pollutants at thresholds intended to protect public health. Federal standards have been established for ozone, carbon monoxide, nitrogen dioxide, sulfur dioxide, lead, PM_{10}, and $PM_{2.5}$. Table 9 summarizes the NAAQS for each of these pollutants, and Table 10 shows each air basin's attainment status for the NAAQS.

Table 9 Current Federal and State Ambient Air Quality Standards

Pollutant	Federal Standard	California Standard
Ozone	0.070 ppm (8-hr avg)	0.09 ppm (1-hr avg) 0.070 ppm (8-hr avg)
Carbon Monoxide	35.0 ppm (1-hr avg) 9.0 ppm (8-hr avg)	20.0 ppm (1-hr avg) 9.0 ppm (8-hr avg)
Nitrogen Dioxide	0.100 ppm (1-hr avg) 0.053 ppm (annual avg)	0.18 ppm (1-hr avg) 0.030 ppm (annual avg)
Sulfur Dioxide	0.075 ppm (1-hr avg) 0.5 ppm (3-hr avg) 0.14 ppm (24-hr avg) 0.030 ppm (annual avg)	0.25 ppm (1-hr avg) 0.04 ppm (24-hr avg)
Lead	0.15 μg/m^3 (rolling 3-month avg) 1.5 μg/m^3 (calendar quarter)	1.5 μg/m^3 (30-day avg)
Particulate Matter (PM10)	150 μg/m^3 (24-hr avg)	50 μg/m^3 (24-hr avg) 20 μg/m^3 (annual avg)
Particulate Matter (PM2.5)	35 μg/m^3 (24-hr avg) 12 μg/m^3 (annual avg)	12 μg/m^3 (annual avg)
Visibility-Reducing Particles	No Federal Standards	Extinction coefficient of 0.23 per kilometer – visibility of ten miles or more (0.07 - 30 miles or more for Lake Tahoe) due to particles when relative humidity is less than 70 percent. Method: Beta Attenuation and Transmittance through Filter Tape (8-hr avg)
Sulfates	No Federal Standards	25 μg/m^3 (24-hr avg)
Hydrogen Sulfide	No Federal Standards	0.03 ppm (1-hr avg)
Vinyl Chloride	No Federal Standards	0.01 ppm (24-hr avg)

ppm= parts per million; hr = hour; avg = average; mg/m^3 = micrograms per cubic meter

4.1.3.2 State

California Clean Air Act

The California Clean Air Act, signed into law in 1988, requires all areas of the state to achieve and maintain the California ambient air quality standards (CAAQS) by the earliest practical date. The CAAQS incorporate additional standards for most of the criteria pollutants and set standards for other pollutants recognized by the state. In general, the California standards are more health protective than the corresponding NAAQS. California has also set standards for sulfates, hydrogen sulfide, vinyl chloride, and visibility-reducing particles. As stated in Section 4.1.2, *Existing Conditions*, eight air districts have jurisdiction over various portions of the seven air basins within the Plan Area. Table 9 details the current CAAQS and Table 10 provides the attainment status of all seven air basins with respect to the CAAQS.

State Tailpipe Emission Standards

To reduce emissions from off-road diesel equipment, on-road diesel trucks, and harbor craft, CARB established a series of increasingly strict emission standards for new engines, such as the recently approved Advanced Clean Trucks regulation. New construction equipment used for the program, including medium- and heavy-duty trucks and off-road construction equipment, would be required to comply with the standards.

Toxic Air Contaminants

California regulates TACs primarily through the Toxic Air Contaminant Identification and Control Act (Tanner Act) and the Air Toxics "Hot Spots" Information and Assessment Act of 1987 ("Hot Spots" Act). In the early 1980s, CARB established a statewide comprehensive air toxics program to reduce exposure to air toxics. The Tanner Act created California's program to reduce exposure to air toxics. The "Hot Spots" Act supplements the Tanner Act by requiring a statewide air toxics inventory, notification of people exposed to a significant health risk, and facility plans to reduce these risks. In addition, in response to AB 617 (C. Garcia, Chapter 136, Statues of 2017), CARB established the Community Air Protection Program, which selects communities disproportionately impacted by high cumulative exposure burdens for criteria air pollutants and TACs and develops community air monitoring plans and community emissions reduction programs for these communities.

CARB identified DPM as a TAC in 1998. Shortly thereafter, CARB approved a comprehensive Diesel Risk Reduction Plan to reduce emissions from both new and existing diesel-fueled engines and vehicles. The goal of the plan is to reduce DPM (respirable particulate matter) emissions and the associated health risk by 75 percent in 2010 and by 85 percent by 2020. The plan identifies several measures for CARB to implement, which have been enacted since publication of the plan (CARB 2000). CARB estimates that DPM emissions in 2035 will be less than half of those in 2010 (CARB 2020). The proposed program would be required to comply with applicable diesel control measures.

4.1.3.3 Regional

Air Pollution Control District Plans, Rules, and Regulations

As summarized in Table 7 in Section 4.1.2, *Existing Conditions*, the SCAQMD, MDAQMD, AVAQMD, SDAPCD, ICAPCD, VCAPCD, SJVAPCD, and BAAQMD all have jurisdiction over portions of the Plan Area. In accordance with the federal and state Clean Air Acts, each of these eight APCDs have prepared air quality management plans (AQMPs) that demonstrate each air district's

clean air strategy to achieve attainment of various federal and state air quality standards, including those for ozone, PM_{10}, and $PM_{2.5}$, depending on each district's attainment status. These plans outline a variety of stationary source, land use, and transportation control measures that each district proposes to implement as part of its clean air strategy. These measures include specific actions to implement new emissions control regulations and Reasonably Available Control Technology requirements; enforce New Source Review; reduce vehicle trips and vehicle miles traveled; facilitate use of public transit and alternative transportation modes; and retrofit, modernize, and electrify the vehicle fleet and equipment used for construction, freight, farming, and lawn and garden activities.

The following are the most recent versions of air quality management plans adopted in the Plan Area. These plans typically have a three- to six-year planning horizon and are updated on a periodic basis depending on the specific federal and state requirements for each nonattainment area and the discretion of each air district:

- SCAQMD (2017) Final 2016 Air Quality Management Plan
- MDAQMD (2017) Federal 8-Hour Ozone Attainment Plan (Western Mojave Desert Nonattainment Area)
- AVAQMD (2017) Federal 75 ppb Ozone Attainment Plan (Western Mojave Desert Nonattainment Area)
- SDAPCD (2016a) 2008 Eight-Hour Ozone Attainment Plan for San Diego County
- SDAPCD (2016b) 2016 Revision to the Regional Air Quality Strategy for San Diego County
- ICAPCD (2018) Imperial County 2018 Redesignation Request and Maintenance Plan for Particulate Matter Less than 10 Microns in Diameter
- ICAPCD (2017a) Imperial County 2017 State Implementation Plan for the 2008 8-Hour Ozone Standard
- ICAPCD (2014) Imperial County 2013 State Implementation plan for the 2006 24-Hour $PM_{2.5}$ Moderate Nonattainment Area
- VCAPCD (2016) Final 2016 Ventura County Air Quality Management Plan
- SJVAPCD (2016) 2016 Ozone Plan for 2008 8-Hour Ozone Standard
- SJVAPCD (2018) 2018 Plan for the 1997, 2006, and 2012 $PM_{2.5}$ Standards
- BAAQMD (2017b) Spare the Air – Cool the Climate: A Blueprint for Clean Air and Climate Protection in the Bay Area

Each air district has also adopted a set of rules and regulations pertaining to various air emissions sources. Rules and regulations applicable to the proposed program would include those related to construction equipment, stationary emergency generators, nuisance odors, fugitive dust, metal coatings, cutback and emulsified asphalt, architectural coatings, consumer paint thinners and multi-purpose solvents, solvent degreasers, composting and related operations, storage tanks for VOCs, organic liquids, publicly owned treatment works operations (i.e., wastewater treatment plants), asbestos emissions from demolition/renovation activities, and particulate emissions from soils with TACs. A comprehensive list of rules and regulations adopted by each air district is available online at CARB's District Rules Database at https://ww3.arb.ca.gov/drdb/drdb.htm.

4.1.3.4 Local

Although local actions have important implications for air quality, regulation of air quality occurs primarily at the federal, state, and regional levels. Local general plans typically include several policies related to air quality that are directed at participating in regional collaboration with the applicable air district, achieving attainment of NAAQS and CAAQS, implementing the use of the applicable air district's thresholds of significance for CEQA analysis, and ensuring project-level compliance with applicable air district rules.

4.1.4 Thresholds and Methodology

4.1.4.1 Thresholds of Significance

Table 11 lists the thresholds from Appendix G of the *State CEQA Guidelines* that pertain to air quality. These thresholds are addressed in the draft PEIR.

Table 11 CEQA Thresholds for Air Quality

Threshold Would the proposed program:
a. Conflict with or obstruct implementation of the applicable air quality plan?
b. Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard?
c. Expose sensitive receptors to substantial pollutant concentrations?
d. Result in other emissions (such as those leading to odors) adversely affecting a substantial number of people?

Appendix G of the *State CEQA Guidelines* further states that the significance criteria established by the applicable air quality management or air pollution control district may be relied upon to make the determinations in Table 11. As such, seven of the eight air districts with jurisdiction in the Plan Area (excluding the SDAPCD) have published guidance documents for use in evaluating the air quality impacts of projects under CEQA, including the following:

- SCAQMD (1993) CEQA Air Quality Handbook (currently being updated) and supplemental guidance
- SCAQMD (2008) Final Localized Significance Threshold Methodology
- SCAQMD (2019) South Coast AQMD Air Quality Significance Thresholds
- MDAQMD (2016) California Environmental Quality Act (CEQA) and Federal Conformity Guidelines
- AVAQMD (2016) California Environmental Quality Act (CEQA) and Federal Conformity Guidelines
- ICAPCD (2017b) CEQA Air Quality Handbook
- VCAPCD (2003) Ventura County Air Quality Assessment Guidelines
- SJVAPCD (2015) Guidance for Assessing and Mitigating Air Quality Impacts
- BAAQMD (2017a) California Environmental Quality Act Air Quality Guidelines

The following subsections discuss the significance thresholds adopted by each air district.

Consistency with Air Quality Plans

Based on a review of the CEQA guidance documents published by seven of the eight air districts with jurisdiction in the Plan Area (excluding the SDAPCD, which has not published guidance), the proposed program would be consistent with the applicable air quality plans listed in Section 4.1.3.3, *Regional*, if it meets all of the following conditions:

1. The program would not generate direct and/or indirect population growth that would exceed the population growth forecasts underlying the applicable air quality plans. Emissions forecasts are usually based on population growth forecasts; therefore, if the program would generate population growth in excess of population growth anticipated by the air quality plans, then it may result in higher emissions than those anticipated and mitigated by the plans.
2. The program would not generate emissions in excess of the thresholds of significance established by the applicable air district, which are often connected to the air quality plans.
3. The program would incorporate all applicable control measures from the applicable air quality plans.
4. The program would provide buffer zones around sources of odors and TACs.

Criteria Pollutant Emissions

Regional Thresholds of Significance

Seven of the eight air districts with jurisdiction in the Plan Area (excluding the SDAPCD) have adopted regional significance thresholds to evaluate air pollutant emissions. Thresholds of significance adopted by each air district for construction and operational emissions are summarized in Table 12 and Table 13, respectively.

Table 12 Thresholds of Significance for Construction Emissions

Air District	VOC	NO_X	CO	SO_X	PM_{10}	$PM_{2.5}$	Lead	H_2S
SCAQMD	75 lbs/day	100 lbs/day	550 lbs/day	150 lbs/day	150 lbs/day	55 lbs/day	3 lbs/day	N/A
MDAQMD	137 lbs/day	137 lbs/day	548 lbs/day	137 lbs/day	82 lbs/day	65 lbs/day	3 lbs/day	54 lbs/day
	25 tons/ year	25 tons/ year	100 tons/ year	25 tons/ year	15 tons/ year	12 tons/ year	0.6 ton/year	10 tons/ year
AVAQMD	137 lbs/day 25 tons/ year	137 lbs/day 25 tons/ year	548 lbs/day 100 tons/ year	137 lbs/day 25 tons/ year	82 lbs/day 15 tons/ year	65 lbs/day 12 tons/ year	3 lbs/day 0.6 ton/year	54 lbs/day 10 tons/ year
SDAPCD[1]	N/A	250 lbs/day	550 lbs/day	250 lbs/day	100 lbs/day	67 lbs/day	N/A	N/A
ICAPCD	75 lbs/day	100 lbs/day	550 lbs/day	N/A	150 lbs/day	N/A	N/A	N/A
VCAPCD	25 lbs/day	25 lbs/day	N/A	N/A	N/A	N/A	N/A	N/A
SJVAPCD	10 tons/ year	10 tons/ year	100 tons/ year	27 tons/ year	15 tons/ year	15 tons/ year	N/A	N/A
BAAQMD	54 lbs/day	54 lbs/day	N/A	N/A	82 lbs/day (exhaust) BMPs (fugitive dust)	54 lbs/day (exhaust) BMPs (fugitive dust)	N/A	N/A

[1] The SDAPCD has not adopted thresholds for determining the significance of air quality impacts under CEQA. However, the SDAPCD has adopted Air Quality Impact Analysis (AQIA) trigger levels for new, modified, or relocated stationary sources (SDAPCD Rules 20.1, 20.2, and 20.3). These AQIA trigger levels do not generally apply to construction, mobile sources, or general land development projects; however, it is general practice for local lead agencies in the jurisdiction of the SDAPCD to use these trigger levels as thresholds of significance for evaluating air quality impacts. The SDAPCD does not consider AQIA trigger levels to represent significance thresholds because exceedances do not necessarily result in air quality impacts; rather, AQIA trigger levels were developed to identify sources with emissions that are too small to cause or substantially contribute to violations of NAAQS or CAAQS and therefore do not warrant further air quality analysis or permitting. In lieu of adopted thresholds, these trigger levels are used as thresholds of significance for the purpose of this analysis.

VOC = volatile organic compounds; NO_X = nitrogen oxides; CO = carbon monoxide; SO_X = sulfur oxides; PM_{10} = particulate matter with a diameter of 10 microns or less; $PM_{2.5}$ = particulate matter with a diameter of 2.5 microns or less; H_2S = hydrogen sulfide; lbs/day = pounds per day; N/A = not adopted (The air district has not adopted a threshold of significance for this pollutant.); CAAQS = California Ambient Air Quality Standards; BMPs = Best Management Practices; SCAQMD = South Coast Air Quality Management District; MDAQMD = Mojave Desert Air Quality Management District; AVAQMD = Antelope Valley Air Quality Management District; SDAPCD = San Diego Air Pollution Control District; ICAPCD = Imperial County Air Pollution Control District; VCAPCD = Ventura County Air Pollution Control District; SJVAPCD = San Joaquin Valley Air Pollution Control District; BAAQMD = Bay Area Air Quality Management District

[1] The SDAPCD has not adopted thresholds for determining the significance of air quality impacts under CEQA. However, the SDAPCD has adopted Air Quality Impact Analysis (AQIA) trigger levels for new, modified, or relocated stationary sources (SDAPCD Rules 20.1, 20.2, and 20.3). These AQIA trigger levels do not generally apply to construction, mobile sources, or general land development projects; however, it is general practice for local lead agencies in the jurisdiction of the SDAPCD to use these trigger levels as thresholds of significance for evaluating air quality impacts. The SDAPCD does not consider AQIA trigger levels to represent significance thresholds because exceedances do not necessarily result in air quality impacts; rather, AQIA trigger levels were developed to identify sources with emissions that are too small to cause or substantially contribute to violations of NAAQS or CAAQS and therefore do not warrant further air quality analysis or permitting. In lieu of adopted thresholds, these trigger levels are used as thresholds of significance for the purpose of this analysis.

[2] The VCAPCD recommends that the fugitive dust mitigation measures described in Section 7.4.1 of the *Air Quality Assessment Guidelines* be implemented as part of all project-related dust-generating operations and activities (VCAPCD 2003).

VOC = volatile organic compounds; NO_X = nitrogen oxides; CO = carbon monoxide; SO_X = sulfur oxides; PM_{10} = particulate matter with a diameter of 10 microns or less; $PM_{2.5}$ = particulate matter with a diameter of 2.5 microns or less; H_2S = hydrogen sulfide; lbs/day = pounds per day; N/A = Not adopted (The air district has not adopted a threshold of significance for this pollutant.); CAAQS = California Ambient Air Quality Standards; BMPs = Best Management Practices; SCAQMD = South Coast Air Quality Management District; MDAQMD = Mojave Desert Air Quality Management District; AVAQMD = Antelope Valley Air Quality Management District; SDAPCD = San Diego Air Pollution Control District; ICAPCD = Imperial County Air Pollution Control District; VCAPCD = Ventura County Air Pollution Control District; SJVAPCD = San Joaquin Valley Air Pollution Control District; BAAQMD = Bay Area Air Quality Management District

Localized Thresholds of Significance

In addition to the regional thresholds of significance identified above, the SCAQMD has developed Localized Significance Thresholds (LSTs) in response to the Governing Board's Environmental Justice Enhancement Initiative (1-4), which was prepared to supplement the *CEQA Air Quality Handbook* (SCAQMD 1993). LSTs were devised in response to concern regarding exposure of individuals to criteria pollutants in local communities and have been developed for nitrogen oxides, carbon monoxide, PM_{10}, and $PM_{2.5}$. LSTs represent the maximum emissions from a project that will not cause or contribute to an air quality exceedance of the most stringent applicable federal or state ambient air quality standard at the nearest sensitive receptor, taking into consideration ambient concentrations in each source receptor area (SRA), distance to the sensitive receptor, and project size. LSTs have been developed for emissions generated at construction sites up to five acres in size. However, LSTs only apply to emissions in a fixed stationary location and are not applicable to mobile sources, such as cars on a roadway (SCAQMD 2008). As such, typically LSTs are referred to for on-site construction emissions, because most operational emissions and off-site construction emissions are associated with vehicle trips. The SCAQMD provides LSTs for one-, two-, and five-acre project

sites for receptors at a distance of 82 feet to 1,640 feet (25 to 500 meters) from a project site's boundary[14].

Due to the programmatic nature of the proposed CAP, there is currently not sufficient detail to allow for the quantification of emissions from individual projects proposed under the program; therefore, the applicability of LSTs to specific proposed projects is also largely unknown. To provide a conservative estimate of project impacts in consideration of the LSTs, this analysis uses the most stringent LSTs recommended by the SCAQMD for use within its jurisdictional area, which are for one-acre sites within the SRA 12 (South Central Los Angeles County) within 82 feet (25 meters) of the nearest sensitive receptor (SCAQMD 2009). These LSTs are summarized in Table 14.[15]

Table 14 SCAQMD LSTs for Construction (SRA 12)

Pollutant	LSTs for a 1-acre Site in SRA 12 for a Receptor 82 Feet Away (lbs/day)
Gradual conversion of NO_X to NO_2	46
CO	231
PM_{10}	4
$PM_{2.5}$	3

SCAQMD = South Coast Air Quality Management District; LSTs = Localized Significance Thresholds; SRA = South Receptor Area; lbs/day = pounds per day; NO_X = nitrogen oxides; NO_2 = nitrogen dioxide; CO = carbon monoxide; PM_{10} = particulate matter with a diameter of 10 microns or less; $PM_{2.5}$ = particulate matter with a diameter of 2.5 microns or less

Source: SCAQMD 2009

Toxic Air Contaminants

Five of the eight air districts with jurisdiction in the Plan Area have adopted thresholds of significance for evaluating impacts related to TAC emissions to be evaluated at the most exposed receptor within 1,000 feet of individual projects that may be implemented under the proposed CAP. The thresholds of significance for TAC emissions are shown in Table 15.

[14] It should be noted that use of LSTs is voluntary.
[15] SRA 12 is bound by Interstate 110 to the west, State Route 91 to the south, Interstate 710 to the east, and Slauson Avenue to the north.

Table 15 Thresholds of Significance for Toxic Air Contaminants

Air District	Excess Cancer Risk	Excess Chronic and Acute Hazard Index	Excess Cancer Burden	Annual Average $PM_{2.5}$ Concentration
SCAQMD (2019)	≥ 10 in 1 million	≥ 1.0	> 0.5 cancer cases in areas with cancer risk greater than or equal to one case in 1 million	N/A
BAAQMD – Individual Source	≥ 10 in 1 million	≥ 1.0	N/A	≥ 0.3 μg/m^3
BAAQMD – Cumulative Sources	≥ 100 in 1 million from all local sources	≥ 10.0 from all local sources[1]	N/A	> 0.8 μg/m^3 from all local sources
VCAPCD	≥ 10 in 1 million	≥ 1.0	N/A	N/A
SJVAPCD	≥ 20 in 1 million	≥ 1.0	N/A	N/A
SDAPCD[2]	≥ 10 in 1 million	≥ 1.0	≥ 1.0	N/A

SCAQMD = South Coast Air Quality Management District; BAAQMD = Bay Area Air Quality Management District; VCAPCD = Ventura County Air Pollution Control District; SJVAPCD = San Joaquin Valley Air Pollution Control District; SDAPCD = San Diego Air Pollution Control District; N/A = not applicable; μg/m^3 = micrograms per cubic meter

Valley Fever

San Joaquin Valley Fever (Valley Fever; formally known as Coccidioidomycosis) is an infectious disease caused by the fungus *Coccidioides immitis*. Valley Fever is a disease of concern in arid and semiarid areas of the western United States, including in the dry, inland regions of southern California. Infection is caused by inhalation of *Coccidioides immitis* spores that become airborne when dry, dusty soil or dirt is disturbed by natural processes such as wind or earthquakes, or by human induced ground-disturbing activities such as construction, farming, or other activities (VCAPCD 2003).

The VCAPCD recommends consideration of the following factors that may indicate a program's potential to result in impacts related to Valley Fever:

- Disturbance of the topsoil of undeveloped land (to a depth of about 12 inches)
- Presence of dry, alkaline, sandy soils
- Ground-disturbing activities in virgin, undisturbed, non-urban areas
- Activities occurring in windy areas
- Presence of archaeological resources probable or known to exist in the area (e.g., Native American midden sites)[16]
- Special events (e.g., fairs, concerts) and motorized activities (e.g., motocross track, All Terrain Vehicle activities) on unvegetated soil (non-grass)
- Exposure of non-native population (e.g., out-of-area construction workers)

[16] The presence of archaeological resources can indicate that soils have been historically undisturbed and therefore have higher potential to contain *Coccidioides immitis* spores.

Odors

The threshold of significance for evaluating odor-related impacts is whether the proposed project would result in the discharge of quantities of air contaminants (including odors from non-agricultural sources) that cause injury, detriment, nuisance, or annoyance to any considerable number of persons or to the public, or which endanger the comfort, repose, health or safety or any such persons or the public, or which cause, or have a natural tendency to cause, injury or damage to business of property.[17]

Cumulative Impacts

Project-level thresholds for criteria air pollutant emissions are typically set at levels that are not cumulatively considerable because these thresholds are developed to address the cumulative air quality impacts already occurring in the air basin. However, several air districts with jurisdiction in the Plan Area have published the following additional guidance on assessing cumulative air quality impacts:

- **SCAQMD**: The SCAQMD's approach to determining cumulative air quality impacts for criteria air pollutants is to first determine whether a proposed project would result in a significant project-level impact to regional air quality based on the SCAQMD significance thresholds. If the project would not generate emissions exceeding the SCAQMD thresholds, then the lead agency needs to consider the additive effects of related projects only if the proposed project is part of an ongoing regulatory program, such as a market program for reducing air pollution, or is contemplated in a PEIR, and the related projects are located within approximately one mile of the project site. If there are related projects within the vicinity (one-mile radius) of the project site that are part of an ongoing regulatory program or are contemplated in a PEIR, then the additive effect of the related projects should be considered (SCAQMD 1993).
- **ICAPCD**: For criteria pollutant emissions, lead agencies should utilize the project-level thresholds to identify whether a project's contribution to a significant cumulative air quality impact is significant (see Table 12 and Table 13). In addition, cumulative traffic volumes should be accounted for in the carbon monoxide hotspot analysis (ICAPCD 2017).
- **VCAPCD**: A project with estimated emissions two pounds per day or greater of VOCs, or two pounds per day or greater of nitrogen oxides that is inconsistent with the AQMP would have a significant cumulative adverse air quality impact (VCAPCD 2003).
- **SJVAPCD**: Any proposed program that would individually have a significant air quality impact would also be considered to have a significant cumulative air quality impact. In addition, cumulative traffic volumes should be accounted for in the carbon monoxide hotspot analysis. Because impacts from TACs are localized and the thresholds of significance for TACs have been established at such a conservative level, risks over the individual thresholds of significance are also considered cumulatively significant (SJVAPCD 2015).
- **BAAQMD**: In developing thresholds of significance for air pollutants, the BAAQMD considered the emission levels for which a program's individual emissions would be cumulatively considerable. If a program exceeds the identified significance thresholds, its emissions would be cumulatively considerable, resulting in significant adverse air quality impacts to the region's existing air quality conditions. Therefore, additional analysis to assess cumulative impacts is unnecessary (BAAQMD 2017a).

[17] This threshold of significance is based on AVAQMD Rule 402, BAAQMD Rule 1-0, ICAPCD Rule 407, MDAQMD Rule 402, SDAPCD Rule 51, SJVAPCD Rule 4102, SCAQMD Rule 402, and VCAPCD Rule 51.

4.1.4.2 Methodology

Due to the programmatic nature of the proposed CAP, there is currently not sufficient detail to allow for the quantification of emissions from individual projects proposed under the program. Therefore, construction emissions were estimated by referencing a "typical," reasonable construction schedule and equipment mix that could be expected to be required for construction of individual projects described in Chapter 2, *Project Description*, such as installation of electric vehicle infrastructure (CAP measure FL-4; CAP measure EC-3), electric-powered equipment (to replace natural gas-powered equipment)(CAP measure DC-2), or BESS facilities (CAP measure E-4) and construction of a direct meter connection between the YLHEP and Diemer WTP (CAP measure E-2). Construction emissions were estimated using the California Emissions Estimator Model (CalEEMod) version 2016.3.2.[18] CalEEMod was developed by the SCAQMD as a statewide land use emissions computer model designed to provide a uniform platform for government agencies, land use planners, and environmental professionals to quantify potential criteria pollutant and GHG emissions associated with both construction and operations from a variety of land use projects (California Air Pollution Control Officers Association 2017). The sample program activity included the following parameters based on reasonable, conservative assumptions that are anticipated to encompass most or all individual projects:

- Construction site size of five acres
- Construction schedule of 12 months, which includes phases for demolition, site preparation, grading, construction/installation, paving, and architectural coating
- Use of the following diesel-powered construction equipment equipped with Tier 3 certified engines for eight hours a day, five days a week during each phase:[19]
    - Demolition: one 81-horsepower (hp) concrete/industrial saw, one 158-hp excavator, and one 247-hp dozer
    - Site Preparation: one 247-hp dozer, two 97-hp tractors/loaders/backhoes, and one water truck
    - Grading: one 158-hp excavator, one 187-hp grader, one 247-hp dozer, and one water truck
    - Construction/Installation: one 231-hp crane, three 89-hp forklifts, one 84-hp generator, three 97-hp tractors/loaders/backhoes, and one 46-hp welder
    - Paving: two 130-hp pavers, two 132-hp paving equipment, and two 80-hp rollers
    - Architectural Coating: one 78-hp air compressor
- Demolition of 20,000 square feet of structures
- Import of 1,000 cubic yards of soil material and export of 1,000 cubic yards of soil material over a 16-day period
- Architectural coating of 10,000 square feet of interior surfaces and 10,000 square feet of exterior surfaces
- Use of architectural coatings with a maximum VOC content of 250 grams per liter[20]
- Implementation of the following standard fugitive dust control measures:

[18] Additional information on the CalEEMod model, including the User Guide, default data tables, technical source documentation is incorporated by reference and is available online at: http://www.caleemod.com/ (click on "User's Guide").
[19] Horsepower values are based on CalEEMod defaults.
[20] All contractors would be required to comply with the applicable air district rule(s) regarding the VOC content limits of architectural coatings, which may be lower than 250 grams per liter depending on the air district and type of coating.

- Water all exposed surfaces two times daily. Exposed surfaces include, but are not limited to soil piles, graded areas, unpaved parking areas, staging areas, and unpaved access roads.
- Limit vehicle speeds on unpaved roads to 15 miles per hour.

4.1.5 Impacts Analysis

4.1.5.1 Program Analysis

Threshold AQ-A: *Would the project conflict with or obstruct implementation of the applicable air quality plan?*

Construction

The following subsections discuss the consistency of proposed program construction activities with the 12 air quality plans adopted by the eight air districts with jurisdiction in the Plan Area (see Section 4.1.3.3, *Regional*) using the four criteria identified in Section 4.1.4.1, *Thresholds of Significance*. As discussed below, proposed program construction activities would be potentially inconsistent with the applicable air quality plans, therefore impacts would be **significant**.

Population Growth

Due to the nature of individual projects to be implemented under the proposed CAP (e.g., replacement of lighting, installation of BESS facilities, installation of electric vehicle infrastructure, installation of electric-powered equipment, construction of a direct meter connection between the YLHEP and Diemer WTP) and their geographic distribution throughout the Plan Area, it is anticipated workers required for construction activities would be from the existing local or regional workforce. As a result, construction of the proposed program would not result in substantial indirect population growth.

Criteria Pollutant Emissions

As discussed under Threshold AQ-B, the individual projects that may be implemented under the proposed CAP do not have sufficient detail to allow specific project-level analysis of criteria pollutant emissions during construction at this time. However, construction emissions were estimated for a sample program activity (see parameters in Section 4.1.4.2, *Methodology*) and compared to the most stringent daily and annual emissions thresholds in Table 12 and to the SCAQMD LSTs in Table 14 to provide a screening level below which individual projects proposed under the CAP would have a less-than-significant impact related to criteria air pollutant emissions. Individual projects that involve construction activities with an intensity (i.e., size, schedule, equipment, demolition, import/export of soil, architectural coating) equal to or less than the sample program activity would have a less-than-significant construction impact associated with criteria air pollutant emissions regardless of location. Therefore, construction emissions associated with proposed CAP measures would not conflict with the applicable air quality plans. However, for individual proposed projects that involve construction activities with an intensity (i.e., size, schedule, equipment, demolition, import/export of soil, architectural coating) greater than the sample program activity, the severity and location of the impacts cannot be determined until the construction details of individual projects are known. As a result, for these projects, construction impacts related to consistency with the applicable air quality plan would be potentially significant because criteria pollutant emissions have the potential to exceed the applicable air district thresholds of significance. Mitigation may be available to reduce emissions of criteria air pollutants during construction (see Mitigation Measures [MM] AQ-1 and AQ-2);

however, it is not possible to determine whether impacts would be reduced to less-than-significant levels because the magnitude of construction emissions is not known at this time. Therefore, criteria pollutant emissions would be **significant.**

Control Measures

The proposed program includes a suite of GHG emission reduction measures, some of which would have the co-benefits of reducing air pollutant emissions generated during construction activities associated with the program. For example, CAP measure AF-2 includes conducting a pilot study of renewable diesel use in on-road and off-road vehicles by providing at least one renewable diesel tank at Metropolitan-owned fueling depots. Based on the results of this study, CAP measure AF-3 includes use of renewable diesel fuel in Metropolitan's diesel-consuming on-road and off-road vehicles. These measures would be consistent with the control measures identified in the 12 air quality plans related to the Plan Area. Furthermore, existing programs implemented by Metropolitan such as the agency's Small Business and Regional Business Programs encourage use of local contractors for construction projects, resulting in fewer vehicle miles traveled and associated mobile source emissions during construction.

Buffer Zones for Odors and TACs

As discussed under Thresholds AQ-C and AQ-D, construction activities associated with the proposed program would not result in substantial sources of TAC or odor emissions because CAP measures would generally result in small-scale and temporary construction activities.

Post-Construction

The following subsections discuss the consistency of post-construction activities with the 12 air quality plans adopted by the eight air districts with jurisdiction in the Plan Area (see Section 4.1.3.3, *Regional*) using the four criteria identified in Section 4.1.4.1, *Thresholds of Significance*. As discussed below, post-construction activities would be consistent with the applicable air quality plans, and **no impact** would occur.

Population Growth

The proposed program includes a suite of GHG emissions reduction measures that would not directly generate population growth because they do not involve construction of housing. As discussed in Chapter 2, *Project Description*, GHG emissions reduction measures proposed under the CAP may include replacement of lighting, installation of BESS facilities, installation of electric vehicle infrastructure, installation of electric-powered equipment to replace natural gas-powered equipment, and construction of a direct meter connection between the YLHEP and Diemer WTP. Implementation of these proposed measures would not be expected to create substantial employment opportunities because measures would either serve existing Metropolitan facilities or require minimal numbers of new employees for operations and maintenance. Given the nature of these employment opportunities, it is anticipated that new employees would be hired from the existing local or regional workforce. As a result, implementation of the proposed program would not result in substantial indirect population growth. Impacts would be **less than significant**.

Criteria Pollutant Emissions

As discussed under Threshold AQ-B, the proposed CAP measures would have the co-benefits of reducing air pollutant emissions and/or would generate *de minimis* post-construction air pollutant emissions beyond those generated by existing Metropolitan operations. Therefore, post-construction

activities under the proposed program would be consistent with the applicable air quality plans and impacts would be **less than significant**.

Control Measures

Upon implementation, many of the proposed CAP measures would have the co-benefits of reducing air pollutant emissions by reducing natural gas, gasoline, and diesel fuel consumption. Measures that would have co-benefits related to air quality include, but are not limited to, reducing natural gas consumption (CAP measure DC-2), increasing use of renewable energy (CAP Strategy 4), improving energy efficiency (CAP Strategy 5), and electrifying fleet vehicles (CAP Strategy 2). These measures would be consistent with the control measures identified in the 12 air quality plans related to the Plan Area.

Buffer Zones for Odors and TACs

As discussed under Thresholds AQ-C and AQ-D, the proposed program would not include post-construction sources of substantial TAC or odor emissions that would potentially impact sensitive receptors and **no impact** would occur.

Threshold AQ-B: *Would the project result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard?*

Construction and implementation of individual projects that may be implemented under the proposed CAP would generate criteria pollutant emissions and fugitive dust emissions, which are discussed further in the following subsections.

Construction

Criteria Pollutant Emissions

Construction of individual projects that may be implemented under the proposed CAP would cause temporary emissions of various air pollutants from fuel combustion by on-site construction equipment, demolition, grading, construction worker travel to and from construction sites, use of architectural coatings, and transport of construction supplies and soil material to and from construction sites. These proposed construction activities would temporarily create emissions of dust, fumes, equipment exhaust, and other air pollutants, particularly during individual projects that require demolition, site preparation, and/or grading. The extent of daily emissions, particularly emissions of VOCs and nitrogen oxides, generated by construction equipment would depend on the equipment used and the hours of operation for each individual project that may be implemented under the CAP. The extent of PM_{10} and $PM_{2.5}$ emissions would primarily depend upon the following factors: 1) the amount of disturbed soils; 2) the length of disturbance time; 3) whether excavation is involved; and 4) whether transporting excavated materials off site is necessary.

At this time, there is not sufficient detail about the proposed individual projects that may be implemented under the CAP to allow for the quantification of construction emissions for each project. Therefore, it is not possible to compare construction-related emissions for each individual project to the thresholds of significance adopted by the appropriate air district, as summarized in Table 12 and it would be too speculative to analyze project-level impacts of individual projects that may be implemented under the CAP.

However, construction emissions were estimated for a sample program activity (see parameters in Section 4.1.4.2, *Methodology*) and compared to the most stringent daily and annual emissions thresholds in Table 12 and to the SCAQMD LSTs in Table 14 to provide a screening level below

which individual projects that may be implemented under the proposed CAP would have a less-than-significant impact related to criteria air pollutant emissions. Table 16 summarizes estimated maximum daily construction emissions from the sample program activity, and Table 17 presents estimated annual construction emissions from the sample program activity. To provide a conservative evaluation of impacts, emissions are compared to the most stringent thresholds adopted by air districts with jurisdiction in the Plan Area. As shown in Table 16 and Table 17, construction of the sample program activity would generate temporary VOC, nitrogen oxides, carbon monoxide, sulfur dioxide, PM_{10}, and $PM_{2.5}$ emissions. However, maximum daily and annual construction emissions from the sample program activity would not exceed the most stringent daily and annual regional significance thresholds of those adopted by the eight air districts with jurisdiction in the Plan Area. In addition, as shown in Table 18, maximum daily on-site construction emissions from the sample program activity would not exceed the most stringent SCAQMD LSTs. Therefore, individual projects that may be implemented under the proposed CAP that involve construction activities with an intensity (i.e., size, schedule, equipment, demolition, import/export of soil, architectural coating) equal to or less than the sample program activity would have a less-than-significant construction impact associated with criteria air pollutant emissions regardless of location.

Table 16 Estimated Maximum Daily Construction Emissions – Sample Program Activity

	Maximum Daily Emissions (lbs/day)					
	VOC	**NO_X**	**CO**	**SO_2**	**PM_{10}**	**$PM_{2.5}$**
Maximum Emissions from Sample Program Activity	21.4	19.1	22.5	< 0.1	3.7	2.0
Most Stringent Thresholds[1]	25	25	548	137	82	55
Threshold Exceeded?	No	No	No	No	No	No

[1] The most stringent daily construction emissions thresholds listed in Table 12 are the VOC and NO_X thresholds adopted by the VCAPCD; the CO, SO_X, and PM_{10} thresholds adopted by MDAQMD/AVAQMD; and the $PM_{2.5}$ threshold adopted by the SCAQMD.

lbs/day = pounds per day; VOC = volatile organic compounds, NO_X = nitrogen oxides, CO = carbon monoxide, SO_2 = sulfur dioxide, PM_{10} = particulate matter 10 microns in diameter or less, $PM_{2.5}$ = particulate matter 2.5 microns or less in diameter; VCAPCD = Ventura County Air Pollution Control District; MDAQMD = Mojave Desert Air Quality Management District; AVAQMD = Antelope Valley Air Quality Management District; SCAQMD = South Coast Air Quality Management District; CalEEMod = California Emissions Estimator Model

Notes: All emissions modeling was completed using CalEEMod. See Appendix B for modeling results. Some numbers may not add up due to rounding.

Table 17 Estimated Maximum Annual Construction Emissions – Sample Program Activity

	Maximum Annual Emissions (tons per year)					
	VOC	NO_X	CO	SO_2	PM_{10}	$PM_{2.5}$
Maximum Emissions from Sample Program Activity	0.5	2.5	2.2	< 0.1	0.2	0.1
Most Stringent Thresholds[1]	10	10	100	25	15	12
Threshold Exceeded?	No	No	No	No	No	No

[1] The most stringent annual construction emissions thresholds listed in Table 12 are the VOC, NO_X, and CO thresholds adopted by the SJVAPCD and the SO_X, PM_{10}, and $PM_{2.5}$ thresholds adopted by the MDAQMD/AVAQMD.

VOC = volatile organic compounds, NO_X = nitrogen oxides, CO = carbon monoxide, SO_2 = sulfur dioxide, PM_{10} = particulate matter 10 microns in diameter or less, $PM_{2.5}$ = particulate matter 2.5 microns or less in diameter; SJVAPCD = San Joaquin Valley Air Pollution Control District; MDAQMD = Mojave Desert Air Quality Management District; AVAQMD = Antelope Valley Air Quality Management District; CalEEMod = California Emissions Estimator Model

Notes: All emissions modeling was completed using CalEEMod. See Appendix B for modeling results. Some numbers may not add up due to rounding.

Table 18 Estimated Maximum Daily On-site Construction Emissions – Sample Program Activity

	Maximum On-Site Emissions (lbs/day)					
	VOC	NO_X	CO	SO_2	PM_{10}	$PM_{2.5}$
Maximum Emissions from Sample Program Activity	21.4	15.2	19.1	< 0.1	3.3	1.9
Most Stringent LSTs[1]	N/A	46	231	N/A	4	3
Threshold Exceeded?	No	No	No	No	No	No

[1] The most stringent LSTs are for construction sites in SRA 12 that are one acre (or less) in size within 82 feet (25 meters) of the nearest sensitive receptor. See Table 14.

VOC = volatile organic compounds, NO_X = nitrogen oxides, CO = carbon monoxide, SO_2 = sulfur dioxide, PM_{10} = particulate matter 10 microns in diameter or less, $PM_{2.5}$ = particulate matter 2.5 microns or less in diameter; lbs/day = pounds per day; N/A = not adopted (The SCAQMD has not adopted LSTs for these pollutants.); LSTs = Localized Significance Thresholds; SCAMQD = South Coast Air Quality Management District; SRA = Source Receptor Area; CalEEMod = California Emissions Estimator Model

Notes: All emissions modeling was completed using CalEEMod. See Appendix B for modeling results. Some numbers may not add up due to rounding.

For individual projects that may be implemented under the proposed CAP that involve construction activities with an intensity (i.e., size, schedule, equipment, demolition, import/export of soil, architectural coating) greater than the sample program activity, the severity and location of the impacts cannot be determined until the construction details and locations of such projects are known. The severity of the impacts would vary depending upon the size of the individual project and the intensity of construction activities. Therefore, for these individual projects, the magnitude of construction impacts related to criteria pollutant emissions cannot be determined at this time. As a result, it is possible that construction emissions associated with individual projects that may be implemented under the proposed CAP would exceed the applicable air district thresholds. Therefore, construction impacts related to criteria air pollutant emissions associated with implementation of the CAP would be **significant**. Mitigation would reduce emissions of criteria pollutants during construction of specific individual projects (see MM AQ-1 and AQ-2); however, it is not possible to

determine whether impacts would be reduced to less-than-significant levels because the magnitude of construction emissions is not known.

Even if individual projects that may be implemented under the proposed CAP require construction activities with an intensity (i.e., size, schedule, equipment, demolition, import/export of soil, architectural coating) equal to or less than the sample program activity, it is possible that more than one individual project would be constructed simultaneously. Simultaneous construction of two or more individual projects under the CAP within the jurisdiction of the same air district would combine to generate higher total air pollutant emissions than those modeled for the individual sample program activity. The severity of the impacts would vary depending upon the size of each individual project implemented under the CAP, the intensity of its construction activities, and the number of individual projects constructed simultaneously within the jurisdiction of the same air district. Therefore, for individual projects that would be constructed simultaneously within the jurisdiction of the same air district, it cannot be determined at this time if combined construction impacts related to criteria air pollutant emissions would exceed the relevant thresholds or by how much. As a result, construction impacts related to criteria air pollutant emissions resulting from implementation of the proposed CAP would be **significant**. Implementation of MM AQ-1 and AQ-2 would reduce combined emissions of criteria pollutants during construction of specific individual projects that may be implemented under the proposed CAP; however, it is not possible to determine whether impacts would be reduced to less-than-significant levels at the program-level because the magnitude of combined construction emissions is not known.

Fugitive Dust Emissions

Site preparation and grading may cause wind-blown dust that could contribute particulate matter into the local atmosphere. As discussed in Chapter 2, *Project Description*, in addition to Metropolitan's standard Environmental Requirements for Construction, Metropolitan implements environmental requirements for construction detailed in Metropolitan's engineering project specification package, which includes compliance with the applicable air district's fugitive dust control measures, such as SCAQMD Rule 403 (Fugitive Dust) and MDAQMD Rule 403 (Fugitive Dust). The BAAQMD requires implementation of additional BMPs for all projects to reduce fugitive dust impacts to less-than-significant levels, and the VCAPCD and the ICAPCD recommend implementation of additional fugitive dust control measures for all projects undergoing CEQA review (BAAQMD 2017a; VCAPCD 2003; ICAPCD 2017). Implementation of Metropolitan's engineering project specification package, which includes fugitive dust control BMPs and compliance with the applicable air district's fugitive dust control measures would ensure that individual project-specific construction impacts related to fugitive dust emissions would be reduced to **less-than-significant** levels.

Post-Construction

Upon implementation, many of the proposed CAP measures would have the co-benefits of reducing air pollutant emissions by reducing natural gas, gasoline, and diesel fuel consumption. Measures that would have co-benefits related to air quality include, but are not limited to, electrifying natural gas-consuming equipment and devices (CAP measure DC-2), reducing electricity demand (CAP Strategy 5), increasing use of renewable energy (CAP Strategy 4), electrifying fleet vehicles (CAP Strategy 2), reducing vehicle miles traveled (CAP Strategy 6), expanding the subsidized transit commute program (CAP measure EC-1), and facilitating alternative transportation (CAP measure EC-4) and alternative work schedules (CAP measure EC-5). Alternatively, some post-construction activities for individual projects would have the potential to result in sources of criteria pollutant and fugitive dust emissions, such as regular maintenance trips and activities for the proposed BESS facilities that may result in additional mobile source emissions of air pollutants.

Because proposed CAP measures are intended to reduce GHG emissions from Metropolitan operations, several of the air pollutant emissions sources identified above would not generate net new emissions as compared to existing conditions. Furthermore, any net new post-construction sources of emissions for individual projects, such as additional maintenance trips and activities, would be minimal and would therefore generate *de minimis* emissions of criteria air pollutants and fugitive dust. Therefore, post-construction impacts related to criteria air pollutant and fugitive dust emissions would be **less than significant**.

Threshold AQ-C: *Would the project expose sensitive receptors to substantial pollutant concentrations?*

Individual projects that may be implemented under the proposed CAP would potentially generate localized emissions of carbon monoxide, TACs, and *Coccidioides immitis* spores during the construction and post-construction periods. As discussed in Section 4.1.2, *Existing Conditions*, sensitive receptors in the Plan Area include residences, schools and schoolyards, parks and playgrounds, day care centers, nursing homes, and hospitals. Sensitive receptors nearest to the known potential locations of proposed individual projects (i.e., the YLHEP/Diemer WTP, the Colorado River Aqueduct Pump Plant facilities, Jensen, Mills, Skinner, Weymouth WTPs) include existing and planned (under construction) residences, the Van Gogh Charter School in the city of Granada Hills, and the Grace Miller Elementary, Calvary Baptist, and Joan Macy schools in the city of La Verne.

Carbon Monoxide Hotspots

A carbon monoxide hotspot is a localized concentration of carbon monoxide that is above a carbon monoxide ambient air quality standard. Specifically, hotspots can be created at intersections and along roadways where traffic levels are sufficiently high such that the local carbon monoxide concentration exceeds the federal one-hour standard of 35.0 ppm or the federal and state eight-hour standard of 9.0 ppm (CARB 2016). Localized carbon monoxide concentrations are primarily the result of the volume of cars along a road and the level of emissions generated by vehicles. Restricted vehicular traffic flows can contribute to higher volumes of vehicles on a given roadway in a period of time but are not the cause of high carbon monoxide concentrations. As shown in Table 10, all seven air basins in the Plan Area are in attainment or are unclassified for the NAAQS and CAAQS for carbon monoxide. Stringent vehicle emission standards in California have reduced the level of carbon monoxide emissions generated by vehicles over time such that carbon monoxide hotspots are rarely a concern, except for roadways with very high traffic volumes. The BAAQMD has established a volume of 44,000 vehicles per hour as the level above which traffic volumes may contribute to a localized violation of carbon monoxide standards (BAAQMD 2017a). The maximum hourly traffic volume on a highway in California in 2017 was 35,500 vehicles on Interstate 405 at its junction with State Route 10 in Los Angeles (California Department of Transportation 2018). Therefore, the minimum number of trips that would need to be added to a roadway in the Plan Area to result in a carbon monoxide hotspot would be approximately 8,500 vehicles per hour (i.e., 44,000 – 35,500).

Construction

Construction activities associated with the proposed program would require vehicle trips to deliver heavy-duty construction equipment and materials, import/export soil, haul demolition debris, and transport construction workers. For example, during construction of the one sample program activity discussed under Threshold AQ-B, up to approximately 127 daily one-way trips would occur in the region of the given sample program activity (see Appendix B for CalEEMod modeling results on which this trip estimate is based). Due to the relatively small scale of individual projects that may be implemented under the CAP and their geographic distribution throughout the Plan Area, construction-

related trips would not have the potential to add 8,500 vehicles per hour on any given roadway in the Plan Area (see previous paragraph above) and therefore would not cause hourly traffic volumes on any roadways in the Plan Area to exceed 44,000 vehicles (per BAAQMD guidelines, described above). Therefore, **no impact** related to carbon monoxide hotspots would occur during construction.

Post-Construction

Individual projects that may be implemented under the proposed CAP would require a minimal number of vehicle trips related to operations and maintenance activities, the majority of which would travel on local and regional roadways that experience hourly traffic volumes far less than 44,000 vehicles per hour. Nevertheless, even if operations and maintenance trips utilize high-volume highways and freeways, these trips would not have the potential to add 8,500 vehicles per hour on any given roadway in the Plan Area due to the relatively small scale of individual projects that may be implemented under the proposed CAP and their geographic distribution throughout the Plan Area. Therefore, post-construction activities would not cause hourly traffic volumes on any roadways in the Plan Area to exceed 44,000 vehicles. Furthermore, the CAP includes measures intended to reduce vehicle trips and vehicle miles traveled, which would result in decreased traffic volumes on some roadways in the Plan Area. As a result, **no impact** related to carbon monoxide hotspots would occur during post-construction activities.

Toxic Air Contaminants

Construction

The greatest potential for TAC emissions during construction would be from DPM emissions associated with heavy equipment operations. According to CARB methodology, health effects from carcinogenic air toxics are usually described in terms of individual cancer risk, which is expressed as an estimate of the increased changes of developing cancer due to emissions over a 70-year lifetime (CARB 2005). The 2015 California Office of Environmental Health Hazard Assessment (OEHHA) Air Toxics Hot Spots Program Guidance Manual for the Preparation of Risk Assessments does not include recommendations for assessing the health risk of TACs associated with temporary construction projects because there is "considerable uncertainty" in evaluating cancer risk over short-term durations (OEHHA 2015).

Construction activities in any one location would be temporary and short-term given the relatively small scale of individual projects that may be implemented under the proposed CAP, after which time all construction-related TAC emissions would cease in that area. Furthermore, DPM emissions would be distributed geographically throughout the Plan Area, and it is unlikely that DPM emissions from construction of one project implemented under the CAP would affect the same sensitive receptor as DPM emissions from construction of another project implemented under the CAP. Therefore, construction impacts related to TAC emissions would be **less than significant**.

Post-Construction

The primary sources of TAC emissions in urbanized and suburban areas are industrial uses and vehicle trips on area roadways. The proposed program would not include new stationary sources of TAC emissions such as diesel generators, dry cleaners, distribution centers, or warehouses. In addition, as discussed under *Carbon Monoxide Hotspots*, the proposed program would not generate a substantial increase in operational vehicle trips. Therefore, the proposed program would not result in

a significant increase in DPM emissions from mobile sources on roadways in the Plan Area. As a result, post-construction impacts related to TAC emissions would be **less than significant**.

Valley Fever

Construction

Construction activities, including site preparation and grading, would have the potential to release *Coccidioides immitis* spores. The populations of arid and semiarid areas in the Plan Area have been and will continue to be exposed to Valley Fever from agricultural and construction activities occurring throughout these regions. Substantial increases in the number of reported cases of Valley Fever tend to occur only after major ground-disturbing events, such as the 1994 Northridge earthquake (VCAPCD 2003). Construction activities under the proposed program would not result in a comparable major ground disturbance, and because of compliance with applicable air district rules related to fugitive dust control, construction activities under the proposed program would not release a large number of spores. As discussed in Section 4.1.4.1, *Thresholds of Significance*, the VCAPCD recommends consideration of the following factors that may indicate the program's potential to result in significant impacts related to Valley Fever:

- Disturbance of the topsoil of undeveloped land (to a depth of about 12 inches)
- Dry, alkaline, sandy soils
- Virgin, undisturbed, non-urban areas
- Windy areas
- Archaeological resources probable or known to exist in the area (Native American midden sites)[21]
- Special events (fairs, concerts) and motorized activities (motocross track, All Terrain Vehicle activities) on unvegetated soil (non-grass)
- Non-native population (i.e., out-of-area construction workers)

The proposed program involves activities that would occur primarily in urbanized areas at or near existing Metropolitan facilities on relatively small project sites (five acres or less). While possible that individual projects may occur on virgin, undisturbed land, due to the relatively small scale of individual projects and their geographic distribution throughout the Plan Area, it is anticipated that construction workers would be from the local or regional area and would therefore have previous exposure to and immunity from Valley Fever. As discussed in Chapter 2, *Project Description*, in addition to Metropolitan's standard Environmental Requirements for Construction, Metropolitan implements environmental requirements for construction that are detailed in Metropolitan's engineering project specification package, which includes compliance with the applicable air district's fugitive dust control measures, such as SCAQMD Rule 403 (Fugitive Dust) and MDAQMD Rule 403 (Fugitive Dust). Therefore, construction activities associated with the proposed program would not result in a substantial increase in entrained fungal spores that cause Valley Fever above existing background levels, and construction impacts related to Valley Fever would be **less than significant**.

[21] The presence of archaeological resources can indicate that soils have been historically undisturbed and therefore have higher potential to contain *Coccidioides immitis* spores.

Post-Construction

Upon completion, individual projects that may be implemented under the CAP would not require substantial ground disturbance on undisturbed land in close proximity to sensitive receptors that could mobilize *Coccidioides immitis* spores. Therefore, **no impacts** related to Valley Fever would occur during post-construction activities.

Threshold AQ-D: *Would the project result in other emissions (such as those leading to odors) adversely affecting a substantial number of people?*

Construction

Construction activities under the proposed program are small in nature and generally occur within the boundaries of Metropolitan -owned facilities and would not require a substantial amount of paving or use of heavy equipment that would generate oil and diesel fuel odors. Any odors would be limited to the construction period and would be temporary. Because the projects under the proposed program are small in nature and would not be expected to generate emissions that would adversely affect a substantial number of people, construction impacts related to odors would be **less than significant**.

Post-Construction

Based on a review of the CEQA guidance documents published by seven of the eight air districts with jurisdiction in the Plan Area (excluding the SDAPCD, which has not published guidance), odor-generating land uses include wastewater treatment facilities, sanitary landfills, solid waste transfer stations, composting facilities, petroleum extraction/transfer/processing/refining operations and facilities, asphalt batch plants, chemical manufacturing, fiberglass manufacturing, painting/coating operations (e.g., auto body shops), food processing facilities, coffee roasters, commercial charbroiling, green waste and recycling operations, wastewater pumping facilities, mushroom farms, metal smelting plants, rendering plants, feed lot/dairies, and agriculture. None of the proposed CAP measures involve these types of facilities or land uses, except planned regenerative agricultural studies on existing agricultural lands in the Palos Verde Valley (CAP measure CS-2). The proposed studies would analyze impacts of traditional fallowing practices and investigate the effects of various cover crops and no-till practices on existing agricultural lands. None of the proposed study activities would result in new or additional odor-generating land uses; therefore, **no impact** related to odors would occur during post-construction activities.

Cumulative Analysis

The geographic scope for the cumulative air quality impact analysis is the area covered by the seven air basins that encompass the Plan Area. In general, there are cumulative air quality impacts in air basins that are designated nonattainment for one or more criteria pollutants, as shown in Table 10. As discussed in the BAAQMD (2017a) *California Environmental Quality Act Air Quality Guidelines*, "By its very nature, air pollution is largely a cumulative impact. No single project is sufficient in size to, by itself, result in nonattainment of ambient air quality standards. Instead, a project's individual emissions contribute to existing cumulatively significant adverse air quality impacts."

As summarized in Section 4.1.4.1, *Thresholds of Significance*, the proposed program would have a cumulatively considerable contribution to a significant cumulative air quality impact if any of the following criteria are met:

1. The project would be inconsistent with the applicable air quality plan, which is intended to address cumulative air quality impacts;

2. Emissions associated with the proposed program would exceed the project-level thresholds of significance, which are set at levels at which air districts have determined that individual projects would not have a cumulatively considerable contribution to cumulative air quality impacts; and/or
3. Cumulative traffic volumes in addition to program-related traffic volumes would result in a carbon monoxide hotspot.

As discussed under Thresholds AQ-A and AQ-B, the individual projects that may be implemented under the proposed CAP do not have sufficient detail to allow project-level analysis of criteria pollutant emissions during the construction phase at this time; however, post-construction activities under the CAP would not generate substantial air quality emissions. As discussed under Threshold AQ-C, the proposed program would not have the potential to generate a substantial number of vehicle trips on any one roadway; therefore, it is unlikely that cumulative traffic volumes in addition to program-related traffic volumes would result in a carbon monoxide hotspot along roadways in the Plan Area. As discussed under Threshold AQ-D, the proposed program activities are small in nature and would not generate emissions (such as those leading to odors) that would adversely affect a substantial number of people.

Nevertheless, for individual projects that may be implemented under the proposed CAP that involve construction activities with an intensity (i.e., size, schedule, equipment, demolition, import/export of soil, architectural coating) greater than the sample program activity as shown in Table 16 through Table 18, it cannot be determined at this time if cumulatively considerable construction and post-construction impacts related to the applicable air quality plans and criteria air pollutants or their severity. Mitigation would reduce emissions of criteria air pollutants during the construction phases for these individual projects to the extent feasible; however, it is not possible to determine whether impacts would be reduced to less-than-significant levels because the magnitude of emissions is not known. Therefore, even with implementation of MM AQ-1 and AQ-2, at the program-level, cumulative impacts are considered potentially **significant** and the CAP's contribution **cumulatively considerable**. Further environmental analysis and documentation is necessary at the project -level prior to construction for each individual project to determine if a potentially significant impact would occur and if mitigation would reduce the project-level impact to less than cumulatively considerable.

4.1.5.2 Mitigation Measures

MM AQ-1 **Construction Air Quality Assessment.** For individual projects to be implemented under the CAP that involve construction activities with an intensity (i.e., size, schedule, equipment, demolition, import/export of soil, architectural coating) greater than the sample program activity, an air quality assessment shall be prepared to evaluate construction emissions in light of the applicable air district thresholds.

MM AQ-2 **Implement Emission Reduction Measures.** If construction emissions would exceed any of the applicable thresholds, emission reduction measures shall be implemented to reduce emissions below the thresholds. Measures may include, but would not be limited to:

- All construction equipment shall be equipped with Tier 4 certified engines or CARB-certified Level 3 diesel particulate filters. All diesel particulate filters shall be kept in working order and maintained in operable condition according to manufacturer's specifications, as applicable.
- Construction equipment with lower horsepower ratings shall be utilized, as applicable and practicable.

- Ultra-low-sulfur diesel fuel shall be used for stationary construction equipment, as applicable.
- Low-emission on-site stationary equipment shall be used, as applicable.
- Alternatively-fueled construction equipment (e.g., renewable diesel, natural gas, electric) shall be utilized instead of diesel-fueled construction equipment, as applicable.
- The schedule for soil import and/or export shall be extended to reduce the number of daily haul truck trips, as applicable.
- The schedule for the coating/painting phase shall be extended to reduce the square footage coated/painted each day, as applicable.
- Architectural coatings with a VOC content of less than 250 grams per liter shall be utilized.

4.1.5.3 Level of Significance After Mitigation

Implementation of MM AQ-1 and AQ-2 would reduce conflicts with applicable air quality plans and criteria air pollutants; however, these impacts are assumed to be **significant and unavoidable**, as the severity of impacts from individual projects carried out under the proposed program cannot be determined at this time. Once project-specific information is available regarding each individual project under the proposed CAP, further environmental analysis and documentation is necessary at a project-level prior to construction to determine if a significant impact would occur and if mitigation would reduce the impact to a less-than-significant level.

This page intentionally left blank.

4.2 Biological Resources

4.2.1 Introduction

This chapter describes the existing conditions for biological resources, the regulatory framework associated with biological resources, the potential impacts to biological resources that would result from the proposed program, and the mitigation measures that would reduce these impacts.

4.2.2 Existing Conditions

The existing conditions related to biological resources, including habitat classifications, drainages and wetlands, sensitive natural communities, special-status plants and animals, and wildlife movement corridors are provided in Appendix C.

4.2.3 Regulatory Framework

Federal, state, and local authorities, under a variety of statutes and guidelines, share regulatory authority over biological resources. The primary authority for general biological resources lies within the land use control and planning authority of local jurisdictions, which in this instance are the counties of Los Angeles, Orange, Riverside, San Bernardino, San Diego, and Ventura, in addition to the portions of Imperial, San Joaquin, and Contra Costa counties, as well as other local jurisdictions including cities within these counties. The CDFW is a trustee agency for biological resources throughout the state as defined in CEQA and also has direct jurisdiction under the California Fish and Game Code (CFGC), which includes, but is not limited to, resources protected by the State of California under the California Endangered Species Act (CESA) and Section 1600 *et. seq*. In addition, the RWQCB is the responsible agency for "waters of the state".

4.2.3.1 Federal

Endangered Species Act

The United States Fish and Wildlife Service (USFWS) and National Marine Fisheries Service (NMFS) share responsibility and regulatory authority for implementing the federal Endangered Species Act (FESA) (16 United States Code [USC] Section 1531 *et seq*.). Under the FESA, authorization is required to "take" a listed species. Take is defined under FESA Section 3 as "to harass, harm, pursue, hunt, shoot, wound, kill, trap, capture, or collect, or to attempt to engage in any such conduct." Under federal regulation (50 Code of Federal Regulations [CFR] Sections 17.3), "harm" is further defined as "an act which actually kills or injures wildlife. Such an act may include significant habitat modification or degradation where it actually kills or injures wildlife by significantly impairing essential behavioral patterns, including breeding, feeding or sheltering." Critical habitat is a specific geographic area(s) containing physical or biological features essential for the conservation of a threatened or endangered species and that may require special management considerations or protection. Critical habitat may include an area that is not currently occupied by the species but will be needed for its recovery.

FESA Section 7 outlines procedures for federal interagency cooperation to conserve federally listed species and designated critical habitat. Section 7(a)(2) of the FESA and its implementing regulations require federal agencies to consult with USFWS or NMFS to ensure that they are not authorizing, funding, or carrying out actions likely to jeopardize the continued existence of listed species, or result in the destruction or adverse modification of critical habitat.

For program activities where federal action is not involved and take of a listed species may occur, the proponent may seek to obtain an incidental take permit (ITP) under FESA Section 10(a)(1)(B). This section, in conjunction with Section 10(a)(2)(A), allows USFWS to permit the incidental take of listed species if such take is accompanied by a Habitat Conservation Plan (HCP)[22] that includes components to minimize and mitigate impacts associated with the take.

Migratory Bird Treaty Act

The Migratory Bird Treaty Act (MBTA) protects native birds and bird parts (16 USC Section 703-712). Under the provisions of the MBTA, it is unlawful to take (pursue, hunt, take, capture, or kill) migratory birds, except under permits issued by the USFWS for special situations, such as imminent threat to human safety or scientific research. The law currently applies to more than 1,000 species (50 CFR Section 10.13), including most native birds, and covers the destruction or removal of active nests of those species. These protections apply regardless of whether other entitlements are in place, such as approvals under CEQA.

Bald and Golden Eagle Protection Act

The Bald and Golden Eagle Protection Act is the primary law protecting eagles, including individuals and their nests and eggs (16 USC Section 668-668d, 54, Stat. 250 and Amendments). It states “no person shall take, possess, sell, purchase, barter, offer for sale, transport, export, or import any bald or golden eagle alive or dead, or any part, nests or eggs, thereof without a valid permit to do so.”

Magnuson-Stevens Fishery Conservation and Management Act

The Magnuson-Stevens Fishery Conservation and Management Act (Magnuson-Stevens Act) is the primary law governing marine fisheries management in United States federal waters. The act was first passed in 1976 and revised in 1996 and 2007. The purpose of the act is to provide long-term biological and economic sustainability of United States marine fisheries.

The NMFS has regulatory authority for implementing the Magnuson-Stevens Act. The NMFS requires regional fishery management councils to develop Fisheries Management Plans (FMP) specific to their regions, fisheries and fish stocks. For waters off the United States West Coast, the Pacific Fishery Management Council has developed four FMPs, which are implemented through fisheries regulations for coastal pelagic species, groundfish species, highly migratory species and salmon species. These FMPs also identify Essential Fish Habitat which is broadly defined as those waters and substrate necessary to fish for spawning, breeding, feeding or growth to maturity. Federal agencies which fund, permit, or undertake activities that may adversely affect Essential Fish Habitat are required to consult with National Oceanic and Atmospheric Administration (NOAA) Fisheries regarding the potential effects of their actions on Essential Fish Habitat and to respond to NOAA’s conservation recommendations.

[22] HCPs are planning documents required as part of an application for an ITP. They describe the anticipated effects of the proposed taking; how those impacts will be minimized or mitigated; and how the HCP is to be funded. HCPs can apply to both listed and nonlisted species, including those that are candidates or have been proposed for listing.

Section 10 of the River and Harbors Act

Section 10 of the Rivers and Harbors Act of 1899 requires authorization from the Secretary of the Army, acting through the USACE, for any structure or work in, under, or over any navigable water of the United States. Regulated activities include dredging or disposal of dredged materials, excavation, filling, re-channelization and construction of any structure or any other modification of a navigable water of the United States.

Clean Water Act

The Clean Water Act was enacted to restore and maintain the chemical, physical, and biological integrity of the nation's waters. Under Section 404 of the Clean Water Act, the USACE, with U.S. EPA oversight, regulates activities that result in discharge of dredged or fill material into wetlands or other "waters of the United States." Any discharge of dredged or fill material into jurisdictional waters requires a Section 404 permit from the USACE prior to the start of work. In administering its regulatory program to achieve the goals of the Clean Water Act, the USACE implements a mitigation sequencing requirement whereby impacts must be avoided, then minimized, and finally compensated for if avoidance and minimization are not sufficient to reduce adverse effects on the aquatic ecosystem. When compensatory mitigation is required, it should comply with the following hierarchy established by the USACE/U.S. EPA 2008 Mitigation Rule (in descending order): (1) mitigation banks; (2) in-lieu fee programs; (3) permittee-responsible mitigation under a watershed approach; (4) permittee-responsible mitigation through on-site and in-kind mitigation; and, (5) permittee-responsible mitigation through off-site and/or out-of-kind mitigation.

The scope of waters of the United States has been the subject of recent agency rulemaking. On April 21, 2020, the USACE and U.S. EPA published the "Navigable Waters Protection Rule," to finalize a revised definition of waters of the United States under the Clean Water Act. Under the revised definition, ephemeral drainages are non-jurisdictional, as are wetlands that do not exhibit, at least seasonally, a continuous surface connection to jurisdictional waters.

Also, in accordance with Section 401 of the Clean Water Act, applicants for a Section 404 permit must obtain water quality certification from the appropriate RWQCB. The certification requirement functions as a mechanism for states to review proposed Section 404 permits and to ensure that proposed discharges do not violate state water quality standards. For program activities that would occur in multiple regions, the water quality certification is issued by the State Water Resources Control Board.

4.2.3.2 State

Endangered Species Act

The CESA (CFGC Section 2050 et. seq.) prohibits take of state-listed threatened and endangered species without a CDFW ITP. Take under California law means "hunt, pursue, catch, capture, or kill, or attempt to hunt, pursue, catch, capture, or kill," and does not include indirect harm by way of habitat modification. In issuing an ITP, CDFW must make several findings, including that the proposed take would not jeopardize the continued existence of the species and that the impacts of the take would be minimized and fully mitigated.

Fully Protected Species

Protection of fully protected species is described in CFGC Sections 3511, 4700, 5050 and 5515. These statutes prohibit take or possession of fully protected species. Incidental take of fully protected

species may be authorized under an approved Natural Community Conservation Plan (NCCP; see CFGC sections 2800 *et seq*.).

California Fish and Game Code sections 3503, 3503.5 and 3513

CFGC sections 3503, 3503.5 and 3513 protect all birds, as well as their nests and eggs, for species that are not already listed as fully protected and that occur naturally within the state. Sections 3503 and 3503.5 of the CFGC stipulate the following regarding eggs and nests: Section 3503 states that it is unlawful to take, possess, or needlessly destroy the nest or eggs of any bird, except as otherwise provided by CFGC or any regulation made pursuant thereto; and Section 3503.5 states that is it unlawful to take, possess, or destroy any birds in the orders Falconiformes or Strigiformes (birds-of-prey) or to take, possess, or destroy the nest or eggs of any such bird except as otherwise provided by CFGC or any regulation adopted pursuant thereto. Section 3513 states that it is unlawful to take or possess any migratory nongame bird as designated in the MBTA or any part of such migratory nongame bird except as provided by rules and regulations adopted by the Secretary of the Interior under provisions of the MBTA. In November 2018, the CDFW and California Attorney General issued an advisory to affirm that relevant statutes in the CFGC continue to provide protections for birds, including their active nests. Specifically, the advisory notes that for purposes of these statutes, California courts have held that the CFGC's protections include prohibitions on incidental take and that such take is not limited to hunting, fishing, and other activities that are lawfully permitted to take/kill wildlife.

Native Plant Protection Act

The Native Plant Protection Act (NPPA) of 1977 (CFGC Sections 1900 *et seq.*) authorizes the CDFW to designate rare and endangered native plants and provides specific protection measures for these listed species. Under Section 1913(c) of the NPPA, the owner of land where a rare or endangered native plant is growing is required to notify the department at least 10 days in advance of changing the land use to allow for salvage of the plant(s).

Section 1600 *et seq*. of the California Fish and Game Code

Sections 1600 through 1617 of the CFGC describe CDFW's Lake and Streambed Alteration program. Section 1602 of the CFGC provides that an entity shall not substantially divert or obstruct the natural flow of, or substantially change or use any material from the bed, channel, or bank of, any river, stream, or lake, or deposit or dispose of debris, waste, or other material containing crumbled, flaked, or ground pavement where it may pass into any river, stream, or lake, without prior notification to CDFW. Upon receiving such notification, CDFW assesses whether the proposed activity would adversely affect fish and wildlife resources. If an adverse effect is identified, CDFW issues a Lake/Streambed Alteration Agreement authorizing the activity to proceed subject to required measures CDFW believes are necessary to protect fish and wildlife resources. Although CDFW has not promulgated regulatory definitions of "Lake" or "Stream" for use in this regulatory program, all lakes, ponds, perennial, intermittent and ephemeral streams, and associated riparian vegetation are typically subject to the program.

Natural Community Conservation Planning Act

The NCCP Act (CFGC Sections 2800 *et seq.*) is administered by the CDFW as a means to protect habitat in California. The NCCP Act takes a regional approach to preserving habitat. The designation of a NCCP area identifies and provides for the regional protection of plants, animals and their habitats, while allowing compatible and appropriate economic activity. Once an NCCP has been approved, CDFW may provide take authorization for all covered species, including fully protected

species, under Section 2835 of the CFGC. Working with landowners, environmental organizations, and other interested parties, a local agency oversees the numerous activities that compose the development of an NCCP. Refer to Section 4.2.3.3, *Local Policies and Adopted/Approved Plans*, below for a summary of NCCPs within the Plan Area.

Porter-Cologne Water Quality Control Act

The State Water Resources Control Board (SWRCB) and each of nine local RWQCBs have jurisdiction over waters of the State pursuant to the Porter-Cologne Water Quality Control Act. Waters of the State are defined as any surface water or groundwater, including saline waters, within the boundaries of the state. The Porter-Cologne Act regulates discharges of waste into waters of the State and includes discharges from both point and non-point sources. Discharges of dredge or fill material are considered discharges of waste and are regulated by the RWQCBs under this statute. Because the limits of Porter-Cologne Act jurisdiction are unaffected by the recent reductions in federal Clean Water Act jurisdiction, the RWQCBs are increasingly relying on their authority under the Porter-Cologne Act to regulate discharges into non-federal waters. The SWRCB has issued general Waste Discharge Requirements regarding discharges to "isolated" waters of the state (Water Quality Order No. 2004-0004-DWQ, Statewide General Waste Discharge Requirements for Dredged or Fill Discharges to Waters Deemed by the USACE to be Outside of Federal Jurisdiction). Additionally, a new set of procedures for regulating discharges of dredge and fill material was approved by the SWRCB in April 2019 and became effective on May 28, 2020.

4.2.3.3 Local Policies and Adopted/Approved Plans

General Plans typically contain elements which address protection of biological resources. Typically, these elements consist of goals, policies and actions that protect natural resources, such as environmentally sensitive habitats, special status species, native trees, creeks, wetland and riparian habitats. Local jurisdictions generally approve development as long as it is consistent with those elements of the General Plan.

Some resources are afforded protection via local ordinances that protect trees, riparian corridors and environmentally sensitive habitats. Each county and many cities in the Plan Area have municipal codes which protect natural resources and address compliance with environmental regulations. For example, local ordinances and policies may be in place that protect native and nonnative trees in urban landscapes, as well as in unincorporated county lands. These ordinances and policies vary in their definitions of protected trees (e.g., certain species, minimum diameter at breast height [dbh], trees that form riparian corridors or a combination thereof) and in the requirements for ordinance or policy compliance. In addition, counties and cities may have local ordinances or policies that are intended to protect other biological resources such as wetlands and drainages, riparian habitat and other sensitive habitat areas. Due to the programmatic nature of the proposed CAP, a precise, project-level analysis of the specific impacts associated with individual program activities is not possible, thus, evaluation of compliance with local ordinances would be completed on a case-by-case basis as covered activities progress through the project planning phase and subsequent CEQA analysis and documentation, as required, as project-level details become available regarding individual proposed projects.

According to the CDFW NCCP website, the following are those NCCPs and HCPs that occur within the Plan Area (CDFW 2019b):

- **Los Angeles County**
  - **City of Rancho Palos Verdes NCCP/HCP**. The City of Rancho Palos Verdes NCCP/HCP covers approximately 3,146 acres within Rancho Palos Verdes. It covers 10 species of plants and wildlife as well as several natural vegetation communities.
- **Orange County**
  - **County of Orange Central/Coastal Subregion NCCP/HCP.** The County of Orange Central/Coastal Subregion NCCP/HCP covers approximately 208,000 acres within the central and coastal portions of Orange County. It covers 45 species of plants and wildlife as well as several natural vegetation communities.
- **Riverside County**
  - **Western Riverside Multiple Species Habitat Conservation Plan (MSHCP).** The Western Riverside Multiple Species HCP covers approximately 1.26 million acres within western Riverside County. It covers 118 species of plants and wildlife as well as many natural vegetation communities.
  - **Coachella Valley MSHCP**. The Coachella Valley Multiple Species HCP covers approximately 1.2 million acres within eastern Riverside County. It covers 27 species of plants and wildlife as well as 27 natural vegetation communities.
- **San Bernardino County**
  - **Town of Apple Valley Multi-Species Conservation Plan.** The Town of Apple Valley Multi-Species Conservation Plan covers approximately 221,180 acres within the town of Apple Valley as well as in unincorporated San Bernardino County to the north and east. It covers 21 species of plants and wildlife as well as 17 natural vegetation communities.
- **San Diego County**
  - **San Diego County Multiple Habitat Conservation Program (East County).** The San Diego County Multiple HCP covers approximately 1.6 million acres within eastern San Diego County. It covers 253 species of plants and wildlife as well as many natural vegetation communities.
  - **San Diego North County Multiple Species Conservation Plan.** The San Diego North County Multiple Species HCP covers approximately 345,000 acres within northern San Diego County. It covers 62 species of plants and wildlife as well as several natural vegetation communities.
  - **San Diego County Multiple Species Conservation Program (South County).** The San Diego County Multiple Species HCP for South San Diego County covers approximately 576,000 acres within southern San Diego County. It covers 80 species of plants and wildlife and several natural vegetation communities.

4.2.4 Thresholds and Methodology

4.2.4.1 Thresholds of Significance

Table 19 lists thresholds from Appendix G of the *State CEQA Guidelines* that pertain to impacts associated with biological resources. These thresholds are addressed in the draft PEIR.

Table 19 CEQA Thresholds for Biological Resources

Threshold Would the proposed program:
a) Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service;
b) Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the California Department of Fish and Game or U.S. Fish and Wildlife Service;
c) Have a substantial adverse effect on state or federally protected wetlands (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means;
d) Interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites;
e) Conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance; and/or
f) Conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan.

4.2.4.2 Methodology

Section 4.2.5, *Impacts Analysis*, below presents a programmatic-level discussion of impacts to special status biological resources from implementation of the proposed CAP. As discussed in Section 1.2, *Purpose of the Program Environmental Impact Report*, a project-level analysis of the specific impacts associated with all individual projects and program activities would occur when project details are available. Potential impacts to plants and animal species would be identified during subsequent environmental analysis conducted when additional project-level details are available prior to construction. If species are identified, the mitigation measures described in this section would apply.

The following section summarizes the impacts associated with implementation of emission reduction measures proposed in the CAP. It is anticipated that construction of planned projects would occur at Metropolitan facilities or within Metropolitan rights-of-way. Specifically, the following Metropolitan locations have been identified as potential project sites for projects that would be implemented under the proposed CAP: Diemer WTP (Orange County), Jensen WTP (Los Angeles County), Mills WTP (Riverside County), Skinner WTP (Riverside County), Weymouth WTP (Los Angeles County), headquarters building (Los Angeles County), CRA pump plants (Riverside and San Bernardino counties), Metropolitan-owned facilities throughout the Plan Area, Metropolitan-owned agricultural land at the southwest corner of 35th Avenue and Keim Boulevard in the Palo Verde Valley (Imperial County), and Webb Tract, Holland Tract, Bouldin Island, and Bacon Island in the Bay Delta (San Joaquin/Contra Costa counties). In general, implementation of proposed program activities envisioned by the CAP could result in the biological resources impacts as described in the following section. Data used for this analysis include aerial photographs, topographic maps, and data on special status species and sensitive habitat information obtained from the CDFW BIOS (CDFW 2020c), the CNDDB (CDFW 2020a), the CNPS Online Inventory of Rare and Endangered Plants (CNPS 2020), the USFWS IPaC (USFWS 2020b), and accepted scientific texts to identify species. The USFWS Critical Habitat Mapper (USFWS 2020c) and USFWS National Wetlands Inventory (USFWS 2020a) were also queried. Due to the large Plan Area, field surveys were not conducted. Analysis is based solely on desktop analysis and literature review.

4.2.5 Impacts Analysis

4.2.5.1 Program Analysis

Threshold BIO-A: *Would the proposed program have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Wildlife or U.S. Fish and Wildlife Service?*

For the purposes of this analysis, special status plant and animal species include those designations described in Appendix C. Most of the program activities proposed under the CAP would occur in urbanized areas at or near existing Metropolitan facilities. While the proposed covered projects located within existing Metropolitan facilities would be unlikely to directly impact special status species, several Metropolitan facilities are located in close proximity to suitable habitat for special status species and proposed covered projects in these locations may potentially result in indirect effects (e.g., disturbance from noise, dust, equipment staging) to adjacent sensitive habitat, if present. Specifically, special status species with potential to occur at the proposed project sites could include:

- Diemer WTP: Adjacent to coastal scrub that may support coastal California gnatcatcher (*Polioptila californica californica*)
- Jensen WTP: Adjacent to riparian habitat surrounding Bull Creek that may support coastal California gnatcatcher, least Bell's vireo (*Vireo bellii pusillus*), and southwestern pond turtle (*Actinemys pallida*)
- Mills WTP: Adjacent to habitat that may support coastal California gnatcatcher, least Bell's vireo, and Stephens' kangaroo rat (*Dipodomys stephensi*)
- Skinner WTP: Adjacent to habitat that may support burrowing owl (*Athene cunicularia*), coastal California gnatcatcher, and Stephens' kangaroo rat
- Weymouth WTP: Existing facilities may support special status bat species
- CRA Pump Plants: Existing facilities and adjacent habitat may support desert tortoise (*Gopherus agassizii*)
- Palo Verde: Agricultural land and adjacent irrigation ditches within and adjacent to the proposed project site may support burrowing owl and rail species
- Bay Delta: Aquatic habitat surrounding the islands may support special status aquatic species including Delta smelt (*Hypomesus transpacificus*), green sturgeon (*Acipenser medirostris*), salmon species, and steelhead (*Oncorhynchus mykiss irideus*)

It is unlikely that construction activities would occur on natural, undisturbed areas, with the exception of sites in the Bay Delta region. Nonetheless, because the specific project-level details regarding program activities are unknown at this time, these activities could have the potential to impact areas occupied by special status plant and animal species. There are 883 special status species known to occur or with potential to occur within the Plan Area (see Appendix C). One hundred fifty-one of these species are given high levels of protection by the federal government through listing under FESA or by the state government through listing under CESA or designation of Fully Protected status (animals only). A full list of species is presented in Appendix C. Most special status species have very limited ranges within the subject counties and have specific habitat requirements. Many special status species also tend to be associated with sensitive habitats, such as riparian habitats and drainages.

Various proposed program activities could affect special status species or their habitats. Vegetation clearing and excavation could remove habitat or individuals. Excavation, ground clearing, equipment and materials storage, access routes, and other activities could result in impacts on runoff and/or water quality, potentially affecting habitat. Excavation, ground clearing, and access routes could result in air quality impacts (dust, exhaust) that could affect adjacent individuals. Equipment or construction-related traffic could introduce hazardous materials into habitats. Equipment and construction-related traffic could result in noise impacts affecting noise-sensitive species. Equipment and construction personnel could also introduce harmful, noxious, and/or invasive species that could damage habitats (such as by tracking in invasive weed seeds). Most projects under the proposed CAP are relatively small in scope and located in previously disturbed areas so the likelihood of a significant impact to special status species or their habitat is low. In addition, projects would be designed/located to avoid or minimize impacts to the extent possible, where feasible. However, impact to special status species would be examined at a project-level during subsequent environmental review when more detailed project description information is available for each individual project proposed under the CAP. If it is determined that construction or operation of any covered activity would result in significant impacts on special status species, implementation of MM BIO-1 through BIO-6 would reduce these impacts to **less than significant**.

Even in fully developed areas, proposed program activities have the potential to result in impacts on protected species. Migratory birds, including most birds that nest in the Plan Area, are protected by the federal MBTA, which prohibits take (including killing, capturing, selling, trading and transport) of protected migratory bird species, including to their active nests. In addition, CFGC Section 3503 makes it unlawful to destroy nests or eggs of any bird. Where vegetation, and especially trees, are removed as part of construction, there is the potential for impacts to nests or eggs under the MBTA and Section 3503 of the CFGC, but the level of impact would need to be determined at the project level when specific details are known about each of the proposed projects covered under the CAP. Compliance with the CFGC and the MBTA would ensure that impacts to migratory birds would be **less than significant**.

Threshold BIO-B: *Would the proposed program have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the California Department of Fish and Game or U.S. Fish and Wildlife Service?*

Threshold BIO-C: *Would the proposed program have a substantial adverse effect on state or federally protected wetlands (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?*

Program activities that may be implemented under the proposed CAP have the potential to impact sensitive habitats, including riparian areas and wetlands. Most of the program activities proposed under the CAP would occur in urbanized areas at or near existing Metropolitan facilities except for projects occurring in the Palo Verde and Bay Delta regions. While work within existing Metropolitan facilities would be unlikely to directly impact wetlands, riparian habitat or other sensitive communities, several Metropolitan facilities are located near these resources, specifically:

- Diemer WTP: Adjacent to coastal sage scrub and California black walnut woodland (considered sensitive communities by CDFW) as well as potentially jurisdictional drainages
- Jensen WTP: Adjacent to riparian habitat within and adjacent to Bull Creek
- Skinner WTP: Adjacent to riparian habitat within and adjacent to Tucalota Creek.
- Bay Delta: Mapped as a wetland by the USFWS National Wetlands Inventory

Due to the programmatic nature of the proposed CAP, the specific details of individual project activities are unknown at this time, so specific project-level analysis cannot be conducted and impacts identified at this time; however, some examples of potential impacts to riparian/wetland habitats include, but are not limited to, the following: vegetation clearing and excavation could remove habitat or result in runoff and/or water quality impacts; excavation, ground clearing, and use of unpaved access routes could result in air quality impacts (dust, exhaust) that could affect adjacent habitat; equipment or construction-related traffic could introduce hazardous materials into habitats; and equipment and construction personnel could also introduce harmful, noxious, and/or invasive species that could damage habitats (such as by tracking in weed seeds). Riparian areas provide wildlife habitat and movement corridors, enabling both terrestrial and aquatic organisms to move along river systems between areas of suitable habitat. The impacts, if any, to riparian or wetland habitat would need to be determined at the project level when specific details are known about each project proposed under the CAP. Construction activities under the proposed program are relatively small in scope and generally located within previously disturbed areas such as Metropolitan pump or treatment plant boundaries or on existing agricultural lands. Projects would be designed and located to avoid or minimize impacts to the extent feasible. Additionally, the projects under the proposed program are small in nature and would not be expected to have a substantial adverse effect on riparian or wetland habitats. However, if, during project-level analysis, it is determined that construction or operation of any covered activity would result in significant impacts to riparian habitats, sensitive natural communities, or state or federally protected wetlands, implementation of MM BIO-7 through MM-BIO-9 would reduce these impacts to **less than significant**.

Threshold BIO-D: *Would the proposed program interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?*

Most of the program activities proposed under the CAP would occur primarily in urbanized areas at or near existing Metropolitan facilities with the exception of proposed projects occurring in the Palo Verde and Bay Delta regions. Proposed projects occurring within existing Metropolitan facilities, including Diemer WTP, Jensen WTP, Skinner WTP, Weymouth WTP, and the CRA pump plants would not interfere with wildlife movement as those facilities are currently fenced and developed. Although the exact locations of program activities in the Bay Delta regions have not been identified at this time, individual project activities in both the Palo Verde and the Bay Delta regions would be small in nature and would be located to not impede or interfere with movement of native resident or migratory fish or wildlife species, established native resident or migratory wildlife corridors, or the use of native wildlife nursery sites. Construction activity and noise could temporarily alter the behavior of wildlife in the area and therefore temporarily disrupt wildlife movement patterns. However, the portions of the Plan Area within the undeveloped areas of the Palo Verde and Bay Delta regions comprise a very small portion of the surrounding habitat areas available for wildlife movement. Therefore, it is unlikely that proposed program activities implemented in these areas would substantially interfere with wildlife movement as there is sufficient adjacent habitat in these areas to facilitate wildlife movement and development in these areas would not isolate wildlife from adjacent movement corridors. Impacts would be **less than significant,** and no mitigation would be required.

Threshold BIO-E: *Would the proposed program conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?*

Protected trees and other biological resources that are protected by city and/or county ordinances and/or policies may be encountered at the locations where program activities are proposed under the CAP and therefore there is potential for conflict with local ordinances and/or policies. Most of the program activities proposed under the CAP, however, would occur primarily in urbanized areas at existing Metropolitan facilities. Because ground disturbances would be limited, the removal of native trees and disturbances to other biological resources protected by local policies or ordinances would likely be minimal for most program activities. Metropolitan would comply with any local policies or ordinances protecting biological resources, therefore impacts would **be less than significant** and no mitigation would be required.

Threshold BIO-F: *Would the proposed program conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan?*

Portions of the Plan Area are within established habitat conservation plans including the Town of Apple Valley Multi-Species Conservation Plan, City of Rancho Palos Verdes NCCP/HCP, County of Orange Central/Coastal Subregion NCCP/HCP, Western Riverside MSHCP, Coachella Valley MSHCP, San Diego County Multiple HCP (East County), San Diego North County Multiple Species Conservation Plan, and San Diego County Multiple Species Conservation Program (South County). However, the only planned projects under the proposed CAP that would occur within the boundaries of an established HCP/NCCP or other approved local, regional, or state HCP would occur at the Skinner WTP and Mills WTP, both of which are in the Western Riverside MSHCP. Proposed activities would not conflict with the provisions of the Western Riverside MSHCP as those facilities are currently developed and the proposed projects are small in nature with minimal impacts. Therefore, program activities that may occur within areas covered by an HCP/NCCP or other approved local, regional, or state habitat conservation plan would be **less than significant** and no mitigation would be required.

4.2.5.2 Mitigation Measures

Depending on the results of the project-specific biological resource assessment completed during subsequent environmental review for each proposed project under the CAP, the following mitigation measures would be applied, as applicable:

MM BIO-1 Special Status Plant Species Surveys

If completion of the project-specific biological resources assessment determines that special status plant species have potential to occur on site, surveys for special status plants shall be completed prior to any vegetation removal, grubbing, or other construction activity of each program activity (including staging and mobilization). The surveys shall be floristic in nature and shall be seasonally timed to coincide with the target species identified in the program activity-specific biological resources assessment. All plant surveys shall be conducted by a qualified biologist no more than one year prior to project implementation (annual grassland habitats may require yearly surveys). Surveys shall be conducted in accordance with current protocols established by the CDFW, USFWS and the local jurisdictions if said protocols exist. If special status plant species are identified, Mitigation Measure BIO-2 shall apply.

MM BIO-2 Special Status Plant Species Avoidance, Minimization, and Mitigation

If state- or federally-listed special status and/or CRPR 1 and 2 plant species are identified during the project-specific biological assessment, the activity shall be re-designed to avoid impacting these plant species to the maximum extent feasible. If CRPR 3 and 4 species are found, the biologist shall evaluate if they meet criteria to be considered special status, and if so, the same process as identified for CRPR 1 and 2 species shall apply.

If special status plant species cannot be avoided and would be impacted by a program activity implemented under the proposed CAP, all impacts shall be mitigated at an appropriate ratio (minimum ratio of 1:1) to fully offset program activity impacts, as determined by a qualified biologist for each species. A restoration plan shall be prepared and implemented, as applicable.

MM BIO-3 Endangered/Threatened Animal Species Habitat Assessment and Protocol Surveys

If the results of the project-specific biological resources assessment determine suitable habitat may be present for any federally and/or state endangered or threatened animal species, habitat assessments and/or protocol surveys shall be completed in accordance with CDFW and/or USFWS/NMFS protocols prior to construction.

Alternatively, in lieu of conducting protocol surveys, Metropolitan may choose to assume presence within the activity footprint and proceed with implementing appropriate avoidance measures, consultation, and permitting, as applicable.

If the target species are detected during protocol surveys, or protocol surveys are not conducted and presence is assumed based on suitable habitat, Mitigation Measure BIO-4 shall apply.

MM BIO-4 Endangered/Threatened Animal Species Avoidance and Mitigation

If habitat is occupied or presumed occupied by federal and/or state-listed species and would be impacted by program activities, the program activity shall be redesigned in coordination with a qualified biologist to avoid impacting occupied/presumed occupied habitat to the maximum extent feasible. If occupied or presumed occupied habitat cannot be avoided, Metropolitan shall consult with USFWS, NMFS, and/or CDFW in order to determine the appropriate course of action, which may include a Biological Opinion (BO) or HCP/ITP issued by the USFWS/NMFS (relevant to federally listed species) and/or the ITP issued by the CDFW (relevant to state listed species).

If occupied or presumed occupied habitat cannot be avoided, compensatory mitigation shall be provided (minimum ratio of 1:1) to fully offset impacts to habitat prior to the construction. Compensatory mitigation may be provided through purchase of mitigation bank credits, in-lieu fee, or permittee-responsible habitat restoration/establishment/enhancement/preservation. Compensatory mitigation may be combined/nested with special status plant species and sensitive natural community restoration, where applicable. Temporary impact areas shall be restored to similar pre-project conditions.

If on and/or off-site habitat restoration/conservation is identified, a Habitat Mitigation and Monitoring Plan (HMMP) shall be prepared to ensure the success of compensatory mitigation sites. The HMMP shall identify long-term site management

needs, routine monitoring techniques, and performance standards for determining that the conservation site has met the necessary criteria to function as a suitable mitigation site.

MM BIO-5 Endangered/Threatened Species Avoidance and Minimization During Construction

The following measures shall be applied to aquatic and terrestrial species, where appropriate. Metropolitan shall select from these measures as appropriate depending on site conditions, the species with potential for occurrence, and the results of the project-specific biological resources assessment (Mitigation Measure BIO-1).

Pre-construction surveys for federal and/or state listed species with potential to occur shall be conducted where suitable habitat is present by a qualified biologist not more than 72 hours prior to the start of construction activities. The survey area shall include the proposed disturbance area and all proposed ingress/egress routes, plus a species-specific buffer. If any life stage of federal and/or state listed species is found within the survey area, the appropriate measures in the BO or HCP/ITP issued by the USFWS/NMFS (relevant to federally listed species) and/or the ITP issued by the CDFW (relevant to state listed species) shall be implemented; or if such guidance is not in place for the activity, the qualified biologist shall recommend an appropriate course of action, which may include consultation with USFWS, NMFS, and/or CDFW.

- The activity limits of disturbance shall be flagged. Areas of special biological concern within or adjacent to the limits of disturbance shall have Environmental Sensitive Area fencing installed between said area and the limits of disturbance.
- All activities occurring within or adjacent to sensitive habitats that may support federally and/or state endangered/threatened species shall have a qualified biologist present during all initial ground disturbing/vegetation clearing activities. Once initial ground disturbing/vegetation clearing activities have been completed, the biologist shall conduct pre-activity clearance surveys, as needed to ensure protection of endangered/threatened species.
- If pumps are used for dewatering activities, all intakes shall be completely screened with wire mesh not larger than five millimeters to prevent animals from entering the pump system.
- If at any time during construction of the program activity an endangered/threatened species enters the construction site or otherwise may be impacted by the program activity, all program activities shall cease. At that point, a qualified biologist shall recommend an appropriate course of action, which may include consultation with USFWS, NMFS, and/or CDFW. Alternatively, the appropriate measures shall be implemented in accordance with the BO or HCP/ITP issued by the USFWS (relevant to federal listed species) and/or the ITP issued by the CDFW (relevant to state listed species) and work can then continue as guided by those documents and the agencies, as appropriate.
- All trenches, pipes, culverts or similar structures shall be inspected for animals prior to burying, capping, moving, or filling.
- Upon completion of the program activity, a qualified biologist shall prepare a final compliance report documenting all compliance activities implemented for the activity, including the pre-construction survey results.

MM BIO-6 Non-Listed Special Status Animal Species Avoidance and Minimization

Depending on the species identified in the project-specific biological resource assessment, the following applicable measures shall be implemented to reduce the potential for impacts to non-listed special status animal species:

- Pre-construction clearance surveys shall be conducted by a qualified biologist within 14 days prior to the start of construction (including staging and mobilization). The surveys shall cover the entire disturbance footprint plus a minimum 100-foot buffer and shall identify all special status animal species that may occur on-site. The qualified biologist shall make recommendations for avoidance of non-listed special status species, such as through the use of exclusion fencing, buffer zones, etc.
- A qualified biologist shall be present during all initial ground disturbing activities, including vegetation removal, to recover special status animal species encountered during construction activities.
- Upon completion of the program activity, a qualified biologist shall prepare a final compliance report documenting all compliance activities implemented for the program activity, including the pre-construction survey results.
- If special status bat species may be present and impacted by the program activity, within 30 days of the start of construction, a qualified biologist shall conduct presence/absence surveys for special status bats where suitable roosting habitat is present. Surveys shall be conducted using acoustic detectors and by searching tree cavities, crevices, and other areas where bats may roost. If active bat roosts or colonies are present, the biologist shall evaluate the type of roost to determine the next step.
- If a maternity colony is present, all construction activities shall be postponed within a 250-foot buffer around the maternity colony until it is determined by a qualified biologist that the young have dispersed. Once it has been determined that the roost is clear of bats, the roost shall be removed immediately.
- If a roost is determined by a qualified biologist to be used by a large number of bats (large hibernaculum), alternative roosts, such as bat boxes if appropriate for the species, shall be designed and installed near the program activity site. The number and size of alternative roosts installed will depend on the size of the hibernaculum and shall be determined by a qualified biologist.
- If other active roosts are located, exclusion devices shall be installed such as valves, sheeting or flap-style one-way devices that allow bats to exit but not re-enter roosts to discourage bats from occupying the site.

MM BIO-7 Jurisdictional Delineation and Impact Avoidance

If the results of Mitigation Measure BIO-1 indicate program activities implemented under the proposed CAP would impact wetlands, drainages, riparian habitats, or other areas that may fall under the jurisdiction of the CDFW, USACE, and/or RWQCB, a qualified biologist shall complete a jurisdictional delineation. The jurisdictional delineation shall determine the extent of the jurisdiction for each of these agencies within the program activity site and shall be conducted in accordance with the requirement set forth by each agency. The results shall be provided in a jurisdictional delineation report submitted to Metropolitan, USACE, RWQCB, and CDFW, as

appropriate, for review and approval. The program activity shall be designed to avoid or minimize impacts to jurisdictional areas to the maximum extent feasible.

MM BIO-8 Wetlands, Drainages and Riparian Habitat Restoration

If impacts to jurisdictional drainages, wetlands, riparian habitat, and sensitive vegetation communities cannot be avoided, impacts shall be mitigated at an appropriate ratio to fully offset project-specific impacts (minimum ratio of 1:1). Where feasible, temporarily impacted areas shall be restored to pre-project conditions. An HMMP shall be developed by a qualified biologist and submitted to the agency overseeing the program activity for approval. Alternatively, mitigation shall be accomplished through purchase of credits from an approved mitigation bank or in-lieu fee program.

MM BIO-9 Sensitive Natural Community Avoidance and Mitigation

If the results of Mitigation Measure BIO-1 indicate program activities implemented under the proposed CAP would impact sensitive natural communities, impacts shall be avoided through final program activity design modifications.

If Metropolitan determines sensitive communities cannot be avoided, impacts shall be mitigated on-site or off-site at an appropriate ratio to fully offset program activity impacts (minimum ratio of 1:1). Temporarily impacted areas shall be restored to pre-project conditions. An HMMP shall be developed by a qualified biologist and submitted to the agency overseeing the program activity for approval.

4.2.5.3 Level of Significance After Mitigation

Implementation of MM BIO-1 through BIO-9 would reduce potential impacts evaluated under Thresholds BIO-A through BIO-C discussed in Section 4.2.5.1, *Program Analysis*, to **less than significant**.

4.2.5.4 Cumulative Analysis

The geographic scope for the cumulative biological resources impact analysis is the area covered by the seven counties that encompass the Plan Area, particularly areas surrounding identified proposed project activities, as described in Chapter 2, *Project Description*. The following factors are considered with respect to analyzing cumulative impacts to biological resources:

- The cumulative contribution of other approved and proposed projects to fragmentation of open space in the program activity vicinity;
- The loss of sensitive habitats and species;
- Contribution of the program activity to urban expansion into natural areas; and
- Isolation of open space within the vicinity by proposed/future projects.

Cumulative impacts depend on the proximity of cumulative projects to proposed program activities within the Plan Area, as well as impacts from past projects in the vicinity. Native vegetation communities and open areas were once more widespread in the vicinity of the Plan Area. Over the last half-century or more, naturally vegetated open areas diminished as the landscape surrounding the Plan Area has been built out with residential and commercial uses.

This program, in conjunction with other nearby planned, pending, and potential future projects on undeveloped land, would have the potential to adversely impact sensitive habitats and biological resources. Cumulative development in the region would continue to disturb areas with the potential to contain sensitive habitats and biological resources. It is anticipated that for other projects that would have significant impacts on these resources, similar mitigation measures as those described herein would be imposed on those other projects, along with requirements to comply with all applicable laws and regulations governing said resources.

Depending on the specific locations of covered activities, it is possible that cumulative development is currently resulting in a significant cumulative impact to biological resources. Therefore, cumulative impacts may be potentially significant. As discussed above, because the specific details regarding covered activities are unknown at this time, the level of impact to biological resources would need to be determined at the project level when specific individual program activity information is known; however, projects proposed under the scope are relatively small and MM BIO-1 through BIO-8 would reduce project-specific impacts to biological resources. Therefore, cumulative impacts are considered **less than significant with mitigation incorporated** and the proposed program's contribution would **not be cumulatively considerable**.

4.3 Cultural Resources

4.3.1 Introduction

This chapter describes the existing conditions, regulatory framework, and potential impacts to cultural resources which would result from the proposed program, as well as mitigation measures to reduce these impacts. Cultural resources under CEQA include archaeological sites (both prehistoric and historic) and built environment resources (including buildings, structures, water conveyance systems, etc.).

4.3.2 Existing Conditions

The Plan Area includes all of Metropolitan's service area and spans approximately 38,280 square miles, including all of Los Angeles, Orange, Riverside, San Bernardino, San Diego, and Ventura counties, as well as a portion of northeastern Imperial County and four islands in the Sacramento-San Joaquin River Delta region. As discussed in Chapter 3, *Environmental Setting*, the Plan Area includes six ecoregions: Southern California Mountains and Valley, Southern California Coast, Sonoran Desert, Mojave Desert, Colorado Desert, and California Central Valley (Great Valley). The Plan Area includes over 220 miles of Pacific Ocean coastline, ranges in elevation from 234 feet below mean sea level to approximately 11,503 feet above mean sea level, and contains a national park, all or portions of four national forests, and three U.S. Census Bureau-designated Metropolitan Statistical Areas.

Within the Plan Area, population centers are concentrated near coastal areas in the western portions of Los Angeles, Orange, Riverside, San Bernardino, San Diego, and Ventura Counties. An extensive freeway network links the major cities of Los Angeles and San Diego to one another and their respective metropolitan areas. Riverside, San Bernardino, and San Diego counties and northeastern Imperial County have experienced some urban development but are sparsely developed overall. Large portions of these areas are agricultural in character. Portions of the Plan Area located in the Sacramento-San Joaquin River Delta region are predominantly rural and characterized by the surrounding estuary system. Land use in the area is predominantly agricultural.

Historic built-environment resources are most likely to be identified in urban areas because they are more densely developed with buildings and infrastructure. Such areas have been densely developed with residential, commercial, institutional, and industrial districts, as well as infrastructure related to transportation, utilities, and other uses. These same areas are most likely to contain historic archaeological resources, particularly in residential areas constructed prior to the mid twentieth century. More rural and agricultural areas may also contain built-environment resources, which could include landscape elements. Areas located near fresh water sources and other natural resources are likeliest to contain prehistoric archaeological resources.

4.3.2.1 Cultural Background

The cultural background discussion is provided in Appendix D. The cultural background is divided into pre- and post-European contact histories. The pre-contact history includes a discussion of the four archaeological regions present in the Plan Area. The post-contact history includes a discussion of the area broken down by county.

4.3.3 Regulatory Framework

This section includes a discussion of the applicable laws, ordinances, regulations, and standards governing cultural resources.

4.3.3.1 Federal

National Register of Historic Places

The National Register of Historic Places (NRHP) was established by the National Historic Preservation Act of 1966 as "an authoritative guide to be used by Federal, state, and local governments, private groups and citizens to identify the Nation's cultural resources and to indicate what properties should be considered for protection from destruction or impairment" (36 Code of Federal Regulations 60.2). The NRHP recognizes properties that are significant at the national, state, and local levels. To be eligible for listing in the NRHP, a resource must be significant in American history, architecture, archaeology, engineering, or culture. Districts, sites, buildings, structures, and objects of potential significance must also possess integrity of location, design, setting, materials, workmanship, feeling, and association. A property is eligible for the NRHP if it meets any one of the following criteria:

Criterion A: Are associated with events that have made a significant contribution to the broad patterns of our history

Criterion B: Are associated with the lives of persons significant in our past

Criterion C: **E**mbody the distinctive characteristics of a type, period, or method of installation, or that represent the work of a master, or that possess high artistic values, or that represent a significant and distinguishable entity whose components may lack individual distinction

Criterion D: Have yielded, or may be likely to yield, information important in prehistory or history

In addition to meeting at least one of the above designation criteria, resources must also retain integrity. The National Park Service recognizes seven aspects or qualities that, considered together, define historic integrity. To retain integrity, a property must possess several, if not all, of these seven qualities, defined in the following manner:

Location: The place where the historic property was constructed or the place where the historic event occurred

Design: The combination of elements that create the form, plan, space, structure, and style of a property

Setting: The physical environment of a historic property

Materials: Materials are the physical elements that were combined or deposited during a particular period of time and in a particular pattern or configuration to form a historic property

Workmanship: The physical evidence of the crafts of a particular culture or people during any given period in history or prehistory

Feeling: A property's expression of the aesthetic or historic sense of a particular period of time

Association: The direct link between an important historic event or person and a historic property

4.3.3.2 State

California Environmental Quality Act

The CEQA requires that a lead agency determine whether a project could have a significant effect on historical resources and tribal cultural resources (Public Resources Code [PRC] Section 21074 [a][1][A]-[B]). A historical resource is a resource listed in or determined to be eligible for listing in the California Register of Historical Resources (CRHR) (Section 21084.1), a resource included in a local register of historical resources (Section 15064.5[a][2]), or any object, building, structure, site, area, place, record, or manuscript that a lead agency determines to be historically significant (Section 15064.5[a][3]).

PRC Section 5024.1 requires an evaluation of historical resources to determine their eligibility for listing in the CRHR. The purpose of the register is to maintain listings of the state's historical resources and to indicate which properties are to be protected from substantial adverse change. The criteria for listing resources in the CRHR were expressly developed to be in accordance with previously established criteria developed for listing in the NRHP, as enumerated according to CEQA and quoted below.

Section 15064.5(a)(3). […]Generally, a resource shall be considered by the lead agency to be "historically significant" if the resource meets the criteria for listing on the California Register of Historical Resources (PRC, § 5024.1, Title 14 California Code of Regulations, Section 4852) including the following:

(1) Is associated with events that have made a significant contribution to the broad patterns of California's history and cultural heritage

(2) Is associated with the lives of persons important in our past

(3) Embodies the distinctive characteristics of a type, period, region, or method of construction, or represents the work of an important creative individual, or possesses high artistic values

(4) Has yielded, or may be likely to yield, information important in prehistory or history

Section 15064.5(a)(4). The fact that a resource is not listed in or determined to be eligible for listing in the California Register of Historical Resources, not included in a local register of historical resources (pursuant to section 5020.1(k) of the PRC), or identified in an historical resources survey (meeting the criteria in section 5024.1(g) of the PRC) does not preclude a lead agency from determining that the resource may be an historical resource as defined in PRC sections 5020.1(j) or 5024.1.

Section 15064.5(b). A project with an effect that may cause a substantial adverse change in the significance of an historical resource is a project that may have a significant effect on the environment.

In addition, if a project can be demonstrated to cause damage to a unique archaeological resource, the lead agency may require reasonable efforts to permit any or all of these resources to be preserved in place or left in an undisturbed state. To the extent that resources cannot be left undisturbed, mitigation measures are required (PRC, Section 21083.2[a], [b], and [c]).

PRC Section 21083.2(g) defines a unique archaeological resource as an artifact, object, or site about which it can be clearly demonstrated that, without merely adding to the current body of knowledge, there is a high probability that it does one or more of the following:

a. Contains information needed to answer important scientific research questions and that there is a demonstrable public interest in that information

b. Has a special and particular quality such as being the oldest of its type or the best available example of its type

c. Is directly associated with a scientifically recognized important prehistoric or historic event or person

Impacts to significant cultural resources that affect the characteristics of any resource that qualify it for the NRHP or adversely alter the significance of a resource listed in or eligible for listing in the CRHR are considered a significant effect on the environment. These impacts could result from physical demolition, destruction, relocation, or alteration of the resource or its immediate surroundings such that the significance of an historical resource would be materially impaired (*State CEQA Guidelines* Section 15064.5 [b][1]). Material impairment is defined as demolition or alteration in an adverse manner [of] those characteristics of an historical resource that convey its historical significance and that justify its inclusion or eligibility for inclusion in the CRHR (*State CEQA Guidelines* Section 15064.5[b][2][A]).

4.3.4 Thresholds and Methodology

4.3.4.1 Thresholds of Significance

Table 20 lists thresholds from Appendix G of the *State CEQA Guideline* that pertain to impacts associated with cultural resources. These thresholds are addressed in the draft PEIR.

Table 20 CEQA Thresholds for Cultural Resources

Threshold Would the proposed program:
a. Cause a substantial adverse change in the significance of a historical resource pursuant to §15064.5?
b. Cause a substantial adverse change in the significance of an archaeological resource as defined in §15064.5?
c. Disturb any human remains, including those interred outside of formal cemeteries?

4.3.4.2 Methodology

Section 4.3.5, *Impacts Analysis,* presents a programmatic-level discussion of potential impacts to cultural resources which may occur from implementation of the proposed CAP. These potential impacts and associated mitigation measures would apply throughout the Plan Area and are directly tied to individual projects with physical impacts to the environment. The CAP is programmatic in nature and due to the extensive size of the Plan Area, field surveys and a records search of the California Historical California Historical Resources Information System were not completed. Rather methods were limited to desktop analysis and definition of the existing conditions which characterize the prehistory and history of the Plan Area. As applicable, Metropolitan-adopted cultural resources guidance is also addressed.

4.3.5 Impacts Analysis

4.3.5.1 Program Analysis

Threshold CUL-A: *Cause a substantial adverse change in the significance of a historical resource pursuant to §15064.5?*

Individual projects implemented under the proposed CAP would have a significant impact on historical resources if such activities would cause a substantial adverse change in the significance of a historical resource. Historical resources are those eligible for listing on the NRHP or CRHR. In addition, as explained in Section 15064.5 of the *State CEQA Guidelines*, "substantial adverse change in the significance of an historical resource means physical demolition, destruction, relocation, or alteration of the resource or its immediate surroundings such that the significance of an historical resource would be materially impaired."

The California Office of Historic Preservation recognizes any evidence of human activities over 45 years of age, including buildings, structures, sites, objectives, and districts, may be eligible for listing in the CRHR. An extensive survey and inventory of the historical resources located within the Plan Area was not completed. However, background research confirms the presence of many known historical resources within the Plan Area. National Park Service data confirms there are over 1,000 resources in the Plan Area listed in the NRHP and the CRHR. Some of these resources include facilities owned and operated by Metropolitan, including the CRHR-eligible Weymouth Water Treatment Plant Historic District at the Weymouth WTP and the Colorado River Aqueduct and associated facilities. Due to insufficient detail to allow specific project-level analysis at this time and the extensive Plan Area, an extensive survey and inventory of the historical resources located within the Plan Area was not completed.

In addition to known historical resources, the Plan Area includes many other potential resources, which are over 45 years of age (or will cross this threshold over the course of proposed CAP implementation) and have yet to be evaluated for historical resources eligibility. This includes not only historic-age buildings, but also structures such as canals, reservoirs, pipelines, pump plants, and other sites. A review of historic aerial imagery indicates that many of the Metropolitan facilities where construction activities would occur under the proposed CAP are over 45 years of age (or will cross this threshold over the course of CAP implementation).

Implementation of projects under the proposed CAP that include physical impacts to the environment may occur at any of the Metropolitan facilities, as described in Chapter 2, *Project Description,* including the Yorba Linda HEP at the Diemer WTP (CAP measure E-2); Diemer WTP, Jensen WTP, Skinner WTP, and Weymouth WTP (CAP measure E-4); pump refurbishment/replacement at the desert pumping plants (CAP measure EE-4a through EE-4d); installation at of EV charging infrastructure at WTPs, pump plants, and other Metropolitan-owned facilities (CAP measure EC-3), agricultural studies on Metropolitan-owned land in the Palo Verde Valley (CAP measure CS-2), and carbon sequestration pilot projects in the Sacramento-San Joaquin River Delta (CAP measure CS-3). Additional measures included in the proposed CAP may be implemented at other existing or planned Metropolitan facilities within the Plan Area but have not been fully developed, and the location of these activities is not known at this time.

Projects proposed under the CAP which could impact historical resources include the alteration of buildings and facilities and the removal or addition of infrastructure that may be necessary components of construction associated with GHG reduction measures (CAP measures DC-2, FL-4). Activities proposed within the boundaries of the Weymouth Water Treatment Plant Historic District would be avoided or mitigated to the greatest extent feasible through adherence to the *Cultural*

Resource Treatment Plan for the Weymouth Water Treatment Plant Historic District, City of La Verne, Los Angeles County, California (Chasteen et al. 2016).The alteration of a historical resource through activities such as renovation or the installation of new infrastructure may result in a significant impact should that activity materially impair, or alter the physical characteristics of a historical resource which conveys its significance and justifies its listing in the CRHR. Projects would be designed and located to avoid or minimize impacts to the extent feasible. If, during project-level analysis, it is determined that construction or operation of any covered activity would result in significant impacts to historic resources MM CUL-1 and CUL-3 would be implemented to avoid or minimize impacts to historical resources to the greatest extent feasible. However, this impact would remain **significant and unavoidable**.

Threshold CUL-B: *Cause a substantial adverse change in the significance of an archaeological resource as defined in §15064.5?*

Due to the extensive Plan Area included in the proposed CAP and insufficient detail to allow specific project-level analysis at this time, a study to identify archaeological resources within the Plan Area is infeasible. Effects on archaeological resources can only be determined once a specific project footprint has been identified because the effects are highly dependent on both the individual project site conditions and the characteristics of the proposed ground-disturbing activity. Projects described in the proposed CAP with the potential to result in physical impacts to the environment are listed in Table 5 (CAP GHG Reduction Measures with Potential Physical Impacts on the Environment). Future ground-disturbing activities associated with these projects may have the potential to impact historic or prehistoric archaeological resources that may be present on or below the ground surface, especially in areas that have not previously been studied through a cultural resources investigation, or where proposed excavation depths exceed those previously attained. Consequently, damage to or destruction of archaeological resources could occur as a result of covered activities, thus impacts to archaeological resources are potentially significant. Projects would be designed and located to avoid or minimize impacts to the extent feasible. If, during project-level analysis, it is determined that construction or operation of any covered activity would result in significant impacts to archaeological resources MM CUL-2 and CUL-3 has been included to reduce impacts to archaeological resources to the extent feasible. However, this impact would remain **significant and unavoidable**.

Threshold CUL-C: *Disturb any human remains, including those interred outside of formal cemeteries?*

The discovery of human remains is always a possibility during ground disturbing activities. If human remains are found, existing regulations outlined in the state of California Health and Safety Code Section 7050.5 state no further disturbance may occur until the County Coroner has made a determination of origin and disposition pursuant to PRC Section 5097.98. In the event of an unanticipated discovery of human remains, the County Coroner where the remains are found must be notified immediately. If the human remains are determined to be prehistoric, the County Coroner will notify the Native American Heritage Commission, which will determine and notify a most likely descendant (MLD). The MLD must complete the inspection of the site within 48 hours of being granted access and provide recommendations as to the treatment of the remains to the landowner. With adherence to existing regulations, impacts to human remains would be **less than significant**.

4.3.5.2 Cumulative Analysis

Cumulative development across the Plan Area could disturb areas that may potentially contain historical and archaeological resources. The potential for impacts from projects in the proposed program is generally site-specific and depends on the location and nature of each individual project.

Individual projects implemented under the proposed program would continue to be subject to applicable federal, state, and local requirements. As discussed above, individual projects implemented under the proposed program have the potential to result in impacts to historical and archaeological resources. While mitigation would reduce impacts to the greatest extent feasible, there is still potential for impacts to historical and archaeological resources to be **significant and unavoidable**. Therefore, the potential for cumulative impacts to historical and archaeological resources is significant, and the proposed program's contribution to such impacts would be **cumulatively considerable**.

4.3.5.3 Mitigation Measures

MM CUL-1(a) **Built Environment Investigation.** A historic resources evaluation shall be prepared for any future proposed project facilitated by the CAP involving a property which includes buildings, structures, objects, landscape/site plans, or other features that are 45 years of age or older. The evaluation shall be prepared by a qualified architectural historian or historian who meets the Secretary of the Interior's (SOI) Professional Qualifications Standards (PQS) in architectural history or history. The qualified architectural historian or historian shall conduct an evaluation in accordance with the guidelines and best practices promulgated by the State Office of Historic Preservation to identify any potential historical resources within the proposed project area. The evaluation of the potential resource within its historic context shall be documented. All evaluated properties shall be documented on Department of Parks and Recreation Series 523 Forms. If a property is identified as an eligible historical resource under CEQA, Mitigation Measure CUL-1(b) shall be implemented.

MM CUL-1(b) **Built Environment Documentation Program.** If eligible built environment historical resources are identified for a future proposed project implemented under the CAP, efforts shall be made to the extent feasible to ensure that impacts are avoided. If avoidance is not possible, a Built Environment Documentation Program shall be implemented. Measures may include but are not limited to, compliance with the Secretary of the Interior's Standards for Treatment of Historic Properties and documentation of the historical resource in the form of a Historic American Building Survey (HABS)- report or HABS-Like report. The HABS or HABS-Like report shall comply with the Secretary of the Interior's Standards for Architectural and Engineering Documentation and shall generally follow the HABS Level III requirements, including digital photographic recordation, detailed historic narrative report, and compilation of historic research. Application of mitigation shall generally be overseen by a qualified architectural historian or historic architect meeting the PQS, unless unnecessary in the circumstances (e.g., preservation in place).

MM CUL-2(a) **Phase 1 Archaeological Resource Investigation.** If archaeological resources are identified during project-specific analysis that may be adversely affected by any future proposed project implemented under the CAP, Metropolitan shall retain a qualified archaeologist meeting the Secretary of the Interior standards in archaeology to complete a Phase 1 cultural resources assessment of the site. A Phase 1 cultural resources assessment will include an archaeological pedestrian survey of the site, if feasible, and sufficient background archival research to determine whether subsurface prehistoric or historic remains may be present. Archival research should include a current records search from the appropriate

California Historical Resources Information System information center and a Sacred Lands File search conducted with the Native American Heritage Commission. A Phase 1 report or results documentation shall be submitted to Metropolitan prior to any ground disturbing activities. Recommendations contained therein shall be implemented throughout all ground disturbance activities.

MM CUL-2(b) **Extended Phase 1 Investigation.** For any projects proposed within 100 feet of a known archaeological site and/or in areas identified as sensitive by the Phase 1 study, an Extended Phase 1 (XPI) study shall be conducted to determine the presence/absence and extent of archaeological resources on the project site. XPI testing should comprise a series of shovel test pits and/or hand augured units and/or mechanical trenching intended to establish the horizontal and vertical boundaries of archaeological site(s) on the project site. No archaeological resources would be collected during the XPI Investigation. If an archaeological site is identified, MM CUL-2(c) or CUL-2(d) shall be implemented.

MM CUL-2(c) **Avoidance of Archaeological Resources.** Identified prehistoric or historic archaeological resources shall be avoided and preserved in place, where feasible. Where avoidance and preservation in place is not feasible, additional measures shall be applied as identified in MM CUL-2(d) through CUL-2(g).

MM CUL-2(d) **Phase 2 Archaeological Resources Investigation and Evaluation.** Where preservation is not feasible, each resource shall be evaluated for significance and eligibility for listing in the CRHR through a Phase 2 archaeological resource evaluation. A Phase 2 evaluation shall include any necessary archival research to identify significant historical associations as well as mapping of surface artifacts, collection of functionally or temporally diagnostic tools and debris, and excavation of a sample of the cultural deposit to characterize the nature of the sites, define the artifact and feature contents, determine horizontal boundaries and depth below surface, and retrieve representative samples of artifacts and other remains. A final Phase 2 Testing and Evaluation report shall be submitted to Metropolitan prior to any ground disturbing activities. Recommendations contained therein shall be implemented throughout all ground disturbance activities.

MM CUL-2(e) **Phase 3 Archaeological Data Recovery Program.** If an archaeological resource meets the CRHR eligibility and cannot be avoided, Metropolitan shall implement a Phase 3 Archaeological Data Recovery Program, conducted to exhaust the data potential of significant archaeological sites. The Phase 3 Archaeological Data Recovery Program shall follow a research design prepared by a qualified archaeologist meeting the SOI PQS standards for archaeology and approved by Metropolitan in advance of Phase 3 fieldwork and excavations. The Phase 3 Data Recovery research design will use appropriate archaeological field and laboratory methods consistent with the California Office of Historic Preservation Planning Bulletin 5 (1991), Guidelines for Archaeological Research Design, or the latest edition thereof. The final Phase 3 Data Recovery report shall be submitted to Metropolitan prior to and any ground disturbing activities. Recommendations contained therein shall be incorporated into project design and implemented throughout all ground disturbance activities.

MM CUL-2(f) **Processing and Curation of Archaeological Materials.** Archaeological materials collected from the sites during the implementation of MM CUL-2(d) through CUL-2(e) shall be processed and analyzed in the laboratory according to standard archaeological procedures. The age of the materials shall be determined using radiocarbon dating and/or other appropriate procedures; lithic artifacts, faunal remains, and other cultural materials shall be identified and analyzed according to current professional standards. The significance of the sites shall be evaluated according to the criteria of the CRHR. The results of the investigations shall be presented in a technical report following the standards of the California Office of Historic Preservation publication "Archaeological Resource Management Reports: Recommended Content and Format (1990 or latest edition)". Upon completion of the work, all artifacts, other cultural remains, records, photographs, and other documentation shall be curated an appropriate established curation facility based on the location of the fieldwork and/or repatriated to local Native Americans as appropriate. All fieldwork, analysis, report production, and curation shall be fully funded by Metropolitan.

MM CUL-2(g) **Cultural Resources Monitoring.** If recommended by Phase 1 (MM CUL-2(a)), XPI (MM CUL-2(b)), Phase 2 (MM CUL-2(d)), or Phase 3 (MM CUL-2(e)) studies, Metropolitan shall retain a qualified archaeologist to monitor project-related, ground-disturbing activities.

MM CUL-3 **Previously Unidentified Resources Encountered During Construction.** In the event that any potentially significant cultural resources are unexpectedly encountered during construction, work will be immediately halted and the discovery shall be protected in place. A 50-foot buffer around the exposed resource shall be established until a qualified cultural resources specialist evaluates the discovery. If the qualified cultural resources specialist determines that the discovery represents a potentially significant cultural resource, including a potential historical resource, additional investigations may be required to mitigate adverse impacts from project implementation. This additional work may include avoidance, testing, and evaluation or data recovery excavation. Work shall be prohibited in the restricted area until Metropolitan provides written authorization.

Level of Significance After Mitigation

At this time, there is insufficient specific project-level analysis to assess impacts to historical resources associated with individual covered activities under the proposed program. As such, impacts may be significant. Further environmental analysis and documentation is necessary prior to construction to determine if a significant impact would occur at the project-level and if mitigation would reduce the impact to a less-than-significant level. Implementation of MM CUL-1 and CUL-3 would reduce impacts to historical built environment resources to the maximum extent feasible; however, mitigation measures which reduce impacts to a less-than-significant level cannot be assured in all cases and demolition, removal, or substantial alteration of a historically significant built-environment resource typically cannot be mitigated to below a level of significance under CEQA. Therefore, impacts to historical built environment resources associated with implementation of the proposed CAP are assumed to be **significant and unavoidable**. Further environmental analysis and documentation is necessary prior to construction to determine if a significant impact would occur at the project-level and if mitigation would reduce the impact to a less-than-significant level.

Impacts to archaeological resources, including those that may be considered historical or unique archaeological resources, associated with the construction or operation of individual projects to be implemented under the proposed program may be significant, but the impacts to archaeological

resources or the location of the impacts cannot be determined at this time. Implementation of MM CUL-2 and CUL-3 may reduce these impacts; however, whether this measure would reduce all impacts to archaeological resources to less-than-significant levels is not known. Therefore, at this stage of planning, impacts to archaeological resources associated with implementation of the proposed CAP are assumed to be **significant and unavoidable**. Further environmental analysis and documentation is necessary prior to construction to determine if a significant impact would occur at the project-level and if mitigation would reduce the impact to a less-than-significant level.

Cumulative impacts to historical and archaeological resources may be significant, and the proposed program's contribution to such impacts may be cumulatively considerable. The mitigation measures described in this section would reduce these impacts by requiring project-specific historical resources evaluation for individual projects involving properties with historic-age buildings, structures, or other features and archaeological resources investigations for covered activities involving ground disturbance. However, because the specific locations of individual projects and potential cultural resources that may be affected are not presently known, the program's contribution to potentially significant cumulative impacts is assumed to remain cumulatively considerable.

4.4 Noise

4.4.1 Introduction

This section describes the existing conditions related to noise, the regulatory framework associated with noise, the impacts caused by noise that would result from the proposed program implementation, and the mitigation measures that would reduce these impacts.

4.4.2 Existing Conditions

4.4.2.1 Environmental Noise

Sound is a vibratory disturbance created by a moving or vibrating source, which is capable of being detected by the hearing organs (e.g., the human ear). Noise is defined as sound that is loud, unpleasant, unexpected, or undesired and may therefore be classified as a more specific group of sounds. The effects of noise on people can include general annoyance, interference with speech communication, sleep disturbance, and, in the extreme, hearing impairment (California Department of Transportation [Caltrans] 2013).

Noise levels are commonly measured in decibels (dB) using the A-weighted sound pressure level (dBA). The A-weighting scale is an adjustment to the actual sound pressure levels so that they are consistent with the human hearing response, which is most sensitive to frequencies between 250 Hertz (Hz) and 10,000 Hz (Federal Transit Administration [FTA] 2018). Decibels are measured on a logarithmic scale that quantifies sound intensity in a manner similar to the Richter scale used to measure earthquake magnitudes. A doubling of the energy of a noise source, such as a doubling of traffic volume, would increase the noise level by 3 dB; similarly, dividing the energy in half would result in a decrease of 3 dB (Crocker 2007).

Human perception of noise has no simple correlation with sound energy: the perception of sound is not linear in terms of dBA or in terms of sound energy. Two sources of equivalent noise level do not "sound twice as loud" as one source. It is widely accepted that the average healthy ear can barely perceive an increase (or decrease) of up to 3 dBA in noise levels (i.e., twice [or half] the sound energy); that a change of 5 dBA is readily perceptible (8 times the sound energy); and that an increase (or decrease) of 10 dBA sounds twice (or half) as loud (10.5 times the sound energy) (Crocker 2007).

Sound changes in both level and frequency spectrum as it travels from the source to the receiver. The most obvious change is the decrease in sound level as the distance from the source increases. The manner by which noise reduces with distance depends on factors such as the type of sources (e.g., point or line), the path the sound will travel, site conditions, and obstructions. Noise levels from a point source (e.g., construction, industrial machinery, ventilation units) typically attenuate, or drop off, at a rate of 6 dBA per doubling of distance. Noise from a line source (e.g., roadway, pipeline, railroad) typically attenuates at about 3 dBA per doubling of distance (Caltrans 2013). The propagation of noise is also affected by the intervening ground, known as ground absorption. A hard site, such as a parking lot or smooth body of water, provides no additional ground attenuation and the changes in noise levels with distance (drop-off rate) result simply from the geometric spreading of sound waves from the source. An additional ground attenuation value of 1.5 dBA per doubling of

distance applies to a soft site (e.g., soft dirt, grass, or scattered bushes and trees) (Caltrans 2013). Noise levels may also be reduced by intervening structures; the amount of attenuation provided by this "shielding" depends on the size of the object and the frequencies of the noise levels. Natural terrain features, such as hills and dense woods, and man-made features, such as buildings and walls, can significantly alter noise levels. Generally, any large structure blocking the line of sight will provide at least a 5-dBA reduction in source noise levels at the receiver (Federal Highway Administration [FHWA] 2011). Structures can substantially reduce occupants' exposure to noise as well. The FHWA's guidelines indicate that modern building construction generally provides an exterior-to-interior noise level reduction of 20 to 35 dBA with closed windows.

The impact of noise is not a function of sound level alone. The time of day when noise occurs and the duration of the noise are also important. Most noise that lasts for more than a few seconds is variable in its intensity. Consequently, a variety of noise descriptors have been developed. One of the most frequently-used noise metrics is the equivalent noise level (L_{eq}); it considers both duration and sound power level. L_{eq} is defined as the single steady A-weighted level equivalent to the same amount of energy as that contained in the actual fluctuating levels over a period of time. Typically, L_{eq} is summed over a one-hour period. L_{max} is the highest root mean squared (RMS) sound pressure level within the sampling period, and L_{min} is the lowest RMS sound pressure level within the measuring period (Crocker 2007). Normal conversational levels are in the 60 to 65 dBA L_{eq} range; ambient noise levels greater than 65 dBA L_{eq} can interrupt conversations (FTA 2018).

Noise that occurs at night tends to be more disturbing than that occurring during the day. Community noise is usually measured using Day-Night Average Level (DNL), which is the 24-hour average noise level with a +10 dBA penalty for noise occurring during nighttime hours (10:00 p.m. to 7:00 a.m.). Community noise can also be measured using Community Noise Equivalent Level (CNEL), which is the 24-hour average noise level with a +5 dBA penalty for noise occurring from 7:00 p.m. to 10:00 p.m. and a +10 dBA penalty for noise occurring from 10:00 p.m. to 7:00 a.m. (Caltrans 2013).

4.4.2.2 Groundborne Vibration

Groundborne vibration consists of oscillatory waves that move from a source through the ground to adjacent structures. The number of cycles per second of oscillation makes up the vibration frequency, described in terms of Hz. The frequency of a vibrating object describes how rapidly it oscillates. The normal frequency range of most groundborne vibration that can be felt by the human body is from a low of less than 1 Hz up to a high of about 200 Hz (Crocker 2007). Typically, groundborne vibration generated by human activities attenuates rapidly with distance from the source of the vibration.

While people have varying sensitivities to vibrations at different frequencies, in general they are most sensitive to low-frequency vibration. Vibration in buildings, such as from nearby construction activities, may cause windows, items on shelves, and pictures on walls to rattle. Building vibration components can also take the form of an audible low-frequency rumbling noise, referred to as groundborne noise. Groundborne noise is usually only a problem when the originating vibration spectrum is dominated by frequencies in the upper end of the range (60 to 200 Hz), or when foundations or utilities, such as sewer and water pipes, physically connect the structure and the vibration source (FTA 2018). Although groundborne vibration is sometimes noticeable in outdoor environments, it is almost never perceived as annoying to people who are outdoors (FTA 2018). The primary concern from vibration is that it can be intrusive and annoying to building occupants and vibration-sensitive land uses.

Vibration energy spreads out as it travels through the ground, causing the vibration level to diminish with distance away from the source. High-frequency vibrations diminish much more rapidly than low frequencies, so low frequencies tend to dominate the spectrum at large distances from the source.

Discontinuities in the soil strata can also cause diffractions or channeling effects that affect the propagation of vibration over long distances (Caltrans 2020). When a building is impacted by vibration, a ground-to-foundation coupling loss will usually reduce the overall vibration level. However, under rare circumstances, the ground-to-foundation coupling may actually amplify the vibration level due to structural resonances of the floors and walls.

Vibration amplitudes are usually expressed in peak particle velocity (PPV) or RMS vibration velocity. The PPV and RMS velocity are normally described in inches per second. PPV is defined as the maximum instantaneous positive or negative peak of a vibration signal. PPV is often used in monitoring of blasting vibration because it is related to the stresses that are experienced by buildings (Caltrans 2020).

Although PPV is appropriate for evaluating the potential for building damage, it is not always suitable for evaluating human response. It takes some time for the human body to respond to vibration signals. In a sense, the human body responds to average vibration amplitude. The RMS of a signal is the average of the squared amplitude of the signal, typically calculated over a one-second period. As with airborne sound, the RMS velocity is often expressed in decibel notation as vibration decibels (VdB), which serves to compress the range of numbers required to describe vibration (FTA 2018).

Vibration significance ranges from approximately 50 VdB, which is the typical background vibration-velocity level, to 100 VdB, the general threshold where minor damage can occur in fragile buildings[23] (FTA 2018). The general human response to different levels of groundborne vibration velocity levels is described in Table 21.

Table 21 Human Response to Different Levels of Groundborne Vibration

Vibration Velocity Level	Human Reaction
65 VdB	Approximate threshold of perception for many people
75 VdB	Approximate dividing line between barely perceptible and distinctly perceptible – many people find that transportation-related vibration at this level is unacceptable
85 VdB	Vibration acceptable only if there are an infrequent number of events per day

VdB = vibration decibels

Source: FTA 2018

4.4.2.3 Sensitive Receivers

Noise-sensitive land uses are generally considered to be residential homes, transient lodging (i.e., hotels and motels), hospitals, nursing homes, public assembly and entertainment venues (e.g., auditoriums, theaters, music halls, meeting halls); places of worship, schools, daycare centers, libraries, museums, parks, playgrounds, recreation and open space areas, and cemeteries. Each local jurisdiction typically includes its definition of noise-sensitive land uses in the Noise Element of its General Plans and/or in its Noise Ordinance.

Vibration-sensitive receivers, which are similar to noise-sensitive receivers, include residences and institutional uses, such as schools, places of worship, and hospitals. Vibration-sensitive receivers also include other places where people sleep, such as hotels and motels, fragile buildings, and buildings where vibrations may interfere with vibration-sensitive equipment that is affected by vibration levels that may be well below those associated with human annoyance (e.g., recording studios or laboratory facilities with sensitive equipment).

[23] Fragile buildings may generally include buildings in disrepair, old or historic buildings, or buildings of poor structural integrity due to inadequate engineering or materials.

Noise- and vibration-sensitive receivers are located throughout the Plan Area. Because the specific locations of individual projects that may be implemented under the proposed CAP are not all known at this time, the specific locations and proximities of sensitive receivers nearest to the sites of all individual projects that may be implemented under the proposed CAP are also not known. However, the following list provides a summary of the nearest sensitive receivers to the known potential project locations, as described in Chapter 2, *Project Description*:

- **YLHEP/Diemer WTP:** residences located approximately 500 feet west and 1,000 feet southeast and the Black Gold Golf Club golf course located approximately 660 feet south of the facility.
- **Jensen WTP:** residences located immediately to the west and south, sports fields located immediately to the east, and the Van Gogh Charter School located approximately 1,000 feet southwest of the facility.
- **Mills WTP:** residences located immediately north and west and approximately 200 feet south of the facility.
- **Skinner WTP:** residences located approximately 600 feet west of the facility.
- **Weymouth WTP:** residences located immediately to the south, west, north, and east; Grace Miller Elementary School located immediately to the east; Calvary Baptist Church and School located immediately to the west; Kuns Park located approximately 460 feet southeast; Joan Macy School located 800 feet south; and Wheeler Avenue Park located approximately 1,200 feet south of the facility.
- **Hinds Pump Plant:** Metropolitan-owned residences located immediately west of the facility within Hinds Pump Plant boundary.
- **Eagle Mountain Pump Plant:** Metropolitan-owned residences located immediately northeast of the facility within the Eagle Mountain Pump Plant boundary.
- **Iron Mountain Pump Plant:** Metropolitan-owned residences located immediately southwest of the facility within the Iron Mountain Pump Plant boundary.

4.4.2.4 Existing Noise Environment

Existing noise levels vary widely throughout the Plan Area depending on the nature, type, and intensity of existing development. Rural and suburban residential areas generally experience lower ambient noise levels while areas in highly urbanized regions, along high-volume roadways, and near industrial development generally experience higher ambient noise levels. Generally, quiet suburban areas typically have noise levels in the range of 40 to 50 dBA, while those along arterial streets are in the 50 to 60+ dBA range. Highly urbanized areas, such as downtown Los Angeles, typically have noise levels in the range of 65 to 80+ dBA.

4.4.3 Regulatory Framework

This section describes the plans, policies, and regulations related to noise that are applicable to the proposed program.

4.4.3.1 Federal

There are no federal regulations related to noise applicable to the proposed program.

4.4.3.2 State

California Noise Control Act (California Health and Safety Code Section 46010 et seq.)

The California Noise Control Act of 1973 gave cities and communities the power to set noise ordinances and enforce them as necessary. The goal of the state and local governments is to prohibit unnecessary, annoying, intrusive, or dangerous noise.

California Office of Planning and Research General Plan Noise Element Guidelines

The California Office of Planning and Research recommends use of the noise/land use compatibility criteria shown in Table 22 in local General Plan Noise Elements (Office of Planning and Research 2017).

Table 22 Noise/Land Use Compatibility Criteria

Land Use	Community Noise Exposure (L_{dn} or CNEL)					
	55	60	65	70	75	80
Residential – Low Density Single Family, Duplex, Mobile Homes						
Residential – Multiple-Family						
Transient Lodging - Motels, Hotels[1]						
Schools, Libraries, Churches, Hospitals, Nursing Homes						
Auditoriums, Concert Halls, Amphitheaters						
Sports Arena, Outdoor Spectator Sports						
Playgrounds, Neighborhood Parks						
Golf Courses, Riding Stables, Water Recreation, Cemeteries						
Office Buildings, Business Commercial and Professional						
Industrial, Manufacturing, Utilities, Agriculture						

Normally Acceptable: Specified land use is satisfactory, based upon the assumption that any buildings involved are of normal conventional construction without any special noise insulation requirements.

Conditionally Acceptable: New construction or development should be undertaken only after a detailed analysis of the noise reduction requirements is made and needed noise insulation features included in the design. Conventional construction, but with closed windows and fresh air supply systems or air conditioning will normally suffice.

Normally Unacceptable: New construction or development should generally be discouraged. If new construction or development does proceed, a detailed analysis of the noise reduction requirements must be made and needed noise insulation features included in the design.

Clearly Unacceptable: New construction or development should generally not be undertaken.

L_{dn} = Day-Night Noise Level; CNEL = Community Noise Exposure Level

[1]Transient lodging generally consists of hotels, motels, inns, hostels, or other short-term living accommodations.

Source: California Office of Planning and Research 2017

4.4.3.3 Local

Each city and county in California is required to include a Noise Element in its General Plan. Most jurisdictions have also adopted Noise Ordinances, and several have adopted noise guidelines for CEQA analysis as well. It should be noted that California Government Code Section 53091 exempts Metropolitan, as a regional public water purveyor and utility, from local zoning and building ordinances but not from codified stand-alone noise ordinances. Despite this exemption from local planning ordinances, for purposes of full disclosure of potential impacts on the environment, this assessment of potential noise impacts broadly considers the potential for noise generated by individual projects that may be implemented under the proposed CAP to exceed locally-applicable noise-related standards contained in the general plans and noise ordinances of the cities and counties in the Plan Area.

The Plan Area encompasses a variety of local jurisdictions throughout the state, including the cities of Los Angeles (Jensen WTP) and La Verne (Weymouth WTP); Contra Costa and San Joaquin Counties (Delta properties); Imperial County (Palo Verde Valley properties); unincorporated Orange County (YLHEP/Diemer WTP); unincorporated Riverside County (Skinner WTP, Hinds and Eagle pump plants); and unincorporated San Bernardino County (Iron Mountain and Gene pump plants). Because the specific locations of individual projects that may be implemented under the proposed CAP are not all known at this time, specific local noise standards and regulations are not detailed in this PEIR. However, local noise standards and regulations generally include some or all of the following components:

- Statement that it is the policy of the city/county to prohibit unnecessary, excessive, and annoying noise within its jurisdiction in order to protect the public health, welfare, and safety of its citizens
- Definition of noise-sensitive receivers
- Procedures for sound level measurements
- Noise/Land use compatibility standards
- Limits on the allowed hours of construction and/or construction noise level limits
- Exemptions for construction noise generated during the allowed hours of construction and for work performed by private or public utilities in the maintenance or modification of their facilities
- Exterior daytime and nighttime noise level limits for stationary noise sources
- Exterior and interior noise level standards for noise-sensitive land uses
- Noise level standards for specific noise sources, such as radios, television sets, powered landscaping equipment, powered hand tools, and heating, ventilation, and air conditioning equipment

4.4.4 Thresholds and Methodology

4.4.4.1 Thresholds of Significance

Table 23 lists the thresholds from Appendix G of the *State CEQA Guidelines* that pertain to impacts associated with noise. These thresholds are addressed in the draft PEIR.

Table 23 CEQA Thresholds for Noise

Threshold Would the proposed program:
a. Generate a substantial temporary or permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?
b. Generate excessive groundborne vibration or groundborne noise levels?
c. For a project located within the vicinity of a private airstrip or an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, expose people residing or working in the project area to excessive noise levels?

Temporary or Permanent Increase in Ambient Noise Levels

Construction Noise

Metropolitan has not adopted thresholds for evaluating the significance of construction noise impacts. Although local jurisdictions often restrict hours of construction to reduce construction noise impacts, they do not always adopt quantitative construction noise level limits. Jurisdictions with quantitative noise construction level limits set varying thresholds, which may depend on the urban or rural environment, daytime or nighttime hours, and mobile or stationary equipment. For the purposes of this analysis, the FTA (2018) *Transit Noise and Vibration Impact Assessment Manual* criteria for construction noise are used for local jurisdictions that do not have quantitative construction noise level limits. The FTA provides reasonable criteria for assessing construction noise impacts based on the potential for adverse community reaction. The daytime noise thresholds are 80 dBA L_{eq} for residential uses, 85 dBA L_{eq} for commercial uses, and 90 dBA L_{eq} for industrial uses for an 8-hour period (FTA 2018).

On-site Operational Noise

Metropolitan has not adopted thresholds for evaluating the significance of on-site operational noise impacts. Most local jurisdictions throughout the Plan Area have their own noise level standards, which are often contained in each jurisdiction's General Plan Noise Element, Noise Ordinance, and/or CEQA noise guidelines. As discussed in Section 4.4.3.3, *Local*, despite Metropolitan's exemption from local zoning and building ordinances, this analysis broadly considers the potential for operational noise generated by individual projects that may be implemented under the proposed CAP to exceed the locally-applicable operational noise standards outlined in the general plans and noise ordinances of the cities and counties in the Plan Area for purposes of full disclosure of potential impacts on the environment.

Off-site Roadway Noise

Metropolitan has not adopted thresholds for evaluating the significance of off-site roadway noise impacts. Therefore, for traffic-related noise, impacts would be significant if project-generated traffic would result in exposure of sensitive receivers to an unacceptable increase in noise levels. For purposes of this analysis, a significant impact would occur if project-related traffic increases the ambient noise environment of noise-sensitive locations by 3 dBA or more (a barely perceptible increase) if the locations are subject to noise levels in excess of 60 CNEL for exterior areas or 45

CNEL for interior noise levels, or by 5 dBA or more (a readily perceptible increase) if the locations are not subject to noise levels in excess of the aforementioned standards.[24]

Vibration

Metropolitan has not adopted thresholds for evaluating the significance of vibration impacts. Therefore, vibration limits used in this analysis to determine a potential impact to local land uses are based on information contained in Caltrans' (2020) *Transportation and Construction Vibration Guidance Manual* and the FTA (2018) *Transit Noise and Vibration Impact Assessment Manual*. Maximum recommended vibration limits by the American Association of State Highway and Transportation Officials (AASHTO) are identified in Table 24.

Table 24 AASHTO Maximum Vibration Levels for Preventing Structural Damage

Type of Situation	Limiting PPV (in/sec)
Historic sites	0.1
Residential buildings, plastered walls	0.2 - 0.3
Residential buildings in good repair with gypsum board walls	0.4 - 0.5
Engineered structures, without plaster	1.0 - 1.5

AASHTO = American Association of State Highway and Transportation Officials; PPV = peak particle velocity; in/sec = inches per second
Source: Caltrans 2020

Based on AASHTO recommendations, limiting vibration levels to below 0.1 PPV inches per second would prevent structural damage regardless of the situation. These limits are applicable regardless of the frequency of the source. However, as shown in Table 25 and Table 26, potential human annoyance associated with vibration is usually different if it is generated by a steady state or a transient vibration source.

Table 25 Human Response to Steady State Vibration

PPV (in/sec)	Human Response
3.6 (at 2 Hz) to 0.4 (at 20 Hz)	Very disturbing
0.7 (at 2 Hz) to 0.17 (at 20 Hz)	Disturbing
0.10	Strongly perceptible
0.035	Distinctly perceptible
0.012	Slightly perceptible

PPV = peak particle velocity; Hz = hertz; in/sec = inches per second
Source: Caltrans 2020

[24] An exterior noise level of 60 CNEL is considered a "normally acceptable" noise level for single-family residential areas by the California Office of Planning and Research (see Table 4.4-1). In addition, California Code of Regulations, Title 24, Part 2 (2019 California Building Code), Chapter 12, Section 1206.4 requires that interior noise levels attributable to exterior sources not exceed 45 CNEL in any habitable room within a residential structure.

Table 26 Human Response to Transient Vibration

PPV (in/sec)	Human Response
2.0	Severe
0.9	Strongly perceptible
0.24	Distinctly perceptible
0.035	Barely perceptible

PPV = peak particle velocity; in/sec = inches per second
Source: Caltrans 2020

As shown in Table 25, the vibration level threshold at which steady vibration sources are considered to be distinctly perceptible is 0.035 inches per second PPV, which is roughly equivalent to the FTA criterion of 78 VdB for identifying impacts to residential land uses from infrequent events, such as passing trains. However, as shown in Table 26, the vibration level at which transient vibration sources (such as construction equipment) are considered to be distinctly perceptible is 0.24 inches per second PPV, which is roughly equivalent to 94 VdB. As a point of reference for the purposes of this analysis, the distinctly perceptible vibration level of 94 VdB is utilized as a significance threshold for assessing vibration impacts. This threshold is appropriate because proposed program activities would result in transient vibration sources, such as construction activities, (distinctly perceptible at 0.24 PPV) and would not result in steady state vibration (distinctly perceptible at 0.035 PPV).

4.4.4.2 Methodology

Temporary or Permanent Increase in Ambient Noise Levels

Construction Noise

Construction noise was estimated using the FHWA (2006) Roadway Construction Noise Model (RCNM). RCNM predicts construction noise levels for a variety of construction operations based on empirical data and the application of acoustical propagation formulas. RCNM provides reference noise levels for standard construction equipment, with an attenuation rate of 6 dBA per doubling of distance. Table 27 summarizes typical noise levels generated by a variety of equipment used in construction activities.

Table 27 Construction Equipment Noise Levels

Equipment	Noise Level at 50 feet (dBA L_{max})	Equipment	Noise Level at 50 feet (dBA L_{max})
Auger Drill Rig	85	Generator (25 kVA or less)	70
Backhoe	80	Generator (more than 25 kVA)	82
Chain Saw	85	Grader	85
Clam Shovel	93	Impact Pile Driver (diesel or drop)	95
Compactor (Ground)	80	Jackhammer	85
Compressor (Air)	80	Paver	85
Concrete Batch Plant	83	Pickup Truck	55
Concrete Mixer Truck	85	Pneumatic Tools	85
Concrete Pump	82	Pumps	77
Concrete Saw	90	Rock Drill	85
Crane (mobile or stationary)	85	Scraper	85
Dozer	85	Tractor	84
Dump Truck	84	Vacuum Street Sweeper	80
Excavator	85	Vibratory Concrete Mixer	80
Flat Bed Truck	84	Vibratory Pile Driver	95
Front End Loader	80	Welder	73

dBA = A-weighted decibel; kVA = kilovolt-amperes; Lmax = highest root mean squared sound pressure level within the sampling period

Source: Adapted from Federal Highway Administration (2006) Construction Noise Handbook

Because there is currently not sufficient detail to allow for the quantification of construction noise generated by each individual project to be implemented under the proposed CAP, construction noise levels were estimated using RCNM for sample program construction phases with different combinations of construction equipment based on reasonable assumptions at distances of 25, 50, and 100 feet to evaluate the intensity of construction activities that would result in less-than-significant impacts related to construction noise. The various combinations of construction equipment are representative of those expected to be used for construction of proposed individual projects, such as installation of electric vehicle infrastructure (CAP measure FL-4) and electric-powered equipment (to replace natural gas-powered equipment)(CAP measure DC-2) and construction of BESS facilities (CAP measure E-4) and a direct meter connection between the YLHEP and Diemer WTP (CAP measure E-2). Table 28 details the type and number of equipment modeled for each sample construction scenario. Because different construction phases have different objectives, each construction scenario has a specific equipment mix, depending on the work to be accomplished during that phase. Each construction scenario also has its own noise characteristics; some will have higher continuous noise levels than others, and some may have higher instantaneous noise levels. The maximum hourly L_{eq} of each phase is determined by combining the L_{eq} contributions from each piece of equipment used in that scenario (FTA 2018).

Table 28 Construction Equipment for Sample Program Construction Scenarios

Sample Construction Scenario	Construction Equipment
1	Excavator, Dozer, Jackhammer
2	Dozer, Front End Loader
3	Excavator, Grader, Dozer
4	Crane, Generator, Front End Loader
5	Pavers (2), Roller

Construction equipment operate in either a stationary or mobile mode during a construction noise assessment. As a rule, stationary equipment operates in a single location for one or more days at a time, with either fixed-power operation (e.g., pumps, generators, and compressors) or variable-power operation (e.g., pile drivers, rock drills, and pavement breakers). Mobile equipment, such as bulldozers, graders, and loaders, move around the construction site with power applied in cyclic fashion (FTA 2018). Noise impacts from stationary equipment are assessed from the center of the equipment, while noise impacts from mobile construction equipment are assessed from the center of the equipment activity area (e.g., construction site). In order to provide a conservative analysis for noise impacts, it is assumed that diesel engines would power all construction equipment.

Variation in power adds additional complexity in characterizing the noise source level from construction equipment. Power variation is accounted for by describing the noise at a reference distance from the equipment operating at full power and adjusting it based on the duty cycle, or percent of operational time, of the activity to determine the L_{eq} of the operation (FTA 2018). RCNM calculations are included in Appendix E.

Operational Noise

Individual projects that may be implemented under the proposed CAP would be located in a variety of jurisdictions with varying noise level standards and restrictions. As a result, the analysis does not use specific quantitative thresholds to evaluate program impacts but rather generally discusses the relationship between the types of noise levels likely to be produced during individual projects under the proposed program and local jurisdictions' noise level standards.

Vibration

The individual projects that may be implemented under the proposed CAP do not include any substantial vibration sources associated with operation, such as the installation of stationary vibration-generating equipment or railroad tracks. Metropolitan complies with all applicable engineering standards and implements up-to-date design measures to ensure infrastructure functions efficiently and excessive vibration is minimized. Accordingly, construction activities have the greatest potential to generate groundborne vibration affecting nearby receivers, especially during site preparation and grading of construction sites. Construction vibration estimates are based on vibration levels and equations developed by Caltrans and the FTA (Caltrans 2020; FTA 2018). Table 29 shows vibration levels used in the assessment of construction vibration (FTA 2018) for various pieces of typical construction equipment expected to be used during construction of projects proposed under the CAP.

Table 29 Vibration Levels Measured during Construction Activities

Equipment	PPV at 25 feet (in/sec)	Approximate VdB at 25 feet
Large bulldozer	0.089	87
Small bulldozer	0.003	58
Loaded trucks	0.076	86
Jackhammer	0.035	79

PPV = peak particle velocity; in/sec = inches per second; VdB = vibration decibels

[1] Caisson drilling was used as a proxy for bore/drill rigs.

Source: FTA 2018

Exposure to Existing Aircraft Noise

The potential for construction workers and Metropolitan employees to be exposed to excessive noise levels in areas near public use airports and private airstrips is addressed in this analysis.

4.4.5 Impacts Analysis

4.4.5.1 Program Analysis

Threshold NOI-A: *Would the proposed program result in the generation of a substantial temporary or permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?*

Construction

During construction, individual projects that may be implemented under the proposed CAP would temporarily increase ambient noise levels in the vicinity of the construction sites due to the operation of construction equipment. The magnitude of the temporary noise level increase would depend on the type and number of equipment pieces used. At this time, there is currently not sufficient detail regarding the proposed individual projects under the CAP to allow for the quantification of construction noise that would be generated by these projects. As a result, it would be speculative to analyze project-level impacts of individual projects that may be implemented under the proposed CAP.

It is, however, possible to evaluate the intensity of construction activities that would result in a less than significant construction noise impact. Some individual projects may only require the use of one

piece of construction equipment at a time. Table 30 summarizes the minimum distances at which noise generated by individual pieces of construction equipment would attenuate to less-than-significant levels at various receiving land uses based on the FTA (2018) construction noise thresholds, described in Section 4.4.4.1, *Thresholds of Significance*. Because noise thresholds are lowest for residential uses and highest for industrial uses, the minimum distance for a less than significant impact is furthest for residential uses and closest for industrial uses. Program construction activities utilizing only one piece of equipment at a time at the minimum distances from receiving land uses as shown in Table 30 would have a less than significant construction noise impact.

Table 30 Construction Noise Screening Criteria for Single Equipment Use

Equipment	Minimum Distance to Receiving Land Use for a Less-than-Significant Impact[1]		
	Industrial[2] (feet)	Commercial[3] (feet)	Residential[4] (feet)
Auger Drill Rig	30	50	90
Backhoe	20	30	50
Chain Saw	30	50	90
Clam Shovel	75	130	225
Compactor (Ground)	20	30	50
Compressor (Air)	20	30	50
Concrete Batch Plant	25	40	75
Concrete Mixer Truck	30	50	90
Concrete Pump	20	35	65
Concrete Saw	50	90	160
Crane (mobile or stationary)	30	50	90
Dozer	30	50	90
Dump Truck	25	45	80
Excavator	30	50	90
Flat Bed Truck	25	45	80
Front End Loader	20	30	50
Generator (25 kVA or less)	5	10	20
Generator (more than 25 kVA)	20	35	65
Grader	30	50	90
Impact Pile Driver (diesel or drop)	90	160	285
Jackhammer	30	50	90
Paver	30	50	90
Pickup Truck	5	5	5
Pneumatic Tools	30	50	90
Pumps	15	20	35
Rock Drill	30	50	90
Scraper	30	50	90
Tractor	25	45	80
Vacuum Street Sweeper	20	30	50
Vibratory Concrete Mixer	20	30	50
Vibratory Pile Driver	90	160	285
Welder	10	15	20

dBA = A-weighted decibel; L_{max} = maximum instantaneous noise level; L_{eq} = equivalent noise level; kVA = kilo volt-amperes

Notes: Noise levels are based on an attenuation rate of 6 dBA per doubling of distance. Distances are rounded up to the nearest 5 feet. This analysis is based on the L_{max} noise level contour of each piece of equipment rather than the L_{eq} noise level contour, which is conservative because average noise levels (L_{eq}) generated by each piece of equipment over an 8-hour period (the typical time period for construction noise limits in noise ordinances) would be less than its estimated instantaneous maximum noise level (L_{max}).

[1] As measured from the center of construction activities.

[2] Distance to the 90 dBA L_{max} contour.

[3] Distance to the 85 dBA L_{max} contour.

[4] Distance to the 80 dBA L_{max} contour.

While some proposed individual projects under the CAP may utilize only one piece of construction equipment at a time, others would require simultaneous use of multiple pieces of equipment during construction. Table 31 summarizes construction noise levels for sample construction scenarios at various distances. For example, the simultaneous use of an excavator, dozer, and jackhammer during sample construction scenario 1 would generate a noise level of approximately 90 dBA L_{eq} at 25 feet from the center of construction activities, 84 dBA L_{eq} at 50 feet from the center of construction activities, and 78 dBA L_{eq} at 100 feet from the center of construction activities.

Table 31 Construction Noise Levels for Sample Construction Scenarios

Sample Construction Scenario	Equipment	Noise Levels (dBA L_{eq})		
		25 Feet from Center of Construction Activities	50 Feet from Center of Construction Activities	100 Feet from Center of Construction Activities
1	Excavator, Dozer, Jackhammer	90	84	78
2	Dozer, Front End Loader	86	80	74
3	Excavator, Grader, Dozer	90	84	78
4	Crane, Generator, Front End Loader	86	80	74
5	Pavers (2), Roller	85	79	73

dBA = A-weighted decibel; L_{eq} = equivalent noise level

Based on the results presented in Table 31, the combined noise levels of various combinations of construction equipment are greater than the individual noise levels for each piece of equipment. Using the data provided in Table 31, Table 32 identifies the minimum distances at which noise generated by combined operation of construction equipment for each of the sample construction scenarios would attenuate to less-than-significant levels at various receiving land uses.

Program construction activities utilizing equipment equivalent to or less intensive than those specified in Table 28 at the minimum distances from receiving land uses as shown in Table 32 would have less than significant construction noise impacts. For example, a proposed program construction activity that requires use of an excavator, dozer, and jackhammer (equivalent to sample construction scenario 1) at a distance of 25 feet from the nearest industrial receiver, 60 feet from the nearest commercial receiver, and 100 feet from the nearest residential receiver would have a less-than-significant impact because the construction activity would occur at a distance equal to or further than the specified minimum distances for receiving land uses. Similarly, a project construction activity that only requires the use of an excavator (i.e., less intensive than sample construction scenario 1) at the same distances from the land uses previously specified would have a less-than-significant impact because construction activities would be less intensive than those evaluated for sample construction scenario 1.

As project-specific information becomes available for proposed projects under the CAP, subsequent CEQA analysis will be conducted. For these proposed projects, construction activities that utilize equipment with louder noise levels and/or are located within the minimum distances of receiving land uses shown in Table 32 would result in a potentially significant construction noise impact and would be required to implement MM NOI-1 and NOI-2. For example, a program construction activity that requires the use of a dozer and front end loader (equivalent to sample construction scenario 2) at a distance of 30 feet from the nearest residential receiver (i.e., closer than the specified distance of 50 feet) would result in a potentially significant construction noise impact, and mitigation would be required. Similarly, a program construction activity that requires the use of a concrete saw, dozer and front-end loader at a distance of 50 feet from the nearest residential receiver would generate higher noise levels than those evaluated for sample construction scenario 4 because of the additional

concrete saw. Therefore, construction noise impacts would be potentially significant, and mitigation would be required.

Table 32 Construction Noise Screening Criteria for Combined Equipment Use

Sample Construction Scenario	Equipment	Minimum Distance to Receiving Land Use for a Less-than-Significant Impact[1]		
		Industrial[2] (feet)	Commercial[3] (feet)	Residential[4] (feet)
1	Excavator, Dozer, Jackhammer	25	45	80
2	Dozer, Front End Loader	20	30	50
3	Excavator, Grader, Dozer	25	45	80
4	Crane, Generator, Front End Loader	20	30	50
5	Pavers (2), Roller	15	25	45

dBA = A-weighted decibel; L_{eq} = equivalent noise level

Notes: Noise levels are based on an attenuation rate of 6 dBA per doubling of distance. Distances are rounded to the nearest 5 feet.

[1] As measured from the center of construction activities.

[2] Distance to the 90 dBA L_{eq} contour.

[3] Distance to the 85 dBA L_{eq} contour.

[4] Distance to the 80 dBA L_{eq} contour.

If construction equipment is used within the minimum distances provided in Table 30 and/or Table 32, then proposed individual projects would result in a potentially significant construction noise impact. The severity of the noise impacts from construction activities would vary depending upon the number and type of equipment utilized for each phase and the proximity to residential, commercial, and industrial receiving land uses. Therefore, construction noise impacts at the program level are considered potentially significant and would be analyzed at the project-level once specific construction parameters are known. With the implementation of MM NOI-1 and NOI-2, noise generated during construction activities would be reduced; however, it is not possible to determine whether impacts would be reduced to less-than-significant levels because the magnitude of the construction noise impacts would need to be determined on a project-by-project basis. Therefore, at a program level of analysis, construction noise impacts would remain **significant and unavoidable**.

Post-Construction

On-site Operational Noise

Upon implementation, none of the proposed CAP measures would generate new on-site operational noise except the BESS facilities proposed under CAP measure E-4, which may include cooling fans and transformers with the potential to generate continuous noise during operation. Projects would be designed and located to avoid or minimize impacts to the extent feasible. Project-level analysis would evaluate noise impacts, including evaluating noise impacts at the nearest sensitive receivers and comparing estimated noise levels to the noise level standards adopted by the applicable local jurisdiction. The severity of the impacts would vary depending upon the type and intensity of the individual project, its proximity to sensitive receivers, and the relevant local noise standards. As a result, it would be speculative to analyze project-level impacts of individual projects that may be implemented under the proposed CAP, and it cannot be determined at this time if post-construction activities would result in a substantial permanent increase in noise levels or the severity of this impact. Therefore, post-construction operational conditions would result in a potentially significant permanent increase in noise levels. The BESS proposed at the Skinner WTP would be more than

1,000 feet from the nearest sensitive receivers, at which distance noise impacts would not be significant. Feasible mitigation for the remainder of the individual projects proposed for implementation under the proposed CAP may reduce noise generated during the post-construction period (see MM NOI-2(c)); however, due to the programmatic nature of the proposed program, it is not possible to determine whether impacts could be reduced to less-than-significant levels. Therefore, these impacts at a program level of analysis are assumed to be **significant and unavoidable**.

Off-site Roadway Noise

As discussed in Section 4.4.2, *Existing Conditions*, a doubling of traffic volumes would increase roadway noise by 3 dBA. Local roadways have the greatest potential to experience roadway noise impacts because low existing traffic volumes result in lower ambient noise levels, which increases the potential for noise generated by program-related traffic volumes to be more perceptible. However, operations and maintenance trips related to individual proposed CAP projects would be distributed throughout the Plan Area. Measures considered in the proposed CAP generally involve efficiency improvements to existing Metropolitan infrastructure and processes and generally do not involve construction of substantial trip-generating land use projects. Due to the scale and nature of the individual projects that would implement CAP measures, each project would likely add an estimated two to ten daily trips to local roadways. The limited number of trips would not have the potential to double traffic volumes even on low-volume local roadways. Thus, it is unlikely the proposed program would increase noise levels by 3 dBA. Operational roadway noise impacts would be **less than significant,** and no mitigation would be required.

Threshold NOI-B: *Would the proposed program result in the generation of excessive groundborne vibration or groundborne noise levels?*

Construction

Construction activities associated with the proposed program would potentially require the use of equipment that may generate substantial levels of vibration, such as bulldozers, loaded trucks, pile drivers/pneumatic post drivers, bore/drill rigs, vibratory rollers, and jackhammers. As shown in Table 29 in Section 4.4.4.2, *Methodology*, the use of this construction equipment would generate vibration levels ranging from 0.003 to 0.089 inches per second PPV, or 58 to 87 VdB, at a distance of 25 feet. At this time, the individual projects that may be implemented under the proposed CAP identified above do not have sufficient detail to allow project-level analysis of vibration impacts during construction.

Nevertheless, it is possible to evaluate the intensity of construction activities that would result in a less-than-significant construction vibration impact on historic sites, other structures, and sensitive land uses as defined in Section 4.4.2.3, *Sensitive Receivers*. Table 33 summarizes the minimum distances at which vibration generated by construction equipment would attenuate to less-than-significant levels at various receivers. Program construction activities utilizing equipment at the minimum distances shown in Table 33 would have a less-than-significant construction vibration impact.

Table 33 Vibration Level Contours during Construction Activities

Equipment		Minimum Distance to Receiving Land Use for a Less-than-Significant Impact (feet)		
		Historic Sites[1]	All Other Structures[2]	Vibration-Sensitive Land Uses[3]
Large bulldozer		25	15	15
Small bulldozer		5	5	5
Loaded trucks		20	10	10
Impact Pile Driver	Upper Range	300	160	165
	Typical	140	75	75
Caisson Drilling[4]		25	15	15
Vibratory Roller		50	30	25
Jackhammer		10	5	5

PPV = peak particle velocity in inches per second; VdB = vibration decibels

Note: Distances are rounded to the nearest 5 feet.

[1] Distance to the 0.1 PPV contour.

[2] Distance to the 0.2 PPV contour.

[3] Distance to the 94 VdB contour.

[4] Caisson drilling was used as a proxy for bore/drill rigs.

If historic sites, structures, or sensitive receivers are located within the minimum distances to construction equipment shown in Table 33, then individual proposed projects would result in a potentially significant construction vibration impact and implementation of MM NOI-3 would be required. The severity of the impacts would vary depending upon the type of equipment used for each construction activity, the nature of the nearest structures and sensitive receivers (see Section 4.4.2.3, *Sensitive Receivers*), and the proximities of the nearest structures and sensitive receivers. Because detailed information is not currently available to conduct a project-level analysis of proposed projects under the CAP, it cannot be determined at this time if significant construction impacts related to vibration would occur or what the severity of the impact would be. As a result, construction impacts related to vibration at a program level of analysis would be potentially significant. Mitigation may be available to reduce vibration levels during construction activities (see MM NOI-3); however, it is not possible to determine whether impacts would be reduced to less-than-significant levels because the nature and intensity of the vibration impact is not fully known at this time. Thus, at a program-level of analysis, construction vibration impacts associated with implementation of the individual projects that may be implemented under the proposed CAP are assumed to be **significant and unavoidable**.

Post-Construction

Post-construction activities and/or conditions associated with individual projects proposed under the CAP would not include sources of vibration, such as heavy machinery. Program components such as BESS facilities (CAP measure E-4), LED lighting (CAP measure EE-1), electric vehicle charging stations (CAP measure FL-4 and CAP measure EC-3), and electric-powered equipment (to replace natural gas-powered equipment)(CAP measure DC-2), do not generate substantial vibration. Therefore, **no impact** would occur.

Threshold NOI-C: *For a program located within the vicinity of a private airstrip or an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the proposed program expose people residing or working in the area to excessive noise levels?*

Public use airports and private air strips are located throughout the Plan Area (see Figure 16 for a map of public use airports within the Plan Area). Airport land use plans establish allowable land uses within areas that are subject to high noise levels related to aircraft operations. Of the individual proposed projects under the CAP identified in Chapter 2, *Project Description*, the only known potential location within two miles of a public or private airport is the Weymouth WTP, located approximately 0.9 mile north of the public use airport Brackett Field Airport.

Construction

For individual projects proposed under the CAP that are located within two miles of a public use airport or private airstrip, construction workers would be intermittently exposed to elevated noise levels during aircraft take-off and landing events, especially within the 75 and 85 dBA noise level contours of the nearest airport or airstrip. Although aircraft take-off and landing events would contribute to the noise environment, construction noise would be the dominant source of noise exposure for construction workers. Construction contractors would be required to comply with California Occupational Safety and Health Administration (Cal OSHA) regulations related to worker exposure to noise. Section 5096 of these regulations sets duration-based noise exposure limits for construction workers that require provision of personal protective equipment should exposure exceed the specified limits. The requisite adherence to these regulations would reduce construction worker exposure to high noise levels such that proposed program construction activities would not expose employees to excessive noise levels. Therefore, construction workers would not be exposed to excessive noise levels from aircraft noise. Construction impacts related to aircraft noise would be **less than significant** and no mitigation would be required.

Post-Construction

Some individual projects implemented under the proposed CAP may be located within two miles of a public use airport or private airstrip, such as those at the Weymouth WTP. None of the proposed CAP measures involve operation of noise-sensitive receptors, such as residences or schools, that would be exposed to excessive airport noise in the Plan Area.

Most proposed program activities, including the proposed BESS facility at the Weymouth WTP (CAP measure E-4), would either be unmanned or would not require new on-site employees. However, some individual projects may require new exterior operations and maintenance activities beyond those currently occurring that could expose staff to elevated noise levels during aircraft take-off and landing events, especially within the 75 and 85 dBA noise level contours of the nearest airport or airstrip. Given the nature of individual projects, maintenance activities would occur infrequently and likely would not require extended exposure to aircraft noise. As stated previously, Metropolitan would be required to comply with Cal OSHA regulations related to worker exposure to noise. These regulations would reduce employee exposure to high noise levels such that post-construction activities would not expose employees to excessive noise levels. Therefore, post-construction impacts related to aircraft noise would be **less than significant**.

Additional data provided by USGS, 2017 and the Federal Aviation Administration, 2019.

Cumulative Analysis

The geographic scope for cumulative noise impacts is generally within 0.5 mile of the locations of individual projects that may be implemented under the proposed CAP. This geographic scope is appropriate for noise because the proposed program's noise impacts are localized and site-specific. Beyond this distance, typical construction and operational noise would be indistinguishable from the background noise level due to distance attenuation and interference from environmental conditions (e.g., topography and air disturbance).

If concurrent construction activities occur in close proximity to proposed program activities, combined construction noise would have the potential to impact the same sensitive receivers and result in cumulative construction noise and vibration levels that exceed the applicable thresholds of significance. The severity of the impacts would vary depending upon the intensity of construction activities for cumulative projects and the proximities of residential, commercial, and industrial land uses to each construction site. Therefore, it cannot be determined at this time if significant cumulative construction noise and vibration impacts would occur or whether the proposed program's contribution to those significant cumulative impacts would be considerable. As a result, cumulative construction noise and vibration impacts would be potentially significant, and proposed program activities would have a **cumulatively considerable contribution**. Mitigation may be available to reduce cumulative noise and vibration generated during construction of individual projects that may be implemented under the proposed CAP (see MM NOI-1 through NOI-3); however, it is not possible to determine whether impacts would be reduced to less than significant levels because the magnitudes of the noise and vibration impacts are not known.

Depending on the specific locations of individual projects that may be implemented under the proposed CAP, it is possible that cumulative development is currently resulting in a significant cumulative operational noise impact if operational noise exceeds the applicable jurisdiction's noise level standards at sensitive receivers. Therefore, cumulative operational noise impacts may be potentially significant. Nevertheless, per MM NOI-2(c), individual projects with the potential to generate on-site operational noise would be required to complete project-level post-construction noise studies and incorporate noise reduction measures to reduce noise levels to the noise level standards of the applicable jurisdiction, as feasible. As a result, regardless of whether a significant cumulative operational noise impact is occurring, the proposed program's noise contribution would **not be cumulatively considerable** with incorporation of MM NOI-2(c).

Cumulative growth in the Plan Area would result in increased traffic volumes on local and regional roadways. However, as discussed under Threshold NOI-A, due to the relatively low number of anticipated operations and maintenance trips associated with individual CAP projects, impacts related to off-site roadway noise would be incremental and likely inaudible; therefore, the proposed program would **not have a cumulatively considerable contribution to this potential cumulative impact**, significant or otherwise.

As discussed under Threshold NOI-C, public use airports and private airstrips are located throughout the Plan Area. The specific locations of individual projects that may be implemented under the proposed CAP are not all known at this time; therefore, it is also unknown whether individual projects or cumulative projects would be located within the vicinity of airports, other than the proposed BESS facility to be located at Weymouth WTP, which would be within 0.9 mile of Brackett Field Airport. Nevertheless, individual projects and cumulative projects would be required to comply with the applicable airport land use plan, federal and state OSHA regulations, and applicable California Building Code standards related to the protection of residents and workers from exposure to excessive aircraft noise. As a result, regardless of whether a significant cumulative noise impact related to airport operations exists, the proposed program would **not have a cumulatively considerable contribution to this potential cumulative impact**, significant or otherwise.

4.4.5.2 Mitigation Measures

MM NOI-1 **Locate Excavation Sites Away from Noise-Sensitive Receivers, Where Feasible.** Construction staging and activities shall be located in areas as far as practicable from sensitive receivers or in areas where receivers can be shielded from construction noise.

MM NOI-2(a) **Conduct Project-Level Noise Studies for Construction Activities Where Noise-Sensitive Receivers are Present.** Project-level construction noise studies shall be conducted for project activities that would exceed the screening criteria for a less-than-significant impact, as summarized in Table 30 and Table 32 of the draft PEIR. Such noise studies shall identify the existing ambient noise levels, characterize the nearest sensitive receivers, estimate the noise levels receivers will experience during construction of individual projects, compare estimated noise levels to the local jurisdiction's noise limits or to the construction noise criteria in the FTA (2018) *Transit Noise and Vibration Impact Assessment Manual* for those that do not have quantitative construction noise level limits, outline any measures that may be used to reduce noise levels, and determine the amount of noise reduction that would occur with implementation of these measures. If the project-level noise study concludes that noise reduction measures are required, MM-NOI-2(b) shall be implemented.

MM-NOI-2(b) **Implement Noise Reduction Measures.** If the results of the noise study determine noise reduction measures are required, noise reduction measures shall be implemented. Construction noise reduction measures may include, but would not be limited to, the use of mufflers, sound blankets/barriers, and/or enclosures and scheduling construction activities to minimize simultaneous operation of noise-producing equipment. Construction noise measures shall be implemented to reduce noise levels to FTA (2018) construction noise criteria, as feasible.

If the individual project would be constructed concurrently with development projects located within a 0.5-mile radius of the individual project location, the noise study shall also consider the cumulative impact of construction noise on sensitive receivers. If applicable, construction noise reduction measures shall be implemented to reduce cumulative noise levels to local jurisdiction or FTA (2018) construction noise criteria, as feasible.

MM NOI-2(c) **Conduct Project-Level Noise Studies for Post-Construction Activities Where Noise Sensitive Receivers are Present**. Prior to the commencement of construction activities for individual projects that may be implemented under the CAP where sensitive receivers are located within 1,000 feet of the individual project sites, project-level post-construction noise studies shall be conducted. Such noise studies shall identify the ambient noise levels, characterize the nearest sensitive receivers, estimate the noise levels receivers will experience during operation of individual projects during the post-construction period, compare estimated noise levels to the noise level standards of the applicable jurisdiction, outline any measures that may be used to reduce noise levels, and determine the amount of noise reduction that would occur with implementation of these measures. Noise reduction measures may include, but would not be limited to, alternative site design, alternative orientation of noise sources, and construction of berms and/or barriers. Noise reduction measures shall be implemented to reduce noise levels to the noise level standards of the applicable jurisdiction, as feasible.

MM NOI-3(a) **Locate Excavation Sites Away from Vibration-Sensitive Receivers, Where Feasible.** Whenever practicable, vibration-generating equipment including bulldozers, loaded trucks, pile drivers/pneumatic post drivers, bore/drill rigs, vibratory rollers, and jackhammers shall operate outside the minimum distances specified in Table 33 of the draft PEIR for historic sites, other structures, and vibration-sensitive receivers during program construction activities. Furthermore, whenever practicable, vibration-generating equipment including bulldozers, loaded trucks, pile drivers/pneumatic post drivers, bore/drill rigs, vibratory rollers, and jackhammers shall not be operated concurrently with vibration-generating equipment associated with cumulative development projects located within 600 feet of program construction sites.

MM NOI-3(b) Conduct Project-Level Vibration Analysis for Construction Activities Where Vibration-Sensitive Receivers are Present. If operation of construction equipment outside the specified buffer distances is not practicable, a detailed study of vibration impacts shall be conducted prior to the commencement of construction for that project. Such vibration studies shall characterize the nearest historic sites, structures, and/or sensitive receivers; estimate the vibration levels receivers will experience during construction of individual projects; compare estimated vibration levels to applicable Caltrans (2020) standards for vibration impacts related to structural damage and human annoyance; outline any measures that may be used to reduce vibration levels; and determine the amount of vibration reduction that would occur with implementation of these measures. Vibration reduction measures may include, but would not be limited to, the use of non-vibratory equipment, vibration monitoring, and repair of structural damage. Construction vibration reduction measures shall be implemented to reduce vibration levels to Caltrans (2020) construction vibration thresholds as feasible.

If the individual project would be constructed concurrently with cumulative development projects located within a 600-foot radius of the activity location, the vibration study shall also consider the cumulative impact of combined vibration levels at the nearest sensitive receivers by estimating the combined vibration levels receivers will experience during construction of individual projects and cumulative development; compare estimated vibration levels to applicable standards for vibration impacts related to structural damage and human annoyance described in the Caltrans (2020) *Transportation and Construction Vibration Guidance Manual* (CT-HWANP-RT-20-365.01.01); identify whether the individual project's contribution to any identified cumulative impact would be cumulatively considerable; outline any measures that may be used to reduce the project's contribution to combined vibration levels; and determine the amount of vibration reduction that would occur with implementation of these measures. Such measures may include, but are not limited to, the installation of wave barriers, maximization of the distance between vibratory equipment and receivers, restriction of vibration-generating activities to daytime hours, or temporary relocation of affected residents Construction vibration reduction measures shall be implemented to reduce cumulative vibration levels to Caltrans construction vibration thresholds as feasible.

4.4.5.3 Level of Significance After Mitigation

Implementation of MM NOI-1 and NOI-2 are intended to reduce potential impacts from construction and post-construction noise; however, whether these measures would reduce all construction and post-construction noise impacts to less-than-significant levels is not known. Therefore, as discussed under Threshold NOI-A, these impacts associated with projects covered under the implementation of the proposed CAP are assumed to be **significant and unavoidable**. Further environmental analysis and documentation is necessary prior to construction of each individual project to determine if a significant project-level impact would occur and if proposed mitigation would reduce the impact to a less-than-significant level.

Implementation of MM NOI-3 is intended to reduce construction vibration impacts; however, whether this measure would reduce all vibration impacts to less-than-significant levels is not known. Therefore, as discussed under Threshold NOI-B, the vibration impact associated with implementation of the proposed CAP is assumed to be **significant and unavoidable**. Further environmental analysis and documentation is necessary prior to construction of each individual project to determine if a significant impact project-level would occur and if mitigation would reduce the impact to a less than significant level.

Adherence to existing regulations regarding worker safety and noise exposure would ensure project-level impacts and the project's contribution to potential cumulative impacts associated with aircraft noise are **less than significant** and **not cumulatively considerable**. No mitigation is required.

Implementation of MM NOI-1, NOI-2, and NOI-3 are intended to reduce cumulative construction noise and vibration impacts; however, whether these measures would reduce the proposed program's contributions to potentially significant cumulative impacts to less-than-significant levels is not known. Therefore, the proposed program's contributions to significant cumulative construction noise and vibration impacts are assumed to be **cumulatively considerable**. As discussed under *Cumulative Analysis*, the project would **not have a cumulatively considerable contribution to cumulative impacts** related to operational noise with implementation of MM NOI-2(b).

4.5 Tribal Cultural Resources

4.5.1 Introduction

This section describes the existing conditions, regulatory framework, and potential impacts to tribal cultural resources which could result from the proposed program, as well as mitigation measures to reduce these impacts. Tribal cultural resources are those resources identified by California Native American tribes in consultation with lead agencies during tribal consultation (also referred to as Assembly Bill (AB) 52 consultation). See Section 4.5.3, *Regulatory Framework*, for a description of AB 52 and its requirements.

4.5.2 Existing Conditions

4.5.2.1 Setting

The Plan Area encompasses the traditional territory of numerous Native American ethnographic groups. Metropolitan has received formal notification for consultation from the following ten California Native American tribes that are traditionally and culturally affiliated with the geographic area of the Plan Area:

- Barbareño-Ventureño Band of Mission Indians
- Barona Band of Mission Indians
- Cabazon Band of Mission Indians
- Fernandeño Tataviam Band of Mission Indians
- Gabrieleño Band of Mission Indians-Kizh Nation
- San Gabriel Band of Mission Indians
- Pechanga Band of Luiseño Indians
- San Manuel Band of Mission Indians
- Soboba Band of Luiseño Indians
- Twenty-Nine Palms Band of Mission Indians

As previously described, most emission reduction measures that would be implemented under the plan are either administrative in nature or involve upgrades to existing infrastructure to improve function, which will reduce emissions (e.g., replacement or refurbishment of pump impellors). While enough project data exists to make reasonable assumptions about the potential level of significance for each project, additional project-level analysis will be completed when project-specific information becomes available for each project proposed in the CAP. Subsequent CEQA documentation will be prepared, as necessary. Future CEQA documents for the CAP updates may require additional consultation with tribes and will be made available for comment, as required.

4.5.2.2 Tribal Cultural Resource Consultation

As part of the process of identifying tribal cultural resources in or near the Plan Area, Metropolitan sent letters inviting all ten tribes whom had previously requested formal notice to consult on the proposed program on June 25, 2020. Metropolitan requested a response within 30 days of receipt of the notification, as specified by Section 21080.3.1 of the CEQA Statute. Metropolitan received one response requesting consultation from the San Manuel Band of Mission Indians on August 2, 2020. A consultation telephone conference meeting took place on August 19, 2020 between Metropolitan staff and Ms. Jessica Mauck, Director of Cultural Resources Management, and Ryan Nordness, Cultural Resource Analyst, for the San Manuel Band of Mission Indians.

During the consultation meeting, Metropolitan staff provided a brief history of Metropolitan, an overview of Metropolitan's cultural resource management and identification efforts and tribal cultural resource identification efforts, description of Metropolitan facilities in the vicinity of the San Manuel Reservation and Serrano ancestral tribal territory, and an overview of the proposed program and milestones. Metropolitan staff also reiterated that the proposed program does not include any specific projects slated for construction, and that any future project incorporating the Plan as a mitigation measure would subject to a project-specific environmental document with required tribal cultural resource outreach and consultation. The Tribe acknowledged understanding that the CAP is a high-level planning document with no direct construction activities and was also supportive of potential projects described in the Plan such as expansion of BESS facilities, electric vehicle charging infrastructure, and other "green" energy projects.

4.5.3 Regulatory Framework

4.5.3.1 Federal

Tribal cultural resources are a resource category identified by state law; there are no federal regulations pertaining to tribal cultural resources.

4.5.3.2 State

Assembly Bill 52 of 2014

AB 52 expanded CEQA by defining a new resource category, "tribal cultural resources." AB 52 establishes that "a project with an effect that may cause a substantial adverse change in the significance of a tribal cultural resource is a project that may have a significant effect on the environment" (Public Resources Code [PRC] Section 21084.2). AB 52 further states when feasible, the lead agency shall establish measures to avoid impacts that would alter the significant characteristics of a tribal cultural resource (PRC Section 21084.3). PRC Section 21074(a)(1) defines tribal cultural resources as "sites, features, places, cultural landscapes, sacred places, and objects with cultural value to a California Native American tribe," that satisfy either of the following criteria:

(A) Included or determined to be eligible for inclusion in the California Register of Historic Resources.

(B) Included in a local register of historical resources as defined in PRC Section 5020.1(k).

And PRC Section 21074(a)(2) defines tribal cultural resources as "A resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in subdivision (c) of PRC Section 5024.1. In applying the criteria set forth in subdivision (c)

of PRC Section 5024.1 for the purposes of this paragraph, the lead agency shall consider the significance of the resource to a California Native American tribe."

In recognition of California Native American tribal sovereignty and the unique relationship of California local governments and public agencies with California Native American tribal governments and with respect to the interests and roles of project proponents, it is the intent AB 52 to accomplish all of the following:

1. Recognize that California Native American prehistoric, historic, archaeological, cultural, and sacred places are essential elements in tribal cultural traditions, heritages, and identities.
2. Establish a new category of resources in CEQA called "tribal cultural resources" that considers the tribal cultural values in addition to the scientific and archaeological values when determining impacts and mitigation.
3. Establish examples of mitigation measures for tribal cultural resources that uphold the existing mitigation preference for historical and archaeological resources of preservation in place, if feasible.
4. Recognize that California Native American tribes may have expertise with regard to their tribal history and practices which concern the tribal cultural resources with which they are traditionally and culturally affiliated (because CEQA calls for a sufficient degree of analysis, tribal knowledge about the land and tribal cultural resources at issue should be included in environmental assessments for projects that may have a significant impact on those resources).
5. In recognition of their governmental status, establish a meaningful consultation process between California Native American tribal governments and lead agencies, respecting the interests and roles of all California Native American tribes and project proponents and the level of required confidentiality concerning tribal cultural resources early in the CEQA environmental review process, so that tribal cultural resources can be identified and culturally appropriate mitigation and mitigation monitoring programs can be considered by the decision-making body of the lead agency.
6. Recognize the unique history of California Native American tribes and uphold existing rights of all California Native American tribes to participate in, and contribute their knowledge to, the environmental review process pursuant to CEQA.
7. Ensure that local and tribal governments, public agencies, and project proponents have information available, early in CEQA environmental review process, for purposes of identifying and addressing potential adverse impacts to tribal cultural resources and to reduce the potential for delay and conflicts in the environmental review process.
8. Enable California Native American tribes to manage and accept conveyances of, and act as caretakers of, tribal cultural resources.
9. Establish that a substantial adverse change to a tribal cultural resource has a significant effect on the environment.
10. AB 52 also establishes a formal consultation process for California tribes regarding those resources. The consultation process must be completed before a CEQA document can be certified or adopted. AB 52 requires that lead agencies "begin consultation with a California Native American tribe that is traditionally and culturally affiliated with the geographic area of the proposed project." Native American tribes to be included in the process are those that have requested notice of projects proposed in the jurisdiction of the lead agency.

4.5.4 Thresholds and Methodology

4.5.4.1 Thresholds of Significance

Table 34 lists the thresholds from Appendix G of the *State CEQA Guidelines* that pertain to impacts associated with tribal cultural resources. These thresholds are addressed in the draft PEIR.

Table 34 CEQA Thresholds for Tribal Cultural Resources

Threshold Would the proposed program:
a. Cause a substantial adverse change in the significance of a tribal cultural resource, defined in Public Resources Code Section 21074 as either a site, feature, place, cultural landscape that is geographically defined in terms of the size and scope of the landscape, sacred place, or object with cultural value to a California Native American Tribe, and that is: 1. Listed or eligible for listing in the California Register of Historical Resources, or in a local register of historical resources as defined in Public Resources Code Section 5020.1(k), or 2. A resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in subdivision (c) of Public Resources Code Section 5024.1. In applying the criteria set forth in subdivision (c) of Public Resources Code Section 5024.1, the lead agency shall consider the significance of the resource to a California Native American tribe.

4.5.4.2 Methodology

The following section presents a programmatic-level discussion of impacts to tribal cultural resources which could occur from implementation of the proposed CAP. These potential impacts would apply throughout the Plan Area and are directly tied to emissions reduction measures with physical construction activities. Due to the programmatic nature of the CAP, a precise, project-level analysis of the specific impacts associated with individual projects is not possible and would be speculative at this time. However, all program activities proposed under the CAP that are subject to CEQA must comply with AB 52.

Refer to Section 4.5.2.2, *Tribal Cultural Resource Consultation*, for a summary of Metropolitan's consultation outreach efforts.

4.5.5 Impacts Analysis

4.5.5.1 Program Analysis

Threshold TCR-A: *Would the program cause a substantial adverse change in the significance of a tribal cultural resource, defined in Public Resources Code Section 21074 as either a site, feature, place, cultural landscape that is geographically defined in terms of the size and scope of the landscape, sacred place, or object with cultural value to a California Native American Tribe, and that is listed or eligible for listing in the California Register of Historical Resources, or in a local register of historical resources as defined in Public Resources Code Section 5020.1(k)?*

As part of its tribal cultural resource identification process, Metropolitan sent letters via certified mail to ten Native American tribes that had previously requested to be informed through formal notification of proposed projects in the geographic area that is traditionally and culturally affiliated

with the tribes. One tribe, the San Manuel Band of Mission Indians, requested consultation. A consultation telephone conference meeting took place on August 19, 2020. During consultation, the San Manuel Band of Mission Indians did not identify any specific tribal cultural resources that would be impacted by the proposed program.

No tribal cultural resources were identified during consultation and no resources eligible for the California Register of Historical Resources or local register have been identified as being impacted by the proposed program. The proposed CAP would have **less than significant** to tribal cultural resources and no mitigation would be required.

Threshold TCR-B: *Would the program cause a substantial adverse change in the significance of a tribal cultural resource, defined in Public Resources Code Section 21074 as either a site, feature, place, cultural landscape that is geographically defined in terms of the size and scope of the landscape, sacred place, or object with cultural value to a California Native American Tribe, and is a resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in subdivision (c) of Public Resources Code Section 5024.1.?*

As described under Threshold TCR-A, Metropolitan sent letters via certified mail to ten Native American tribes that had previously requested to be informed through formal notification of proposed projects in the geographic area that is traditionally and culturally affiliated with the tribes. The San Manuel Band of Mission Indians requested consultation. Metropolitan, as lead agency, has not determined any significant impacts to resources pursuant to criteria set forth in subdivision (c) of Public Resources Code Section 5024.1. Additionally, the San Manuel Tribe did not identify any specific tribal cultural resources potentially impacted by the proposed program. For these reasons, the CAP would have a **less than significant** impact to tribal cultural resources and no mitigation would be required.

4.5.5.2 Cumulative Analysis

Tribal cultural resources are regionally specific and determined by the consulting tribes. As described above, based on Metropolitan's outreach to Native American tribes in the Plan Area and the fact that no tribal cultural resources have been identified that may be impacted by the CAP, a **less than significant** cumulative impact associated with implementation of the proposed program would occur and no mitigation would be required.

4.5.5.3 Mitigation Measures

No mitigation is required.

4.5.5.4 Level of Significance After Mitigation

Impacts are **less than significant,** and no mitigation would be required.

This page intentionally left blank.

5 Effects Found Not to be Significant

According to Section 15128 of the *State CEQA Guidelines*, an EIR shall contain a statement that briefly indicates the reasons that various possible significant effects of a project were determined not to be significant and were therefore not discussed in detail in the PEIR. Such a statement may be contained in an attached copy of an Initial Study.

This chapter includes a brief description and analysis of the impact categories described in Appendix G of the *State CEQA Guidelines* that were found not to be significant. The analysis includes a review of resources, a detailed impact assessment conducted during the PEIR preparation process, and incorporation of comments received during the NOP process. Impacts that are found not to have a significant effect on the environment include Aesthetics, Agriculture and Forestry, Energy, Geology and Soils, Greenhouse Gases, Hazards and Hazardous Materials, Hydrology and Water Quality, Land Use and Planning, Mineral Resources, Population and Housing, Public Services, Recreation, Transportation, Utilities and Service Systems, and Wildfire. The Appendix G of the *State CEQA Guidelines* thresholds and a discussion of the impacts associated with implementation of the proposed program on these resources are discussed below.

5.1 Aesthetics

Pursuant to Appendix G of the *State CEQA Guidelines*, potentially significant aesthetic impacts would occur if implementation of the proposed program would:

- Have a substantial adverse effect on a scenic vista; or
- Substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway; or
- Substantially degrade the existing visual character or quality of public views of the site and its surroundings? (Public views are those that are experienced from publicly accessible vantage points. If the project is in an urbanized area, would the project conflict with applicable zoning and other regulations governing scenic quality); or
- Create a new source of substantial light or glare that would adversely affect day or nighttime views in the area.

Individual projects under the proposed CAP identified in Chapter 2, *Project Description*, include electrification, infrastructure, and renewable energy storage improvements at existing Metropolitan facilities (e.g., BESS facilities under CAP measure E-4), as well as carbon capture and sequestration pilot studies on agricultural land in the Palo Verde Valley and Sacramento-San Joaquin River Delta Islands (e.g., CAP measures CS-1 through CS-3). None of the individual projects under the CAP are located near a scenic vista such that they would have a substantial adverse effect on a scenic vista. None of the projects are located near a state scenic highway and would, therefore, not result in damage to scenic resources located within a state scenic highway.

Though some projects could be seen from a publicly accessible vantage point, individual projects would be small in nature and occur entirely within existing Metropolitan facilities that already include buildings, fuel pumps, water conveyance and treatment infrastructure, parking structures, maintenance facilities, etc. The addition of new structures at these facilities would not represent a major change in visual character of the sites. In urban areas, local jurisdictions may adopt zoning or other regulations governing scenic quality. Generally, projects implemented under the CAP would not conflict with such local regulations because California Government Code Section 53091 exempts Metropolitan, as a regional public water purveyor and utility, from local zoning and building ordinances. Furthermore, the CAP includes measures, such as carbon capture and sequestration initiatives, that may improve views of project sites from publicly accessible viewpoints by enhancing vegetation cover and improving the quality of those views. Therefore, none of the individual CAP projects would substantially degrade the existing visual character of a public view or conflict with applicable zoning or other regulations governing scenic quality. Impacts related to scenic resources, scenic highways, and visual character associated with aesthetics resources would be less than significant and no mitigation would be required.

Metropolitan plans to convert all interior and exterior lighting to light emitting diode (LED) technology (CAP measure EE-1), which is more energy efficient and emits light in a specific direction, unlike incandescent and compact fluorescent lamp technology, which emits light in all directions. Lighting would be directed downward or would be shielded and would not adversely affect day or nighttime views in the area. Though projects such as the proposed BESS facilities (CAP measure E-4) would include new lighting to illuminate the buildings/structures, new lighting would be shielded, directed downwards, and would use low wattage bulbs to reduce impacts to nighttime views in the area. Project lighting would be designed to reduce intrusion onto adjacent properties. In addition, the project designs do not propose new highly reflective materials that could potentially cause significant glare during the day, such as stainless-steel panels or expansive glass. Lighting may be required during construction activities for individual projects, particularly if overnight work is necessary. However, such lighting would conform to Metropolitan's standard construction specifications, which require contractors to direct floodlights downward and shield them to avoid nuisance. Therefore, the projects identified in the proposed CAP would not create substantial light or glare that would adversely affect day or nighttime views in the area. Impacts related to light and glare associated with aesthetics resources would be less than significant and no mitigation would be required.

5.2 Agriculture and Forestry

Pursuant to Appendix G of the *State CEQA Guidelines*, potentially significant agriculture and forestry impacts would occur if implementation of the proposed program would:

- Convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland), as shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency, to nonagricultural use; or
- Conflict with existing zoning for agricultural use, or a Williamson Act contract; or
- Conflict with existing zoning for, or cause rezoning of, forest land (as defined in Public Resources Code Section 12220(g)), timberland (as defined by Public Resources Code Section 4526), or timberland zoned Timberland Production (as defined by Government Code Section 51104(g)); or
- Result in the loss of forest land or conversion of forest land to non-forest use; or

- Involve other changes in the existing environment which, due to their location or nature, could result in conversion of Farmland, to non-agricultural use or conversion of forest land to non-forest use.

Most of the individual projects under the proposed CAP identified in Chapter 2, *Project Description*, are not related to agriculture and are not anticipated to have an impact on agricultural or forestry resources, either directly or indirectly, within the Plan Area. Activities that may occur on existing farmland include regenerative agriculture studies and investigation of carbon sequestration opportunities in the Palo Verde Valley (CAP measure CS-2) that would involve the use of small plots of existing agricultural land to study how current conventional agricultural practices may benefit from regenerative land management practices, including reduced soil loss, increased soil health, and reduced time, labor, and fuel use. Carbon sequestration and carbon capture pilot projects in the Sacramento-San Joaquin Delta (CAP measure CS-3) would utilize small plots of land to study how to improve soil health and reduce soil erosion, while protecting the Delta Islands from the impacts of climate change.

Individual projects under the proposed CAP would not convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland) to nonagricultural use or conflict with a Williamson Act contract. As discussed above, most projects to be implemented under the proposed CAP would occur at existing Metropolitan facilities and would not result in direct or indirect farmland or forestland conversion. Proposed activities that may occur on farmland pursuant to CAP measure CS-2 would involve the study of regenerative agricultural practices that would improve farming practices, reduce soil loss, and increase soil health to improve current farming practices and would not, therefore, conflict with land zoned for agricultural use or Williamson Act contracts. Proposed studies associated with CAP measure CS-3 would include carbon sequestration and carbon capture pilot programs on the Delta Islands aimed at reducing soil loss by studying the use of cover crops or planting tules at the margins of the islands and unfarmable areas to protect the islands from sea level rise while providing habitat for aquatic and avian species. The proposed CAP does not include construction of commercial or residential land uses on existing agricultural sites that would substantially preclude future agricultural use or productivity of such sites.

The proposed CAP does not include measures that would add new homes, businesses, or large increases in employment that would trigger expansion of development into agricultural or forested areas. Thus, the proposed program activities would not result in the loss of forest land or conflict with existing zoning for forest land, timberland, or timberland production or involve other changes in the existing environment that would result in conversion of farmland to non-agricultural use or conversion of forest land to non-forest use. Therefore, no impact related to farmland, Williamson Act contracts, forest land, and associated agricultural resources would occur, and no mitigation would be required.

5.3 Energy

Pursuant to Appendix G of the *State CEQA Guidelines*, a potentially significant impact to energy would occur if implementation of the proposed program would:

- Result in wasteful, inefficient, or unnecessary consumption of energy resources, during project construction or operation; or
- Conflict with or obstruct a state or local plan for renewable energy or energy efficiency.

Construction associated with specific individual projects under the proposed CAP would result in short-term energy consumption. Short-term energy consumption includes consumption of petroleum-

based fuels used to power off-road construction equipment on individual project sites, worker travel to and from construction sites, and vehicles used to deliver construction materials to project sites during construction activities. Construction activities would be required to comply with all applicable regulations limiting wasteful or inefficient energy use, including compliance with the CARB In-Use Off-Road Diesel-Fueled Fleets Regulation, which imposes limits on idling and restricts the use of older, less fuel-efficient equipment. Compliance would reduce fuel consumption and lead to the use of more fuel-efficient vehicles and equipment on construction sites. Construction equipment would be maintained to applicable standards, and construction activity and associated fuel consumption and energy use would be temporary. In addition to Metropolitan's standard Environmental Requirements for Construction, Metropolitan implements environmental requirements for construction projects that are detailed in Metropolitan's engineering project specification package, which includes specific practices for contractors to implement during construction to reduce or avoid impacts to the environment, including limitations on engine idling to reduce unnecessary fuel consumption and emissions (refer to Chapter 2, *Project Description,* for more details).

As described in Chapter 2, *Project Description,* many of the individual projects under the proposed CAP would improve energy efficiency, increase procurement of renewable energy, and promote energy conservation. CAP measures include efforts to promote energy conservation at existing and planned Metropolitan facilities (CAP measures EE-1 through EE-5); reduce generated waste and increase waste diversion (CAP measures WA-1 through WA-4); encourage use of alternative transportation, alternative fuel types, and electric vehicles (CAP measures EC-1 through EC-6); and promote water conservation (CAP measures WC-1 through WC-6). The CAP promotes energy efficiency and, therefore, would not result in wasteful, inefficient, or unnecessary consumption of energy resources.

The proposed CAP itself is a plan that will enable Metropolitan to meet specific GHG reduction goals by increasing the use of renewable energy and promoting energy efficiency. As discussed above, the CAP includes various GHG reduction measures focused on improving energy efficiency and increasing procurement of renewable energy (e.g., CAP measures DC-2, E-1 through E-5, and EE-1 through EE-5). The CAP includes the proposed construction and operation of BESS facilities under CAP measure E-4 that will store renewable energy during peak periods and discharge that energy during periods when renewable energy may not be available. These facilities will be used to power existing or future Metropolitan facilities. Furthermore, SB 100 mandates 100 percent clean electricity for California by 2045. Future infrastructure projects would be connected to the existing electricity grid and would eventually be powered by renewable energy pursuant to SB 100 requirements. Therefore, the CAP would not conflict with or obstruct implementation of any state plan for renewable energy or energy efficiency and no impact would occur.

5.4 Geology and Soils

Pursuant to Appendix G of the *State CEQA Guidelines*, a potentially significant impact on geology and soils would occur if the proposed program would:

- Directly or indirectly cause potential substantial adverse effects, including the risk of loss, injury, or death involving:
    - Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault. Refer to Division of Mines and Geology Special Publication 42;
    - Strong seismic ground shaking;

- Seismic-related ground failure, including liquefaction;
- Landslides; or
- Result in substantial soil erosion or the loss of topsoil; or
- Be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction or collapse; or
- Be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial direct or indirect risks to life or property; or
- Have soils incapable of adequately supporting the use of septic tanks or alternative wastewater disposal systems where sewers are not available for the disposal of wastewater; or
- Directly or indirectly destroy a unique paleontological resource or site or unique geologic feature.

Projects associated with implementation of the proposed CAP would be located within existing Metropolitan facilities. Of the facilities described in Chapter 2, *Project Description*, only portions of the Jensen WTP are located within or adjacent to a fault zone. Portions of the Jensen, Diemer, and Skinner WTPs are located within liquefaction and landslide hazard zones, and the Webb and Holland Tracts in the Sacramento-San Joaquin River Delta are located within a liquefaction hazard zone[25]. As such, the probability of damage to facilities from significant nearby surface fault rupture, seismic-related ground failure, or landslides is considered moderate to high. However, projects covered under the CAP involve the installation of small structures (such as BESS facilities; CAP measure E-4), replacing or refurbishing old or outdated equipment (CAP measures EE-4a through EE-4d), and the installation of new infrastructure to support zero-emission vehicles (CAP measure FL-4 and Cap measure EC-3). Design of the proposed projects would be developed in accordance with California Building Code (CBC) standards for seismic stability. None of the proposed projects would include the development of structures for human occupancy that would occur within 50 feet of an identified fault. Any proposed new structures that would be located on sites with liquefiable soils or at risk of landslides would similarly be constructed in accordance with the requirements of the CBC, which specifies foundation and other construction requirements for sites with unstable soils, as well as project-specific recommendations from any applicable geotechnical studies completed. If structures are proposed in areas subject to liquefaction or earthquake induced landslides, compliance with the applicable regulatory requirements and project-specific geotechnical recommendations would reduce the potential for adverse effects. Therefore, individual projects to be implemented under the CAP would not directly or indirectly cause potential substantial adverse effects, including the risk of loss, injury, or death involving strong seismic shaking, liquefaction, or landslides. Impacts associated with earthquakes, seismic shaking, landslides, liquefaction, and expansive soils would be less than significant and no mitigation would be required.

While proposed construction activities could result in loss of topsoil or soil erosion, the implementation of BMPs, including a SWPPP would be required for sediment and erosion control, pollutant treatment, outlet protection, and general site management, and coverage under the National Pollutant Discharge Elimination System Construction General Permit would be required when construction would disturb an area greater than one acre in size. These standard measures would ensure that construction activities do not result in a substantial loss of topsoil or erosion. Implementation of other proposed CAP projects, such as regenerative agricultural practices and cover cropping conducted as part of carbon capture and sequestration initiatives (CAP measures CS-1

[25] Bouldin Island, Bacon Island, and land within the Palo Verde Valley are not located within a fault zone and have not been evaluated for liquefaction or landslide hazards.

through CS-3), would have the added benefit of reducing erosion and topsoil loss relative to traditional, intensive agricultural practices; therefore, loss of topsoil or soil erosion would be less than significant and no mitigation would be required.

None of the projects associated with the CAP would require the installation of a septic system or alternative wastewater disposal systems, therefore no impact would occur.

Paleontological resources, or fossils, are the evidence of once-living organisms preserved in the rock record. They include both the fossilized remains of ancient plants and animals and the traces thereof (e.g., trackways, imprints, burrows, etc.). Paleontological resources are not found in "soil" but are contained within the geologic deposits or bedrock that underlies the soil layer. The Plan Area spans six of the eleven major geomorphic provinces in California: the Great Central Valley, Basin and Range, Mojave Desert, Colorado Desert, Transverse Ranges, and Peninsular Ranges (California Geological Survey 2002). Each geomorphic province has its own unique geologic history, lithology, and potential to yield paleontological resources.

Paleontological sensitivity refers to the potential for a geologic unit to produce scientifically significant fossils. Sensitivity is determined by rock type, preservation potential (i.e., likelihood) of the geologic unit to yield significant fossils, and fossil localities recorded from that unit, if any. In general, ground disturbing activities located in areas of high paleontological sensitivity have the potential to damage or destroy a unique paleontological resource or site or unique geologic feature, if any such resources or features are present. Direct impacts to paleontological resources occur when earthwork activities, such as grading or trenching, cut into the geologic deposits within which fossils are buried and physically destroy the fossils. Since fossils are the remains of prehistoric animal and plant life, they are considered to be nonrenewable resources.

There are numerous paleontological resources known to occur within the Plan Area; however, assessing the unit-specific potential to yield sensitive paleontological resources for all geologic units present within the Plan Area is beyond the scope of this programmatic analysis. Regionally, the surface geology with the Plan Area includes a large number of igneous, metamorphic, and sedimentary units, with a corresponding paleontological sensitivity that ranges from no potential to high potential for containing significant non-renewable fossiliferous resources (Society of Vertebrate Paleontology 2010). However, most of the individual projects to be implemented under the CAP would be located at existing Metropolitan facilities that are currently heavily disturbed due to existing water infrastructure and its appurtenant development. For projects proposed in the CAP, excavation and/or grading activities would be shallow in nature and would occur in mostly previously disturbed areas. Planned studies in the Palo Verde Valley (CAP measure CS-2) and the San Joaquin-Sacramento Delta Islands (CAP measure CS-3) would occur on existing agricultural lands or would require ground disturbing activities on previously disturbed agricultural land. Activities under these CAP measures would be consistent with existing ground disturbance associated with the ongoing agricultural use of the area. Furthermore, in addition to Metropolitan's standard Environmental Requirements for Construction, Metropolitan implements environmental requirements for construction projects that are detailed in Metropolitan's engineering project specification package which includes specific practices for contractors to implement during construction to reduce or avoid impacts to the environment, including cessation of construction within 50 feet of an unplanned discovery, protection of the discovery area, and evaluation of the discovery by a qualified paleontologist (refer to Chapter 2, *Project Description,* for more details). Therefore, construction and post-construction activities involving trenching, excavation, or other ground disturbance for the proposed CAP projects would be located in previously disturbed areas and would have low potential to adversely impact paleontological resources. Given the location and nature of the individual projects proposed under the CAP and Metropolitan's standard project specifications, impacts to paleontological resources would be less than significant and no mitigation would be required.

5.5 Greenhouse Gases

Pursuant to Appendix G of the *State CEQA Guidelines*, a potentially significant GHG impact would occur if implementation of the proposed program would:

- Generate GHG emissions, either directly or indirectly, that may have a significant impact on the environment; or
- Conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing the emissions of GHGs.

Construction associated with individual projects proposed under the CAP would result in short-term increases of GHG emissions due to combustion of petroleum-based fuels, such as fuels used to power off-road construction equipment on individual project sites, fuel consumed from construction worker travel to and from project sites, and vendor vehicles used to deliver materials to sites. However, these short-term emissions would be balanced against long-term GHG emissions reductions that would be realized as a result of program measure implementation. It should be noted that construction GHG emissions were accounted for in the GHG forecast prepared for the CAP, on which the carbon budget is based. Projects under the proposed CAP are intended to increase the purchase of renewable energy (CAP measure E-3), develop battery storage (CAP measure E-4), identify carbon sequestration opportunities (CAP measures CS-1 through CS-3), increase CRA pump efficiency (CAP measures EE-4a through EE-4d), install recycled water infrastructure (CAP measure WC-6), and increase water conservation and waste diversion (CAP measures WC-1 through WC-6 and WA-1 through WA-4), which would result in a net decrease in overall GHG emissions. Furthermore, as discussed above under Section 5.3, *Energy*, construction activities would be subject to applicable state regulations and Metropolitan specifications intended to improve construction fleet efficiency through equipment idling restrictions and decommissioning of older, less efficient engines.

Post-construction implementation of the proposed CAP would result in a long-term reduction in Metropolitan's GHG emissions, as the CAP itself is a plan adopted for the purpose of reducing emissions of GHGs. As discussed in detail in Chapter 2, *Project Description*, the CAP adopts a per capita emissions reduction target intended to achieve carbon neutrality by 2045 using a carbon budget tracking mechanism. This reduction target is more aggressive than the emissions reduction target established by SB 32 (40 percent below 1990 levels by 2030, adopted in 2006) and consistent with the goal of carbon neutrality by 2045 established by Executive Order B-55-18. As such, the proposed CAP would not generate GHG emissions, either directly or indirectly, that may have a significant impact on the environment and would not conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing GHG emissions. The proposed program would result in a beneficial impact with respect to GHG and therefore, no impact would occur.

5.6 Hazards and Hazardous Materials

Pursuant to Appendix G of the *State CEQA Guidelines*, a potentially significant hazards and hazardous materials impact would occur if implementation of the proposed program would:

- Create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials; or
- Create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment; or

- Emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school; or
- Be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, create a significant hazard to the public or the environment; or
- For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, result in a safety hazard or excessive noise for people residing or working in the project area; or
- Impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan; or
- Expose people, structures, either directly or indirectly, to a significant risk or loss, injury or death involving wildland fires.

Construction and operation of the proposed projects under the CAP would temporarily require the routine transport, use, storage, and disposal of hazardous materials and petroleum products (i.e., diesel fuel, lubricants, paints and solvents, and cement products potentially containing strong alkali or acidic chemicals) that are commonly used during construction and operational activities. Several federal and state laws regulate the routine use, transport, storage, and disposal of hazardous materials to minimize potential health risks, including the Toxic Substance Control Act, Resource Conservation and Recovery Act (RCRA), U.S. Department of Transportation (DOT) regulations, California Health and Safety Code (CHSC), Unified Program, and the California Hazardous Waste Control Act.

All individual projects to be implemented under the proposed CAP would be required to comply with applicable federal, state, and local regulatory requirements. Furthermore, Metropolitan's standard construction practices would ensure that all materials are stored safely within the project footprint. BMPs required pursuant to Metropolitan's standard construction specifications include the designation of special storage areas and labeling, containment berms, coverage from rain, and use of concrete washout areas. In addition to Metropolitan's standard Environmental Requirements for Construction, Metropolitan implements environmental requirements for construction projects that are detailed in Metropolitan's engineering project specification package which includes specific practices for contractors to implement during construction to reduce or avoid impacts to the environment, including implementation of drip pans below stationary equipment, proper storage and covering of stockpiled debris and soils, proper cleanup of spills in accordance with environmental regulations, and proper storage of all hazardous materials pursuant to state and federal requirements (refer to Chapter 2, *Project Description*, for more details). Finally, development and implementation of a Water Pollution Control Plan (WPCP) in accordance with the RWQCB guidance would be required during construction of individual projects under the CAP and would comply with local, state, and federal regulations. As such, the proposed program would not create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials and no reasonably foreseeable upset or accident conditions involving the release of hazardous substances used during construction are anticipated. Because construction activities would comply with federal, state, or local laws, standards, or requirements, impacts related to hazardous materials associated with construction of the proposed GHG emissions reduction measures would be less than significant and no mitigation would be required.

As described in Chapter 2, *Project Description*, individual projects that may be implemented under the proposed CAP are primarily located within existing Metropolitan facilities; however, schools are located within one-quarter mile of some proposed project locations. Table 35 lists schools located within one-quarter mile of potential project locations. For some GHG emissions reduction measures, construction, operation, and maintenance activities associated with implementation of the CAP would

require the handling of small quantities of hazardous materials as described above. The potential for accidental releases of hazardous materials, primarily fuel and lubricants from equipment fuel leaks and spills, could result from construction and maintenance activities. However, the small quantities of hazardous materials that would be handled would not create an impact to nearby schools. Additionally, none of the projects proposed under the CAP would use or generate acutely hazardous materials. Multiple local and state regulations require a discretionary process that results in the consultation of databases which store information related to contaminated sites, soils testing of potential project sites, project-level environmental assessments before grading, and compliance with various regulations which heavily restrict the use and storage of hazardous materials within one-quarter mile of a school. While grading and site preparation activities have the potential to pose health concerns to workers and nearby sensitive receptors, including schools, none of the projects are located near known hazardous waste clean-up sites or leaking underground storage sites within one-quarter mile of a school. Implementation of the GHG emissions reduction measures would comply with all applicable federal, state, and local laws, standards, and requirements regarding the handling of hazardous materials. Therefore, the impact would be less than significant, and no mitigation would be required.

Table 35 Schools within One-Quarter Mile of a Proposed Project Location

Metropolitan Facility	School Facility	Address
Weymouth WTP	Grace Miller Elementary School	1629 Holly Oak Street, La Verne
Weymouth WTP	Calvary Baptist School	2990 Damien Avenue, La Verne
Weymouth WTP	La Verne Parent Participation Preschool	909 Juanita Avenue, La Verne
Weymouth WTP	La Verne KinderCare	3602 Wheeler Avenue, La Verne
Weymouth WTP	Damien High School	2280 Damien Avenue, La Verne
Weymouth WTP	Ramona Middle School	3490 Ramona Avenue, La Verne
Weymouth WTP	Ramona Avenue Christian Church	909 E. Juanita Avenue, La Verne
Weymouth WTP	Joan Macy School	1350 3rd Street, La Verne
Jensen WTP	Van Gogh Charter School	17160 Van Gogh Street, Granada Hills

Because of the size of the Plan Area, there are numerous existing contaminated sites within the Plan Area listed in the Department of Toxic Substances Control's EnviroStor and the SWRCB's Geotracker databases, including Metropolitan's existing Skinner, Weymouth, and Diemer WTP facilities. However, all of these Metropolitan facilities are listed as case closed following necessary remediation actions. As such, none of the proposed project locations would be located on a site that is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and expected to create a significant hazard to the public or the environment as a result. Therefore, this impact would be less than significant.

As discussed in Chapter 2*, Project Description*, several GHG emissions reduction measures may require construction, demolition, excavation and/or renovation activities. Most of these projects would be completed within existing Metropolitan facilities that currently comply with any applicable airport land use plans. Of the individual project locations identified in Chapter 2, *Project Description*, only Weymouth WTP is located within the airport influence area of an existing airport (Brackett Field Airport; Los Angeles County Airport Land Use Commission 2015). The proposed CAP projects do not include construction of residential or other sensitive land uses that would result in exposure of people residing or working in the project area to excessive noise or safety hazards. Any proposed GHG emissions reduction projects in proximity to existing public use airports or private airstrips would be required to comply with applicable federal, state, and local aviation safety requirements,

including the facility's airport land use compatibility plan. Because projects covered under the proposed CAP would comply with applicable regulations, impacts associated with aviation hazards would be less than significant and no mitigation would be required.

Finally, most of the proposed projects to be implemented under the CAP would be completed within existing Metropolitan facilities and would not require street modifications such as road widening that would interfere with an adopted emergency response or evacuation plan. Other proposed projects, such as implementation of regenerative agricultural practices on agricultural lands in the Palo Verde Valley and Delta Islands pursuant to CAP measures CS-1 through CS-3, would involve similar land uses to those already occurring on these agricultural sites. Given that individual projects would generally either occur within the footprints of existing, developed Metropolitan facilities or involve similar land uses to those already occurring on individual project sites, construction and operation of the proposed CAP projects are unlikely to require closure of roadways, travel lanes, or create other impediments to emergency access, response, or evacuation. Implementation of the proposed CAP measures would not conflict or interfere with emergency response plans. Therefore, impacts would be less than significant and no mitigation would be required.

For discussion of potential impacts related to wildland fire, refer to Section 5.15, *Wildfire*.

5.7 Hydrology and Water Quality

Pursuant to Appendix G of the *State CEQA Guidelines*, a potentially significant hydrology impact would occur if implementation of the proposed program would:

- Violate any water quality standards or waste discharge requirements or otherwise substantially degrade surface groundwater quality; or
- Substantially decrease groundwater supplies or interfere substantially with groundwater recharge such that the project may impede sustainable groundwater management of the basin; or
- Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner which would:
    - Result in substantial erosion or siltation on- or off-site;
    - Substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or off-site;
    - Create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff;
    - Impede or redirect flood flows; or
- In flood hazard, tsunami, or seiche zones, risk release of pollutants due to project inundation; or
- Conflict with or obstruct implementation of a water quality control plan or sustainable groundwater management plan.

Individual projects implemented under the proposed CAP would generally be located at existing, developed Metropolitan facilities. As such, these projects would not result in substantial changes to drainage patterns resulting in siltation, erosion, runoff, or flooding. Individual project construction may result in minor ground disturbance, which has the potential to result in water quality impacts due to soil erosion and pollutant runoff during construction activities. Where the anticipated total disturbance for a project would be greater than one acre, coverage under the statewide Construction General Permit (SWRCB Water Quality Order 2009-0009-DWQ) would be fulfilled by compliance

with the Construction General Permit and SWPPP implementation. The SWPPP would include project-specific BMPs to control erosion, sedimentation, and release of hazardous materials from construction sites into surface waters. Additionally, project-construction BMPs and the SWPPP would be updated and amended, as necessary, during construction to ensure adequate compliance due to changes to the construction site conditions. In addition, the SWPPP must identify the following: equipment storage, cleaning, and maintenance areas/activities; points of ingress and egress to the construction site; material loading, unloading, and storage practices and areas, including construction materials, building materials, and waste materials; and materials, equipment, or vehicles that may come in contact with stormwater. Implementation of these measures would prevent excavated soils, construction materials, or debris from being transported to receiving waters.

As described in Chapter 2, *Project Description,* Metropolitan's standard construction specifications for all construction activities prohibit contractors from violating any applicable water quality standards for receiving waters associated with waste storage, and require use of drip pans, secondary containment, and prohibit storage of equipment within drainage channels. Furthermore, carbon capture and sequestration initiatives, such as regenerative agricultural practices implemented pursuant to CAP measures CS-1 through CS-3, may result in water quality benefits by promoting vegetation cover (i.e., cover crops) on agricultural land. Given the nature of individual projects under the proposed CAP and compliance with existing regulations, implementation of the CAP would not result in violation of water quality standards, degradation of groundwater or surface water quality, or substantial alterations to drainage patterns. Therefore, such impacts would be less than significant and no mitigation would be required.

Individual projects that may involve placement of structures, such as BESS projects implemented pursuant to the proposed CAP measure E-4, would be located at existing Metropolitan facilities. None of the facilities where BESS projects are proposed, as identified in Chapter 2, *Project Description*, are located within a flood, tsunami, or seiche hazard zone and, therefore, these projects would not risk release of pollutants due to inundation. Other projects under the proposed CAP, such as electrification or infrastructure efficiency improvements (e.g., CAP measures EE-4a through EE-4d), would also occur at existing Metropolitan facilities. These projects would not require the use of acutely hazardous pollutants that could be released in the event of inundation.

As discussed above, projects implemented under the CAP would occur primarily at existing Metropolitan facilities. They would not substantially increase impervious surface cover in a manner that would substantially impede groundwater recharge. Furthermore, the CAP does not involve any projects that would directly or indirectly increase water demand that could decrease groundwater supplies. Given the analysis above, impacts related to floods, tsunami, seiche, and groundwater impacts associated with hydrology and water quality would be less than significant and no mitigation would be required.

5.8 Land Use and Planning

Pursuant to Appendix G of the *State CEQA Guidelines*, a potentially significant land use and planning impact would occur if implementation of the proposed program would:

- Physically divide an established community; or
- Cause a significant environmental impact due to a conflict with any land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect.

Implementation of individual projects under the proposed CAP would not result in land use and planning conflicts. Individual projects under the CAP include electrification (CAP measure DC-2), BESS (CAP measure E-4), and infrastructure efficiency improvements (CAP measures EE-4a

through EE-4d) at existing Metropolitan facilities and carbon capture and sequestration projects on agricultural land owned by Metropolitan (CAP measures CS-1 through CS-3). Existing facilities owned and operated by Metropolitan are currently developed with water and energy infrastructure, and agricultural land owned by Metropolitan proposed for carbon capture and sequestration projects is surrounded by existing agricultural land. Because projects would occur at facilities on land currently owned by Metropolitan and the nature of individual proposed projects would be consistent with the current land use at these locations, the proposed CAP would not physically divide an established community or cause a significant environmental impact due to a conflict with any land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect. Therefore, there are no impacts associated with land use and planning and no mitigation would be required.

5.9 Mineral Resources

Pursuant to Appendix G of the *State CEQA Guidelines*, a potentially significant mineral resources impact would occur if implementation of the proposed program would:

- Result in the loss of availability of a known mineral resource that would be of value to the region and the residents of the state; or
- Result in the loss of availability of a locally important mineral resources recovery site delineated on a local general plan, specific plan, or other land use plan.

Mineral resources found in the Plan Area include construction aggregate (sand, gravel, and crushed stone), clay, and petroleum. The Surface Mining and Reclamation Act of 1975 requires policy makers to consider mineral resource recovery areas that have been designated Mineral Resource Zone (MRZ)-2, which indicates significant mineral deposits are present or likely to be present. Furthermore, many local jurisdictions have general plan policies in place that provide oversight and management of mineral resources. Implementation of some of the proposed GHG reduction measures would necessitate earth moving or ground disturbing activities, the removal or installation of facilities and infrastructure, or placement of permanent structures. However, proposed new structures (e.g., BESS facilities constructed pursuant to CAP measure E-4) and other potential infrastructure improvements would be located at existing Metropolitan facilities, which are already developed with water treatment and conveyance infrastructure. These projects would not result in expansion of the footprints of existing Metropolitan facilities, would not convert land uses, and would not impact the availability of a known mineral resource. Other potential projects under the CAP would include carbon capture and sequestration projects on land currently in agricultural production (CAP measures CS-1 through CS-3). The proposed land use and extent of ground disturbance associated with these projects would be consistent with the current conditions at these agricultural sites. As such, individual projects under the proposed CAP would not damage or otherwise preclude access to mineral resources in the Plan Area beyond current conditions.

Implementation of individual projects under the proposed CAP would not result in the loss of availability of mineral resources that are of value to the region, to the residents of the state, or identified in any local jurisdiction’s land use plans. No impact to mineral resources would occur, and no mitigation would be required.

5.10 Population and Housing

Pursuant to Appendix G of the *State CEQA Guidelines*, a potentially significant impact to population and housing would occur if implementation of the proposed program would:

- Induce substantial unplanned population growth in an area either directly (for example, by proposing new homes and businesses) or indirectly (for example, through extension of roads or other infrastructure); or
- Displace substantial numbers of existing people or housing, necessitating the construction of replacement housing elsewhere.

Implementation of individual projects under the proposed CAP would not induce population growth directly or indirectly, remove existing housing, or displace existing populations because the CAP does not propose changes to policies related to land use or residential zoning. Construction activities for individual proposed projects would be temporary in nature and would require mobilization of construction crews to individual project sites. However, it is anticipated that construction labor would be sourced from the local/regional labor pool and would not result in substantial population growth in the Plan Area.

Operation of individual projects, such as BESS facilities pursuant to CAP measure E-4 or retrofitting and installing new equipment pursuant to CAP measures EE-4a through EE-4d, generally would not have a population-generating component and would not be expected to substantially increase population in the Plan Area. The proposed CAP does not include measures that would propose new homes or businesses, nor would projects require large increases in employment.

The proposed CAP would include projects on Metropolitan's existing facilities located throughout the Plan Area. Therefore, implementation of proposed CAP projects would not induce substantial unplanned population growth either directly or indirectly, nor displace substantial numbers of existing people or housing, thus there is no impact to population and housing associated with projects implemented under the proposed program, and no mitigation would be required.

5.11 Public Services

Pursuant to Appendix G of the *State CEQA Guidelines*, the proposed program would have a potentially significant impact on public services if it would:

- Result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities or need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for any of the following public services:
- Fire protection;
- Police protection;
- Schools;
- Parks; or
- Other public facilities.

Construction associated with individual projects proposed under the CAP would be temporary in nature and would involve mobilization of construction crews to project construction sites throughout

the Plan Area. It is anticipated that construction labor would be sourced from a local/regional labor pool. Future projects proposed under the CAP would not require the long-term relocation of workers or families that would increase demand on public services or increase in police or fire protection response times near construction sites. It is possible that construction activities may require temporary relocation of construction workers, such as projects occurring in more remote sites (e.g., desert locations) of the Plan Area. However, such relocation would be temporary in nature and not of a scale expected to result in an increased demand for public services necessitating new or physically altered facilities. As such, there would be no impact from construction to public services.

As described in Section 5.10, *Population and Housing*, the proposed CAP would not result in substantial population growth in the Plan Area. Post-construction implementation of proposed individual projects, such as operation of BESS projects (CAP measure E-4) and retrofitting and installing new equipment (CAP measures EE-4a through EE-4d), would not result in substantial population growth that would require the provision of new public services or physically altered government facilities because these projects do not have a population-generating component. If needed, minor increases in employment needed for operation and maintenance of new or improved infrastructure would not be expected to result in substantial population growth in the Plan Area, as such employment would generally be expected to be sourced from the regional labor pool. Based on the analysis above, construction and operation of individual projects under the proposed CAP would not result in a need for new police and fire protection facilities, schools, parks, or other public facilities that may result in significant environmental impacts. Therefore, there would be no impact related to governmental facilities such as police and fire protection, schools, and parks associated with public services, and no mitigation would be required.

5.12 Recreation

Pursuant to Appendix G of the *State CEQA Guidelines*, the proposed program would have a potentially significant impact on recreation if it would:

- Increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated; or
- Include recreational facilities or require the construction or expansion of recreational facilities which might have an adverse physical effect on the environment.

The projects proposed under the CAP would not increase the use of existing neighborhood or regional parks or other recreational facilities. As described in Section 5.11, *Public Services*, construction activities for projects under the CAP may result in a temporary increase in employment associated with construction workers at individual project sites. However, construction labor would generally be sourced locally or regionally and would not result in long-term relocation of construction workers that would increase the use of existing recreational facilities. Given the nature of projects under the CAP, any temporary increase in the use of neighborhood or regional parks or other recreational facilities resulting from construction workers would not be of a scale to result in substantial physical deterioration to such facilities.

Further, as discussed in Section 5.10, *Population and Housing*, post-construction implementation of the CAP would not result in substantial population growth in the Plan Area. As such, the program would not increase the use of existing neighborhood and regional parks or other recreational facilities in the Plan Area. Potential impacts related to parks and recreational facilities associated with recreation resources would be less than significant and no mitigation would be required.

5.13 Transportation

Pursuant to Appendix G of the *State CEQA Guidelines*, the proposed program would have a potentially significant impact on transportation if it would:

- Conflict with a program, plan, ordinance or policy addressing the circulation system, including transit, roadway, bicycle, and pedestrian facilities; or
- Conflict or be inconsistent with CEQA Guidelines Section 15064.3, subdivision (b); or
- Substantially increase hazards due to a geometric design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment); or
- Result in inadequate emergency access.

As discussed in Section 5.10, *Population and Housing*, and Section 5.11, *Public Services,* proposed projects to be implemented under the CAP would be located at existing Metropolitan facilities throughout the Plan Area. Construction activities for individual projects implemented under the proposed program would be temporary in nature and would require mobilization of construction crews to individual project sites. It is anticipated that construction labor would be sourced from the local/regional labor pool. Operation of individual projects, such as BESS facilities pursuant to CAP measure E-4 or retrofitting and installing new equipment pursuant to CAP measures EE-4a through EE-4d, generally would not be expected to substantially increase employment to operate the proposed project. Studies proposed under CAP measure CS-2 and CS-3 would be small in nature and would not require substantial travel to and from the study sites. The CAP does not include measures that would propose new homes or businesses that would result in a substantial increase in vehicle miles travelled (VMT). Given the relatively small nature of the projects proposed under the CAP, VMT during construction and operation of the proposed projects are not expected to increase substantially.

Construction trips for individual projects that may be implemented under the proposed CAP can be estimated using established criteria for estimating worker and delivery trips by construction workers and vendors (e.g., material delivery, concrete truck, water truck)[26] using CalEEMod, which is also used for analyzing potential air quality impacts. Construction trips for example projects of similar sizes to those of representative projects proposed under the CAP, such as the construction of the BESS facilities (CAP measure E-4) are shown in Table 36.

Table 36 Construction Trips Associated with Example Projects

	Number of Daily One-Way Trips[1]	
Phase	**1-Acre Project**	**5-Acre Project**
Demolition	10 worker trips	16 worker trips
Site Preparation	6 worker trips	18 worker trips
Grading	10 worker trips	16 worker trips
Building Construction[2]	18 worker trips 8 vendor trips	92 worker trips 36 vendor trips
Paving	18 worker trips	20 worker trips
Architectural Coating	18 worker trips	92 worker trips

[1] Based on CalEEMod methodology, the number of construction worker trips for the demolition, site preparation, grading, and paving phases assumes 1.25 construction workers (or 2.5 daily one-way construction worker trips) per piece of construction equipment. For the building construction and architectural coating phases for commercial and industrial land uses, the number of construction worker trips assumes 0.42 daily one-way trips per 1,000 square feet and the number of vendor trips assumes 0.1639 daily one-way vendor trips per 1,000 square feet.

[2] Vendor trips include material delivery, concrete, and water trucks.

Source: California Air Pollution Control Officers Association 2017

[26] Given the nature of the proposed CAP measures, it is not anticipated that substantial soil import or export would be required.

As shown in Table 36, construction trips for "typical" construction activities would represent a negligible increase in daily traffic volumes in areas surrounding existing and potential future Metropolitan facilities where the majority of proposed individual CAP projects would be implemented (such as the locations of the proposed BESS projects at Metropolitan facilities in the cities of Los Angeles and La Verne; and unincorporated Riverside County pursuant to CAP measure E-4). Furthermore, individual projects proposed under the CAP would be located at existing Metropolitan facilities and would not be expected to require partial or full closures of public roadways. Therefore, construction activities associated with proposed individual projects would not conflict with an applicable plan, ordinance, or policy addressing the circulation system, including transit, roadway, bicycle, and pedestrian facilities; substantially increase hazards due to a geometric design feature or incompatible uses; or result in inadequate emergency access. Construction-related impacts to the transportation network would be less than significant and no mitigation would be required.

During operation, traffic generated by proposed individual projects would include minimal employee maintenance, repair, and inspection trips (approximately two to 10 daily trips on days when maintenance, repair, or inspection is required). However, many program activities are anticipated to occur at existing Metropolitan facilities where maintenance trips to these existing facilities are already occurring. Furthermore, maintenance activities would likely be conducted on a monthly or weekly basis, rather than a daily basis. As a result, individual projects under the CAP would not substantially increase the number of required maintenance trips. Therefore, operation of the proposed program would not conflict with an applicable plan, ordinance, or policy addressing the circulation system, including transit, roadway, bicycle, and pedestrian facilities. In addition, implementation of the proposed CAP would not result in any permanent alterations to existing roadway alignments or intersections that could create a traffic hazard, incompatible use, or limit emergency access. Furthermore, as described in Chapter 2, *Project Description*, several of the proposed CAP measures would reduce vehicle trips including, but not limited to, expanding the subsidized transit commute program (CAP measure EC-1), providing employee education programs on public transportation and vanpools (CAP measure EC-2), incentivizing use of alternative transportation (CAP measure EC-4), and facilitating alternative work schedules (e.g., telecommuting and flexible schedules; CAP measure EC-5). Therefore, post-construction impacts to the transportation network would be less than significant and no mitigation would be required.

CEQA Guidelines Section 15064.3(b) identifies criteria for evaluating transportation impacts using VMT. VMT is a measurement of miles traveled by vehicles within a specified area over a specific time period. Unlike level of service, VMT does not measure delay or traffic congestion levels. Specifically, the guidelines state VMT exceeding an applicable threshold of significance may indicate a significant impact. According to CEQA Guidelines Section 15064.3(b)(3), a lead agency may include a qualitative analysis of operational and construction traffic. Currently, official measures and significance thresholds related to VMT are still being developed and have not yet been adopted by Metropolitan. A VMT calculation is typically conducted on a daily or annual basis, for long-range planning purposes. As discussed above, traffic on local roadways would be temporarily increased during construction of individual projects due to construction worker and vendor trips. Increases in VMT from construction would be limited to the duration of construction activities and temporary in nature. Because construction would not result in a permanent increase to area VMT and due to the minimal amount of construction work required for individual projects proposed under the CAP, construction crews would likely be locally or regionally sourced, rather than commuting large distances from another region, which would minimize construction-related VMT. Additionally, operation of individual projects under the proposed CAP would also involve minimal employee operations and maintenance trips at existing facilities. Thus, operation of individual projects under the CAP would not be expected to substantially increase VMT associated with travel to and from these facilities. Furthermore, as discussed above, several emissions reduction measures described in

Chapter 2, *Project Description*, would reduce VMT in the Plan Area by encouraging alternative transportation (CAP measure EC-4), telecommuting (CAP measure EC-5), and vanpool commuting options for Metropolitan employees (CAP measure EC-2). Therefore, the proposed program would not substantially increase VMT in the Plan Area. Impacts associated with VMT per CEQA Guidelines Section 15064.3(b) would be less than significant, and no mitigation would be required.

5.14 Utilities and Service Systems

Pursuant to Appendix G of the *State CEQA Guidelines*, the proposed program would have a potentially significant impact on utilities and service systems if it would:

- Require or result in the relocation or construction of new or expanded water, wastewater treatment or stormwater drainage, electric power, natural gas, or telecommunications facilities, the construction or relocation of which could cause significant environmental effects; or
- Have insufficient water supplies available to serve the project and reasonably foreseeable future development during normal, dry, and multiple dry years; or
- Result in a determination by the wastewater treatment provider which serves or may serve the project that it has inadequate capacity to serve the project's projected demand in addition to the provider's existing commitments; or
- Generate solid waste in excess of state or local standards, or in excess of the capacity of local infrastructure, or otherwise impair the attainment of solid waste reduction goals; or
- Not comply with federal, state, and local management and reduction statutes and regulations related to solid waste.

Individual projects under the proposed CAP may involve replacement of existing water infrastructure (i.e., pump refurbishment pursuant to CAP measure EE-4a through EE-4d) or construction of new or expanded electric power infrastructure (i.e., BESS facilities pursuant to CAP measure E-4, EV charging stations pursuant to CAP measure FL-4 and CAP measure EC-3). However, as described in Chapter 2, *Project Description*, these infrastructure improvements would be located at and within the existing footprints of Metropolitan facilities. Furthermore, such improvements would serve to improve the efficiency of Metropolitan's operations by reducing energy consumption and emissions. Individual projects under the proposed CAP would not require new or relocated wastewater treatment, stormwater drainage, natural gas, or telecommunications facilities.

The proposed CAP includes measures intended to increase water conservation, such as turf removal programs and water conservation education (CAP measures WC-1 through WC-6). None of the individual projects to be implemented under the CAP would generate substantial new water demand. As such, there would be sufficient water supplies available to serve these projects and reasonably foreseeable future development during normal, dry, and multiple dry years.

Construction of individual projects under the proposed CAP would result in the temporary generation of solid waste, such as demolition debris. However, impacts to solid waste infrastructure associated with construction activities would be temporary and reduced by compliance with the California Green Building Code and Senate Bill 1016, which require that construction operations recycle a minimum of 50 percent of waste generated. Compliance with this requirement would ensure that solid waste generated from construction of individual projects would be minimized to the extent practical.

Non-diverted waste generated by construction and operation of individual projects would require disposal in area landfills. There are active landfills throughout the Plan Area with substantial remaining capacity for receiving construction waste. These facilities include, but are not limited to,

Scholl Canyon Landfill in Glendale (approximately 9,900,000 cubic yards [cy] remaining capacity), El Sobrante Landfill in Corona (approximately 143,977,170 cy remaining capacity) and Frank R. Bowerman Sanitary Landfill in Irvine (approximately 205,000,000 cy remaining capacity). In addition, AB 939 requires that all California counties provide at least 15 years of ongoing landfill capacity. With this long-range landfill capacity planning, adequate landfill capacity would exist or be constructed to accommodate the solid waste generated by individual projects under the proposed CAP.

Additionally, as described in Chapter 2, *Project Description*, the proposed CAP includes GHG reduction measures that would increase solid waste diversion through partnering programs with municipal waste agencies and reduce the existing solid waste generation from Metropolitan facilities to achieve zero waste (CAP measures WA-1 through WA-4). Implementation of the proposed CAP would have a less than significant impact to utilities and service systems, and no mitigation would be required.

5.15 Wildfire

Pursuant to Appendix G of the *State CEQA Guidelines*, a potentially significant wildfire impact would occur if implementation of the proposed program would, within or near a State Responsibility Area (SRA) or Very High Fire Hazard Severity Zone (FHSZ):

- Substantially impair an adopted emergency response plan or emergency evacuation plan; or
- Due to slope, prevailing winds, and other factors, exacerbate wildfire risks, and thereby expose project occupants to pollutant concentrations from a wildfire or the uncontrolled spread of a wildfire; or
- Require the installation or maintenance of associated infrastructure (such as roads, fuel breaks, emergency water sources, power lines or other utilities) that may exacerbate fire risk or that may result in temporary or ongoing impacts to the environment; or
- Expose people or structures to significant risks, including downslope or downstream flooding or landslides, as a result of runoff, post-fire slope instability, or drainage changes.

In California, responsibility for wildfire prevention and suppression is shared by federal, state, and local agencies. Federal agencies are responsible for federal lands in Federal Responsibility Areas; California has determined that some non-federal lands in unincorporated areas with watershed value are of statewide interest and have classified those lands as SRA, which are managed by the California Department of Forestry and Fire Protection (CAL FIRE). All incorporated areas and other unincorporated lands are classified as Local Responsibility Areas (LRA).

While nearly all of California is subject to some degree of wildfire hazard, there are specific features that make certain areas more hazardous. CAL FIRE is required by PRC Section 4201-4204 and California Government Code Section 51175-89 to map areas of significant fire hazards based on fuels, terrain, weather, and other relevant factors. The primary factors that increase an area's susceptibility to fire hazards include slope, aspect, vegetation type and condition, and atmospheric conditions. CAL FIRE maps fire hazards based on zones, referred to as FHSZs. CAL FIRE maps three zones for SRA: 1) Moderate FHSZ; 2) High FHSZ; and 3) Very High FHSZ. Only the Very High FHSZs are mapped for LRA. Each of the zones influence how people construct buildings and protect property to reduce risk associated with wildfires. Under state regulations, areas within Very High FHSZ must comply with specific building and vegetation management requirements intended to reduce property damage and loss of life within these areas. Figure 17 shows the LRA Very High FHSZ and all FHSZ in SRA within the Plan Area.

Figure 17 Fire Hazard Severity Zones

Additional data provided by USGS, 2017 and CALFIRE, 2007.

Fig 4.15-1 Wildfire Hazard Zones_v2

Individual projects to be implemented under the proposed CAP may include construction of BESS structures at Metropolitan facilities, electrification at existing Metropolitan facilities, and replacement of existing infrastructure. Several existing Metropolitan facilities where proposed CAP projects may be implemented are located within or near LRA Very High FHSZs or SRA of Moderate FHSZ, High FHSZ, and Very High FHSZ. However, as described in Section 5.6, *Hazards and Hazardous Materials*, the proposed projects that may be implemented at these sites would be completed within existing Metropolitan facilities and would not interfere with an adopted emergency response plan or emergency evacuation plan. Should individual projects require temporary roadway or lane closures, Metropolitan's engineering project specifications package requires contractors to prepare a traffic control plan for each construction site in public roadways pursuant to the local and/or state traffic authority's requirements. Therefore, if proposed projects were to encroach upon public roadways, the traffic control plan would implement measures to minimize traffic flow disruption and maintain emergency access routes to the extent feasible during construction. As such, impacts related to impairment of an adopted emergency response or emergency evacuation plan would be less than significant and no mitigation would be required.

Individual projects proposed under the CAP do not include the construction of housing or a substantial increase in total number of employees. Temporary construction employees would be anticipated to be sourced locally or regionally. Therefore, the proposed program would not introduce new permanent residents or permanent employees to sites in the Plan Area. Because there would be no new occupants in the Plan Area as a result of the CAP, the proposed program would not expose project occupants to pollutant concentrations resulting from wildfire. Accordingly, there would be no impact.

Construction of individual projects under the proposed program, including those related to installation of BESS facilities or removal of natural gas infrastructure at existing facilities, would involve the use of construction equipment powered by internal combustion engines. Use of heavy-duty equipment during construction of individual projects under the proposed program may produce sparks with the potential to ignite vegetation. However, California PRC Section 4442 mandates the use of spark arresters, which prevent the emission of flammable debris from exhaust on earth-moving and portable construction equipment with internal combustion engines operating on any forest-covered, brush-covered, or grass-covered land. Furthermore, PRC Sections 4427 and 4431 specify standards for conducting construction activities on days when a burning permit is required (excessive smog or high fire danger), and PRC Section 4428 requires construction contractors to maintain fire suppression equipment during the highest fire danger period (April 1 to December 1) when operating on or near any forest-covered, brush-covered, or grass-covered land. Furthermore, Metropolitan's standard specifications for construction projects require gasoline-powered or diesel-powered machinery used during construction to be equipped with standard exhaust controls and muffling devices that will act as spark arrestors. The specifications also require fire containment and extinguishing equipment to be located on site and remain accessible during construction activities. Construction workers must be trained in the use of fire suppression equipment. Therefore, with compliance with applicable PRC provisions and Metropolitan's standard specifications, construction-related activities for projects implemented under the CAP would not exacerbate wildfire risk. This impact would be less than significant, and no mitigation would be required.

Operation and maintenance of the individual projects constructed under the proposed program would not exacerbate fire risk, as the purpose of maintenance activities is to ensure the proper operation of installed facilities. This includes evaluating and ensuring that equipment is in proper working condition, with a low risk of creating sparks that could start a wildfire.

Projects implemented under the proposed program would be subject to the requirements of the California Fire Code. Chapter 49 of the California Fire Code includes requirements for projects in Wildland-Urban Interface Fire Areas, including hazardous vegetation and fuel management for

buildings and structures in LRA Very High FHSZ or SRA. Some jurisdictions have amended the California Fire Code to adopt more stringent fire-reduction measures. For example, Orange County Fire Authority requires all new buildings in wildfire risk areas to submit a fuel modification plan for approval prior to construction.

Chapter 12 of the California Fire Code includes standards for construction of energy systems, including BESS facilities. Such requirements include minimum separation distances between BESS facilities and buildings or combustible materials and preparation of hazard mitigation analyses at the request of the local fire code official. Compliance with these regulatory requirements would substantially reduce wildfire risk associated with individual projects under the proposed program. This impact would be less than significant, and no mitigation would be required.

As discussed above, construction of individual projects under the proposed CAP would be required to adhere to existing regulations requiring the use of spark arresters on equipment with internal combustion engines, maintenance of fire suppression equipment, and construction standards for days when a burning permit is required. Consequently, construction of individual projects under the proposed program would not be expected to substantially increase wildfire risk, and therefore would not increase exposure of people or structures to post-fire slope instability, landslides, or downstream flooding. This impact would be less than significant, and no mitigation would be required.

Individual projects implemented under the proposed program would not substantially affect slopes, soil stability, or the drainage of sites in the Plan Area, as most would be located at existing Metropolitan facilities which are heavily graded and developed. Individual projects requiring substantial changes to site drainage patterns would be subject to applicable regulations of the SWRCB and RWQCB related to post-construction drainage patterns and stormwater retention, reducing the potential for downstream flooding impacts or drainage changes. Compliance with the California Building Code and implementation of the recommendations of site-specific geotechnical evaluations would reduce risks to people or structures associated with flooding or landslides resulting from post-fire runoff, slope instability, or drainage changes. Therefore, post-construction impacts would be less than significant, and no mitigation would be required.

This page intentionally left blank.

6 Other Required CEQA Discussion

This section discusses other topics for which CEQA requires analysis in addition to the specific resource areas discussed in Chapter 4, *Environmental Impact Analysis*. CEQA requires an EIR to evaluate a project's foreseeable effects in relationship to other broader changes that may be occurring in the environment (*State CEQA Guidelines* Section 15126; PRC Section 21002.1). Accordingly, this chapter includes a discussion of the other CEQA-mandated analyses, including the following:

- Section 6.1, Significant and Unavoidable Environmental Impacts
- Section 6.2, Significant and Irreversible Environmental Impacts
- Section 6.3, Growth Inducement

6.1 Significant and Unavoidable Environmental Impacts

State CEQA Guidelines Sections 15126(b) and 15126.2(c) require an EIR to describe any significant impacts, including those that can be mitigated but not to a less-than-significant level, the implications of any impacts that cannot be avoided and reasons why the project is being proposed, despite these effects.

Due to the lack of project-specific details about the individual projects proposed under the CAP, three resource areas are identified that may have the potential for significant and unavoidable impacts. Implementation of mitigation measures would reduce environmental impacts to the extent feasible; however, due to the lack of project-specific details about the individual projects proposed under the CAP, it is unknown at this time whether the impact can be reduced to less than significant. Therefore, a significant an unavoidable impact has been assumed. Table 37 lists the potential significant and unavoidable impacts, as well as the mitigation measures proposed for each impact (see Section 4.1 *Air Quality,* Section 4.3 *Cultural Resources,* and Section 4.4, *Noise*, for further discussion of each resource area). As proposed projects are implemented under the CAP and project-specific details become available, subsequent CEQA analysis will be conducted at the project level to determine the impact significance level for each resource area.

Table 37 Significant and Unavoidable Impacts and Mitigation Measures

Impact	Significance Before Mitigation	Mitigation	Significance After Mitigation
AQ-A: Would the proposed program conflict with or obstruct implementation of the applicable air quality plan?	Significant	AQ-1: Construction Air Quality Assessment AQ-2: Implement Emissions Reduction Measures	Significant and unavoidable
AQ-B: Would the proposed program result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard?	Significant	AQ-1 and AQ-2	Significant and unavoidable
CUL-A: Would the proposed program cause a substantial adverse change in the significance of a historical resource pursuant to §15064.5?	Significant	CUL-1(a): Built Environment Investigation CUL-1(b): Built Environment Documentation Program CUL-3: Previously Unidentified Resources Encountered During Construction.	Significant and unavoidable
CUL-B: Would the proposed program cause a substantial adverse change in the significance of an archaeological resource as defined in §15064.5?	Significant	CUL-2(a): Phase 1 Archaeological Resource Investigation CUL-2(b): Extended Phase 1 Investigation CUL-2(c): Avoidance of Archaeological Resources CUL-2(d): Phase 2 Archaeological Resources Investigation and Evaluation CUL-2(e): Phase 3 Archaeological Data Recovery Program CUL-2(f): Processing and Curation of Archaeological Materials CUL-2(g): Cultural Resources Monitoring CUL-3: Previously Unidentified Resources Encountered During Construction	Significant and unavoidable
NOI-A: Would the proposed program result in the generation of a substantial temporary or permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?	Significant	NOI-1: Locate Excavation Sites Away from Noise-Sensitive Receivers, Where Feasible NOI-2(a): Conduct Project-Level Noise Studies for Construction Activities Where Noise-Sensitive Receptors are Present NOI-2(b): Implement Noise Reduction Measures NOI-2(c): Conduct Project-Level Noise Studies for Post-Construction Activities Where Noise Sensitive Receivers are Present	Significant and unavoidable
NOI-B: Would the proposed program result in the generation of excessive groundborne noise levels?	Significant	NOI-3(a): Locate Excavation Sites Away from Vibration-Sensitive Receivers, Where Feasible NOI-3(b): Conduct Project-Level Vibration Analysis for Construction Activities Where Vibration-Sensitive Receivers are Present	Significant and unavoidable

6.1.1 Significant and Irreversible Environmental Impacts

Pursuant to Section 15126.2(d) of the *State CEQA Guidelines*, an EIR must consider any significant irreversible environmental changes that would be caused by the proposed program should it be implemented. Specifically, Section 15126.2(d) of the *CEQA Guidelines* describes significant irreversible environmental changes as follows:

> Uses of nonrenewable resources during the initial and continued phases of the project may be irreversible since a large commitment of such resources makes removal or nonuse thereafter unlikely. Primary impacts and, particularly, secondary impacts (such as a highway improvement which provides access to a previously inaccessible area) generally commit future generations to similar uses. Also, irreversible damage can result from environmental accidents associated with the project. Irretrievable commitments of resources should be evaluated to assure that such current consumption is justified (14 CCR 15126.2[d]).

Determining whether the proposed program may result in significant and irreversible effects requires a determination of whether key resources would be degraded or destroyed in such a way that there would be little possibility of restoring them.

The proposed program does not include individual projects that would result in irreversible damage to the environment through the commitment of resources or environmental accidents. The proposed CAP would reduce Metropolitan's GHG emissions by implementing emissions reduction measures such as energy-efficient retrofits, installation of BESS facilities at existing Metropolitan treatment and pumping plants, fleet conversion, and waste reduction. By reducing GHG emissions, the proposed CAP would also provide a number of co-benefits, such as reduced energy consumption, criteria pollutant emissions, water use, and demand for solid waste facilities, that would improve the environment within the Plan Area.

As discussed throughout Chapter 4, *Environmental Impact Analysis*, several of the individual projects to be implemented under the proposed CAP would involve construction. While construction activities would require the consumption of natural resources and construction materials, such as petroleum, the use of construction materials and nonrenewable resources would not be unusual or extraordinary and would not negatively impact the availability of these resources. Furthermore, the commitment of these resources to temporary construction activities would not negate the long-term benefits of the proposed CAP associated with reductions in the use of nonrenewable resources.

As discussed throughout the PEIR and specifically in Chapter 5, *Effects Found Not to be Significant*, the proposed CAP does not include any changes that would alter the planned population or employment growth anticipated under applicable regional plans within the Plan Area. The CAP would not directly or indirectly increase population or commit future generations to similar uses within the Plan Area as it does not propose new housing, employment, or the expansion of water supply infrastructure to new areas where they do not already exist. Given the small amounts of hazardous substances used during construction activities and the federal, state, and local regulations governing the use of such substances and the minimal use of such materials during the operation of projects implemented under the proposed program, the proposed program would not damage the environment or pose a risk to public health. Overall, the proposed CAP would result in the conservation of energy and nonrenewable resources within the Plan Area by improving energy-efficiency of buildings and operations (CAP Strategy 5), reducing petroleum use by improving vehicle and equipment efficiencies (CAP measures EC-3 and FL-4), and conserving water (CAP Strategy 8). Therefore, the proposed CAP does not include any measures that would create a wasteful commitment of energy or nonrenewable resources or result in an environmental accident that would cause significant and irreversible impacts.

6.1.2 Growth Inducement

Section 15126.2(e) of the *State CEQA Guidelines* requires a discussion of a proposed project's potential to foster economic or population growth, including ways in which a project could remove an obstacle to growth. Growth itself does not necessarily create significant physical changes to the environment. However, depending upon the type, magnitude, and location of growth, it can result in significant adverse environmental effects. Generally, a project may be considered growth-inducing if it results in one or more of the conditions identified below:

- Induces population growth;
- Induces economic expansion;
- Establishes a precedent-setting action (e.g., an innovation, a radical change in zoning or general plan designation);
- Results in development or encroachment in an isolated or adjacent area of open space (i.e., being distinct from "infill" development); or
- Removes an impediment to growth (e.g., the establishment of an essential public service or the provision of new access to an area).

A proposed project's growth-inducing potential is considered significant if project-induced growth could result in significant physical effects in one or more environmental resource areas.

6.1.3 Population Growth

The proposed program would focus on the reduction of GHG emissions resulting from Metropolitan's operations within the Plan Area. As discussed in Chapter 5, *Effects Found Not to be Significant*, the proposed CAP would not directly induce population growth because it does not include residential land uses or the construction of housing. Furthermore, the CAP would not indirectly induce population growth because it would not expand any existing infrastructure to serve new areas.

6.1.4 Economic Expansion

The proposed CAP would include measures that require construction and maintenance activities. Construction activities associated with individual projects would likely be performed by workers hired from the local region. Because construction workers would be expected to be drawn from the existing regional workforce, construction of individual projects would not be growth-inducing from a temporary employment standpoint. The proposed CAP includes GHG reduction measures that would result in changes to Metropolitan's existing and ongoing operations such as equipment fuel conversion (CAP Strategy 3), building energy and utility equipment efficiency improvements (CAP Strategy 5), BESS facilities (CAP measure E-4), carbon capture and sequestration projects (CAP measures CS-2 through and CS-3), and expansion of alternative transportation options for employees (CAP Strategy 6). These changes may result in new maintenance activities conducted by existing Metropolitan employees, which may result in the hiring of a limited number of new employees. However, program activities would not result in large increases in employment. Similar to construction-related impacts, new employees, if warranted for operation and maintenance of CAP projects, would be expected to be sourced from the regional workforce and are unlikely to result in substantial relocation of workers to the Plan Area. Therefore, the proposed program would not induce growth from an economic expansion.

6.1.5 Precedent-Setting Action

The proposed CAP does not include any General Plan or zoning amendments or create opportunities to expand existing water supplies. Rather, the CAP proposes measures that Metropolitan can undertake in order to improve the sustainability of its operations and reduce GHG emissions, including infrastructure upgrades and improvements at existing Metropolitan facilities in the Plan Area. As discussed above and in Chapter 5, *Effects Found Not to be Significant*, the CAP does not contain measures that would result in substantial population growth either directly or indirectly. As such, the proposed CAP would not set a precedent that would result in new growth-inducing impacts in the area.

6.1.6 Development of Open Space/Vacant Land

Development of open space is considered growth-inducing when it occurs outside urban boundaries or in isolated locations instead of infill areas. The proposed CAP does not include new residential, commercial, or other development that would result in the development of open space or vacant land in isolated areas that could induce growth at the periphery of developed areas within the Plan Area. The CAP would involve implementation of carbon capture and sequestration projects on agricultural land in the Palo Verde Valley and Delta Islands pursuant to CAP measures CS-2 and CS-3; however, these efforts would involve implementation of regenerative agricultural practices (i.e., cover cropping), which would be substantially similar to existing land use occurring on these sites. As such, the proposed CAP would not involve development of open space or vacant land in the Plan Area.

6.1.7 Removal of an Impediment to Growth

The proposed CAP includes improvements to Metropolitan's operations that would reduce GHG emissions and does not include any measures that would expand water supply infrastructure, public roadways, or other utilities to areas currently lacking these services. Any infrastructure improvements proposed under the CAP would be for the purpose of reducing GHG emissions and improving Metropolitan's environmental sustainability, rather than for the expansion of services to new areas. Accordingly, the proposed program would not remove existing obstacles to growth within the Plan Area.

7 Alternatives

7.1 Introduction

During consideration of a project or program that could have a potentially significant effect to the environment, CEQA requires that alternatives that could avoid or lessen the project's significant effect(s) be considered (*State CEQA Guidelines,* Section 15126.6). This chapter presents potential alternatives to the proposed program and evaluates them as required by CEQA. The *State CEQA Guidelines* also require EIRs to identify the environmentally superior alternative from among the alternatives (including the proposed program). The environmentally superior alternative is identified in Section 7.5, *Identification of the Environmentally Superior Alternative*.

7.2 Summary of Program Objectives and Significant Impacts

7.2.1 Program Objectives

The objectives of the proposed program, the CAP, include the following:

- Identify and quantify emissions associated with Metropolitan operations to prepare a baseline GHG emissions inventory in order to track emissions reduction progress over time
- Adopt an emissions reduction target that is both consistent with existing state emissions reduction targets while preparing Metropolitan to meet future state targets
- Identify and quantify specific reduction actions and policies that Metropolitan may implement to achieve the goal of reducing GHG emissions from its construction and operational activities
- Provide a roadmap for future activities to achieve consistency with the CAP and use CEQA streamlining tools for analysis of GHG emissions pursuant to the requirements of CEQA Guidelines Section 15183.5

7.2.2 Significant Environmental Impacts

The proposed program would potentially result in the following significant impacts (or potentially significant impacts) that could not be reduced to less than significant levels with mitigation, as described in Chapter 6, *Other Required CEQA Discussion*.

- Conflict with or obstruct implementation of the applicable air quality plan (AQ-A)
- Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard (AQ-B)

- Cause a substantial adverse change in the significance of a historical resource pursuant to §15064.5 (CUL-A)
- Cause a substantial adverse change in the significance of an archaeological resource as defined in §15064.5 (CUL-B)
- Result in the generation of a substantial temporary or permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies (NOI-A)
- Result in the generation of excessive groundborne vibration levels (NOI-B)

7.3 Alternatives Considered but Rejected

Section 15126.6(a) of the *State CEQA Guidelines* states that an EIR shall describe "a range of reasonable alternatives to the project, or to the location of the project, which would feasibly attain most of the basic objectives of the project but would avoid or substantially lessen any of the significant effects of the project," as well as provide an evaluation of "the comparative merits of the alternatives." Under Section 15126.6(a), an EIR does not need to consider alternatives that are not feasible, nor need it address every conceivable alternative to the project. Section 15126.6(f) of the *State CEQA Guidelines* states that the range of alternatives "is governed by the 'rule of reason' that requires the EIR to set forth only those alternatives necessary to permit a reasoned choice." The focus is on informed decision-making and public participation rather than providing a set of alternatives simply to satisfy format.

As described below, two types of alternatives to the proposed program were considered—alternative locations and alternative methods—along with a No Program Alternative. Except for the No Program Alternative, all these potential alternatives have been rejected, as described below.

7.3.1 Alternative Locations

Metropolitan's proposed CAP is a programmatic approach to reduce GHG emissions within the Plan Area in accordance with state GHG emissions reduction targets. The proposed CAP accomplishes this by adopting strategies and measures that reduce GHG emissions. As described in Chapter 2, *Project Description*, these strategies and measures would be implemented at Metropolitan facilities and land holdings under Metropolitan's jurisdiction throughout the Plan Area. The proposed project locations have been selected at the most operationally feasible location or are proposed because they are located in areas where improvements can be made to existing Metropolitan operational facilities for which an alternative location does not exist. Constructing new facilities or acquiring property for other locations would not enable Metropolitan to improve the existing facilities or take advantage of existing infrastructure that would support the CAP measures and could create new impacts of its own. Additionally, alternative locations would not enable Metropolitan to create emissions reductions at existing facilities, which would conflict with the goal of reducing Metropolitan's operational GHG emissions. Therefore, an alternative site where the program could be implemented would not be appropriate because it would exclude land, facilities, and infrastructure under Metropolitan's control where emissions reduction measures could feasibly be implemented. As such, consideration of an alternative location has been eliminated from further analysis in this PEIR.

7.3.2 Alternative Methods

The proposed CAP includes GHG reduction measures, which would result in total mass GHG emissions reductions from direct and indirect GHG emissions related to Metropolitan operations. The categories of emissions reduction measures where most potentially significant environmental impacts would result are the Electricity (E) and Energy Efficiency (EE) categories (measures associated with producing renewable energy and transitioning existing uses to clean energy) and the Carbon Sequestration (CS) category (measures associated with sequestering carbon on Metropolitan-owned land). Metropolitan could consider varying degrees of implementation of each GHG reduction measure to reach its ultimate 2030 target and make progress toward the 2045 goal. However, the CAP that is proposed and evaluated throughout this PEIR has recommended the full spectrum of feasible GHG reduction measures at the levels that reductions can be feasibly estimated, attained, and substantiated. This PEIR has programmatically evaluated the potential environmental impacts of implementation of the suite of reduction measures based on the best available information regarding the technical and economic feasibility of those measures. Therefore, this PEIR appropriately evaluates the landscape of environmental impacts that could potentially occur with all reduction measures considered.

The purpose of an alternatives analysis is to identify alternatives that reduce or avoid the significant impacts of the project. As summarized above and evaluated throughout the PEIR, significant and unavoidable environmental impacts could occur in relation to air quality, cultural resources, and noise, depending on project-level designs. These significant and unavoidable impacts are typically related to construction of individual projects under the proposed CAP. As described in Chapter 2, *Project Description*, emissions reduction measures under the CAP are grouped into various emissions reduction strategies, which include phasing out natural gas combustion at facilities, improving energy efficiency, and incentivizing more sustainable commutes. While many individual emissions reduction measures may not result in physical impacts to the environment, most of these reduction strategies include at least some measures with the potential to result in construction-related impacts. Because construction-related impacts would occur across most of the emissions reduction strategies, an alternative that would reduce the construction-related impacts under one strategy, would likely require implementation of additional projects under another strategy in order to achieve the GHG reduction target, such that the overall magnitude and type of construction-related impacts would not change substantially. Within the context of CEQA, this would not offer an alternative that would reduce the impacts of the project.

While commenters may suggest that certain GHG reduction measures be pursued, funded, or supported to a greater degree than others, as described above, Metropolitan has proposed a CAP that based on its assessment of local conditions, regulatory requirements, and feasibility, provides a full spectrum of GHG reduction measures at levels that can be feasibly achieved and quantified based upon the information and technology available today. As described in *State CEQA Guidelines* Section 15126.6(a),

An EIR need not consider every conceivable alternative to a project. Rather it must consider a reasonable range of potentially feasible alternatives that will foster informed decision making and public participation. An EIR is not required to consider alternatives which are infeasible. The lead agency is responsible for selecting a range of project alternatives for examination and must publicly disclose its reasoning for selecting those alternatives.

The draft PEIR provides a reasonable range of alternatives for consideration by decisionmakers. Metropolitan has considered and evaluated the categories of alternatives that reduce or avoid the significant impacts of the project. As such, evaluation of additional combinations or levels of implementation of the GHG reduction measures is not required nor would it be meaningful to the analysis.

7.4 No Program Alternative

Under the No Program Alternative, the proposed CAP would not be adopted or implemented. As a result, the CAP's coordinated program of proposed GHG emission reduction measures and policies would not be adopted or implemented in a coordinated manner to achieve consistency with the statewide goals. This alternative would not provide a clear pathway for Metropolitan to meet and exceed the statewide 2030 GHG reduction goal identified in Senate Bill (SB) 32 or meet the 2045 carbon neutrality goal established by Executive Order (EO) B-55-18. Under CEQA, each of Metropolitan's capital improvement projects would still be required to implement GHG emission reduction strategies, but rather than relying on consistency with the CAP, each project would have to identify and implement GHG reductions specific to the individual project only.

7.4.1 Comparison of the Impacts of the No Program Alternative to the Proposed Program

Under the No Program Alternative, compliance with legislative requirements under CEQA would be achieved through individual project-level analysis for all Metropolitan projects subject to discretionary review. Because Metropolitan would still need to comply with applicable statewide GHG reduction requirements, local and statewide air quality regulations, and water conservation requirements, many of the individual projects identified under this alternative would still be built (e.g., E-4, BESS; FL-4, install ZEV infrastructure; CS-2 and CS-3, regenerative agriculture and carbon sequestration), thus many of the physical environmental impacts identified in this PEIR could still occur. Therefore, impacts under the No Program Alternative may be similar to those of the proposed program. However, with the No Program Alternative, Metropolitan would identify and reduce individual project emissions on a project-by-project basis, and forgo the opportunity to reduce emissions from all of its activities (e.g., operational and construction). Nevertheless, because emissions reduction efforts under the No Program Alternative would not be as aggressive as those occurring under the proposed CAP, the No Program Alternative may result in reduced physical impacts to some resource areas.

Table 38 Alternatives Impact Comparison Table

Environmental Resource Area	Proposed Program Impacts	No Program Alternative Impacts
Aesthetics	Less than significant	Similar, but reduced.
Agriculture and Forestry	No impact	Similar
Air quality	AQ-A: Significant and unavoidable AQ-B: Significant and unavoidable AQ-C: Less than significant AQ-D: Less than significant	Similar, but reduced.
Biological Resources	BIO-A: Less than significant with mitigation BIO-B: Less than significant with mitigation BIO-C: Less than significant with mitigation BIO-D: Less than significant BIO-E: Less than significant BIO-F: Less than significant	Similar, but reduced
Cultural Resources	CUL-A: Significant and unavoidable CUL-B: Significant and unavoidable CUL-C: Less than significant	Similar, but reduced
Energy	No impact	Similar
Geology and Soils	Less than significant	Similar, but reduced
Greenhouse Gas Emissions	No impact	Greater: GHG reductions for individual projects would be analyzed and implemented. However, this would forgo an opportunity to realize GHG emissions reductions for all of Metropolitan's emissions.
Hazards and Hazardous Materials	Less than significant	Similar, but reduced
Hydrology and Water Quality	Less than significant	Similar, but reduced
Land Use Planning	No impact	Similar, but reduced
Mineral Resources	No impact	Similar
Noise	NOI-A: Significant and unavoidable NOI-B: Significant and unavoidable NOI-C: Less than significant	Similar, but reduced
Population and Housing	No impact	Similar
Public Services	No impact	Similar
Recreation	Less than significant	Similar, but reduce
Transportation	Less than significant	Similar, but reduced
Tribal Cultural Resources	TCR-A: Less than significant TCR-B: Less than significant	Similar, but reduced
Utilities and Service Systems	Less than significant	Similar, but reduced
Wildfire	Less than significant	Similar, but reduced

7.5 Identification of the Environmentally Superior Alternative

7.5.1 Environmentally Superior Alternative

If an alternative is considered clearly superior to the proposed project relative to identified impacts, Section 15126.6 of the *State CEQA Guidelines* requires that alternative to be identified as the environmentally superior alternative. By statute, if the environmentally superior alternative is the No Project Alternative, an EIR must also identify an environmentally superior alternative among the other alternatives.

Two alternatives to the proposed program, other than the No Program Alternative, were considered; however, these alternatives were not further considered and analyzed for the reasons stated in Section 7.3, *Alternatives Considered but Rejected*.

Based on the analysis provided in Section 7.4, *No Program Alternative*, the No Program Alternative would have "similar" or "similar but reduced" environmental impacts as the proposed program with regard to: aesthetics, agriculture, air quality, biological resources, cultural resources, energy, geology and soils, hazards and hazardous materials, hydrology and water quality, land use planning, mineral resources, noise, population and housing, public services, recreation transportation, tribal cultural resources, utilities and service systems, and wildfire. The No Program Alternative would result in reduced impacts due to the smaller scope of this alternative, however, the No Program Alternative would not necessarily avoid any significant and unavoidable impacts, and beneficial impacts to GHG and Energy discussed in Chapter 5, *Effects Found Not to be Significant*, would not be realized to the same extent as under proposed CAP implementation. Individual projects could be implemented that would reduce GHG emissions for Metropolitan, but to the extent that the proposed CAP is a commitment by Metropolitan to reduce its emissions to carbon neutrality by 2045, the No Program Alternative would not meet the program objectives identified by Metropolitan. In particular, this alternative does not meet the objective of providing a mechanism for CEQA streamlining of GHG emissions analysis.

The proposed program would implement GHG emission reduction measures, which would advance compliance with statewide GHG reduction goals and provide specific measures that would reduce GHG emissions from natural gas use, fossil fuel consumption, electricity use, water use, wastewater generation, and other resource use modifications. The proposed program, therefore, is considered to be the environmentally superior alternative.

Appendix A

Notice of Preparation and Comment Letters

Date: June 23, 2020

To: State Clearinghouse, State Responsible Agencies, State Trustee Agencies, Other Public Agencies, Interested Organizations

From: The Metropolitan Water District of Southern California

Subject: **Notice of Preparation of a Draft Program Environmental Impact Report for The Metropolitan Water District of Southern California Climate Action Plan**

The Metropolitan Water District of Southern California (Metropolitan) will be the Lead Agency under the California Environmental Quality Act (CEQA) and will prepare a Draft Program Environmental Impact Report (PEIR) for The Metropolitan Water District of Southern California Climate Action Plan (CAP) (proposed project). This Notice of Preparation (NOP) and Scoping Meeting is being sent to responsible, trustee, and other public agencies as part of the review process under CEQA for projects of statewide, regional, or areawide significance (Sections 21080.4 and 21080.9 of the Public Resources Code).

Metropolitan is requesting input from responsible, trustee, and other public agencies, as well as interested organizations and individuals, regarding the scope and content of the environmental information to be included in the Draft PEIR. If you are a responsible or trustee agency, you are requested to indicate your statutory responsibilities in connection with the proposed project.

The description and location of the proposed project and information on the potential environmental effects resulting from the proposed project are provided in this NOP. Due to the time limits mandated by state law (*State CEQA Guidelines* §15082 - Notice of Preparation and Determination of Scope of EIR), written comments must be sent at the earliest possible date, but not later than the end of the public review period, which begins June 23, 2020 and ends July 22, 2020.

Project Title: **The Metropolitan Water District of Southern California Climate Action Plan**

Applicant: **The Metropolitan Water District of Southern California**

OPPORTUNITY FOR PUBLIC REVIEW AND COMMENT

Copies of the NOP are available for public review at:

The Metropolitan Water District of Southern California
700 North Alameda Street
Los Angeles, California 90012

Additionally, a copy of the NOP is available online for public review at:

Metropolitan's website at: http://www.mwdh2o.com/CEQA

Written comments should be sent to the address shown below or via e-mail at EP@mwdh2o.com (reference "CAP PEIR" in the subject line) and should include the name, mailing address, telephone number, and email address, if available, of a contact person.

Ms. Malinda Stalvey, Senior Environmental Specialist
The Metropolitan Water District of Southern California
Environmental Planning Section
P.O. Box 54153
Los Angeles, California 90054-0153
(213) 217-5545

Please contact Malinda Stalvey via telephone or email at EP@mwdh2o.com to make arrangements for viewing or to receive a hard copy if you are not able to access the document online or view a copy at the location listed above.

All parties who have submitted their names and mailing addresses will be placed on the mailing list to receive notifications during the course of this CEQA environmental review process.

Scoping Meeting: Metropolitan will hold a virtual scoping meeting in conjunction with the NOP to present the proposed project and the PEIR process. The meeting will provide an opportunity for agency representatives and the public to assist the lead agency in determining the scope and content of the environmental analysis for the PEIR. The scoping meeting will be held online on July 15, 2020 at 10:00 a.m. To participate in the meeting, please register here: https://us02web.zoom.us/webinar/register/WN_UohxhPynTW6jwvyl_bDUkw.
The public can submit written comments via e-mail at EP@mwdh2o.com (reference "CAP PEIR Scoping" in the subject line) or can provide oral comments during the meeting.

Signature: Jennifer Harriger Date: 6-16-2020

Jennifer Harriger
Manager, Environmental Planning Section

INTRODUCTION

The Metropolitan Water District of Southern California (Metropolitan) is a regional wholesaler that provides water for 26 member public agencies to deliver either directly or through their sub-agencies to nearly 19 million people, across a 5,200 square mile service area in six counties in Southern California. On average, Metropolitan moves more than 1.7 billion gallons of water daily through its distribution system, which includes an extensive water system including the Colorado River Aqueduct, 16 small hydroelectric facilities, nine reservoirs, 819 miles of large-scale pipes and five water treatment plants, four of which are among the 10 largest plants in the world. Metropolitan imports water from the California Department of Water Resources' State Water Project and the Colorado River to supplement local supplies. It also helps its member agencies develop water recycling, storage and other local resource programs to provide additional supplies and conservation programs to reduce regional demands.

PROJECT DESCRIPTION

Metropolitan is preparing a Climate Action Plan (CAP) to outline a strategy for reducing greenhouse gas (GHG) emissions associated with future construction, operation, and maintenance activities. The CAP is a comprehensive roadmap that analyzes historical GHG emissions, prepares a forecast of future GHG emissions, sets a GHG reduction target for reducing emissions consistent with applicable state policies, and identifies a suite of specific reduction actions that Metropolitan can choose from to achieve the adopted target consistent with Section 15183.5 of the State CEQA Guidelines. The CAP is a customized roadmap for making informed decisions and understanding where and how to achieve emissions reductions that conform to Metropolitan's mission/goals in a meaningful and cost-effective manner. While a CAP identifies potential projects that may be implemented to meet GHG reduction goals, no specific projects will be implemented without further CEQA review.

Emissions Inventory

Metropolitan's operations inherently result in GHG emissions. Understanding the processes that generate these emissions is essential to identifying strategies to reduce GHG emissions and achieve the identified GHG reduction target. Metropolitan's activities can be categorized into the following GHG generating sectors:

- **Water Conveyance and Treatment.** A majority of Metropolitan's emissions are a direct result of the energy consumed to pump, treat and deliver water throughout Metropolitan's extensive service area.
- **Buildings/Infrastructure.** Infrastructure including offices, facilities, control buildings, lighting, computers, air conditioners, and other equipment that is required to support the treatment and delivery of water.
- **Transportation.** This includes the transportation of employees and equipment to and from offices and worksites. Emissions stem from both Metropolitan's fleet vehicles and employee commute emissions.
- **Waste Disposal.** Waste falls into three categories: mixed solids waste, mixed recyclables, and organics. Metropolitan generates waste from various sources, ranging from employee lunches to office waste, which results in indirect GHG emissions as it decomposes in landfills.
- **Water Use.** Water sector GHG emissions by Metropolitan result from water use in facilities and irrigation.
- **Construction.** As Metropolitan's infrastructure ages, there is a continued need for construction of new facilities and infrastructure or rehabilitation of existing facilities and infrastructure. Construction activities result in direct GHG emissions from fuel combustion associated with construction equipment use and transportation of workers and materials.

The CAP will include an inventory of Metropolitan's emissions, including an estimate of emissions associated with Metropolitan's operations from 1990 through 2017. The inventory will describe methodologies used to calculate Scope 1, Scope 2, and Scope 3 emissions. Scope 1 emissions include those from direct fuel combustion, including natural gas, propane, welding gasses, and gasoline and diesel used to power Metropolitan's vehicle fleet. Scope 2 emissions include indirect GHG emissions associated with the purchase and consumption of electricity. Scope 3 emissions are indirect emissions resulting from employee commute, waste generation, water consumption in Metropolitan-owned buildings, and construction projects. The emissions inventory will also provide a forecast of future emissions based on current operations and construction of capital improvement projects.

GHG Reduction Target

The CAP will establish a GHG reduction target aligned with applicable state GHG reduction policies including Senate Bill 32, which establishes a statewide GHG reduction target of 40 percent below 1990 levels by the year 2030, and Executive Order B-55-18, which sets a statewide goal of carbon neutrality by 2045. Metropolitan will measure and track its emissions inventory using:

- **Per Capita Emissions Calculation.** Per capita emissions uses Metropolitan's calculated mass emissions and divides by the service population.
- **Carbon Budget Tracking**. Sets a carbon budget that is incrementally reduced over time to reach the adopted target.

In addition to establishing a reduction target, the CAP will provide a detailed analysis of the emissions reductions necessary for Metropolitan to achieve its target based on the emissions inventory and forecast described above.

Reduction Measures

The CAP will identify a suite of GHG emissions reduction measures that can be implemented to achieve the adopted emissions reduction target. At this time, GHG emission reduction measures are anticipated to span the following categories:

- Energy Use
- Waste
- Transportation
- Reduce Downstream Emissions
- Colorado River Aqueduct Pumping
- Off-road Construction
- Water Conservation
- Carbon Sequestration
- Conventional Treatment Plants
- Advanced Water Treatment Facilities
- New Pump Specifications
- General Engineering

It is anticipated that a majority of GHG reduction measures will be administrative in nature and, consequently, will not result in physical impacts to the environment. Nevertheless, all potential GHG reduction measures will be evaluated in the Draft PEIR.

PROJECT LOCATION

The CAP will include reduction measures to reduce GHG emissions from Metropolitan's construction, operation, and maintenance activities. It is anticipated that most reduction measures would be implemented throughout a six-county Southern California region comprised of Los Angeles, Orange, Riverside, San Bernardino, San Diego, and Ventura counties. These counties include all of Metropolitan's service area and most of its infrastructure facilities. The CAP may also involve implementation of GHG emissions reduction measures or programs at Metropolitan land holdings in Imperial County, specifically within the Palo Verde Irrigation District; as well as land holdings in San Joaquin and Contra Costa Counties, specifically on lands commonly known as Bacon Island, Bouldin Island, Holland Tract, and Webb Tract in the Sacramento-San Joaquin Delta region. Figure 1 shows the project location.

POTENTIAL ENVIRONMENTAL IMPACTS OF THE PROPOSED PROJECT

The Draft PEIR will include an analysis of all required impact areas, as well as feasible mitigation measures and a reasonable range of alternatives to avoid or reduce potentially significant impacts, if any. Environmental resource areas where it is determined that the proposed project would result in a less than significant impact will be summarized in an "Effects Found to be Less than Significant" section of the Draft PEIR.

Re: 2020060450, The Metropolitan Water District of Southern California Climate Action Plan Project, Contra Costa, Imperial, Los Angeles, Orange, Riverside, San Bernardino, San Diego, San Joaquin, and Ventura Counties

Dear Ms. Stalvey:

The Native American Heritage Commission (NAHC) has received the Notice of Preparation (NOP), Draft Environmental Impact Report (DEIR) or Early Consultation for the project referenced above. The California Environmental Quality Act (CEQA) (Pub. Resources Code §21000 et seq.), specifically Public Resources Code §21084.1, states that a project that may cause a substantial adverse change in the significance of a historical resource, is a project that may have a significant effect on the environment. (Pub. Resources Code § 21084.1; Cal. Code Regs., tit.14, §15064.5 (b) (CEQA Guidelines §15064.5 (b)). If there is substantial evidence, in light of the whole record before a lead agency, that a project may have a significant effect on the environment, an Environmental Impact Report (EIR) shall be prepared. (Pub. Resources Code §21080 (d); Cal. Code Regs., tit. 14, § 5064 subd.(a)(1) (CEQA Guidelines §15064 (a)(1)). In order to determine whether a project will cause a substantial adverse change in the significance of a historical resource, a lead agency will need to determine whether there are historical resources within the area of potential effect (APE).

CEQA was amended significantly in 2014. Assembly Bill 52 (Gatto, Chapter 532, Statutes of 2014) (AB 52) amended CEQA to create a separate category of cultural resources, "tribal cultural resources" (Pub. Resources Code §21074) and provides that a project with an effect that may cause a substantial adverse change in the significance of a tribal cultural resource is a project that may have a significant effect on the environment. (Pub. Resources Code §21084.2). Public agencies shall, when feasible, avoid damaging effects to any tribal cultural resource. (Pub. Resources Code §21084.3 (a)). **AB 52 applies to any project for which a notice of preparation, a notice of negative declaration, or a mitigated negative declaration is filed on or after July 1, 2015.** If your project involves the adoption of or amendment to a general plan or a specific plan, or the designation or proposed designation of open space, on or after March 1, 2005, it may also be subject to Senate Bill 18 (Burton, Chapter 905, Statutes of 2004) (SB 18). **Both SB 18 and AB 52 have tribal consultation requirements.** If your project is also subject to the federal National Environmental Policy Act (42 U.S.C. § 4321 et seq.) (NEPA), the tribal consultation requirements of Section 106 of the National Historic Preservation Act of 1966 (154 U.S.C. 300101, 36 C.F.R. §800 et seq.) may also apply.

The NAHC recommends consultation with California Native American tribes that are traditionally and culturally affiliated with the geographic area of your proposed project as early as possible in order to avoid inadvertent discoveries of Native American human remains and best protect tribal cultural resources. Below is a brief summary of portions of AB 52 and SB 18 as well as the NAHC's recommendations for conducting cultural resources assessments.

Consult your legal counsel about compliance with AB 52 and SB 18 as well as compliance with any other applicable laws.

AB 52

AB 52 has added to CEQA the additional requirements listed below, along with many other requirements:

1. Fourteen Day Period to Provide Notice of Completion of an Application/Decision to Undertake a Project: Within fourteen (14) days of determining that an application for a project is complete or of a decision by a public agency to undertake a project, a lead agency shall provide formal notification to a designated contact of, or tribal representative of, traditionally and culturally affiliated California Native American tribes that have requested notice, to be accomplished by at least one written notice that includes:

a. A brief description of the project.

b. The lead agency contact information.

c. Notification that the California Native American tribe has 30 days to request consultation. (Pub. Resources Code §21080.3.1 (d)).

d. A "California Native American tribe" is defined as a Native American tribe located in California that is on the contact list maintained by the NAHC for the purposes of Chapter 905 of Statutes of 2004 (SB 18). (Pub. Resources Code §21073).

2. Begin Consultation Within 30 Days of Receiving a Tribe's Request for Consultation and Before Releasing a Negative Declaration, Mitigated Negative Declaration, or Environmental Impact Report: A lead agency shall begin the consultation process within 30 days of receiving a request for consultation from a California Native American tribe that is traditionally and culturally affiliated with the geographic area of the proposed project. (Pub. Resources Code §21080.3.1, subds. (d) and (e)) and prior to the release of a negative declaration, mitigated negative declaration or Environmental Impact Report. (Pub. Resources Code §21080.3.1(b)).

a. For purposes of AB 52, "consultation shall have the same meaning as provided in Gov. Code §65352.4 (SB 18). (Pub. Resources Code §21080.3.1 (b)).

3. Mandatory Topics of Consultation If Requested by a Tribe: The following topics of consultation, if a tribe requests to discuss them, are mandatory topics of consultation:

a. Alternatives to the project.

b. Recommended mitigation measures.

c. Significant effects. (Pub. Resources Code §21080.3.2 (a)).

4. Discretionary Topics of Consultation: The following topics are discretionary topics of consultation:

a. Type of environmental review necessary.

b. Significance of the tribal cultural resources.

c. Significance of the project's impacts on tribal cultural resources.

d. If necessary, project alternatives or appropriate measures for preservation or mitigation that the tribe may recommend to the lead agency. (Pub. Resources Code §21080.3.2 (a)).

5. Confidentiality of Information Submitted by a Tribe During the Environmental Review Process: With some exceptions, any information, including but not limited to, the location, description, and use of tribal cultural resources submitted by a California Native American tribe during the environmental review process shall not be included in the environmental document or otherwise disclosed by the lead agency or any other public agency to the public, consistent with Government Code §6254 (r) and §6254.10. Any information submitted by a California Native American tribe during the consultation or environmental review process shall be published in a confidential appendix to the environmental document unless the tribe that provided the information consents, in writing, to the disclosure of some or all of the information to the public. (Pub. Resources Code §21082.3 (c)(1)).

6. Discussion of Impacts to Tribal Cultural Resources in the Environmental Document: If a project may have a significant impact on a tribal cultural resource, the lead agency's environmental document shall discuss both of the following:

a. Whether the proposed project has a significant impact on an identified tribal cultural resource.

b. Whether feasible alternatives or mitigation measures, including those measures that may be agreed to pursuant to Public Resources Code §21082.3, subdivision (a), avoid or substantially lessen the impact on the identified tribal cultural resource. (Pub. Resources Code §21082.3 (b)).

7. Conclusion of Consultation: Consultation with a tribe shall be considered concluded when either of the following occurs:

a. The parties agree to measures to mitigate or avoid a significant effect, if a significant effect exists, on a tribal cultural resource; or

b. A party, acting in good faith and after reasonable effort, concludes that mutual agreement cannot be reached. (Pub. Resources Code §21080.3.2 (b)).

8. Recommending Mitigation Measures Agreed Upon in Consultation in the Environmental Document: Any mitigation measures agreed upon in the consultation conducted pursuant to Public Resources Code §21080.3.2 shall be recommended for inclusion in the environmental document and in an adopted mitigation monitoring and reporting program, if determined to avoid or lessen the impact pursuant to Public Resources Code §21082.3, subdivision (b), paragraph 2, and shall be fully enforceable. (Pub. Resources Code §21082.3 (a)).

9. Required Consideration of Feasible Mitigation: If mitigation measures recommended by the staff of the lead agency as a result of the consultation process are not included in the environmental document or if there are no agreed upon mitigation measures at the conclusion of consultation, or if consultation does not occur, and if substantial evidence demonstrates that a project will cause a significant effect to a tribal cultural resource, the lead agency shall consider feasible mitigation pursuant to Public Resources Code §21084.3 (b). (Pub. Resources Code §21082.3 (e)).

10. Examples of Mitigation Measures That, If Feasible, May Be Considered to Avoid or Minimize Significant Adverse Impacts to Tribal Cultural Resources:

a. Avoidance and preservation of the resources in place, including, but not limited to:

i. Planning and construction to avoid the resources and protect the cultural and natural context.

ii. Planning greenspace, parks, or other open space, to incorporate the resources with culturally appropriate protection and management criteria.

b. Treating the resource with culturally appropriate dignity, taking into account the tribal cultural values and meaning of the resource, including, but not limited to, the following:

i. Protecting the cultural character and integrity of the resource.

ii. Protecting the traditional use of the resource.

iii. Protecting the confidentiality of the resource.

c. Permanent conservation easements or other interests in real property, with culturally appropriate management criteria for the purposes of preserving or utilizing the resources or places.

d. Protecting the resource. (Pub. Resource Code §21084.3 (b)).

e. Please note that a federally recognized California Native American tribe or a non-federally recognized California Native American tribe that is on the contact list maintained by the NAHC to protect a California prehistoric, archaeological, cultural, spiritual, or ceremonial place may acquire and hold conservation easements if the conservation easement is voluntarily conveyed. (Civ. Code §815.3 (c)).

f. Please note that it is the policy of the state that Native American remains and associated grave artifacts shall be repatriated. (Pub. Resources Code §5097.991).

11. Prerequisites for Certifying an Environmental Impact Report or Adopting a Mitigated Negative Declaration or Negative Declaration with a Significant Impact on an Identified Tribal Cultural Resource: An Environmental Impact Report may not be certified, nor may a mitigated negative declaration or a negative declaration be adopted unless one of the following occurs:

a. The consultation process between the tribes and the lead agency has occurred as provided in Public Resources Code §21080.3.1 and §21080.3.2 and concluded pursuant to Public Resources Code §21080.3.2.

b. The tribe that requested consultation failed to provide comments to the lead agency or otherwise failed to engage in the consultation process.

c. The lead agency provided notice of the project to the tribe in compliance with Public Resources Code §21080.3.1 (d) and the tribe failed to request consultation within 30 days. (Pub. Resources Code §21082.3 (d)).

The NAHC's PowerPoint presentation titled, "Tribal Consultation Under AB 52: Requirements and Best Practices" may be found online at: http://nahc.ca.gov/wp-content/uploads/2015/10/AB52TribalConsultation_CalEPAPDF.pdf

SB 18

SB 18 applies to local governments and requires local governments to contact, provide notice to, refer plans to, and consult with tribes prior to the adoption or amendment of a general plan or a specific plan, or the designation of open space. (Gov. Code §65352.3). Local governments should consult the Governor's Office of Planning and Research's "Tribal Consultation Guidelines," which can be found online at: https://www.opr.ca.gov/docs/09_14_05_Updated_Guidelines_922.pdf.

Some of SB 18's provisions include:

1. Tribal Consultation: If a local government considers a proposal to adopt or amend a general plan or a specific plan, or to designate open space it is required to contact the appropriate tribes identified by the NAHC by requesting a "Tribal Consultation List." If a tribe, once contacted, requests consultation the local government must consult with the tribe on the plan proposal. **A tribe has 90 days from the date of receipt of notification to request consultation unless a shorter timeframe has been agreed to by the tribe.** (Gov. Code §65352.3 (a)(2)).
2. No Statutory Time Limit on SB 18 Tribal Consultation. There is no statutory time limit on SB 18 tribal consultation.
3. Confidentiality: Consistent with the guidelines developed and adopted by the Office of Planning and Research pursuant to Gov. Code §65040.2, the city or county shall protect the confidentiality of the information concerning the specific identity, location, character, and use of places, features and objects described in Public Resources Code §5097.9 and §5097.993 that are within the city's or county's jurisdiction. (Gov. Code §65352.3 (b)).
4. Conclusion of SB 18 Tribal Consultation: Consultation should be concluded at the point in which:
    a. The parties to the consultation come to a mutual agreement concerning the appropriate measures for preservation or mitigation; or
    b. Either the local government or the tribe, acting in good faith and after reasonable effort, concludes that mutual agreement cannot be reached concerning the appropriate measures of preservation or mitigation. (Tribal Consultation Guidelines, Governor's Office of Planning and Research (2005) at p. 18).

Agencies should be aware that neither AB 52 nor SB 18 precludes agencies from initiating tribal consultation with tribes that are traditionally and culturally affiliated with their jurisdictions before the timeframes provided in AB 52 and SB 18. For that reason, we urge you to continue to request Native American Tribal Contact Lists and "Sacred Lands File" searches from the NAHC. The request forms can be found online at: http://nahc.ca.gov/resources/forms/.

NAHC Recommendations for Cultural Resources Assessments

To adequately assess the existence and significance of tribal cultural resources and plan for avoidance, preservation in place, or barring both, mitigation of project-related impacts to tribal cultural resources, the NAHC recommends the following actions:

1. Contact the appropriate regional California Historical Research Information System (CHRIS) Center (http://ohp.parks.ca.gov/?page_id=1068) for an archaeological records search. The records search will determine:
    a. If part or all of the APE has been previously surveyed for cultural resources.
    b. If any known cultural resources have already been recorded on or adjacent to the APE.
    c. If the probability is low, moderate, or high that cultural resources are located in the APE.
    d. If a survey is required to determine whether previously unrecorded cultural resources are present.

2. If an archaeological inventory survey is required, the final stage is the preparation of a professional report detailing the findings and recommendations of the records search and field survey.
    a. The final report containing site forms, site significance, and mitigation measures should be submitted immediately to the planning department. All information regarding site locations, Native American human remains, and associated funerary objects should be in a separate confidential addendum and not be made available for public disclosure.

b. The final written report should be submitted within 3 months after work has been completed to the appropriate regional CHRIS center.

3. Contact the NAHC for:

a. A Sacred Lands File search. Remember that tribes do not always record their sacred sites in the Sacred Lands File, nor are they required to do so. A Sacred Lands File search is not a substitute for consultation with tribes that are traditionally and culturally affiliated with the geographic area of the project's APE.

b. A Native American Tribal Consultation List of appropriate tribes for consultation concerning the project site and to assist in planning for avoidance, preservation in place, or, failing both, mitigation measures.

4. Remember that the lack of surface evidence of archaeological resources (including tribal cultural resources) does not preclude their subsurface existence.

a. Lead agencies should include in their mitigation and monitoring reporting program plan provisions for the identification and evaluation of inadvertently discovered archaeological resources per Cal. Code Regs., tit. 14, §15064.5(f) (CEQA Guidelines §15064.5(f)). In areas of identified archaeological sensitivity, a certified archaeologist and a culturally affiliated Native American with knowledge of cultural resources should monitor all ground-disturbing activities.

b. Lead agencies should include in their mitigation and monitoring reporting program plans provisions for the disposition of recovered cultural items that are not burial associated in consultation with culturally affiliated Native Americans.

c. Lead agencies should include in their mitigation and monitoring reporting program plans provisions for the treatment and disposition of inadvertently discovered Native American human remains. Health and Safety Code §7050.5, Public Resources Code §5097.98, and Cal. Code Regs., tit. 14, §15064.5, subdivisions (d) and (e) (CEQA Guidelines §15064.5, subds. (d) and (e)) address the processes to be followed in the event of an inadvertent discovery of any Native American human remains and associated grave goods in a location other than a dedicated cemetery.

If you have any questions or need additional information, please contact me at my email address: Andrew.Green@nahc.ca.gov.

Sincerely,

Andrew Green

Subject: RE: 063-BE - Environmental Document Review - SCH# 2020060450 - Due to Lead Agency by 07/16/2020

Good afternoon,

Special Projects Section (SPS) recently received the referenced Notice of Environmental Impact document from the State Clearinghouse (SCH) outlined in the following Web site:

https://ceqanet.opr.ca.gov/2020060450/2

Due to the project's geographical proximity to the Southern Division, please use the attached checklist to assess its potential impact to local Area/Section operations and public safety.

Please feel free to e-mail me if you have any questions.

Thank you!

Kind Regards,

Blanca Enciso
Special Projects Section- 063

Special Projects Section

File No.: 063.A10212.A18109.Nop.Doc

Subject: ENVIRONMENTAL DOCUMENT REVIEW AND RESPONSE
SCH#2020060450

Special Projects Section (SPS) recently received the referenced "Notice of Preparation" environmental impact document from the State Clearinghouse (SCH).

Please use the attached checklist to assess its potential impact to local operations and public safety. Due to the project's geographical proximity to multiple divisions, SPS will coordinate the response. If it is determined that departmental input is advisable, your written comments referencing the above SCH number must be sent to SPS no later than **July 16, 2020**. For reference, additional information can be found in General Order 41.2, Environmental Impact Documents.

Please e-mail a copy of Division's response to Associate Governmental Program Analyst Blanca Enciso at blanca.enciso@ca.gov. For questions or concerns, please contact Ms. Enciso at (916) 843-3370.

NOTICE OF PREPARATION AND SCOPING MEETING

Date: June 23, 2020

To: State Clearinghouse, State Responsible Agencies, State Trustee Agencies, Other Public Agencies, Interested Organizations

From: The Metropolitan Water District of Southern California

Subject: **Notice of Preparation of a Draft Program Environmental Impact Report for The Metropolitan Water District of Southern California Climate Action Plan**

The Metropolitan Water District of Southern California (Metropolitan) will be the Lead Agency under the California Environmental Quality Act (CEQA) and will prepare a Draft Program Environmental Impact Report (PEIR) for The Metropolitan Water District of Southern California Climate Action Plan (CAP) (proposed project). This Notice of Preparation (NOP) and Scoping Meeting is being sent to responsible, trustee, and other public agencies as part of the review process under CEQA for projects of statewide, regional, or areawide significance (Sections 21080.4 and 21080.9 of the Public Resources Code).

Metropolitan is requesting input from responsible, trustee, and other public agencies, as well as interested organizations and individuals, regarding the scope and content of the environmental information to be included in the Draft PEIR. If you are a responsible or trustee agency, you are requested to indicate your statutory responsibilities in connection with the proposed project.

The description and location of the proposed project and information on the potential environmental effects resulting from the proposed project are provided in this NOP. Due to the time limits mandated by state law (*State CEQA Guidelines* §15082 - Notice of Preparation and Determination of Scope of EIR), written comments must be sent at the earliest possible date, but not later than the end of the public review period, which begins June 23, 2020 and ends July 22, 2020.

Project Title: **The Metropolitan Water District of Southern California Climate Action Plan**

Applicant: **The Metropolitan Water District of Southern California**

OPPORTUNITY FOR PUBLIC REVIEW AND COMMENT

Copies of the NOP are available for public review at:

The Metropolitan Water District of Southern California
700 North Alameda Street
Los Angeles, California 90012

Additionally, a copy of the NOP is available online for public review at:

Metropolitan's website at: http://www.mwdh2o.com/CEQA

Written comments should be sent to the address shown below or via e-mail at EP@mwdh2o.com (reference "CAP PEIR" in the subject line) and should include the name, mailing address, telephone number, and email address, if available, of a contact person.

Ms. Malinda Stalvey, Senior Environmental Specialist
The Metropolitan Water District of Southern California
Environmental Planning Section
P.O. Box 54153
Los Angeles, California 90054-0153
(213) 217-5545

Please contact Malinda Stalvey via telephone or email at EP@mwdh2o.com to make arrangements for viewing or to receive a hard copy if you are not able to access the document online or view a copy at the location listed above.

All parties who have submitted their names and mailing addresses will be placed on the mailing list to receive notifications during the course of this CEQA environmental review process.

Scoping Meeting: Metropolitan will hold a virtual scoping meeting in conjunction with the NOP to present the proposed project and the PEIR process. The meeting will provide an opportunity for agency representatives and the public to assist the lead agency in determining the scope and content of the environmental analysis for the PEIR. The scoping meeting will be held online on July 15, 2020 at 10:00 a.m. To participate in the meeting, please register here:
https://us02web.zoom.us/webinar/register/WN_UohxhPynTW6jwvyl_bDUkw.
The public can submit written comments via e-mail at EP@mwdh2o.com (reference "CAP PEIR Scoping" in the subject line) or can provide oral comments during the meeting.

Signature: Jennifer Harriger Date: 6-16-2020

Jennifer Harriger
Manager, Environmental Planning Section

INTRODUCTION

The Metropolitan Water District of Southern California (Metropolitan) is a regional wholesaler that provides water for 26 member public agencies to deliver either directly or through their sub-agencies to nearly 19 million people, across a 5,200 square mile service area in six counties in Southern California. On average, Metropolitan moves more than 1.7 billion gallons of water daily through its distribution system, which includes an extensive water system including the Colorado River Aqueduct, 16 small hydroelectric facilities, nine reservoirs, 819 miles of large-scale pipes and five water treatment plants, four of which are among the 10 largest plants in the world. Metropolitan imports water from the California Department of Water Resources' State Water Project and the Colorado River to supplement local supplies. It also helps its member agencies develop water recycling, storage and other local resource programs to provide additional supplies and conservation programs to reduce regional demands.

PROJECT DESCRIPTION

Metropolitan is preparing a Climate Action Plan (CAP) to outline a strategy for reducing greenhouse gas (GHG) emissions associated with future construction, operation, and maintenance activities. The CAP is a comprehensive roadmap that analyzes historical GHG emissions, prepares a forecast of future GHG emissions, sets a GHG reduction target for reducing emissions consistent with applicable state policies, and identifies a suite of specific reduction actions that Metropolitan can choose from to achieve the adopted target consistent with Section 15183.5 of the State CEQA Guidelines. The CAP is a customized roadmap for making informed decisions and understanding where and how to achieve emissions reductions that conform to Metropolitan's mission/goals in a meaningful and cost-effective manner. While a CAP identifies potential projects that may be implemented to meet GHG reduction goals, no specific projects will be implemented without further CEQA review.

Emissions Inventory

Metropolitan's operations inherently result in GHG emissions. Understanding the processes that generate these emissions is essential to identifying strategies to reduce GHG emissions and achieve the identified GHG reduction target. Metropolitan's activities can be categorized into the following GHG generating sectors:

- **Water Conveyance and Treatment.** A majority of Metropolitan's emissions are a direct result of the energy consumed to pump, treat and deliver water throughout Metropolitan's extensive service area.
- **Buildings/Infrastructure.** Infrastructure including offices, facilities, control buildings, lighting, computers, air conditioners, and other equipment that is required to support the treatment and delivery of water.
- **Transportation.** This includes the transportation of employees and equipment to and from offices and worksites. Emissions stem from both Metropolitan's fleet vehicles and employee commute emissions.
- **Waste Disposal.** Waste falls into three categories: mixed solids waste, mixed recyclables, and organics. Metropolitan generates waste from various sources, ranging from employee lunches to office waste, which results in indirect GHG emissions as it decomposes in landfills.
- **Water Use.** Water sector GHG emissions by Metropolitan result from water use in facilities and irrigation.
- **Construction.** As Metropolitan's infrastructure ages, there is a continued need for construction of new facilities and infrastructure or rehabilitation of existing facilities and infrastructure. Construction activities result in direct GHG emissions from fuel combustion associated with construction equipment use and transportation of workers and materials.

The CAP will include an inventory of Metropolitan's emissions, including an estimate of emissions associated with Metropolitan's operations from 1990 through 2017. The inventory will describe methodologies used to calculate Scope 1, Scope 2, and Scope 3 emissions. Scope 1 emissions include those from direct fuel combustion, including natural gas, propane, welding gasses, and gasoline and diesel used to power Metropolitan's vehicle fleet. Scope 2 emissions include indirect GHG emissions associated with the purchase and consumption of electricity. Scope 3 emissions are indirect emissions resulting from employee commute, waste generation, water consumption in Metropolitan-owned buildings, and construction projects. The emissions inventory will also provide a forecast of future emissions based on current operations and construction of capital improvement projects.

GHG Reduction Target

The CAP will establish a GHG reduction target aligned with applicable state GHG reduction policies including Senate Bill 32, which establishes a statewide GHG reduction target of 40 percent below 1990 levels by the year 2030, and Executive Order B-55-18, which sets a statewide goal of carbon neutrality by 2045. Metropolitan will measure and track its emissions inventory using:

- **Per Capita Emissions Calculation.** Per capita emissions uses Metropolitan's calculated mass emissions and divides by the service population.
- **Carbon Budget Tracking**. Sets a carbon budget that is incrementally reduced over time to reach the adopted target.

In addition to establishing a reduction target, the CAP will provide a detailed analysis of the emissions reductions necessary for Metropolitan to achieve its target based on the emissions inventory and forecast described above.

Reduction Measures

The CAP will identify a suite of GHG emissions reduction measures that can be implemented to achieve the adopted emissions reduction target. At this time, GHG emission reduction measures are anticipated to span the following categories:

- Energy Use
- Waste
- Transportation
- Reduce Downstream Emissions
- Colorado River Aqueduct Pumping
- Off-road Construction
- Water Conservation
- Carbon Sequestration
- Conventional Treatment Plants
- Advanced Water Treatment Facilities
- New Pump Specifications
- General Engineering

It is anticipated that a majority of GHG reduction measures will be administrative in nature and, consequently, will not result in physical impacts to the environment. Nevertheless, all potential GHG reduction measures will be evaluated in the Draft PEIR.

PROJECT LOCATION

The CAP will include reduction measures to reduce GHG emissions from Metropolitan's construction, operation, and maintenance activities. It is anticipated that most reduction measures would be implemented throughout a six-county Southern California region comprised of Los Angeles, Orange, Riverside, San Bernardino, San Diego, and Ventura counties. These counties include all of Metropolitan's service area and most of its infrastructure facilities. The CAP may also involve implementation of GHG emissions reduction measures or programs at Metropolitan land holdings in Imperial County, specifically within the Palo Verde Irrigation District; as well as land holdings in San Joaquin and Contra Costa Counties, specifically on lands commonly known as Bacon Island, Bouldin Island, Holland Tract, and Webb Tract in the Sacramento-San Joaquin Delta region. Figure 1 shows the project location.

POTENTIAL ENVIRONMENTAL IMPACTS OF THE PROPOSED PROJECT

The Draft PEIR will include an analysis of all required impact areas, as well as feasible mitigation measures and a reasonable range of alternatives to avoid or reduce potentially significant impacts, if any. Environmental resource areas where it is determined that the proposed project would result in a less than significant impact will be summarized in an "Effects Found to be Less than Significant" section of the Draft PEIR.

Project Title: The Metropolitan Water District of Southern California Climate Action Plan (CAP)

Lead Agency: The Metropolitan Water District of Southern California

Contact Name: Malinda Stalvey

Email: mstalvey@mwdh2o.com Phone Number: (213) 217-5545

Project Location: Multiple counties
City *County*

Project Description (Proposed actions, location, and/or consequences).

Metropolitan is preparing a Program EIR for a Climate Action Plan (CAP) that will outline a strategy for reducing greenhouse gas (GHG) emissions associated with future construction, operation, and maintenance activities. The CAP is a roadmap that analyzes historical and forecasts future GHG emissions; sets a GHG reduction target for reducing emissions consistent with state policies; and identifies a suite of reduction actions that Metropolitan can choose from to achieve the adopted target consistent with Section 15183.5 of the CEQA Guidelines. The CAP is a customized roadmap for making informed decisions and understanding where and how to achieve emissions reductions that conform to Metropolitan's mission/goals in a meaningful and cost-effective manner. While a CAP identifies potential projects that may be implemented to meet GHG reduction goals, no specific projects will be implemented without further CEQA review.
See attached for additional description of proposed actions and location.

Identify the project's significant or potentially significant effects and briefly describe any proposed mitigation measures that would reduce or avoid that effect.

See attached for potentially significant effects that could occur and potential mitigation measures under consideration for each issue area.

Revised September 2011

continued

If applicable, describe any of the project's areas of controversy known to the Lead Agency, including issues raised by agencies and the public.

There are no areas of known controversy for the proposed project.

Provide a list of the responsible or trustee agencies for the project.

Summary Form for Electronic Document Submittal - Attachment

Project Description (Proposed actions, location, and/or consequences) *(continued)*

It is anticipated that most reduction measures would be implemented throughout a six-county Southern California region comprised of Los Angeles, Orange, Riverside, San Bernardino, San Diego, and Ventura counties. These counties include all of Metropolitan's service area and most of its infrastructure facilities. The CAP may also involve implementation of GHG reduction measures or programs at Metropolitan land holdings in Imperial County, specifically within the Palo Verde Irrigation District, as well as land holdings in San Joaquin and Contra Costa counties, specifically on lands commonly known Bacon Island, Bouldin Island, Holland Tract, and Webb Tract in the Sacramento-San Joaquin Delta region.

Identify the project's significant or potentially significant effects and briefly describe any proposed mitigation measures that would reduce or avoid that effect. *(continued)*

Potentially significant effects could occur in the below listed areas. Potential mitigation measures under consideration are also listed for each issue area.

- Aesthetics - Light spillover reduction, design modifications, vegetation replacement, geologic formation avoidance
- Agriculture and Forestry Resources - Avoidance of farmland and Williamson Act contracted land, mitigation
- Air Quality - Construction fugitive dust control, odor minimization plans, health risk assessment
- Biological Resources - Biological resources assessment, worker environmental awareness program, wetland restoration
- Cultural Resources - Historical resource implementation program, archaeological resources investigation
- Hazards and Hazardous Materials - Prepare Phase I and II Environmental Site Assessments
- Land Use and Planning - Coordinate with jurisdictions, maintain access to community facilities during construction
- Mineral Resources - Mineral resources surveys
- Noise - Project-level noise and vibration analyses, construction and staging avoidance of sensitive receptors
- Paleontological Resources - Paleontological resources studies and construction monitoring, salvage of fossils
- Transportation - Construction transportation management plans at project level
- Tribal Cultural Resources – To be determined based on results of tribal outreach
- Utilities and Service Systems – Construction and operational water and energy conservation measures
- Wildfire - Construction traffic management plan to maintain emergency access, spark arresters, avoidance of landslide-susceptible areas and slopes hillsides for new structures

ENVIRONMENTAL IMPACT REPORT EVALUATION/RESPONSE CHECKLIST FOR AREA/SECTION

Reference: General Order 41.2

	Action	Reference GO 41.2
☐	Review memorandum for the due date(s).	
☐	Determine if the proposed project might impact local operations and/or public safety. Examples include: housing developments, large commercial projects, large recreational developments or expansions, landfill or quarry operations, hazardous materials storage and/or dump sites, highway construction/improvement projects, new schools, airport improvements, annexations/incorporations, off-highway vehicle facilities, and Indian gaming facilities.	Page 5
☐	Review environmental impact documents to identify issues or concerns with possible impact to departmental operations (i.e., increased response times, enforcement, emergency services, service calls, telecommunications, public safety).	
	Responses	
☐	**<u>If comments are advisable</u>:**	
☐	Correspondence should focus primarily on traffic safety, congestion, or other impacts to the CHP's mission; however, **Areas shall not indicate to the lead agency that additional personnel, facilities, vehicles, etc., are a means to mitigate departmental service issues**.	Page 7
☐	Ensure the State Clearinghouse number (SCH#) is included in all correspondence.	
☐	Comments shall be provided directly to the lead agency and emailed to State Clearinghouse at state.clearinghouse@opr.ca.gov no later than the designated due date. Provide a copy to Special Projects Section (SPS) via electronic mail (e-mail).	
	For project tracking purposes, SPS must be notified of Area/Section's assessment of the project. After mailing your comments to the SCH or lead agency, send a scanned copy via e-mail to SPS.	
☐	<u>If no impact is determined</u>:	
☐	Via e-mail, please respond "no impact to _____ Area's local operations and/or public safety by SCH# _____ was identified," by the designated SCH due date to the SPS analyst listed on the Environmental Document Review and Response memorandum. Ensure the SCH# is included.

Environmental Planning Section
P.O. Box 54153
Los Angeles, CA 90054-0153

Project: Notice of Preparation of a Draft Program Environmental Impact Report for The Metropolitan Water District of Southern California Climate Action Plan

Dear Ms. Stalvey:

The Mojave Desert Air Quality Management District (District) has received a Notice of Preparation and Scoping Meeting for The Metropolitan Water District (MWD) of Southern California Climate Action Plan (CAP). MWD is requesting input regarding the scope and content of environmental information to be included in the Draft PEIR.

The District has reviewed the Notice of Preparation and Scoping Meeting Notice. The District recommends the Draft PEIR should analyze potential short-term and long-term air quality impacts associated with the proposed plan, and recommends the use of URBEMIS or CalEEMod as the appropriate computer model to be used to estimate associated emissions. District California Environmental Quality Act (CEQA) significance thresholds can be found in the "MDAQMD CEQA and Federal Conformity Guidelines" (available for download at the MDAQMD website https://www.mdaqmd.ca.gov/rules/overview).

Thank you for the opportunity to review this planning document. If you have any questions regarding this letter, please contact me at (760) 245-1661, extension 6726, or Tracy Walters at extension 6122.

Sincerely,

Alan J. De Salvio
Deputy Director – Mojave Desert Operations

Los Angeles, California 90054-0153

Project: The Metropolitan Water District of Southern California Climate Action Plan Notice of Preparation

District CEQA Reference No: 20200538

Dear Ms. Stalvey,

The San Joaquin Valley Unified Air Pollution Control District (District) has reviewed the project referenced above from the Metropolitan Water District of Southern California consisting of a Climate Action Plan (CAP) to outline a strategy for reducing greenhouse gas (GHG) emissions associated with future construction, operation, and maintenance activities (Project). The Project is located at Bacon Island, Bouldin Island, Holland Tract, and Webb Tract in the Sacramento-San Joaquin Delta Region. The District offers the following comments:

Project Description

The Metropolitan Water District of Southern California is proposing in the CAP a comprehensive roadmap that analyzes historical GHG emissions, prepares a forecast of future GHG emissions, sets a GHG reduction target for reducing emissions consistent with applicable state policies, and identifies a suite of specific reduction actions that Metropolitan can chose from to achieve the adopted target consistent with Section 15183.5 of the State CEQA Guidelines.

The District offers the following comments:

1) Project Related Emissions

The District recommends that a more detailed preliminary review of the Project be conducted. The additional environmental review of the Project's potential impact on air quality should consider the following items:

Samir Sheikh
Executive Director/Air Pollution Control Officer

Northern Region
4800 Enterprise Way
Modesto, CA 95356-8718
Tel: (209) 557-6400 FAX: (209) 557-6475

Central Region (Main Office)
1990 E. Gettysburg Avenue
Fresno, CA 93726-0244
Tel: (559) 230-6000 FAX: (559) 230-6061

Southern Region
34946 Flyover Court
Bakersfield, CA 93308-9725
Tel: (661) 392-5500 FAX: (661) 392-5585

www.valleyair.org www.healthyairliving.com

1a) Recommended Model: Project related criteria pollutant emissions from construction and operation non-permitted (limited to equipment not subject to District permits) should be identified and quantified. Emissions analysis should be performed using CalEEMod (California Emission Estimator Model), which uses the most recent approved version of relevant Air Resources Board (ARB) emissions models and emission factors. CalEEMod is available to the public and can be downloaded from the CalEEMod website at: www.caleemod.com.

1b) Project Related Construction Emissions: Construction emissions are short-term emissions and should be evaluated separately from operational emissions. Equipment exhaust, as well as fugitive dust emissions should be quantified.

For reference, the District's annual criteria thresholds of significance for construction are: 100 tons per year of carbon monoxide (CO), 10 tons per year of oxides of nitrogen (NOx), 10 tons per year of reactive organic gases (ROG), 27 tons per year of oxides of sulfur (SOx), 15 tons per year of particulate matter of 10 microns or less in size (PM10), or 15 tons per year of particulate matter of 2.5 microns or less in size (PM2.5).

1c) Project Related Operational Emissions – Cleanest Available Truck: Permitted (stationary sources) and non-permitted (mobile sources) sources should be analyzed separately. For reference, the District's annual criteria thresholds of significance for operational emissions are listed above.

The San Joaquin Valley will not be able to attain stringent health-based federal air quality standards without significant reductions in emissions from heavy-heavy duty (HHD) Trucks, the single largest source of NOx emissions in the San Joaquin Valley. The District recently adopted the 2018 PM2.5 Plan which includes significant new reductions from HHD Trucks, including emissions reductions by 2023 through the implementation of the California Air Resources Board (CARB) Statewide Truck and Bus Regulation, which requires truck fleets operating in California to meet the 2010 0.2 g/bhp-hr NOx standard by 2023. Additionally, to meet the federal air quality standards by the 2020 to 2024 attainment deadlines, the District's Plan relies on a significant and immediate transition of heavy duty truck fleets to zero or near-zero emissions technologies, including the near-zero truck standard of 0.02 g/bhp-hr NOx established by the California Air Resources Board.

For development projects which typically generate a high volume of heavy duty truck traffic (e.g. "high-cube" warehouse or distribution center), there are heavy duty trucks traveling to-and-from from the project location at longer trip length

distances for potential distribution. To reduce impacts from operational mobile source emissions, the District recommends that the following mitigation measures be considered for inclusion in the EIR.

- Advise fleets associated with Project operational activities to utilize the cleanest available HHD truck technologies, including zero and near-zero (0.02 g/bhp-hr NOx) technologies as feasible.

- Advise all on-site service equipment (cargo handling, yard hostlers, forklifts, pallet jacks, etc.) to utilize zero-emissions technologies as feasible.

- Advise fleets associated with future development projects to be subject to the best practices (i.e. eliminating unnecessary idling).

In addition, the District recommends that the mitigation measures be included to reduce project related operational impacts through incorporation of design elements, for example, increased energy efficiency, reducing vehicle miles traveled, etc. More information on mitigation measures can be found on the District's website at http://www.valleyair.org/transportation/Mitigation-Measures.pdf.

1d) Project Related Operational Emissions – Truck Routing

Truck routing involves the path/roads heavy-duty trucks take to and from their destination. The air emissions from heavy-duty trucks can impact residential communities and sensitive receptors.

The District recommends the EIR evaluate heavy-duty truck routing patterns to help limit emission exposure to residential communities and sensitive receptors. More specifically, this measure would assess current truck routes, in consideration of the number and type of each vehicle, destination/origin of each vehicular trip, time of day/week analysis, vehicle miles traveled and emissions. The truck routing study would also identify alternative truck routes and their impacts on VMT, GHG emissions, and air quality.

2) District Rules and Regulations

The District issues permits for many types of air pollution sources and regulates some activities not requiring permits. A project subject to District rules and regulation would reduce its impacts on air quality through compliance with regulatory requirements. In general, a regulation is a collection of rules, each of which deals with a specific topic. Here are a couple of example, Regulation II (Permits) deals with permitting emission

sources and includes rules such as District permit requirements (Rule 2010), New and Modified Stationary Source Review (Rule 2201), and implementation of Emission Reduction Credit Banking (Rule 2301).

The list of rules below is neither exhaustive nor exclusive. Current District rules can be found online at: www.valleyair.org/rules/1ruleslist.htm. To identify other District rules or regulations that apply to this Project or to obtain information about District permit requirements, the applicant is strongly encouraged to contact the District's Small Business Assistance (SBA) Office at (209) 557-6446.

2a) District Rules 2010 and 2201 - Air Quality Permitting for Stationary Sources

Stationary Source emissions include any building, structure, facility, or installation which emits or may emit any affected pollutant directly or as a fugitive emission. District Rule 2010 requires operators of emission sources to obtain an Authority to Construct (ATC) and Permit to Operate (PTO) from the District. District Rule 2201 requires that new and modified stationary sources of emissions mitigate their emissions using best available control technology (BACT).

This future developments may be subject to District Rule 2010 (Permits Required) and Rule 2201 (New and Modified Stationary Source Review) and will require District permits. Prior to construction, the Project proponent should submit to the District an application for an Authority to Construct (ATC). For further information or assistance, the project proponent may contact the District's Small Business Assistance (SBA) Office at (209) 557-6446.

2b) District Rule 9510 (Indirect Source Review)

The purpose of District Rule 9510 is to reduce the growth in both NOx and PM10 emissions associated with development and transportation projects from mobile and area sources associated with construction and operation of development projects. The rule encourages clean air design elements to be incorporated into development projects. In case the proposed development project clean air design elements are insufficient to meet the targeted emission reductions, the rule requires developers to pay a fee used to fund projects to achieve off-site emissions reductions.

Accordingly, future development projects within the Project would be subject to District Rule 9510 if:

(1) Upon full build-out, the project would receive a project-level discretionary approval from a public agency and would equal or exceed any one of the following applicability thresholds:

- 50 dwelling units
- 2,000 square feet of commercial space;
- 25,000 square feet of light industrial space;
- 100,000 square feet of heavy industrial space;
- 20,000 square feet of medical office space;
- 39,000 square feet of general office space; or
- 9,000 square feet of educational space; or
- 10,000 square feet of government space; or
- 20,000 square feet of recreational space; or
- 9,000 square feet of space not identified above

(2) Or would equal or exceed any of the applicability thresholds in section 2.2 of the rule.

District Rule 9510 also applies to any transportation or transit development projects where construction exhaust emissions equal or exceed two (2.0) tons of NOx or two (2.0) tons of PM10.

In the case the future development project(s) are subject to District Rule 9510, an Air Impact Assessment (AIA) application is required and the District recommends that demonstration of compliance with District Rule 9510, before issuance of the first building permit, be made a condition of Project approval.

Information about how to comply with District Rule 9510 can be found online at: http://www.valleyair.org/ISR/ISRHome.htm.

The AIA application form can be found online at: http://www.valleyair.org/ISR/ISRFormsAndApplications.htm.

District staff is available to provide assistance with determining if future development projects will be subject to Rule 9510, and can be reached by phone at (559) 230-6000 or by email at ISR@valleyair.org.

2c) Other District Rules and Regulations

Future projects may also be subject to the following District rules: Regulation VIII, (Fugitive PM10 Prohibitions), Rule 4102 (Nuisance), Rule 4601 (Architectural Coatings), and Rule 4641 (Cutback, Slow Cure, and Emulsified Asphalt, Paving

and Maintenance Operations). In the event an existing building will be renovated, partially demolished or removed, the project may be subject to District Rule 4002 (National Emission Standards for Hazardous Air Pollutants).

If you have any questions or require further information, please contact Will Worthley by e-mail at will.worthley@valleyair.org or by phone at (559) 230-5925.

Sincerely,

For Arnaud Marjollet
Director of Permit Services

Notice of Preparation of a Draft Program Environmental Impact Report for The Metropolitan Water District of Southern California Climate Action Plan

South Coast Air Quality Management District (South Coast AQMD) staff appreciates the opportunity to comment on the above-mentioned document. South Coast AQMD staff's comments are recommendations regarding the analysis of potential air quality impacts from the Proposed Project that should be included in the Draft Program Environmental Impact Report (PEIR). Please send a copy of the Draft PEIR upon its completion and public release directly to South Coast AQMD at the address shown in the letterhead. Note that copies of the Draft PEIR that are submitted to the State Clearinghouse are not forwarded to South Coast AQMD. **In addition, please send with the Draft PEIR all appendices or technical documents related to the air quality, health risk, and greenhouse gas analyses and electronic versions of all air quality modeling and health risk assessment files[1]. These include emission calculation spreadsheets and modeling input and output files (not PDF files). Without all files and supporting documentation, South Coast AQMD staff will be unable to complete our review of the air quality analyses in a timely manner. Any delays in providing all supporting documentation will require additional time for review beyond the end of the comment period.**

CEQA Air Quality Analysis

South Coast AQMD adopted its California Environmental Quality Act (CEQA) Air Quality Handbook in 1993 to assist other public agencies with the preparation of air quality analyses. South Coast AQMD staff recommends that the Lead Agency use this Handbook as guidance when preparing its air quality analyses. Copies of the Handbook are available from the South Coast AQMD's Subscription Services Department by calling (909) 396-3720. More recent guidance developed since this Handbook was published is also available on South Coast AQMD's website at: http://www.aqmd.gov/home/regulations/ceqa/air-quality-analysis-handbook/ceqa-air-quality-handbook-(1993). South Coast AQMD staff also recommends that the Lead Agency use the CalEEMod land use emissions software. This software has recently been updated to incorporate up-to-date state and locally approved emission factors and methodologies for estimating pollutant emissions from typical land use development. CalEEMod is the only software model maintained by the California Air Pollution Control Officers Association (CAPCOA) and replaces the now outdated URBEMIS. This model is available free of charge at: www.caleemod.com.

On March 3, 2017, the South Coast AQMD's Governing Board adopted the 2016 Air Quality Management Plan (2016 AQMP), which was later approved by the California Air Resources Board on March 23, 2017.

[1] Pursuant to the CEQA Guidelines Section 15174, the information contained in an EIR shall include summarized technical data, maps, plot plans, diagrams, and similar relevant information sufficient to permit full assessment of significant environmental impacts by reviewing agencies and members of the public. Placement of highly technical and specialized analysis and data in the body of an EIR should be avoided through inclusion of supporting information and analyses as appendices to the main body of the EIR. Appendices to the EIR may be prepared in volumes separate from the basic EIR document, but shall be readily available for public examination and shall be submitted to all clearinghouses which assist in public review.

Built upon the progress in implementing the 2007 and 2012 AQMPs, the 2016 AQMP provides a regional perspective on air quality and the challenges facing the South Coast Air Basin. The most significant air quality challenge in the Basin is to achieve an additional 45 percent reduction in nitrogen oxide (NOx) emissions in 2023 and an additional 55 percent NOx reduction beyond 2031 levels for ozone attainment. The 2016 AQMP is available on South Coast AQMD's website at: http://www.aqmd.gov/home/library/clean-air-plans/air-quality-mgt-plan.

South Coast AQMD staff recognizes that there are many factors Lead Agencies must consider when making local planning and land use decisions. To facilitate stronger collaboration between Lead Agencies and South Coast AQMD to reduce community exposure to source-specific and cumulative air pollution impacts, South Coast AQMD adopted the Guidance Document for Addressing Air Quality Issues in General Plans and Local Planning in 2005[2]. This Guidance Document provides suggested policies that local governments can use in their General Plans or through local planning to prevent or reduce potential air pollution impacts and protect public health. South Coast AQMD staff recommends that the Lead Agency review this Guidance Document as a tool when making local planning and land use decisions. Additional guidance on siting incompatible land uses (such as placing homes near freeways or other polluting sources) can be found in the California Air Resources Board's *Air Quality and Land Use Handbook: A Community Health Perspective*, which can be found at: http://www.arb.ca.gov/ch/handbook.pdf. Guidance[3] on strategies to reduce air pollution exposure near high-volume roadways can be found at: https://www.arb.ca.gov/ch/rd_technical_advisory_final.PDF.

South Coast AQMD has developed both regional and localized significance thresholds. South Coast AQMD staff recommends that the Lead Agency quantify criteria pollutant emissions and compare the emissions to South Coast AQMD's CEQA regional pollutant emissions significance thresholds[4] and localized significance thresholds (LSTs)[5] to determine the Proposed Project's air quality impacts. The localized analysis can be conducted by either using the LST screening tables or performing dispersion modeling.

When specific development is reasonably foreseeable as result of the goals, policies, and guidelines in the Proposed Project, the Lead Agency should identify any potential adverse air quality impacts and sources of air pollution that could occur using its best efforts to find out and a good-faith effort at full disclosure in the EIR. The degree of specificity will correspond to the degree of specificity involved in the underlying activity which is described in the EIR (CEQA Guidelines Section 15146). When quantifying air quality emissions, emissions from both construction (including demolition, if any) and operations should be calculated. Construction-related air quality impacts typically include, but are not limited to, emissions from the use of heavy-duty equipment from grading, earth-loading/unloading, paving, architectural coatings, off-road mobile sources (e.g., heavy-duty construction equipment) and on-road mobile sources (e.g., construction worker vehicle trips, material transport trips, and hauling trips). Operation-related air quality impacts may include, but are not limited to, emissions from stationary sources (e.g., boilers), area sources (e.g., solvents and coatings), and vehicular trips (e.g., on- and off-road tailpipe emissions and entrained dust). Air quality impacts from indirect sources, such as sources that generate or attract vehicular trips, should be included in the analysis. Furthermore, emissions from the overlapping construction and operational activities should be combined and compared to South Coast AQMD's regional air quality CEQA ***operational*** thresholds to determine the level of significance.

[2] South Coast AQMD. 2005. Accessed at: http://www.aqmd.gov/docs/default-source/planning/air-quality-guidance/complete-guidance-document.pdf.

[3] In April 2017, CARB published a technical advisory, *Strategies to Reduce Air Pollution Exposure Near High-Volume Roadways: Technical Advisory*, to supplement CARB's Air Quality and Land Use Handbook: A Community Health Perspective. This technical advisory is intended to provide information on strategies to reduce exposures to traffic emissions near high-volume roadways to assist land use planning and decision-making in order to protect public health and promote equity and environmental justice. The technical advisory is available at: https://www.arb.ca.gov/ch/landuse.htm.

[4] South Coast AQMD's CEQA regional pollutant emissions significance thresholds can be found here: http://www.aqmd.gov/docs/default-source/ceqa/handbook/scaqmd-air-quality-significance-thresholds.pdf.

[5] Guidance for performing a localized air quality analysis can be found at: http://www.aqmd.gov/home/regulations/ceqa/air-quality-analysis-handbook/localized-significance-thresholds.

If the Proposed Project generates or attracts vehicular trips, especially heavy-duty diesel-fueled vehicles, it is recommended that the Lead Agency perform a mobile source health risk assessment[6]. An analysis of all toxic air contaminant impacts due to the use of equipment potentially generating such air pollutants should also be included.

Mitigation Measures

If the Proposed Project generates significant adverse air quality impacts, CEQA requires that all feasible mitigation measures that go beyond what is required by law be utilized during project construction and operation to minimize or eliminate these impacts. Pursuant to CEQA Guidelines Section 15126.4 (a)(1)(D), any impacts resulting from mitigation measures must also be discussed. Several resources are available to assist the Lead Agency with identifying possible mitigation measures for the Proposed Project, including:

- Chapter 11 "Mitigating the Impact of a Project" of South Coast AQMD's *CEQA Air Quality Handbook*
- South Coast AQMD's CEQA web pages available here: http://www.aqmd.gov/home/regulations/ceqa/air-quality-analysis-handbook/mitigation-measures-and-control-efficiencies
- South Coast AQMD's Rule 403 – Fugitive Dust, and the Implementation Handbook for controlling construction-related emissions and Rule 1403 – Asbestos Emissions from Demolition/Renovation Activities
- California Air Pollution Control Officers Association's (CAPCOA) *Quantifying Greenhouse Gas Mitigation Measures* available here: http://www.capcoa.org/wp-content/uploads/2010/11/CAPCOA-Quantification-Report-9-14-Final.pdf

Permits

If implementation of the Proposed Project requires a permit from South Coast AQMD, South Coast AQMD should be identified as a Responsible Agency for the Proposed Project in the EIR. For more information on permits, please visit South Coast AQMD's webpage at: http://www.aqmd.gov/home/permits. Questions on permits can be directed to South Coast AQMD's Engineering and Permitting staff at (909) 396-3385.

Data Sources

South Coast AQMD rules and relevant air quality reports and data are available by calling South Coast AQMD's Public Information Center at (909) 396-2001 or at South Coast AQMD's website at: http://www.aqmd.gov.

South Coast AQMD staff is available to work with the Lead Agency to ensure that project air quality and health risk impacts are accurately evaluated and mitigated to the extent feasible. If you have any questions regarding this letter, please contact me at lsun@aqmd.gov.

Sincerely,

Lijin Sun

VENTURA COUNTY
AIR POLLUTION CONTROL DISTRICT
Memorandum

TO: Malinda Stalvey, Sr. Environmental Specialist DATE: July 20, 2020

FROM: Nicole Collazo, Air Quality Specialist

SUBJECT: Request for Review of Notice of Preparation of a Draft Environmental Impact Report for the Metropolitan Water District of Southern California Climate Action Plan (RMA 20-005)

Ventura County Air Pollution Control District (APCD) staff has reviewed the subject Notice of Preparation (NOP) for the draft environmental impact report (DEIR) of the Metropolitan Water District of Southern California's (Metropolitan) Climate Action Plan (CAP), outlining its strategy for reducing greenhouse gas emissions associated with future construction, operation and maintenance activities at the Metropolitan. The Project Location spans 6 Southern California counties, including Ventura County. The Lead Agency for the project is the Metropolitan Water District of Southern California.

General Comments

Air Quality Section- The air quality assessment should consider project consistency with the 2016 Air Quality Management Plan (AQMP) for emissions expected in the Ventura County region. The 2016 AQMP presents Ventura County's strategy (including related mandated elements) to attain the 2008 federal 8-hour ozone standard by 2020, as required by the federal Clean Air Act Amendments of 1990 and applicable U.S. EPA clean air regulations. The 2016 AQMP uses an updated 2012 emissions inventory as baseline for forecasting data, SCAG RTP 2016 data, and CARB's EMFAC2014 emission factors for mobile sources. The AQMP can be downloaded from our website at http://www.vcapcd.org/AQMP-2016.htm.

The Ventura County Air Quality Assessment Guidelines (AQAG) should also be used to evaluate all potential air quality impacts the proposed project will have in Ventura County. The AQAG are also downloadable from our website here: http://www.vcapcd.org/environmental-review.htm. Specifically, the air quality assessment should consider reactive organic compound, nitrogen oxide emissions and particulate matter from all project-related motor vehicles, sources not permitted with APCD, and construction equipment that may result from potential buildout, as appropriate to future development policies and implementation measures. We note that the AQAG has not been updated since 2003 and serves as a reference and is not required or mandated by the APCD (AQAG Page 1-1). Current air quality determinations follow the same process but using different tools (CalEEMod vs. URBEMIS, CO Hotspots analysis no longer

required, etc.). The recommended list of mitigation measures in the AQAG are also limited and outdated. For example, the following template is currently being recommended by APCD as a Commenting Agency for projects that include construction equipment, reflecting state laws adopted since the AQAG was last updated in 2003:

Construction Equipment

Purpose: In order to ensure that ozone precursor and particulate emissions from diesel-powered mobile construction equipment are reduced to the greatest amount feasible.

Requirement: The Permittee shall comply with the provisions of all applicable California State Laws and APCD Rules and Regulations regarding portable construction equipment and construction vehicles.

Documentation: The project applicant shall ensure compliance with the following State Laws and APCD requirements:

I. Construction equipment shall not have visible emissions greater than 20% opacity, as required by APCD Rule 50, Opacity.

II. All portable diesel-powered equipment over 50 BHP shall be registered with the State's Portable Equipment Registration Program (PERP) or an APCD Portable Permit.

III. Off-Road Heavy-Duty trucks shall comply with the California State Regulation for In-Use Off-Road Diesel Vehicles (Title 13, CCR §2449), the purpose of which is to reduce NO_x and diesel particulate matter exhaust emissions.

IV. On-Road Heavy-Duty trucks shall comply with the California State Regulation for In-Use On-Road Diesel Vehicles (Title 13, CCR §2025), the purpose of which is to reduce NO_x and diesel particulate matter exhaust emissions.

V. All commercial on-road and off-road diesel vehicles are subject to the idling limits of Title 13, CCR §2485, §2449(d)(3), respectively. Construction equipment shall not idle for more than five (5) consecutive minutes. The idling limit does not apply to: (1) idling when queuing; (2) idling to verify that the vehicle is in safe operating condition; (3) idling for testing, servicing, repairing or diagnostic purposes; (4) idling necessary to accomplish work for which the vehicle was designed (such as operating a crane); (5) idling required to bring the machine system to operating temperature, and (6) idling necessary to ensure safe operation of the vehicle. It is the Permittee's responsibility to have a written idling policy that is made available to operators of the vehicles and equipment and informs them that idling is limited to 5 consecutive minutes or less, except as exempted in subsection a. above.

The following are recommended measures for construction equipment and vehicles:

I. Diesel powered equipment should be replaced by electric equipment whenever feasible.

II. Maintain equipment engines in good condition and in proper tune as per manufacturer's specifications.

III. Lengthen the construction period during smog season (May through October), to minimize the number of vehicles and equipment operating at the same time.

IV. Use alternatively fueled construction equipment, such as compressed natural gas (CNG), liquefied natural gas (LNG), or electric, if feasible.

V. Minimum Tier 3 diesel off-road equipment shall be used, or Tier 4 if commercially available.

GHG Section- Neither APCD nor the County has adopted a threshold of significance applicable to Greenhouse Gas (GHG) emissions from projects subject to the County's discretionary land use permitting authority. APCD published a report as a request by the Ventura County Air Pollution Control Board to report back on possible GHG thresholds options on November 8, 2011. The District will be looking into what GHG threshold is best suitable for Ventura County in the near future which will undergo a public review process. The County of Ventura is currently in the public review process of adopting a Climate Action Plan, to be included in their General Plan Update. For more information, including draft CAP and DEIR, please visit https://vc2040.org/review/documents.

The following are recommended guidance documents that may be used to address the impacts of climate change and greenhouse gases in Ventura County.

On May 2016, the CARB published a Mobile Source Strategy. In this report, ARB staff is outlining a mobile source strategy that simultaneously meets air quality standards, achieves GHG emission reduction targets, decreases toxics health risk, and reduces petroleum consumption from transportation emissions over the next fifteen years. These goals and targets include These include 1) Attaining federal health-based air quality standards for ozone in 2023 and 2031 in the South Coast and San Joaquin Valley, and fine particulate matter (PM2.5) standards in the next decade; 2) Achieving greenhouse gas (GHG) emission reduction targets of 40 percent below 1990 levels by 2030, with continued progress towards an 80 percent reduction by 2050; 3) Minimizing health risk from exposure to toxic air contaminants; 4) Reducing our petroleum use by up to 50 percent by 2030; and 5) Increasing energy efficiency and deriving 50 percent of our electricity from renewable sources by 2030. The report can be found here: https://www.arb.ca.gov/planning/sip/2016sip/2016mobsrc.htm.

On November 2017, the California Air Resources Board published it latest Climate Change Scoping Plan. The Scoping Plan lays out a strategy for achieving California's 2030 Greenhouse Gas target and builds on the state's successes to date, proposing to strengthen major programs that have been a hallmark of success, while further integrating efforts to reduce both GHGs and air pollution. California's climate efforts will 1) Lower GHG emissions on a trajectory to avoid the worst impacts of climate change; 2) Support a clean energy economy which provides more opportunities for all Californians; 3) Provide a more equitable future with good jobs and less pollution for all communities; 4) Improve the health of all Californians by reducing air and water pollution and making it easier to bike and walk; and 5) Make California an even better place to live, work, and play by improving our natural and working lands. The 2017 Climate Change Scoping Plan can be accessed here https://www.arb.ca.gov/cc/scopingplan/scoping_plan_2017.pdf.

Finally, on December 2018, the Governor's Office of Planning and Research (OPR) published a Draft Technical Advisory. This document incorporates developments since the June 2008 Technical Advisory publication, including regulatory changes made to the regulations that implement CEQA (commonly known as the "CEQA Guidelines" in late 2018 by the California Natural Resources Agency (Agency). Although this document largely focuses on project-level

analyses of greenhouse gas impacts, Section IV.7 briefly addresses community-scale greenhouse gas reduction plans as one pathway to streamline CEQA analyses. This discussion draft is intended to address some common issues and topics that arise in greenhouse gas emissions analyses under CEQA but is not intended to address every single issue and topic. More information on the OPR's Technical Advisory can be found here http://opr.ca.gov/ceqa/technical-advisories.html.

The APCD would like to make the Metropolitan aware of its Incentives Program that are directed at reducing criteria pollutants by reducing the amount of nitrous oxides (NOx) generated from mobile sources. NOx when combined with reactive organic compounds (ROC or VOCs) can react with sunlight to create ground-level smog. The two types of programs, Incentives Program and Transportation Outreach Program, have a co-benefit in indirectly reducing GHG emissions as older, dirtier equipment and vehicles are traded in for newer engines that have stricter air quality emission standards or as Vehicle Miles Travelled (VMT) are reduced due to an increase in alternative modes of transportation, respectively. More information can be found online here on our District Incentive Programs and here on the Transportation Outreach Program. These existing programs may be included in the Metropolitan's CAP as the implementation programs, if the Metropolitan should qualify for funding. Some of these programs include Lower Emission School Bus Program, EV Charging Stations Funding and Funding Agricultural Replacement Measures for Emission Reductions (FARMER).

Environmental Justice- The AB 617 legislation sets out an ambitious implementation schedule for APCD. The California Air Resources Board (CARB) must set the overall direction of the program by October 1, 2018. This includes identifying impacted communities, establishing the criteria for air monitoring and local emissions reduction programs, and developing statewide strategies for reducing emissions. The local air districts also have specific roles and responsibilities. On April 27, 2018, the VCAPCD submitted to CARB a technical assessment to develop an initial list of candidate communities for Ventura County.

On July 31, 2018 the Ventura County Air Pollution Control Board approved the District staff's recommendation that the greater Oxnard/Port Hueneme area be the highest priority region in Ventura County for inclusion in CARB's Community Air Protection Program. District staff's recommendation is based on our assessment that we have not identified a single or multiple sources of significant air emissions that would lead us to identify a smaller region adjacent to these source(s). This is in part based on our review of our permitted sources in the area. The greater Oxnard/Port Hueneme area is also home to several agricultural operations and these operations generally utilize pesticides and diesel equipment. In addition, the Port of Hueneme and several warehouse type distribution centers are located in the area. Heavy-duty trucks associated with these goods movement facilities move throughout the area. In summary, we are looking at a diffuse inventory of air pollution sources in this area. This will likely require additional research including community level air monitoring in several locations to identify any sources of concern. In addition, by having a larger area, the VCAPCD will have flexibility to target our incentive funds within the area as we learn more about potential issues with air pollutant sources in and adjacent to the area.

As amended by Assembly Bill 617 (C. Garcia, Chapter 136, Statutes of 2017), Health and Safety Code section 40920.6(c) requires that on or before January 1, 2019, each local air district that is a

nonattainment area for one or more air pollutants must adopt an expeditious schedule for the implementation of BARCT by the earliest feasible date, but in any event not later than December 31, 2023.

District staff has created a BARCT rule development schedule to comply with this statutory requirement. CARB has identified four affected facilities that are subject to AB 617 BARCT requirements; the facilities are operated by Procter and Gamble, New Indy Container, California Resources (Santa Clara Valley Gas Plant), and Trinity ESC. District staff then evaluated which District rules are applicable to these facilities that may not meet BARCT requirements including Rule 74.23, *Stationary Gas Turbines*; Rule 74.15, *Boilers, Steam Generators and Process Heaters*; Rule 71.3, *Transfer of Reactive Organic Compound Liquids*; and Rule 74.10, *Components at Crude Oil and Natural Gas Production and Processing Facilities*.

Thank you for the opportunity to comment on the NOP and we look forward to reading Metropolitan's DEIR for the proposed project.

Should you have any questions, you may reach me at nicole@vcapcd.org.

STANISLAUS COUNTY ENVIRONMENTAL REVIEW COMMITTEE

July 21, 2020

Ms. Malinda Stalvey, Senior Environmental Specialist
The Metropolitan Water District of Southern California
Environmental Planning Section
P.O. Box 54153
Los Angeles, CA 90054-0153

SUBJECT: ENVIRONMENTAL REFERRAL – THE METROPOLITAN WATER DISTRICT OF SOUTHERN CALIFORNIA – THE METROPOLITAN WATER DISTRICT OF SOUTHERN CALIFORNIA (METROPOLITAN) CLIMATE ACTION PLAN – NOTICE OF PREPARATION OF A DRAFT PROGRAM ENVIRONMENTAL IMPACT REPORT

Ms. Stalvey:

Thank you for the opportunity to review the above-referenced project.

The Stanislaus County Environmental Review Committee (ERC) has reviewed the subject project and has no comments at this time.

The ERC appreciates the opportunity to comment on this project.

Sincerely,

Patrick Cavanah
Sr. Management Consultant
Environmental Review Committee

TO: Anthony Ciuffetelli, RMA Planner
County of Ventura

FROM: Sergio Vargas, Deputy Director S.V.

SUBJECT: RMA20-005 Climate Action Plan NOP
Various Zones
Watershed Protection Project Number: WC2020-0027

Pursuant to your request dated June 24, 2020, this office has reviewed the submitted materials and provides the following comments.

PROJECT LOCATION:

Throughout a six-county Southern California region comprised of Los Angeles, Orange, Riverside, San Bernardino, San Diego, and Ventura counties.

PROJECT DESCRIPTION:

Metropolitan is preparing a Climate Action Plan (CAP) to outline a strategy for reducing greenhouse gas (GHG) emissions associated with future construction, operation, and maintenance activities. The CAP is a comprehensive roadmap that analyzes historical GHG emissions, prepares a forecast of future GHG emissions, sets a GHG reduction target for reducing emissions consistent with applicable state policies, and identifies a suite of specific reduction actions that Metropolitan can choose from to achieve the adopted target consistent with Section 15183.5 of the State CEQA Guidelines. The CAP is a customized roadmap for making informed decisions and understanding where and how to achieve emissions reductions that conform to Metropolitan's mission/goals in a meaningful and cost-effective manner. While a CAP identifies potential projects that may be implemented to meet GHG reduction goals, no specific projects will be implemented without further CEQA review.

WATERSHED PROTECTION DISTRICT COMMENTS:

Flood Control Facilities / Watercourses – Ventura County Watershed Protection District

Activities Within Jurisdictional Channel Limits Will Require Watercourse/Encroachment Permits

To comply with the *Ventura County Watershed Protection District (WP) Ordinance*, and mitigate potential impacts, any activities proposed in, on, over, under, or across a jurisdictional channel or WP's Right of Way will require a permit. The applicant shall obtain the appropriate WP permit prior to obtaining a building permit or grading permit or prior to project start date if no grading or building permits are required. Prior to permit closure, Watershed Protection District staff shall inspect the project site to assure that construction was completed in accordance with the any approved plans and the Permit.

If you have any questions, please feel free to contact Sergio Vargas by email at Sergio.Vargas@ventura.org or by phone at (805) 640-4077.

1.3 User Entered Comments & Non-Default Data

Sample Met CAP Program Activity - Statewide , Annual

Project Characteristics - Assumed 12-month construction schedule.

Land Use -

Construction Phase - Adjusted schedule to be one year.

Off-road Equipment - Use of equipment for eight hours per day.

Off-road Equipment - Use of all equipment for eight hours each day.

Off-road Equipment - Reduced default equipment list.

Off-road Equipment - Reduced default equipment list.

Off-road Equipment - Default equpiment list.

Off-road Equipment - Reduced default equipment list.

Demolition - Assumed 20,000 square feet of demolition.

Grading - Assumed 1,000 CY import and 1,000 CY export.

Architectural Coating - Assumed 10,000 sf of painted area for interior and exterior.

Construction Off-road Equipment Mitigation - Assumed Tier 2 for all equipment

Trips and VMT - Added water truck trips.

1.3 User Entered Comments & Non-Default Data

Sample Met CAP Program Activity - Statewide , Winter

Project Characteristics - Assumed 12-month construction schedule.

Land Use -

Construction Phase - Adjusted schedule to be one year.

Off-road Equipment - Use of equipment for eight hours per day.

Off-road Equipment - Use of all equipment for eight hours each day.

Off-road Equipment - Reduced default equipment list.

Off-road Equipment - Reduced default equipment list.

Off-road Equipment - Default equpiment list.

Off-road Equipment - Reduced default equipment list.

Demolition - Assumed 20,000 square feet of demolition.

Grading - Assumed 1,000 CY import and 1,000 CY export.

Architectural Coating - Assumed 10,000 sf of painted area for interior and exterior.

Construction Off-road Equipment Mitigation - Assumed Tier 2 for all equipment

Trips and VMT - Added water truck trips.

1 Biological Resources Existing Conditions

The Plan Area includes all of Metropolitan's service area and spans approximately 38,280 square miles, including the following six counties: Los Angeles, Orange, Riverside, San Bernardino, San Diego, and Ventura Counties, as well as the portion of Palo Verde Valley in Imperial County and Bacon Island, Bouldin Island, Holland Tract, and Webb Tract, in the Sacramento-San Joaquin Delta region (San Joaquin County and Contra Costa County). It is anticipated that construction of planned projects would occur at Metropolitan facilities or within Metropolitan rights-of-way. Specifically, the following Metropolitan locations have been identified as potential project sites for projects that would be implemented under the CAP: Robert B. Diemer (Diemer) Water Treatment Plant (WTP) (Orange County), Joseph Jensen (Jensen) WTP (Los Angeles County), Robert A. Skinner (Skinner) WTP (Riverside County), F.E. Weymouth WTP (Los Angeles County), Metropolitan-owned agricultural land at southwest corner of 35th Avenue and Keim Boulevard (Riverside County), and Webb Tract, Holland Tract, Bouldin Island, and Bacon Island in the Bay Delta (San Joaquin/Contra Costa Counties). However, because the precise locations of all planned projects that may be implemented under the CAP are not known at this time, this section includes a discussion of sensitive biological resources, including habitat classifications, drainages and wetlands, sensitive natural communities, special status plants and wildlife, and wildlife movement corridors that are known to occur in the Plan Area.

1.1 Habitat Classifications

Los Angeles, Orange, Riverside, San Bernardino, San Diego, and Ventura Counties; Palo Verde Valley in Imperial County; and the Sacramento-San Joaquin Delta region contain a wide diversity of tree (hardwood and coniferous forest, oak woodland, riparian woodland), shrub (chaparral, coastal scrub, creosote bush scrub), and herbaceous (grassland, wetlands) habitat types. Vegetation communities are important biological resources because they provide habitat for special status plants and wildlife and provide wildlife movement corridors. The following 12 habitat classification are mapped within the Plan Area using the LANDFIRE (2020) Landscape Fire and Resource Management Planning Tools (Table 1; Figure 1 through Figure 8): Agricultural, Conifer, Conifer-Hardwood, Developed, Exotic Herbaceous, Exotic Tree-Shrub, Grassland, Hardwood, Open Water, Riparian, Shrubland, and Sparsely Vegetated.

LANDFIRE is a shared program between the wildland fire management programs of the U.S. Department of Agriculture Forest Service and U.S. Department of the Interior. It provides landscape-scale geo-spatial products. A description of each of these habitat classifications is provided below as adapted from the U.S. National Vegetation Classification (USNVC) (2020) system.

Due to the large scale of the Plan Area and the level at which habitats are mapped using the LANDFIRE/USNVC classification system, habitat classifications are generalized and site-specific variation is likely present. Further, the LANDFIRE classification system maps habitats from a broad perspective, and in many areas two or more habitats may converge with one another.[1] Table 1 provides the percentage of each habitat type within each county in the Plan Area.

[1] Vernal pools, wetlands and drainages are discussed separately in subsection *Drainages and Wetlands* utilizing sources of information that better capture aquatic and wetland habitats that are of smaller scale in the landscape such as the National Wetlands Inventory.

Fig 4.4-x Habitat Classifications in Palo Verde Valley

Agricultural

This classification includes agricultural vegetation, including row crops, planted grain crops, pastures, hayfields, horticultural crops (such as commercial flower operations), fallow fields and early-successional weed fields, and wetland rice and taro crop fields. Large areas of agricultural land occur surrounding the cities of Palmdale and Lancaster in Los Angeles County; east of the city of Indio and near Blythe in Riverside County; near the city of Fallbrook in San Diego County; surrounding developed areas in much of Ventura County; and encompasses the majority of terrestrial landcover in the Sacramento-San Joaquin Delta region and the Palo Verde Valley.

Conifer

This classification consists of coniferous forests and woodlands below about 2,450 meters (8,000 feet) above mean sea level, primarily found along the immediate coast or within the coastal ranges. Dominant species in this classification include cypress (*Hesperocyparis* sp.) and pines (*Pinus* sp.), with limited oaks (*Quercus* sp.) and other hardwoods. Large areas of conifer habitats occur in the San Gabriel Mountains in Los Angeles County; in the Santa Ana Mountains in Orange County; in the San Jacinto and San Bernardino Mountains in Riverside County; in the San Bernardino and San Gabriel Mountains in San Bernardino County; in the Palomar and Cuyamaca Mountains in San Diego County; and in the Santa Ynez and San Rafael Mountains in Ventura County.

Conifer-Hardwood

This forest classification is characterized by a mix of coniferous and broad-leaved evergreen trees. Species in this classification include pines, oaks, beech (*Chrysolepis* sp.), Douglas fir (*Pseudotsuga* sp.), and bays (*Umbellularia* sp.). Conifer-hardwood habitats generally serve as the transition between conifer and hardwood habitats and do not represent a large portion of the habitats of any county or region.

Developed

Developed areas include a mixture of some constructed materials and vegetation in the form of lawn grasses. Impervious surfaces account for less than 20 percent to 100 percent of the total cover. These areas include commercial/industrial, apartment complexes, row houses, single-family housing units, large-lot single-family housing units, parks, golf courses, and vegetation planted in developed settings for recreation, erosion control, or aesthetic purposes. As shown in the LANDFIRE figures, large areas of developed land occur in metropolitan (metro) Los Angeles, the San Fernando Valley, the San Gabriel Valley, and Palmdale in Los Angeles County; across much of Orange County; in metro Riverside and Palm Springs in Riverside County; in metro San Bernardino and Victorville in San Bernardino County; in metro San Diego from Oceanside to the Mexican border in San Diego County; in metro Ventura, Oxnard, and the Conejo Valley in Ventura County; and in and around Blythe in southeastern Riverside County.

Exotic Herbaceous

This classification occurs in temperate areas throughout western North America and is comprised of disturbed upland grasslands, meadows and shrublands dominated by non-native and generalist native species. Large areas of exotic herbaceous habitats occur near the cities of Palmdale and Lancaster in Los Angeles County; near Laguna Woods and scattered throughout south Orange County; between Banning and Desert Hot Springs in Riverside County; in Marine Corps Base Camp Pendleton and near San Ysabel in San Diego County; and near Fillmore in Ventura County. Large areas of exotic herbaceous habitats are mainly absent from San Bernardino County. Exotic herbaceous habitats are

mostly found along the edges of other habitats in the Sacramento-San Joaquin Delta region but do not occur in large expanses.

Exotic Tree-shrub

This classification is generally found on mountainsides in California. Stands are typically 5-50 meters (16 to 164 feet) tall and can have an open canopy to dense tree canopy (greater than 10 percent tree cover) that is strongly dominated (greater than 90 percent relative cover) by exotic tree species such as gum (*Eucalyptus* sp.). Large areas of exotic tree-shrub habitats occur surrounding the San Luis Rey River in San Diego County and on the side of the San Rafael Mountains near Pine Mountain Club.

Grassland

This classification includes native perennial grasslands, native annual grasslands and native annual forb meadows. Species in this classification include grasses (*Bromus* sp. and *Festuca* sp.), fiddleneck (*Amsinckia* sp.) and poppies (*Eschscholzia* sp.). Large areas of grassland habitats occur near Santa Clarita and along the foothills of the San Gabriel Mountains in Los Angeles County; the foothills of the Santa Ana Mountains in Orange County; scattered throughout southern Riverside County; in the foothills of the San Bernardino Mountains in San Bernardino County; in Marine Corps Base Camp Pendleton in San Diego County; and within the San Rafael Mountains in Ventura County.

Hardwood

This classification consists of oak and other broadleaf woodlands which are primarily dominated by various oak species. Large areas of hardwood habitats occur along the foothills of the San Gabriel Mountains in Los Angeles County; along the foothills of the Palomar and Cuyamaca Mountain Ranges in San Diego County; and along the foothills of the Santa Ynez Mountains in Ventura County.

Open Water

This classification includes areas of open water, generally with less than 25 percent cover of vegetation or soil. Large areas of open water within the Plan Area include Castaic Lake in Los Angeles County; Newport Back Bay and Irvine Lake in Orange County; Lake Matthews, Lake Elsinore, Perris Reservoir, Diamond Valley Lake, the Salton Sea, and the Colorado River in Riverside County; Big Bear Lake, Lake Havasu, and the Colorado River in San Bernardino County; Lake Henshaw and the San Vincente Reservoir in San Diego County; Lake Casitas in Ventura County; and the Sacramento-San Joaquin Delta in the Sacramento-San Joaquin Delta region.

Riparian

This classification consists of riparian, floodplain, seep, and oasis habitats dominated by trees. Riparian habitats are dependent on a water source such as a river, stream, lake, or pond. Dominant species in this classification include sycamore (*Platanus* sp.), cottonwoods (*Populus* sp.), and willows (*Salix* spp.). Riparian habitats are considered rare and, as such, do not represent a large portion of the Plan Area. Riparian habitat is found along the edges of Bacon Island, Bouldin Island, Holland Tract and Webb Tract in the Sacramento-San Joaquin Delta region.

Shrubland

This classification is dominated by a variety of native scrub or chaparral habitats but may also include annual and perennial native and non-native grass and herb vegetation endemic to the Mediterranean climate zone of California. Shrubland habitats make up one of the largest habitat classifications. Large areas of shrubland habitats can be found throughout the Plan Area.

Sparsely Vegetated

This classification includes open deserts and other regions where vegetation is very sparse. It is characterized by areas where the ground layer consists of sand, stony desert pavements, or salt crust (bare rock, often with nonvascular mats is placed in lithomorphic vegetation). Sparsely vegetated habitats are mainly limited to the desert regions of Los Angeles, Riverside, San Bernardino, and San Diego Counties.

1.2 Drainages and Wetlands

Watersheds and Drainages

The Plan Area contains seven primary watersheds: the Los Angeles River, Santa Ana River, Santa Margarita River, Whitewater River, Laguna-San Diego Coastal, Ventura-San Gabriel Coastal, and San Joaquin. Many rivers, creeks and tributaries are associated with each of these watersheds. The National Wetlands Inventory (USFWS 2020a) provides an overview of the drainages within the Plan Area (Figure 9 through Figure 16). Certain drainages and wetlands are regulated by the California Department of Fish and Wildlife (CDFW), U.S. Army Corps of Engineers (USACE), and the Regional Water Quality Control Boards (RWQCB).[2] The drainages within these watersheds are of biological importance as they may provide valuable foraging habitat, breeding habitat and movement habitat for a wide variety of animal species, including sensitive species such as steelhead (*Oncorhynchus mykiss*) and California red-legged frog (*Rana draytonii*). Many of these rivers and their tributaries are also federally designated critical habitat for salmonid species. The seven primary watersheds found within the Plan Area are described by county/region below (United States Geological Survey [USGS] 2018):

Los Angeles County

Los Angeles County contains one primary watershed, the Los Angeles River watershed, which conveys water from the Santa Monica Mountains through the Los Angeles River out to the Pacific Ocean and from the San Gabriel Mountains through the San Gabriel River to the Los Angeles River and out to the Pacific Ocean.

Orange County

Orange County contains one primary watershed, the Santa Ana River watershed, which conveys water from the San Bernardino Mountains in San Bernardino County through the Santa Ana River out to the Pacific Ocean. Other major waterways in the watershed include San Diego Creek, San Juan Creek, Aliso Creek, and Arroyo Trabuco.

[2] Section 4.2.3 discusses the regulatory framework in more detail.

Fig 4.4-7 Habitat Classifications in the Sacramento-San Joaquin Delta Region

Figure 16 National Wetlands Inventory, Palo Verde Valley

Riverside County

Riverside County contains three primary watersheds: the Santa Ana River, Santa Margarita River, and Whitewater River watersheds. The Santa Ana watershed conveys water from the San Bernardino Mountains through the Santa Ana River out to the Pacific Ocean and from the San Jacinto Mountains through the San Jacinto River to the Santa Ana River and out to the Pacific Ocean. The Santa Margarita watershed conveys water from the Santa Margarita Mountains through the Santa Margarita River from Riverside County into San Diego County. The Whitewater watershed conveys water from the San Bernardino Mountains through the Whitewater River to the Salton Sea and Sonoran Desert. Additionally, the eastern boundary of the County is the Colorado River, which originates in Colorado, travels through Utah, Arizona, and Nevada; travels along California's southeastern border; and ends in the Gulf of California in Mexico.

San Bernardino County

San Bernardino County contains one primary watershed, the Santa Ana River watershed, which conveys water from the San Bernardino Mountains through the Santa Ana River out to the Pacific Ocean. Other major waterways in the watershed include the Mojave River, Amargosa River, and Lytle Creek. The Colorado River is also located along a portion of the eastern boundary of San Bernardino County.

San Diego County

San Diego County contains one primary watershed, the Laguna-San Diego Coastal watershed, which conveys water from the Julian, Laguna, and Cuyamaca Mountains through the Santa Margarita River, San Luis Rey River, San Dieguito River, Poway Creek, Chollas Creek, and the Tijuana River out to the Pacific Ocean.

Ventura County

Ventura County contains one primary watershed, the Ventura-San Gabriel Coastal watershed, which conveys water from the Santa Monica, Santa Susana, Santa Ynez, and San Emigdio Mountains through the Ventura River, Santa Clara River, and Calleguas Creek out to the Pacific Ocean.

Sacramento-San Joaquin Delta Region

The Sacramento-San Joaquin Delta region contains one primary watershed, the San Joaquin watershed, which conveys water from the Eastern Sierra Nevada mountain range to the San Joaquin Valley floor and out to the Sacramento-San Joaquin Delta via the Sacramento and San Joaquin Rivers.

Palo Verde Valley

The Palo Verde Valley contains one primary watershed, the Lower Colorado watershed, which conveys water to the Colorado River toward the Gulf of California. The Colorado River is also located along the eastern boundary of Palo Verde Valley.

Wetlands and Aquatic Habitats

Wetlands are important biological resources both because of their rarity and because they provide a variety of ecosystem services. Several types of wetlands exist throughout the Plan Area as described in more detail below. The classifications below are used by the National Wetland Inventory (USFWS 2020a). For simplicity, the various wetland and aquatic habitats have been grouped together and are shown in blue on Figure 9 through Figure 16.

Vernal Pools

These seasonal wetlands are small depressions that fill with water during the winter, gradually drying during the spring and becoming completely dry in the summer. These pools are found in only a few places in the world outside of California. Vernal pool vegetation is adapted to the cycle of brief inundation followed by seasonal drying. Vernal pools are characterized by herbaceous plants that may begin their growth as aquatic or semi-aquatic plants and transition to a dry land environment as the pool dries, while other species germinate in the mud as the pool begins to dry. Most vernal pool plants are annual herbs, many of which are endemic to vernal pools.

Estuarine and Marine Deep-Water Wetlands

These deep-water wetlands are composed of the deep-water portion of estuarine or marine systems. Estuarine systems are composed of tidal habitats and adjacent tidal wetlands that are influenced by water runoff from and often semi-enclosed by land. They are located along low-energy coastlines (i.e., beaches and spits) and have variable salinity. Marine systems of this type are generally open ocean and occur along high energy coastlines with salinities exceeding 30 parts per thousand (ppt) and little or no dilution except outside the mouths of estuaries.

Estuarine and Marine Wetlands

These wetlands are composed of estuarine and marine systems as described above; however, they are not deep-water. These areas can be subtidal or intertidal with a variety of vegetated and non-vegetated bottoms. Beaches, bars and flats are also included as estuarine and marine wetlands.

Freshwater Emergent Wetlands

Freshwater emergent wetlands include all non-tidal waters dominated by emergent herbaceous plant species, mosses and/or lichens. Wetlands of this type are also low in salinity. The National Wetland Inventory also includes in this category wetlands that lack vegetation if they are less than 20 acres in size, do not have an active wave-formed or bedrock shoreline feature, and/or have a low water depth less than 6.6 feet. Freshwater emergent wetlands are characterized by erect, rooted herbaceous hydrophytes. Dominant vegetation is generally perennial monocots. All emergent wetlands are inundated or saturated frequently enough that the roots of the vegetation prosper in an anaerobic environment. The wetlands may vary in size from small clumps to vast areas covering several kilometers. The acreage of Freshwater Emergent Wetlands in California has decreased dramatically since the turn of the century due to drainage and conversion to other uses, primarily agriculture.

Freshwater Forested/Shrub Wetlands

These wetlands include non-tidal waters that are dominated by trees and shrubs, with emergent herbaceous plants, mosses and/or lichens. Freshwater forested/shrub wetlands are generally dominated by woody vegetation such as shrubs and trees. This wetland category can also include riparian habitats.

Freshwater Ponds

Freshwater ponds include non-tidal waters, typically less than 20 acres in size and typically with vegetative cover along the edges such as trees, shrubs, emergent herbaceous plants, mosses and/or lichens. Freshwater ponds can be man-made or natural and typically consist of an area of standing water with variable amounts of shoreline. These wetlands and deep-water habitats are dominated by plants that grow on or below the surface of the water.

Lakes

Lakes are lacustrine systems which include wetlands and deep-water habitats located in a topographic depression or dammed river channel. These areas tend to be greater than 20 acres. Vegetation cover within this habitat type is generally less than 30 percent and often occurs in the form of emergent or surface vegetation. Substrates are composed of at least 25 percent cover of particles smaller than stones.

Riverine

Riverine habitats are stream systems that include all wetlands and deep-water habitats contained in natural or artificial channels that contain periodically or continuously flowing water. This system may also form a connecting link between two bodies of standing water. Substrates generally consist of rock, cobble, gravel or sand.

1.3 Sensitive Natural Communities

The CDFW California Sensitive Natural Communities list identifies sensitive natural communities throughout California, based in part on global and state rarity ranks. According to the CDFW Vegetation Program, alliances with state ranks of S1-S3 are classified as imperiled and thus, potentially of special concern. Several natural communities considered sensitive by the CDFW occur within the six counties which comprise the Plan Area. The California Natural Diversity Database (CNDDB) lists 48 natural communities that occur with the Plan Area which are listed by county/region in Table 2 below (CDFW 2020a).

Because this analysis is programmatic and biological resources in this document are assessed at a general, county-wide scale, vegetation mapping and analysis at the alliance and association level has not been conducted; that level of analysis would be more appropriate at the project level.

Table 2 Sensitive Natural Communities by County/Region

Communities Considered Sensitive by the CDFW	Status	County/Region
Alkali Seep	S2.1	San Bernardino
Amargosa River	SNR	San Bernardino

1.4 Special Status Plants and Animals

For the purpose of this analysis, special status species are those plants and animals listed, proposed for listing, or candidates for listing as threatened or endangered by the United States Fish and Wildlife Service (USFWS) under the federal Endangered Species Act (FESA); those listed or proposed for listing as rare, threatened, or endangered by the CDFW under the California Endangered Species Act (CESA); and animals designated as "Species of Special Concern," "Fully Protected," or "Watch List" by the CDFW. The CNDDB also provides records of other special animals that CDFW is tracking but are not currently designated a special status, including NatureServe Element Rankings which include a global and state rank (CDFW 2019a). The global rank provides a status over a species' entire distribution, and the state rank provides a status across California. Due to the programmatic nature of the CAP, a precise, project-level analysis of the specific impacts associated with individual activities is not possible, thus, these species were also included as "special status" considering the CDFW is currently collecting data and tracking these species and therefore there is potential for their status to be elevated in the future.

The NatureServe Element Rankings are defined as:

- GX: Presumed Extinct – Not located despite intensive searches and virtually no likelihood of rediscovery.
- GH: Possibly Extinct – Known from only historical occurrences but still some hope of rediscovery. Examples of evidence include (1) that a species has not been documented in approximately 20-40 years despite some searching and/or some evidence of significant habitat loss or degradation; (2) that a species has been searched for unsuccessfully, but not thoroughly enough to presume that it is extinct throughout its range.
- G1: Critically Imperiled – At very high risk of extinction due to very restricted range, very few populations or occurrences, very steep declines, very severe threats, or other factors.
- G2: Imperiled – At high risk of extinction due to restricted range, few populations or occurrences, steep declines, severe threats, or other factors.
- G3: Vulnerable – At moderate risk of extinction due to a fairly restricted range, relatively few populations or occurrences, recent and widespread declines, threats, or other factors.
- G4: Apparently Secure – At fairly low risk of extinction due to an extensive range and/or many populations or occurrences, but with possible cause for some concern as a result of local recent declines, threats, or other factors.
- G5: Secure – At very low risk of extinction due to a very extensive range, abundant populations or occurrences, and little to no concern from declines or threats.
- GNR: Unranked – Global rank not yet assessed.
- SX: Presumed Extirpated – Species is believed to be extirpated from the state Not located despite intensive searches of historical sites and other appropriate habitat, and virtually no likelihood that it will be rediscovered.
- SH: Possibly Extirpated – Known from only historical records but still some hope of rediscovery. There is evidence that the species may no longer be present in the state, but not enough to state this with certainty. Examples of such evidence include (1) that a species has not been documented in approximately 20-40 years despite some searching and/or some evidence of significant habitat loss or degradation; (2) that a species has been searched for

unsuccessfully, but not thoroughly enough to presume that it is no longer present in the jurisdiction.

- S1: Critically Imperiled – At very high risk of extirpation in the state due to very restricted range, very few populations or occurrences, very steep declines, severe threats, or other factors.
- S2: Imperiled – At high risk of extirpation in the state due to restricted range, few populations or occurrences, steep declines, severe threats, or other factors.
- S3: Vulnerable – At moderate risk of extirpation in the state due to a fairly restricted range, relatively few populations or occurrences, recent and widespread declines, threats, or other factors.
- S4: Apparently Secure – At a fairly low risk of extirpation in the state due to an extensive range and/or many populations or occurrences, but with possible cause for some concern as a result of local recent declines, threats, or other factors.
- S5: Secure – At very low or no risk of extirpation in the state due to a very extensive range, abundant populations or occurrences, and little to no concern from declines or threats.
- SNR: Unranked – State rank not yet assessed.

Additional NatureServe Element rank qualifiers:

- Taxa which are subspecies receive a taxon rank (T-rank) in addition to the G-rank. Whereas the G-rank reflects the condition of the entire species, the T-rank reflects the global status of just the subspecies. For example, the Point Reyes mountain beaver, *Aplodontia rufa* ssp. *phaea*, is ranked G5T2. The G-rank refers to the whole species, i.e., *Aplodontia rufa*; the T-rank refers only to the global condition of ssp. *phaea*.
- C = Captive or Cultivated Only — taxon at present is presumed or possibly extinct or eliminated in the wild across their entire native range but is extant in cultivation, in captivity, as a naturalized population (or populations) outside their native range, or as a reintroduced population not yet established. The “C” modifier is only used at a global level and not at a state level. Possible ranks are GXC or GHC.
- Q = Questionable taxonomy that may reduce conservation priority — Distinctiveness of this entity as a taxon at the current level is questionable; resolution of this uncertainty may result in change from a species to a subspecies or hybrid, or inclusion of this taxon in another taxon, with the resulting taxon having a lower-priority (numerically higher) conservation status rank. The “Q” modifier is only used at the global level, not at the state level.

Uncertainty about the status of an element is expressed in two major ways:

- By expressing the ranks as a range of values: e.g., S2S3 indicates the rank is somewhere between S2 and S3.
- By adding a “?” to the rank: e.g., S2?; this represents more certainty than S2S3, but less certainty than S2.

Other considerations used when ranking a species include the pattern of distribution of the element on the landscape, fragmentation of the population, and historical extent as compared to its modern range. It is important to take an overall view when ranking sensitive elements rather than simply counting element occurrences

Additionally, special status plants with California Rare Plant Rank (CRPR) designations of 1 through 4 were included. CDFW standards state that plants with a CRPR 1A, 1B, 2A and 2B may meet definitions of rare or endangered under CEQA Sections 15380 (b) and (d) (CDFW 2020b). By California Native Plant Society (CNPS) standards, the plants of CRPR Ranks 1A, 1B, 2A and 2B meet the definitions of Sections 2062 and 2067 (CESA) of the California Fish and Game Code (CFGC), and are eligible for state listing, thus should be considered under CEQA Section 15380. In general, CNPS Rank 3 plants (plants about which more information is needed) and Rank 4 plants (plants of limited distribution) may not warrant consideration under CEQA Section 15380. However, at the discretion of various jurisdictions, these plants may be included on special status plant lists where they would be required to be addressed under CEQA Section 15380. Factors such as regional rarity versus. statewide rarity should be considered in determining whether cumulative impacts to a Rank 4 plant are significant even if individual program activity impacts are not. Due to the programmatic nature of the CAP, a precise, project-level analysis of the specific impacts associated with individual program activities is not possible, thus, the evaluation of Rank 3 and 4 species in context of type localities, unique vegetation types and local designation of special status would need to be completed on a case-by-case basis and requires site-specific knowledge of the vegetation type in which the plant occurs on a given site. To provide a conservative analysis, all plants with a CRPR rank are included.

Plants with a CRPR of 1, 2, 3 and 4 are defined as:

- CRPR 1A = Plants presumed extinct in California;
- CRPR 1B.1 = Rare or endangered in California and elsewhere; seriously endangered in California (over 80 percent of occurrences threatened/high degree and immediacy of threat);
- CRPR 1B.2 = Rare or endangered in California and elsewhere; fairly endangered in California (20-80 percent occurrences threatened);
- CRPR 1B.3 = Rare or endangered in California and elsewhere, not very endangered in California (<20 percent of occurrences threatened or no current threats known);
- CRPR 2 = Rare, threatened or endangered in California, but more common elsewhere;
- CRPR 3 = Plants needing more information (most are species that are taxonomically unresolved; some species on this list meet the definitions of rarity under CNPS and CESA);
- CRPR 4.1 = Plants of limited distribution (watch list), seriously endangered in California;
- CRPR 4.2 = Plants of limited distribution (watch list), fairly endangered in California (20-80 percent occurrences threatened); and
- CRPR 4.3 = Plants of limited distribution (watch list), not very endangered in California.

Species of Special Concern (SSC) is a category used by the CDFW for those species which are considered indicators of regional habitat changes or may be potential future protected species. Species of Special Concern do not have any special legal status except that which may be afforded by the CFGC (e.g., nesting birds). The SSC category is intended by the CDFW for use as a management tool to include these species into special consideration when decisions are made concerning the development of natural lands, and these species are considered special status as described under the CEQA Appendix G questions.

Queries of the USFWS Information, Planning and Conservation (IPaC) species database (USFWS 2020b), CNDDB (CDFW 2020a) and CNPS Online Inventory of Rare and Endangered Plants of California (CNPS 2020) were conducted to obtain comprehensive information regarding state and federally listed species considered to have potential to occur within Los Angeles, Orange, Riverside,

San Bernardino, San Diego, and Ventura Counties; the Palo Verde Valley in Imperial County; and the Sacramento-San Joaquin Delta region.

The Plan Area is home to several species protected by federal and state agencies. Special status animal species can be found in a variety of habitats these counties host. The CNDDB, CNPS, and USFWS IPaC together list 1,148 special status plant and animal species that have been identified within Los Angeles, Orange, Riverside, San Bernardino, San Diego, and Ventura Counties; the Palo Verde Valley in Imperial County; and the Sacramento-San Joaquin Delta region. The status and habitat requirements of those species are presented in Appendix D.

Critical habitats are specific geographic area(s) designated by the USFWS as essential for the conservation of a threatened or endangered species and that may require special management and protection. Critical habitat may include areas not currently occupied by the species but potentially needed for its recovery. Federally designated critical habitat for 54 species occurs within the Plan Area (Table 3; Figure 17 through Figure 24). Table 3 includes the critical habitat available for species in each County/Region in the Plan Area. The equals sign , "=" denotes the former accepted name for the species.

Table 3 Federally Designated Critical Habitat by County/Region

Critical Habitat	County/Region
Arroyo (=arroyo southwestern) toad (*Anaxyrus californicus*)	Los Angeles, Orange, Riverside, San Bernardino, San Diego, Ventura
Ash-grey paintbrush (*Castilleja cinerea*)	San Bernardino
Bear Valley sandwort (*Arenaria ursina*)	San Bernardino
Bonytail (*Gila elegans)*	San Bernardino
Braunton's milk-vetch (*Astragalus brauntonii)*	Los Angeles, Orange, Ventura
California condor (*Gymnogyps californianus*)	Los Angeles, Ventura
California red-legged frog (*Rana draytonii*)	Los Angeles, Ventura
California taraxacum (*Taraxacum californicum*)	San Bernardino
Casey's june beetle (*Dinacoma caseyi*)	Riverside
Chinook Salmon (*Oncorhynchus tshawytscha*)	Sacramento-San Joaquin Delta
Coachella Valley fringe-toed lizard (*Uma inornata*)	Riverside
Coachella Valley milk-vetch (*Astragalus lentiginosus* var. *coachellae*)	Riverside
Coastal California gnatcatcher (*Polioptila californica californica*)	Los Angeles, Orange, Riverside, San Bernardino, San Diego, Ventura
Conservancy fairy shrimp (*Branchinecta conservatio*)	Ventura
Cushenbury buckwheat (*Eriogonum ovalifolium* var. *vineum*)	San Bernardino
Cushenbury milk-vetch (*Astragalus albens*)	San Bernardino
Cushenbury oxytheca (*Oxytheca parishii* var. *goodmaniana*)	San Diego
Delta smelt (*Hypomesus transpacificus*)	Sacramento-San Joaquin Delta
Desert tortoise (*Gopherus agasazzi*)	Los Angeles, Riverside, San Bernardino
Green sturgeon (*Acipenser medirostris*), Southern DPS	Sacramento-San Joaquin Delta
Laguna Mountains skipper (*Pyrgus ruralis lagunae*)	San Diego
Lane Mountain milk-vetch (*Astragalus jaegerianus*)	San Bernardino
Least Bell's vireo (*Vireo bellii pusillus*)	Los Angeles, Riverside, San Bernardino, San Diego, Ventura
Lyon's pentachaeta (*Pentachaeta lyonii*)	Los Angeles, Ventura

Critical Habitat	County/Region
Mexican flannelbush (*Fremontodendron mexicanum*)	San Diego
Mountain yellow-legged frog (*Rana muscosa*)	Los Angeles, Riverside, San Bernardino
Munz's onion (*Allium munzii*)	Riverside
Nevin's barberry (*Berberis nevinii*)	Riverside
Otay tarplant (*Deinandra* (=*Hemizonia*) *conjugens*)	San Diego
Palos Verde blue butterfly (*Glaucopsyche lygdamus palosverdesensis*)	Los Angeles
Parish's daisy (*Erigeron parishii*)	San Bernardino
Peninsular bighorn sheep (*Ovis canadensis nelsoni*)	Riverside, San Diego
Quino checkerspot butterfly (*Euphydryas editha quino* (=*E. e. wrighti*))	Riverside, San Diego
Razorback sucker (*Xyrauchen texanus*)	Riverside, San Bernardino, Palo Verde Valley
Riverside fairy shrimp (*Streptocephalus woottoni*)	Orange, San Diego, Ventura
San Bernardino bluegrass (*Poa atropurpurea*)	San Bernardino, San Diego
San Bernardino Merriam's kangaroo rat (*Dipodomys merriami parvus*)	Riverside
San Bernardino Mountains bladderpod (*Lesquerella kingii* ssp. *bernardina*)	San Bernardino
Santa Ana sucker (*Catostomus santaanae*)	Los Angeles, Orange, Riverside, San Bernardino
San Diego ambrosia (*Ambrosia pumila*)	Riverside, San Diego
San Diego fairy shirmp (*Branchinecta sandiegonensis*)	Orange, San Diego
San Diego thornmint (*Acanthomintha ilicifolia*)	San Diego
Southern mountain wild-buckwheat (*Eriogonum kennedyi* var. *austromontanum*)	San Bernardino
Southwestern willow flycatcher (*Empidonax traillii extimus*)	Los Angeles, Riverside, San Bernardino, San Diego, Ventura
Spreading navarretia (*Navarretia fossalis*)	Los Angeles, Riverside, San Diego
Steelhead (*Oncorhynchus mykiss irideus*)	Los Angeles, Orange, San Diego, Ventura, Sacramento-San Joaquin Delta
Thread-leaved brodiaea (*Brodiaea filifolia*)	Los Angeles, Orange, Riverside, San Bernardino, San Diego
Tidewater goby (*Eucyclogobius newberryi*)	Los Angeles, Orange, San Diego, Ventura
Vail Lake ceanothus (*Ceanothus ophiochilus*)	Riverside
Ventura Marsh milk-vetch (*Astragalus pycnostachyus* var. *lanosissimus*)	Ventura
Vernal pool fairy shrimp (*Branchinecta lynchi*)	Ventura
Western snowy plover (*Charadrius alexandrinus nivosus*)	Los Angeles, Orange, San Diego, Ventura
Willowy monardella (*Monardella viminea*)	San Diego
Yellow-billed cuckoo (*Coccyzus americanus*)	Riverside, San Bernardino, Palo Verde Valley

1.5 Wildlife Movement Corridors

Wildlife movement corridors, or habitat linkages, are generally defined as connections between habitat patches that allow for physical and genetic exchange between otherwise isolated animal populations. Such linkages may serve a local purpose, such as providing a linkage between foraging and denning areas, or they may be regional in nature. Some habitat linkages may serve as migration corridors, wherein animals periodically move away from an area and then subsequently return. Others may be important as dispersal corridors for young animals. A group of habitat linkages in an area can form a wildlife corridor network.

The habitats within the linkage do not necessarily need to be the same as the habitats that are being linked. Rather, the linkage merely needs to contain sufficient cover and forage to allow temporary inhabitation by ground-dwelling species. Typically, habitat linkages are contiguous strips of natural areas, though dense plantings of landscape vegetation can be used by certain disturbance-tolerant species. Depending upon the species using a corridor, specific physical resources (such as rock outcroppings, vernal pools, or oak trees) may need to be located within the habitat linkage at certain intervals to allow slower-moving species to traverse the linkage. For highly mobile or aerial species, habitat linkages may be discontinuous patches of suitable resources spaced sufficiently close together to permit travel along a route in a short period of time. Wildlife movement corridors can be both large and small scale.

The mountainous regions of Los Angeles, Orange, Riverside, San Bernardino, San Diego, and Ventura Counties support wildlife movement on a regional scale while riparian corridors and waterways, provide more local scale opportunities for wildlife movement throughout each county. No wildlife movement corridors were identified the Sacramento-San Joaquin Delta region or the Palo Verde Valley portion of the Plan Area. The CDFW Biogeographic Information and Observation System (BIOS) (CDFW 2020c) mapped multiple natural landscape blocks and essential connectivity areas within Los Angeles, Orange, Riverside, San Bernardino, San Diego, and Ventura Counties (Figure 25 through Figure 32). Many of these areas are restricted to higher elevation landscapes such as Angeles National Forest, the Santa Monica Mountains, Cleveland National Forest, San Bernardino National Forest, the Chocolate Mountains, Cuyamaca Rancho State Park, and Los Padres National Forest. Large blocks of desert habitats also provide significant movement corridors and include Joshua Tree National Park, Mojave National Preserve, Death Valley National Park, and Anza-Borrego Desert State Park.

Table 4 Special Status Species List

Scientific Name Common Name	Status	Habitat Requirements
Plants and Lichens		
Abronia maritima red sand-verbena	None/None G4/S3? 4.2	Coastal dunes. 0 - 100 m. perennial herb. Blooms Feb-Nov
Abronia nana var. *covillei* Coville's dwarf abronia	None/None G4T3/S3 4.2	Great Basin scrub, Joshua tree woodland, Pinyon and juniper woodland, Subalpine coniferous forest, Upper montane coniferous forest. carbonate, sandy. 1524 - 3100 m. perennial herb. Blooms May-Aug
Abronia villosa var. *aurita* chaparral sand-verbena	None/None G5T2?/S2 1B.1	Chaparral, Coastal scrub, Desert dunes. sandy. 75 - 1600 m. annual herb. Blooms (Jan)Mar-Sep
Abutilon abutiloides shrubby Indian mallow	None/None G5/S1 2B.1	Sonoran desert scrub. Rocky, granitic. 855 - 900 m. perennial herb. Blooms Aug,Nov
Abutilon parvulum dwarf abutilon	None/None G5/S2S3 2B.3	Chenopod scrub (rocky). 900 - 1360 m. perennial herb. Blooms Apr-May
Acanthomintha ilicifolia San Diego thorn-mint	FT/SCE G1/S1 1B.1	Chaparral, Coastal scrub, Valley and foothill grassland, Vernal pools. Clay, openings. 10 - 960 m. annual herb. Blooms Apr-Jun
Acanthomintha obovata ssp. *cordata* heart-leaved thorn-mint	None/None G4T3/S3 4.2	Chaparral (openings), Cismontane woodland, Pinyon and juniper woodland, Valley and foothill grassland. clay. 785 - 1540 m. annual herb. Blooms Apr-Jul
Acanthoscyphus parishii var. *abramsii* Abrams' oxytheca	None/None G4?T1T2/S1S2 1B.2	Chaparral (sandy or shale). 1143 - 2057 m. annual herb. Blooms Jun-Aug
Acanthoscyphus parishii var. *cienegensis* Cienega Seca oxytheca	None/None G4?T2/S2 1B.3	Joshua tree woodland, Pinyon and juniper woodland, Upper montane coniferous forest (sandy, granitic). 2105 - 2450 m. annual herb. Blooms (May)Jun-Sep
Acanthoscyphus parishii var. *goodmaniana* Cushenbury oxytheca	FE/None G4?T1/S1 1B.1	Pinyon and juniper woodland (carbonate, talus). sandy, carbonate. 1219 - 2377 m. annual herb. Blooms May-Oct
Acanthoscyphus parishii var. *parishii* Parish's oxytheca	None/None G4?T3T4/S3S4 4.2	Chaparral, Lower montane coniferous forest. sandy or gravelly. 1220 - 2600 m. annual herb. Blooms Jun-Sep
Acleisanthes longiflora angel trumpets	None/None G5/S1 2B.3	Sonoran desert scrub (carbonate). 90 - 95 m. perennial herb. Blooms May
Acleisanthes nevadensis desert wing-fruit	None/None G4?/S1 2B.1	Joshua tree woodland, Mojavean desert scrub. rocky, gravelly. 795 - 1250 m. perennial herb. Blooms Apr-Sep
Acmispon argophyllus var. *adsurgens* San Clemente Island bird's-foot trefoil	None/SCE G5T2/S2 1B.1	Coastal bluff scrub, Coastal scrub. rocky. 15 - 395 m. perennial herb. Blooms Apr-Jun
Acmispon argyraeus var. *multicaulis* scrub lotus	None/None G4?T2/S2 1B.3	Pinyon and juniper woodland (granitic). 1200 - 1500 m. perennial herb. Blooms Apr-Jun
Acmispon argyraeus var. *notitius* Providence Mountains lotus	None/None G4?T2/S2 1B.3	Pinyon and juniper woodland. 1200 - 2000 m. perennial herb. Blooms May-Aug

Scientific Name Common Name	Status	Habitat Requirements
Acmispon dendroideus var. *traskiae* San Clemente Island lotus	FT/SCE G4T3/S3 1B.3	Coastal bluff scrub, Coastal scrub, Valley and foothill grassland. 15 - 365 m. perennial shrub. Blooms Feb-Aug
Acmispon haydonii pygmy lotus	None/None G3/S3 1B.3	Pinyon and juniper woodland, Sonoran desert scrub. rocky. 520 - 1200 m. perennial herb. Blooms Jan-Jun
Acmispon prostratus Nuttall's acmispon	None/None G1G2/S1 1B.1	Coastal dunes, Coastal scrub (sandy). 0 - 10 m. annual herb. Blooms Mar-Jun(Jul)
Adolphia californica California adolphia	None/None G3/S2 2B.1	Chaparral, Coastal scrub, Valley and foothill grassland. Clay. 10 - 740 m. perennial deciduous shrub. Blooms Dec-May
Agave shawii var. *shawii* Shaw's agave	None/None G2G3T2/S1 2B.1	Coastal bluff scrub, Coastal scrub. Maritime succulent scrub. 3 - 120 m. perennial leaf succulent. Blooms Sep-May
Agave utahensis var. *nevadensis* Clark Mountain agave	None/None G4T4?/S3 4.2	Joshua tree woodland, Mojavean desert scrub, Pinyon and juniper woodland. carbonate or volcanic. 900 - 1585 m. perennial leaf succulent. Blooms May-Jul
Ageratina herbacea desert ageratina	None/None G5/S3 2B.3	Pinyon and juniper woodland (rocky). 1525 - 2200 m. perennial herb. Blooms Jul-Oct
Aliciella ripleyi Ripley's aliciella	None/None G3/S2 2B.3	Mojavean desert scrub (carbonate). 305 - 1950 m. perennial herb. Blooms May-Jul
Aliciella triodon coyote gilia	None/None G5/S2 2B.2	Great Basin scrub, Pinyon and juniper woodland. sometimes sandy. 610 - 1700 m. annual herb. Blooms Apr-Jun
Allium atrorubens var. *atrorubens* Great Basin onion	None/None G4T4/S2 2B.3	Great Basin scrub, Pinyon and juniper woodland. rocky or sandy. 1200 - 2315 m. perennial bulbiferous herb. Blooms May-Jun
Allium atrorubens var. *cristatum* Inyo onion	None/None G4T4/S4 4.3	Joshua tree woodland, Mojavean desert scrub, Pinyon and juniper woodland. sandy or rocky. 1200 - 2560 m. perennial bulbiferous herb. Blooms Apr-Jun
Allium howellii var. *clokeyi* Mt. Pinos onion	None/None G4T2/S2 1B.3	Great Basin scrub, Meadows and seeps (edges), Pinyon and juniper woodland. 1300 - 1850 m. perennial bulbiferous herb. Blooms Apr-Jun
Allium marvinii Yucaipa onion	None/None G1/S1 1B.2	Chaparral (clay, openings). 760 - 1065 m. perennial bulbiferous herb. Blooms Apr-May
Allium munzii Munz's onion	FE/SCT G1/S1 1B.1	Chaparral, Cismontane woodland, Coastal scrub, Pinyon and juniper woodland, Valley and foothill grassland. mesic, clay. 297 - 1070 m. perennial bulbiferous herb. Blooms Mar-May
Allium nevadense Nevada onion	None/None G4/S3 2B.3	Pinyon and juniper woodland (sandy or gravelly). 810 - 1700 m. perennial bulbiferous herb. Blooms Apr-May
Allium parishii Parish's onion	None/None G3/S3 4.3	Joshua tree woodland, Mojavean desert scrub, Pinyon and juniper woodland. rocky. 900 - 1735 m. perennial bulbiferous herb. Blooms Apr-May
Almutaster pauciflorus alkali marsh aster	None/None G4/S1S2 2B.2	Meadows and seeps. alkaline. 240 - 800 m. perennial herb. Blooms Jun-Oct

Scientific Name Common Name	Status	Habitat Requirements
Aloysia wrightii Wright's beebrush	None/None G5/S4 4.3	Joshua tree woodland, Pinyon and juniper woodland. rocky, often carbonate. 900 - 1600 m. perennial evergreen shrub. Blooms Apr-Oct
Amaranthus watsonii Watson's amaranth	None/None G5?/S3 4.3	Mojavean desert scrub, Sonoran desert scrub. 20 - 1700 m. annual herb. Blooms Apr-Sep
Ambrosia chenopodiifolia San Diego bur-sage	None/None G2G3/S1 2B.1	Coastal scrub. 55 - 155 m. perennial shrub. Blooms Apr-Jun
Ambrosia monogyra singlewhorl burrobrush	None/None G5/S2 2B.2	Chaparral, Sonoran desert scrub. sandy. 10 - 500 m. perennial shrub. Blooms Aug-Nov
Ambrosia pumila San Diego ambrosia	FE/None G1/S1 1B.1	Chaparral, Coastal scrub, Valley and foothill grassland, Vernal pools. sandy loam or clay, often in disturbed areas, sometimes alkaline. 20 - 415 m. perennial rhizomatous herb. Blooms Apr-Oct
Androsace elongata ssp. *acuta* California androsace	None/None G5?T3T4/S3S4 4.2	Chaparral, Cismontane woodland, Coastal scrub, Meadows and seeps, Pinyon and juniper woodland, Valley and foothill grassland. 150 - 1305 m. annual herb. Blooms Mar-Jun
Androstephium breviflorum small-flowered androstephium	None/None G4/S2? 2B.2	Desert dunes, Mojavean desert scrub (bajadas). 210 - 890 m. perennial bulbiferous herb. Blooms Mar-Apr
Anomobryum julaceum slender silver moss	None/None G5?/S2 4.2	Broadleafed upland forest, Lower montane coniferous forest, North Coast coniferous forest. damp rock and soil on outcrops, usually on roadcuts. 100 - 1000 m. moss. Blooms
Antennaria marginata white-margined everlasting	None/None G4G5/S1 2B.3	Lower montane coniferous forest, Upper montane coniferous forest. 2120 - 3353 m. perennial stoloniferous herb. Blooms May-Aug
Aphanisma blitoides aphanisma	None/None G3G4/S2 1B.2	Coastal bluff scrub, Coastal dunes, Coastal scrub. sandy or gravelly. 1 - 305 m. annual herb. Blooms Feb-Jun
Arctomecon merriamii white bear poppy	None/None G3/S3 2B.2	Chenopod scrub, Mojavean desert scrub. rocky. 490 - 1800 m. perennial herb. Blooms (Mar) Apr-May
Arctostaphylos catalinae Santa Catalina Island manzanita	None/None G2?/S2? 1B.2	Chaparral (volcanic). 75 - 600 m. perennial evergreen shrub. Blooms (Feb)Mar-Apr (May)
Arctostaphylos crustacea ssp. *subcordata* Santa Cruz Island manzanita	None/None G4T3/S3 4.2	Closed-cone coniferous forest, Chaparral. rocky. 100 - 730 m. perennial evergreen shrub. Blooms Jan, Mar-Apr
Arctostaphylos glandulosa ssp. *crassifolia* Del Mar manzanita	FE/None G5T2/S2 1B.1	Chaparral (maritime, sandy). 0 - 365 m. perennial evergreen shrub. Blooms Dec-Jun
Arctostaphylos glandulosa ssp. *gabrielensis* San Gabriel manzanita	None/None G5T3/S3 1B.2	Chaparral (rocky). 595 - 1500 m. perennial evergreen shrub. Blooms Mar
Arctostaphylos otayensis Otay manzanita	None/None G1/S1 1B.2	Chaparral, Cismontane woodland. metavolcanic. 275 - 1700 m. perennial evergreen shrub. Blooms Jan-Apr
Arctostaphylos parryana ssp. *tumescens* interior manzanita	None/None G4T3T4/S3S4 4.3	Chaparral (montane), Cismontane woodland. 2100 - 2310 m. perennial evergreen shrub. Blooms Feb-Apr

Scientific Name Common Name	Status	Habitat Requirements
Arctostaphylos rainbowensis Rainbow manzanita	None/None G2/S2 1B.1	Chaparral. 205 - 670 m. perennial evergreen shrub. Blooms Dec-Mar
Arctostaphylos refugioensis Refugio manzanita	None/None G3/S3 1B.2	Chaparral (sandstone). 274 - 820 m. perennial evergreen shrub. Blooms Dec-Mar (May)
Arenaria lanuginosa var. *saxosa* rock sandwort	None/None G5T5/S2 2B.3	Subalpine coniferous forest, Upper montane coniferous forest. mesic, sandy. 1455 - 2600 m. perennial herb. Blooms Jul-Aug
Arenaria paludicola marsh sandwort	FE/SCE G1/S1 1B.1	Marshes and swamps (freshwateror brackish). sandy, openings. 3 - 170 m. perennial stoloniferous herb. Blooms May-Aug
Argyrochosma limitanea ssp. *limitanea* southwestern false cloak-fern	None/None G4G5T3T4/S1 2B.1	Pinyon and juniper woodland (carbonate, rocky). 1800 - 1800 m. perennial rhizomatous herb. Blooms Apr-Oct
Artemisia palmeri San Diego sagewort	None/None G3?/S3? 4.2	Chaparral, Coastal scrub, Riparian forest, Riparian scrub, Riparian woodland. sandy, mesic. 15 - 915 m. perennial deciduous shrub. Blooms (Feb)May-Sep
Asclepias asperula ssp. *asperula* antelope-horns	None/None G5T5/S3 4.3	Mojavean desert scrub, Pinyon and juniper woodland. rocky. 915 - 2195 m. perennial herb. Blooms May-Sep
Asclepias nyctaginifolia Mojave milkweed	None/None G4?/S2 2B.1	Mojavean desert scrub, Pinyon and juniper woodland. 875 - 1700 m. perennial herb. Blooms May-Jun
Asplenium vespertinum western spleenwort	None/None G4/S4 4.2	Chaparral, Cismontane woodland, Coastal scrub. rocky. 180 - 1000 m. perennial rhizomatous herb. Blooms Feb-Jun
Astragalus albens Cushenbury milk-vetch	FE/None G1/S1 1B.1	Joshua tree woodland, Mojavean desert scrub, Pinyon and juniper woodland. usually carbonate, rarely granitic. 1095 - 2000 m. perennial herb. Blooms Mar-Jun
Astragalus allochrous var. *playanus* playa milk-vetch	None/None G4T4/S2 2B.2	Mojavean desert scrub (sandy). 800 - 800 m. perennial herb. Blooms Apr
Astragalus bernardinus San Bernardino milk-vetch	None/None G3/S3 1B.2	Joshua tree woodland, Pinyon and juniper woodland. Often granitic or carbonate. 900 - 2000 m. perennial herb. Blooms Apr-Jun
Astragalus bicristatus crested milk-vetch	None/None G3/S3 4.3	Lower montane coniferous forest, Upper montane coniferous forest. sandy or rocky, mostly carbonate. 1700 - 2745 m. perennial herb. Blooms May-Aug
Astragalus brauntonii Braunton's milk-vetch	FE/None G2/S2 1B.1	Chaparral, Coastal scrub, Valley and foothill grassland. recent burns or disturbed areas, usually sandstone with carbonate layers. 4 - 640 m. perennial herb. Blooms Jan-Aug
Astragalus cimae var. *cimae* Cima milk-vetch	None/None G3T2T3/S2? 1B.2	Great Basin scrub, Joshua tree woodland, Pinyon and juniper woodland. clay. 890 - 1850 m. perennial herb. Blooms Apr-May
Astragalus crotalariae Salton milk-vetch	None/None G4G5/S4 4.3	Sonoran desert scrub (sandy or gravelly). -60 - 250 m. perennial herb. Blooms Jan-Apr
Astragalus deanei Dean's milk-vetch	None/None G1/S1 1B.1	Chaparral, Cismontane woodland, Coastal scrub, Riparian forest. 75 - 695 m. perennial herb. Blooms Feb-May

Scientific Name Common Name	Status	Habitat Requirements
Astragalus didymocarpus var. *milesianus* Miles' milk-vetch	None/None G5T2/S2 1B.2	Coastal scrub (clay). 20 - 90 m. annual herb. Blooms Mar-Jun
Astragalus douglasii var. *perstrictus* Jacumba milk-vetch	None/None G5T3?/S2S3 1B.2	Chaparral, Cismontane woodland, Pinyon and juniper woodland, Riparian scrub, Valley and foothill grassland. rocky. 900 - 1370 m. perennial herb. Blooms Apr-Jun
Astragalus hornii var. *hornii* Horn's milk-vetch	None/None G4G5T1T2/S1 1B.1	Meadows and seeps, Playas. lake margins, alkaline. 60 - 850 m. annual herb. Blooms May-Oct
Astragalus insularis var. *harwoodii* Harwood's milk-vetch	None/None G5T4/S2 2B.2	Desert dunes, Mojavean desert scrub. sandy or gravelly. 0 - 710 m. annual herb. Blooms Jan-May
Astragalus jaegerianus Lane Mountain milk-vetch	FE/None G2/S2 1B.1	Joshua tree woodland, Mojavean desert scrub. granitic, sandy or gravelly. 900 - 1200 m. perennial herb. Blooms Apr-Jun
Astragalus lentiginosus var. *antonius* San Antonio milk-vetch	None/None G5T2/S2 1B.3	Lower montane coniferous forest, Upper montane coniferous forest. 1500 - 2600 m. perennial herb. Blooms Apr-Jul
Astragalus lentiginosus var. *borreganus* Borrego milk-vetch	None/None G5T5?/S4 4.3	Mojavean desert scrub, Sonoran desert scrub. sandy. 30 - 895 m. annual herb. Blooms Feb-May
Astragalus lentiginosus var. *coachellae* Coachella Valley milk-vetch	FE/None G5T1/S1 1B.2	Desert dunes, Sonoran desert scrub (sandy). 40 - 655 m. annual/perennial herb. Blooms Feb-May
Astragalus lentiginosus var. *sierrae* Big Bear Valley milk-vetch	None/None G5T2/S2 1B.2	Mojavean desert scrub, Meadows and seeps, Pinyon and juniper woodland, Upper montane coniferous forest. gravelly or rocky. 1800 - 2600 m. perennial herb. Blooms Apr-Aug
Astragalus leucolobus Big Bear Valley woollypod	None/None G2/S2 1B.2	Lower montane coniferous forest, Pebble (Pavement) plain, Pinyon and juniper woodland, Upper montane coniferous forest. rocky. 1100 - 2885 m. perennial herb. Blooms May-Jul
Astragalus magdalenae var. *peirsonii* Peirson's milk-vetch	FT/SCE G3G4T1/S1 1B.2	Desert dunes. 60 - 225 m. perennial herb. Blooms Dec-Apr
Astragalus nevinii San Clemente Island milk-vetch	None/None G3/S3 1B.2	Coastal dunes, Coastal scrub, Valley and foothill grassland. 5 - 225 m. perennial herb. Blooms Feb-Jul
Astragalus nutans Providence Mountains milk-vetch	None/None G3/S3 4.3	Joshua tree woodland, Mojavean desert scrub, Pinyon and juniper woodland, Sonoran desert scrub. sandy or gravelly. 450 - 1950 m. annual herb. Blooms Mar-Jun (Oct)
Astragalus oocarpus San Diego milk-vetch	None/None G2?/S2? 1B.2	Chaparral (openings), Cismontane woodland. 305 - 1524 m. perennial herb. Blooms May-Aug
Astragalus pachypus var. *jaegeri* Jaeger's bush milk-vetch	None/None G4T1/S1 1B.1	Chaparral, Cismontane woodland, Coastal scrub, Valley and foothill grassland. sandy or rocky. 365 - 975 m. perennial shrub. Blooms Dec-Jun
Astragalus preussii var. *laxiflorus* Lancaster milk-vetch	None/None G4T2/S1 1B.1	Chenopod scrub. 700 - 700 m. perennial herb. Blooms Mar-May
Astragalus preussii var. *preussii* Preuss' milk-vetch	None/None G4T4/S1 2B.1	Chenopod scrub, Mojavean desert scrub. clay. 750 - 805 m. perennial herb. Blooms Apr-Jun

Scientific Name Common Name	Status	Habitat Requirements
Astragalus pycnostachyus var. *lanosissimus* Ventura marsh milk-vetch	FE/SCE G2T1/S1 1B.1	Coastal dunes, Coastal scrub, Marshes and swamps (edges, coastal salt or brackish). 1 - 35 m. perennial herb. Blooms (Jun)Aug-Oct
Astragalus sabulonum gravel milk-vetch	None/None G4G5/S2 2B.2	Desert dunes, Mojavean desert scrub, Sonoran desert scrub. Usually sandy, sometimes gravelly. Flats, washes, and roadsides. -60 - 930 m. annual/perennial herb. Blooms Feb-Jun
Astragalus tener var. *tener* alkali milk-vetch	None/None G2T1/S1 1B.2	Playas, Valley and foothill grassland (adobe clay), Vernal pools. alkaline. 1 - 60 m. annual herb. Blooms Mar-Jun
Astragalus tener var. *titi* coastal dunes milk-vetch	FE/SCE G2T1/S1 1B.1	Coastal bluff scrub (sandy), Coastal dunes, Coastal prairie (mesic). often vernally mesic areas. 1 - 50 m. annual herb. Blooms Mar-May
Astragalus tidestromii Tidestrom's milk-vetch	None/None G4/S2 2B.2	Mojavean desert scrub. carbonate, sandy or gravelly. 600 - 1785 m. perennial herb. Blooms (Jan)Apr-Jul
Astragalus traskiae Trask's milk-vetch	None/SCR G3/S3 1B.2	Coastal bluff scrub, Coastal dunes, Coastal scrub. 5 - 245 m. perennial herb. Blooms Feb-Jul
Astragalus tricarinatus triple-ribbed milk-vetch	FE/None G2/S2 1B.2	Joshua tree woodland, Sonoran desert scrub. sandy or gravelly. 450 - 1190 m. perennial herb. Blooms Feb-May
Astrolepis cochisensis ssp. *cochisensis* scaly cloak fern	None/None G5?T4/S2 2B.3	Joshua tree woodland, Pinyon and juniper woodland. carbonate. 900 - 1800 m. perennial rhizomatous herb. Blooms Apr-Oct
Atriplex coronata var. *coronata* crownscale	None/None G4T3/S3 4.2	Chenopod scrub, Valley and foothill grassland, Vernal pools. alkaline, often clay. 1 - 590 m. annual herb. Blooms Mar-Oct
Atriplex coronata var. *notatior* San Jacinto Valley crownscale	FE/None G4T1/S1 1B.1	Playas, Valley and foothill grassland (mesic), Vernal pools. alkaline. 139 - 500 m. annual herb. Blooms Apr-Aug
Atriplex coulteri Coulter's saltbush	None/None G3/S1S2 1B.2	Coastal bluff scrub, Coastal dunes, Coastal scrub, Valley and foothill grassland. alkaline or clay. 3 - 460 m. perennial herb. Blooms Mar-Oct
Atriplex pacifica South Coast saltscale	None/None G4/S2 1B.2	Coastal bluff scrub, Coastal dunes, Coastal scrub, Playas. 0 - 140 m. annual herb. Blooms Mar-Oct
Atriplex parishii Parish's brittlescale	None/None G1G2/S1 1B.1	Chenopod scrub, Playas, Vernal pools. alkaline. 25 - 1900 m. annual herb. Blooms Jun-Oct
Atriplex serenana var. *davidsonii* Davidson's saltscale	None/None G5T1/S1 1B.2	Coastal bluff scrub, Coastal scrub. alkaline. 10 - 200 m. annual herb. Blooms Apr-Oct
Ayenia compacta California ayenia	None/None G4/S3 2B.3	Mojavean desert scrub, Sonoran desert scrub. rocky. 150 - 1095 m. perennial herb. Blooms Mar-Apr
Azolla microphylla Mexican mosquito fern	None/None G5/S4 4.2	Marshes and swamps (ponds, slow water). 30 - 100 m. annual/perennial herb. Blooms Aug
Baccharis malibuensis Malibu baccharis	None/None G1/S1 1B.1	Chaparral, Cismontane woodland, Coastal scrub, Riparian woodland. 150 - 305 m. perennial deciduous shrub. Blooms Aug

Scientific Name Common Name	Status	Habitat Requirements
Baccharis plummerae ssp. *plummerae* Plummer's baccharis	None/None G3T3/S3 4.3	Broadleafed upland forest, Chaparral, Cismontane woodland, Coastal scrub. rocky. 5 - 425 m. perennial deciduous shrub. Blooms May, Aug-Sep-Oct
Baccharis vanessae Encinitas baccharis	FT/SCE G1/S1 1B.1	Chaparral (maritime), Cismontane woodland. sandstone. 60 - 720 m. perennial deciduous shrub. Blooms Aug, Oct-Nov
Bahia neomexicana many-flowered bahia	None/None G5/S2S3 2B.3	Pinyon and juniper woodland (sandy). 1500 - 1700 m. annual herb. Blooms Sep-Oct
Berberis fremontii Fremont barberry	None/None G5/S3 2B.3	Joshua tree woodland, Pinyon and juniper woodland. Rocky, sometimes granitic. 1145 - 1720 m. perennial evergreen shrub. Blooms Mar-May
Berberis harrisoniana Kofa Mountain barberry	None/None G2/S1 1B.2	Chaparral, Mojavean desert scrub. usually north-facing talus slopes, sometimes volcanic (breccia). 780 - 840 m. perennial evergreen shrub. Blooms Jan-Mar
Berberis higginsiae Higgins? barberry	None/None G3Q/S1 3.2	Chaparral, Sonoran desert scrub. Rocky, sometimes granitic. 800 - 1065 m. perennial shrub. Blooms Mar-Apr
Berberis nevinii Nevin's barberry	FE/SCE G1/S1 1B.1	Chaparral, Cismontane woodland, Coastal scrub, Riparian scrub. sandy or gravelly. 70 - 825 m. perennial evergreen shrub. Blooms (Feb) Mar-Jun
Berberis pinnata ssp. *insularis* island barberry	FE/SCE G5T1/S1 1B.2	Closed-cone coniferous forest, Chaparral, Cismontane woodland, Coastal scrub. rocky. 75 - 400 m. perennial evergreen shrub. Blooms Feb-May
Bergerocactus emoryi golden-spined cereus	None/None G2G3/S2 2B.2	Closed-cone coniferous forest, Chaparral, Coastal scrub. sandy. 3 - 395 m. perennial stem succulent. Blooms May-Jun
Blepharidachne kingii King's eyelash grass	None/None G4/S2 2B.3	Great Basin scrub (usually carbonate). 1065 - 2135 m. perennial herb. Blooms May
Bloomeria clevelandii San Diego goldenstar	None/None G2/S2 1B.1	Chaparral, Coastal scrub, Valley and foothill grassland, Vernal pools. clay. 50 - 465 m. perennial bulbiferous herb. Blooms Apr-May
Boechera dispar pinyon rockcress	None/None G3/S3 2B.3	Joshua tree woodland, Mojavean desert scrub, Pinyon and juniper woodland. granitic, gravelly. 1200 - 2540 m. perennial herb. Blooms Mar-Jun
Boechera hirshbergiae Hirshberg's rockcress	None/None G1Q/S1 1B.2	Pebble (Pavement) plain. 1400 - 1415 m. perennial herb. Blooms Mar-May
Boechera hoffmannii Hoffmann's rockcress	FE/None G1G2/S1S2 1B.1	Coastal bluff scrub, Chaparral, Coastal scrub. sandy, rocky, volcanic. 60 - 395 m. perennial herb. Blooms Feb-Apr
Boechera johnstonii Johnston's rockcress	None/None G1/S1 1B.2	Chaparral, Lower montane coniferous forest. often on eroded clay. 1350 - 2150 m. perennial herb. Blooms Feb-Jun
Boechera lincolnensis Lincoln rockcress	None/None G4G5/S3 2B.3	Chenopod scrub, Mojavean desert scrub. carbonate. 1100 - 2705 m. perennial herb. Blooms Mar-May
Boechera parishii Parish's rockcress	None/None G2/S2 1B.2	Pebble (Pavement) plain, Pinyon and juniper woodland, Upper montane coniferous forest. rocky, quartzite on clay, or sometimes carbonate. 1770 - 2990 m. perennial herb. Blooms Apr-May

Scientific Name Common Name	Status	Habitat Requirements
Boechera peirsonii San Bernardino rockcress	None/None G1/S1 1B.2	Subalpine coniferous forest (rocky). 2700 - 3200 m. perennial herb. Blooms Mar-Aug
Boechera shockleyi Shockley's rockcress	None/None G3/S2 2B.2	Pinyon and juniper woodland (carbonate or quartzite, rocky or gravelly). 875 - 2310 m. perennial herb. Blooms May-Jun
Botrychium ascendens upswept moonwort	None/None G3G4/S2 2B.3	Lower montane coniferous forest, Meadows and seeps. mesic. 1115 - 3045 m. perennial rhizomatous herb. Blooms (Jun) Jul-Aug
Botrychium crenulatum scalloped moonwort	None/None G4/S3 2B.2	Bogs and fens, Lower montane coniferous forest, Meadows and seeps, Marshes and swamps (freshwater), Upper montane coniferous forest. 1268 - 3280 m. perennial rhizomatous herb. Blooms Jun-Sep
Botrychium minganense Mingan moonwort	None/None G4G5/S3 2B.2	Bogs and fens, Lower montane coniferous forest, Meadows and seeps (edges), Upper montane coniferous forest. Mesic. 1455 - 2180 m. perennial rhizomatous herb. Blooms Jul-Sep
Bouteloua eriopoda black grama	None/None G5/S4 4.2	Joshua tree woodland, Pinyon and juniper woodland. 900 - 1900 m. perennial stoloniferous herb. Blooms May-Aug
Bouteloua trifida three-awned grama	None/None G4G5/S3 2B.3	Mojavean desert scrub (carbonate, rocky). 700 - 2000 m. perennial herb. Blooms (Apr) May-Sep
Brasenia schreberi watershield	None/None G5/S3 2B.3	Marshes and swamps (freshwater). 30 - 2200 m. perennial rhizomatous herb (aquatic). Blooms Jun-Sep
Brodiaea filifolia thread-leaved brodiaea	FT/SCE G2/S2 1B.1	Chaparral (openings), Cismontane woodland, Coastal scrub, Playas, Valley and foothill grassland, Vernal pools. often clay. 25 - 1120 m. perennial bulbiferous herb. Blooms Mar-Jun
Brodiaea kinkiensis San Clemente Island brodiaea	None/None G2/S2 1B.2	Valley and foothill grassland (clay). 305 - 600 m. perennial bulbiferous herb. Blooms May-Jun
Brodiaea orcuttii Orcutt's brodiaea	None/None G2/S2 1B.1	Closed-cone coniferous forest, Chaparral, Cismontane woodland, Meadows and seeps, Valley and foothill grassland, Vernal pools. mesic, clay. 30 - 1692 m. perennial bulbiferous herb. Blooms May-Jul
Brodiaea santarosae Santa Rosa Basalt brodiaea	None/None G1/S1 1B.2	Valley and foothill grassland. basaltic. 565 - 1045 m. perennial bulbiferous herb. Blooms May-Jun
Bursera microphylla little-leaf elephant tree	None/None G4/S2 2B.3	Sonoran desert scrub (rocky). 200 - 700 m. perennial deciduous tree. Blooms Jun-Jul
Calandrinia breweri Brewer's calandrinia	None/None G4/S4 4.2	Chaparral, Coastal scrub. sandy or loamy, disturbed sites and burns. 10 - 1220 m. annual herb. Blooms (Jan)Mar-Jun
Calliandra eriophylla pink fairy-duster	None/None G5/S3 2B.3	Sonoran desert scrub (sandy or rocky). 120 - 1500 m. perennial deciduous shrub. Blooms Jan-Mar
Calochortus catalinae Catalina mariposa lily	None/None G3G4/S3S4 4.2	Chaparral, Cismontane woodland, Coastal scrub, Valley and foothill grassland. 15 - 700 m. perennial bulbiferous herb. Blooms (Feb) Mar-Jun

Scientific Name Common Name	Status	Habitat Requirements
Calochortus clavatus var. *clavatus* club-haired mariposa lily	None/None G4T3/S3 4.3	Chaparral, Cismontane woodland, Coastal scrub, Valley and foothill grassland. usually serpentinite, clay, rocky. 75 - 1300 m. perennial bulbiferous herb. Blooms (Mar)May-Jun
Calochortus clavatus var. *gracilis* slender mariposa lily	None/None G4T2T3/S2S3 1B.2	Chaparral, Coastal scrub, Valley and foothill grassland. 320 - 1000 m. perennial bulbiferous herb. Blooms Mar-Jun (Nov)
Calochortus dunnii Dunn's mariposa lily	None/SCR G2G3/S2S3 1B.2	Closed-cone coniferous forest, Chaparral, Valley and foothill grassland. gabbroic or metavolcanic, rocky. 185 - 1830 m. perennial bulbiferous herb. Blooms (Feb) Apr-Jun
Calochortus fimbriatus late-flowered mariposa lily	None/None G3/S3 1B.3	Chaparral, Cismontane woodland, Riparian woodland. often serpentinite. 275 - 1905 m. perennial bulbiferous herb. Blooms Jun-Aug
Calochortus palmeri var. *munzii* San Jacinto mariposa lily	None/None G3T3/S3 1B.2	Chaparral, Lower montane coniferous forest, Meadows and seeps. 855 - 2200 m. perennial bulbiferous herb. Blooms Apr-Jul
Calochortus palmeri var. *palmeri* Palmer's mariposa lily	None/None G3T2/S2 1B.2	Chaparral, Lower montane coniferous forest, Meadows and seeps. mesic. 710 - 2390 m. perennial bulbiferous herb. Blooms Apr-Jul
Calochortus plummerae Plummer's mariposa lily	None/None G4/S4 4.2	Chaparral, Cismontane woodland, Coastal scrub, Lower montane coniferous forest, Valley and foothill grassland. granitic, rocky. 100 - 1700 m. perennial bulbiferous herb. Blooms May-Jul
Calochortus striatus alkali mariposa lily	None/None G3?/S2S3 1B.2	Chaparral, Chenopod scrub, Mojavean desert scrub, Meadows and seeps. alkaline, mesic. 70 - 1595 m. perennial bulbiferous herb. Blooms Apr-Jun
Calochortus weedii var. *intermedius* intermediate mariposa lily	None/None G3G4T2/S2 1B.2	Chaparral, Coastal scrub, Valley and foothill grassland. rocky, calcareous. 105 - 855 m. perennial bulbiferous herb. Blooms May-Jul
Calyptridium arizonicum Arizona pussypaws	None/None G3?/S1 2B.1	Sonoran desert scrub. Metamorphic, washes. 610 - 790 m. annual herb. Blooms Mar-Apr
Calyptridium pygmaeum pygmy pussypaws	None/None G1G2/S1S2 1B.2	Subalpine coniferous forest, Upper montane coniferous forest. sandy or gravelly. 1980 - 3110 m. annual herb. Blooms Jun-Aug
Calystegia felix lucky morning-glory	None/None G1Q/S1 1B.1	Meadows and seeps (sometimes alkaline), Riparian scrub (alluvial). Historically associated with wetland and marshy places, but possibly in drier situations as well. Possibly silty loam and alkaline. 30 - 215 m. annual rhizomatous herb. Blooms Mar-Sep
Calystegia peirsonii Peirson's morning-glory	None/None G4/S4 4.2	Chaparral, Chenopod scrub, Cismontane woodland, Coastal scrub, Lower montane coniferous forest, Valley and foothill grassland. 30 - 1500 m. perennial rhizomatous herb. Blooms Apr-Jun
Calystegia sepium ssp. *binghamiae* Santa Barbara morning-glory	None/None G5TXQ/SX 1A	Marshes and swamps (coastal). 5 - 5 m. perennial rhizomatous herb. Blooms Aug
Camissoniopsis guadalupensis ssp. *clementina* San Clemente Island evening-primrose	None/None G3T2/S2 1B.2	Coastal dunes. 0 - 30 m. annual herb. Blooms Apr-Jun
Camissoniopsis lewisii Lewis' evening-primrose	None/None G4/S4 3	Coastal bluff scrub, Cismontane woodland, Coastal dunes, Coastal scrub, Valley and foothill grassland. sandy or clay. 0 - 300 m. annual herb. Blooms Mar-May (Jun)

Scientific Name Common Name	Status	Habitat Requirements
Canbya candida white pygmy-poppy	None/None G3G4/S3S4 4.2	Joshua tree woodland, Mojavean desert scrub, Pinyon and juniper woodland. gravelly, sandy, granitic. 600 - 1460 m. annual herb. Blooms Mar-Jun
Carex comosa bristly sedge	None/None G5/S2 2B.1	Coastal prairie, Marshes and swamps (lake margins), Valley and foothill grassland. 0 - 625 m. perennial rhizomatous herb. Blooms May-Sep
Carex obispoensis San Luis Obispo sedge	None/None G3?/S3? 1B.2	Closed-cone coniferous forest, Chaparral, Coastal prairie, Coastal scrub, Valley and foothill grassland. often serpentinite seeps, sometimes gabbro; often on clay soils. 10 - 820 m. perennial herb. Blooms Apr-Jun
Carex occidentalis western sedge	None/None G4/S3 2B.3	Lower montane coniferous forest, Meadows and seeps. 1645 - 3135 m. perennial rhizomatous herb. Blooms Jun-Aug
Carlowrightia arizonica Arizona carlowrightia	None/None G4G5/S2 2B.2	Sonoran desert scrub (sandy, granitic alluvium). 285 - 430 m. perennial deciduous shrub. Blooms Mar-May
Carnegiea gigantea saguaro	None/None G5/S1 2B.2	Sonoran desert scrub (rocky). 50 - 1500 m. perennial stem succulent. Blooms May-Jun
Castela emoryi Emory's crucifixion-thorn	None/None G3G4/S2S3 2B.2	Mojavean desert scrub, Playas, Sonoran desert scrub. gravelly. 90 - 725 m. perennial deciduous shrub. Blooms (Apr) Jun-Jul (Sep-Oct)
Castilleja cinerea ash-gray paintbrush	FT/None G1G2/S1S2 1B.2	Mojavean desert scrub, Meadows and seeps, Pebble (Pavement) plain, Pinyon and juniper woodland, Upper montane coniferous forest (clay openings). 1800 - 2960 m. perennial herb (hemiparasitic). Blooms Jun-Aug
Castilleja gleasoni Mt. Gleason paintbrush	None/SCR G2/S2 1B.2	Chaparral, Lower montane coniferous forest, Pinyon and juniper woodland. granitic. 665 - 2170 m. perennial herb (hemiparasitic). Blooms May-Jun (Sep)
Castilleja grisea San Clemente Island paintbrush	FT/SCE G3/S3 1B.3	Coastal bluff scrub, Coastal scrub. rocky, often canyons. 10 - 535 m. perennial herb (hemiparasitic). Blooms (Dec)Feb-Aug
Castilleja hololeuca island white-felted paintbrush	None/None G3/S3 1B.2	Closed-cone coniferous forest, Chaparral, Coastal scrub. rocky. 20 - 365 m. perennial herb (hemiparasitic). Blooms Feb-Sep
Castilleja lasiorhyncha San Bernardino Mountains owl's-clover	None/None G2?/S2? 1B.2	Chaparral, Meadows and seeps, Pebble (Pavement) plain, Riparian woodland, Upper montane coniferous forest. mesic. 1300 - 2390 m. annual herb (hemiparasitic). Blooms May-Aug
Castilleja montigena Heckard's paintbrush	None/None G3/S3 4.3	Lower montane coniferous forest, Pinyon and juniper woodland, Upper montane coniferous forest. 1950 - 2800 m. perennial herb (hemiparasitic). Blooms May-Aug
Castilleja plagiotoma Mojave paintbrush	None/None G4/S4 4.3	Great Basin scrub (alluvial), Joshua tree woodland, Lower montane coniferous forest, Pinyon and juniper woodland. 300 - 2500 m. perennial herb (hemiparasitic). Blooms Apr-Jun
Caulanthus lemmonii Lemmon's jewelflower	None/None G3/S3 1B.2	Pinyon and juniper woodland, Valley and foothill grassland. 80 - 1580 m. annual herb. Blooms Feb-May
Caulanthus simulans Payson's jewelflower	None/None G4/S4 4.2	Chaparral, Coastal scrub. sandy, granitic. 90 - 2200 m. annual herb. Blooms (Feb) Mar-May (Jun)

Scientific Name Common Name	Status	Habitat Requirements
Ceanothus cyaneus Lakeside ceanothus	None/None G2/S2 1B.2	Closed-cone coniferous forest, Chaparral. 235 - 755 m. perennial evergreen shrub. Blooms Apr-Jun
Ceanothus foliosus var. *viejasensis* Viejas Mountain ceanothus	None/None G5T1/S1 1B.2	Chaparral. Gabbro. 785 - 1370 m. perennial shrub. Blooms Mar-Jun
Ceanothus ophiochilus Vail Lake ceanothus	FT/SCE G1/S1 1B.1	Chaparral (gabbroic or pyroxenite-rich outcrops). 580 - 1065 m. perennial evergreen shrub. Blooms Feb-Mar
Ceanothus otayensis Otay Mountain ceanothus	None/None G1G2/S1 1B.2	Chaparral (metavolcanic or gabbroic). 600 - 1100 m. perennial evergreen shrub. Blooms Jan-Apr
Ceanothus pendletonensis Pendleton ceanothus	None/None G1/S1 1B.2	Chaparral, Cismontane woodland. Granitic. 110 - 870 m. perennial shrub. Blooms Mar-Jun
Ceanothus verrucosus wart-stemmed ceanothus	None/None G2/S2? 2B.2	Chaparral. 1 - 380 m. perennial evergreen shrub. Blooms Dec-May
Centromadia parryi ssp. *australis* southern tarplant	None/None G3T2/S2 1B.1	Marshes and swamps (margins), Valley and foothill grassland (vernally mesic), Vernal pools. 0 - 480 m. annual herb. Blooms May-Nov
Centromadia pungens ssp. *laevis* smooth tarplant	None/None G3G4T2/S2 1B.1	Chenopod scrub, Meadows and seeps, Playas, Riparian woodland, Valley and foothill grassland. alkaline. 0 - 640 m. annual herb. Blooms Apr-Sep
Cercocarpus betuloides var. *blancheae* island mountain-mahogany	None/None G5T4/S4 4.3	Closed-cone coniferous forest, Chaparral. 30 - 600 m. perennial evergreen shrub. Blooms Feb-May
Cercocarpus traskiae Catalina Island mountain-mahogany	FE/SCE G1/S1 1B.1	Chaparral, Coastal scrub. rocky, sausserite gabbro. 100 - 250 m. perennial evergreen shrub. Blooms Mar-May
Chaenactis carphoclinia var. *peirsonii* Peirson's pincushion	None/None G5T2/S2 1B.3	Sonoran desert scrub (sandy). 3 - 500 m. annual herb. Blooms Mar-Apr
Chaenactis glabriuscula var. *orcuttiana* Orcutt's pincushion	None/None G5T1T2/S1 1B.1	Coastal bluff scrub (sandy), Coastal dunes. 0 - 100 m. annual herb. Blooms Jan-Aug
Chaenactis parishii Parish's chaenactis	None/None G3G4/S3 1B.3	Chaparral (rocky). 1300 - 2500 m. perennial herb. Blooms May-Jul
Chamaebatia australis southern mountain misery	None/None G4/S4 4.2	Chaparral (gabbroic or metavolcanic). 300 - 1020 m. perennial evergreen shrub. Blooms Nov-May
Chenopodium littoreum coastal goosefoot	None/None G1/S1 1B.2	Coastal dunes. 10 - 30 m. annual herb. Blooms Apr-Aug
Chloropyron maritimum ssp. *maritimum* salt marsh bird's-beak	FE/SCE G4?T1/S1 1B.2	Coastal dunes, Marshes and swamps (coastal salt). 0 - 30 m. annual herb (hemiparasitic). Blooms May-Oct (Nov)
Chloropyron molle ssp. *molle* soft bird's-beak	FE/SCR G2T1/S1 1B.2	Marshes and swamps (coastal salt). 0 - 3 m. annual herb (hemiparasitic). Blooms Jun-Nov

Scientific Name Common Name	Status	Habitat Requirements
Chloropyron tecopense Tecopa bird's-beak	None/None G2/S1 1B.2	Mojavean desert scrub, Meadows and seeps. Mesic, alkaline. 60 - 900 m. annual herb (hemiparasitic). Blooms Jul-Oct
Chorizanthe blakleyi Blakley's spineflower	None/None G2/S2 1B.3	Chaparral, Pinyon and juniper woodland. 600 - 1600 m. annual herb. Blooms Apr-Jun
Chorizanthe leptotheca Peninsular spineflower	None/None G3/S3 4.2	Chaparral, Coastal scrub, Lower montane coniferous forest. alluvial fan, granitic. 300 - 1900 m. annual herb. Blooms May-Aug
Chorizanthe orcuttiana Orcutt's spineflower	FE/SCE G1/S1 1B.1	Closed-cone coniferous forest, Chaparral (maritime), Coastal scrub. sandy openings. 3 - 125 m. annual herb. Blooms Mar-May
Chorizanthe parryi var. *fernandina* San Fernando Valley spineflower	FC/SCE G2T1/S1 1B.1	Coastal scrub (sandy), Valley and foothill grassland. 150 - 1220 m. annual herb. Blooms Apr-Jul
Chorizanthe parryi var. *parryi* Parry's spineflower	None/None G3T2/S2 1B.1	Chaparral, Cismontane woodland, Coastal scrub, Valley and foothill grassland. sandy or rocky, openings. 275 - 1220 m. annual herb. Blooms Apr-Jun
Chorizanthe polygonoides var. *longispina* long-spined spineflower	None/None G5T3/S3 1B.2	Chaparral, Coastal scrub, Meadows and seeps, Valley and foothill grassland, Vernal pools. often clay. 30 - 1530 m. annual herb. Blooms Apr-Jul
Chorizanthe spinosa Mojave spineflower	None/None G4/S4 4.2	Chenopod scrub, Joshua tree woodland, Mojavean desert scrub, Playas. Sometimes alkaline. 6 - 1300 m. annual herb. Blooms Mar-Jul
Chorizanthe xanti var. *leucotheca* white-bracted spineflower	None/None G4T3/S3 1B.2	Coastal scrub (alluvial fans), Mojavean desert scrub, Pinyon and juniper woodland. sandy or gravelly. 300 - 1200 m. annual herb. Blooms Apr-Jun
Chylismia arenaria sand evening-primrose	None/None G4?/S2S3 2B.2	Sonoran desert scrub (sandy or rocky). -70 - 915 m. annual/perennial herb. Blooms Nov-May
Cicuta maculata var. *bolanderi* Bolander's water-hemlock	None/None G5T4T5/S2? 2B.1	Marshes and swamps Coastal, fresh or brackish water. 0 - 200 m. perennial herb. Blooms Jul-Sep
Cirsium arizonicum var. *tenuisectum* desert mountain thistle	None/None G5T2/S2 1B.2	Joshua tree woodland, Mojavean desert scrub, Pinyon and juniper woodland. rocky, disturbed areas, often roadsides. 1500 - 2800 m. perennial herb. Blooms Jun-Nov
Cirsium occidentale var. *compactum* compact cobwebby thistle	None/None G3G4T2/S2 1B.2	Chaparral, Coastal dunes, Coastal prairie, Coastal scrub. 5 - 150 m. perennial herb. Blooms Apr-Jun
Cistanthe maritima seaside cistanthe	None/None G3G4/S3 4.2	Coastal bluff scrub, Coastal scrub, Valley and foothill grassland. sandy. 5 - 300 m. annual herb. Blooms (Feb) Mar-Jun (Aug)
Cladium californicum California sawgrass	None/None G4/S2 2B.2	Meadows and seeps, Marshes and swamps Alkaline or Freshwater. 60 - 1600 m. perennial rhizomatous herb. Blooms Jun-Sep
Clarkia delicata delicate clarkia	None/None G3/S3 1B.2	Chaparral, Cismontane woodland. often gabbroic. 235 - 1000 m. annual herb. Blooms Apr-Jun
Clarkia xantiana ssp. *parviflora* Kern Canyon clarkia	None/None G4T3?/S3? 4.2	Chaparral, Cismontane woodland, Great Basin scrub, Valley and foothill grassland. often sandy, sometimes rocky, slopes, sometimes roadsides. 700 - 3620 m. annual herb. Blooms May-Jun

Scientific Name Common Name	Status	Habitat Requirements
Claytonia lanceolata var. *peirsonii* Peirson's spring beauty - Synonym	None/None G5T1Q/S1 3.1	Subalpine coniferous forest, Upper montane coniferous forest. Scree. 1510 - 2745 m. perennial herb. Blooms (Mar) May-Jun
Claytonia peirsonii ssp. *bernardinus* San Bernardino spring beauty	None/None G3G4T1 G2G3T1/S1 1B.1	pinyon and juniper woodland, upper montane coniferous forest. rocky, talus, carbonate, usually openings. 2360 - 2465 m. perennial herb. Blooms Mar-Apr
Claytonia peirsonii ssp. *californacis* Furnace spring beauty	None/None G3G4T1 G2G3T1/S1 1B.1	pinyon and juniper woodland, upper montane coniferous forest. rocky, talus, carbonate, usually openings. 2300 - 2300 m. perennial herb. Blooms Mar-May
Claytonia peirsonii ssp. *peirsonii* Peirson’s spring beauty	None/None G5T2 G2G3T2/S2 1B.2	subalpine coniferous forest, upper montane coniferous forest. granitic, metamorphic, scree, talus. 1510 - 2745 m. perennial herb. Blooms (Mar) May-Jun
Cleomella brevipes short-pedicelled cleomella	None/None G4/S3 4.2	Meadows and seeps, Marshes and swamps, Playas. alkaline. 395 - 2195 m. annual herb. Blooms May-Oct
Clinopodium chandleri San Miguel savory	None/None G3/S2 1B.2	Chaparral, Cismontane woodland, Coastal scrub, Riparian woodland, Valley and foothill grassland. Rocky, gabbroic or metavolcanic. 120 - 1075 m. perennial shrub. Blooms Mar-Jul
Clinopodium mimuloides monkey-flower savory	None/None G3/S3 4.2	Chaparral, North Coast coniferous forest. streambanks, mesic. 305 - 1800 m. perennial herb. Blooms Jun-Oct
Colubrina californica Las Animas colubrina	None/None G4/S2S3 2B.3	Mojavean desert scrub, Sonoran desert scrub. 10 - 1000 m. perennial deciduous shrub. Blooms Apr-Jun
Comarostaphylis diversifolia ssp. *diversifolia* summer holly	None/None G3T2/S2 1B.2	Chaparral, Cismontane woodland. 30 - 790 m. perennial evergreen shrub. Blooms Apr-Jun
Condalia globosa var. *pubescens* spiny abrojo	None/None G5T4/S3 4.2	Sonoran desert scrub. 85 - 1000 m. perennial deciduous shrub. Blooms Mar-May (Nov)
Constancea nevinii Nevin's woolly sunflower	None/None G3/S3 1B.3	Coastal bluff scrub, Coastal scrub. 5 - 410 m. perennial deciduous shrub. Blooms Apr-Aug
Convolvulus simulans small-flowered morning-glory	None/None G4/S4 4.2	Chaparral (openings), Coastal scrub, Valley and foothill grassland. clay, serpentinite seeps. 30 - 740 m. annual herb. Blooms Mar-Jul
Cordylanthus eremicus ssp. *eremicus* desert bird's-beak	None/None G3T3/S3 4.3	Joshua tree woodland, Mojavean desert scrub, Pinyon and juniper woodland. 1000 - 3000 m. annual herb (hemiparasitic). Blooms Jul-Oct
Cordylanthus parviflorus small-flowered bird's-beak	None/None G4/S2 2B.3	Joshua tree woodland, Mojavean desert scrub, Pinyon and juniper woodland. 700 - 2200 m. annual herb (hemiparasitic). Blooms Aug-Oct
Corethrogyne filaginifolia var. *incana* San Diego sand aster	None/None G4T1Q/S1 1B.1	Coastal bluff scrub, Chaparral, Coastal scrub. 3 - 115 m. perennial herb. Blooms Jun-Sep
Corethrogyne filaginifolia var. *linifolia* Del Mar Mesa sand aster	None/None G4T1Q/S1 1B.1	Coastal bluff scrub, Chaparral (maritime, openings), Coastal scrub. sandy. 15 - 150 m. perennial herb. Blooms May-Jul, Aug-Sep

Scientific Name Common Name	Status	Habitat Requirements
Coryphantha alversonii foxtail cactus	None/None G3/S3 4.3	Mojavean desert scrub, Sonoran desert scrub. sandy or rocky, usually granitic. 75 - 1525 m. perennial stem succulent. Blooms Apr-Jun
Coryphantha chlorantha desert pincushion	None/None G4/S3 2B.1	Joshua tree woodland, Mojavean desert scrub, Pinyon and juniper woodland. carbonate, gravelly, rocky. 45 - 1705 m. perennial stem succulent. Blooms Apr-Sep
Coryphantha vivipara var. *rosea* viviparous foxtail cactus	None/None G5T3/S1 2B.2	Mojavean desert scrub, Pinyon and juniper woodland. carbonate. 1250 - 2700 m. perennial stem succulent. Blooms May-Jun
Crocanthemum greenei island rush-rose	FT/None G3/S3 1B.2	Closed-cone coniferous forest, Chaparral, Cismontane woodland, Coastal scrub. Rocky, openings. 15 - 490 m. perennial evergreen shrub. Blooms (Jan) Mar-Jul (Aug)
Crossosoma californicum Catalina crossosoma	None/None G3/S3 1B.2	Chaparral, Coastal scrub. rocky. 0 - 500 m. perennial deciduous shrub. Blooms Feb-May
Cryptantha clokeyi Clokey's cryptantha	None/None G3/S3 1B.2	Mojavean desert scrub. 725 - 1365 m. annual herb. Blooms Apr
Cryptantha ganderi Gander's cryptantha	None/None G2G3/S1 1B.1	Desert dunes, Sonoran desert scrub (sandy). 160 - 400 m. annual herb. Blooms Feb-May
Cryptantha traskiae Trask's cryptantha	None/None G2/S2 1B.1	Coastal bluff scrub, Coastal dunes, Coastal scrub. 15 - 400 m. annual herb. Blooms Mar-Jun
Cryptantha tumulosa New York Mountains cryptantha	None/None G4/S4 4.3	Mojavean desert scrub, Pinyon and juniper woodland. gravelly or clay, granitic or carbonate. 915 - 2130 m. perennial herb. Blooms Apr-Jun
Cryptantha wigginsii Wiggins' cryptantha	None/None G2/S1 1B.2	Coastal scrub. often clay. 20 - 275 m. annual herb. Blooms Feb-Jun
Cuscuta californica var. *apiculata* pointed dodder	None/None G5T3/S3? 3	Mojavean desert scrub, Sonoran desert scrub. sandy. 0 - 500 m. annual vine (parasitic). Blooms Feb-Aug
Cuscuta obtusiflora var. *glandulosa* Peruvian dodder	None/None G5T4?/SH 2B.2	Marshes and swamps (freshwater). 15 - 280 m. annual vine (parasitic). Blooms Jul-Oct
Cylindropuntia californica var. *californica* snake cholla	None/None G3T2/S1 1B.1	Chaparral, Coastal scrub. 30 - 150 m. perennial stem succulent. Blooms Apr-May
Cylindropuntia fosbergii pink teddy-bear cholla	None/None G2/S2 1B.3	Sonoran desert scrub. 85 - 850 m. perennial stem succulent. Blooms Mar-May
Cylindropuntia munzii Munz's cholla	None/None G3/S1 1B.3	Sonoran desert scrub (sandy or gravelly). 150 - 600 m. perennial stem succulent. Blooms May
Cylindropuntia wolfii Wolf's cholla	None/None G4/S3 4.3	Sonoran desert scrub. 100 - 1200 m. perennial stem succulent. Blooms Mar-May
Cymopterus deserticola desert cymopterus	None/None G2/S2 1B.2	Joshua tree woodland, Mojavean desert scrub. sandy. 630 - 1500 m. perennial herb. Blooms Mar-May

Scientific Name Common Name	Status	Habitat Requirements
Cymopterus gilmanii Gilman's cymopterus	None/None G3/S2 2B.3	Mojavean desert scrub (often carbonate). 915 - 2000 m. perennial herb. Blooms Apr-May
Cymopterus multinervatus purple-nerve cymopterus	None/None G4G5/S2 2B.2	Mojavean desert scrub, Pinyon and juniper woodland. sandy or gravelly. 790 - 1800 m. perennial herb. Blooms Mar-Apr
Deinandra conjugens Otay tarplant	FT/SCE G1/S1 1B.1	Coastal scrub, Valley and foothill grassland. clay. 25 - 300 m. annual herb. Blooms (Apr) May-Jun
Deinandra floribunda Tecate tarplant	None/None G2/S2 1B.2	Chaparral, Coastal scrub. 70 - 1220 m. annual herb. Blooms Aug-Oct
Deinandra minthornii Santa Susana tarplant	None/SCR G2/S2 1B.2	Chaparral, Coastal scrub. rocky. 280 - 760 m. perennial deciduous shrub. Blooms Jul-Nov
Deinandra mohavensis Mojave tarplant	None/SCE G2/S2 1B.3	Chaparral, Coastal scrub, Riparian scrub. mesic. 640 - 1600 m. annual herb. Blooms (May) Jun-Oct (Jan)
Deinandra paniculata paniculate tarplant	None/None G4/S4 4.2	Coastal scrub, Valley and foothill grassland, Vernal pools. usually vernally mesic, sometimes sandy. 25 - 940 m. annual herb. Blooms (Mar) Apr-Nov (Dec)
Delphinium hesperium ssp. *cuyamacae* Cuyamaca larkspur	None/SCR G4T2/S2 1B.2	Lower montane coniferous forest, Meadows and seeps, Vernal pools. mesic. 1220 - 1631 m. perennial herb. Blooms May-Jul
Delphinium parishii ssp. *subglobosum* Colorado Desert larkspur	None/None G4T4/S4 4.3	Chaparral, Cismontane woodland, Pinyon and juniper woodland, Sonoran desert scrub. 600 - 1800 m. perennial herb. Blooms Mar-Jun
Delphinium parryi ssp. *blochmaniae* dune larkspur	None/None G4T2/S2 1B.2	Chaparral (maritime), Coastal dunes. 0 - 200 m. perennial herb. Blooms Apr-Jun
Delphinium scaposum bare-stem larkspur	None/None G5/S1 2B.3	Sonoran desert scrub. rocky, sometimes washes. 270 - 1055 m. perennial herb. Blooms Mar-Apr
Delphinium umbraculorum umbrella larkspur	None/None G3/S3 1B.3	Chaparral, Cismontane woodland. 400 - 1600 m. perennial herb. Blooms Apr-Jun
Delphinium variegatum ssp. *kinkiense* San Clemente Island larkspur	FE/SCE G4T2/S2 1B.1	Valley and foothill grassland (coastal). 75 - 500 m. perennial herb. Blooms Mar-Apr
Delphinium variegatum ssp. *thornei* Thorne's royal larkspur	None/None G4T1/S1 1B.1	Cismontane woodland, Valley and foothill grassland (coastal). 250 - 575 m. perennial herb. Blooms (Mar)Apr-May
Dendromecon harfordii var. *rhamnoides* south island bush-poppy	None/None G4T1Q/S1 3.1	Chaparral, Cismontane woodland, Coastal scrub. 150 - 520 m. perennial evergreen shrub. Blooms Apr-Jun
Dichondra occidentalis western dichondra	None/None G3G4/S3S4 4.2	Chaparral, Cismontane woodland, Coastal scrub, Valley and foothill grassland. 50 - 500 m. perennial rhizomatous herb. Blooms (Jan) Mar-Jul
Dicranostegia orcuttiana Orcutt's bird's-beak	None/None G2G3/S1 2B.1	Coastal scrub. 10 - 350 m. annual herb (hemiparasitic). Blooms (Mar) Apr-Jul (Sep)

Scientific Name Common Name	Status	Habitat Requirements
Dieteria asteroides var. *lagunensis* Mt. Laguna aster	None/SCR G5T2T3/S1 2B.1	Cismontane woodland, Lower montane coniferous forest. 790 - 2400 m. perennial herb. Blooms (May) Jul-Aug (Sep-Oct)
Dieteria canescens var. *ziegleri* Ziegler's aster	None/None G5T1/S1 1B.2	Lower montane coniferous forest, Upper montane coniferous forest. 1372 - 2499 m. perennial herb. Blooms Jul-Oct
Digitaria californica var. *californica* Arizona cottontop	None/None G5T5/S2 2B.3	Mojavean desert scrub, Sonoran desert scrub. rocky. 290 - 1490 m. perennial herb. Blooms Jul-Nov
Diplacus aridus low bush monkeyflower	None/None G4/S3 4.3	Chaparral (rocky), Sonoran desert scrub. 750 - 1200 m. perennial evergreen shrub. Blooms Apr-Jul
Diplacus clevelandii Cleveland's bush monkeyflower	None/None G4/S4 4.2	Chaparral, Cismontane woodland, Lower montane coniferous forest. Gabbroic, often in disturbed areas, openings, rocky. 450 - 2000 m. perennial rhizomatous herb. Blooms Apr-Jul
Diplacus johnstonii Johnston's monkeyflower	None/None G4/S4 4.3	Lower montane coniferous forest (scree, disturbed areas, rocky or gravelly, roadside). 975 - 2920 m. annual herb. Blooms (Apr) May-Aug
Diplacus mohavensis Mojave monkeyflower	None/None G2/S2 1B.2	Joshua tree woodland, Mojavean desert scrub. sandy or gravelly, often in washes. 600 - 1200 m. annual herb. Blooms Apr-Jun
Diplacus traskiae Santa Catalina Island monkeyflower	None/None GX/SX 1A	Coastal scrub. - m. annual herb. Blooms Mar-Apr
Dissanthelium californicum California dissanthelium	None/None G2/S1 1B.2	Coastal scrub. 5 - 500 m. annual herb. Blooms Mar-May
Ditaxis claryana glandular ditaxis	None/None G3G4/S2 2B.2	Mojavean desert scrub, Sonoran desert scrub. sandy. 0 - 465 m. perennial herb. Blooms Oct, Dec, Jan, Feb, Mar
Ditaxis serrata var. *californica* California ditaxis	None/None G5T3T4/S2? 3.2	Sonoran desert scrub. 30 - 1000 m. perennial herb. Blooms Mar-Dec
Dithyrea maritima beach spectaclepod	None/SCT G1/S1 1B.1	Coastal dunes, Coastal scrub (sandy). 3 - 50 m. perennial rhizomatous herb. Blooms Mar-May
Dodecahema leptoceras slender-horned spineflower	FE/SCE G1/S1 1B.1	Chaparral, Cismontane woodland, Coastal scrub (alluvial fan). sandy. 200 - 760 m. annual herb. Blooms Apr-Jun
Downingia concolor var. *brevior* Cuyamaca Lake downingia	None/SCE G4T1/S1 1B.1	Meadows and seeps (vernally mesic), Vernal pools. 1030 - 1500 m. annual herb. Blooms May-Jul
Draba saxosa Southern California rock draba	None/None G2G3/S2S3 1B.3	Alpine boulder and rock field, Subalpine coniferous forest, Upper montane coniferous forest. rocky. 2440 - 3600 m. perennial herb. Blooms Jun-Sep
Drymocallis cuneifolia var. *cuneifolia* wedgeleaf woodbeauty	None/None G2T1/S1 1B.1	Riparian scrub, Upper montane coniferous forest. Sometimes carbonate. 1800 - 2415 m. perennial herb. Blooms Jun-Aug
Drymocallis cuneifolia var. *ewanii* Ewan's woodbeauty	None/None G2T2/S2 1B.3	Lower montane coniferous forest (near seeps and springs), Meadows and seeps. 1900 - 2400 m. perennial herb. Blooms Jun-Jul

Scientific Name Common Name	Status	Habitat Requirements
Dryopteris filix-mas male fern	None/None G5/S2 2B.3	Upper montane coniferous forest (granitic, rocky). 1850 - 3100 m. perennial rhizomatous herb. Blooms Jul-Sep
Dudleya abramsii ssp. *affinis* San Bernardino Mountains dudleya	None/None G4T2/S2 1B.2	Pebble (Pavement) plain, Pinyon and juniper woodland, Upper montane coniferous forest. granitic, quartzite, or carbonate. 1250 - 2600 m. perennial herb. Blooms Apr-Jul
Dudleya alainae Banner dudleya	None/None G2Q/S2 3.2	Chaparral, Lower montane coniferous forest, Sonoran desert scrub. rocky. 740 - 1200 m. perennial herb. Blooms Apr-Jul
Dudleya attenuata ssp. *attenuata* Orcutt's dudleya	None/None G4T1T2/S1 2B.1	Coastal bluff scrub, Chaparral, Coastal scrub. rocky or gravelly. 3 - 50 m. perennial herb. Blooms May-Jul
Dudleya blochmaniae ssp. *blochmaniae* Blochman's dudleya	None/None G3T2/S2 1B.1	Coastal bluff scrub, Chaparral, Coastal scrub, Valley and foothill grassland. rocky, often clay or serpentinite. 5 - 450 m. perennial herb. Blooms Apr-Jun
Dudleya blochmaniae ssp. *insularis* Santa Rosa Island dudleya	None/None G3T1/S1 1B.1	Coastal bluff scrub. 3 - 10 m. perennial herb. Blooms Mar-Apr
Dudleya brevifolia short-leaved dudleya	None/SCE G1/S1 1B.1	Chaparral (maritime, openings), Coastal scrub. Torrey sandstone. 30 - 250 m. perennial herb. Blooms Apr-May
Dudleya cymosa ssp. *agourensis* Agoura Hills dudleya	FT/None G5T1/S1 1B.2	Chaparral, Cismontane woodland. rocky, volcanic. 200 - 500 m. perennial herb. Blooms May-Jun
Dudleya cymosa ssp. *crebrifolia* San Gabriel River dudleya	None/None G5T2/S2 1B.2	Chaparral (granitic). 275 - 457 m. perennial herb. Blooms Apr-Jul
Dudleya cymosa ssp. *marcescens* marcescent dudleya	FT/SCR G5T2/S2 1B.2	Chaparral. volcanic, rocky. 150 - 520 m. perennial herb. Blooms Apr-Jul
Dudleya cymosa ssp. *ovatifolia* Santa Monica dudleya	FT/None G5T1/S1 1B.1	Chaparral, Coastal scrub. volcanic or sedimentary, rocky. 150 - 1675 m. perennial herb. Blooms Mar-Jun
Dudleya densiflora San Gabriel Mountains dudleya	None/None G2/S2 1B.1	Chaparral, Cismontane woodland, Coastal scrub, Lower montane coniferous forest, Riparian woodland. granitic, cliffs and canyon walls. 244 - 610 m. perennial herb. Blooms Mar-Jun
Dudleya multicaulis many-stemmed dudleya	None/None G2/S2 1B.2	Chaparral, Coastal scrub, Valley and foothill grassland. often clay. 15 - 790 m. perennial herb. Blooms Apr-Jul
Dudleya parva Conejo dudleya	FT/None G1/S1 1B.2	Coastal scrub, Valley and foothill grassland. rocky or gravelly, clay or volcanic. 60 - 450 m. perennial herb. Blooms May-Jun
Dudleya stolonifera Laguna Beach dudleya	FT/SCT G1/S1 1B.1	Chaparral, Cismontane woodland, Coastal scrub, Valley and foothill grassland. rocky. 10 - 260 m. perennial stoloniferous herb. Blooms May-Jul
Dudleya variegata variegated dudleya	None/None G2/S2 1B.2	Chaparral, Cismontane woodland, Coastal scrub, Valley and foothill grassland, Vernal pools. clay. 3 - 580 m. perennial herb. Blooms Apr-Jun
Dudleya verityi Verity's dudleya	FT/None G1/S1 1B.1	Chaparral, Cismontane woodland, Coastal scrub. volcanic, rocky. 60 - 120 m. perennial herb. Blooms May-Jun

Scientific Name Common Name	Status	Habitat Requirements
Dudleya virens ssp. *hassei* Catalina Island dudleya	None/None G3?T2/S2 1B.2	Coastal bluff scrub, Coastal scrub. Rocky. 0 - 400 m. perennial herb. Blooms Mar-Jun
Dudleya virens ssp. *insularis* island green dudleya	None/None G3?T3/S3 1B.2	Coastal bluff scrub, Coastal scrub. rocky. 5 - 300 m. perennial herb. Blooms Apr-Jun
Dudleya virens ssp. *virens* bright green dudleya	None/None G3?T2/S2 1B.2	Coastal bluff scrub, Chaparral, Coastal scrub. rocky. 5 - 400 m. perennial herb. Blooms Apr-Jul
Dudleya viscida sticky dudleya	None/None G2/S2 1B.2	Coastal bluff scrub, Chaparral, Cismontane woodland, Coastal scrub. rocky. 10 - 550 m. perennial herb. Blooms May-Jun
Echinocereus engelmannii var. *howei* Howe's hedgehog cactus	None/None G5T1/S1 1B.1	Mojavean desert scrub. 430 - 775 m. perennial stem succulent. Blooms Apr-May
Eleocharis parvula small spikerush	None/None G5/S3 4.3	Marshes and swamps. 1 - 3020 m. perennial herb. Blooms (Apr) Jun-Aug (Sep)
Elymus salina Salina Pass wild-rye	None/None G4G5/S2S3 2B.3	Pinyon and juniper woodland (rocky). 1350 - 2135 m. perennial rhizomatous herb. Blooms May-Jun
Enceliopsis nudicaulis var. *nudicaulis* naked-stemmed daisy	None/None G5T5/S3 4.3	Great Basin scrub, Mojavean desert scrub. volcanic or carbonate. 950 - 2000 m. perennial herb. Blooms Apr-May
Enneapogon desvauxii nine-awned pappus grass	None/None G5/S3 2B.2	Pinyon and juniper woodland (rocky, carbonate). 1275 - 1825 m. perennial herb. Blooms Aug-Sep
Eremalche parryi ssp. *kernensis* Kern mallow	FE/None G3G4T3/S3 1B.2	Chenopod scrub, Pinyon and juniper woodland, Valley and foothill grassland. On dry, open sandy to clay soils; often at edge of balds. 70 - 1290 m. annual herb. Blooms Jan, Mar, Apr, May (Feb)
Eremogone congesta var. *charlestonensis* Charleston sandwort	None/None G5T2?/S1 1B.3	Pinyon and juniper woodland (sandy). 2200 - 2225 m. perennial herb. Blooms Jun
Eremogone ursina Big Bear Valley sandwort	FT/None G1/S1 1B.2	Meadows and seeps, Pebble (Pavement) plain, Pinyon and juniper woodland. mesic, rocky. 1800 - 2900 m. perennial herb. Blooms May-Aug
Eremothera boothii ssp. *boothii* Booth's evening-primrose	None/None G5T4/S3 2B.3	Joshua tree woodland, Pinyon and juniper woodland. 815 - 2400 m. annual herb. Blooms Apr-Sep
Eremothera boothii ssp. *intermedia* Booth's hairy evening-primrose	None/None G5T3T4/S3 2B.3	Great Basin scrub (sandy), Pinyon and juniper woodland. 1500 - 2150 m. annual herb. Blooms (May) Jun
Eriastrum densifolium ssp. *sanctorum* Santa Ana River woollystar	FE/SCE G4T1/S1 1B.1	Chaparral, Coastal scrub (alluvial fan). sandy or gravelly. 91 - 610 m. perennial herb. Blooms Apr-Sep
Eriastrum harwoodii Harwood's eriastrum	None/None G2/S2 1B.2	Desert dunes. 125 - 915 m. annual herb. Blooms Mar-Jun
Eriastrum hooveri Hoover's eriastrum	None/None G3/S3 4.2	Chenopod scrub, Pinyon and juniper woodland, Valley and foothill grassland. Sometimes gravelly. 50 - 915 m. annual herb. Blooms (Feb) Mar-Jul

Scientific Name Common Name	Status	Habitat Requirements
Eriastrum rosamondense Rosamond eriastrum	None/None G1?/S1? 1B.1	Chenopod scrub (openings), Vernal pools (edges). Alkaline hummocks, often sandy. 700 - 715 m. annual herb. Blooms Apr-May (Jun-Jul)
Ericameria cuneata var. *macrocephala* Laguna Mountains goldenbush	None/None G5T2T3/S2S3 1B.3	Chaparral (granitic). 1195 - 1850 m. perennial shrub. Blooms Sep-Dec
Ericameria nana dwarf goldenbush	None/None G5/S4 4.3	Pinyon and juniper woodland (rocky, carbonate or granitic). 1465 - 2800 m. perennial shrub. Blooms Jul-Nov
Ericameria palmeri var. *palmeri* Palmer's goldenbush	None/None G4T2?/S2 1B.1	Chaparral, Coastal scrub. mesic. 30 - 600 m. perennial evergreen shrub. Blooms (Jul) Sep-Nov
Erigeron breweri var. *jacinteus* San Jacinto Mountains daisy	None/None G5T3/S3 4.3	Subalpine coniferous forest, Upper montane coniferous forest. rocky. 2700 - 2900 m. perennial rhizomatous herb. Blooms Jun-Sep
Erigeron oxyphyllus wand-like fleabane daisy	None/None G4/S2 2B.3	Sonoran desert scrub. dry, rocky slopes and washes. 645 - 790 m. perennial herb. Blooms Apr-May
Erigeron parishii Parish's daisy	FT/None G2/S2 1B.1	Mojavean desert scrub, Pinyon and juniper woodland. usually carbonate, sometimes granitic. 800 - 2000 m. perennial herb. Blooms May-Aug
Erigeron uncialis var. *uncialis* limestone daisy	None/None G3G4T2/S2 1B.2	Great Basin scrub, Pinyon and juniper woodland, Subalpine coniferous forest. carbonate. 1900 - 2900 m. perennial herb. Blooms May-Jul
Erigeron utahensis Utah daisy	None/None G4/S2 2B.3	Pinyon and juniper woodland (carbonate). 1500 - 2320 m. perennial herb. Blooms May-Jun
Eriodictyon angustifolium narrow-leaved yerba santa	None/None G5/S3 2B.3	Pinyon and juniper woodland. 1500 - 1900 m. perennial evergreen shrub. Blooms May-Aug
Eriodictyon sessilifolium sessile-leaved yerba stanta	None/None G4/S1 2B.1	Coastal scrub. volcanic. 170 - 170 m. perennial shrub. Blooms Jul
Eriogonum bifurcatum forked buckwheat	None/None G3/S3 1B.2	Chenopod scrub (sandy). 645 - 810 m. annual herb. Blooms Apr-Jun
Eriogonum contiguum Reveal's buckwheat	None/None G3/S2 2B.3	Mojavean desert scrub (sandy). 30 - 1320 m. annual herb. Blooms (Feb) Mar-May (Jun)
Eriogonum crocatum conejo buckwheat	None/SCR G1/S1 1B.2	Chaparral, Coastal scrub, Valley and foothill grassland. Conejo volcanic outcrops, rocky. 50 - 580 m. perennial herb. Blooms Apr-Jul
Eriogonum evanidum vanishing wild buckwheat	None/None G2/S1 1B.1	Chaparral, Cismontane woodland, Lower montane coniferous forest, Pinyon and juniper woodland. sandy or gravelly. 1100 - 2225 m. annual herb. Blooms Jul-Oct
Eriogonum giganteum var. *formosum* San Clemente Island buckwheat	None/None G3T3?/S3? 1B.2	Coastal bluff scrub (rocky). 10 - 455 m. perennial deciduous shrub. Blooms Mar-Oct
Eriogonum grande var. *timorum* San Nicolas Island buckwheat	None/SCE G4T1/S1 1B.1	Coastal bluff scrub. 10 - 215 m. perennial herb. Blooms Mar, May, Jun, Jul, Aug, Sep, Oct

Scientific Name Common Name	Status	Habitat Requirements
Eriogonum heermannii var. *floccosum* Clark Mountain buckwheat	None/None G5T4/S4 4.3	Pinyon and juniper woodland (carbonate). 900 - 2400 m. perennial deciduous shrub. Blooms Aug-Oct
Eriogonum kennedyi var. *alpigenum* southern alpine buckwheat	None/None G4T3/S3 1B.3	Alpine boulder and rock field, Subalpine coniferous forest. granitic, gravelly. 2600 - 3500 m. perennial herb. Blooms Jul-Sep
Eriogonum kennedyi var. *austromontanum* southern mountain buckwheat	FT/None G4T2/S2 1B.2	Lower montane coniferous forest (gravelly), Pebble (Pavement) plain. 1770 - 2890 m. perennial herb. Blooms Jun-Sep
Eriogonum microthecum var. *johnstonii* Johnston's buckwheat	None/None G5T2/S2 1B.3	Subalpine coniferous forest, Upper montane coniferous forest. rocky. 1829 - 2926 m. perennial deciduous shrub. Blooms Jul-Sep
Eriogonum microthecum var. *lacus-ursi* Bear Lake buckwheat	None/None G5T1/S1 1B.1	Great Basin scrub, Lower montane coniferous forest. clay outcrops. 2000 - 2100 m. perennial shrub. Blooms Jul-Aug
Eriogonum ovalifolium var. *vineum* Cushenbury buckwheat	FE/None G5T1/S1 1B.1	Joshua tree woodland, Mojavean desert scrub, Pinyon and juniper woodland. carbonate. 1400 - 2440 m. perennial herb. Blooms May-Aug
Eriogonum thornei Thorne's buckwheat	None/SCE G1/S1 1B.2	Pinyon and juniper woodland (gravelly). 1800 - 1830 m. perennial shrub. Blooms Jul-Aug
Eriogonum umbellatum var. *juniporinum* juniper sulphur-flowered buckwheat	None/None G5T4/S3 2B.3	Mojavean desert scrub, Pinyon and juniper woodland. 1300 - 2500 m. perennial herb. Blooms Jul-Oct
Eriogonum umbellatum var. *minus* alpine sulfur-flowered buckwheat	None/None G5T4/S4 4.3	Subalpine coniferous forest, Upper montane coniferous forest. gravelly. 1800 - 3068 m. perennial herb. Blooms Jun-Sep
Erioneuron pilosum hairy erioneuron	None/None G5/S2 2B.3	Pinyon and juniper woodland (rocky, sometimes carbonate). 1420 - 2010 m. perennial herb. Blooms (Apr) May-Jun
Eriophyllum lanatum var. *obovatum* southern Sierra woolly sunflower	None/None G5T4/S4 4.3	Lower montane coniferous forest, Upper montane coniferous forest. sandy loam. 1114 - 2500 m. perennial herb. Blooms Jun-Jul
Eriophyllum mohavense Barstow woolly sunflower	None/None G2/S2 1B.2	Chenopod scrub, Mojavean desert scrub, Playas. 500 - 960 m. annual herb. Blooms Mar-May
Eryngium aristulatum var. *hooveri* Hoover's button-celery	None/None G5T1/S1 1B.1	Vernal pools. 3 - 45 m. annual/perennial herb. Blooms (Jun) Jul (Aug)
Eryngium aristulatum var. *parishii* San Diego button-celery	FE/SCE G5T1/S1 1B.1	Coastal scrub, Valley and foothill grassland, Vernal pools. mesic. 20 - 620 m. annual/perennial herb. Blooms Apr-Jun
Eryngium pendletonense Pendleton button-celery	None/None G1/S1 1B.1	Coastal bluff scrub, Valley and foothill grassland, Vernal pools. clay, vernally mesic. 15 - 110 m. perennial herb. Blooms Apr-Jun (Jul)
Eryngium racemosum Delta button-celery	None/SCE G1/S1 1B.1	Riparian scrub (vernally mesic clay depressions). 3 - 30 m. annual/perennial herb. Blooms Jun-Oct

Scientific Name Common Name	Status	Habitat Requirements
Erysimum ammophilum sand-loving wallflower	None/None G2/S2 1B.2	Chaparral (maritime), Coastal dunes, Coastal scrub. sandy, openings. 0 - 60 m. perennial herb. Blooms Feb-Jun
Erysimum insulare island wallflower	None/None G3/S3 1B.3	Coastal bluff scrub, Coastal dunes. 0 - 300 m. perennial herb. Blooms Mar-Jul
Erysimum suffrutescens suffrutescent wallflower	None/None G3/S3 4.2	Coastal bluff scrub, Chaparral (maritime), Coastal dunes, Coastal scrub. 0 - 150 m. perennial herb. Blooms Jan-Jul (Aug)
Erythranthe diffusa Palomar monkeyflower	None/None G4/S3 4.3	Chaparral, Lower montane coniferous forest. sandy or gravelly. 1220 - 1830 m. annual herb. Blooms Apr-Jun
Erythranthe exigua San Bernardino Mountains monkeyflower	None/None G2/S2 1B.2	Meadows and seeps, Pebble (Pavement) plain, Upper montane coniferous forest. mesic, clay. 1800 - 2315 m. annual herb. Blooms May-Jul
Erythranthe purpurea little purple monkeyflower	None/None G2/S2 1B.2	Meadows and seeps, Pebble (Pavement) plain, Upper montane coniferous forest. 1900 - 2300 m. annual herb. Blooms May-Jun
Eschscholzia androuxii Joshua Tree poppy	None/None G3/S3 4.3	Joshua tree woodland, Mojavean desert scrub. Desert washes, flats, and slopes; sandy, gravelly, and/or rocky. 585 - 1685 m. annual herb. Blooms Feb-May (Jun)
Eschscholzia minutiflora ssp. *twisselmannii* Red Rock poppy	None/None G5T2/S2 1B.2	Mojavean desert scrub (volcanic tuff). 680 - 1230 m. annual herb. Blooms Mar-May
Eucnide rupestris annual rock-nettle	None/None G3/S1 2B.2	Sonoran desert scrub. 500 - 600 m. annual herb. Blooms Dec-Apr
Euphorbia abramsiana Abrams' spurge	None/None G4/S2 2B.2	Mojavean desert scrub, Sonoran desert scrub. sandy. -5 - 1310 m. annual herb. Blooms (Aug) Sep-Nov
Euphorbia arizonica Arizona spurge	None/None G5/S3 2B.3	Sonoran desert scrub (sandy). 50 - 300 m. perennial herb. Blooms Mar-Apr
Euphorbia exstipulata var. *exstipulata* Clark Mountain spurge	None/None G5T5?/S2 2B.1	Mojavean desert scrub (rocky). 1280 - 2000 m. annual herb. Blooms Sep
Euphorbia jaegeri Orocopia Mountains spurge	None/None G1/S1 1B.1	Mojavean desert scrub. Rocky hillsides and arroyos, gravelly or rocky crevices; granitic, carbonate, or metamorphic. 600 - 850 m. perennial shrub. Blooms Oct-May
Euphorbia misera cliff spurge	None/None G5/S2 2B.2	Coastal bluff scrub, Coastal scrub, Mojavean desert scrub. rocky. 10 - 500 m. perennial shrub. Blooms Dec-Aug (Oct)
Euphorbia parryi Parry's spurge	None/None G5/S1 2B.3	Desert dunes, Mojavean desert scrub (sandy). 395 - 730 m. annual herb. Blooms May-Nov
Euphorbia platysperma flat-seeded spurge	None/None G3/S1 1B.2	Desert dunes, Sonoran desert scrub (sandy). 65 - 100 m. annual herb. Blooms Feb-Sep
Euphorbia revoluta revolute spurge	None/None G5/S4 4.3	Mojavean desert scrub (rocky). 1095 - 3100 m. annual herb. Blooms Aug-Sep

Scientific Name Common Name	Status	Habitat Requirements
Euphorbia vallis-mortae Death Valley sandmat	None/None G3/S3 4.2	Mojavean desert scrub (sandy or gravelly). 230 - 1460 m. perennial herb. Blooms May-Oct
Extriplex joaquinana San Joaquin spearscale	None/None G2/S2 1B.2	Chenopod scrub, Meadows and seeps, Playas, Valley and foothill grassland. alkaline. 1 - 835 m. annual herb. Blooms Apr-Oct
Fendlerella utahensis yerba desierto	None/None G5/S4 4.3	Lower montane coniferous forest, Mojavean desert scrub, Pinyon and juniper woodland. carbonate. 1300 - 2800 m. perennial deciduous shrub. Blooms Jun-Aug
Ferocactus viridescens San Diego barrel cactus	None/None G3?/S2S3 2B.1	Chaparral, Coastal scrub, Valley and foothill grassland, Vernal pools. 3 - 450 m. perennial stem succulent. Blooms May-Jun
Fimbristylis thermalis hot springs fimbristylis	None/None G4/S1S2 2B.2	Meadows and seeps (alkaline, near hot springs). 110 - 1340 m. perennial rhizomatous herb. Blooms Jul-Sep
Frankenia palmeri Palmer's frankenia	None/None G3?/S1 2B.1	Coastal dunes, Marshes and swamps (coastal salt), Playas. 0 - 10 m. perennial herb. Blooms May-Jul
Frasera albomarginata var. *albomarginata* desert green-gentian	None/None G5T5/S3 2B.2	Pinyon and juniper woodland (rocky or gravelly). 1370 - 2315 m. perennial herb. Blooms Apr-Jun (Jul-Sep)
Frasera albomarginata var. *induta* Clark Mountain green-gentian	None/None G5T2/S1 1B.2	Pinyon and juniper woodland. Rocky or gravelly, usually carbonate. 1705 - 1770 m. perennial herb. Blooms May-Jun (Sep)
Frasera neglecta pine green-gentian	None/None G4/S4 4.3	Lower montane coniferous forest, Pinyon and juniper woodland, Upper montane coniferous forest. 1400 - 2500 m. perennial herb. Blooms May-Jul
Fraxinus parryi chaparral ash	None/None G3?/S1 2B.2	Chaparral. 213 - 620 m. perennial shrub. Blooms Mar-May
Fremontodendron mexicanum Mexican flannelbush	FE/SCR G2/S1 1B.1	Closed-cone coniferous forest, Chaparral, Cismontane woodland. gabbroic, metavolcanic, or serpentinite. 10 - 716 m. perennial evergreen shrub. Blooms Mar-Jun
Fritillaria ojaiensis Ojai fritillary	None/None G3/S3 1B.2	Broadleafed upland forest (mesic), Chaparral, Cismontane woodland, Lower montane coniferous forest. rocky. 225 - 998 m. perennial bulbiferous herb. Blooms Feb-May
Fritillaria pinetorum pine fritillary	None/None G4/S4 4.3	Chaparral, Lower montane coniferous forest, Pinyon and juniper woodland, Subalpine coniferous forest, Upper montane coniferous forest. granitic or metamorphic. 1735 - 3300 m. perennial bulbiferous herb. Blooms May-Jul (Sep)
Funastrum crispum wavyleaf twinevine	None/None G4/S1 2B.2	Chaparral, Pinyon and juniper woodland. 1165 - 1840 m. perennial herb. Blooms May-Aug
Funastrum utahense Utah vine milkweed	None/None G4/S4 4.2	Mojavean desert scrub, Sonoran desert scrub. sandy or gravelly. 100 - 1435 m. perennial herb. Blooms (Mar) Apr-Jun (Sep-Oct)
Galium andrewsii ssp. *gatense* phlox-leaf serpentine bedstraw	None/None G5T3/S3 4.2	Chaparral, Cismontane woodland, Lower montane coniferous forest. serpentinite, rocky. 150 - 1450 m. perennial herb. Blooms Apr-Jul
Galium angustifolium ssp. *borregoense* Borrego bedstraw	None/SCR G5T3?/S3? 1B.3	Sonoran desert scrub (rocky). 350 - 1250 m. perennial herb. Blooms Mar (May)

Scientific Name Common Name	Status	Habitat Requirements
Galium angustifolium ssp. *gabrielense* San Antonio Canyon bedstraw	None/None G5T3/S3 4.3	Chaparral, Lower montane coniferous forest. granitic, sandy or rocky. 1200 - 2650 m. perennial herb. Blooms Apr-Aug
Galium angustifolium ssp. *gracillimum* slender bedstraw	None/None G5T4/S4 4.2	Joshua tree woodland, Sonoran desert scrub. granitic, rocky. 130 - 1550 m. perennial herb. Blooms Apr-Jun (Jul)
Galium angustifolium ssp. *jacinticum* San Jacinto Mountains bedstraw	None/None G5T2?/S2? 1B.3	Lower montane coniferous forest. 1350 - 2100 m. perennial herb. Blooms Jun-Aug
Galium californicum ssp. *primum* Alvin Meadow bedstraw	None/None G5T2/S2 1B.2	Chaparral, Lower montane coniferous forest. granitic, sandy. 1350 - 1700 m. perennial herb. Blooms May-Jul
Galium catalinense ssp. *acrispum* San Clemente Island bedstraw	None/SCE G4T3/S3 1B.3	Valley and foothill grassland. 25 - 275 m. perennial deciduous shrub. Blooms Mar-May (Aug)
Galium catalinense ssp. *catalinense* Santa Catalina Island bedstraw	None/None G4T2/S2 1B.3	Chaparral, Coastal scrub. 5 - 440 m. perennial deciduous shrub. Blooms Feb-Jul
Galium cliftonsmithii Santa Barbara bedstraw	None/None G4/S4 4.3	Cismontane woodland. 200 - 1220 m. perennial herb. Blooms May-Jul
Galium grande San Gabriel bedstraw	None/None G1/S1 1B.2	Broadleafed upland forest, Chaparral, Cismontane woodland, Lower montane coniferous forest. 425 - 1500 m. perennial deciduous shrub. Blooms Jan-Jul
Galium hilendiae ssp. *kingstonense* Kingston Mountains bedstraw	None/None G4T3/S2 1B.3	Lower montane coniferous forest, Pinyon and juniper woodland. rocky. 1200 - 2100 m. perennial herb. Blooms (May) Jun (Oct)
Galium jepsonii Jepson's bedstraw	None/None G3/S3 4.3	Lower montane coniferous forest, Upper montane coniferous forest. granitic, rocky or gravelly. 1540 - 2500 m. perennial rhizomatous herb. Blooms Jul-Aug
Galium johnstonii Johnston's bedstraw	None/None G4/S4 4.3	Chaparral, Lower montane coniferous forest, Pinyon and juniper woodland, Riparian woodland. 1220 - 2300 m. perennial herb. Blooms Jun-Jul
Galium munzii Munz's bedstraw	None/None G4G5/S4 4.3	Great Basin scrub, Lower montane coniferous forest, Pinyon and juniper woodland, Upper montane coniferous forest. 1100 - 3330 m. perennial herb. Blooms May-Jul
Galium proliferum desert bedstraw	None/None G5/S2 2B.2	Joshua tree woodland, Mojavean desert scrub, Pinyon and juniper woodland. rocky, carbonate (limestone). 1190 - 1630 m. annual herb. Blooms Mar-Jun
Galium wrightii Wright's bedstraw	None/None G5/S3 2B.3	Lower montane coniferous forest, Pinyon and juniper woodland. carbonate, rocky. 1600 - 2000 m. perennial herb. Blooms Jun-Oct
Gambelia speciosa showy island snapdragon	None/None G3/S3 1B.2	Coastal scrub. rocky. 0 - 900 m. perennial shrub. Blooms Feb-May
Gentiana fremontii Fremont's gentian	None/None G4/S2 2B.3	Meadows and seeps (mesic), Upper montane coniferous forest. 2400 - 2700 m. annual herb. Blooms Jun-Aug
Geothallus tuberosus Campbell's liverwort	None/None G1/S1 1B.1	Coastal scrub (mesic), Vernal pools. soil. 10 - 600 m. ephemeral liverwort. Blooms

Scientific Name Common Name	Status	Habitat Requirements
Geraea viscida sticky geraea	None/None G2G3/S2 2B.2	Chaparral (often in disturbed areas). 450 - 1700 m. perennial herb. Blooms (Apr) May-Jun
Gilia latiflora ssp. *cuyamensis* Cuyama gilia	None/None G5?T4/S4 4.3	Pinyon and juniper woodland (sandy). 595 - 2000 m. annual herb. Blooms Apr-Jun
Gilia leptantha ssp. *leptantha* San Bernardino gilia	None/None G4T2/S2 1B.3	Lower montane coniferous forest (sandy or gravelly). 1500 - 2560 m. annual herb. Blooms Jun-Aug
Gilia mexicana El Paso gilia	None/None G4/S1 2B.3	Pinyon and juniper woodland. 1475 - 1475 m. annual herb. Blooms May
Githopsis diffusa ssp. *filicaulis* Mission Canyon bluecup	None/None G5T1Q/S1 3.1	Chaparral (mesic, disturbed areas). 450 - 700 m. annual herb. Blooms Apr-Jun
Glossopetalon pungens pungent glossopetalon	None/None G2/S1 1B.2	Chaparral, Pinyon and juniper woodland. carbonate. 1675 - 2000 m. perennial deciduous shrub. Blooms May-Jun
Goodmania luteola golden goodmania	None/None G3/S3 4.2	Mojavean desert scrub, Meadows and seeps, Playas, Valley and foothill grassland. alkaline or clay. 20 - 2200 m. annual herb. Blooms Apr-Aug
Graphis saxorum Baja rock lichen	None/None G2?/S1 3	Coastal scrub (?). Volcanic rocks. 30 - 80 m. crustose lichen (saxicolous). Blooms
Grimmia vaginulata vaginulate grimmia	None/None G2G3/S1 1B.1	Chaparral (openings). Rocky, boulder and rock walls, carbonate. 685 - 685 m. moss. Blooms
Grindelia hallii San Diego gumplant	None/None G2/S2 1B.2	Chaparral, Lower montane coniferous forest, Meadows and seeps, Valley and foothill grassland. 185 - 1745 m. perennial herb. Blooms May-Oct
Grusonia parishii Parish's club-cholla	None/None G3G4/S2 2B.2	Joshua tree woodland, Mojavean desert scrub, Sonoran desert scrub. sandy, rocky. 300 - 1524 m. perennial stem succulent. Blooms May-Jun (Jul)
Harpagonella palmeri Palmer's grapplinghook	None/None G4/S3 4.2	Chaparral, Coastal scrub, Valley and foothill grassland. Clay; open grassy areas within shrubland. 20 - 955 m. annual herb. Blooms Mar-May
Hazardia cana San Clemente Island hazardia	None/None G3/S3 1B.2	Coastal bluff scrub, Coastal scrub, Riparian forest. 60 - 500 m. perennial evergreen shrub. Blooms Jun-Sep
Hazardia orcuttii Orcutt's hazardia	None/SCT G1/S1 1B.1	Chaparral (maritime), Coastal scrub. often clay. 80 - 85 m. perennial evergreen shrub. Blooms Aug-Oct
Hecastocleis shockleyi prickle-leaf	None/None G4/S4 3	Chenopod scrub, Mojavean desert scrub. rocky slopes, washes; often carbonate or slate. 1200 - 2200 m. perennial evergreen shrub. Blooms May-Jul
Hedeoma drummondii Drummond's false pennyroyal	None/None G5/S1 2B.2	Great Basin scrub, Pinyon and juniper woodland. rocky or gravelly, usually carbonate. 1400 - 1700 m. perennial herb. Blooms May-Jul
Hedeoma nana ssp. *californica* California mock pennyroyal	None/None G5T4/S4 4.3	Joshua tree woodland, Pinyon and juniper woodland. rocky, often carbonate. 855 - 2100 m. perennial herb. Blooms Apr-Jun

Scientific Name Common Name	Status	Habitat Requirements
Helianthus inexpectatus Newhall sunflower	None/None G1/S1 1B.1	Marshes and swamps, Riparian woodland. freshwater, seeps. 305 - 305 m. perennial rhizomatous herb. Blooms Aug-Oct
Helianthus niveus ssp. *tephrodes* Algodones Dunes sunflower	None/SCE G4T2T3/S1 1B.2	Desert dunes. 50 - 100 m. perennial herb. Blooms Sep-May
Helianthus nuttallii ssp. *parishii* Los Angeles sunflower	None/None G5TH/SH 1A	Marshes and swamps (coastal salt and freshwater). 10 - 1525 m. perennial rhizomatous herb. Blooms Aug-Oct
Herissantia crispa curly herissantia	None/None G5/S1 2B.3	Sonoran desert scrub. 700 - 725 m. annual/perennial herb. Blooms (Apr) Aug-Sep
Hesperevax caulescens hogwallow starfish	None/None G3/S3 4.2	Valley and foothill grassland (mesic, clay), Vernal pools (shallow). sometimes alkaline. 0 - 505 m. annual herb. Blooms Mar-Jun
Hesperocyparis forbesii Tecate cypress	None/None G2/S2 1B.1	Closed-cone coniferous forest, Chaparral. clay, gabbroic or metavolcanic. 80 - 1500 m. perennial evergreen tree. Blooms
Hesperocyparis stephensonii Cuyamaca cypress	None/None G1/S1 1B.1	Closed-cone coniferous forest, Chaparral, Cismontane woodland, Riparian forest. gabbroic. 1035 - 1705 m. perennial evergreen tree. Blooms
Heterotheca sessiliflora ssp. *sessiliflora* beach goldenaster	None/None G4T2T3/S1 1B.1	Chaparral (coastal), Coastal dunes, Coastal scrub. 0 - 1225 m. perennial herb. Blooms Mar-Dec
Heuchera abramsii Abrams' alumroot	None/None G3/S3 4.3	Upper montane coniferous forest (rocky). 2800 - 3500 m. perennial rhizomatous herb. Blooms Jul-Aug
Heuchera brevistaminea Laguna Mountains alumroot	None/None G2/S2 1B.3	Broadleafed upland forest, Chaparral, Cismontane woodland, Riparian forest. rocky. 1370 - 2000 m. perennial rhizomatous herb. Blooms Apr-Jul (Sep)
Heuchera caespitosa urn-flowered alumroot	None/None G3/S3 4.3	Cismontane woodland, Lower montane coniferous forest, Riparian forest (montane), Upper montane coniferous forest. rocky. 1155 - 2650 m. perennial rhizomatous herb. Blooms May-Aug
Heuchera hirsutissima shaggy-haired alumroot	None/None G3/S3 1B.3	Subalpine coniferous forest, Upper montane coniferous forest. rocky, granitic. 1520 - 3500 m. perennial rhizomatous herb. Blooms (May) Jun-Jul
Heuchera maxima island alumroot	None/None G3/S3 1B.2	Coastal bluff scrub, Chaparral, Cismontane woodland, Coastal scrub. rocky. 10 - 500 m. perennial rhizomatous herb. Blooms Feb-May
Heuchera parishii Parish's alumroot	None/None G3/S3 1B.3	Alpine boulder and rock field, Lower montane coniferous forest, Subalpine coniferous forest, Upper montane coniferous forest. rocky, sometimes carbonate. 1500 - 3800 m. perennial rhizomatous herb. Blooms Jun-Aug
Heuchera rubescens var. *versicolor* San Diego County alumroot	None/None G5T4/S2 3.3	Chaparral, Lower montane coniferous forest. rocky. 1500 - 4000 m. perennial rhizomatous herb. Blooms May-Jun
Hibiscus lasiocarpos var. *occidentalis* woolly rose-mallow	None/None G5T3/S3 1B.2	Marshes and swamps (freshwater). Often in riprap on sides of levees. 0 - 120 m. perennial rhizomatous herb (emergent). Blooms Jun-Sep
Holocarpha virgata ssp. *elongata* graceful tarplant	None/None G5T3/S3 4.2	Chaparral, Cismontane woodland, Coastal scrub, Valley and foothill grassland. 60 - 1100 m. annual herb. Blooms May-Nov

Scientific Name Common Name	Status	Habitat Requirements
Hordeum intercedens vernal barley	None/None G3G4/S3S4 3.2	Coastal dunes, Coastal scrub, Valley and foothill grassland (saline flats and depressions), Vernal pools. 5 - 1000 m. annual herb. Blooms Mar-Jun
Horkelia cuneata var. *puberula* mesa horkelia	None/None G4T1/S1 1B.1	Chaparral (maritime), Cismontane woodland, Coastal scrub. sandy or gravelly. 70 - 810 m. perennial herb. Blooms Feb-Jul (Sep)
Horkelia truncata Ramona horkelia	None/None G3/S3 1B.3	Chaparral, Cismontane woodland. clay, gabbroic. 400 - 1300 m. perennial herb. Blooms May-Jun
Horkelia wilderae Barton Flats horkelia	None/None G1/S1 1B.1	Chaparral (edges), Lower montane coniferous forest, Upper montane coniferous forest. 1675 - 2925 m. perennial herb. Blooms May-Sep
Horsfordia alata pink velvet-mallow	None/None G5/S4 4.3	Sonoran desert scrub (rocky). 100 - 500 m. perennial shrub. Blooms Feb-Dec
Horsfordia newberryi Newberry's velvet-mallow	None/None G5/S4 4.3	Sonoran desert scrub (rocky). 3 - 800 m. perennial shrub. Blooms Feb,Apr,Nov,Dec
Hosackia crassifolia var. *otayensis* Otay Mountain lotus	None/None G5T1/S1 1B.1	Chaparral (metavolcanic, often in disturbed areas). 380 - 1005 m. perennial herb. Blooms May-Aug
Hulsea californica San Diego sunflower	None/None G3/S3 1B.3	Chaparral, Lower montane coniferous forest, Upper montane coniferous forest. openings and burned areas. 915 - 2915 m. perennial herb. Blooms Apr-Jun
Hulsea mexicana Mexican hulsea	None/None G3G4/S1 2B.3	Chaparral (volcanic, often on burns or disturbed areas). 1200 - 1200 m. annual/perennial herb. Blooms Apr-Jun
Hulsea vestita ssp. *callicarpha* beautiful hulsea	None/None G5T4/S4 4.2	Chaparral, Lower montane coniferous forest. rocky or gravelly, granitic. 915 - 3050 m. perennial herb. Blooms May-Oct
Hulsea vestita ssp. *gabrielensis* San Gabriel Mountains sunflower	None/None G5T3/S3 4.3	Lower montane coniferous forest, Upper montane coniferous forest. rocky. 1500 - 2500 m. perennial herb. Blooms May-Jul
Hulsea vestita ssp. *parryi* Parry's sunflower	None/None G5T4/S4 4.3	Lower montane coniferous forest, Pinyon and juniper woodland, Upper montane coniferous forest. granitic or carbonate, rocky, openings. 1370 - 2895 m. perennial herb. Blooms Apr-Aug
Hulsea vestita ssp. *pygmaea* pygmy hulsea	None/None G5T1/S1 1B.3	Alpine boulder and rock field, Subalpine coniferous forest. granitic, gravelly. 2835 - 3900 m. perennial herb. Blooms Jun-Oct
Hymenopappus filifolius var. *eriopodus* hairy-podded fine-leaf hymenopappus	None/None G5T3/S2S3 2B.3	Pinyon and juniper woodland. carbonate. 1600 - 1700 m. perennial herb. Blooms May-Jul
Hymenothrix wrightii Wright's hymenothrix	None/None G5/S3 4.3	Cismontane woodland, Lower montane coniferous forest, Valley and foothill grassland. 1400 - 1550 m. perennial herb. Blooms Jun-Oct
Hymenoxys odorata bitter hymenoxys	None/None G5/S2 2B.1	Riparian scrub, Sonoran desert scrub. sandy. 45 - 150 m. annual herb. Blooms Feb, Apr, May, Jun, Aug, Sep, Oct, Nov
Imperata brevifolia California satintail	None/None G4/S3 2B.1	Chaparral, Coastal scrub, Mojavean desert scrub, Meadows and seeps (often alkali), Riparian scrub. mesic. 0 - 1215 m. perennial rhizomatous herb. Blooms Sep-May

Scientific Name Common Name	Status	Habitat Requirements
Ipomopsis tenuifolia slender-leaved ipomopsis	None/None G4/S2 2B.3	Chaparral, Pinyon and juniper woodland, Sonoran desert scrub. gravelly or rocky. 100 - 1200 m. perennial herb. Blooms Mar-May
Isocoma menziesii var. *decumbens* decumbent goldenbush	None/None G3G5T2T3/S2 1B.2	Chaparral, Coastal scrub (sandy, often in disturbed areas). 10 - 135 m. perennial shrub. Blooms Apr-Nov
Iva hayesiana San Diego marsh-elder	None/None G3/S2 2B.2	Marshes and swamps, Playas. 10 - 500 m. perennial herb. Blooms Apr-Oct
Ivesia argyrocoma var. *argyrocoma* silver-haired ivesia	None/None G2T2/S2 1B.2	Meadows and seeps (alkaline), Pebble (Pavement) plain, Upper montane coniferous forest. 1463 - 2960 m. perennial herb. Blooms (May) Jun-Aug
Ivesia callida Tahquitz ivesia	None/SCR G1/S1 1B.3	Upper montane coniferous forest (granitic, rocky). 2410 - 2450 m. perennial herb. Blooms Jul-Sep
Ivesia jaegeri Jaeger's ivesia	None/None G2G3/S1 1B.3	Pinyon and juniper woodland, Upper montane coniferous forest. carbonate, rocky. 1830 - 3600 m. perennial herb. Blooms Jun-Jul
Ivesia patellifera Kingston Mountains ivesia	None/None G2/S2 1B.3	Pinyon and juniper woodland (granitic, rocky). 1400 - 2100 m. perennial herb. Blooms Jun-Oct
Jaffueliobryum raui Rau?s jaffueliobryum moss	None/None G4?/S2? 2B.3	Alpine dwarf scrub, Chaparral, Mojavean desert scrub, Sonoran desert scrub. Dry openings, rock crevices, carbonate. 490 - 2100 m. moss. Blooms
Jaffueliobryum wrightii Wright?s jaffueliobryum moss	None/None G4G5/S2? 2B.3	Alpine dwarf scrub, Mojavean desert scrub, Pinyon and juniper woodland. Dry openings, rock crevices, carbonate. 160 - 2500 m. moss. Blooms
Johnstonella costata ribbed cryptantha	None/None G4G5/S4 4.3	Desert dunes, Mojavean desert scrub, Sonoran desert scrub. sandy. -60 - 500 m. annual herb. Blooms Feb-May
Johnstonella holoptera winged cryptantha	None/None G4G5/S4 4.3	Mojavean desert scrub, Sonoran desert scrub. 100 - 1690 m. annual herb. Blooms Mar-Apr
Juglans californica Southern California black walnut	None/None G4/S4 4.2	Chaparral, Cismontane woodland, Coastal scrub, Riparian woodland. alluvial. 50 - 900 m. perennial deciduous tree. Blooms Mar-Aug
Juncus acutus ssp. *leopoldii* southwestern spiny rush	None/None G5T5/S4 4.2	Coastal dunes (mesic), Meadows and seeps (alkaline seeps), Marshes and swamps (coastal salt). 3 - 900 m. perennial rhizomatous herb. Blooms (Mar) May-Jun
Juncus cooperi Cooper's rush	None/None G4/S3 4.3	Meadows and seeps (mesic, alkaline or saline). -260 - 1770 m. perennial herb. Blooms Apr-May (Aug)
Juncus duranii Duran's rush	None/None G3/S3 4.3	Lower montane coniferous forest, Meadows and seeps, Upper montane coniferous forest. mesic. 1768 - 2804 m. perennial rhizomatous herb. Blooms Jul-Aug
Juncus interior inland rush	None/None G4/S1 2B.2	Pinyon and juniper woodland. 1830 - 1845 m. perennial herb. Blooms Jun-Aug
Juncus luciensis Santa Lucia dwarf rush	None/None G3/S3 1B.2	Chaparral, Great Basin scrub, Lower montane coniferous forest, Meadows and seeps, Vernal pools. 300 - 2040 m. annual herb. Blooms Apr-Jul

Scientific Name Common Name	Status	Habitat Requirements
Juncus nodosus knotted rush	None/None G5/S3 2B.3	Meadows and seeps (mesic), Marshes and swamps (lake margins). 30 - 1980 m. perennial rhizomatous herb. Blooms Jul-Sep
Kallstroemia parviflora warty caltrop	None/None G5/S3 4.2	Joshua tree woodland, Mojavean desert scrub, Pinyon and juniper woodland. Sometimes disturbed areas. 855 - 1705 m. annual herb. Blooms Aug-Nov
Koeberlinia spinosa var. *tenuispina* slender-spined all thorn	None/None G4T4?/S2 2B.2	Riparian woodland, Sonoran desert scrub. 150 - 510 m. perennial deciduous shrub. Blooms May-Jul
Lasthenia glabrata ssp. *coulteri* Coulter's goldfields	None/None G4T2/S2 1B.1	Marshes and swamps (coastal salt), Playas, Vernal pools. 1 - 1220 m. annual herb. Blooms Feb-Jun
Lathyrus jepsonii var. *jepsonii* Delta tule pea	None/None G5T2/S2 1B.2	Marshes and swamps (freshwater and brackish). 0 - 5 m. perennial herb. Blooms May-Jul (Aug-Sep)
Lathyrus splendens pride-of-California	None/None G4/S4 4.3	Chaparral. 200 - 1525 m. perennial herb. Blooms Mar-Jun
Lavatera assurgentiflora ssp. *assurgentiflora* island mallow	None/None G1T1/S1 1B.1	Coastal bluff scrub, Coastal scrub. sandy or rocky. 15 - 245 m. perennial evergreen shrub. Blooms Mar-Nov
Lavatera assurgentiflora ssp. *glabra* southern island mallow	None/None G1T1/S1 1B.1	Coastal bluff scrub. 5 - 250 m. perennial evergreen shrub. Blooms May-Sep
Layia heterotricha pale-yellow layia	None/None G2/S2 1B.1	Cismontane woodland, Coastal scrub, Pinyon and juniper woodland, Valley and foothill grassland. alkaline or clay. 300 - 1705 m. annual herb. Blooms Mar-Jun
Layia munzii Munz's tidy-tips	None/None G2/S2 1B.2	Chenopod scrub, Valley and foothill grassland (alkaline clay). 150 - 700 m. annual herb. Blooms Mar-Apr
Lepechinia cardiophylla heart-leaved pitcher sage	None/None G3/S2S3 1B.2	Closed-cone coniferous forest, Chaparral, Cismontane woodland. 520 - 1370 m. perennial shrub. Blooms Apr-Jul
Lepechinia fragrans fragrant pitcher sage	None/None G3/S3 4.2	Chaparral. 20 - 1310 m. perennial shrub. Blooms Mar-Oct
Lepechinia ganderi Gander's pitcher sage	None/None G3/S3 1B.3	Closed-cone coniferous forest, Chaparral, Coastal scrub, Valley and foothill grassland. Gabbroic or metavolcanic. 305 - 1005 m. perennial shrub. Blooms Jun-Jul
Lepechinia rossii Ross' pitcher sage	None/None G1/S1 1B.2	Chaparral. 305 - 790 m. perennial shrub. Blooms May-Sep
Lepidium flavum var. *felipense* Blair Valley pepper-grass	None/None G5T1/S1 1B.2	Pinyon and juniper woodland, Sonoran desert scrub. sandy. 455 - 840 m. annual herb. Blooms Mar-May
Lepidium virginicum var. *robinsonii* Robinson's pepper-grass	None/None G5T3/S3 4.3	Chaparral, Coastal scrub. 1 - 885 m. annual herb. Blooms Jan-Jul
Leptosiphon floribundus ssp. *hallii* Santa Rosa Mountains leptosiphon	None/None G4T1T2/S1S2 1B.3	Pinyon and juniper woodland, Sonoran desert scrub. 1000 - 2000 m. perennial herb. Blooms May-Jul (Nov)

Scientific Name Common Name	Status	Habitat Requirements
Leptosiphon pygmaeus ssp. *pygmaeus* pygmy leptosiphon	None/None G4T1/S1 1B.2	Coastal scrub, Valley and foothill grassland. 455 - 595 m. annual herb. Blooms Apr
Leptosyne maritima sea dahlia	None/None G2/S1S2 2B.2	Coastal bluff scrub, Coastal scrub. 5 - 150 m. perennial herb. Blooms Mar-May
Lessingia glandulifera var. *tomentosa* Warner Springs lessingia	None/None G4?T2/S2 1B.1	Chaparral (sandy). 870 - 1220 m. annual herb. Blooms Aug, Oct
Lewisia brachycalyx short-sepaled lewisia	None/None G4/S2 2B.2	Lower montane coniferous forest, Meadows and seeps. mesic. 1370 - 2300 m. perennial herb. Blooms (Feb)Apr-Jun (Jul)
Lilaeopsis masonii Mason's lilaeopsis	None/SCR G2/S2 1B.1	Marshes and swamps (brackish or freshwater), Riparian scrub. 0 - 10 m. perennial rhizomatous herb. Blooms Apr-Nov
Lilium humboldtii ssp. *ocellatum* ocellated Humboldt lily	None/None G4T4?/S4? 4.2	Chaparral, Cismontane woodland, Coastal scrub, Lower montane coniferous forest, Riparian woodland. openings. 30 - 1800 m. perennial bulbiferous herb. Blooms Mar-Jul (Aug)
Lilium parryi lemon lily	None/None G3/S3 1B.2	Lower montane coniferous forest, Meadows and seeps, Riparian forest, Upper montane coniferous forest. mesic. 1220 - 2745 m. perennial bulbiferous herb. Blooms Jul-Aug
Limnanthes alba ssp. *parishii* Parish's meadowfoam	None/SCE G4T2/S2 1B.2	Lower montane coniferous forest, Meadows and seeps, Vernal pools. vernally mesic. 600 - 2000 m. annual herb. Blooms Apr-Jun
Limosella australis Delta mudwort	None/None G4G5/S2 2B.1	Marshes and swamps (freshwater or brackish), Riparian scrub. Usually mud banks. 0 - 3 m. perennial stoloniferous herb. Blooms May-Aug
Linanthus bellus desert beauty	None/None G2G3/S2 2B.1	Chaparral (sandy). 1000 - 1400 m. annual herb. Blooms Apr-May
Linanthus bernardinus Pioneertown linanthus	None/None G1/S1 1B.2	Joshua tree woodland, Pinyon and juniper woodland. 1190 - 1340 m. annual herb. Blooms Mar-May
Linanthus concinnus San Gabriel linanthus	None/None G2/S2 1B.2	Chaparral, Lower montane coniferous forest, Upper montane coniferous forest. rocky, openings. 1520 - 2800 m. annual herb. Blooms Apr-Jul
Linanthus jaegeri San Jacinto linanthus	None/None G2/S2 1B.2	Subalpine coniferous forest, Upper montane coniferous forest. granitic, rocky. 2195 - 3050 m. perennial herb. Blooms Jul-Sep
Linanthus killipii Baldwin Lake linanthus	None/None G1/S1 1B.2	Joshua tree woodland, Meadows and seeps (alkaline), Pebble (Pavement) plain, Pinyon and juniper woodland. 1700 - 2400 m. annual herb. Blooms May-Jul
Linanthus maculatus ssp. *emaculatus* Jacumba Mountains linanthus	None/None G2T1/S1 1B.1	Desert dunes (edges), Sonoran desert scrub. Sandy or course, opaque-white, decomposed granite soils of washes and on flats near wash margins. 395 - 585 m. annual herb. Blooms (Mar) Apr (May)
Linanthus maculatus ssp. *maculatus* Little San Bernardino Mtns. linanthus	None/None G2T2/S2 1B.2	Desert dunes, Joshua tree woodland, Mojavean desert scrub, Sonoran desert scrub. Sandy. 140 - 1220 m. annual herb. Blooms Mar-May
Linanthus orcuttii Orcutt's linanthus	None/None G3/S2 1B.3	Chaparral, Lower montane coniferous forest, Pinyon and juniper woodland. openings. 915 - 2145 m. annual herb. Blooms May-Jun

Scientific Name Common Name	Status	Habitat Requirements
Linum puberulum plains flax	None/None G5/S2 2B.3	Great Basin scrub, Joshua tree woodland, Mojavean desert scrub, Pinyon and juniper woodland. 1000 - 2500 m. perennial herb. Blooms May-Jul(Oct)
Lithophragma maximum San Clemente Island woodland star	FE/SCE G1/S1 1B.1	Coastal bluff scrub, Coastal scrub. rocky. 120 - 400 m. perennial rhizomatous herb. Blooms Apr-Jun
Lithospermum incisum plains stoneseed	None/None G5/S1 2B.3	Pinyon and juniper woodland. 1650 - 1720 m. perennial herb. Blooms May
Loeflingia squarrosa var. *artemisiarum* sagebrush loeflingia	None/None G5T3/S2 2B.2	Desert dunes, Great Basin scrub, Sonoran desert scrub. sandy. 700 - 1615 m. annual herb. Blooms Apr-May
Loeseliastrum depressum depressed standing-cypress	None/None G5/S3S4 4.3	Great Basin scrub, Mojavean desert scrub, Pinyon and juniper woodland. sandy or gravelly. 1220 - 2100 m. annual herb. Blooms
Lomatium insulare San Nicolas Island lomatium	None/None G3/S2S3 1B.2	Coastal bluff scrub (sandy). 15 - 800 m. perennial herb. Blooms Jan-Apr (Jun)
Lonicera subspicata var. *subspicata* Santa Barbara honeysuckle	None/None G5T2?/S2? 1B.2	Chaparral, Cismontane woodland, Coastal scrub. 10 - 1000 m. perennial evergreen shrub. Blooms May-Aug (Dec-Feb)
Lupinus albifrons var. *johnstonii* interior bush lupine	None/None G4T4/S4 4.3	Chaparral, Lower montane coniferous forest. decomposed granitic. 1500 - 2500 m. perennial shrub. Blooms May-Jul
Lupinus albifrons var. *medius* Mountain Springs bush lupine	None/None G4T3/S2 1B.3	Pinyon and juniper woodland, Sonoran desert scrub. 425 - 1370 m. perennial shrub. Blooms Mar-May
Lupinus elatus silky lupine	None/None G4/S4 4.3	Lower montane coniferous forest, Upper montane coniferous forest. 1500 - 3000 m. perennial herb. Blooms (May) Jun-Aug
Lupinus guadalupensis Guadalupe Island lupine	None/None G3/S3 4.2	Coastal scrub. Sandy, gravelly, or rocky; sometimes in disturbed areas. 10 - 465 m. annual herb. Blooms Feb-Apr
Lupinus magnificus var. *glarecola* Coso Mountains lupine	None/None G3T4/S4 4.3	Great Basin scrub, Joshua tree woodland, Mojavean desert scrub. granitic, often talus and scree. 1110 - 2440 m. perennial herb. Blooms Apr-Jun
Lupinus paynei Payne's bush lupine	None/None G1Q/S1 1B.1	Coastal scrub, Riparian scrub, Valley and foothill grassland. Sandy. 220 - 420 m. perennial shrub. Blooms Mar-Apr (May-Jul)
Lupinus peirsonii Peirson's lupine	None/None G3/S3 1B.3	Joshua tree woodland, Lower montane coniferous forest, Pinyon and juniper woodland, Upper montane coniferous forest. gravelly or rocky. 1000 - 2500 m. perennial herb. Blooms Apr-Jun
Lycium brevipes var. *hassei* Santa Catalina Island desert-thorn	None/None G5T1Q/S1 3.1	Coastal bluff scrub, Coastal scrub. 65 - 300 m. perennial deciduous shrub. Blooms Jun (Aug)
Lycium californicum California box-thorn	None/None G4/S4 4.2	Coastal bluff scrub, Coastal scrub. 5 - 150 m. perennial shrub. Blooms (Dec)Mar, Jun, Jul, Aug
Lycium exsertum Arizona desert-thorn	None/None G4G5/S1 2B.1	Sonoran desert scrub. volcanic, gravelly. 265 - 265 m. perennial shrub. Blooms Jan-Mar

Scientific Name Common Name	Status	Habitat Requirements
Lycium parishii Parish's desert-thorn	None/None G3?/S1 2B.3	Coastal scrub, Sonoran desert scrub. 135 - 1000 m. perennial shrub. Blooms Mar-Apr
Lycium torreyi Torrey's box-thorn	None/None G4G5/S3 4.2	Mojavean desert scrub, Sonoran desert scrub. Sandy, rocky, washes, streambanks, desert valleys. -50 - 1220 m. perennial shrub. Blooms (Jan-Feb) Mar-Jun (Sep-Nov)
Lycium verrucosum San Nicolas Island desert-thorn	None/None GXQ/SX 1A	Coastal scrub. - m. perennial shrub. Blooms Apr
Lyonothamnus floribundus ssp. *aspleniifolius* Santa Cruz Island ironwood	None/None G3T3/S3 1B.2	Broadleafed upland forest, Chaparral, Cismontane woodland. 20 - 580 m. perennial evergreen tree. Blooms May-Jul
Lyonothamnus floribundus ssp. *floribundus* Santa Catalina Island ironwood	None/None G3T2/S2 1B.2	Broadleafed upland forest, Chaparral, Cismontane woodland. 75 - 500 m. perennial evergreen tree. Blooms May-Jun
Lyrocarpa coulteri Palmer's lyrepod	None/None G4G5/S4 4.3	Sonoran desert scrub (gravelly or rocky). 120 - 795 m. perennial herb. Blooms Dec-Apr
Malacothamnus clementinus San Clemente Island bush-mallow	FE/SCE G2G3/S2S3 1B.1	Valley and foothill grassland (rocky). 10 - 275 m. perennial deciduous shrub. Blooms Mar-Aug
Malacothamnus davidsonii Davidson's bush-mallow	None/None G2/S2 1B.2	Chaparral, Cismontane woodland, Coastal scrub, Riparian woodland. 185 - 1140 m. perennial deciduous shrub. Blooms Jun-Jan
Malacothamnus parishii Parish's bush-mallow	None/None GXQ/SX 1A	Chaparral, Coastal scrub. 305 - 455 m. perennial deciduous shrub. Blooms Jun-Jul
Malacothrix foliosa ssp. *crispifolia* wavy-leaved malacothrix	None/None G4T1/S1 1B.2	Coastal scrub (rocky). 3 - 65 m. annual herb. Blooms Mar, May (Jul)
Malacothrix incana dunedelion	None/None G3G4/S3S4 4.3	Coastal dunes, Coastal scrub. 2 - 35 m. perennial herb. Blooms (Jan) Apr-Oct
Malacothrix junakii Junak's malcothrix	None/None G1/S1 1B.1	Coastal scrub. 20 - 25 m. annual herb. Blooms Apr,Jun
Malacothrix saxatilis var. *saxatilis* cliff malacothrix	None/None G5T4/S4 4.2	Coastal bluff scrub, Coastal scrub. 3 - 200 m. perennial rhizomatous herb. Blooms Mar-Sep
Malacothrix similis Mexican malacothrix	None/None G2G3/SH 2A	Coastal dunes. 0 - 40 m. annual herb. Blooms Apr-May
Malacothrix squalida island malacothrix	FE/None G1/S1 1B.1	Coastal bluff scrub, Chaparral, Cismontane woodland. 15 - 200 m. annual herb. Blooms Apr-Jul
Malaxis monophyllos var. *brachypoda* white bog adder's-mouth	None/None G4?T4/S1 2B.1	Bogs and fens, Meadows and seeps, Upper montane coniferous forest. mesic. 2200 - 2743 m. perennial bulbiferous herb. Blooms Jun, Aug
Malperia tenuis brown turbans	None/None G4?/S2? 2B.3	Sonoran desert scrub (sandy, gravelly). 15 - 335 m. annual herb. Blooms (Feb) Mar-Apr

Scientific Name Common Name	Status	Habitat Requirements
Mammillaria grahamii var. *grahamii* Graham's fishhook cactus	None/None G4T4/S2 2B.2	Sonoran desert scrub gravelly or rocky. 300 - 900 m. perennial stem succulent. Blooms Apr-Sep
Marina orcuttii var. *orcuttii* California marina	None/None G2G3T1T2/S2? 1B.3	Chaparral, Pinyon and juniper woodland, Sonoran desert scrub. rocky. 1050 - 1160 m. perennial herb. Blooms May-Oct
Matelea parvifolia spearleaf	None/None G5/S3 2B.3	Mojavean desert scrub, Sonoran desert scrub. rocky. 440 - 1095 m. perennial herb. Blooms Mar-May (Jul)
Maurandella antirrhiniflora violet twining snapdragon	None/None G5/S2 2B.3	Joshua tree woodland, Mojavean desert scrub. carbonate. 760 - 1525 m. perennial herb. Blooms Apr-May
Meesia triquetra three-ranked hump moss	None/None G5/S4 4.2	Bogs and fens, Meadows and seeps, Subalpine coniferous forest, Upper montane coniferous forest (mesic). soil. 1300 - 2953 m. moss. Blooms Jul
Meesia uliginosa broad-nerved hump moss	None/None G5/S3 2B.2	Bogs and fens, Meadows and seeps, Subalpine coniferous forest, Upper montane coniferous forest. damp soil. 1210 - 2804 m. moss. Blooms Jul, Oct
Menodora scabra var. *scabra* rough menodora	None/None G5T4T5/S3 2B.3	Joshua tree woodland, Mojavean desert scrub, Pinyon and juniper woodland. 1200 - 1800 m. perennial herb. Blooms May-Jun
Menodora spinescens var. *mohavensis* Mojave menodora	None/None G4T2/S2 1B.2	Mojavean desert scrub. Andesite gravel, rocky hillsides, canyons. 690 - 2000 m. perennial deciduous shrub. Blooms Apr-May
Mentzelia eremophila solitary blazing star	None/None G4/S3S4 4.2	Mojavean desert scrub. 700 - 1220 m. annual herb. Blooms Mar-May
Mentzelia hirsutissima hairy stickleaf	None/None G4?/S3 2B.3	Sonoran desert scrub (rocky). 0 - 700 m. annual herb. Blooms Mar-May
Mentzelia polita polished blazing star	None/None G2G3/S2? 1B.2	Mojavean desert scrub. carbonate. 1200 - 1580 m. perennial herb. Blooms Apr-Aug
Mentzelia pterosperma wing-seed blazing star	None/None G4/S1S2 2B.2	Mojavean desert scrub. clay, gypseous. 1140 - 1140 m. annual/perennial herb. Blooms Apr-Jun
Mentzelia puberula Darlington's blazing star	None/None G5/S2 2B.2	Mojavean desert scrub, Sonoran desert scrub. sandy or rocky. 90 - 1280 m. perennial herb. Blooms Mar-May
Mentzelia tricuspis spiny-hair blazing star	None/None G4/S2 2B.1	Mojavean desert scrub. sandy, gravelly, slopes, and washes. 150 - 1280 m. annual herb. Blooms Mar-May
Mentzelia tridentata creamy blazing star	None/None G3/S3 1B.3	Mojavean desert scrub. rocky, gravelly, sandy. 700 - 1175 m. annual herb. Blooms Mar-May
Micromonolepis pusilla dwarf monolepis	None/None G5/S3? 2B.3	Great Basin scrub. alkaline, openings. 1500 - 2400 m. annual herb. Blooms May-Aug
Microseris douglasii ssp. *platycarpha* small-flowered microseris	None/None G4T4/S4 4.2	Cismontane woodland, Coastal scrub, Valley and foothill grassland, Vernal pools. clay. 15 - 1070 m. annual herb. Blooms Mar-May

Scientific Name Common Name	Status	Habitat Requirements
Microseris sylvatica sylvan microseris	None/None G4/S4 4.2	Chaparral, Cismontane woodland, Great Basin scrub, Pinyon and juniper woodland, Valley and foothill grassland (serpentinite). 45 - 1500 m. perennial herb. Blooms Mar-Jun
Mielichhoferia shevockii Shevock's copper moss	None/None G2/S2 1B.2	Cismontane woodland (metamorphic, rock, mesic). 750 - 1400 m. moss. Blooms
Mirabilis coccinea red four o'clock	None/None G5/S2 2B.3	Pinyon and juniper woodland. 1070 - 1800 m. perennial herb. Blooms May-Jul
Mirabilis tenuiloba slender-lobed four o'clock	None/None G5/S4 4.3	Sonoran desert scrub. 230 - 1095 m. perennial herb. Blooms (Feb) Mar-May
Mobergia calculiformis light gray lichen	None/None G3/S1 3	Coastal scrub. Abundant on cobbles in right habitat; only known from one site in Baja and one in San Diego area.
Monarda pectinata plains bee balm	None/None G5/SH 2B.3	Joshua tree woodland, Pinyon and juniper woodland. rocky. 1150 - 1525 m. annual herb. Blooms Jul-Sep
Monardella australis ssp. *cinerea* gray monardella	None/None G4T3/S3 4.3	Lower montane coniferous forest, Subalpine coniferous forest, Upper montane coniferous forest. 1800 - 3050 m. perennial rhizomatous herb. Blooms Jul-Aug
Monardella australis ssp. *jokerstii* Jokerst?s monardella	None/None G4T1/S1 1B.1	Chaparral, Lower montane coniferous forest. Steep scree or talus slopes between breccia, secondary alluvial benches along drainages and washes. 1350 - 1750 m. perennial rhizomatous herb. Blooms Jul-Sep
Monardella boydii Boyd?s monardella	None/None G1?Q/S1? 1B.2	Mojavean desert scrub, Pinyon and juniper woodland, Riparian scrub (desert). Usually in alluvial soils and cracks of bedrock in washes on canyon bottoms and rocky slopes. 1400 - 1650 m. perennial shrub. Blooms Aug-Oct
Monardella eremicola Clark Mountain monardella	None/None G3Q/S3 1B.3	Pinyon and juniper woodland, Riparian scrub (desert). Granitic or carbonate. Usually in bedrock cracks and benches along canyon washes. 1500 - 2100 m. perennial shrub. Blooms Jun-Aug
Monardella hypoleuca ssp. *hypoleuca* white-veined monardella	None/None G4T3/S3 1B.3	Chaparral, Cismontane woodland. 50 - 1525 m. perennial herb. Blooms (Apr) May-Aug (Sep-Dec)
Monardella hypoleuca ssp. *intermedia* intermediate monardella	None/None G4T2?/S2? 1B.3	Chaparral, Cismontane woodland, Lower montane coniferous forest (sometimes). Usually understory. 400 - 1250 m. perennial rhizomatous herb. Blooms Apr-Sep
Monardella hypoleuca ssp. *lanata* felt-leaved monardella	None/None G4T3/S3 1B.2	Chaparral, Cismontane woodland. 300 - 1575 m. perennial rhizomatous herb. Blooms Jun-Aug
Monardella linoides ssp. *oblonga* Tehachapi monardella	None/None G5T2/S2 1B.3	Lower montane coniferous forest, Pinyon and juniper woodland, Upper montane coniferous forest. 900 - 2470 m. perennial rhizomatous herb. Blooms (May) Jun-Aug
Monardella macrantha ssp. *hallii* Hall's monardella	None/None G5T3/S3 1B.3	Broadleafed upland forest, Chaparral, Cismontane woodland, Lower montane coniferous forest, Valley and foothill grassland. 730 - 2195 m. perennial rhizomatous herb. Blooms Jun-Oct
Monardella nana ssp. *leptosiphon* San Felipe monardella	None/None G4G5T2Q/S2 1B.2	Chaparral, Lower montane coniferous forest. 1200 - 1855 m. perennial rhizomatous herb. Blooms Jun-Jul

Scientific Name Common Name	Status	Habitat Requirements
Monardella pringlei Pringle's monardella	None/None GX/SX 1A	Coastal scrub (sandy). 300 - 400 m. annual herb. Blooms May-Jun
Monardella robisonii Robison's monardella	None/None G3/S3 1B.3	Pinyon and juniper woodland. 610 - 1500 m. perennial rhizomatous herb. Blooms (Feb) Apr-Sep (Oct)
Monardella saxicola rock monardella	None/None G3/S3 4.2	Closed-cone coniferous forest, Chaparral, Lower montane coniferous forest. rocky, usually serpentinite. 500 - 1800 m. perennial rhizomatous herb. Blooms Jun-Sep
Monardella sinuata ssp. *gerryi* Gerry?s curly-leaved monardella	None/None G3T1/S1 1B.1	Coastal scrub. Sandy openings. 150 - 245 m. annual herb. Blooms Apr-Jun
Monardella stoneana Jennifer's monardella	None/None G2/S1 1B.2	Closed-cone coniferous forest, Chaparral, Coastal scrub, Riparian scrub. usually rocky intermittent streambeds. 10 - 790 m. perennial herb. Blooms Jun-Sep
Monardella viminea willowy monardella	FE/SCE G1/S1 1B.1	Chaparral, Coastal scrub, Riparian forest, Riparian scrub, Riparian woodland. alluvial ephemeral washes. 50 - 225 m. perennial herb. Blooms Jun-Aug
Mortonia utahensis Utah mortonia	None/None G4G5/S3? 4.3	Joshua tree woodland, Mojavean desert scrub, Pinyon and juniper woodland. carbonate. 760 - 2100 m. perennial evergreen shrub. Blooms Mar-May
Mucronea californica California spineflower	None/None G3/S3 4.2	Chaparral, Cismontane woodland, Coastal dunes, Coastal scrub, Valley and foothill grassland. sandy. 0 - 1400 m. annual herb. Blooms Mar-Jul (Aug)
Muhlenbergia alopecuroides wolftail	None/None G5/S1? 2B.2	Joshua tree woodland, Pinyon and juniper woodland. 500 - 500 m. perennial herb. Blooms Aug-Sep
Muhlenbergia appressa appressed muhly	None/None G4/S3 2B.2	Coastal scrub, Mojavean desert scrub, Valley and foothill grassland. rocky. 20 - 1600 m. annual herb. Blooms Apr-May
Muhlenbergia arsenei tough muhly	None/None G5/S2 2B.3	Pinyon and juniper woodland (rocky, carbonate). 1400 - 1860 m. perennial rhizomatous herb. Blooms Aug-Oct
Muhlenbergia californica California muhly	None/None G4/S4 4.3	Chaparral, Coastal scrub, Lower montane coniferous forest, Meadows and seeps. mesic, seeps and streambanks. 100 - 2000 m. perennial rhizomatous herb. Blooms Jun-Sep
Muhlenbergia fragilis delicate muhly	None/None G5/S2 2B.3	Pinyon and juniper woodland (carbonate, gravelly). 1600 - 1600 m. annual herb. Blooms Oct
Muhlenbergia pauciflora few-flowered muhly	None/None G5/S2 2B.3	Pinyon and juniper woodland (rocky). 1755 - 1860 m. perennial rhizomatous herb. Blooms Sep-Oct
Muhlenbergia utilis aparejo grass	None/None G4/S2S3 2B.2	meadows and seeps, marshes and swamps, chaparral, coastal scrub, cismontane woodland. sometimes alkaline, sometimes serpentinite. 25 - 2325 m. perennial rhizomatous herb. Blooms Mar-Oct
Muilla coronata crowned muilla	None/None G3/S3 4.2	Chenopod scrub, Joshua tree woodland, Mojavean desert scrub, Pinyon and juniper woodland. 670 - 1960 m. perennial bulbiferous herb. Blooms Mar-Apr (May)
Munroa squarrosa false buffalo-grass	None/None G5/S2 2B.2	Pinyon and juniper woodland (gravelly or rocky). 1500 - 1800 m. annual herb. Blooms Oct

Scientific Name Common Name	Status	Habitat Requirements
Munzothamnus blairii Blair's munzothamnus	None/None G3/S3 1B.2	Coastal bluff scrub, Coastal scrub. rocky. 25 - 455 m. perennial shrub. Blooms Jul-Sep
Myosurus minimus ssp. *apus* little mousetail	None/None G5T2Q/S2 3.1	Valley and foothill grassland, Vernal pools (alkaline). 20 - 640 m. annual herb. Blooms Mar-Jun
Myriopteris wootonii Wooton's lace fern	None/None G5/S2 2B.3	Joshua tree woodland, Pinyon and juniper woodland. rocky. 1600 - 1900 m. perennial rhizomatous herb. Blooms May-Oct
Nama demissa var. *covillei* Coville's purple mat	None/None G5T3/S3 1B.3	Mojavean desert scrub. dry, sandy flats, slopes; often roadsides. -85 - 1800 m. annual herb. Blooms Feb-May
Nama dichotoma var. *dichotoma* forked purple mat	None/None G5T5?/S1 2B.3	Pinyon and juniper woodland (granitic or carbonate). 1900 - 2200 m. annual herb. Blooms Sep-Oct
Nama stenocarpa mud nama	None/None G4G5/S1S2 2B.2	Marshes and swamps (lake margins, riverbanks). 5 - 500 m. annual/perennial herb. Blooms Jan-Jul
Nasturtium gambelii Gambel's water cress	FE/SCT G1/S1 1B.1	Marshes and swamps (freshwater or brackish). 5 - 330 m. perennial rhizomatous herb. Blooms Apr-Oct
Navarretia fossalis spreading navarretia	FT/None G2/S2 1B.1	Chenopod scrub, Marshes and swamps (assorted shallow freshwater), Playas, Vernal pools. 30 - 655 m. annual herb. Blooms Apr-Jun
Navarretia ojaiensis Ojai navarretia	None/None G2/S2 1B.1	Chaparral (openings), Coastal scrub (openings), Valley and foothill grassland. 275 - 620 m. annual herb. Blooms May-Jul
Navarretia peninsularis Baja navarretia	None/None G3/S2 1B.2	Chaparral (openings), Lower montane coniferous forest, Meadows and seeps, Pinyon and juniper woodland. mesic. 1500 - 2300 m. annual herb. Blooms (May)Jun-Aug
Navarretia prostrata prostrate vernal pool navarretia	None/None G2/S2 1B.1	Coastal scrub, Meadows and seeps, Valley and foothill grassland (alkaline), Vernal pools. Mesic. 3 - 1210 m. annual herb. Blooms Apr-Jul
Navarretia setiloba Piute Mountains navarretia	None/None G2/S2 1B.1	Cismontane woodland, Pinyon and juniper woodland, Valley and foothill grassland. clay or gravelly loam. 285 - 2100 m. annual herb. Blooms Apr-Jul
Nemacaulis denudata var. *denudata* coast woolly-heads	None/None G3G4T2/S2 1B.2	Coastal dunes. 0 - 100 m. annual herb. Blooms Apr-Sep
Nemacaulis denudata var. *gracilis* slender cottonheads	None/None G3G4T3?/S2 2B.2	Coastal dunes, Desert dunes, Sonoran desert scrub. -50 - 400 m. annual herb. Blooms (Mar) Apr-May
Nemacladus gracilis slender nemacladus	None/None G4/S4 4.3	Cismontane woodland, Valley and foothill grassland. sandy or gravelly. 120 - 1900 m. annual herb. Blooms Mar-May
Nemacladus secundiflorus var. *robbinsii* Robbins' nemacladus	None/None G3T2/S2 1B.2	Chaparral, Valley and foothill grassland. openings. 350 - 1700 m. annual herb. Blooms Apr-Jun
Nemacladus twisselmannii Twisselmann's nemacladus	None/SCR G1/S1 1B.2	Upper montane coniferous forest (sandy or rocky, granitic). 2240 - 2450 m. annual herb. Blooms Jul

Scientific Name Common Name	Status	Habitat Requirements
Nolina cismontana chaparral nolina	None/None G3/S3 1B.2	Chaparral, Coastal scrub. sandstone or gabbro. 140 - 1275 m. perennial evergreen shrub. Blooms (Mar) May-Jul
Nolina interrata Dehesa nolina	None/SCE G2/S2 1B.1	Chaparral (gabbroic, metavolcanic, or serpentinite). 185 - 855 m. perennial herb. Blooms Jun-Jul
Oenothera cavernae cave evening-primrose	None/None G2G3/S1 2B.1	Great Basin scrub, Joshua tree woodland, Mojavean desert scrub. gravelly, often calcareous. 760 - 1280 m. annual herb. Blooms Mar-Nov
Oenothera cespitosa ssp. *crinita* caespitose evening-primrose	None/None G5T4/S4? 4.2	Pinyon and juniper woodland, Subalpine coniferous forest, Sonoran desert scrub. 1150 - 3370 m. perennial rhizomatous herb. Blooms (Apr) Jun-Sep
Oenothera deltoides ssp. *howellii* Antioch Dunes evening-primrose	FE/SCE G5T1/S1 1B.1	Inland dunes. 0 - 30 m. perennial herb. Blooms Mar-Sep
Oenothera longissima long-stem evening-primrose	None/None G4/S1 2B.2	Mojavean desert scrub, Pinyon and juniper woodland. seasonally mesic. 1000 - 1700 m. annual/perennial herb. Blooms Jul-Sep
Ophioglossum californicum California adder's-tongue	None/None G4/S4 4.2	Chaparral, Valley and foothill grassland, Vernal pools (margins). mesic. 60 - 525 m. perennial rhizomatous herb. Blooms (Dec) Jan-Jun
Opuntia basilaris var. *brachyclada* short-joint beavertail	None/None G5T3/S3 1B.2	Chaparral, Joshua tree woodland, Mojavean desert scrub, Pinyon and juniper woodland. 425 - 1800 m. perennial stem succulent. Blooms Apr-Jun (Aug)
Opuntia basilaris var. *treleasei* Bakersfield cactus	FE/SCE G5T1/S1 1B.1	Chenopod scrub, Cismontane woodland, Valley and foothill grassland. sandy or gravelly. 100 - 1450 m. perennial stem succulent. Blooms Apr-May
Opuntia wigginsii Wiggins' cholla	None/None G3?Q/S1? 3.3	Sonoran desert scrub (sandy). 30 - 885 m. perennial stem succulent. Blooms Mar
Opuntia xcurvispina curved-spine beavertail	None/None G2G3/S1 2B.2	Chaparral, Mojavean desert scrub, Pinyon and juniper woodland. 1000 - 1400 m. perennial stem succulent. Blooms Apr-Jun
Orcuttia californica California Orcutt grass	FE/SCE G1/S1 1B.1	Vernal pools. 15 - 660 m. annual herb. Blooms Apr-Aug
Oreonana vestita woolly mountain-parsley	None/None G3/S3 1B.3	Lower montane coniferous forest, Subalpine coniferous forest, Upper montane coniferous forest. gravel or talus. 1615 - 3500 m. perennial herb. Blooms Mar-Sep
Ornithostaphylos oppositifolia Baja California birdbush	None/SCE G3/S1 2B.1	Chaparral. 55 - 800 m. perennial evergreen shrub. Blooms Jan-Apr
Orobanche parishii ssp. *brachyloba* short-lobed broomrape	None/None G4?T4/S3 4.2	Coastal bluff scrub, Coastal dunes, Coastal scrub. sandy. 3 - 305 m. perennial herb (parasitic). Blooms Apr-Oct
Orobanche valida ssp. *valida* Rock Creek broomrape	None/None G4T2/S2 1B.2	Chaparral, Pinyon and juniper woodland. granitic. 1030 - 2000 m. perennial herb (parasitic). Blooms May-Sep
Oxytropis oreophila var. *oreophila* rock-loving oxytrope	None/None G5T4T5/S2 2B.3	Alpine boulder and rock field, Subalpine coniferous forest. gravelly or rocky. 3400 - 3800 m. perennial herb. Blooms Jun-Sep

Scientific Name Common Name	Status	Habitat Requirements
Packera bernardina San Bernardino ragwort	None/None G2/S2 1B.2	Meadows and seeps (mesic, sometimes alkaline), Pebble (Pavement) plain, Upper montane coniferous forest. 1800 - 2300 m. perennial herb. Blooms May-Jul
Packera ganderi Gander's ragwort	None/SCR G2/S2 1B.2	Chaparral (burns, gabbroic outcrops). 400 - 1200 m. perennial herb. Blooms Apr-Jun
Packera ionophylla Tehachapi ragwort	None/None G4/S4 4.3	Lower montane coniferous forest, Upper montane coniferous forest. granitic, rocky. 1500 - 2700 m. perennial herb. Blooms Jun-Jul
Panicum hirticaule ssp. *hirticaule* roughstalk witch grass	None/None G5T5/S2 2B.1	Desert dunes, Joshua tree woodland, Mojavean desert scrub, Sonoran desert scrub. sandy, silty, depressions. 45 - 1315 m. annual herb. Blooms Aug-Dec
Parkinsonia microphylla little-leaved palo verde	None/None G5/S3 4.3	Mojavean desert scrub (rocky or gravelly). 45 - 1070 m. perennial deciduous shrub. Blooms Apr-May
Parnassia cirrata var. *cirrata* San Bernardino grass-of-Parnassus	None/None G5T2/S2 1B.3	Lower montane coniferous forest, Meadows and seeps, Upper montane coniferous forest. mesic, streamsides, sometimes calcareous. 1250 - 2440 m. perennial herb. Blooms Aug-Sep
Pediomelum castoreum Beaver Dam breadroot	None/None G3/S2 1B.2	Joshua tree woodland, Mojavean desert scrub. Sandy, washes and roadcuts. 610 - 1525 m. perennial herb. Blooms Apr-May
Pellaea truncata spiny cliff-brake	None/None G5/S3 2B.3	Pinyon and juniper woodland (volcanic or granitic, rocky). 1200 - 2150 m. perennial rhizomatous herb. Blooms Apr-Jun
Penstemon albomarginatus white-margined beardtongue	None/None G2/S1 1B.1	Desert dunes (stabilized), Mojavean desert scrub (sandy). 640 - 1065 m. perennial herb. Blooms Mar-May (Jun)
Penstemon bicolor ssp. *roseus* rosy two-toned beardtongue	None/None G3T3Q/S1 1B.1	Joshua tree woodland, Mojavean desert scrub. rocky or gravelly, sometimes disturbed areas. 700 - 1500 m. perennial herb. Blooms May
Penstemon calcareus limestone beardtongue	None/None G3?/S3? 1B.3	Joshua tree woodland, Mojavean desert scrub, Pinyon and juniper woodland. carbonate, rocky. 1065 - 2040 m. perennial herb. Blooms Apr-May
Penstemon californicus California beardtongue	None/None G3/S2 1B.2	Chaparral, Lower montane coniferous forest, Pinyon and juniper woodland. sandy. 1170 - 2300 m. perennial herb. Blooms May-Jun (Aug)
Penstemon clevelandii var. *connatus* San Jacinto beardtongue	None/None G5T4/S3 4.3	Chaparral, Pinyon and juniper woodland, Sonoran desert scrub. rocky. 400 - 1500 m. perennial herb. Blooms Mar-May
Penstemon fruticiformis var. *amargosae* Amargosa beardtongue	None/None G4T3/S2 1B.3	Mojavean desert scrub. 850 - 1400 m. perennial herb. Blooms Apr-Jun
Penstemon pseudospectabilis ssp. *pseudospectabilis* desert beardtongue	None/None G4G5T4/S3 2B.2	Mojavean desert scrub, Sonoran desert scrub. often sandy washes, sometimes rocky. 80 - 1935 m. perennial herb. Blooms Jan-May
Penstemon stephensii Stephens' beardtongue	None/None G3?/S3? 1B.3	Mojavean desert scrub, Pinyon and juniper woodland. usually carbonate, rocky. 1160 - 1850 m. perennial herb. Blooms Apr-Jun
Penstemon thompsoniae Thompson's beardtongue	None/None G4/S1 2B.3	Pinyon and juniper woodland (gravelly, carbonate). 1500 - 2700 m. perennial herb. Blooms May-Jun

Scientific Name Common Name	Status	Habitat Requirements
Penstemon thurberi Thurber's beardtongue	None/None G5/S3 4.2	Chaparral, Joshua tree woodland, Pinyon and juniper woodland, Sonoran desert scrub. 500 - 1220 m. perennial herb. Blooms May-Jul
Penstemon utahensis Utah beardtongue	None/None G4/S2 2B.3	Chenopod scrub, Great Basin scrub, Mojavean desert scrub, Pinyon and juniper woodland. rocky. 1065 - 2500 m. perennial herb. Blooms Apr-May
Pentachaeta aurea ssp. *allenii* Allen's pentachaeta	None/None G4T1/S1 1B.1	Coastal scrub (openings), Valley and foothill grassland. 75 - 520 m. annual herb. Blooms Mar-Jun
Pentachaeta aurea ssp. *aurea* golden-rayed pentachaeta	None/None G4T3/S3 4.2	Chaparral, Cismontane woodland, Coastal scrub, Lower montane coniferous forest, Riparian woodland, Valley and foothill grassland. 80 - 1850 m. annual herb. Blooms Mar-Jul
Pentachaeta lyonii Lyon's pentachaeta	FE/SCE G1/S1 1B.1	Chaparral (openings), Coastal scrub, Valley and foothill grassland. rocky, clay. 30 - 690 m. annual herb. Blooms (Feb) Mar-Aug
Perideridia gairdneri ssp. *gairdneri* Gairdner's yampah	None/None G5T3T4/S3S4 4.2	Broadleafed upland forest, Chaparral, Coastal prairie, Valley and foothill grassland, Vernal pools. vernally mesic. 0 - 610 m. perennial herb. Blooms Jun-Oct
Perideridia parishii ssp. *parishii* Parish's yampah	None/None G4T3T4/S2 2B.2	Lower montane coniferous forest, Meadows and seeps, Upper montane coniferous forest. 1465 - 3000 m. perennial herb. Blooms Jun-Aug
Perideridia pringlei adobe yampah	None/None G4/S4 4.3	Chaparral, Cismontane woodland, Coastal scrub, Pinyon and juniper woodland. Serpentinite, often clay. 300 - 1800 m. perennial herb. Blooms Apr-Jun (Jul)
Petalonyx linearis narrow-leaf sandpaper-plant	None/None G4/S3? 2B.3	Mojavean desert scrub, Sonoran desert scrub. Sandy or rocky canyons. -25 - 1115 m. perennial shrub. Blooms (Jan-Feb) Mar-May (Jun-Dec)
Petalonyx thurberi ssp. *gilmanii* Death Valley sandpaper-plant	None/None G5T2/S2 1B.3	Desert dunes, Mojavean desert scrub. 260 - 1445 m. perennial evergreen shrub. Blooms May-Sep
Petradoria pumila ssp. *pumila* rock goldenrod	None/None G5T4/S4? 4.3	Pinyon and juniper woodland (rocky, carbonate). 1070 - 3400 m. perennial herb. Blooms Jul-Oct
Phacelia anelsonii Aven Nelson's phacelia	None/None G3/S2 2B.3	Joshua tree woodland, Pinyon and juniper woodland. carbonate, sandy or gravelly. 1200 - 1980 m. annual herb. Blooms Apr-May
Phacelia barnebyana Barneby's phacelia	None/None G3?/S2 2B.3	Great Basin scrub, Pinyon and juniper woodland. usually carbonate, gravelly, rocky. 1600 - 2700 m. annual herb. Blooms (Apr)May-Jul
Phacelia coerulea sky-blue phacelia	None/None G5/S2 2B.3	Mojavean desert scrub, Pinyon and juniper woodland. 1400 - 2000 m. annual herb. Blooms Apr-May
Phacelia exilis Transverse Range phacelia	None/None G4Q/S4 4.3	Lower montane coniferous forest, Meadows and seeps, Pebble (Pavement) plain, Upper montane coniferous forest. sandy or gravelly. 1100 - 2700 m. annual herb. Blooms May-Aug
Phacelia floribunda many-flowered phacelia	None/None G2/S2 1B.2	Coastal scrub. 15 - 500 m. annual herb. Blooms Mar-May
Phacelia hubbyi Hubby's phacelia	None/None G4/S4 4.2	Chaparral, Coastal scrub, Valley and foothill grassland. gravelly, rocky, talus. 0 - 1000 m. annual herb. Blooms Apr-Jul

Scientific Name Common Name	Status	Habitat Requirements
Phacelia keckii Santiago Peak phacelia	None/None G1/S1 1B.3	Closed-cone coniferous forest, Chaparral. 545 - 1600 m. annual herb. Blooms May-July
Phacelia mohavensis Mojave phacelia	None/None G4Q/S4 4.3	Cismontane woodland, Lower montane coniferous forest, Meadows and seeps, Pinyon and juniper woodland. sandy or gravelly. 1400 - 2500 m. annual herb. Blooms Apr-Aug
Phacelia mustelina Death Valley round-leaved phacelia	None/None G3/S2 1B.3	Mojavean desert scrub, Pinyon and juniper woodland. carbonate or volcanic, gravelly or rocky. 730 - 2620 m. annual herb. Blooms May-Jul
Phacelia parishii Parish's phacelia	None/None G2G3/S1 1B.1	Mojavean desert scrub, Playas. clay or alkaline. 540 - 1200 m. annual herb. Blooms Apr-May (Jun-Jul)
Phacelia perityloides var. *jaegeri* Jaeger's phacelia	None/None G4T2/S2 1B.3	Pinyon and juniper woodland (rocky, often carbonate). 1830 - 2345 m. perennial herb. Blooms May-Jul
Phacelia pulchella var. *gooddingii* Goodding's phacelia	None/None G5T3/S2 2B.2	Mojavean desert scrub (clay, often alkaline). 765 - 1000 m. annual herb. Blooms Apr-Jun
Phacelia ramosissima var. *austrolitoralis* south coast branching phacelia	None/None G5?T3Q/S3 3.2	Chaparral, Coastal dunes, Coastal scrub, Marshes and swamps (coastal salt). sandy, sometimes rocky. 5 - 300 m. perennial herb. Blooms Mar-Aug
Phacelia stellaris Brand's star phacelia	None/None G1/S1 1B.1	Coastal dunes, Coastal scrub. 1 - 400 m. annual herb. Blooms Mar-Jun
Phaseolus filiformis slender-stem bean	None/None G5/S1 2B.1	Sonoran desert scrub. 125 - 125 m. annual herb. Blooms Apr
Phlox dolichantha Big Bear Valley phlox	None/None G2/S2 1B.2	Pebble (Pavement) plain, Upper montane coniferous forest (openings). 1830 - 2970 m. perennial herb. Blooms May-Jul
Pholistoma auritum var. *arizonicum* Arizona pholistoma	None/None G5T4?/S3 2B.3	Mojavean desert scrub. 275 - 835 m. annual herb. Blooms Mar
Physalis lobata lobed ground-cherry	None/None G5/S1S2 2B.3	Mojavean desert scrub (decomposed granitic), Playas. 500 - 800 m. perennial herb. Blooms (May) Sep-Jan
Physaria chambersii Chambers' physaria	None/None G5/S2S3 2B.3	Pinyon and juniper woodland (carbonate, rocky). 1500 - 2590 m. perennial herb. Blooms Apr-May
Physaria kingii ssp. *bernardina* San Bernardino Mountains bladderpod	FE/None G5T1/S1 1B.1	Lower montane coniferous forest, Pinyon and juniper woodland, Subalpine coniferous forest. usually carbonate. 1850 - 2700 m. perennial herb. Blooms May-Jun
Pickeringia montana var. *tomentosa* woolly chaparral-pea	None/None G5T3T4/S3S4 4.3	Chaparral. Gabbroic, granitic, clay. 0 - 1700 m. evergreen shrub. Blooms May-Aug
Pilostyles thurberi Thurber's pilostyles	None/None G5/S4 4.3	Sonoran desert scrub. 0 - 365 m. perennial herb (parasitic). Blooms Dec-Apr
Pinus edulis two-needle pinyon pine	None/None G5/S3 3.3	Lower montane coniferous forest, Pinyon and juniper woodland. 1300 - 2700 m. perennial evergreen tree. Blooms

Scientific Name Common Name	Status	Habitat Requirements
Pinus torreyana ssp. *torreyana* Torrey pine	None/None G1T1/S1 1B.2	Closed-cone coniferous forest, Chaparral. Sandstone. 30 - 160 m. perennial evergreen tree. Blooms
Piperia cooperi chaparral rein orchid	None/None G3G4/S3S4 4.2	Chaparral, Cismontane woodland, Valley and foothill grassland. 15 - 1585 m. perennial herb. Blooms Mar-Jun
Piperia leptopetala narrow-petaled rein orchid	None/None G4/S4 4.3	Cismontane woodland, Lower montane coniferous forest, Upper montane coniferous forest. 380 - 2225 m. perennial herb. Blooms May-Jul
Piperia michaelii Michael's rein orchid	None/None G3/S3 4.2	Coastal bluff scrub, Closed-cone coniferous forest, Chaparral, Cismontane woodland, Coastal scrub, Lower montane coniferous forest. 3 - 915 m. perennial herb. Blooms Apr-Aug
Plagiobothrys parishii Parish's popcornflower	None/None G1/S1 1B.1	Great Basin scrub, Joshua tree woodland. alkaline, mesic. 750 - 1400 m. annual herb. Blooms Mar-Jun (Nov)
Plagiobryoides vinosula wine-colored tufa moss	None/None G3G4/S2 4.2	Cismontane woodland, Mojavean desert scrub, Meadows and seeps, Pinyon and juniper woodland, Riparian woodland. usually granitic rock or granitic soil along seeps and streams, sometimes clay. 30 - 1735 m. moss. Blooms
Poa atropurpurea San Bernardino blue grass	FE/None G2/S2 1B.2	Meadows and seeps (mesic). 1360 - 2455 m. perennial rhizomatous herb. Blooms (Apr) May-Jul (Aug)
Podistera nevadensis Sierra podistera	None/None G4/S4 4.3	Alpine boulder and rock field. 3000 - 4000 m. perennial herb. Blooms Jul-Sep
Pogogyne abramsii San Diego mesa mint	FE/SCE G1/S1 1B.1	Vernal pools. 90 - 200 m. annual herb. Blooms Mar-Jul
Pogogyne nudiuscula Otay Mesa mint	FE/SCE G1/S1 1B.1	Vernal pools. 90 - 250 m. annual herb. Blooms May-Jul
Poliomintha incana frosted mint	None/None G5/SH 2A	Lower montane coniferous forest (mesic). 1600 - 1700 m. perennial shrub. Blooms Jun-Jul
Polygala acanthoclada thorny milkwort	None/None G4/S2S3 2B.3	Chenopod scrub, Joshua tree woodland, Pinyon and juniper woodland. 760 - 2285 m. perennial shrub. Blooms May-Aug
Polygala cornuta var. *fishiae* Fish's milkwort	None/None G5T4/S4 4.3	Chaparral, Cismontane woodland, Riparian woodland. 100 - 1000 m. perennial deciduous shrub. Blooms May-Aug
Polygala intermontana intermountain milkwort	None/None G4/S2 2B.1	Pinyon and juniper woodland. 2010 - 3080 m. perennial shrub. Blooms Jun-Jul (Oct)
Polystichum kruckebergii Kruckeberg's sword fern	None/None G4/S4 4.3	Subalpine coniferous forest, Upper montane coniferous forest. rocky. 2100 - 3200 m. perennial rhizomatous herb. Blooms Jun-Aug
Populus angustifolia narrow-leaved cottonwood	None/None G5/S2 2B.2	Riparian forest. 1200 - 1800 m. perennial deciduous tree. Blooms Mar-Apr
Portulaca halimoides desert portulaca	None/None G5/S3 4.2	Joshua tree woodland (sandy). 1000 - 1200 m. annual herb. Blooms Sep

Scientific Name Common Name	Status	Habitat Requirements
Potamogeton zosteriformis eel-grass pondweed	None/None G5/S3 2B.2	Marshes and swamps (assorted freshwater). 0 - 1860 m. annual herb (aquatic). Blooms Jun-Jul
Potentilla multijuga Ballona cinquefoil	None/None GX/SX 1A	Meadows and seeps (brackish). 0 - 2 m. perennial herb. Blooms Jun-Aug
Potentilla rimicola cliff cinquefoil	None/None G2/S1 2B.3	Subalpine coniferous forest, Upper montane coniferous forest. granitic, rocky. 2400 - 2800 m. perennial herb. Blooms Jul-Sep
Proboscidea althaeifolia desert unicorn-plant	None/None G5/S4 4.3	Sonoran desert scrub. gently sloping sandy flats and washes, sometimes roadsides. 85 - 1000 m. perennial herb. Blooms May-Sep (Oct)
Prunus eremophila Mojave Desert plum	None/None G2/S2 1B.2	Mojavean desert scrub. granitic or rhyolitic, usually washes. 975 - 1175 m. perennial deciduous shrub. Blooms Mar-Apr
Pseudognaphalium leucocephalum white rabbit-tobacco	None/None G4/S2 2B.2	Chaparral, Cismontane woodland, Coastal scrub, Riparian woodland. sandy, gravelly. 0 - 2100 m. perennial herb. Blooms (Jul) Aug-Nov (Dec)
Pseudorontium cyathiferum Deep Canyon snapdragon	None/None G4G5/S1 2B.3	Sonoran desert scrub (rocky). 0 - 800 m. annual herb. Blooms Feb-Apr
Psilocarphus brevissimus var. *multiflorus* Delta woolly-marbles	None/None G4T3/S3 4.2	Vernal pools. 10 - 500 m. annual herb. Blooms May-Jun
Psorothamnus arborescens var. *arborescens* Mojave indigo-bush	None/None G5T4/S4 4.3	Mojavean desert scrub, Riparian scrub. 400 - 1185 m. perennial deciduous shrub. Blooms Apr-May
Psorothamnus fremontii var. *attenuatus* narrow-leaved psorothamnus	None/None G5T4?/S3 2B.3	Sonoran desert scrub (granitic or volcanic). 335 - 915 m. perennial shrub. Blooms Apr
Puccinellia parishii Parish's alkali grass	None/None G3/S1 1B.1	Meadows and seeps (alkaline springs and seeps). 700 - 1000 m. annual herb. Blooms Apr-May
Puccinellia simplex California alkali grass	None/None G3/S2 1B.2	Chenopod scrub, Meadows and seeps, Valley and foothill grassland, Vernal pools. Alkaline, vernally mesic; sinks, flats, and lake margins. 2 - 930 m. annual herb. Blooms Mar-May
Pyrrocoma uniflora var. *gossypina* Bear Valley pyrrocoma	None/None G5T1/S1 1B.2	Meadows and seeps, Pebble (Pavement) plain. 1600 - 2300 m. perennial herb. Blooms Jul-Sep
Quercus cedrosensis Cedros Island oak	None/None G3/S1 2B.2	Closed-cone coniferous forest, Chaparral, Coastal scrub. 255 - 960 m. perennial evergreen tree. Blooms Apr-May
Quercus dumosa Nuttall's scrub oak	None/None G3/S3 1B.1	Closed-cone coniferous forest, Chaparral, Coastal scrub. sandy, clay loam. 15 - 400 m. perennial evergreen shrub. Blooms Feb-Apr (May-Aug)
Quercus durata var. *gabrielensis* San Gabriel oak	None/None G4T3/S3 4.2	Chaparral, Cismontane woodland. 450 - 1000 m. perennial evergreen shrub. Blooms Apr-May
Quercus engelmannii Engelmann oak	None/None G3/S3 4.2	Chaparral, Cismontane woodland, Riparian woodland, Valley and foothill grassland. 50 - 1300 m. perennial deciduous tree. Blooms Mar-Jun

Scientific Name Common Name	Status	Habitat Requirements
Quercus turbinella shrub live oak	None/None G5/S4 4.3	Chaparral, Cismontane woodland, Lower montane coniferous forest, Pinyon and juniper woodland. 1200 - 2000 m. perennial evergreen shrub. Blooms Apr-Jun
Rhus aromatica var. *simplicifolia* single-leaved skunkbrush	None/None G5T5/S2 2B.3	Pinyon and juniper woodland. Usually granitic. 1220 - 1370 m. perennial deciduous shrub. Blooms Mar-Apr
Ribes canthariforme Moreno currant	None/None G2/S2 1B.3	Chaparral, Riparian scrub. 340 - 1200 m. perennial deciduous shrub. Blooms Feb-Apr
Ribes divaricatum var. parishii Parish's gooseberry	None/None G5TX/SX 1A	Riparian woodland. 65 - 300 m. perennial deciduous shrub. Blooms Feb-Apr
Ribes viburnifolium Santa Catalina Island currant	None/None G2?/S2? 1B.2	Chaparral, Cismontane woodland. 30 - 350 m. perennial evergreen shrub. Blooms Feb-Apr
Robinia neomexicana New Mexico locust	None/None G4/S1 2B.3	Pinyon and juniper woodland (sandy). 1500 - 1770 m. perennial deciduous shrub. Blooms May, Jul
Romneya coulteri Coulter's matilija poppy	None/None G4/S4 4.2	Chaparral, Coastal scrub. Often in burns. 20 - 1200 m. perennial rhizomatous herb. Blooms Mar-Jul (Aug)
Rosa minutifolia small-leaved rose	None/SCE G2G3/SXC 2B.1	Chaparral, Coastal scrub. 150 - 160 m. perennial deciduous shrub. Blooms Jan-Jun
Rosa woodsii var. *glabrata* Cushenbury rose	None/None G5T1/S1 1B.1	Mojavean desert scrub (springs). 910 - 1435 m. perennial shrub. Blooms (Apr) May-Aug
Rubus glaucifolius var. *ganderi* Cuyamaca raspberry	None/None G5T1Q/S1 3.1	Lower montane coniferous forest (gabbroic). 1200 - 1675 m. perennial evergreen shrub. Blooms May-Jun
Rupertia rigida Parish's rupertia	None/None G4/S4 4.3	Chaparral, Cismontane woodland, Lower montane coniferous forest, Meadows and seeps, Pebble (Pavement) plain, Valley and foothill grassland. 700 - 2500 m. perennial herb. Blooms Jun-Aug
Sagittaria sanfordii Sanford's arrowhead	None/None G3/S3 1B.2	Marshes and swamps (assorted shallow freshwater). 0 - 650 m. perennial rhizomatous herb (emergent). Blooms May-Oct (Nov)
Saltugilia caruifolia caraway-leaved woodland-gilia	None/None G4/S4 4.3	Chaparral, Lower montane coniferous forest. Sandy, openings. 840 - 2300 m. annual herb. Blooms May-Aug
Saltugilia latimeri Latimer's woodland-gilia	None/None G3/S3 1B.2	Chaparral, Mojavean desert scrub, Pinyon and juniper woodland. rocky or sandy, often granitic, sometimes washes. 400 - 1900 m. annual herb. Blooms Mar-Jun
Salvia eremostachya desert sage	None/None G4/S3 4.3	Sonoran desert scrub (rocky or gravelly). 700 - 1400 m. perennial evergreen shrub. Blooms Mar-May
Salvia greatae Orocopia sage	None/None G2G3/S2S3 1B.3	Mojavean desert scrub, Sonoran desert scrub. -40 - 825 m. perennial evergreen shrub. Blooms Mar-Apr
Salvia munzii Munz's sage	None/None G2/S2 2B.2	Chaparral, Coastal scrub. 115 - 1065 m. perennial evergreen shrub. Blooms Feb-Apr

Scientific Name Common Name	Status	Habitat Requirements
Sanvitalia abertii Abert's sanvitalia	None/None G5/S2S3 2B.2	Pinyon and juniper woodland (carbonate). 1570 - 1800 m. annual herb. Blooms Aug-Sep (Oct)
Schoenus nigricans black bog-rush	None/None G4/S2 2B.2	Marshes and swamps (often alkaline). 150 - 2000 m. perennial herb. Blooms Aug-Sep
Sclerocactus johnsonii Johnson's bee-hive cactus	None/None G3/S2 2B.2	Mojavean desert scrub (granitic). 500 - 1200 m. perennial stem succulent. Blooms Apr-May
Sclerocactus polyancistrus Mojave fish-hook cactus	None/None G3/S3 4.2	Great Basin scrub, Joshua tree woodland, Mojavean desert scrub. usually carbonate. 640 - 2320 m. perennial stem succulent. Blooms Apr-Jul
Scleropogon brevifolius burro grass	None/None G5/S1S2 2B.3	Joshua tree woodland, Mojavean desert scrub (decomposed granitic). 1360 - 1600 m. perennial stoloniferous herb. Blooms Oct
Scrophularia villosa Santa Catalina figwort	None/None G3/S3 1B.2	Chaparral, Coastal scrub. 45 - 510 m. perennial shrub. Blooms Apr-Aug
Scutellaria bolanderi ssp. *austromontana* southern mountains skullcap	None/None G4T3/S3 1B.2	Chaparral, Cismontane woodland, Lower montane coniferous forest. mesic. 425 - 2000 m. perennial rhizomatous herb. Blooms Jun-Aug
Scutellaria galericulata marsh skullcap	None/None G5/S2 2B.2	Lower montane coniferous forest, Meadows and seeps (mesic), Marshes and swamps. 0 - 2100 m. perennial rhizomatous herb. Blooms Jun-Sep
Scutellaria lateriflora side-flowering skullcap	None/None G5/S2 2B.2	Meadows and seeps (mesic), Marshes and swamps. 0 - 500 m. perennial rhizomatous herb. Blooms Jul-Sep
Sedum niveum Davidson's stonecrop	None/None G3/S3 4.2	Lower montane coniferous forest, Subalpine coniferous forest, Upper montane coniferous forest. rocky. 2075 - 3000 m. perennial rhizomatous herb. Blooms Jun-Aug
Selaginella asprella bluish spike-moss	None/None G4/S4 4.3	Cismontane woodland, Lower montane coniferous forest, Pinyon and juniper woodland, Subalpine coniferous forest, Upper montane coniferous forest. granitic, rocky. 1600 - 2700 m. perennial rhizomatous herb. Blooms Jul
Selaginella cinerascens ashy spike-moss	None/None G3G4/S3 4.1	Chaparral, Coastal scrub. 20 - 640 m. perennial rhizomatous herb. Blooms
Selaginella eremophila desert spike-moss	None/None G4/S2S3 2B.2	Chaparral, Sonoran desert scrub (gravelly or rocky). 200 - 1295 m. perennial rhizomatous herb. Blooms (May) Jun (Jul)
Selaginella leucobryoides Mojave spike-moss	None/None G4/S3S4 4.3	Great Basin scrub, Lower montane coniferous forest, Mojavean desert scrub, Pinyon and juniper woodland. rocky, usually carbonate. 600 - 3150 m. perennial rhizomatous herb. Blooms Jun
Senecio aphanactis chaparral ragwort	None/None G3/S2 2B.2	Chaparral, Cismontane woodland, Coastal scrub. sometimes alkaline. 15 - 800 m. annual herb. Blooms Jan-Apr (May)
Senecio astephanus San Gabriel ragwort	None/None G3/S3 4.3	Coastal bluff scrub, Chaparral. rocky slopes. 400 - 1500 m. perennial herb. Blooms May-Jul
Senna covesii Coves' cassia	None/None G5/S3 2B.2	Sonoran desert scrub. Dry, sandy desert washes and slopes. 225 - 1295 m. perennial herb. Blooms Mar-Jun (Aug)

Scientific Name Common Name	Status	Habitat Requirements
Sibara deserti desert winged-rockcress	None/None G4/S4 4.3	Mojavean desert scrub. 345 - 1300 m. annual herb. Blooms Mar-Apr
Sibara filifolia Santa Cruz Island winged-rockcress	FE/None G2/S2 1B.1	Coastal scrub (rocky, volcanic). often openings. 60 - 305 m. annual herb. Blooms (Feb) Mar-Apr
Sibaropsis hammittii Hammitt's clay-cress	None/None G2/S2 1B.2	Chaparral (openings), Valley and foothill grassland. clay. 720 - 1065 m. annual herb. Blooms Mar-Apr
Sidalcea hickmanii ssp. *parishii* Parish's checkerbloom	None/SCR G3T1/S1 1B.2	Chaparral, Cismontane woodland, Lower montane coniferous forest. 1000 - 2499 m. perennial herb. Blooms (May) Jun-Aug
Sidalcea malviflora ssp. *dolosa* Bear Valley checkerbloom	None/None G5T2/S2 1B.2	Lower montane coniferous forest (meadows and seeps), Meadows and seeps, Riparian woodland, Upper montane coniferous forest (meadows and seeps). 1495 - 2685 m. perennial herb. Blooms May-Aug
Sidalcea neomexicana salt spring checkerbloom	None/None G4/S2 2B.2	Chaparral, Coastal scrub, Lower montane coniferous forest, Mojavean desert scrub, Playas. alkaline, mesic. 15 - 1530 m. perennial herb. Blooms Mar-Jun
Sidalcea pedata bird-foot checkerbloom	FE/SCE G1/S1 1B.1	Meadows and seeps (mesic), Pebble (Pavement) plain. 1600 - 2500 m. perennial herb. Blooms May-Aug
Sidotheca caryophylloides chickweed oxytheca	None/None G4/S4 4.3	Lower montane coniferous forest (sandy). 1114 - 2600 m. annual herb. Blooms Jul-Sep (Oct)
Sidotheca emarginata white-margined oxytheca	None/None G3/S3 1B.3	Chaparral, Lower montane coniferous forest, Pinyon and juniper woodland. 1200 - 2500 m. annual herb. Blooms (Feb) Apr-Jul (Aug)
Silene krantzii Krantz's catchfly	None/None G1/S1 1B.2	Alpine dwarf scrub. Usually sandy or gravelly, sometimes rocky. 3235 - 3510 m. perennial herb. Blooms Apr-Sep
Sisyrinchium longipes timberland blue-eyed-grass	None/None G3G4/S1 2B.2	Meadows and seeps. mesic. 2060 - 2060 m. perennial herb. Blooms Jun-Aug
Solanum wallacei Wallace's nightshade	None/None G3Q/S2 1B.1	Chaparral, Cismontane woodland. rocky. 3 - 410 m. perennial herb. Blooms Mar-Aug
Spermolepis gigantea desert scaleseed	None/None G2G3/SH 2B.1	Sonoran desert scrub. 400 - 400 m. annual herb. Blooms Mar-Apr
Spermolepis infernensis Hellhole scaleseed	None/None G1/S1 1B.2	Sonoran desert scrub. Rocky or sandy. 230 - 670 m. annual herb. Blooms Mar-Apr
Spermolepis lateriflora western bristly scaleseed	None/None G5/SH 2A	Sonoran desert scrub. Rocky or sandy. 365 - 670 m. annual herb. Blooms Mar-Apr
Sphaeralcea rusbyi var. *eremicola* Rusby's desert-mallow	None/None G4T2/S2 1B.2	Joshua tree woodland, Mojavean desert scrub. 975 - 1645 m. perennial herb. Blooms Mar-Jun
Sphaerocarpos drewei bottle liverwort	None/None G1/S1 1B.1	Chaparral, Coastal scrub. openings, soil. 90 - 600 m. ephemeral liverwort. Blooms

Scientific Name Common Name	Status	Habitat Requirements
Sphenopholis obtusata prairie wedge grass	None/None G5/S2 2B.2	Cismontane woodland, Meadows and seeps. mesic. 300 - 2000 m. perennial herb. Blooms Apr-Jul
Stemodia durantifolia purple stemodia	None/None G5/S2 2B.1	Sonoran desert scrub (often mesic, sandy). 180 - 300 m. perennial herb. Blooms (Jan) Apr, Jun, Aug, Sep, Oct, Dec
Stipa arida Mormon needle grass	None/None G5/S3? 2B.3	Joshua tree woodland, Pinyon and juniper woodland. carbonate. 500 - 2570 m. perennial herb. Blooms May-Jul
Stipa diegoensis San Diego County needle grass	None/None G4/S4 4.2	Chaparral, Coastal scrub. rocky, often mesic. 10 - 800 m. perennial herb. Blooms Feb-Jun
Stipa divaricata small-flowered rice grass	None/None G5/S2 2B.3	Pinyon and juniper woodland (gravelly, carbonate). 700 - 2950 m. perennial herb. Blooms Jun-Sep
Streptanthus bernardinus Laguna Mountains jewelflower	None/None G3G4/S3S4 4.3	Chaparral, Lower montane coniferous forest. 670 - 2500 m. perennial herb. Blooms May-Aug
Streptanthus campestris southern jewelflower	None/None G3/S3 1B.3	Chaparral, Lower montane coniferous forest, Pinyon and juniper woodland. rocky. 900 - 2300 m. perennial herb. Blooms (Apr) May-Jul
Stylocline citroleum oil neststraw	None/None G3/S3 1B.1	Chenopod scrub, Coastal scrub, Valley and foothill grassland. clay. 50 - 400 m. annual herb. Blooms Mar-Apr
Stylocline masonii Mason's neststraw	None/None G1/S1 1B.1	Chenopod scrub, Pinyon and juniper woodland. sandy. 100 - 1200 m. annual herb. Blooms Mar-May
Stylocline sonorensis mesquite neststraw	None/None G3G5/SX 2A	Sonoran desert scrub (sandy). 425 - 425 m. annual herb. Blooms Apr
Suaeda esteroa estuary seablite	None/None G3/S2 1B.2	Marshes and swamps (coastal salt). 0 - 5 m. perennial herb. Blooms (May) Jul-Oct (Jan)
Suaeda taxifolia woolly seablite	None/None G4/S4 4.2	Coastal bluff scrub, Coastal dunes, Marshes and swamps (margins of coastal salt). 0 - 50 m. perennial evergreen shrub. Blooms Jan-Dec
Symphyotrichum defoliatum San Bernardino aster	None/None G2/S2 1B.2	Cismontane woodland, Coastal scrub, Lower montane coniferous forest, Meadows and seeps, Marshes and swamps, Valley and foothill grassland (vernally mesic). near ditches, streams, springs. 2 - 2040 m. perennial rhizomatous herb. Blooms Jul-Nov (Dec)
Symphyotrichum greatae Greata's aster	None/None G2/S2 1B.3	Broadleafed upland forest, Chaparral, Cismontane woodland, Lower montane coniferous forest, Riparian woodland. mesic. 300 - 2010 m. perennial rhizomatous herb. Blooms Jun-Oct
Symphyotrichum lentum Suisun Marsh aster	None/None G2/S2 1B.2	Marshes and swamps (brackish and freshwater). 0 - 3 m. perennial rhizomatous herb. Blooms (Apr) May-Nov
Syntrichopappus lemmonii Lemmon's syntrichopappus	None/None G4/S4 4.3	Chaparral, Joshua tree woodland, Pinyon and juniper woodland. sandy or gravelly. 500 - 1830 m. annual herb. Blooms Apr-May (Jun)
Taraxacum californicum California dandelion	FE/None G1G2/S1S2 1B.1	Meadows and seeps (mesic). 1620 - 2800 m. perennial herb. Blooms May-Aug

Scientific Name Common Name	Status	Habitat Requirements
Tetracoccus dioicus Parry's tetracoccus	None/None G2G3/S2 1B.2	Chaparral, Coastal scrub. 165 - 1000 m. perennial deciduous shrub. Blooms Apr-May
Tetracoccus hallii Hall's tetracoccus	None/None G4/S4 4.3	Mojavean desert scrub, Sonoran desert scrub. 30 - 1200 m. perennial deciduous shrub. Blooms Jan-May
Tetradymia argyraea striped horsebrush	None/None G4?/S4 4.3	Pinyon and juniper woodland (rocky). 1400 - 2230 m. perennial deciduous shrub. Blooms (May) Jun-Sep
Teucrium cubense ssp. *depressum* dwarf germander	None/None G4G5T3T4/S2 2B.2	Desert dunes, Playas margins, Sonoran desert scrub. 45 - 400 m. annual herb. Blooms Mar-May (Sep-Nov)
Teucrium glandulosum desert germander	None/None G4/S2 2B.3	Sonoran desert scrub (rocky). 400 - 790 m. perennial stoloniferous herb. Blooms Apr-May
Texosporium sancti-jacobi woven-spored lichen	None/None G3/S1 3	Chaparral (openings). On soil, small mammal pellets, dead twigs, and on Selaginella spp. 60 - 660 m. crustose lichen (terricolous). Blooms
Thelypodium stenopetalum slender-petaled thelypodium	FE/SCE G1/S1 1B.1	Meadows and seeps (mesic, alkaline). 1600 - 2500 m. perennial herb. Blooms May-Sep
Thelypteris puberula var. *sonorensis* Sonoran maiden fern	None/None G5T3/S2 2B.2	Meadows and seeps (seeps and streams). 50 - 610 m. perennial rhizomatous herb. Blooms Jan-Sep
Thermopsis californica var. *argentata* silvery false lupine	None/None G4T4/S4 4.3	Cismontane woodland, Lower montane coniferous forest, Pinyon and juniper woodland. 665 - 2335 m. perennial rhizomatous herb. Blooms Apr-Oct
Thermopsis californica var. *semota* velvety false lupine	None/None G4T2/S2 1B.2	Cismontane woodland, Lower montane coniferous forest, Meadows and seeps, Valley and foothill grassland. 1000 - 1870 m. perennial rhizomatous herb. Blooms Mar-Jun
Thysanocarpus rigidus rigid fringepod	None/None G1G2/S1 1B.2	Pinyon and juniper woodland. Dry rocky slopes. 600 - 2200 m. annual herb. Blooms Feb-May
Tidestromia eliassoniana Eliasson?s woolly tidestromia	None/None G5/S2 2B.2	Mojavean desert scrub. rocky to gravelly volcanic flats, clay. 655 - 2105 m. annual herb. Blooms Jul-Oct
Tiquilia canescens var. *pulchella* Chocolate Mountains tiquilia	None/None G5T3T4/S3 3.2	Sonoran desert scrub. sometimes slopes, ridges, or washes. 250 - 700 m. perennial shrub. Blooms Feb-May
Tortella alpicola alpine crisp-moss	None/None G5?/S1 2B.3	Cismontane woodland (volcanic, rock). 1400 - 1400 m. moss. Blooms
Tortula californica California screw-moss	None/None G2G3/S2S3 1B.2	Chenopod scrub, Valley and foothill grassland. sandy, soil. 10 - 1460 m. moss. Blooms
Tragia ramosa desert tragia	None/None G5/S4 4.3	Chenopod scrub, Pinyon and juniper woodland. rocky. 900 - 1860 m. perennial herb. Blooms Apr-May
Trichocoronis wrightii var. *wrightii* Wright's trichocoronis	None/None G4T3/S1 2B.1	Meadows and seeps, Marshes and swamps, Riparian forest, Vernal pools. alkaline. 5 - 435 m. annual herb. Blooms May-Sep

Scientific Name Common Name	Status	Habitat Requirements
Trichostema austromontanum ssp. *compactum* Hidden Lake bluecurls	FT/None G3G4T1/S1 1B.1	Upper montane coniferous forest (seasonally submerged lake margins). 2400 - 2680 m. annual herb. Blooms Jul-Sep
Trichostema micranthum small-flowered bluecurls	None/None G4/S3 4.3	Lower montane coniferous forest, Meadows and seeps. mesic. 1525 - 2300 m. annual herb. Blooms Jun-Sep
Tripterocalyx micranthus small-flowered sand-verbena	None/None G5/S1 2B.2	Desert dunes, Mojavean desert scrub (sandy). 550 - 855 m. perennial herb. Blooms Apr-May
Triquetrella californica coastal triquetrella	None/None G2/S2 1B.2	Coastal bluff scrub, Coastal scrub. soil. 10 - 100 m. moss. Blooms
Triteleia clementina San Clemente Island triteleia	None/None G2/S2 1B.2	Valley and foothill grassland (rocky). 100 - 445 m. perennial bulbiferous herb. Blooms Mar-Apr
Tropidocarpum capparideum caper-fruited tropidocarpum	None/None G1/S1 1B.1	Valley and foothill grassland (alkaline hills). 1 - 455 m. annual herb. Blooms Mar-Apr
Verbesina dissita big-leaved crownbeard	FT/SCT G1G2/S1 1B.1	Chaparral (maritime), Coastal scrub. 45 - 205 m. perennial herb. Blooms (Mar) Apr-Jul
Viguiera laciniata San Diego County viguiera	None/None G4/S4 4.3	Chaparral, Coastal scrub. 60 - 750 m. perennial shrub. Blooms Feb-Jun (Aug)
Viguiera purisimae La Purisima viguiera	None/None G4/S1 2B.3	Coastal bluff scrub, Chaparral. 365 - 425 m. shrub. Blooms Apr-Sep
Viola pinetorum ssp. *grisea* grey-leaved violet	None/None G4G5T3/S3 1B.2	Meadows and seeps, Subalpine coniferous forest, Upper montane coniferous forest. 1500 - 3400 m. perennial herb. Blooms Apr-Jul
Viola purpurea ssp. *aurea* golden violet	None/None G5T2/S2 2B.2	Great Basin scrub, Pinyon and juniper woodland. sandy. 1000 - 2500 m. perennial herb. Blooms Apr-Jun
Wislizenia refracta ssp. *palmeri* Palmer's jackass clover	None/None G5T3T5/S1 2B.2	Chenopod scrub, Desert dunes, Sonoran desert scrub, Sonoran thorn woodland. 0 - 300 m. perennial deciduous shrub. Blooms Jan-Dec
Wislizenia refracta ssp. *refracta* jackass-clover	None/None G5T5?/S1 2B.2	Desert dunes, Mojavean desert scrub, Playas, Sonoran desert scrub. 600 - 800 m. annual herb. Blooms Apr-Nov
Woodsia plummerae Plummer's woodsia	None/None G5/S2 2B.3	Pinyon and juniper woodland (granitic, rocky). 1600 - 2000 m. perennial rhizomatous herb. Blooms May-Sep
Xanthisma gracile annual bristleweed	None/None G5/S4 4.3	Joshua tree woodland, Mojavean desert scrub. 1220 - 1555 m. annual herb. Blooms Apr-Jul (Sep)
Xanthisma junceum rush-like bristleweed	None/None G5/S4 4.3	Chaparral, Coastal scrub. 240 - 1000 m. perennial herb. Blooms May-Jan
Xylorhiza cognata Mecca-aster	None/None G2/S2 1B.2	Sonoran desert scrub. 20 - 400 m. perennial herb. Blooms Jan-Jun

Scientific Name Common Name	Status	Habitat Requirements
Xylorhiza orcuttii Orcutt's woody-aster	None/None G3?/S2 1B.2	Sonoran desert scrub. Arid canyons; often in washes. 0-365 m. - m. Blooms
Invertebrates		
Aglaothorax longipennis Santa Monica shieldback katydid	None/None G1G2/S1S2	Occur nocturnally in chaparral and canyon stream bottom vegetation, in the Santa Monica Mtns of Southern California. Inhabit introduced iceplant and native chaparral plants.
Ammopelmatus kelsoensis Kelso jerusalem cricket	None/None G1G2/S1S2	Inhabits a limited area of the Kelso Dunes (type locality), San Bernardino County. Found at the north base of a sand declivity, 15-25 ft high; associated plants: sandpaper weed, croton, sand dune grass.
Anomala carlsoni Carlson's dune beetle	None/None G1/S1	Known primarily from creosote scrub in vicinity of Algodones Dunes, Imperial County. Also taken from Borrego, San Diego County. Host preferences unknown.
Assiminea infima Badwater snail	None/None G1/S1	Restricted to saline spring sources in the Death Valley region, Inyo County. Occurs either under a salt-crust roof fringing the water's edge or on moistened vegetation; often found fully submerged.
Atractelmis wawona Wawona riffle beetle	None/None G1G3/S1S2	Aquatic; found in riffles of rapid, small to medium clear mountain streams; 2000-5000 ft elev. Strong preference for inhabiting submerged aquatic mosses
Belostoma saratogae Saratoga Springs belostoman bug	None/None G1/S1	Known only from Saratoga Spring in Death Valley, San Bernardino County. Inhabits the hot spring pool and inlet/outlet channels; have been collected year-round.
Bombus caliginosus obscure bumble bee	None/None G4?/S1S2	Coastal areas from Santa Barabara county to north to Washington state. Food plant genera include Baccharis, Cirsium, Lupinus, Lotus, Grindelia and Phacelia.
Bombus crotchii Crotch bumble bee	None/SCE G3G4/S1S2	Coastal California east to the Sierra-Cascade crest and south into Mexico. Food plant genera include Antirrhinum, Phacelia, Clarkia, Dendromecon, Eschscholzia, and Eriogonum.
Bombus morrisoni Morrison bumble bee	None/None G4G5/S1S2	From the Sierra-Cascade ranges eastward across the intermountain west. Food plant genera include Cirsium, Cleome, Helianthus, Lupinus, Chrysothamnus, and Melilotus.
Bombus occidentalis western bumble bee	None/SCE G2G3/S1	Once common & widespread, species has declined precipitously from central CA to southern B.C., perhaps from disease.
Branchinecta conservatio Conservancy fairy shrimp	FE/None G2/S2	Endemic to the grasslands of the northern two-thirds of the Central Valley; found in large, turbid pools. Inhabit astatic pools located in swales formed by old, braided alluvium; filled by winter/spring rains, last until June.
Branchinecta lynchi vernal pool fairy shrimp	FT/None G3/S3	Endemic to the grasslands of the Central Valley, Central Coast mountains, and South Coast mountains, in astatic rain-filled pools. Inhabit small, clear-water sandstone-depression pools and grassed swale, earth slump, or basalt-flow depression pools.
Branchinecta sandiegonensis San Diego fairy shrimp	FE/None G2/S2	Endemic to San Diego and Orange County mesas. Vernal pools.
Brennania belkini Belkin's dune tabanid fly	None/None G1G2/S1S2	Inhabits coastal sand dunes of Southern California.
Calileptoneta oasa Andreas Canyon leptonetid spider	None/None G1/S1	Known only from the type locality, Andreas Canyon, Palm Springs, Riverside County.
Callophrys mossii hidakupa San Gabriel Mountains elfin butterfly	None/None G4T1T2/S1S2	San Gabriel and San Bernardino mountains at elevations of 3,000 to approximately 5,500 ft. Foodplant is Sedum spathulifolium. Type locality is southern mixed evergreen forest.

Scientific Name Common Name	Status	Habitat Requirements
Callophrys thornei Thorne's hairstreak	None/None G1/S1	Associated with the endemic tecate cypress (Cupressus forbesii). Only known from vicinity of Otay Mountain.
Carolella busckana Busck's gallmoth	None/None G1G3/SH	
Ceratochrysis bradleyi Bradley's cuckoo wasp	None/None G1/S1	
Ceratochrysis longimala Desert cuckoo wasp	None/None G1/S1	
Cicindela gabbii western tidal-flat tiger beetle	None/None G2G4/S1	Inhabits estuaries and mudflats along the coast of Southern California. Generally found on dark-colored mud in the lower zone; occasionally found on dry saline flats of estuaries.
Cicindela hirticollis gravida sandy beach tiger beetle	None/None G5T2/S2	Inhabits areas adjacent to non-brackish water along the coast of California from San Francisco Bay to northern Mexico. Clean, dry, light-colored sand in the upper zone. Subterranean larvae prefer moist sand not affected by wave action.
Cicindela latesignata latesignata western beach tiger beetle	None/None G2G4T1T2/S1	Mudflats and beaches in coastal Southern California.
Cicindela senilis frosti senile tiger beetle	None/None G2G3T1T3/S1	Inhabits marine shoreline, from Central California coast south to salt marshes of San Diego. Also found at Lake Elsinore. Inhabits dark-colored mud in the lower zone and dried salt pans in the upper zone.
Cicindela tranquebarica viridissima greenest tiger beetle	None/None G5T1/S1	Inhabits the woodlands adjacent to the Santa Ana River basin. Usually found in open spots between trees.
Coelus globosus globose dune beetle	None/None G1G2/S1S2	Inhabitant of coastal sand dune habitat; erratically distributed from Ten Mile Creek in Mendocino County south to Ensenada, Mexico. Inhabits foredunes and sand hummocks; it burrows beneath the sand surface and is most common beneath dune vegetation.
Coenonycha clementina San Clemente Island coenonycha beetle	None/None G1G2/S1S2	
Danaus plexippus pop. 1 monarch - California overwintering population	None/None G4T2T3/S2S3	Winter roost sites extend along the coast from northern Mendocino to Baja California, Mexico. Roosts located in wind-protected tree groves (eucalyptus, Monterey pine, cypress), with nectar and water sources nearby.
Deltaspis ivae marsh-elder long-horned beetle	None/None G1/S1	Found in a few scattered locations in San Diego and Riverside counties; larva breeds in Iva hayesiana root collars.
Dinacoma caseyi Casey's June beetle	FE/None G1/S1	Found only in two populations in a small area of southern Palm Springs. Found in sandy soils; the females live underground and only come to the ground surface to mate.
Diplectrona californica California diplectronan caddisfly	None/None G1G2/S1S2	
Eremarionta immaculata white desertsnail	None/None G1/S1	Known only from the east slope of Riverside Mountains, Riverside County. Found in and around rockslides.
Eremarionta morongoana Morongo (=Colorado) desertsnail	None/None G1G3/S1	Known only from a gulch on the north side of Morongo Pass (type locality), San Bernardino County, near Riverside County line. Found under rocks.
Eremarionta rowelli bakerensis Baker's desertsnail	None/None G3G4T1/S1	Inhabits north slope of a small range of limestone hills, 0.5 miles south of Baker, San Bernardino County. Found in rockslides.

Scientific Name Common Name	Status	Habitat Requirements
Eremarionta rowelli mccoiana California Mccoy snail	None/None G3G4T1/S1	Found in various sites in the McCoy Mountains and the Big Maria Mountains. Inhabits rockslides in gullies.
Eucerceris ruficeps redheaded sphecid wasp	None/None G1G3/S1S2	Central California interior dunes. Nest in hard-packed sand utilizing abandoned halictine bee burrows.
Euchloe hyantis andrewsi Andrew's marble butterfly	None/None G3G4T1/S1	Inhabits yellow pine forest near Lake Arrowhead and Big Bear Lake, San Bernardino Mtns, San Bernardino Co, 5000-6000 ft. Hostplants are Streptanthus bernardinus & Arabis holboellii var pinetorum; larval foodplant is Descurainia richardsonii.
Eucosma hennei Henne's eucosman moth	None/None G1/S1	Endemic to the El Segundo Dunes (type locality), Los Angeles County. Larval foodplant is Phacelia ramosissima var austrolitoralis; larvae can be found on woody stems and upper root parts.
Euparagia unidentata Algodones euparagia	None/None G1G2/S1S2	Endemic to the Algodones Dunes in Imperial County.
Euphilotes battoides allyni El Segundo blue butterfly	FE/None G5T1/S1	Restricted to remnant coastal dune habitat in Southern California. Host plant is Eriogonum parvifolium; larvae feed only on the flowers and seeds; used by adults as major nectar source.
Euphydryas editha quino quino checkerspot butterfly	FE/None G5T1T2/S1S2	Sunny openings within chaparral & coastal sage shrublands in parts of Riverside & San Diego counties. Hills and mesas near the coast. Need high densities of food plants Plantago erecta, P. insularis, and Orthocarpus purpurescens.
Euproserpinus euterpe Kern primrose sphinx moth	FT/None G1G2/S1	Found in the Walker Basin, Kern County, and several other scattered locations (Carrizo Plain, Pinnacles NM). Host plant is Camissonia contorta epilobioides (evening primrose).
Glaresis arenata Kelso Dunes scarab glaresis beetle	None/None G2/S2	Known only from the Kelso Dunes.
Glaucopsyche lygdamus palosverdesensis Palos Verdes blue butterfly	FE/None G5T1/S1	Restricted to the cool, fog-shrouded, seaward side of Palos Verdes Hills, Los Angeles County. Host plant is Astragalus trichopodus var. lonchus (locoweed).
Glyptostoma gabrielense San Gabriel chestnut	None/None G2/S2	Terrestrial.
Gonidea angulata western ridged mussel	None/None G3/S1S2	Primarily creeks & rivers & less often lakes. Originally in most of state, now extirpated from Central & Southern Calif.
Halictus harmonius haromonius halictid bee	None/None G1/S1	Known only from the foothills of the San Bernardino Mts., possibly also the San Jacinto Mts.
Haliotis cracherodii black abalone	FE/None G3/S1S2	Mid to low rocky intertidal areas.
Haplotrema catalinense Santa Catalina lancetooth	None/None G1/S1	Occurs only on Santa Catalina Island.
Hedychridium argenteum Riverside cuckoo wasp	None/None G1G2/S1S2	This species appears to be endemic to eastern Riverside County. External parasite of bee larva.
Helminthoglypta ayresiana sanctaecrucis Ayer's snail	None/None G1G2T1T2/S1S2	Restricted to Santa Cruz Island, occupying diverse habitats; sea level to 2000 ft elevation. Found in rock slides, beneath logs and leaves in wooded localities, in clumps of cacti and other dense vegetation.
Helminthoglypta coelata mesa shoulderband	None/None G1/S1	Known only from a few locations in western San Diego County. Found in rock slides, beneath bark and rotten logs, and among coastal vegetation.
Helminthoglypta milleri peak shoulderband	None/None G1/S1	Known only from the type locality at Cuyamaca Peak in San Diego County. Found in rock piles.

Scientific Name Common Name	Status	Habitat Requirements
Helminthoglypta mohaveana Victorville shoulderband	None/None G1/S1	Known only from along the Mojave River in San Bernardino County. Found among granite boulders and at the base of rocky cliffs.
Helminthoglypta taylori westfork shoulderband	None/None G1/S1	Vicinity of the Mojave River. Under logs and leaves.
Helminthoglypta traskii traskii Trask shoulderband	None/None G1G2T1/S1	Known from Ventura, Los Angeles, Orange, and San Diego counties. Also reported from northwestern Baja California.
Helminthoglypta vasquezi Vasquez shoulderband	None/None G1/S1	Terrestrial.
Hydroporus simplex simple hydroporus diving beetle	None/None G1?/S1?	Known from aquatic habitats in Tuolumne and San Bernardino counties.
Hygrotus curvipes curved-foot hygrotus diving beetle	None/None G1/S1	Aquatic; known only from Alameda & Contra Costa counties.
Juniperella mirabilis juniper metallic wood-boring beetle	None/None G1/S1	Larvae develop in juniper in Santa Rosa Mts. in Southern California.
Linderiella occidentalis California linderiella	None/None G2G3/S2S3	Seasonal pools in unplowed grasslands with old alluvial soils underlain by hardpan or in sandstone depressions. Water in the pools has very low alkalinity, conductivity, and total dissolved solids.
Linderiella santarosae Santa Rosa Plateau fairy shrimp	None/None G1G2/S1	Found only in the vernal pools on Santa Rosa Plateau in Riverside County. Southern basalt flow vernal pools.
Lycaena hermes Hermes copper butterfly	FC/None G1/S1	Found in southern mixed chaparral and coastal sage scrub at western edge of Laguna Mountains. Host plant is Rhamnus crocea. Although R. crocea is widespread throughout the coast range, Lycaena hermes is not.
Macrobaenetes kelsoensis Kelso giant sand treader cricket	None/None G2/S2	Known only from the Kelso Dunes, San Bernardino County; 2500 ft elevation. Found on bare, hard-packed sand ridges, 0.5 mile inland from margin.
Macrobaenetes valgum Coachella giant sand treader cricket	None/None G1G2/S1S2	Known from the sand dune ridges in the vicinity of Coachella Valley. Population size regulated by amount of annual rainfall; some spots favor permanent habitation where springs dampen sand.
Melitta californica California mellitid bee	None/None G4?/S2?	Desert regions of SW Arizona, SE California, and Baja California, Mexico. Also collected from Torrey Pines, San Diego Co. Earlier records of M. wilmattae pertain to this species; species was synonymized with M. californica in 1981.
Micrarionta feralis San Nicolas islandsnail	None/None G1/S1	Known only from San Nicolas Island, Ventura County. Fossilized shells from San Clemente Island, but none living.
Micrarionta gabbi San Clemente islandsnail	None/None G1/S1	Known only from San Clemente Island, Los Angeles County.
Micrarionta opuntia pricklypear islandsnail	None/None G1/S1	Known only from NE San Nicolas Island, in areas of isolated Opuntia littoralis and in Lycium patches among annual grass. Occurs beneath the surface, either covered by soil or clinging to sides of depressions or small burrows.
Miloderes nelsoni Nelson's miloderes weevil	None/None G2/S2	Known from Mojave Desert in Inyo and San Bernardino counties.
Minymischa ventura Ventura cuckoo wasp	None/None GU/SU	

Scientific Name Common Name	Status	Habitat Requirements
Neolarra alba white cuckoo bee	None/None GH/SH	Known only from 6 historical localities in Southern California; has not been collected since 1946. Cleptoparasitic in the nests of perdita bees.
Oliarces clara cheeseweed owlfly (cheeseweed moth lacewing)	None/None G1G3/S2	Inhabits the lower Colorado River drainage. Found under rocks or in flight over streams. Larrea tridentata is the suspected larval host.
Onychobaris langei Lange's El Segundo Dune weevil	None/None G1/S1	Known from El Segundo Dunes.
Panoquina errans wandering (=saltmarsh) skipper	None/None G4G5/S2	Southern California coastal salt marshes. Requires moist saltgrass for larval development.
Paranomada californica California cuckoo bee	None/None G1/S1	
Parnopes borregoensis Borrego parnopes cuckoo wasp	None/None G1G2/S1S2	Known from San Diego, San Bernardino, and Inyo counties.
Pelocoris shoshone Amargosa naucorid bug	None/None G1G3/S1S2	Endemic to the Amargosa River drainage in Death Valley, Inyo County, and San Bernardino County.
Perdita scitula antiochensis Antioch andrenid bee	None/None G1T1/S1	Known only from Antioch Dunes and Oakley. Visits flowers of Eriogonum, Gutierrezia californica, Heterotheca grandiflora, Lessingia glandulifera.
Plebejus saepiolus aureolus San Gabriel Mountains blue butterfly	None/None G5T1/S1	Type locality is a wet meadow seep in yellow pine forest. Foodplant is Trifolium wormskioldii.
Plebulina emigdionis San Emigdio blue butterfly	None/None G1G2/S1S2	Found in desert canyons & along riverbeds in Inyo, Kern, Los Angeles, and San Bernardino counties. Host plant is Atriplex canescens; maybe Lotus purshianus also.
Polyphylla erratica Death Valley June beetle	None/None G1G2/S1S2	Halophytic species. Larva, pupae and adults found in moist, salt-encrusted soil in the Amargosa River system. Larvae taken at roots of Distichlis divaricata.
Pristiloma shepardae Shepard's snail	None/None G1/S1	Known only from Santa Catalina and Santa Cruz islands. Usually found in moist leaf litter.
Psychomastax deserticola desert monkey grasshopper	None/None G1G2/S1S2	Occurs in very arid environments in the vicinity of the San Bernardino Mtns. Known to occur on chamise (Adenostoma fasciculatum).
Pyrgus ruralis lagunae Laguna Mountains skipper	FE/None G5T1/S1	Only in a few open meadows in yellow pine forest between 5,000 & 6,000 ft. in the vicinity of Mt Laguna & Palomar Mtn. Eggs laid on leaves of Horkelia bolanderi clevelandi. Larvae feed on leaves and overwinter on the host plant.
Radiocentrum avalonense Catalina mountainsnail	None/None G1/S1	Known only from southeast end of Santa Catalina Island. Coastal sage scrub habitats dominated by Salvia and Opuntia.
Rhaphiomidas terminatus abdominalis Delhi Sands flower-loving fly	FE/None G1T1/S1	Found only in areas of the Delhi Sands formation in southwestern San Bernardino & northwestern Riverside counties. Requires fine, sandy soils, often with wholly or partly consolidated dunes & sparse vegetation. Oviposition req. shade.
Rhaphiomidas terminatus terminatus El Segundo flower-loving fly	None/None G1T1/S1	Presumed extinct but recently discovered on Malaga Dunes, Los Angeles County. Perched dunes.
Rhopalolemma robertsi Roberts' rhopalolemma bee	None/None G1/S1	Known only from the type locality 8 km south of Twentynine Palms.

Scientific Name Common Name	Status	Habitat Requirements
Rothelix warnerfontis Warner Springs shoulderband	None/None G1/S1	Known only from two localities near Warner Springs, San Diego County. Found in wood rat nests; as development eliminates rat nests, snail has become scarce.
Socalchemmis gertschi Gertsch's socalchemmis spider	None/None G1/S1	Known from only 2 localities in Los Angeles County: Brentwood (type locality) and Topanga Canyon.
Socalchemmis icenoglei Icenogle's socalchemmis spider	None/None G1/S1	Known only from the type locality in the vicinity of Winchester, Riverside County.
Stenopelmatus cahuilaensis Coachella Valley jerusalem cricket	None/None G1G2/S1S2	Inhabits a small segment of the sand and dune areas of the Coachella Valley, in the vicinity of Palm Springs. Found in the large, undulating dunes piled up at the north base of Mt San Jacinto.
Sterkia clementina San Clemente Island blunt-top snail	None/None G1/S1S2	Known only from San Clemente, San Nicolas, Santa Catalina, and Santa Barbara islands. Inhabits the undersides of rocks or the soil beneath iceplant.
Streptocephalus woottoni Riverside fairy shrimp	FE/None G1G2/S1S2	Endemic to Western Riverside, Orange, and San Diego counties in areas of tectonic swales/earth slump basins in grassland and coastal sage scrub. Inhabit seasonally astatic pools filled by winter/spring rains. Hatch in warm water later in the season.
Texella kokoweef Kokoweef Crystal Cave harvestman	None/None G1/S1	Known only from the type locality, Kokoweef Crystal Cave, San Bernardino County. Specimens were collected under decaying wood debris.
Trigonoscuta brunnotesselata brown tassel trigonoscuta weevil	None/None G1G2/S1S2	Known only from the Kelso Dunes, San Bernardino County.
Trigonoscuta dorothea dorothea Dorothy's El Segundo Dune weevil	None/None G1T1/S1	Coastal sand dunes in Los Angeles County.
Trimerotropis occidentiloides Santa Monica grasshopper	None/None G1G2/S1S2	Known only from the Santa Monica Mountains. Found on bare hillsides and along dirt trails in chaparral.
Tryonia imitator mimic tryonia (=California brackishwater snail)	None/None G2/S2	Inhabits coastal lagoons, estuaries and salt marshes, from Sonoma County south to San Diego County. Found only in permanently submerged areas in a variety of sediment types; able to withstand a wide range of salinities.
Xerarionta intercisa horseshoe snail	None/None G1/S1	San Clemente Island. Found around rocks and Opuntia cactus.
Xerarionta redimita wreathed cactussnail	None/None G1G2/S1	Known only from San Clemente Island.
Xerarionta tryoni Bicolor cactussnail	None/None G1/S1	
Fish		
Catostomus latipinnis flannelmouth sucker	None/None G3G4/S1	Colorado River bordering California. Spawns in riffles, usually over a substrate of coarse gravel.
Catostomus santaanae Santa Ana sucker	FT/None G1/S1	Endemic to Los Angeles Basin south coastal streams. Habitat generalists, but prefer sand-rubble-boulder bottoms, cool, clear water, and algae.
Cyprinodon macularius desert pupfish	FE/SE G1/S1	Desert ponds, springs, marshes and streams in Southern California. Can live in salinities from freshwater to 68 ppt; can withstand temps from 9 - 45 C and dissolved oxygen levels down to 0.1 ppm.
Cyprinodon nevadensis amargosae Amargosa pupfish	None/None G2T1T2/S1S2	Permanent water sections of the lower Amargosa River. Two types of habitat: broad marshes fed by hot springs, and a narrow, steep-sided canyon area with swift flows.

Scientific Name Common Name	Status	Habitat Requirements
Cyprinodon nevadensis nevadensis Saratoga Springs pupfish	None/None G2T1/S1	Only known from Saratoga Springs and its outflow in Death Valley. A series of marshes and shallow lakes. Water temps vary from 10 to 49 C.
Eucyclogobius newberryi tidewater goby	FE/None G3/S3	Brackish water habitats along the California coast from Agua Hedionda Lagoon, San Diego County to the mouth of the Smith River. Found in shallow lagoons and lower stream reaches, they need fairly still but not stagnant water and high oxygen levels.
Gasterosteus aculeatus williamsoni unarmored threespine stickleback	FE/SE G5T1/S1	Weedy pools, backwaters, and among emergent vegetation at the stream edge in small Southern California streams. Cool (<24 C), clear water with abundant vegetation.
Gila elegans bonytail	FE/SE G1/SH	Found in the Colorado River bordering California. Adapted for swimming in swift water, but both adults and young need backwaters and eddies. Needs gravel riffles for spawning.
Gila orcuttii arroyo chub	None/None G2/S2	Native to streams from Malibu Creek to San Luis Rey River basin. Introduced into streams in Santa Clara, Ventura, Santa Ynez, Mojave & San Diego river basins. Slow water stream sections with mud or sand bottoms. Feeds heavily on aquatic vegetation and associated invertebrates.
Hypomesus transpacificus Delta smelt	FT/SE G1/S1	Sacramento-San Joaquin Delta. Seasonally in Suisun Bay, Carquinez Strait & San Pablo Bay. Seldom found at salinities > 10 ppt. Most often at salinities < 2ppt.
Oncorhynchus mykiss irideus pop. 10 steelhead - southern California DPS	FE/None G5T1Q/S1	Federal listing refers to populations from Santa Maria River south to southern extent of range (San Mateo Creek in San Diego County). Southern steelhead likely have greater physiological tolerances to warmer water and more variable conditions.
Oncorhynchus mykiss irideus pop. 11 steelhead - Central Valley DPS	FT/None G5T2Q/S2	Populations in the Sacramento and San Joaquin rivers and their tributaries.
Ptychocheilus lucius Colorado pikeminnow	FE/SE G1/SX	Was native to the Colorado River bordering California. Adults found in deep pools in the main river channel, smaller fish are found in shallow and quiet waters.
Rhinichthys osculus ssp. *1* Amargosa Canyon speckled dace	None/None G5T1Q/S1	Found only in Amargosa Canyon and tributaries of the Amargosa River, esp. Willow Creek & Willow Creek Reservoir. Prefers pools with relatively deep water (0.5 - 0.75 m) and slow water velocity.
Rhinichthys osculus ssp. *3* Santa Ana speckled dace	None/None G5T1/S1	Headwaters of the Santa Ana and San Gabriel rivers. May be extirpated from the Los Angeles River system. Requires permanent flowing streams with summer water temps of 17-20 C. Usually inhabits shallow cobble and gravel riffles.
Siphateles bicolor mohavensis Mohave tui chub	FE/SE G4T1/S1	Endemic to the Mojave River basin, adapted to alkaline, mineralized waters. Needs deep pools, ponds, or slough-like areas. Needs vegetation for spawning.
Spirinchus thaleichthys longfin smelt	FC/ST G5/S1	Euryhaline, nektonic & anadromous. Found in open waters of estuaries, mostly in middle or bottom of water column. Prefer salinities of 15-30 ppt but can be found in completely freshwater to almost pure seawater.
Xyrauchen texanus razorback sucker	FE/SE G1/S1S2	Found in the Colorado River bordering California. Adapted for swimming in swift currents but also need quiet waters. Spawn in areas of sand/gravel/rocks in shallow water.

Scientific Name Common Name	Status	Habitat Requirements
Amphibians		
Anaxyrus californicus arroyo toad	FE/None G2G3/S2S3	Semi-arid regions near washes or intermittent streams, including valley-foothill and desert riparian, desert wash, etc. Rivers with sandy banks, willows, cottonwoods, and sycamores; loose, gravelly areas of streams in drier parts of range.
Batrachoseps gabrieli San Gabriel slender salamander	None/None G2G3/S2S3	Known only from the San Gabriel Mtns. Found under rocks, wood, and fern fronds, and on soil at the base of talus slopes. Most active on the surface in winter and early spring.
Batrachoseps major aridus desert slender salamander	FE/SE G4T1/S1	Known only from Hidden Palm Canyon and Guadalupe Creek, Riverside County, in barren, palm oasis, desert wash, and desert scrub. Occurs under limestone sheets, rocks, and talus, usually at the base of damp, shaded, north and west-facing walls.
Batrachoseps pacificus Channel Islands slender salamander	None/None G4/S3S4	Found only on San Miguel, Santa Rosa, Santa Cruz, and Anacapa islands. Found in a variety of habitats from forest to chaparral to grassland.
Ensatina eschscholtzii croceater yellow-blotched salamander	None/None G5T3/S3	Forests and well-shaded canyons, as well as oak woodlands and old chaparral. Needs surface objects, such as logs, boards, and rocks. Also needs old rodent burrows or other underground retreats.
Ensatina eschscholtzii klauberi large-blotched salamander	None/None G5T2?/S3	Found in conifer and woodland associations. Found in leaf litter, decaying logs and shrubs in heavily forested areas.
Incilius alvarius Sonoran desert toad	None/None G5/SH	Breeds in temporary pools and irrigation ditches along the Colorado River and southern Imperial Valley.
Lithobates yavapaiensis lowland leopard frog	None/None G4/SX	Were found along the Colorado River and in streams near the Salton Sea.
Rana boylii foothill yellow-legged frog	None/SCT G3/S3	Partly-shaded, shallow streams and riffles with a rocky substrate in a variety of habitats. Needs at least some cobble-sized substrate for egg-laying. Needs at least 15 weeks to attain metamorphosis.
Rana draytonii California red-legged frog	FT/None G2G3/S2S3	Lowlands and foothills in or near permanent sources of deep water with dense, shrubby or emergent riparian vegetation. Requires 11-20 weeks of permanent water for larval development. Must have access to estivation habitat.
Rana muscosa southern mountain yellow-legged frog	FE/SE G1/S1	Federal listing refers to populations in the San Gabriel, San Jacinto and San Bernardino mountains (southern DPS). Northern DPS was determined to warrant listing as endangered, Apr 2014, effective Jun 30, 2014. Always encountered within a few feet of water. Tadpoles may require 2 - 4 yrs to complete their aquatic development.
Scaphiopus couchii Couch's spadefoot	None/None G5/S2	Temporary desert rainpools that last at least 7 days, with water temps > 15 C, and with subterranean refuge sites close by. An insect food base, especially termites, must be available.
Spea hammondii western spadefoot	None/None G3/S3	Occurs primarily in grassland habitats but can be found in valley-foothill hardwood woodlands. Vernal pools are essential for breeding and egg-laying.
Taricha torosa Coast Range newt	None/None G4/S4 CDFW_SSC-Species of Special Concern	Coastal drainages from Mendocino County to San Diego County. Lives in terrestrial habitats & will migrate over 1 km to breed in ponds, reservoirs & slow-moving streams.

Scientific Name Common Name	Status	Habitat Requirements
Reptiles		
Anniella pulchra northern California legless lizard	None/None G3/S3	Sandy or loose loamy soils under sparse vegetation. Soil moisture is essential. They prefer soils with a high moisture content.
Anniella spp. California legless lizard	None/None G3G4/S3S4 CDFW_SSC-Species of Special Concern	Contra Costa County south to San Diego, within a variety of open habitats.This element represents California records of Anniella not yet assigned to new species within the Anniella pulchra complex. Variety of habitats; generally in moist, loose soil. They prefer soils with a high moisture content.
Anniella stebbinsi southern California legless lizard	None/None G3/S3	Generally south of the Transverse Range, extending to northwestern Baja California. Occurs in sandy or loose loamy soils under sparse vegetation. Disjunct populations in the Tehachapi and Piute Mountains in Kern County. Variety of habitats; generally in moist, loose soil. They prefer soils with a high moisture content.
Arizona elegans occidentalis California glossy snake	None/None G5T2/S2 CDFW_SSC-Species of Special Concern	Patchily distributed from the eastern portion of San Francisco Bay, southern San Joaquin Valley, and the Coast, Transverse, and Peninsular ranges, south to Baja California. Generalist reported from a range of scrub and grassland habitats, often with loose or sandy soils.
Aspidoscelis hyperythra orange-throated whiptail	None/None G5/S2S3	Inhabits low-elevation coastal scrub, chaparral, and valley-foothill hardwood habitats. Prefers washes and other sandy areas with patches of brush and rocks. Perennial plants necessary for its major food: termites.
Aspidoscelis tigris stejnegeri coastal whiptail	None/None G5T5/S3 CDFW_SSC-Species of Special Concern	Found in deserts and semi-arid areas with sparse vegetation and open areas. Also found in woodland & riparian areas. Ground may be firm soil, sandy, or rocky.
Charina umbratica southern rubber boa	None/ST G2G3/S2S3	Known from the San Bernardino and San Jacinto mtns; found in a variety of montane forest habitats. Snakes resembling C. umbratica reported from Mt. Pinos and Tehachapi mtns group with C. bottae based on mtDNA. Further research needed. Found in vicinity of streams or wet meadows; requires loose, moist soil for burrowing; seeks cover in rotting logs, rock outcrops, and under surface litter.
Chelonia mydas green turtle	FT/None G3/S1	Marine. Completely herbivorous; needs adquate supply of seagrasses and algae.
Coleonyx switaki barefoot gecko	None/ST G4/S1	Found only in areas of massive rock & rock outcrops at the heads of canyons. Occurs in rock cracks and crevices.
Coleonyx variegatus abbotti San Diego banded gecko	None/None G5T3T4/S1S2 CDFW_SSC-Species of Special Concern	Coastal & cismontane Southern California. Found in granite or rocky outcrops in coastal scrub and chaparral habitats.
Crotalus ruber red-diamond rattlesnake	None/None G4/S3	Chaparral, woodland, grassland, & desert areas from coastal San Diego County to the eastern slopes of the mountains. Occurs in rocky areas and dense vegetation. Needs rodent burrows, cracks in rocks or surface cover objects.
Diadophis punctatus modestus San Bernardino ringneck snake	None/None G5T2T3/S2?	Most common in open, relatively rocky areas. Often in somewhat moist microhabitats near intermittent streams. Avoids moving through open or barren areas by restricting movements to areas of surface litter or herbaceous veg.

Scientific Name Common Name	Status	Habitat Requirements
Diadophis punctatus regalis regal ringneck snake	None/None GNR/S2S3 CDFW_SSC-Species of Special Concern	Variety of habitats in higher elevation desert mountains. In California known from the Clark, Providence, and Grapevine mountain ranges. Often in somewhat moist microhabitats such as springs and intermittant streams.
Diadophis punctatus similis San Diego ringneck snake	None/None G5T2T3/S2?	Open, fairly rocky areas. Use boards, flat rocks, woodpiles, stable talus, rotting logs & small ground holes for cover. Prefer areas with surface litter or herbaceous vegetation. Often in somewhat moist areas near intermittent streams.
Emys marmorata western pond turtle	None/None G3G4/S3	A thoroughly aquatic turtle of ponds, marshes, rivers, streams and irrigation ditches, usually with aquatic vegetation, below 6000 ft elevation. Needs basking sites and suitable (sandy banks or grassy open fields) upland habitat up to 0.5 km from water for egg-laying.
Gambelia copeii Cope's leopard lizard	None/None G5/S1S2	Restricted in California to Southeastern San Diego County. Occurs in desert scrub, coastal sage scrub, oak woodland, and chaparral. Open flat areas within vegetation.
Gambelia sila blunt-nosed leopard lizard	FE/SE G1/S1	Resident of sparsely vegetated alkali and desert scrub habitats, in areas of low topographic relief. Seeks cover in mammal burrows, under shrubs or structures such as fence posts; they do not excavate their own burrows.
Gopherus agassizii desert tortoise	FT/ST G3/S2S3	Most common in desert scrub, desert wash, and Joshua tree habitats; occurs in almost every desert habitat. Require friable soil for burrow and nest construction. Creosote bush habitat with large annual wildflower blooms preferred.
Heloderma suspectum cinctum banded Gila monster	None/None G4T4/S1	Inhabits the lower slopes of rocky canyons and arroyos but is also found on desert flats among scrub and succulents. Eggs are laid in soil in excavated nests; thus, soil must be sandy or friable. Found in areas moister than surroundings.
Kinosternon sonoriense Sonoran mud turtle	None/None G4/SH	The lower Colorado River system in southeastern California. Permanent slackwater habitats along intermittent or perennial streams with abundant submergent vegetation and benthic inverts.
Masticophis fuliginosus Baja California coachwhip	None/None G5/S1S2 CDFW_SSC-Species of Special Concern	In California restricted to southern San Diego County, where it is known from grassland and coastal sage scrub. Open areas in grassland and coastal sage scrub
Phrynosoma blainvillii coast horned lizard	None/None G3G4/S3S4	Frequents a wide variety of habitats, most common in lowlands along sandy washes with scattered low bushes. Open areas for sunning, bushes for cover, patches of loose soil for burial, and abundant supply of ants and other insects.
Phrynosoma mcallii flat-tailed horned lizard	None/None G3/S2	Restricted to desert washes and desert flats in central Riverside, eastern San Diego, and Imperial counties. Critical habitat element is fine sand, into which lizards burrow to avoid temperature extremes; requires vegetative cover and ants.
Plestiodon skiltonianus interparietalis Coronado skink	None/None G5T5/S2S3	Grassland, chaparral, pinon-juniper and juniper sage woodland, pine-oak and pine forests in Coast Ranges of Southern California. Prefers early successional stages or open areas. Found in rocky areas close to streams and on dry hillsides.
Salvadora hexalepis virgultea coast patch-nosed snake	None/None G5T4/S2S3 CDFW_SSC-Species of Special Concern	Brushy or shrubby vegetation in coastal Southern California. Require small mammal burrows for refuge and overwintering sites.

Scientific Name Common Name	Status	Habitat Requirements
Thamnophis gigas giant gartersnake	FT/ST G2/S2	Prefers freshwater marsh and low gradient streams. Has adapted to drainage canals and irrigation ditches. This is the most aquatic of the gartersnakes in California.
Thamnophis hammondii two-striped gartersnake	None/None G4/S3S4	Coastal California from vicinity of Salinas to northwest Baja California. From sea to about 7,000 ft elevation. Highly aquatic, found in or near permanent fresh water. Often along streams with rocky beds and riparian growth.
Thamnophis sirtalis pop. 1 south coast gartersnake	None/None G5T1T2/S1S2 CDFW_SSC-Species of Special Concern	Southern California coastal plain from Ventura County to San Diego County, and from sea level to about 850 m. Marsh and upland habitats near permanent water with good strips of riparian vegetation.
Uma inornata Coachella Valley fringe-toed lizard	FT/SE G1Q/S1	Limited to sandy areas in the Coachella Valley, Riverside County. Requires fine, loose, windblown sand (for burrowing), interspersed with hardpan and widely-spaced desert shrubs.
Uma notata Colorado Desert fringe-toed lizard	None/None G3/S2	Colorado Desert region; in sand dunes, dry lakebeds, sandy beaches or riverbanks, desert washes, or sparse desert scrub. Requires fine, loose, windblown sand (for burrowing); shrubs or annuals for arthropod production.
Uma scoparia Mojave fringe-toed lizard	None/None G3G4/S3S4	Fine, loose, wind-blown sand in sand dunes, dry lakebeds, riverbanks, desert washes, sparse alkali scrub and desert scrub. Shrubs or annual plants may be necessary for arthropods found in the diet.
Xantusia gracilis sandstone night lizard	None/None G1/S1	Known only from the Truckhaven Rocks in the eastern part of Anza-Borrego State Park. Found in fissures or under slabs of exfoliating sandstone and rodent burrows in compacted sandstone and mudstone.
Xantusia riversiana island night lizard	FD/None G3/S3	Found in a wide variety of habitats on three of the Channel Islands: Santa Barbara, San Clemente, and San Nicolas. Main habitat requirement is available cover, from prostrate plants (Opuntia and ice plant) to rocks, logs, and rubble.
Birds		
Accipiter cooperii Cooper's hawk	None/None G5/S4	Woodland, chiefly of open, interrupted or marginal type. Nest sites mainly in riparian growths of deciduous trees, as in canyon bottoms on river floodplains; also, live oaks.
Agelaius tricolor tricolored blackbird	None/ST G2G3/S1S2	Highly colonial species, most numerous in Central Valley & vicinity. Largely endemic to California. Requires open water, protected nesting substrate, and foraging area with insect prey within a few km of the colony.
Aimophila ruficeps canescens southern California rufous-crowned sparrow	None/None G5T3/S3 CDFW_WL-Watch List	Resident in Southern California coastal sage scrub and sparse mixed chaparral. Frequents relatively steep, often rocky hillsides with grass and forb patches.
Ammodramus savannarum grasshopper sparrow	None/None G5/S3	Dense grasslands on rolling hills, lowland plains, in valleys and on hillsides on lower mountain slopes. Favors native grasslands with a mix of grasses, forbs and scattered shrubs. Loosely colonial when nesting.
Aquila chrysaetos golden eagle	None/None G5/S3	Rolling foothills, mountain areas, sage-juniper flats, and desert. Cliff-walled canyons provide nesting habitat in most parts of range; also, large trees in open areas.
Ardea alba great egret	None/None G5/S4	Colonial nester in large trees. Rookery sites located near marshes, tide-flats, irrigated pastures, and margins of rivers and lakes.

Scientific Name Common Name	Status	Habitat Requirements
Ardea herodias great blue heron	None/None G5/S4	Colonial nester in tall trees, cliffsides, and sequestered spots on marshes. Rookery sites in close proximity to foraging areas: marshes, lake margins, tide-flats, rivers and streams, wet meadows.
Artemisiospiza belli belli Bell's sage sparrow	None/None G5T2T3/S3	Nests in chaparral dominated by fairly dense stands of chamise. Found in coastal sage scrub in south of range. Nest located on the ground beneath a shrub or in a shrub 6-18 inches above ground. Territories about 50 yds apart.
Artemisiospiza belli clementeae San Clemente sage sparrow	FT/None G5T1Q/S1	Resident of dry brushlands of San Clemente Island. Inhabits scrubby brush on mesas, thorny brush growing in clumps and patches interspersed with cactus.
Asio flammeus short-eared owl	None/None G5/S3	Found in swamp lands, both fresh and salt; lowland meadows; irrigated alfalfa fields. Tule patches/tall grass needed for nesting/daytime seclusion. Nests on dry ground in depression concealed in vegetation.
Asio otus long-eared owl	None/None G5/S3?	Riparian bottomlands grown to tall willows and cottonwoods; also, belts of live oak paralleling stream courses. Require adjacent open land, productive of mice and the presence of old nests of crows, hawks, or magpies for breeding.
Athene cunicularia burrowing owl	None/None G4/S3	Open, dry annual or perennial grasslands, deserts, and scrublands characterized by low-growing vegetation. Subterranean nester, dependent upon burrowing mammals, most notably, the California ground squirrel.
Baeolophus inornatus oak titmouse	None/None G4/S4	Oak woodlands. Cavity nester
Buteo regalis ferruginous hawk	None/None G4/S3S4	Open grasslands, sagebrush flats, desert scrub, low foothills and fringes of pinyon and juniper habitats. Eats mostly lagomorphs, ground squirrels, and mice. Population trends may follow lagomorph population cycles.
Buteo swainsoni Swainson's hawk	None/ST G5/S3	Breeds in grasslands with scattered trees, juniper-sage flats, riparian areas, savannahs, & agricultural or ranch lands with groves or lines of trees. Requires adjacent suitable foraging areas such as grasslands, or alfalfa or grain fields supporting rodent populations.
Campylorhynchus brunneicapillus sandiegensis coastal cactus wren	None/None G5T3Q/S3	Southern California coastal sage scrub. Wrens require tall opuntia cactus for nesting and roosting.
Cardinalis cardinalis northern cardinal	None/None G5/S1	Extremely rare resident along the Colorado River. Dense, brushy river bottom thickets, well-vegetated dry washes and dense desert scrub.
Charadrius alexandrinus nivosus western snowy plover	FT/None G3T3/S2S3	Sandy beaches, salt pond levees & shores of large alkali lakes. Needs sandy, gravelly or friable soils for nesting.
Charadrius montanus mountain plover	None/None G3/S2S3	Short grasslands, freshly plowed fields, newly sprouting grain fields, & sometimes sod farms. Short vegetation, bare ground, and flat topography. Prefers grazed areas and areas with burrowing rodents.
Circus hudsonius northern harrier	None/None G5/S3	Coastal salt & freshwater marsh. Nest and forage in grasslands, from salt grass in desert sink to mountain cienagas. Nests on ground in shrubby vegetation, usually at marsh edge; nest built of a large mound of sticks in wet areas.
Coccyzus americanus occidentalis western yellow-billed cuckoo	FT/SE G5T2T3/S1	Riparian forest nester, along the broad, lower flood-bottoms of larger river systems. Nests in riparian jungles of willow, often mixed with cottonwoods, with lower story of blackberry, nettles, or wild grape.

Scientific Name Common Name	Status	Habitat Requirements
Colaptes chrysoides gilded flicker	None/SE G5/S1	Sonoran desert habitat and riparian woodlands along the Colorado River. Uses willows, cottonwood, tree yucca and, when available, saguaro cactus.
Coturnicops noveboracensis yellow rail	None/None G4/S1S2	Summer resident in eastern Sierra Nevada in Mono County. Freshwater marshlands.
Cypseloides niger black swift	None/None G4/S2	Coastal belt of Santa Cruz and Monterey counties; central & southern Sierra Nevada; San Bernardino & San Jacinto mountains. Breeds in small colonies on cliffs behind or adjacent to waterfalls in deep canyons and sea-bluffs above the surf; forages widely.
Dendragapus fuliginosus howardi Mount Pinos sooty grouse	None/None G5T2T3/S2S3 CDFW_SSC-Species of Special Concern	Inhabitant of southern Sierra Nevada mountains, in small islands of populations. Mainly inhabits white fir covered slopes. Also found in other conifer types and open, brushy areas adjacent to forest.
Egretta thula snowy egret	None/None G5/S4	Colonial nester, with nest sites situated in protected beds of dense tules. Rookery sites situated close to foraging areas: marshes, tidal-flats, streams, wet meadows, and borders of lakes.
Elanus leucurus white-tailed kite	None/None G5/S3S4	Rolling foothills and valley margins with scattered oaks & river bottomlands or marshes next to deciduous woodland. Open grasslands, meadows, or marshes for foraging close to isolated, dense-topped trees for nesting and perching.
Empidonax traillii extimus southwestern willow flycatcher	FE/SE G5T2/S1	Riparian woodlands in Southern California.
Eremophila alpestris actia California horned lark	None/None G5T4Q/S4	Coastal regions, chiefly from Sonoma County to San Diego County. Also main part of San Joaquin Valley and east to foothills. Short-grass prairie, bald hills, mountain meadows, open coastal plains, fallow grain fields, alkali flats.
Falco columbarius merlin	None/None G5/S3S4	Seacoast, tidal estuaries, open woodlands, savannahs, edges of grasslands & deserts, farms & ranches. Clumps of trees or windbreaks are required for roosting in open country.
Falco mexicanus prairie falcon	None/None G5/S4	Inhabits dry, open terrain, either level or hilly. Breeding sites located on cliffs. Forages far afield, even to marshlands and ocean shores.
Falco peregrinus anatum American peregrine falcon	FD/SD G4T4/S3S4	Near wetlands, lakes, rivers, or other water; on cliffs, banks, dunes, mounds; also, human-made structures. Nest consists of a scrape or a depression or ledge in an open site.
Gelochelidon nilotica gull-billed tern	None/None G5/S1	Only known breeding colonies at San Diego Bay and the Salton Sea. Nests on low, sandy islets. Known to feed on fishes at mouth of Colorado River and on grasshoppers in alfalfa fields.
Gymnogyps californianus California condor	FE/SE G1/S1	Require vast expanses of open savannah, grasslands, and foothill chaparral in mountain ranges of moderate altitude. Deep canyons containing clefts in the rocky walls provide nesting sites. Forages up to 100 miles from roost/nest.
Haliaeetus leucocephalus bald eagle	FD/SE G5/S3	Ocean shore, lake margins, and rivers for both nesting and wintering. Most nests within 1 mile of water. Nests in large, old-growth, or dominant live tree with open branches, especially ponderosa pine. Roosts communally in winter.
Icteria virens yellow-breasted chat	None/None G5/S3	Summer resident; inhabits riparian thickets of willow and other brushy tangles near watercourses. Nests in low, dense riparian, consisting of willow, blackberry, wild grape; forages and nests within 10 ft of ground.

Scientific Name Common Name	Status	Habitat Requirements
Ixobrychus exilis least bittern	None/None G4G5/S2	Colonial nester in marshlands and borders of ponds and reservoirs which provide ample cover. Nests usually placed low in tules, over water.
Junco hyemalis caniceps gray-headed junco	None/None G5T5/S1 CDFW_WL-Watch List	Summer resident of Clark Mountain (eastern San Bernardino County) and Grapevine Mountains (Inyo County). Inhabits white fir association at 7300 ft (Clark Mountain); also, from dense pinyons above 6700 ft (Grapevine Mountains).
Lanius ludovicianus loggerhead shrike	None/None G4/S4	Broken woodlands, savannah, pinyon-juniper, Joshua tree, and riparian woodlands, desert oases, scrub & washes. Prefers open country for hunting, with perches for scanning, and fairly dense shrubs and brush for nesting.
Lanius ludovicianus mearnsi San Clemente loggerhead shrike	FE/None G4T1Q/S1	Resident of San Clemente Island. Inhabits washes, ravines, and mesas, in vicinity of scattered tall bushes (toyon, wild cherry) or low thorny scrub or cactus.
Laterallus jamaicensis coturniculus California black rail	None/ST G3G4T1/S1	Inhabits freshwater marshes, wet meadows and shallow margins of saltwater marshes bordering larger bays. Needs water depths of about 1 inch that do not fluctuate during the year and dense vegetation for nesting habitat.
Melanerpes uropygialis Gila woodpecker	None/SE G5/S1	In California, inhabits cottonwoods and other desert riparian trees, shade trees, and date palms. Cavity nester in riparian trees or saguaro cactus.
Melospiza melodia song sparrow ("Modesto" population)	None/None G5/S3? CDFW_SSC-Species of Special Concern	Only in Sacramento Valley, Sacramento–San Joaquin River Delta, and northern San Joaquin Valley. Occurs in emergent freshwater marshes, riparian willow thickets, riparian forests of valley oak, and irrigation cannals and levees. Requires moderately dense vegetation to supply cover for nest sites.
Melospiza melodia graminea Channel Island song sparrow	None/None G5T1/S1	Only on San Miguel and Santa Rosa Islands. Need moderately dense scrubby vegetation for nesting, a water source & exposed ground for foraging.
Micrathene whitneyi elf owl	None/SE G5/S1	In California, nesting area limited to cottonwood-willow & mesquite riparian zone along the Colorado River. Nests in deserted woodpecker holes, often in larger trees which offer insulation from high daytime temperatures.
Myiarchus tyrannulus brown-crested flycatcher	None/None G5/S3	Inhabits desert riparian areas along the Colorado River, as well as other desert oases and riparian areas NW to Victorville. Requires riparian thickets, trees, snags, and shrubs for foraging perches, nesting cavities, and cover.
Nycticorax nycticorax black-crowned night heron	None/None G5/S4	Colonial nester, usually in trees, occasionally in tule patches. Rookery sites located adjacent to foraging areas: lake margins, mud-bordered bays, marshy spots.
Oceanodroma homochroa ashy storm-petrel	None/None G2/S2	Colonial nester on off-shore islands. Usually nests on driest part of islands. Forages over open ocean. Nest sites on islands are in crevices beneath loosely piled rocks or driftwood, or in caves.
Oreothlypis luciae Lucy's warbler	None/None G5/S2S3	Primarily along lower Colorado River Valley and the washes & arroyos emptying into it, with occasional occurrences throughout the Sonoran and Mojave deserts. Partial to thickets of mesquite, riparian scrub and even stands of tamarisk.
Oreothlypis virginiae Virginia's warbler	None/None G5/S2	East slope of Southern Sierra Nevada to San Bernardino Mountains. In arid, shrubby, mixed-conifer, pinyon-juniper, montane-chaparral. 7000-9000 ft. Nests on arid slopes with stands of tall shrubs/scattered trees; also, riparian thickets of willow/wild rose along streams.

Scientific Name Common Name	Status	Habitat Requirements
Pandion haliaetus osprey	None/None G5/S4	Ocean shore, bays, freshwater lakes, and larger streams. Large nests built in tree-tops within 15 miles of a good fish-producing body of water.
Passerculus sandwichensis beldingi Belding's savannah sparrow	None/SE G5T3/S3	Inhabits coastal salt marshes, from Santa Barbara south through San Diego County. Nests in Salicornia on and about margins of tidal flats.
Pelecanus occidentalis californicus California brown pelican	FD/SD G4T3T4/S3	Colonial nester on coastal islands just outside the surf line. Nests on coastal islands of small to moderate size which afford immunity from attack by ground-dwelling predators. Roosts communally.
Phalacrocorax auritus double-crested cormorant	None/None G5/S4	Colonial nester on coastal cliffs, offshore islands, and along lake margins in the interior of the state. Nests along coast on sequestered islets, usually on ground with sloping surface, or in tall trees along lake margins.
Piranga flava hepatic tanager	None/None G5/S1	White fir-pinyon forest on desert peaks, 5300-8100 ft elevation. Understory of xerophytic shrubs.
Piranga rubra summer tanager	None/None G5/S1	Summer resident of desert riparian along lower Colorado River, and locally elsewhere in California deserts. Requires cottonwood-willow riparian for nesting and foraging; prefers older, dense stands along streams.
Plegadis chihi white-faced ibis	None/None G5/S3S4	Shallow freshwater marsh. Dense tule thickets for nesting, interspersed with areas of shallow water for foraging.
Polioptila californica californica coastal California gnatcatcher	FT/None G4G5T2Q/S2	Obligate, permanent resident of coastal sage scrub below 2500 ft in Southern California. Low, coastal sage scrub in arid washes, on mesas and slopes. Not all areas classified as coastal sage scrub are occupied.
Polioptila melanura black-tailed gnatcatcher	None/None G5/S3S4	Primarily inhabits wooded desert wash habitats; also occurs in desert scrub habitat, especially in winter. Nests in desert washes containing mesquite, palo verde, ironwood, acacia; absent from areas where salt cedar introduced.
Progne subis purple martin	None/None G5/S3	Inhabits woodlands, low elevation coniferous forest of Douglas-fir, ponderosa pine, and Monterey pine. Nests in old woodpecker cavities mostly; also in human-made structures. Nest often located in tall, isolated tree/snag.
Psiloscops flammeolus flammulated owl	None/None G4/S2S4	Need montane forests with some understory brush for breeding. In California the breeding range is closely associated with the presence of ponderosa pine and Jeffery pine.
Pyrocephalus rubinus vermilion flycatcher	None/None G5/S2S3	During nesting, inhabits desert riparian adjacent to irrigated fields, irrigation ditches, pastures, and other open, mesic areas. Nest in cottonwood, willow, mesquite, and other large desert riparian trees.
Rallus obsoletus levipes light-footed Ridgway's rail	FE/SE G5T1T2/S1	Found in salt marshes traversed by tidal sloughs, where cordgrass and pickleweed are the dominant vegetation. Requires dense growth of either pickleweed or cordgrass for nesting or escape cover; feeds on molluscs and crustaceans.
Rallus obsoletus yumanensis Yuma Ridgway's rail	FE/ST G5T3/S1S2	Nests in freshwater marshes along the Colorado River and along the south and east ends of the Salton Sea. Prefers stands of cattails and tules dissected by narrow channels of flowing water; principle food is crayfish.
Riparia riparia bank swallow	None/ST G5/S2	Colonial nester; nests primarily in riparian and other lowland habitats west of the desert. Requires vertical banks/cliffs with fine-textured/sandy soils near streams, rivers, lakes, ocean to dig nesting hole.
Rynchops niger black skimmer	None/None G5/S2	Nests on gravel bars, low islets, and sandy beaches, in unvegetated sites. Nesting colonies usually less than 200 pairs.

Scientific Name Common Name	Status	Habitat Requirements
Setophaga petechia yellow warbler	None/None G5/S3S4	Riparian plant associations in close proximity to water. Also nests in montane shrubbery in open conifer forests in Cascades and Sierra Nevada. Frequently found nesting and foraging in willow shrubs and thickets, and in other riparian plants including cottonwoods, sycamores, ash, and alders.
Setophaga petechia sonorana Sonoran yellow warbler	None/None G5T2T3/S2	Summer resident of Colorado River Valley, in riparian deciduous habitat. Below 600 ft elevation. Inhabits cottonwoods and willows, particularly the crown foliage; nests in understory, usually 2-16 ft above ground.
Spinus lawrencei Lawrence's goldfinch	None/None G3G4/S3S4	Nests in open oak or other arid woodland and chaparral, near water. Nearby herbaceous habitats used for feeding. Closely associated with oaks.
Sternula antillarum browni California least tern	FE/SE G4T2T3Q/S2	Nests along the coast from San Francisco Bay south to northern Baja California. Colonial breeder on bare or sparsely vegetated, flat substrates: sand beaches, alkali flats, landfills, or paved areas.
Synthliboramphus scrippsi Scripps's murrelet	FC/ST G3/S2	Open ocean except during breeding season. Breeds on offshore islands in Southern California. Nests in rock crevices, under bushes, in old burrows and among man-made debris.
Toxostoma bendirei Bendire's thrasher	None/None G4G5/S3	Migratory; local spring/summer resident in flat areas of desert succulent shrub/Joshua tree habitats in Mojave Desert. Nests in cholla, yucca, palo verde, thorny shrub, or small tree, usually 0.5 to 20 feet above ground.
Toxostoma crissale Crissal thrasher	None/None G5/S3	Resident of southeastern deserts in desert riparian and desert wash habitats. Nests in dense vegetation along streams/washes; mesquite, screwbean mesquite, ironwood, catclaw, acacia, arrowweed, willow.
Toxostoma lecontei Le Conte's thrasher	None/None G4/S3	Desert resident; primarily of open desert wash, desert scrub, alkali desert scrub, and desert succulent scrub habitats. Commonly nests in a dense, spiny shrub or densely branched cactus in desert wash habitat, usually 2-8 feet above ground.
Vireo bellii arizonae Arizona bell's vireo	None/SE G5T4/S1S2	Summer resident along Colorado River. Chiefly inhabits willow thickets with undergrowth of Baccharis glutinosa. Nests in willow, mesquite, or other small tree/shrub, within 8 ft (usually 2-3 ft) of ground.
Vireo bellii pusillus least Bell's vireo	FE/SE G5T2/S2	Summer resident of Southern California in low riparian in vicinity of water or in dry river bottoms; below 2000 ft. Nests placed along margins of bushes or on twigs projecting into pathways, usually willow, Baccharis, mesquite.
Vireo vicinior gray vireo	None/None G4/S2	Dry chaparral; west of desert, in chamise-dominated habitat; mountains of Mojave Desert, associated with juniper & Artemisia. Forage, nest, and sing in areas formed by a continuous growth of twigs, 1-5 ft above ground.
Xanthocephalus xanthocephalus yellow-headed blackbird	None/None G5/S3	Nests in freshwater emergent wetlands with dense vegetation and deep water. Often along borders of lakes or ponds. Nests only where large insects such as Odonata are abundant, nesting timed with maximum emergence of aquatic insects.

Scientific Name Common Name	Status	Habitat Requirements
Mammals		
Ammospermophilus nelsoni Nelson's antelope squirrel	None/ST G2/S2S3	Western San Joaquin Valley from 200-1200 ft elev. On dry, sparsely vegetated loam soils. Dig burrows or use k-rat burrows. Need widely scattered shrubs, forbs and grasses in broken terrain with gullies and washes.
Antrozous pallidus pallid bat	None/None G5/S3	Deserts, grasslands, shrublands, woodlands and forests. Most common in open, dry habitats with rocky areas for roosting. Roosts must protect bats from high temperatures. Very sensitive to disturbance of roosting sites.
Arctocephalus townsendi Guadalupe fur-seal	FT/ST G1/S1	Breeds on Isla de Guadalupe off of Mexico, occasionally found on San Miguel, San Nicolas, and San Clemente islands. Prefers shallow, nearshore island water, with cool and sheltered rocky areas for haul-outs.
Canis lupus gray wolf	FE/SE G4/S1	Habitat generalists, historically occupying diverse habitats including tundra, forests, grasslands, and deserts. Primary habitat requirements are the presence of adequate ungulate prey, water, and low human contact.
Chaetodipus californicus femoralis Dulzura pocket mouse	None/None G5T3/S3 CDFW_SSC-Species of Special Concern	Variety of habitats including coastal scrub, chaparral & grassland in San Diego County. Attracted to grass-chaparral edges.
Chaetodipus fallax fallax northwestern San Diego pocket mouse	None/None G5T3T4/S3S4 CDFW_SSC-Species of Special Concern	Coastal scrub, chaparral, grasslands, sagebrush, etc. in western San Diego County. Sandy, herbaceous areas, usually in association with rocks or coarse gravel.
Chaetodipus fallax pallidus pallid San Diego pocket mouse	None/None G5T34/S3S4 CDFW_SSC-Species of Special Concern	Desert border areas in eastern San Diego County in desert wash, desert scrub, desert succulent scrub, pinyon-juniper, etc. Sandy, herbaceous areas, usually in association with rocks or coarse gravel.
Choeronycteris mexicana Mexican long-tongued bat	None/None G4/S1	Occasionally found in San Diego County, which is on the periphery of their range. Feeds on nectar and pollen of night-blooming succulents. Roosts in relatively well-lit caves, and in and around buildings.
Corynorhinus townsendii Townsend's big-eared bat	None/None G3G4/S2	Throughout California in a wide variety of habitats. Most common in mesic sites. Roosts in the open, hanging from walls and ceilings. Roosting sites limiting. Extremely sensitive to human disturbance.
Dipodomys merriami collinus Earthquake Merriam's kangaroo rat	None/None G5T2?/S1S2	Known only from San Diego & Riverside Co. Associated with riversidean sage scrub, chaparral, & non-native grassland. Need sandy loam substrates for digging of burrows.
Dipodomys merriami parvus San Bernardino kangaroo rat	FE/SCE G5T1/S1 CDFW_SSC-Species of Special Concern	Alluvial scrub vegetation on sandy loam substrates characteristic of alluvial fans and flood plains. Needs early to intermediate seral stages.
Dipodomys stephensi Stephens' kangaroo rat	FE/ST G2/S2	Primarily annual & perennial grasslands, but also occurs in coastal scrub & sagebrush with sparse canopy cover. Prefers buckwheat, chamise, brome grass and filaree. Will burrow into firm soil.
Enhydra lutris nereis southern sea otter	FT/None G4T2/S2	Nearshore marine environments from about Ano Nuevo, San Mateo Co. to Point Sal, Santa Barbara Co. Needs canopies of giant kelp & bull kelp for rafting & feeding. Prefers rocky substrates with abundant invertebrates.

Scientific Name Common Name	Status	Habitat Requirements
Erethizon dorsatum North American porcupine	None/None G5/S3	Forested habitats in the Sierra Nevada, Cascade, and Coast ranges, with scattered observations from forested areas in the Transverse Ranges. Wide variety of coniferous and mixed woodland habitat.
Euderma maculatum spotted bat	None/None G4/S3	Occupies a wide variety of habitats from arid deserts and grasslands through mixed conifer forests. Feeds over water and along washes. Feeds almost entirely on moths. Needs rock crevices in cliffs or caves for roosting.
Eumops perotis californicus western mastiff bat	None/None G5T4/S3S4	Many open, semi-arid to arid habitats, including conifer & deciduous woodlands, coastal scrub, grasslands, chaparral, etc. Roosts in crevices in cliff faces, high buildings, trees and tunnels.
Glaucomys oregonensis californicus San Bernardino flying squirrel	None/None G5T1T2/S1S2	Known from black oak or white fir dominated woodlands between 5200 - 8500 ft in the San Bernardino and San Jacinto ranges. May be extirpated from San Jacinto range. Needs cavities in trees/snags for nests and cover. Needs nearby water.
Lasionycteris noctivagans silver-haired bat	None/None G5/S3S4	Primarily a coastal and montane forest dweller, feeding over streams, ponds & open brushy areas. Roosts in hollow trees, beneath exfoliating bark, abandoned woodpecker holes, and rarely under rocks. Needs drinking water.
Lasiurus blossevillii western red bat	None/None G5/S3	Roosts primarily in trees, 2-40 ft above ground, from sea level up through mixed conifer forests. Prefers habitat edges and mosaics with trees that are protected from above and open below with open areas for foraging.
Lasiurus cinereus hoary bat	None/None G5/S4	Prefers open habitats or habitat mosaics, with access to trees for cover and open areas or habitat edges for feeding. Roosts in dense foliage of medium to large trees. Feeds primarily on moths. Requires water.
Lasiurus xanthinus western yellow bat	None/None G5/S3	Found in valley foothill riparian, desert riparian, desert wash, and palm oasis habitats. Roosts in trees, particularly palms. Forages over water and among trees.
Leptonycteris yerbabuenae lesser long-nosed bat	FD/None G4/S1	Arid regions such as desert grasslands and shrub land. Suitable day roosts (caves & mines) and suitable concentrations of food plants (columnar cacti & agaves) are critical resources. No maternity roosts known from California; may only be vagrant. Caves and mines are used as day roosts. Caves, mines, rock crevices, trees and shrubs, and abandoned buildings are used as night roosts for digesting meals. Nectar, pollen, and fruit eating bat; primarily feeding on agaves, saguaro, and organ pipe cactus.
Lepus californicus bennettii San Diego black-tailed jackrabbit	None/None G5T3T4/S3S4 CDFW_SSC-Species of Special Concern	Intermediate canopy stages of shrub habitats & open shrub/herbaceous & tree/herbaceous edges. Coastal sage scrub habitats in Southern California.
Lontra canadensis sonora southwestern river otter	None/None G5T1/S1 CDFW_SSC-Species of Special Concern	Aquatic habitats along the Colorado River. Needs abundant food sources and sufficient water for shelter and foraging.
Macrotus californicus California leaf-nosed bat	None/None G4/S3	Desert riparian, desert wash, desert scrub, desert succulent scrub, alkali scrub and palm oasis habitats. Needs rocky, rugged terrain with mines or caves for roosting.

Scientific Name Common Name	Status	Habitat Requirements
Microtus californicus mohavensis Mohave river vole	None/None G5T1/S1 CDFW_SSC-Species of Special Concern	Occurs only in weedy herbaceous growth in wet areas along the Mojave River. May be found in some irrigated pastures. Burrows into soft soil. Feeds on leafy parts of grasses, sedges and herbs. Clips grasses to form runways from burrow.
Microtus californicus stephensi south coast marsh vole	None/None G5T1T2/S1S2 CDFW_SSC-Species of Special Concern	Tidal marshes in Los Angeles, Orange and southern Ventura counties.
Myotis ciliolabrum western small-footed myotis	None/None G5/S3	Wide range of habitats mostly arid wooded & brushy uplands near water. Seeks cover in caves, buildings, mines, and crevices. Prefers open stands in forests and woodlands. Requires drinking water. Feeds on a wide variety of small flying insects.
Myotis evotis long-eared myotis	None/None G5/S3	Found in all brush, woodland and forest habitats from sea level to about 9000 ft. Prefers coniferous woodlands and forests. Nursery colonies in buildings, crevices, spaces under bark, and snags. Caves used primarily as night roosts.
Myotis occultus Arizona Myotis	None/None G4/S1	Lowlands of the Colorado River and adjacent desert mountain ranges. Needs roosting areas in tree hollows, rock crevices, under bridges, etc.
Myotis thysanodes fringed myotis	None/None G4/S3	In a wide variety of habitats, optimal habitats are pinyon-juniper, valley foothill hardwood & hardwood-conifer. Uses caves, mines, buildings or crevices for maternity colonies and roosts.
Myotis velifer cave myotis	None/None G5/S1	Lowlands of the Colorado River and adjacent mountain ranges. Require caves or mines for roosting.
Myotis volans long-legged myotis	None/None G5/S3	Most common in woodland and forest habitats above 4000 ft. Trees are important day roosts; caves and mines are night roosts. Nursery colonies usually under bark or in hollow trees, but occasionally in crevices or buildings.
Myotis yumanensis Yuma myotis	None/None G5/S4	Optimal habitats are open forests and woodlands with sources of water over which to feed. Distribution is closely tied to bodies of water. Maternity colonies in caves, mines, buildings or crevices.
Neotamias panamintinus acrus Kingston Mountain chipmunk	None/None G4T1T2/S1S2	Arid pinyon-juniper woodlands in the Kingston Mountains of northeastern San Bernardino County. Occupies nests among rocks in fissured cliffs and ledges.
Neotamias speciosus callipeplus Mount Pinos chipmunk	None/None G4T1T2/S2	Open forests with a mix of shrubs and trees on the upper slopes and summit of Mt. Abel and Mt. Frazier. Arboreal habits - rarely ventures far from tree cover.
Neotamias speciosus speciosus lodgepole chipmunk	None/None G4T2T3/S2S3	Summits of isolated Piute, San Bernardino, & San Jacinto mountains. Usually found in open-canopy forests. Habitat is usually lodgepole pine forests in the San Bernardino Mts & chinquapin slopes in the San Jacinto Mts.
Neotoma albigula venusta Colorado Valley woodrat	None/None G5T3T4/S1S2	Low-lying desert areas in southeastern California. Closely associated with beaver-tail cactus & mesquite. Intolerant of cold temps. Eats mainly succulent plants. Distribution influenced by abundance of nest building material
Neotoma lepida intermedia San Diego desert woodrat	None/None G5T3T4/S3S4 CDFW_SSC-Species of Special Concern	Coastal scrub of Southern California from San Diego County to San Luis Obispo County. Moderate to dense canopies preferred. They are particularly abundant in rock outcrops, rocky cliffs, and slopes.

Scientific Name Common Name	Status	Habitat Requirements
Nyctinomops femorosaccus pocketed free-tailed bat	None/None G4/S3	Variety of arid areas in Southern California; pine-juniper woodlands, desert scrub, palm oasis, desert wash, desert riparian, etc. Rocky areas with high cliffs.
Nyctinomops macrotis big free-tailed bat	None/None G5/S3	Low-lying arid areas in Southern California. Need high cliffs or rocky outcrops for roosting sites. Feeds principally on large moths.
Onychomys torridus ramona southern grasshopper mouse	None/None G5T3/S3 CDFW_SSC-Species of Special Concern	Desert areas, especially scrub habitats with friable soils for digging. Prefers low to moderate shrub cover. Feeds almost exclusively on arthropods, especially scorpions and orthopteran insects.
Ovis canadensis nelsoni desert bighorn sheep	None/None G4T4/S3	Widely distributed from the White Mtns in Mono Co. to the Chocolate Mts in Imperial Co. Open, rocky, steep areas with available water and herbaceous forage.
Ovis canadensis nelsoni pop. 2 Peninsular bighorn sheep DPS	FE/ST G4T3Q/S1	Eastern slopes of the Peninsular Ranges below 4,600 ft elevation. This DPS of the subspecies inhabits the Peninsular Ranges in southern California from the San Jacinto Mountains south to the US-Mexico International Border. Optimal habitat includes steep walled canyons and ridges bisected by rocky or sandy washes, with available water.
Perognathus alticola alticola white-eared pocket mouse	None/None G1G2TH/SH	Ponderosa and Jeffrey pine habitats; also in mixed chaparral and sagebrush habitats in the San Bernardino Mountains. Burrows are constructed in loose soil.
Perognathus alticola inexpectatus Tehachapi pocket mouse	None/None G1G2T1T2/S1S2	Arid annual grassland and desert shrub communities, but also taken in fallow grain fields and in Russian thistle. Burrows for cover and nesting. Aestivates and hibernates during extreme weather. Forages on open ground and under shrubs.
Perognathus inornatus San Joaquin Pocket Mouse	None/None G2G3/S2S3	Grassland, oak savanna and arid scrubland in the southern Sacramento Valley, Salinas Valley, San Joaquin Valley and adjacent foothills, south to the Mojave Desert. Associated with fine-textured, sandy, friable soils.
Perognathus longimembris bangsi Palm Springs pocket mouse	None/None G5T2/S2	Desert riparian, desert scrub, desert wash and sagebrush habitats. Most common in creosote-dominated desert scrub. Rarely found on rocky sites. Occurs in all canopy coverage classes.
Perognathus longimembris brevinasus Los Angeles pocket mouse	None/None G5T1T2/S1S2 CDFW_SSC-Species of Special Concern	Lower elevation grasslands and coastal sage communities in and around the Los Angeles Basin. Open ground with fine, sandy soils. May not dig extensive burrows, hiding under weeds and dead leaves instead.
Perognathus longimembris internationalis Jacumba pocket mouse	None/None G5T2T3/S2 CDFW_SSC-Species of Special Concern	Desert riparian, desert scrub, desert wash, coastal scrub and sagebrush. Rarely found on rocky sites; uses all canopy coverages.
Perognathus longimembris pacificus Pacific pocket mouse	FE/None G5T1/S1 CDFW_SSC-Species of Special Concern	Inhabits the narrow coastal plains from the Mexican border north to El Segundo, Los Angeles County. Seems to prefer soils of fine alluvial sands near the ocean, but much remains to be learned.
Peromyscus maniculatus anacapae Anacapa Island deer mouse	None/None G5T1T2/S1S2 CDFW_SSC-Species of Special Concern	Restricted to East, Middle & West Anacapa islands. Live in all terrestrial habitats & also forage in the intertidal zone.

Scientific Name Common Name	Status	Habitat Requirements
Sigmodon arizonae plenus Colorado River cotton rat	None/None G5T2T3/S1S2 CDFW_SSC-Species of Special Concern	Colorado River floodplain from the Nevada border to about Bard. Distribution is spotty. Isolated sections of alluvial bottom along the Colorado River in areas supporting sedges, rushes, and other marsh plants.
Sorex ornatus salicornicus southern California saltmarsh shrew	None/None G5T1?/S1 CDFW_SSC-Species of Special Concern	Coastal marshes in Los Angeles, Orange and Ventura counties. Requires dense vegetation and woody debris for cover.
Sorex ornatus willetti Santa Catalina shrew	None/None G5T1/S1 CDFW_SSC-Species of Special Concern	Santa Catalina Island. Larger stream-bearing canyons of valley foothill riparian. Prefers moist areas. Uses stumps, logs, and litter for cover.
Taxidea taxus American badger	None/None G5/S3	Most abundant in drier open stages of most shrub, forest, and herbaceous habitats, with friable soils. Needs sufficient food, friable soils and open, uncultivated ground. Preys on burrowing rodents. Digs burrows.
Urocyon littoralis catalinae Santa Catalina Island fox	FT/ST G1T1/S1	Found only on Santa Catalina Island. Mixed chaparral, coastal scrub and shrubby woodland. Prefers more complex, layered vegetation with a high density of woody, perennial fruiting shrubs, and rocky places for cover.
Urocyon littoralis clementae San Clemente Island fox	None/ST G1T1/S1	Found only on San Clemente Island. Mixed chaparral, coastal scrub & shrubby woodland. Prefers more complex, layered vegetation with a high density of woody, perennial fruiting shrubs, & rocky places for cover.
Urocyon littoralis dickeyi San Nicolas Island fox	None/ST G1T1/S1	Found only on San Nicolas Island. Mixed chaparral, coastal scrub & shrubby woodland. Prefers more complex, layered vegetation with a high density of woody, perennial fruiting shrubs, & rocky places for cover.
Xerospermophilus mohavensis Mohave ground squirrel	None/ST G2G3/S2S3	Open desert scrub, alkali scrub & Joshua tree woodland. Also feeds in annual grasslands. Restricted to Mojave Desert. Prefers sandy to gravelly soils, avoids rocky areas. Uses burrows at base of shrubs for cover. Nests are in burrows.
Xerospermophilus tereticaudus chlorus Palm Springs round-tailed ground squirrel	None/None G5T2Q/S2	Restricted to the Coachella Valley. Prefers desert succulent scrub, desert wash, desert scrub, alkali scrub, and levees. Prefers open, flat, grassy areas in fine-textured, sandy soil. Density correlated with winter rainfall.

1 Cultural Resources Background

1.1 Pre-Contact History

Colorado Desert/Southern Mojave Desert

The first recognizable human use of the Colorado Desert was by highly mobile hunter-gatherers at the end of the Pleistocene Epoch, between 12,000 and 10,000 years ago. The settlement patterns of the Late Pleistocene and Early Holocene inhabitants suggest that they preferred to live along the shores of prehistoric lakes and on mesas near perennial washes (Schaefer and Laylander 2007). The San Dieguito complex during the Paleoindian Period (10,000 – 5000 BCE) is characterized entirely by sites with flaked stone tools such as choppers, scrapers, blades, projectile points and distinctive crescent-shaped items interpreted as amulets found around now-dry inland lakes, old desert terraces, and notably Ventana Cave in southern Arizona (Rogers 1939, 1966; Warren 1967). If the Lake Mojave and San Dieguito complexes are contemporaneous, then this highly mobile, hunting-focused use of the land ended early in the Holocene as ancient pluvial lakes contracted and large mammals became scarce.

Although evidence of occupation of the Colorado Desert during the Archaic Period (5000 BCE – 500 CE) is scarce, developments during this time can be inferred from the development trajectories of adjacent areas. Regional culture complexes of this time are defined by distinct projectile point types. The Colorado Desert falls into the Pinto Complex during the early Archaic ca. 5000 – 1500 BCE. (Crabtree 1980; Rogers 1939), then the Amargosa complex during the later Archaic ca. 1500 BCE – 500 CE (Rogers 1939; Rogers 1966). Few open-air sites date to the Archaic. Rockshelter deposits at Indian Hill Rockshelter in Anza-Borrego Desert State Park and at Tahquitz Canyon near Palm Springs contain dart-sized projectile points, ground stone implements, rock-lined cache pits, and non-cremated inhumations (McDonald 1992; Wilke et al. 1986; Schaefer 1994b). The materials at the rockshelter sites and others outside of the Colorado Desert suggest that the Archaic period inhabitants of southern California were a mobile and diversified group of hunters and gatherers who exploited seasonally variable resources and focused increasingly on processing and storing seed and nut foods (Schaefer 1994b).

The Late Prehistoric/Protohistoric Period consists of the Patayan complex and dates from approximately 500 CE until the American expansion into the area at the turn of the nineteenth century. The Patayan complex is characterized by marked changes in the artifact assemblage, economic system, and settlement patterns of the region. This included the introduction of paddle-and-anvil pottery, either from Mexico or from the Ancestral Pueblo groups of the United States Southwest (Rogers 1945; Schaefer 2003; Schroeder 1975, 1979); floodplain horticulture, featuring maize, beans, squash, and other crops; bow-and-arrow technology, possibly from desert hunter-gatherer groups moving in from the west and north; smaller, arrow-sized projectile point types of the Cottonwood Triangular and Desert Side-notched series are common; new burial cremations and partial cremations; artistic expression on rock (petroglyphs) and land (intaglios); expanding trade and trail networks; and increasingly elaborate kinship systems tying together extensive territories (McGuire and Schiffer 1982). It is likely warfare also increased at this time and was well documented in the Protohistoric and Historical periods. By all accounts, most of the archaeological materials in the Colorado Desert date to the Late Prehistoric and Protohistoric

periods (e.g., Rogers 1945; Schaefer 1994b, 2003). Most sites in the area consist of ceramic sherds and a limited variety of stone tools and tool-making debris.

Coastal and Inland Southern California

The prehistoric chronological sequence for southern California presented here is a composite based on Wallace (1955) and Warren (1968) as well as later studies, including Koerper and Drover (1983). This sequence is broken into three horizons. Early Man Horizon (10,000 – 6000 BCE) sites are generally associated with a greater emphasis on hunting than later horizons. Recent data indicate that the Early Man economy was a diverse mixture of hunting and gathering, including a significant focus on aquatic resources in coastal areas (e.g., Jones et al. 2002) and on inland Pleistocene lakeshores (Moratto 1984). Numerous pre-8000 BCE sites have been identified along the mainland coast and Channel Islands of southern California (c.f., Erlandson 1991; Johnson et al. 2002; Jones and Klar 2007; Moratto 1984; Rick et al. 2001:609). One of them, the Arlington Springs site on Santa Rosa Island, produced human femurs dating to approximately 13,000 years ago (Arnold et al. 2004; Johnson et al. 2002). On nearby San Miguel Island, human occupation at Daisy Cave (SMI-261) has been dated to nearly 12,000 years ago (Arnold et al. 2004). A warm and dry 3,000-year period called the Altithermal began around 6000 BCE. The conditions of the Altithermal are likely responsible for the change in human subsistence patterns during Early Man Horizon, including a greater emphasis on plant foods and small game.

The Milling Stone Horizon (6000 – 3000 BCE) showed an increase in use of milling stone and other processing tools (Wallace 1955). The dominance of such artifact types indicates subsistence relied heavily on collecting plant foods and hunting small terrestrial and littoral animals (Kowta 1969). Lithic artifacts associated with Milling Stone Horizon sites are dominated by locally available tool stone and ground stone tools, such as manos and metates, chopping, scraping, and cutting tools are very common. The mortar and pestle, associated with acorns or other foods processed through pounding, were first used during the Milling Stone Horizon and increased dramatically in later periods (Wallace 1955, 1978; Warren 1968). Wallace (1955) notes a decrease in well-made projectile points and an increase of burials with rock cairns also occurred during this horizon.

The Intermediate Horizon (3000 BCE – 500 CE) is characterized by a shift toward a hunting and maritime subsistence strategy, as well as greater use of plant foods and adaptation to local resources. Tool kits for hunting, fishing, and processing food and materials reflect this increased diversity, with flake scrapers, drills, various projectile points, and shell fishhooks being manufactured. Mortars and pestles became more common during this transitional period, gradually replacing manos and metates as the dominant milling equipment. Many archaeologists believe this change in milling stones signals a change from the processing and consuming of hard seed resources to the increasing reliance on acorn (e.g., Glassow et al. 1988). Mortuary practices during the Intermediate typically included fully flexed burials oriented toward the north or west (Warren 1968).

The Late Prehistoric Horizon (500 CE – Historic Contact) had an increase in the diversity of plant food resources and land and sea mammal hunting. More classes of artifacts were observed during this period and high quality exotic lithic materials were used for small, finely worked projectile points associated with the bow and arrow. Steatite containers were made for cooking and storage and an increased use of asphalt for waterproofing is noted. More artistic artifacts were recovered from Late Prehistoric sites, and cremation became a common mortuary custom. Larger, more permanent villages supported an increased population size and social structure (Wallace 1955).

Southern Central Coast

Chronological sequence for the southern central coast is separated into three distinct time periods: the Early Holocene, the Middle Holocene, and the Late Holocene. Evidence of Paleo-Indian occupation of southern California remains very limited during the Early Holocene (9600 – 5600 BCE). Approximately 75 sites on the southern and central California coast are known that date to 7500 BCE (Erlandson and Colten 1991). The earliest accepted dates for human occupation of the California coast are from the Northern Channel Islands, off the Santa Barbara coast. Daisy Cave, located on San Miguel Island, dates to as early as 9600 BCE (Erlandson et al. 1996). At the Arlington Springs site on Santa Rosa Island human remains yielded a date of approximately 10,000 BCE (Johnson et al. 2002). San Diego and Orange counties and the Southern Channel Islands have not produced dates as early as these. However, radiocarbon evidence has dated early occupation of the coastal region between ca. 8000 and 7000 BCE (Byrd and Raab 2007). Leaf-shaped points and knives, crescents, and scrapers characterize the artifact assemblages throughout the region (Byrd and Raab 2007).

The Middle Holocene (5600 – 1650 BCE) is generally viewed as a time of cultural transition. During this time, the cultural adaptations of the Early Holocene gradually altered. Use of milling stone tools began to appear across most of central and southern California around 6000 – 5000 BCE, indicating a focus on the collection and processing of hard-shelled seeds. Environmental changes in the Southern Bight are thought to have been the key factor in these changing adaptations (Byrd and Raab 2007). Occupation patterns indicated semi-sedentary populations focused on bays and estuaries, with shellfish and plant resources as the most important dietary components (Warren 1968). Sometime around 2000 BCE, extensive estuarine silting began to cause a decline in shellfish and thus a depopulation of the coastal zone. Settlement shifted to river valleys, and resource exploitation focused on hunting small game and gathering plant resources (Warren 1968; Byrd and Raab 2007).

The Late Holocene (1650 BCE – 1769 CE) witnessed numerous cultural adaptations. The bow and arrow were adopted sometime after 500 CE, and ceramics appeared in the area circa 1000 CE. Populations were sustained by food surpluses, especially acorns (Byrd and Raab 2007; Kroeber 1925). Other exploited food resources include shellfish, fish, small terrestrial mammals, and small-seeded plants. Settlement patterns of the Late Holocene are characterized by large residential camps linked to smaller specialized camps for resource procurement (Byrd and Raab 2007).

Sacramento-San Joaquin River Delta

California prehistory in the Sacramento-San Joaquin River Delta (Central Valley) is generally divided into three broad time periods: Paleoindian period (ca. 11,550 – 8550 BCE), Archaic Period (8550 BCE – 1100 CE) and Emergent Occupation (1000 CE – European Contact) (Fredrickson 1973, 1994; Moratto 1984; Rosenthal et al. 2007).

Little is known about the Paleoindian period (11,550 – 8550 BCE) in the Central Valley. Geoarchaeological studies have demonstrated that erosion and deposition have likely buried or destroyed early archaeological deposits. The only known Paleoindian site in the Sacramento Valley is a single possible fluted point from near Thomes Creek (Rosenthal et al. 2007).

The Archaic period (8550 BCE – 1100 CE) breaks into three subsections: lower, middle, and upper. The Lower Archaic (8550 – 5550 BCE), like the Paleoindian Period, is represented only by limited isolated finds. No other Lower Archaic sites have been identified within the Sacramento Valley.

The Middle Archaic (5550 – 550 BCE) began with substantial climate change to much warmer, drier conditions. The late Middle Archaic is relatively well-represented in the Sacramento Valley and Delta. Late Middle Archaic sites typically include extended burials oriented to the west and more sophisticated technology, including: fishing technologies, such as bone gorges, hooks, and spears; the mortar and pestle, which become more widespread suggesting a shift toward intensive subsistence practices; baked-clay impressions of twined basketry, simple pottery, and other baked clay; and personal adornment items (Rosenthal et al. 2007). Trade with outside groups is evidenced by the presence of obsidian, shell beads, and ornaments (Rosenthal et al. 2007; Moratto 1984).

The Upper Archaic (550 BCE – 1100 CE) began with the onset of the Late Holocene, marked by a cooler, wetter climate. Cultural diversity was more pronounced and is marked by contrasting material cultures throughout the valley (Rosenthal et al. 2007). Numerous specialized technologies were developed such as bone tools and implements, manufactured goods such as *Olivella* and *Haliotis* beads and ornaments, well-made ceremonial blades, and ground-stone plummets. Beginning after circa 2,700 years ago, lower Sacramento Valley settlements shifted to a pattern of large, mounded villages, now identified as the Berkeley Pattern, which typically contain large amounts of habitation debris and features suggestive of long-term occupation (Rosenthal et al. 2007).

The stable climatic conditions of the Upper Archaic continued into the Emergent Period (1100 CE – Historic). After 1000 CE, many of the technologies identified during the Archaic disappeared to be replaced by cultural traditions recorded at European contact. The bow and arrow replaced the atlatl as the preferred hunting method sometime between 1000 and 1300 CE. Increased social complexity is evidenced by increased variation in burial types and offerings such as shell beads, ornaments, and ritually "killed" mortars and pestles. Pottery was produced at several sites in the lower Sacramento Valley, known as Cosumnes brownware, including baked clay human and animal effigies. New fishing technology like harpoons, fishhooks, gorges, and netting suggest an increased reliance on fishing for subsistence and economy. After circa 1000 CE, the mortar and pestle become the dominant tool type and small seeds increase in archaeological deposits over time (Rosenthal et al. 2007).

1.2 Post-Contact Historic Overview

The Post-European contact history of California is generally divided into three periods: the Spanish Period (1769 – 1822), the Mexican Period (1822 – 1848), and the American Period (1848 – present). Each of these periods is briefly described below.

Spanish Period (1769 – 1822)

Spanish exploration of what was then known as Alta (upper) California began when Juan Rodríguez Cabrillo led the first European expedition into the region in 1542. For more than 200 years after his initial expedition, Spanish, Portuguese, British, and Russian explorers sailed the Alta California coast and made limited inland expeditions, but they did not establish permanent settlements (Bean 1968: 16-21; Rolle 2003).

In 1769, Gaspar de Portolá and Franciscan Father Junípero Serra established the first Spanish settlement at Mission San Diego de Alcalá. This was the first of 21 missions erected by the Spanish between 1769 and 1823. Elsewhere in the Plan Area, missions were established at San Gabriel (1771), San Juan Capistrano (1776), San Buenaventura (1782), San Fernando (1797), and San Luis Rey (1798). The establishment of the missions marks the first sustained occupation of Alta California by the Spanish. In addition to the missions, four presidios and three pueblos

(towns) were established throughout the state (State Lands Commission 1982). Within the Plan Area, these included a presidio at San Diego (1769) and the pueblo of Los Angeles (1781).

During this period, Spain also deeded ranchos to prominent citizens and soldiers, though very few in comparison to the subsequent Mexican Period. To manage and expand their herds of cattle on these large ranchos, colonists enlisted the labor of the surrounding Native American population (Engelhardt 1927a). The missions were responsible for administrating to the local Indians as well as converting the population to Christianity (Engelhardt 1927b). The influx of European settlers brought the local Native American population in contact with European diseases which they had no immunity against, resulting in catastrophic reduction in native populations throughout the state (McCawley 1996).

Mexican Period (1822 – 1848)

The Mexican Period commenced when news of the success of the Mexican War of Independence (1810 – 1821) against the Spanish crown reached California in 1822. This period saw the privatization of mission lands in California with the passage of the Secularization Act of 1833. This act federalized mission lands and enabled Mexican governors in California to distribute former mission lands to individuals in the form of land grants. Successive Mexican governors made approximately 700 land grants between 1833 and 1846, putting most of California lands into private ownership for the first time (Shumway 2007). During this era, a class of wealthy landowners known as rancheros worked large ranches based on cattle hide and tallow production.

The beginnings of a profitable trade in cattle hide and tallow exports opened the way for larger, commercially driven farms. Land grants owned by the Spanish crown and clergy were distributed to mostly Mexican settlers born in California, or the "Californios." While this shift marked the beginning of the rancho system that would "dominate California life for nearly half a century" (Poole 2002), the rural character of emerging cities in and around Los Angeles remained intact. Ranchos were largely self-sufficient enterprises (partly out of necessity, given California's geographic isolation), producing goods to maintain their households and operations.

In the early 1840s, American settlers began migrating overland to Alta California. The Bidwell-Bartelson party was the first to arrive, entering the Central Valley in 1841. American settlement disrupted the established social and economic order in Mexican-era California, as many recent arrivals quickly became prominent in Alta California commerce (Kyle 2003).

In 1846, the Mexican-American War was initiated following the annexation of Texas by the United States and a dispute over the boundary of the state between the United States and Mexico. Governor Pío de Jesús Pico, the last governor of Alta California, began selling off 12 million acres of public land to financially support the war (Los Angeles Almanac 2018a). Mexican forces fought and lost to combined United States Army and Navy forces in the Battle of the San Gabriel River on January 8 and in the Battle of La Mesa on January 9. On January 10, leaders of the pueblo of Los Angeles surrendered peacefully after Mexican General José María Flores withdrew his forces (Nevin 1978). On June 14, Lieutenant Colonel John C. Frémont captured Sonoma and raised the California Republic's Bear Flag over the town's plaza (Kyle 2003). Shortly thereafter, newly appointed Mexican Military Commander of California Andrés Pico surrendered all of Alta California to Frémont in the Treaty of Cahuenga (Nevin 1978).

American Period (1848–Present)

The Mexican Period officially ended in early January 1848 with the signing of the Treaty of Guadalupe Hidalgo, formally concluding the Mexican-American War. Per the treaty, the United States agreed to pay Mexico 15 million U.S. dollars for conquered territory, including California, Nevada, Utah, and parts of Colorado, Arizona, New Mexico, and Wyoming. California gained

statehood in 1850, and this political shift set in motion a variety of factors that began to erode the rancho system. Given the size of their holdings, the initiation of property taxes proved onerous for many southern California ranchers. In addition, the creation of the United States Land Commission in 1851 required that property owners prove the validity of their property titles, many of which had been granted relatively informally and without the benefit of formal survey. Ranchers often paid for legal debts with portions—or all—of their ranchos. During this period, 40 percent of rancho-held lands in the County of Los Angeles passed to the United States government. The large-scale rancho system also suffered greatly from the 1860s droughts, which decimated the cattle industry upon which southern Californian ranchers depended.

In 1848, the discovery of gold in northern California led to the California Gold Rush, though the first gold was found in 1842 in San Francisquito, about 35 miles northwest of Los Angeles (Workman 1935:107; Guinn 1976). The Gold Rush significantly transformed northern California and also contributed to an exponential increase in California's population overall. During this time, San Francisco became California's first true city, growing from a population of 812 to 25,000 in only a few years (Rolle 1987). By 1853, the population of California exceeded 300,000. Thousands of settlers and immigrants continued to immigrate to the state, particularly after the completion of the First Transcontinental Railroad in 1869.

In the 1880s, a dramatic boom arrived in southern California, fueled by various factors including increasingly accessible rail travel, agricultural development, and favorable advertisement (Dumke 1994). In 1883, the California Immigration Commission designed an advertisement declaring the state as "the Cornucopia of the World" (Poole 2002:36). Characterized as a "second Gold Rush," the emergence of the citrus industry in Los Angeles, Orange, Riverside, San Bernardino, and San Diego counties emerged as one of the leading drivers of Southern California's agricultural boom (Lee 2010). New southern Californian towns were promoted as havens for good health and economic opportunity. Between 1880 and 1890, the population of Los Angeles expanded fivefold, from approximately 11,000 to 50,000 (Los Angeles Almanac 2018b). Following the collapse of the real estate market in 1888, economic stagnancy lasted through the mid-1890s in the region. Despite the economic downturn however, the industrial and commercial transformation of the region was well entrenched, setting the stage for the region's rapid rise in the twentieth century.

Additional details regarding the historical development of specific portions of the Plan Area and Metropolitan facilities are provided below.

Los Angeles County

With the 1849 advent of the Gold Rush and the growing influx of European-Americans to southern California, the population of Los Angeles County expanded rapidly in the early American Period. Much of this growth was concentrated in the city of Los Angeles, where between 1850 and 1860, the city's population grew from approximately 1,600 to 4,300 (Hill 1929). In the mid-to-late nineteenth century, population growth and the rapid decline of the ranchos opened the door to greater economic diversification throughout Los Angeles County. The earliest non-ranching industries to emerge in the region included packing houses adjacent to rail lines, wineries, flour mills, and grain processing plants, among many others (City of Los Angeles 2018a).

In the final quarter of the nineteenth century, the greater Los Angeles region began to shed its predominantly rural character and grew into a major urban industrial center. Central to this transformation was the 1876 completion of the Southern Pacific Railroad, which connected Los Angeles with the East Coast and eventually with harbor facilities in San Pedro Bay. Rail access accelerated population growth in, and tourism to, Southern California. A speculative real estate

market and improved rail travel prompted a major real estate boom in the 1880s (Deverell 1994). During that decade the population of Los Angeles County nearly tripled, growing from 33,000 to 101,000. In addition to boosting population growth and tourism throughout Southern California, the advent of the transcontinental railroad was "the most important catalyst for industrial growth" (City of Los Angeles 2018a). This included a wide range of sectors, from agricultural packing and shipping houses to oil extraction and refining. With access to rail and shipping links, the petroleum industry quickly became a regional economic driver, and by 1910, produced upwards of 77 million barrels of oil a year (City of Los Angeles 2018a).

After a lull in the 1890s, rapid, sustained expansion in the region characterized the first three decades of the twentieth century. Over this period the population of Los Angeles County grew from 170,000 to over 2.2 million residents. Additionally, two major events had a lasting influence on growth throughout the Los Angeles region: the selection of San Pedro Harbor as the international Port of Los Angeles and the inauguration of William Mulholland's Los Angeles Aqueduct. Together, these events laid the groundwork for the expansion of the county's residential and industrial areas. Development at the Port of Los Angeles and the neighboring Port of Long Beach helped to spread the establishment of industrial suburbs, in Los Angeles Basin communities such as Vernon and Commerce. The local oil, automotive, and aviation industries all achieved a significant foothold in the county before 1930. This growth was aided further by the network of the Pacific Electric Railway trolley line, also known as the "Big Red Cars," which linked the region's emerging "streetcar suburbs" to increasingly distant workplaces (Caltrans 1982; Nicolaides 1999; City of Los Angeles 2018a). By the 1920s, the growing popularity of the automobile allowed developers to build new suburban subdivisions even farther from downtown Los Angeles and other employment centers (Hise and Gish 2007). In spite of the region's rapid urbanization, however, many areas, such as the San Fernando Valley, remained predominantly rural and agricultural through World War II.

Although the county's growth slowed during the Great Depression, the relative success of the oil, automobile, motion picture, and aviation/aeronautics industries offered some protection from the ill effects of the economic downturn. The onset of World War II ended the depression unequivocally and provided a boost to the region's well-established industrial base. To aid the war effort, aircraft and shipbuilding concerns throughout the region expanded rapidly, producing new types of aircraft and other war materiel. At its high point, nearly 90,000 workers were employed simultaneously at the various shipbuilding yards at the Port of Los Angeles. New factories were established along rail corridors, with an important concentration constructed in the San Fernando Valley. Defense-related industrial expansion during World War II and the emergence of an expansive aeronautics and aerospace industry in Southern California contributed to another population boom during and immediately after the war (City of Los Angeles 2018a). Between 1940 and 1950, Los Angeles County added more than 1.4 million new residents.

By the postwar period, the transformation of Los Angeles County from its place in the nineteenth century as "'Queen of the Cow Counties' to the epicenter of the Aerospace Industry" was complete (City of Los Angeles 2018a). The postwar period brought a sustained boom in all industrial sectors. Aircraft manufacturing in particular, became a significant magnet for new residents and workers, leading to the construction of extensive suburban tracts. Postwar highway projects played an important role in the county's suburban expansion by making it possible to live ever-further from the workplace. One such project included the construction of the Hollywood Freeway, which linked the rapidly urbanizing San Fernando Valley to downtown Los Angeles by means of a modern, multi-lane highway. After decades of success, Los Angeles County's manufacturing sector entered a gradual decline in the late 1960s and 1970s (City of Los Angeles 2018a). Despite this decline, the aerospace, technology, entertainment, and tourism

industries experienced continued growth. As of 2010, the county boasted a population of 9.8 million, with 3.8 million living in Los Angeles proper.

Orange County

At the time of California's annexation, what is now Orange County (which originally made up the southern one-third of Los Angeles County) was almost entirely occupied by ranchos dating from the Spanish and Mexican eras. As was the case throughout the region, the local cattle ranching industry boomed with the arrival of new settlers. Starting in the 1850s, settlers founded Orange County's first towns, which were concentrated in the northern portion of the county. The first was Anaheim, established in 1859 by a group of San Francisco-based German immigrants. The failure and eventual subdivision of most of the old ranchos in the 1860s paved the way for the establishment of several more towns, including Santa Ana, Tustin, Orange, Westminster, and Garden Grove. While a handful of large ranches persisted at the southern end of the county—albeit under new ownership—farming emerged as the main sector of the area's economy. Prior to the rise of the county's dominant citrus industry, wine and raisin grapes, wheat, barley, and corn were among the chief crops (Brigandi 2007).

In the latter three decades of the nineteenth century, the area began to boom and matured politically and economically. In 1870, commercial shipping first served Newport Bay, which soon developed as an important local port. Southern Pacific built the area's first railroad in 1875 and held a monopoly until the Santa Fe Railroad arrived in 1885. Rail service was a boon to local agriculturalists, including the area's emerging cohort of citrus growers (Lee 2010). The area's newfound economic vitality contributed to a renewed drive for independence from Los Angeles County, and Orange County was established in 1889 with Santa Ana as the county seat (Brigandi 2007). Following the construction of a new county courthouse downtown, Santa Ana cemented its place as the administrative and political center of the county (Goddard and Goddard 1988). In the following decade, a local oil boom helped to diversify an economy that had been dependent historically on farming. New oil fields were discovered periodically through the second decade of the twentieth century, with important strikes at La Habra, Brea Canyon, Olinda, Placentia, and Huntington Beach (Brigandi 2007).

In the early twentieth century, the establishment of new transportation networks opened more of Orange County to urban development. By 1910, the Pacific Electric Railway had built three new streetcar lines to serve Orange County. The birth and early development of communities such as Seal Beach, Corona del Mar, Stanton, and Cypress was partially dependent on the convenient transit the Pacific Electric's "big red cars" provided. The growing popularity of the automobile in the 1910s and 1920s led to new roadway connections between once-distant Orange County communities. In these years, a state highway was constructed to connect La Habra and San Juan Capistrano, the Coast Highway was completed, and Manchester Boulevard and Beach Boulevard emerged as major thoroughfares. Paired with major investments in roads, the automotive revolution led to new residential and commercial development in communities located near new arterial roadways (Brigandi 2007).

The World War II and the postwar eras brought significant changes to Orange County. The establishment of El Toro Marine Corps Air Station, the Los Alamitos Naval Weapons Station, and the Santa Ana Army Air Base brought an influx of military personnel, many of whom remained in Southern California after the war. The county's once-dominant citrus industry faded as expansive orange groves were rapidly redeveloped as residential tracts and shopping centers. As agriculture's local importance declined, new industries filled the vacuum. The opening of Disneyland in 1955 marked Orange County's embrace of tourism as an important economic sector. In the late 1950s, aerospace, industrial, and service jobs also made up a growing proportion of economic opportunities. In the 1950s and 1960s, the population boom led to a wave

of urban annexations and the incorporation of several North County communities, including La Habra, Buena Park, and Los Alamitos. Orange County's population reached one million in 1963. During the 1960s, large swaths of the South County were developed as master-planned communities, including Irvine, Mission Viejo, Laguna Niguel, Aliso Viejo, Rancho Santa Margarita, and Ladera Ranch (Brigandi 2007). Currently, Orange County is home to more than 3 million residents.

Riverside County

Present-day Riverside County consists of parts of the original territory of San Diego and San Bernardino Counties. Like much of the Plan Area, Riverside County's early American-era history was characterized by cattle ranching on large ranchos, such as Rancho Jurupa and Rancho El Rincón. However, the decline of cattle ranching in the region in the 1860s paved the way for the subdivision and sale of the large landholdings and, in turn, the ascent of intensive agriculture.

Development of southern California's citrus industry started in the late nineteenth century in the eventual county seat, Riverside. Under the leadership of John W. North, the community was founded in 1870, when investors from the Southern California Colony Association laid out a mile-square town site, originally named Jurupa. Early farming featured a diversity of crops, including raisin grapes, alfalfa, hay, and stone fruits, but after Eliza Tibbets introduced the navel orange to the county in 1873, the area's farmers turned overwhelmingly to citrus cultivation (City of Riverside 2009). The area's first successful orange orchards were planted in the 1870s, and their success lured a stream of agriculturalists, investors, and immigrants into the area. The California Fruit Growers Exchange, later renamed Sunkist, was founded in the late nineteenth century, and the University of California Citrus Experimentation Station followed in 1907, helping to solidify Riverside's place as a key center of citrus production and marketing (Kyle 2002: 298). The citrus industry dominated local agriculture well into the twentieth century (City of Riverside 2009). In the late nineteenth century, an influx of homesteaders began the transformation of barren desert areas, such as the Coachella and Palo Verde valleys, into productive agricultural regions. Initially watered by artesian wells, Coachella Valley farming centered on citrus and date cultivation, the latter enterprise supported by the United States Department of Agriculture Date Experiment Stations (established 1904) near Mecca. The construction of the All-American Canal in the 1930s provided a new source of irrigation and eventually allowed farms to expand throughout the valley when it became fully operation in the early 1940s (Brown 1985; Conrad 2018).

During World War II, Riverside County's trajectory was shaped by the presence of several permanent and temporary military installations. Most important among these was March Air Force Base, which was founded in 1918 and served as an important training, aircraft repair, and staging facility. Another important development related to military themes, was the establishment of the Desert Training Center in the Mojave Desert in 1942. As was the case across Southern California, Riverside County's military and defense-industry presence remained strong after the war with the presence of companies such as Kaiser Steel and served as a magnet for new settlement. Communities on Riverside County's east side were augmented with vast residential tracts and new commercial strips. In 1953, the city of Riverside recorded the nation's fourteenth fastest growth rate. The postwar popularity of the automobile left an important mark—especially on the more heavily populated area west of the San Jacinto Mountains—as southern California's regional freeway network was expanded to connect the county's far-flung communities (City of Riverside 2009). The freeway system served as the backbone for continued urbanization, and Riverside County grew steadily through the latter quarter of the twentieth century. Moreno Valley, the county's second-largest city, was incorporated in 1984.

San Bernardino County

The Gold Rush of 1849 brought thousands of Americans into what is now San Bernardino County. Departing from near present-day Yuma, miners and other settlers crossed the Colorado River and followed the Mojave River Trail into what is now the western part of the county. After settlers established homesteads in the Mojave River Valley, the United States Army fortified the area to keep trails open. About a decade later, gold was discovered in the Holcomb and Bear valleys and along Lytle Creek. In 1851, amid the influx of settlers to the county, a group of 500 colonists affiliated with the Church of Latter-Day Saints purchased Rancho San Bernardino and established the town of San Bernardino. Two years later, the County of San Bernardino was created from parts of Los Angeles and San Diego Counties. San Bernardino was selected as the county seat and, the following year, incorporated. In 1857, the colonists affiliated with the Church of Latter-Day Saints were recalled to Utah, leaving the city with a population of just 300 (County of San Bernardino 2020).

Between 1860 and 1890, the county's population grew more than six-fold to approximately 25,000. Much of this growth is attributed to the development of agriculture in the western section of the county and the expansion of mining operations in the east, both of which were assisted by the arrival of the Southern Pacific and Santa Fe railroads in the 1870s (County of San Bernardino 2020; CA Genealogy 2020). Grape and, especially, citrus production shaped the development of such West County communities as San Bernardino and Redlands well into the twentieth century. In the late nineteenth and early twentieth centuries, mining emerged as a major economic pursuit in the desert regions of the county. Borax mining began in the 1860s near Searles Lake and in the Calico Mountains. The Calico silver mining district was also first exploited in the 1880s (County of San Bernardino 2020; Legends of America 2020).

San Bernardino County's major population centers remained relatively small agricultural communities well into the twentieth century (Archaeological Associates 2018). Southern California's postwar suburban boom helped to urbanize many towns and cities in the southwest corner of the county, such as San Bernardino, Ontario, Redlands, Rancho Cucamonga, and Fontana. This trend was exemplified by Fontana, where the steady construction of suburban tracts helped to grow the city's population from about 15,000 in 1960 to 87,000 in 1990. Growth on the county's west side contributed to the growth of the wider Inland Empire metropolitan region, which comprises the major urban areas of Riverside and San Bernardino Counties. By 2010, San Bernardino County's population was over 2 million.

San Diego County

The American period in San Diego County began unofficially in 1846 when the United States military occupied the Pueblo of San Diego. With the signing of the Treaty of Guadalupe Hidalgo, the Americans inherited a pueblo whose population had been destabilized by more than a decade of hostilities with local Native American groups (City of San Diego 2007). Outside the pueblo, cattle ranches dominated the local economy, as they would throughout much of southern California until the 1860s (Guinn 1977).

San Diego County was formally organized in February 1850 as one of the original counties of California and grew slowly during the next decade. The mid-nineteenth century saw the gradual urbanization of San Diego, thanks to the development and promotion of the area by Alonzo Horton, who offered free lots to anyone who would build a house worth $500. The Santa Fe Railroad began construction in San Diego in 1880, with the first trains arriving in 1882. Later that decade, branch lines were built to connect such agricultural communities as Escondido, Chula Vista, National City, and Otay (Save Our Heritage Association 2007; City of Chula Vista 2020; Whetstone 1963). After several population booms, the city of San Diego reached a population of

35,000 by 1888. The population fell again to 17,000 in 1890, after a devastating real estate market crash (City of San Diego 2007). The mountain and desert areas of the eastern side of the county remained sparsely populated in comparison. Farming was an economic mainstay in areas such as the inland valley surrounding El Cajon, while mining—first gold and later gemstones—drew settlers and industry to communities in the eastern section of the county (City of El Cajon 2020; San Diego Natural History Museum 2020).

The twentieth century brought further development to the San Diego area and neighboring coastal communities. Intent on modernizing the city, businessman John D. Spreckels oversaw a downtown building campaign that produced a number of multiple-story commercial buildings. Meanwhile, improvements in public transportation connected downtown to outlying areas where residential, commercial, and institutional development flourished. Elsewhere, summer cottage retreats began to develop in the beach communities of Ocean Beach and La Jolla. In 1915, the Panama-California Exposition was held in San Diego in celebration of the opening of the Panama Canal. The exposition was, among other things, a showcase for Spanish Colonial Revival-style architecture, as envisioned by the event's chief architect Bertram Goodhue (City of San Diego 2007). In the wake of the exposition, many local architects adopted the style, reshaping Southern California's residential, commercial, and institutional architecture.

During the 1920s, San Diego County's population grew from 112,248 to 209,659 residents. Much of this growth took place in the city of San Diego, where the population rose by more than 70,000 during the same period. Much of the population and economic growth of the interwar years owed to a rapidly expanding military presence in San Diego. By the eve of World War II, San Diego had been transformed into a "Gibraltar of the Pacific," thanks to the establishment of ten bases and training installations established in the city (City of San Diego 2007: 22-23).

Like much of the rest of California, San Diego County experienced a massive population boom after World War II. As defense workers and decommissioned GIs settled in the county, suburban growth transformed the growing San Diego metropolitan area. New residential and commercial development rapidly filled many of the former farmlands that had separated San Diego from outlying towns and cities (City of San Diego 2007). About three decades after the war's conclusion, the county's 485 miles of interstate freeways had incorporated many former agricultural communities into the San Diego metropolitan area (Smith 2017). Long-established localities of the county's North Inland region, such as Santee and El Cajon, grew into bedroom communities serving San Diego proper (City of Santee 2014; City of El Cajon 2020). Carlsbad, Oceanside and other North Coastal-region communities experienced a similar expansion in the latter half of the twentieth century. Anchored by a large military presence, thriving tourism industry, and proximity to the United States-Mexico border, the county's population multiplied by a factor of six between 1950 and 2010, topping a population of 3 million.

Ventura County

When California's original 18 counties were established in February 1850, present-day Ventura County made up the southernmost potion of Santa Barbara County. The area remained a sparsely populated cattle-ranching region into the 1860s. However, in the aftermath of the drought of the 1860s, most of the ranchos were subdivided and sold to eastern investors who, in turn, sold the land to farmers. Around the time Ventura County was established in 1873, a courthouse and wharf were constructed at the town of Ventura, which had begun to grow around the old Spanish mission. Within a year of the county's formation, towns began to spring up in the coastal and valley areas west of the present Conejo Grade. These included Port Hueneme and Ojai in 1874, and Santa Paula in 1875 (Ventura Weekly 2005).

In 1887, the construction of the Saugus to Santa Barbara Branch (or Santa Paula Branch) of the Southern Pacific Railroad connected Ventura County to the national rail network. The coming of the railroad encouraged settlement of the rural, agricultural Santa Clara River Valley, and provided access to a distribution network for the valley's citrus and other products (Sperry 2006). The establishment of the towns of Piru, Fillmore, and Montalvo accompanied the Southern Pacific's arrival (Ventura Weekly 2005). Service to Ventura was inaugurated in late April 1887. Logistical and financial obstacles slowed the line's construction north of Santa Barbara, but Southern Pacific completed the route to San Francisco in 1900 (Sperry 2006).

Rail service laid the groundwork for the county's two related booms in the early twentieth century. The first of these shaped the oil industry. Although the county's petroleum deposits had long been used by the Chumash and were noted by Americans in the 1850s, the local petroleum industry did not get off the ground until around the end of the nineteenth century. During this period, much of the exploitation of Ventura County's petroleum deposits took place along the Ventura and Santa Clara rivers (Sperry 1906; Ventura Weekly 2005). In 1890, the Union Oil company of California was founded in Santa Paula, and the city was soon regarded as the "center of the [state's] oil industry" (Belknap 1968). In the 1910s, major oil firms, such as Shell and General Petroleum, established a presence in the county. In turn, the growth of the petroleum industry helped to lure an influx of new settlers in the 1920s (Sperry 1906; Ventura Weekly 2005). That decade, the county's population nearly doubled to 55,000 residents. The population boom was particularly beneficial to Ventura, where the population rose by 179 percent in ten years, reaching 11,600 in 1930.

During the 1930s, improvements to the county's commercial shipping facilities laid the groundwork for the establishment of major military installations. The Oxnard Harbor District was established and initiated the construction of a commercial harbor to replace the Hueneme wharf, which was lost to a storm in 1938. After the start of World War II, the United States took control of the entire port, deepened the harbor, and, in 1945, renamed the facility as the Naval Construction Battalion Center. During the war, the Construction Battalion built the first air strip at Point Mugu. The naval installation eventually grew into Naval Base Ventura County, which has been a major economic force in Ventura County for the past eight decades (Scheid 1995).

Ventura County's dramatic growth in the decades following World War II was closely related to the development of the state's freeway network. In the East County region, the upgrading of U.S. Highway 101 to a freeway allowed for the development of 10,000 acres in the Conejo Valley, including master-planned communities in and around Thousand Oaks. Although the northward progress of freeway construction was temporarily stalled outside Camarillo, improvements to U.S. Highway 101 were completed to Ventura in 1962. As industry settled in the region, Ventura County took in unprecedented numbers of new residents and, in 1964, was the fastest growing county in the United States (Triem 1985). Once-sleepy Oxnard was perhaps the biggest beneficiary of the county's population surge. A town of 8,500 in 1940, by 1970, it had grown to a city of about 70,000, becoming the county's largest population center.

Delta Islands

The Plan Area includes four islands and reclamation districts located in the lower Sacramento-San Joaquin River Delta region: Bacon and Bouldin islands and Webb and Holland tracts. In the late nineteenth and early twentieth centuries, these areas were subject to land reclamation projects that converted the often-marshy islands and riverbanks of the Delta region to a productive farming district.

Agricultural development in the Delta region began in earnest in the 1850s, after the federal Swampland Act of 1850 authorized state government to sell wetlands areas owned by the

national government to prospective farmers. Land sales under the law began, and the most successful early reclamation efforts were typically in the upper Delta region, where solid soils and the presence of natural levees made flood control comparatively easy (Lund et al. 2007).

Many low-lying islands and riverbanks in the central and lower Delta areas were particularly susceptible to flooding and initially proved resistant to permanent reclamation. In the late 1860s and 1870s, the business of Delta-region reclamation changed dramatically. Improved engineering techniques and the introduction of heavy earth-moving machinery allowed for the dredging of streambeds and building of large earthen levees. Coupled with lifting of the 640-acre limit on swampland land sales, these advances opened the door to large-scale reclamation in the lower Delta. Because the mechanized methods required large capital investments, reclamation by individual operators nearly ceased and most new tracts were established by well-capitalized land companies, who leased the improved land as small farms (Lund et al. 2007).

The early history of Bacon Island illustrates the difficulties even well-financed reclamation efforts faced in the marshy central and lower Delta areas. San Francisco businessman Henry D. Bacon acquired the island by the 1870s and encircled it with the first of many levee systems. The peat soil on which he erected the levels proved vulnerable to land subsidence, however, and in 1873, the barriers required rebuilding with soils excavated from the island's outer rim. These levees, too, eventually failed, and in 1915 the California Delta Farms Company undertook a more robust reclamation program, rebuilding the levees using more sophisticated dredging equipment than Bacon had used. With the completion of this project, flood-prone portions of the island were protected from inundations and made suitable for farming (Anonymous 2009; San Joaquin County Office of Emergency Services 2020; Thompson 1957). California Delta Farms was also responsible for the reclamation of Holland Tract and several additional islands and tracts in the early twentieth century (Thompson 1957).

Even with periodic levee improvements, the Delta region remained vulnerable to seasonal flooding. In the early twentieth century, state and federal programs sought to implement a series of new flood control and navigation improvement measures. These included the dredging of the Sacramento River and other channels, implementation of mandated levee heights and construction of the Yolo Bypass, which allowed for the diversion of flood waters to certain farmlands (Lund et al. 2007). These flood control programs coincided roughly with state investments in bridge and roadway construction in the first three decades of the twentieth century. In the postwar years, economic life in the Delta remained centered mainly on agriculture, but recreational uses on the region's many waterways were of growing importance to the regional economy. To this day, agriculture and recreation are the predominant uses of the northern Delta region (ICF 2016).

Metropolitan Water District

The California Legislature formed Metropolitan in the 1920s to oversee matters related to water supply for southern California's growing population. Introduced in 1925 by state Senators A.B. Johnson and Ralph Swing, Senate Bill 178 would have allowed for the establishment of metropolitan water districts. Although the bill passed the Senate, the Assembly did not adopt it. Two years later, a new bill (S. 132) authorizing the formation of Metropolitan passed the Legislature and was signed into law by Governor Clement C. Young as the Metropolitan Water District Act. Metropolitan was incorporated on December 6, 1928. The Metropolitan's first board of directors represented the cities of Anaheim, Beverly Hills, Burbank, Colton, Glendale, Los Angeles, Pasadena, San Bernardino, San Marino, Santa Ana, and Santa Monica (AECOM 2015).

F.E. Weymouth assumed the dual role of general manager and chief engineer of Metropolitan in July 1929. By the end of the year, Metropolitan's service area covered 600 square miles. In April

1930, under Weymouth's leadership, Metropolitan and the United States Department of the Interior entered a contract for the delivery of water to Metropolitan. The next year, Metropolitan assumed management of the engineering of the Colorado River Aqueduct (AECOM 2015).

The mid-twentieth century was a time of marked expansion for Metropolitan. By the 1940s, Metropolitan had too much water and too few customers, conditions which threatened Metropolitan's financial security. To remedy this, Metropolitan sought new customers, and by the early 1960s forged agreements with the San Diego County Water Authority, Pomona Water District, and several local authorities to manage their water supplies. By 1965, 26 public agencies had joined Metropolitan, and its service area covered more than 4,500 miles (AECOM 2015). Presently Metropolitan operates the Colorado River Aqueduct, sixteen hydroelectric facilities, nine reservoirs, and five water treatment plants. Metropolitan delivers water from the Colorado River and northern California to 19 million customers in southern California (Metropolitan 2020).

1.3 Ethnographic Setting

The Plan Area encompasses the traditional territory of numerous Native American ethnographic groups, including: Cahuilla, Chemehuevi, Chumash, Cupeño, Gabrieleño, Halchidoma, Juaneño, Kumeyaay, Luiseño, Miwok, Mojave, Serrano, Tataviam, Yokuts, and Yuman/Quechan. A brief ethnographic description of each tribe is presented below.

Cahuilla

Traditional Cahuilla ethnographic territory extended west to east from the present-day city of Riverside to the central portion of the Salton Sea in the Colorado Desert, and south to north from the San Jacinto Valley to the San Bernardino Mountains (Heizer 1978; Bean and Smith 1978; Kroeber 1925). The term Cahuilla likely derived from the native word *káwiya,* meaning "master" or "boss" (Bean and Smith 1978:575). The Cahuilla are speakers of a Cupan language, part of the Takic linguistic subfamily of the Uto-Aztecan language family. It is thought that the Cahuilla migrated to southern California approximately 2,000 to 3,000 years ago, most likely from the southern Sierra Nevada mountain ranges of east-central California with other Takic speaking social groups (Moratto 1984:559). Cahuilla social organization was hierarchical and contained three primary levels: cultural nationality, patrimoieties: Wildcats (*tuktum*) and Coyotes (*'istam*), and sibs or patrilineal clan (Bean and Smith 1978:580). Cahuilla villages were usually located in canyons or on alluvial fans near a source of accessible water. Each lineage group maintained their own houses (*kish*) and granaries, and constructed ramadas for work and cooking. Other structures included sweat houses and song houses, and ceremonial houses or *kíš ?ámnawet.* Villages were often spaced out and different resource areas would be controlled by a specific lineage (Bean 1990:2). Cahuilla subsistence included hunting, sometimes communal, various game such as mountain sheep, cottontail, and jackrabbit and birds such as quail, duck, and dove using tools such as bow and arrow, traps, nets, slings and binds. Foodstuffs were processed using stone grinding implements like mortars/pestles and manos/metates then stored in finely woven baskets, large granaries, or pottery vessels. Bean (1978:578) has noted the use of some agricultural techniques and the Romero Expedition (1823-24) noted the Cahuilla growing corn, pumpkins, and beans in small, localized gardens.

Chemehuevi

The Chemehuevi are the southernmost of 16 groups of Southern Paiute peoples (Kelly and Fowler 1986), and the only non-Yuman speakers living along the lower Colorado River at the time of European contact. The traditional territory of the Chemehuevi was an extensive area

southwest of Las Vegas, including portions of the eastern Mojave Desert of California. The vast Chemehuevi territory contains some of the driest deserts in the west, and the traditional Chemehuevi subsistence system was the most attuned to desert resources. The desert living Chemehuevi practiced a relatively nomadic hunting/gathering way of life, with larger settlements near reliable water sources, but no permanent villages. Groups moved with the seasons, arriving to harvest plant foods as they matured and hunting primarily small game. Housing was typically of brush erected to protect inhabitants from the harsh sun and wind (Kroeber 1925:597–598; Laird 1976:5). Several foods, including dried meats, dried melon and squash, agave hearts, and various seeds, were stored in specially prepared baskets, earth pits, and caves. In the protohistoric and historical periods, the Chemehuevi traveled extensively through the deserts and as far west as the Pacific coast to exchange goods and obtain marine shell ornaments and raw materials (Kelly and Fowler 1986:377). Traditional Chemehuevi subsistence was based on hunting and gathering, although the groups living along the lower Colorado River adopted floodplain horticulture like that practiced by the Mohave and Quechan (Kroeber 1925; Roth 1976). The Colorado River Chemehuevi, though, retained a greater reliance on hunting and gathering than their Yuman neighbors.

Chumash

The Ventureño Chumash are so called after their historic period association with Mission San Buenaventura (Grant 1978). The Chumash spoke six closely related languages, which have been divided into three branches—Northern Chumash (consisting only of Obispeño), Central Chumash (consisting of Purisimeño, Ineseño, Barbareño, and Ventureño), and Island Chumash (Jones and Klar 2007:80). Early Spanish accounts describe the Santa Barbara Channel region as heavily populated at the time of contact. Coastal Chumash lived in hemispherical dwellings made of tule reed mats, or animal skins in rainy weather. These houses could usually lodge as many as 60 people (Brown 2001). The acorn was an especially important resource. Acorn procurement and processing involved the manufacture of baskets for gathering, winnowing, and cooking and the production of mortars and milling stones for grinding. Bow and arrow, spears, traps and other various methods were used for hunting (Hudson and Blackburn 1979). The tomol, or wooden plank canoe, was an important tool for the procurement of marine resources and for maintaining trade networks between Coastal and Island Chumash. Sea mammals were hunted with harpoons, while deep-sea fish were caught using nets and hooks and lines. Shellfish were gathered from beach sands using digging sticks, and mussels and abalone were pried from rocks using wood or bone wedges. The Chumash also manufactured various other utilitarian and nonutilitarian items. Eating utensils, ornaments, fishhooks, harpoons, and other items were made using bone and shell. Olivella shell beads were especially important for trade (Hudson and Blackburn 1979).

Cupeño

The Cupeño occupied the area surrounding the headwaters of the San Luis Rey River. The name Cupeño likely came from the word *kupa-ngakitom*, meaning Kupa people (Kroeber 1925). Cupeño social organization fell into two moieties (groups), Istam (Coyotes) and Tuktun (Wildcats). These moieties were further separated into seven different patrilinear clans, three Wildcat clans and four Coyote clans (Gifford 1918; Kroeber 1925). Each clan had a hereditary chief of paternal descent and a hereditary assistant who carried messages, supervised food preparation, and received guests for the chief. Further, each of the seven clans were part of one of three “parties” (Gifford 1918). Cupeño religion revolved around the creation myth of two original deities, Tumayowi and Mukat. The Cupeño participate in several religious ceremonies, including: the Toloache initiation, the *morahash* whirling dance, and the girls’ adolescence rite. Mourning ceremonies and eagle killing ceremonies were conducted by the moieties (Kroeber 1925). Subsistence for Cupeño included hunting and gathering of plants and animals respectively.

Processing of food could be with a rectangular metates in a back and forth grinding motion or use of a special club, as for pounding agave or yucca leaves. Meat might be pulverized for the toothless (Schroth 1996).

Gabrieleño/Tongva

The Tongva, also called Gabrieleño by early Spanish explorers due to a connection to the San Gabriel Mission (Kroeber 1925; Bean and Smith 1978:538), occupied the greater Los Angeles Basin and three Channel Islands; San Clemente, San Nicolas, and Santa Catalina. The Tongva language belongs to the Takic branch of the Uto-Aztecan language family, which can be traced to the Great Basin region (Mithun 2004). The Tongva established large, permanent villages in the fertile lowlands along rivers and streams, and in sheltered areas along the coast, stretching from the foothills of the San Gabriel Mountains to the Pacific Ocean. Houses constructed by the Tongva were large, circular, domed structures made of willow poles thatched with tule that could hold up to 50 people (Bean and Smith 1978). Other structures served as sweathouses, menstrual huts, ceremonial enclosures, and probably communal granaries. Cleared fields for races and games, such as lacrosse and pole throwing, were created adjacent to Tongva villages (McCawley 1996: 27). The Tongva subsistence economy was centered on gathering, hunting, and fishing. The tribe utilized mountains, foothills, valleys, deserts, riparian, estuarine, and open and rocky coastal eco-niches. Acorns were the staple food, which were supplemented by the roots, leaves, seeds, and fruits of a wide variety of flora (e.g., islay, cactus, yucca, sages, and agave). These would be processed using hammerstones and anvils, mortars and pestles, manos and metates, and a variety of other tools. Birds, reptiles, insects, and large and small mammals were hunted with bow and arrow, traps, digging sticks and other tools. Fresh water and saltwater fish as well as shellfish were also consumed. The use of oceangoing plank canoes (*ti'at*) allowed for far reaching fishing, travel and trade (Kroeber 1925:631–632; Blackburn 1963; Bean and Smith 1978:546; McCawley 1996: 119–123, 128–131).

Halchidoma

The Halchidhoma (also known as the Panya) are a Yuman-speaking people who, until about 1825, lived along the Colorado River between the present-day cities of Blythe and Needles. The Halchidhoma were known to travel and trade over great distances. The Coco-Maricopa Trail, leading west from a portage point across the Colorado River adjacent to the city of Blythe, linked the Halchidhoma with the Pacific coast (Dobyns et al. 1963). Ceramic seriation and radiocarbon dates from marine shell artifacts indicate that an extensive trade network between the Pacific coast and the lower Colorado River region was established by at least 1100 B.P. (Sample 1950). The Halchidhoma traded with the Cahuilla, Hualapai, Papago, and Pima of Arizona, and were closely allied with the Maricopa (Bean and Vane 1978). The Halchidhoma were frequently in conflict with their Colorado River neighbors, the Quechan and Mohave (e.g., Bean and Vane 1978; Kroeber 1925). The Halchidhoma established strong alliances with the Yuman-speaking Maricopa and Cocopa peoples who lived to the east, along the Gila River. Ultimately, the Halchidhoma went to live with and intermarried with their allies the Maricopa, and are, therefore, poorly documented in the ethnographic literature.

Juaneño

The name Juaneño refers to the people associated with the Mission San Juan Capistrano during Spanish Colonial times (Kroeber 1925; Bean and Shipek 1978; Stever 2017). Acjachemen refers to contemporary Juaneño and coastal Luiseño who identify as descendants of the indigenous people living in the local area. The language of the Juaneño, shares a dialect with the Luiseño, and like the Gabrieleño, was derived from the Takic family; it is part of the larger Uto-Aztecan

language stock. Groups of Juaneño resided in permanent, autonomous villages and associated seasonal camps. Villages were composed of a dominant clan who maintained access to hunting and resource collecting areas (Bean and Shipek 1978). The politically independent villages ranged from 35 to 300 in size and were led by a hereditary chief in conjunction with an advisory council that conducted economic, ceremonial and warfare authorities together. Juaneño villages were situated near viable water and food sources. Acorns were a dietary staple and were prepared in various ways. Other important food sources included grass and other seed types, manzanita, chia, pine nuts, and yucca, and wild game such as deer, rabbit, ground squirrel, quail, and other fowl (Stever 2017). The mythological figure Chinigchinich was the center of the Juaneño religion. The religious beliefs of the Juaneño describe the sagas of heroes who originated from the stars. Lake Elsinore is part of the creation myth and religion of the Juaneño and Luiseño. The Elsinore Hot Springs is significant to the Juaneño and Luiseño and is where the religious leader Wiyot became ill and died (Grenda 1997: 22).

Kumeyaay

Kumeyaay occupied the Pacific Coast from central San Diego County southward into Baja California and eastward into Imperial County, a region with tremendous environmental variation and resource zones. The Kumeyaay were referred to by Europeans as the Diegueño (Gifford 1931; Carrico 1987; Shipek 1987). Linguistic studies support the division of the Kumeyaay people into northern (Ipai) and southern (Tipai) dialect groups (Gifford 1931; Luomala 1978). Prior to European contact, the boundary between the Kumeyaay groups was not rigid and the distinction between them likely existed as a gradient rather than a clear division of cultural and political units (Carrico 1987). Kumeyaay territory was divided among bands, and within each band's territory there would be a primary village and several secondary homesteads located along tributary creeks (Shipek 1982:297). Each band was composed of five to 15 kinship groups called *sib* or *shiimul* and had a designated band leader, or *Kwaaypaay*, who directed ceremonies, acted as disciplinary head, and advised on marriage and family matters. The band leader would also have an assistant who acted as a messenger (Kroeber 1925:719; Luomala 1978; Shipek 1982, 1987). Religious mythologies shared by Kumeyaay groups include abstract spiritual concepts and a higher creator-god. Several sacred landmarks were designated for good, healing, and peace, the most important of which was Kuuchama, or Tecate Peak (Shipek 1985). Ceremonies included puberty initiation rites, marriage, naming, cremation, and mourning (keruk). While clothing was minimal, special costumes and adornments were worn during ceremonies (Luomala 1978:599). A main winter village would consist of semi-subterranean and roughly circular structures with wooden pole framework and brush thatch roofs. Other structures included family-owned granaries, a village-owned brush ceremonial enclosure, sweat lodges, and a semi-circular enclosure for the *keruk* mourning ceremony. Summer camps contained ramadas and windbreaks which were built into trees or rock shelters (Luomala 1978). Subsistence activities depended on the season and location. These included fishing, hunting, gathering, and plant cultivation. Acorns and other seeds were gathered, processed, and stored in woven baskets or pottery (Jordan and Shennan 2002). Fishing could be done with hooks or nets and bows from tule boats, while shellfish would be gathered from sandy beaches or rocky shores (Luomala 1978:601). Both birds (doves, quail, and geese) and small game (rabbits and woodrats) were hunted using throwing sticks, bow and arrow, and nets (Luomala 1978:601).

Luiseño

The Luiseño occupied territory in what is currently north San Diego County, southwestern Riverside County, and southern Orange County. Luiseño territory extended along the coast between Aliso Creek and Agua Hedionda Creek and extended inland to Santiago Peak in the north and the east side of Palomar Mountain in the south, including Lake Elsinore and the Valley

of San Jose (Bean and Shipek 1978). The term Luiseño was applied to the Native Americans who were administered by the Spanish from Mission San Luis Rey and later used for the Payomkawichum nation that lived in the area where the mission was founded (Mithun 2001:539-540). The Luiseño language belongs to the Cupan group of the Takic subfamily of languages (previously known as Southern California Shoshonean), and the Uto-Aztecan language family from the Great Basin (Driver 1969; Bean and Shipek 1978). The center of the Luiseño religion was Chinigchinich, which centered around sagas of heroes who were originally from the stars. Religious rituals took place in a brush enclosure that housed a representation of Chinigchinich. Ritual ceremonies included puberty initiation rites, burial and cremation ceremonies, hunting rituals, and peace rituals (Bean and Shipek 1978). The Luiseño lived in permanent, politically autonomous villages and associated seasonal camps. Each village controlled a larger resource territory and maintained ties to other villages through trade and social networks. Trespassing within another village's resource area was cause for war (Bean and Shipek 1978). Villages consisted of dome-shaped dwellings (*kish*), sweat lodges, and a ceremonial enclosure (*vamkech*). Leadership within the villages focused on the chief, or Nota, and a council of elders (puuplem). The chief controlled religious, economic, and war-related activities (Bean 1978:109-111; Bean and Shipek 1978). Luiseño subsistence was focused on the acorn and supplemented by the gathering of other plant resources and shellfish, fishing, and hunting. Acorns were leached and served in various ways. Seeds were ground. Prey included deer, antelope, rabbit, quail, ducks and other birds. Fish, sea mammals, and shellfish were taken from the shore or caught in rivers and creeks using dugout canoes (Bean and Shipek 1978).

Miwok

The Plains Miwok are members of the larger Miwokan subgroup of the Utian language family inhabiting an area along the lower reaches of the Mokelumne and Cosumnes rivers and both banks of the Sacramento River roughly from the city of Rio Vista north to Freeport (Levy 1977). Political organization centered on small tribelets and several distinct settlements. Each tribelet was headed by a chief, and each settlement had a representative of the chief overseeing local affairs. Winter settlements included thatched, conical houses and semi subterranean earth-covered dwellings with central hearth and an earth oven for cooking purposes. In summer, a circular brush hut was constructed for use in mourning ceremonies. Other structures included sweathouses for purification, conical menstrual huts, and grinding houses (Levy 1977). Miwok social organization was based on affiliation with one of two spiritual and social categories: land and water. These categories are known as moieties. These groups were not associated specifically with resource procurement. Moieties were typically exogamous and played an important role in many ceremonies (Levy 1977). Plains Miwok subsistence practices centered on the use of acorns and of seeds as primary plant food sources and on hunting of mule deer, tule elk, pronghorn antelope, and various species of waterfowl. Hunting was typically done with a sinew-backed bow and arrow and fishing with various types of nets. Seines were used in large rivers and sloughs where the pace of water flow was slow. Hook and line was typically used to take sturgeon, while harpoons were the most common implement for salmon fishing (Levy 1977). The Plains Miwok made both twined and coiled basketry, usually from willow and redbud. They also manufactured tule mats used as floor covering. Woven blankets were often made of rabbit skin strips or feathers attached to cordage woven from plant fibers. Tule balsa rafts were crafted and used to navigate rivers and sloughs (Levy 1977).

Mojave

Most of the Mojave population lived along both sides of the lower Colorado River from south of Davis Dam to Topock, and also extended their territory south into the Chemehuevi and Colorado valleys, and intermittently controlled areas as far south as the Palo Verde Valley (cf. Kroeber

1959). The Mojave language belonged to the Yuman language family, part of the larger Hokan language phylum (Laylander 2010). According to Kroeber (1925) the Mojave tribes consisted of patrilinear familial clans. During much of the year, the Mojave lived in villages on terraces above the Colorado River, only moving down onto the floodplain in the spring to plant crops after the seasonal floods. Like other lower Colorado River peoples, the Mojave relied on floodplain agriculture, fishing, and gathering for subsistence. The Mojave were hunters of deer, rabbit and other small game, which also were often taken in traps, snares, and communal drives. When the high waters of the Colorado River receded, the Mojave caught a variety of Colorado River fish species by driving them into shallow sloughs or trapping them in seines (Kroeber 1925:737; Stewart 1957). They travelled long-distances, like other Colorado River tribes and they participated in a trade network extending east to the Pueblos of Arizona and west to the Pacific coast (Bean and Vane 1978). Mojave songs seem to act as a means of storing and transferring important landscape knowledge; they are, among other things, a collection of meaningfully constituted mental maps of the Mojave territory and beyond (Stoffle et al. 1997:235).

Serrano

The Serrano occupied an area in and around the San Bernardino Mountains. Their territory extended west of the Cajon Pass, east past Twentynine Palms, north of Victorville, and south to Yucaipa Valley. The Serrano language is part of the Serran division of a branch of the Takic family of the Uto-Aztecan linguistic stock (Mithun 2001:539, 543). The two Serran languages, Kitanemuk and Serrano, are closely related. (Kroeber 1925:611). Most Serrano lived in small villages located near water sources (Bean and Smith 1978a:571). A village was usually composed of at least two lineages. The Serrano were loosely organized along patrilineal lines and associated themselves with one of two exogamous moieties or "clans"—the Wahiyam (coyote) or the Tukum (wildcat) moiety. Houses were circular and domed, constructed of willow branches and tule thatching. Many of the villages had a ceremonial house, used both as a religious center and the residence of the lineage leaders. Additional structures in a village might include granaries and a large circular subterranean sweathouse typically built along streams or pools. The subsistence economy relied on collecting plant goods, especially seeds like acorn nuts, black oak, and piñon nuts, but also roots, shoots, and blooms. Additionally, Serrano would hunt large and small mammals, including mountain sheep, deer, antelope, rabbits, small rodents, and various birds, particularly quail, and occasionally fish (Bean and Smith 1978a:571). The Serrano used fire as a management tool to increase yields of specific plants, particularly chía. Trade and exchange were an important aspect of the Serrano economy. Those living in the lower-elevation, desert floor villages traded foodstuffs with people living in the foothill villages who had access to a different variety of edible resources.

Tataviam

Tataviam territory included the upper Santa Clara River from Piru Creek eastward, extending over the Sawmill Mountains to the southwest edge of the Antelope Valley, making much of their territory situated on sloped areas surrounded by desert (King and Blackburn 1978; Stickel and Weinman-Roberts 1980). Their territory was bounded on the west and north by various Chumash groups; on the south by the Tongva (Gabrieliño and Fernandeño, though some Tataviam were also identified as Fernandeño because of their association with Mission San Fernando); and to the east by the Kitanemuk and Serrano. The Tataviam were not well documented by early ethnographers. However, researchers today generally agree the Tataviam spoke an Uto-Aztecan language, most likely a Takic language (Hudson 1982). Archaeological evidence from Bower's Cave – located between Newhall and Piru – combined with ethnographic evidence suggest their ritual organization was similar to both the Chumash and Tongva, whose lifestyles were distinct from one another (King and Blackburn 1978). Dwellings would include cool, domed thatch

shelters under shady overhanging rocks (Eargle 2008). Rock art around these areas included representational and abstract pictographs, incised pictographs, petroglyphs, and cupules (Knight 2010), with small settlements often ancillary to large villages. The Tataviam were a hunting and gathering society who relied on yucca, which they would roast over a fire or in an earth oven (Garza 2012), and acorns, which they would harvest and grind (Eargle 2008; Garza 2012). Additional food resources included sage seeds, berries, small mammals, deer, and possibly antelope.

Yokuts

The San Joaquin Valley was historically occupied by the Penutian-speaking Yokuts (Kroeber 1925; Wallace 1978; Latta 1999). The Yokut territory can be broken into the Northern Valley, Southern Valley, and Foothill Yokuts (Wallace 1978). The distinction between the three Yokuts groups is primarily based on language dialect (Mithun 2001). The Yokuts established permanent villages. Residential structures were most often of two types: single-family dwellings and larger communal residences that housed ten families or more. Villages frequently included mat-covered granaries and a sweathouse (Mithun 2001). The basic economic unit among the Yokuts was the nuclear family. Totemic lineages were based on patrilineal descent. Totem symbols were passed from father to offspring and families sharing the same totem formed an exogamous lineage. Totems were associated with one of two moieties, a division which played a role during ceremonies and other social events (Wallace 1978). Yokuts were split into self-governing local groups, most often including several villages. Each group had a chief who directed ceremonies, mediated disputes, handled punishment of those doing wrong, hosted visitors, and provided aid to the impoverished (Wallace 1978). Shamans were also an important part of Yokuts village life. The Yokuts' shamans gained power through a dream or vision, providing them the ability to heal the sick and serve as the primary role in religious life (Wallace 1978). Yokuts technology relied primarily on tule, which was used to make baskets cradles, boats, housing, and many other items. Yokuts subsistence also relied on tule. The roots and seeds were gathered, dried, and pounded into a flour. Tule rafts allowed for fishing with nets spears, basket traps, and bow and arrow. Yokuts also gathered mussels and hunted turtles (Wallace 1978). Yokuts also engaged in trade with their neighbors. Since acorns were not readily available in the Yokuts ethnographic territory, some Yokuts tribes journeyed to neighboring groups to trade for them. Marine shells secured through trade with coastal peoples were used in the manufacture of shell money and personal adornment items (Wallace 1978).

Yuman/Quechan

Quechan is a variation on the names Kwichyan or Kuchiana, but this group is also commonly known as the Yuma; today they refer to themselves as Kw'tsan. Quechan language is considered a river dialect of the Yuman Language Family, part of the larger Hokan language phylum (Laylander 2010). The ethnographic territory traditionally associated with the Quechan, now divided between the states of California and Arizona, is centered around the confluence of the Colorado and the Gila rivers, extending several miles north and south along the Colorado and east along the Gila. Settlements consisted of extended hierarchical family groups that were widely dispersed along the riverbanks. These settlements shifted throughout the year. Smaller groups would disperse into lower areas during farming seasons and reconvene into larger groups on higher ground during flood seasons (Bee 1983:86-88). Subsistence patterns included riverine agriculture cultivated in the richly silted river bottomlands following the recession of the spring floods which provided a relatively high yield of corn, beans, and squash (Bee 1983:86– 87; Esquinca 2019:106). The Quechan also relied on the gathering of wild foods, the most important of which were mesquite and screw-bean pods, although a variety of other wild plants also were collected (Bee 1983:87). Fishing would also be done in the river or in the delta (Esquinca 2019).

The Quechan considered warfare to be ceremonial and it was common for small party raids to be conducted against their neighbors. Every few years, there might also be warfare conducted by larger war parties. Tribes were advised by both a war chief and a peace chief (James and Graziani 1975).

FINAL EXECUTIVE SUMMARY

ES.1 Introduction

This Final Program Environmental Impact Report (Final PEIR) has been prepared in accordance with the California Environmental Quality Act (CEQA) (California Public Resources Code, Section 21000 et seq.), as amended. The Metropolitan Water District of Southern California (Metropolitan) is the lead agency for the environmental review of the proposed Climate Action Plan (CAP or proposed program) evaluated herein and has the responsibility for approving the proposed program.

As described in the *State CEQA Guidelines* (14 California Code of Regulations [CCR] 15000 et seq.), public agencies are charged with the duty to avoid or substantially lessen significant environmental effects, with consideration of other conditions, including economic, social, technological, legal, and other benefits. As required by CEQA, this Final PEIR assesses the potentially significant direct and indirect environmental effects of the proposed program, as well as the potentially significant cumulative impacts that could occur from implementation of the proposed program. This Final PEIR is an informational document only, the purpose of which is to identify the significant effects of the proposed program on the environment and to indicate the manner in which those significant effects can be avoided or significantly lessened (including feasible mitigation measures); to identify any significant and unavoidable adverse impacts that cannot be mitigated to below a significant level; and to identify reasonable and feasible alternatives to the proposed program that would avoid or substantially lessen any significant adverse environmental effects associated with the proposed program and achieve the fundamental objectives of the proposed program.

ES.2 Contents and Organization of Final Program EIR

This Final PEIR is prepared pursuant to Sections 15088, 15089, and 15132 of the *State CEQA Guidelines*. The Final PEIR, in compliance with Section 15132 of the *State CEQA Guidelines*, contains the following:

- Final PEIR, Volume 1
    - **Final Executive Summary.** The Final Executive Summary provides the contents and organization of the Final PEIR, a summary of procedural compliance with CEQA, and a brief description of the proposed program.
    - **Chapter 1: Responses to Comments Received.** This chapter includes a list of persons, organizations, and public agencies that provided written comments on the Draft PEIR and Draft CAP during the public review period. This chapter also includes a copy of the comments received during the public review process for the Draft PEIR and Draft CAP, as well as Metropolitan's responses to these written comments. Each comment is assigned a comment number, which corresponds to a response number and response.
    - **Chapter 2: Changes to the Draft PEIR and Draft CAP.** This chapter contains a summary of changes made to the documents since publication of the Draft PEIR and Draft CAP as a result of comments received. Revisions were made to clarify information presented in the Draft PEIR and only minor technical changes or additions have been made to the Draft CAP. These changes and additions to the PEIR and CAP do not raise important new issues related

to significant effects on the environment. Such changes are "insignificant," as the term is used in Section 15088.5(b) of the *State CEQA Guidelines*. This chapter describes changes that were made and presents textual changes made since public review as signified by strikethrough (~~strikethrough~~) where text is removed, and by underlined text (underline) where text is added for clarification.

- Final PEIR, Volume 2
  - **Chapter 1: Introduction to Final PEIR – Volume 2.**
  - **Chapter 2: Findings of Fact in Support of the Proposed Program and Statement of Overriding Considerations.** This chapter of the Final PEIR provides a summary of the impacts associated with the proposed program and the findings regarding alternatives to the proposed program. This chapter also includes a summary of the general findings, legal effects of the findings, and a summary of the independent review and analysis. Lastly, this chapter includes a Statement of Overriding Considerations, pursuant to *State CEQA Guidelines* Sections 15043 and 15093, which provides the program's economic, social, or other benefits for choosing to allow the occurrence of significant environmental effects that have not been avoided.
  - **Chapter 3: Mitigation Monitoring and Reporting Program.** This chapter of the Final PEIR provides the mitigation monitoring and reporting program (MMRP) for the proposed program. The MMRP is presented in table format and identifies mitigation measures for the proposed program, the party responsible for implementing the mitigation measures, the timing of implementing the mitigation measures, and the entity responsible for monitoring and reporting compliance with each mitigation measure.

ES.3 Contents and Organization of Final Program EIR

Metropolitan has complied with CEQA and the *State CEQA Guidelines* during preparation of the PEIR for the proposed program. Pursuant to Section 15082 of the *State CEQA Guidelines*, a Notice of Preparation (NOP) and Scoping Meeting was prepared and published by Metropolitan on June 23, 2020 and circulated to local, state, and federal agencies and to members of the public and other interested agencies, organizations, and individuals. The NOP was also sent to the State Clearinghouse at the California Governor's Office of Planning and Research to solicit participation from state agencies in determining the scope of the Draft PEIR. The State Clearinghouse assigned a state identification number (SCH No. 2020060450) to the Draft PEIR. A virtual scoping meeting was held on July 15, 2020 at 10:00 a.m. to present the proposed program, describe the environmental review process, and provide an opportunity for agency representatives and the public to assist Metropolitan in determining the scope and content of the environmental analysis for the PEIR. Pursuant to Section 15082 of the *State CEQA Guidelines*, recipients of the NOP for the proposed program were requested to provide responses within 30 days of their receipt of the NOP. As such, the review period for the NOP ended on July 22, 2020.

Metropolitan received a total of ten written comment letters from the following parties:

- South Coast Air Quality Management District (SCAQMD)
- Mohave Desert Air Quality Management District (MDAQMD)
- San Joaquin Valley Unified Air Pollution Control District (SJVAPCD)
- Ventura County Air Pollution Control District (VCAPCD)

- Stanislaus County Environmental Review Committee
- Stanislaus County Public Works
- Ventura County Watershed Protection District
- California Highway Patrol (CHP)
- Native American Heritage Commission (NAHC)
- California Department of Fish and Wildlife (CDFW)

All comments received during the NOP public notice period were considered during the preparation of the Draft PEIR. Appendix A of the Draft PEIR includes the NOP and copies of the comment letters received on the NOP.

Pursuant to CEQA and its implementing guidelines, the Draft PEIR and Draft CAP were circulated for a 45-day public review and comment period which began on November 18, 2021 and concluded on January 7, 2022. The Draft PEIR and Draft CAP were distributed to the State Clearinghouse and a Notice of Availability of the Draft PEIR and Draft CAP was distributed to interested parties and agencies. Copies of the Draft PEIR and Draft CAP were made available to the general public for review during normal operating hours at the following location:

The Metropolitan Water District of Southern California
700 North Alameda Street
Los Angeles, California 90012

The Draft PEIR and Draft CAP were also available for review on Metropolitan's website, and at nine public libraries within the Plan Area for the proposed program.

Volume 1 of this Final PEIR contains the Executive Summary and Chapters 1 and 2, which provide responses to comments received during the public comment period for the Draft PEIR and any changes made to the Draft PEIR. Volume 2, Chapters 2 and 3, of this Final PEIR make detailed findings with respect to the potential effects of the proposed program and refer, where appropriate, to the mitigation measures set forth in this Final PEIR.

The Final PEIR and the administrative record concerning the proposed program provide additional information in support of the Findings of Fact (Volume 2, Chapter 2) herein. The Findings of Fact are hereby incorporated in the Final PEIR in its entirety. Furthermore, the mitigation measures set forth in the Final PEIR and the MMRP are incorporated by reference in the Findings. The MMRP was developed in compliance with California Public Resources Code Section 21081.6 and is contained in Volume 2, Chapter 3, of this Final PEIR.

ES.4 Proposed Project Description

ES.4.1 Overview and Scope of the Project

Metropolitan is proposing a CAP to identify strategies to reduce greenhouse gas (GHG) emissions and achieve the proposed GHG reduction targets. The CAP includes a baseline GHG emissions inventory of Metropolitan's operations from 1990 through 2020, an emissions forecast through 2045, emissions reduction targets consistent with Senate Bill (SB) 32 and Executive Order B-55-18, actions and policies that Metropolitan could implement to achieve GHG reductions, and an implementation roadmap. The CAP would apply to Metropolitan's operations within the proposed Plan Area, described in the following section.

ES.4.2 Overview of the Region

The Plan Area consists of the following six counties in Southern California: Los Angeles, Orange, Riverside, San Bernardino, San Diego, and Ventura. Portions of northeastern Imperial County within the Palo Verde Valley, as well as four islands in the Sacramento-San Joaquin River Delta area, are also included in the Plan Area. The Plan Area includes all of Metropolitan's service area and its member agencies' jurisdictions, as well as all areas where Metropolitan owns land or facilities.

The Plan Area spans approximately 38,213 square miles across six ecoregions, including Southern California Mountains and Valley, Southern California Coast, Sonoran Desert, Mojave Desert, Colorado Desert, and California Central Valley (Great Valley) (United States Department of Agriculture 2007). The Plan Area contains a population of approximately 22,176,450 across 202 incorporated cities and unincorporated county regions (California Department of Finance [DOF] 2020; United States Census Bureau 2020). It also includes over 220 miles of Pacific Ocean coastline, ranges in elevation from 234 feet below mean sea level to approximately 11,503 feet above mean sea level, and contains a national park, one national recreation area, all or portions of four national forests, and three United States Census Bureau-designated Metropolitan Statistical Areas.

ES.4.3 Project Objectives

The proposed program is designed to reduce GHG emissions associated with Metropolitan's operations. Specifically, the objectives of the proposed program include the following:

- Identify and quantify emissions associated with Metropolitan operations to prepare a baseline GHG emissions inventory in order to track emissions reduction progress over time
- Adopt an emissions reduction target that is consistent with existing state emissions reduction targets while preparing Metropolitan to meet future state targets
- Identify and quantify specific reduction actions and policies that Metropolitan may implement to achieve the goal of reducing GHG emissions from its construction and operational activities
- Provide a roadmap for future activities to achieve consistency with the CAP and use CEQA streamlining tools for analysis of GHG emissions pursuant to the requirements of *State CEQA Guidelines* Section 15183.5

ES.4.4 Project Description

The proposed program contains the following primary components.

Emissions Inventory

The proposed CAP contains an inventory of Metropolitan's GHG emissions from 1990 to 2020. Due to the geographically disparate nature of Metropolitan's operations, emissions reported in the inventory are based on activities over which Metropolitan has direct operational control. The inventory delineates emissions by Scope, as defined in the Local Governments for Sustainability reporting frameworks and detailed below. The emissions inventory reports Metropolitan's GHG emissions in metric tons of carbon dioxide equivalent (CO_2e).

- **Scope 1 Emissions**. Scope 1 emissions are those associated with direct emissions from sources owned or controlled by Metropolitan. This includes emissions from direct fuel combustion, including natural gas, propane, welding gasses, and gasoline and diesel used to power Metropolitan's vehicle fleet.

- **Scope 2 Emissions**. Scope 2 emissions are those indirect emissions associated with the consumption of Metropolitan's purchased electricity use. Specifically, emissions generated at power plants that supply electricity for Metropolitan operations. Metropolitan purchases electricity from power generated from within California and from outside of California in the southwestern United States, which includes electricity generated from hydropower at the Hoover Dam. Scope 2 emissions also include transmission and distribution losses that occur as electricity is delivered to Metropolitan facilities.
- **Scope 3 Emissions**. Scope 3 emissions are other indirect emissions that occur as a result of Metropolitan's operations, including emissions associated with waste generation, water consumption and wastewater generation from Metropolitan-owned buildings, employee commutes, and construction activities.

The proposed CAP also includes an emission forecast through 2045 to account for potential changes in hydrology, climate, climate and air quality regulations, population growth, operations, and future construction projects that may affect Metropolitan's emissions in the future. Furthermore, the emissions forecast allows for comparison between forecasted GHG emissions and reduction targets to understand the reductions necessary to achieve Metropolitan's GHG reduction goals.

Reduction Target

The proposed CAP establishes a GHG reduction target aligned with applicable state GHG reduction policies. The CAP considers various reduction levels, target methodologies, and tracking mechanisms to quantify GHG emissions reductions and measure progress towards meeting the established GHG reduction target. Ultimately, the CAP includes a linear per capita target or "Linear Reduction to Carbon Neutral by 2045 – Per Capita Target" with a Carbon Budget tracking mechanism.

GHG Reduction Measures

In order to achieve the proposed CAP's emissions reduction target, GHG emissions reduction measures would need to be implemented. The CAP includes 39 proposed GHG emissions reduction measures that, if implemented, could help Metropolitan reduce its Scope 1, Scope 2, and Scope 3 emissions. Reduction measures for each Scope are grouped into nine strategies that could be employed at Metropolitan's various facility types during facility maintenance activities and future expansion and construction activities, as well as policies and projects to explore new technologies and practices to conserve resources. The reduction measures do not include actions taken by Metropolitan to date that have resulted in GHG emissions reductions, such as Metropolitan's early adoption of solar facilities at several of its treatment plants and Leadership in Energy Efficiency and Design (LEED) certification for several of its facilities. However, the measures may build or expand upon these past actions. Most measures within the nine categories are either administrative (e.g., studies, investigations) in nature or involve replacement of existing infrastructure with newer, more efficient infrastructure at the same location and, therefore, would not have physical impacts to the environment.

ES.4.4 Areas of Controversy

Section 15123(b)(2) of the *State CEQA Guidelines* requires that an EIR identify areas of controversy which are known to the lead agency, including issues raised by other agencies and the public. Areas of controversy associated with the proposed program are made known through comments received during the NOP process, as well as input solicited during public scoping meetings and an understanding of the community issues in the study area.

The comments on the NOP for the draft PEIR for the proposed CAP generally expressed concern over the following issues: alternatives analysis and impacts to biological species and jurisdictional habitats (CDFW), air quality impacts from construction or operation of projects implemented under the proposed program (SJVAPCD, MDAQMD, SCAQMD, and VCAPCD), impacts to tribal cultural resources (NAHC), and watershed management (Ventura County Public Works). Appendix A of the Draft PEIR contains a copy of the NOP and the comment letters received during the NOP scoping period.

ES.4.4 Summary of Environmental Impacts and Mitigation Measures

Table ES-1 includes a brief description of the identified environmental impacts associated with each threshold analyzed in detail in the Draft PEIR, proposed mitigation measures, and the level of significance after mitigation.

Table ES-1 Summary of Environmental Impacts, Mitigation Measures and Impacts After Mitigation

Impact	Mitigation Measure(s)	Significance After Mitigation
Air Quality		
Impact AQ-A. Implementation of the individual projects proposed under the CAP would potentially conflict with or obstruct implementation of the applicable air quality plan due to construction emissions. This impact would be potentially significant.	**MM AQ-1 Construction Air Quality Assessment** For individual projects to be implemented under the CAP that involve construction activities with an intensity (i.e., size, schedule, equipment, demolition, import/export of soil, architectural coating) greater than the sample project activity, an air quality assessment shall be prepared to evaluate construction emissions in light of the applicable air district thresholds. **MM AQ-2 Implement Emission Reduction Measures** If construction emissions would exceed any of the applicable thresholds, emission reduction measures shall be implemented to reduce emissions below the thresholds. Measures may include, but would not be limited to: • All construction equipment shall be equipped with Tier 4 certified engines or CARB-certified Level 3 diesel particulate filters. All diesel particulate filters shall be kept in working order and maintained in operable condition according to manufacturer's specifications, as applicable. • Construction equipment with lower horsepower ratings shall be utilized, as applicable and practicable. • Ultra-low-sulfur diesel fuel shall be used for stationary construction equipment, as applicable. • Low-emission on-site stationary equipment shall be used, as applicable. • Alternatively-fueled construction equipment (e.g., renewable diesel, natural gas, electric) shall be utilized instead of diesel-fueled construction equipment, as applicable. • The schedule for soil import and/or export shall be extended to reduce the number of daily haul truck trips, as applicable. • The schedule for the coating/painting phase shall be extended to reduce the square footage coated/painted each day, as applicable. • Architectural coatings with a VOC content of less than 250 grams per liter shall be utilized.	Significant and unavoidable.
Impact AQ-B. Construction impacts related to criteria air pollutant emissions resulting from implementation of individual projects proposed under the CAP would be potentially significant.	**MM AQ-1** and **MM AQ-2**.	Significant and unavoidable.

Impact	Mitigation Measure(s)	Significance After Mitigation
Impact AQ-C. Neither construction nor operation of individual projects proposed under the CAP would expose sensitive receptors to substantial pollutant concentrations. This impact would be less than significant.	This impact would be less than significant. No mitigation is required.	Less than significant. No mitigation required.
Impact AQ-D. Neither construction nor operation of individual projects implemented under the proposed CAP would result in other emissions (such as those leading to odors) adversely affecting a substantial number of people. This impact would be less than significant.	This impact would be less than significant. No mitigation is required.	Less than significant. No mitigation required.
Biological Resources		
Impact BIO-A. Implementation of individual projects under the proposed CAP would potentially have a substantial adverse effect, either directly or through habitat modifications, on species identified as candidate, sensitive, or other special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Wildlife or U.S. Fish and Wildlife Service. This impact would be potentially significant.	**MM BIO-1 Special Status Plant Species Surveys** If completion of the project-specific biological resources assessment determines that special status plant species have potential to occur on site, surveys for special status plants shall be completed prior to any vegetation removal, grubbing, or other construction activity of each project activity (including staging and mobilization). The surveys shall be floristic in nature and shall be seasonally timed to coincide with the target species identified in the project activity-specific biological resources assessment. All plant surveys shall be conducted by a qualified biologist no more than one year prior to project implementation (annual grassland habitats may require yearly surveys). Surveys shall be conducted in accordance with current protocols established by the CDFW, USFWS and the local jurisdictions if said protocols exist. If special status plant species are identified, Mitigation Measure BIO-2 shall apply. **MM BIO-2 Special Status Plant Species Avoidance, Minimization, and Mitigation** If state- or federally-listed special status and/or CRPR 1 and 2 plant species are identified during the project-specific biological assessment, the activity shall be re-designed to avoid impacting these plant species to the maximum extent feasible. If CRPR 3 and 4 species are found, the biologist shall evaluate if they meet criteria to be considered special status, and if so, the same process as identified for CRPR 1 and 2 species shall apply. If special status plant species cannot be avoided and would be impacted by a project activity implemented under the proposed CAP, all impacts shall be mitigated at an appropriate ratio (minimum ratio of 1:1) to fully offset project activity impacts, as determined by a qualified biologist for each species. A restoration plan shall be prepared and implemented, as applicable. **MM BIO-3 Endangered/Threatened Animal Species Habitat Assessment and Protocol Surveys** If the results of the project-specific biological resources assessment determine suitable habitat may be present for any federally and/or state endangered or threatened animal	Less than significant with mitigation incorporated.

Impact	Mitigation Measure(s)	Significance After Mitigation
	species, habitat assessments and/or protocol surveys shall be completed in accordance with CDFW and/or USFWS/NMFS protocols prior to construction. Alternatively, in lieu of conducting protocol surveys, Metropolitan may choose to assume presence within the activity footprint and proceed with implementing appropriate avoidance measures, consultation, and permitting, as applicable. If the target species are detected during protocol surveys, or protocol surveys are not conducted and presence is assumed based on suitable habitat, Mitigation Measure BIO-4 shall apply. **MM BIO-4 Endangered/Threatened Animal Species Avoidance and Mitigation** If habitat is occupied or presumed occupied by federal and/or state-listed species and would be impacted by project activities, the project activity shall be redesigned in coordination with a qualified biologist to avoid impacting occupied/presumed occupied habitat to the maximum extent feasible. If occupied or presumed occupied habitat cannot be avoided, Metropolitan shall consult with USFWS, NMFS, and/or CDFW in order to determine the appropriate course of action, which may include a Biological Opinion (BO) or HCP/ITP issued by the USFWS/NMFS (relevant to federally listed species) and/or the ITP issued by the CDFW (relevant to state listed species). If occupied or presumed occupied habitat cannot be avoided, compensatory mitigation shall be provided (minimum ratio of 1:1) to fully offset impacts to habitat prior to the construction. Compensatory mitigation may be provided through purchase of mitigation bank credits, in-lieu fee, or permittee-responsible habitat restoration/establishment/enhancement/preservation. Compensatory mitigation may be combined/nested with special status plant species and sensitive natural community restoration, where applicable. Temporary impact areas shall be restored to similar pre-project conditions. If on and/or off-site habitat restoration/conservation is identified, a Habitat Mitigation and Monitoring Plan (HMMP) shall be prepared to ensure the success of compensatory mitigation sites. The HMMP shall identify long-term site management needs, routine monitoring techniques, and performance standards for determining that the conservation site has met the necessary criteria to function as a suitable mitigation site. **MM BIO-5 Endangered/Threatened Species Avoidance and Minimization During Construction** The following measures shall be applied to aquatic and terrestrial species, where appropriate. Metropolitan shall select from these measures as appropriate depending on site conditions, the species with potential for occurrence, and the results of the project-specific biological resources assessment ~~(Mitigation Measure BIO-1)~~. Pre-construction surveys for federal and/or state listed species with potential to occur shall be conducted where suitable habitat is present by a qualified biologist not more than 72 hours prior to the start of construction activities. The survey area shall include the proposed disturbance area and all proposed ingress/egress routes, plus a species-specific buffer. If any life stage of federal and/or state listed species is found within the survey area, the	

Impact	Mitigation Measure(s)	Significance After Mitigation
	appropriate measures in the BO or HCP/ITP issued by the USFWS/NMFS (relevant to federally listed species) and/or the ITP issued by the CDFW (relevant to state listed species) shall be implemented; or if such guidance is not in place for the activity, the qualified biologist shall recommend an appropriate course of action, which may include consultation with USFWS, NMFS, and/or CDFW. • The activity limits of disturbance shall be flagged. Areas of special biological concern within or adjacent to the limits of disturbance shall have Environmental Sensitive Area fencing installed between said area and the limits of disturbance. • All activities occurring within or adjacent to sensitive habitats that may support federally and/or state endangered/threatened species shall have a qualified biologist present during all initial ground disturbing/vegetation clearing activities. Once initial ground disturbing/vegetation clearing activities have been completed, the biologist shall conduct pre-activity clearance surveys, as needed to ensure protection of endangered/threatened species. • If pumps are used for dewatering activities, all intakes shall be completely screened with wire mesh not larger than five millimeters to prevent animals from entering the pump system. • If at any time during construction of the project activity an endangered/threatened species enters the construction site or otherwise may be impacted by the project activity, all project activities shall cease. At that point, a qualified biologist shall recommend an appropriate course of action, which may include consultation with USFWS, NMFS, and/or CDFW. Alternatively, the appropriate measures shall be implemented in accordance with the BO or HCP/ITP issued by the USFWS (relevant to federal listed species) and/or the ITP issued by the CDFW (relevant to state listed species) and work can then continue as guided by those documents and the agencies, as appropriate. • All trenches, pipes, culverts or similar structures shall be inspected for animals prior to burying, capping, moving, or filling. • Upon completion of the project activity, a qualified biologist shall prepare a final compliance report documenting all compliance activities implemented for the activity, including the pre-construction survey results. **MM BIO-6 Non-Listed Special Status Animal Species Avoidance and Minimization** Depending on the species identified in the project-specific biological resource assessment , the following applicable measures shall be implemented to reduce the potential for impacts to non-listed special status animal species: • Pre-construction clearance surveys shall be conducted by a qualified biologist within 14 days prior to the start of construction (including staging and mobilization). The surveys shall cover the entire disturbance footprint plus a minimum 100-foot buffer and shall identify all special status animal species that may occur on-site. The qualified	

Impact	Mitigation Measure(s)	Significance After Mitigation
	biologist shall make recommendations for avoidance of non-listed special status species, such as through the use of exclusion fencing, buffer zones, etc. • A qualified biologist shall be present during all initial ground disturbing activities, including vegetation removal, to recover special status animal species encountered during construction activities. • Upon completion of the project activity, a qualified biologist shall prepare a final compliance report documenting all compliance activities implemented for the project activity, including the pre-construction survey results. • If special status bat species may be present and impacted by the project activity, within 30 days of the start of construction a qualified biologist shall conduct presence/absence surveys for special status bats where suitable roosting habitat is present. Surveys shall be conducted using acoustic detectors and by searching tree cavities, crevices and other areas where bats may roost. If active bat roosts or colonies are present, the biologist shall evaluate the type of roost to determine the next step. ◦ If a maternity colony is present, all construction activities shall be postponed within a 250-foot buffer around the maternity colony until it is determined by a qualified biologist that the young have dispersed. Once it has been determined that the roost is clear of bats, the roost shall be removed immediately. ◦ If a roost is determined by a qualified biologist to be used by a large number of bats (large hibernaculum), alternative roosts, such as bat boxes if appropriate for the species, shall be designed and installed near the project activity site. The number and size of alternative roosts installed will depend on the size of the hibernaculum and shall be determined by a qualified biologist. ◦ If other active roosts are located, exclusion devices shall be installed such as valves, sheeting or flap-style one-way devices that allow bats to exit but not re-enter roosts to discourage bats from occupying the site.	
Impact BIO-B. Individual projects implemented under the proposed CAP could result in significant impacts to riparian habitats wetlands and/or sensitive natural communities. This impact would be potentially significant. **Impact BIO-C.** Individual projects implemented under the proposed CAP may result in significant impacts to state or federally protected wetlands. This impact would be potentially significant.	**MM BIO-7 Jurisdictional Delineation and Impact Avoidance** If the results of the project-specific biological resource assessment ~~Mitigation Measure BIO-1~~ indicate project activities implemented under the proposed CAP would impact wetlands, drainages, riparian habitats, or other areas that may fall under the jurisdiction of the CDFW, USACE, and/or RWQCB, a qualified biologist shall complete a jurisdictional delineation. The jurisdictional delineation shall determine the extent of the jurisdiction for each of these agencies within the project activity site and shall be conducted in accordance with the requirement set forth by each agency. The results shall be provided in a jurisdictional delineation report submitted to Metropolitan, USACE, RWQCB, and CDFW, as appropriate, for review and approval. The project activity shall be designed to avoid or minimize impacts to jurisdictional areas to the maximum extent feasible. **MM BIO-8 Wetlands, Drainages and Riparian Habitat Restoration** If impacts to jurisdictional drainages, wetlands, riparian habitat, and sensitive vegetation communities cannot be avoided, impacts shall be mitigated at an appropriate ratio to fully	Less than significant with mitigation incorporated.

Impact	Mitigation Measure(s)	Significance After Mitigation
	offset project-specific impacts (minimum ratio of 1:1). Where feasible, temporarily impacted areas shall be restored to pre-project conditions. An HMMP shall be developed by a qualified biologist and submitted to the agency overseeing the project activity for approval. Alternatively, mitigation shall be accomplished through purchase of credits from an approved mitigation bank or in-lieu fee project. **MM BIO-9 Sensitive Natural Community Avoidance and Mitigation** If the results of the project-specific biological resource assessment ~~Mitigation Measure BIO-1~~ indicate project activities implemented under the proposed CAP would impact sensitive natural communities, impacts shall be avoided through final project activity design modifications. If Metropolitan determines sensitive communities cannot be avoided, impacts shall be mitigated on-site or off-site at an appropriate ratio to fully offset project activity impacts (minimum ratio of 1:1). Temporarily impacted areas shall be restored to pre-project conditions. An HMMP shall be developed by a qualified biologist and submitted to the agency overseeing the project activity for approval.	
Impact BIO-D. Neither construction nor operation of individual projects implemented under the proposed CAP would interfere with movement of native resident or migratory fish or wildlife species or established wildlife corridors. This impact would be less than significant.	This impact would be less than significant. No mitigation is required.	Less than significant. No mitigation required.
Impact BIO-E. Neither construction nor operation of individual projects implemented under the proposed CAP would impact protected trees and, as such, would not conflict with local policies or ordinances protecting biological resources. This impact would be less than significant.	This impact would be less than significant. No mitigation is required.	Less than significant. No mitigation required.
Impact BIO-F. Individual projects implemented under the proposed CAP would not conflict with a Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan area. This impact would be less than significant.	This impact would be less than significant. No mitigation is required.	Less than significant. No mitigation required.

Impact	Mitigation Measure(s)	Significance After Mitigation
Cultural Resources		
Impact CUL-A. Individual projects implemented under the proposed CAP would have the potential to cause a substantial adverse change in the significant of a historical resource. This impact would be potentially significant.	**MM CUL-1(a) Built Environment Investigation** A historic resources evaluation shall be prepared for any future proposed project facilitated by the CAP involving a property which includes buildings, structures, objects, landscape/site plans, or other features that are 45 years of age or older. The evaluation shall be prepared by a qualified architectural historian or historian who meets the Secretary of the Interior's (SOI) Professional Qualifications Standards (PQS) in architectural history or history. The qualified architectural historian or historian shall conduct an evaluation in accordance with the guidelines and best practices promulgated by the State Office of Historic Preservation to identify any potential historical resources within the proposed project area. The evaluation of the potential resource within its historic context shall be documented. All evaluated properties shall be documented on Department of Parks and Recreation Series 523 Forms. If a property is identified as an eligible historical resource under CEQA, Mitigation Measure CUL-1(b) shall be implemented. **MM CUL-1(b) Built Environment Documentation Program** If eligible built environment historical resources are identified for a future proposed project implemented under the CAP, efforts shall be made to the extent feasible to ensure that impacts are avoided. If avoidance is not possible, a Built Environment Documentation Program shall be implemented. Measures may include but are not limited to, compliance with the Secretary of the Interior's Standards for Treatment of Historic Properties and documentation of the historical resource in the form of a Historic American Building Survey (HABS)- report or HABS-Like report. The HABS or HABS-Like report shall comply with the Secretary of the Interior's Standards for Architectural and Engineering Documentation and shall generally follow the HABS Level III requirements, including digital photographic recordation, detailed historic narrative report, and compilation of historic research. Application of mitigation shall generally be overseen by a qualified architectural historian or historic architect meeting the PQS, unless unnecessary in the circumstances (e.g., preservation in place). **MM CUL-3 Previously Unidentified Resources Encountered During Construction** In the event that any potentially significant cultural resources are unexpectedly encountered during construction, work will be immediately halted and the discovery shall be protected in place. A 50-foot buffer around the exposed resource shall be established until a qualified cultural resources specialist evaluates the discovery. If the qualified cultural resources specialist determines that the discovery represents a potentially significant cultural resource, including a potential historical resource, additional investigations may be required to mitigate adverse impacts from project implementation. This additional work may include avoidance, testing, and evaluation or data recovery excavation. Work shall be prohibited in the restricted area until Metropolitan provides written authorization.	Significant and unavoidable

Impact	Mitigation Measure(s)	Significance After Mitigation
Impact CUL-B. Individual projects implemented under the proposed CAP may cause a substantial adverse change in the significance of an archaeological resource. This impact would be potentially significant.	**MM CUL-2(a) Phase 1 Archaeological Resource Investigation** If archaeological resources are identified during project-specific analysis that may be adversely affected by any future proposed project implemented under the CAP, Metropolitan shall retain a qualified archaeologist meeting the Secretary of the Interior standards in archaeology to complete a Phase 1 cultural resources assessment of the site. A Phase 1 cultural resources assessment will include an archaeological pedestrian survey of the site, if feasible, and sufficient background archival research to determine whether subsurface prehistoric or historic remains may be present. Archival research should include a current records search from the appropriate California Historical Resources Information System information center and a Sacred Lands File search conducted with the Native American Heritage Commission. A Phase 1 report or results documentation shall be submitted to Metropolitan prior to any ground disturbing activities. Recommendations contained therein shall be implemented throughout all ground disturbance activities. **MM CUL-2(b) Extended Phase 1 Investigation** For any projects proposed within 100 feet of a known archaeological site and/or in areas identified as sensitive by the Phase 1 study, an Extended Phase 1 (XPI) study shall be conducted to determine the presence/absence and extent of archaeological resources on the project site. XPI testing should comprise a series of shovel test pits and/or hand augured units and/or mechanical trenching intended to establish the horizontal and vertical boundaries of archaeological site(s) on the project site. No archaeological resources would be collected during the XPI Investigation. If an archaeological site is identified, Mitigation Measure CUL-2I or CUL-2(d) shall be implemented. **MM CUL-2(c) Avoidance of Archaeological Resources** Identified prehistoric or historic archaeological resources shall be avoided and preserved in place, where feasible. Where avoidance and preservation in place is not feasible, additional measures shall be applied as identified in Mitigation Measure CUL-2(d) through CUL-2(g). **MM CUL-2(d) Phase 2 Archaeological Resources Investigation and Evaluation** Where preservation is not feasible, each resource shall be evaluated for significance and eligibility for listing in the CRHR through a Phase 2 archaeological resource evaluation. A Phase 2 evaluation shall include any necessary archival research to identify significant historical associations as well as mapping of surface artifacts, collection of functionally or temporally diagnostic tools and debris, and excavation of a sample of the cultural deposit to characterize the nature of the sites, define the artifact and feature contents, determine horizontal boundaries and depth below surface, and retrieve representative samples of artifacts and other remains. A final Phase 2 Testing and Evaluation report shall be submitted to Metropolitan prior to any ground disturbing activities. Recommendations contained therein shall be implemented throughout all ground disturbance activities. **MM CUL-2(e) Phase 3 Archaeological Data Recovery Program** If an archaeological resource meets the CRHR eligibility and cannot be avoided, Metropolitan shall implement a Phase 3 Archaeological Data Recovery Program, conducted to exhaust the data potential of significant archaeological sites. The Phase 3 Archaeological	Significant and unavoidable.

Impact	Mitigation Measure(s)	Significance After Mitigation
	Data Recovery Program shall follow a research design prepared by a qualified archaeologist meeting the SOI PQS standards for archaeology and approved by Metropolitan in advance of Phase 3 fieldwork and excavations. The Phase 3 Data Recovery research design will use appropriate archaeological field and laboratory methods consistent with the California Office of Historic Preservation Planning Bulletin 5 (1991), Guidelines for Archaeological Research Design, or the latest edition thereof. The final Phase 3 Data Recovery report shall be submitted to Metropolitan prior to and any ground disturbing activities. Recommendations contained therein shall be incorporated into project design and implemented throughout all ground disturbance activities. **MM CUL-2(f) Processing and Curation of Archaeological Materials** Archaeological materials collected from the sites during the implementation of Mitigation Measures CUL-2(d) through CUL-2(e) shall be processed and analyzed in the laboratory according to standard archaeological procedures. The age of the materials shall be determined using radiocarbon dating and/or other appropriate procedures; lithic artifacts, faunal remains, and other cultural materials shall be identified and analyzed according to current professional standards. The significance of the sites shall be evaluated according to the criteria of the CRHR. The results of the investigations shall be presented in a technical report following the standards of the California Office of Historic Preservation publication "Archaeological Resource Management Reports: Recommended Content and Format (1990 or latest edition)". Upon completion of the work, all artifacts, other cultural remains, records, photographs, and other documentation shall be curated an appropriate established curation facility based on the location of the fieldwork and/or repatriated to local Native Americans as appropriate. All fieldwork, analysis, report production, and curation shall be fully funded by Metropolitan. **MM CUL-2(g) Cultural Resources Monitoring** If recommended by Phase 1 (Mitigation Measure CUL-2(a)), XPI (Mitigation Measure CUL-2(b)), Phase 2 (Mitigation Measure CUL-2(d)), or Phase 3 (Mitigation Measure CUL-2(e)) studies, Metropolitan shall retain a qualified archaeologist to monitor project-related, ground-disturbing activities. **MM CUL-3 Previously Unidentified Resources Encountered During Construction** MM CUL-3 is described above under Impact CUL-A.	
Impact CUL-C. Individual projects implemented under the proposed CAP would be required to comply with all applicable regulations pertaining to the discovery of human remains. This impact would be less than significant.	This impact would be less than significant. No mitigation is required.	Less than significant. No mitigation required.

Impact	Mitigation Measure(s)	Significance After Mitigation
Noise		
Impact NOI-A. Individual projects implemented under the proposed CAP may result in generation of a substantial temporary or permanent increase in ambient noise levels. This impact would be potentially significant.	**MM NOI-1 Locate Excavation Sites Away from Noise-Sensitive Receivers, Where Feasible** Construction staging and activities shall be located in areas as far as practicable from sensitive receivers or in areas where receivers can be shielded from construction noise. **MM NOI-2(a) Conduct Project-Level Noise Studies for Construction Activities Where Noise-Sensitive Receivers are Present** Project-level construction noise studies shall be conducted for project activities that would exceed the screening criteria for a less-than-significant impact, as summarized in Table 30 and Table 32 of the draft PEIR. Such noise studies shall identify the existing ambient noise levels, characterize the nearest sensitive receivers, estimate the noise levels receivers will experience during construction of individual projects, compare estimated noise levels to the local jurisdiction's noise limits or to the construction noise criteria in the FTA (2018) *Transit Noise and Vibration Impact Assessment Manual* for those that do not have quantitative construction noise level limits, outline any measures that may be used to reduce noise levels, and determine the amount of noise reduction that would occur with implementation of these measures. If the project-level noise study concludes that noise reduction measures are required, Mitigation Measure NOI-2(b) shall be implemented. **MM-NOI-2(b) Implement Noise Reduction Measures** If the results of the noise study determine noise reduction measures are required, noise reduction measures shall be implemented. Construction noise reduction measures may include, but would not be limited to, the use of mufflers, sound blankets/barriers, and/or enclosures and scheduling construction activities to minimize simultaneous operation of noise-producing equipment. Construction noise measures shall be implemented to reduce noise levels to FTA (2018) construction noise criteria, as feasible. If the individual projects would be constructed concurrently with development projects located within a 0.5-mile radius of the individual project location, the noise study shall also consider the cumulative impact of construction noise on sensitive receivers. If applicable, construction noise reduction measures shall be implemented to reduce cumulative noise levels to local jurisdiction or FTA (2018) construction noise criteria, as feasible. **MM NOI-2(c) Conduct Project-Level Noise Studies for Post-Construction Activities Where Noise Sensitive Receivers are Present** Prior to the commencement of construction activities for individual projects that may be implemented under the CAP where sensitive receivers are located within 1,000 feet of the individual project sites, project-level post-construction noise studies shall be conducted. Such noise studies shall identify the ambient noise levels, characterize the nearest sensitive receivers, estimate the noise levels receivers will experience during operation of individual projects during the post-construction period, compare estimated noise levels to the noise level standards of the applicable jurisdiction, outline any measures that may be used to reduce noise levels, and determine the amount of noise reduction that would occur with implementation of these measures. Noise reduction measures may include, but would not be	Significant and unavoidable

Impact	Mitigation Measure(s)	Significance After Mitigation
	limited to, alternative site design, alternative orientation of noise sources, and construction of berms and/or barriers. Noise reduction measures shall be implemented to reduce noise levels to the noise level standards of the applicable jurisdiction, as feasible.	
Impact NOI-B. Construction activities associated with implementation of individual projects under the proposed CAP may result in generation of excessive groundborne vibration or groundborne noise levels, depending on the nature and location of such projects. This impact would be potentially significant.	**NOI-3 (a) Locate Excavation Sites Away from Vibration-Sensitive Receivers, Where Feasible** Whenever practicable, vibration-generating equipment including bulldozers, loaded trucks, pile drivers/pneumatic post drivers, bore/drill rigs, vibratory rollers, and jackhammers shall operate outside the minimum distances specified in Table 33 of the draft PEIR for historic sites, other structures, and vibration-sensitive receivers during project construction activities. Furthermore, whenever practicable, vibration-generating equipment including bulldozers, loaded trucks, pile drivers/pneumatic post drivers, bore/drill rigs, vibratory rollers, and jackhammers shall not be operated concurrently with vibration-generating equipment associated with cumulative development projects located within 600 feet of project construction sites. **NOI-3(b) Conduct Project-Level Vibration Analysis for Construction Activities Where Vibration-Sensitive Receivers are Present** If operation of construction equipment outside the specified buffer distances is not practicable, a detailed study of vibration impacts shall be conducted prior to the commencement of construction for that project. Such vibration studies shall characterize the nearest historic sites, structures, and/or sensitive receivers; estimate the vibration levels receivers will experience during construction of individual projects; compare estimated vibration levels to applicable Caltrans (2020) standards for vibration impacts related to structural damage and human annoyance; outline any measures that may be used to reduce vibration levels; and determine the amount of vibration reduction that would occur with implementation of these measures. Vibration reduction measures may include, but would not be limited to, the use of non-vibratory equipment, vibration monitoring, and repair of structural damage. Construction vibration reduction measures shall be implemented to reduce vibration levels to Caltrans (2020) construction vibration thresholds as feasible. If the individual project would be constructed concurrently with cumulative development projects located within a 600-foot radius of the activity location, the vibration study shall also consider the cumulative impact of combined vibration levels at the nearest sensitive receivers by estimating the combined vibration levels receivers will experience during construction of individual projects and cumulative development; compare estimated vibration levels to applicable standards for vibration impacts related to structural damage and human annoyance described in the Caltrans (2020) *Transportation and Construction Vibration Guidance Manual* (CT-HWANP-RT-20-365.01.01); identify whether the individual project's contribution to any identified cumulative impact would be cumulatively considerable; outline any measures that may be used to reduce the project's contribution to combined vibration levels; and determine the amount of vibration reduction that would occur with implementation of these measures. Such measures may include, but are not limited to, the installation of wave barriers, maximization of the distance between vibratory equipment and receivers, restriction of vibration-generating activities to daytime hours, or	Significant and unavoidable

Impact	Mitigation Measure(s)	Significance After Mitigation
	temporary relocation of affected residents Construction vibration reduction measures shall be implemented to reduce cumulative vibration levels to Caltrans construction vibration thresholds as feasible.	
Impact NOI-C. One individual project to be implemented under the proposed CAP is located within the vicinity of a private airstrip or within an airport land use plan. However, projects implemented under the proposed CAP would not expose people residing or working in the area to excessive noise levels. This impact would be less than significant.	This impact would be less than significant. No mitigation is required.	Less than significant. No mitigation required.
Tribal Cultural Resources		
Impact TCR-A. Implementation of projects under the proposed CAP would not cause a substantial adverse change in the significance of a tribal cultural resource as defined in Public Resources Code Section 5020.1(k), as Native American consultation completed pursuant to Assembly Bill (AB) 52 identified no resources that may be impacted by the proposed project. This impact would be less than significant.	This impact would be less than significant. No mitigation is required.	Less than significant. No mitigation required.
Impact TCR-B. Implementation of projects under the proposed CAP would not cause a substantial adverse change in the significance of a tribal cultural resource determined to be significant pursuant to criteria set forth in subdivision (c) of Public Resources Code Section 5024.1. Native American consultation completed pursuant to AB 52 identified no resources that may be impacted by the proposed project. This impact would be less than significant.	This impact would be less than significant. No mitigation is required.	Less than significant. No mitigation required.

CHAPTER 1
RESPONSES TO COMMENTS RECEIVED

Responses to Comments

This section includes comments received during public circulation of the Draft PEIR prepared for the CAP and the draft CAP. This chapter of the Final PEIR includes copies of all comment letters submitted during the 45-day public review period for the Draft PEIR, along with Metropolitan's responses to comments in accordance with the *State CEQA Guidelines*, Section 15088. Under Section 15088 of the *State CEQA Guidelines*, Metropolitan is required to evaluate and provide written responses to comments received on the Draft PEIR. Metropolitan has also included written responses to comments received on the Draft CAP during the Draft PEIR public review period.

All written comments received have been coded to facilitate identification and tracking. Each comment letter received during the public review period was assigned an identification number, provided in Table 1-1. Each numbered comment letter is the submittal of a single individual, agency, or organization. These comment letters were reviewed and divided into individual comments, with each comment containing a single theme, issue, or concern. Individual comments were bracketed and numbered, and the responses were assigned corresponding numbers (Response 1-1, for example, indicates that the response is for the first issue raised in Comment Letter 1). To aid the readers and commenters, comments have been reproduced in this chapter together with the corresponding responses. Table 1-1 identifies a list of interested parties who submitted comments during the 45-day public review period for the Draft PEIR and Draft CAP, which began on November 18, 2021 and ended on January 7, 2022. It also includes two letters dated January 11 and January 12, 2022, which were submitted to Metropolitan following the closure of the public comment period.

Table 1-1 Comments Received on the Draft PEIR

To finalize the Draft PEIR for the proposed program, the following responses have been prepared for comments that were received during the public review period. In accordance with the requirements of the *State CEQA Guidelines* Section 15088(b), Metropolitan will provide a written response for comments submitted to each commenter at least 10 days prior to certifying the Final PEIR.

As a general introduction, the PEIR's conclusions on the character and significance level of the program's potential to cause environmental impacts are supported by substantial evidence, which is presented in the Draft PEIR, Draft CAP, and Appendices, and further clarified in this document. Some commenters may disagree with the analyses and conclusions in the Draft PEIR. Consistent with the intent of CEQA, and the *State CEQA Guidelines* for its implementation, this Final PEIR also includes the differing opinions and statements presented by the commenters.

Topical Response

A substantial number of comments received during the public review period for the Draft PEIR pertain directly to the contents of the Draft CAP itself, and do not address the contents or adequacy of the Draft PEIR or the CEQA process. Such comments do not specifically relate to environmental issues analyzed in the Draft PEIR and generally do not warrant changes to the contents or findings of the Draft PEIR. However, because review and adoption of the CAP is occurring as a public process pursuant to *State CEQA Guidelines* Section 15183.5(b)(1)(F), comments received regarding the contents of the CAP are disclosed in this document. This section presents a topical response to comments related to the contents of the CAP where such comments are similarly related and do not otherwise relate to environmental issues analyzed in the Draft PEIR. Responses to specific comment letters may refer the commenter to the Topical Response presented herein.

Topical Response A – State Water Project Emissions

Many of the comments received focused on the total embedded energy of water delivered to Southern California, thus a description of the Department of Water Resources' (DWR's) State Water Project (SWP) deliveries emissions is provided here and a discussion of the embedded energy of Metropolitan's water has been included in Appendix B of the Final CAP. Metropolitan acknowledges that water received from the SWP has GHG emissions associated with the delivery of that water to Southern California. Thus, when more water is received from the SWP, there is a corresponding increase in overall GHG emissions. Metropolitan's CAP is intended to be a comprehensive plan to reduce GHG emissions from Metropolitan's operations. As a result, emission reductions measures are targeted to reduce emissions within Metropolitan's operational control. As described in the CAP, Metropolitan imports water from two sources: the Colorado River Aqueduct (CRA) and through the DWR's SWP. Metropolitan has operational control over water pumped from the Colorado River through the CRA; however, as explained in the CAP, Metropolitan's operational control of imported water from the SWP begins when the water enters Metropolitan's system.

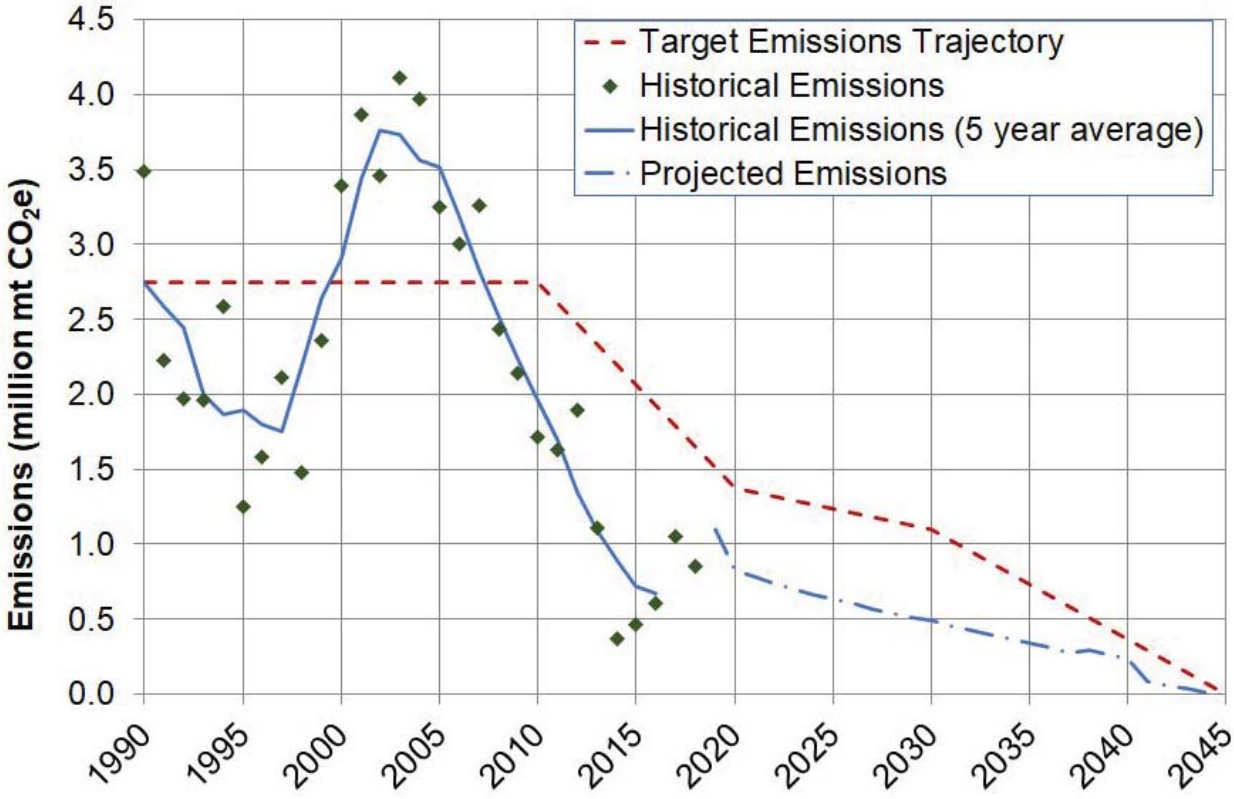
Metropolitan is one of 29 public water agencies that contracts with the DWR for delivery of water from the SWP. The SWP, which provides water supply, recreation, and flood control benefits to California residents, is a multi-purpose water storage and delivery system that extends more than 705 miles, two-thirds the length of California. A collection of canals, pipelines, reservoirs, and hydroelectric power facilities delivers clean water to 27 million Californians, 750,000 acres of farmland, and businesses throughout the state. Getting water to these users requires a large amount of electricity.[1] In fact, the SWP is one of the largest single consumers of electricity in the state, using around 8,000 gigawatt-hours per year. The SWP also generates a large amount of electricity each year at its reservoirs and in-conduit generating stations, about half of all the energy it uses annually. Even

[1] https://water.ca.gov/Programs/State-Water-Project

with all of the electricity the SWP uses, it only accounts for approximately 3 percent of statewide electricity use.[2]

To accomplish the GHG goals set forth by the state, in 2012, DWR developed the Greenhouse Gas Emissions Reduction Plan (2012 Plan) as the first phase of its CAP to guide decision-making related to energy use and GHG emissions. DWR's CAP is divided into three phases to address mitigation, adaptation, and consistency in its analysis of climate change: Phase 1: Greenhouse Gas Reduction Plan; Phase II: Climate Change Analysis Guide; and Phase III: Climate Change Vulnerability Assessment. In its 2012 Plan, DWR committed to regular updates to its plan. In 2020, DWR prepared a Greenhouse Gas Emissions Reduction Plan Update (Update 2020) to review its GHG reductions since the 2012 Plan and to update strategies for further reduction consistent with legislative changes, including the GHG emissions reduction targets established in Senate Bill (SB) 32 (2016), SB 100 (2018), Executive Order B-18-12 (2012), Executive Order B-30-15 (2015), and Executive Order B-55-18 (2018). In addition, since the 2012 Plan was adopted, California's wholesale electricity market has also seen a significant increase in renewable resources. To reflect this change and to align with industry practice in emission reporting, Update 2020 incorporates updated emission factors to determine emissions from unspecified market resources. DWR has made significant progress in meeting GHG reduction goals through its CAP. The figure below illustrates the decline in emissions from operation of the SWP over time.

Figure 1-1 SWP's Historic and Projected Annual Emissions



[2] https://water.ca.gov/Programs/All-Programs/Climate-Change-Program/Climate-Action-Plan

As DWR manages its GHG emissions over the next 20 years and as the wholesale electricity market continues to increase its renewable resources portfolio to meet the goals of SB 100 (2018), the SWP will become a negligible portion of emissions by 2045 and will not be an emission contributor to Metropolitan's water supply portfolio. Commenters who wish to track SWP GHG emissions to DWR's CAP can visit the following site for more detailed information:

- https://water.ca.gov/Programs/All-Programs/Climate-Change-Program/Climate-Action-Plan

Upon adoption of the CAP, work will begin on a customized, award-winning, publicly accessible, web-based CAPDash tool that will track projects implemented and GHG emissions realized from measures detailed in the CAP, provide annual progress reports, and provide the status of the carbon budget. In addition, Metropolitan will work with DWR to include a complete picture of emissions associated with the delivery of imported water to Southern California. Metropolitan's CAPDash tool is expected to be launched early in 2023.

Letter 1

From: John Brooks
To: EPT
Subject: CAP
Date: Friday, December 17, 2021 11:02:25 AM

I have reviewed the CAP and did not see a section on Adaptation and Resilience and I did not hear it addressed in the meeting this morning. Is there a separate document that includes this type of information?

I am looking for something that addresses the following types of issues:

- SWP dependent areas – projects to ensure reliable water when the state issues a zero percent allocation.
- Major fires negatively impacting critical watersheds or storage.
- Land subsidence in the central valley effects on the conveyance system
- Impacts of zero snowpack in the Sierras by 2050 on the system.
- Extreme heat and evapotranspiration effects on operations and water availability.

1-1

I thought that the CAP's content was good and that separating the SWP GHG impacts is reasonable. However, for project evaluations and understanding the overall benefits, it would be helpful to have the aggregated GHG number as a comparison.

1-2

Thanks, John

John Brooks
Senior Sustainability Analyst
Public Works Department
805.449.2472 | toaks.org/publicworks

Response to Comment Letter 1

COMMENTER: John Brooks, Senior Sustainability Analyst, City of Thousand Oaks Public Works Department

DATE: December 17, 2021

Response 1-1

The commenter notes the CAP does not contain a section on adaptation and resilience and asked if a separate document addresses these concerns. Specifically, the commenter notes that they are looking for a section or document addressing the following:

- SWP dependent areas;
- Major fires negatively impacting critical watersheds or storage;
- Land subsidence in the Central Valley and effects on the conveyance system;
- Impacts of zero snowpack in the Sierras by 2050; and
- Extreme heat and evapotranspiration effects on operations and water availability.

Metropolitan understands the importance of adapting to changing climatic conditions to ensure a reliable supply of water to its service area. Metropolitan's Integrated Resources Plan (IRP) and Urban Water Management Plan (UWMP) focus on water supply reliability and actions that Metropolitan employs to ensure a reliable supply of water during periods of drought, a decrease in snowpack, heat events, and the effects on operational conditions. The CAP complements these two plans by creating a GHG reduction plan. The IRP is currently being updated and will be released in the coming months. Links to both current documents and information about the planning process are provided below.

- https://www.mwdh2o.com/planning-for-tomorrow/how-we-plan/integrated-resource-plan/
- https://www.mwdh2o.com/planning-for-tomorrow/how-we-plan/

Response 1-2

The commenter adds that separating SWP GHG impacts is reasonable, however for project evaluations and understanding the overall benefits, it would be helpful to have the aggregated GHG number as a comparison.

This comment relates to the contents of the proposed CAP and does not raise concerns regarding the adequacy of the Draft PEIR or the CEQA process; no revisions have been made to the Draft PEIR.

Metropolitan's CAP is a GHG reduction plan aimed at identifying GHG emissions from within its operational control; therefore, emissions were calculated for its own operations including conveyance, treatment and distribution of SWP water from where it enters Metropolitan's system. DWR has its own CAP, which identifies emissions reductions for its operations. While an aggregated number will not be used in the Metropolitan's CAP, Metropolitan understands that having an aggregated emissions factor for the imported water to Southern California is beneficial to better understand the overall emissions related to imported water, therefore a discussion of DWR's emissions is provided in Topical Response A and a detailed discussion of the overall embedded energy of water imported to Southern California has been added to Appendix B of the Final CAP.

Letter 2

From: Kim, Theresa
To: EPT
Subject: CAP PEIR
Date: Tuesday, December 28, 2021 12:17:53 PM

To whom this may concern,

The Los Angeles Department of Water and Power's Water Resources Division recently reviewed the draft MWD Climate Action Plan. The CAP helps to show how Metropolitan will reduce GHG emissions in their operations; however, I have a couple questions. LADWP tracks their carbon emissions related to our operations and purchases and would like to know if MWD will provide their System Average GHG metric to Member Agencies so we can account for Scope 3 emissions related to purchase of water from your company. The other question that we have is regarding Strategy 8. We would like to know more about how the water conservation and local supply program will reduce Scope 3 emissions. 2-1 2-2

Feel free to contact me at (213) 367-1491 to discuss the questions.

Thanks so much,

Theresa Kim
Water Resources Division
Los Angeles Department of Water and Power
111 N. Hope Street, Room 308
Los Angeles, CA 90012
(213) 367-1491

Response to Comment Letter 2

COMMENTER: Theresa Kim, Los Angeles Department of Water and Power (LADWP) Water Resources Division

DATE: December 28, 2021

Response 2-1

The commenter asks if Metropolitan will provide its System Average GHG metric to Member Agencies, such as LADWP, to account for Scope 3 emissions related to purchase of water.

Metropolitan's CAP is a GHG reduction plan aimed at identifying GHG emissions from within its operational control; therefore, emissions were calculated for its own operations including conveyance, treatment and distribution of SWP water from where it enters Metropolitan's system. DWR has its own CAP, which identifies emissions reductions for its operations. While an aggregated number will not be used in the Metropolitan's CAP, Metropolitan understands that having an aggregated emissions factor for the imported water to Southern California is beneficial to better understand the overall emissions related to imported water, therefore a discussion of DWR's emissions is provided in Topical Response A and a detailed discussion of the overall embedded energy of water imported to Southern California has been added to Appendix B of the Final CAP.

The comment relates to the contents of the proposed CAP and does not raise concerns regarding the adequacy of the Draft PEIR or the CEQA process. No changes to the Draft PEIR are warranted in response to this comment.

Response 2-2

The commenter also requests additional information regarding Strategy 8 of the CAP, specifically how the water conservation and local supply program will reduce Scope 3 emissions.

Strategy 8 is a largely supportive measure that includes the implementation of new and continued funding of existing water conservation programs aimed at reducing local water use and thereby indirectly reducing GHG emissions associated with transport and delivery of water. While Strategy 8 measures clearly reduce emissions associated with conveyance and treatment of water, the measures were included under Scope 3 because though Metropolitan can invest in and encourage water conservation efforts, the decision to participate in the programs, such as purchase of low flush toilets, lies outside of Metropolitan's control.

The comment relates to the contents of the proposed CAP and does not raise concerns regarding the adequacy of the Draft PEIR or the CEQA process. No changes to the Draft PEIR or Draft CAP are warranted in response to this comment.

Letter 3

COUNTY of VENTURA
RESOURCE MANAGEMENT AGENCY
DAVE WARD, AICP
Planning Director

DATE: November 29, 2021

TO: Metropolitan Water District of Southern California

FROM: Abigail Convery, Senior Planner and Biologist

SUBJECT: Climate Action Plan and Draft Environmental Impact Report (RMA 20-005-1)

Thank you for the opportunity to comment on the Metropolitan Water District of Southern California's Climate Action Plan and Draft Environmental Impact Report (EIR) (RMA 20-005-1). The Water District should be commended for developing a Climate Action Plan to achieve carbon neutrality by 2045. Section 2.5 of the Draft EIR lists nine projects that would reduce energy use and/or sequester carbon, but none of these projects are proposed within Ventura County. This comment letter is simply regarding one factual correction to the document, as described below.

Within the Biological Resource section of Draft Environmental Impact Report, Section 4.2.3.3-Local Policies and Adopted/Approved Plans, should acknowledge Locally Important Species which are animal and plant communities designated as significant biological resources to be protected from incompatible land uses and development according to the Ventura County General Plan COS-1 Goal and Policy COS-1.1. The Locally Important Species list available on our website https://vcrma.org/ventura-county-locally-important-species-list. 3-1

Thank you for the opportunity to comment on the Climate Action Plan and Draft Environmental Impact Report (EIR). Please evaluate Locally Important Species for any discretionary projects that will occur within unincorporated Ventura County. If you have questions regarding the information set forth in this memo, please contact Abigail Convery, at (805) 654-2489 or via email at Abigail.Convery@ventura.org.

HALL OF ADMINISTRATION #1740
805-654-2481 • FAX 805-654-2509 • 800 South Victoria Avenue, Ventura, CA 93009 • vcrma.org

Response to Comment Letter 3

COMMENTER: Abigail Convery, Senior Planner and Biologist, County of Ventura

DATE: November 29, 2021

Response 3-1

The commenter acknowledges that none of the proposed projects in the Draft PEIR are within Ventura County. Additionally, the commenter suggests that Section 4.2.3.3, *Local Policies and Adopted/Approved Plans*, of the Biological Resources section of the Draft PEIR should acknowledge Locally Important Species, which are animal and plant communities designated as significant biological resources to be protected from incompatible land uses and development according to the Ventura County General Plan COS-1 Goal and Policy COS-1.1.

Section 4.2.3.3, *Local Policies and Adopted/Approved Plan*s, of the Draft PEIR, states that local general plans contain elements which address protection of biological resources, including special status species. As described on page 114 of the Draft PEIR, Metropolitan would comply with any applicable local policies or ordinances protecting biological resources. While the exact location of all projects that may be implemented under the proposed program are not known at this time, the commenter's statement that there are currently no proposed project sites in Ventura County is correct.

Air Pollution Control Officer

VENTURA COUNTY
AIR POLLUTION CONTROL DISTRICT
Memorandum

TO: Malinda Stalvey, Senior Environmental Specialist DATE: January 4, 2022

FROM: Nicole Collazo, Air Quality Specialist, Planning Division

SUBJECT: Public Comment for the Metropolitan Water District of Southern California Climate Action Plan (CAP) and Draft Environmental Impact Report (DEIR) (RMA 20-005-1)

Air Pollution Control District (APCD) staff have reviewed the subject CAP and DEIR for the project referenced above (project). The Lead Agency for the project is the Metropolitan Water District of Southern California (Metropolitan), which has jurisdiction over portions of Los Angeles, Riverside, Orange, San Bernardino, San Diego, and Ventura counties.. APCD as a Commenting Agency has the following comments about the draft CAP and EIR as it pertains to air quality and/or greenhouse gas environmental impact sections.

GENERAL COMMENTS

4-1

Draft Climate Action Plan

Item 1, Page 5.27-5.28. DC-1 and DC-2 have conflicting deadlines. DC-1 intends to establish a schedule to replace all natural gas equipment in Metropolitans' buildings to electric by 2025, yet DC-2 states natural gas from the same sources (Metropolitans' buildings, etc.) will be reduced by 50% by 2030. DC-2 then goes on to say some natural gas-fired equipment will be replaced as it ends its lifetime, and that may be after the intended replacement deadline of 2025, and even 2030.

Item 2, Page 5.34 As part of Measure FL-4 Phase 1's ZEV/EV Feasibility Study, it is encouraged to factor in costs and commitment to apply to applicable air district's incentive grants program(s), which include funding the cost of EV infrastructure installations. For more information regarding the VCAPCD's Incentive Programs, please visit http://www.vcapcd.org/grant_programs.htm .

4-2

Item 3, Page 5.37. The implementation year for Measure AF-2 is 2021, which has already passed. If not implemented yet, it is recommended the year be changed to reflect the measure's current status, and concurrently AF-3 as it depends on the 2021 Pilot Study referenced in Measure AF-2.

4-3

Item 4, Page 5.4. Scope 1 Strategy 1 states "natural gas-powered equipment can be electrified over time as the equipment reaches the end of its useful life". This strategy is not proactive and in line with the goal of a climate action plan, as the end life of some equipment may exceed 2025, 2030,

4-4

and perhaps 2045 in some cases, depending on when the equipment was purchased. Consider rewording this strategy or stating all natural gas equipment will be replaced by a concrete date. 4-4

Item 5, Table 6-1. The implementation year for several strategies are past due (2021 for DC-2, E-5, EC-2, EC-5, WC-3). Consider updating these implementation years unless already begun in 2021. 4-5

Draft Environmental Impact Report

Item 1, Page 101. We recommend adding the statement "and make assessment available to the applicable air district for review" in the last sentence of Mitigation Measure AQ-1. 4-6

Item 2, Page 101. We recommend adding the statement "unless a lower VOC is required from applicable air district prior to mitigation." in the last sentence of Mitigation Measure AQ-2. For example, the current VOC limit for VCAPCD is 50 g/L for general coatings. 4-7

Thank you for the opportunity to comment on the project's draft CAP and EIR. You may reach me at nicole@vcapcd.,org should you have any questions.

Response to Comment Letter 4

COMMENTER: Nicole Collazo, Air Quality Specialist, Ventura County Air Pollution Control District

DATE: January 4, 2022

Response 4-1

The commenter states the Air Pollution Control District has reviewed the CAP and the Draft PEIR and notes that on pages 5.27 and 5.28 of the CAP, measures DC-1 and DC-2 have conflicting deadlines.

The comment relates to the contents of the proposed CAP and does not raise concerns regarding the adequacy of the Draft PEIR or the CEQA process. Metropolitan is committed to reducing its natural gas consumption. Measure DC-1 ensures that an analysis of natural gas consuming equipment is completed no later than 2025. The analysis will include cost-effective replacement options, a budget, and an established replacement schedule. Measure DC-1 is a complementary, supportive measure that is critical to the success of the quantifiable Measure DC-2 which includes a commitment to reduce Metropolitan's natural gas emissions by 50 percent by 2030.

Response 4-2

The commenter references page 5.34 of the CAP, specifically measure FL-4 Phase 1's ZEV/EV Feasibility Study and encourages Metropolitan to factor in costs and commitment to apply to applicable air district's incentive grants program(s). Additionally, the commenter provided information on their EV infrastructure incentive programs on their website.

The comment relates to the contents of the proposed CAP and does not raise concerns regarding the adequacy of the Draft PEIR or the CEQA process. Metropolitan initiated a comprehensive ZEV/EV Feasibility Study in January 2022 and anticipates a completion date by January 2023. The Scope of Work includes a study of available vehicle options, preliminary infrastructure design plans, and identification of government grant and local agency incentive programs to ensure a cost-effective transition to ZEV/EV technology(s).

Response 4-3

The commenter notes the implementation year for measure AF-2 is listed in the CAP as 2021. If not implemented yet, the commenter recommends the year be changed to reflect the measure's current status. The commenter recommends measure AF-3 be updated accordingly, as it is dependent on the study referenced in AF-2.

The comment relates to the contents of the proposed CAP and does not raise concerns regarding the adequacy of the Draft PEIR or the CEQA process. A renewable diesel use pilot project for on-road and off-road vehicles was implemented in late 2021. Results from this pilot project will be used to determine the feasibility of implementing the interim measure of transitioning 100 percent of Metropolitan's diesel fuel use to renewable diesel. This strategy will be employed to reduce diesel emissions until such time that Metropolitan transitions its fleet to ZEV/EV as described in Strategy 2 – Zero-Emission Fleet.

Response 4-4

The commenter recommends rewording Scope 1, Strategy 1 in the CAP, or stating that all natural gas equipment will be replaced by an established date.

The comment relates to the contents of the proposed CAP and does not raise concerns regarding the adequacy of the Draft PEIR or the CEQA process. While electrification is an important step in decarbonization of natural gas equipment, not all natural gas consuming equipment can be electrified at this time. Metropolitan has committed to replacing 100 percent of its natural gas consuming equipment by 2045. For further discussion on the replacement of natural gas equipment, please see Response 4-1.

Response 4-5

The commenter recommends updating the implementation years that are past due unless already begun in 2021 for CAP measures DC-2, E-5, EC-2, EC-5, and WC-3.

The comment relates to the contents of the proposed CAP and does not raise concerns regarding the adequacy of the Draft PEIR or the CEQA process. All the measures identified are already being implemented. Therefore, the implementation schedule is correct.

Response 4-6

The commenter recommends adding the statement, "and make assessment available to the applicable air district for review," in the last sentence of Mitigation Measure AQ-1 on page 101 of the Draft PEIR.

Mitigation Measure AQ-1, as described on page 101 of the Draft PEIR, requires preparation of a project-specific construction air quality assessment for individual projects to be implemented under the CAP that involve construction activities with an intensity (i.e., size, schedule, equipment, demolition, import/export of soil, architectural coating) greater than the sample program activity described in Section 4.1, *Air Quality*, of the Draft PEIR. Future projects implemented under the CAP would be required to undergo the appropriate level of project-specific environmental review, during such time any applicable project-specific air quality analyses would be available as part of the public record during project approval. At such time, applicable air districts with jurisdiction over individual project sites would have the opportunity to review and/or comment on any project-specific construction air quality assessments. Because this would occur through the CEQA-required process, no changes to the mitigation measure are warranted.

Response 4-7

The commenter suggests adding the statement, "unless a lower [volatile organic compound] VOC is required from applicable air district prior to mitigation," in the last sentence of Mitigation Measure AQ-2, since the current VOC limit for VCAPCD is 50 grams per liter (g/L) for general coatings.

Section 4.1, *Air Quality*, of the Draft PEIR acknowledges that air districts promulgate their own rules with respect to VOC content limits for architectural coatings, which may be lower than 250 g/L. The list of emissions reduction measures described in Mitigation Measure AQ-2 is intended to be representative of the type of measures that may be included to reduce emissions from individual projects and is not an exhaustive list. Furthermore, as noted in footnote 20 on page 90 of the Draft PEIR, all contractors would be required to comply with applicable air district rules regarding VOC content limits for architectural coatings, which may be more stringent than 250 g/L depending on the air district and type of coating. Because compliance with the applicable air district's required VOC content limit constitutes regulatory compliance, no changes to the mitigation measure are warranted.

RE: SCAG Comments on the Draft Program Environmental Impact Report for the Metropolitan Water District of Southern California Climate Action Plan (CAP) [SCAG NO. IGR10524]

Dear Ms. Stalvey,

Thank you for submitting the Notice of Availability of the Draft Program Environmental Impact Report for the Metropolitan Water District of Southern California Climate Action Plan (CAP) ("proposed project") to the Southern California Association of Governments (SCAG) for review and comment. The proposed project is a Climate Adaption Plan that establishes an inventory of historical and current greenhouse gas (GHG) emissions and outlines a strategy for reducing GHG emissions associated with future construction, operation, and maintenance activities by 40 percent below 1990 levels by year 2030.

Based on SCAG staff's review, the proposed project does not reference the most recently adopted 2020 Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS or Connect SoCal). SCAG staff comments are detailed in the attachment to this letter.

5-1

When available, please send the Final Program Environmental Impact Report to IGR@scag.ca.gov. If you have any questions regarding the attached comments, please contact the Intergovernmental Review (IGR) Program, attn.: Anita Au, Senior Regional Planner, at (213) 236-1874 or IGR@scag.ca.gov. Thank you.

Sincerely,

Frank Wen, Ph.D.
Manager, Planning Strategy Department

COMMENTS ON THE NOTICE OF AVAILABILITY OF A DRAFT PROGRAM ENVIRONMENTAL IMPACT REPORT FOR METROPOLITAN WATER DISTRICT OF SOUTHERN CALIFORNIA CLIMATE ACTION PLAN (CAP) [SCAG NO. IGR10524]

SUMMARY

Pursuant to Senate Bill (SB) 375, SCAG is the designated Regional Transportation Planning Agency under state law and is responsible for preparation of the Regional Transportation Plan (RTP) including the Sustainable Communities Strategy (SCS). SCAG's feedback is intended to assist local jurisdictions and project proponents to implement projects that have the potential to contribute to attainment of Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS) goals and align with RTP/SCS policies.

Based on SCAG staff review, the proposed project generally supports the applicable goals of the 2020 Connect SoCal, and the analysis in the Draft Program Environmental Impact Report is based on the growth forecasts adopted as part of the 2020 Connect SoCal.

5-1

CONNECT SOCAL GOALS

The SCAG Regional Council fully adopted Connect SoCal in September 2020. Connect SoCal, also known as the 2020 – 2045 RTP/SCS, builds upon and expands land use and transportation strategies established over several planning cycles to increase mobility options and achieve a more sustainable growth pattern. The long-range visioning plan balances future mobility and housing needs with goals for the environment, the regional economy, social equity and environmental justice, and public health. The goals included in Connect SoCal may be pertinent to the proposed project. These goals are meant to provide guidance for considering the proposed project. Among the relevant goals of Connect SoCal are the following:

SCAG CONNECT SOCAL GOALS	
Goal #1:	*Encourage regional economic prosperity and global competitiveness*
Goal #2:	*Improve mobility, accessibility, reliability and travel safety for people and goods*
Goal #3:	*Enhance the preservation, security, and resilience of the regional transportation system*
Goal #4:	*Increase person and goods movement and travel choices within the transportation system*
Goal #5:	*Reduce greenhouse gas emissions and improve air quality*
Goal #6:	*Support healthy and equitable communities*
Goal #7:	*Adapt to a changing climate and support an integrated regional development pattern and transportation network*
Goal #8:	*Leverage new transportation technologies and data-driven solutions that result in more efficient travel*
Goal #9:	*Encourage development of diverse housing types in areas that are supported by multiple transportation options*
Goal #10:	*Promote conservation of natural and agricultural lands and restoration of habitats*

5-2

Connect SoCal Strategies

To achieve the goals of Connect SoCal, a wide range of land use and transportation strategies are included in the accompanying twenty (20) technical reports. To view Connect SoCal and the accompanying technical reports, please visit the Connect SoCal webpage. Connect SoCal builds upon the progress from previous RTP/SCS cycles and continues to focus on integrated, coordinated, and balanced planning for land use and transportation that helps the SCAG region strive towards a more sustainable region, while meeting statutory requirements pertinent to RTP/SCSs. These strategies within the regional context are provided as guidance for lead agencies such as local jurisdictions when the proposed project is under consideration.

SCAG Staff Comments

SCAG staff recommends that you review 2020 Connect SoCal and consider its adopted goals and policies when finalizing the proposed project.

SCAG staff would like to call your attention to resources available from SCAG's Regional Climate Adaptation Framework including the Southern California Climate Adaptation Planning Guide, Communication and Outreach Toolkit, Library of Model Policies, and SB 379 Compliance Curriculum for Local Jurisdictions.

5-2

DEMOGRAPHICS AND GROWTH FORECASTS

A key, formative step in projecting future population, households, and employment through 2045 for Connect SoCal was the generation of a forecast of regional and county level growth in collaboration with expert demographers and economists on Southern California. From there, jurisdictional level forecasts were ground-truthed by subregions and local agencies, which helped SCAG identify opportunities and barriers to future development. This forecast helps the region understand, in a very general sense, where we are expected to grow, and allows SCAG to focus attention on areas that are experiencing change and may have increased transportation needs. After a year-long engagement effort with all 197 jurisdictions one-on-one, 82 percent of SCAG's 197 jurisdictions provided feedback on the forecast of future growth for Connect SoCal. SCAG also sought feedback on potential sustainable growth strategies from a broad range of stakeholder groups – including local jurisdictions, county transportation commissions, other partner agencies, industry groups, community-based organizations, and the general public. Connect SoCal utilizes a bottom-up approach in that total projected growth for each jurisdiction reflects feedback received from jurisdiction staff, including city managers, community development/planning directors, and local staff. Growth at the neighborhood level (i.e., transportation analysis zone (TAZ) reflects entitled projects and adheres to current general and specific plan maximum densities as conveyed by jurisdictions (except in cases where entitled projects and development agreements exceed these capacities as calculated by SCAG). Neighborhood level growth projections also feature strategies that help to reduce greenhouse gas emissions (GHG) from automobiles and light trucks to achieve Southern California's GHG reduction target, approved by the California Air Resources Board (CARB) in accordance with state planning law. Connect SoCal's Forecasted Development Pattern is utilized for long range modeling purposes and does not supersede actions taken by elected bodies on future development, including entitlements and development agreements. SCAG does not have the authority to implement the plan -- neither through decisions about what type of development is built where, nor what transportation projects are ultimately built, as Connect SoCal is adopted at the jurisdictional level. Achieving a sustained regional outcome depends upon informed and intentional local action. To access jurisdictional level growth estimates and forecasts for years 2016 and 2045, please refer to the Connect SoCal Demographics and Growth Forecast Technical Report. The growth forecasts for the region and applicable jurisdictions are below.

5-3

	Adopted SCAG Region Wide Forecasts			
	Year 2020	**Year 2030**	**Year 2035**	**Year 2045**
Population	19,517,731	20,821,171	21,443,006	22,503,899
Households	6,333,458	6,902,821	7,170,110	7,633,451
Employment	8,695,427	9,303,627	9,566,384	10,048,822

5-3

SCAG Staff Comments

SCAG staff recommends including a reference to the population, housing, and employment trends and forecasts of the most recently adopted SCAG 2020 Connect SoCal Regional Growth Forecasts.

MITIGATION

SCAG Staff Comments

SCAG staff recommends that you review the Final Program Environmental Impact Report (Final PEIR) for Connect SoCal for guidance, as appropriate. SCAG's Regional Council certified the PEIR and adopted the associated Findings of Fact and a Statement of Overriding Considerations (FOF/SOC) and Mitigation Monitoring and Reporting Program (MMRP) on May 7, 2020 and also adopted a PEIR Addendum and amended the MMRP on September 3, 2020 (please see the PEIR webpage and scroll to the bottom of the page for the PEIR Addendum). The PEIR includes a list of project-level performance standards-based mitigation measures that may be considered for adoption and implementation by lead, responsible, or trustee agencies in the region, as applicable and feasible. Project-level mitigation measures are within responsibility, authority, and/or jurisdiction of project-implementing agency or other public agency serving as lead agency under CEQA in subsequent project- and site- specific design, CEQA review, and decision-making processes, to meet the performance standards for each of the CEQA resource categories.

5-4

Response to Comment Letter 5

COMMENTER: Frank Wen, Ph.D., Manager, Planning Strategy Department, Southern California Association of Governments (SCAG)

DATE: January 6, 2022

Response 5-1

The commenter states the proposed CAP does not reference the most recently adopted 2020 Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS or 2020 Connect SoCal). However, the commenter adds the proposed program does generally support the applicable goals of 2020 Connect SoCal, and the analysis in the Draft PEIR is based on the growth forecasts adopted as part of 2020 Connect SoCal.

The comment relates to the contents of the proposed CAP and does not raise concerns regarding the adequacy of the Draft PEIR or the CEQA process. As acknowledged by the commenter, the analysis in the Draft PEIR is based on growth forecasts adopted as part of 2020 Connect SoCal. For more information on the growth forecasts employed in the Draft PEIR analysis, refer to Chapter 3, *Environmental Setting*, of the Draft PEIR. No changes to the Draft PEIR are warranted in response to this comment.

Response 5-2

The commenter provides information regarding SCAG's 2020 Connect SoCal adopted in September 2020. The commenter describes 2020 Connect SoCal's goals and recommends that 2020 Connect SoCal be reviewed, and its goals and policies be considered when finalizing the proposed program.

This comment is acknowledged and does not raise concerns pertaining to the adequacy of the Draft PEIR or the CEQA process. As described in the draft CAP, the CAP complements Metropolitan's other long-range planning efforts. As appropriate, other plans and programs intended to reduce GHG emissions at a regional scale have been reviewed in support of the CAP. No further response is required.

Response 5-3

The commenter provides information regarding SCAG's demographics and growth forecasts. The comment recommends including a reference to the population, housing, and employment trends and forecasts of the most recently adopted SCAG 2020 Connect SoCal Regional Growth Forecasts.

As acknowledged by the commenter, the analysis contained in the Draft PEIR is based on growth forecasts adopted as part of 2020 Connect SoCal. These growth forecasts are presented in Table 6 on page 60 of the Draft PEIR. No changes to the Draft PEIR are warranted in response to this comment.

Response 5-4

The commenter recommends the Final PEIR for 2020 Connect SoCal be reviewed for guidance related to mitigation measures.

Metropolitan appreciates this recommendation. Various program-level environmental documents, including the Final PEIR for 2020 Connect SoCal, were reviewed to inform the approach to analysis and mitigation for the Draft PEIR. No changes to the Draft PEIR are warranted in response to this comment.

From: Demkowicz, Erica
To: EPT
Cc: Reekstin, Scott; Huitron, Irma
Subject: RE; CAP PEIR Scoping - MWD - CITY OF TUSTIN RESPONSE
Date: Thursday, January 6, 2022 9:35:27 AM

Good Morning,

The City of Tustin has reviewed the Notice of Availability and PEIR for MWD's Climate Action Plan (CAP) and does not have any comments. 6-1

Regards,

Erica H. Demkowicz, AICP
Senior Planner
City of Tustin
Community Development Department
300 Centennial Way
Tustin, CA 92780
(714) 573-3127
edemkowicz@tustinca.org

Response to Comment Letter 6

COMMENTER: Erica H. Demkowicz, AICP, Senior Planner, Community Development Department, City of Tustin

DATE: January 6, 2022

Response 6-1

The comment states the Notice of Availability and Draft PEIR for the CAP were reviewed by the City of Tustin and the City does not have any comments.

This comment is acknowledged and does not raise concerns pertaining to the adequacy of the Draft PEIR, draft CAP, or the CEQA process. Therefore, no further response is required.

Los Angeles, CA 90054-0153

Sent via email to: EP@mwdh2o.com

RE: NOTICE OF AVAILABILITY – DRAFT CLIMATE ACTION PLAN, AND CLIMATE ACTION PLAN DRAFT PROGRAMMATIC ENVIRONMENTAL IMPACT REPORT

To Ms. Stalvey:

Heal the Bay is a non-profit environmental organization with over 35 years of experience and 15,000 members dedicated to making the coastal waters and watersheds of Greater Los Angeles safe, healthy, and clean. We would first like to recognize that we are on Indigenous land. The main office of Heal the Bay in Santa Monica is located on Tongva, Chumash, and Kizh land.[1] We acknowledge and respect Tongva, Chumash, and Kizh elders past, present, and emerging. Heal the Bay respectfully submits the following comments in response to the Metropolitan Water District (MWD) Draft Climate Action Plan (CAP) and CAP Draft Programmatic Environmental Impact Report (PEIR).

We would first like to acknowledge and commend MWD for creating this CAP and including interim goals to ensure achievement of carbon neutrality by 2045, as required by the State of California. We would also like to recognize the significant decrease in greenhouse gasses (GHGs) already achieved by MWD through actions such as conservation programs, groundwater recovery programs, and divesting in coal. However, the dimate crisis is a huge challenge that we can – and must – overcome. Bearing that in mind, we must all recognize that we can no longer pursue unsustainable practices. With limited time and resources to achieve global climate reduction requirements, and with the health of our communities and ecosystem on the line, we must focus efforts on the latest science and the best practices available, offering the most benefit. We offer the following comments to bolster the MWD CAP, and to ensure successful implementation moving forward.

- The MWD CAP must address the larger context of the climate crisis and its myriad impacts to properly assess the most effective path forward.
- GHG reduction targets and land management practices should be based on the latest science and best management practices available.
- MWD should focus strategy efforts on the most sustainable approaches and invest in multi-benefit projects that utilize vegetated nature-based solutions.
- MWD must strive for transparency throughout the process of assessing implementation, reporting on progress, and updating the CAP every 5 years or earlier if necessary.
- MWD should pursue project level EIRs for individual projects proposed in the CAP to better understand the impacts of the project, to fully investigate alternatives, and to ensure public participation in project development and review through the CEQA process.

These comments are discussed in further detail below.

7-1

Heal the Bay

1444 9th Street ph. 310-451-1500 info@healthebay.org
Santa Monica, CA 90401 fax 310-496-1902 www.healthebay.org

The MWD CAP must address the larger context of the climate crisis and its myriad impacts to properly assess the most effective path forward.

Explain additional climate planning that has been completed by MWD.

The climate crisis is about much more than GHG emissions. We appreciate that wildfires are addressed in this CAP, but other impacts such as sea level rise (which will affect not only our coastline but also inland areas with the myriad impacts of seawater intrusion), are not. Please include in Section 2.0 "Scientific Context and Climate Change Impacts" a full discussion of the myriad impacts of the climate crisis, and include references to other MWD planning documents, when applicable, where additional associated climate planning has been completed. 7-2

Provide an overview of the State Water Project and associated GHG emissions.

We request that MWD include in their CAP an overview of the State Water project and its associated GHG emission, as outlined in the California Department of Water Resources Climate Action Plan. We understand not wanting to double count these emissions, but it would be helpful to understand the bigger picture if there was information on what percentage of MWD emissions are from the State Water Project, and how that might change if MWD could reduce its need to import water by sourcing more water locally. 7-3

We also request that MWD include a new section in the CAP to recognize the importance of a healthy Bay Delta to climate resilience on a larger scale, considering how heavily MWD currently relies on the import of water from the Delta, and the impacts that water transportation can have on this important ecological area.

Make additional small edits for clarification.

We also offer a minor edit to Page 1.19 of the MWD CAP to recognize that the local environmental responses to climate fluctuations have been variable throughout California's history, on a geologic time scale, but that the 2011-2014 drought is the hottest and driest period in recorded history. 7-4

"This period includes the hottest and driest period in ~~California~~ recorded history for California..."

GHG reduction targets and land management practices should be based on the latest science and best management practices available.

Adjust the current interim goal (to exceed 40% below 1990 emissions by 2030) to align with the Intergovernmental Panel on Climate Change recommendation to achieve 49% below 2017 emissions by 2030.

The Paris Agreement recognizes that we must remain under a 1.5°C rise in average global temperature in order to avoid an ecological tipping point that makes it more difficult to sustain healthy natural systems. The latest report from the Intergovernmental Panel on Climate Change (IPCC) states that it is still possible to remain under this 1.5°C tipping point, but that it will require immediate action to reduce emissions by 49% below 2017 levels by 2030 and to achieve carbon neutrality by 2050 through a combination of reducing emissions and sequestering carbon. 7-5

The MWD CAP recognizes the California State requirements to achieve 40% below 1990 emissions by 2030. We appreciate that MWD has set their own goal to exceed this 40% reduction requirement by 2030 in order to ensure that carbon neutrality can be achieved by 2045, pursuant to Executive Order B-55-18. We encourage MWD to make this goal more specific, and in line with the best available science, by maintaining the final goal to achieve carbon neutrality by 2045, and including an interim goal to achieve a 49% reduction below 2017 levels by 2030.

Heal the Bay

1444 9th Street ph. 310-451-1500 info@healthebay.org
Santa Monica, CA 90401 fax 310-496-1902 www.healthebay.org

Update the definitions of low, average, and high emissions scenarios based on increases in local water supplies such as stormwater capture.

We urge MWD to update the definition of low, average, and high emissions scenarios (based on projections around the average rainfall year and therefore how much imported water is necessary) to reflect projected improvements in local stormwater capture as an additional source of local water supply. Between investments from water agencies (such as MWD), local funding through the Safe, Clean Water Program (SCWP), as well as available state and federal funding, the potential is enormous for stormwater capture to fulfill a high percentage of Southern California's water needs, thus reducing the need for imported water and providing additional opportunities to reduce GHG emissions. We encourage MWD to work with other local agencies and municipalities, such as the Los Angeles County Department of Public Works, to identify potential for collaboration and for increasing local water supply. 7-6

Land management practices should pursue multiple benefits and be conducted in consultation with local and Indigenous expertise.

The language used focuses on the threat wildfire poses to the workers on site and the MWD owned buildings. MWD should instead make it clear that these wildfire prevention measures are needed to preserve human life on and off MWD property, protect public health and quality of life from impacts to air quality and water quality, and to protect lands surrounding MWD property. We also recommend that MWD work with local and Indigenous experts to properly manage MWD owned land. MWD should also make sure that traffic control plans for wildfire emergencies are heavily scrutinized, as wildfires continue to increase in intensity. In addition to identifying wildfire hazard zones, MWD should also take into account sensitive ecosystems and habitat areas that could be impacted by wildfire. If operations will increase the wildfire risk to a significant natural area, MWD should take extra precautions. MWD also states that some jurisdictions have more stringent wildfire restrictions than others. We urge MWD to follow the most stringent regulations at all developments, regardless of jurisdiction, except where necessary to protect local ecological health (e.g. not removing more vegetation than is necessary, etc.). This approach will be most protective of human life, local ecosystems, and MWD facilities. 7-7

We also recommend that MWD utilize vegetated nature-based solutions to the extent feasible on all projects moving forward, again conducted in consultation with local and Indigenous experts. Examples of GHG reduction efforts in the CAP include conservation of natural lands, which is important; however, MWD cannot use existing natural space to offset future emissions in order to achieve carbon neutrality by 2045. New natural space must be created or restored in order to generate the sequestration necessary to offset any continued emissions, and there are opportunities for creating new natural spaces within the scope of MWD planned projects. For example, road construction will be necessary to lay piping for the Regional Recycled Water Project, and that construction can include replacing existing roads with Living Streets.[2] MWD could even pursue local funding through Measures W and M to cover any additional costs, and the myriad benefits would far surpass the limited co-benefits currently identified in the MWD CAP. An added benefit to this approach of using vegetated nature-based solutions is that healthy soils with healthy vegetation and microbial ecosystems can actually hold more water, increasing our capacity for natural water storage, as well. 7-8

[2] Climate Resolve, GreenLA Coalition, and Heal the Bay. "Living Streets Economic Feasibility Study Final Report." Available at: https://healthebay.org/sites/default/files/pdf/fact-sheets/Final%20Living%20Streets%20Working%20Economic%20Feasibility%20%20Final%20Print%20Version%20022616.pdf

Heal the Bay

1444 9th Street ph. 310-451-1500 info@healthebay.org
Santa Monica, CA 90401 fax 310-496-1902 www.healthebay.org

MWD should focus strategy efforts on the most sustainable approaches and invest in multi-benefit projects that utilize vegetated nature-based solutions.

We generally support the goals for GHG emissions reduction and the plans to achieve reduction outlined in Strategies 1-6 of the MWD CAP. We appreciate ways in which MWD has taken responsibility for emissions that fall within their operational control down to very fine details and even including planned contracted construction work. However, one major oversight is consideration of GHG emission associated with the manufacturing of supplies used by MWD or its contractors such as the production of asphalt for repaving. 7-9

MWD should remove all reference to "Low Carbon Electricity" from Strategy 4, and instead focus entirely on renewable carbon-free sources of electricity.

We do have some concerns regarding Strategy 4: Utilize Low-Carbon and Carbon-Free Electricity. There is a definition in the CAP for carbon-free electricity ("electricity produced by a resource that generates no carbon emissions") with a few examples given as renewable energy (such as photovoltaic, nuclear, and large hydroelectric sources). MWD should include clarifying language to explain their definition of Carbon-Free Electricity that "generates no carbon emissions" refers to the power generation itself, and not to include emissions from, for example, construction of associated power generating or storage facilities. We further urge MWD to modify this definition to include only renewable energy and to prioritize renewable energy sources with fewer negative environmental impacts. For instance, nuclear and large hydroelectric sources for energy should be deprioritized given the known environmental issues with nuclear waste disposal and impacts to riparian ecology and anadromous fish from dams. In particular, we do not support the creation of new dams for energy (or water) needs. Additionally, MWD should remove any reference to "Low-Carbon" from Strategy 4 and focus on renewable carbon-free energy sources. At a minimum, MWD must clearly define "Low-Carbon Electricity" within the context of this CAP. 7-10

MWD must support movement towards a circular economy as part of Strategy 7.

We support the Phase 1 measure of zero landfilled waste, as these GHG emissions from waste are not insignificant, as well as the prioritization of these measures into the short-term Phase 1 strategies. However, zero landfilled waste is not attainable with continued widespread use of non-recyclable or non-compostable products, most notably many types of single-use plastic such as polystyrene. Therefore, to achieve this goal, MWD must also support strategies that phase these products out of the consumer market chain and support movement towards a circular economy.

As a fossil fuel product, emissions from plastics are a serious contribution to overall GHG emissions throughout the entire lifecycle of the material and is on trend to "account for 20% of total oil consumption and 15% of the global annual carbon budget by 2050 (this is the budget that must be adhered to in order to achieve the internationally accepted goal to remain below a 2°C increase in global warming)."[3] We suggest that MWD support municipalities such as the Los Angeles City Council in developing and passing policies, many of which are already in motion, that reduce not only the disposal of GHG emitting plastics into landfill, but truly phase out non-recyclable and non-compostable options and support reuse and refill to truly reduce waste from the source and achieve zero net waste. 7-11

[3] World Economic Forum. 2016. "The New Plastic Economy: Rethinking the Future of Plastic." Available at: https://www3.weforum.org/docs/WEF_The_New_Plastics_Economy.pdf

Heal the Bay

1444 9th Street ph. 310-451-1500 info@healthebay.org
Santa Monica, CA 90401 fax 310-496-1902 www.healthebay.org

We are supportive of Strategy 8, though we encourage MWD to invest further in stormwater capture, and incorporate vegetated nature-based solutions into all projects moving forward.

We support expanding MWD education programs, as well as the continuation of water efficiency programs. We encourage MWD to also expand all successful water efficiency programs to the extent possible to ensure accessibility.

We also support the turf removal program. However, we do request that MWD include a clear definition for "water efficient landscapes" to not include impermeable surfaces and to prioritize landscapes utilizing climatically appropriate native plant species. We also encourage MWD to expand any incentives associated with this program and to pursue the option for a funding program to provide access for low-income households or historically under-resourced communities.

7-12

We most certainly support funding for stormwater projects, but this can no longer be considered a pilot project. The water supply benefits of stormwater capture are well known and documented, as reported by LA for a New Economy in 2018[4] and the Pacific Institute in 2020.[5] The successful passage of Measure W and creation of the Safe, Clean Water program in 2018 provides further evidence, and also provides the potential for additional project funding which could be leveraged with existing MWD resources to create multi-benefit stormwater capture projects. Examples of the types of projects that MWD is pursuing provided in the CAP are spreading basins, dry wells, and infiltration galleries. However, the ecosystem health co-benefit claimed for these types of projects are limited, at best. As discussed above, multi-benefit projects using vegetated nature-based solutions are the best way to achieve ecosystem health benefits and can offer immense return on investment costs through other co-benefits, as well. This can also make these kinds of projects more competitive for securing additional funding.

7-13

Similarly, we also support the Regional Recycled Water Project. Increased use of recycled wastewater is another smart water practice that Heal the Bay supports. However, there are opportunities to utilize vegetated nature-based solutions (e.g. implementing Living Streets during necessary road construction for setting new pipelines) that MWD is not yet pursuing. In fact, the pumping stations required for this project will significantly increase energy demand, and carbon sequestration will be necessary to offset that demand. Living Streets is one way to increase local carbon sequestration.

7-14

MWD should prioritize natural carbon sequestration, and not rely too heavily on engineered solutions for carbon capture and storage.

MWD should focus efforts on continuing restoration and protection of natural spaces and on creation of new natural space through the implementation of vegetated nature-based solutions within projects moving forward. Engineered solutions for carbon capture and storage do not provide the myriad co-benefits that vegetated nature-based solutions offer. Therefore, MWD should not rely too heavily on future technological advances in these kinds of engineered solutions.

Additionally, we do support regenerative agriculture practices, and encourage MWD to conduct this work in coordination with local and tribal land management experts. Particularly for strategy

Santa Monica, CA 90401 fax 310-496-1902 www.healthebay.org

CS-3 for soil carbon sequestration, MWD should collaborate with groups such as the Marin Carbon Project to maximize soil carbon sequestration on all MWD owned land.[6]

MWD must strive for transparency throughout the process of monitoring implementation, reporting on progress, and updating the CAP every 5 years or earlier if necessary.

We appreciate that MWD has opted to define specific reduction targets in this CAP, and support the carbon budget approach to measure progress towards meeting its GHG reduction goals. We understand that the Climate Working Group will provide updates on CAP implementation progress and status of the carbon budget to the Board of Directors on an annual basis, and that this process will also include updates on Metropolitan's CAPDash and monitoring software, which will be used to provide transparent and regular updates for stakeholders. To ensure full transparency, please include in the CAP a detailed list of information that will be shared through the CAPDash website to ensure that the public will have access to all the necessary information to assess progress. 7-16

One piece of information that should be disclosed through the CAPDash website is a clear statement of whether or not MWD is on track to achieving both the interim 2030 reduction goal and the final 2045 carbon neutrality goal, with supporting evidence to back the statement up. This will not only provide transparency to the public for the implementation process, but also allow for public engagement if it does become necessary to update the CAP prior to the designated 5-year interval. Please also include in the first annual report a determination of whether or not WMD met the 2020 projected target necessary to achieving carbon neutrality by 2045, as outlined in Figure 4-1 of the MWD CAP. 7-17

In addition to transparency through the CAPDash website, MWD should begin immediate outreach and engagement on the next 5-year update to engage local communities, as well as the environmental community at large, early and often in the update process. 7-18

MWD should pursue project level EIRs for individual projects proposed in the CAP to better understand the impacts of the project, to fully investigate alternatives, and to ensure public participation in project development and review through the CEQA process.

It is unclear why a PEIR is necessary at this time rather than approving the MWD CAP now, moving forward with implementation, and conducting project level EIRs as necessary. The PEIR recognizes one of the main issues still to be addressed: how to address impacts from individual projects under the proposed CAP. The PEIR states that it serves as a first-tier CEQA document that will support second-tier CEQA documents for individual projects to be implemented under the proposed CAP. It also states that the projected significant and unavoidable impacts in the resource categories of air quality, cultural resources, and noise may change once individual project details are known and project-level analysis occurs. Therefore, it is still unclear what level of environmental investigation will be required for any given project proposed in the CAP, particularly since projects outlined in the CAP have yet to be approved by the MWD Board. For example, how will the impacts of larger scale infrastructure projects (like those on the scale of the Regional Recycled Water Project) be addressed? Some specific examples would be helpful. 7-19

MWD must also revisit the alternatives section of the draft PEIR. This is another area where the PEIR will be insufficient and a project level EIR would be more appropriate. The only alternatives explored are an alternate location (rejected due to restrictions around MWD owned properties), alternative methods (rejected without much detail because other methods would also result in similar construction related impacts), and no project (which would result in having to face the broader implications of the climate crisis). However, this alternatives section does not explore the full breadth of approaches that MWD could pursue, including the recommendations provided in this letter.

Heal the Bay

1444 9th Street ph. 310-451-1500 info@healthebay.org
Santa Monica, CA 90401 fax 310-496-1902 www.healthebay.org

Thank you for the opportunity to comment on the Draft Climate Action Plan and associated Draft Programmatic Environmental Impact Report. We believe that the Climate Action Plan, with the recommendations provided above, has the potential to contribute significantly to global GHG reduction goals, and serve as an example of good climate practice. MWD states in the CAP that it can be used by the 26 member agencies when considering local policies and programs. We encourage MWD to work collaboratively with these 26 member agencies now, and consider providing requirements or incentives where feasible to include member agencies in these plans and in achieving similar goals. In this way, the MWD CAP can have broader implications even beyond those that fall under operational control.

7-20

We look forward to continuing our collaborative work with the Metropolitan Water District in order to ensure a sustainable, affordable, and accessible water future for Southern California. If you have any questions concerning this comment letter, please contact Annelisa Moe via e-mail at amoe@healthebay.org, or by telephone at (310) 451-1500 X115.

Sincerely,

Annelisa Ehret Moe
Water Quality Scientist
Heal the Bay

Science and Policy Director
Heal the Bay

Response to Comment Letter 7

COMMENTER: Annelisa Ehret Moe, Water Quality Scientist, Heal the Bay
Dr. Katherine Pease, Science and Policy Director, Heal the Bay

DATE: January 6, 2022

Response 7-1

The commenter provides background on Heal the Bay and commends Metropolitan for creating the CAP. The commenter then offers a bulleted list of comments that are addressed in greater detail in the remainder of the letter.

This comment is acknowledged and does not raise concerns pertaining to the adequacy of the Draft PEIR or the CEQA process. Responses to more detailed comments included in this comment letter are provided below.

Response 7-2

The commenter recommends adding information on additional climate planning that has been completed by Metropolitan as well as a full discussion of all impacts associated with the climate crisis in Section 2.0, *Scientific Context and Climate Change Impacts*, of the CAP.

The comment relates to the contents of the proposed CAP and does not raise concerns regarding the adequacy of the Draft PEIR or the CEQA process. Section 2.2 of the proposed CAP provides a detailed discussion of climate impacts that affect Metropolitan's operations including sea-level rise, reduced snowpack in the Sierra Nevada and the Rocky Mountains, increased threat from wildfires, and extreme heat events. Metropolitan's CAP is a greenhouse gas reduction plan and does not address resource adequacy or adaptation efforts. Impacts associated with the climate crisis are also addressed in Metropolitan's UWMP and IRP, which are incorporated by reference in the CAP. No changes to the Draft PEIR or Draft CAP are warranted as a result of this comment.

Response 7-3

The commenter recommends providing an overview of the SWP and associated GHG emissions as outlined in the DWR CAP. The comment also requests that Metropolitan include a new section in the CAP to recognize the importance of a healthy Bay Delta to climate resilience on a larger scale.

The comment relates to the contents of the proposed CAP and does not raise concerns regarding the adequacy of the Draft PEIR or the CEQA process. While Metropolitan recognizes that a healthy Bay Delta ecosystem is important for climate resilience, it is beyond the scope of the Draft CAP. Metropolitan's CAP is a GHG reduction plan aimed at identifying GHG emissions from within its operational control, therefore emissions were calculated for its own operations including conveyance, treatment and distribution of SWP water from where it enters Metropolitan's system. DWR has its own CAP, which identifies emissions reductions for its operations. While an aggregated number will not be used in the Metropolitan's CAP, Metropolitan understands that having an aggregated emissions factor for the imported water to Southern California is beneficial to better understand the overall emissions related to imported water, therefore a discussion of DWR's emissions is provided in Topical Response A and a detailed discussion of the overall embedded energy of water imported to Southern California has been added to Appendix B of the Final CAP. No changes to the Draft PEIR are warranted as a result of this comment.

Response 7-4

The commenter recommends the following edits to Page 1.19 of the CAP to recognize that the local environmental responses to climate fluctuations have been variable throughout California's history: "This period includes the hottest and driest period in ~~California~~ recorded history for California…."

The comment relates to the contents of the proposed CAP and does not raise concerns regarding the adequacy of the Draft PEIR or the CEQA process. Metropolitan agrees with the recommended edits. The CAP has been updated accordingly.

Response 7-5

The commenter recommends adjusting the current interim goal stated in the CAP (to exceed 40 percent below 1990 emissions by 2030) to align with the Intergovernmental Panel on Climate Change (IPCC) recommendation to achieve 19 percent below 2017 emissions by 2030.

The comment relates to the contents of the proposed CAP and does not raise concerns regarding the adequacy of the Draft PEIR or the CEQA process. Metropolitan was unable to locate any reference for 19 percent below 2017 emissions. However, the IPCC states that, "Global net human-caused emissions of carbon dioxide (CO2) would need to fall by about 45 percent from 2010 levels by 2030, reaching 'net zero' around 2050. This means that any remaining emissions would need to be balanced by removing CO2 from the air."[3] However, this number is not specific to California where GHG emissions have already fallen to below 1990 levels while global emissions have increased during this time. According to the International Energy Agency (IEA), global emissions increased from 20.5 GT to 31.5 GT globally (65 percent) between 1990 and 2017. Metropolitan emissions decreased by nearly 70 percent during this same time period.[4] Metropolitan is already in line with and exceeding the IPCC targets by charting a linear course to carbon neutrality by 2045. By meeting the goals set forth in the CAP, consistent with the California legislation, Metropolitan will meet or exceed the IPCC recommendations. No changes to the Draft PEIR or Draft CAP are warranted as a result of this comment.

Response 7-6

The commenter recommends updating the definitions of low, average, and high emissions scenarios in the CAP based on increases in local water supplies such as stormwater capture.

The comment relates to the contents of the proposed CAP and does not raise concerns regarding the adequacy of the Draft PEIR or the CEQA process. Metropolitan agrees that stormwater capture is a key action to increase local water and decrease emissions. However, the projections are based on Metropolitan's current demand forecasts and the UWMP. Potential reductions due to stormwater management are covered under Strategy 8 of the GHG reduction measures. No changes to the Draft PEIR or Draft CAP are warranted as a result of this comment.

Response 7-7

The commenter recommends land management practices pursue multiple benefits and be conducted in consultation with local and indigenous expertise. Specifically, the commenter suggests Metropolitan should clarify wildfire prevention measures are needed to preserve human life on and off-Metropolitan property, protect public health and quality of life from impacts to air quality and water quality, and protect lands surrounding Metropolitan property. The commenter adds traffic control plans for wildfire emergencies should be heavily scrutinized and Metropolitan should follow

[3] https://www.ipcc.ch/2018/10/08/summary-for-policymakers-of-ipcc-special-report-on-global-warming-of-1-5c-approved-by-governments/
[4] https://www.iea.org/reports/global-energy-review-2021/co2-emissions

the most stringent wildfire restrictions regardless of the jurisdiction in which activities under the proposed program would occur.

Wildfire impacts associated with implementation of the CAP are discussed in Section 5.15, *Wildfire*, of the Draft PEIR. Impacts are assessed pursuant to Appendix G of the *State CEQA Guidelines*, which state a significant wildfire impact would occur if implementation of the proposed program would, within or near a State Responsibility Area (SRA) or Very High Fire Hazard Severity Zone (FHSZ):

- Substantially impair an adopted emergency response plan or emergency evacuation plan; or
- Due to slope, prevailing winds, and other factors, exacerbate wildfire risks, and thereby expose project occupants to pollutant concentrations from a wildfire or the uncontrolled spread of a wildfire; or
- Require the installation or maintenance of associated infrastructure (such as roads, fuel breaks, emergency water sources, power lines or other utilities) that may exacerbate fire risk or that may result in temporary or ongoing impacts to the environment; or
- Expose people or structures to significant risks, including downslope or downstream flooding or landslides, as a result of runoff, post-fire slope instability, or drainage changes.

The Draft PEIR describes the various fire prevention regulations with which Metropolitan must comply for all potential projects implemented under the CAP, including, but not limited to, California Public Resources Code Section 4442 (mandated use of spark arrestors), Sections 4427 and 4431 (standards for construction activities on days with high fire danger), and Section 4428 (required fire suppression equipment for contractors during high fire danger periods). Furthermore, the Draft PEIR describes applicable provisions of the California Fire Code with which Metropolitan would comply and acknowledges some jurisdictions have amended the California Fire Code to adopt more stringent fire-reduction measures. As such, Metropolitan would be required to comply with all applicable regulatory fire prevention measures.

Furthermore, as described on page 180 of the Draft PEIR, individual projects implemented under the CAP would generally occur within existing Metropolitan facilities and, therefore, are unlikely to interfere with an adopted emergency response plan. If temporary lane or roadway closures are required, contractors would be required to prepare a traffic control plan pursuant to the local and/or state traffic authority's requirements. To confirm adherence to these requirements, such plans would undergo review by the applicable local and/or state traffic authority to confirm adequate emergency access in the event of a wildfire emergency.

Given the discussion above, no changes to the Draft PEIR are warranted in response to this comment.

Response 7-8

The commenter recommends Metropolitan utilize vegetated nature-based solutions to the extent feasible on all projects moving forward, conducted in consultation with local and indigenous experts. The commenter specifically adds Metropolitan cannot use existing natural space to offset future emissions to achieve carbon neutrality, and new natural space must be created or restored.

The comment relates to the contents of the proposed CAP and does not raise concerns regarding the adequacy of the Draft PEIR or the CEQA process. Metropolitan has prioritized actions with multiple co-benefits and will coordinate with applicable stakeholders to implement these measures. Metropolitan understands that existing carbon sequestration benefits cannot mitigate new emissions, but enhancements in existing carbon sequestration can. Therefore, measure CS-3 calls for Metropolitan to establish baseline sequestration levels so that enhancements to this baseline can be

accurately quantified. No changes to the Draft PEIR or Draft CAP are warranted as a result of this comment.

Response 7-9

The commenter recommends Metropolitan focus strategy efforts on the most sustainable approaches and invest in multi-benefit projects that utilize vegetated nature-based solutions. The commenter recommends consideration of GHG emissions associated with the manufacturing of supplies used by Metropolitan or its contractors such as the production of asphalt for repaving.

The comment relates to the contents of the proposed CAP and does not raise concerns regarding the adequacy of the Draft PEIR or the CEQA process.

As discussed in Response 7-8, Metropolitan will continue to prioritize actions with multiple co-benefits such as nature-based solutions. Metropolitan will consider including life cycle emissions in future iterations of the CAP. This CAP is intended to align with the state of California's GHG reduction targets and the state does not currently incorporate consumptive based emissions. Therefore, Metropolitan will continue to use the state recommended protocols for its CAP and inventories. No changes to the Draft PEIR or Draft CAP are warranted as a result of this comment.

Response 7-10

The commenter recommends Metropolitan remove all reference to "Low Carbon Electricity" from Strategy 4 in the CAP, and instead focus entirely on renewable carbon-free sources.

The comment relates to the contents of the proposed CAP and does not raise concerns regarding the adequacy of the Draft PEIR or the CEQA process. The use of the term "low carbon electricity" refers to the incremental decarbonization of electricity for Metropolitan facilities. For example, Metropolitan is not currently able to purchase 100 percent carbon free electricity for all of its facilities, but options may exist to shift the load towards a higher renewable/carbon free percentage. To become entirely carbon-free will require a multi-pronged approach that will include battery energy storage, development of additional green energy resources and the implementation of efficiency measures such as those outlined in Strategy 5.0, for instance. These measures will ensure Metropolitan will continue to meet its GHG reduction goals. No changes to the Draft PEIR or Draft CAP are warranted as a result of this comment.

Response 7-11

The commenter recommends Metropolitan support movement towards a circular economy as part of Strategy 7 in the CAP. Specifically, the commenter supports the Phase 1 measure of zero landfilled waste, but states it is not attainable with continued widespread use of non-recyclable or non-compostable products.

The comment relates to the contents of the proposed CAP and does not raise concerns regarding the adequacy of the Draft PEIR or the CEQA process. Metropolitan will identify opportunities to achieve zero waste through the implementation of Strategy 7, which not only reduces landfill waste but includes a measure to implement a sustainable procurement policy to reduce or eliminate the use of non-recyclable or non-compostable products. No changes to the Draft PEIR or Draft CAP are warranted as a result of this comment.

Response 7-12

The commenter supports Strategy 8 and encourages Metropolitan to invest further in stormwater capture and incorporate vegetated nature-based solutions into all projects moving forward.

Specifically, the commenter recommends addition of a clear definition for “water efficient landscapes” to not include impermeable surfaces and prioritizing landscapes using climatically appropriate native plant species.

The comment relates to the contents of the proposed CAP and does not raise concerns regarding the adequacy of the Draft PEIR or the CEQA process. Metropolitan agrees that stormwater capture is a key component of Metropolitan's water supply and can reduce emissions. Metropolitan currently invests in stormwater recharge and direct use projects through the stormwater pilot program, a study that evaluates the water supply benefit of stormwater capture projects. Based on the results of the study, Metropolitan will include specific stormwater capture projects in future updates to the CAP. No changes to the Draft PEIR or Draft CAP are warranted as a result of this comment.

Response 7-13

The commenter supports funding for stormwater projects but adds these can no longer be considered pilot projects. The commenter adds projects considered in the CAP, such as spreading basins, dry wells, and infiltration galleries, have limited ecosystem health co-benefits and nature-based multi-benefit projects should be prioritized.

The comment relates to the contents of the proposed CAP and does not raise concerns regarding the adequacy of the Draft PEIR or the CEQA process. Metropolitan agrees that stormwater capture is a key component of Metropolitan's water supply and can reduce emissions. Metropolitan currently invests in stormwater recharge and direct use projects through a stormwater pilot program. This pilot study evaluates the water supply benefit of stormwater capture projects. Although Metropolitan's primary focus in local resource development is water supply, Metropolitan acknowledges that there may be opportunities to partner with other entities to achieve mutually beneficial goals. No changes to the Draft PEIR or Draft CAP are warranted as a result of this comment.

Response 7-14

The commenter supports the Regional Recycled Water Project (RRWP) but notes there are opportunities to use vegetated nature-based solutions that Metropolitan is not currently pursuing.

This comment is acknowledged and does not raise concerns regarding the adequacy of the Draft PEIR or the CEQA process. One of the purposes of the RRWP is to reduce discharges to the ocean from the Los Angeles County Sanitation Districts' Joint Water Pollution Control Plant by maximizing reuse to meet demands for groundwater replenishment, non-potable industrial needs, and raw water augmentation. However, opportunities to utilize vegetated nature-based solutions will be reviewed on a project-by-project basis and will be considered for future projects at Metropolitan. No changes to the Draft PEIR or Draft CAP are warranted as a result of this comment.

Response 7-15

The commenter recommends Metropolitan prioritize natural carbon sequestration, and not rely too heavily on engineered solutions for carbon capture and storage. The commenter also supports regenerative agriculture practices, such as CAP measure CS-3, and encourages Metropolitan to conduct this work in coordination with local and tribal land management experts.

The comment relates to the contents of the proposed CAP and does not raise concerns regarding the adequacy of the Draft PEIR or the CEQA process. Metropolitan appreciates the support of natural carbon sequestration and regenerative agriculture practices. Though a carbon capture and storage measure was included in the CAP, Metropolitan is prioritizing natural carbon sequestration due to its multiple co-benefits and is the only carbon sequestration approach being considered at this time. No changes to the Draft PEIR or Draft CAP are warranted as a result of this comment.

Response 7-16

The commenter recommends Metropolitan strive for transparency throughout the process of monitoring implementation, reporting on progress, and updating the CAP every five years or earlier if necessary. Specifically, the commenter requests that the CAP include a detailed list of information that will be shared through the CAPDash website and to ensure the public will have access to all the necessary information to assess progress.

The comment relates to the contents of the proposed CAP and does not raise concerns regarding the adequacy of the Draft PEIR or the CEQA process. Metropolitan agrees that transparency throughout the implementation and reporting phase is critical to the success of the CAP. Upon adoption of the CAP, work will begin on a customized, award-winning, web-based CAPDash tool that will track projects implemented, GHG emissions realized from measures detailed in the CAP, provide annual progress reports, and provide the status of the carbon budget. Should the CAPDash tool not have all the information necessary to assess Metropolitan's progress towards meeting its stated goals, Metropolitan will work with interested parties to ensure the appropriate level of data will be included to facilitate assessment of Metropolitan's progress. Outreach for the 5-year CAP update will begin when the CAP update begins. No changes to the Draft PEIR or Draft CAP are warranted as a result of this comment.

Response 7-17

The commenter requests a clear statement of whether Metropolitan is on track to achieving both the interim 2030 goal and the final 2045 carbon neutrality goal be included on the CAPDash website. The commenter adds a determination of whether Metropolitan met the 2020 projected target (as outlined in Figure 4-1 of the CAP) should be added to the first annual report.

This comment is acknowledged. Progress towards Metropolitan's goals will be included in annual progress reports. As shown in Figure 4-6 of the CAP, Metropolitan used 53 percent of their allocated carbon budget for the years 2005 to 2020. This means that Metropolitan exceeded their 2020 target (which exceeds the state target) by 47 percent. As detailed in the CAP and in Response 7-16, Metropolitan's progress will be through CAPDash, a publicly-accessible web-based tracking tool. The comment does not raise concerns regarding the adequacy of the Draft PEIR or the CEQA process. No changes to the Draft PEIR or Draft CAP are warranted in response to this comment.

Response 7-18

The commenter recommends Metropolitan begin immediate outreach and engagement on the next five-year update to engage local communities, as well as the environmental community at large.

This comment is acknowledged and the suggestion will be considered by Metropolitan. The comment does not raise concerns regarding the adequacy of the Draft PEIR, the adequacy of the CAP, or the CEQA process. No changes to the Draft PEIR or Draft CAP are warranted in response to this comment.

Response 7-19

This comment recommends Metropolitan pursue project-level EIRs for individual projects proposed in the CAP to better understand the impacts of the project, to fully investigate alternatives, and to ensure public participation in project development and review through the CEQA process.

The Draft PEIR provides a program-level analysis of potential environmental impacts associated with implementation of the CAP. As described in Chapter 4, *Environmental Impact Analysis*, the lack of project-specific details, such as the location of construction sites and proposed construction methods, limits the ability of this PEIR to determine the severity of impacts of specific project-level activities

covered by the CAP. As such, supplemental environmental analysis for individual projects to be implemented under the CAP would be required when project-specific details are known and projects are further defined. Individual projects would undergo the appropriate level of project-specific environmental review, including the appropriate level of analysis and public review pursuant to CEQA, prior to approval.

Response 7-20

This comment concludes the comment letter and thanks Metropolitan for the opportunity to comment on the Draft CAP and associated Draft PEIR. The commenter encourages Metropolitan to work collaboratively with its 26 member agencies now and consider providing requirements or incentives where feasible to include member agencies in these plans and in achieving similar goals.

The comment is acknowledged. Metropolitan has already begun collaboration with its member agencies on the CAP and supports their development of similar goals. The comment does not raise concerns regarding the adequacy of the Draft PEIR, the Draft CAP, or the CEQA process. No changes to the Draft PEIR or Draft CAP are warranted in response to this comment.

Letter 8

POSEIDON WATER

January 6, 2022

Ms. Malinda Stalvey, Senior Environmental Specialist
The Metropolitan Water District of Southern California
Environmental Planning Section
P.O. Box 54153
Los Angeles, CA 90054-0153
Office: (213) 217-5545
Email: EP@mwdh2o.com

RE: COMMENT LETTER RELATED TO THE NOTICE OF AVAILABILITY OF THE METROPOLITAN WATER DISTRICT OF SOUTHERN CALIFORNIA DRAFT CLIMATE ACTION PLAN

Dear Chairwoman Gray and Members of the Metropolitan Board of Directors:

Poseidon Water LLC (Poseidon) would like to commend Metropolitan staff for its excellent work and effort on the draft Climate Action Plan. Poseidon believes this document offers a robust, well-defined pathway for Metropolitan to achieve lower GHG emissions and eventual carbon neutrality.

Poseidon is the developer of both the Carlsbad Desalination Plant (began operating in 2015) and the Huntington Beach Desalination Project (expected to begin construction by 2023). Both seawater desalination facilities are located in Metropolitan's service territory in Southern California and are designed to produce approximately 50 million gallons of potable water per day on average. 8-1

Poseidon has made zero carbon emission guarantees associated with both projects, including the proposed Huntington Beach Desalination Project, which will be 100% carbon neutral through the purchase of renewable electricity and carbon offsets. While the process of seawater desalination requires a certain minimum amount of electricity (comparable on a volumetric basis to the amount of electricity required to import water from Northern California to Southern California through the State Water Project), the proposed reverse osmosis technology coupled with state-of-the-art energy recovery devices results in a highly efficient treatment process. The reverse osmosis seawater desalination process itself does not have any direct GHG emissions (Scope 1 emissions).

New projects such as the Huntington Beach Desalination Project help increase local supplies and reduce Southern California's reliance on imported water to meet expected future demands.[1] The Huntington Beach Desalination Project should be included as a part of Metropolitan's Climate Action Plan (CAP) because of its extraordinary commitment to 100% carbon neutrality. The Project offers a near-term opportunity to directly replace imported water supplies from the State Water Project and/or Colorado River Aqueduct with carbon neutral local water supplies. This is consistent with Metropolitan's CAP Strategy 4 (Utilize Low-Carbon and Carbon-Free Electricity), Strategy 5 (Improve Energy Efficiency), and Strategy 8 (Increase Water Conservation and Local Water Supplies). 8-2

Metropolitan's Phase 1 Emission Reduction Measure (E-3) states: *"In markets where available, Metropolitan will switch its retail accounts to green tariff options offered by power providers by 2025 to reduce the Scope 2 GHG emissions associated with retail electricity use."* Not all market areas offer viable green tariff options or community choice aggregation programs, therefore new water supply projects implemented between now and 2045 should be prioritized in geographic areas where they do have access to 100% renewable power options. In addition to green tariff options in Orange County offered by Southern

[1] See Metropolitan letters dates October 2, 2017, and June 13, 2019, to the Santa Ana Regional Water Quality Control Board

POSEIDON WATER

California Edison, the Orange County Power Authority is one such community choice aggregation program that could offer a 100% renewable power option for the Huntington Beach Desalination Project.

Poseidon appreciates the opportunity to comment on Metropolitan's draft Climate Action Plan and encourages the District to consider including the proposed Huntington Beach Desalination Facility in its Climate Action Plan as a Phase 1 Emission Reduction Measure. Poseidon would be happy to provide additional information about the Project to Metropolitan staff as necessary to support this inclusion. 8-2

Sincerely,

Scott Maloni
Vice President, Project Development
Poseidon Water

cc: Orange County Water District General Manager Michael R. Markus
Brian Probolsky, Chief Executive Office, Orange County Power Authority

Response to Comment Letter 8

COMMENTER: Scott Maloni, Vice President, Project Development, Poseidon Water

DATE: January 6, 2022

Response 8-1

This comment provides information about how Poseidon Water LLC is the developer of both the Carlsbad Desalination Plant and the Huntington Beach Desalination Project. The comment adds these facilities are located in Metropolitan's service territory and the reverse osmosis seawater desalination process Poseidon uses does not have any direct GHG emissions (Scope 1 emissions).

The comment is acknowledged and does not raise concerns regarding the adequacy of the Draft PEIR, Draft CAP, or the CEQA process. No changes to the Draft PEIR or Draft CAP are warranted in response to this comment.

Response 8-2

This comment encourages Metropolitan to consider including the proposed Huntington Beach Desalination Facility in its CAP as a Phase 1 Emission Reduction Measure, as it offers a near-term opportunity to directly replace imported water supplies from the SWP/Colorado River Aqueduct with carbon neutral local water supplies.

The development of low carbon/carbon free local water resources is in line with Metropolitan's CAP and the impacts of new water supplies will be reflected in future Metropolitan GHG emission inventories. The comment relates to the contents of the proposed CAP and does not raise concerns regarding the adequacy of the Draft PEIR or the CEQA process. No changes to the Draft PEIR or Draft CAP are warranted in response to this comment.

Letter 9

CENTER for BIOLOGICAL DIVERSITY Because life is good.

January 7, 2022

Sent via email

Ms. Malinda Stalvey
Senior Environmental Specialist
The Metropolitan Water District of Southern California
Environmental Planning Section
P.O. Box 54153
Los Angeles, California 90054-0153
EP@mwdh2o.com

Re: Comments on Public Review Draft of Metropolitan Water District of Southern California's Climate Action Plan and Draft Environmental Impact Report

Dear Metropolitan Water District of Southern California:

The Center for Biological Diversity ("Center") submits the following comments on the Metropolitan Water District ("MWD") of Southern California's Climate Action Plan ("Draft CAP") and Draft Environmental Impact Report ("DEIR"). While the Draft CAP includes some laudable goals, it suffers from a lack of specificity on tracking and implementation measures that would ensure significant reductions in regional greenhouse gas ("GHG") emissions. In addition, the DEIR does not accurately assess and mitigate impacts to hydrology, sensitive species and wildlife connectivity. We strongly urge MWD to incorporate more specific tracking methods and numeric targets for all measures listed in the plan as well as better account for impacts to native ecosystems in the EIR. 9-1

The Center is a non-profit, public interest environmental organization dedicated to the protection of native species and their habitats through science, policy, and environmental law. The Center has over 1.7 million members and online activists throughout California and the United States. The Center has worked for many years to protect imperiled plants and wildlife, open space, air and water quality, and overall quality of life for people in Southern California.

I. Climate Change Is an Urgent and Existential Concern.

Recent science has made clear that human-caused climate change is causing widespread harms to human society and natural systems, and climate change threats are becoming increasingly dangerous. In its 2018 *Special Report on Global Warming of 1.5°C*, the Intergovernmental Panel on Climate Change ("IPCC")—the leading international scientific body for the assessment of climate change—describes the devastating harms that would occur at 2°C 9-2

warming. The report highlights the necessity of limiting warming to 1.5°C to avoid catastrophic impacts to people and life on Earth (IPCC 2018). The report also provides overwhelming evidence that climate hazards are more urgent and more severe than previously thought, and that aggressive reductions in emissions within the next decade are essential to avoid the most devastating climate change harms.

The impacts of climate change are already being felt by humans and wildlife. Thousands of studies conducted by researchers around the world have documented changes in surface, atmospheric, and oceanic temperatures; melting glaciers; diminishing snow cover; shrinking sea ice; rising sea levels; ocean acidification; and increasing atmospheric water vapor (USGCRP 2017). In California, climate change will transform our climate, resulting in impacts including, but not limited to, increased temperatures and wildfires and a reduction in snowpack and precipitation levels and water availability. 9-2

II. MWD Has a Responsibility to Reduce GHG Emissions.

California gives local authorities like MWD significant responsibility over land use and planning decisions within their jurisdictions. But with that responsibility comes a corresponding obligation to account for the negative environmental impacts of those decisions—especially when it comes to controlling GHG emissions. As the California Air Resources Board ("CARB") explains:

> [L]ocal governments and agencies are critical leaders in reducing emissions through actions that reduce demand for electricity, transportation fuels, and natural gas, and improved natural and working lands management. . . . Over the last 60 years, development patterns have led to sprawling suburban neighborhoods, a vast highway system, growth in automobile ownership, and under-prioritization of infrastructure for public transit and active transportation. Local decisions about these policies today can establish a more sustainable built environment for the future. 9-3

(CARB 2017.) Thus, MWD must take seriously its obligation to do its utmost to ensure that it is reducing GHG emissions and contributing to the state's achievement of its emissions reduction targets.

III. The Draft CAP's GHG Emissions Inventory Is Incomplete and the Forecasts Don't Account for Climate Change.

The Draft CAP emissions inventory is improperly narrow in scope. This leads to a gross mischaracterization within the emissions forecast analysis, as evident by the stated assumption that the State Water Project ("SWP") has significantly less associated emissions as compared to water sourced from the Colorado River because it "does not require substantial, additional pumping due to the use of gravity to transport the water once it enters Metropolitan's operational control" (Draft CAP 3.15). This statistic is given a footnote that explains that water from the SWP does have associated emissions not captured by Metropolitan that are detailed in the Department of Water Resources CAP" (Draft CAP 3.15). 9-4

This very type of exclusion led to a judge invalidating Sonoma County's CAP in 2019, after the judge determined that it failed to account for all of the County's emissions by excluding transboundary emissions.[1] 9-4

Additionally, the Draft CAP uses data from previous years to determine the low, average and high GHG emissions forecasts (Draft CAP 3.16). However, scientific models predict that climate change has increased drought risk in California (Diffenbaugh et al., 2015). Thus, using historical data from non-drought years to influence the low and average GHG emissions scenarios directly contradicts the best available scientific knowledge on future climate scenarios. Instead, it should be assumed that drought conditions will continue and therefore the low, average and high **GHG emission forecasts should be recalculated using our most recent drought data as the assumed baseline.** 9-5

IV. The Draft CAP's Tracking Methods are Flawed

Using a carbon budget instead of clear linear targets will prevent early detection of delayed progress. The Draft CAP itself admits that in the high emission scenario, "Metropolitan will deplete its carbon budget by 2033" (Draft CAP 4.13). This would mean that in 2030, MWD could claim that it was still within budget, knowing full well that in 3 years it will exceed the total carbon budget set for 2005-2045. This tracking method, by its own admission, does not ensure that MWD meets its stated goal of carbon neutrality by 2045. Instead, **MWD should rely on the per capita GHG emissions analysis** as well as the overall GHG emissions reported to determine progress towards goals. This will ensure that interventions can be made in a timelier manner if the trajectory of reductions is lagging. 9-6

V. The Draft CAP's Reduction Strategies and Measures Are Non-Binding And Unenforceable.

The Draft CAP states that "Metropolitan Water District of Southern California (Metropolitan) has developed a Climate Action Plan (CAP) or greenhouse gas (GHG) reduction plan that meets the requirements of Section 15183.5 of the California Environmental Quality Act (CEQA) Guidelines, which provides the *opportunity for tiering and streamlining CEQA review* and mitigation of project-level GHG emissions" (Draft CAP 1). The legal requirements of a climate action plan must specify measures or a group of measures, including performance standards, that substantial evidence demonstrates, if implemented on a project-by-project basis, would collectively achieve the specified emissions level. Therefore, the Final CAP, and any such plan prepared pursuant to CEQA Guidelines 15183.5, must meet the requirements for all first-tier environmental review documents and thus must impose enforceable requirements and measures with defined performance standards.[2] 9-7

Unfortunately, many of the Draft CAP's reduction measures are largely non-binding and generally lack performance standards. Notably, the words "promote," "study" or "whenever

[1] The court also held that the CAP's GHG reduction measures were not clearly defined or enforceable, which is also an issue with the Draft CAP here.
[2] Specifically, CEQA Guidelines section 15183.5(b)(1)(D) states that measures should have "performance standards" which demonstrate they will achieve the planned reductions on a project by project basis.

feasible" occur many times in the sections describing the Draft CAP's implementation measures. These measures are legally inadequate and cannot be considered mitigation under CEQA and applicable case law. (*Lincoln Place Tenants Assn. v. City of Los Angeles* (2007) 155 Cal.App.4th 425, 445 ["A 'mitigation measure' is a suggestion or change that would reduce or minimize significant adverse impacts on the environment caused by the project as proposed"]); *Preserve Wild Santee v. City of Santee* (2012) 210 CA 4th 260, 281 [mitigation measures that are so undefined that their effectiveness is impossible to determine are legally inadequate].) The California Attorney General has also expressly disapproved such an approach for measures upon which an agency relies:

> **Can a lead agency rely on policies and measures that simply "encourage" GHG efficiency and emissions reductions?**
>
> No. Mitigation measures must be "fully enforceable." ***Adequate mitigation does not, for example, merely "encourage" or "support" carpools and transit options, green building practices, and development in urban centers***. While a menu of hortatory GHG policies is positive, it does not count as adequate mitigation because there is no certainty that the policies will be implemented.

(CA Attorney General 2009.) The California Attorney General further states that programmatic plans to reduce GHG emissions pursuant to CEQA Guidelines section 15183.5 must "[i]dentify a set of specific, enforceable measures that, collectively, will achieve the emissions targets…." (CA Attorney General 2019.)

9-7

In *Sierra Club v. County of San Diego* (2014) 231 Cal.App.4th 1152, the Fourth District Court of Appeal criticized the County of San Diego for including measures in its CAP that were not backed up by a firm commitment by the County that they would be implemented. The Court noted that many of the measures in the CAP "are not currently funded," such that the County of San Diego could not rely upon such unfunded programs to meet GHG reductions. (*Id.* At 1168-1169.) The *Sierra Club* opinion also questioned whether people would actually participate in various programs outlined in the CAP, given that the record contained no evidence of such participation. (*Id*. At 1170.) Here, the Draft CAP suffers from similar defects – there is no evidence of funding for many of the various programs set forth in the Final CAP, nor evidence in the record that people or industry will actually participate in the voluntary programs described in the Draft CAP.

9-8

Accordingly, although the Draft CAP's reduction measures may generally be worthwhile objectives for MWD to pursue, the Draft CAP fails as a CEQA compliance tool because it relies upon non-binding measures that lack performance standards.

VI. Increasing Wastewater Recycling Programs to Reduce Reliance on Imported Water Should Be a Central Goal in the Draft CAP (MEASURE WC 6 PHASE 2).

The Center is happy to see water conservation and recycling as a stated measure in the Draft CAP, however we are concerned that it currently does not have any specific goals associated with the listed metric of "acre-feet of water generated" (Draft CAP 5.71). The Draft CAP claims to currently be studying the potential of localized water, but a UCLA study already

9-9

concluded that there is the potential for Los Angeles County to be 100% reliant on local water.[3] While some of the specifics on implementation may still need to be assessed, setting long-term goals that state the intent to transition to a large majority of local water across MWD's service area would help ensure that the energy associated with transport of imported water was greatly reduced. This would also align the Draft CAP with regional goals outlined in the OurCounty Sustainability Plan that aims to get LA County to 80% of local water by 2045.[4]

9-9

VII. Strategy 9 Should Only Include Natural Carbon Sequestration Solutions, not Industrial Carbon Capture and Storage.

While the Center commends MWD for incorporating "carbon sequestration on natural and working lands (e.g., rangeland, forests, woodlands, wetlands and coastal areas, grasslands, shrubland, farmland, riparian areas, and urban green space)," the Center is concerned that these natural methods are bundled with industrial carbon capture and storage methods (Draft CAP 5.6). Investing in the preservation, ecological health and restoration of our natural areas as a form of carbon sequestration can and should be a component of all climate action plans. However, the ecological and economic impact cannot be adequately assessed without knowing what methods will be used. The strategy's only metric is to "conduct a carbon capture reconnaissance and general assessment that evaluates technological, scientific, economic, and regulatory dimensions relevant to potential carbon capture and storage on Metropolitan properties" (Draft CAP 5.73).

9-10

The science is clear. Protecting, enhancing, and restoring forests and natural habitat is an internationally recognized strategy that has the potential to help solve the climate crisis. Natural habitats, including in particular forests, absorb billions of tons of carbon dioxide (CO2) annually and preservation efforts have the potential to alter the trajectory of climate change (Dybala et al., 2019).

MWD must commit to land preservation and native habitat restoration as a central component of this CAP instead of merely studying the potential of both natural and industrial carbon storage strategies.

VIII. The Draft CAP Fails to Identify Funding Sources for Implementation Measures.

As noted above, in *Sierra Club v. County of San Diego* (2014) 231 Cal.App.4th 1152, the Court of Appeal determined that measures in a CAP were insufficient when they were not adequately funded. (*Id.* At 1168-1169.) Here, the various "actions" in the Draft CAP acknowledge that funding will be required, but often fail to include a specific estimate of how much a measure may cost, or identify an available source of funding. Specifically, in the Implementation and Monitoring Section, the Draft CAP states "the Climate Working Group will identify policies and projects for implementation, work with relevant departments to draft and review required projects or policies, present the items to Metropolitan management to *identify funding* and obtain approval, and track implementation metrics" (Draft CAP 6.4). This omission

9-11

[3] Mika, K., Gallo, E., Read, L., Edgley, R., Truong, K., Hogue, T., ... & Gold, M. (2017). LA sustainable water project: Los Angeles river watershed. https://escholarship.org/uc/item/42m433ps

[4] LA County Sustainability Office. "OurCounty Sustainability Plan." August 2020. https://ourcountyla.lacounty.gov/wp-content/uploads/2019/07/OurCounty-Final-Plan.pdf

calls into question whether many of the programs outlined in the Draft CAP will ever be implemented. Thus, all measures need an estimated cost and the funding source must be clearly identified. 9-11

IX. The DEIR needs to better assess and mitigate the impacts to hydrology, sensitive species and wildlife movement.

A. The DEIR's conclusion of "less than significant impacts" to wildlife movement does not reflect the best available science.

Climate change is increasing stress on species and ecosystems, causing changes in distribution, phenology, physiology, vital rates, genetics, ecosystem structure and processes, and increasing species extinction risk (Warren et al., 2011). A 2016 analysis found that climate-related local extinctions are already widespread and have occurred in hundreds of species, including almost half of the 976 species surveyed (Wiens, 2016). A separate study estimated that nearly half of terrestrial non-flying threatened mammals and nearly one-quarter of threatened birds may have already been negatively impacted by climate change in at least part of their distribution (Pacifici et al., 2017). A 2016 meta-analysis reported that climate change is already impacting 82 percent of key ecological processes that form the foundation of healthy ecosystems and on which humans depend for basic needs (Scheffers et al., 2016). Genes are changing, species' physiology and physical features such as body size are changing, species are moving to try to keep pace with suitable climate space, species are shifting their timing of breeding and migration, and entire ecosystems are under stress (Cahill et al., 2012; Chen et al., 2011; Maclean & Wilson, 2011; Parmesan, 2006; Parmesan & Yohe, 2003; Root et al., 2003; Warren et al., 2011). 9-12

The DEIR must analyze Draft CAP's potential impacts to riparian corridors. Riparian ecosystems have long been recognized as biodiversity hotspots performing important ecological functions in a transition zone between freshwater systems and upland habitats. Many species that rely on these aquatic habitats also rely on the adjacent upland habitats (*e.g.*, riparian areas along streams, and grassland habitat adjacent to wetlands). In fact, 60% of amphibian species, 16% of reptiles, 34% of birds and 12% of mammals in the Pacific Coast ecoregion depend on riparian-stream systems for survival (Kelsey and West 1998). Many other species, including mountain lions and bobcats, often use riparian areas and natural ridgelines as migration corridors or foraging habitat (Dickson et al, 2005; Hilty & Merenlender, 2004; Jennings & Lewison, 2013; Jennings & Zeller, 2017). Additionally, fish rely on healthy upland areas to influence suitable spawning habitat (Lohse et al. 2008), and agricultural encroachment on these habitats and over-aggressive removal of riparian areas have been identified as a major driver of declines in freshwater and anadromous fish (e.g., Stillwater Sciences 2002; Lohse et al. 2008; Moyle et al. 2011). Therefore, buffers that allow for connectivity between the aquatic resource and upland habitat is vital for many species to persist.

It is estimated that 90-95% of historic riparian habitat in the state has been lost (Bowler, 1989; Riparian Habitat Joint Venture, 2009). Using 2002 land cover data from CalFire, the Riparian Habitat Joint Venture estimated that riparian vegetation makes up less than 0.5% of California's total land area at about 360,000 acres (Riparian Habitat Joint Venture, 2004). This is

alarming because riparian habitats perform a number of biological and physical functions that benefit wildlife, plants, and humans, and loss of what little is left will have severe, harmful impacts on special-status species, overall biodiversity, and ecosystem function. California cannot afford to lose more riparian corridors.

A literature review found that recommended buffers for wildlife often far exceeded 100 meters (~325 feet), well beyond the largest buffers implemented in practice (Robins, 2002). For example, Kilgo et al. (1998) recommend more than 1,600 feet of riparian buffer to sustain bird diversity. In addition, amphibians, which are considered environmental health indicators, have been found to migrate over 1,000 feet between aquatic and terrestrial habitats through multiple life stages (Cushman, 2006; Fellers & Kleeman, 2007; Semlitsch & Bodie, 2003; Trenham & Shaffer, 2005). Accommodating the more long-range dispersers is vital for continued survival of species populations and/or recolonization following a local extinction (Cushman, 2006; Semlitsch & Bodie, 2003). In addition, more extensive buffers provide resiliency in the face of climate change-driven alterations to these habitats, which will cause shifts in species ranges and distributions (Cushman et al., 2013; Heller & Zavaleta, 2009; Warren et al., 2011). This emphasizes the need for sizeable riparian and upland buffers around streams and wetlands in and adjacent to any project included in the RTP/SCS, as well as connectivity corridors between heterogeneous habitats. Again, the EIR must adequately assess and mitigate impacts to local, regional, and global wildlife movement and habitat connectivity. 9-12

It is widely recognized that the continuing fragmentation of habitat by humans threatens biodiversity and diminishes our (humans, plants, and animals) ability to adapt to climate change. In a report for the International Union for Conservation of Nature (IUCN), world-renowned scientists from around the world stated that "[s]cience overwhelmingly shows that interconnected protected areas and other areas for biological diversity conservation are much more effective than disconnected areas in human-dominated systems, especially in the face of climate change" and "[i]t is imperative that the world moves toward a coherent global approach for ecological connectivity conservation, and begins to measure and monitor the effectiveness of efforts to protect connectivity and thereby achieve functional ecological networks" (J. Hilty et al., 2020).

Given the potential for projects associated with the Draft CAP to fragment and destroy important habitat, including riparian areas, the Center urges MWD to avoid further fragmentation and degradation of existing, intact, heterogeneous habitats and incorporate clear and enforceable wildlife connectivity mitigation measures that address the needs of target species into the Draft CAP and EIR. Unfortunately, as currently written, it appears that the DEIR does not include such measures. The EIR should encourage the involvement of wildlife connectivity experts from CDFW and other agencies, organizations, academic institutions, communities, and local groups starting at the initial planning stage of development and transportation projects so that habitat connectivity can be strategically integrated into project design and appropriately considered in the project budget. The EIR should require that water infrastructure projects assess current wildlife use and include adequate adjustments to future projects to enhance wildlife's ability to use or navigate through such projects in order to reduce impacts to species.

B. The DEIR should include a habitat replacement ratio of 3:1 onsite or 5:1 offsite and ensure funding in perpetuity.

Mitigation Measure BIO-4, BIO-8 and BIO-9 all only call for a minimum 1:1 mitigation ratio for restoration, preservation, or creation of designated critical habitat, which is grossly insufficient. Avoidance of impacts to sensitive habitats and designated critical habitat should be prioritized, after which in-kind mitigation should be a minimum of 3:1 given that critical habitat is designated for threatened and endangered species that are on a trajectory towards extinction without protective action and are already struggling to survive in the long-term, and 5:1 for off-site restoration or habitat creation with continued monitoring, adaptive management strategies, and well-defined success criteria, to be funded in perpetuity.

9-13

Life on Earth is experiencing a sixth mass extinction, with species disappearing at a rate of more than 1,000 times greater than the background extinction rate. Habitat loss and fragmentation are the primary drivers of the extinction crisis.[5] As the world confronts multiple crises, it has to take an intersectional approach to creating and implementing solutions. If climate action plans only exacerbate the global extinction crisis, they should not be considered a solution to the climate crisis.

Additionally, conservation of nature is a listed strategy in the Draft CAP because of the known carbon sequestration ability of natural lands (Draft CAP 5.73). Therefore, any other project associated with the DRAFT CAP that would deplete our remaining natural lands, adequate habitat replacement ratios must be implemented as mitigation to ensure the net impact of that project is positive.

C. The DEIR's conclusion of "less than significant impacts" to hydrology and water quality does not reflect the best available science.

The DEIR claims that "individual projects implemented under the proposed CAP would generally be located at existing, developed Metropolitan facilities" and that "as such, these projects would not result in substantial changes to drainage patterns resulting in siltation, erosion, runoff, or flooding" (DEIR 170). This assumption that new projects won't impact the hydrology because they will exist on already developed Metropolitan facilities does not account for the impacts associated with changes in how those facilities operate. If a new project increases the amount of water that is extracted, the associated water body will be impacted.

9-14

Waterbodies throughout the world are impacted by hydrologic alterations. MWD's past and current operations have significantly reshaped California and Colorado's hydrology. One example is the San Francisco Bay Delta, that has changed considerably as a result of anthropogenic drivers (Hutton et al., 2017). Particularly the construction of the State Water Project (SWP) and the Central Valley Project (CVP) with their network of dams, pump stations, and aqueducts for water storage and transport to other parts of the state, construction of dams,

[5] United Nations. Nature's Dangerous Decline 'Unprecedented'; Species Extinction Rates 'Accelerating.' Published 2019. https://www.un.org/sustainabledevelopment/blog/2019/05/nature-decline-unprecedented-report/

expansion of irrigated agriculture, and growth in population have all influenced the Delta hydrology (Hutton et al., 2017).

The DEIR's claim that no future project associated with the Draft CAP will have a significant impact on the hydrology or water quality is a gross oversight, especially because of the lack of clarity within the existing document on specific measures and projects that will be implemented. Whether there is investment in more imported water, which will impact Northern California hydrology (Hutton et al., 2017), or investment in localized water recycling, stream flow and therefore hydrology will be impacted.[6] The EIR must account for these impacts and set a standard of mitigation measures for each type of project that could be potentially implemented to ensure the DRAFT CAP does not cause more environmental harm than it solves. 9-14

X. Conclusion

Thank you for the opportunity to submit comments on the Draft CAP and associated DEIR. The Center strongly supports many of the goals of the Draft CAP. But these goals are not supported by clear, enforceable, and funded policies. In addition, the DEIR does not accurately reflect the scientifically documented impacts of MWD's projects on ecosystems. The Center urges MWD to revise the CAP to provide more specific metrics and the associated EIR to better assess and mitigate the impacts to sensitive wildlife and wildlife movement. 9-15

Please do not hesitate to contact us if you would like to meet to further discuss these issues.

Sincerely,

Elizabeth Reid-Wainscoat

Response to Comment Letter 9

COMMENTER: Elizabeth Reid-Wainscoat, Campaigner, Urban Wildlands, Center for Biological Diversity

DATE: January 7, 2022

Response 9-1

The commenter provides information about the Center for Biological Diversity and summarizes the main themes of the comment letter, specifically the opinion that the Draft CAP suffers from a lack of specificity on tracking and implementation measures that would ensure significant reductions in regional greenhouse gas emissions and that the Draft PEIR does not accurately assess and mitigate impacts to hydrology, sensitive species, and wildlife connectivity.

This comment is acknowledged and specific responses to the commenter's concerns are provided in the responses below.

Response 9-2

The commenter provides information describing how climate change is an urgent and existential concern. The commenter states that, in California, climate change will transform the climate, resulting in impacts including, but not limited to, increased temperatures and wildfires and a reduction in snowpack and precipitation levels and water availability.

The comment is acknowledged. Background on climate change and its impacts is included in Chapter 2, *Project Description*, of the Draft PEIR and in Chapter 2.2 *Climate Change Impacts,* of the Draft CAP. The comment does not raise concerns regarding the adequacy of the Draft PEIR, the Draft CAP, or the CEQA process. No changes to the Draft PEIR or Draft CAP are warranted in response to this comment.

Response 9-3

The commenter states the opinion Metropolitan has a responsibility to ensure that it is reducing GHG emissions and contributing to the state's achievement of its emissions reduction targets.

The comment is acknowledged. Metropolitan's CAP addresses its fair share of GHG emissions using operational controls consistent with state targets and methodologies to reduce emissions. The comment does not raise concerns regarding the adequacy of the Draft PEIR, the Draft CAP, or the CEQA process. No changes to the Draft PEIR or CAP are warranted in response to this comment.

Response 9-4

The commenter states the opinion the Draft CAP's GHG Emissions Inventory is improperly narrow in scope, and the forecasts do not account for climate change. Specifically, the commenter suggests the characterization and exclusion of SWP emissions and their being accounted for in the California DWR CAP is the type of exclusion that led to invalidation of Sonoma County's CAP in 2019, stating that it fails to account for transboundary emissions.

Metropolitan recognizes that there are transboundary emissions associated with water provided by DWR's SWP. However, unlike the emissions in the Sonoma County CAP, these emissions are currently being accounted for and managed by DWRs, which has its own Greenhouse Gas Emissions Reduction Plan that includes a complete emissions inventory, identifies measures to reduce emissions, and has a monitoring and reporting program to ensure progress towards meeting its adopted targets which are in line with state targets. As discussed in Metropolitan's CAP, these emissions also fall outside of Metropolitan's operational control. Furthermore, Metropolitan will

continue to work with DWR to align efforts, where applicable. While aggregated emissions are not used in the Metropolitan's CAP, Metropolitan understands that having an aggregated emissions factor for the imported water to Southern California is beneficial to better understand the overall emissions related to imported water, therefore a discussion of DWR's emissions is provided in Topical Response A and a detailed discussion of the overall embedded energy of water imported to Southern California has been added to Appendix B of the Final CAP.

The comment does not raise concerns regarding the adequacy of the Draft PEIR or the CEQA process. No changes to the Draft PEIR are warranted in response to this comment.

Response 9-5

The commenter suggests an alternate way to calculate GHG emissions forecasts and provides information describing how GHG emission forecasts could be recalculated to assume drought conditions will continue.

Metropolitan recognizes that forecasts are an estimate of a likely outcome based on the available information at the time of the analysis. The Metropolitan CAP forecast uses past data to estimate emissions per acre foot only and demand projections consistent with the 2020 UWMP. Historic Metropolitan data includes years with nearly 100 percent CRA pumping which provides a worst-case scenario for Metropolitan emissions. This paired with increased demand, as forecasted by the UWMP, provides the "high" estimate used in the Metropolitan CAP. This is expected to be a worst-case scenario. Metropolitan has committed to performing annual GHG inventories and five-year updates to the CAP to ensure it stays on track to meet its GHG reduction goals. The five-year updates to the CAP will also include a new forecast to ensure that the most recent data is included for future forecasts ensuring that Metropolitan captures any changing climatic conditions that would affect its ability to reliability reduce its GHG emissions.

The comment does not raise concerns regarding the adequacy of the Draft PEIR or the CEQA process. No changes to the Draft PEIR or Draft CAP are warranted in response to this comment.

Response 9-6

The commenter states the opinion the Draft CAP's tracking methods are flawed and suggests Metropolitan rely on the per capita GHG emissions analysis, as well as the overall GHG emissions reported, to determine progress towards goals.

As stated in Chapter 4.3, *Metropolitan's GHG Emissions Reduction Targets,* Metropolitan will pursue a linear per capita GHG emissions reduction pathway to meet its GHG reduction goals. The carbon budget is an appropriate, conservative, and more accurate methodology to track a GHG emissions for a jurisdiction that has variable emissions over time. Using this approach, Metropolitan will track and account for 100 percent of its total GHG emissions between 2005 and its interim target in 2030 as well as its long-term goal of carbon neutrality by 2045. Without the carbon budget, Metropolitan could theoretically emit a very high amount of GHG emissions for every year up to 2030 and then have a low emissions year in 2030 and "meet its target". With the carbon budget approach, GHG emissions are accounted for annually, which allows Metropolitan to monitor the success of its programs and pivot, if necessary, to meet its interim 2030 goal, as well as its long-term goal of carbon neutrality by 2045. Additionally, Metropolitan's is utilizing CAPDash, a web-based tracking tool, to track and report its GHG emissions. Metropolitan will track its mass emissions, per capita emissions, and the carbon budget to ensure it is meeting its established targets.

The comment relates to the contents of the proposed CAP and does not raise concerns regarding the adequacy of the Draft PEIR or the CEQA process. No changes to the Draft PEIR or Draft CAP are warranted in response to this comment.

Response 9-7

The commenter suggests the Draft CAP's reduction strategies and measures are non-binding and unenforceable. The commenter suggests a lead agency cannot rely on policies and measures that simply "encourage" GHG efficiency and emissions reductions as mitigation measures, citing *State CEQA Guidelines* Section 15183.5.

Metropolitan completed an emissions forecast used to estimate the emissions reductions necessary to achieve carbon neutrality by 2045 under three potential scenarios. Metropolitan's CAP includes two types of measures: quantifiable measures and supportive measures. Every quantifiable measure included in the CAP has an implementation date and specific action and assumptions that were used to calculate the associated GHG reductions. The specific calculations are identified in Appendix C. As shown in the CAP, Metropolitan will meet its established GHG reduction goal using the identified, quantifiable measures in the CAP for all modelled scenarios. While the CAP also has supportive measures, such as conducting studies or encouraging behaviors, no GHG reductions are applied or expected for these supportive measures. They do, however, provide an important foundation for the development of future quantitative measures.

In addition, as described in detail in Section 5.0 of the CAP, *Metropolitan's GHG Emissions Reduction Strategy*, the CAP includes specific strategies that, when implemented, can achieve carbon neutrality by 2045 and satisfy the requirements of *State CEQA Guidelines* Section 15183.5(b)(1)(D). Furthermore, *State CEQA Guidelines* Section 15183.5 does not require that all measures in a qualified GHG reduction plan be binding and enforceable. Rather, for future projects which may tier their GHG impact analyses from the CAP, Section 15183.5(b)(2) states:

> An environmental document that relies on a greenhouse gas reduction plan for a cumulative impacts analysis must identify those requirements specified in the plan that apply to the project and, if those requirements are not otherwise binding and enforceable, incorporate those requirements as mitigation measures applicable to the project.

Future projects which may tier their GHG impact analyses from the CAP would be required to evaluate consistency with the qualified CAP. If applicable measures of the CAP are not by themselves binding and enforceable, such measures may be incorporated as mitigation measures in future project-specific environmental review documents, consistent with the *State CEQA Guidelines*. This does not preclude the CAP from serving as a qualified GHG reduction plan pursuant to *State CEQA Guidelines* Section 15183.5. Given the discussion above, no changes to the Draft PEIR or Draft CAP are warranted in response to this comment.

Response 9-8

The commenter suggests there is no evidence of funding for many of the various programs set forth in the Draft CAP, nor evidence in the record that people or industry will actually participate in the voluntary programs described in the Draft CAP. This comment also states the opinion the Draft CAP fails as a CEQA compliance tool because it relies upon non-binding measures that lack performance standards.

State CEQA Guidelines Section 15183.5 does not require evidence of funding for programs in order for a CAP to serve as a qualified GHG reduction plan for tiering and streamlining of GHG impact analyses. Rather, the *State CEQA Guidelines* require performance standards for measures or groups of measures that, if implemented on a project-by-project basis, would collectively achieve the specified emissions level. Section 5.0, *Metropolitan's GHG Emissions Reduction Strategy*, of the CAP outlines all CAP measures intended to achieve carbon neutrality by 2045 and includes target metrics for each measure, consistent with this requirement. As discussed in Response 9-7, though supportive measures such as conducting studies or encouraging behaviors do not have specific GHG reductions tied to

their them, they do, however, provide an important foundation for the development of future quantitative measures. Given the discussion above, no changes to the Draft PEIR or Draft CAP are warranted in response to this comment.

Response 9-9

The commenter suggests increasing wastewater recycling programs to reduce reliance on imported water should be a central goal in the Draft CAP. The commenter opines that currently, the Draft CAP does not have any specific goals associated with the listed metric of "acre-feet of water generated" (CAP page 5.71).

Metropolitan's CAP is a comprehensive document that identifies GHG reduction measures to reduce its GHG emissions associated with all emissions sectors. Metropolitan's many conservation programs are intended to reduce water consumption while its energy sustainability programs target greener energy for water deliveries. The RRWP reference on page 5.13 is one such measure intended to reduce reliance on imported water supplies, however this Program is still in the planning phase. As such, it was listed as a Phase 2 measure (2030-2045). As more data becomes available, future iterations of the CAP will identify specific goals for the listed metric of acre-feet of water generated. Taken together, this balanced approach will ensure that Southern California has a reliable supply of water into the future.

The comment relates to the contents of the proposed CAP and does not raise concerns regarding the adequacy of the Draft PEIR or the CEQA process. No changes to either the Draft PEIR or CAP are warranted in response to this comment.

Response 9-10

The commenter suggests that Strategy 9 of the CAP should only include natural carbon sequestration solutions, not industrial carbon capture and storage. The commenter further recommends Metropolitan commit to land preservation and native habitat restoration as a central component of the CAP instead of merely studying the potential of both natural and industrial carbon storage strategies.

Metropolitan agrees that natural carbon sequestration methods on natural and working lands are a key strategy in fighting climate change and provide many co-benefits. As discussed in the CAP, Metropolitan will use the information from the studies to develop quantifiable carbon sequestration programs in future CAP updates.

The comment relates to the contents of the proposed CAP and does not raise concerns regarding the adequacy of the Draft PEIR or the CEQA process. No changes to the Draft PEIR or CAP are warranted in response to this comment.

Response 9-11

The commenter states the Draft CAP does not identify funding sources for implementation measures. The commenter adds the Implementation and Monitoring Section of the CAP states, "the Climate Working Group will identify policies and projects for implementation, work with relevant departments to draft and review required projects or policies, present items to Metropolitan management to identify funding and obtain approval, and track implementation metrics," and opines the omission of funding calls into question whether many programs outlined in the CAP will ever be implemented.

Metropolitan has funding available to maintain, update, and enhance its operations. The process of allocating funds includes biennial budgeting through the capital improvement program (CIP) budget cycle. Metropolitan will also be able to augment the CIP budgets with additional grants and other incentive programs. Many of the actions included in the CAP are cost comparable to baseline

operations and even provide long-term savings. Refer also to Response 9-8, above, regarding identification of funding sources for implementation of CAP measures.

The comment relates to the contents of the proposed CAP and does not raise concerns regarding the adequacy of the Draft PEIR or the CEQA process.

Response 9-12

The commenter recommends the Draft PEIR better assess and mitigate the impacts to hydrology, sensitive species and wildlife movement. Specifically, the commenter questions the Draft PEIR's conclusion of "less than significant impacts" to wildlife movement and states that the Draft PEIR must analyze the proposed program's potential impacts to riparian corridors. The commenter cites literature on the importance and ongoing fragmentation of such corridors and encourages Metropolitan to incorporate clear, enforceable wildlife connectivity mitigation measures that address the needs of target species.

As discussed on page 113 of the Draft PEIR under Threshold BIO-D, proposed projects would generally occur within urbanized areas at or near existing Metropolitan facilities. These facilities are fenced and developed and therefore, implementation of program activities proposed under the CAP would not impede wildlife movement. It is anticipated that project activities in both the Palo Verde and the Bay Delta regions would be small in nature and would avoid impeding or interfering with wildlife movement. Additionally, there is sufficient adjacent habitat in these areas to facilitate wildlife movement such that development in these areas would not isolate wildlife from adjacent movement corridors and would not substantially interfere with wildlife movement. As such, impacts to wildlife movement would be less than significant and no mitigation would be required.

Impacts to riparian corridors are also discussed under Threshold BIO-B and BIO-C. As noted on page 113 of the Draft PEIR, projects would be designed and located to avoid or minimize impacts to riparian and wetland habitat to the extent feasible. Additionally, if, during project-level analysis, it is determined that construction or operation of any covered activity would result in significant impacts to riparian habitats, sensitive natural communities, or state or federally protected wetlands, implementation of MM BIO-7 (Jurisdictional Delineation and Impact Avoidance), MM BIO-8 (Wetlands, Drainages and Riparian Habitat Restoration), and MM BIO-9 (Sensitive Natural Community Avoidance and Mitigation) would reduce these impacts to a less than significant level. Given the discussion above, no changes to the Draft PEIR are warranted in response to this comment.

Response 9-13

The commenter recommends the Draft PEIR, specifically Mitigation Measures BIO-4, BIO-8, and BIO-9, include a habitat replacement ratio of 3:1 on-site or 5:1 off-site and ensure funding in perpetuity. Additionally, the commenter adds that since conservation of nature is a listed strategy in the Draft CAP, any other project associated with the CAP that would deplete remaining natural lands should incorporate adequate habitat replacement ratios to ensure the net impact of the project is positive.

Mitigation Measures BIO-4, BIO-8 and BIO-9 require a minimum mitigation ratio of 1:1 and do not prohibit implementation of higher mitigation ratios for individual projects. The minimum ratio of 1:1 is intended to ensure impacts are mitigated such that the project would have a net neutral impact and thus, impacts would not rise to the level of significance under CEQA. If an individual project implemented under the CAP would result in impacts that require mitigation, the mitigation ratio will be determined through consultation with the appropriate regulatory agencies during the permitting process as outlined in the mitigation measures. Given the discussion above, no changes to the Draft PEIR are warranted in response to this comment.

Response 9-14

The commenter states the opinion the Draft PEIR's conclusion of "less than significant impacts" to hydrology and water quality does not reflect the best available science. Specifically, the commenter notes that though projects under the CAP would be implemented on Metropolitan facilities, the Draft PEIR does not account for the impacts associated with changes in how those facilities operate (e.g., increasing the amount of water extracted). The comment suggests the Draft PEIR's claim that no future project associated with the Draft CAP will have a significant impact on the hydrology or water quality is an oversight, especially because of the lack of clarity within the existing document on specific measures and projects that will be implemented.

Impacts related to hydrology and water quality are analyzed in Section 5.7, *Hydrology and Water Quality*, of the Draft PEIR. Potential impacts to this resource area are analyzed relative to the criteria outlined in Appendix G of the *State CEQA Guidelines*. Improvements to Metropolitan facilities that may occur under the CAP generally include infrastructure/pump efficiency improvements (e.g., CAP measures EE-4a through EE-4d) or energy efficiency improvements, such as construction of battery energy storage system (BESS) facilities pursuant to CAP measure E-4. Such improvements are intended to improve the energy efficiency with which Metropolitan facilities operate and would not alter the amount of water extracted in the Plan Area. As stated on page 171 of the Draft PEIR, the CAP does not involve any projects that would directly or indirectly increase water demand. On the contrary, the proposed CAP includes various measures under Strategy 8, *Increase Water Conservation and Local Water Supply*, intended to reduce water demand and, by extension, water extraction.

The nature of individual projects envisioned under the CAP presently would not result in significant impacts to hydrology and water quality. As described on page 50 of the Draft PEIR, the CAP includes CAP measure WC-6, which involves implementing advanced technology systems to increase Metropolitan-owned recycled and groundwater recovery systems to maintain local water supply. This measure may include pursuing projects like the proposed RRWP. However, as discussed in the Draft PEIR, the RRWP is currently being considered by Metropolitan and is not a Board-approved project. While emissions associated with implementation of the RRWP are accounted for in the CAP, the RRWP would be subject to its own CEQA analysis, during which time project-specific impacts to hydrology and water quality would be analyzed at a project-level. Given the discussion above, no changes to the Draft PEIR are warranted in response to this comment.

Response 9-15

The commenter summarizes their previous comments by recommending Metropolitan revise the CAP to provide more specific metrics and the associated Draft PEIR to better assess and mitigate the impacts to sensitive wildlife and wildlife movement.

This general comment is acknowledged, and the individual comments raised by the commenter have been addressed in greater detail in the preceding responses.

Letter 10

SIERRA CLUB CALIFORNIA

January 11, 2022

Adel Hagekhalil
General Manager
& Malinda Stalvey
Environmental Planning Section
Metropolitan Water District of Southern California
P.O. Box 54153
Los Angeles, CA 90054-0153

Re: Voluntary Agreements

Dear General Manager Hagekhalil and Ms. Stalvey:

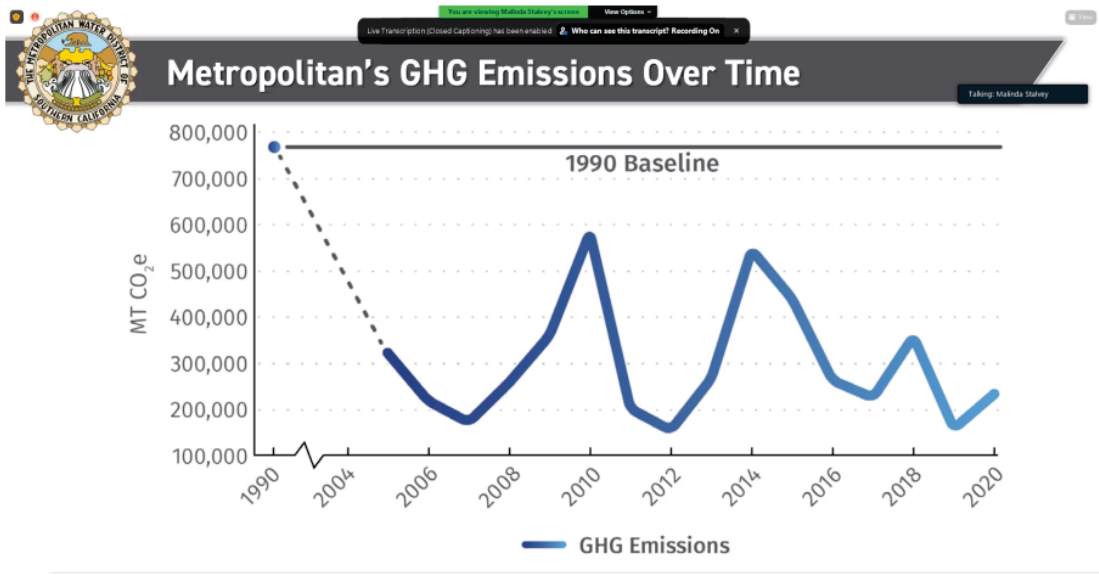
We hope this letter finds you well in the New Year and we appreciate the extension you gave us to submit these comments. We are writing to provide you with some feedback and concerns on MWD's Climate Action Plan (CAP). 10-1

SWP GHG Emissions

We will not focus so heavily on the energy and greenhouse gases (GHG) components of the CAP, but we have a few comments regarding the State Water Project (SWP). We understand that MWD does not plan to count the GHG from the SWP because they are counted by the State, but MWD should include these numbers in its reports for several reasons:

1. MWD must have an accurate understanding of their energy use when weighing the pros and cons of SWP-related projects such as the Delta Conveyance project, Sites Reservoir, and operations and maintenance needs, especially given the state's and MWD's goal of carbon neutrality. Board members, and the public alike, must have a more complete picture when making decisions on such expensive and controversial projects. 10-2
2. The cost of energy used in the SWP, especially given the effects of subsidence on the California Aqueduct, are passed along to ratepayers, and presenting the full scope to ratepayers is part of the transparency and openness of the new general manager's tenure. 10-3

909 12th Street, Suite 202, Sacramento, CA 95814
(916) 557-1100 • Fax (916) 557-9669 • www.sierraclubcalifornia.org



The graph above depicts MWD's GHG emissions over time. But this image is misleading. The increases are seen due to a reliance on the Colorado River during drought years, and the reductions are during years when MWD relied more heavily on the SWP, but the choice to not include SWP energy gives the appearance that MWD was not using as much energy in these years. Such a depiction can make MWD's local projects seem less appealing to board members when comparing their energy use to imported water projects with these misleading figures. Local supply and reuse projects are critical to the long-term sustainability of water in Southern California. 10-4

Carbon Neutrality

MWD has a goal of carbon neutrality by 2045, but the Delta Conveyance project is estimated to be online in 2040 if it were built. Meeting the 2045 goal would likely be very difficult to meet with such an energy-intensive project, which seems to be a motivation not to include SWP energy outputs in the CAP calculations, which is misleading for the CAP Project and renders the PEIR inadequate, if not incomplete. 10-5

Carbon Capture and Sequestration

The CAP says that MWD is planning to both "investigate and implement" carbon capture and sequestration. We caution against committing to implementation before fully investigating the risks of the process to Delta (or Kern County) communities and working with them to understand the consequences. Carbon wells need over 100 years of monitoring. At this point in time, the risks of improper carbon capture and storage can lead to slow carbonic acid leaks, and it is impossible to detect where the leaks will appear in groundwater, which can lead to geysers forming in communities and under homes. 10-6

Commendable Goals

We are pleased to see the following goals: 10-7

- Increase water conservation and local water supply
- Expand water conservation educational workshops

- Provide funding and monitoring of local stormwater recharge and reuse projects
- Reduced natural gas emissions by 50% by 2030 and 100% by 2045
- Update annually new MWD buildings with all-electric construction and retrofitting
- Achieve zero waste by 2045
- Incentivize more sustainable commutes by 2045
- Improve efficiency and using carbon-free electricity by 30% by 2030 and 50% by 2045
- Move to near-zero and zero emission vehicle fleets by 2030 and 2045
- Reduce landfill waste by 67% by 2030 and 100% by 2045

10-7

Components Missing from the CAP

There are several topics that we would like to see included in the CAP-PEIR. The plan does not include alternative solutions (e.g., solar panels on all MWD properties by 2035 for shading and generation), the PEIR says only that there will not be a do-nothing plan. There are no mentions of unintended consequences and risks of harm to the environment or communities. These components should be included in the CAP to better understand the holistic value of MWD's efforts to limit its carbon output.

10-8

If you have further questions, please do not hesitate to reach out. Thank you for your consideration.

Sincerely,

Caty Wagner
Southern California Water Organizer
Sierra Club California

Response to Comment Letter 10

COMMENTER: Caty Wagner, Southern California Water Organizer, Sierra Club California

DATE: January 11, 2022

Response 10-1

The commenter understands Metropolitan does not plan to count the GHG emissions from the SWP because they are counted by the state but suggests Metropolitan include these numbers in its report.

The comment relates to the contents of the proposed CAP and does not raise concerns regarding the adequacy of the Draft PEIR or the CEQA process. Metropolitan's CAP is a GHG reduction plan aimed at reducing GHG emissions from sources within its operational control, therefore emissions were calculated for its own operations including conveyance, treatment and distribution of SWP water from where it enters Metropolitan's system. DWR has its own CAP, which identifies emissions reductions for its operations. While an aggregated number will not be used in the Metropolitan's CAP, Metropolitan understands that having an aggregated emissions factor for the imported water to Southern California is beneficial to better understand the overall emissions related to imported water, therefore a discussion of DWR's emissions is provided in Topical Response A and a detailed discussion of the overall embedded energy of water imported to Southern California has been added to Appendix B of the Final CAP. No changes to the Draft PEIR are warranted in response to this comment.

Response 10-2

The commenter recommends Metropolitan include SWP emissions in its CAP in order to have an accurate understanding of its energy use when discussing pros and cons of the projects related to the SWP, such as the Delta Conveyance project, Sites Reservoir, and operations and maintenance needs.

The comment relates to the contents of the proposed CAP and does not raise concerns regarding the adequacy of the Draft PEIR or the CEQA process. As discussed in Response 10-1, Metropolitan has included a discussion of DWR's emissions in Topical Response A and a detailed discussion of the overall embedded energy of water imported to Southern California has been added to Appendix B of the Final CAP. However, Metropolitan does not own or operate the SWP, therefore a discussion about the pros and cons of SWP related projects has not been included.

Response 10-3

The commenter notes energy costs associated with the SWP are passed to ratepayers and presenting the full scope to ratepayers is part of the transparency and openness of the new general manager's tenure.

As discussed in Response 10-1, Metropolitan has included a discussion of DWR's emissions in Topical Response A and a detailed discussion of the overall embedded energy of water imported to Southern California has been added to Appendix B of the Final CAP. A discussion of the energy costs associated with the SWP, which is outside of the operational control of Metropolitan, is outside the scope of the CAP. No changes to the Draft PEIR or Draft CAP are warranted in response to this comment.

Response 10-4

The commenter suggests the graphical depiction of Metropolitan's GHG emissions over time is misleading, as the choice not to include SWP energy emissions gives the appearance that Metropolitan was not using as much energy in years when it depended more heavily on SWP water.

The comment relates to the contents of the proposed CAP and does not raise concerns regarding the adequacy of the Draft PEIR or the CEQA process. Metropolitan's CAP includes a complete emissions inventory of its operations. The SWP is not within Metropolitan's operational control and emissions associated with operation and maintenance of the SWP are covered under the DWR's CAP. However, Metropolitan has included a discussion of DWR's emissions in Topical Response A and a detailed discussion of the overall embedded energy of water imported to Southern California has been added to Appendix B of the Final CAP. No changes to the Draft PEIR are warranted in response to this comment.

Response 10-5

The commenter expresses concern regarding Metropolitan's ability to meet the 2045 carbon neutrality goal, since the Delta Conveyance project is estimated to be operational in 2040. The comment states the opinion that meeting the 2045 goal would be difficult with such an energy-intensive project. The commenter further opines this seems to be a motivation not to include SWP energy outputs in the CAP calculations and renders the PEIR inadequate, if not incomplete.

The commenter states the opinion that the exclusion of SWP energy from CAP calculations renders the Draft PEIR inadequate or incomplete but does not raise a significant environmental issue indicating why the document is inadequate or incomplete. The proposed Delta Conveyance Project would be owned, operated, and funded by the DWR and is not a proposed project or activity that would be covered under Metropolitan's CAP and, therefore, is not analyzed in the Draft PEIR. The Draft PEIR analyzes and discloses potential environmental impacts associated with implementation of the CAP as it is described in Chapter 2, *Project Description*, of the Draft PEIR. No changes to the Draft PEIR are warranted in response to this comment.

Response 10-6

The commenter cautions against committing to implementation of carbon capture and sequestration before fully investigating the risks of the process to Delta or Kern County communities and recommends working with these communities to understand the consequences of improper carbon capture and storage.

CAP measure CS-3 involves developing pilot projects to enhance carbon sequestration on Metropolitan-owned properties within the Sacramento-San Joaquin River Delta, as described on page 51 of the Draft PEIR. No such projects are proposed in Kern County. As noted on page 51 of the Draft PEIR, any such projects, if deemed feasible, would comply with existing laws and regulations pertaining to carbon capture and sequestration. Furthermore, as stated on page 51 of the Draft PEIR, such projects would be aligned with the CARB's Approved Carbon Capture and Sequestration Protocol, which includes monitoring and oversight requirements to avoid impacts to public health, natural resources, or the environment. Individual projects to be implemented under the CAP would undergo the appropriate level of project-specific environmental review, including compliance with all applicable noticing and review requirements pursuant to CEQA. No changes to the Draft PEIR are warranted in response to this comment.

Response 10-7

The commenter commends specific goals included in the CAP.

This comment is acknowledged. No changes to the Draft PEIR or Draft CAP are warranted in response to this comment.

Response 10-8

The commenter states the CAP and Draft PEIR do not include alternative solutions, such as solar panels on all Metropolitan properties by 2035 for shading and generation and does not address unintended consequences and risks of harm to the environment or communities.

As stated in *State CEQA Guidelines* Section 15126.6(a):

> An EIR need not consider every conceivable alternative to a project. Rather it must consider a reasonable range of potentially feasible alternatives that will foster informed decision making and public participation…The lead agency is responsible for selecting a range of project alternatives for examination and must publicly disclose its reasoning for selecting those alternatives.

A range of potentially feasible alternatives to the proposed program, including alternatives considered but rejected, are described in Chapter 7, *Alternatives*, of the Draft PEIR. As explained on page 191 of the Draft PEIR, while the commenter may suggest various GHG reduction measures that may be pursued, funded, or supported to a greater degree, Metropolitan has proposed a CAP that based on its assessment of local conditions, regulatory requirements, and feasibility, provides a full spectrum of GHG reduction measures at levels that can be feasibly achieved and quantified based upon the information and technology available today. The potential environmental impacts associated with the CEQA-required "No Program Alternative" are also described in this chapter. While the "No Program Alternative" may not avoid all significant and unavoidable impacts identified for the proposed program, Chapter 7, *Alternatives*, concludes it would result in similar but reduced impacts to resource areas where the proposed program would result in significant and unavoidable impacts, specifically air quality, cultural resources, and noise. As such, the Draft PEIR considers a range of potentially feasible alternatives intended to address one or more potentially significant impacts. The commenter does not provide any evidence the alternatives considered in the Draft PEIR are inadequate nor any evidence the alternative suggested by the commenter would address any of the potential significant impacts identified in the Draft PEIR.

The commenter suggests the CAP and Draft PEIR do not address unintended consequences and risks of harm to the environment or communities but does not provide any evidence or information regarding potential unintended consequences or risks of harm that could occur as a result of program implementation. The Draft PEIR analyzes and discloses potential environmental impacts associated with implementation of the CAP as it is currently written and as it is described in Chapter 2, *Project Description*, of the Draft PEIR. No changes to the Draft PEIR are warranted in response to this comment.

Letter 11

LOS ANGELES WATERKEEPER®

January 12, 2022

Ms. Malinda Stalvey, Senior Environmental Specialist
The Metropolitan Water District of Southern California
Environmental Planning Section
P.O. Box 54153
Los Angeles, CA 90054-0153
Sent via email to: EP@mwdh2o.com

RE: DRAFT CLIMATE ACTION PLAN

To Ms. Stalvey:

On behalf of Los Angeles Waterkeeper, a nonprofit environmental watchdog that fights for the health of the region's waterways, and for sustainable, equitable and climate-friendly water supplies, I am writing to provide the following comments on The Metropolitan Water District of Southern California's (MWD's) Draft Climate Action Plan (CAP).

First, we commend MWD for taking the initiative to develop a Climate Action Plan and committing to carbon neutrality by 2045, as required by the State of California. We also appreciate MWD's acknowledgement of its role in mitigating the climate crisis. The conveyance, treatment, and distribution of water is energy-intensive, and it is critical that MWD, as the nation's largest water wholesaler, address the water-energy-climate nexus head on. MWD is poised to lead water agencies nationwide, and we believe the following recommendations will move MWD closer to the agency's ambitious and necessary commitments. 11-1

That said, **MWD must address the State Water Project in its CAP**. MWD's Energy Sustainability Plan includes the agency's net energy use and costs, which are dominated by pumping imported water through the State Water Project (SWP) and Colorado River Aqueduct (CRA) systems. Between 2013 and 2018, the SWP constituted 54% of MWD's overall electricity requirements and 75% of its electricity costs on average. In comparison, the CRA constituted 44% of MWD's overall electricity requirements and 18% of its electricity costs during the same time period.[1] Despite this, the Draft Climate Action Plan fails to include the SWP's GHG emissions, potential actions to mitigate those emissions and measures to protect the Delta from climate impacts. 11-2

While we understand the desire to not double count GHG emissions already assessed through the California Department of Water Resources' Climate Action Plan, MWD cannot ignore its role in the SWP in its own CAP. MWD is the largest SWP contractor and is responsible for the largest share of operational costs, including energy costs. MWD also has an outsized role in the planning and implementation of projects within the SWP due to its majority share. Moreover, asking the public to try to piece together various climate action plans to understand the impacts of MWD's policies, programs and projects does not rise to the level of transparency to which I know this agency aspires. MWD has a responsibility to its member agencies, ratepayers and the general public to address the SWP's climate

[1] Metropolitan Water District of Southern California (July 2020), *Energy Sustainability Plan, Executive Summary, p. i.*

120 BROADWAY, SUITE 105 • SANTA MONICA, CA 90401 • PH: 310-394-6162 • FX: 310-394-6178 • LAWATERKEEPER.ORG
POLLUTION HOTLINE: 1-877-4-CACOAST

vulnerabilities and impacts in its CAP as well as in its decision-making on management, operations, construction, and funding related to the SWP.

By excluding SWP operations from the CAP, MWD fails to look at its system holistically. Admittedly, CRP emissions increase during drought years when SWP allocations are decreased. The inverse is also true, but not accounted for in MWD's GHG calculations or management decisions. Thus, emissions will appear artificially low when maximizing imports from the SWP. As the CAP acknowledges, GHG reporting protocols generally require an organization to limit its GHG accounting to within its operational boundaries. However, considering MWD's influence over SWP operations, MWD staff must account for the energy use and emissions associated with its operations even if solely in a qualitative manner. 11-2

MWD should develop a climate resilience and adaptation plan. Many of MWD's strategies to mitigate its GHG emissions are significant, especially the divestment from coal and its own installation of renewable energy at its facilities. However, MWD must also fully address the immediate impacts of climate change, assess the whole system's climate vulnerabilities (including physical infrastructure and social vulnerabilities) and develop a proactive climate adaptation plan that builds resilience into the system. This plan should address all operations over which MWD has significant influence, including the SWP. And through coordination with the State, MWD can reduce the impacts of unpredictable precipitation and drought, and design infrastructure and ecosystem restoration that protects communities and wildlife. 11-3

MWD should consider deeper emissions cuts in the near term. The latest Intergovernmental Panel on Climate Change (IPCC) report warns the climate is changing faster than expected and climate scientists agree that the faster we act, the less severe the consequences. MWD should consider additional near-term actions to accelerate its emissions reductions by 2030. Specifically, MWD should include a commitment of utilizing 100% renewable energy for all its operations and should assess potential methane emissions from its facilities, including reservoirs. 11-4

LA Waterkeeper supports MWD's shift towards a *One Water* approach that fully incorporates and addresses the water-energy-climate nexus. As MWD looks to pull together its climate action, resilience and *One Water* planning, the connection between water and climate must be at the core of its work.

Thank you for the opportunity to comment on the Draft Climate Action Plan. Please do not hesitate to reach out to me at bruce@lawaterkeeper.org or 619-851-9997 with any questions and for further discussion of these recommendations. LA Waterkeeper looks forward to being an ally and resource as MWD pursues the critically important *One Water* approach that prioritizes resilience and equity.

Sincerely,

Bruce Reznik
Executive Director

Response to Comment Letter 11

COMMENTER: Bruce Reznik, Executive Director, Los Angeles Waterkeeper

DATE: January 12, 2022

Response 11-1

The commenter provides background on Los Angeles Waterkeeper and commends Metropolitan for creating the CAP.

This comment is acknowledged. No changes to the Draft PEIR or Draft CAP are warranted in response to this comment.

Response 11-2

The commenter recommends Metropolitan address the SWP in its CAP. The commenter understands not wanting to double-count GHG emissions considered by the state but suggests that Metropolitan should account for the energy use and emissions associated with SWP operations, even if solely in a qualitative manner. As currently presented, the commenter states the opinion that emissions appear artificially low when maximizing imports from the SWP.

Metropolitan's CAP is a GHG reduction plan aimed at identifying GHG emissions from within its operational control; therefore, emissions were calculated for its own operations including conveyance, treatment and distribution of SWP water from where it enters Metropolitan's system. DWR has its own CAP, which identifies emissions reductions for its operations. While an aggregated number will not be used in the Metropolitan's CAP, Metropolitan understands that having an aggregated emissions factor for the imported water to Southern California is beneficial to better understand the overall emissions related to imported water, therefore a discussion of DWR's emissions is provided in Topical Response A and a detailed discussion of the overall embedded energy of water imported to Southern California has been added to Appendix B of the Final CAP.

The comment relates to the contents of the proposed CAP and does not raise concerns regarding the adequacy of the Draft PEIR or the CEQA process. No changes to the Draft PEIR are warranted in response to this comment.

Response 11-3

The commenter recommends Metropolitan develop a climate resilience and adaptation plan. Specifically, the commenter suggests the plan should address all operations over which Metropolitan has significant influence, including the SWP.

As described in Response 1-1, Metropolitan's IRP and UWMP address climate resilience and adaptation by focusing on water supply reliability and how Metropolitan ensures a reliable supply of water during periods of drought and changing climatic conditions. The CAP complements these two plans by creating a GHG reduction plan. The IRP is currently being updated and will be released in the coming months. The following links include both current documents and information about the planning process:

- https://www.mwdh2o.com/planning-for-tomorrow/how-we-plan/integrated-resource-plan/
- https://www.mwdh2o.com/planning-for-tomorrow/how-we-plan/

The comment relates to the contents of the proposed CAP and does not raise concerns regarding the adequacy of the Draft PEIR or the CEQA process. No changes to the Draft PEIR or Draft CAP are warranted in response to this comment.

Response 11-4

The commenter recommends Metropolitan consider deeper emissions cuts in the near term. Specifically, the commenter suggests Metropolitan include a commitment of utilizing 100 percent renewable energy for all its operations and should assess potential methane emissions from its facilities, including reservoirs. Finally, the commenter supports Metropolitan's shift toward a One Water approach that fully incorporates and addresses the water-energy-climate nexus.

Metropolitan supports the transition for 100 percent renewable energy for all its operations but must balance the need for a reliable water delivery system and the cost of transitioning to 100 percent renewable energy to its ratepayers. At this time, neither the retail nor the wholesale market is capable of providing a reliable source of 100 percent renewable energy.[5] As described in CAP Strategies 4 and 5, Metropolitan has developed a comprehensive plan to transition to 100 percent renewable energy including evaluating operations that can be shifted to lower emissions periods, installation of Battery Energy Storage Systems (BESS) to capture energy during periods of low grid emissions and discharging when renewable energy is not produced, transitioning one of our facilities from energy supplied by the retail market to available hydropower currently sold to the wholesale market, and investigating the feasibility of installing additional solar and large scale battery storage systems, to name a few. Additionally, as the state begins to realize the benefits of SB 100, which calls for 100 percent of electric retail sales to come from renewable energy in California by 2045, Metropolitan's operations will benefit from the investments in renewable and zero-carbon resources.

Currently, there is no accepted protocol for measuring and verifying annual methane emissions from lakes and reservoirs. Current approaches for estimating GHG emissions from reservoirs do not account for carbon sequestration in reservoir sediments and do not account for the complete carbon cycle in reservoirs including carbon inflows, stocks, and outflows. Additionally, current approaches do not recognize a difference between a natural lake system fed by rivers and runoff rather than pass through terminal reservoirs that are fed by aqueducts and pipelines and typically discharge into water conveyance systems or groundwater recharge basins. As protocols are developed, Metropolitan will include this analysis in its emissions calculations.

The comment relates to the contents of the proposed CAP and does not raise concerns regarding the adequacy of the Draft PEIR or the CEQA process. No changes to the Draft PEIR or Draft CAP are warranted in response to this comment.

Letter 12

From: kris kwak <rubydog2@hotmail.com>
Sent: Sunday, November 21, 2021 6:21 PM
To: Stalvey,Malinda K <mstalvey@mwdh2o.com>
Subject: Draft CAP - SCH No 2020060450

We received letter concerning the above draft.
We live in Granada Hills and have view of DWP water treatment plant.
Will the above draft affect us?
Appear the 2 proposed sites are Sacramento and San Diego.
Will DWP expand their water treatment plant in the future.

12-1

Thank You
Kristelle

Get Outlook for Android

Response to Comment Letter 12

COMMENTER: Kristelle Kwak, Resident

DATE: November 21, 2021

Response 12-1

The commenter requests clarification regarding whether the proposed program will affect them, as residents of Granada Hills with a view of an existing water treatment plant in the area. The commenter asks if there are plans to expand the water treatment plant in the future.

As described in Section 2.5, *Description of Covered Projects with Potential for Physical Impacts*, of the Draft PEIR, Metropolitan's Joseph Jensen (Jensen) Water Treatment Plant (WTP) in Granada Hills, California is considered as a proposed site for a BESS facility, pursuant to CAP measure E-4. Activities associated with CAP measure E-4, are described on page 46 of the Draft PEIR, and Figure 10 of the Draft PEIR shows the proposed locations for BESS facilities at the Jensen WTP. As shown in Figure 10, proposed locations would be located within the existing footprint of the Jensen WTP; no expansion of the Jensen WTP is proposed as part of implementation of the CAP.

The Draft PEIR identifies significant and unavoidable impacts with respect to air quality, cultural resources, and noise. For all other environmental issue areas, implementation of the CAP would result in no impact, less than significant impacts, or less than significant impacts with incorporation of mitigation measures. This comment does not raise concerns regarding the adequacy of the Draft PEIR or the CEQA process, and no changes to the Draft PEIR or Draft CAP are warranted in response to this comment.

Letter 13

From: Liz Amsden
To: EPT
Subject: CAP PEIR
Date: Saturday, January 1, 2022 9:35:16 AM

To whom it may concern:

Some thoughts on the Metropolitan Water District's proposed Climate Action Plan.

Which is a good start on a complex and vexing problem. A lot of thought has gone into it but I read a certain amount of constraint between the lines, limitations set by expectations and by data points that feel dated

13-1

Scope 3 addresses carbon sequestration as one of the routes to be pursued. This has been contemplated a number of times over the past decades and seems to fade into obscurity every time. What is the time and cost involved compared to benefit? Does it even come close to offsetting the current carbon being released from the poles and the Himalayas due to ongoing global warming?

I do support your commitment to water conservation and investing in local water supplies. However, what is the MWD doing to protect the people's rights to the water commons - what falls from the sky and flows through our rivers and fills our lakes?

13-2

That is water that should be conserved for all uses, drinking water, fishes, eco-habitats rebuilding water tables. Water is a human right and should not be auctioned off to feed the greed of multinationals such as Nestles or to irrigate crops which are patently unsuitable for the semi-desert valleys of California, or even to maintain senior water rights.

What is being done to prevent evaporation of water in the aqueducts feeding into SoCal? What is being done to stop contamination by Big Ag and Big Oil/fracking? What is being done to reduce the salinity of the water to ensure downstream users don't receive toxic chemicals?

13-3

How are you rectifying the cowboy approach of the dam-builders in the American west that have forever destroyed its river systems?

13-4

To that extent, I request you look at the following issues in reformulating and implementing your Plan:

- The need to preserve or return ecosystems to their states prior to the damming of the western rivers and draining of the aquifers and river systems – both the State Water Project and the Colorado River Aqueduct and the various backroom deals related thereto;

13-5

- Why is the MWD still supporting the current iteration of the Twin Tunnels Project which is NOT needed by LA County and charges LA County households huge amounts for the benefit Central Valley agribusinesses who care little for the land and more about the tax savings of their use of antiquated anti-environmental incentives?

13-6

- There are many conservation options that are not being pursued because they do not suit the political aspirations of those in power and the profiteers who enable them – how will the

13-7

MWD address this?

- In drought year of 2014 with water use strongly regulated, Los Angeles saw significant cut-backs that were then abandoned in favor of keeping the LADWP from having to increase unit charges to cover its fixed costs – what can you do to re-implement and enforce these measures without creating economic hardship? — 13-8
- Yes, the per unit charge will have to be raised – hopefully with households reducing use so their net expense remains within reason - but why should MWD customers pay for the Central Valley's poor husbandry? — 13-9
- Has the MWD and other agencies discussed leveraging their power to revamp the existing water rights mish-mash into a system that will be more flexible and fairer for all in years to come? — 13-10
- California doesn't 'owe' luxury foodstuffs and alfalfa to any state or country; its agricultural sector needs to come to terms with the fact that most of the state is semi-desert with limited water resources that are difficult to replenish and should adjust their crops and methods accordingly – cutting pesticides, moving to less harmful fertilizing methods, installing drip irrigation systems used in Israel rather than continuing to spray precious water into the air where it does not even reach the ground let alone the roots of the plants, etc. — 13-11
- Again, the water rights regulations need to be redone to reflect reality and the future of the state, not to preserve deeded water amounts
- High water-demand plants should be relegated to greenhouse cultivation
- Indoor vertical farming (closed-system greenhouses) can operate year round, recycle water and use little if any pesticides and chemical fertilizers, both of which are contaminating our groundwater and drinking water supplies
- With the experience of the pandemic years, look at how much of your work can now be done by telecommuting to reduce emissions, reduce stress, reduce traffic, and how that can be increased in the future — 13-12
- Co-office use will reduce costs at all levels including carbon footprints
- Consider what existing spaces can be converted to affordable housing, small business incubators, recycling facilities, and bringing the manufacture of necessary goods back to the United States — 13-13
- Cover the canals to reduce evaporation and generate solar power — 13-14
- Stop the Delta project, the most recent iteration of the Twin Tunnels scheme which would not only be an ecological disaster with a disproportional cost falling on Los Angeles households but primarily subsidize Central Valley agribusinesses that care little for the land and more about personal profit margins and tax benefits, planting high water-demand crops and use inefficient irrigation to maintain their primary water rights — 13-15
- How do we repair and care for California's multiple ecological systems; even if we conserve every drop, it doesn't mean that fish will have enough free water to breed- destruction of one species can impact many others and severely impact various economic systems throughout the state
- How are you addressing chemicals getting into our aquifers from your construction projects as well as from fracking, BigAg run-off, adjacent landfills (i.e. Scholl Canyon), runoff pollution, salt/alkalinity build-up, etc.? — 13-16
- Divide electricity into coal, oil and hydro which need to be phased out as soon as possible and the land restored to prior health be it 10 or 100 years ago, from tidal, solar and wind provided these are established and maintained in an ecologically sound and sustainable manner — 13-17
- Seriously investigate desalinization but NOT in the way that it is currently being pursued in California which is incredibly destructive of marine habitat and uses ridiculous amounts of carbon energy to producer - investigate Perth's tidal desalination plant and possible Melbourne's (both in Australia)
- BTW, hydro is now considered to be WORSE than other carbon fuels as the dams bury trees

and vegetation that decomposes in addition to the carbon-cost for building and maintaining the infrastructure

- Biodiesel is not more sustainable – there is the cost to create it and the cost to move it and the carbon cost from burning ANY fuel
- Bridge / transitional energy sources having no purpose in this discussion because of all the infrastructure required to build infrastructure to create them, retool equipment to use them and find an aftermarket to capture or dispose of their byproducts, all of which then encourages people to go on using them to justify their initial cost

13-17

The impact of climate change for such a complex entity as the MWD is a multi-tiered challenge and deserves careful assessment and even more careful implementation of policies to ensure that it actually achieves objectives beneficial to all its stakeholders and not just those with the most power or the loudest voices.

The MWD must address the interrelated ecological issues as well as current and future stakeholder needs.

Extreme caution must be taken to avoid short term profiteering and pretty metrics at the expense of long term restoration needed to repair over a century of mismanagement and safeguard future sustainability.

13-18

These are just a few thoughts.

Sincerely

Liz Amsden
Los Angeles, CA 90042
(323) 254-0590

Response to Comment Letter 13

COMMENTER: Liz Amsden, Resident

DATE: January 1, 2022

Response 13-1

The commenter states the opinion the CAP is a good start on a complex problem but inquires about the time and cost of carbon sequestration and whether these measures come close to offsetting current carbon being released from the poles and the Himalayas due to ongoing global warming.

This comment is acknowledged. The CAP is intended to reduce GHG emissions associated with Metropolitan's operations. Metropolitan would complete a full cost/benefit analysis before implementing carbon sequestration measures. Carbon sequestration provides a significant opportunity to reduce emissions associated with Metropolitan's operations while providing co-benefits of habitat restoration and protecting the natural environment. Emissions outside Metropolitan's operational control, such as DWR's SWP, are outside the scope of the CAP. The comment does not raise concerns regarding the adequacy of the Draft PEIR or the CEQA process. No changes to the Draft PEIR or Draft CAP are warranted in response to this comment.

Response 13-2

The commenter supports commitment to water conservation and investing in local water supplies, but asks what Metropolitan is doing to protect people's rights to water commons.

The commenter's support of water conservation and investing in local water supplies is acknowledged. Metropolitan's core mission is to provide its service area with adequate and reliable supplies of high-quality water to meet present and future needs in an environmentally and economically responsible way. The proposed CAP is intended to reduce GHG emissions associated with Metropolitan's operations; therefore, the document supports Metropolitan's core mission of providing a reliable water supply in an environmentally responsible way. The comment does not raise concerns regarding the adequacy of the Draft PEIR or the CEQA process. No changes to the Draft PEIR are warranted in response to this comment.

Response 13-3

The commenter asks what is being done to prevent evaporation of water in the aqueducts serving Southern California, as well as what is being done to stop contamination of water due to agricultural practices, oil production, increasing salinity for downstream users.

While there are no projects identified in the proposed CAP that specifically address the evaporation of water in the aqueducts or contamination of water, Metropolitan continually evaluates ways to improve water efficiency and protect water quality. The comment does not raise concerns with the adequacy of the Draft PEIR or the CEQA process, nor does the comment identify concerns with the analysis in the CAP or the GHG reduction measures identified to reduce emissions. No changes to the Draft PEIR or Draft CAP are warranted in response to this comment.

Response 13-4

The commenter asks how Metropolitan is rectifying the historical approach of constructing dams in the American west in ways that have destroyed river systems.

The comment is acknowledged. Metropolitan's mission is to provide a safe and reliable supply of water to Southern California. Metropolitan is continually evaluating its operations to ensure it is providing water in an environmentally and economically responsible way. The comment does not

raise concerns with the adequacy of the Draft PEIR or the CEQA process, nor does the comment identify concerns with the analysis in the CAP or the GHG reduction measures identified to reduce emissions. No changes to the Draft PEIR or Draft CAP are warranted in response to this comment.

Response 13-5

The commenter suggests the CAP consider the need to preserve or return ecosystems to their states prior to the damming of the western rivers and draining of the aquifers and river systems.

The comment is acknowledged. Please refer to Response 13-4.

Response 13-6

The commenter suggests the CAP consider why Metropolitan supports the current iteration of the Twin Tunnels Project, adding the opinion the project is not needed by Los Angeles County and charges County households for the benefit of Central Valley agri-businesses.

The comment is acknowledged. Please refer to Response 13-4.

Response 13-7

The commenter suggests the CAP consider how Metropolitan will address conservation options that the commenter believes are not being pursued because they do not suit the political aspirations of those in power and the profiteers who enable them.

The comment is acknowledged. No specific examples of conservation options that should have been considered by Metropolitan are offered by the commenter. Please refer to Response 13-4.

Response 13-8

The commenter suggests the CAP consider re-implementing and enforcing 2014 water use regulations that realized significant cutbacks without creating economic hardship.

Regulatory water restrictions such as those imposed by the State Water Board in 2014 are the result of an Executive Order issued by the Governor declaring a State of Emergency. Metropolitan does not have the authority to impose water use regulations. Metropolitan recognizes that water conservation is key to ensuring a reliable supply of water to its service area. Water conservation measures are included as part of Strategy 8 of the proposed CAP. The comment does not raise concerns regarding the adequacy of the Draft PEIR or the CEQA process. No changes to the Draft PEIR or Draft CAP are warranted in response to this comment.

Response 13-9

The commenter suggests the CAP consider why Metropolitan customers should pay for the Central Valley's poor husbandry.

The comment is acknowledged. Please refer to Response 13-4.

Response 13-10

The commenter suggests the CAP consider revamping the existing water rights mish-mash into a system that will be more flexible and fairer for all in years to come.

The comment is acknowledged. Please refer to Response 13-4.

Response 13-11

The commenter suggests the CAP consider reforms to the state's agricultural system, including cutting pesticides, moving to less harmful fertilizing methods, installing drip irrigation systems, etc. The commenter further requests the CAP consider relegating high water-demand plants to greenhouse cultivation and supports indoor vertical farming.

The comment is acknowledged. Please refer to Response 13-4.

Response 13-12

The commenter suggests the CAP consider the benefits of telecommuting and co-office use.

Strategy 6 of the CAP addresses the issue of telecommuting and incentivizing more sustainable commutes. Specifically, Measure EC-5 of the proposed CAP would allow for 50 percent of employees located at Metropolitan's headquarters to telecommute or use flexible schedules through 2030 to reduce travel time, vehicle miles traveled, and GHG emissions. This comment does not raise concerns regarding the adequacy of the Draft PEIR or the CEQA process. No changes to the Draft PEIR or Draft CAP are warranted in response to this comment.

Response 13-13

The commenter suggests the CAP consider what existing spaces can be converted to affordable housing, small business incubators, recycling facilities, and bringing the manufacturing of necessary goods back to the United States.

The comment is acknowledged. Please refer to Response 13-4.

Response 13-14

The commenter suggests the CAP consider covering canals to reduce evaporation and generate solar power.

This comment is acknowledged. Please refer to Response 13-4.

Response 13-15

The commenter opposes the Delta (Twin Tunnels) Project and suggests the CAP consider how to repair and care for California's multiple ecological systems.

The comment is acknowledged. Please refer to Response 13-4.

Response 13-16

The commenter asks how Metropolitan repairs and care for California's multiple ecological systems, especially ensuring enough free water for fish to breed.

The comment is acknowledged. Please refer to Response 13-4.

Response 13-17

The commenter suggests the CAP consider aquifer contamination from Metropolitan's construction projects, as well as from agricultural practices, landfills, runoff pollution, and salinity.

Impacts to hydrology and water quality associated with implementation of the proposed CAP, including potential degradation of groundwater quality, are addressed in Section 5.7, *Hydrology and Water Quality*, of the Draft PEIR. As discussed in that section, construction-related impacts to water

quality are determined to be less than significant with adherence to best management practices required in Metropolitan's standard construction specifications and regulatory compliance, including coverage under the statewide Construction General Permit. The commenter provides no evidence that construction of any project to be implemented under the proposed CAP would result in aquifer contamination such that this impact would be potentially significant.

Impacts to hydrology and water quality associated with agricultural practices, landfills, and salinity are beyond the scope of the proposed CAP, which is intended to reduce GHG emissions associated with Metropolitan's operations. As such, these issues are not discussed further in the Draft PEIR. Given the discussion above, no changes to the Draft PEIR or Draft CAP are warranted in response to this comment.

Response 13-17

The commenter suggests the CAP consider the benefits and liabilities of various energy sources. Specifically, the commenter states the opinion coal, oil, and hydroelectric sources should be phased out as soon as possible, that Metropolitan should consider less-destructive or energy-intensive desalination processes and questions the sustainability of biodiesel.

Metropolitan appreciates the comment. Metropolitan has already divested itself from the use of coal and plans to electrify its operations completely by 2045. Measures included in Strategies 4 and 5 will ensure increased energy efficiency and a transition to 100 percent carbon free electricity by 2045. While Metropolitan plans to shift its fleet to zero emission vehicles as outlined in Strategy 2: Zero Emission Fleet, the limited availability of electric medium- and heavy-duty vehicles, will require the use of carbon-based fuel sources during the transition to zero emissions vehicles. Using alternative fuels like biodiesel or biogas, which can be used interchangeably in traditional diesel-powered engines are short-term measures that can be implemented to reduce emissions from conventional diesel fuel during the transition to a decarbonized Metropolitan fleet. The comment does not raise concerns regarding the adequacy of the Draft PEIR or the CEQA process. No changes to the Draft PEIR or Draft CAP are warranted in response to this comment.

Response 13-18

The commenter suggests Metropolitan address the interrelated ecological issues as well as current and future stakeholder needs.

The comment is acknowledged. Please refer to Response 13-4.

CHAPTER 2
CHANGES TO THE DRAFT PEIR

Introduction

As provided in Section 15088(d) of the *State CEQA Guidelines* (14 California Code of Regulations 15000 et seq.), responses to comments may take the form of a revision to a draft EIR or may be a separate section in the Final EIR. This section complies with the latter and provides changes to the Draft PEIR presented in strikethrough text (~~strikethrough~~) signifying deletions and underlined text (underline) signifying additions. These notations are meant to provide clarification, corrections, or minor revisions as needed as a result of public comments or because of changes in the proposed program since the release of the Draft PEIR, as required by Section 15132 of the *State CEQA Guidelines*. None of the corrections and additions constitutes significant new information or substantial project changes requiring recirculation as defined by Section 15088.5 of the *State CEQA Guidelines*.

Changes to the Draft PEIR

Changes to the Draft PEIR are provided in this section. Page numbers correspond to the Draft PEIR. After the location or locations of the changes (by page number), a brief explanation of the nature of the change is provided, followed by the text from the Draft PEIR with changes shown in ~~strikethrough~~/underline.

Page 8 and Page 116

Mitigation Measure BIO-5 has been revised to remove an erroneous reference to Mitigation Measure BIO-1. This change does not alter the meaning or intent of the mitigation measure and does not result in a change to the impact findings of the Draft PEIR. The following change has been made in in Table 1 of Section ES.6, *Summary of Impacts and Mitigation Measures*, and in Section 4.2.5.2, *Mitigation Measures*, of the Draft PEIR.

MM BIO-5 **Endangered/Threatened Species Avoidance and Minimization During Construction.** The following measures shall be applied to aquatic and terrestrial species, where appropriate. Metropolitan shall select from these measures as appropriate depending on site conditions, the species with potential for occurrence, and the results of the project-specific biological resources assessment ~~(Mitigation Measure BIO-1)~~.

Pre-construction surveys for federal and/or state listed species with potential to occur shall be conducted where suitable habitat is present by a qualified biologist not more than 72 hours prior to the start of construction activities. The survey area shall include the proposed disturbance area and all proposed ingress/egress routes, plus a species-specific buffer. If any life stage of federal and/or state listed species is found within the survey area, the appropriate measures in the BO or HCP/ITP issued by the USFWS/NMFS (relevant to federally listed species) and/or the ITP issued by the CDFW (relevant to state listed species) shall be implemented; or if such guidance is not in place for the activity, the qualified biologist shall recommend an appropriate

course of action, which may include consultation with USFWS, NMFS, and/or CDFW.

The activity limits of disturbance shall be flagged. Areas of special biological concern within or adjacent to the limits of disturbance shall have Environmental Sensitive Area fencing installed between said area and the limits of disturbance.

All activities occurring within or adjacent to sensitive habitats that may support federally and/or state endangered/threatened species shall have a qualified biologist present during all initial ground disturbing/vegetation clearing activities. Once initial ground disturbing/vegetation clearing activities have been completed, the biologist shall conduct pre-activity clearance surveys, as needed to ensure protection of endangered/threatened species.

If pumps are used for dewatering activities, all intakes shall be completely screened with wire mesh not larger than five millimeters to prevent animals from entering the pump system.

If at any time during construction of the project activity an endangered/threatened species enters the construction site or otherwise may be impacted by the project activity, all project activities shall cease. At that point, a qualified biologist shall recommend an appropriate course of action, which may include consultation with USFWS, NMFS, and/or CDFW. Alternatively, the appropriate measures shall be implemented in accordance with the BO or HCP/ITP issued by the USFWS (relevant to federal listed species) and/or the ITP issued by the CDFW (relevant to state listed species) and work can then continue as guided by those documents and the agencies, as appropriate.

All trenches, pipes, culverts or similar structures shall be inspected for animals prior to burying, capping, moving, or filling.

Upon completion of the project activity, a qualified biologist shall prepare a final compliance report documenting all compliance activities implemented for the activity, including the pre-construction survey results.

Page 10 and Page 117

Mitigation Measure BIO-7 has been revised to remove an erroneous reference to Mitigation Measure BIO-1. This change does not alter the meaning or intent of the mitigation measure and does not result in a change to the impact findings of the Draft PEIR. The following change has been made in in Table 1 of Section ES.6, *Summary of Impacts and Mitigation Measures*, and in Section 4.2.5.2, *Mitigation Measures*, of the Draft PEIR.

MM BIO-7 **Jurisdictional Delineation and Impact Avoidance.** If the results of the project-specific biological resource assessment ~~Mitigation Measure BIO-1~~ indicate project activities implemented under the proposed CAP would impact wetlands, drainages, riparian habitats, or other areas that may fall under the jurisdiction of the CDFW, USACE, and/or RWQCB, a qualified biologist shall complete a jurisdictional delineation. The jurisdictional delineation shall determine the extent of the jurisdiction for each of these agencies within the project activity site and shall be conducted in accordance with the requirement set forth by each agency. The results shall be provided in a jurisdictional delineation report submitted to Metropolitan, USACE, RWQCB, and CDFW, as appropriate, for review and approval. The project activity shall be designed to avoid or minimize impacts to jurisdictional areas to the maximum extent feasible.

Page 11 and Page 118

Mitigation Measure BIO-9 has been revised to remove an erroneous reference to Mitigation Measure BIO-1. This change does not alter the meaning or intent of the mitigation measure and does not result in a change to the impact findings of the Draft PEIR. The following change has been made in in Table 1 of Section ES.6, *Summary of Impacts and Mitigation Measures*, and in Section 4.2.5.2, *Mitigation Measures*, of the Draft PEIR.

MM BIO-9 **Sensitive Natural Community Avoidance and Mitigation.** If the results of the project-specific biological resource assessment ~~Mitigation Measure BIO-1~~ indicate project activities implemented under the proposed CAP would impact sensitive natural communities, impacts shall be avoided through final project activity design modifications.

If Metropolitan determines sensitive communities cannot be avoided, impacts shall be mitigated on-site or off-site at an appropriate ratio to fully offset project activity impacts (minimum ratio of 1:1). Temporarily impacted areas shall be restored to pre-project conditions. An HMMP shall be developed by a qualified biologist and submitted to the agency overseeing the project activity for approval.

Table of Contents

Tables

This page intentionally left blank.

CHAPTER 1
INTRODUCTION TO FINAL PROGRAM EIR – VOLUME 2

1.1 Introduction

This Final Program Environmental Impact Report (Final PEIR) has been prepared in accordance with the California Environmental Quality Act (CEQA) (California Public Resources Code, Section 21000 et seq.), as amended. The Metropolitan Water District of Southern California (Metropolitan) is the lead agency for the environmental review of the proposed Climate Action Plan (CAP or proposed program) evaluated herein and has the responsibility for approving the proposed program.

As described in the *State CEQA Guidelines* (14 California Code of Regulations [CCR] 15000 et seq.), public agencies are charged with the duty to avoid or substantially lessen significant environmental effects, with consideration of other conditions, including economic, social, technological, legal, and other benefits. As required by CEQA, this Final PEIR assesses the potentially significant direct and indirect environmental effects of the proposed program, as well as the potentially significant cumulative impacts that could occur from implementation of the proposed program. This Final PEIR is an informational document only, the purpose of which is to identify the significant effects of the proposed program on the environment and to indicate the manner in which those significant effects can be avoided or significantly lessened (including feasible mitigation measures); to identify any significant and unavoidable adverse impacts that cannot be mitigated to below a significant level; and to identify reasonable and feasible alternatives to the proposed program that would avoid or substantially lessen any significant adverse environmental effects associated with the proposed program and achieve the fundamental objectives of the proposed program.

1.2 Contents and Organization of Final PEIR

This Final PEIR is prepared pursuant to Sections 15088, 15089, and 15132 of the *State CEQA Guidelines*. The Final PEIR, in compliance with Section 15132 of the *State CEQA Guidelines*, contains the following:

- Final PEIR, Volume 1
    - **Final Executive Summary.** The Final Executive Summary provides the contents and organization of the Final PEIR, a summary of procedural compliance with CEQA, and a brief description of the proposed program.
    - **Chapter 1: Responses to Comments Received.** This chapter includes a list of persons, organizations, and public agencies that provided written comments on the Draft PEIR and Draft CAP during the public review period. This chapter also includes a copy of the comments received during the public review process for the Draft PEIR and Draft CAP, as well as Metropolitan's responses to these written comments. Each comment is assigned a comment number, which corresponds to a response number and response.
    - **Chapter 2: Changes to the Draft PEIR and Draft CAP.** This chapter contains a summary of changes made to the documents since publication of the Draft PEIR and Draft CAP as a result of comments received. Revisions were made to clarify information presented in the Draft PEIR and only minor technical changes or additions have been made to the Draft CAP.

These changes and additions to the PEIR and CAP do not raise important new issues related to significant effects on the environment. Such changes are "insignificant," as the term is used in Section 15088.5(b) of the *State CEQA Guidelines*. This chapter describes changes that were made and presents textual changes made since public review as signified by strikethrough (~~strikethrough~~) where text is removed, and by underlined text (underline) where text is added for clarification.

- Final PEIR, Volume 2
  - **Chapter 1: Introduction to Final PEIR – Volume 2.**
  - **Chapter 2: Findings of Fact in Support of the Proposed Program and Statement of Overriding Considerations.** This chapter of the Final PEIR provides a summary of the impacts associated with the proposed program and the findings regarding alternatives to the proposed program. This chapter also includes a summary of the general findings, legal effects of the findings, and a summary of the independent review and analysis. Lastly, this chapter includes a Statement of Overriding Considerations, pursuant to *State CEQA Guidelines* Sections 15043 and 15093, which requires the lead agency's decision-making body to balance, as applicable, the program's economic, social, or other benefits, including region-wide or statewide environmental benefits, against the occurrence of significant environmental effects that have not been avoided when determining whether to approve the program.
  - **Chapter 3: Mitigation Monitoring and Reporting Program.** This chapter of the Final PEIR provides the mitigation monitoring and reporting program (MMRP) for the proposed program. The MMRP is presented in table format and identifies mitigation measures for the proposed program, the party responsible for implementing the mitigation measures, the timing of implementing the mitigation measures, and the entity responsible for monitoring and reporting compliance with each mitigation measure.

1.3 California Environmental Quality Act Review

Metropolitan has complied with CEQA and the *State CEQA Guidelines* during preparation of the PEIR for the proposed program. Pursuant to Section 15082 of the *State CEQA Guidelines*, a Notice of Preparation (NOP) and Scoping Meeting was prepared and published by Metropolitan on June 23, 2020 and circulated to local, state, and federal agencies and to members of the public and other interested agencies, organizations, and individuals. The NOP was also sent to the State Clearinghouse at the California Governor's Office of Planning and Research to solicit participation from state agencies in determining the scope of the Draft PEIR. The State Clearinghouse assigned a state identification number (SCH No. 2020060450) to the Draft PEIR. A virtual scoping meeting was held on July 15, 2020 at 10:00 a.m. to present the proposed program, describe the environmental review process, and provide an opportunity for agency representatives and the public to assist Metropolitan in determining the scope and content of the environmental analysis for the PEIR. Pursuant to Section 15082 of the *State CEQA Guidelines*, recipients of the NOP for the proposed program were requested to provide responses within 30 days of their receipt of the NOP. As such, the review period for the NOP ended on July 22, 2020.

Metropolitan received a total of ten written comment letters on the NOP from the following parties:

- South Coast Air Quality Management District (SCAQMD)
- Mohave Desert Air Quality Management District (MDAQMD)
- San Joaquin Valley Unified Air Pollution Control District (SJVAPCD)
- Ventura County Air Pollution Control District (VCAPCD)

- Stanislaus County Environmental Review Committee
- Stanislaus County Public Works
- Ventura County Watershed Protection District
- California Highway Patrol (CHP)
- Native American Heritage Commission (NAHC)
- California Department of Fish and Wildlife (CDFW)

All comments received during the NOP public notice period were considered during the preparation of the Draft PEIR. Appendix A of the Draft PEIR includes the NOP and copies of the comment letters received on the NOP.

Pursuant to CEQA and its implementing guidelines, the Draft PEIR was circulated for a 45-day public review and comment period which began on November 18, 2021 and concluded on January 7, 2022. The Draft PEIR was distributed to the State Clearinghouse and a Notice of Availability of the Draft PEIR was distributed to interested parties and agencies. Copies of the Draft PEIR were made available to the general public for review during normal operating hours at the following location:

The Metropolitan Water District of Southern California
700 North Alameda Street
Los Angeles, California 90012

The Draft PEIR was also available for review on Metropolitan's website, and at nine public libraries within the Plan Area for the proposed program.

Volume 1 of this Final PEIR contains the Executive Summary and Chapters 1 and 2, which provide responses to comments received during the public comment period for the Draft PEIR and any changes made to the Draft PEIR. Volume 2, Chapters 2 and 3, of this Final PEIR make detailed findings with respect to the potential effects of the proposed program and refer, where appropriate, to the mitigation measures set forth in this Final PEIR.

The Final PEIR and the administrative record concerning the proposed program provide additional information in support of the Findings of Fact (Volume 2, Chapter 2) herein. The Findings of Fact are hereby incorporated in the Final PEIR in its entirety. Furthermore, the mitigation measures set forth in the Final PEIR and the MMRP are incorporated by reference in the Findings. The MMRP was developed in compliance with California Public Resources Code Section 21081.6 and is contained in Volume 2, Chapter 3, of this Final PEIR.

1.4 Proposed Program Description

1.4.1 Overview and Scope of the Program

Metropolitan is proposing a CAP to identify strategies to reduce greenhouse gas (GHG) emissions and achieve the proposed GHG reduction targets. The CAP includes a baseline GHG emissions inventory of Metropolitan's operations from 1990 through 2020, an emissions forecast through 2045, emissions reduction targets consistent with Senate Bill (SB) 32 and Executive Order B-55-18, actions and policies that Metropolitan could implement to achieve GHG reductions, and an implementation roadmap. The CAP would apply to Metropolitan's operations within the proposed Plan Area, described in the following section.

1.4.2 Overview of the Region

The Plan Area consists of the following six counties in Southern California: Los Angeles, Orange, Riverside, San Bernardino, San Diego, and Ventura. Portions of northeastern Imperial County within the Palo Verde Valley, as well as four islands in the Sacramento-San Joaquin River Delta area, are also included in the Plan Area. The Plan Area includes all of Metropolitan's service area and its member agencies' jurisdictions, as well as all areas where Metropolitan owns land or facilities.

The Plan Area spans approximately 38,213 square miles across six ecoregions, including Southern California Mountains and Valley, Southern California Coast, Sonoran Desert, Mojave Desert, Colorado Desert, and California Central Valley (Great Valley) (United States Department of Agriculture 2007). The Plan Area contains a population of approximately 22,176,450 across 202 incorporated cities and unincorporated county regions (California Department of Finance [DOF] 2020; United States Census Bureau 2020). It also includes over 220 miles of Pacific Ocean coastline, ranges in elevation from 234 feet below mean sea level to approximately 11,503 feet above mean sea level, and contains a national park, one national recreation area, all or portions of four national forests, and three United States Census Bureau-designated Metropolitan Statistical Areas.

1.4.3 Program Objectives

The proposed program is designed to reduce GHG emissions associated with Metropolitan's operations. Specifically, the objectives of the proposed program include the following:

- Identify and quantify emissions associated with Metropolitan operations to prepare a baseline GHG emissions inventory in order to track emissions reduction progress over time
- Adopt an emissions reduction target that is consistent with existing state emissions reduction targets while preparing Metropolitan to meet future state targets
- Identify and quantify specific reduction actions and policies that Metropolitan may implement to achieve the goal of reducing GHG emissions from its construction and operational activities
- Provide a roadmap for future activities to achieve consistency with the CAP and use CEQA streamlining tools for analysis of GHG emissions pursuant to the requirements of *State CEQA Guidelines* Section 15183.5

1.4.4 Program Description

The proposed program contains the following primary components.

1.4.4.1 Emissions Inventory

The proposed CAP contains an inventory of Metropolitan's GHG emissions from 1990 to 2020. Due to the geographically disparate nature of Metropolitan's operations, emissions reported in the inventory are based on activities over which Metropolitan has direct operational control. The inventory delineates emissions by Scope, as defined in the Local Governments for Sustainability reporting frameworks and detailed below. The emissions inventory reports Metropolitan's GHG emissions in metric tons of carbon dioxide equivalent (CO_2e).

- **Scope 1 Emissions**. Scope 1 emissions are those associated with direct emissions from sources owned or controlled by Metropolitan. This includes emissions from direct fuel combustion, including natural gas, propane, welding gasses, and gasoline and diesel used to power Metropolitan's vehicle fleet.

- **Scope 2 Emissions**. Scope 2 emissions are those indirect emissions associated with the consumption of Metropolitan's purchased electricity use. Specifically, emissions generated at power plants that supply electricity for Metropolitan operations. Metropolitan purchases electricity from power generated from within California and from outside of California in the southwestern United States, which includes electricity generated from hydropower at the Hoover Dam. Scope 2 emissions also include transmission and distribution losses that occur as electricity is delivered to Metropolitan facilities.
- **Scope 3 Emissions**. Scope 3 emissions are other indirect emissions that occur as a result of Metropolitan's operations, including emissions associated with waste generation, water consumption and wastewater generation from Metropolitan-owned buildings, employee commutes, and construction activities.

The proposed CAP also includes an emissions forecast through 2045 to account for potential changes in hydrology, climate, climate and air quality regulations, population growth, operations, and future construction projects that may affect Metropolitan's emissions in the future. Furthermore, the emissions forecast allows for comparison between forecasted GHG emissions and reduction targets to understand the reductions necessary to achieve Metropolitan's GHG reduction goals.

1.4.4.2 Reduction Target

The proposed CAP establishes a GHG reduction target aligned with applicable state GHG reduction policies. The CAP considers various reduction levels, target methodologies, and tracking mechanisms to quantify GHG emissions reductions and measure progress towards meeting the established GHG reduction target. Ultimately, the CAP includes a linear per capita target or "Linear Reduction to Carbon Neutral by 2045 – Per Capita Target" with a Carbon Budget tracking mechanism.

1.4.4.3 GHG Reduction Measures

In order to achieve the proposed CAP's emissions reduction target, GHG emissions reduction measures would need to be implemented. The CAP includes 39 proposed GHG emissions reduction measures that, if implemented, could help Metropolitan reduce its Scope 1, Scope 2, and Scope 3 emissions. Reduction measures for each Scope are grouped into nine strategies that could be employed at Metropolitan's various facility types during facility maintenance activities and future expansion and construction activities, as well as policies and projects to explore new technologies and practices to conserve resources. The reduction measures do not include actions taken by Metropolitan to date that have resulted in GHG emissions reductions, such as Metropolitan's early adoption of solar facilities at several of its treatment plants and Leadership in Energy Efficiency and Design (LEED) certification for several of its facilities. However, the measures may build or expand upon these past actions. Most measures within the nine categories are either administrative (e.g., studies, investigations) in nature or involve replacement of existing infrastructure with newer, more efficient infrastructure at the same location and, therefore, would not have physical impacts to the environment.

1.4.5 Areas of Controversy

Section 15123(b)(2) of the *State CEQA Guidelines* requires that an EIR identify areas of controversy which are known to the lead agency, including issues raised by other agencies and the public. Areas of controversy associated with the proposed program are made known through comments received during

the NOP process, as well as input solicited during public scoping meetings and an understanding of the community issues in the study area.

The comments on the NOP for the draft PEIR for the proposed CAP generally expressed concern over the following issues: alternatives analysis and impacts to biological species and jurisdictional habitats (CDFW), air quality impacts from construction or operation of projects implemented under the proposed program (SJVAPCD, MDAQMD, SCAQMD, and VCAPCD), impacts to tribal cultural resources (NAHC), and watershed management (Ventura County Public Works). Appendix A of the Draft PEIR contains a copy of the NOP and the comment letters received during the NOP scoping period.

1.4.6 Summary of Environmental Impacts and Mitigation Measures

Table 1 includes a brief description of the identified environmental impacts associated with each threshold analyzed in detail in the draft PEIR, proposed mitigation measures, and the level of significance after mitigation.

Table 1 Summary of Environmental Impacts, Mitigation Measures and Impacts After Mitigation

Impact	Mitigation Measure(s)	Significance After Mitigation
Air Quality		
Impact AQ-A. Implementation of the individual projects proposed under the CAP would potentially conflict with or obstruct implementation of the applicable air quality plan due to construction emissions. This impact would be potentially significant.	**MM AQ-1 Construction Air Quality Assessment** For individual projects to be implemented under the CAP that involve construction activities with an intensity (i.e., size, schedule, equipment, demolition, import/export of soil, architectural coating) greater than the sample project activity, an air quality assessment shall be prepared to evaluate construction emissions in light of the applicable air district thresholds. **MM AQ-2 Implement Emission Reduction Measures** If construction emissions would exceed any of the applicable thresholds, emission reduction measures shall be implemented to reduce emissions below the thresholds. Measures may include, but would not be limited to: • All construction equipment shall be equipped with Tier 4 certified engines or CARB-certified Level 3 diesel particulate filters. All diesel particulate filters shall be kept in working order and maintained in operable condition according to manufacturer's specifications, as applicable. • Construction equipment with lower horsepower ratings shall be utilized, as applicable and practicable. • Ultra-low-sulfur diesel fuel shall be used for stationary construction equipment, as applicable. • Low-emission on-site stationary equipment shall be used, as applicable. • Alternatively-fueled construction equipment (e.g., renewable diesel, natural gas, electric) shall be utilized instead of diesel-fueled construction equipment, as applicable. • The schedule for soil import and/or export shall be extended to reduce the number of daily haul truck trips, as applicable. • The schedule for the coating/painting phase shall be extended to reduce the square footage coated/painted each day, as applicable. • Architectural coatings with a VOC content of less than 250 grams per liter shall be utilized.	Significant and unavoidable.

Impact	Mitigation Measure(s)	Significance After Mitigation
Impact AQ-B. Construction impacts related to criteria air pollutant emissions resulting from implementation of individual projects proposed under the CAP would be potentially significant.	**MM AQ-1** and **MM AQ-2**.	Significant and unavoidable.
Impact AQ-C. Neither construction nor operation of individual projects proposed under the CAP would expose sensitive receptors to substantial pollutant concentrations. This impact would be less than significant.	This impact would be less than significant. No mitigation is required.	Less than significant. No mitigation required.
Impact AQ-D. Neither construction nor operation of individual projects implemented under the proposed CAP would result in other emissions (such as those leading to odors) adversely affecting a substantial number of people. This impact would be less than significant.	This impact would be less than significant. No mitigation is required.	Less than significant. No mitigation required.
Biological Resources		
Impact BIO-A. Implementation of individual projects under the proposed CAP would potentially have a substantial adverse effect, either directly or through habitat modifications, on species identified as candidate, sensitive, or other special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Wildlife or U.S. Fish and Wildlife Service. This impact would be potentially significant.	**MM BIO-1 Special Status Plant Species Surveys** If completion of the project-specific biological resources assessment determines that special status plant species have potential to occur on site, surveys for special status plants shall be completed prior to any vegetation removal, grubbing, or other construction activity of each project activity (including staging and mobilization). The surveys shall be floristic in nature and shall be seasonally timed to coincide with the target species identified in the project activity-specific biological resources assessment. All plant surveys shall be conducted by a qualified biologist no more than one year prior to project implementation (annual grassland habitats may require yearly surveys). Surveys shall be conducted in accordance with current protocols established by the CDFW, USFWS and the local jurisdictions if said protocols exist. If special status plant species are identified, Mitigation Measure BIO-2 shall apply. **MM BIO-2 Special Status Plant Species Avoidance, Minimization, and Mitigation** If state- or federally-listed special status and/or CRPR 1 and 2 plant species are identified during the project-specific biological assessment, the activity shall be re-designed to avoid impacting these plant species to the maximum extent feasible. If CRPR 3 and 4 species are found, the biologist shall evaluate if they meet criteria to be considered special status, and if so, the same process as identified for CRPR 1 and 2 species shall apply. If special status plant species cannot be avoided and would be impacted by a project activity implemented under the proposed CAP, all impacts shall be mitigated at an appropriate ratio (minimum ratio of 1:1) to fully offset project activity impacts, as determined by a qualified biologist for each species. A restoration plan shall be prepared and implemented, as applicable.	Less than significant with mitigation incorporated.

Impact	Mitigation Measure(s)	Significance After Mitigation
	MM BIO-3 Endangered/Threatened Animal Species Habitat Assessment and Protocol Surveys If the results of the project-specific biological resources assessment determine suitable habitat may be present for any federally and/or state endangered or threatened animal species, habitat assessments and/or protocol surveys shall be completed in accordance with CDFW and/or USFWS/NMFS protocols prior to construction. Alternatively, in lieu of conducting protocol surveys, Metropolitan may choose to assume presence within the activity footprint and proceed with implementing appropriate avoidance measures, consultation, and permitting, as applicable. If the target species are detected during protocol surveys, or protocol surveys are not conducted and presence is assumed based on suitable habitat, Mitigation Measure BIO-4 shall apply. **MM BIO-4 Endangered/Threatened Animal Species Avoidance and Mitigation** If habitat is occupied or presumed occupied by federal and/or state-listed species and would be impacted by project activities, the project activity shall be redesigned in coordination with a qualified biologist to avoid impacting occupied/presumed occupied habitat to the maximum extent feasible. If occupied or presumed occupied habitat cannot be avoided, Metropolitan shall consult with USFWS, NMFS, and/or CDFW in order to determine the appropriate course of action, which may include a Biological Opinion (BO) or HCP/ITP issued by the USFWS/NMFS (relevant to federally listed species) and/or the ITP issued by the CDFW (relevant to state listed species). If occupied or presumed occupied habitat cannot be avoided, compensatory mitigation shall be provided (minimum ratio of 1:1) to fully offset impacts to habitat prior to the construction. Compensatory mitigation may be provided through purchase of mitigation bank credits, in-lieu fee, or permittee-responsible habitat restoration/establishment/enhancement/preservation. Compensatory mitigation may be combined/nested with special status plant species and sensitive natural community restoration, where applicable. Temporary impact areas shall be restored to similar pre-project conditions. If on and/or off-site habitat restoration/conservation is identified, a Habitat Mitigation and Monitoring Plan (HMMP) shall be prepared to ensure the success of compensatory mitigation sites. The HMMP shall identify long-term site management needs, routine monitoring techniques, and performance standards for determining that the conservation site has met the necessary criteria to function as a suitable mitigation site. **MM BIO-5 Endangered/Threatened Species Avoidance and Minimization During Construction** The following measures shall be applied to aquatic and terrestrial species, where appropriate. Metropolitan shall select from these measures as appropriate depending on site conditions, the species with potential for occurrence, and the results of the project-specific biological resources assessment ~~(Mitigation Measure BIO-1)~~.	

Impact	Mitigation Measure(s)	Significance After Mitigation
	Pre-construction surveys for federal and/or state listed species with potential to occur shall be conducted where suitable habitat is present by a qualified biologist not more than 72 hours prior to the start of construction activities. The survey area shall include the proposed disturbance area and all proposed ingress/egress routes, plus a species-specific buffer. If any life stage of federal and/or state listed species is found within the survey area, the appropriate measures in the BO or HCP/ITP issued by the USFWS/NMFS (relevant to federally listed species) and/or the ITP issued by the CDFW (relevant to state listed species) shall be implemented; or if such guidance is not in place for the activity, the qualified biologist shall recommend an appropriate course of action, which may include consultation with USFWS, NMFS, and/or CDFW. • The activity limits of disturbance shall be flagged. Areas of special biological concern within or adjacent to the limits of disturbance shall have Environmental Sensitive Area fencing installed between said area and the limits of disturbance. • All activities occurring within or adjacent to sensitive habitats that may support federally and/or state endangered/threatened species shall have a qualified biologist present during all initial ground disturbing/vegetation clearing activities. Once initial ground disturbing/vegetation clearing activities have been completed, the biologist shall conduct pre-activity clearance surveys, as needed to ensure protection of endangered/threatened species. • If pumps are used for dewatering activities, all intakes shall be completely screened with wire mesh not larger than five millimeters to prevent animals from entering the pump system. • If at any time during construction of the project activity an endangered/threatened species enters the construction site or otherwise may be impacted by the project activity, all project activities shall cease. At that point, a qualified biologist shall recommend an appropriate course of action, which may include consultation with USFWS, NMFS, and/or CDFW. Alternatively, the appropriate measures shall be implemented in accordance with the BO or HCP/ITP issued by the USFWS (relevant to federal listed species) and/or the ITP issued by the CDFW (relevant to state listed species) and work can then continue as guided by those documents and the agencies, as appropriate. • All trenches, pipes, culverts or similar structures shall be inspected for animals prior to burying, capping, moving, or filling. • Upon completion of the project activity, a qualified biologist shall prepare a final compliance report documenting all compliance activities implemented for the activity, including the pre-construction survey results. **MM BIO-6 Non-Listed Special Status Animal Species Avoidance and Minimization** Depending on the species identified in the project-specific biological resource assessment , the following applicable measures shall be implemented to reduce the potential for impacts to non-listed special status animal species:	

Impact	Mitigation Measure(s)	Significance After Mitigation
	• Pre-construction clearance surveys shall be conducted by a qualified biologist within 14 days prior to the start of construction (including staging and mobilization). The surveys shall cover the entire disturbance footprint plus a minimum 100-foot buffer and shall identify all special status animal species that may occur on-site. The qualified biologist shall make recommendations for avoidance of non-listed special status species, such as through the use of exclusion fencing, buffer zones, etc. • A qualified biologist shall be present during all initial ground disturbing activities, including vegetation removal, to recover special status animal species encountered during construction activities. • Upon completion of the project activity, a qualified biologist shall prepare a final compliance report documenting all compliance activities implemented for the project activity, including the pre-construction survey results. • If special status bat species may be present and impacted by the project activity, within 30 days of the start of construction a qualified biologist shall conduct presence/absence surveys for special status bats where suitable roosting habitat is present. Surveys shall be conducted using acoustic detectors and by searching tree cavities, crevices and other areas where bats may roost. If active bat roosts or colonies are present, the biologist shall evaluate the type of roost to determine the next step. ◦ If a maternity colony is present, all construction activities shall be postponed within a 250-foot buffer around the maternity colony until it is determined by a qualified biologist that the young have dispersed. Once it has been determined that the roost is clear of bats, the roost shall be removed immediately. ◦ If a roost is determined by a qualified biologist to be used by a large number of bats (large hibernaculum), alternative roosts, such as bat boxes if appropriate for the species, shall be designed and installed near the project activity site. The number and size of alternative roosts installed will depend on the size of the hibernaculum and shall be determined by a qualified biologist. ◦ If other active roosts are located, exclusion devices shall be installed such as valves, sheeting or flap-style one-way devices that allow bats to exit but not re-enter roosts to discourage bats from occupying the site.	
Impact BIO-B. Individual projects implemented under the proposed CAP could result in significant impacts to riparian habitats wetlands and/or sensitive natural communities. This impact would be potentially significant. **Impact BIO-C.** Individual projects implemented under the proposed CAP may result in significant impacts to state or federally protected wetlands. This impact would be potentially significant.	**MM BIO-7 Jurisdictional Delineation and Impact Avoidance** If the results of the project-specific biological resource assessment ~~Mitigation Measure BIO-1~~ indicate project activities implemented under the proposed CAP would impact wetlands, drainages, riparian habitats, or other areas that may fall under the jurisdiction of the CDFW, USACE, and/or RWQCB, a qualified biologist shall complete a jurisdictional delineation. The jurisdictional delineation shall determine the extent of the jurisdiction for each of these agencies within the project activity site and shall be conducted in accordance with the requirement set forth by each agency. The results shall be provided in a jurisdictional delineation report submitted to Metropolitan, USACE, RWQCB, and CDFW,	Less than significant with mitigation incorporated.

Impact	Mitigation Measure(s)	Significance After Mitigation
	as appropriate, for review and approval. The project activity shall be designed to avoid or minimize impacts to jurisdictional areas to the maximum extent feasible. **MM BIO-8 Wetlands, Drainages and Riparian Habitat Restoration** If impacts to jurisdictional drainages, wetlands, riparian habitat, and sensitive vegetation communities cannot be avoided, impacts shall be mitigated at an appropriate ratio to fully offset project-specific impacts (minimum ratio of 1:1). Where feasible, temporarily impacted areas shall be restored to pre-project conditions. An HMMP shall be developed by a qualified biologist and submitted to the agency overseeing the project activity for approval. Alternatively, mitigation shall be accomplished through purchase of credits from an approved mitigation bank or in-lieu fee project. **MM BIO-9 Sensitive Natural Community Avoidance and Mitigation** If the results of the project-specific biological resource assessment ~~Mitigation Measure BIO-1~~ indicate project activities implemented under the proposed CAP would impact sensitive natural communities, impacts shall be avoided through final project activity design modifications. If Metropolitan determines sensitive communities cannot be avoided, impacts shall be mitigated on-site or off-site at an appropriate ratio to fully offset project activity impacts (minimum ratio of 1:1). Temporarily impacted areas shall be restored to pre-project conditions. An HMMP shall be developed by a qualified biologist and submitted to the agency overseeing the project activity for approval.	
Impact BIO-D. Neither construction nor operation of individual projects implemented under the proposed CAP would interfere with movement of native resident or migratory fish or wildlife species or established wildlife corridors. This impact would be less than significant.	This impact would be less than significant. No mitigation is required.	Less than significant. No mitigation required.
Impact BIO-E. Neither construction nor operation of individual projects implemented under the proposed CAP would impact protected trees and, as such, would not conflict with local policies or ordinances protecting biological resources. This impact would be less than significant.	This impact would be less than significant. No mitigation is required.	Less than significant. No mitigation required.

Impact	Mitigation Measure(s)	Significance After Mitigation
Impact BIO-F. Individual projects implemented under the proposed CAP would not conflict with a Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan area. This impact would be less than significant.	This impact would be less than significant. No mitigation is required.	Less than significant. No mitigation required.
Cultural Resources		
Impact CUL-A. Individual projects implemented under the proposed CAP would have the potential to cause a substantial adverse change in the significant of a historical resource. This impact would be potentially significant.	**MM CUL-1(a) Built Environment Investigation** A historic resources evaluation shall be prepared for any future proposed project facilitated by the CAP involving a property which includes buildings, structures, objects, landscape/site plans, or other features that are 45 years of age or older. The evaluation shall be prepared by a qualified architectural historian or historian who meets the Secretary of the Interior's (SOI) Professional Qualifications Standards (PQS) in architectural history or history. The qualified architectural historian or historian shall conduct an evaluation in accordance with the guidelines and best practices promulgated by the State Office of Historic Preservation to identify any potential historical resources within the proposed project area. The evaluation of the potential resource within its historic context shall be documented. All evaluated properties shall be documented on Department of Parks and Recreation Series 523 Forms. If a property is identified as an eligible historical resource under CEQA, Mitigation Measure CUL-1(b) shall be implemented. **MM CUL-1(b) Built Environment Documentation Program** If eligible built environment historical resources are identified for a future proposed project implemented under the CAP, efforts shall be made to the extent feasible to ensure that impacts are avoided. If avoidance is not possible, a Built Environment Documentation Program shall be implemented. Measures may include but are not limited to, compliance with the Secretary of the Interior's Standards for Treatment of Historic Properties and documentation of the historical resource in the form of a Historic American Building Survey (HABS)- report or HABS-Like report. The HABS or HABS-Like report shall comply with the Secretary of the Interior's Standards for Architectural and Engineering Documentation and shall generally follow the HABS Level III requirements, including digital photographic recordation, detailed historic narrative report, and compilation of historic research. Application of mitigation shall generally be overseen by a qualified architectural historian or historic architect meeting the PQS, unless unnecessary in the circumstances (e.g., preservation in place). **MM CUL-3 Previously Unidentified Resources Encountered During Construction** In the event that any potentially significant cultural resources are unexpectedly encountered during construction, work will be immediately halted and the discovery shall be protected in place. A 50-foot buffer around the exposed resource shall be established until a qualified cultural resources specialist evaluates the discovery. If the qualified cultural resources specialist determines that the discovery represents a potentially significant cultural resource,	Significant and unavoidable

Impact	Mitigation Measure(s)	Significance After Mitigation
	including a potential historical resource, additional investigations may be required to mitigate adverse impacts from project implementation. This additional work may include avoidance, testing, and evaluation or data recovery excavation. Work shall be prohibited in the restricted area until Metropolitan provides written authorization.	
Impact CUL-B. Individual projects implemented under the proposed CAP may cause a substantial adverse change in the significance of an archaeological resource. This impact would be potentially significant.	**MM CUL-2(a) Phase 1 Archaeological Resource Investigation** If archaeological resources are identified during project-specific analysis that may be adversely affected by any future proposed project implemented under the CAP, Metropolitan shall retain a qualified archaeologist meeting the Secretary of the Interior standards in archaeology to complete a Phase 1 cultural resources assessment of the site. A Phase 1 cultural resources assessment will include an archaeological pedestrian survey of the site, if feasible, and sufficient background archival research to determine whether subsurface prehistoric or historic remains may be present. Archival research should include a current records search from the appropriate California Historical Resources Information System information center and a Sacred Lands File search conducted with the Native American Heritage Commission. A Phase 1 report or results documentation shall be submitted to Metropolitan prior to any ground disturbing activities. Recommendations contained therein shall be implemented throughout all ground disturbance activities. **MM CUL-2(b) Extended Phase 1 Investigation** For any projects proposed within 100 feet of a known archaeological site and/or in areas identified as sensitive by the Phase 1 study, an Extended Phase 1 (XPI) study shall be conducted to determine the presence/absence and extent of archaeological resources on the project site. XPI testing should comprise a series of shovel test pits and/or hand augured units and/or mechanical trenching intended to establish the horizontal and vertical boundaries of archaeological site(s) on the project site. No archaeological resources would be collected during the XPI Investigation. If an archaeological site is identified, Mitigation Measure CUL-2I or CUL-2(d) shall be implemented. **MM CUL-2(c) Avoidance of Archaeological Resources** Identified prehistoric or historic archaeological resources shall be avoided and preserved in place, where feasible. Where avoidance and preservation in place is not feasible, additional measures shall be applied as identified in Mitigation Measure CUL-2(d) through CUL-2(g). **MM CUL-2(d) Phase 2 Archaeological Resources Investigation and Evaluation** Where preservation is not feasible, each resource shall be evaluated for significance and eligibility for listing in the CRHR through a Phase 2 archaeological resource evaluation. A Phase 2 evaluation shall include any necessary archival research to identify significant historical associations as well as mapping of surface artifacts, collection of functionally or temporally diagnostic tools and debris, and excavation of a sample of the cultural deposit to characterize the nature of the sites, define the artifact and feature contents, determine horizontal boundaries and depth below surface, and retrieve representative samples of artifacts and other remains. A final Phase 2 Testing and Evaluation report shall be submitted to Metropolitan prior to any ground disturbing activities. Recommendations contained therein shall be implemented throughout all ground disturbance activities.	Significant and unavoidable.

Impact	Mitigation Measure(s)	Significance After Mitigation
	MM CUL-2(e) Phase 3 Archaeological Data Recovery Program If an archaeological resource meets the CRHR eligibility and cannot be avoided, Metropolitan shall implement a Phase 3 Archaeological Data Recovery Program, conducted to exhaust the data potential of significant archaeological sites. The Phase 3 Archaeological Data Recovery Program shall follow a research design prepared by a qualified archaeologist meeting the SOI PQS standards for archaeology and approved by Metropolitan in advance of Phase 3 fieldwork and excavations. The Phase 3 Data Recovery research design will use appropriate archaeological field and laboratory methods consistent with the California Office of Historic Preservation Planning Bulletin 5 (1991), Guidelines for Archaeological Research Design, or the latest edition thereof. The final Phase 3 Data Recovery report shall be submitted to Metropolitan prior to and any ground disturbing activities. Recommendations contained therein shall be incorporated into project design and implemented throughout all ground disturbance activities. **MM CUL-2(f) Processing and Curation of Archaeological Materials** Archaeological materials collected from the sites during the implementation of Mitigation Measures CUL-2(d) through CUL-2(e) shall be processed and analyzed in the laboratory according to standard archaeological procedures. The age of the materials shall be determined using radiocarbon dating and/or other appropriate procedures; lithic artifacts, faunal remains, and other cultural materials shall be identified and analyzed according to current professional standards. The significance of the sites shall be evaluated according to the criteria of the CRHR. The results of the investigations shall be presented in a technical report following the standards of the California Office of Historic Preservation publication "Archaeological Resource Management Reports: Recommended Content and Format (1990 or latest edition)". Upon completion of the work, all artifacts, other cultural remains, records, photographs, and other documentation shall be curated an appropriate established curation facility based on the location of the fieldwork and/or repatriated to local Native Americans as appropriate. All fieldwork, analysis, report production, and curation shall be fully funded by Metropolitan. **MM CUL-2(g) Cultural Resources Monitoring** If recommended by Phase 1 (Mitigation Measure CUL-2(a)), XPI (Mitigation Measure CUL-2(b)), Phase 2 (Mitigation Measure CUL-2(d)), or Phase 3 (Mitigation Measure CUL-2(e)) studies, Metropolitan shall retain a qualified archaeologist to monitor project-related, ground-disturbing activities. **MM CUL-3 Previously Unidentified Resources Encountered During Construction** MM CUL-3 is described above under Impact CUL-A.	
Impact CUL-C. Individual projects implemented under the proposed CAP would be required to comply with all applicable regulations pertaining to the discovery of human remains. This impact would be less than significant.	This impact would be less than significant. No mitigation is required.	Less than significant. No mitigation required.

Impact	Mitigation Measure(s)	Significance After Mitigation
Noise		
Impact NOI-A. Individual projects implemented under the proposed CAP may result in generation of a substantial temporary or permanent increase in ambient noise levels. This impact would be potentially significant.	**MM NOI-1 Locate Excavation Sites Away from Noise-Sensitive Receivers, Where Feasible** Construction staging and activities shall be located in areas as far as practicable from sensitive receivers or in areas where receivers can be shielded from construction noise. **MM NOI-2(a) Conduct Project-Level Noise Studies for Construction Activities Where Noise-Sensitive Receivers are Present** Project-level construction noise studies shall be conducted for project activities that would exceed the screening criteria for a less-than-significant impact, as summarized in Table 30 and Table 32 of the draft PEIR. Such noise studies shall identify the existing ambient noise levels, characterize the nearest sensitive receivers, estimate the noise levels receivers will experience during construction of individual projects, compare estimated noise levels to the local jurisdiction's noise limits or to the construction noise criteria in the FTA (2018) *Transit Noise and Vibration Impact Assessment Manual* for those that do not have quantitative construction noise level limits, outline any measures that may be used to reduce noise levels, and determine the amount of noise reduction that would occur with implementation of these measures. If the project-level noise study concludes that noise reduction measures are required, Mitigation Measure NOI-2(b) shall be implemented. **MM-NOI-2(b) Implement Noise Reduction Measures** If the results of the noise study determine noise reduction measures are required, noise reduction measures shall be implemented. Construction noise reduction measures may include, but would not be limited to, the use of mufflers, sound blankets/barriers, and/or enclosures and scheduling construction activities to minimize simultaneous operation of noise-producing equipment. Construction noise measures shall be implemented to reduce noise levels to FTA (2018) construction noise criteria, as feasible. If the individual projects would be constructed concurrently with development projects located within a 0.5-mile radius of the individual project location, the noise study shall also consider the cumulative impact of construction noise on sensitive receivers. If applicable, construction noise reduction measures shall be implemented to reduce cumulative noise levels to local jurisdiction or FTA (2018) construction noise criteria, as feasible. **MM NOI-2(c) Conduct Project-Level Noise Studies for Post-Construction Activities Where Noise Sensitive Receivers are Present** Prior to the commencement of construction activities for individual projects that may be implemented under the CAP where sensitive receivers are located within 1,000 feet of the individual project sites, project-level post-construction noise studies shall be conducted. Such noise studies shall identify the ambient noise levels, characterize the nearest sensitive receivers, estimate the noise levels receivers will experience during operation of individual projects during the post-construction period, compare estimated noise levels to the noise level standards of the applicable jurisdiction, outline any measures that may be used to reduce noise levels, and determine the amount of noise reduction that would occur with implementation of these measures. Noise reduction measures may include, but would not be	Significant and unavoidable

Impact	Mitigation Measure(s)	Significance After Mitigation
	limited to, alternative site design, alternative orientation of noise sources, and construction of berms and/or barriers. Noise reduction measures shall be implemented to reduce noise levels to the noise level standards of the applicable jurisdiction, as feasible.	
Impact NOI-B. Construction activities associated with implementation of individual projects under the proposed CAP may result in generation of excessive groundborne vibration or groundborne noise levels, depending on the nature and location of such projects. This impact would be potentially significant.	**NOI-3 (a) Locate Excavation Sites Away from Vibration-Sensitive Receivers, Where Feasible** Whenever practicable, vibration-generating equipment including bulldozers, loaded trucks, pile drivers/pneumatic post drivers, bore/drill rigs, vibratory rollers, and jackhammers shall operate outside the minimum distances specified in Table 33 of the draft PEIR for historic sites, other structures, and vibration-sensitive receivers during project construction activities. Furthermore, whenever practicable, vibration-generating equipment including bulldozers, loaded trucks, pile drivers/pneumatic post drivers, bore/drill rigs, vibratory rollers, and jackhammers shall not be operated concurrently with vibration-generating equipment associated with cumulative development projects located within 600 feet of project construction sites. **NOI-3(b) Conduct Project-Level Vibration Analysis for Construction Activities Where Vibration-Sensitive Receivers are Present** If operation of construction equipment outside the specified buffer distances is not practicable, a detailed study of vibration impacts shall be conducted prior to the commencement of construction for that project. Such vibration studies shall characterize the nearest historic sites, structures, and/or sensitive receivers; estimate the vibration levels receivers will experience during construction of individual projects; compare estimated vibration levels to applicable Caltrans (2020) standards for vibration impacts related to structural damage and human annoyance; outline any measures that may be used to reduce vibration levels; and determine the amount of vibration reduction that would occur with implementation of these measures. Vibration reduction measures may include, but would not be limited to, the use of non-vibratory equipment, vibration monitoring, and repair of structural damage. Construction vibration reduction measures shall be implemented to reduce vibration levels to Caltrans (2020) construction vibration thresholds as feasible. If the individual project would be constructed concurrently with cumulative development projects located within a 600-foot radius of the activity location, the vibration study shall also consider the cumulative impact of combined vibration levels at the nearest sensitive receivers by estimating the combined vibration levels receivers will experience during construction of individual projects and cumulative development; compare estimated vibration levels to applicable standards for vibration impacts related to structural damage and human annoyance described in the Caltrans (2020) *Transportation and Construction Vibration Guidance Manual* (CT-HWANP-RT-20-365.01.01); identify whether the individual project's contribution to any identified cumulative impact would be cumulatively considerable; outline any measures that may be used to reduce the project's contribution to combined vibration levels; and determine the amount of vibration reduction that would occur with implementation of these measures. Such measures may include, but are not limited to, the installation of wave barriers, maximization of the distance between vibratory equipment and receivers, restriction of vibration-generating activities to daytime hours, or	Significant and unavoidable

Impact	Mitigation Measure(s)	Significance After Mitigation
	temporary relocation of affected residents Construction vibration reduction measures shall be implemented to reduce cumulative vibration levels to Caltrans construction vibration thresholds as feasible.	
Impact NOI-C. One individual project to be implemented under the proposed CAP is located within the vicinity of a private airstrip or within an airport land use plan. However, projects implemented under the proposed CAP would not expose people residing or working in the area to excessive noise levels. This impact would be less than significant.	This impact would be less than significant. No mitigation is required.	Less than significant. No mitigation required.
Tribal Cultural Resources		
Impact TCR-A. Implementation of projects under the proposed CAP would not cause a substantial adverse change in the significance of a tribal cultural resource as defined in Public Resources Code Section 5020.1(k), as Native American consultation completed pursuant to Assembly Bill (AB) 52 identified no resources that may be impacted by the proposed project. This impact would be less than significant.	This impact would be less than significant. No mitigation is required.	Less than significant. No mitigation required.
Impact TCR-B. Implementation of projects under the proposed CAP would not cause a substantial adverse change in the significance of a tribal cultural resource determined to be significant pursuant to criteria set forth in subdivision (c) of Public Resources Code Section 5024.1. Native American consultation completed pursuant to AB 52 identified no resources that may be impacted by the proposed project. This impact would be less than significant.	This impact would be less than significant. No mitigation is required.	Less than significant. No mitigation required.

CHAPTER 2
FINDINGS OF FACT IN SUPPORT OF THE PROPOSED PROGRAM

2.1 Findings on Significant Impacts of the Proposed Program

CEQA requires the lead agency, Metropolitan, to make written findings when deciding to approve a project for which an EIR was certified (California Public Resources Code, Section 21081). Specifically, Section 15091 of the *State CEQA Guidelines* states that:

a) No public agency shall approve or carry out a project for which an EIR has been certified which identifies one or more significant environmental effects of the project unless the public agency makes one or more written findings for each of those significant effects, accompanied by a brief explanation of the rationale for each finding. The possible findings are:

   (1) Changes or alterations have been required in, or incorporated into, the project which avoid or substantially lessen the significant environmental effect as identified in the final EIR.

   (2) Such changes or alterations are within the responsibility and jurisdiction of another public agency and not the agency making the finding. Such changes have been adopted by such other agency or can and should be adopted by such other agency.

   (3) Specific economic, legal, social, technological, or other considerations, including provision of employment opportunities for highly trained workers, make infeasible the mitigation measures or project alternatives identified in the final EIR.

b) The findings required by subsection (a) shall be supported by substantial evidence in the record.

Section 15092(b) of the *State CEQA Guidelines* further stipulates that a public agency shall not decide to approve or carry out a project for which an EIR was prepared unless either:

   (1) The project as approved will not have a significant effect on the environment, or

   (2) The agency has:

      (A) Eliminated or substantially lessened all significant effects on the environment where feasible as shown in findings under Section 15091, and

      (B) Determined that any remaining significant effects on the environment found to be unavoidable under Section 15091 are acceptable due to overriding concerns as described in Section 15093.

The PEIR prepared for the proposed program identifies certain significant impacts that may occur as a result of the implementation of the proposed program, either alone or on a cumulative basis in conjunction with other past, present, and reasonably foreseeable projects and programs. Metropolitan is the lead agency with respect to the proposed program pursuant to *State CEQA Guidelines* Section 15367. As the lead agency, Metropolitan is required by CEQA to make findings with respect to each significant effect of the proposed program. The following sections make detailed findings with respect to the potential effects of the proposed program and refer, where appropriate, to the mitigation measures set forth in the Final PEIR.

The Final PEIR and the administrative record concerning the proposed program provide additional facts in support of the findings herein. Changes to the Draft PEIR are shown in ~~strikeout~~/underline of this Final PEIR. Furthermore, the mitigation measures set forth in the Final PEIR and the MMRP are incorporated by reference in these findings. The MMRP was developed in compliance with California Public Resources Code Section 21081.6.

2.1.1 Impacts Related to Air Quality

2.1.1.1 Potentially Significant Impacts Related to Air Quality

As discussed in Section 4.1, *Air Quality*, of the PEIR, implementation of individual projects under the proposed CAP would emit air pollutants stemming from the use of construction equipment (primarily diesel-powered), haul and materials vehicle trips, and fugitive dust. Implementation of the individual projects proposed under the CAP would potentially conflict with or obstruct implementation of the applicable air quality plan or result in a cumulatively considerable net increase of criteria pollutants for which the region is in non-attainment under an applicable federal or state air quality standard due to construction emissions that may exceed applicable thresholds of regional air districts. Implementation of Mitigation Measures (MM) AQ-1 and AQ-2 would reduce combined emissions of criteria pollutants during construction of specific individual projects that may be implemented under the proposed CAP; however, it is not possible to determine whether impacts would be reduced to less-than-significant levels because the magnitude of construction emissions is not known. Therefore, implementation of MM AQ-1 through MM AQ-2 may reduce this impact, but this impact would remain significant and unavoidable.

Neither construction nor operation of individual projects proposed under the proposed program would expose sensitive receptors to substantial pollutant concentrations; impacts related to these factors would be less than significant. Furthermore, neither construction nor operation of individual projects implemented under the proposed program would result in other emissions (such as those leading to odors) adversely affecting a substantial number of people. This impact would be less than significant.

As discussed above, impacts to air quality from the proposed program as a whole would be cumulatively considerable due to the potential for construction of individual projects implemented under the CAP to exceed applicable emissions thresholds of regional air districts.

2.1.1.2 Mitigation

MM AQ-1 **Construction Air Quality Assessment**. For individual projects to be implemented under the CAP that involve construction activities with an intensity (i.e., size, schedule, equipment, demolition, import/export of soil, architectural coating) greater than the sample project activity, an air quality assessment shall be prepared to evaluate construction emissions in light of the applicable air district thresholds.

MM AQ-2 **Implement Emission Reduction Measures**. If construction emissions would exceed any of the applicable thresholds, emission reduction measures shall be implemented to reduce emissions below the thresholds. Measures may include, but would not be limited to:

- All construction equipment shall be equipped with Tier 4 certified engines or CARB-certified Level 3 diesel particulate filters. All diesel particulate filters shall be kept in working order and maintained in operable condition according to manufacturer's specifications, as applicable.

- Construction equipment with lower horsepower ratings shall be utilized, as applicable and practicable.
- Ultra-low-sulfur diesel fuel shall be used for stationary construction equipment, as applicable.
- Low-emission on-site stationary equipment shall be used, as applicable.
- Alternatively-fueled construction equipment (e.g., renewable diesel, natural gas, electric) shall be utilized instead of diesel-fueled construction equipment, as applicable.
- The schedule for soil import and/or export shall be extended to reduce the number of daily haul truck trips, as applicable.
- The schedule for the coating/painting phase shall be extended to reduce the square footage coated/painted each day, as applicable.
- Architectural coatings with a VOC content of less than 250 grams per liter shall be utilized.

2.1.1.3 Findings per State CEQA Guidelines

Consistent with *State CEQA Guidelines* Section 15126.4(a)(1), feasible measures that can minimize significant adverse impacts were developed for the potentially significant impacts described above. The feasible measures are listed above as MM AQ-1 and MM AQ-2. Metropolitan finds that the above mitigation measures are feasible, are adopted, and will substantially reduce the potential air quality impacts. Nonetheless, the impacts would not be reduced to a less-than-significant level. Specific economic, legal, social, technological, or other considerations make mitigation measures or alternatives that would reduce air quality impacts to a less-than-significant level infeasible.

2.1.1.4 Facts in Support of Findings Related to Air Quality

Implementation of MM AQ-1 and MM AQ-2 would reduce potentially significant impacts related to air quality, but due to unknowns with respect to implementation of individual projects under the proposed program, it is possible such impacts may not be reduced to a less-than-significant level. There would be significant and unavoidable impacts related to air quality after implementation of these mitigation measures.

2.1.2 Impacts Related to Biological Resources

2.1.2.1 Potentially Significant Impacts Related to Biological Resources

As discussed in Section 4.2, *Biological Resources,* of the PEIR, implementation of individual projects under the proposed CAP would potentially have a substantial adverse effect, either directly or through habitat modifications, on species identified as candidate, sensitive, or other special status species in local or regional plans, policies, or regulations, or by CDFW or the U.S. Fish and Wildlife Service. Vegetation clearing, excavation, materials storage, traffic, and other activities could remove habitat, result in impacts on runoff and/or water quality, potentially affecting habitat; air quality impacts (dust, exhaust) could affect adjacent habitat; and construction-related traffic could introduce hazardous materials into habitats. Implementation of Mitigation Measure MM BIO-1 through MM

BIO-6 would reduce this impact to a less-than-significant level. Migratory birds, including most birds that nest in the Plan Area, are protected by the federal Migratory Bird Treaty Act, which forbids most forms of harm to birds, including to their active nests. In addition, California Fish and Game Code (CFGC) Section 3503 makes it unlawful to destroy nests or eggs of any bird. Compliance with the CFGC and MBTA would ensure that impacts to migratory birds would be less than significant.

Individual projects implemented under the proposed CAP could result in significant impacts to riparian habitats and/or sensitive natural communities, or state or federally protected wetlands. Due to the programmatic nature of the proposed CAP, the specific details of individual project activities are unknown at this time, so specific project-level analysis cannot be conducted. However, potential impacts to riparian/wetland habitats could include, but are not limited to, vegetation clearing and excavation resulting in removal of habitat or runoff and/or water quality impacts; excavation, ground clearing, and use of unpaved roads resulting in air quality impacts to adjacent habitats; or equipment and construction personnel introducing hazardous materials into habitats. The level of impact would need to be determined at the project level when specific details are known about each project proposed under the CAP. Nevertheless, projects implemented under the CAP would be designed and located to avoid or minimize impacts to riparian/wetland habitats to the extent feasible. Furthermore, implementation of MM BIO-7 through MM BIO-9 would reduce these impacts to less-than-significant levels.

Neither construction nor operation of individual projects implemented under the proposed CAP would interfere with movement of native resident or migratory fish or wildlife species or established wildlife corridors. In addition, neither construction nor operation of individual projects implemented under the proposed CAP would impact protected trees and, as such, would not conflict with local policies or ordinances protecting biological resources. Such impacts would be less than significant.

Individual projects implemented under the proposed CAP would not conflict with a Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan area. This impact would be less than significant.

Depending on the specific location of individual projects to be implemented under the CAP, it is possible that cumulative development in the Plan Area, coupled with implementation of the proposed program, would result in a potentially significant cumulative impact to biological resources. However, projects to be implemented under the proposed program are relatively small, and implementation of MM BIO-1 through MM BIO-9 would reduce project-level impacts to biological resources to a less-than-significant level. Therefore, cumulative impacts are considered less than significant with mitigation incorporated.

2.1.2.2 Mitigation

MM BIO-1 **Special Status Plant Species Surveys.** If completion of the project-specific biological resources assessment determines that special status plant species have potential to occur on site, surveys for special status plants shall be completed prior to any vegetation removal, grubbing, or other construction activity of each project activity (including staging and mobilization). The surveys shall be floristic in nature and shall be seasonally timed to coincide with the target species identified in the project activity-specific biological resources assessment. All plant surveys shall be conducted by a qualified biologist no more than one year prior to project implementation (annual grassland habitats may require yearly surveys). Surveys shall be conducted in accordance with current protocols established by the CDFW, USFWS and the local jurisdictions if said protocols exist. If special status plant species are identified, Mitigation Measure BIO-2 shall apply.

MM BIO-2 **Special Status Plant Species Avoidance, Minimization, and Mitigation.** If state- or federally-listed special status and/or CRPR 1 and 2 plant species are identified during the project-specific biological assessment, the activity shall be re-designed to avoid impacting these plant species to the maximum extent feasible. If CRPR 3 and 4 species are found, the biologist shall evaluate if they meet criteria to be considered special status, and if so, the same process as identified for CRPR 1 and 2 species shall apply.

If special status plant species cannot be avoided and would be impacted by a project activity implemented under the proposed CAP, all impacts shall be mitigated at an appropriate ratio (minimum ratio of 1:1) to fully offset project activity impacts, as determined by a qualified biologist for each species. A restoration plan shall be prepared and implemented, as applicable.

MM BIO-3 **Endangered/Threatened Animal Species Habitat Assessment and Protocol Surveys.** If the results of the project-specific biological resources assessment determine suitable habitat may be present for any federally and/or state endangered or threatened animal species, habitat assessments and/or protocol surveys shall be completed in accordance with CDFW and/or USFWS/NMFS protocols prior to construction.

Alternatively, in lieu of conducting protocol surveys, Metropolitan may choose to assume presence within the activity footprint and proceed with implementing appropriate avoidance measures, consultation, and permitting, as applicable. If the target species are detected during protocol surveys, or protocol surveys are not conducted and presence is assumed based on suitable habitat, Mitigation Measure BIO-4 shall apply.

MM BIO-4 **Endangered/Threatened Animal Species Avoidance and Mitigation.** If habitat is occupied or presumed occupied by federal and/or state-listed species and would be impacted by project activities, the project activity shall be redesigned in coordination with a qualified biologist to avoid impacting occupied/presumed occupied habitat to the maximum extent feasible. If occupied or presumed occupied habitat cannot be avoided, Metropolitan shall consult with USFWS, NMFS, and/or CDFW in order to determine the appropriate course of action, which may include a Biological Opinion (BO) or HCP/ITP issued by the USFWS/NMFS (relevant to federally listed species) and/or the ITP issued by the CDFW (relevant to state listed species).

If occupied or presumed occupied habitat cannot be avoided, compensatory mitigation shall be provided (minimum ratio of 1:1) to fully offset impacts to habitat prior to the construction. Compensatory mitigation may be provided through purchase of mitigation bank credits, in-lieu fee, or permittee-responsible habitat restoration/establishment/enhancement/preservation. Compensatory mitigation may be combined/nested with special status plant species and sensitive natural community restoration, where applicable. Temporary impact areas shall be restored to similar pre-project conditions.

If on and/or off-site habitat restoration/conservation is identified, a Habitat Mitigation and Monitoring Plan (HMMP) shall be prepared to ensure the success of compensatory mitigation sites. The HMMP shall identify long-term site management needs, routine monitoring techniques, and performance standards for determining that the conservation site has met the necessary criteria to function as a suitable mitigation site.

MM BIO-5 **Endangered/Threatened Species Avoidance and Minimization During Construction.** The following measures shall be applied to aquatic and terrestrial species, where appropriate. Metropolitan shall select from these measures as appropriate depending on site conditions, the species with potential for occurrence, and the results of the project-specific biological resources assessment ~~(Mitigation Measure BIO-1)~~.

Pre-construction surveys for federal and/or state listed species with potential to occur shall be conducted where suitable habitat is present by a qualified biologist not more than 72 hours prior to the start of construction activities. The survey area shall include the proposed disturbance area and all proposed ingress/egress routes, plus a species-specific buffer. If any life stage of federal and/or state listed species is found within the survey area, the appropriate measures in the BO or HCP/ITP issued by the USFWS/NMFS (relevant to federally listed species) and/or the ITP issued by the CDFW (relevant to state listed species) shall be implemented; or if such guidance is not in place for the activity, the qualified biologist shall recommend an appropriate course of action, which may include consultation with USFWS, NMFS, and/or CDFW.

- The activity limits of disturbance shall be flagged. Areas of special biological concern within or adjacent to the limits of disturbance shall have Environmental Sensitive Area fencing installed between said area and the limits of disturbance.
- All activities occurring within or adjacent to sensitive habitats that may support federally and/or state endangered/threatened species shall have a qualified biologist present during all initial ground disturbing/vegetation clearing activities. Once initial ground disturbing/vegetation clearing activities have been completed, the biologist shall conduct pre-activity clearance surveys, as needed to ensure protection of endangered/threatened species.
- If pumps are used for dewatering activities, all intakes shall be completely screened with wire mesh not larger than five millimeters to prevent animals from entering the pump system.
- If at any time during construction of the project activity an endangered/threatened species enters the construction site or otherwise may be impacted by the project activity, all project activities shall cease. At that point, a qualified biologist shall recommend an appropriate course of action, which may include consultation with USFWS, NMFS, and/or CDFW. Alternatively, the appropriate measures shall be implemented in accordance with the BO or HCP/ITP issued by the USFWS (relevant to federal listed species) and/or the ITP issued by the CDFW (relevant to state listed species) and work can then continue as guided by those documents and the agencies, as appropriate.
- All trenches, pipes, culverts or similar structures shall be inspected for animals prior to burying, capping, moving, or filling.
- Upon completion of the project activity, a qualified biologist shall prepare a final compliance report documenting all compliance activities implemented for the activity, including the pre-construction survey results.

MM BIO-6 **Non-Listed Special Status Animal Species Avoidance and Minimization.** Depending on the species identified in the project-specific biological resource assessment, the following applicable measures shall be implemented to reduce the potential for impacts to non-listed special status animal species:

- Pre-construction clearance surveys shall be conducted by a qualified biologist within 14 days prior to the start of construction (including staging and mobilization). The surveys shall cover the entire disturbance footprint plus a minimum 100-foot buffer and shall identify all special status animal species that may occur on-site. The qualified biologist shall make recommendations for avoidance of non-listed special status species, such as through the use of exclusion fencing, buffer zones, etc.
- A qualified biologist shall be present during all initial ground disturbing activities, including vegetation removal, to recover special status animal species encountered during construction activities.
- Upon completion of the project activity, a qualified biologist shall prepare a final compliance report documenting all compliance activities implemented for the project activity, including the pre-construction survey results.
- If special status bat species may be present and impacted by the project activity, within 30 days of the start of construction a qualified biologist shall conduct presence/absence surveys for special status bats where suitable roosting habitat is present. Surveys shall be conducted using acoustic detectors and by searching tree cavities, crevices and other areas where bats may roost. If active bat roosts or colonies are present, the biologist shall evaluate the type of roost to determine the next step.
    - If a maternity colony is present, all construction activities shall be postponed within a 250-foot buffer around the maternity colony until it is determined by a qualified biologist that the young have dispersed. Once it has been determined that the roost is clear of bats, the roost shall be removed immediately.
    - If a roost is determined by a qualified biologist to be used by a large number of bats (large hibernaculum), alternative roosts, such as bat boxes if appropriate for the species, shall be designed and installed near the project activity site. The number and size of alternative roosts installed will depend on the size of the hibernaculum and shall be determined by a qualified biologist.
    - If other active roosts are located, exclusion devices shall be installed such as valves, sheeting or flap-style one-way devices that allow bats to exit but not re-enter roosts to discourage bats from occupying the site.

MM BIO-7 **Jurisdictional Delineation and Impact Avoidance.** If the results of the project-specific biological resource assessment ~~Mitigation Measure BIO-1~~ indicate project activities implemented under the proposed CAP would impact wetlands, drainages, riparian habitats, or other areas that may fall under the jurisdiction of the CDFW, USACE, and/or RWQCB, a qualified biologist shall complete a jurisdictional delineation. The jurisdictional delineation shall determine the extent of the jurisdiction for each of these agencies within the project activity site and shall be conducted in accordance with the requirement set forth by each agency. The results shall be provided in a jurisdictional delineation report submitted to Metropolitan, USACE, RWQCB, and CDFW, as appropriate, for review and approval. The project activity shall be designed to avoid or minimize impacts to jurisdictional areas to the maximum extent feasible.

MM BIO-8 **Wetlands, Drainages and Riparian Habitat Restoration.** If impacts to jurisdictional drainages, wetlands, riparian habitat, and sensitive vegetation communities cannot be avoided, impacts shall be mitigated at an appropriate ratio to fully offset project-specific impacts (minimum ratio of 1:1). Where feasible, temporarily impacted areas shall be restored to pre-project conditions. An HMMP shall be developed by a qualified biologist and submitted to the agency overseeing the project activity for approval. Alternatively, mitigation shall be accomplished through purchase of credits from an approved mitigation bank or in-lieu fee project**.**

MM BIO-9 **Sensitive Natural Community Avoidance and Mitigation.** If the results of the project-specific biological resource assessment ~~Mitigation Measure BIO-1~~ indicate project activities implemented under the proposed CAP would impact sensitive natural communities, impacts shall be avoided through final project activity design modifications.

If Metropolitan determines sensitive communities cannot be avoided, impacts shall be mitigated on-site or off-site at an appropriate ratio to fully offset project activity impacts (minimum ratio of 1:1). Temporarily impacted areas shall be restored to pre-project conditions. An HMMP shall be developed by a qualified biologist and submitted to the agency overseeing the project activity for approval.

2.1.2.3 Findings per State CEQA Guidelines

Consistent with *State CEQA Guidelines* Section 15126.4(a)(1), feasible measures that can minimize significant adverse impacts were developed for the potentially significant impacts described above. The feasible measures are listed above as MM BIO-1 through MM BIO-9. Metropolitan finds that the above mitigation measures are feasible, are adopted, and will substantially reduce the potential biological resource impacts such that they would be less than significant with mitigation incorporated.

2.1.2.4 Facts in Support of Findings Related to Biological Resources

Implementation of Mitigation Measures MM BIO-1 through MM BIO-9 would reduce potentially significant impacts related to biological resources such that they would be less than significant with mitigation incorporated.

2.1.3 Impacts Related to Cultural Resources

2.1.3.1 Potentially Significant Impacts Related to Cultural Resources

As discussed in Section 4.3, *Cultural Resources*, of the PEIR, individual projects implemented under the proposed CAP would have the potential to cause a substantial adverse change in the significance of an historical resource. Specifically, alteration of buildings and facilities and the removal or addition of infrastructure that may be necessary components of construction associated with GHG reduction measures could impact historical resources. Implementation of MM CUL-1 and MM CUL-3 may reduce this impact; however, this impact would remain significant and unavoidable.

Effects on archaeological resources can only be determined once a specific project footprint has been identified because the effects are highly dependent on both the individual project site conditions and the characteristics of the proposed ground-disturbing activity. If, during project-level analysis, it is determined that construction or operation of any covered activity would result in significant impacts

to archaeological resources, MM CUL-2 and MM CUL-3 have been included to reduce impacts to archaeological resources to the extent feasible. However, this impact would remain significant and unavoidable.

Human remains could be inadvertently unearthed during ground-disturbing activities. In the event of an unanticipated discovery of human remains during construction of individual projects proposed under the CAP, existing regulations outlined in the state of California Health and Safety Code Section 7050.5 and Public Resources Code Section 5097.98 would require notification of the County Coroner and determination of origin. With adherence to existing regulations, impacts to human remains would be less than significant.

Cumulative development in the Plan Area could disturb areas that may potentially contain historical and archaeological resources. The potential for impacts from projects under the proposed program is generally site-specific and depends on the location and nature of each project. As discussed above, individual projects implemented under the proposed program have the potential to result in impacts to historical and archaeological resources. While mitigation would reduce impacts to the degree feasible, such impacts may remain significant and unavoidable. Therefore, the potential for cumulative impacts to cultural resources is significant, and the proposed program's contribution to such impacts would be cumulatively considerable.

2.1.3.2 Mitigation

MM CUL-1(a) **Built Environment Investigation.** A historic resources evaluation shall be prepared for any future proposed project facilitated by the CAP involving a property which includes buildings, structures, objects, landscape/site plans, or other features that are 45 years of age or older. The evaluation shall be prepared by a qualified architectural historian or historian who meets the Secretary of the Interior's (SOI) Professional Qualifications Standards (PQS) in architectural history or history. The qualified architectural historian or historian shall conduct an evaluation in accordance with the guidelines and best practices promulgated by the State Office of Historic Preservation to identify any potential historical resources within the proposed project area. The evaluation of the potential resource within its historic context shall be documented. All evaluated properties shall be documented on Department of Parks and Recreation Series 523 Forms. If a property is identified as an eligible historical resource under CEQA, Mitigation Measure CUL-1(b) shall be implemented.

MM CUL-1(b) **Built Environment Documentation Program.** If eligible built environment historical resources are identified for a future proposed project implemented under the CAP, efforts shall be made to the extent feasible to ensure that impacts are avoided. If avoidance is not possible, a Built Environment Documentation Program shall be implemented. Measures may include but are not limited to, compliance with the Secretary of the Interior's Standards for Treatment of Historic Properties and documentation of the historical resource in the form of a Historic American Building Survey (HABS)- report or HABS-Like report. The HABS or HABS-Like report shall comply with the Secretary of the Interior's Standards for Architectural and Engineering Documentation and shall generally follow the HABS Level III requirements, including digital photographic recordation, detailed historic narrative report, and compilation of historic research. Application of mitigation shall generally be overseen by a qualified architectural historian or historic architect meeting the PQS, unless unnecessary in the circumstances (e.g., preservation in place).

MM CUL-2(a) **Phase 1 Archaeological Resource Investigation.** If archaeological resources are identified during project-specific analysis that may be adversely affected by any future proposed project implemented under the CAP, Metropolitan shall retain a qualified archaeologist meeting the Secretary of the Interior standards in archaeology to complete a Phase 1 cultural resources assessment of the site. A Phase 1 cultural resources assessment will include an archaeological pedestrian survey of the site, if feasible, and sufficient background archival research to determine whether subsurface prehistoric or historic remains may be present. Archival research should include a current records search from the appropriate California Historical Resources Information System information center and a Sacred Lands File search conducted with the Native American Heritage Commission. A Phase 1 report or results documentation shall be submitted to Metropolitan prior to any ground disturbing activities. Recommendations contained therein shall be implemented throughout all ground disturbance activities.

MM CUL-2(b) **Extended Phase 1 Investigation.** For any projects proposed within 100 feet of a known archaeological site and/or in areas identified as sensitive by the Phase 1 study, an Extended Phase 1 (XPI) study shall be conducted to determine the presence/absence and extent of archaeological resources on the project site. XPI testing should comprise a series of shovel test pits and/or hand augured units and/or mechanical trenching intended to establish the horizontal and vertical boundaries of archaeological site(s) on the project site. No archaeological resources would be collected during the XPI Investigation. If an archaeological site is identified, Mitigation Measure CUL-2(c) or CUL-2(d) shall be implemented.

MM CUL-2(c) **Avoidance of Archaeological Resources.** Identified prehistoric or historic archaeological resources shall be avoided and preserved in place, where feasible. Where avoidance and preservation in place is not feasible, additional measures shall be applied as identified in Mitigation Measure CUL-2(d) through CUL-2(g).

MM CUL-2(d) **Phase 2 Archaeological Resources Investigation and Evaluation.** Where preservation is not feasible, each resource shall be evaluated for significance and eligibility for listing in the CRHR through a Phase 2 archaeological resource evaluation. A Phase 2 evaluation shall include any necessary archival research to identify significant historical associations as well as mapping of surface artifacts, collection of functionally or temporally diagnostic tools and debris, and excavation of a sample of the cultural deposit to characterize the nature of the sites, define the artifact and feature contents, determine horizontal boundaries and depth below surface, and retrieve representative samples of artifacts and other remains. A final Phase 2 Testing and Evaluation report shall be submitted to Metropolitan prior to any ground disturbing activities. Recommendations contained therein shall be implemented throughout all ground disturbance activities.

MM CUL-2(e) **Phase 3 Archaeological Data Recovery Program.** If an archaeological resource meets the CRHR eligibility and cannot be avoided, Metropolitan shall implement a Phase 3 Archaeological Data Recovery Program, conducted to exhaust the data potential of significant archaeological sites. The Phase 3 Archaeological Data Recovery Program shall follow a research design prepared by a qualified archaeologist meeting the SOI PQS standards for archaeology and approved by Metropolitan in advance of Phase 3 fieldwork and excavations. The Phase 3 Data Recovery research design will use appropriate archaeological field and laboratory methods consistent with the California Office of Historic Preservation Planning Bulletin 5 (1991), Guidelines for Archaeological Research Design, or the latest

edition thereof. The final Phase 3 Data Recovery report shall be submitted to Metropolitan prior to and any ground disturbing activities. Recommendations contained therein shall be incorporated into project design and implemented throughout all ground disturbance activities.

MM CUL-2(f) **Processing and Curation of Archaeological Materials.** Archaeological materials collected from the sites during the implementation of Mitigation Measures CUL-2(d) through CUL-2(e) shall be processed and analyzed in the laboratory according to standard archaeological procedures. The age of the materials shall be determined using radiocarbon dating and/or other appropriate procedures; lithic artifacts, faunal remains, and other cultural materials shall be identified and analyzed according to current professional standards. The significance of the sites shall be evaluated according to the criteria of the CRHR. The results of the investigations shall be presented in a technical report following the standards of the California Office of Historic Preservation publication "Archaeological Resource Management Reports: Recommended Content and Format (1990 or latest edition)". Upon completion of the work, all artifacts, other cultural remains, records, photographs, and other documentation shall be curated an appropriate established curation facility based on the location of the fieldwork and/or repatriated to local Native Americans as appropriate. All fieldwork, analysis, report production, and curation shall be fully funded by Metropolitan.

MM CUL-2(g) **Cultural Resources Monitoring**. If recommended by Phase 1 (Mitigation Measure CUL-2(a)), XPI (Mitigation Measure CUL-2(b)), Phase 2 (Mitigation Measure CUL-2(d)), or Phase 3 (Mitigation Measure CUL-2(e)) studies, Metropolitan shall retain a qualified archaeologist to monitor project-related, ground-disturbing activities.

MM CUL-3 **Previously Unidentified Resources Encountered During Construction.** In the event that any potentially significant cultural resources are unexpectedly encountered during construction, work will be immediately halted and the discovery shall be protected in place. A 50-foot buffer around the exposed resource shall be established until a qualified cultural resources specialist evaluates the discovery. If the qualified cultural resources specialist determines that the discovery represents a potentially significant cultural resource, including a potential historical resource, additional investigations may be required to mitigate adverse impacts from project implementation. This additional work may include avoidance, testing, and evaluation or data recovery excavation. Work shall be prohibited in the restricted area until Metropolitan provides written authorization.

2.1.3.3 Findings per State CEQA Guidelines

Consistent with *State CEQA Guidelines* Section 15126.4(a)(1), feasible measures that can minimize significant adverse impacts were developed for the potentially significant impacts described above. The feasible measures are listed above as MM CUL-1 through MM CUL-3. Metropolitan finds that the above mitigation measures are feasible, are adopted, and will substantially reduce the potential cultural resource impacts. Nonetheless, the impacts would not be reduced to a less-than-significant level. Specific economic, legal, social, technological, or other considerations make mitigation measures or alternatives that would reduce cultural resource impacts to a less than significant level infeasible.

2.1.3.4 Facts in Support of Findings Related to Cultural Resources

Implementation of MM CUL-1 through MM CUL-3 would reduce potentially significant project impacts related to cultural resources, but due to unknowns with respect to implementation of individual projects under the proposed program, it is possible such impacts may not be reduced to a less-than-significant level. There would be significant and unavoidable impacts related to cultural resources after implementation of these mitigation measures.

2.1.4 Impacts Related to Noise

2.1.4.1 Potentially Significant Impacts Related to Noise

As discussed in Section 4.3, *Noise*, of the PEIR, noise levels during construction of individual projects under the CAP, would temporarily increase ambient noise levels in the vicinity of the construction sites due to the operation of construction equipment. The severity of the noise impacts from construction activities would vary depending upon the number and type of equipment utilized for each phase and the proximity to residential, commercial, and industrial receiving land uses. Therefore, impacts would be potentially significant and would be analyzed at the project-level. MM NOI-1 and MM NOI-2 would reduce impacts, but because specific information regarding individual project construction equipment, schedule, and location is not known at this time, construction noise impacts may remain significant and unavoidable. Generally, individual projects implemented under the CAP would not result in new on-site operational noise sources, with the exception of proposed battery energy storage system (BESS) facilities proposed under CAP measure E-4, which may include cooling fans and transformers with the potential to generate continuous noise during operation. The severity of post-construction noise impacts would vary depending on the type and intensity of the individual project, its proximity to sensitive receivers, and the relevant local noise standards. Implementation of MM NOI-2 would reduce potential post-construction noise impacts, but such impacts may remain significant and unavoidable.

Construction activities associated with the proposed program would potentially require the use of equipment that may generate substantial levels of vibration, such as bulldozers, loaded trucks, pile drivers/pneumatic post drivers, bore/drill rigs, vibratory rollers, and jackhammers. The severity of construction groundborne vibration impacts would vary depending on the type of equipment used for each construction activity, the nature of the nearest structures and sensitive receivers, and the proximity of such structures/receivers to construction activities. MM NOI-3 would reduce potential construction vibration impacts, but such impacts may remain significant and unavoidable. Individual projects implemented under the CAP would result in no post-construction groundborne vibration impacts, and less than significant construction and post-construction impacts with respect to aircraft noise.

As described above, individual projects implemented under the proposed program may result in significant and unavoidable noise impacts. If concurrent construction activities occur in close proximity to proposed program activities, combined construction noise would have the potential to impact the same sensitive receivers and result in cumulative construction noise and vibration levels that exceed the applicable thresholds of significance. Therefore, cumulative noise impacts would be significant and unavoidable, and the CAP's contribution to such impacts would be cumulatively considerable.

2.1.4.2 Mitigation

MM NOI-1 **Locate Excavation Sites Away from Noise-Sensitive Receivers, Where Feasible.** Construction staging and activities shall be located in areas as far as practicable from sensitive receivers or in areas where receivers can be shielded from construction noise.

MM NOI-2(a) **Conduct Project-Level Noise Studies for Construction Activities Where Noise-Sensitive Receivers are Present.** Project-level construction noise studies shall be conducted for project activities that would exceed the screening criteria for a less-than-significant impact, as summarized in Table 30 and Table 32 of the draft PEIR. Such noise studies shall identify the existing ambient noise levels, characterize the nearest sensitive receivers, estimate the noise levels receivers will experience during construction of individual projects, compare estimated noise levels to the local jurisdiction's noise limits or to the construction noise criteria in the FTA (2018) Transit Noise and Vibration Impact Assessment Manual for those that do not have quantitative construction noise level limits, outline any measures that may be used to reduce noise levels, and determine the amount of noise reduction that would occur with implementation of these measures. If the project-level noise study concludes that noise reduction measures are required, Mitigation Measure NOI-2(b) shall be implemented.

MM-NOI-2(b) **Implement Noise Reduction Measures.** If the results of the noise study determine noise reduction measures are required, noise reduction measures shall be implemented. Construction noise reduction measures may include, but would not be limited to, the use of mufflers, sound blankets/barriers, and/or enclosures and scheduling construction activities to minimize simultaneous operation of noise-producing equipment. Construction noise measures shall be implemented to reduce noise levels to FTA (2018) construction noise criteria, as feasible.

If the individual project would be constructed concurrently with development projects located within a 0.5-mile radius of the individual project location, the noise study shall also consider the cumulative impact of construction noise on sensitive receivers. If applicable, construction noise reduction measures shall be implemented to reduce cumulative noise levels to local jurisdiction or FTA (2018) construction noise criteria, as feasible.

MM NOI-2(c) **Conduct Project-Level Noise Studies for Post-Construction Activities Where Noise Sensitive Receivers are Present**. Prior to the commencement of construction activities for individual projects that may be implemented under the CAP where sensitive receivers are located within 1,000 feet of the individual project sites, project-level post-construction noise studies shall be conducted. Such noise studies shall identify the ambient noise levels, characterize the nearest sensitive receivers, estimate the noise levels receivers will experience during operation of individual projects during the post-construction period, compare estimated noise levels to the noise level standards of the applicable jurisdiction, outline any measures that may be used to reduce noise levels, and determine the amount of noise reduction that would occur with implementation of these measures. Noise reduction measures may include, but would not be limited to, alternative site design, alternative orientation of noise sources, and construction of berms and/or barriers. Noise reduction measures shall be implemented to reduce noise levels to the noise level standards of the applicable jurisdiction, as feasible.

MM NOI-3 (a) **Locate Excavation Sites Away from Vibration-Sensitive Receivers, Where Feasible.** Whenever practicable, vibration-generating equipment including bulldozers, loaded trucks, pile drivers/pneumatic post drivers, bore/drill rigs, vibratory rollers, and jackhammers shall operate outside the minimum distances specified in Table 33 of the draft PEIR for historic sites, other structures, and vibration-sensitive receivers during project construction activities. Furthermore, whenever practicable, vibration-generating equipment including bulldozers, loaded trucks, pile drivers/pneumatic post drivers, bore/drill rigs, vibratory rollers, and jackhammers shall not be operated concurrently with vibration-generating equipment associated with cumulative development projects located within 600 feet of project construction sites.

MM NOI-3(b) **Conduct Project-Level Vibration Analysis for Construction Activities Where Vibration-Sensitive Receivers are Present.** If operation of construction equipment outside the specified buffer distances is not practicable, a detailed study of vibration impacts shall be conducted prior to the commencement of construction for that project. Such vibration studies shall characterize the nearest historic sites, structures, and/or sensitive receivers; estimate the vibration levels receivers will experience during construction of individual projects; compare estimated vibration levels to applicable Caltrans (2020) standards for vibration impacts related to structural damage and human annoyance; outline any measures that may be used to reduce vibration levels; and determine the amount of vibration reduction that would occur with implementation of these measures. Vibration reduction measures may include, but would not be limited to, the use of non-vibratory equipment, vibration monitoring, and repair of structural damage. Construction vibration reduction measures shall be implemented to reduce vibration levels to Caltrans (2020) construction vibration thresholds as feasible.

If the individual project would be constructed concurrently with cumulative development projects located within a 600-foot radius of the activity location, the vibration study shall also consider the cumulative impact of combined vibration levels at the nearest sensitive receivers by estimating the combined vibration levels receivers will experience during construction of individual projects and cumulative development; compare estimated vibration levels to applicable standards for vibration impacts related to structural damage and human annoyance described in the Caltrans (2020) *Transportation and Construction Vibration Guidance Manual* (CT-HWANP-RT-20-365.01.01); identify whether the individual project's contribution to any identified cumulative impact would be cumulatively considerable; outline any measures that may be used to reduce the project's contribution to combined vibration levels; and determine the amount of vibration reduction that would occur with implementation of these measures. Such measures may include, but are not limited to, the installation of wave barriers, maximization of the distance between vibratory equipment and receivers, restriction of vibration-generating activities to daytime hours, or temporary relocation of affected residents Construction vibration reduction measures shall be implemented to reduce cumulative vibration levels to Caltrans construction vibration thresholds as feasible.

2.1.4.3 Findings per State CEQA Guidelines

Consistent with *State CEQA Guidelines* Section 15126.4(a)(1), feasible measures that can minimize significant adverse impacts were developed for the potentially significant impacts described above. The feasible measures are listed above as MM NOI-1 through MM NOI-3. Metropolitan finds that the above mitigation measures are feasible, are adopted, and will reduce the potential noise impacts. Nonetheless, the impacts would not be reduced to a less-than-significant level. Specific economic, legal, social, technological, or other considerations make mitigation measures or alternatives that would reduce noise impacts to a less-than-significant level infeasible.

2.1.4.4 Facts in Support of Findings Related to Noise

Implementation of MM NOI-1 through MM NOI-3 would reduce potentially significant impacts related to noise, but due to unknowns with respect to implementation of individual projects under the proposed program, it is possible such impacts may not be reduced to a less-than-significant level. As such, impacts would remain significant and unavoidable.

2.2 General Findings

1. The potential environmental impacts of the proposed program have been analyzed, and the public has been afforded the opportunity to submit comments pursuant to CEQA requirements.
2. The proposed program would result in direct and/or indirect potentially significant impacts to the following issues: air quality, biological resources, cultural resources, and noise. Impacts to biological resources would be reduced to a less than significant level through the adoption of feasible mitigation measures set forth in the Draft PEIR. However, even with implementation of the mitigation measures set forth in the Draft PEIR, the proposed program would result in significant and unavoidable impacts to air quality, cultural resources, and noise; therefore, a Statement of Overriding Considerations is required.
3. Thirteen comments regarding the Draft PEIR were received during the public review period. Two of these comment letters were received after the public review period closed. Responses to the comments in those letters are provided in Chapter 1 of the Final PEIR, Volume 1, *Responses to Comments*. No new significant effects were identified as a result of public comments. Impacts have been avoided or substantially lessened by the mitigation measures described in the Draft and Final PEIR.

2.3 Legal Effects of Findings

To the extent that these findings conclude that the proposed mitigation measures outlined in the Final PEIR are feasible and have not been modified, superseded, or withdrawn, Metropolitan hereby commits to implementing these measures. These findings, in other words, are not merely informational, but rather constitute a binding set of obligations that will come into effect when Metropolitan approves the proposed program. The mitigation measures that are referenced in the MMRP and adopted concurrently with these findings will be effectuated through the process of construction and implementation of the proposed program.

2.4 Statement of Overriding Considerations

2.4.1 Significant and Unavoidable Impacts

The proposed program would have significant, unavoidable impacts to the following areas, described in detail in Section 2.1 of these Findings of Fact:

Air Quality

- Conflict with or obstruct implementation of the applicable air quality plan
- Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard

Cultural Resources

- Cause a substantial adverse change in the significance of a historical resource pursuant to §15064.5
- Cause a substantial adverse change in the significance of an archaeological resource as defined in §15064.5

Noise

- Result in the generation of a substantial temporary or permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies
- Result in the generation of excessive groundborne noise levels

Metropolitan has adopted all feasible mitigation measures and supplemental mitigation measures with respect to these impacts. Although implementation of these measures would substantially lessen these significant impacts, adoption of the measures will, for these impacts, not fully avoid the impacts.

As a result of these significant and unavoidable impacts, Metropolitan must adopt a Statement of Overriding Considerations pursuant to *State CEQA Guidelines* Sections 15043 and 15093. This provision allows a lead agency to cite a project's general economic, social, or other benefits as a justification for choosing to allow the occurrence of specified significant environmental effects that have not been avoided. The provision explains why, in the agency's judgment, the project's benefits outweigh the unavoidable significant effects. Where another substantive law (e.g., the California Clean Air Act, the federal Clean Air Act, or the California and federal Endangered Species Acts) prohibits the lead agency from taking certain actions with environmental impacts, a statement of overriding considerations does not relieve the lead agency from such prohibitions. Rather, the decision-maker has recommended mitigation measures based on the analysis contained in the Final PEIR, recognizing that other resource agencies have the ability to impose more stringent standards or measures.

CEQA does not require lead agencies to analyze "beneficial impacts" in an EIR. Rather, EIRs are to focus on potential "significant effects on the environment" defined to be "adverse." (California Public Resources Code, Section 21068.) The state legislature amended the definition to focus on "adverse" impacts after the California Supreme Court held that beneficial impacts must also be addressed (see *Wildlife Alive v. Chickering* (1976) 18 Cal.3d 190, 206). Nevertheless, decision-makers benefit from information about project benefits. These benefits can be cited, if necessary, in a Statement of Overriding Considerations (14 CCR 15093).

Metropolitan finds that the proposed program would have substantial benefits as specified in Section 2.4.2, *Substantial Benefits of the Program*, below. Metropolitan, after balancing the specific economic, legal, social, technological or other benefits of the proposed program, determines and finds that the unavoidable adverse environmental effects may be considered "acceptable" due to the following specific considerations.

2.4.2 Substantial Benefits of the Program

2.4.2.1 Reinforcing Metropolitan's Commitment to Environmental Stewardship

The CAP represents the next step of Metropolitan's long-standing commitment to environmental stewardship and complements Metropolitan's various long-range planning efforts. As described in the CAP itself, Metropolitan's mission has evolved to ensure the water reliability of Southern California by incorporating a diverse portfolio of water sources and initiatives to help meet the needs of the region. As such, environmental stewardship and responsibility, particularly as they relate to efficiency and energy reliability, are integral to Metropolitan's mission and operations. Beyond establishing a feasible and implementable pathway to its emissions reduction target of carbon neutrality by 2045, the CAP:

- Incorporates legislation and guidance from state, federal, and international sources;
- Identifies cost-effective energy efficient measures; and
- Integrates actions to achieve California's transportation strategies to transition away from fossil fuels.

The emissions reduction measures contained in the CAP, while intended to achieve reductions in GHG emissions, also have the potential to deliver various environmental co-benefits, including, but not limited to, the following:

- Strategy 6 – Incentivize More Sustainable Commutes – of the CAP includes multiple measures intended to reduce vehicle miles traveled (VMT) by subsidizing transit, encouraging telecommuting and vanpooling, and installing electric vehicle (EV)/ zero-emission vehicle (ZEV) infrastructure. Not only would these measures reduce GHG emissions associated with vehicle use, but they would also result in reductions in air quality contaminant emissions—such as total organic gases (TOG) and diesel particulate matter—associated with mobile sources.
- Strategy 7— Increase Waste Diversion to Achieve Zero Waste—of the CAP includes multiple measures to reduce GHG emissions by reducing the waste produced at Metropolitan's facilities and increasing waste diversion. Not only would these measures reduce GHG emissions associated with solid waste, but they would also result in improved utility and service system impacts by reducing strain on landfill capacity and reducing trash pollution to land and waterways.
- Strategy 8 – Increase Water Conservation and Local Water Supply – of the CAP includes multiple measures to reduce GHG emissions by increasing water conservation. In addition to GHG emissions benefits associated with reduced energy to pump, treat, and heat water, implementing innovative water conservation and education programs would also reduce pollution associated with water runoff due to reduced consumption for uses such as lawn irrigation.

While the Final PEIR identifies several significant and unavoidable impacts, many of these impacts are identified due to the programmatic nature of the analysis and lack of project-specific details at this time. Additionally, many of these impacts—while significant—are associated with short-term construction activities. It should be noted that the PEIR also acknowledges potential longer-term, post-construction beneficial impacts, where appropriate. For example, Chapter 5, *Effects Found Not to be Significant*, describes potential beneficial impacts of CAP measures to CEQA resource areas such as energy, transportation, utilities and service systems, and GHG emissions. As such, despite significant and unavoidable impacts identified in the PEIR, the proposed program also offers a substantial benefit by reinforcing Metropolitan's commitment to environmental stewardship and responsibility, particularly as it relates to the pressing environmental challenge of GHG emissions and global climate change. Lastly, as proposed projects are implemented under the CAP and project-specific details become available, the appropriate level of project-specific CEQA analysis will be conducted to determine the impact significance level for each resource area.

2.4.2.2 Providing a Roadmap for Compliance with State Emissions Targets

The CAP provides Metropolitan with a broad range of feasible and implementable strategies and measures to mitigate or reduce GHG emissions in line with state goals and targets. The emissions reduction regulations establishing these goals and targets are described in Chapter 2, *Project Description*, of the PEIR and include the following:

- **Assembly Bill (AB) 32.** Signed into law in 2006, the California Global Warming Solutions Act codifies a statewide goal of reducing GHG emissions to 1990 levels by 2020.
- **Senate Bill (SB) 32.** SB 32 serves as an update to the emissions reduction target codified under AB 32. Signed into law in 2016, SB 32 establishes a statewide emissions reduction target of 40 percent below 1990 levels by 2030.
- **Executive Order B-55-18.** On September 10, 2018, former Governor Jerry Brown issued this Executive Order, which established a new statewide goal of achieving carbon neutrality by 2045 and maintaining net negative emissions thereafter.

The CAP is designed to be consistent with the above regulatory goals and targets, specifically by establishing a 2030 target of 40 percent below 1990 levels (consistent with SB 32) and a 2045 target of carbon neutrality (consistent with Executive Order B-55-18). By adopting these targets—as well as the CAP's supporting measures, tracking and implementation mechanisms intended to demonstrate attainment of these targets over time—Metropolitan is creating a roadmap for regulatory compliance and meaningfully contributing to the state's emissions reduction goals.

2.4.2.3 Streamlining California Environmental Quality Act Review for Future Projects

As described in the CAP and consistent with the program objectives described in Chapter 2, *Project Description*, one of the key intents and uses for the proposed program is to provide Metropolitan with a "Qualified GHG Reduction Plan" pursuant to the requirements of *State CEQA Guidelines* Section 15183.5(b)(1). Using a qualified CAP will allow Metropolitan to realize efficiencies in the environmental review process by facilitating tiering of future project-specific GHG emissions analyses from the CAP, if those projects demonstrate consistency with the CAP. Section 1.1 of the CAP document explains the proposed CAP's consistency with the requirements for a qualified CAP, specifically:

- Quantification of existing and projected GHG emissions within the Plan Area (refer to Section 3.0 of the CAP)
- Establishment of a reduction target based on local, regional, or state targets (refer to Section 4.0 of the CAP)
- Identification and analysis of sector-specific GHG emissions from Plan activities (refer to Section 3.0 of the CAP)
- Specification of policies and actions (measures) that, if implemented, would achieve the specific reduction target (refer to Section 5.0 of the CAP)
- Establishment of a mechanism to monitor progress and amend the CAP (refer to Section 6.0 of the CAP)
- Adoption of the document in a public process following environmental review

The proposed program, as described and analyzed in this CEQA document, satisfies the requirements of *State CEQA Guidelines* Section 15183.5(b)(1) and, as such, offers a substantial benefit by facilitating streamlining of GHG emissions analyses for future Metropolitan projects undergoing CEQA review.

2.5 Independent Review and Analysis

Under CEQA, the lead agency must (1) independently review and analyze the EIR; (2) circulate draft documents that reflect its independent judgment; (3) as part of the certification of an EIR, find that the report or declaration reflects the independent judgment of the lead agency; and (4) submit copies of the documents to the State Clearinghouse if there is state agency involvement or if the project is of statewide, regional, or area-wide significance (California Public Resources Code Section 21082.1(c)).

Metropolitan independently reviewed and analyzed the PEIR and determined that it reflects its independent judgment. Moreover, upon completing this review and making this determination, Metropolitan circulated the Draft PEIR for public review. With the preparation of these findings for submittal to Metropolitan's Board of Directors for adoption, Metropolitan finds that this Final PEIR reflects its independent judgment.

CHAPTER 3
MITIGATION AND MONITORING PROGRAM

3.1 Mitigation Monitoring and Reporting Program

The Mitigation Monitoring and Reporting Program (MMRP) for the proposed program has been prepared in accordance with Public Resources Code Section 21081.6 and *State CEQA Guidelines* Section 15091(d). Metropolitan will use this MMRP to track compliance with the required program mitigation measures.

Metropolitan's Board of Directors will consider the MMRP during the certification hearing for the Final PEIR. The final MMRP will incorporate all mitigation measures adopted for the proposed program. Metropolitan makes the finding that the measures included in the MMRP constitute changes or alterations that avoid or substantially lessen the potentially significant environmental effects of the proposed program on the environment.

This MMRP summarizes mitigation commitments identified in the Climate Action Plan Final PEIR. Table 2 provides the MMRP, which includes all mitigation measures, monitoring process, and monitoring timing. Metropolitan is the agency responsible for ensuring implementation of all mitigation measures. Impacts and mitigation measures are presented in the same order as in the Final PEIR. The columns in the table provide the following information:

- **Mitigation Measures:** This column indicates the action(s) that will be taken to reduce the impact to a less-than significant level or to the maximum extent feasible.
- **Responsible Party:** This column indicates the party who must ensure each mitigation measure is implemented and that monitoring, and reporting activities occur.
- **Timing of Implementation:** This column indicates the general schedule for conducting each monitoring task, either during the design phase, prior to construction, during construction, and/or after construction.
- **Implementation Party:** This column lists the party responsible for implementing the mitigation measure.

Table 2 Mitigation Monitoring and Reporting Program

Mitigation Measure	Responsible Party	Timing of Implementation	Implementation Party
Air Quality			
AQ-1 Construction Air Quality Assessment			
For individual projects to be implemented under the CAP that involve construction activities with an intensity (i.e., size, schedule, equipment, demolition, import/export of soil, architectural coating) greater than the sample program activity, an air quality assessment shall be prepared to evaluate construction emissions in light of the applicable air district thresholds.	Metropolitan	Prior to construction	Metropolitan
AQ-2 Implement Emission Reduction Measures			
If construction emissions would exceed any of the applicable thresholds, emission reduction measures shall be implemented to reduce emissions below the thresholds. Measures may include, but would not be limited to: • All construction equipment shall be equipped with Tier 4 certified engines or CARB-certified Level 3 diesel particulate filters. All diesel particulate filters shall be kept in working order and maintained in operable condition according to manufacturer's specifications, as applicable. • Construction equipment with lower horsepower ratings shall be utilized, as applicable and practicable. • Ultra-low-sulfur diesel fuel shall be used for stationary construction equipment, as applicable. • Low-emission on-site stationary equipment shall be used, as applicable. • Alternatively-fueled construction equipment (e.g., renewable diesel, natural gas, electric) shall be utilized instead of diesel-fueled construction equipment, as applicable. • The schedule for soil import and/or export shall be extended to reduce the number of daily haul truck trips, as applicable. • The schedule for the coating/painting phase shall be extended to reduce the square footage coated/painted each day, as applicable. • Architectural coatings with a VOC content of less than 250 grams per liter shall be utilized.	Metropolitan	• Prior to construction to confirm all applicable reduction measures • Periodic field checks throughout construction to confirm proper implementation of all applicable reduction measures	Metropolitan Contractor

Mitigation Measure	Responsible Party	Timing of Implementation	Implementation Party
Biological Resources			
BIO-1 Special Status Plant Species Surveys			
If completion of the project-specific biological resources assessment determines that special status plant species have potential to occur on site, surveys for special status plants shall be completed prior to any vegetation removal, grubbing, or other construction activity of each program activity (including staging and mobilization). The surveys shall be floristic in nature and shall be seasonally timed to coincide with the target species identified in the program activity-specific biological resources assessment. All plant surveys shall be conducted by a qualified biologist no more than one year prior to project implementation (annual grassland habitats may require yearly surveys). Surveys shall be conducted in accordance with current protocols established by the CDFW, USFWS and the local jurisdictions if said protocols exist. If special status plant species are identified, Mitigation Measure BIO-2 shall apply.	Metropolitan	No more than one year prior to any vegetation removal, grubbing, or other construction activity and during the appropriate season for the target species	Metropolitan Qualified biologist
BIO-2 Special Status Plant Species Avoidance, Minimization, and Mitigation			
If state- or federally listed special status and/or CRPR 1 and 2 plant species are identified during the project-specific biological assessment, the activity shall be re-designed to avoid impacting these plant species to the maximum extent feasible. If CRPR 3 and 4 species are found, the biologist shall evaluate if they meet criteria to be considered special status, and if so, the same process as identified for CRPR 1 and 2 species shall apply. If special status plant species cannot be avoided and would be impacted by a program activity implemented under the proposed CAP, all impacts shall be mitigated at an appropriate ratio (minimum ratio of 1:1) to fully offset program activity impacts, as determined by a qualified biologist for each species. A restoration plan shall be prepared and implemented, as applicable.	Metropolitan	• Prior to vegetation removal, grubbing, or other construction activity for re-design or preparation of a mitigation strategy/restoration plan (if avoidance is not feasible) • Within one year of initiation of construction activity for purchase of mitigation • Within one year of completion of construction activity for initial implementation of restoration plan	Metropolitan Qualified biologist
BIO-3 Endangered/Threatened Animal Species Habitat Assessment and Protocol Surveys			
If the results of the project-specific biological resources assessment determine suitable habitat may be present for any federally and/or state endangered or threatened animal species, habitat assessments and/or protocol surveys shall be completed in accordance with CDFW and/or USFWS/NMFS protocols prior to construction. Alternatively, in lieu of conducting protocol surveys, Metropolitan may choose to assume presence within the activity footprint and proceed with implementing appropriate avoidance measures, consultation, and permitting, as applicable. If the target species are detected during protocol surveys, or protocol surveys are not conducted and presence is assumed based on suitable habitat, Mitigation Measure BIO-4 shall apply.	Metropolitan	Prior to construction and during the appropriate season as identified by the survey protocols for the target species	Metropolitan Qualified biologist

Mitigation Measure	Responsible Party	Timing of Implementation	Implementation Party
BIO-4 Endangered/Threatened Animal Species Avoidance and Mitigation			
If habitat is occupied or presumed occupied by federal and/or state-listed species and would be impacted by program activities, the program activity shall be redesigned in coordination with a qualified biologist to avoid impacting occupied/presumed occupied habitat to the maximum extent feasible. If occupied or presumed occupied habitat cannot be avoided, Metropolitan shall consult with USFWS, NMFS, and/or CDFW in order to determine the appropriate course of action, which may include a Biological Opinion (BO) or HCP/ITP issued by the USFWS/NMFS (relevant to federally listed species) and/or the ITP issued by the CDFW (relevant to state listed species). If occupied or presumed occupied habitat cannot be avoided, compensatory mitigation shall be provided (minimum ratio of 1:1) to fully offset impacts to habitat prior to the construction. Compensatory mitigation may be provided through purchase of mitigation bank credits, in-lieu fee, or permittee-responsible habitat restoration/establishment/enhancement/preservation. Compensatory mitigation may be combined/nested with special status plant species and sensitive natural community restoration, where applicable. Temporary impact areas shall be restored to similar pre-project conditions. If on and/or off-site habitat restoration/conservation is identified, a Habitat Mitigation and Monitoring Plan (HMMP) shall be prepared to ensure the success of compensatory mitigation sites. The HMMP shall identify long-term site management needs, routine monitoring techniques, and performance standards for determining that the conservation site has met the necessary criteria to function as a suitable mitigation site.	Metropolitan	• Prior to construction for re-design, agency consultation, permitting, and preparation of a mitigation strategy/HMMP (if avoidance is not feasible) • Within one year of initiation of construction activity for purchase of mitigation • Within one year of completion of construction activity for initial implementation of HMMP	Metropolitan Qualified biologist
BIO-5 Endangered/Threatened Species Avoidance and Minimization During Construction			
The following measures shall be applied to aquatic and terrestrial species, where appropriate. Metropolitan shall select from these measures as appropriate depending on site conditions, the species with potential for occurrence, and the results of the project-specific biological resources assessment ~~(Mitigation Measure BIO-1)~~. Pre-construction surveys for federal and/or state listed species with potential to occur shall be conducted where suitable habitat is present by a qualified biologist not more than 72 hours prior to the start of construction activities. The survey area shall include the proposed disturbance area and all proposed ingress/egress routes, plus a species-specific buffer. If any life stage of federal and/or state listed species is found within the survey area, the appropriate measures in the BO or HCP/ITP issued by the USFWS/NMFS (relevant to federally listed species) and/or the ITP issued by the CDFW (relevant to state listed species) shall be implemented; or if such guidance is not in place for the activity, the qualified biologist shall recommend an appropriate course of action, which may include consultation with USFWS, NMFS, and/or CDFW.	Metropolitan	• Not more than 72 hours prior to the start of construction activities in suitable habitat for the target species for pre-construction surveys; prior to construction for agency consultation (if applicable) • Pre-, during, and post- construction for implementation of BO or HCP/ITP • Prior to construction for disturbance limit flagging • During initial ground disturbing/vegetation clearing within	Metropolitan, Qualified biologist Contractor

Mitigation Measure	Responsible Party	Timing of Implementation	Implementation Party
• The activity limits of disturbance shall be flagged. Areas of special biological concern within or adjacent to the limits of disturbance shall have Environmental Sensitive Area fencing installed between said area and the limits of disturbance. • All activities occurring within or adjacent to sensitive habitats that may support federally and/or state endangered/threatened species shall have a qualified biologist present during all initial ground disturbing/vegetation clearing activities. Once initial ground disturbing/vegetation clearing activities have been completed, the biologist shall conduct pre-activity clearance surveys, as needed to ensure protection of endangered/threatened species. • If pumps are used for dewatering activities, all intakes shall be completely screened with wire mesh not larger than five millimeters to prevent animals from entering the pump system. • If at any time during construction of the program activity an endangered/threatened species enters the construction site or otherwise may be impacted by the program activity, all program activities shall cease. At that point, a qualified biologist shall recommend an appropriate course of action, which may include consultation with USFWS, NMFS, and/or CDFW. Alternatively, the appropriate measures shall be implemented in accordance with the BO or HCP/ITP issued by the USFWS (relevant to federal listed species) and/or the ITP issued by the CDFW (relevant to state listed species) and work can then continue as guided by those documents and the agencies, as appropriate. • All trenches, pipes, culverts or similar structures shall be inspected for animals prior to burying, capping, moving, or filling. • Upon completion of the program activity, a qualified biologist shall prepare a final compliance report documenting all compliance activities implemented for the activity, including the pre-construction survey results.		or adjacent to sensitive habitats for qualified biologist monitoring • During dewatering for wire mesh screening • During construction for halting work if target species enters the construction site • During construction for trench inspections • Within one-year of completion of construction activity for final compliance report	
BIO-6 Non-Listed Special Status Animal Species Avoidance and Minimization			
Depending on the species identified in the project-specific biological resource assessment, the following applicable measures shall be implemented to reduce the potential for impacts to non-listed special status animal species: • Pre-construction clearance surveys shall be conducted by a qualified biologist within 14 days prior to the start of construction (including staging and mobilization). The surveys shall cover the entire disturbance footprint plus a minimum 100-foot buffer and shall identify all special status animal species that may occur on-site. The qualified biologist shall make recommendations for avoidance of non-listed special status species, such as through the use of exclusion fencing, buffer zones, etc.	Metropolitan	• Within 14 days prior to construction for pre-construction surveys • During all initial ground disturbing activities for qualified biologist monitoring (if target species encountered) • Within one-year of completion of construction activity for final compliance report • Within 30 days prior to	Metropolitan Qualified biologist Contractor

Mitigation Measure	Responsible Party	Timing of Implementation	Implementation Party
• A qualified biologist shall be present during all initial ground disturbing activities, including vegetation removal, to recover special status animal species encountered during construction activities. • Upon completion of the program activity, a qualified biologist shall prepare a final compliance report documenting all compliance activities implemented for the program activity, including the pre-construction survey results. • If special status bat species may be present and impacted by the program activity, within 30 days of the start of construction a qualified biologist shall conduct presence/absence surveys for special status bats where suitable roosting habitat is present. Surveys shall be conducted using acoustic detectors and by searching tree cavities, crevices and other areas where bats may roost. If active bat roosts or colonies are present, the biologist shall evaluate the type of roost to determine the next step. o If a maternity colony is present, all construction activities shall be postponed within a 250-foot buffer around the maternity colony until it is determined by a qualified biologist that the young have dispersed. Once it has been determined that the roost is clear of bats, the roost shall be removed immediately. o If a roost is determined by a qualified biologist to be used by a large number of bats (large hibernaculum), alternative roosts, such as bat boxes if appropriate for the species, shall be designed and installed near the program activity site. The number and size of alternative roosts installed will depend on the size of the hibernaculum and shall be determined by a qualified biologist. If other active roosts are located, exclusion devices shall be installed such as valves, sheeting or flap-style one-way devices that allow bats to exit but not re-enter roosts to discourage bats from occupying the site.		construction for presence/absence bat surveys where suitable roosting habitat is present • During construction for implementation of avoidance buffers, installation of alternative roosts/exclusion devices, and removal of roosts	
BIO-7 Jurisdictional Delineation and Impact Avoidance			
If the results of the project-specific biological resource assessment ~~Mitigation Measure BIO-1~~ indicate program activities implemented under the proposed CAP would impact wetlands, drainages, riparian habitats, or other areas that may fall under the jurisdiction of the CDFW, USACE, and/or RWQCB, a qualified biologist shall complete a jurisdictional delineation. The jurisdictional delineation shall determine the extent of the jurisdiction for each of these agencies within the program activity site and shall be conducted in accordance with the requirement set forth by each agency. The results shall be provided in a jurisdictional delineation report submitted to Metropolitan, USACE, RWQCB, and CDFW, as appropriate, for review and approval. The program activity shall be designed to avoid or minimize impacts to jurisdictional areas to the maximum extent feasible.	Metropolitan	Prior to construction	Metropolitan Qualified biologist

Mitigation Measure	Responsible Party	Timing of Implementation	Implementation Party
BIO-8 Wetlands, Drainages and Riparian Habitat Restoration			
If impacts to jurisdictional drainages, wetlands, riparian habitat, and sensitive vegetation communities cannot be avoided, impacts shall be mitigated at an appropriate ratio to fully offset project-specific impacts (minimum ratio of 1:1). Where feasible, temporarily impacted areas shall be restored to pre-project conditions. An HMMP shall be developed by a qualified biologist and submitted to the agency overseeing the program activity for approval. Alternatively, mitigation shall be accomplished through purchase of credits from an approved mitigation bank or in-lieu fee program.	Metropolitan	• Prior to construction for preparation of a mitigation strategy/HMMP • Within one year of initiation of construction activity for purchase of mitigation • Within one year of completion of construction activity for initial implementation of HMMP	Metropolitan Qualified biologist
BIO-9 Sensitive Natural Community Avoidance and Mitigation			
If the results of the project-specific biological resource assessment ~~Mitigation Measure BIO-1~~ indicate program activities implemented under the proposed CAP would impact sensitive natural communities, impacts shall be avoided through final program activity design modifications. If Metropolitan determines sensitive communities cannot be avoided, impacts shall be mitigated on-site or off-site at an appropriate ratio to fully offset program activity impacts (minimum ratio of 1:1). Temporarily impacted areas shall be restored to pre-project conditions. An HMMP shall be developed by a qualified biologist and submitted to the agency overseeing the program activity for approval.	Metropolitan	• Prior to construction for preparation of a mitigation strategy/HMMP • Within one year of initiation of construction activity for purchase of mitigation • Within one year of completion of construction activity for initial implementation of HMMP	Metropolitan Qualified biologist Contractor
Cultural Resources			
CUL-1(a) Built Environment Investigation			
A historic resources evaluation shall be prepared for any future proposed project facilitated by the CAP involving a property which includes buildings, structures, objects, landscape/site plans, or other features that are 45 years of age or older. The evaluation shall be prepared by a qualified architectural historian or historian who meets the Secretary of the Interior's (SOI) Professional Qualifications Standards (PQS) in architectural history or history. The qualified architectural historian or historian shall conduct an evaluation in accordance with the guidelines and best practices promulgated by the State Office of Historic Preservation to identify any potential historical resources within the proposed project area. The evaluation of the potential resource within its historic context shall be documented. All evaluated properties shall be documented on Department of Parks and Recreation Series 523 Forms. If a property is identified as an eligible historical resource under CEQA, Mitigation Measure CUL-1(b) shall be implemented.	Metropolitan	Prior to construction	Metropolitan Qualified architectural historian or historian

Mitigation Measure	Responsible Party	Timing of Implementation	Implementation Party
CUL-1(b) Built Environment Documentation Program			
If eligible built environment historical resources are identified for a future proposed project implemented under the CAP, efforts shall be made to the extent feasible to ensure that impacts are avoided. If avoidance is not possible, a Built Environment Documentation Program shall be implemented. Measures may include but are not limited to, compliance with the Secretary of the Interior's Standards for Treatment of Historic Properties and documentation of the historical resource in the form of a Historic American Building Survey (HABS)- report or HABS-Like report. The HABS or HABS-Like report shall comply with the Secretary of the Interior's Standards for Architectural and Engineering Documentation and shall generally follow the HABS Level III requirements, including digital photographic recordation, detailed historic narrative report, and compilation of historic research. Application of mitigation shall generally be overseen by a qualified architectural historian or historic architect meeting the PQS, unless unnecessary in the circumstances (e.g., preservation in place).	Metropolitan	Prior to construction	Metropolitan Qualified historian
CUL-2(a) Phase 1 Archaeological Resource Investigation			
If archaeological resources are identified during project-specific analysis that may be adversely affected by any future proposed project implemented under the CAP, Metropolitan shall retain a qualified archaeologist meeting the Secretary of the Interior standards in archaeology to complete a Phase 1 cultural resources assessment of the site. A Phase 1 cultural resources assessment will include an archaeological pedestrian survey of the site, if feasible, and sufficient background archival research to determine whether subsurface prehistoric or historic remains may be present. Archival research should include a current records search from the appropriate California Historical Resources Information System information center and a Sacred Lands File search conducted with the Native American Heritage Commission. A Phase 1 report or results documentation shall be submitted to Metropolitan prior to any ground disturbing activities. Recommendations contained therein shall be implemented throughout all ground disturbance activities.	Metropolitan	Prior to construction	Metropolitan Qualified archaeologist
CUL-2(b) Extended Phase 1 Investigation			
For any projects proposed within 100 feet of a known archaeological site and/or in areas identified as sensitive by the Phase 1 study, an Extended Phase 1 (XPI) study shall be conducted to determine the presence/absence and extent of archaeological resources on the project site. XPI testing should comprise a series of shovel test pits and/or hand augured units and/or mechanical trenching intended to establish the horizontal and vertical boundaries of archaeological site(s) on the project site. No archaeological resources would be collected during the XPI Investigation. If an archaeological site is identified, Mitigation Measure CUL-2(c) or CUL-2(d) shall be implemented.	Metropolitan	Prior to construction	Metropolitan Qualified archaeologist

Mitigation Measure	Responsible Party	Timing of Implementation	Implementation Party
CUL-2(c) Avoidance of Archaeological Resources			
Identified prehistoric or historic archaeological resources shall be avoided and preserved in place, where feasible. Where avoidance and preservation in place is not feasible, additional measures shall be applied as identified in Mitigation Measure CUL-2(d) through CUL-2(g).	Metropolitan	Prior to and during construction activities	Metropolitan Qualified archaeologist Contractor
CUL-2(d) Phase 2 Archaeological Resources Investigation and Evaluation			
Where preservation is not feasible, each resource shall be evaluated for significance and eligibility for listing in the CRHR through a Phase 2 archaeological resource evaluation. A Phase 2 evaluation shall include any necessary archival research to identify significant historical associations as well as mapping of surface artifacts, collection of functionally or temporally diagnostic tools and debris, and excavation of a sample of the cultural deposit to characterize the nature of the sites, define the artifact and feature contents, determine horizontal boundaries and depth below surface, and retrieve representative samples of artifacts and other remains. A final Phase 2 Testing and Evaluation report shall be submitted to Metropolitan prior to any ground disturbing activities. Recommendations contained therein shall be implemented throughout all ground disturbance activities.	Metropolitan	Prior to construction activities	Metropolitan Qualified archaeologist Contractor
CUL-2(e) Phase 3 Archaeological Data Recovery Program			
If an archaeological resource meets the CRHR eligibility and cannot be avoided, Metropolitan shall implement a Phase 3 Archaeological Data Recovery Program, conducted to exhaust the data potential of significant archaeological sites. The Phase 3 Archaeological Data Recovery Program shall follow a research design prepared by a qualified archaeologist meeting the SOI PQS standards for archaeology and approved by Metropolitan in advance of Phase 3 fieldwork and excavations. The Phase 3 Data Recovery research design will use appropriate archaeological field and laboratory methods consistent with the California Office of Historic Preservation Planning Bulletin 5 (1991), Guidelines for Archaeological Research Design, or the latest edition thereof. The final Phase 3 Data Recovery report shall be submitted to Metropolitan prior to and any ground disturbing activities. Recommendations contained therein shall be incorporated into project design and implemented throughout all ground disturbance activities.	Metropolitan	Prior to construction activities	Metropolitan Qualified archaeologist Contractor

Mitigation Measure	Responsible Party	Timing of Implementation	Implementation Party
CUL-2(f) Processing and Curation of Archaeological Materials			
Archaeological materials collected from the sites during the implementation of Mitigation Measures CUL-2(d) through CUL-2(e) shall be processed and analyzed in the laboratory according to standard archaeological procedures. The age of the materials shall be determined using radiocarbon dating and/or other appropriate procedures; lithic artifacts, faunal remains, and other cultural materials shall be identified and analyzed according to current professional standards. The significance of the sites shall be evaluated according to the criteria of the CRHR. The results of the investigations shall be presented in a technical report following the standards of the California Office of Historic Preservation publication "Archaeological Resource Management Reports: Recommended Content and Format (1990 or latest edition)". Upon completion of the work, all artifacts, other cultural remains, records, photographs, and other documentation shall be curated an appropriate established curation facility based on the location of the fieldwork and/or repatriated to local Native Americans as appropriate. All fieldwork, analysis, report production, and curation shall be fully funded by Metropolitan.	Metropolitan	Following implementation of MM CUL-2(d) and CUL-2(e)	Metropolitan Qualified archaeologist
CUL-2(g) Cultural Resources Monitoring			
If recommended by Phase 1 (Mitigation Measure CUL-2(a)), XPI (Mitigation Measure CUL-2(b)), Phase 2 (Mitigation Measure CUL-2(d)), or Phase 3 (Mitigation Measure CUL-2(e)) studies, Metropolitan shall retain a qualified archaeologist to monitor project-related, ground-disturbing activities.	Metropolitan	• Prior to ground-disturbing activities for retaining a qualified archaeologist • During project ground-disturbing activities for monitoring	Metropolitan Qualified archaeologist
CUL-3 Previously Unidentified Resources Encountered During Construction			
In the event that any potentially significant cultural resources are unexpectedly encountered during construction, work will be immediately halted, and the discovery shall be protected in place. A 50-foot buffer around the exposed resource shall be established until a qualified cultural resources specialist evaluates the discovery. If the qualified cultural resources specialist determines that the discovery represents a potentially significant cultural resource, including a potential historical resource, additional investigations may be required to mitigate adverse impacts from project implementation. This additional work may include avoidance, testing, and evaluation or data recovery excavation. Work shall be prohibited in the restricted area until Metropolitan provides written authorization.	Metropolitan	During ground-disturbing activities	Metropolitan Qualified archaeologist Contractor
Noise			
NOI-1 Locate Excavation Sites Away from Noise-Sensitive Receivers, Where Feasible			
Construction staging and activities shall be located in areas as far as practicable from sensitive receivers or in areas where receivers can be shielded from construction noise.	Metropolitan	During construction	Metropolitan Contractor

Mitigation Measure	Responsible Party	Timing of Implementation	Implementation Party
NOI-2(a) Conduct Project-Level Noise Studies for Construction Activities Where Noise-Sensitive Receivers are Present			
Project-level construction noise studies shall be conducted for project activities that would exceed the screening criteria for a less-than-significant impact, as summarized in Table 30 and Table 32 of the draft PEIR. Such noise studies shall identify the existing ambient noise levels, characterize the nearest sensitive receivers, estimate the noise levels receivers will experience during construction of individual projects, compare estimated noise levels to the local jurisdiction's noise limits or to the construction noise criteria in the FTA (2018) *Transit Noise and Vibration Impact Assessment Manual* for those that do not have quantitative construction noise level limits, outline any measures that may be used to reduce noise levels, and determine the amount of noise reduction that would occur with implementation of these measures. If the project-level noise study concludes that noise reduction measures are required, Mitigation Measure NOI-2(b) shall be implemented.	Metropolitan	Prior to construction	Metropolitan Qualified noise specialist Contractor
NOI-2(b) Implement Noise Reduction Measures			
If the results of the noise study determine noise reduction measures are required, noise reduction measures shall be implemented. Construction noise reduction measures may include, but would not be limited to, the use of mufflers, sound blankets/barriers, and/or enclosures and scheduling construction activities to minimize simultaneous operation of noise-producing equipment. Construction noise measures shall be implemented to reduce noise levels to FTA (2018) construction noise criteria, as feasible. If the individual project would be constructed concurrently with development projects located within a 0.5-mile radius of the individual project location, the noise study shall also consider the cumulative impact of construction noise on sensitive receivers. If applicable, construction noise reduction measures shall be implemented to reduce cumulative noise levels to local jurisdiction or FTA (2018) construction noise criteria, as feasible.	Metropolitan	During construction	Metropolitan Qualified noise specialist Contractor
NOI-2(c) Conduct Project-Level Noise Studies for Post-Construction Activities Where Noise Sensitive Receivers are Present			
Prior to the commencement of construction activities for individual projects that may be implemented under the CAP where sensitive receivers are located within 1,000 feet of the individual project sites, project-level post-construction noise studies shall be conducted. Such noise studies shall identify the ambient noise levels, characterize the nearest sensitive receivers, estimate the noise levels receivers will experience during operation of individual projects during the post-construction period, compare estimated noise levels to the noise level standards of the applicable jurisdiction, outline any measures that may be used to reduce noise levels, and determine the amount of noise reduction that would occur with implementation of these measures. Noise reduction measures may include, but would not be limited to, alternative site design, alternative orientation of noise	Metropolitan	Prior to the commencement of construction activities	Metropolitan Qualified noise specialist Contractor

Mitigation Measure	Responsible Party	Timing of Implementation	Implementation Party
sources, and construction of berms and/or barriers. Noise reduction measures shall be implemented to reduce noise levels to the noise level standards of the applicable jurisdiction, as feasible.			
NOI-3(a) Locate Excavation Sites Away from Vibration-Sensitive Receivers, Where Feasible			
Whenever practicable, vibration-generating equipment including bulldozers, loaded trucks, pile drivers/pneumatic post drivers, bore/drill rigs, vibratory rollers, and jackhammers shall operate outside the minimum distances specified in Table 33 of the draft PEIR for historic sites, other structures, and vibration-sensitive receivers during program construction activities. Furthermore, whenever practicable, vibration-generating equipment including bulldozers, loaded trucks, pile drivers/pneumatic post drivers, bore/drill rigs, vibratory rollers, and jackhammers shall not be operated concurrently with vibration-generating equipment associated with cumulative development projects located within 600 feet of program construction sites.	Metropolitan	During construction	Metropolitan Contractor
NOI-3(b) Conduct Project-Level Vibration Analysis for Construction Activities Where Vibration-Sensitive Receivers are Present			
If operation of construction equipment outside the specified buffer distances is not practicable, a detailed study of vibration impacts shall be conducted prior to the commencement of construction for that project. Such vibration studies shall characterize the nearest historic sites, structures, and/or sensitive receivers; estimate the vibration levels receivers will experience during construction of individual projects; compare estimated vibration levels to applicable Caltrans (2020) standards for vibration impacts related to structural damage and human annoyance; outline any measures that may be used to reduce vibration levels; and determine the amount of vibration reduction that would occur with implementation of these measures. Vibration reduction measures may include, but would not be limited to, the use of non-vibratory equipment, vibration monitoring, and repair of structural damage. Construction vibration reduction measures shall be implemented to reduce vibration levels to Caltrans (2020) construction vibration thresholds as feasible. If the individual project would be constructed concurrently with cumulative development projects located within a 600-foot radius of the activity location, the vibration study shall also consider the cumulative impact of combined vibration levels at the nearest sensitive receivers by estimating the combined vibration levels receivers will experience during construction of individual projects and cumulative development; compare estimated vibration levels to applicable standards for vibration impacts related to structural damage and human annoyance described in the Caltrans (2020) *Transportation and Construction Vibration Guidance Manual* (CT-HWANP-RT-20-365.01.01); identify whether the individual project's contribution to any identified cumulative impact would be cumulatively considerable; outline any measures that may be used to reduce the project's contribution to combined vibration levels; and determine the amount of vibration	Metropolitan	Prior to and during construction	Metropolitan Qualified noise specialist Contractor

Mitigation Measure	Responsible Party	Timing of Implementation	Implementation Party
reduction that would occur with implementation of these measures. Such measures may include, but are not limited to, the installation of wave barriers, maximization of the distance between vibratory equipment and receivers, restriction of vibration-generating activities to daytime hours, or temporary relocation of affected residents Construction vibration reduction measures shall be implemented to reduce cumulative vibration levels to Caltrans construction vibration thresholds as feasible.

EXECUTIVE SUMMARY

The Metropolitan Water District of Southern California's (Metropolitan) core mission is to provide a clean, reliable water supply to Southern California. Changing climatic conditions, variable precipitation patterns, availability of water supplies, changes in consumer demands, and sea level rise will change the way Metropolitan provides its services and how it operates its regional water system. Metropolitan recognizes the potential impact of climate change to water availability and is committed to environmental stewardship to protect this valuable resource. Reducing greenhouse gas (GHG) emissions is an important step in protecting California and the region from the effects of climate change. Reducing GHG emissions from Metropolitan's operations supports California's overall GHG reduction goals. This Climate Action Plan (CAP) sets targets for reducing GHG emissions from Metropolitan's operations, including conveyance, storage, treatment, and delivery of water to its 26 member water agencies. Additionally, this CAP complements Metropolitan's existing long-range planning efforts, including the Integrated Water Resources Plan, Energy Sustainability Plan, and Capital Investment Plan. Through the implementation of this CAP, Metropolitan will strengthen its commitment to environmental sustainability, increase the resiliency of its operations, and strategically achieve GHG reduction goals. For additional details on the purpose of this CAP and Metropolitan's history and existing operations, refer to Section 1.0, Purpose, Overview, and Environmental History and Leadership.

Diamond Valley Lake, West Dam

PURPOSE OF THE CAP

CALIFORNIA AND INTERNATIONAL GHG REDUCTION GOALS

California passed the California Global Warming Solutions Act of 2006 (Assembly Bill 32 or AB 32), creating a comprehensive strategy to reduce greenhouse gas (GHG) emissions in California. AB 32 required the California Air Resources Board (CARB) to develop a Scoping Plan that details the strategy and GHG reduction goals for the State. On the international stage, the Paris Agreement, a legally binding, international global climate agreement, establishes a roadmap for nations to remain under 2 degrees Celsius of warming by the end of the century with a goal of limiting the temperature increase to 1.5 degrees Celsius. Based on the scientific research supporting the Paris Agreement goals, the 2017 Scoping Plan outlines California's strategic vision for achieving at least a 40 percent reduction in GHG emissions from 1990 levels by 2030.

In its Fifth Assessment Report (AR5), the Intergovernmental Panel on Climate Change (IPCC), concluded there's a more than

95%

likelihood that human activities are a principal cause of our warming planet over the past 50 years.[1]

1. *https://archive.ipcc.ch/report/ar5/syr/*

This Climate Action Plan (CAP) is consistent with all California GHG reduction legislation, including Senate Bill (SB) 32 and Executive Order (EO) B-55-18, which expands upon AB 32. The CAP also meets the requirements of Section 15183.5(b)(1) of the State CEQA Guidelines for a "Qualified GHG Reduction Plan" (CAP or Plan). A qualified CAP allows Metropolitan to tier future project-level GHG emissions analyses if projects demonstrate consistency with the CAP goals. Section 4.2, California Regulations and GHG Emissions Targets, of this CAP, California Regulations and GHG Emissions Targets, can be referenced for more information on the regulatory context of the CAP.

SCIENTIFIC CONTEXT

The gases that make up Earth's atmosphere act like a blanket that allows high-energy light from the Sun to pass through to Earth, while reflecting and absorbing lower-energy heat radiating back from Earth. The trapping of this heat is known as the greenhouse effect because atmospheric gases function similar to the windows of a greenhouse, which trap the Sun's rays and create a much warmer space inside as compared to the outside air.

The greenhouse effect regulates the Earth's climate, maintaining conditions suitable for life on Earth. However, a rapid increase of GHGs can cause excess heat to be trapped, affecting global temperatures and climate. Human activities such as burning fossil fuels, deforestation, and land development release GHGs that contribute to global warming. For more detailed information, please refer to Section 2.0, Scientific Context and Climate Change Impacts.

Weymouth Water Treatment Plant

METROPOLITAN'S GREENHOUSE GAS EMISSIONS

METROPOLITAN'S GHG EMISSIONS INVENTORY

Metropolitan imports its water supply from two sources - Northern California via the State Water Project (SWP), which is owned and operated by the California Department of Water Resources (DWR), and the Colorado River via the Colorado River Aqueduct (CRA). Metropolitan's GHG emissions are calculated based on sources within its operational control, thus water from the Colorado River pumped from Lake Havasu in San Bernardino County and water from the SWP where Metropolitan takes delivery of its SWP supplies. Metropolitan takes delivery of the SWP at several locations including the Foothill Feeder immediately downstream of Castaic Lake in Los Angeles County, through the Rialto Pipeline and Inland Feeder which connect to the Devil Canyon Powerplant after-bays in San Bernardino County, through the Box Springs Feeder, and through the Perris Pressure Control Structure at Lake Perris in Riverside County. See Appendix B for more information on emissions associated with the DWR's SWP.

Metropolitan's GHG emissions are primarily generated from the purchase and consumption of electricity used for conveyance, treatment, and delivery of water throughout Metropolitan's Southern California service area. Metropolitan's GHG emissions vary due to the amount of water pumped from the Colorado River to meet the demands of Southern California. Higher Colorado River pumping generally correlates to dry years with low SWP allocations. Through the implementation of energy and water efficiency projects, as well as state legislation, overall emissions from Metropolitan operations have decreased since 1990, even during extreme drought events that resulted in increased pumping on the CRA.

The GHG inventory was calculated using the protocol from the International Council for Local Environmental Initiatives (ICLEI) and The Climate Registry (TCR). The data is organized into three source categories, or scopes, related to the level of operational control the organization or reporting entity has over the emission source. Figure ES-1 shows Metropolitan's GHG emissions by scope as well as the sources of emissions within each scope.

FIGURE ES-1: GHG Emissions by Scope

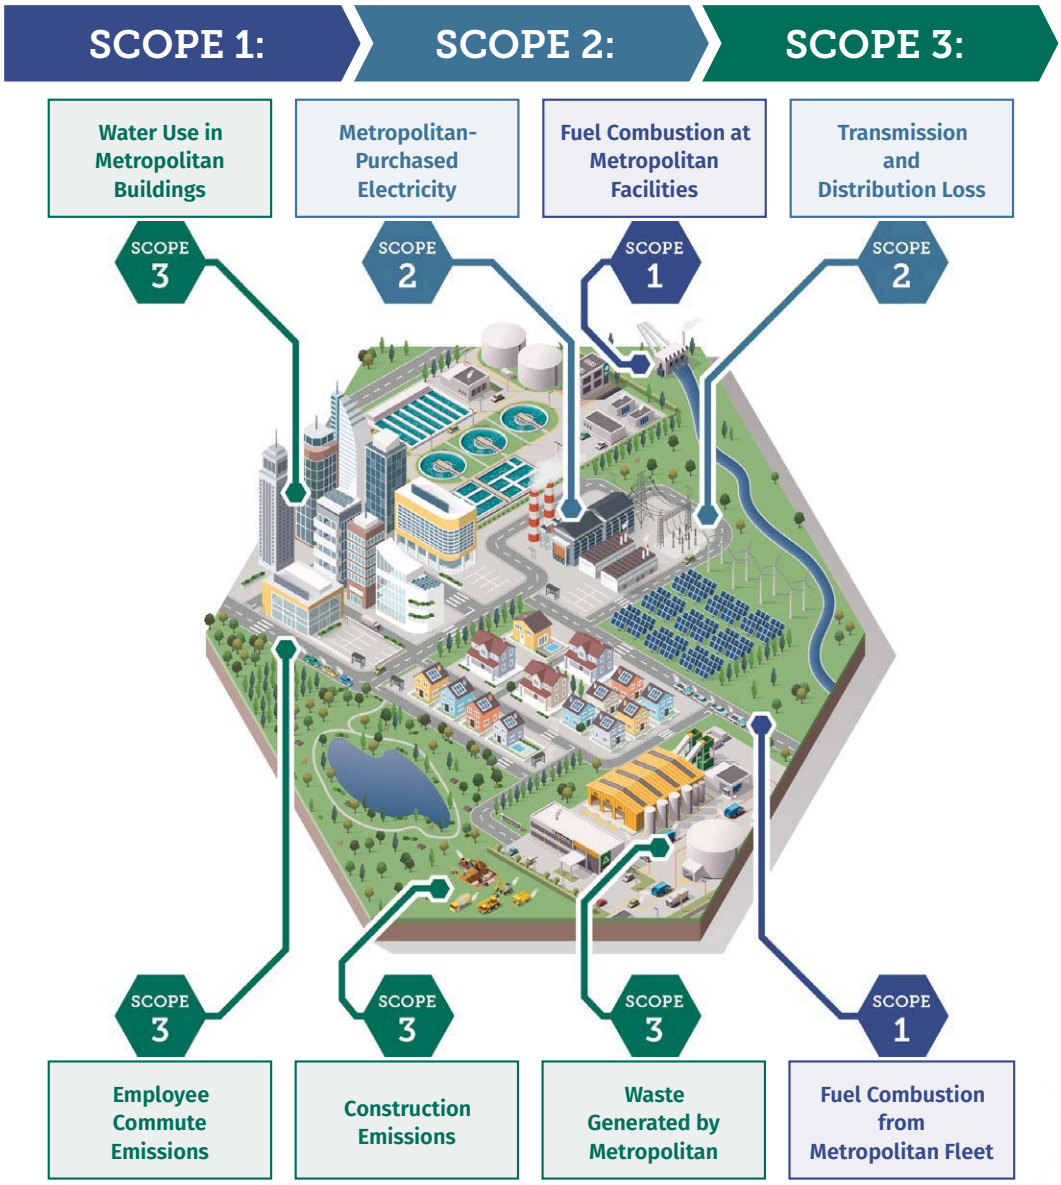

Figure ES-2 illustrates Metropolitan's historical GHG emissions in metric tons of carbon dioxide equivalent (MT CO_2e).[2] For more information on historic emissions please see Section 3.2, Historical Metropolitan GHG Emissions. Metropolitan's emissions are highly variable depending on the amount of CRA pumping during each calendar year.

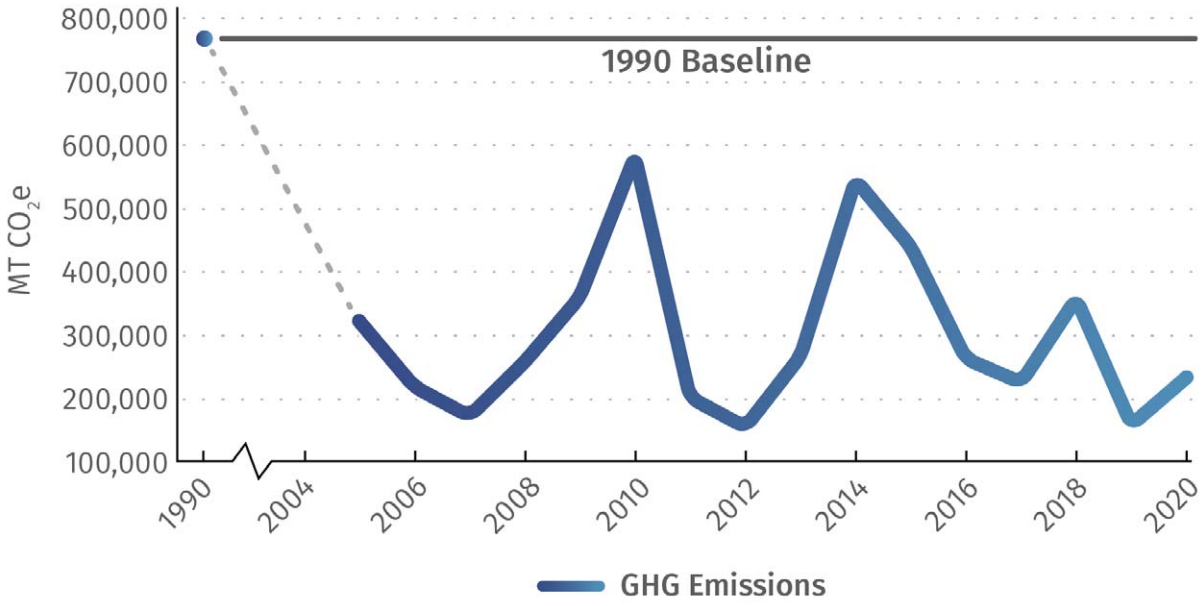
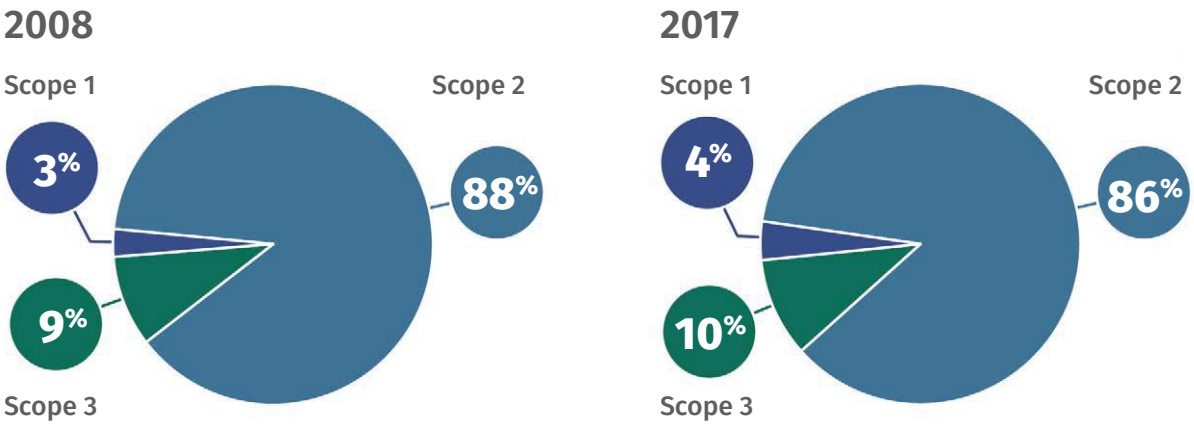
FIGURE ES-2: Metropolitan GHG Emissions Over Time

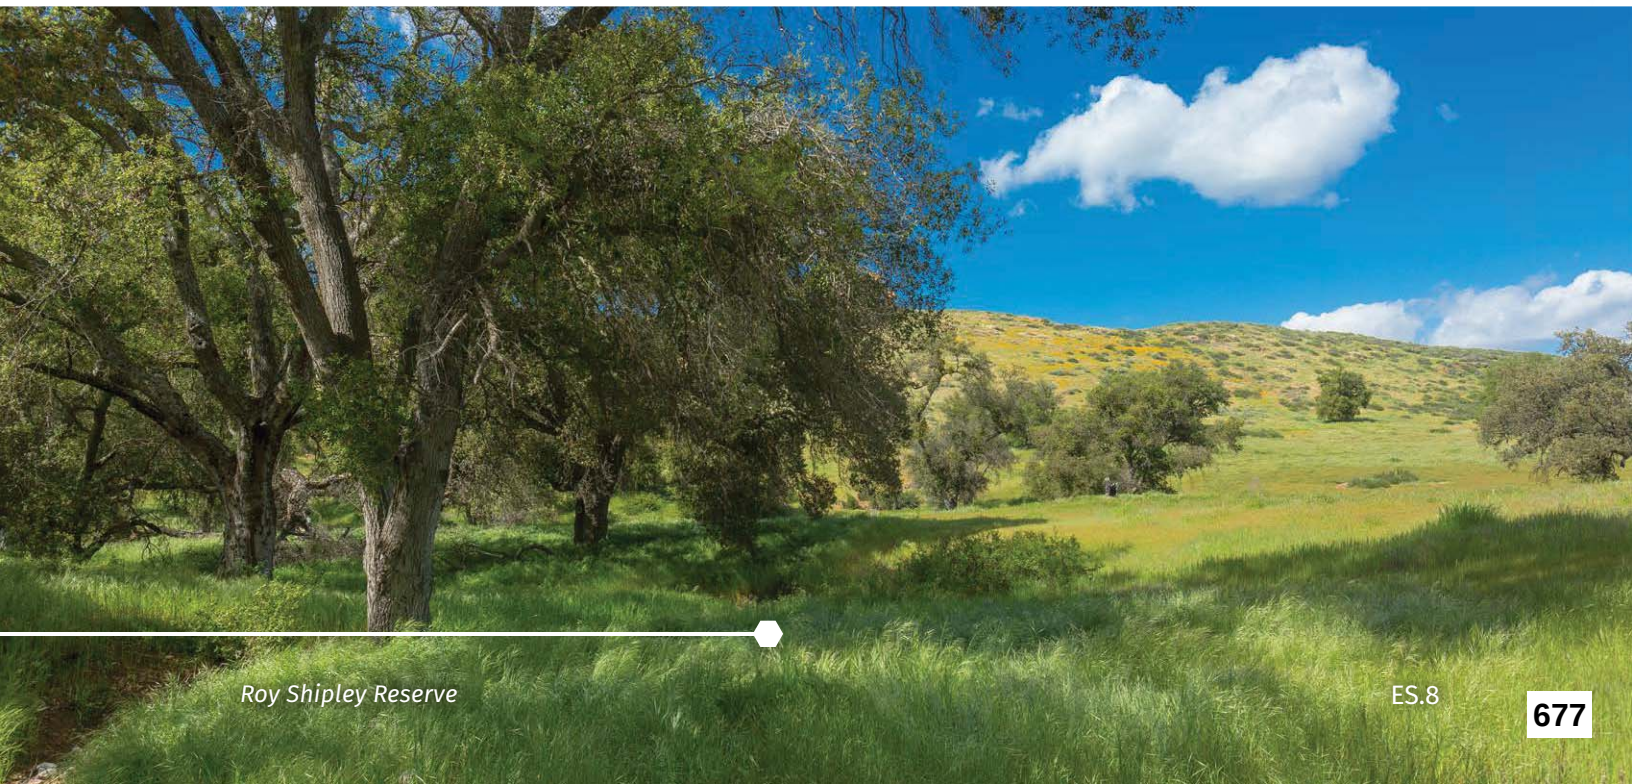


Emissions are categorized into three scopes. Scope 1 emissions are associated with fuel use associated with combustion in equipment or vehicles, propane and natural gas use at Metropolitan facilities, and fugitive emissions. Scope 2 emissions are indirect emissions associated with the purchase and consumption of electricity, and Scope 3 emissions are from other indirect emissions, such as those associated with employee commutes, waste generation, water consumption, and emissions associated with construction projects. Metropolitan's emissions are largely dominated by Scope 2 emissions (electricity). Figure ES-3 shows the breakdown of Metropolitan's emissions in 2008 and 2017 by scope. For more detailed information on Metropolitan's GHG inventory, please refer to Section 3.1, Metropolitan Operational Boundary and Emissions Sources and Section 3.2, Historical Metropolitan GHG Emissions.

2. *MT CO_2e – Metric tons of carbon dioxide equivalent. This is a measure of all greenhouse gases (carbon dioxide, methane, nitrogen dioxide, and others) converted into tons of carbon dioxide using the global warming potential. For more information, see Section 2, Scientific Context and Climate Change Impacts.*

FIGURE ES-3: Metropolitan Emissions By Scope



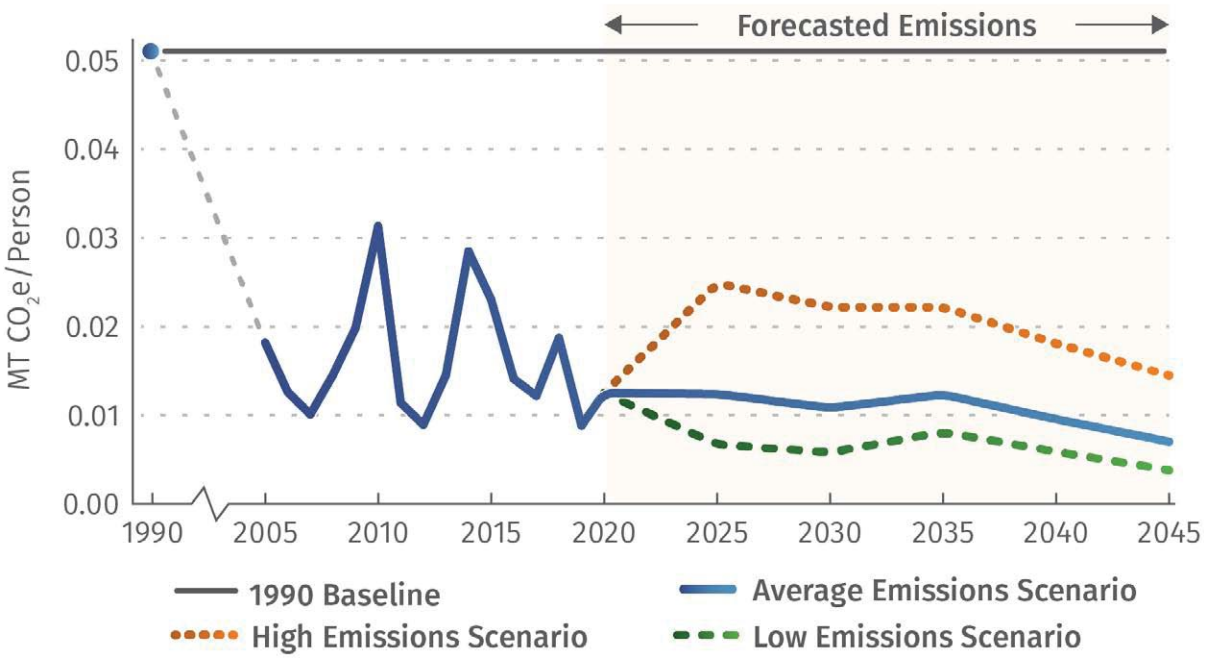


Roy Shipley Reserve

METROPOLITAN'S GHG EMISSIONS FORECAST

To better estimate future emissions, Metropolitan prepared an emissions forecast through 2045 under high-, average-, and low-emissions scenarios, which are based on projections for water demand in its 2020 Urban Water Management Plan. Section 3.3, Metropolitan GHG Emissions Forecast details Metropolitan's forecast results. Figure ES-4 illustrates Metropolitan's GHG emissions forecasts through 2045.

FIGURE ES-4: GHG Emissions Forecast and Potential Range (Per Capita)



Joshua Tree area desert landscape

EMISSIONS REDUCTION TARGETS

The emissions inventory and forecast provide a basis for Metropolitan to establish targets for future GHG reductions. Metropolitan established a 2030 target of 40% below 1990 levels by 2030 for GHG emissions reduction to achieve consistency with SB 32 and a 2045 target of carbon neutrality consistent with EO B-55-18. By defining specific reduction targets, Metropolitan can track its progress towards meeting its goals and measure the success of its CAP. CEQA Guidelines Section 15183.5(b)(1) requires that plans establish a level, based on substantial evidence, below which the contribution to GHG emissions from activities covered by the plan would not be cumulatively considerable. Metropolitan will utilize a per capita emissions calculation to track progress towards meeting its GHG reduction goals. The per-capita GHG emissions forecast provides a metric to measure each person's GHG emissions generated from water use. This approach can clearly illustrate the positive effect an individual's lower water use can have on GHG emissions. Metropolitan will pursue a linear per capita GHG emission reduction pathway, as demonstrated in Figure ES-5, to exceed the State's target of 40 percent below 1990 levels by 2030 (0.0309 MT CO_2e per person) and make significant progress towards ultimately achieving carbon neutrality by 2045 (0.0 MT CO_2e per person). Table ES-1 provides more detail on Metropolitan's adopted GHG reduction targets and how they compare to the state reduction targets. For more information on the emissions reductions targets, please refer to section 4.3, Metropolitan's GHG Emissions Reduction Targets.

FIGURE ES-5: Metropolitan's Per Capita GHG Emissions Targets

TABLE ES-1: Comparison of Metropolitan and California GHG Reduction Targets

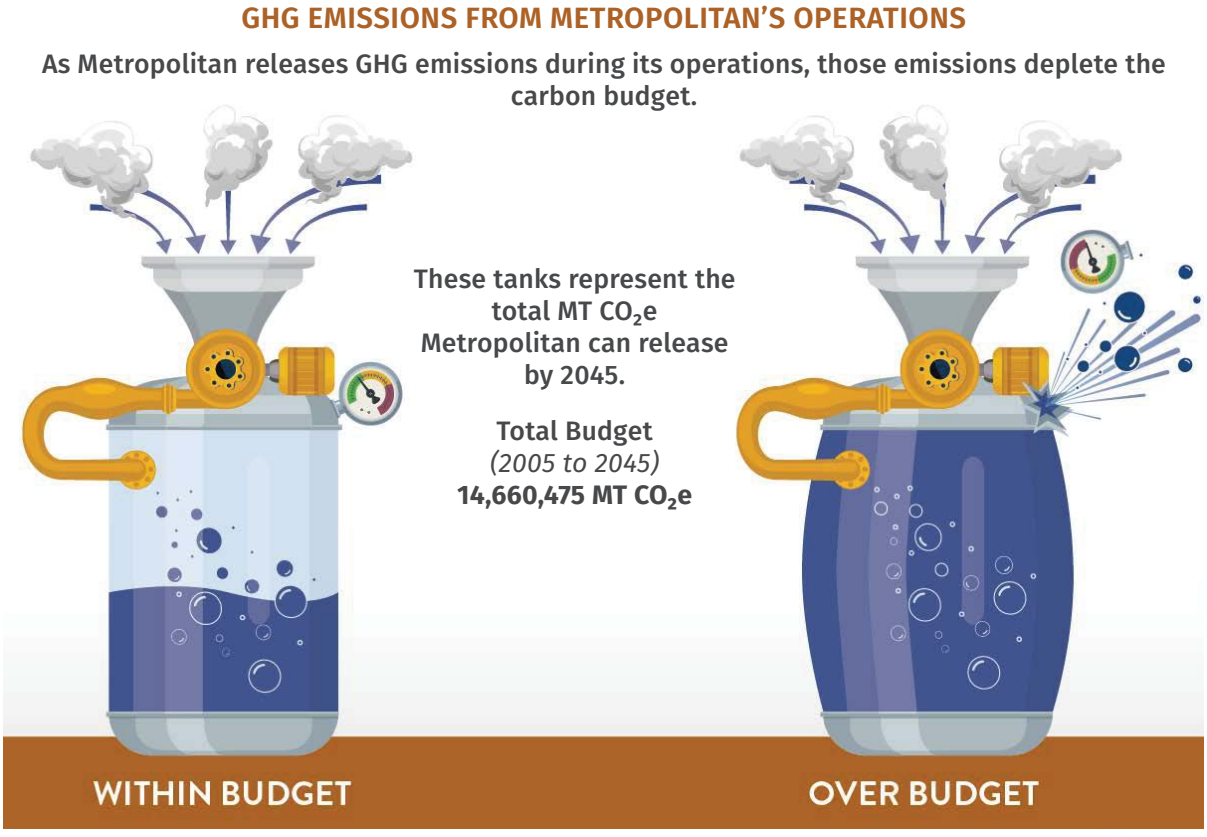
Target	Per Capita Emissions (MT CO_2e)	Associated Mass Emissions* (MT CO_2e)	Percent Reduction (Below 1990)
Metropolitan's 1990 Per Capita Emissions (AB32 Target)	0.0516	771,514	N/A
Minimum Per Capita Reduction Target for SB 32 Consistency	0.0309	638,423	40%
Metropolitan's Per Capita 2030 GHG Emissions Target+	0.0141	290,192	73%
Metropolitan's 2045 Per Capita Goal	0	0	100%
California's EO B-55-18 Per Capita Goal	0	0	100%

+Pending final population numbers
**Associated Mass Emissions are calculated by multiplying the per capita emissions target by the projected population in that year. Final mass emission values will be updated based on actual population data.*

METROPOLITAN'S CARBON BUDGET

Metropolitan's GHG emissions fluctuate from year to year depending on the amount of water pumped from the Colorado River. Consequently, GHG emissions recorded in any one particular year are not necessarily representative of Metropolitan's overall progress towards meeting its GHG emissions reduction targets. To account for this factor, Metropolitan will track its emissions annually using a carbon budget approach. Figure ES-6 illustrates the carbon budget approach as applied to Metropolitan's operations.

FIGURE ES-6: How a Carbon Budget Works



Between 2005 and 2020, Metropolitan used approximately 4,770,038 MT CO_2e of its total carbon budget of 14,660,475 MT CO_2e. This accounts for only 53 percent of the total budget allocated for this timeframe. As shown in Figure ES-7, Metropolitan has approximately 9.9 million MT GHG emissions (as CO_2e) remaining until 2045

FIGURE ES-7: Metropolitan's Remaining Carbon Budget as of 2020

Estimated Carbon Budget (2005–2045)

14,660,475 MT CO_2e

Allocated Carbon Budget (2005–2020)

8,924,634 MT CO_2e

Carbon Budget Used Through 2020

4,770,038 MT CO_2e

Percent of 2020 Carbon Budget Used

53%

Total Carbon Budget Remaining

9,890,437 MT CO_2e

As shown in Table ES-2, under current projections, Metropolitan is expected to stay within the carbon budget through 2030 in all three scenarios. However, achieving carbon neutrality will require additional reductions regardless of the water demand scenario modeled. In order to stay within its established carbon budget, Metropolitan developed a suite of GHG reduction strategies outlined in Section 5.0, Metropolitan's GHG Emissions Reduction Strategy.

TABLE ES-2: Metropolitan's Forecasted Carbon Budget Outcomes

Emissions Levels	Remaining Budget 2030 (MT CO_2e)	Remaining Budget 2045 ($MTCO_2e$)
Low Emissions	6,405,936	6,704,456
Average Emissions	5,465,774	4,413,932
High Emissions	3,384,248	(718,236)

( ) denotes a negative value

Inland Feeder

METROPOLITAN'S GHG EMISSIONS REDUCTION STRATEGY

This CAP includes specific strategies that will help Metropolitan achieve carbon neutrality while providing co-benefits such as improved infrastructure reliability, increased energy resiliency, and decreased costs associated with energy procurement and maintenance. The following section presents the nine GHG reduction strategies included in the CAP. For more detailed information on the strategies, refer to section 5.0, Metropolitan's GHG Emissions Reduction Strategy.

SCOPE 1:

DIRECT EMISSIONS

Strategy 1: Phase Out Natural Gas Combustion at Facilities

Combustion of fossil fuels at Metropolitan facilities emits over 1,000 MT CO_2e annually. Natural gas-powered equipment can be electrified over time as the equipment reaches the end of its useful life. Carbon-free electricity can then be used to power equipment, further reducing emissions.

Strategy 2: Zero Emissions Vehicle Fleet

Metropolitan's vehicle fleet emits an average of 7,000 MT CO_2e per year. Decarbonizing Metropolitan's fleet and powering it with carbon-free electricity or other zero-emission technology would allow for this emission source to achieve carbon neutrality.

Strategy 3: Use Alternative Fuels to Bridge the Technology Gap to Zero Emission Vehicles and Equipment

While zero-emission vehicles are being developed, using low-carbon intensity fuels like renewable diesel in older vehicles can help reduce GHG emissions in the near-term.

SCOPE 2:

INDIRECT EMISSIONS FROM ELECTRICITY

Strategy 4: Utilize Low-Carbon and Carbon-Free Electricity

Electricity consumption is Metropolitan's single largest and most variable emissions source. While the California Renewables Portfolio Standard Program (SB 100) mandates that emissions from retail electricity will be reduced over time, additional steps are necessary to generate and procure carbon-free electricity to reach Metropolitan's carbon neutrality goal. This strategy includes purchasing low-carbon and carbon-free electricity, implementing time-of-use strategies, and developing additional carbon-free energy generation like wind, solar, and hydropower.

Strategy 5: Improve Energy Efficiency

Increasing the efficiency of electric-powered equipment can substantially reduce GHG emissions. Improving pump efficiency, installing light emitting diode (LED) lighting and energy recovery systems can reduce total demand for electricity from Metropolitan operations, saving money and decreasing emissions.

SCOPE 3:

OTHER INDIRECT EMISSIONS

Strategy 6: Incentivize More Sustainable Commutes

While Metropolitan does not have direct control over the manner in which its employees travel to and from their jobs, Metropolitan can facilitate alternative commute strategies, including use of active and shared/subsidized transportation, remote work, and charging equipment for electric vehicles.

Strategy 7: Increase Waste Diversion to Achieve Zero Waste

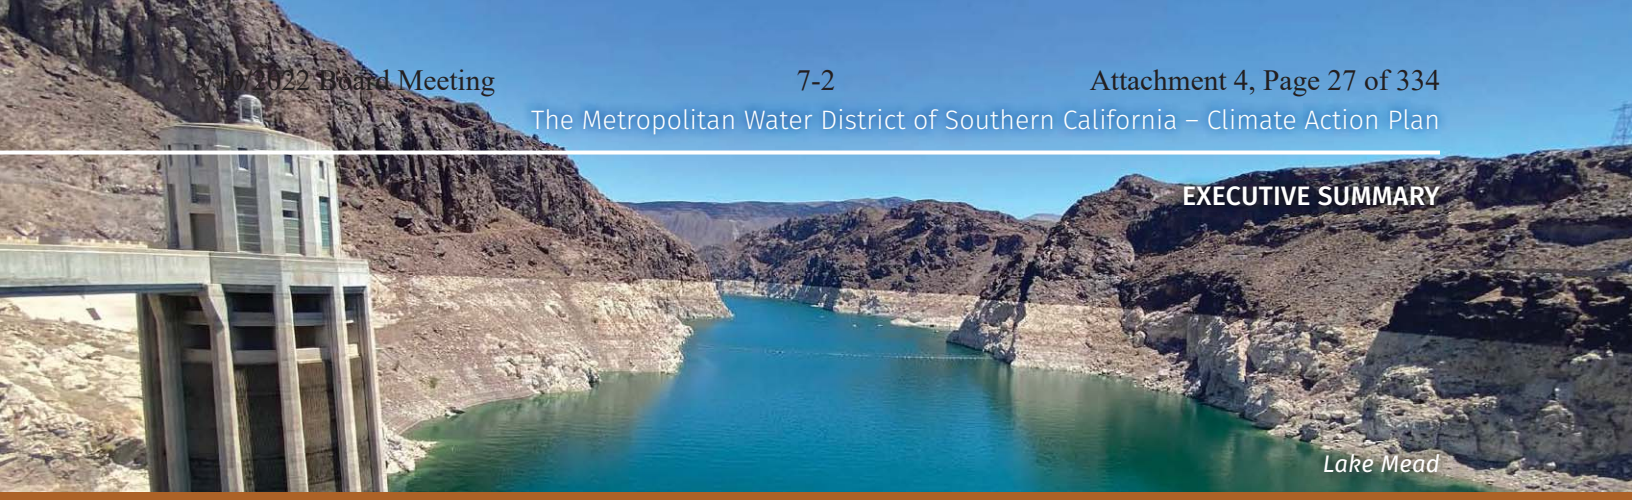
Though waste generated by Metropolitan operations results in only a small fraction of overall annual GHG emissions, Metropolitan will implement specific measures designed to reduce the waste generated at its offices and facilities.

Strategy 8: Increase Water Conservation and Local Water Supply

Metropolitan will continue incentivizing conservation and investing in local projects that increase local water supplies such as groundwater, recycled water, and stormwater.

Strategy 9: Investigate and Implement Carbon Capture and Sequestration Opportunities

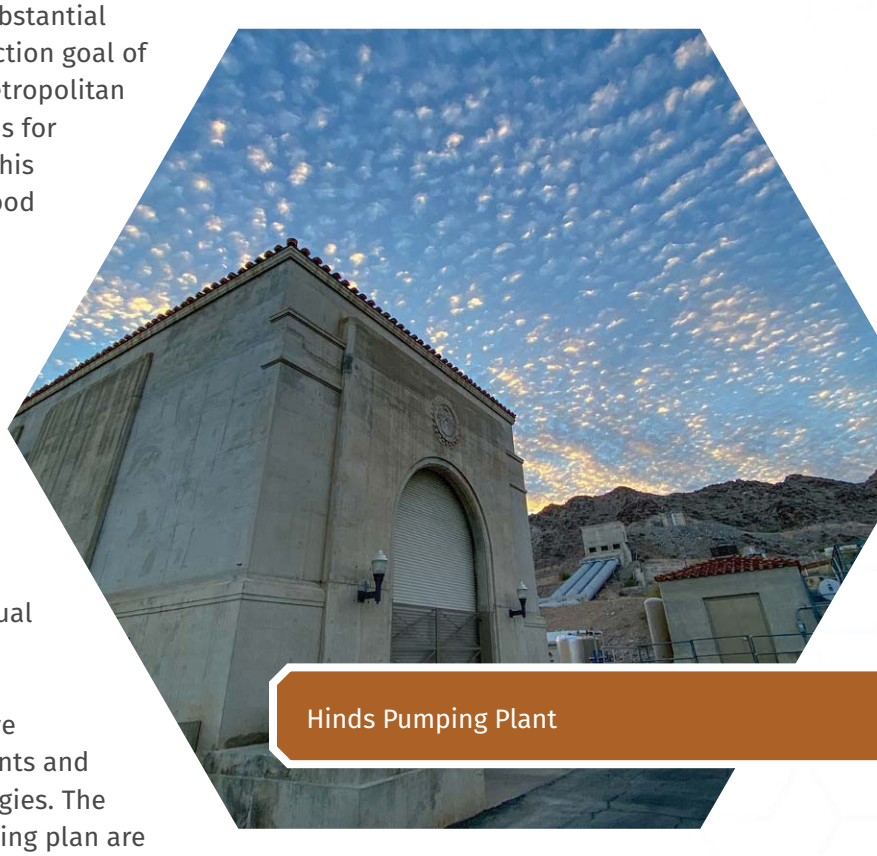
Carbon sequestration and carbon capture and storage projects could provide Metropolitan a source of "negative" GHG emissions that will support its efforts to achieve carbon neutrality. Metropolitan will continue to track these opportunities as they progress. While GHG reduction through electrification, carbon-free electricity, and efficiency will drive a significant portion of Metropolitan's GHG reduction needs, sequestering and storing carbon will likely play a critical role in achieving and maintaining carbon neutrality for both Metropolitan and California.



Lake Mead

IMPLEMENTATION STRATEGY AND MONITORING

This CAP will guide Metropolitan to achieve the 2030 GHG reduction target and demonstrate substantial progress toward the long-term state reduction goal of carbon neutrality by 2045. At this time, Metropolitan has developed two implementation phases for the GHG reduction measures included in this CAP. Phase 1 will implement well-understood measures over the next 10 years based on cost, available technology, and certainty of future conditions. Phase 2 will follow with measures that show promise, but require additional research, new or emerging technology, or different market conditions before implementation. To maintain accuracy and adapt to changing conditions, Metropolitan will conduct annual updates of the carbon budget and develop an annual progress report to demonstrate successes and areas for continued improvement. Metropolitan will update the CAP every five years to capture new research developments and identify new, adapted, or expanded strategies. The CAP implementation strategy and monitoring plan are detailed in Section 6.0, Implementation and Monitoring.



Hinds Pumping Plant

SECTION 1.0
PURPOSE, OVERVIEW, AND ENVIRONMENTAL HISTORY AND LEADERSHIP

The Metropolitan Water District of Southern California (Metropolitan) recognizes the potential impact of climate change to its core mission of providing a reliable water supply for Southern California. Variable precipitation patterns, timing and availability of water supplies, changes in consumer demands, and sea level rise will all change the way Metropolitan plans to provide its services and how it operates its regional water system. Reducing greenhouse gas (GHG) emissions from water operations supports California's overall strategy to achieve statewide GHG reduction goals. This Climate Action Plan (CAP) sets targets and goals for reducing GHG emissions from Metropolitan's operations, including conveyance, storage, treatment and delivery of water to its 26 member public agencies. The CAP also will have an important role in the environmental review of projects subject to the California Environmental Quality Act (CEQA) that were included in the GHG emissions forecast, as it provides a pathway to tier GHG emissions analysis for projects. In addition, it complements Metropolitan's other long-range planning efforts, including the Integrated Water Resources Plan, Energy Sustainability Plan and Capital Investment Plan.

This section establishes the purpose of the CAP, provides an overview of Metropolitan, and describes Metropolitan's efforts to date in reducing GHG emissions.

1.0

1.0

Diamond Valley Lake

1.1 PURPOSE OF THE CAP

The CAP is a long-range planning document that will inform policy and planning decisions on operations, water resources, capital investments, and conservation and local resource programs. It also can be used by member agencies when considering local policies and programs. Additionally, as mentioned previously, the CAP will allow Metropolitan to streamline the environmental review process for future projects under CEQA. The CAP creates a roadmap that will provide Metropolitan with a broad range of feasible and implementable strategies and measures to mitigate or reduce GHG emissions in line with State goals. The CAP also will help Metropolitan reduce overall GHG emissions from its operations and improve cost effectiveness, while avoiding negative impacts to Metropolitan's core mission. Beyond establishing a feasible and implementable pathway to its emissions reduction target of carbon neutrality by 2045, the CAP will:

- Incorporate legislation and guidance from state, federal, and international sources
- Identify cost-effective energy efficient measures
- Provide co-benefits, such as improved operational resilience and air quality
- Streamline CEQA review for future projects in accordance with CEQA Guidelines Section 15183.5(b)(1)
- Integrate actions to achieve California's transportation strategies to transition away from fossil fuels.

Metropolitan is adopting a long-term goal of achieving carbon neutrality by 2045, consistent with California's Executive Order B-55-18.

METROPOLITAN CAP INTENT AND USE

CEQA GHG Emissions Analyses Streamlining

This CAP is consistent with all state legislation, including Senate Bill (SB) 32 and Executive Order (EO) B-55-18, and meets the requirements of Section 15183.5(b)(1) of the CEQA Guidelines for a "Qualified GHG Reduction Plan" (CAP or Plan).

To meet the requirements of CEQA Guidelines Section 15183.5(b)(1), a qualified CAP must:

1. Quantify existing and projected GHG emissions within the Plan area (see Section 3.0)
2. Establish a reduction target based on local, regional or state targets (see Section 4.0)
3. Identify and analyze sector specific GHG emissions from Plan activities (see Section 3.0)
4. Specify policies and actions (measures) that, if implemented, would achieve the specified reduction target (see Section 5.0)
5. Establish a mechanism to monitor progress and amend the CAP (see Section 6.0)
6. Adopt the document in a public process following environmental review (see CAP Program Environmental Impact Report).

Using a qualified CAP will allow Metropolitan to tier future project-level GHG emissions analyses from the CAP, if those projects demonstrate consistency with the CAP. Consistency will be determined by conducting annual GHG emissions inventories to ensure Metropolitan is meeting its adopted GHG reduction goals.

CAP Implementation Tracking

Metropolitan is committed to tracking the implementation of this CAP using a specialized tracking tool as well as through annual, third-party verified GHG emissions inventories submitted to The Climate Registry (TCR).[1] Metropolitan will use this information to monitor its consistency with its GHG reduction goals (Section 4.0) and ensure the effectiveness of the CAP at reducing GHG emissions. The CAP measures and actions in Section 5.0, Metropolitan's GHG Emissions Reduction Strategy, are summarized by responsible entity, timing, and monitoring approach. Section 6.0, Implementation and Monitoring, details how GHG emissions will be measured on an annual basis, and how and when the CAP will be updated. At a minimum, the CAP will be updated every five years, or sooner if needed to ensure progress towards meeting Metropolitan's GHG reduction goals. Metropolitan will be responsible for tracking the implementation of the CAP measures and actions as well as staying within the GHG emissions established by the carbon budget defined in Section 4.0.

1. *The Climate Registry was formed to continue the work of the California Climate Action Registry. Created by the State of California in 2001, the California Climate Action Registry promoted and protected businesses' early actions to manage and reduce their GHG emissions. 1.0

Colorado River Aqueduct

1.2 OVERVIEW OF METROPOLITAN

Formed in 1928 by an act of the California Legislature, Metropolitan is a regional wholesaler providing water for its 26 member public agencies – to deliver either directly or through their sub-agencies – to 19 million people living in Los Angeles, Orange, Riverside, San Bernardino, San Diego and Ventura counties. Metropolitan's mission is to provide its 5,200-square-mile service area with adequate and reliable supplies of high-quality water to meet present and future needs in an environmentally and economically responsible way.

To fulfill its mission, Metropolitan imports water from the Colorado River and Northern California to supplement local supplies and helps its members develop increased water conservation, recycling, storage, and other resource management projects. Metropolitan's service area is shown in Figure 1-1.

The mission of the Metropolitan Water District of Southern California is to provide its service area with adequate and reliable supplies of high-quality water to meet present and future needs in an environmentally and economically responsible way.

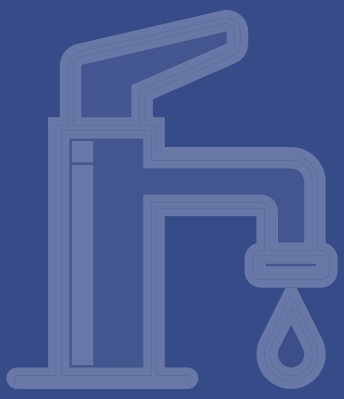

FIGURE 1-1: Metropolitan's Service Area

METROPOLITAN'S WATER SOURCES

Metropolitan imports water from two sources:

- The Colorado River via the Colorado River Aqueduct (CRA), which is owned and operated by Metropolitan. The headwaters of the Colorado River originate in the Rocky Mountains. The system is governed by water rights and agreements among the seven Colorado River Basin states[2] and is managed by the United States Bureau of Reclamation.
- Northern California via the State Water Project (SWP),[3] which delivers water through the California Aqueduct to 29 state contractors. The California Department of Water Resources (DWR) owns and operates the system. Metropolitan is the largest SWP contractor.

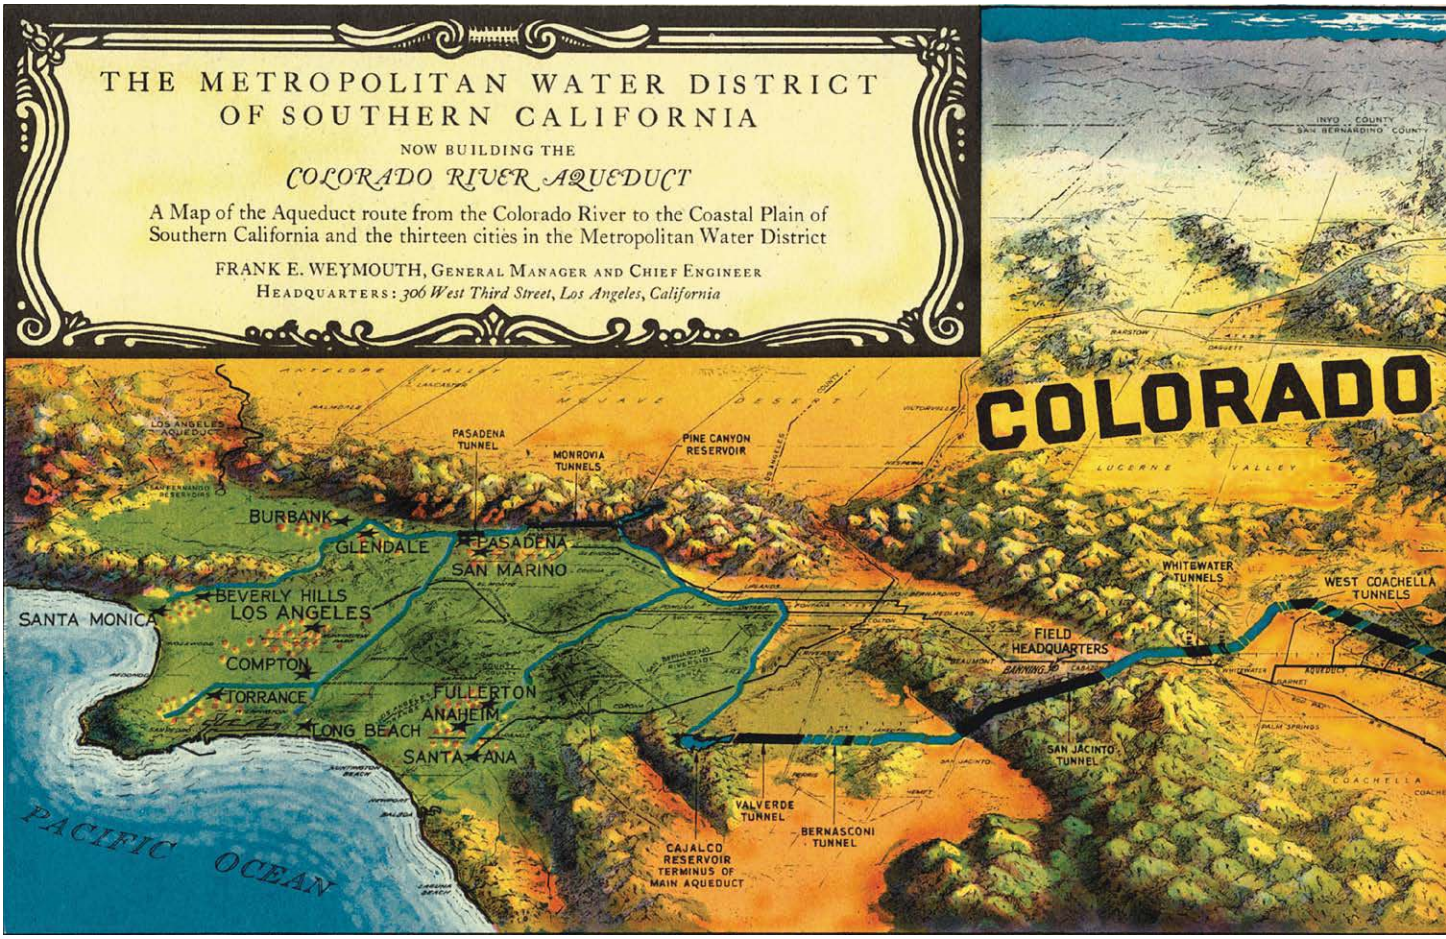
2. *The Colorado River Basin states include Arizona, California, Colorado, Nevada, New Mexico, Utah, and Wyoming. Source:* ***https://www.usbr.gov/lc/hooverdam/faqs/riverfaq.html.***

3. *The SWP is a water storage and delivery system of reservoirs, aqueducts, power plants and pumping plants extending throughout California for more than 700 miles (or approximately two-thirds the length of California).*

An increasing percentage of Southern California's water supply comes from water conservation, water recycling, and other local resources. Metropolitan supports these programs with funding to support additional development.

Metropolitan owns and operates the 242-mile CRA (see Figure 1-2), a system of reservoirs, pump plants, canals, tunnels, and pipelines that convey water from Lake Havasu on the California-Arizona border across the Mojave Desert and southern edge of the San Bernardino Mountains, to Lake Mathews on the east side of the Santa Ana Mountains in western Riverside County.

FIGURE 1-2: Colorado River Aqueduct System



Metropolitan takes delivery of its SWP supplies through the Foothill Feeder immediately downstream of Castaic Lake in Los Angeles County, through the Rialto Pipeline and Inland Feeder which connect to the Devil Canyon Powerplant after-bays in San Bernardino County, through the Box Springs Feeder in Riverside County, and through the Perris Pressure Control Structure at Lake Perris in Riverside County (see Figure 1-3). The operations of the SWP and associated GHG emissions are addressed in the DWR Climate Action Plan and are not included in this CAP.[4]

Accessed April 15, 2020.

ENVIRONMENTAL COMMITMENT AND GHG REDUCTION GOALS

Commitment to Environmental Responsibility

Although Metropolitan was formed in 1928 to build a system to import water from the Colorado River, its mission has evolved to ensure the water reliability of Southern California by incorporating a diverse portfolio of water sources and initiatives to help meet the needs of the region.[6] Early on, Metropolitan's planners and engineers recognized the need for efficiency and energy reliability. The CRA, Metropolitan's first and primary source of water conveyance, was designed to deliver water 242 miles across the arid desert to Southern California, primarily through gravity. Five pump plants along the aqueduct lift the water to cross mountains and allow gravity to continue the work. In 1960, Metropolitan was instrumental in securing a new supply from Northern California, with California voters approving construction of SWP.[7] In 2000, Metropolitan completed construction of Diamond Valley Lake (DVL), the region's largest drinking water reservoir, which helps protect the region from droughts and ensures a reliable supply of water in emergencies. In 2009, Metropolitan completed the Inland Feeder, a 44-mile-long conveyance system that connects the SWP to DVL and the CRA, increasing the operational flexibility necessary to store water in wet years.

6. ***http://www.mwdh2o.com/DocSvcsPubs/mwd_newsletter/aug2011/article4.html***
7. ***https://www.mwdh2o.com/who-we-are/our-story/***

Diamond Valley Lake

Today, Metropolitan continues to adapt to the region's ever-changing needs and challenges by investing in its imported supplies while also making significant investments in conservation, water recycling, groundwater storage, and innovative water transfer and storage projects. Metropolitan also works with its partners on the co-equal goals of restoring the environmental health of the Sacramento-San Joaquin Delta and protecting its water resources to ensure a reliable source of imported water. The CAP represents the next step of Metropolitan's long-standing commitment to environmental stewardship.

Water use efficiency, which includes both short-term conservation efforts and longer-term demand management actions play a key role in water reliability for the region. All water savings actions in Metropolitan's service area and the greater Southern California region will continue to play a priority role in the reduction of GHG emissions. While all of Metropolitan's actions to reduce its GHG emissions will benefit the region, its conservation programs allow Metropolitan to target more specific sectors, communities, and technologies. Underserved (Disadvantaged Communities/DACs) communities represent a significant portion of Metropolitan's Southern California service area. Residents in these areas may lack the resources to take advantage of rebates or incentives for high-efficiency appliances or equipment that can require large, up-front purchases. They also may live in apartments and other multi-family buildings without yards, limiting their participation in outdoor programs such as Metropolitan's landscape transformation program or rebates for smart irrigation controllers.

Metropolitan continually reviews and updates its conservation programs to improve water savings and benefits to communities throughout its service area. For example, in FY 2021-22 Metropolitan is continuing a pilot program to penetrate underserved communities that are traditionally "hard to reach" to increase access to incentives and help ensure equitable distribution of water savings devices. The program targets older multi-family housing (built prior to 1994) and allows contractors to directly install high-efficiency toilets in the housing units. Metropolitan also provides funding to its Member Agencies that helps subsidize their local programs for underserved communities. These local programs are also aimed at generating water savings in underserved communities, and may include replacement of older, high water-using toilets, shower heads, aerators, and other water-saving devices in multi-family housing within Member Agencies' service areas. Other programs include providing leak detection equipment that monitor flows and identifies leaky devices and providing technical assistance for educational programs. Lastly, Metropolitan continues to partner with local utility companies like Southern California Gas Company (SoCalGas) to pursue joint Water-Energy efficiency

programs. One of the longer-running programs allows Metropolitan to provide incentives to SoCalGas to help offset the cost of high-efficiency clothes washers that use less water and gas and expand installations directly into income-qualified, single-family residences.

Metropolitan also includes outreach and messaging campaigns over a variety of media and in multiple languages to ensure that the broader community is aware of the conservation opportunities available to them. Conservation and water use efficiency play a key role in water reliability for the region and water savings actions in local communities will continue to play a priority role in the reduction of GHG emissions. All of these efforts help to ensure a more equitable distribution of conservation funds and that the broader community is educated about water conservation and its contribution to the region's ability to provide a safe and reliable water supply for all.

Partnership with California Native Plant Society

Skinner Water Treatment Plant solar panels

1.3 METROPOLITAN'S GHG EMISSIONS REDUCTION HISTORY AND LEADERSHIP

Metropolitan's GHG emissions are primarily from the purchase and consumption of electricity used for conveyance, treatment, and delivery of water throughout Metropolitan's service area. Since 1990, Metropolitan has continued to take significant steps to reduce GHG emissions by improving its operational efficiency and by supporting the development of local water supplies and water use efficiency for homes, businesses and industries. These actions among others contribute to an overall decrease in Metropolitan's GHG emissions. Some of the GHG emissions reduction projects implemented by Metropolitan to date are summarized below. More information about Metropolitan's Energy Sustainability Plan can be found at ***https://www.mwdh2o.com/planning-for-tomorrow/addressing-climate-change/***.

METROPOLITAN GHG REDUCTION STRATEGIES

Infrastructure Energy Efficiency and Renewable Energy

Through its Capital Investment Plan, Metropolitan helps make significant investments to ensure energy reliability by upgrading its infrastructure with the most efficient technology. Metropolitan also is committed to the development of new innovations through programs like the Technology Feedback Forum, a program that offers innovators and entrepreneurs an opportunity to pitch their new technologies or services to Metropolitan, its member agencies, and their partners. Metropolitan also invests in carbon-free energy resources, including procuring a significant portion of its electricity from hydroelectric power and installing 5.5 megawatt (MW) total capacity of photovoltaic solar power at its facilities. Planning and adoption of new energy technologies is managed through the Energy Sustainability Plan that positions Metropolitan as a leader in energy efficiency and forward-thinking energy management. The development of new initiatives considers the evolving regulatory landscape, economic factors, water supply reliability, and development of new technologies or improvements to existing technologies.

Vehicle Fleet and Facilities

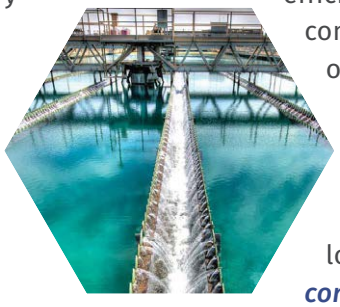
Metropolitan has reduced GHG emissions through its fleet management and facilities design and management. Metropolitan was an early adopter of high-fuel-efficiency and hybrid-electric vehicles for its fleet. Offices and facilities also are strategically located near public transportation. Employees have access to electric vehicle charging stations and the Metropolitan Rideshare Program. This commitment to GHG emissions reduction is further demonstrated through the design of its facilities, with Metropolitan achieving Leadership in Energy and Environmental Design (LEED) Platinum certification at the DVL Visitors Center and LEED Silver certification at the Union Station Headquarters in Los Angeles.

Conservation of Natural Lands

Metropolitan directly contributes to the safeguarding of over 30,000 acres of multi-species preserves within California and more than 8,100 acres of native habitat along the Colorado River through participation in the Lower Colorado River Multi-Species Habitat Conservation Plan. By preserving natural lands, Metropolitan helps ensure that critical habitats and valuable natural carbon stockpiles are protected from future release, contributing to the removal and storage of carbon from the atmosphere.

Water Conservation Efforts

Metropolitan's investment of more than $1 billion in water conservation, recycling, and groundwater recovery has funded projects responsible for the conservation of over 7 million acre-feet of water since 1990. These efforts, coupled with behavior changes by Southern Californians, reduced per capita water use in the region by a third since the 1990 baseline. Metropolitan provides funding, education, and engagement on multiple water conservation programs, including incentives for turf replacement, high efficiency appliances, smart irrigation controllers, and through the funding of water conservation innovation programs. A detailed description of Metropolitan's conservation efforts can be found in the Annual Regional Progress Report located at ***http://www.mwdh2o.com/inthecommunity/conservation-programs/Pages/default.aspx.***



METROPOLITAN HISTORICAL GHG EMISSIONS TIMELINE

Metropolitan's GHG emissions are extremely variable and are tied directly to the amount of water pumped from the Colorado River to help meet the needs of Southern California. Depending on the carbon content of the energy used to pump the water, increased CRA pumping can result in higher GHG emissions. The amount of water Metropolitan pumps from the Colorado River is driven by availability of water on both the Colorado River and SWP systems, available storage, demand, and other factors. Higher Colorado River pumping generally correlates to dry years with low SWP allocations. Through the implementation of energy and water efficiency projects as well as state legislation, overall emissions from Metropolitan operations have decreased since 1990, even during extreme drought events that resulted in increased pumping on the CRA. Although Metropolitan's emissions spike in drought years, the level of GHG emissions associated with these spikes is decreasing over time.

The following graph summarizes Metropolitan's annual GHG emissions since 1990. The major events, reduction actions, and state legislation that have driven Metropolitan's unique GHG emission profile are also included to generate a timeline of emissions from Metropolitan's operations. For more detailed information about legislative drivers of GHG emissions reduction, see Section 4.0, and for more information on Metropolitan's GHG emissions see Section 3.0.

Hinds Pumping Plant

1990

Conservation Credits Program

Metropolitan launches the Conservation Credits Program, providing incentives for water savings and reducing water use by an average of 158,000 acre-feet per year and GHG emissions by an average of 27,000 metric tons (MT) of carbon dioxide equivalent (CO_2e) per year from 1990 to 2018.[8]

1991

No More Coal

Metropolitan stops purchasing electricity from coal-fired power plants, significantly reducing GHG emissions over time.

Groundwater Recovery Program

Metropolitan initiates its Groundwater Recovery Program to encourage treatment and use of degraded groundwater for municipal purposes.[9]

1987–1992

DROUGHT

During these years California experienced one of the longest droughts in its history, resulting in increased Colorado River pumping. The drought was eventually broken by a strong El Niño known as the "March Miracle."

2002

Senate Bill 1078

SB 1078, establishes the California Renewables Portfolio Standards (RPS) Program requiring 20 percent of electricity retail sales be served by renewable energy sources by 2017. Passage of SB 107 in 2006 accelerates this goal to a 2010 deadline.

2005

First GHG Emissions Inventory

Metropolitan completes its first annual GHG emissions inventory reported to the California Climate Action Registry, including Scope 1 and Scope 2 emissions.

Executive Order S-3-05

EO S-3-05 is signed, establishing statewide GHG emissions reduction targets for the years 2020 and 2050. The order calls for the reduction of GHG emissions in California to 1990 levels by 2020 and 80 percent below 1990 levels by 2050.

2006

Solar at DVL Visitors Center

Metropolitan installs 0.5 MW of roof-mounted solar panels at the DVL Visitors Center, offsetting GHG emissions by approximately 80 MT CO_2e per year.

8. *Water Tomorrow Annual Report to the California State Legislature. February 2019. Pg. 4. Average between 1990 and 2018 was multiplied by emission factors from Metropolitan Conservation Efforts Summary, and then averaged.*

9. *Water Tomorrow Annual Report to the California State Legislature. February 2019. Pg. 5*

Assembly Bill 32

With the passage of Assembly Bill (AB) 32, the California Global Warming Solutions Act of 2006, California becomes the first state in the nation to mandate GHG emissions reductions across all industries. This landmark legislation requires the state to reduce GHG emissions to 1990 levels by 2020. It also directs the California Air Resources Board (CARB) to develop and implement a scoping plan and regulations to meet the 2020 target.

2007

High-Fuel-Efficient Fleet

Metropolitan purchases 11 additional hybrid vehicles, making 30 percent of its passenger car fleet high-fuel-efficient vehicles.

Senate Bill 97

The signing of SB 97 acknowledges that climate change is an environmental issue that requires analysis in CEQA documents. In 2010, CARB adopts guidelines that give lead agencies the discretion to set quantitative or qualitative thresholds for the assessment and mitigation of GHG emissions and climate change impacts. It also allows lead agencies to streamline the analysis of GHG emissions on a project level using a programmatic GHG emissions reduction plan that meets certain criteria.

2008

SoCal Water$mart

Metropolitan launches a program to provide rebates to residential and commercial customers for water-efficiency upgrades.[10]

Senate Bill 375

SB 375, the Sustainable Communities and Climate Protection Act, is signed, establishing regional GHG emission reduction targets for passenger vehicles. Under SB 375, CARB establishes targets for 2020 and 2035 for each region covered by one of the metropolitan planning organizations. Each major metropolitan planning organization must prepare a sustainable communities strategy (SCS) as an integral part of its regional transportation plan.

2009

Solar at Skinner Water Treatment Plant (WTP)

Metropolitan installs a 1 MW photovoltaic power facility at the Skinner Water Treatment Plant, replacing 17 percent of the facility's grid electricity and reducing GHG emissions by approximately 550 MT CO_2e per year.

Senate Bill X7-7

SB X7-7, the Water Conservation Act, is signed, requiring all water suppliers to increase water use efficiency. This legislation sets an overall goal of reducing per capita urban water use by 20 percent by 2020.

10. 2015 IWRP

2007–2009

DROUGHT

These three years of drought were the 12th worst in California's history and the first drought that resulted in the issuance of a statewide emergency. This drought limited water diversions from the SWP resulting in higher CRA pumping and corresponding high emissions that carried over into 2010.

2010

GHG Reduction Strategy

Metropolitan completes an Energy Management and Reliability Study, which established policies and strategies for reducing GHG emissions, increasing revenue and mitigating price volatility.

2011

Senate Bill 2X

SB 2X is signed, requiring California energy providers to buy (or generate) 33 percent of their electricity from renewable energy sources by 2020.

2012

GHG Emissions Reach All-time Low

An 2012 GHG emissions inventory shows GHG emissions from Metropolitan operations at an all-time low due to almost all of Metropolitan's electric energy use being provided by hydro-electric power at the Parker and Hoover Dams in this year.

Assembly Bill 341

AB 341 is signed, directing the California Department of Resources Recycling and Recovery (CalRecycle) to develop and adopt regulations for mandatory commercial recycling. As of July 2012, businesses are required to recycle and jurisdictions must implement a program that includes education, outreach, and monitoring. AB 341 also set a statewide goal of 75 percent waste diversion by the year 2020.

2011–2014

DROUGHT

This period includes the hottest and driest period in California history, leading to increased CRA pumping and GHG emissions. In 2015 Governor Jerry Brown instituted a mandatory 25 percent water restriction. By 2016, California experienced the wettest year on record, replenishing water supplies, but causing widespread damage.

2014

HECW Program

In partnership with SoCal Gas, Metropolitan implements a High Efficiency Clothes Washer (HECW) direct installation program for low income customers.

California Water Action Plan

The California Water Action Plan is issued at the direction of Governor Brown in January, establishing 10 priority actions that guide the state's effort to create more resilient, reliable water systems and to restore

critical ecosystems. The plan is established as California feels the effects of a record-breaking drought. An update to the plan is adopted in 2016 as drought continues.

2015

Metropolitan Headquarters Energy Star Certification

Metropolitan's commitment to sustainability is recognized when the Metropolitan's Headquarters building at Union Station again receives ENERGY STAR certification, this time with a score of 97 out of 100.

2016

Solar at Weymouth WTP

Metropolitan installs a 3 MW photovoltaic power facility at the Weymouth Water Treatment Plant, replacing 45 percent of the facility's grid electricity and reducing GHG emissions by approximately 1,500 MT CO_2e per year.

Senate Bill 32

SB 32 is signed, requiring CARB to develop technologically feasible and cost-effective regulations to achieve the target of 40 percent below 1990 GHG emission levels by 2030.

2017

Solar at Jensen WTP

Metropolitan installs a 1 MW photovoltaic power facility at the Jensen Water Treatment Plant, offsetting 20 percent of the facility's energy demand and reducing GHG emissions by approximately 550 MT CO_2e per year.

2018

Save Water 365 campaign

Metropolitan launches the Save Water 365 campaign through multiple platforms, encouraging Southern Californians to save water everyday and take advantage of Metropolitan's water efficiency rebate programs.

Executive Order B-55-18

EO B-55-18 is signed, establishing the goal for state agencies to reach carbon neutrality by 2045 and to achieve and maintain net negative emissions thereafter.

Senate Bill 100

SB 100 requires 100 percent of retail electricity sales to be zero carbon by 2045.

SECTION 2.0
SCIENTIFIC CONTEXT AND CLIMATE CHANGE IMPACTS

While the scientific understanding of climate change continues to improve and develop, the mechanism driving climate change has been well understood since the middle of the twentieth century. This section provides an overview of the scientific context and forecasted impacts of climate change and how these impacts could affect Metropolitan's operations.

Climate change:
A change in the average conditions — such as temperature and rainfall — in a region over a long period of time.

2.0

2.0

Farming in the Sacramento-San Joaquin Delta

2.1 SCIENTIFIC CONTEXT

GREENHOUSE EFFECT AND GLOBAL WARMING

Greenhouse Effect

Gases in the Earth's atmosphere act like a blanket that allows high-energy light from the Sun to pass through to Earth, while reflecting and absorbing lower-energy heat that has been radiated back from Earth. The trapping of this heat is known as the greenhouse effect because atmospheric gases function similar to the windows in a greenhouse, which trap the Sun's rays and create a much warmer space inside as compared to the outside air. The greenhouse effect regulates the Earth's climate, maintaining conditions suitable for life on Earth. However, a rapid increase of GHGs can cause excess heat to be trapped, affecting global temperatures and climate. This process is depicted in Figure 2-1.

In its Fifth Assessment Report (AR5), the Intergovernmental Panel on Climate Change (IPPC), concluded there's a more than

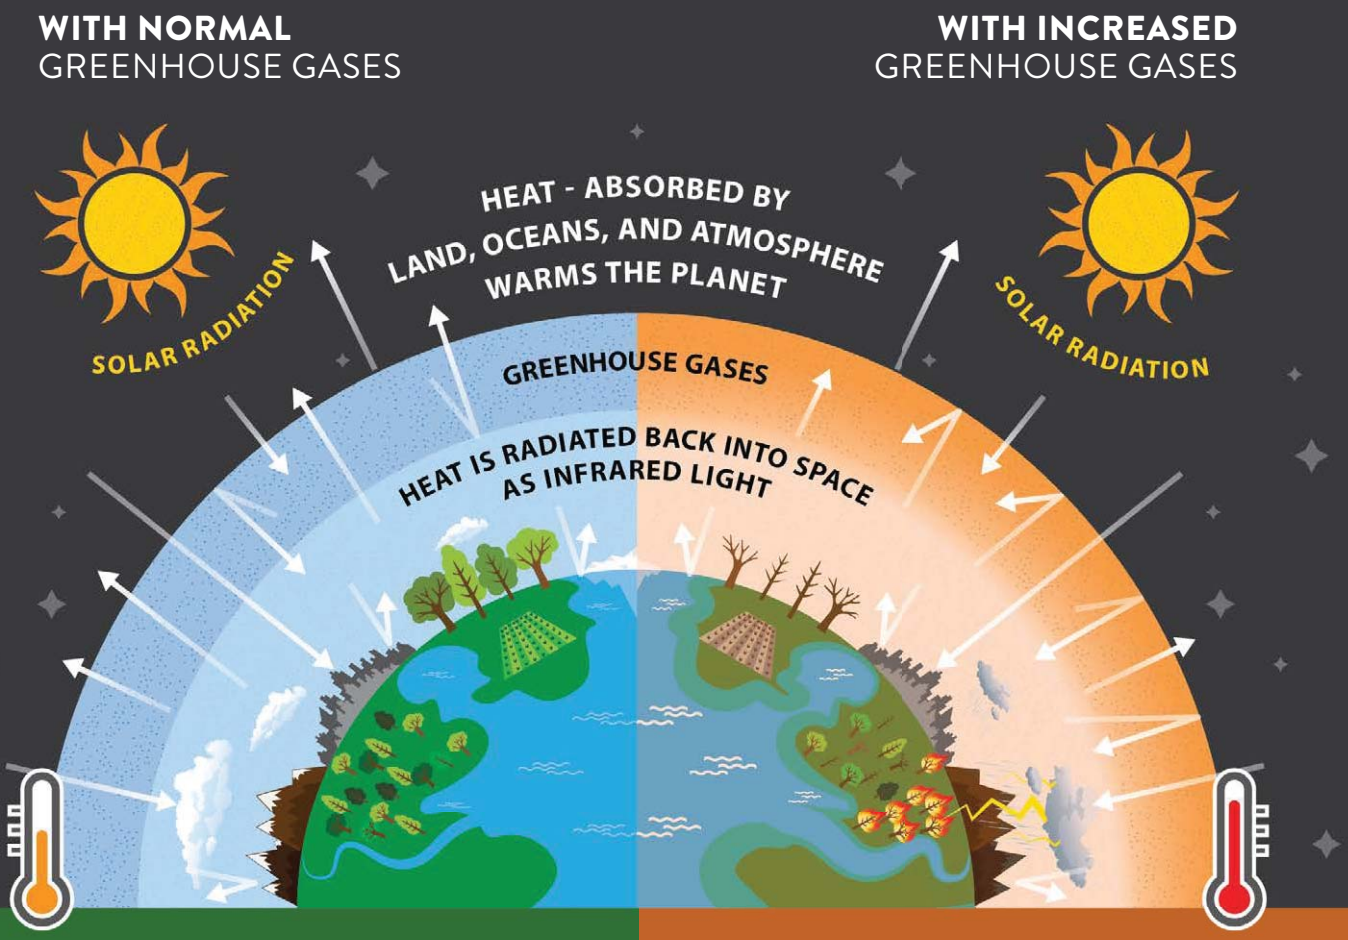
95%

likelihood that human activities are a principal cause of our warming planet over the past 50 years.[1]

1. *https://archive.ipcc.ch/report/ar5/syr/*

FIGURE 2-1: Greenhouse Gas Effect and Associated Climate Impacts

Greenhouse Gas Effect



Some heat continues into space while the rest, trapped by GHGs, help maintain the planet's relatively comfortable temperatures.

LESS GAS =
LESS HEAT TRAPPED IN THE ATMOSPHERE

Retain more reliable:

- Weather
- Temperature
- Rainfall
- Sea Level

Increased GHGs means less heat escapes to space. Between preindustrial times and now, the earth's average temperature has risen by 1.8°F (1.0°C).

MORE GAS =
MORE HEAT TRAPPED IN THE ATMOSPHERE

Results in more intense:

- Storms
- Heat
- Drought
- Sea Level Rise

2.0

GLOBAL GHG CONTRIBUTIONS

Carbon dioxide (CO_2) and other GHGs including methane (CH_4) and nitrous oxide (N_2O) are responsible for the radiative greenhouse effect on Earth. Each GHG has its own global warming potential (GHG), or the extent to which it traps energy in the atmosphere. GHGs utilize CO_2 as a reference point to compare the potential impact of different GHGs. As such, CO_2 has a GHG of one. Methane has a GHG of 21, meaning that each unit of methane causes 21 times more global warming potential than one unit of CO_2, while N_2O has a GHG of 310. Other GHGs include the fluorinated gases, which can have a GHG of up to 22,000 (see Figure 2-4); however, in comparison, fluorinated gases are released in such small quantities that they only contribute about two percent of overall global warming (see Figure 2-2).

When individual GHGs are normalized based on their GHGs, we refer to them as CO_2e. Generally, GHG emissions are quantified in terms of MT CO_2e emitted per year.

As shown in Figure 2-3, the total annual emissions generated anthropogenically have increased continuously since 1970, with an increase of approximately 1.3 percent annually between 1970 and 2000 and an increase of 2.2 percent annually between 2000 and 2010. Globally, economic and population growth were the most direct drivers of increases in CO_2 emissions from fossil fuel combustion, with population growth generally plateauing globally over the three decade period, while economic growth continued to increase rapidly over that same time.

FIGURE 2-2: Overall GHG Contribution

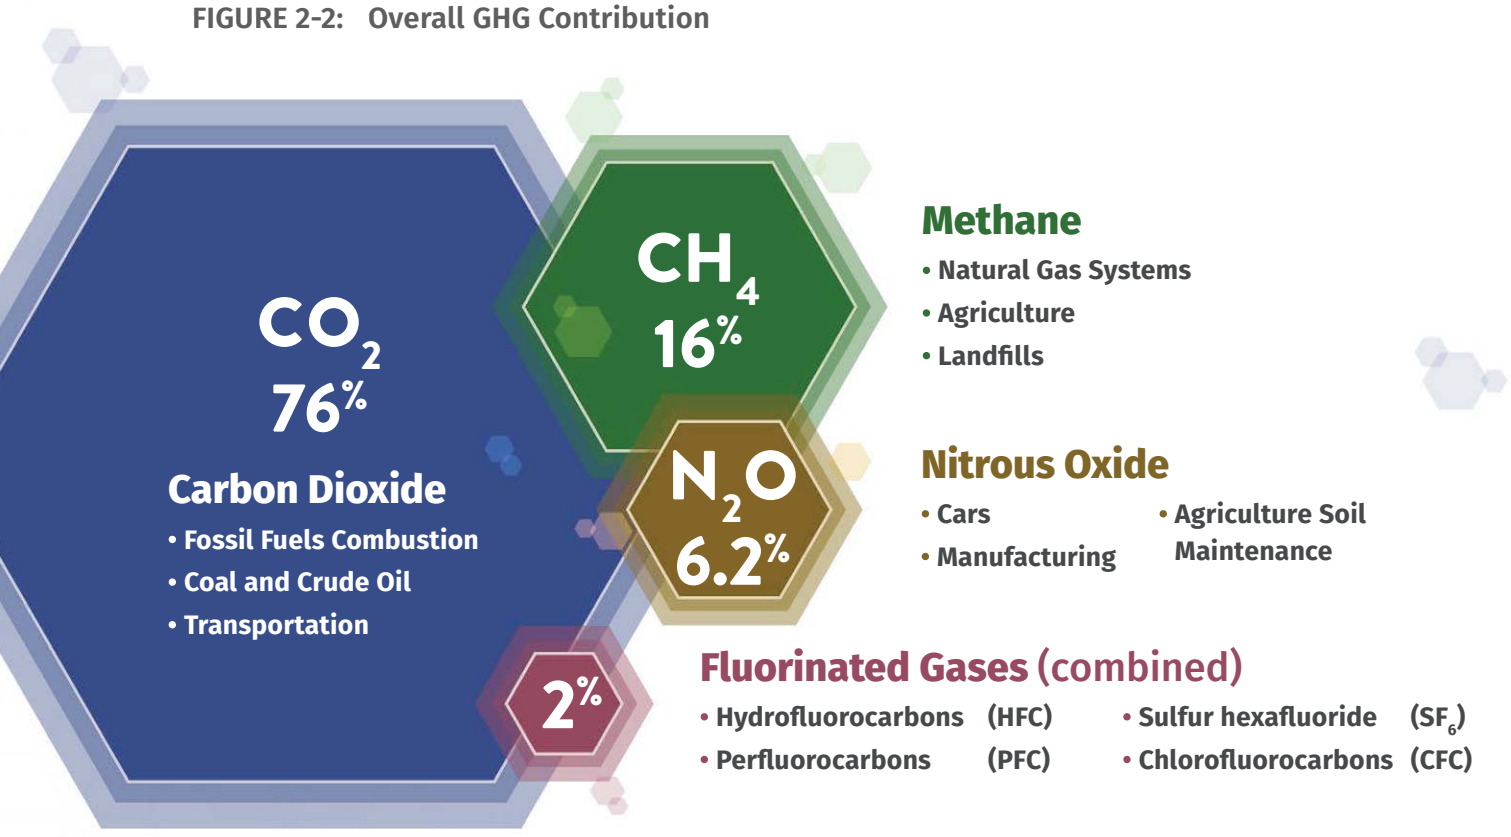


FIGURE 2-3: GHG Contribution Over Time

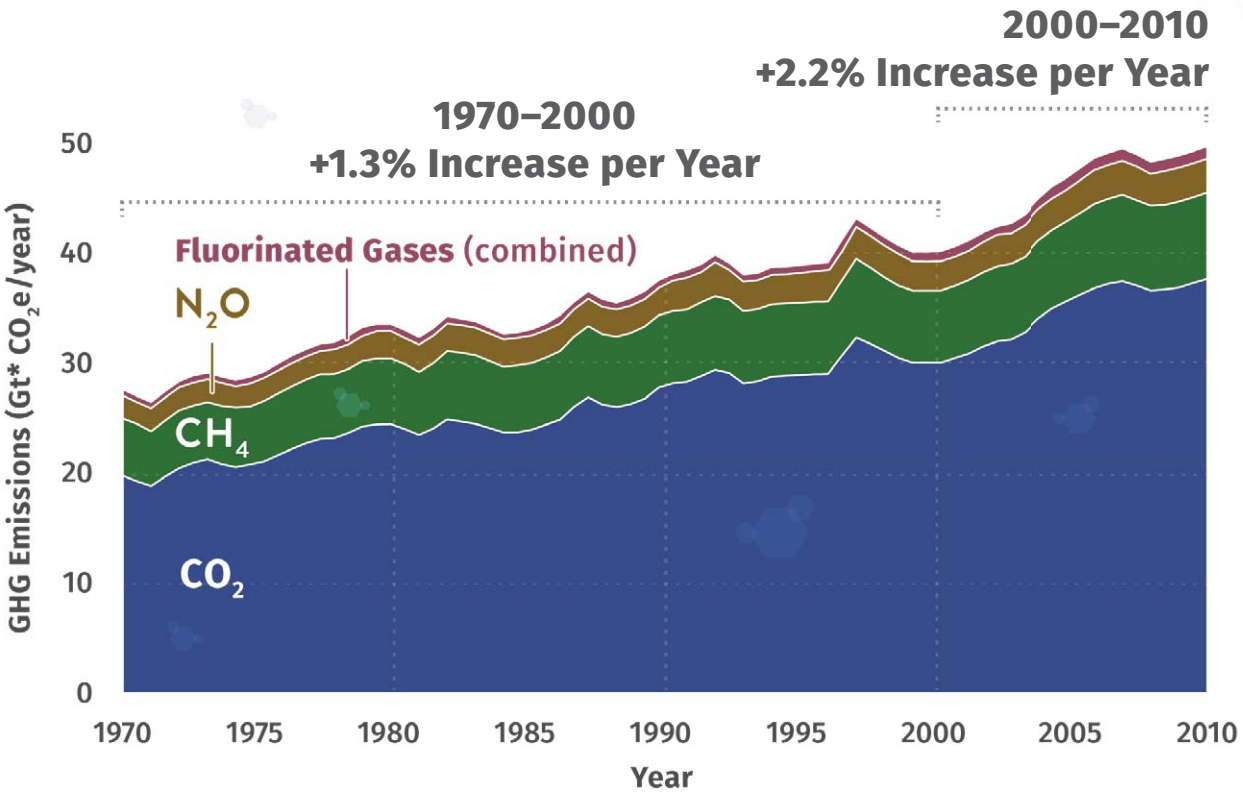
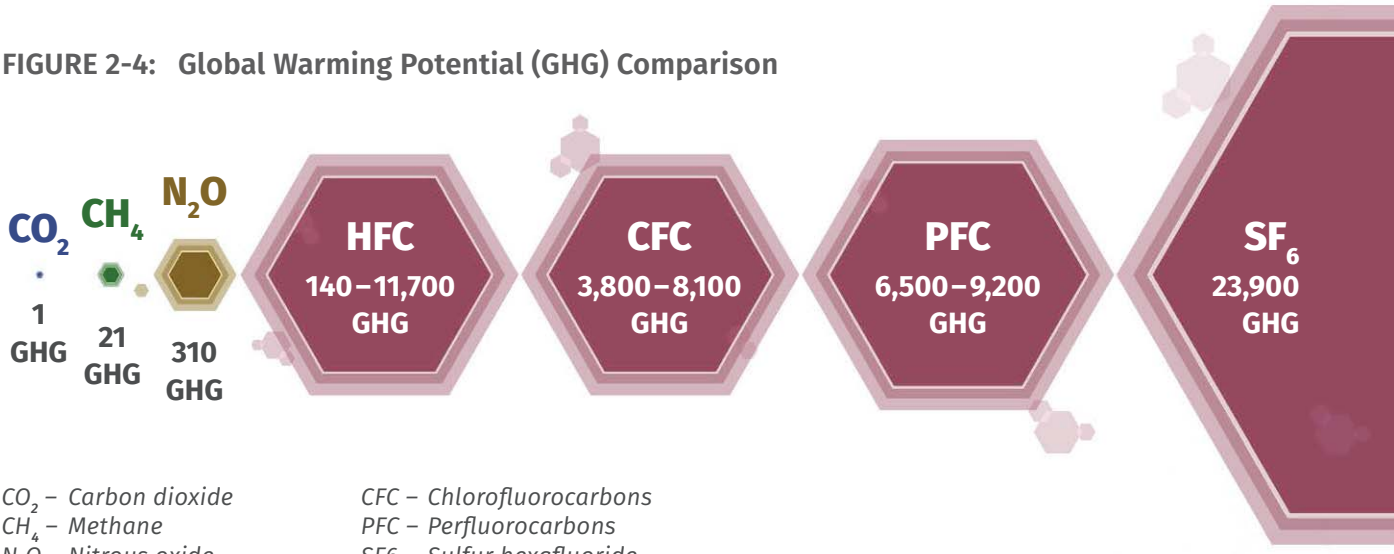


** Gt = gigaton or one million metric tons*
*Source: IPPC–**https://www.ipcc.ch/site/assets/uploads/2018/02/AR5_SYR_FINAL_SPM.pdf***

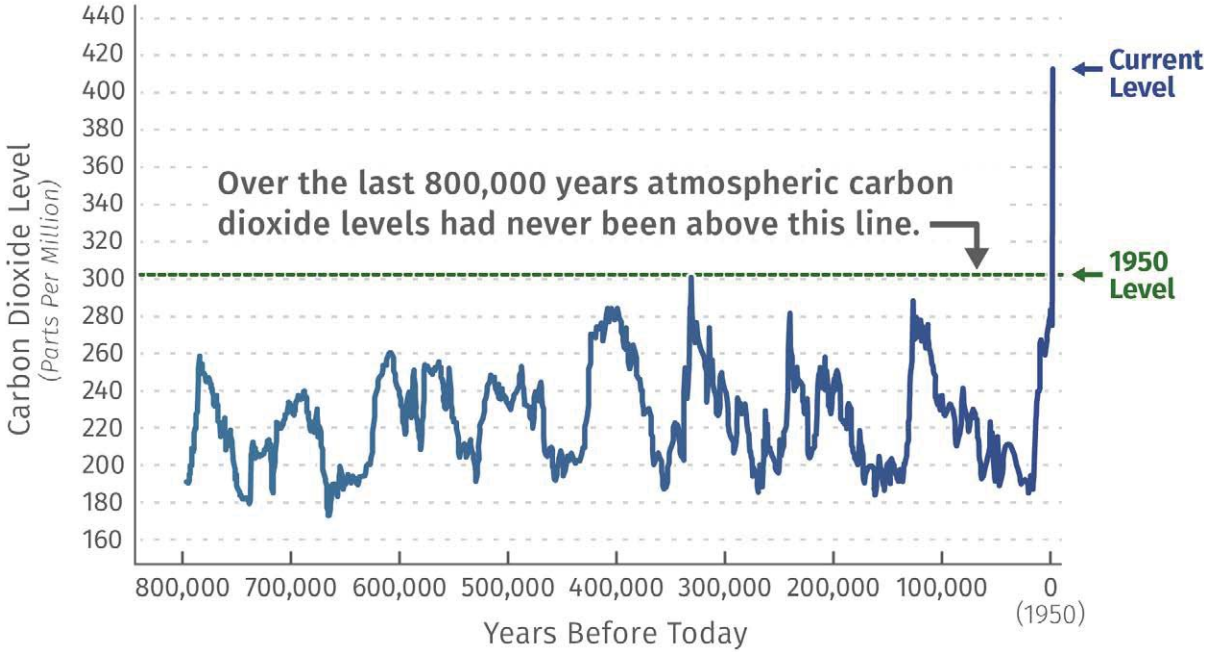
FIGURE 2-4: Global Warming Potential (GHG) Comparison



CO_2 – Carbon dioxide
CH_4 – Methane
N_2O – Nitrous oxide
HFC – Hydrofluorocarbons
CFC – Chlorofluorocarbons
PFC – Perfluorocarbons
SF6 – Sulfur hexafluoride

While CO_2 has the lowest GHG of the GHGs, it is by far the largest contributor due to the total mass of anthropogenic GHG emissions released annually. Since the dawn of the industrial revolution in the mid-nineteenth century, human activities have been emitting large quantities of GHGs into the atmosphere, enough to nearly double the amount of CO_2 from 280 parts per million to over 400 parts per million, which is 100 parts per million higher than any time in the last 800,000 years. The atmospheric concentration of CO_2 over time, based on measuring the composition of air trapped in ice cores from Antarctica,[2] is shown in Figure 2-5.

FIGURE 2-5: Atmospheric Carbon Dioxide Levels



Source: ***https://climate.nasa.gov/evidence/***

The more CO_2 and other GHGs in the atmosphere, the greater the amount of heat trapped on Earth. The mechanisms surrounding anthropogenic (human-caused or based on human activity) global warming are well-understood and widely accepted by the scientific community, with over 97 percent of climate scientists agreeing that the planet is warming at an accelerated rate and that human activities are the root cause.[3]

GREENHOUSE GAS EMISSIONS

GHG Emission Sources

Anthropogenic processes that release GHGs include the burning of fossil fuels for transportation, heating, and electricity generation; agricultural practices that release methane, such as livestock grazing and crop residue decomposition; and industrial processes that release smaller amounts of high-GHG gases. Deforestation and land cover conversion also contribute to global warming by reducing the Earth's capacity to remove CO_2 from the air and altering the Earth's albedo,[4] or surface reflectance, allowing for absorption of additional solar radiation.

Metropolitan GHG Emission Sources

Metropolitan's sources of GHG emissions include, but are not limited to:

- Energy (water pumping and treatment, facilities operation and construction activities);
- Transportation (fleet vehicle fuel and employee commutes);
- Water (consumption by Metropolitan facilities);
- Waste (generation, diversion, and decomposition); and
- Fugitive emissions (which are small amounts of high GHG gases, from refrigerants and fire suppression equipment).

For a complete description of Metropolitan's emissions and associated GHG emissions see Section 3.0, GHG Emissions Inventory and Forecast.

Whitsett Intake Pumping Plant

4. *Albedo refers to the amount of diffuse radiation of energy out of the total that is reflected by a surface, ranging from 0 (a black body that absorbs all radiation) to 1 where no energy/radiation is absorbed. AIR QUALITY

According to the United States Environmental Protection Agency (EPA), changes in climate can result in impacts to local air quality.[5] Specifically, atmospheric warming associated with climate change has the potential to increase ground-level ozone emissions. The federal and State Clean Air Acts mandate the control and reduction of certain air pollutants, including ozone (O_3). Under these laws, the EPA and CARB established the National Ambient Air Quality Standards and the California Ambient Air Quality Standards for "criteria pollutants" and other pollutants. Primary criteria pollutants are emitted directly from a source (e.g., vehicle tailpipe, an exhaust stack of a factory, etc.) into the atmosphere and include carbon monoxide, volatile organic compounds (VOC)/reactive organic gases (ROG),[6] nitrogen oxides (NO_X), fine particulate matter (PM_{10} and $PM_{2.5}$), sulfur dioxide, and lead. Secondary criteria pollutants, such as oxidants, O_3, and sulfate and nitrate particulates (smog), are created by atmospheric chemical and photochemical reactions primarily between VOCs and NO_X.

A photochemical reaction (triggered by sunlight) between NO_X and VOCs produces O_3. VOCs are composed of non-methane hydrocarbons (with some specific exclusions), and NO_X is composed of different chemical combinations of nitrogen and oxygen, mainly nitric oxide and nitrogen dioxide. NO_X is formed during the combustion of fuels, while VOCs are formed during combustion and evaporation of organic solvents. As a highly reactive molecule, O_3 readily combines with many different components of the atmosphere.

5. ***https://www.epa.gov/air-research/air-quality-and-climate-change-research***

6. *The California Air Resources Board defines VOC and ROG similarly as, "any compound of carbon excluding carbon monoxide, carbon dioxide, carbonic acid, metallic carbides or carbonates, and ammonium carbonate," with the exception that VOC are compounds that participate in atmospheric photochemical reactions*

Sacramento-San Joaquin Delta

2.2 CLIMATE CHANGE IMPACTS

CALIFORNIA CLIMATE CHANGE IMPACTS

California has undertaken extensive research at the state and local levels in order to support State and local agencies on long-range planning and adaptation strategies to protect infrastructure and resources. The impacts of climate change from potential sea level rise, changing weather patterns, extended drought, increased fire danger, and more severe storms have the potential to affect Metropolitan's infrastructure and water supply. By leveraging these studies as part of the climate action planning process, Metropolitan can identify potential climate vulnerabilities that may occur even while striving to reduce GHG emissions. Potential vulnerabilities are presented here to highlight possible impacts to its operations and infrastructure.

The most apparent effects of climate change in the southwestern United States, including the Metropolitan service area, will likely be in the form of more days of extreme heat, an increase in periods of drought, resulting in a reduction in water supply, as well as increased fire danger from hot, dry conditions, which could threaten critical infrastructure.[7,8] Air quality impacts from heat and wildfires may also continue to be an issue. Due to the size and scope of Metropolitan's operational area, which includes the Sierra Nevada and Colorado River watersheds, the potential climate change impacts to Metropolitan are diverse. The changes expected to impact Metropolitan specifically include: reduced quality and availability of water from the Sierra Nevada and Rocky Mountains snowpacks, sea level rise and coastal displacement affecting local coastal groundwater basins and water quality and levee stability in the Sacramento-San Joaquin Delta, increased risk of large wildfires, increased temperatures and extreme heat events, and exacerbation of air quality problems, each of which are described in more detail below.

Sierra Nevada Mountains snowpack

Reduced Quality and Supply of Water from the Sierra Nevada and Rocky Mountains Snowpacks

If heat-trapping emissions continue unabated, more precipitation will fall as rain instead of snow, and the snow that does fall will melt earlier, reducing the Sierra Nevada and Rocky Mountains spring snowpacks by as much as 65 percent by the end of the century (see Figure 2-6).[9] Figure 2-6 shows the historical (1961–1990) and projected (2070–2099) Sierra Nevada snowpack measured in "Snow Water Content in inches"[10] on April 1 based on two warming scenarios or ranges. The effect of different estimates of the sensitivity of the climate system to emissions is generally understood by comparing the temperature projections from different global climate models.[11] As outlined by the California Climate Change Center (2015), the models each contain unique variables and projections that result in different levels of climate sensitivity. In total, there are three climate scenarios or ranges – lower emissions scenario, medium-high emissions scenario, and higher emissions scenario. The lower and higher emissions scenarios characterize a world with similar population growth, but the lower emission scenario anticipates rapid changes in clean technologies and a shift toward a service and information economy (Cayan et al. 2005).

Without the natural storage provided by a deep snowpack, less water will be available through California's dry summer months. This can limit the availability of water traditionally produced from local snowpack. As snow melts sooner and faster, less water can be captured and stored in reservoirs like Oroville, which could reduce the potential to generate hydropower used to power Metropolitan's pumps along the SWP. Further, as outlined in Metropolitan's 2015 Urban Water Management Plan (UWMP) (June 2016),[12] the amount of contractual supplies that the DWR approves for delivery varies annually with contractor demands and projected water supplies from tributary sources to the Delta based on snowpack in the Sierra Nevada Mountains, reservoir storage, operational constraints, and demands of other water users. As such, reduced quality and supply of water from the Sierra Nevada and Rocky Mountains snowpacks may further result in decreased accessibility to water in the Metropolitan service area.

Sea Level Rise and Coastal Displacement

Along with temperature increases and shifting weather patterns associated with climate change, sea level is expected to rise an additional one to nine feet by the end of the century depending on the magnitude of global emissions[13] modeled (Figure 2-7).[14] While sea level rise is most often talked about as a threat to coastal communities and infrastructure, a rising sea will also push more salt water into the Sacramento-San Joaquin Delta, which supplies water to the SWP. To keep saltwater out of critical water supplies, more fresh water will need to be flushed through the Delta, decreasing the amount available for Californians.[15]

13. *Emissions scenarios refer to a set of six global sea level rise scenarios that reflect different assumptions about the degree to which ocean warming and ice sheet loss will affect the rate and magnitude of global sea level rise that were developed by oceanographers and climatologists. Source: U.S. Climate Resilience Toolkit. September 19, 2019. Sea Level Rise.* ***https://toolkit.climate.gov/topics/coastal/sea level-rise***
14. ***http://www.opc.ca.gov/webmaster/ftp/pdf/docs/rising-seas-in-california-an-update-on-sea level-rise-science.pdf***
15. ***https://water.ca.gov/Programs/All-Programs/Climate-Change-Program/Climate-Change-and-Water***

As demonstrated in Figure 2-7, sea level rise of one meter (3.3 feet) would push salt water farther into the Sacramento-San Joaquin Delta. As sea levels rise, and salt water intrusion takes place, additional water would be required to be pumped through the Delta to ensure salt does not reach potable water supplies. This means less water available for SWP allocations. The Delta system relies on levees that are vulnerable to earthquakes, floods, and rising sea levels. When these levees fail, water rushes into the lower-than-sea-level islands behind them, pulling in salt water from the bay and diminishing water quality before it can be delivered to Southern California, the Bay Area, and Central Valley farmland. However, the proposed Delta Conveyance Facilities could potentially provide salinity protection of water supplies without additional Delta outflow.[16]

Increased Risk of Large Wildfires

Wildfires in the grasslands and chaparral ecosystems of Southern California are estimated to increase by approximately 30 percent toward the end of the twenty-first century because increases in winter rain will stimulate the growth of more vegetation that will act as fuel in the summer and autumn months. Metropolitan infrastructure within vegetated areas could be impacted by the increased number of fires and hinder potential carbon sequestration projects. For example, the area around Diamond Valley Lake is projected to see an increase in annual acreage burned throughout the rest of the century, potentially impacting infrastructure and water quality (Figure 2-8).[17]

In order to better understand the potential impacts of climate change, scientists use several "scenarios" to help put bounds on the uncertainty associated with modeling complex systems. These scenarios show what California would look like under different climate conditions based on the level of emissions reductions moving forward and the impact of those emissions on precipitation and temperature. The lines in Figure 2-8 show the change between historical and projected burn area for the DVL area under four global emissions scenarios including: warm/drier, cooler/wetter, average, and complement, which is the scenario that is most unlike the other three models and is chosen to give better coverage of the full spread of 10 California GCM model results.[18]

Under each of the scenarios shown, the burned area is projected to increase. This may seem counterintuitive because it may be anticipated that the cooler/wetter scenario may show a significant difference between the warm/drier scenario. However, the timing of rainfall during the year determines growth patterns which, when followed by the higher anticipated temperatures in the warm summer months, could exacerbate fire risk. Likewise, there may also be an impact from larger wildfires on upper watershed areas for the SWP and CRA. For example, during active wildfires, there is a risk of increased contaminants, such as ash, in water, and vegetation that holds soil in place and retains water may be destroyed. In the rainstorms following wildfires, ash, sediment, nutrients, and other contaminants may also be transported into the waterways.[19]

Increased Temperatures and Extreme Heat Events

California is expected to see an average annual temperature increase of 2.5°F by 2030 and 2.7°F by 2050,[20] with inland areas expected to see the most extreme changes.[21] Evidence of increasing annual temperatures has already been documented, as shown in Figure 2-9.[22] Furthermore, according to current climate prediction models, California's average annual temperature increases could range from approximately 3.5°F to 11°F by the end of the century, relative to the annual average temperature for the 1961–1990 time period. In addition, the number of extreme heat days, defined as days with temperatures above the 98th percentile of computed maximum temperature by 2050, in Southern California are expected to increase from approximately four annually on average up to approximately 53 in 2050 and up to approximately 99 in 2100.[23]

FIGURE 2-9: Average Minimum Temperature for July in California 1890 to 2020

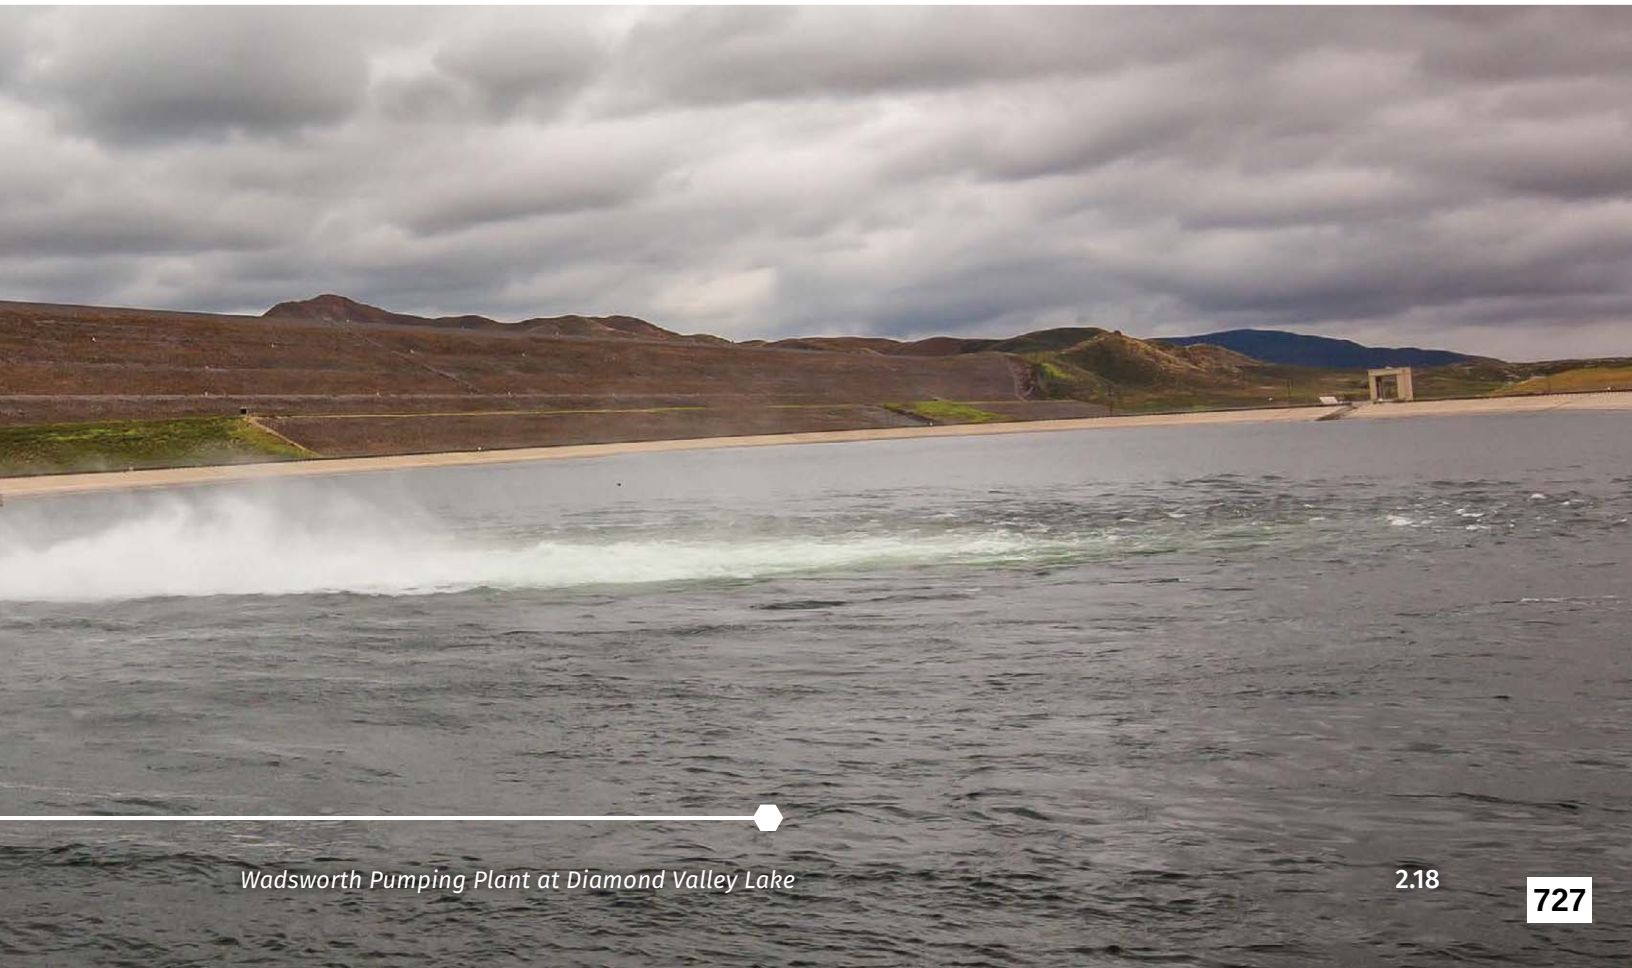
Exacerbation of Air Quality Problems

If temperatures rise to the medium warming range,[24] there could be 75 to 85 percent more days with weather conducive to O_3 formation, relative to current conditions. This is more than twice the increase expected if rising temperatures remain in the lower warming range. This increase in air quality problems could result in an increase in asthma and other health-related problems. Increased wildfire events also create poor air quality that impacts human health. For example, researchers at Harvard University linked short-term exposure to $PM_{2.5}$ pollution from events such as wildfires to hospitalizations among older adults for septicemia, fluid and electrolyte disorders, renal failure, urinary tract infections, and skin and tissue disorders. Additionally, there are clear links between $PM_{2.5}$ pollution and cognitive disease, such as dementia.[25]

24. *A medium warming scenario reflects a projected temperature rise between 5.5 and 8°F.*

25. ***https://www.sierraclub.org/sierra/particle-pollution-wildfires-big-problem-for-california***

For Metropolitan, climate change will bring many challenges. Increases in the frequency, duration, and severity of drought and rising temperatures are but a few of the resulting impacts that threaten the reliability of Metropolitan's regional water supply. Metropolitan has long made ensuring a reliable supply of water a planning priority and will need to anticipate and adapt to changing climactic conditions to continue to do so. The 2020 Integrated Water Resources Plan uses scenario analysis to look at a range of futures affected by varying impacts of climate change. The measures identified in this CAP complement Metropolitan's efforts to prepare for these future changes.



Wadsworth Pumping Plant at Diamond Valley Lake

SECTION 3.0
GHG EMISSIONS INVENTORY AND FORECAST

Metropolitan prepared a GHG emissions inventory for activities under its control for each year from 2005–2017 to provide an understanding of emissions over time. The inventory was prepared in accordance with standard accounting protocols from TCR[1] and the International Council for Local Environmental Initiatives (ICLEI).[2] This section defines the boundary of Metropolitan operations, reflects the GHG emissions inventory and sources within that boundary, and provides a summary of the methods and data sources used to inventory Metropolitan's GHG emissions. A full description of the data, methodology, and emissions factors for each inventory year are included in Appendix A. Metropolitan's inventory includes its operational GHG emissions for the baseline year of 1990, as well as each year from 2005 through 2017. Historical GHG emissions were calculated using consistent methodologies to allow accurate comparison between years.

Whitsett Intake Pumping Plant

3.1 METROPOLITAN OPERATIONAL BOUNDARY AND EMISSIONS SOURCES

GHG reporting protocols generally require a clear delineation of an organization's operational boundaries to account for sources of GHG emissions in an inventory. The organizational boundary includes all facilities, equipment, and operations over which the reporting entity (i.e., Metropolitan) has management control. Management control can be defined in either financial or operational terms, but the chosen definition of control must be applied consistently across the organization.

Metropolitan's primary operational infrastructure includes five CRA pumping stations and two smaller pumping stations, 15 hydroelectric facilities, multiple pressure control systems, nine reservoirs, and five water treatment plants. Emissions from supporting infrastructure are also included, such as those from the Union Station Headquarters and various control facilities, fleet vehicles, aircraft owned and operated by Metropolitan, stationary equipment like generators, and waste generation and water use associated with these facilities. In addition, Metropolitan includes employee commutes within its operational boundary. Although Metropolitan does not have complete control over this specific emission source, it can provide programs and infrastructure to influence employee behaviors. Finally, Metropolitan's operational boundary includes construction-related emissions associated with maintenance of existing facilities and new construction undertaken by contractors of Metropolitan. While these emissions are not directly under Metropolitan's control, Metropolitan can make decisions to decrease these emissions over time; therefore, these emissions sources have been included in the overall emissions inventory.

METROPOLITAN'S PRIMARY OPERATIONAL INFRASTRUCTURE:
five CRA pumping stations and two smaller pumping stations, 15 hydroelectric facilities, multiple pressure control systems, nine reservoirs, and five water treatment plants.

GHG EMISSIONS SCOPES

As mentioned above, the ICLEI and TCR reporting protocols were used to analyze the emissions generated by Metropolitan. Both ICLEI and TCR's protocols provide authoritative guidance to account for GHG emissions accurately and consistently.[3,4] Specifically, ICLEI's protocols, including the Local Government Operations Protocol, serve as the national standards for local-scale accounting of emissions that contribute to climate change. These were developed through robust stakeholder consultation and partnerships with leading GHG emission experts. This inventory protocol provides detailed guidance on accounting for emissions from the buildings, facilities, and vehicles operated by a local government or agency, such as Metropolitan. TCR's program aligns with international standards and provides a nexus between business, government, and non-governmental organizations to share policy information and exchange best practices.[5] The protocol used in this analysis was established for TCR's voluntary emission reporting program, which is called the Carbon Footprint Registry. Per the ICLEI and TCR reporting protocols, the data is organized into three source categories, or scopes, related to the level of operational control the organization or reporting entity has over the emission source. It is important to recognize that Metropolitan is a water distributor, and although the ICLEI and TCR protocols were used to analyze the data, only applicable emission sources were included in this inventory.

Gene Pumping Plant

SCOPE 1: DIRECT EMISSIONS

Scope 1 emissions consist of direct GHG emissions associated with fuel use, such as emissions from gasoline and diesel consumption by Metropolitan's vehicle fleet, propane and natural gas use at its facilities, and unintended fugitive emissions.[6]

SCOPE 2: INDIRECT EMISSIONS FROM ELECTRICITY

Scope 2 emissions consist of indirect GHG emissions associated with the purchase and consumption of electricity used primarily for the transmission, treatment, and distribution of water. Scope 2 also includes electricity transmission and distribution (T&D) losses. T&D losses arise from three primary causes: short- and long-distance transmission losses from the electricity generation station to the step-down transformer substation, distribution losses between the step-down substation and the end user, and transformer losses.[7]

SCOPE 3: OTHER INDIRECT EMISSIONS

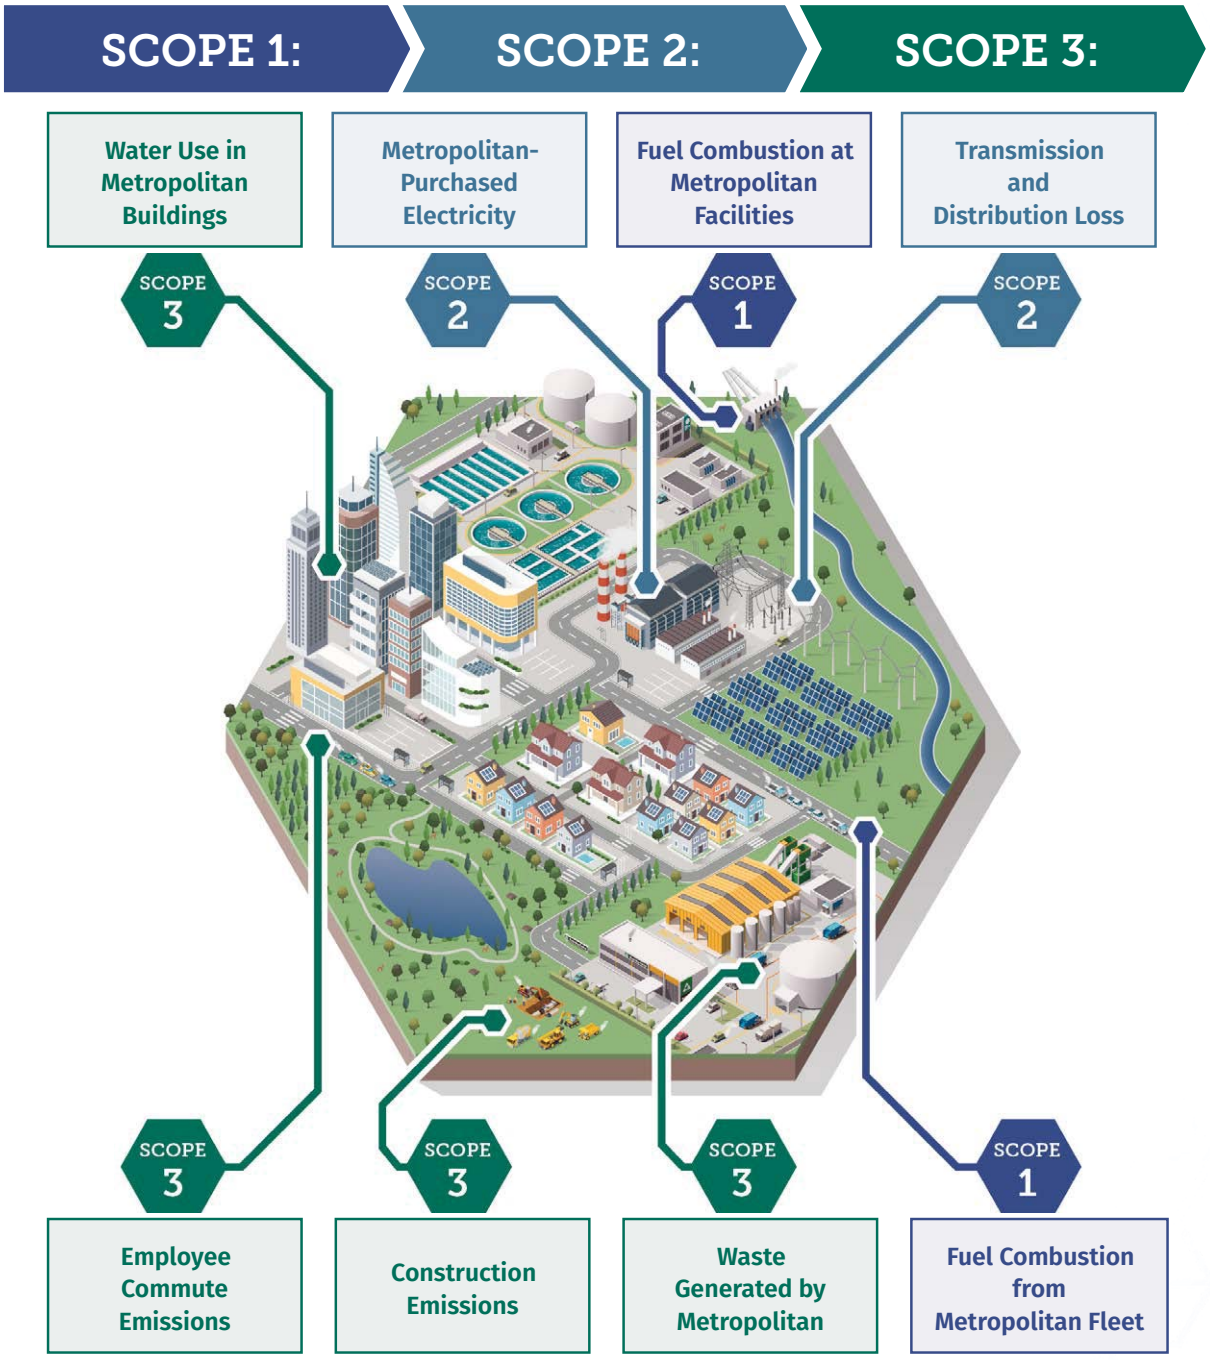
Scope 3 emissions consist of other indirect GHG emissions not captured in Scopes 1 or 2, such as those associated with employee commutes, waste generation, water consumption occurring at Metropolitan facilities, and emissions associated with construction projects.

6. *Fugitive emissions are emissions of gases or vapors from industrial equipment due to leaks or other unintended releases.*

7. ***https://web.stanford.edu/group/efmh/jacobson/Articles/I/TransmisDistrib.pdf***

Section 3.2 provides greater details and examples of each scope. Figure 3-1 illustrates the three types of emissions scopes and the Metropolitan-specific emissions that fall within each scope.

FIGURE 3-1: GHG Emissions by Scope



3.0

Copper Basin Reservoir

3.2 HISTORICAL METROPOLITAN GHG EMISSIONS

Metropolitan has reported its Scope 1 and Scope 2 GHG emissions data to TCR since 2005. In addition, Metropolitan conducted an analysis of Scope 3 emissions for the years 2008 and 2017. These years were chosen as the most recent (2017) and oldest (2008) years for which complete data were available.[8] Unlike Scope 2 electricity use, which changes as a result of pumping, Scope 3 emissions remain relatively constant from year to year. Therefore, the average of the 2008 and 2017 Scope 3 emissions were applied to all inventory years. Metropolitan also calculated a baseline GHG emissions inventory using data records from 1990, to be consistent with the State's long-term emission reduction goals. For a complete description of GHG calculation methodologies and data sources, please refer to Appendix A.

1990 GHG EMISSIONS BASELINE YEAR

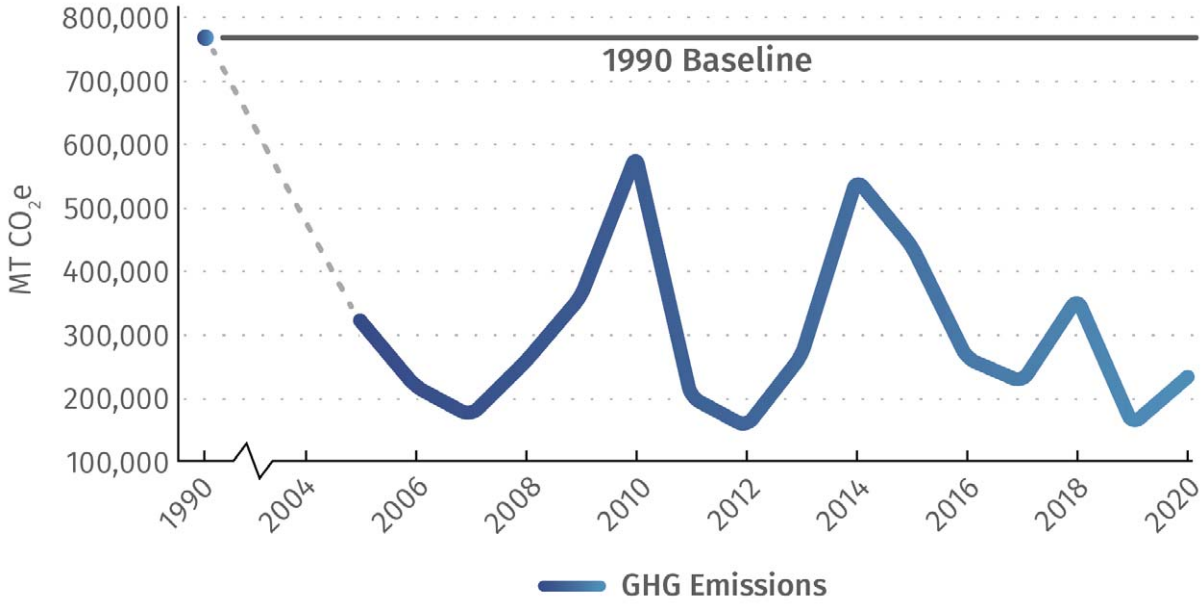
As described in Section 4.0, Regulatory Context and GHG Reduction Targets, AB 32 and SB 32 established the 1990 statewide emissions level as the baseline against which GHG emissions reduction targets are measured. Although Metropolitan did not begin reporting annual GHG emissions until 2005, historical operational data records, including electricity and fuel consumption exist. Using this data, Metropolitan was able to calculate a 1990 emissions inventory that is consistent with California's established baseline date. The 1990 emissions estimate of 771,000 MT CO_2e provides an accurate representation of Metropolitan's operational emissions in 1990 from which future reduction targets can be established.

8. *Complete data refers to Scope 3 data including waste, water, and employee commute which are collected via invoices. Scope 1 and 2 data was available for all inventory years.*

ANNUAL GHG EMISSIONS: 1990 THROUGH 2017

Based on a review of the available data (2005–2017), Metropolitan's annual GHG emissions are highly variable, ranging from a high of 583,000 MT CO_2e[9] in 2010 to a low of 156,000 MT CO_2e in 2012. These fluctuations tie directly to the volume of water pumped from the CRA. Transporting water from the CRA is energy-intensive as a lot of energy is needed to move it long distances. This results in increased GHG emissions. Annual GHG emissions have declined since 1990, even with the periodic energy use spikes related to increased pumping from the CRA in 2010 and 2013. The GHG emission trend has generally decreased from approximately 771,000 MT CO_2e in 1990 to approximately 234,000 MT CO_2e in 2020, a decrease of approximately 70 percent over this time period, although intervening years have been highly variable. Much of the decrease in emissions from 1990 is attributable, in part, to the removal of carbon from electricity required by California's Renewable Portfolio Standard and the Cap-and-Trade Program.[10] In addition, water conservation efforts by Metropolitan and the community have helped keep emissions low even as population increased. Figure 3-2 shows Metropolitan's annual emissions from 1990 through 2020.

FIGURE 3-2: Metropolitan GHG Emissions Over Time



9. *According to the United States Environmental Protection Agency (USEPA), "the unit "CO_2e" represents an amount of a GHG whose atmospheric impact has been standardized to that of one-unit mass of carbon dioxide (CO_2), based on the global warming potential (GWP) of the gas." USEPA. October 2014. Pollution Prevention Greenhouse Gas (GHG) Calculator Guidance.* ***https://www.epa.gov/sites/production/files/2014-12/documents/GHGcalculatorhelp.pdf***

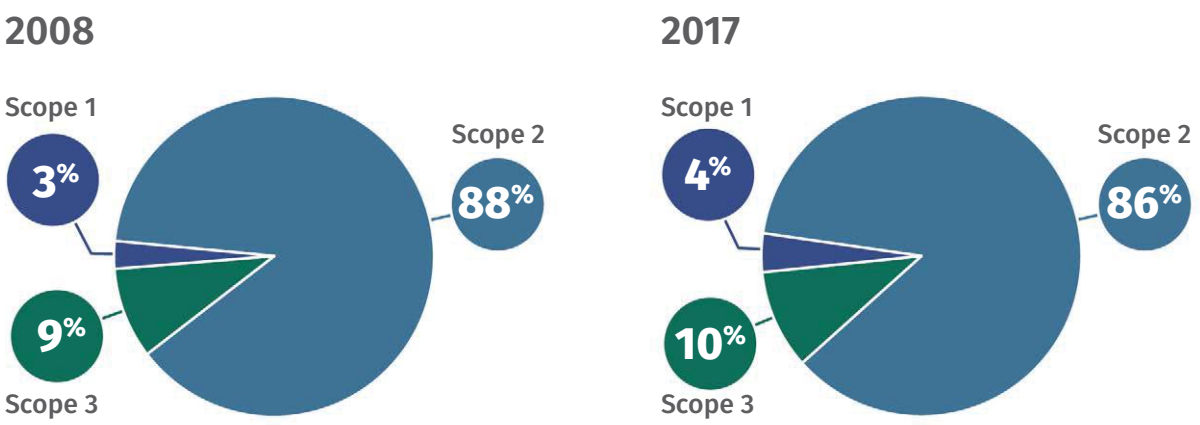
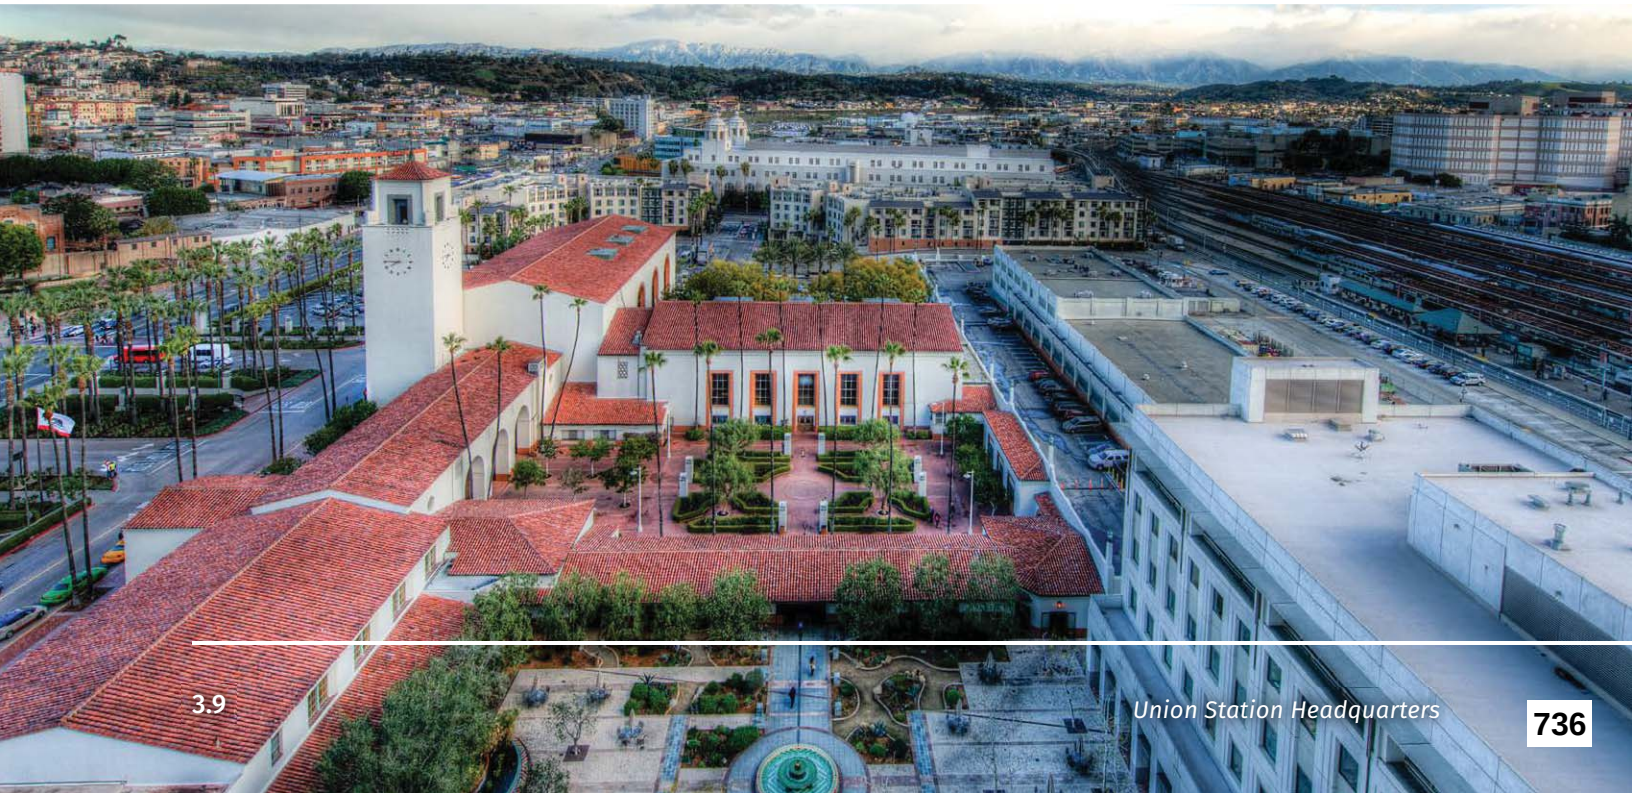
GHG EMISSIONS BY SCOPE: 2008 AND 2017

Metropolitan's organization-wide GHG emissions in 2008 and 2017 were estimated at 258,419 MT CO_2e and 226,036 MT CO_2e, respectively. Figure 3-3 details the breakdown of Metropolitan's GHG emissions in both years by scope. The figures clearly show that emissions associated with electricity dominate Metropolitan's GHG emissions (Scope 2). In comparison, Scope 1 and Scope 3 sources contribute a small percentage overall each year.

FIGURE 3-3: Metropolitan GHG Emissions by Scope





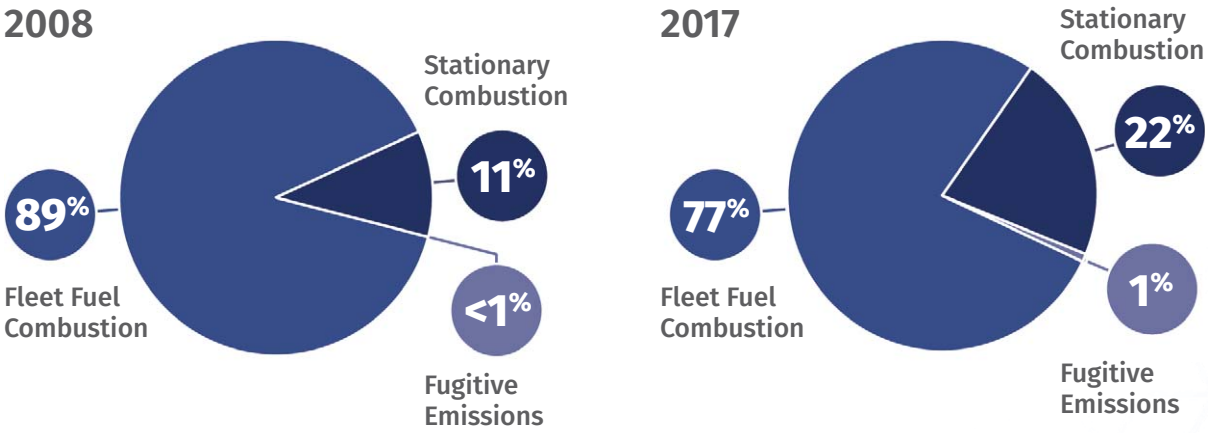
Colorado River Aqueduct shutdown

SCOPE 1:

Metropolitan Scope 1 Emissions

Metropolitan's Scope 1 GHG emissions comprise approximately three percent of total emissions in 2008 and four percent of total emissions in 2017. Figure 3-4 details the breakdown of Metropolitan's Scope 1 GHG emissions in both years by source. The largest source of Scope 1 GHG emissions is mobile combustion of fuel by Metropolitan's vehicle fleet, accounting for approximately 89 percent of total Scope 1 emissions in 2008. This decreased to 77 percent in 2017, largely due to increased vehicle efficiency. Stationary combustion of fuel in Metropolitan buildings is the second largest source of Scope 1 emissions, which accounted for approximately 11 percent of total Scope 1 emissions in 2008. Fugitive emissions make up a small percentage of Scope 1 emissions and include sulfur hexafluoride emissions leakage from electrical equipment, hydrofluorocarbon emissions from refrigerants, and fugitive emissions from use of welding gas.

FIGURE 3-4: Scope 1 Emissions by Source



SCOPE 2:

Metropolitan Scope 2 Emissions

The majority of Metropolitan's GHG emissions are Scope 2, with 88 percent and 86 percent of total emissions coming from Scope 2 emissions in 2008 and 2017, respectively. The small decrease in Scope 2 emissions is attributed to pumping variability on the CRA, availability of water from other sources (SWP), and variable rainfall and pumping requirements as well as decreased emission factors for electricity that are attributable to the increased use of carbon-free electricity. Direct electricity consumption makes up 99 percent of Scope 2 emissions, and T&D losses consistently comprise the remainder. Figure 3-5 details the breakdown of Metropolitan's Scope 2 GHG emissions in both years by source. Pumping associated with the conveyance and distribution of water from the CRA is the primary driver of Metropolitan's electricity demand and overall GHG emissions, representing 75 percent of total emissions in 2008 and 78 percent in 2017. Availability of hydropower from Hoover Dam and Parker Dam also contributes to GHG emissions variability. Because these dams generally produce carbon neutral electricity, the more electricity they generate, the less carbon intensive electricity Metropolitan is required to source from the utilities and wholesale electricity market.

FIGURE 3-5: Scope 2 Emissions by Source

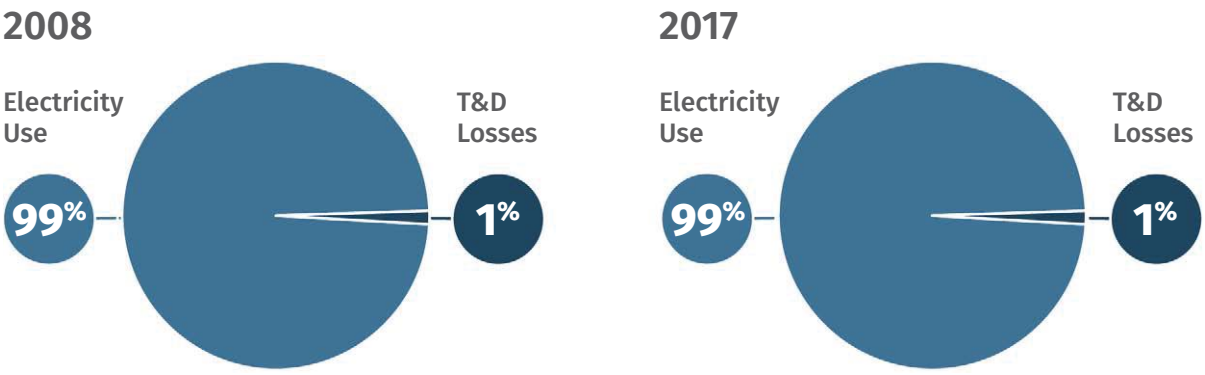


Table 3-1 depicts how much electricity is used throughout Metropolitans various operations. A majority of electricity consumption is due to pumping on the CRA using wholesale power. Other electricity consumption is due to water treatment, reservoir operations, transmission losses, and other facilities including Metropolitan's offices.

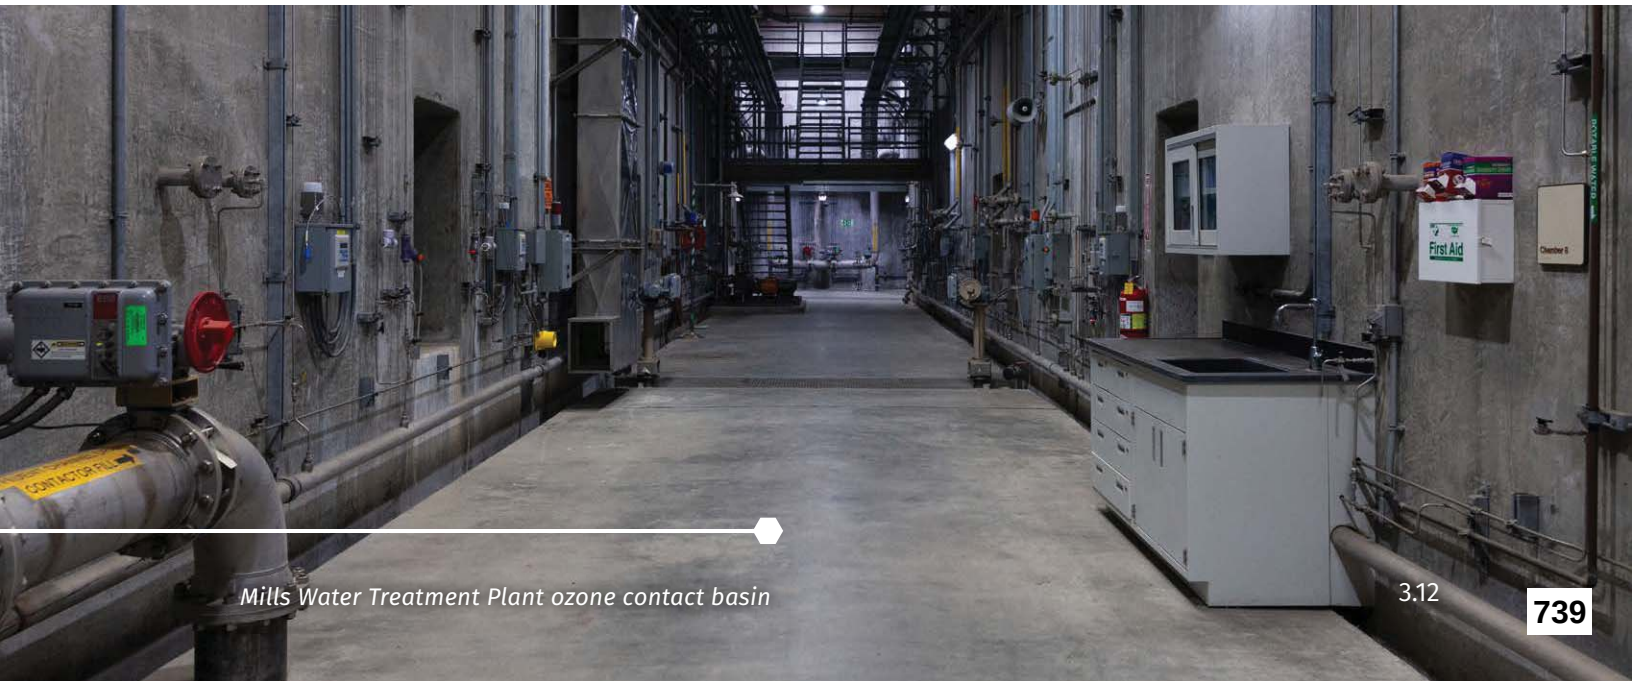
TABLE 3-1: Scope 2 Electricity Consumption by End Use (kWh)

Consumption Source	2008	2017
Treatment Plants	42,907,728	48,788,848
Pumping Plants - Wholesale Power	1,762,803,183	1,313,240,090
Pumping Plants - Retail Power	11,420,786	4,875,221
Reservoirs	2,597,860	2,538,876
Power Plants & PCS	2,385,665	2,124,924
Other Facilities	10,203,709	8,073,807
MISC Energy Usage	3,261,236	1,960,488
T&D Losses	26,593,474	14,687,361



Mills Water Treatment Plant ozone contact basin

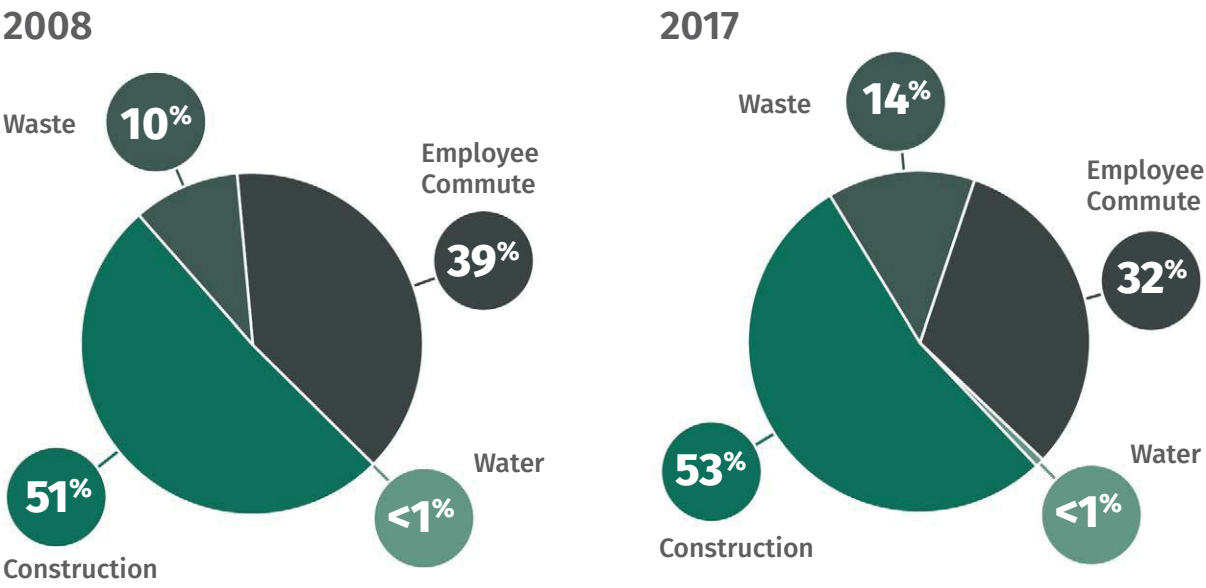
3.0

SCOPE 3:

Metropolitan Scope 3 Emissions

Metropolitan's Scope 3 GHG emissions comprised approximately nine percent of annual emissions in 2008 and 10 percent of annual emissions in 2017. As detailed in Figure 3-6, construction activities represent the largest percentage of Scope 3 emissions, contributing 51 percent in 2008 and 53 percent in 2017. Employee commutes generated 39 percent of inventoried Scope 3 emissions in 2008 but decreased to 32 percent by 2017. Solid waste-associated emissions contributed 9 percent of Scope 3 emissions in 2008 and 14 percent in 2017. In both years, water-related emissions contributed about one percent.

FIGURE 3-6: Scope 3 Emissions by Source



GHG EMISSIONS INVENTORY SUMMARY

Table 3-2 provides a summary of Metropolitan's GHG emissions by sector for both the 2008 and 2017 calendar years. Additional information and details on methodologies and other calendar years can be found in Appendix B.

TABLE 3-2: GHG Emissions Inventory Summary (MT CO_2e)

Scope	Emissions	2008	2017
Scope 1	Mobile Emissions	7,180	6,886
	Stationary Emissions	893	1,918
	SF_6/HFC Emissions	N/A	71
Scope 2	Treatment Plants	18,167	11,727
	Pumping Plants–Wholesale Power	193,731	176,080
	T&D Losses	2,546	1,969
	Pumping Plants–Retail Power	3,595	1,172
	Power Plants & PCS	780	511
	Reservoirs	818	610

Sacramento-San Joaquin Delta

3.3 METROPOLITAN GHG EMISSIONS FORECAST

The annual GHG emissions inventories presented in this CAP provide accurate reference points for GHG emissions in past years. To estimate the level of GHG emissions reductions necessary for Metropolitan to achieve its GHG reduction target and be consistent with the requirements for a qualified GHG emissions reduction plan, an emissions forecast must be prepared.[11] Forecasts of future scope 1, 2, and 3 emissions are based on Metropolitan's projected energy demand and energy sources, the anticipated impact of future Metropolitan projects, the anticipated impact of existing energy efficiency and GHG reduction programs, and regional population growth assumptions.

GHG emissions associated with Metropolitan's operations are tied closely to the location where water is sourced. Metropolitan imports water to the Southern California region from two sources: the Colorado River through the CRA and via the California Aqueduct through the SWP. Water from the CRA requires substantially more electricity usage, as it requires additional pumping across an extended distance from the Colorado River before it enters Metropolitan's distribution system. In contrast, water from the SWP does not require substantial, additional pumping due to the use of gravity to transport the water once it enters Metropolitan's operational control.[12] To account for this variability in electricity use and, therefore, GHG emissions, three forecast scenarios were modeled.

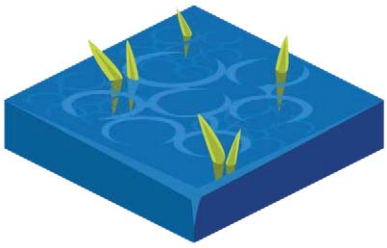
Figure 3-7 provides a description of the three modeled GHG emissions scenarios used to forecast Metropolitan's GHG emissions in 2030 and 2045. To calculate the three GHG emissions scenarios (high, average, and low), the expected water demand forecasts from the 2020 UWMP were combined with Metropolitan-specific per acre-foot emissions factors.

11. ***https://govt.westlaw.com/calregs/Document/I872A68805F7511DFBF66AC2936A1B85A?viewType=FullText&originationContext=documenttoc&transitionType=CategoryPageItem&contextData=%28sc.Default%29***

12. *However, water from the SWP does have associated emissions not captured by Metropolitan. These emissions are detailed in the DWR CAP found here:* ***https://water.ca.gov/Programs/All-Programs/Climate-Change-Program/Climate-Action-Plan***

FIGURE 3-7: Future GHG Emissions Scenarios

LOW EMISSIONS SCENARIO



The low GHG emissions scenario utilizes the assumed water delivery demands for the average rainfall year as defined in the Metropolitan 2015 UWMP. The GHG emissions factor for this scenario is derived by calculating the activity data per acre-foot of delivered water from calendar year 2012, which is the lowest emissions year between 2008 and 2017.[13]

AVERAGE EMISSIONS SCENARIO

The average GHG emissions scenario utilizes the assumed water delivery demands of a single dry year with below-average rainfall as defined in the Metropolitan 2015 UWMP. However, the single dry year forecast assumes a single dry year level of water availability each year through 2045. The average GHG emissions factor for this scenario is calculated by averaging the activity data per acre-foot delivered from 2008-2017.

HIGH EMISSIONS SCENARIO

The high GHG emissions scenario utilizes the assumed water delivery demands for consecutive dry years with below-average rainfall as defined in the Metropolitan 2015 UWMP. The GHG emissions factor for this scenario was derived by using the activity data associated with the year 2010, which is the highest emissions year between 2008 and 2017.

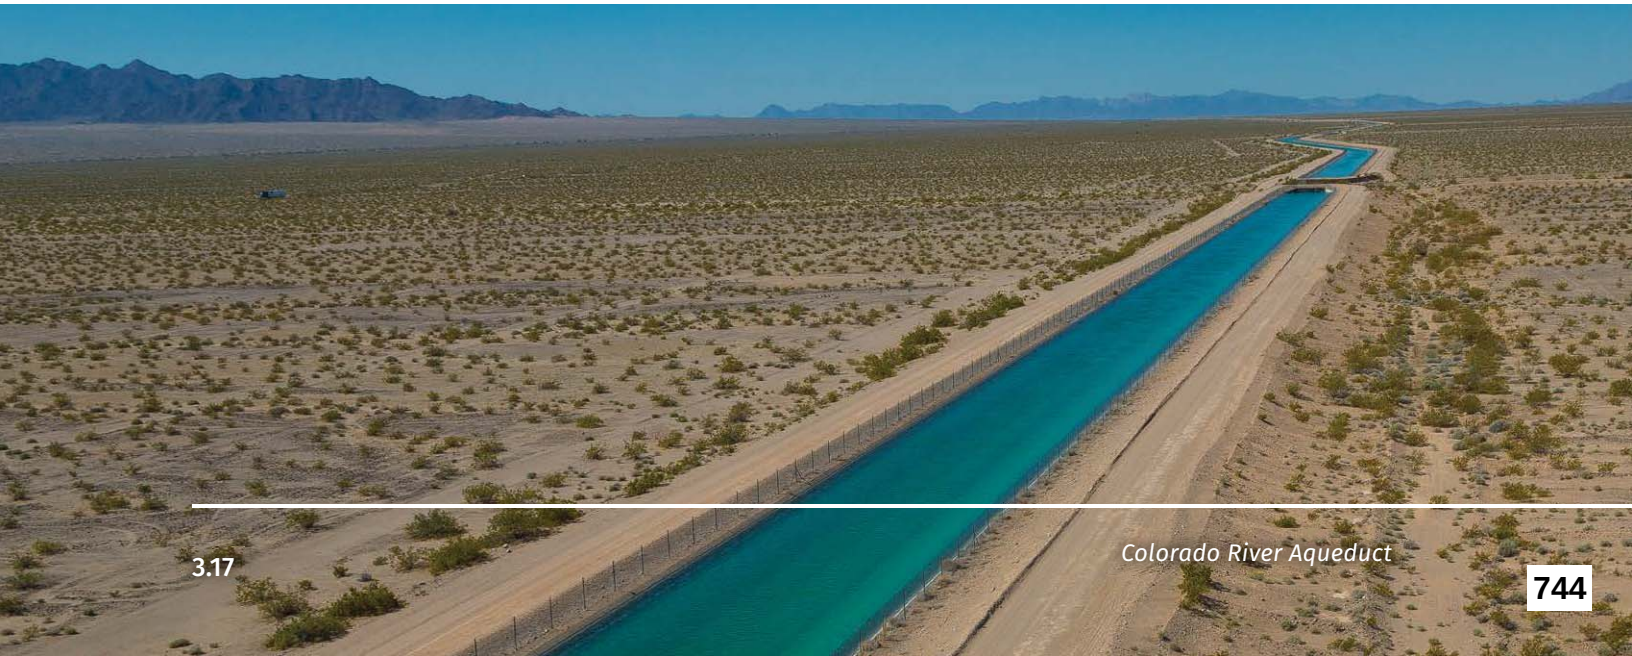
13. *This scenario provides the lowest emissions scenario for Metropolitan. Although this scenario considers multiple "average" rainfall years, due to the expected impacts of climate change (see Section 2.0), the Low Emission Scenario is considered a conservative estimate of the lower bound of future Metropolitan emissions.*

To calculate emissions factors used in forecasting, emissions in previous years (2005 through 2020) were divided by the total deliveries in each year. In years with high CRA pumping, emissions factors are much higher due to the increased electricity consumption required to pump CRA water to Metropolitan's service area. To ensure the most conservative estimates for each scenario were used to forecast the worst-case future emissions scenario, the highest resulting emissions factor (2010) was applied to the multiple dry year scenario for water deliveries from the 2020 UWMP. The average emissions scenario utilized the average emissions factor and the single dry year water delivery forecast from the 2020 UWMP. Finally, the low emissions scenario utilized the lowest emissions factor (2012) and applied the average year forecast from the 2020 UWMP. Table 3-3 provides a summary of the 2020 UWMP factors used in the GHG emissions forecasting.

TABLE 3-3: 2020 Urban Water Management Plan Factors

Inventory Year	Emissions (MT CO_2e)	Deliveries (Acre-feet)	Emissions Factor (MT CO_2e/ Acre-foot)	Scenario Applied
2010	582,952	1,642,000	0.355	High
Average of all years (2005-2020)	298,127	1,794,625	0.170	Average
2012	155,637	1,756,000	0.089	Low

**Numbers may not sum due to rounding.*



Colorado River Aqueduct

ADDITIONAL GHG EMISSIONS FORECAST CONSIDERATIONS

Regional Recycled Water Program Construction and Operation

In addition to forecasting the GHG emissions from existing Metropolitan operations under the high-, average-, and low-emissions scenarios, the planned construction and operational GHG emissions from the proposed Regional Recycled Water Program (RRWP) were also modeled and included in the forecast. The program-specific information was used to estimate the future emissions from the RRWP, including construction and operation of an Advanced Water Treatment Plant, approximately 40 miles of pipelines, three pumping stations, and groundwater injection sites. To approximate annual construction GHG emissions, total construction emissions were divided by an assumed five-year construction schedule from 2025 through 2030. Operational GHG emissions are assumed to begin in 2031. Additional information about the RRWP emissions calculations and assumptions can be found in Appendix B.

State GHG Emissions Reduction Regulations

California has enacted several regulations to reduce GHG emissions generated by energy consumption, water use, and transportation that will assist in reducing Metropolitan's emissions over time. SB 100 (2018) is the primary driver of emissions reductions in the forecast, and it accelerates the State's Renewables Portfolio Standard Program.[14] SB 100 requires electricity providers to increase procurement from eligible renewable energy resources to 33 percent of total retail sales by 2020, 60 percent by 2030, and 100 percent by 2045. Since Metropolitan also receives electricity from other states, the renewable portfolio standards of each state in the Western Electricity Coordinating Council was included in the forecast. California has several other regulations intended to reduce GHG emissions, examples of which include Title 24 and the Advanced Clean Cars Program. Each of these regulations was reviewed and found to have limited impact on Metropolitan operations as they are designed to primarily impact community-level emissions. Furthermore, leaving these expected reductions from State regulations out of the Metropolitan forecast provides a conservative estimate of future emissions.

14. *SB 100 and other regulations are covered in depth in Appendix A.*

3.0

GHG EMISSIONS FORECAST RESULTS

The GHG emissions forecast projects Metropolitan's future GHG emissions through 2045 under high-, average-, and low-emissions scenarios. Both a mass emissions and a per-capita scenario are included below. The mass emissions forecast shows the total GHG emissions generated by Metropolitan's operations. The mass emissions forecast also serves as the basis for the per-capita forecast, which normalizes for population growth within Metropolitan's service area by dividing mass GHG emissions by Metropolitan's service population. As shown in Figure 3-8 and Figure 3-9, both mass and per-capita GHG emissions are expected to decline in future years due to the implementation of SB 100. SB 100 requires all retail electricity be carbon-free by the year 2045. Table 3-4 and Table 3-5 provide a comparison of the projected mass GHG emissions and per-capita GHG emissions for each emissions scenario in 2030 and 2045 relative to the 1990 emissions baseline.

CARBON-FREE ELECTRICITY: Electricity produced by a resource that generates no carbon emissions, such as renewable energy, nuclear or large hydroelectric sources.

FIGURE 3-8: GHG Emissions Forecast and Potential Range of Emissions

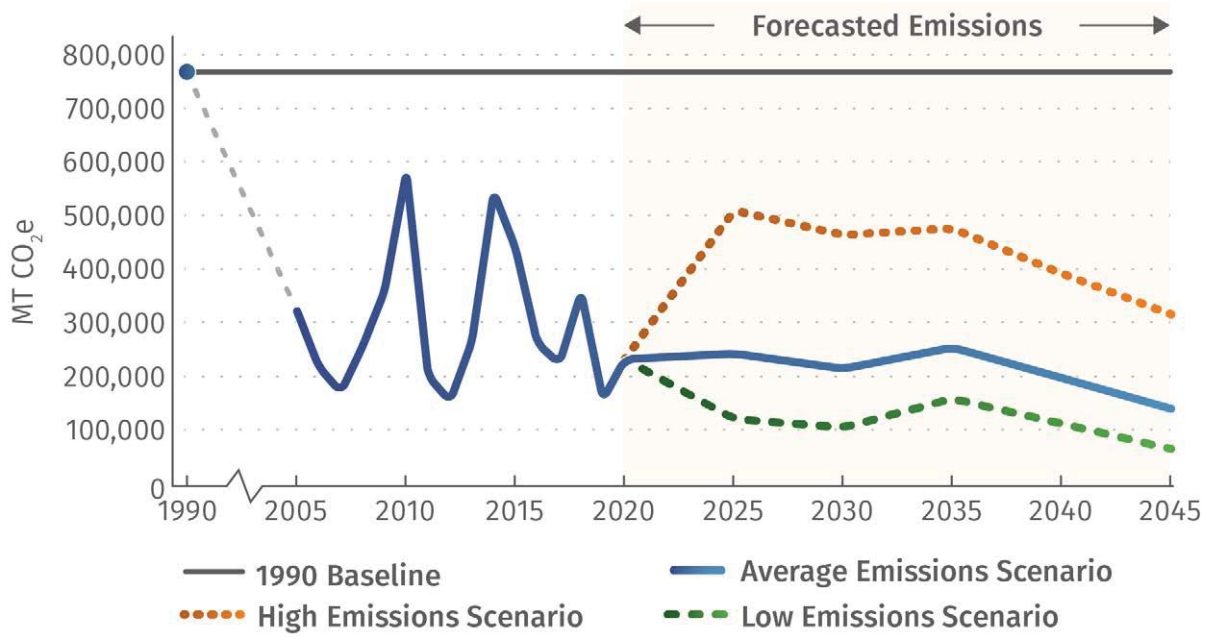

TABLE 3-4: Anticipated Changes to Mass GHG Emissions Between 1990 and 2045 (MT CO_2e)

Emissions Scenario	1990 Emissions (Baseline)	2030 Forecast Emissions	Percent Reduction	2045 Forecast	Percent Reduction
High	771,514	465,664	40%	317,441	59%
Average	771,514	216,460	72%	142,059	82%
Low	771,514	106,615	86%	66,812	91%

FIGURE 3-9: GHG Emissions Forecast and Potential Range (Per Capita)

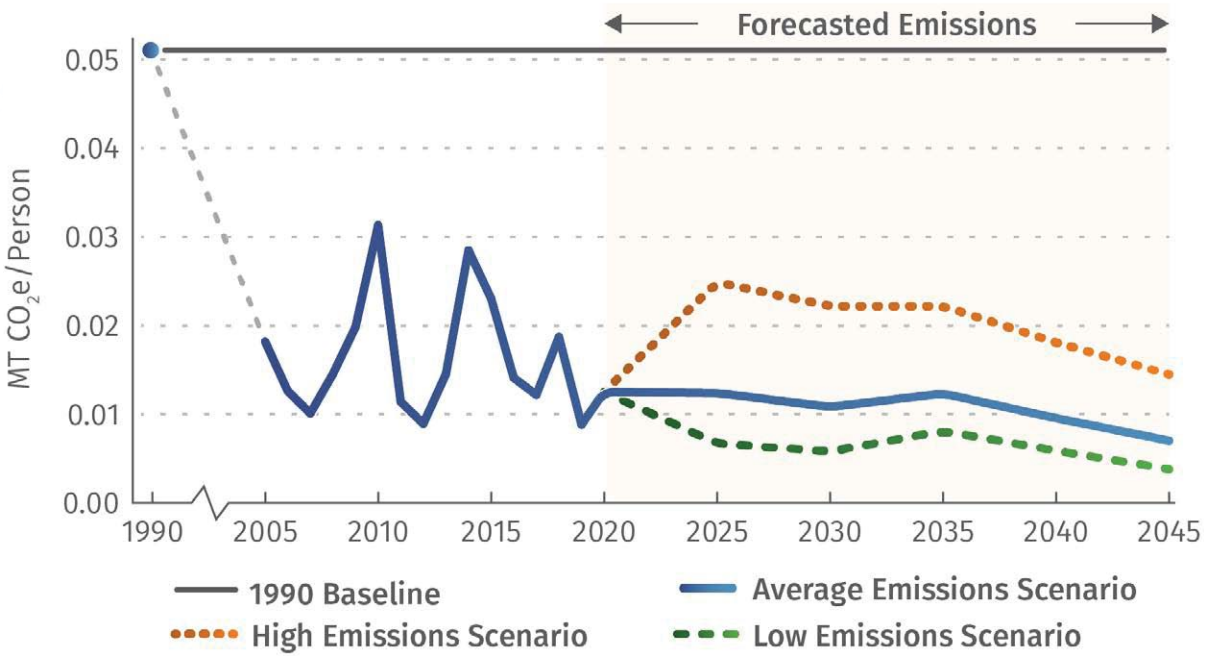

TABLE 3-5: Forecasted Per-Capita GHG Emissions Between 1990 and 2045 (MT CO_2e)

Emissions Scenario	1990 Emissions Baseline (MT/Person/Year)	2030 Forecast (MT/Person/Year)	Percent Reduction	2045 Forecast (MT/Person/Year)	Percent Reduction
High	0.0516	0.0226	56%	0.0144	72%
Average	0.0516	0.0105	80%	0.0064	87%
Low	0.0516	0.0052	90%	0.0030	94%

Population assumptions for the Metropolitan service area are as follows: 1990 population = 14,961,310; 2030 population = 20,634,000; 2045 population = 22,026,000. Population numbers are consistent with the 2020 UWMP and SCAG projections. More information on Metropolitan's per capita water use over time can be found in the 2020 UWMP.

Pursuant to guidance provided in the State's Global Warming Solutions Act of 2006 (AB 32) and the 2017 Scoping Plan, Metropolitan utilized the per capita emissions calculation to track progress and set targets for future GHG reductions (Section 4.0).[15] The per-capita GHG emissions forecast provides a metric detailing each person's GHG emissions generated from water use and can clearly illustrate the effect of water conservation on the basis of an individual's actions. For example, under the average GHG emissions scenario, mass emissions are expected to decrease by 72 percent by 2030 when compared to 1990 levels. However, using the per-capita approach, 2030 GHG emissions are 80 percent lower when compared to 1990 levels, capturing the decrease in water use of an average individual due to Metropolitan's substantial investments in water conservation efforts.

As shown in Table 3-5, Metropolitan's per-capita GHG emissions reductions are expected to range between 56 percent and 90 percent, relative to 1990 emissions by 2030, and between 72 and 94 percent, relative to 1990 emissions by 2045. Due to the variable nature of annual emission rates and the large projected range of future emissions, Metropolitan will use a carbon budget approach to measure progress towards meeting its GHG reduction goals. The carbon budget methodology is outlined in Section 4.0.

15. *See Appendix A for a full discussion of relevant legislation as well as the 2017 Scoping Plan.*

SECTION 4.0
REGULATORY CONTEXT AND GHG REDUCTION TARGETS

Metropolitan prepared this CAP to ensure that its operations and future projects are implemented in alignment with the State of California's SB 32, which builds on AB 32: The California Global Warming Solutions Act of 2006.[1] In support of AB 32, California established regulatory GHG emissions reduction mechanisms, such as the California Cap-and-Trade Program,[2] and thresholds on future GHG emissions levels. As part of this CAP, Metropolitan established GHG reduction targets consistent with the State's climate goals which would result in Metropolitan's "fair share" of emissions reductions in support of the overall statewide reductions.[3] Fair share emission reductions are determined by assessing whether an entity supports substantial progress toward the statewide reduction targets over time, not whether the entity is meeting a milestone target many years in the future. This section addresses applicable regulations related to GHG emissions and describes Metropolitan's approach to align with these GHG reduction targets and demonstrate progress over time.

1. *In 2016 statewide GHG emissions fell below 1990 levels, generally achieving the goals of AB 32.* ***https://ww2.arb.ca.gov/news/climate-pollutants-fall-below-1990-levels-first-time***
2. *An in-depth description of California's GHG reduction legislation can be found in Appendix A.*

4.1 INTERNATIONAL REGULATIONS

INTERNATIONAL REGULATIONS

As a global intergovernmental organization, the United Nations (UN) leads and coordinates climate change response at the global level. The United Nations Framework Convention on Climate Change (UNFCCC) and Paris Agreement are central to the UN's action on climate change. Additional UN policies and programs related to climate change are discussed in Appendix A.

The Paris Agreement

The Paris Agreement (Agreement) is the first international, legally binding, global climate agreement. The Agreement was adopted in 2015 and has been ratified by 189 countries worldwide.[4] The Agreement establishes a roadmap to keep the world under 2°C of warming by the end of the century with a goal of limiting an increase of global temperature to 1.5°C. The Agreement does not dictate one specific reduction target; instead, it relies on individual countries to set nationally determined contributions or reduction targets based on gross domestic product and other factors. According to the Intergovernmental Panel on Climate Change (IPPC), achieving a global warming limit of 1.5°C requires global emissions reductions of at least 49 percent below 2017 emissions[5] through 2030 and carbon neutrality by mid-century,[6] with carbon neutrality being defined as a balance between reducing carbon and GHG emissions emitted into the atmosphere and absorbing carbon from the atmosphere through carbon sequestration and other techniques.

Transmission towers near Colorado River Aqueduct

4.2 CALIFORNIA REGULATIONS AND GHG EMISSIONS TARGETS

CALIFORNIA REGULATIONS AND GHG EMISSIONS TARGETS

California is a leader in the development of GHG policy and the mitigation of GHG emissions. Legislation and policy related to climate change mitigation have been in place since 2002. Some of these regulations establish statewide reduction goals, while others establish specific mechanisms to achieve California's goals. California became the first state to establish levels for statewide GHG reduction with the passage of AB 32 in 2006. California has since enacted additional legislation, regulations, and EOs to promote robust GHG emissions reductions across many economic sectors[7]. Although these regulations drive climate policy in California, they do not include requirements for water agencies like Metropolitan. The following is a summary of the most relevant executive and legislative emissions reduction goals established at the state level. Additional relevant policies related to climate change and GHG emissions are discussed in Appendix A.

Executive Order S-3-05 (2005)

EO S-3-05 was signed in 2005, establishing statewide GHG emissions reduction targets for the years 2020 and 2050. The EO calls for the reduction of GHG emissions in California to 2000 levels by 2010, 1990 levels by 2020, and 80 percent below 1990 levels by 2050. The 2050 emissions reduction target would put the State's emissions in line with the worldwide reductions needed to reach long-term climate stabilization as concluded by the IPPC 2007 Fourth Assessment Report.

7. *Scoping Plan Sectors include; Industrial, Electricity, Agriculture, Commercial and Residential, High GWP, Recycling and Waste, and Transportation.*

Assembly Bill 32 (2006)

AB 32, the California Global Warming Solutions Act of 2006, is at the core of California policy related to GHG emissions reductions. By enacting AB 32, California became the first state to mandate GHG emissions reduction across all industries and economic sectors. The landmark legislation converted the 2020 GHG emissions reduction goal set by EO S-3-05 into statewide requirements, mandating the reduction of GHG emissions to 1990 levels by 2020. It also directed CARB to develop and implement a Scoping Plan and other regulations to ensure California would meet the 2020 goal.[8] The Scoping Plan includes the State's GHG inventory and 1990 baseline emission rate.[9]

Senate Bill 32 (2016)

SB 32 extends the provisions of AB 32 by requiring the State to reduce GHG emissions to 40 percent below 1990 levels by 2030 (the other provisions of AB 32 remain unchanged). In 2017, the CARB adopted the 2017 Scoping Plan, which provides a framework for achieving the 2030 goal. The 2017 Scoping Plan relies on the continuation and expansion of existing policies and regulations, such as the Cap-and-Trade Program, along with implementation of recently adopted policies, such as SB 350 (renewable electricity), which was signed in 2020, and SB 1383 (organic waste diversion), which was signed in 2016, both discussed in Appendix B.

Executive Order B-55-18 (2018)

EO B-55-18 establishes a statewide carbon neutrality goal for GHG emissions in all sectors by 2045. The EO states, "Achievement of carbon neutrality will require both significant reduction in carbon pollution and removal of carbon dioxide from the atmosphere, including sequestration in forests, soils, and other natural landscapes."[10] It further directs the CARB to update the Scoping Plan to reflect this goal.

8. *The SB32 scoping plan does not include specific goals or requirements for water agencies.*

Whitsett Intake Pumping Plant

4.3 METROPOLITAN'S GHG EMISSIONS REDUCTION TARGETS

The emissions inventory and forecast presented in Section 3.0 provide a basis for Metropolitan to establish targets for future GHG reductions. Metropolitan established a 2030 target for GHG emissions reduction to achieve consistency with SB 32 and a 2045 target consistent with EO B-55-18. By defining specific reduction targets, Metropolitan can track its progress towards meeting its goals and measure the success of its CAP. CEQA Guidelines Section 15183.5(b)(1) requires that plans establish a level, based on substantial evidence, below which the contribution to GHG emissions from activities covered by the plan would not be cumulatively considerable.[11] Metropolitan has chosen to adopt GHG emissions reduction targets that align with State goals as well as international consensus on the GHG reductions needed to avoid the most serious climate change impacts. Consistency with statewide GHG reduction goals has been established through case law as an appropriate methodology for establishing significance under CEQA.[12]

ESTABLISHING AND TRACKING GHG REDUCTION TARGETS

With the release of the 2017 Scoping Plan,[13] the CARB recognized the need to balance population growth with emissions reductions, and in doing so, provided a new methodology for proving consistency with State GHG reduction goals through the use of per capita efficiency targets. These targets are calculated by dividing a jurisdiction's GHG emissions for each horizon year by the jurisdiction's total population for that target year. Metropolitan will pursue a linear per capita GHG emission reduction pathway to exceed the State's target of 40 percent

11. *14 CCR § 15183.5*
12. *CENTER FOR BIOLOGICAL DIVERSITY v. The Newhall Land and Farming Company. Decided: November, 30 2015.*
13. ***https://ww2.arb.ca.gov/sites/default/files/classic//cc/scopingplan/scoping_plan_2017.pdf***

below 1990 levels by 2030 (0.0309 MT CO_2e per person) and make significant progress towards the ultimate goal of achieving carbon neutrality by 2045 (0.0 MT CO_2e per person). Measuring progress towards meeting the established target using a per capita emissions approach is achieved by using Metropolitan's 1990 GHG emissions and then dividing by the population of Metropolitan's service area in that year to calculate a baseline per capita emissions rate of 0.0516 MT CO_2e per person in 1990. Using Metropolitan's long-term goal of carbon neutrality, a per capita emissions rate of 0.0 MT CO_2e per person was established for the year 2045, and interim targets (between 1990 and 2045) were established by drawing a straight line between these two points. The straight line approach results in a per capita target that is 73 percent below 1990 levels by 2030, as shown in Table 4-1, which exceeds the State's 40 percent reduction goal.

While the GHG reduction targets have been determined using a per capita approach, Metropolitan will measure progress towards these goals by calculating its total operational GHG emissions in MT CO_2e. In order to better understand the total emissions allowable in each year, the per capita target in MT CO_2e per person is multiplied by the expected service area population in each year. This generates a total MT CO_2e value for that year as shown in Table 4-1 in the "Associated Mass Emissions" column.

TABLE 4-1: Comparison of Metropolitan and California GHG Reduction Targets

Target	Per Capita Emissions (MT CO_2e)	Associated Mass Emissions* (MT CO_2e)	Percent Reduction (Below 1990)
Metropolitan's 1990 Per Capita Emissions (AB32 Target)	0.0516	771,514	N/A
Minimum Per Capita Reduction Target for SB 32 Consistency	0.0309	638,423	40%
Metropolitan's Per Capita 2030 GHG Emissions Target	0.0141	290,192	73%
Metropolitan's 2045 Per Capita Goal	0	0	100%
California's EO B-55-18 Per Capita Goal	0	0	100%

+Pending final population numbers
**Associated Mass Emissions are calculated by multiplying the per capita emissions target by the projected population in that year. Final mass emission values will be updated based on actual population data.*

FIGURE 4-1: Metropolitan's Per Capita GHG Emissions Targets (MT CO_2e per Person)

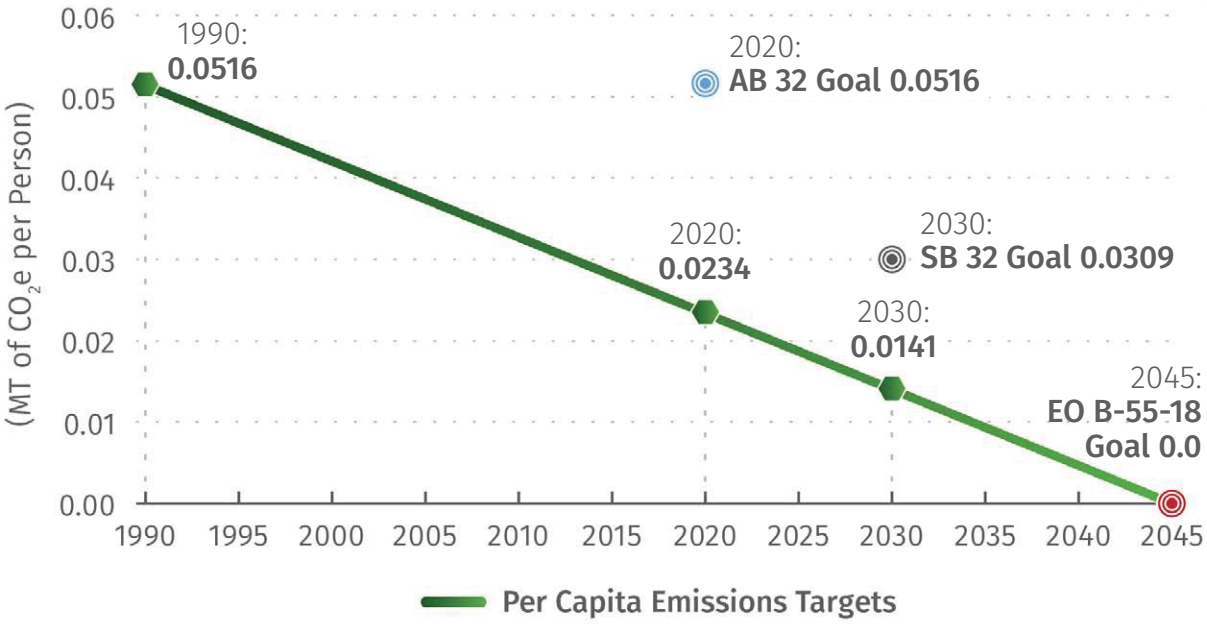

Figure 4-1 describes the complete per capita reduction pathway. The figure shows Metropolitan will meet or exceed the per capita emissions target for all three California goals described by AB 32, SB 32, and EO B-55-18. The use of per capita reduction targets to show progress towards GHG reduction goals was established and promoted by the State in the 2017 Scoping Plan Update.[14] Figure 4-2 illustrates the per capita reduction pathway translated into mass emissions. Per capita emissions are translated to mass emissions by multiplying by the population in each year. As shown in Figure 4-2, Metropolitan's target pathway exceeds the State's emissions reduction goals in 2020 and 2030 before ultimately reaching carbon neutrality in line with the State's long-term goal in 2045. The current population values are projected and will need to be updated over time as actual population numbers are established. This will change the allowable emissions (MT CO_2e) in each year by effectively including a variable that considers the actual service population in determining the emission reductions. Normalizing the emissions by dividing the total emissions by population removes population growth as a variable and allows Metropolitan to focus on deep decarbonization over time. Furthermore, achieving the 2045 target of carbon neutrality may be an iterative process and require revisions between now and 2045, with changes to State policy or new statewide GHG emissions targets established by the California legislature.

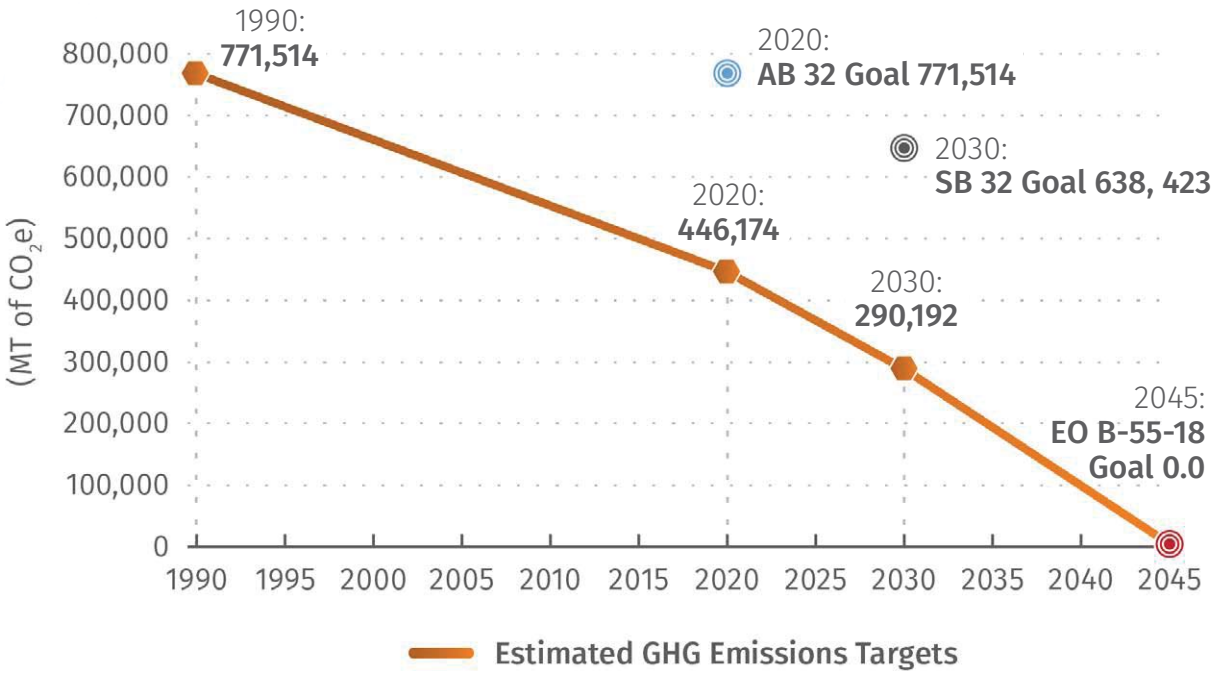
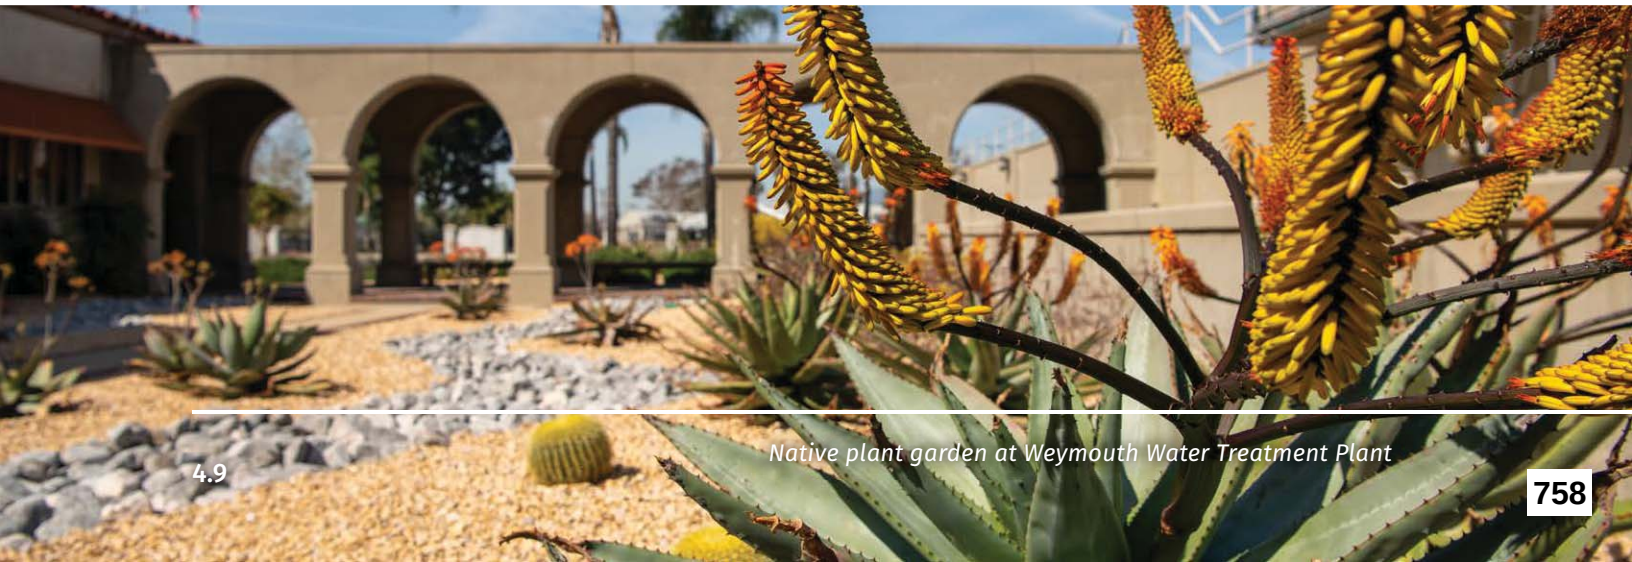
FIGURE 4-2: Metropolitan's Per Capita GHG Emissions Targets Translated to Mass Emissions (MT CO_2e)



Metropolitan's estimated emissions in 2030 are well below the State's 2030 target. However, due to the variability associated with Metropolitan's GHG emissions (as discussed in Section 3.0), using any individual year to gain an understanding of Metropolitan's GHG emissions reduction progress would not provide a clear picture of overall emissions reduction trends. Therefore, Metropolitan intends to implement a carbon budget approach to determine GHG emissions reduction progress.



Native plant garden at Weymouth Water Treatment Plant

METROPOLITAN'S CARBON BUDGET AND LINEAR EMISSIONS

Due to the nature of its operations, Metropolitan's GHG emissions fluctuate from year to year depending on water pumped from the Colorado River (see Figure 3-2). Consequently, GHG emissions recorded in any one particular year are not necessarily representative of Metropolitan's overall progress towards meeting its GHG emissions reduction targets. To account for this factor, Metropolitan will track its emissions annually using a carbon budget approach.

The carbon budget is analogous to a tank with a set capacity or a total mass emission cap between 2005 and carbon neutrality in 2045. All of the emissions from Metropolitan's operations go into this tank each year. The total capacity of the tank is Metropolitan's total emissions budget, and over time that tank fills up. As long as Metropolitan produces fewer GHG emissions than can fit in the tank, the target will be achieved regardless of emissions produced during any particular year. This process is illustrated in Figure 4-3. Carbon budgets are widely used in the context of international climate policy and development of global-scale GHG emissions targets.[15,16,17] The importance of staying within the carbon budget has also been established by CARB.[18] As outlined in the 2017 Scoping Plan, California's strategic vision for achieving at least a 40 percent reduction in GHG emissions below 1990 levels by 2030 is based on the level of reductions scientists say is necessary to meet the Paris Agreement goals (CARB 2017). To track progress in achieving the GHG emissions reduction goals, Metropolitan will utilize the per capita target methodology in combination with an established carbon budget.

As described above, Metropolitan will pursue carbon neutrality by 2045 via a linear per capita emissions reduction methodology. To calculate the total carbon budget that corresponds to Metropolitan's GHG emissions reduction targets, the area beneath the reduction curve shown in Figure 4-2 is calculated. The sum of this area represents the carbon budget. Data is not available for the years 1990 through 2004; therefore, the carbon budget begins in 2005, the year in which Metropolitan began submitting data to The Climate Registry. Using this methodology allows Metropolitan to capture its significant progress toward reducing emissions to well below the AB 32 goal of returning to 1990 emissions levels by 2020. According to this methodology, between 2005 and 2045 Metropolitan's total carbon budget is 14,660,475 MT CO_2e.

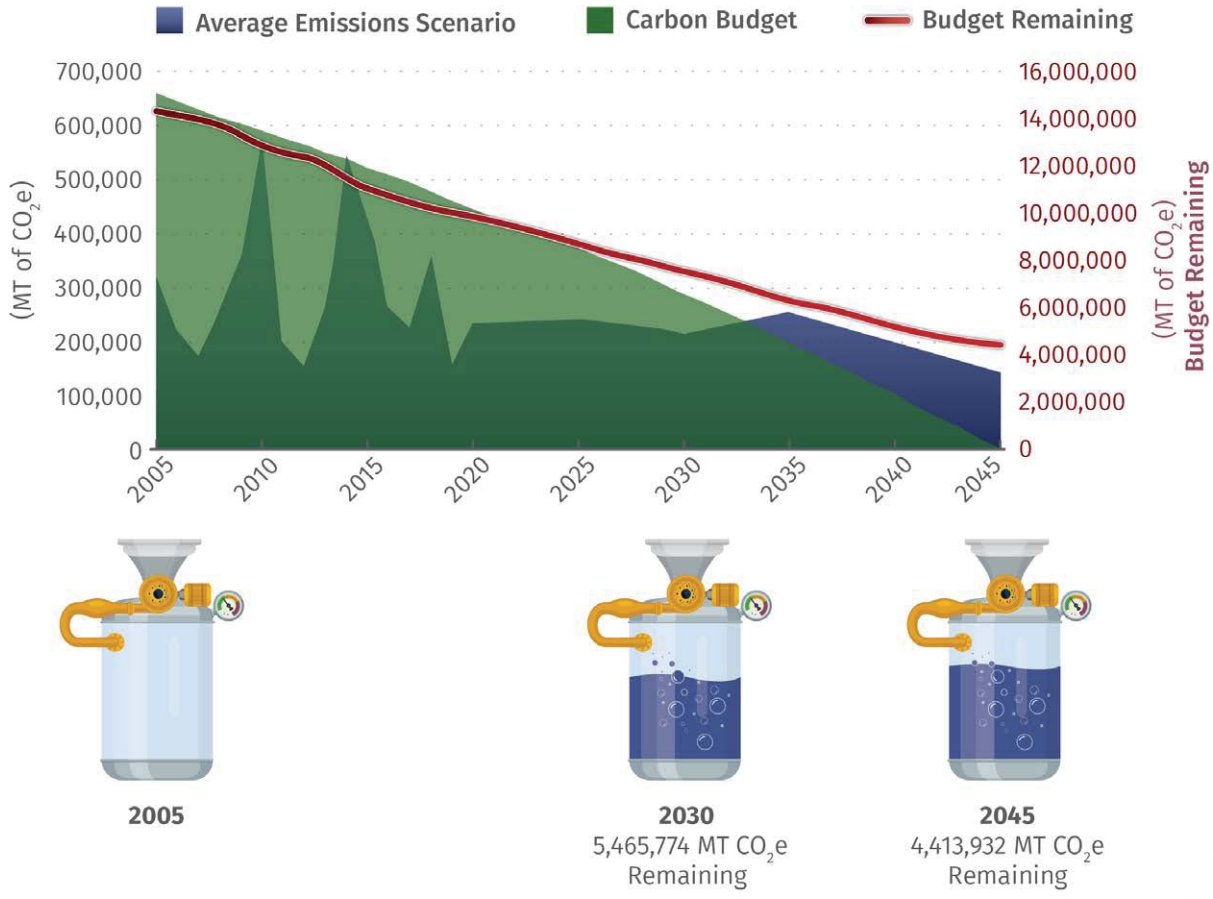
FIGURE 4-3: How a Carbon Budget Works

GHG EMISSIONS REDUCTION GAP

In order to better illustrate how the carbon budget will be applied to Metropolitan's operations, each of the emissions scenarios defined in Section 3.0 can be analyzed under the carbon budget approach. Figure 4-4 illustrates Metropolitan's carbon budget contextualized with the average GHG emissions scenario in dark blue with the carbon budget overlaid in green. The tanks below the graph in Figure 4-4 show the remaining budget in each year. Under this scenario, Metropolitan stays within its carbon budget through 2045 (red line) but would still need additional GHG reductions to achieve carbon neutrality by 2045.[19]

FIGURE 4-4: Metropolitan's Projected Carbon Budget Under the Average Emissions Scenario



19. *Based on Metropolitan's historical emissions, it is expected that actual future emissions will continue to be highly variable and Metropolitan will continue to monitor its carbon budget on an annual basis.*

4.0

The average GHG emissions scenario is only one of the potential GHG emissions scenarios Metropolitan is including in its planning process. Table 4-2 and Figure 4-5 show the impact of each of the three forecasted GHG emissions scenarios on the projected carbon budget. In every GHG emissions forecast scenario, Metropolitan is expected to remain within its carbon budget through 2030. Both the average and low emissions scenarios show Metropolitan maintaining a positive budget through 2045. However, under the high emissions scenario, without additional GHG emissions reductions, Metropolitan will deplete its carbon budget by 2043, as shown in Table 4-2. In all scenarios, additional reductions will be needed to achieve carbon neutrality in 2045. This CAP establishes the foundation for achieving these reductions over time and will allow Metropolitan to stay within its allotted carbon budget. Metropolitan will continue to update the CAP with new and additional GHG emissions reduction measures as necessary to remain under the carbon budget regardless of how actual future scenarios play out.

FIGURE 4-5: Metropolitan's Forecasted Carbon Budget Outcomes

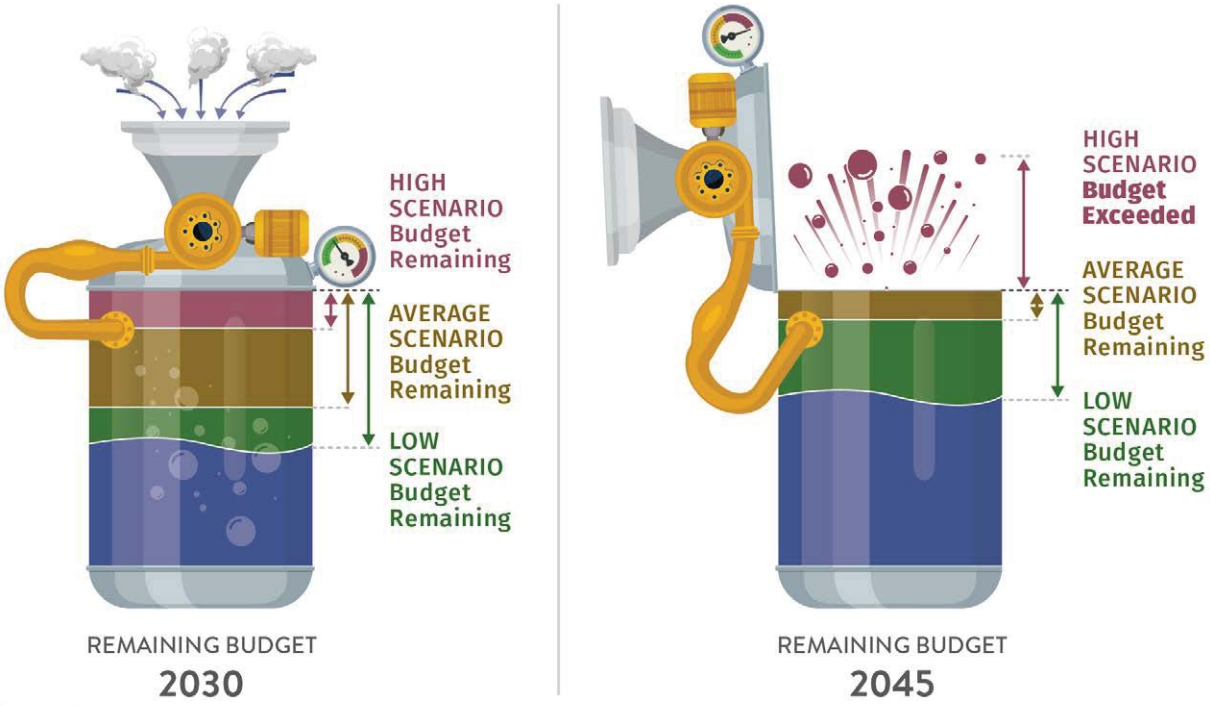


TABLE 4-2: Metropolitan's Forecasted Carbon Budget Outcomes

Emissions Levels	Remaining Budget 2030 (MT CO_2e)	Remaining Budget 2045 (MT CO_2e)
Low Emissions	6,405,936	6,704,456
Average Emissions	5,465,774	4,413,932
High Emissions	3,384,248	*(718,236)*

( ) denotes a negative value

METROPOLITAN'S CURRENT BALANCE

Between 2005 and 2020, Metropolitan used approximately 4,770,038 MT CO_2e of its total carbon budget of 14,660,475 MT CO_2e. This accounts for only 53 percent of the total budget allocated for this timeframe. As shown in Figure 4-6, Metropolitan has approximately 9.9 million MT GHG emissions (as CO_2e) remaining until 2045. In order to stay within its established carbon budget, Metropolitan developed a suite of GHG reduction strategies outlined in Section 5.0.

FIGURE 4-6: Metropolitan's Remaining Carbon Budget as of 2020

Estimated Carbon Budget (2005 to 2045)
14,660,475 MT CO_2e

Allocated Carbon Budget (2005 to 2020)

Total Carbon Budget Remaining
9,890,437 MT CO_2e

SECTION 5.0
METROPOLITAN'S GHG EMISSIONS REDUCTION STRATEGY

While Metropolitan has made significant progress towards reducing its GHG emissions (especially over 1990 baseline levels), achieving carbon neutrality by 2045 requires additional focused actions. This CAP includes specific strategies that, when implemented, can achieve carbon neutrality and provide co-benefits, such as improved infrastructure reliability, increased energy reliability, and decreased costs associated with energy procurement and maintenance. This section focuses on GHG emission reduction strategies over which Metropolitan has direct operational control (e.g., emissions from construction equipment or fleet vehicle replacement). These strategies or action items can have either quantifiable (i.e., with clear GHG tracking metrics and performance standards) or non-quantifiable (i.e., "supportive") goals associated with them. While "supportive" measures may not be quantifiable, they can provide opportunities to study technologies and strategies that can ensure Metropolitan reaches its GHG reduction goals. An example of a quantifiable measure would be purchasing a specific amount of carbon-free electricity, whereas a supportive measure would be implementing a sustainable purchasing policy. The first example has a quantifiable GHG reduction. The second may reduce emissions somewhere, but that reduction is not quantifiable for Metropolitan. Together, these measures establish a pathway to achieve carbon neutrality and satisfy the requirements of CEQA Guidelines Section 15183.5(b)(1)(D) for a qualified GHG reduction plan. It is important to note that none of the projects listed in Section 5.0 have been approved and are subject to the approval of Metropolitan's Board of Directors or General Manager before implementation.

5.1 STRATEGY OVERVIEW

Metropolitan serves a critical function within its service area by providing safe and reliable water to its member agencies who then serve homes and businesses throughout Southern California. The transport and delivery of water will always be needed to meet the needs of Southern California's growing population and dynamic economy. While increasing water efficiency can decrease per capita water demand and thus reduce some of Metropolitan's GHG emissions, these actions alone will not be sufficient to meet the goal of carbon neutrality. This comprehensive CAP identifies strategies to reduce GHG emissions, ensures implementation of future technological advances, and incorporates State regulations related to climate change.

Metropolitan has organized its GHG reduction measures into three emission categories or scopes–direct combustion (Scope 1), indirect electrical consumption (Scope 2), and indirect emissions and sequestration (Scope 3)–as well as nine core strategies to systematically reduce overall GHG emissions.[1] These strategies and measures are summarized below. Sections 5.2 through 5.4 detail the specific actions required to reduce emissions and provide a high-level course of action to achieve Metropolitan's goal of carbon neutrality. Through these measures, Metropolitan will be well-positioned to meet its carbon neutrality goal by 2045. By utilizing a carbon budget to track its emissions reductions, Metropolitan can leverage this data to accelerate GHG reduction strategies and identify and implement new technologies, as needed. As outlined in Section 6.0, Metropolitan will evaluate and update the CAP every five years and adjust its implementation measures (such as the amount of carbon-free electricity to purchase) to balance the carbon budget, all the while balancing the cost of the water Metropolitan provides to its customers.

1. *The GHG Protocol, which is discussed in detail in Section 3.0, GHG Emissions Inventory and Forecast, segregates GHG emission sources into 3 scopes based on varying levels of control: Scope 1 –Direct Emissions from the activities that are directly under an organization's control, such as on-site fuel combustion including boilers, fleet vehicles and air-conditioning leaks; Scope 2 – Indirect Emissions from purchased electricity–emissions are created during the production of the electricity that is eventually used by the organization; and Scope 3 – All Other Indirect Emissions from activities of the organization, occurring from sources that it does not own or control, including emissions associated with business travel, procurement, waste and water usage.*

SCOPE 1:

DIRECT EMISSIONS

STRATEGY 1: Phase Out Natural Gas Combustion at Facilities

Natural gas and other fossil fuels combusted in Metropolitan facilities emit approximately 1,000 MT CO_2e per year. While natural gas and other fossil fuels are not the most substantial source of emissions, natural gas-powered equipment can be electrified over time as the equipment reaches the end of its useful life. Once equipment is electrified, carbon-free electricity can be used to power it, further reducing GHG emissions.

STRATEGY 2: Zero Emission Vehicle Fleet

Metropolitan's fleet emits on average 7,000 MT CO_2e per year. Fully electrifying or otherwise decarbonizing Metropolitan's fleet and powering it with carbon-free electricity or other zero emission technology would allow for this emission source to achieve carbon neutrality. However, not all vehicles in Metropolitan's fleet currently have a zero-emission option. While passenger vehicles can take advantage of commercially available zero-emission vehicle technologies (ZEV), such as electric vehicles (EVs), replacement of heavy-duty vehicles will occur at a slower pace as new technologies are introduced.

STRATEGY 3: Use Alternative Fuels to Bridge the Technology Gap to Zero Emission Vehicles and Equipment

Metropolitan currently uses a combination of gasoline, diesel, and compressed natural gas to fuel its fleet. While zero-emission heavy-duty vehicles are being developed, using low-carbon intensity fuels like renewable diesel in its older vehicles can help reduce GHG emissions over the short-term. The use of alternative fuels allows for additional time to fully vet the new zero-emission technology before significant infrastructure investments are made, which could help prevent stranded assets through the proper selection of the most cost-effective alternatives.

While zero-emission heavy-duty vehicles are being developed, using low-carbon intensity fuels like renewable diesel can help reduce GHG emissions over the short term.

SCOPE 2:

INDIRECT EMISSIONS FROM ELECTRICITY

STRATEGY 4: Utilize Low-Carbon and Carbon-Free Electricity

Electricity consumption is Metropolitan's single largest and most variable emission source. While SB100 ensures that emissions from retail electricity will be reduced over time, additional steps will be needed to generate or procure carbon-free electricity to reach Metropolitan's carbon neutrality goal. Purchasing low-carbon and carbon-free electricity, implementing pump time-of-use strategies, and developing additional carbon-free energy generation are all covered under this strategy.

STRATEGY 5: Improve Energy Efficiency

Increased efficiency of electric-powered equipment can substantially reduce GHG emissions. Improving pump efficiency, installing light emitting diode (LED) lighting, and installing energy recovery systems could all reduce the total demand for electricity from Metropolitan systems, saving money and emissions.

SCOPE 3:

OTHER INDIRECT EMISSIONS

STRATEGY 6: Incentivize More Sustainable Commutes

Based on its experiences with the COVID-19 global pandemic, Metropolitan is re-evaluating its remote working options and alternative work schedules. These changes alone may affect when and how employees commute to work, and thus, may reduce Metropolitan's carbon footprint. In addition, Metropolitan tracks employee commuting methods and provides education on alternative commute options as well as discounts on transit passes and EV charging stations at select facilities (e.g., Union Station Headquarters and the Weymouth Water Treatment Plant). Providing EV charging infrastructure encourages employees to drive personal EVs by providing workplace charging options. Collectively, these incentives help Metropolitan lower its carbon footprint.

STRATEGY 7: Increase Waste Diversion to Achieve Zero Waste

To reduce emissions in a variety of sectors, Metropolitan will develop and implement a Net-Zero Waste Plan to eliminate waste generated at offices and other facilities, which would involve diverting 100 percent of organic and inorganic waste streams from the landfill, as well as develop policies to eliminate the use of single-use plastics.

STRATEGY 8: Increase Water Conservation and Local Water Supply

Metropolitan has a long history of incentivizing water conservation, which has had a measurable effect on overall water conservation (and GHG emissions). This can be clearly seen through the decrease in per capita water consumption over time from 0.14 acre-feet per person in 1990 to 0.09 acre-feet per person in 2017, a 36 percent reduction in per capita water use. Metropolitan plans to continue and expand its water conservation efforts into the future. Reduced per capita water consumption allows Metropolitan to meet the water demands of a growing population and reduce operational emissions.

STRATEGY 9: Investigate and Implement Carbon Capture and Sequestration Opportunities

While Strategies 1 through 8 actively reduce GHG emissions from Metropolitan's operations, Strategy 9 looks at opportunities for negative emissions through carbon capture and storage and/or carbon sequestration on natural and working lands (e.g., rangeland, forests, woodlands, wetlands and coastal areas, grasslands, shrubland, farmland, riparian areas, and urban green space). Carbon capture and storage refers to the process of capturing CO_2 emissions from the atmosphere or an industrial process, transporting it, and storing it in deep geological formations, the ocean, or minerals.[2] Carbon sequestration programs will be an important tool to mitigate some of Metropolitan's emissions. It is important to plan and implement sequestration programs that can be used as mitigation. Although no reductions were quantified for this strategy, future CAP updates and projects may utilize carbon sequestration to help Metropolitan achieve carbon neutrality.

Table 5-1 summarizes how each of the strategies established by Metropolitan in this CAP align with the emission sources outlined in ICLEI's[3] Local Government Operations Protocol by scope to provide a transparent outline of how Metropolitan plants to reduce its emissions over the next decade.

2. ***https://www.ipcc.ch/site/assets/uploads/2018/03/srccs_wholereport-1.pdf***
3. *ICLEI is an international non-governmental organization that promotes sustainable development. ICLEI provides technical consulting to local governments to meet sustainability objectives.*

TABLE 5-1: Scope, Strategy, and Measure Summary

Scope	Emissions Source	Strategy
1	Stationary Combustion	Strategies 1, 3
1	Mobile Combustion	Strategies 2, 3
1	Fugitive Emissions	Strategy 9
2	Purchased Electricity	Strategies 4, 5, 8
3	Waste Generation	Strategy 7
3	Employee Commute	Strategy 6
3	Employee Business Travel	Strategies 6, 9

IMPLEMENTATION PHASES AND GHG REDUCTION

The intent of the CAP is to achieve the 2030 GHG reduction target and demonstrate substantial progress toward the long-term State reduction goal of carbon neutrality by 2045. New opportunities are anticipated to emerge that could yield additional reductions beyond those identified in this CAP. Furthermore, it is recognized that climate action planning is an iterative process, and additional phases may be needed to continue and expand the actions in the CAP and to explore new opportunities to meet carbon neutrality. At this time, Metropolitan has developed two implementation phases for the GHG reduction measures considered in the CAP, Phase 1 and Phase 2.

Phase 1 measures are ready for implementation over the next ten years based on their cost, available technology, and certainty about future conditions. Phase 2 measures show promise, but need more research, new technologies, or different financial conditions before they can be implemented. While Metropolitan will work to stay under its carbon budget through 2030 and 2045 through implementation of the identified measures, the high degree of variability in annual emissions could require increased or adapted implementation of the measures outlined in this section.

As discussed in Section 4.0 Regulatory Context and Targets, Table 5-2 shows the carbon budget compared to Metropolitan's expected emissions between 2005 and 2030 under the low average and high emission scenarios. As seen in the table Metropolitan is expected to stay within the carbon budget in all of the emission

forecasts. However due to the uncertainty of future demand potential climate impacts and the long term goal of carbon neutrality Metropolitan will implement the GHG reduction measures outlined in Sections 5.2 through 5.4. The modeled forecasts represent the likely best, worst, and average case for any particular year. The most likely scenario is an oscillation around the mean with some high emission years and some low emission years. However, the measures listed in Table 5-3 (see Section 5.3, Measure Quantification and Summary Table) allow Metropolitan to achieve its GHG reduction goal regardless of actual future conditions.

TABLE 5-2: Carbon Budget and Projected Reduction Gap Through 2030

Scenario	Total Allowable Budget (2005–2030)	Estimated Metropolitan Emissions (2005–2030)	2030 Gap*
Low Emissions Scenario	12,577,075	6,171,139	*(6,405,936)*
Average Emissions Scenario	12,577,075	7,111,301	*(5,465,774)*
High Emissions Scenario	12,577,075	9,192,827	(3,384,248)

Additional GHG reductions will be needed to achieve carbon neutrality in 2045. While the strategies listed above provide a high-level pathway for Metropolitan to achieve carbon neutrality and the measures outlined in this CAP provide a framework to achieve that goal, utilization of new technologies and the implementation of existing and future state policies will ensure that Metropolitan will ultimately reach its goal.

Execution of the established strategies and implementation of the supporting measures are detailed in Section 6.0, Implementation and Monitoring. Following the implementation strategy outlined in Section 6.0 will be critical to meeting the GHG emissions reduction targets established by Metropolitan.

The measures in Table 5-3 allow Metropolitan to achieve its GHG reduction goal regardless of actual future conditions.

5.2 GHG REDUCTION MEASURES CO-BENEFIT SUMMARY

Reducing emissions and mitigating the potential impacts of climate change have a range of additional co-benefits that result in a positive impact or benefit to Metropolitan and its service area. For example, eliminating direct emissions would also reduce the amount of carbon monoxide and other pollutants released into the atmosphere, thereby incrementally improving regional air quality and community health. Likewise, as discussed in Section 5.6, Measure WC-2 will identify and expand on the current water reduction programs with the highest adoption rates and highest water reduction impacts. Expanding those programs will increase water conservation while also reducing GHG emissions. A co-benefit analysis has been conducted for each strategy and is outlined in the following section. Although there are myriad co-benefits related to reducing emissions, this analysis focuses on five primary co-benefits.

COMMUNITY HEALTH

One of the primary co-benefits of reducing GHG emissions is directly improving community health. For example, replacing natural gas and propane-consuming equipment with electrically-powered equivalents, as outlined in Measure DC-2, would result in cleaner air because burning natural gas and propane results in the release of carbon monoxide, nitrogen dioxide, and particulate matter (PM).[4] According to a California Energy Commission study of public health and electrification would significantly reduce air pollutant emissions, resulting in improved air quality and a reduction in mortality rates from pollution.[5] The analysis specifically notes that the monetized health benefits for combined changes in O_3 and $PM_{2.5}$[6] from electrification would result in $108 billion per year in cost-savings

4. ***https://www.epa.gov/indoor-air-quality-iaq/sources-combustion-products-introduction-indoor-air-quality***
5. ***https://ww2.energy.ca.gov/2019publications/CEC-500-2019-049/CEC-500-2019-049.pdf***
6. *$PM_{2.5}$ stands for particulate matter below 2.5 micrometers or below (a unit of measurement). $PM_{2.5}$ is small particulates found in the air that can enter lungs and cause health issues.* ***https://www.cdc.gov/air/particulate_matter.html***

by 2050 for California, including $56 billion in benefits for the South Coast Air Basin.[7] Similarly, electrifying the fleet (Strategy 2) would result in a reduction of gasoline and diesel fuel combustion, which similarly provides incremental benefits to air quality and human health.

COST SAVINGS

Although implementation of the GHG emissions reduction measures generally requires an investment of either time or money, many measures have longer-term cost savings that are attributable to reduced utility and transportation costs or avoided waste. These cost savings co-benefits can range in timeframe and monetary returns, and do not account for the potentially significant economic benefits of avoiding impacts associated with climate change, such as increased drought and sea level rise. Examples of cost saving measures to be implemented by Metropolitan are the energy efficiency measures outlined in Strategy 5. These measures will result in long-term cost-savings from reducing the amount of energy required to operate.

Additionally, establishing a zero emission fleet, as outlined in Strategy 2, would be completed as vehicles are replaced at the end of their natural life. Replacing gasoline powered vehicles with electric vehicles may result in a higher up-front cost. However, recent studies including one by Massachusetts Institute of Technology found that, over the course of the vehicle's useful life, the cost savings associated with fuel savings and decreased maintenance costs result in lower lifecycle costs compared to both hybrid and internal combustion vehicles.[8] Maintenance costs on an electric car are much lower because they have fewer moving parts and fewer fluids to be replaced and are easier on brake systems. Furthermore, the study found that EV lifecycle costs are fairly insensitive to electricity costs and that even a doubling of electricity costs does not change the relative cost comparison between battery electric vehicles and internal combustion vehicles.[9]

7. *The South Coast Air Basin is one of several regional air basin areas designated by the State to manage air quality. The South Coast Air Basin covers an area of 6,745 square miles and encompasses much of Metropolitan's service area.*

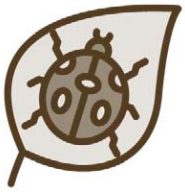
9. ***https://pubs.acs.org/doi/suppl/10.1021/acs.est.6b00177/suppl_file/es6b00177_si_001.pdf***

ECOSYSTEM HEALTH



It is estimated that plastics make up approximately 90 percent of the floating marine debris[10] and, based on a study of beach debris at sites along the Orange County coast, expanded polystyrene foam was the second most abundant form of beach debris.[11] Debris is released into the world's oceans at a rate of 13 million MT of plastic annually, which is equivalent to dumping one standard garbage truck of waste into the ocean every minute.[12] Globally, over 800 species are affected by marine debris, including fish, seabirds, sea turtles, and marine mammals, which can become entangled in or ingest plastic debris, causing suffocation, starvation, and drowning. As of 2018, it is estimated that half of sea turtles worldwide have ingested plastic and plastic waste kills up to a million seabirds a year. Integrating a plan to replace single-use plastics, polystyrene, and other non-biodegradable items with biodegradable or multi-use materials would thereby improve ecosystem health while helping to drive down Metropolitan's GHG emissions. The health of an ecosystem is directly correlated to the health of the humans living in it because humans ultimately depend upon ecosystem products and services (such as availability of fresh water, food, and air).[13] Measure WA-1, discussed in detail in Section 5.4, aims to implement procurement policies that eliminate the use of single-use plastics, polystyrene, and other non-biodegradable items at Metropolitan and reduce the waste stream to the surrounding ecosystems.

OPERATIONAL RESILIENCE

Metropolitan's core mission is to provide adequate and reliable supplies of high-quality water to its service area in an environmentally and economically responsible way. Operation and maintenance of its infrastructure is essential to Metropolitan's core mission. Operational resilience requires preparation and planning to ensure functioning equipment, operational flexibility, and a robust water supply in spite of changing environmental conditions, including those related to climate change. Many of the CAP strategies and measures increase Metropolitan's operational resilience, adding benefits beyond GHG emissions reduction. Measure E-5, for example, includes the installation of 3.5 MW battery storage systems at treatment plants, which would ensure that these facilities would have on-site power for some period after a major catastrophic event, such as a large earthquake, if the electricity grid is impacted.

WATER CONSERVATION

Retaining a diverse, robust, and sustainable water supply is at the heart of Metropolitan's mission and is woven into various strategies to reduce long-term emissions. As Metropolitan moves forward and faces more extreme impacts of climate change and population growth, water conservation will become even more essential. Water conservation combined with operational resilience results in water supply reliability and ultimately an ability to adapt to more frequent droughts and extreme weather events. This co-benefit is specifically demonstrated through the measures included in Strategy 8.

Bald Eagle near the Colorado River Aqueduct

5.3 MEASURE QUANTIFICATION AND SUMMARY TABLE

Table 5-3 summarizes the Phase 1 measures, the co-benefits associated with each measure, and the cumulative emissions reduction potential between 2020 and 2030.[14] In some instances, measures do not directly result in quantitative GHG emission reductions, although they support the overall goals of the CAP; these measures are considered "supportive." The Phase 1 measures have been developed to ensure Metropolitan can stay within its carbon budget even under the high emissions scenario. This approach allows Metropolitan the flexibility to respond to unforeseen circumstances yet stay within the established carbon budget. As mentioned previously, Phase 1 measures are expected to be implemented between 2020 and 2030. Before implementation, each measure will need to be approved by the Metropolitan Board of Directors.

Due to the high degree of uncertainty around Metropolitan's long-term emissions, GHG reduction measures were not quantified through 2045. Each measure is quantified based on the noted implementation timeline and the estimated cumulative emissions reductions through 2030. Cumulative savings provide an estimate on how the carbon budget will be impacted over time. However, based on Metropolitan's emission scenario, GHG savings may vary, and actual GHG emissions reductions will be tracked through the carbon budget and an annual GHG inventory as outlined in Section 6.0.

14. The anticipated reductions by 2030 are shown because 2030 represents California's next major emissions reduction target year.

TABLE 5-3: Phase One Emission Reduction Measure Co-Benefit and Reduction Summary (Implement Between 2020 to 2030)

Phase	#	Measure	Co-Benefits	Cumulative Emissions Reduction 2020–2030
Scope 1: Direct Combustion				
Strategy 1–Phase Out Natural Gas Combustion at Facilities				
1	DC-1	Conduct a survey of all natural gas consuming devices in offices, control buildings, and residential structures and establish a schedule to replace natural gas equipment with electric by 2025.	• Operational Resilience	Supportive
1-2	DC-2	Reduce natural gas emissions by 50 percent by 2030 and 100 percent by 2045 through electrification.	• Community Health • Cost Savings • Operational Resilience	2,830 MT CO_2e
1	DC-3	Update Metropolitan building standards to require all-electric construction for new buildings and retrofits.	• Community Health • Cost Savings • Operational Resilience	Supportive
Strategy 2–Zero Emission Vehicle Fleet				
1	FL-1	Conduct a ZEV/EV Feasibility Study to determine which fleet vehicles can be converted, what chargers/fueling stations are required, and where they should be located by the end of 2022.	• Operational Resilience	Supportive
1	FL-2	Adopt an ZEV/EV first policy for fleet vehicles to obtain ZEVs when technological, operational, or cost effectiveness parameters are met.	• Operational Resilience	Supportive
1	FL-3	Replace fossil fuel passenger fleet vehicles as identified in the ZEV/EV Feasibility Study (FL-1).	• Community Health • Cost Savings • Operational Resilience	Supportive
1	FL-4	Install EV charging and/or ZEV infrastructure at facilities pursuant to the findings of the ZEV/EV Feasibility Study (FL-1).	• Community Health • Operational Resilience	Supportive

TABLE 5-3: Phase One Emission Reduction Measure Co-Benefit and Reduction Summary (Implement Between 2020 to 2030) *(continued)*

Phase	#	Measure	Co-Benefits	Cumulative Emissions Reduction 2020–2030
Strategy 3–Use Alternative Fuels to Bridge the Technology Gap to Zero Emission Vehicles and Equipment				
1	AF-1	Complete a pilot project on the use of renewable diesel rather than conventional diesel for all stationary equipment by 2025.	• Community Health • Cost Savings • Operational Resilience	Supportive
1	AF-2	Complete a pilot project of renewable diesel use in on-road and off-road vehicles by providing at least one renewable diesel tank at Metropolitan-owned fueling depots in 2021.	• Community Health • Cost Savings • Operational Resilience	Supportive
1	AF-3	Based on the results of the study in AF-2, Metropolitan will begin using renewable diesel fuel in 100 percent of Metropolitan's diesel-consuming on-road and off-road vehicles by 2025.	• Community Health • Cost Savings • Operational Resilience	998 MT CO_2e
Scope 2: Electricity				
Strategy 4 – Utilize Low-Carbon and Carbon-Free Electricity				
1	E-1	Analyze marginal emissions rates and evaluate the feasibility of shifting energy use to lower emission periods.	• Operational Resilience	Supportive
1	E-2	Connect the Yorba Linda Hydroelectric Power Plant (YLHEP) behind Metropolitan's Southern California Edison (SCE) electricity meter to directly utilize carbon-free electricity at Metropolitan's Diemer facility by 2025.	• Community Health • Cost Savings • Operational Resilience	6,301 MT CO_2e

TABLE 5-3: Phase One Emission Reduction Measure Co-Benefit and Reduction Summary (Implement Between 2020 to 2030) *(continued)*

Phase	#	Measure	Co-Benefits	Cumulative Emissions Reduction 2020–2030
1	E-3	In markets where available, Metropolitan will switch its retail accounts to green tariff options offered by power providers by 2025 to reduce the Scope 2 GHG emissions associated with retail electricity use.	• Community Health • Operational Resilience	18,048 MT CO_2e
1	E-4	Install 3.5 MW battery storage systems at the Jensen, Skinner, and Weymouth treatment plants. Investigate the use of a software system to track and optimize GHG emissions reduction due to time-of-use strategies by 2025.	• Community Health • Cost Savings • Operational Resilience	219 MT CO_2e
1	E-5	Manage Metropolitan's energy purchases to ensure cost-effective energy supply while achieving the required GHG emissions objective.		1,961,822 MT CO_2e (high emissions scenario)
Strategy 5 – Improve Energy Efficiency				
1	EE-1	Convert all interior and exterior lighting at 50 percent of Metropolitan facilities to LED technologies by 2030 and 100 percent by 2045.	• Cost Savings • Operational Resilience	1,220 MT CO_2e
1	EE-2	Continue programs to analyze CRA pump efficiency and replace or refurbish pumps when cost effective.	• Cost Savings • Operational Resilience	Supportive

TABLE 5-3: Phase One Emission Reduction Measure Co-Benefit and Reduction Summary (Implement Between 2020 to 2030) *(continued)*

Phase	#	Measure	Co-Benefits	Cumulative Emissions Reduction 2020–2030
Scope 3: Other Indirect Emissions				
Strategy 6 – Incentivize More Sustainable Commutes				
1	EC-1	Expand subsidized transit commute program to reduce employee commute miles.	• Community Health • Operational Resilience	Supportive
1	EC-2	Expand employee use of carbon-free and low carbon transportation by providing education programs on the benefits of commute options including public transportation, EV/ZEV options, and vanpools.	• Community Health • Operational Resilience	Supportive
1	EC-3	Install ZEV and/or EV infrastructure as directed by the ZEV/EV Feasibility Study to support at least a 15 percent transition of employee-owned vehicles to ZEVs/EVs by 2025.	• Community Health • Operational Resilience	3,427 MT CO_2e
1	EC-4	Continue to offer benefits to employees who use alternative modes of transportation (e.g. public transportation, bikes).	• Community Health • Operational Resilience	Supportive
1	EC-5	Allow 50 percent of employees located at Metropolitan's headquarters to telecommute or utilize flexible schedules through 2030 to reduce travel time, vehicle miles traveled (VMT), and GHG emissions.	• Community Health • Cost Savings • Operational Resilience	3,345 MT CO_2e

TABLE 5-3: Phase One Emission Reduction Measure Co-Benefit and Reduction Summary (Implement Between 2020 to 2030) *(continued)*

Phase	#	Measure	Co-Benefits	Cumulative Emissions Reduction 2020–2030
Strategy 7 – Increase Waste Diversion to Achieve Zero Waste				
1	WA-1	Develop and implement net zero waste policies and programs at all facilities to reduce landfilled waste by 30 percent by 2030 and achieve zero landfilled waste by 2045.	• Community Health • Ecosystem Health • Operational Resilience	4,517 MT CO_2e
1	WA-2	Implement a program to reduce organic waste at Metropolitan's Union Station building. Contract or team with local organizations and waste disposal companies to route organic waste to anaerobic digestion or composting facilities and edible food-to-food recovery centers.	• Ecosystem Health • Operational Resilience	Supportive
1	WA-3	Develop and implement a sustainable procurement policy.	• Community Health • Ecosystem Health	Supportive
Strategy 8 – Increase Water Conservation and Local Water Supply				
1	WC-1	Expand programs that educate customers on water conservation initiatives through workshops and speaking engagements.	• Cost Savings • Water Conservation	Supportive
1	WC-2	Continue to implement innovative water use efficiency programs.	• Cost Savings • Operational Resilience • Water Conservation	Supportive
1	WC-3	Continue Turf Removal Program to install an average of 1,500,000 square feet (sq. ft.) of water efficient landscapes per year through 2030 through the use of a rebate program.	• Operational Resilience • Water Conservation	968 MT CO_2e

TABLE 5-3: Phase One Emission Reduction Measure Co-Benefit and Reduction Summary (Implement Between 2020 to 2030) *(continued)*

Phase	#	Measure	Co-Benefits	Cumulative Emissions Reduction 2020–2030
1	WC-4	Provide funding for the development and monitoring of local stormwater recharge and use projects to evaluate the water supply benefit of stormwater.	• Ecosystem Health • Operational Resilience • Water Conservation	Supportive
1	WC-5	Continue to promote water efficiency technologies and innovative practices that can be adopted into future water conservation program updates.	• Ecosystem Health • Operational Resilience • Water Conservation	Supportive
Strategy 9 – Investigate and Implement Carbon Capture and Sequestration Opportunities				
1	CS-1	Study carbon capture protocols in the Sacramento-San Joaquin River Delta.	• Community Health • Cost Savings • Ecosystem Health • Operational Resilience	Supportive
1	CS-2	Conduct a five-year research program to increase Metropolitan's knowledge of regenerative agriculture and carbon sequestration opportunities on Metropolitan properties in the Palo Verde Valley.	• Community Health • Cost Savings • Ecosystem Health • Operational Resilience	Supportive
Total Phase 1 Reduction Under High Emission Scenario				**2,003,695**
Remaining Carbon Budget Under High Emission Scenario				**3,384,248**
Remaining Carbon Budget After Measure Implementation				**5,387,943**[15]

15. *Parentheses denotes a negative number. In this case, Metropolitan would have 5,387,943 MT CO_2e remaining in its carbon budget through 2030 under the High Emissions Scenario. Metropolitan would have even larger remaining budgets under the Low and Average Emissions Scenarios.*

Using the Phase 1 measures identified in Table 5-3, Metropolitan can reduce the estimated 725,909 MT CO_2e needed to offset the projected emissions under the high emissions scenario with budget remaining. The actual implementation schedule and the quantified GHG emissions over time will determine the actual emissions reductions necessary for Metropolitan to meet its GHG reduction goals. While purchasing carbon-free electricity from the wholesale market under Measure E-5 may increase costs, it provides Metropolitan the flexibility to ensure that it will meet its GHG reduction goals. However, other Phase 1 and 2 measures, which provide co-benefits such as cost savings, operational resiliency, and water conservation, will be implemented first.

In addition to the Phase I measures, Metropolitan has also identified a suite of Phase 2 measures that have high potential for reducing GHG emissions and providing significant co-benefits. These measures are included in Table 5-4. Phase 2 measures have been quantified by the expected average annual GHG reduction since the timeline for implementation is not yet known. The earlier these measures can be implemented the more reductions Metropolitan will realize. However, more information or the development of new technologies are required before the Phase 2 measures can be deployed. Phase 2 measures also have a longer-term implementation time frame between 2025 and 2045.

Jensen Water Treatment Plant solar panels

TABLE 5-4: Phase Two Emission Reduction Measure Co-Benefit and Reduction Summary

Phase	#	Measure	Co-Benefits	Cumulative Emissions Reduction 2020–2030
Scope 2: Electricity				
Strategy 4 – Utilize Low-Carbon and Carbon-Free Electricity				
2	EE-3	Investigate feasibility of a large-scale (100 MW) battery storage system for the CRA.	• Operational Resilience	Supportive
Strategy 5 – Improve Energy Efficiency				
2	EE-4a	Replace pump impellers at the Iron Mountain pumping plant if directed by findings of the pump assessment (Measure EE-2).	• Cost Savings • Operational Resilience	Supportive
2	EE-4b	Replace pump impellers at Eagle Mountain or Hinds pumping plants if directed by findings of the pump assessment (Measure EE-2).	• Cost Savings • Operational Resilience	Supportive
2	EE-4c	Refurbish motors at Iron Mountain if applicable based on the findings of the pump assessment (Measure EE-2).	• Cost Savings • Operational Resilience	Supportive
2	EE-4d	Refurbish motors at Eagle Mountain or Hinds pumping plants if directed by findings of the pump assessment (Measure EE-2).	• Cost Savings • Operational Resilience	Supportive
2	EE-5	If the proposed RRWP is ultimately constructed, install an inter-stage pumping system on the reverse osmosis brine stream to reduce energy use.	• Cost Savings • Operational Resilience	Supportive

TABLE 5-4: Phase Two Emission Reduction Measure Co-Benefit and Reduction Summary (continued)

Phase	#	Measure	Co-Benefits	Cumulative Emissions Reduction 2020–2030
Scope 3: Other Indirect Emissions				
Strategy 6 – Incentivize More Sustainable Commutes				
2	EC-6	Replace all Metropolitan vanpool vehicles with ZEVs. Start with a pilot study (Measure FL-1) to evaluate the best approach.	• Community Health • Cost Savings • Operational Resilience	Supportive
Strategy 7 – Increase Waste Diversion to Achieve Zero Waste				
2	WA-4	Partner with municipal agencies, like the City of Los Angeles, to create programs that will allow Metropolitan to provide its fair share of diversion and help local jurisdictions meet the goals of SB 1383 for organics diversion, including food waste and composting.	• Ecosystem Health • Water Conservation	Supportive
Strategy 8 – Increase Water Conservation and Local Water Supply				
2	WC-6	Implement advanced technology systems to increase Metropolitan-owned recycled and groundwater recovery systems to maintain local water supply (e.g., proposed RRWP).	• Ecosystem Health • Operational Resilience • Water Conservation	Supportive
2	CS-3	Establish baseline soil carbon quantities through science-based approaches then develop pilot projects to enhance carbon sequestration and implement larger scale carbon sequestration projects as deemed feasible.	• Community Health • Cost Savings • Ecosystem Health • Operational Resilience	Supportive

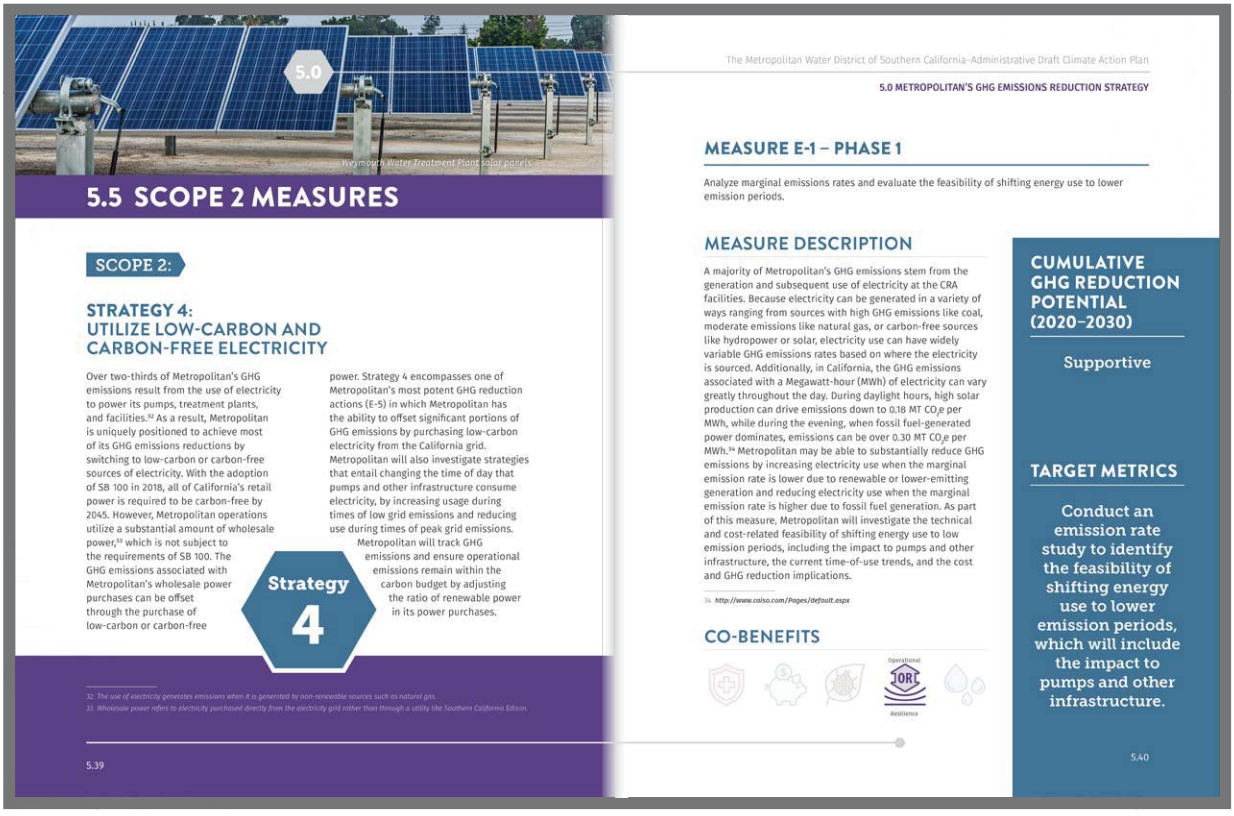
HOW TO READ THE MEASURE SECTIONS

Sections 5.4 through 5.6 include robust details on each of the measures summarized by scope and strategy. Section 5.4 covers Scope 1 strategies and measures, Section 5.5 covers Scope 2 strategies and measures, and Section 5.6 covers Scope 3 strategies and measures.

Details on what is included in each page layout is provided on the following pages. Figures 5-1 and 5-2 provide a visual example of how to review and interpret the information found in these sections. Figure 5-1 shows a typical strategy and identifies the main components of a strategy summary page, while Figure 5-2 shows a specific measure that supports the execution of the strategy.



5.0

Weymouth Water Treatment Plant solar panels

5.5 SCOPE 2 MEASURES

SCOPE 2:

STRATEGY 4: UTILIZE LOW-CARBON AND CARBON-FREE ELECTRICITY

Over two-thirds of Metropolitan's GHG emissions result from the use of electricity to power its pumps, treatment plants, and facilities.[32] As a result, Metropolitan is uniquely positioned to achieve most of its GHG emissions reductions by switching to low-carbon or carbon-free sources of electricity. With the adoption of SB 100 in 2018, all of California's retail power is required to be carbon-free by 2045. However, Metropolitan operations utilize a substantial amount of wholesale power,[33] which is not subject to the requirements of SB 100. The GHG emissions associated with Metropolitan's wholesale power purchases can be offset through the purchase of low-carbon or carbon-free power. Strategy 4 encompasses one of Metropolitan's most potent GHG reduction actions (E-5) in which Metropolitan has the ability to offset significant portions of GHG emissions by purchasing low-carbon electricity from the California grid. Metropolitan will also investigate strategies that entail changing the time of day that pumps and other infrastructure consume electricity, by increasing usage during times of low grid emissions and reducing use during times of peak grid emissions. Metropolitan will track GHG emissions and ensure operational emissions remain within the carbon budget by adjusting the ratio of renewable power in its power purchases.

Strategy 4

32. The use of electricity generates emissions when it is generated by non-renewable sources such as natural gas.
33. Wholesale power refers to electricity purchased directly from the electricity grid rather than through a utility like Southern California Edison.

5.39

The Metropolitan Water District of Southern California–Administrative Draft Climate Action Plan

5.0 METROPOLITAN'S GHG EMISSIONS REDUCTION STRATEGY

MEASURE E-1 – PHASE 1

Analyze marginal emissions rates and evaluate the feasibility of shifting energy use to lower emission periods.

MEASURE DESCRIPTION

A majority of Metropolitan's GHG emissions stem from the generation and subsequent use of electricity at the CRA facilities. Because electricity can be generated in a variety of ways ranging from sources with high GHG emissions like coal, moderate emissions like natural gas, or carbon-free sources like hydropower or solar, electricity use can have widely variable GHG emissions rates based on where the electricity is sourced. Additionally, in California, the GHG emissions associated with a Megawatt-hour (MWh) of electricity can vary greatly throughout the day. During daylight hours, high solar production can drive emissions down to 0.18 MT CO_2e per MWh, while during the evening, when fossil fuel-generated power dominates, emissions can be over 0.30 MT CO_2e per MWh.[34] Metropolitan may be able to substantially reduce GHG emissions by increasing electricity use when the marginal emission rate is lower due to renewable or lower-emitting generation and reducing electricity use when the marginal emission rate is higher due to fossil fuel generation. As part of this measure, Metropolitan will investigate the technical and cost-related feasibility of shifting energy use to low emission periods, including the impact to pumps and other infrastructure, the current time-of-use trends, and the cost and GHG reduction implications.

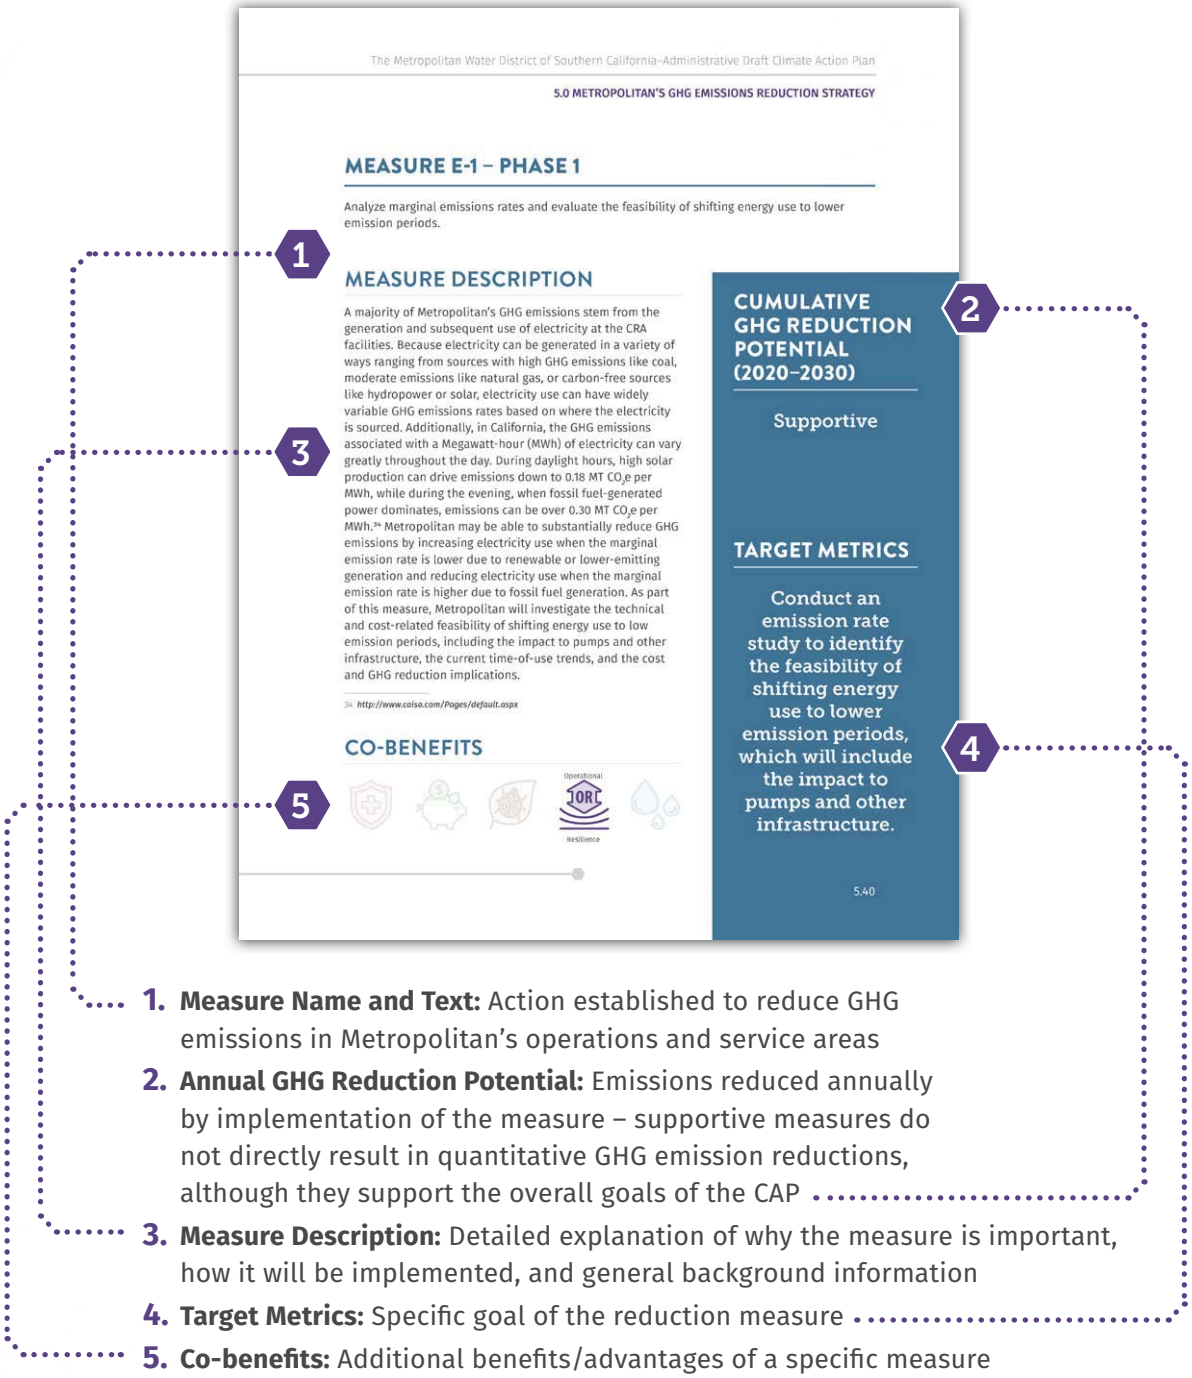
FIGURE 5-1: How to Read Strategy Summary Layout Page

1. **Scope:** Categories (1–3) established by the Greenhouse Gas Protocol to better understand the source of emissions
2. **Strategy Number and Name:** Number and name of the specific high-level course of action complemented by the emission reduction measures (Figure 5-2)
3. **Strategy Description:** Detailed summary of the strategy and how it will contribute to Metropolitan's long-term goals

FIGURE 5-2: How to Read Measure Summary Layout Page



1. **Measure Name and Text:** Action established to reduce GHG emissions in Metropolitan's operations and service areas
2. **Annual GHG Reduction Potential:** Emissions reduced annually by implementation of the measure – supportive measures do not directly result in quantitative GHG emission reductions, although they support the overall goals of the CAP
3. **Measure Description:** Detailed explanation of why the measure is important, how it will be implemented, and general background information
4. **Target Metrics:** Specific goal of the reduction measure
5. **Co-benefits:** Additional benefits/advantages of a specific measure

Jensen Water Treatment Plant

5.4 SCOPE 1 MEASURES

SCOPE 1:

STRATEGY 1: PHASE OUT NATURAL GAS COMBUSTION AT FACILITIES

California adopted SB 100 in 2018, making electrification an important strategy for reducing GHG emissions. SB 100 requires that all retail energy sold in California be 100 percent carbon-free by 2045; therefore, electrifying a fossil fuel source like a natural gas hot water heater means that piece of equipment will also be carbon-free by 2045. In addition to GHG reductions, removing natural gas from facilities would also improve indoor and local outdoor air quality by reducing atmospheric $PM_{2.5}$.[16]

16. ***https://www.nrdc.org/experts/pierre-delforge/gas-appliances-pollute-indoor-and-outdoor-air-study-shows***

Strategy 1

SCOPE 1: 5.0

MEASURE DC-1 – PHASE 1

Conduct a survey of all natural gas consuming devices in offices, control buildings, and residential structures and establish a schedule to replace natural gas equipment with electric by 2025.

CUMULATIVE GHG REDUCTION POTENTIAL (2020–2030)

Supportive Measure Description

MEASURE DESCRIPTION

Completing a survey of all natural gas and propane-consuming equipment in Metropolitan-owned buildings is a critical first step to identifying cost-effective and efficient replacement options, developing a budget, and establishing a replacement schedule. The first step of this measure will include establishing an updated list of Metropolitan-owned facilities and creating a matrix, which outlines the various pieces of equipment and appliances (e.g., water heaters, HVAC, and stoves) at each facility. This matrix may include the facility name, types and number of pieces of equipment, location of equipment, estimated age, and potential cost to replace it. An added benefit of this measure will be an up-to-date inventory of equipment, their condition, and expected replacement schedule, thereby increasing operational resiliency.

TARGET METRICS

Complete a natural gas equipment consumption survey.

CO-BENEFITS

Operational Resilience

MEASURE DC-2 – PHASE 1

Reduce natural gas emissions by 50 percent by 2030 and 100 percent by 2045 through electrification.

MEASURES DESCRIPTION

Upon completion of the survey and replacement schedule matrix (Measure DC-1), Metropolitan will begin replacing natural gas and propane-consuming equipment with electrically-powered equivalents in line with the established timeframes. As part of this measure, the original survey results should be updated and reviewed annually as equipment and appliances are replaced to provide a tracking mechanism. It is anticipated that most equipment would be replaced near the end of its useful life or in an order that replaces the oldest and most antiquated pieces of equipment first. Electrification of natural gas equipment will likely save money over time due to decreased operating costs even when upfront costs may be higher.[17]

17. *https://rmi.org/insight/the-economics-of-electrifying-buildings/*

CO-BENEFITS

Community Health | Cost Savings | Operational Resilience

CUMULATIVE GHG REDUCTION POTENTIAL (2020–2030)

2,830

MT CO_2e

TARGET METRICS

Replace all natural gas consuming equipment with electrically-powered equivalents and measure quantity in therms of natural gas reduced.

SCOPE 1: 5.0

MEASURE DC-3 – PHASE 1

Update Metropolitan building standards to require all-electric construction for new buildings and retrofits.

CUMULATIVE GHG REDUCTION POTENTIAL (2020–2030)

Supportive

TARGET METRICS

Adopt an operating policy that updates Metropolitan's building standards to require all-electric new construction and retrofits.

MEASURE DESCRIPTION

Adopt an operating policy requiring new construction to be all-electric. Electrification ensures new buildings can achieve carbon neutrality once electricity is carbon-free. All-electric buildings are often less expensive to build and operate.[18] Switching to electricity also helps avoid potential natural gas cost increases, which are expected to greatly outpace electricity increases.[19] This measure also applies to building retrofits (upgrades and rehabilitation). While electric equipment for residential and commercial applications are readily available and cost-effective today, technologies for some industrial applications may either not be readily available or are cost prohibitive. Industrial applications will be electrified as cost effective technologies become available. An added benefit of all-electric building design and construction is that battery storage or generators can power the whole building in an emergency or outage.

19. ***https://gridworks.org/initiatives/cagas-system-transition/***

CO-BENEFITS

Community Health | Cost Savings | Operational Resilience

SCOPE 1:

STRATEGY 2: ZERO EMISSION VEHICLE FLEET

Transportation is the largest source of GHG emissions in California. While Metropolitan's vehicle fleet represents only two to three percent of Metropolitan's total annual emissions, electrifying the fleet is a key step towards achieving carbon neutrality.[20] Electric passenger vehicles are quickly reaching cost parity with internal combustion vehicles and can even provide cost savings over the lifetime of the vehicle.[21] While heavy duty electric vehicles are not currently available for all commercial requirements, new technology that will advance heavy duty vehicle choices will become available in the near future.[22] Furthermore, the advancement of ZEVs, such as EVs, adoption will be driven at the State level in part by EO N-79-20, which directs CARB to develop regulations to achieve 100 percent zero-emission car sales in California by 2035 and zero-emission medium- or heavy-duty vehicles by 2045. Currently, the most promising ZEVs are electric. However, Metropolitan will continue to consider new technologies as they become available and will consider other alternative ZEVs in the future, if feasible. At this phase, beginning to prepare for an emission-free future will ensure Metropolitan can continue to operate without disruption and leverage grants and financing for EV/ZEV infrastructure while they are available.

20. *Fleet refers to the vehicles that are owned and operated by Metropolitan including all passenger vehicles, work trucks, and other mobile equipment.*
21. ***https://rosap.ntl.bts.gov/view/dot/31875/dot_31875_DS1.pdf***

Strategy 2

Metropolitan's vehicle fleet

SCOPE 1: 5.0

MEASURE FL-1 – PHASE 1

Conduct a ZEV/EV Feasibility Study to determine which fleet vehicles can be converted, what chargers/fueling stations are required, and where they should be located by the end of 2022.

CUMULATIVE GHG REDUCTION POTENTIAL (2020–2030)

Supportive

MEASURE DESCRIPTION

Completing a ZEV/EV Feasibility Study will provide Metropolitan with a clear understanding of the existing fleet and establish a path forward to replace fossil fuel-powered vehicles with ZEVs/EVs. In analyzing the existing fleet, the uses of the various fleet vehicles will be considered in order to establish an efficient replacement vehicle schedule and budget. A large component of this study will review and address where new ZEV/EV infrastructure may be required and establish an outline of where it should be installed. The assessment will include all of Metropolitan's facilities and will provide detailed recommendations on vehicle replacement, charging infrastructure, and scheduling. In addition to fleet vehicles, the study will also investigate needs and opportunities relating to vanpool vehicles and employee owned vehicles. This measure will be used as a blueprint for transitioning Metropolitan's fleet to zero emissions.

TARGET METRICS

Complete a ZEV/EV Feasibility Study on fleet vehicles.

CO-BENEFITS

Operational Resilience

MEASURE FL-2 – PHASE 1

Adopt an ZEV/EV first policy for fleet vehicles to obtain ZEVs when technological, operational, or cost effectiveness parameters are met.

MEASURE DESCRIPTION

Based on the results of the analysis completed as part of Measure FL-1, Metropolitan will adopt an ZEV/EV first policy for fleet vehicles when vehicles are purchased unless technological, operational, or cost effectiveness issues are identified. The policy will establish a framework for Metropolitan to purchase ZEVs/EVs or the cleanest available bridge technology per South Coast Air Quality Management District (SCAQMD) Rule 1196 for Clean On-Road Heavy-Duty Public Fleet Vehicles and CARB public fleet rules. It is anticipated that new technology will be developed to establish a pathway forward for medium- or heavy-duty vehicles to become powered by electricity or other alternative fuels as time progresses. Switching to EVs may decrease maintenance costs, result in less downtime for vehicle repairs, decrease emissions, and improve air quality.[23] Cost savings from the decreased operations and maintenance of ZEVs/EVs can then be used to offset vehicle purchase costs for future ZEV/EV purchases. In the event that ZEVs/EVs are not available (due to technological constraints or cost effectiveness), fuel efficiency should be prioritized to help decrease overall fossil fuel consumption as described in Measure AF-2.

23. ***https://www.government-fleet.com/327215/nyc-compares-maintenance-costs-for-ev-and-gasoline-vehicles***

CO-BENEFITS

Operational Resilience

CUMULATIVE GHG REDUCTION POTENTIAL (2020–2030)

Supportive

TARGET METRICS

Adopt an ZEV/EV first policy for fleet vehicles.

SCOPE 1: 5.0

MEASURE FL-3 – PHASE 1

Replace fossil fuel passenger fleet vehicles as identified in the ZEV/EV Feasibility Study (FL-1).

CUMULATIVE GHG REDUCTION POTENTIAL (2020–2030)

Supportive

TARGET METRICS

Number of passenger ZEVs purchased.

MEASURE DESCRIPTION

Metropolitan will replace its fossil fuel-powered passenger vehicles with ZEV/EVs at the time of vehicle replacement with a goal of replacing its fossil-fuel fleet with a ZEV/EV passenger fleet, as feasible. While the ZEV/EV Feasibility Study will include all ZEV types, EVs currently appear to be the leading technology. While the upfront price of passenger EVs is continuing to drop, they may still be more expensive than purchasing traditional passenger vehicles. However, when the total lifetime cost of the passenger EVs (which includes vehicle acquisition costs, maintenance, fuel and electricity, ZEV incentives, reduced tolls for EVs or low-emission vehicles on freeways, and insurance) is compared, passenger EVs can result in a significant cost savings on fuel and maintenance, all of which often make up the difference in initial cost.[24] As the state transitions to carbon-free electricity, the benefits of transitioning to EVs become even greater. Even without carbon-free electricity, passenger EVs result in far fewer GHG emissions, improved air quality, energy security, and increased fuel economy. It is anticipated that each of the fossil fuel-powered passenger vehicles that are currently in Metropolitan's fleet would be replaced at the end of their useful life with an ZEV/EV, as feasible.

24. ***https://www.geotab.com/white-paper/going-electric/***

CO-BENEFITS

Community Health | Cost Savings | Operational Resilience

MEASURE FL-4 – PHASE 1

Install EV charging and/or ZEV infrastructure at facilities pursuant to the findings of the ZEV/EV Feasibility Study (FL-1).

MEASURE DESCRIPTION

A core component of establishing a network of EVs/ZEVs is creating a robust charging/refueling infrastructure network that is available, accessible, and reliable. One of the greatest hurdles with EV/ZEV adoption is a lack of available infrastructure.[25] While all ZEV options will be included in the feasibility study, EVs currently appear to be the leading technology. Expanding EV charger availability will be an essential aspect of creating a reliable EV fleet. The analysis completed as part of Measure FL-1 will outline which facilities would benefit from installing EV infrastructure and at what scale. Installation of EV charging stations would include chargers, grid equipment, software, and communication networks. EV charging stations will be used by Metropolitan's fleet, employees, and visitors to Metropolitan facilities. EV chargers will likely be needed at Metropolitan offices like Union Station Headquarters, the five treatment plants, pumping stations, and Metropolitan-owned housing and other facilities.

Operational Resilience

CUMULATIVE GHG REDUCTION POTENTIAL (2020–2030)

Supportive

TARGET METRICS

Install ZEV/ EV charging infrastructure detailed in the ZEV/EV Feasibility Study.

SCOPE 1:

STRATEGY 3: USE ALTERNATIVE FUELS TO BRIDGE THE TECHNOLOGY GAP TO ZERO EMISSION VEHICLES AND EQUIPMENT

Because of the limited availability of electric medium- and heavy-duty vehicles, the use of alternative fuels like renewable diesel or biogas can serve as a temporary solution to help reduce GHG emissions in the near-term. Although there are opportunities for near-term advances in this area, care will be taken to assure that the measures included in this CAP work towards carbon neutrality without promoting build-out of significant infrastructure for transition fuels that will leave stranded assets. Instead, the measures focus on long-term decarbonization of the fleet as technology becomes available.

Strategy 3

MEASURE AF-1 – PHASE 1

Complete a pilot project on the use of renewable diesel rather than conventional diesel for all stationary equipment by 2025.

MEASURE DESCRIPTION

Metropolitan operates a variety of stationary equipment currently powered by diesel fuel. Replacing the existing diesel fuel with renewable diesel as a short-term measure would reduce emissions with no change in existing infrastructure. Renewable diesel can be used interchangeably in a traditional diesel-powered engine and does not result in any negative operational impacts.[26] According to a study completed by the United States Department of Energy, renewable diesel is also currently cost-competitive with traditional petroleum diesel and sometimes less expensive than conventional petroleum-based diesel in California.[27] In addition, a 2015 study by the California Environmental Protection Agency concluded that renewable diesel has approximately 30 percent less PM emissions, five percent less total hydrocarbon emissions, and 10 percent less NO_X emissions than conventional diesel.[28] Currently, renewable diesel is utilized at a large scale by the United States military and is also used by a variety of city, state, and private fleets.[29] Replacing petroleum diesel with renewable diesel in stationary combustion sources would reduce up to 760 MT CO_2e per year based on the 2017 GHG inventory.

26. *https://www.government-fleet.com/156621/what-you-need-to-know-about-renewable-diesel*

CO-BENEFITS

Community Health | Cost Savings | Operational Resilience

CUMULATIVE GHG REDUCTION POTENTIAL (2020–2030)

Supportive

TARGET METRICS

Complete pilot project on the use of renewable diesel in stationary diesel equipment.

SCOPE 1: 5.0

MEASURE AF-2 – PHASE 1

Complete a pilot project of renewable diesel use in on-road and off-road vehicles by providing at least one renewable diesel tank at Metropolitan-owned fueling depots in 2021.

CUMULATIVE GHG REDUCTION POTENTIAL (2020–2030)

Supportive

TARGET METRICS

Install one renewable diesel tank at a Metropolitan-owned fuel depot and complete pilot project.

MEASURE DESCRIPTION

Metropolitan vehicles generally fuel at Metropolitan-owned fueling depots. By contracting with fuel suppliers to replace petroleum diesel with renewable diesel at these facilities, Metropolitan can reduce GHG emissions and easily track the amount of low carbon fuels being utilized in the fleet. In California, renewable diesel fuel costs mirror the cost of petroleum-based diesel fuel.[30] This measure will be implemented through new contracts for renewable fuels and a change in Metropolitan's policy to use only renewable diesel fuel following the results of the pilot project.

30. ***https://www.government-fleet.com/348069/is-renewable-diesel-still-a-miracle-fuel***

CO-BENEFITS

Community Health | Cost Savings | Operational Resilience

MEASURE AF-3 – PHASE 1

Based on the results of the study in AF-2, Metropolitan will begin using renewable diesel fuel in 100 percent of Metropolitan's diesel-consuming on-road and off-road vehicles by 2025.

MEASURE DESCRIPTION

Implementation of this measure is in addition to Measure AF-1, which covers stationary equipment. Similar to stationary equipment, diesel-powered on-road equipment could utilize renewable diesel fuel, which is a domestically-produced, clean-burning, renewable substitute for petroleum diesel fuel, without any modifications to the internal combustion engines. Because the CO_2 emissions associated with renewable diesel fuels are biogenic, those emissions do not contribute to climate change.[31] Only the N_2O and CH_4 emissions increase net GHG emissions in the atmosphere, leading to a significantly lower GHG emission factor for those fuels. The use of these fuels is considered a bridge to reduce emissions in the short term before electric technologies are available for heavy duty and medium duty on-road vehicles. As stated in Measure AF-1, renewable diesel fuel also burns cleaner, resulting in lower air quality emissions. This measure will be implemented by updating contracts with fuel suppliers for renewable diesel fuel and tracking the total volume of diesel fuel consumed.

5.5 SCOPE 2 MEASURES

SCOPE 2:

STRATEGY 4: UTILIZE LOW-CARBON AND CARBON-FREE ELECTRICITY

Over two-thirds of Metropolitan's GHG emissions result from the use of electricity to power its pumps, treatment plants, and facilities.[32] As a result, Metropolitan is uniquely positioned to achieve most of its GHG emissions reductions by switching to low-carbon or carbon-free sources of electricity. With the adoption of SB 100 in 2018, all of California's retail power is required to be carbon-free by 2045. However, Metropolitan operations utilize a substantial amount of wholesale power,[33] which is not subject to the requirements of SB 100. The GHG emissions associated with Metropolitan's wholesale power purchases can be offset through the purchase of low-carbon or carbon-free power. Strategy 4 encompasses one of Metropolitan's most potent GHG reduction actions (E-5) in which Metropolitan has the ability to offset significant portions of GHG emissions by purchasing low-carbon electricity from the California grid. Metropolitan will also investigate strategies that entail changing the time of day that pumps and other infrastructure consume electricity, by increasing usage during times of low grid emissions and reducing use during times of peak grid emissions.

Strategy 4

Metropolitan will track GHG emissions and ensure operational emissions remain within the carbon budget by adjusting the ratio of renewable power in its power purchases.

32. The use of electricity generates emissions when it is generated by non-renewable sources such as natural gas.

33. Wholesale power refers to electricity purchased directly from the electricity grid rather than through a utility like Southern California Edison.

MEASURE E-1 – PHASE 1

Analyze marginal emissions rates and evaluate the feasibility of shifting energy use to lower emission periods.

MEASURE DESCRIPTION

A majority of Metropolitan's GHG emissions stem from the generation and subsequent use of electricity at the CRA facilities. Because electricity can be generated in a variety of ways ranging from sources with high GHG emissions like coal, moderate emissions like natural gas, or carbon-free sources like hydropower or solar, electricity use can have widely variable GHG emissions rates based on where the electricity is sourced. Additionally, in California, the GHG emissions associated with a Megawatt-hour (MWh) of electricity can vary greatly throughout the day. During daylight hours, high solar production can drive emissions down to 0.18 MT CO_2e per MWh, while during the evening, when fossil fuel-generated power dominates, emissions can be over 0.30 MT CO_2e per MWh.[34] Metropolitan may be able to substantially reduce GHG emissions by increasing electricity use when the marginal emission rate is lower due to renewable or lower-emitting generation and reducing electricity use when the marginal emission rate is higher due to fossil fuel generation. As part of this measure, Metropolitan will investigate the technical and cost-related feasibility of shifting energy use to low emission periods, including the impact to pumps and other infrastructure, the current time-of-use trends, and the cost and GHG reduction implications.

34. ***http://www.caiso.com/Pages/default.aspx***

CO-BENEFITS

CUMULATIVE GHG REDUCTION POTENTIAL (2020–2030)

Supportive

TARGET METRICS

Conduct an emission rate study to identify the feasibility of shifting energy use to lower emission periods, which will include the impact to pumps and other infrastructure.

SCOPE 2: 5.0

MEASURE E-2 – PHASE 1

Connect the Yorba Linda Hydroelectric Power Plant (YLHEP) behind Metropolitan's Southern California Edison (SCE) electricity meter to directly utilize carbon-free electricity at Metropolitan's Diemer facility by 2025.

CUMULATIVE GHG REDUCTION POTENTIAL (2020–2030)

6,301

MT CO_2e

TARGET METRICS

Connect YLHEP lines behind the SCE meter to utilize carbon-free electricity at the Diemer Plant.

MEASURE DESCRIPTION

The YLHEP currently generates carbon-free electricity by harnessing the power of water as it flows through turbines on its way to the Robert B. Diemer Water Treatment Plant (Diemer Plant). This electricity is currently sold by Metropolitan to the wholesale market and released to the state's electricity grid. In its existing configuration, the Diemer Plant uses retail electricity that has a GHG emission factor greater than zero. By reconfiguring the YLHEP power source behind the meter, the electricity it generates would become directly available to the Diemer Plant, offsetting the need for retail power. This reconfiguration would allow Metropolitan to power the Diemer Plant with carbon-free electricity and generate cost savings for Metropolitan by eliminating external electricity purchases. Excess electricity generated at the YLHEP not utilized by the Diemer Plant would continue to be sold by Metropolitan to SCE.

CO-BENEFITS

Community Health | Cost Savings | Operational Resilience

MEASURE E-3 – PHASE 1

In markets where available, Metropolitan will switch its retail accounts to green tariff options offered by power providers by 2025 to reduce the Scope 2 GHG emissions associated with retail electricity use.

MEASURE DESCRIPTION

Metropolitan can reduce its retail electricity emissions by purchasing low-carbon electricity through green tariff options and potentially reduce the cost of electricity simultaneously. Most retail providers offer a portfolio of green energy options, each with a guaranteed percentage of green energy. The price per kilowatt-hour (kWh) varies depending on the mix of energy. For example, a provider in Los Angeles County currently has three options for both commercial and residential customers:

- 36 percent renewable energy content
- 50 percent renewable energy content
- 100 percent renewable energy content

By implementing this measure, Metropolitan will switch to a mix that offers a middle-of-the-road renewable and carbon -free energy mix. Additional reductions could be achieved by switching to a "greener" option, like a 100 percent renewable electricity program.

CO-BENEFITS

Community Health

Operational Resilience

CUMULATIVE GHG REDUCTION POTENTIAL (2020–2030)

18,048

Percent of retail electricity purchased as no or low-carbon.

SCOPE 2: 5.0

MEASURE E-4 – PHASE 1

Install 3.5 MW battery storage systems at the Jensen, Skinner, and Weymouth treatment plants. Investigate the use of a software system to track and optimize GHG emissions reduction due to time-of-use strategies by 2025.

CUMULATIVE GHG REDUCTION POTENTIAL (2020–2030)

219

MT CO_2e

MEASURE DESCRIPTION

Although utilizing renewable energy is an excellent option to reduce Scope 2 GHG emissions, many renewable sources are limited to the time of day when there is sun or wind. Therefore, energy storage systems are an essential component to store energy produced during peak renewable power generation periods in order to power systems during periods when renewable power is not produced. By storing renewable energy, Metropolitan will reduce GHG emissions by charging the battery system during periods of low grid emissions and discharging them during periods of high emission electricity. Battery storage systems will also add increased operational resilience by allowing facilities to operate for short periods of time without power from the grid. The batteries can also be used to conduct rate arbitrage by charging during times when electricity is cheapest and offsetting the peak (most expensive) power periods through use of stored energy.

TARGET METRICS

MW of energy storage installed.

CO-BENEFITS

Community Health | Cost Savings | Operational Resilience

MEASURE E-5 – PHASE 1

Manage Metropolitan's energy purchases to ensure cost-effective energy supply while achieving the required GHG emissions objective.

MEASURE DESCRIPTION

The single largest source of GHG emissions associated with Metropolitan's operations relates to electricity consumption. Most of Metropolitan's Scope 2 GHG emissions are tied to the consumption of electricity needed for pumping water along the CRA, which is directly tied to water demands. Metropolitan's water demands are met through its imported water supplies, which vary year-to-year. When Metropolitan is required to meet these demands through increased pumping on the CRA, higher GHG emissions may result. Electricity used to power the pumps along the CRA comes from three distinct sources: Hoover and Parker Dam hydroelectric power, which has an emission factor of zero, energy purchased from the California Independent System Operator (CAISO's) centralized markets, which had an emission factor of approximately 0.239 MT CO_2e per MWh in 2017, and out-of-state electricity, which is delivered through the Arizona, southern Nevada, New Mexico (AZNM) regional grid, which receives power from multiple states outside California and had an emission factor of 0.480 MT CO_2e in 2017.[35] Metropolitan relies on zero-emission large hydro pumping from Hoover and Parker Dams during low pumping periods. The amount of additional electricity purchased from each source during high pumping years varies year-to-year depending on multiple factors. In general, power purchased from the CAISO or AZNM regional grid makes up a higher percentage of Metropolitan's electricity in high pumping years and adds to the higher GHG emissions in those years.

This measure would change electricity procurement policies to reduce reliance on AZNM electricity and increase the use of energy from the CAISO grid or specific lower GHG emission generating resources. Not only will this action reduce a significant amount of GHG emissions in the short term, but emissions will also likely continue to decrease over time due to SB 100. Energy sales in both markets will also likely continue to transition to carbon-free sources, further reducing GHG emissions. However, it is difficult to predict the future market energy mix or the cost of lower emission energy. Since the emissions reduction associated with this measure will change depending on the actual amount of electricity purchased and the source of purchased energy, Metropolitan will meet any shortfall in its carbon budget through

35. ***https://www.epa.gov/sites/production/files/2020-01/documents/egrid2018_summary_tables.pdf***

SCOPE 2: 5.0

low or no carbon energy purchases and other measures that most cost-effectively achieve the carbon budget objective. The GHG emission reductions below show the potential reduction associated with purchasing CAISO electricity instead of AZNM electricity from 2021 through 2030.

CO-BENEFITS

ESTIMATED CUMULATIVE GHG REDUCTION POTENTIAL (2020–2030)[36]

High Emissions Scenario

1,961,822 MT CO_2e

Average Emissions Scenario

610,245 MT CO_2e

Low Emissions Scenario

TARGET METRICS

GHG emissions reductions realized to meet the GHG target.

36. Assumes current CAISO emission factor compared to current and forecasted AZNM emission factor.

MEASURE EE-3 – PHASE 2

Investigate feasibility of a large-scale (100 MW) battery storage system for the CRA.

MEASURE DESCRIPTION

Metropolitan will complete a feasibility study to analyze the feasibility of large-scale battery storage for the CRA. As renewable electricity becomes more available, establishing a mechanism to store the energy for times when renewable power may not be available will become essential. This will increase resilience in the water conveyance system in the event of a power outage or during an emergency scenario. The system would also be available to use for rate and GHG emissions arbitrage, allowing Metropolitan to reduce GHG emissions and potentially save money over time. The true costs and savings associated with a storage system of this size would be further defined by the feasibility study. The GHG emissions reduction potential for a 100 MW battery storage array is estimated at 20,000 MT CO_2e annually, on average. However, this measure is supportive because more data is needed before a project of this magnitude is implemented.

CO-BENEFITS

Operational Resilience

AVERAGE ANNUAL GHG REDUCTION POTENTIAL

Supportive

TARGET METRICS

Complete a feasibility study of large-scale battery storage system for the CRA.

SCOPE 2:

STRATEGY 5: IMPROVE ENERGY EFFICIENCY

In addition to reducing the Scope 2 carbon intensity of electricity usage, Metropolitan can reduce GHG emissions associated with electricity use by reducing demand through improvements in energy efficiency. Metropolitan's major electrical demand is associated with the pumping of water, and these pumps are already maintained to a high degree of energy efficiency. However, due to their size and amount of electricity used, even marginal improvements in pump efficiency can lead to substantial cost savings and GHG emissions reductions. Additional opportunities include more efficient lighting systems and more energy-efficient buildings (predominantly covered under Strategy 1). Improvements in electrical efficiency will reduce the total demand for electricity from Metropolitan systems, saving money and reducing GHG emissions over the long term.

Strategy 5

MEASURE EE-1 – PHASE 1

Convert all interior and exterior lighting at 50 percent of Metropolitan facilities to light emitting diode (LED) technologies by 2030 and 100 percent by 2045.

MEASURE DESCRIPTION

Metropolitan's facilities include extensive lighting systems. According to the United States Department of Energy, ENERGY STAR-qualified LEDs use only 20 to 25 percent of the energy and last 15 to 25 times longer than the traditional incandescent bulbs they replace. Likewise, LEDs use 25 to 30 percent of the energy and last eight to 25 times longer than halogen incandescent bulbs. Studies show that LEDs not only reduce energy consumption, but they also provide cost savings over traditional bulbs.[37] Implementation of this measure is estimated to save Metropolitan an estimated 1,700 MWh per year by 2030 and 3,400 MWh per year by 2045.

37. *https://www.energy.gov/energysaver/save-electricity-and-fuel/lighting-choices-save-you-money/led-lighting*

TARGET METRICS

Convert

50%

of facilities to LED by 2030 and 100% facilities by 2045.

SCOPE 2: 5.0

MEASURE EE-2 – PHASE 1

Continue programs to analyze CRA pump efficiency and replace or refurbish pumps when cost effective.

CUMULATIVE GHG REDUCTION POTENTIAL (2020–2030)

Supportive

TARGET METRICS

Complete the CRA pump efficiency study, and replace/ refurbish pumps, as needed.

MEASURE DESCRIPTION

To ensure the CRA pumps operate at maximum efficiency, Metropolitan is currently implementing a review of the CRA pumping facilities for operational dependability and efficiency. Based on the results of these studies, pumps will be refurbished or replaced as needed to ensure cost effectiveness and operational resilience. Metropolitan has five pumping plants along the CRA in the California Mojave Desert that transport water 242 miles to its terminus at Lake Mathews.[38] Each pumping plant has nine pumps with a total lift of 1,617 feet. Ensuring that these units are operating at the highest efficiency level will maximize cost savings and enhance operational resilience.

38. *http://www.mwdh2o.com/AboutYourWater/Storage-And-Delivery/Pumping-Plants#:~:text=These%20pumping%20plants%20move%20water,225%20cubic%20feet%20per%20second.*

CO-BENEFITS

Cost Savings

Operational Resilience

MEASURE EE-4A-D – PHASE 2

Implement findings of the CRA pump assessment (from Measure EE-2) to either refurbish or replace pumps at Eagle Mountain, Iron Mountain or Hinds pumping plants.

MEASURE DESCRIPTION

Based on the findings of the pump plant assessment, Metropolitan will refurbish or replace some or all of the pumps at Eagle Mountain, Iron Mountain, and Hinds Pumping Plants. The actual efficiency gain for refurbishment/ replacement of these pumps will be identified by the pump assessment. However, for this analysis, an efficiency gain of two percent was assumed for replacements and 0.5 percent for repairs based on feedback from Metropolitan engineers and industry standards. Even with these marginal efficiency improvements, Metropolitan could substantially reduce GHG emissions over time. However, because the actual efficiency gain will be based on the pump assessment and the implementation would not occur until Phase 2 of the CAP, emission reduction estimates for this measure are not yet considered quantifiable and are not quantified in this report.

- **EE-4a** – Replace impellers at Iron Mountain
- **EE-4b** – Replace impellers at Eagle Mountain or Hinds
- **EE-4c** – Refurbish motors at Iron Mountain
- **EE-4d** – Refurbish motors at Eagle Mountain or Hinds

SCOPE 2: 5.0

MEASURE EE-5 – PHASE 2

If the proposed RRWP is ultimately constructed, install an inter-stage pumping system on the reverse osmosis brine stream to reduce energy use.

AVERAGE ANNUAL GHG REDUCTION POTENTIAL

Supportive

TARGET METRICS

Install an energy recovery system if the Regional Recycled Water Program is approved.

MEASURE DESCRIPTION

Inter-stage pumping systems help improve balance throughout the reverse osmosis (RO) system, decreasing energy demand by approximately 6 percent.[39] Since the RO system would be the largest consumer of electricity at the proposed RRWP, this measure would help decrease electricity demand and therefore lower GHG emissions associated with electricity use at the proposed facility. If the RRWP is ultimately constructed, Metropolitan will include an inter-stage pumping system to improve overall system efficiency while keeping operating costs and GHG emissions at a minimum.

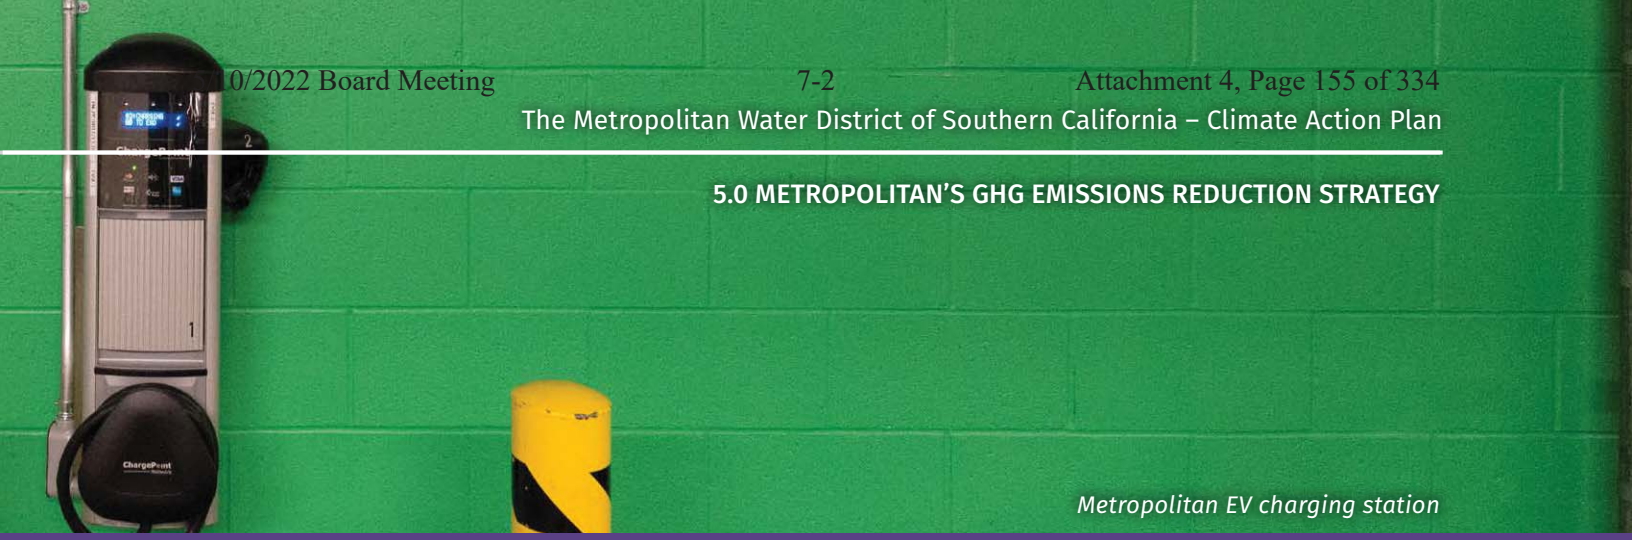
CO-BENEFITS

Cost Savings

Operational Resilience



Metropolitan EV charging station

5.6 SCOPE 3 MEASURES

SCOPE 3:

STRATEGY 6: INCENTIVIZE MORE SUSTAINABLE COMMUTES

While Metropolitan does not have direct control over the manner in which its employees travel to and from their jobs, Metropolitan can facilitate alternative commute strategies, including use of active and shared/subsidized transportation as well as EVs. By providing EV charging infrastructure, Metropolitan can encourage employees to drive personal EVs and shift how some individuals travel in both their work and non-work time. Reducing the potential hurdles of charging during work can encourage Metropolitan staff to purchase EVs. Metropolitan will continue its transit programs to further encourage staff to commute through shared transit. In addition, working remotely during the COVID-19 pandemic has substantially reduced commuter vehicle miles traveled. Metropolitan will develop a policy allowing for remote work in some capacity moving forward, which will both reduce GHG emissions and commuter vehicle miles traveled for employees.

Strategy 6

SCOPE 3: 5.0

MEASURE EC-1 – PHASE 1

Expand subsidized transit commute program to reduce employee commute miles.

CUMULATIVE GHG REDUCTION POTENTIAL (2020–2030)

Supportive

MEASURE DESCRIPTION

The transit commute program is designed to incentivize employees to use mass transit for their commutes to and from work. Metropolitan will evaluate the current success of the subsidized transit commute program and identify avenues to expand the program to reach new employees or provide additional incentives to current employees to increase the rate of alternative commutes by 2025. One potential subsidy is to add incentives for employees to carpool. The role of transit in Metropolitan's commute portfolio will need to be tracked closely over time due to the impacts of COVID-19. More employees working from home and hesitation to take public transit during the pandemic may shift Metropolitan's approach to reducing emissions from employee commutes.

TARGET METRICS

Miles commuted by alternative transportation.

CO-BENEFITS

Community Health

Operational Resilience

MEASURE EC-2 – PHASE 1

Expand employee use of carbon-free and low carbon transportation by providing education programs on the benefits of commute options including public transportation, EV/ZEV options, and vanpools.

MEASURE DESCRIPTION

Providing education to staff on the use of new programs and policies is a fundamental component of achieving significant and impactful change. Metropolitan has established an employee commute education program that provides clear information on the various commute options available to Metropolitan employees, including public transportation, EV charging options, and vanpools. A portion of the education focuses on how Metropolitan employees can integrate diverse commute options and provides a clear list of benefits, including incentive programs and maps outlining where services are available. Metropolitan will track employee participation. One avenue of sharing information may be through Metropolitan's "Water Talk" newsletter and Rideshare's quarterly e-newsletter "Met's On the Go," which provides highlights of Metropolitan's Rideshare programs and announcements for commuters.

CO-BENEFITS

CUMULATIVE GHG REDUCTION POTENTIAL (2020–2030)

Supportive

TARGET METRICS

Miles commuted by low/no carbon vehicles.

SCOPE 3: 5.0

MEASURE EC-3 – PHASE 1

Install ZEV and/or EV infrastructure as directed by the ZEV/EV Feasibility Study to support at least a 15 percent transition of employee-owned vehicles to ZEVs/EVs by 2025.

CUMULATIVE GHG REDUCTION POTENTIAL (2020–2030)

3,427

MT CO_2e

TARGET METRICS

Install ZEV/EV infrastructure to support at least 15% ZEV/EV total adoption by Metropolitan employees.

MEASURE DESCRIPTION

Metropolitan recognizes that current estimates indicate that approximately 90 percent of EV owners charge at home or work with up to 40 percent of charging happening at work.[40] Given this fact, Metropolitan will install additional EV charging stations at its facilities for employees and visitors. Implementation of this measure may encourage Metropolitan employees and visitors to its sites to purchase or lease personal EVs/ZEVs with reduced range anxiety, one of the leading reasons for not moving to EVs/ZEVs. This measure would also allow employees who live further away to commute via personal EVs without worrying about completing round-trip commutes on a single charge. The most appropriate installation locations and charger technologies will be specified in the EV study outlined in Measure FL-1.

40. ***https://avt.inl.gov/sites/default/files/pdf/arra/PluggedInSummaryReport.pdf***

CO-BENEFITS

Community Health

Operational Resilience

MEASURE EC-4 – PHASE 1

Continue to offer benefits to employees who use alternative modes of transportation (e.g., public transportation, bikes).

MEASURE DESCRIPTION

Measure EC-4 supports the implementation of Measure EC-1 by further expanding the benefits Metropolitan will provide to employees who utilize alternative forms of transportation for their commute. Parking cash outs, pre-tax benefits, and other solutions like gift cards or commute competitions will be implemented over time in support of the goal of achieving a reduction in employee commutes.

CO-BENEFITS

CUMULATIVE GHG REDUCTION POTENTIAL (2020–2030)

Supportive

TARGET METRICS

Miles commuted by alternative transportation.

SCOPE 3: 5.0

MEASURE EC-5 – PHASE 1

Allow 50 percent of employees located at Metropolitan's headquarters to telecommute or utilize flexible schedules through 2030 to reduce travel time, vehicle miles traveled (VMT), and GHG emissions.

CUMULATIVE GHG REDUCTION POTENTIAL (2020–2030)

3,345

MT CO_2e

MEASURE DESCRIPTION

As a result of the COVID-19 pandemic, many organizations have allowed their staff to work remotely. This remote work has substantially reduced employee commute times, travel costs, and associated GHG emissions during 2020. This measure would implement a policy to allow Metropolitan staff to continue working from home through the end of 2030. The GHG reduction benefit calculated below conservatively assumes 50 percent of all staff would telecommute on average 1.5 times per week. However, as demonstrated during the COVID-19 pandemic, the number of employees who can feasibly work from home at one time is substantially higher than the conservative numbers assumed here.

TARGET METRICS

Reduce employee commute VMT by 11%.

CO-BENEFITS

Community Health | Cost Savings | Operational Resilience

MEASURE EC-6 – PHASE 2

Replace all Metropolitan vanpool vehicles with ZEVs. Start with a pilot study (Measure FL-1) to evaluate the best approach.

MEASURE DESCRIPTION

Metropolitan currently has a rideshare vanpool program in which more than 40 percent of employees participate. Metropolitan's current rideshare program uses approximately 48 conventional vans to allow staff to carpool together instead of driving individually. Based on the EV study described in Measure FL-1, Metropolitan would replace the conventional fossil fuel-operated vans with electric vans. New technologies for passenger vans are already being developed, and some electric options for commercial vans are already available.[41,42] This measure is considered to be part of Phase 2, because no passenger EV vans are currently available to suit this need.[43] Once those technologies are prevalent and cost effective, Metropolitan will move to replace the current Rideshare vanpool fleet with EVs.

41. ***https://www.ford.com/commercial-trucks/e-transit/2022/***
42. ***https://www.vans.mercedes-benz.com/vans/en/mercedes-benz-vans/insights/mercedes-benz-esprinter-emission-free***
43. *While commercial vans are currently available, passenger vans (with seats) are not. They will likely become available in the next several years.*

TARGET METRICS

Replace all vanpool vehicles with ZEVs.

SCOPE 3:

STRATEGY 7: INCREASE WASTE DIVERSION TO ACHIEVE ZERO WASTE

Though waste generated by Metropolitan operations results in only a small fraction of overall annual GHG emissions, Metropolitan will implement specific measures designed to reduce the waste generated at its offices and other facilities. A majority of the GHG emissions resulting from Metropolitan-generated waste are caused by decomposition of organic material under anaerobic conditions. The remainder of the emissions come from inorganic wastes, such as plastic, which have both upstream and downstream emissions. Therefore, increasing the diversion of organic and inorganic waste streams is a primary measure to reduce waste-related GHG emissions. Waste reduction programs will prioritize organic waste streams, like food waste, first as they contribute the most to overall waste emissions when sent to the landfill.[44] By composting and diverting these items from the landfill, Metropolitan can not only reduce its GHG emissions, but also generate valuable compost, which can be used to sequester carbon and keep it from entering the atmosphere. Organics diversion is a major driver of State regulations including SB 1383.[45]

44. *https://www.usda.gov/foodlossandwaste/why*
45. *https://www.calrecycle.ca.gov/climate/slcp*

Strategy 7

MEASURE WA-1 – PHASE 1

Develop and implement net zero waste policies and programs at all facilities to reduce landfilled waste by 30 percent by 2030 and achieve zero landfilled waste by 2045.

MEASURE DESCRIPTION

Achieving zero landfilled waste is an attainable goal for Metropolitan. While Metropolitan does have control over the items it purchases, without substantial changes to how products are designed and the materials used, zero waste will remain a challenge. However, Metropolitan will continue its efforts to lower its waste generation by implementing procurement policies, updating food service requirements, and adhering to State and local regulations, like SB 1383 that will increase waste diversion as it works towards the ultimate goal of achieving carbon neutrality. This measure assumes a linear reduction of waste starting in 2022 (3.3 percent) and achieving a 30 percent reduction by 2030.

CUMULATIVE GHG REDUCTION POTENTIAL (2020–2030)

4,517

MT CO_2e

TARGET METRICS

Reduce waste generation by 30%.

CO-BENEFITS

Community Health

Ecosystem Health

Operational Resilience

SCOPE 3: 5.0

MEASURE WA-2 – PHASE 1

Implement a program to reduce organic waste at Metropolitan's Union Station building. Contract or team with local organizations and waste disposal companies to route organic waste to anaerobic digestion or composting facilities and edible food-to-food recovery centers.

CUMULATIVE GHG REDUCTION POTENTIAL (2020–2030)

Supportive

TARGET METRICS

Separate organic waste from other materials at Metropolitan's Union Station building and route organics to local facilities.

MEASURE DESCRIPTION

To reduce organics in the waste stream, Metropolitan will implement composting at the Union Station building food service areas. Composting diverts organic waste from the landfill where it decomposes and generates methane, which is a potent GHG. Organic waste pickup is available through Los Angeles Sanitation & Environment and other waste haulers. Edible organics (food left over from food service, but not provided to Metropolitan staff) can also be diverted and beneficially reused because many local organizations focus on edible food diversion to those in need.[46, 47] As part of this measure, composting with signage will be included in all eating areas and in the kitchen of the food service areas.

46. *https://www.lacitysan.org/san/faces/home?_adf.ctrl-state=po85gh5ho_5*

TARGET METRICS

Develop and implement an environmentally-preferred purchasing policy.

SCOPE 3: 5.0

MEASURE WA-4 – PHASE 2

Partner with municipal agencies, like the City of Los Angeles, to create programs that will allow Metropolitan to provide its fair share of diversion and help local jurisdictions meet the goals of SB 1383 for organics diversion, including food waste and composting.

AVERAGE ANNUAL GHG REDUCTION POTENTIAL

Supportive

TARGET METRICS

Partner with local jurisdictions to help meet the goals of SB 1383.

Tons of compost utilized.

Tons of organics diverted.

MEASURE DESCRIPTION

SB 1383 calls for the diversion of 75 percent of organics from the waste stream by 2025. In order to achieve this goal, jurisdictions throughout California will need to collect organics, create compost through organics processing, and utilize compost as a soil amendment to sequester carbon and avoid methane emissions. Metropolitan can support this process not only by providing composting at Metropolitan facilities, but also by investigating opportunities to utilize compost application techniques on Metropolitan-owned lands. Compost application to range lands and agricultural fields offers several benefits, including healthier soils, more plant growth, and carbon sequestration.[51] Compost application can also enhance water retention in some soil types, reducing the need for watering.[52] By working to both reduce its own organic waste and find a place for compost application, Metropolitan can support the overall goals of S B 1383 and reduce its own GHG emissions.

51. *https://www.ioes.ucla.edu/project/carbon-sequestration-through-compost/*

CO-BENEFITS

Ecosystem Health

Water Conservation

SCOPE 3:

STRATEGY 8: INCREASE WATER CONSERVATION AND LOCAL WATER SUPPLY

Through the implementation of water conservation programs, per capita water consumption in the Metropolitan service area has decreased from 0.14 acre-feet of deliveries per person in 1990 to 0.09 acre-feet of deliveries per person in 2017, an approximate reduction of 36 percent in per capita water use. This increase in water efficiency has come from a variety of actions by the State, Metropolitan, and the community. Metropolitan has invested millions of dollars to support these actions, including educational programs and incentives for water efficient appliances and turf removal. Reducing water consumption provides many benefits in addition to the potential reduction in GHG emissions. Lower per capita demand means the same amount of water can meet the demand of a growing region while leaving enough water in the ecosystem to support critical habitats. Metropolitan will continue and potentially expand its water conservation efforts into the future through incentivizing conservation and through the proposed Regional Recycled Water Program which, if completed, will provide a substantial source of local water to the Los Angeles Basin.

Strategy 8

Regional Recycled Water Program Advanced Purification Center

SCOPE 3: 5.0

MEASURE WC-1 – PHASE 1

Expand programs that educate customers on water conservation initiatives through workshops and speaking engagements.

CUMULATIVE GHG REDUCTION POTENTIAL (2020–2030)

Supportive

MEASURE DESCRIPTION

Metropolitan already provides educational programs about the benefits of water conservation throughout its service area. Implementation of this measure will ensure that Metropolitan continues to provide these services and expand the message to include the benefits of GHG reduction and resiliency achieved through water conservation.

TARGET METRICS

Expand water conservation education initiatives.

CO-BENEFITS

MEASURE WC-2 – PHASE 1

Continue to implement innovative water use efficiency programs.

MEASURE DESCRIPTION

Metropolitan completed a study of its water use efficiency programs. Metropolitan will commit to continue to review current and past water conservation programs with the goal of identifying the most successful programs on a water reduction per dollar spent basis.

CO-BENEFITS

Cost Savings

Operational Resilience

Water Conservation

Water Conservation

MEASURE WC-4 – PHASE 1

Provide funding for the development and monitoring of local stormwater recharge and use projects to evaluate the water supply benefit of stormwater.

MEASURE DESCRIPTION

Metropolitan's Stormwater Pilot Programs provide up to $12.5 million for the development and monitoring of stormwater recharge and direct use projects. The purpose of the Stormwater Pilot Programs is to gain a better understanding of the actual costs and potential water supply benefits associated with stormwater recharge and use by increasing monitoring data collection for new and existing stormwater projects in the region. Funding is open to public and private (non-residential) locations within Metropolitan's service area. Ultimately, these studies will provide a basis for potential future funding approaches for stormwater.

The Recharge Pilot Program is open to new and existing projects that capture stormwater for groundwater recharge. Examples of stormwater recharge projects include capture and recharge through spreading basins, dry wells, or subsurface infiltration galleries. These projects increase groundwater levels and storage in the groundwater basin. The stormwater recharge projects included in this study are designed to benefit the regional water supply by increasing local groundwater production or reducing Metropolitan replenishment demands.

The Direct Use Pilot Program focuses on projects that capture and directly use stormwater on-site, often through an underground cistern. These direct use projects will be used to offset non-potable demands.

CO-BENEFITS

CUMULATIVE GHG REDUCTION POTENTIAL (2020–2030)

Supportive

TARGET METRICS

Provide funding for the development and monitoring of local stormwater recharge and use projects to evaluate the water supply benefit of stormwater.

SCOPE 3: 5.0

MEASURE WC-5 – PHASE 1

Continue to promote water efficiency technologies and innovative practices that can be adopted into future water conservation program updates.

MEASURE DESCRIPTION

1. Metropolitan's Innovative Conservation Program provides funding in cooperation with other entities (currently Southern California Gas Company) for research that will document water savings and reliability of innovative water savings devices. A call for proposals is released approximately every two years, and applicants selected for grant funding are given one to two years to implement their test protocols and deliver a final report to Metropolitan staff. The objective is to evaluate the water savings potential and reliability of innovative water saving devices, technologies, and strategies. **EXAMPLE:** One study evaluates the use of drone imagery to improve irrigation management in golf courses. (http://www.bewaterwise.com/icp-projects.html)

2. Metropolitan's Water Savings Incentive Program provides financial incentives for customized water efficiency projects, including installation of commercial or industrial high-efficiency equipment; industrial process improvements; agricultural and landscape water efficiency improvements; and water management services. New technologies or custom strategies to save water can be tested in real-world settings; if a project or application is repeatedly successful, the technology or strategy may be incorporated into Metropolitan's standard programs.

   EXAMPLE: Fire-fighting training devices allow for recycling of hose water during training cycles. Metropolitan has funded about six of these projects and has seen a high success rate; the device may be considered for a standard incentive.

3. Metropolitan's Conservation Credits Program has a standing committee – the Program Advisory Committee (PAC) – that is comprised of Metropolitan and member and retail agency staff and meets on a regular basis to provide recommendations to Metropolitan's management on all the water efficiency incentive programs. The PAC has the ability to investigate new devices and technologies to determine potential applicability to Metropolitan incentive programs.

MEASURE WC-5 – PHASE 1 (CONTINUED)

MEASURE DESCRIPTION

EXAMPLE: The Municipal Water District of Orange County (MWDOC) has provided information on average water savings associated with conversion of overhead/spray irrigation to drip irrigation in its service area. The MWDOC provided this information to the PAC; the PAC felt it was representative for all member agencies and recommended adoption of the water savings value for other agency projects.

4. Metropolitan's existing program, MWD Innovates, provides developers of new technologies a venue to pitch their ideas and receive feedback from Metropolitan staff.[54] This measure will extend this program through 2030. This measure will realize GHG emissions reduction as a result of implementation of projects approved under this program, and Metropolitan will conduct additional outreach about the program's goals and its benefits. Metropolitan will also increase support of these projects with the potential for funding or pilot projects.

54. ***http://mwdinnovates.com/***

CO-BENEFITS

CUMULATIVE GHG REDUCTION POTENTIAL (2020–2030)

Supportive

TARGET METRICS

Number of new technologies/ ideas reviewed.

SCOPE 3: 5.0

MEASURE WC-6 – PHASE 2

Implement advanced technology systems to increase Metropolitan-owned recycled and groundwater recovery systems to maintain local water supply (e.g., proposed RRWP).

AVERAGE ANNUAL GHG REDUCTION POTENTIAL

Supportive

TARGET METRICS

Acre-feet of water generated by the RRWP that replaces water pumped from the CRA.

MEASURE DESCRIPTION

Metropolitan is in the process of investigating the feasibility of a regional recycled water program that would treat wastewater to potable water quality and send treated water to groundwater injection wells within the Los Angeles area. The development and operation of this facility would substantially increase the amount of local water available and potentially reduce the amount of imported water needed to meet increasing demand, reducing operational GHG emissions. The increased GHG emissions associated with the RRWP have already been included in the GHG emissions forecast, and the savings estimated below are associated with estimates of reduced imported water pumping. Actual GHG emissions savings would depend on changes observed after RRWP implementation.

CO-BENEFITS

Ecosystem Health | Operational Resilience | Water Conservation

SCOPE 3:

STRATEGY 9: INVESTIGATE AND IMPLEMENT CARBON CAPTURE AND SEQUESTRATION OPPORTUNITIES

Carbon sequestration and carbon capture and storage projects could provide Metropolitan a source of "negative" GHG emissions that will support its ability to achieve carbon neutrality. Carbon sequestration generally refers to natural processes such as plant growth or avoided soil carbon loss, while carbon capture and storage refers to technologies that take CO_2 or other GHG emissions out of the atmosphere and store them in deep underground geologic formations. Several carbon sequestration/carbon capture and storage opportunities are being investigated, researched and evaluated. Metropolitan will continue to track these opportunities as they progress. While GHG reduction through electrification, carbon-free electricity, and efficiency will drive a significant portion of the GHG reductions Metropolitan needs, sequestering and storing carbon from the atmosphere will likely play a critical role in achieving and maintaining carbon neutrality for both Metropolitan and California.[55]

Carbon capture will be based on the CARB protocol adopted in 2018 under "Carbon Capture and Sequestration Protocol". Other carbon sequestration opportunities will be vetted through the "Restoration of California Deltaic and Coastal Wetlands" protocol adopted in 2017 by the American Carbon Registry, which operates in the voluntary and regulated carbon markets until the time CARB adopts the protocol into the compliance market.

Strategy 9

SCOPE 3: 5.0

MEASURE CS-1–PHASE 1

Study carbon capture protocols in the Sacramento-San Joaquin River Delta.

CUMULATIVE GHG REDUCTION POTENTIAL (2020–2030)

Supportive

TARGET METRICS

Conduct a carbon capture reconnaissance and general assessment that evaluates technological, scientific, economic, and regulatory dimensions relevant to potential carbon capture and storage on Metropolitan properties.

MEASURE DESCRIPTION

Prepare an assessment that will investigate potential opportunities within Metropolitan's Delta property boundaries. The carbon capture protocols will be aligned with CARB's approved "Carbon Capture and Sequestration Protocol" under the Low Carbon Fuel Standard adopted in 2018.

CO-BENEFITS

Community Health | Cost Savings | Ecosystem Health | Operational Resilience

MEASURE CS-2–PHASE 1

Conduct a five-year research program to increase Metropolitan's knowledge of regenerative agriculture and carbon sequestration opportunities on Metropolitan properties in the Palo Verde Valley.

MEASURE DESCRIPTION

Metropolitan will partner with the California State University, Chico Center for Regenerative Agriculture and Resilient Systems to conduct a five-year research program designed to increase Metropolitan's knowledge of regenerative agriculture and carbon sequestration opportunities. The project will compare regenerative land management methods to the current conventional practices used by Metropolitan and contrast cash crop (alfalfa) productivity between the two systems. The program will look at the impacts of traditional fallowing practices, which involve significant inputs of fuel, time, and labor and can also damage soil and increase soil loss. In an effort to reduce or eliminate these impacts, the pilot program will investigate the effects of various cover crops and no-till practices. The benefits of these practices may include improved carbon capture and storage, less soil erosion, and reduced emissions from fuel consumption. The results of the study will be reviewed, and changes to a larger area of agricultural land would follow based on the results.[56]

56. ***https://www.csuchico.edu/regenerativeagriculture/research/metro-district-water-soil-carbon.shtml***

CO-BENEFITS

Community Health | Cost Savings | Ecosystem Health | Operational Resilience

CUMULATIVE GHG REDUCTION POTENTIAL (2020–2030)

Supportive

TARGET METRICS

Complete a regenerative agriculture and carbon sequestration study on Metropolitan properties in the Palo Verde Valley.

SCOPE 3: 5.0

MEASURE CS-3 – PHASE 2

Establish baseline soil carbon quantities through science-based approaches then develop pilot projects to enhance carbon sequestration and implement larger scale carbon sequestration projects as deemed feasible.

AVERAGE ANNUAL GHG REDUCTION POTENTIAL

Supportive

TARGET METRICS

Conduct a Carbon Sequestration Feasibility Study on Metropolitan-owned lands.

Carbon Sequestered in MT CO_2e.

MEASURE DESCRIPTION

Metropolitan owns several separate islands/tracts in the Sacramento-San Joaquin River Delta (California Delta). These properties have significant soil acreages rich in organics, making them potentially strong candidates for carbon sequestration projects. This measure directs Metropolitan to fully research the feasibility of conducing carbon sequestration projects on the islands to reduce GHG emissions. Significant research on current property conditions and the impacts of alternative land use strategies would be required before these programs are implemented and quantified.

CO-BENEFITS

Community Health | Cost Savings | Ecosystem Health | Operational Resilience

Lake Skinner

SECTION 6.0
IMPLEMENTATION AND MONITORING

Through this CAP, Metropolitan is committed to achieving long-term carbon neutrality. The CAP outlines specific strategies and measures to achieve demonstrative GHG emissions reductions in Metropolitan's day-to-day operations (see Section 5.0 for more details). The CAP will be implemented in two phases: Phase 1 from 2020 to 2030 and Phase 2 from 2031 to 2045. Throughout the process, strategies and measures included in the CAP may evolve over time. Implementation of this plan is grounded in science and current best practices in climate action planning. This section details Metropolitan's commitment to continually implement the CAP, monitor progress, and prepare the CAP updates required to achieve its ambitious goals.

6.0

California-friendly rock garden

6.0

Colorado River Aqueduct shutdown work

6.1 CAP IMPLEMENTATION

To ensure that the CAP is being implemented, Metropolitan established the Climate Working Group and developed an internal pathway to prioritize and implement the strategies and measures discussed in Sections 5.4 through 5.6.

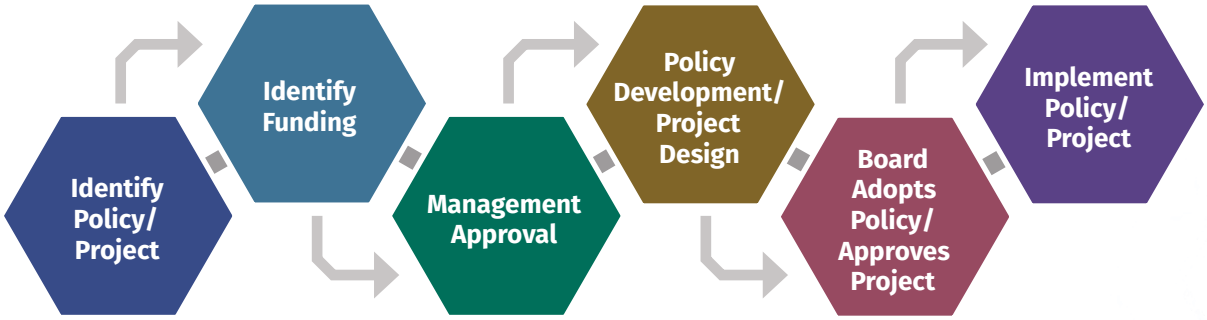
The Climate Working Group is comprised of a key group of Metropolitan team members specifically selected from each of the internal responsible departments, as shown in Figure 6-1.

FIGURE 6-1: Metropolitan Responsible Departments

The Climate Working Group will identify policies and projects for implementation, work with relevant departments to draft and review required projects or policies, present the items to Metropolitan management to identify funding and obtain approval, and track implementation metrics. The Climate Working Group also will work with all relevant departments to develop policies/project design, as appropriate. Plans, programs and relevant projects will be submitted to the Metropolitan Board of Directors to fund and adopt the new plan, program, policy, or project. Figure 6-2 provides a visual demonstration of the CAP implementation phases, which requires the Climate Working Group to manage the implementation process.

Metropolitan's Environmental Planning Section, along with the Climate Working Group, will track GHG emission reductions realized from implementation of the measures to ensure Metropolitan stays within its carbon budget. The Environmental Planning Section will also be responsible for future updates to the CAP, which are anticipated every five years. Tracking will occur through an annual GHG inventory, which will be used to adjust the remaining carbon budget. Metropolitan is committed to staying within the carbon budget and will implement the monitoring and reporting protocol, update the GHG inventory, and provide an update to the Board of Directors on progress every year starting in the summer of 2022. Table 6-1 includes a complete list of the Phase 1 GHG reduction strategies and measures, the estimated year of implementation for each strategy and measure, and the departments responsible for implementation. Phase 1 measures are those that will be implemented through 2030 and contribute to Metropolitan's plan to stay within its carbon budget even under the high emissions scenario. Table 6-2 includes Phase 2 measures which are focused on long-term GHG emission reduction that will require further development and may be adjusted based on the findings of specified feasibility studies.

FIGURE 6-2: Metropolitan CAP Implementation Process



6.0

RESPONSIBLE METROPOLITAN DEPARTMENTS AND GROUPS

Several departments within Metropolitan will play key roles in the CAP implementation. Each of the departments responsible for CAP implementation are listed below as well as the climate working group that is made up of members from each of these departments as well as additional departments within Metropolitan as outlined in Figure 6-1.

Climate Working Group

The Climate Working Group will be the primary entity responsible for CAP implementation and will be made up of staff from key departments. The Climate Working Group convened at the start of the CAP process, has developed and reviewed each section of the CAP, and will ensure the CAP is implemented over time. The Climate Working Group meets monthly and will take the lead on educating and engaging other departments on the implementation of measures identified in the CAP.

Administrative Services

Administrative Services manages Metropolitan's purchasing processes and rideshare programs and will lead implementation of the employee commute measures, including distribution of subsidized transit passes and education campaigns.

Environmental Planning

Environmental Planning will be responsible for implementation of the CAP, tracking the carbon budget on an annual basis with data validated by TCR, updating the CAPDash tool that tracks progress towards meeting the targets, producing annual progress reports, and developing the five-year CAP updates. CAPDash is a customizable, web-based dashboard developed by Rincon Consultants, Inc. that allows Metropolitan to track the implementation of each measure and meet the requirements of State CEQA Guidelines Section 15183.5(b)(1). Environmental Planning will also work with the Climate Working Group to spearhead the work with other departments and present annual progress reports to Metropolitan's Board of Directors.

Facility Management

Facility Management is tasked with maintaining Metropolitan's building operations and will be critical in implementing waste, energy, and other reduction measures that focus on facility operations.

Fleet

Fleet is responsible for purchasing and maintaining Metropolitan's on-road, off-road, and stationary equipment. The Fleet Department will be responsible for implementing many of the vehicle- and fuel-related measures in the CAP, including Metropolitan's transition to ZEVs and biofuels.

Engineering Department

Engineering, along with Facility Management, discussed above, will lead the implementation of Metropolitan's building and energy efficiency related projects, including the development of electric building policies, existing building electrification projects, and infrastructure changes, such as water pump retrofits.

Water Resources Management/ Water Efficiency

Water Resources Management and its Water Efficiency division are tasked with planning, securing, and managing Metropolitan's water resources. This department will take the lead on many of the water conservation measures such as continuation of the turf removal program (WC-3).

Bay Delta Initiatives

Bay Delta Initiatives is responsible for overseeing efforts to secure a reliable water supply from the SWP through environmental and water supply improvements in the Sacramento-San Joaquin River Delta. Bay Delta Initiatives will be responsible for implementing many of the carbon sequestration measures.

Power Operations and Planning

Power Operations and Planning manages the wholesale power requirements of the CRA pumping operation and the power supplies from Metropolitan's entitlements to the output from Hoover and Parker Dams. Power Operations and Planning also manages power sales from Metropolitan's hydroelectric plant fleet and power issues related to Metropolitan's retail treatment and pumping energy needs.

6.0

THE PHASE 1 IMPLEMENTATION PLAN

The Implementation Plan (Table 6-1) includes the strategies and measures included in Section 5.0 of the CAP, their implementation timeframe, the responsible departments, and the implementation performance metrics. The strategies are intended to identify the general focus areas for GHG emissions reductions, while measures show the specific and quantifiable actions that will be taken to achieve Metropolitan's GHG emission reduction targets and stay within the carbon budget under all emissions scenarios. Each Phase I measure includes specific actions that are known to be feasible and implementable. Based on substantial evidence, including Metropolitan-specific data, these measures are found to be capable of reducing a specific quantity of GHG emissions within a reasonable period of time, considering economic, environmental, legal, social, and technological factors.

TABLE 6-1: Phase 1 Measure Implementation Plan

Phase	#	Measure	Implementation Year	Responsible Department(s) and Group(s)	Implementation Metric
Scope 1: Direct Combustion					
Strategy 1 – Phase Out Natural Gas Combustion at Facilities					
1	DC-1	Conduct a survey of all natural gas consuming devices in offices, control buildings, and residential structures and establish a schedule to replace natural gas equipment with electric by 2025.	2025	• Facility Management • Engineering	Complete Study
1-2	DC-2	Reduce natural gas emissions by 50 percent by 2030 and 100 percent by 2045 through electrification.	2021	• Facility Management • Engineering	Therms Reduced
1	DC-3	Update Metropolitan building standards to require all-electric construction for new buildings and retrofits.	2022	• Facility Management • Engineering	Update Building Standards

TABLE 6-1: Phase 1 Measure Implementation Plan *(continued)*

Phase	#	Measure	Implementation Year	Responsible Department(s) and Group(s)	Implementation Metric
Strategy 2 - Zero Emission Vehicle Fleet					
1	FL-1	Conduct a ZEV/EV Feasibility Study to determine which fleet vehicles can be converted, what chargers/fueling stations are required, and where they should be located by the end of 2022.	2022	• Fleet Management • Engineering • Environmental Planning	Complete Study
1	FL-2	Adopt an ZEV/EV first policy for fleet vehicles to obtain ZEVs when technological, operational, or cost effectiveness parameters are met.	2022	• Fleet Management	Update Policy
1-2	FL-3	Replace fossil fuel passenger fleet vehicles as identified in the ZEV/EV Feasibility Study.	2025	• Fleet Management	Percent ZEVs/EVs in Fleet
1	FL-4	Install EV charging and/or ZEV infrastructure at facilities pursuant to the findings of the ZEV/EV Feasibility Study (FL-1).	2023	• Fleet Management • Facility Management • Engineering	ZEV/EV Infrastructure Installed
Strategy 3 - Use Alternative Fuels to Bridge the Technology Gap to Zero Emission Vehicles					
1	AF-1	Complete a pilot project on the use of renewable diesel rather than conventional diesel for all stationary equipment by 2025.	2022	• Fleet Management	Complete Study
1	AF-2	Complete a pilot project of renewable diesel use in on-road and off-road vehicles by providing at least one renewable diesel tank at Metropolitan-owned fueling depots in 2021.	2021	• Fleet Management	Complete Pilot
1	AF-3	Based on the results of the study in AF-2, Metropolitan will begin using renewable diesel fuel in 100 percent of Metropolitan's diesel-consuming on-road and off-road vehicles by 2025.	2022	• Fleet Management	Gallons of Renewable Diesel Fuel Used

TABLE 6-1: Phase 1 Measure Implementation Plan *(continued)*

Phase	#	Measure	Implementation Year	Responsible Department(s) and Group(s)	Implementation Metric
Scope 2: Electricity					
Strategy 4 – Utilize Low-Carbon and Carbon-Free Electricity					
1	E-1	Analyze marginal emissions rates and evaluate the feasibility of shifting energy use to lower emission periods.	2023	• Power Operations and Planning	Complete Study
1	E-2	Connect the YLHPP behind SCE electricity meter to directly utilize carbon-free electricity at Metropolitan's Diemer facility by 2025.	2025	• Facility Management • Engineering	Complete Project
1	E-3	In markets where available, Metropolitan will switch its retail accounts to green tariff options offered by power providers by 2025 to reduce the Scope 2 GHG emissions associated with retail electricity use.	2025	• Power Operations and Planning	Percent Low-Carbon or Carbon-Free Electricity
1	E-4	Install 3.5 MW battery storage systems at the Jensen, Skinner, and Weymouth treatment plants. Investigate the use of a software system to track and optimize GHG emissions reduction due to time-of-use strategies by 2025.	2023	• Power Operations and Planning • Facility Management • Engineering	Complete Project
1	E-5	Manage Metropolitan's energy purchases to ensure cost-effective energy supply while achieving the required GHG emissions objective.	2021	• Power Operations and Planning	GHG Emissions Reductions

TABLE 6-1: Phase 1 Measure Implementation Plan *(continued)*

Phase	#	Measure	Implementation Year	Responsible Department(s) and Group(s)	Implementation Metric
Strategy 5 – Improve Energy Efficiency					
1	EE-1	Convert all interior and exterior lighting at 50 percent of Metropolitan facilities to LED technologies by 2030 and 100 percent by 2045.	2025	• Facility Management	Percent of Facilities Upgraded
1	EE-2	Continue programs to analyze CRA pump efficiency and replace or refurbish pumps when cost effective.	2023	• Facility Management • Engineering	Complete Study
Scope 3: Indirect Emissions and Sequestration					
Strategy 6 – Incentivize More Sustainable Commutes					
1	EC-1	Expand subsidized transit commute program to reduce employee commute miles.	2022	• Administrative Services	Expand Subsidized Transit Commute Program
1	EC-2	Expand employee use of carbon-free and low carbon transportation by providing education programs on the benefits of commute options including public transportation, ZEV options, and vanpools.	2021	• Administrative Services	Continue Education Program
1	EC-3	Install ZEV and/or EV infrastructure as directed by the ZEV/EV Feasibility Study to support at least a 15 percent transition of employee-owned vehicles to ZEVs/EVs by 2025.	2030	• Facility Management • Engineering	Number of ZEV/EV Infrastructure Installed
1	EC-4	Continue to offer benefits to employees who use alternative modes of transportation (e.g. public transportation, bikes).	2021	• Administrative Services	Maintain Program

TABLE 6-1: Phase 1 Measure Implementation Plan *(continued)*

Phase	#	Measure	Implementation Year	Responsible Department(s) and Group(s)	Implementation Metric
1	EC-5	Allow 50 percent of employees located at Metropolitan's headquarters to telecommute or utilize flexible schedules through 2030 to reduce travel time, VMT, and GHG emissions.	2021	• Administrative Services	Update Policy
Strategy 7 – Increase Waste Diversion to Achieve Zero Waste					
1	WA-1	Develop and implement net zero waste policies and programs at all facilities to reduce landfilled waste by 30 percent by 2030 and achieve zero landfilled waste by 2045.	2023	• Facility Management	Percent Waste Reduction
1	WA-2	Implement a program to reduce organic waste at Metropolitan's Union Station building. Contract or team with local organizations and waste disposal companies to route organic waste to anaerobic digestion or composting facilities and edible food-to-food recovery centers.	2023	• Facility Management	Percent Waste Reduction
1	WA-3	Develop and implement a sustainable procurement policy.	2022	• Administrative Services	Develop and Adopt Policy
Strategy 8 – Increase Water Conservation and Local Water Supply					
1	WC-1	Expand programs that educate customers on water conservation initiatives through workshops and speaking engagements.	2023	◦ Water Resources Management/ Water Efficiency	Expand Program
1	WC-2	Continue to implement innovative water use efficiency programs.	2022	• Water Resources Management/ Water Efficiency	Maintain Program

TABLE 6-1: Phase 1 Measure Implementation Plan *(continued)*

Phase	#	Measure	Implementation Year	Responsible Department(s) and Group(s)	Implementation Metric
1	WC-3	Continue Turf Removal Program to install an average of 1,500,000 square feet (sq. ft.) of water efficient landscapes per year through 2030 through the use of a rebate program.	2021	• Water Resources Management/ Water Efficiency	Maintain Program
1	WC-4	Provide funding for the development and monitoring of local stormwater recharge and use projects to evaluate the water supply benefit of stormwater.	2025	• Water Resources Management/ Water Efficiency	Acre-feet of Stormwater Capacity Installed
1	WC-5	Continue to promote water efficiency technologies and innovative practices that can be adopted into future water conservation program updates.	2025	• Water Resources Management/ Water Efficiency	New Technologies Reviewed
Strategy 9 – Investigate and Implement Carbon Capture and Sequestration Opportunities					
1	CS-1	Study carbon capture protocols in the Sacramento-San Joaquin River Delta.	2025	• Facility Management • Engineering • Bay Delta Initiatives • Water Resources Management	Complete Study
1	CS-2	Conduct a five-year research program to increase Metropolitan's knowledge of regenerative agriculture and carbon sequestration opportunities on Metropolitan properties in the Palo Verde Valley.	2020	• Water Resources Management	Complete Study

6.0

Table 6-2 includes the implementation plan for Phase 2 measures. Because Phase 2 measures still require additional information or new technologies before they can be implemented, the implementation year is not listed. Furthermore, the short-term implementation metric for each of these measures is to complete a feasibility study, with the potential long-term implementation metrics shown in Table 6-1. More detailed implementation metrics and dates will be included in future updates of the CAP. However, the party responsible for research and future implementation are listed as well as the implementation tracking metrics.

TABLE 6-2: Phase 2 Measure Implementation Plan

Phase	#	Measure	Responsible Department(s) and Group(s)	Implementation Metric
Strategy 4 – Utilize Low-Carbon and Carbon-Free Electricity				
2	EE-3	Investigate feasibility of a large-scale (100 MW) battery storage system for the CRA.	• Facility Management • Engineering • Power Operations and Planning	Complete Feasibility Study
Strategy 5 – Improve Energy Efficiency				
2	EE-4a	Replace pump impellers at the Iron Mountain pumping plant if directed by findings of the pump assessment (Measure EE-2).	• Facility Management • Engineering	Replace Impellers
2	EE-4b	Replace pump impellers at Eagle Mountain or Hinds pumping plants if directed by findings of the pump assessment (Measure EE-2).	• Facility Management • Engineering	Replace Impellers
2	EE-4c	Refurbish motors at Iron Mountain if applicable based on the findings of the pump assessment (Measure EE-2).	• Facility Management • Engineering	Refurbish Motors
2	EE-4d	Refurbish motors at Eagle Mountain or Hinds pumping plants if directed by findings of the pump assessment (Measure EE-2).	• Facility Management • Engineering	Refurbish Motors

TABLE 6-2: Phase 2 Measure Implementation Plan *(continued)*

Phase	#	Measure	Responsible Department(s) and Group(s)	Implementation Metric
2	EE-5	If the proposed RRWP is ultimately constructed, install an inter-stage pumping system on the reverse osmosis brine stream to reduce energy use.	• Facility Management • Engineering	Install Energy Recovery System
Strategy 6 – Incentivize More Sustainable Commutes				
2	EC-6	Replace all Metropolitan vanpool vehicles with ZEVs. Start with a pilot study (Measure FL-1) to evaluate the best approach.	• Administrative Services/ Rideshare	Replace All Vanpool Vehicles with EVs
Strategy 7 – Increase Waste Diversion to Achieve Zero Waste				
2	WA-4	Partner with municipal agencies, like the City of Los Angeles, to create programs that will allow Metropolitan to provide its fair share of diversion and help local jurisdictions meet the goals of SB 1383 for organics diversion, including food waste and composting.	• Facility Management	Complete Feasibility Study
Strategy 8 – Increase Water Conservation and Local Water Supply				
2	WC-6	Implement advanced technology systems to increase Metropolitan-owned recycled and groundwater recovery systems to maintain local water supply (e.g., RRWP).	• Facility Management • Engineering	Acre-feet of Water Generated
Strategy 9 – Investigate and Implement Carbon Capture and Sequestration Opportunities				
2	CS-3	Establish baseline soil carbon quantities through science-based approaches then develop pilot projects to enhance carbon sequestration and implement larger scale carbon sequestration projects as deemed feasible.	• Facility Management • Engineering • Bay Delta Initiatives • Water Resources Management	Complete Feasibility Study

Newport Back Bay restoration project

6.2 CAP MONITORING

One requirement of a successful CAP is routine monitoring of progress towards the established GHG reduction goals. For Metropolitan, this will include the monitoring of and reporting on the CAP implementation metrics defined in Sections 5.4 through 5.6 and summarized in the implementation plan. CAP monitoring will also include the preparation of annual GHG inventories. These annual inventories will be used to track carbon budget progress and provide the detail needed to make implementation decisions. Specifically, Metropolitan may need to make adjustments to renewable power purchases to ensure progress towards carbon neutrality by 2045. The Climate Working Group will provide updates on CAP implementation progress and status of the carbon budget to the Board of Directors on an annual basis.

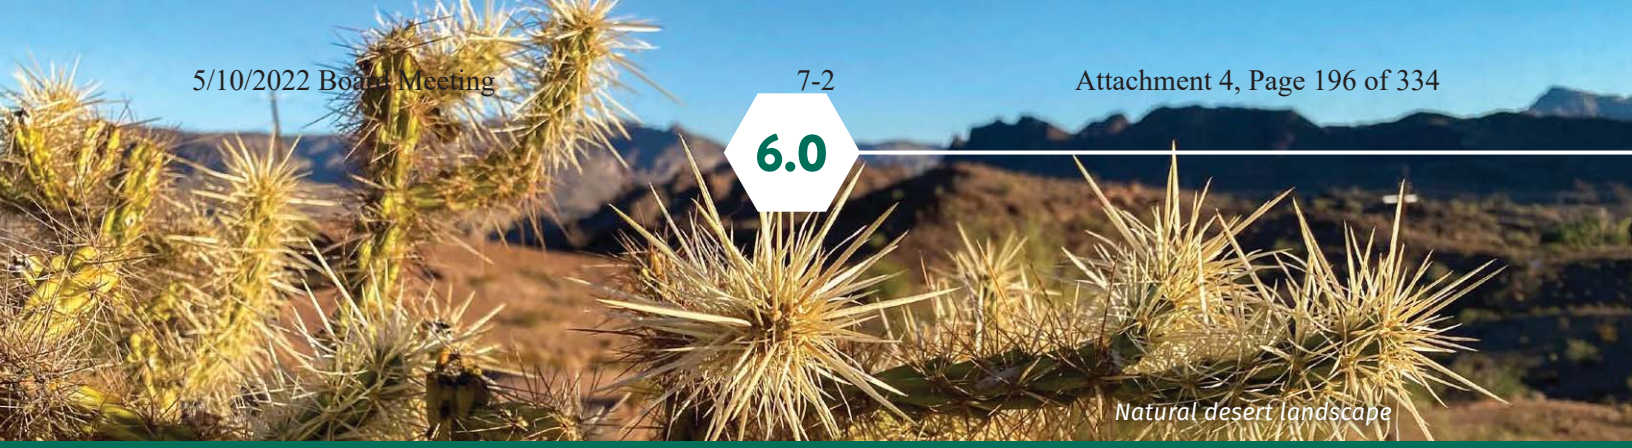
CARBON BUDGET UPDATES

The key step in maintaining the accuracy of the carbon budget is an annual GHG inventory of Metropolitan operations. To ensure the carbon budget is an accurate representation of Metropolitan's GHG emissions and progress towards its targets, Metropolitan will conduct annual updates of the carbon budget. On an annual basis, Metropolitan will record Scopes 1 and 2 GHG emission sources, including fuel consumption and electricity use. Due to the small contribution of Scope 3 emissions to Metropolitan's overall emissions and the relatively difficult data collection process, Metropolitan will conduct a complete inventory, which will also calculate all Scope 3 emissions, every five years. In interim years between major inventories, a Scope 3 estimate will be included. Carbon budget updates will be done every spring, once the prior year's energy data is available. This ensures that the carbon budget results can be tied into decision making across Metropolitan's planning efforts.

ANNUAL MONITORING AND REPORTING OF METROPOLITAN GHG REDUCTION MEASURES

Metropolitan will monitor implementation of the GHG emissions reduction measures and develop an annual progress report, which will include both the most recent carbon budget update and updates on the implementation status of each GHG reduction measure. The process for monitoring and quantifying measure implementation status requires tracking the key target metrics identified in each of the GHG reduction measures in Sections 5.4 through 5.6. In order to provide a transparent mechanism of tracking, Table 6-1 and Table 6-2 identify specific actions, expected implementation timing, and which Metropolitan department(s) will monitor the ongoing implementation of the CAP measures. This process will also include updates to Metropolitan's CAPDash and monitoring software, which will be used to provide transparent and regular updates to stakeholders.

Dennis Underwood Conservation Area



Natural desert landscape

6.3 CAP UPDATE SCHEDULE

Metropolitan's CAP has been designed to provide substantial progress towards achieving carbon neutrality by 2045. As part of this plan, Metropolitan has established a carbon budget with interim targets that exceed the State GHG reduction goals. To support these goals, strategies and measures have been developed that will form the foundation of carbon-neutral operations at Metropolitan. Some of these strategies include transitioning buildings to all-electric power, procuring carbon-free electricity, and transitioning the vehicle fleet to ZEVs. These strategies have been identified to ensure Metropolitan will achieve carbon neutrality over time. However, new technologies, new State regulations, and new incentives as well as Metropolitan's operational conditions will all change over time. Therefore, Metropolitan is committed to conducting comprehensive updates of the CAP every five years. These updates will revisit the strategies in the plan, update actions based on progress to date, and evaluate new technologies and the legislative landscape. The five-year update will also include a comprehensive GHG inventory, identify new opportunities to reduce emissions, revise emissions forecasts to ensure an accurate analysis of Metropolitan's operations, and adjust the implementation schedule accordingly to ensure Metropolitan stays within its carbon budget.

FIGURE 6-3: CAP Update Timeline

APPENDICES

Diamond Valley Lake

APPENDIX A:
REGULATORY CONTEXT

Table of Contents

This page intentionally left blank.

Regulatory Context

As the impacts of climate change are becoming clearer, strategies to address climate change are emerging at all levels of government. This section provides an overview of the regulatory context at the international, state, and local levels relative to Metropolitan's actions toward reducing greenhouse gas (GHG) emissions.

International Climate Action Guidance

1992 United Nations Framework Convention on Climate Change

The primary international regulatory framework for GHG reduction is the United Nations Framework Convention on Climate Change (UNFCCC). The UNFCCC is an international treaty adopted in 1992 with the objective of stabilizing atmospheric GHG concentrations to prevent disruptive anthropogenic climate change. The framework established non-binding limits on global GHG emissions and specified a process for negotiating future international climate-related agreements.[1]

1997 Kyoto Protocol

The Kyoto Protocol is an international treaty that was adopted in 1997 to extend and operationalize the UNFCCC. The protocol commits industrialized nations to reduce GHG emissions per country-specific targets, recognizing that they hold responsibility for existing atmospheric GHG levels. The Kyoto Protocol involves two commitment periods during which emissions reductions are to occur, the first of which took place between 2008-2012. The second commitment period set new targets and other changes but has not been entered into force (meaning it has not gone into effect).[2]

2015 The Paris Agreement

The Paris Agreement is the first universal, legally binding global climate agreement that was adopted in 2015 and has been ratified by 191 countries worldwide.[3] The Paris Agreement establishes a roadmap to keep the world under 2 degrees Celsius (°C) of warming with a goal of limiting an increase of temperature to 1.5°C. The Paris Agreement does not dictate one specific reduction target, instead relying on individual countries to set nationally determined contributions (NDCs) or reductions based on gross domestic product and other factors. According to the International Panel on Climate Change (IPCC), limiting global warming to 1.5°C will require global emissions to reduce through 2030 and hit carbon neutrality by mid-century.[4]

California Regulations and State GHG Targets

California remains a global leader in the effort to reduce GHG emissions and combat climate change through its mitigation and adaptation strategies. By the early 2000's, California was passing climate change bills including Senate Bill (SB) 1078 and Executive Order (EO) S-3-05 which began to require

state agencies and utilities to address climate change. With the passage of Assembly Bill (AB) 32 in 2006, California became the first state in the nation to mandate GHG emission reductions across its entire economy. To support AB 32, California has enacted legislation, regulations, and executive orders (EO) that put it on course to achieve robust emission reductions and address the impacts of a changing climate. The following is a summary of executive and legislative actions most relevant to the Climate Action Plan.

2002 Senate Bill 1078

In 2002, Senate Bill (SB) 1078 established the California Renewables Portfolio Standards (RPS) Program which requires that 20 percent of retail electricity sales be composed of renewable energy sources by 2017 and was accelerated in 2006 by SB 107,[5] which requires that 20 percent of retail electricity sales be composed of renewable energy sources by 2010, instead of 2017. EO S-14-08 was signed in 2008 to further streamline California's renewable energy project approval process and increase the state's RPS to the most aggressive in the nation requiring 33 percent renewable power by 2020.[6] SB 350, discussed further below, further accelerated the program which mandated a 50% RPS by 2030.

2002 Assembly Bill 1493

In 2002, AB 1493, also known as the Pavley Regulations, directed the California Air Resources Board (CARB) to establish regulations to reduce GHG emissions from passenger vehicles to the maximum and most cost-effective extent feasible. CARB approved the first set of regulations to reduce GHG emissions from passenger vehicles in 2004, with the regulations initially taking effect with the 2009 model year.

2005 Executive Order S-3-05

EO S-3-05 was signed in 2005, establishing statewide GHG emissions reduction targets for the years 2020 and 2050. The EO calls for the reduction of GHG emissions in California to 2000 levels by 2010, 1990 levels by 2020, and 80 percent below 1990 levels by 2050. The 2050 emission reductions target would put the state's emissions in line with the worldwide reductions needed to reach long-term climate stabilization as concluded by the IPCC *2007 Fourth Assessment Report*.

2006 Assembly Bill 32

California's major initiative for reducing GHG emissions is outlined in AB 32, the "California Global Warming Solutions Act of 2006," which was signed into law in 2006. AB 32 codifies the statewide goal of reducing GHG emissions to 1990 levels by 2020 and requires CARB to prepare a Scoping Plan that outlines the main state strategies for reducing GHG emissions to meet the 2020 deadline. In addition, AB 32 requires CARB to adopt regulations to require reporting and verification of statewide GHG emissions.

Based on this guidance, CARB approved a 1990 statewide GHG baseline and 2020 emissions limit of 427 million metric tons of CO_2 equivalent (MMT CO_2e). The Scoping Plan was approved by CARB on December 11, 2008 and included measures to address GHG emission reduction strategies related to energy efficiency, water use, and recycling and solid waste, among other measures. Many of the

[6] Executive Order S-14-08. http://www.climatestrategies.us/library/library/view/292

GHG reduction measures included in the Scoping Plan (e.g., Low Carbon Fuel Standard, Advanced Clean Car standards,[7] and Cap-and-Trade) have been adopted since approval of the Scoping Plan.

In May 2014, CARB approved the first update to the AB 32 Scoping Plan. The 2014 Scoping Plan update defined CARB's climate change priorities for the next five years and set the groundwork to reach post-2020 statewide goals. The update highlighted California's progress toward meeting the "near-term" 2020 GHG emission reduction goals defined in the original Scoping Plan. It also evaluated how to align the state's longer-term GHG reduction strategies with other state policy priorities, including those for water, waste, natural resources, clean energy, transportation, and land use (CARB 2014).

2007 Executive Order S-1-07

Also known as the Low Carbon Fuel Standard, EO S-1-07, issued in 2007, established a statewide goal that requires transportation fuel providers to reduce the carbon intensity of California's transportation fuels by at least 10 percent by 2020. EO S-1-07 was readopted and amended in 2015 to require a 20 percent reduction in carbon intensity by 2030, the most stringent requirement in the nation. The new requirement aligns with California's overall 2030 target of reducing climate changing emissions 40 percent below 1990 levels by 2030, which was set by SB 32 and signed by the governor in 2016.

2007 Senate Bill 97

Signed in August 2007, SB 97 acknowledges that climate change is an environmental issue that requires analysis in California Environmental Quality Act (CEQA) documents. In March 2010, the California Natural Resources Agency adopted amendments to the State CEQA Guidelines for the feasible mitigation of GHG emissions or the effects of GHG emissions. The adopted guidelines give lead agencies the discretion to set quantitative or qualitative thresholds for the assessment and mitigation of GHG and climate change impacts.

2008 Senate Bill 375

SB 375, signed in August 2008, enhances the state's ability to reach AB 32 goals by directing CARB to develop regional GHG emission reduction targets to be achieved from passenger vehicles by 2020 and 2035. In addition, SB 375 directs each of the state's 18 major Metropolitan Planning Organizations (MPOs), to prepare a Sustainable Communities Strategy" that contains a growth strategy to meet these emission targets for inclusion in the MPO's Regional Transportation Plan.

In March 2018, CARB adopted updated regional targets for reducing GHG emissions from 2005 levels by 2020 and 2035. Each region was assigned a target for 2020 and 2035.[8] Metropolitan's operations span several of these regions.

2009 California Green Building Code

The California Green Building Standards Code (CALGreen) is Part 11 of the California Building Standards Code or Title 24 and is the first statewide "green" building code in the nation. The

[7] On September 19, 2019, the National Highway Traffic Safety Agency and the U.S. Environmental Protection Agency issued a final action entitled the One National Program on Federal Preemption of State Fuel Economy Standards Rule. This action finalizes Part I of the Safer, Affordable, Fuel-Efficient (SAFE) Vehicles Rule. This rule states that federal law preempts State and local tailpipe GHG emissions standards as well as zero emission vehicle (ZEV) mandates. The SAFE Rule withdraws the Clean Air Act waiver it granted to California in January 2013 as it relates to California's GHG and zero emission vehicle programs.

8 https://ww2.arb.ca.gov/sites/default/files/2020-06/SB375_Final_Targets_2018.pdf

purpose of CALGreen is to improve public health, safety, and general welfare by enhancing the design and construction of buildings. Enhancements include higher energy efficiency, better air quality, and improved daylighting. The first CALGreen Code was adopted in 2009 and has been updated in 2013, 2016, and 2019. The CALGreen Code will have subsequent, and continually more stringent, updates every three years.

2009 Senate Bill X7-7

In 2009, SB X7-7, also known as the Water Conservation Act, was signed, requiring all water suppliers to increase water use efficiency. This legislation sets an overall goal of reducing per capita urban water use by 20 percent by2020.

2011 Senate Bill 2X

In 2011, SB 2X was signed, requiring California energy providers to buy (or generate) 33 percent of their electricity from renewable energy sources by 2020.

2012 Assembly Bill 341

AB 341 directed the California Department of Resources Recycling and Recovery (CalRecycle) to develop and adopt regulations for mandatory commercial recycling. As of July 2012, businesses are required to recycle, and jurisdictions must implement a program that includes education, outreach, and monitoring. AB 341 also set a statewide goal of 75 percent waste diversion from landfill by the year 2020.

2014 Assembly Bill 32 Scoping Plan Update

In 2014, CARB approved the first update to the Scoping Plan. This update defines CARB's climate change priorities and sets the groundwork to reach the post-2020 targets set forth in EO S-3-05. The update highlights California's progress toward meeting the near-term 2020 GHG emissions reduction target, defined in the original Scoping Plan. It also evaluates how to align California's longer-term GHG reduction strategies with other statewide policy priorities, such as water, waste, natural resources, clean energy, transportation, and land use.

2014 Assembly Bill 1826

AB 1826 was signed in 2014 to increase the recycling of organic material. GHG emissions produced by the decomposition of these materials in landfills were identified as a significant source of emissions contributing to climate change. Therefore, reducing organic waste and increasing composting and mulching are goals set out by the AB 32 Scoping Plan. AB 1826 specifically requires jurisdictions to establish organic waste recycling programs by 2016, and phases in mandatory commercial organic waste recycling over time.

2015 Senate Bill 350

SB 350, the Clean Energy and Pollution Reduction Act of 2015, has two objectives: to increase the procurement of electricity from renewable sources from 33 percent to 50 percent by 2030 and to double the energy efficiency of electricity and natural gas end users through energy efficiency and conservation.

2015 Executive Order B-30-15

EO B-30-15 was signed in 2015, establishing an interim GHG emissions reduction target to reduce emissions to 40 percent below 1990 levels by 2030. The EO also calls for another update to the CARB Scoping Plan to provide a pathway to achieve this goal.

2016 Senate Bill 32

In September 2016, the governor signed SB 32 into law, extending AB 32 by requiring the state to further reduce GHGs to 40 percent below 1990 levels by 2030 (the other provisions of AB 32 remain unchanged).

2016 Senate Bill 1383

Adopted in September 2016, SB 1383 requires CARB to approve and begin implementing a comprehensive strategy to reduce emissions of short-lived climate pollutants. SB 1383 requires achievement of the following reduction targets by 2030:

- Methane – 40 percent below 2013 levels
- Hydrofluorocarbons – 40 percent below 2013 levels
- Anthropogenic black carbon – 50 percent below 2013 levels

SB 1383 also requires CalRecycle, in consultation with CARB, to adopt regulations that achieve specified targets for reducing organic waste in landfills. SB 1383 further requires 20% of edible food disposed of at the time to be recovered by 2025.

2017 Scoping Plan Update

In December 2017, CARB adopted the 2017 Scoping Plan, which provides a framework for achieving the 2030 goal set by SB 32. The 2017 Scoping Plan relies on the continuation and expansion of existing policies and regulations, such as the Cap-and-Trade Program, as well as implementation of recently approved legislation, such as SB 350 and SB 1383.

The 2017 Scoping Plan also puts an increased emphasis on innovation, adoption of existing technology, and strategic investment to support its strategies. As with the 2014 Scoping Plan Update, the 2017 Scoping Plan does not provide project-level thresholds for land use development. Instead, it recommends that local governments adopt policies and locally appropriate quantitative thresholds consistent with statewide per capita goals of six metric tons (MT) CO_2e by 2030 and two MT CO_2e by 2050 (CARB 2017). As stated in the 2017 Scoping Plan, these goals may be appropriate for plan-level analyses (i.e., city, county, subregional, or regional level), but not for specific individual projects because they include all emissions sectors in the state (CARB 2017).

2018 Senate Bill 100

Adopted in September 2018, SB 100 supports the reduction of GHG emissions from the electricity sector by accelerating the state's RPS Program, which was last updated by SB 350 in 2015. SB 100 requires electricity providers to increase procurement from eligible renewable energy resources to 33 percent of total retail sales by 2020, 60 percent by 2030, and 100 percent by 2045.

2018 Executive Order B-55-18

In September 2018, the governor issued Executive Order B-55-18, which established a new statewide goal of achieving carbon neutrality by 2045 and maintaining net negative emissions thereafter. This goal is in addition to the existing statewide GHG reduction targets established by SB 375, SB 32, SB 1383, and SB 100.

APPENDIX B:
GHG INVENTORY AND FORECAST METHODOLOGY

1 Introduction

California considers the impact of climate change to be a serious threat to the public health, the environment, and the economic well-being of the State. California has taken an aggressive stance to mitigate the impact on climate change at the State-level through the adoption of legislation and policies to protect natural resources and reduce greenhouse gas (GHG) emissions. The three major State GHG-related goals are established by Assembly Bill (AB) 32 and Senate Bill (SB) 32, and most recently, Executive Order (EO) B-55-18, which has not yet been codified. AB 32 required State Air Resources Board to adopt rules and regulations that would reduce the State's GHG emissions to 1990 levels by 2020; whereas SB 32 requires a 40 percent reduction below 1990 levels by 2030. EO B-55-18 sets a long-term goal of achieving carbon neutrality as soon as possible, but no later than 2045. The goals set by AB 32 were achieved by the State in 2016[1]and many jurisdictions have completed GHG inventories to quantify compliance with their own 2020 goals as well as develop targets to align with the requirements of SB 32 and show progress towards carbon neutrality. The Metropolitan Water District of Southern California (Metropolitan) has chosen to develop a Climate Action Plan (CAP) for its operations and align GHG reduction goals to correspond with State emissions reduction targets.

Estimating GHG emissions enables entities to establish an emissions baseline, track emissions trends, identify the greatest sources of GHG emissions within their jurisdictions, and set targets for future reductions. This inventory is compliant with the Local Governments for Sustainability (ICLEI) *Local Government Operations Protocol for the Quantification and Reporting of Greenhouse Gas Emissions Inventories*[2] (Local Government Protocol) and meets the requirements of the California Environmental Quality Act (CEQA) Guidelines Section 15183.5(b) for a 'qualified' GHG emissions reduction plan or CAP. Methodology used in some sections (water/wastewater) has been updated to conform with the industry standard as recommended in the Association of Environmental Professionals (AEP) *California Supplement to the United States Community-Wide GHG Emissions Protocol*[3] (California Supplement). Emissions inventories are an iterative process and must be reviewed annually to ensure consistency with current emissions inventory methodologies and factors.

Emissions contained within this inventory include activities under the jurisdictional control or significant influence of Metropolitan, as recommended by AEP in preparing CEQA-compliant inventories.[3]

1.1 Executive Summary

GHG Emissions Inventories

Metropolitan has reported operational GHG emissions to The Climate Registry (TCR) annually since 2005. For each year from 2005 to 2020, Scope 1 and 2 emissions are calculated using operational activity data. Scope 3 emissions were calculated for the year 2008, the first year with complete data, and 2017, the final complete year of data available for the inventory. At the time of developing the CAP the complete scope 3 datasets for 2018, 2019 and 2020 were not available. Scope 3 emissions were found to contribute a relatively small amount of overall emissions, as shown below in Figure 1 and Table 1. Scope 3 emissions from 2008 and 2017 were averaged and the average was then applied to all interim years for consistency. Construction emissions were estimated based on annual construction forecasts for the years 2019 through 2024. An analysis of Metropolitan's Annual Capital Expenditures since 1990 showed construction activities during the period 2019-2024 represents an average or less than average level of construction activity when compared to historical annual capital expenditures adjusted to current dollars. Therefore, the GHG inventory provides a conservative estimate of past emissions (by not inflating historical emissions and thereby making future reduction targets easier to meet). Both Figure 1 and Table 1 summarize the emissions inventory. For an in-depth data analysis of the years 2008 and 2017, including detailed inventory methodologies, please see Section 4 of this appendix.

Figure 1 Metropolitan Emissions by Scope

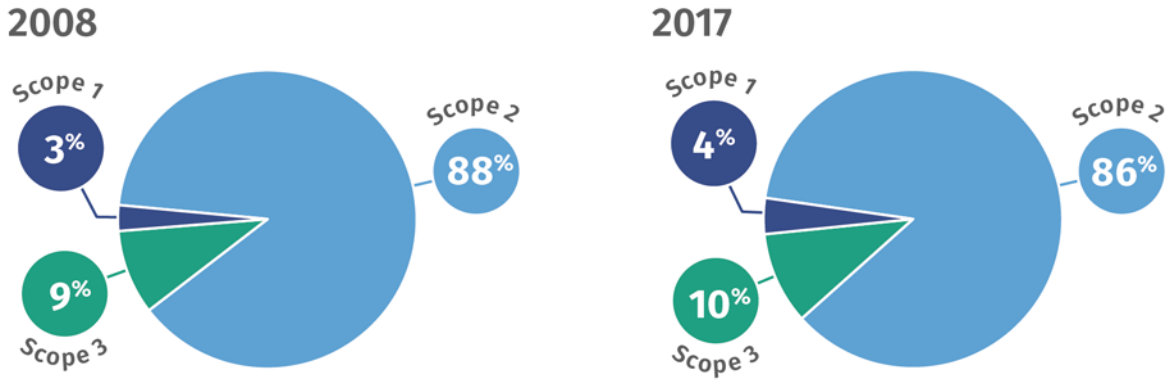

Table 1 2008 and 2017 Emissions by Scope and Sector

Scope	2008 GHG Emissions (MT of CO_2e)	2008 Percent of Total Emissions	2017 GHG Emissions (MT of CO_2e)	2017 Percent of Total Emissions
Scope 1	**8,073**	**3%**	**8,875**	**4%**
Stationary Combustion	893	<1%	1,918	1%
Fugitive Emissions	0	0%	71	<1%
Mobile Combustion	7,180	3%	6,886	3%
Scope 2	**226,651**	**88%**	**194,480**	**86%**
Electricity Consumption	224,105	87%	192,511	85%
T&D Losses	2,546	1%	1,969	1%
Scope 3	**11,613**	**4%**	**10,598**	**5%**
Water and Wastewater	13	<1%	184	<1%
Waste Generation	2,363	1%	3,157	1%
Employee Commute	9,237	4%	7,257	3%
Scope 3 Construction	**12,081**	**5%**	**12,081**	**5%**
Construction Emissions	12,081	5%	12,081	5%
Total Emissions	**258,419**	**100%**	**226,036**	**100%**

Numbers may not sum due to rounding

MT = metric tons

CO_2e = carbon dioxide equivalent

T&D = transmission and distribution

Metropolitan's GHG emissions have steadily decreased compared to 1990 levels even during periods of GHG emissions spikes caused by increased pumping along the Colorado River Aqueduct (CRA) between 2010 and 2014. Emissions in 2017 were 71 percent lower than 1990 emission levels. Figure 2 presents the annual operational emissions for every year Metropolitan has reported emissions to TCR as well as estimated emissions for 1990. Emissions are reported as metric tons (MT) of carbon dioxide equivalents (CO_2e) per standard practice and using the global warming potential (GWP) presented in the Intergovernmental Panel on Climate Change (1995) Second Assessment Report to maintain consistency with State regulations. Future inventories may update these GWPs to maintain consistency with State methodologies. Inventory results highlighted in Figure 2 and Table 2 shows Metropolitan emissions have decreased from approximately 772,000 MT of CO_2e in 1990 to approximately 226,000 MT of CO_2e in 2017.

Figure 2 GHG Emissions 1990 through 2020

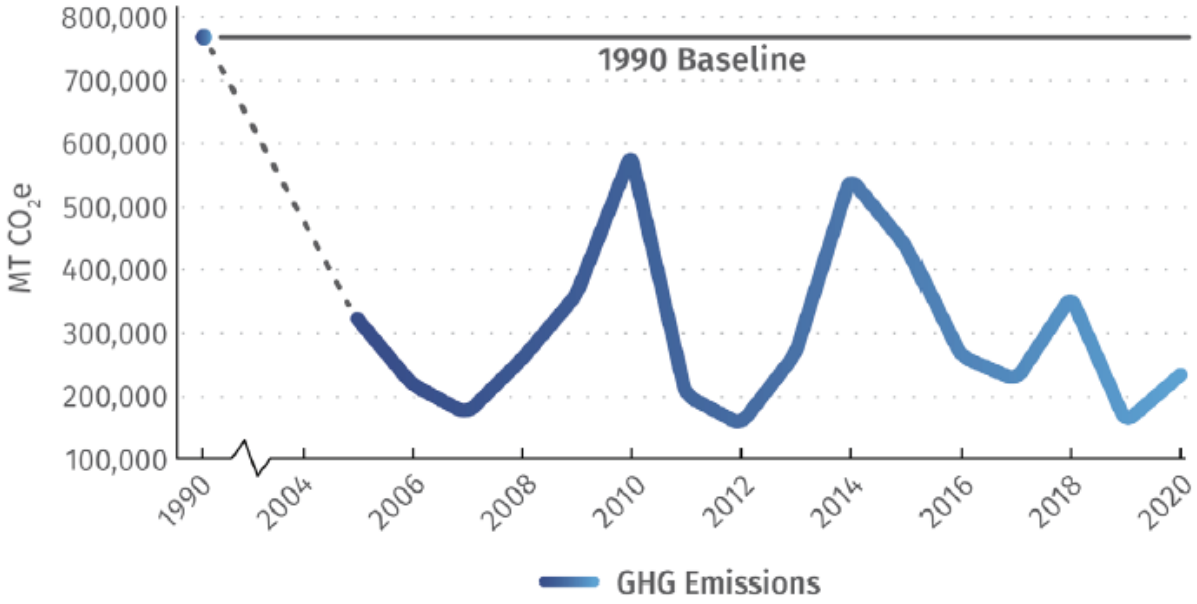

Table 2 Inventory Results 1990 and 2005 Through 2017

Year	Scope 1 & 2 (MT CO_2e)	Scope 3 (MT CO_2e)	Scope 3 Construction (MT CO_2e)	Total Emissions (MT CO_2e)
1990	748,326	11,106	12,081	771,514
2005	300,036	11,106	12,081	323,224
2006	196,167	11,106	12,081	219,355
2007	149,580	11,106	12,081	172,768
2008	234,724	11,614	12,081	258,419
2009	337,269	11,106	12,081	360,457
2010	559,764	11,106	12,081	582,952
2011	179,187	11,106	12,081	202,374
2012	132,449	11,106	12,081	155,637
2013	244,164	11,106	12,081	267,352
2014	522,643	11,106	12,081	545,830
2015	417,213	11,106	12,081	440,400
2016	240,233	11,106	12,081	263,420
2017	203,356	10,599	12,081	226,036
2018	335,099	11,106	12,081	358,287
2019	136,012	11,106	12,081	159,200
2020	211,141	11,106	12,081	234,329

Numbers may not sum due to rounding

MT = metric tons

CO_2e = carbon dioxide equivalent

GHG Emissions Forecast

The GHG inventories provide an accurate depiction of Metropolitan emission trends over time. Because annual emissions change over time due to external factors such as hydrology, climate, population growth, operational changes, and construction projects, Metropolitan also developed an emissions forecast that estimates GHG emissions between 2017 and 2045.[4] The forecast is used to assist Metropolitan in setting targets that are consistent with State-level goals by means of a gap analysis between the forecasted emissions and the reductions targets. Because GHG emissions associated with Metropolitan operations are heavily impacted by water demand and water source, three scenarios were modeled for Metropolitan's forecast. Each of the three scenarios are based on Metropolitan's 2020 Urban Water Management Plan water demand forecast. The three scenarios are intended to capture the full range of possible future emissions. The scenarios account for a high emission scenario where there are multiple-dry years and high operational emissions; an average emission scenario which assumes a single dry year demand level and average operational emissions; and a low emission scenario associated with an average demand year and low operational emissions.

The forecast presented here has been further adjusted to incorporate State and federal programs which are currently codified and are expected to continue being implemented through 2045. However, to be conservative only SB 100 (100% carbon free electricity by 2045) was applied to the forecast. Other State and federal programs may support Metropolitan's GHG emission reductions in the future, but they were not quantified as part of this forecast. In addition, emissions resulting from the construction and operation of the proposed Regional Recycled Water Plant (RRWP) were also included in each of the GHG emission forecasts. Calculating the difference between the adjusted GHG emissions forecast and the reduction targets set by Metropolitan determines the gap to be closed through Metropolitan's CAP policies. Figure 3 presents the projected emissions for Metropolitan through 2045 associated with the three different forecast scenarios (high, average, low). Table 3 includes a comparison of the projected emissions for each scenario in each target year (2030 and 2045) compared to the 1990 emissions baseline. The full methodology used to derive these results are provided in Section 4 of this appendix.

[4] 2018, 2019, and 2020 emissions inventories were received after completion of the forecast and therefore, not used to develop Metropolitan's GHG emissions forecast. However, they have been accounted for in the carbon budget. However, the forecasts are based on the 2020 UWMP which was updated in 2021.

Figure 3 Adjusted Emissions Forecast 1990-2045

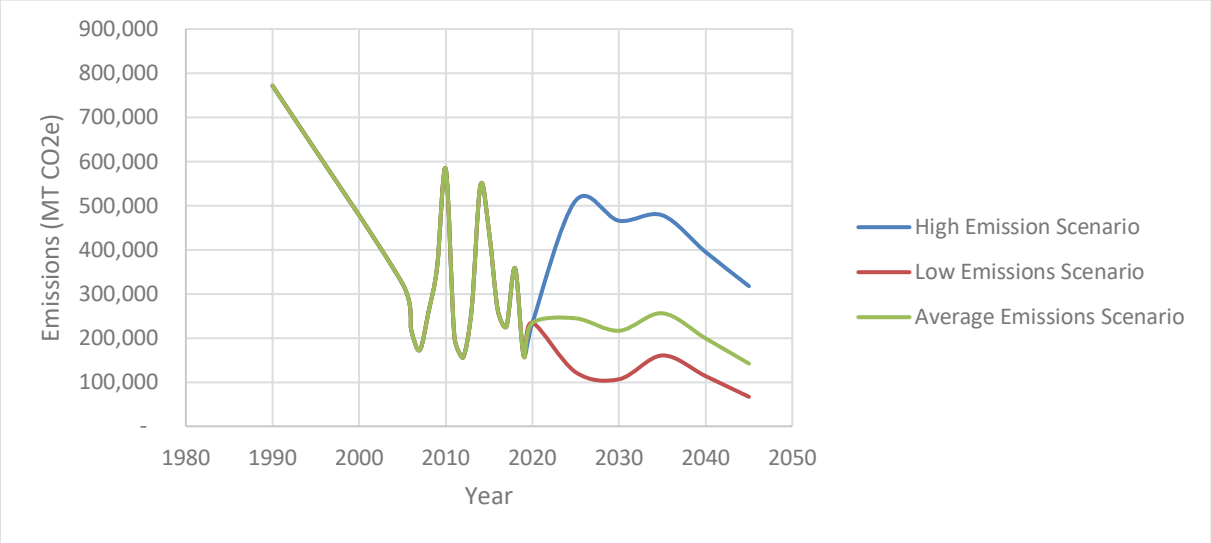

Table 3 Expected Percent Reduction from 1990 by 2030 and 2045

Emissions Scenario	1990 Emissions	2030 Forecast Emissions	Percent Reduction	2045 Forecast Emissions	Percent Reduction
High	771,514	465,664	40%	317,441	59%
Average	771,514	216,460	72%	142,059	82%
Low	771,514	106,615	86%	66,812	91%

1.2 Background

In response to climate change the State of California has enacted several cornerstone GHG reduction legislations. The primary legislative drivers for climate action in California are included below and a full list is included in Appendix A.

- **Executive Order S-3-05,** signed by former Governor Schwarzenegger in 2005, establishes statewide GHG emissions reduction goals to achieve long-term climate stabilization as follows: by 2020, reduce GHG emissions to 1990 levels and by 2050, reduce GHG emissions to 80 percent below 1990 levels. The 2050 goal was accelerated by the 2045 carbon neutral goal established by EO B-55-18, as discussed below.[5]
- **Assembly Bill 32,** known as the Global Warming Solutions Act of 2006, requires California's GHG emissions be reduced to 1990 levels by the year 2020 (approximately a 15 percent reduction from 2005 to 2008 levels). The AB 32 Climate Change Scoping Plan, published in 2008, identifies mandatory and voluntary measures to achieve the statewide 2020 emissions limit, and encourages local governments to reduce municipal and community GHG emissions proportionate with State goals.[6]

[5] Executive Orders are binding only unto State agencies. Accordingly, EO S-03-05 will guide State agencies' efforts to control and regulate GHG emissions but will have no direct binding effect on local government or private actions.

[6] Specifically, the AB 32 Climate Change Scoping Plan states CARB, "encourages local governments to adopt a reduction goal for municipal operations emissions and move toward establishing similar goals for community emissions that parallel the State commitment to reduce GHG emissions by approximately 15 percent from current levels by 2020" (p. 27). "Current" as it pertains to the AB 32 Climate Change Scoping Plan is commonly understood as between 2005 and 2008.

- **Senate Bill 32,** signed by former Governor Brown in 2016, establishes a statewide mid-term GHG reduction goal of 40 percent below 1990 levels by 2030. California Air Resources Board (CARB) formally adopted an updated Climate Change Scoping Plan in December 2017, laying the roadmap to achieve 2030 goals and giving guidance to achieve substantial progress toward 2050 State goals.
- **Executive Order B-55-18,** signed by former Governor Brown in 2018, expanded upon EO S-3-05 by creating a statewide GHG goal of carbon neutrality by 2045. EO S-55-18 identifies CARB as the lead agency to develop a framework for implementation and progress tracking toward this goal in the next Climate Change Scoping Plan Update.

The State of California, via CARB, has issued several guidance documents establishing GHG emissions reduction targets in order for local climate action plans to comply with legislated GHG emissions reductions goals and CEQA Guidelines Section 15183.5(b). In the first *Climate Change Scoping Plan,*[7] CARB encouraged local governments to adopt a reduction target for community emissions paralleling the State commitment to reduce GHG emissions. In 2016, the State adopted SB 32 mandating a reduction of GHG emissions by 40 percent from 1990 levels by 2030 and in 2017 CARB published *California's 2017 Climate Change Scoping Plan* (hereafter referred to as the Scoping Plan Update) outlining the strategies the State will employ to reach these targets.[8] With the release of the Scoping Plan Update, CARB recognized the need to balance population growth with emissions reductions and in doing so, provided a new methodology for proving consistency with State GHG reduction goals through the use of per capita efficiency targets. These targets are generated by dividing a jurisdiction's GHG emissions for each horizon year by the jurisdiction's total population for that target year and are discussed further in the Forecast Section.

1.3 Greenhouse Gases

Scope 1 emissions are defined as direct anthropogenic GHG emissions generated from sources that are owned or directly controlled by the reporting organization. Scope 2 refers to GHG emissions that are indirectly generated due to the consumption of purchased electricity, steam, heating, or cooling. Scope 3 refers to all other indirect emissions not covered under Scope 2 that are associated with sources that are not directly owned or controlled by the reporting organization but are fundamental to the organization's operation. A visualization of each Scope category is provided in Figure 4, *Example Emissions by Scope*.

Metropolitan has reported operational GHG emissions to TCR annually since 2005. For each year, Scope 1 and 2 emissions are calculated using operational activity data. Additionally, Rincon completed a Scope 3 analysis for data years 2008 and 2017 using methodologies described in the Local Government Protocol.[9] These two years were chosen for an in-depth analysis due to guidance from the AB 32 Scoping Plan which suggests using GHG emissions from 2005-2008 to back cast to 1990 since most jurisdictions do not have a GHG inventory for 1990.

[9] ICLEI. 2010. Local Government Operations Protocol *For the quantification and reporting of greenhouse gas emissions inventories*, Version 1.1

Emissions were calculated using the principles and methods from the Local Government Protocol[10] and 2017 Scoping Plan Update.[11] Emissions from nitrous oxide (N_2O), methane (CH_4), and carbon dioxide (CO_2) are included in this assessment. Each GHG has a different capability of trapping heat in the atmosphere, known as its GWP, which is normalized relative to CO_2 and expressed as carbon dioxide equivalent, or CO_2e. The CO_2e values for these gases are derived from the Second Assessment of the Intergovernmental Panel on Climate Change GWP values for consistency with the yearly GHG inventory reported to TCR by Metropolitan, as shown in Figure 4.[12]

Table 4 Global Warming Potentials of Greenhouse Gases

Greenhouse Gas	Molecular Formula	Global Warming Potential (CO_2e)
Carbon Dioxide	CO_2	1
Methane	CH_4	21
Nitrous Oxide	N_2O	310
Sulfuric hexafluoride	SF_6	23,900
Hydrofluorocarbons (HFCs)	R-134a	1,300
Hydrofluorocarbons (HFCs)	R-1410a	1,725

CO_2e: carbon dioxide equivalent

1.4 Excluded Emissions

The following emissions are excluded from the inventory and emissions forecast.

Consumption-based Emissions

Currently, no widely accepted standard methodology for reporting consumption-based inventories exists. Therefore, GHG emissions from consumed goods used by Metropolitan facilities are excluded from the inventory and forecast of Metropolitan emissions.

Natural and Working Lands

GHG emissions from carbon sinks and sources in natural and working lands are not included in this inventory and forecast due to the lack of granular data and standardized methodology. Forestry and other land emissions potentially associated with Metropolitan's properties were also excluded, due to limited availability of appropriate data and lack of standardized methods for quantifying such emissions. The sequestration potential of Metropolitan lands may be evaluated during the GHG reduction measure development process.

Agricultural Emissions

Emissions from agricultural activities are not relevant to Metropolitan operations and therefore, are not included in the inventory.

State Water Project Emissions

The State Water Project (SWP) is a water storage and delivery system that extends more than 705 miles from northern to southern California. This system is owned and operated by the Department of Water Resources (DWR) and provides water to urban and industrial water users In the San Francisco Bay Area and Southern California, and agricultural users in the Central Valley. As a State Water Contractor, Metropolitan has a set maximum allocation of this water that can be distributed to its member agencies. However actual annual deliveries could be reduced based on a number of factors including regulatory restrictions, water supply imbalances, monthly snowpack and runoff, water quality, and health and safety issues. Metropolitan has no control or direct influence over DWR operations or the SWP.

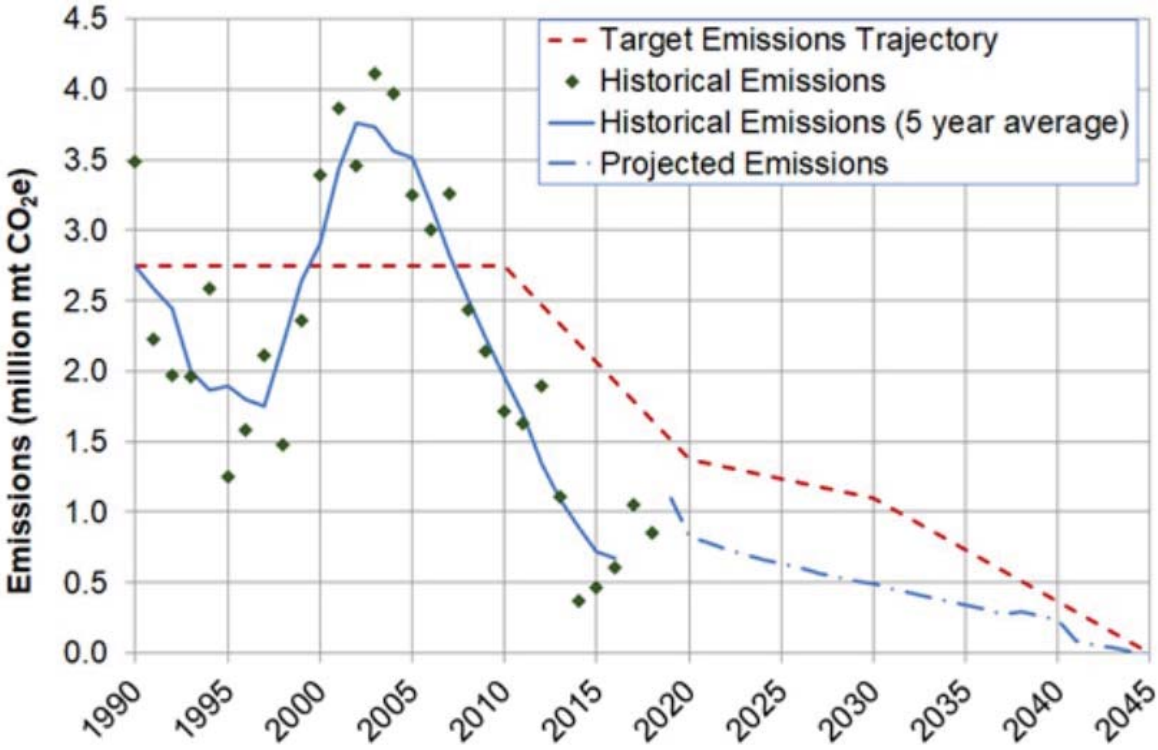
Pursuant to the Climate Registry General Reporting Protocol (2019), Metropolitan used Operational Control to define the boundaries of the GHG Inventory. TCR defines Operational Control as:

Operational Control: Reflects the activities where the organization or its subsidiaries has the full authority to introduce and implement operating policies. The organization that holds the operating license for an activity typically has operational control.[14]

Metropolitan's GHG inventory includes sources within each sector that are under its operational control, in accordance with established GHG accounting protocols and state guidance. SWP water, and its associated emissions, were assumed to remain outside of Metropolitan's operational boundary until the water enters Metropolitan-controlled facilities. Thus, upstream emissions associated with the SWP are not included in the Metropolitan CAP.

Upstream emissions associated with the SWP are covered in the DWR's own CAP. Since 2005 the SWP emissions have decreased significantly, exceeding the GHG emissions reduction targets set by DWR as shown in Figure 5. The DWR CAP GHG reduction targets align with Metropolitan's CAP and both seek to achieve carbon neutrality by 2045. Therefore, while not addressed in Metropolitan's CAP, SWP emissions are actively being managed and reduced in accordance with State targets. Through continued collaboration, Metropolitan and DWR will work to decarbonize a significant portion of California's water infrastructure.

Figure 5 State Water Project Historic Emissions and Targets



[14] General Reporting Protocol V3, The Climate Registry, May 2019.

1.5 Target Years

The emissions forecast is based upon the latest available operational data from Metropolitan including Scope 1 and 2 emissions reported annual to TCR and the average annual Scope 3 emissions estimated as described in this appendix. This forecast uses benchmark years of 2025, 2030, 2035, 2040, and 2045, consistent with currently codified GHG reduction targets or executive orders which are expected to be codified in future, and a target of carbon neutrality on or before 2045.

The forecast years align with the following targets:

- 2030 (SB 32)
- 2045 (EO B-55-18)

The 2030 target is required for consistency with SB 32, while the remainder of the targets (i.e., 2025, 2035, 2040) identify a clear path and milestones of progress toward the long-term State reduction goals.

2 Previous GHG Inventories

Metropolitan has reported operational GHG emissions to TCR annually for the years 2005-2017. Emissions reported to the TCR were calculated by Metropolitan using operational activity data and only include Scope 1 and Scope 2 emissions.[15] Scope 1 emissions include direct fuel combustion within Metropolitan's operational control including emissions from propane, natural gas, and welding gasses. Mobile combustion of gasoline and diesel from Metropolitan fleet vehicles and fugitive emissions were also included in Scope 1. Scope 2 emissions include the indirect GHG emissions associated with the purchase and consumption of electricity as well as transmission and distribution (T&D) losses associated with transmission lines.

Metropolitan provided Rincon with operational data and the internal emission calculations that were reported to TCR for all years between 2005 and 2020. Additionally, Metropolitan provided estimations for 1990 emissions. A summary of previous GHG emissions inventories reported to TCR for these years can be found in Table 5. Metropolitan methodologies used to calculate Scope 1 and Scope 2 emissions are summarized in the following sections.

Table 5 Metropolitan GHG Inventories Summary

Year	Scope 1 & 2 (MT CO_2e)	Scope 3 (MT CO_2e)	Scope 3 Construction (MT CO_2e)	Total Emissions (MT CO_2e)
1990	748,326	11,106	12,081	771,514
2005	300,036	11,106	12,081	323,224
2006	196,167	11,106	12,081	219,355
2007	149,580	11,106	12,081	172,768
2008	234,724	11,614	12,081	258,419
2009	337,269	11,106	12,081	360,457
2010	559,764	11,106	12,081	582,952
2011	179,187	11,106	12,081	202,374
2012	132,449	11,106	12,081	155,637
2013	244,164	11,106	12,081	267,352
2014	522,643	11,106	12,081	545,830
2015	417,213	11,106	12,081	440,400
2016	240,233	11,106	12,081	263,420
2017	203,356	10,599	12,081	226,036
2018	335,099	11,106	12,081	358,287
2019	136,012	11,106	12,081	159,200
2020	211,141	11,106	12,081	234,329

Numbers may not sum due to rounding

MT = metric tons

CO_2e = carbon dioxide equivalent

[15] 2017 was the most recent GHG inventory available at time of this report.

2.1 1990 Baseline

The State of California uses 1990 as a reference year to remain consistent with AB 32 and SB 32, which codified the State's 2020 and 2030 GHG emissions targets by directing CARB to reduce statewide emissions to 1990 levels by 2020 and 40 percent below 1990 levels by 2030.

Metropolitan has reported estimated emissions for 1990 to TCR that include Scope 1 and Scope 2 emissions. The 1990 emissions were calculated using available 1990 activity data; when 1990 activity data was not available, activity data from 2006 was used as a proxy for operational activity in 1990. Energy consumption data, including electricity, natural gas and propane usage from 1990 was only available for the Treatment and Pumping plant facilities which represent over 90% of annual electricity consumption. Energy consumption data for all other facilities from 2006 was used as a proxy for 1990 energy related emissions.

Electricity emissions account for a vast majority of Metropolitan's overall emissions. Electricity emission factors from 2004 were used to estimate 1990 emission levels due to 1990 emission factors for electricity not being available. This is assumed to be a conservative estimate since estimated emission factors for 1990 have been calculated to be higher than the emission factors used in this study. For example, *Estimating Carbon Dioxide Emissions Factors for the California Electric Power Sector* (August 2002) conducted by Lawrence Berkeley Labs calculated an emission factor of 0.488 MT CO_2e per megawatt hour (MWh) for Southern California Edison power[16] while the 2004 emission factor used for the 1990 baseline is 0.333 MT CO_2e per MWh. Using a lower emission factor in 1990 is considered more conservative since it increases the reduction required to be consistent with State targets in 2030. A portion of Metropolitan's GHG emissions were also due to direct purchases from the Salt River Project Navajo Generating Station[17], a coal fired power plant. Metropolitan utilized an estimated emission factor of 1.04 MT CO_2e per MWh for electricity from this source. The remaining electricity was hydro power generated by Hoover and Parker Dams, which is assumed to be carbon free.

Mobile emissions were estimated based on mobile fuel consumption in 2006. Emission factors for gasoline use in vehicles of model year 1994-1999 was applied to mobile fuel consumption of gasoline to estimate 1990 mobile emissions. Metropolitan estimated emissions from Scope 1 and Scope 2 sources in 1990 to total 748,326 MT CO_2e.

In order to improve consistency and allow for comparison between 1990 and current inventories, historical Scope 3 emissions from waste, water use at Metropolitan facilities, and employee commute were estimated based on the average Scope 3 emissions for 2008 and 2017. Construction emissions for 1990 were assumed to be 12,081 MT CO_2e (annual average applied to all inventory years). This is assumed to be a conservative estimate of actual construction activities based on CIP budgets analyzed as part of the project. For more information see Section 3.2.

[16] This emission factor was calculated based on data in Table 25 of *Estimating carbon dioxide emissions factors for the California electric power sector.* SCE emissions were calculated as 0.132 kg C/kWh. To convert between kg C and kg CO_2e the following equation was used. 0.133 kg C/kWh * (44.0g CO2 / 12.0g C) = 0.488 kg CO2/kWh = 0.488 metric tons CO_2e/MWh.

2.2 2005-2017 Inventory Methodology

Metropolitan is a regional water district that operates an aqueduct, pumping plants, treatment plants, a 230kV transmission line system, and a distribution system that includes reservoirs, hydroelectric power plants, pressure control structures, and valve structures. Metropolitan reports GHG emissions data to the CARB under the Mandatory Reporting of Greenhouse Gas Emissions as an Electric Power Entity-Marketer. The data used by the Cap-and-Trade Program is included in California's Greenhouse Gas Inventory.

In addition to reporting GHG emissions for the Cap-and-Trade Program, Metropolitan has voluntarily reported GHG emissions through the California Climate Action Registry starting in 2007 (which included 2005 and 2006 calendar year data) and then through TCR starting in 2010.[18] Metropolitan reports annual emissions of carbon dioxide, methane, nitrous oxide, hydrofluorocarbons, perfluorocarbons, and sulfur hexafluorides. Data is obtained from a mix of sources including utilities and applicable Metropolitan organizational units. Emission factors obtained from TCR, CARB or the United States Environmental Protection Agency (EPA) are applied to operational activity data to calculated annual GHG emissions in a Metropolitan Excel workbook. Data from the workbooks are reviewed and verified prior to entry into the CARB and TCR online reporting tools. Reports are verified by approved third-party verification bodies. The following sections summarize activity data sources and methodology used by Metropolitan for emission calculations. It should be noted that GHG emissions reported to TCR and discussed below do not include Scope 3 emissions, which were calculated for the first time as part of this project.

Electricity

Metropolitan electricity use includes both wholesale power purchases and retail energy. Wholesale power used for pumping requirements of the CRA are mainly provided by the Hoover and Parker Hydroelectric Power Plants, though this is often supplemented by grid mix from the CAMX or AZNM

[18] California Climate Action Registry transitioned all emissions reporting to the TCR in 2010.

electricity grids[19]. Monthly transaction data from wholesale power sources is compiled into monthly reports by an internal working group (Power Resources Unit). Metropolitan calculates its own blended emission factor for wholesale electricity based on all the power sources acquired for the CRA. Retail electricity is based on actual consumption data provided by individual utilities and utilities bills. Emission factors for retail electricity is obtained from TCR public reports or eGRID data and is based on the specific entity's power mix.

Fuel Use

Metropolitan uses propane, welding gas, natural gas and various transportation fuels for its fleet. Annual consumption of propane is provided by individual facilities and is tracked by the Metropolitan Fleet Unit. Welding gas is purchased by the Metropolitan Manufacturing Services Unit. Natural gas usage at facilities is obtained through utility billing from Southern California Gas company. Metropolitan's fleet uses gasoline, diesel, compressed natural gas, and aviation fuel. Fuel use is recorded internally by the Fleet Unit and reported quarterly using the WARD System. TCR's "Default Emission Factors" published each year are used to calculate emission for each fuel type.

Non-CO_2 Emissions

Sulfur hexafluoride (SF6) usage is tracked and accounted for through Maximo and is based on changes in inventory, purchases, disbursements, and changes in nameplate capacity of equipment. The EPA mass balance method is used to estimate sulfur hexafluoride emissions from circuit breakers.

Hydrofluorocarbons (HFCs) used in Metropolitan's cooling system are accounted for using TCR's recommended methodology for estimating emissions from refrigeration and air conditioning equipment.

2.3 Inventory GHG Data Sources

The data used to complete this inventory and forecast came from multiple sources, as summarized in Table 7. As previously discussed, Scope 1 and 2 data and calculations were provided by Metropolitan and reported to TCR. Scope 3 emissions were calculated using data supplied by Metropolitan.

[19] CAMX and AZNM are subregions of the electricity grid that cover California and Arizona/New Mexico respectively (with some overlap). https://www.epa.gov/sites/production/files/2015-10/documents/egrid2012_summarytables_0.pdf

Table 7 Inventory and Forecast Data Sources

Sector	Activity Data	Unit	Source
Scope 1 and Scope 2			
Energy	Electricity Usage	MWh	Metropolitan TCR Reports
	T&D Losses	MWh	Metropolitan TCR Reports
	Stationary Combustion (fuel)	MMBtu	Metropolitan TCR Reports
Mobile Combustion	Annual fuel consumption (gasoline, diesel, jet fuel, aviation gasoline, CNG)	gallons	Metropolitan TCR Reports
Fugitive Emissions	SF6 use HFCs use	pounds	Metropolitan TCR Reports
Scope 3			
Employee Commute	VMT by Transport Mode	VMT	Metropolitan Employee Commute Survey/VanPool Ridership
Water/Wastewater	Water Usage	HCF	Utility invoices
Solid Waste	Waste Generated	Cubic Yards	Utility invoices
Construction	Construction	N/A	CEQA documentation/CalEEMod/CIP
Forecast Growth Indicators			
Operational Growth	Water Deliveries	Acre Feet	2015 Urban Water Management Plan
Electricity Emissions	Renewable Portfolio Standard	Percent	Renewable Portfolio Standard; Senate Bill 100

Numbers may not sum due to rounding

MWh: megawatt hours; T&D: transmission and distribution; MMBtu: one million British thermal unit; VMT: vehicle miles traveled; HCF: hundred cubic feet; CIP: Capital Investment Plan; CEQA: California Environmental Quality Act

3 Inventory

Metropolitan used operational activity data to calculate Scope 1 and Scope 2 emissions for years 2005 through 2017, as summarized in Section 2. However, no Scope 3 data was collected for these reports. Therefore, to bring Metropolitan's GHG inventories into consistency with applicable CAP guidelines, Scope 3 data for 2008 and 2017 was calculated and used to estimate Scope 3 emissions in all other interim years including 1990. The average of the Scope 3 emissions from 2008 and 2017 was then applied to all interim years for consistency. Though Scope 1 and 2 data was available for 2005, 2008 was used because it was the earliest year for which complete Scope 3 emissions data was available. Each of the in-depth inventory years were chosen for specific reasons. The 2008 data year was chosen due to the availability of Scope 3 data as well as its consistency with state protocols for baseline years which can be backcast. The 2017 data year was chosen because, at the time of the inventory preparation, it was the most recent year for which all data was available while also providing a clear picture of current Metropolitan emissions.

3.1 Scope 1 and 2

The methodologies, data sources, calculations, and results associated with the 2008 and 2017 GHG inventory update are included in this section. Information regarding data sources used by Metropolitan to calculate Scope 1 and Scope 2 emissions for the 2008 and 2017 inventories are located in Section 2.2 of this technical appendix. The following sections summarize the activity data, emission factors, and absolute emissions reported by Metropolitan for 2008 and 2017. This includes emissions from direct fuel combustion at Metropolitan facilities, mobile combustion of gasoline and diesel from Metropolitan fleet vehicles, non-CO_2 fugitive emissions, and indirect GHG emissions associated with the purchase and consumption of electricity. Table 8 and Table 9 summarize the activity data, emission factors and total emissions reported by Metropolitan for Scope 1 and 2 emissions in 2008 and 2017, respectively.

Table 8 Scope 1 and 2 Emissions by Category for Year 2008

Source	Activity Data	Emission Factor	Total Emissions (MT of CO_2e)
Energy			**227,544**
Electricity	1,835,580 MWh	0.1221 MT CO_2e/MWh	224,105
Electricity T&D Loss	26,593 MWh	0.0957 MT CO_2e/MWh	2,546
Natural Gas	16,308 MMBtu	0.0532 MT CO_2e/MMBtu	868
Propane	401 MMBtu	0.0631 MT CO_2e/MMBtu	25
Mobile			**7,180**
Gasoline (unleaded)	663,738 gallons	0.0092 MT CO_2e/gallon	6,076
Diesel	108,644 gallons	0.0017 MT CO_2e/gallon	1,104
Non-CO_2 Fugitive Emissions			**0**
SF6	0 lbs	N/A	0

Diesel	10,244 MMBtu	0.0744 MT CO_2e/MMBtu	762
Mobile			**6,886**
Gasoline (unleaded)	637,079 gallons	0.0089 MT CO_2e/gallon	5,673
Diesel	89,866 gallons	0.0104 MT CO_2e/gallon	931
Aviation Gasoline	10,237 gallons	0.0085 MT CO_2e/gallon	87
Jet Fuel	16,171 gallons	0.0098 MT CO_2e/gallon	159
CNG	5,525 gallons	0.0066 MT CO_2e/gallon	36
Non-CO_2 Fugitive Emissions[1]			**72**
SF6	2 pounds	N/A	24
HFC	66 pounds	N/A	47
Total			**203,356**

Numbers may not sum due to rounding

MWh: megawatt hours; MMBtu: one million British Thermal Units; MT CO_2e: metric tons of carbon dioxide equivalent; CNG: compressed natural gas; SF6: sulfur hexafluoride; HFC: Hydrofluorocarbons; N/A: not applicable

[1] Fugitive emissions are estimated using a mass balance approach and are directly converted from the mass of gaseous emissions to CO_2e using the appropriate GWP factor.

[2] This emission factor represents a weighted average of multiple emission factors specific to each source of electricity used by Metropolitan including but not limited to SCE, LADWP, CAMX, AZNM, and Hoover and Parker Hydroelectric Plants

Energy

The energy sector includes GHG emissions resulting from the consumption of electricity, natural gas, propane, and welding gases at Metropolitan facilities. The following subsections describe the data sources, emission factors and calculation methodologies associated with energy sources.

Electricity

Emissions resulting from electricity consumption were estimated by multiplying annual electricity consumption by an electricity emission factor representing the average emissions associated with generation of 1 MWh of electricity. Metropolitan receives wholesale and retail electricity from numerous providers. In 2008, Metropolitan used electricity provider specific emission factors obtained from TCR public reports or 2007 eGRID data when provider specific emission factors were not available. Metropolitan developed a blended emission factor that is weighted based on the amount of electricity received by the power source for wholesale electricity used for CRA pumping. In 2017 Metropolitan applied the WECC California average emission factor from the EPA's 2016 eGRid data for electricity purchased from retail providers. To calculate emissions from electricity, the total electricity use reported by Metropolitan was multiplied by the carbon intensity factor to determine MT CO_2e. Metropolitan reports and calculates emissions for electricity use at Metropolitan facilities and for T&D losses associated with Metropolitan transmission lines.

Electricity associated with water use and wastewater generation by employees at Metropolitan facilities is not included under this section and is discussed in the water and wastewater section. As shown in Table 8 and Table 9, a total of 226,652 MT CO_2eand 194,481 MT CO_2e were generated due to electricity use, including T&D losses by Metropolitan facilities in 2008 and 2017, respectively.

Stationary Fuel Combustion

In order to calculate emissions from stationary sources at Metropolitan facilities, the total fuel consumption in MMBtus was multiplied by the fuel specific default emission factors provided by TCR. Fuel consumption reported by Metropolitan for 2008 and 2017 is provided in Table 8 and Table 9 along with the associated fuel specific emission factors. A total of 893 MT CO_2e and 1,918 MT CO_2e were generated due to combustion of fuel by stationary sources at Metropolitan facilities in 2008 and 2017, respectively.

Mobile Sources

Transportation emissions are generated by Metropolitan through on-road transportation, including passenger, commercial, and heavy machinery, and through aviation. Metropolitan records fleet fuel use by gallon by fuel type including unleaded gasoline, diesel, compressed natural gas, aviation gasoline, and jet fuel. Metropolitan applies TCR default emission factors for mobile fuel combustion to the annual fuel use. As shown in Table 8 and Table 9, a total of 7,180 MT CO_2e and 6,886 MT CO_2e were generated due to combustion of fuel by mobile sources at Metropolitan facilities in 2008 and 2017, respectively.

Non-CO_2 Fugitive Emissions

Metropolitan tracks sulfur hexafluoride (SF6) usage based on changes in inventory, purchases, disbursements, and changes in nameplate capacity of equipment. The EPA mass balance method is used to estimated sulfur hexafluoride emissions from circuit breakers and other equipment used by utilities. Sulfur hexafluoride in pounds is converted to metric tons then multiplied by the GWP for sulfur hexafluoride to estimate CO_2e emissions. There were no sulfur hexafluoride emissions reported for 2008, however 24 MT CO_2e was generated from sulfur hexafluoride use in 2017 (Table 9)

Hydrofluorocarbons (HFCs) used in Metropolitan's cooling system are accounted for using TCR's recommended methodology for estimating emissions from refrigeration and air conditioning equipment. Metropolitan tracks various hydrofluorocarbons (e.g., R-410a, R-134a) through HVAC team field reports. Quantity per year of hydrofluorocarbons is estimated using the simplified mass balance approach as described by the EPA and TCR.[20] Each hydrofluorocarbon (e.g., R-410a, R-134a) is converted from pounds to metric tons and multiplied by the appropriate GWP from the IPCC's Second Assessment[12]. Hydrofluorocarbons were not tracked in 2008, however 47 MT CO_2e was generated due to use of 39 pounds of R-134a for fleet AC and 8 pounds of R-404a for HVAC systems.

[20] https://www.theclimateregistry.org/protocols/GRP-V3-Quantification-Methods.pdf

3.2 Scope 3

Scope 3 includes all other indirect GHG emissions including those resulting from employee commute, waste generation, water consumption (in Metropolitan-owned buildings), and construction related emissions. Scope 3 data collection and emissions calculations followed the methodologies outlined in the ICLEI-Local Government Operations Protocol.[21] Because Scope 3 data requires significant data collection efforts, Scope 3 emissions for employee commute, waste disposal, and water service were calculated for 2008 and 2017 only. These years represent the most recent and most historical years for which complete data was available. Scope 3 emissions were then averaged and applied to all other years to allow for a comparable estimate and accurate tracking via the carbon budget approach. The following sections summarize activity data sources and methodology used for emission calculations for each of the identified Scope 3 emission sources.

Employee Commute

Emissions associated with employees commuting to work by their own personal vehicles, local transit, or company owned vehicles are classified as Scope 3 emissions. Based on an employee list provided by Metropolitan, there were 1,975 employees in 2008 and 1,796 employees in 2017. Rincon used a geographic information system (GIS) mapping exercise to estimate vehicle miles traveled for each employee based on the zip code and regular office location of each employee. It was assumed that all employees listed were full-time. Employee commute data was derived from the existing Metropolitan Employee Commute Survey and employee VanPool ridership data. The survey included the employee's mode of transport and the number of miles traveled one way to work. The commute survey results were used to scale the total VMT calculated using the zip code of each employee. Annual employee vehicle miles traveled (VMT) was calculated using the number of employees, workdays, and round-trip mileage traveled per day per employee. The number of workdays, 250, was estimated assuming full-time employees did not work on federal holidays and that full-time employees would take two weeks of vacation. Emissions factors from personal vehicle commutes, including those that drive alone and carpool, were derived from the EMFAC2017 model for Los Angeles County and were weighted based on the percent of fuel type used per class of vehicle. The Los Angeles County Metropolitan Transportation Authority emission factors were used to calculate emissions from alternative trips including bus and rail. [22,23] Emission factors are shown by passenger mile which take into account the shared emissions on mass transit or carpool and vanpooling scenarios.

Table 10 and Table 11 include the activity data, derived annual VMT, emission factors by passenger mile, and total emissions from employee commutes in 2008 and 2017, respectively. Employee commutes resulted in emissions of 9,237 MT CO_2e and 7,257 MT CO_2e in 2008 and 2017, respectively.

Water and Wastewater Service

Metropolitan received water from 14 water providers in 2008 and 2017. Water usage data by facility was provided by Metropolitan and was derived from utility provider invoices. Water supplied to Metropolitan facilities contributes emissions through the use of energy to extract, convey, treat, and deliver water. The amount of energy required for facility water usage was calculated following Community Protocol Method WW.14[24], where the total emissions are equal to the energy used in each of the four phases above.

The wastewater generated by Metropolitan facilities also creates GHG emissions during the treatment processes, including process, stationary, and fugitive emissions. The sources and magnitude of emissions depend on the type of wastewater treatment plant and the treatment processes utilized. Wastewater generated by Metropolitan facilities is collected in local sewer lines and discharged to various regional wastewater treatment plants. Because Metropolitan does not have operational control over the wastewater treatment plants and the wastewater generated at Metropolitan facilities is distributed to numerous treatments plants, fugitive emissions were not

[24] U.S Community Protocol for Accounting and Reporting of Greenhouse Gas Emissions, Version 1.1, July 2013, https://static1.squarespace.com/static/5d1e51dd2a98da000183bc20/t/5db5c0f84f74010ee4dac41a/1572192509182/Appendix+F+-+Wastewater+and+Water+Emission+Activities+and+Sources+-+U.S.+Community+Protocol.pdf

calculated. In the absence of wastewater generated at Metropolitan facilities it was assumed wastewater volume was equivalent to water use volume. This is a conservative estimate because it assumes all water used in the building was then treated at the wastewater treatment facility, when any outdoor/irrigation water would not be treated.

The energy required for each segment of the water cycle, including wastewater treatment, was calculated using standardized energy intensity factors (kWh/million gallons) for a typical urban system in Southern California.[25] For recycled water use, the statewide average energy intensity factor was applied.[26] As previously described in Section 2.2 of this technical appendix, Metropolitan receives electricity from a number of retail and wholesale providers. Therefore, a blended electricity emission factor from Metropolitan's annual operations was used to calculate emissions associated with electricity embedded in water consumption. Metropolitan's energy emission factor of 269.16 pounds CO_2e/MWh and 307.19 pounds CO_2e/MWh was applied to the calculated electricity used for water and wastewater services in 2008 and 2017, respectively. Table 12 and Table 13 include the activity data, emission factors, and total emissions from water use and wastewater generation in 2008 and 2017, respectively. Energy consumption related to water use and wastewater generation by Metropolitan facilities resulted in the generation of approximately 13 MT CO_2e in 2008 and 184 MT CO_2e in 2017, respectively.

Table 12 Water and Wastewater Emissions for Year 2008

Source	Activity Data (MWh)	Emission Factor (MT CO_2e/MWh)	Total Emissions (MT CO_2e)
Water Use	**93**	**0.12209**	**11**

Solid Waste

GHG emissions result from management and decay of organic material solid waste. ICLEI guidance provides multiple accounting methods to address emissions arising from solid waste generated (regardless of where it is disposed of) as well as emissions arising from solid waste disposed of inside a community's boundaries (regardless of where it was generated). Because Metropolitan does not have operational control of any landfill, GHG emissions associated with solid waste are based solely on the amount of waste generated by Metropolitan facilities. ICLEI guidance for local entities recommends using the EPA's Waste Reduction Model (WARM) model. The WARM emissions factors account for the lifecycle of waste generation, including the collection and transport, processing, landfilling, and potential carbon reduction associated with the type of waste.

Waste data was derived from service provider invoices and utility providers. Metropolitan estimated waste generation based on bin size, pick up schedule of bins, and the conservative assumption that bins were completely full when emptied. Three types of waste bins were categorized as mixed municipal solid waste (MSW), mixed recyclables, and mixed organics. Cubic yards of waste reported by Metropolitan was converted to tons based on the type of waste.[27] Mixed organic waste was considered to include food, yard and other green waste and assumed to all be sent to a landfill. It was assumed that 11 percent of mixed MSW was combusted, while the remaining 89 percent was sent to a landfill.[28] Recycled waste included mixed paper, cardboard, mixed plastics, glass, aluminum and steel cans. It was assumed that all material within this category was recycled. Emissions factors from EPA's WARM version 14 were applied to the three categories of waste generated.[29] Offset or negative emissions calculated by the WARM model associated with recycling material were not included in the total solid waste emissions to provide a conservative estimate.

A summary of the emissions associated with solid waste generated during Metropolitan operations in 2008 and 2017 is provided in Table 14 and Table 15, respectively. Process emissions and energy consumption related to waste generation and disposal by Metropolitan facilities resulted in the generation of approximately 2,363 MT CO_2e in 2008 and 3,157 MT CO_2e in 2017, respectively.

[27] National Recycling Coalition Measurement Standards and Reporting Guidelines; EPA; FEECO and CIWMB 2006

[28] https://archive.epa.gov/epawaste/nonhaz/municipal/web/pdf/2012_msw_fs.pdf

[29] Per ICLEI guidance, emission factors for solid waste generation were obtained from U.S. EPA's Waste Reduction Model (WARM) version 14 (https://www.epa.gov/warm/versions-waste-reduction-model-warm#WARM Tool V14).

Table 14 Summary of Solid Waste Emissions for Year 2008

Source	Activity Data (tons)	Emission Factor (MT CO_2e/ton)	Total Emissions (MT CO_2e)
Mixed Organic Waste	11,817	0.204	2,363
Recycled Waste	3,125	-2.825	-8,813

MSW: municipal solid waste; MT CO_2e: metric tons of carbon dioxide equivalent

Numbers may not sum due to rounding

Construction

Construction emissions were estimated using the Capital Investment Plan (CIP) projections for 2019 through 2024. To estimate the annual emissions associated with construction, the GHG emissions associated with all CIP projects between 2019 and 2024 were calculated and then divided by six to gain an annual emission rate which was then applied to all previous years including 1990. A complete list of every project analyzed and the associated GHG emissions can be found in Attachment 1 of Appendix B. Emissions associated with construction of the RRWP were not included in the inventory. Because construction of the RRWP is a future program, it is not representative of past construction projects and therefore would not be appropriate to apply such emissions to previous years.[30]

Construction emissions data is based on Metropolitan's CIP which provides information on capital programs and projects scheduled to begin in fiscal year (FY) 2018/19 through FY 2023/24. Projects without emissions include feasibility studies, computer system development and other planning initiatives. The CIP program includes projects at varying levels of design and specificity. Because of this variability in available project specifics, emissions for planned projects were estimated using the following three methodologies:

(1) GHG emissions estimates were derived for specific projects from previously prepared GHG studies used in environmental documentation (CEQA)

(2) GHG emissions were estimated for projects using project-specific details from design and engineering documents and emissions factors from the EPA, CalEEMod and EMFAC2011

[30] Construction and operational estimates for the RRWP are included in the GHG Emissions forecast.

(3) GHG emissions were developed for an example project within specific categories (e.g., pipeline repair, valve repair, minor construction) and then applying the calculated GHG emissions to similar projects of equal or smaller size

GHG emissions were calculated using conservative assumptions and were scaled based on project size, duration, or activity level. The sum of the FY 2018/19 through FY 2023/24 CIP emissions estimates was then averaged to produce an annual construction emissions rate. Emissions from the Prestressed Concrete Cylinder Pipe Rehabilitation (PCCP) program, which is a 20-year program, were calculated for the entire 20-year program, then divided by 20 years and added to Metropolitan's construction emissions to create an annual total. As previously discussed, construction emissions from the RRWP are included in the forecast, but not the inventory. When analyzing the Annual Capital Expenditures for Metropolitan, Rincon determined construction activities during the period analyzed represents an average or less than average level of construction activity when compared to historical annual capital expenditures adjusted to current dollars. Therefore, the GHG inventory provides a conservative estimate of past emissions.[31] Table 16 provides a summary of construction emissions determined by construction category.

Table 16 Capital Investment Program Construction Emissions Estimate 2019-2024

Construction Category	GHG Emission MT CO_2e (2019-2024)
Pipelines	3,026
Paving	1,255
Equipment Replacement	9,061
CRA Domestic Water Systems	959
Building Construction	1,419
Utility Upgrades	2,070
Pump Rehab	742
Power Plant Rehab	495
Reservoir Cover Replacement	4,943
Treatment Plant Reliability	4,796
Pipeline Repairs/Refurbishment	1,538
CIP Emissions (6-year total)[1]	**30,305**
CIP Emissions Annual Estimate	5,051
PCCP Program (20-year total)[1]	**140,609**
Annual PCCP Emissions	7,030
Total Annual Construction Emissions Estimate	**12,081**

[1] CIP and PCCP emissions are annualized based on program length.

MT = metric tons; CO_2e = carbon dioxide equivalent; CRA = Colorado River Aqueduct; CIP = Capital Improvement Plan; PCCP = Prestressed Cylinder Concrete Pipeline

[31] A lower historical GHG estimate for construction means an overall lower 1990 emission level and more stringent GHG reduction targets.

Capital Investment Plan (CIP)

CIP projects occurring annually include pipeline additions and improvements, paving projects, equipment replacement, improvements to CRA domestic water systems, building construction, utility upgrades, pump rehabilitation, power plant rehabilitation, reservoirs cover replacements, treatment plant reliability projects, and pipeline repairs/refurbishments. Construction emissions include emissions from construction activity as well as emissions associated with worker and haul trips. The following subsections provide additional detail on methodology specific to the construction project type.

PIPELINES

GHG emissions factors for the RRWP were utilized to estimate emissions associated with these pipelines. To be conservative, the most carbon intensive type of pipeline construction methodology was utilized. Emissions were estimated for each project based on the miles of pipeline installed.

PAVING

CalEEMod was used to estimate the GHG emissions associated with the demolition and replacement of 1 acre of paving. This emission factor (23 MT CO_2e/ acre) was then applied to the total acreage for each project to estimate GHG emissions.

EQUIPMENT REPLACEMENT

These projects utilized similar equipment as modeled for the "New Valve/Meter Valve Structure" activity quantified in the Program Environmental Impact Report (PEIR) for the PCCP program. The New Valve/Meter Valve Structure activity was estimated to generate 407 MT CO_2e and was applied to equipment replacement projects that involved excavation. For equipment replacement projects that did not involve excavation activities but did involve construction or installation of new equipment, the project generated 247 MT CO_2e

CRA DOMESTIC WATER SYSTEMS

CalEEMod was used to estimate the emissions associated with the wastewater system replacement projects using a 500 by 500-foot grading scenario. A trenching machine was also added to the analysis. This modeled scenario generated 107 MT CO_2e per project.

BUILDING CONSTRUCTION

CalEEMod was used to estimate the emissions associated with each building construction project and was specific to the building dimensions (i.e., square footage) and land use type as specified by Metropolitan.

UTILITY UPGRADE

These projects utilized similar equipment as modeled for the "New Valve/Meter Valve Structure" activity quantified in the PEIR for the PCCP program except for the need for excavation. The removal of activities involving excavation, shoring, dewatering, and backfilling from the "New Valve/Meter Valve Structure" emission estimates result in 247 MT CO_2e per project. If the upgrade project did not involve the construction of a new structure, then new construction emissions were further removed from the PCCP PEIR estimations for the "New Valve/Meter Valve Structure" activity

resulting in approximately 108 MT CO_2e per project that only involved restoration and replacement of utilities.

PUMP REHABILITATION

These projects utilized similar equipment as modeled for the "New Valve/Meter Valve Structure" activity quantified in the PEIR for the PCCP program except for the need for excavation. The removal of activities involving excavation, shoring, dewatering, and backfilling from the "New Valve/Meter Valve Structure" emission estimates result in 247 MT CO_2e per project

POWER PLANT REHABILITATION

These projects utilized similar equipment as modeled for the "New Valve/Meter Valve Structure" activity quantified in the PEIR for the PCCP program except for the need for excavation. The removal of activities involving excavation, shoring, dewatering, and backfilling from the "New Valve/Meter Valve Structure" emission estimates result in 247 MT CO_2e per project per year. These projects were further scaled by the length of the project.

RESERVOIR COVER REPLACEMENT

These projects were considered similar as the modeled project in the Palos Verdes Reservoir Initial Study-Mitigated Negative Declaration.[32] Therefore, the estimated emissions of 2,321 MT CO_2e were applied per project. This estimation is considered conservative because the Palos Verdes Reservoir project consists of other improvements not included in the reservoir cover replacement projects.

TREATMENT PLANT RELIABILITY

Various project and construction activities ranging in size and duration are associated with the treatment plant reliability program. Emissions were estimated using CalEEMod based on the specific activities involved in each project.

TRAVEL EMISSIONS ESTIMATES

Worker truck trips and associated emissions were estimated using data from the Weymouth Basin Refurbishment Program.[33] The program is considered a conservative estimate of the worker truck trips occurring for projects involving new construction (95 MT CO_2e). For projects identified to be upgrades, worker trip data from the Weymouth Administration and Control Buildings Seismic Upgrades Project (150 miles round trip and 1402 workdays) were applied (143 MT CO_2e).

Prestressed Concrete Cylinder Pipe Rehabilitation (PPCP)

The PPCP encompasses specific construction work related to the PCCP program that will span 20-years. Metropolitan prepared a Program Environmental Impact Report (PEIR) for the project which quantified the GHG emissions associated with the construction activities conducted for this program.[34] For the purpose of this inventory and forecast, the total construction emissions reported for this program were divided by 20 years to obtain an annual average of construction emissions related to the PCCP program.

SCOPE 3 SUMMARY

The average annual Scope 3 emissions were calculated using the annual Scope 3 emissions for 2008 and 2017. Because Scope 3 emissions are related to standard Metropolitan operations, they do not change substantially over time unlike Scope 1 and 2 emissions which can fluctuate annually. As such, the annual average Scope 3 emissions were applied to each year's inventory to provide a complete estimate of overall operational emissions. Furthermore, Scope 3 emissions represent a small portion (9 percent to 10 percent annually) of all Metropolitan emissions.

Table 17 summarizes the annual average Scope 3 emissions by sector that were included in the completed inventory.

Table 17 Average Scope 3 Emissions

Sector	Activity Data	Emission Factor	Emissions (MT CO_2e)
Employee Commute (passenger VMT)	28,624,230	0.000288 MT CO_2e/passenger VMT	8,247
Waste (tons)	16,749	0.1673 MT CO_2e/tons	2,760
Water (mgy)	55	1.5238 MT CO_2e/tons	84
Wastewater (mgy)	55	0.2615 MT CO_2e/tons	14
CIP Construction (year)	6	5,051 MT CO_2e/year	12,081
PCCP Construction (years)	20	7,030 MT CO_2e/year	
Annual Total			**23,188**

VMT: vehicle miles travelled; mgy: million gallons per year; MT CO_2e: metric tons of carbon dioxide equivalent; CIP: Capital Investment Plan; PCCP: Prestressed Concrete Cylinder Pipe Rehabilitation

3.3 Completed Inventory

The ICLEI Community Protocol recommends local governments examine their emissions in the context of the sector responsible for those emissions. Many local governments or entities like Metropolitan will find a sector-based analysis more directly relevant to policy making and project management, as it assists in formulating sector-specific reduction measures for climate action planning. The reporting sectors are made up of multiple subsectors to allow for easier identification of sources and targeting of reduction policies.

With the addition of the Scope 3 emissions, the updated 2008 and 2017 inventory reports all Basic Emissions Generating Activities[35] required by the Community Protocol[36] by the following main sectors:

- Energy (electricity and natural gas)
- Transportation
- Water and Wastewater
- Solid Waste

[35] Required emissions generating activities include: use of electricity by the community, use of fuel in residential and commercial stationary combustion equipment, on-road passenger and freight motor vehicle travel, use of energy in potable water and wastewater treatment and distribution, and generation of solid waste by the community.

[36] ICLEI. 2012. Community Protocol for Accounting and Reporting of Greenhouse Gas Emissions. Section 2.2.

Given the extensive construction and associated emissions generated, construction emissions have also been included as a Scope 3 emission source.

Table 18 and Table 19 include all of the activity data, emission factors, and total emissions available for the 2008 inventory and the 2017 inventory, respectively. The inventories include Scope 1 and Scope 2 data provided by Metropolitan as well as Scope 3 data used to bring Metropolitan's GHG inventories into consistency with applicable CAP guidelines. Figure 6 presents a summary of the 2008 and 2017 Metropolitan emissions by Scope.

Table 18 Updated 2008 GHG Inventory

Source	Activity Data	Emission Factor	Total Emissions (MT of CO_2e)
Scope 1			**8,073**
Natural Gas (Stationary)	16,308 MMBtu	0.0532 MT CO_2e/MMBtu	868

[1] Fugitive emissions are estimated using a mass balance approach and are directly converted from estimated quantify to CO_2e using the appropriate GWP factor.

[2] Includes the sum of water and wastewater generation.

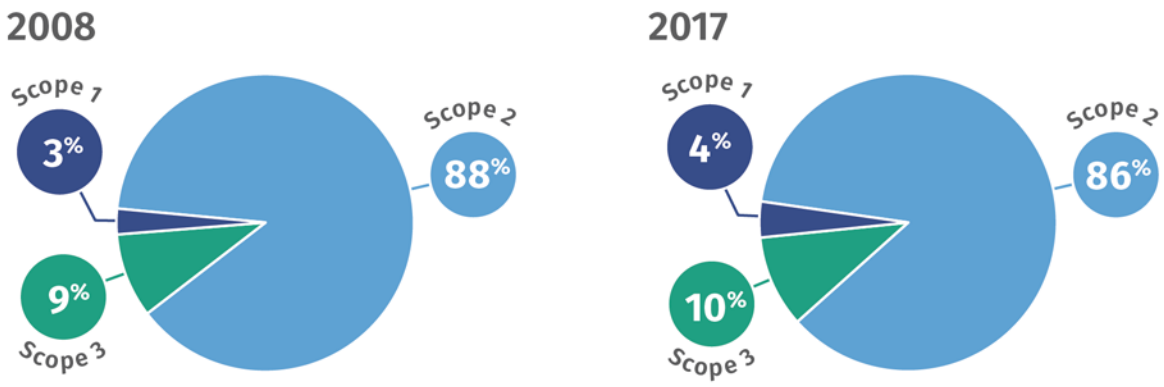
Figure 6 Metropolitan Emissions by Scope



As shown in Figure 6, a majority (86 to 88 percent) of Metropolitan's emissions in 2008 and 2017 are from Scope 2 emissions (electricity). Scope 1 (combustion) emissions comprise about 3 to 4 percent of total emissions and Scope 3 emissions (other and construction) comprise approximately 10 percent of Metropolitan's overall emissions. The following subsections discuss the emission trends by Scope.

Scope 1

Scope 1 emissions comprise approximately four percent of total emissions. The largest Scope 1 emission source was mobile combustion of fuel for Metropolitan's vehicle fleet. In 2008, gasoline and diesel were used to fuel the vehicle fleet. In 2017, Metropolitan's vehicle fleet also used compressed natural gas as well as jet and aviation fuel. The second largest Scope 1 emission source is from stationary combustion of fuel at Metropolitan's facilities including natural gas and diesel usage.

Scope 1 emissions increased from 2008 to 2017, primarily because of the use of diesel fuel for generators. Fugitive emissions make up a small percentage of Scope 1 emissions and include sulfur hexafluoride emissions leakage from electrical equipment, emissions associated with additional electricity generation to offset T&D, hydrofluorocarbon emissions from refrigerants and fleet air conditioning, and welding gas fugitive emissions. Fugitive emissions were measured directly by Metropolitan.

Scope 2

Over 86 percent of Metropolitan emissions are from the generation of electricity used at Metropolitan's facilities. Direct electricity consumption makes up 99 percent of Scope 2 emissions while T&D losses consistently make up about one percent of Scope 2 emissions. Emissions associated with electricity consumption are expected to decrease due to State regulations requiring electricity providers to increase procurement of eligible renewable energy resources to 100 percent by 2045.[37] The level of pumping on the CRA is the primary driver of Metropolitan's electricity demand and, therefore, GHG emissions. Availability of hydropower from Hoover Dam and Parker Dam are also significant contributors to emissions variability since hydropower contributes electricity with zero GHG emissions when it is available.

Scope 3

Scope 3 emissions included in the GHG inventories are from water consumption and wastewater generation at Metropolitan facilities, construction activities, solid waste generation, and mobile emissions from employee commutes. The largest portion of Scope 3 emissions was due to construction activities which contributed 51 to 53 percent of total Scope 3 emissions annually. The second largest Scope 3 emissions source was from employee commute. Employee commuting generated 39 percent of inventoried Scope 3 emissions in 2008, but by 2017 had decreased to 32 percent. Solid waste associated emissions contributed between 10 in 2008 and 14 percent in 2017 of Scope 3 emissions while water-related emissions contribute about one percent.

Water Conservation

Water conservation reduces GHG emissions. The emissions savings from conservation projects conducted by Metropolitan since 1990 were responsible for a portion of the GHG emissions

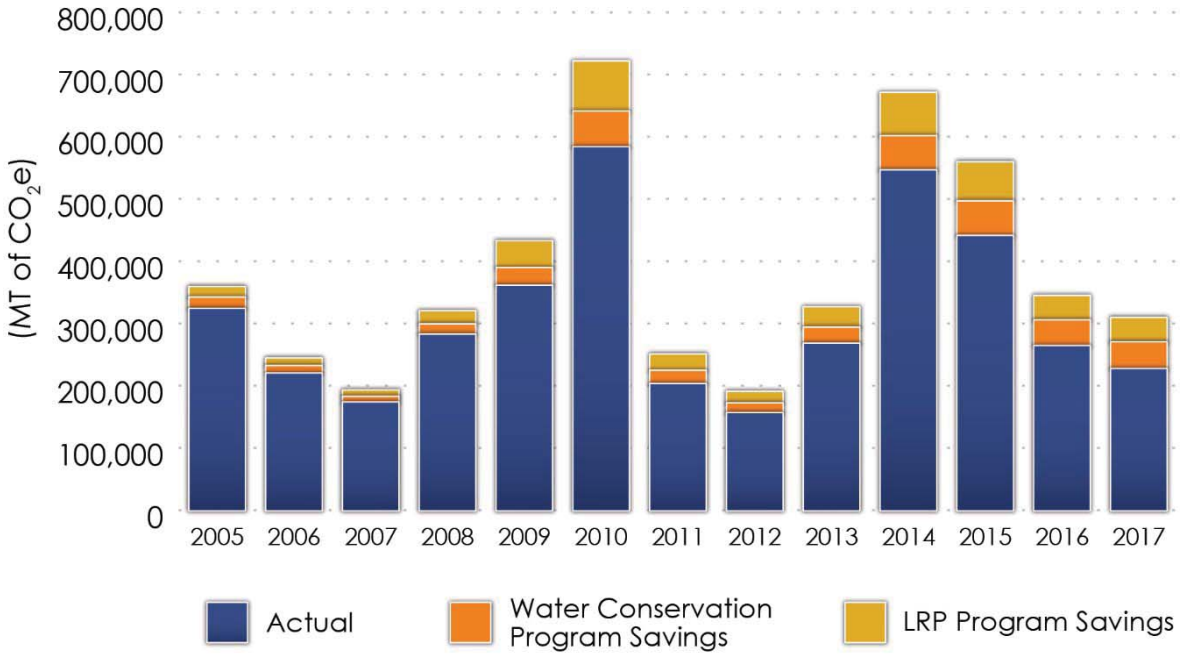
[37] Senate Bill 100 was signed into law in 2018.

reductions seen over time. The impact of these projects is already accounted for in the activity data, which is the basis for the GHG inventory. By applying the annual emissions factor per acre-foot of deliveries, estimates were developed to show what emissions would have been without these measures. Figure 7 shows annual GHG emissions both with (actual) and without (estimated) the implementation of conservation programs.

To calculate savings from conservation programs, Rincon analyzed water savings data by program by year. Programs included in the analysis included the Local Resources Program (LRP) and other conservation programs including turf removal, fixture replacement, weather controllers, and a variety of other projects. For the LRP, total water savings per project per year were calculated and summed for each individual year. For the other conservation measures, it was assumed water saved through each program would continue over time. This means that if 100-acre feet were saved in 2005 and another 50-acre feet were saved in 2006, the total savings in 2006 would be 150 acre feet.[38] This assumption was made because when those fixtures need to be replaced at the end of their useful life, it is unlikely that a less efficient model would be installed that would increase water use. Instead, it is likely that the same or more efficient fixture will be available for replacement.

After calculating the total acre feet saved per year, the annual total was then multiplied by the emission factor (MT of CO_2e per acre-foot delivered) calculated for that year. The resulting emissions were then added to the inventory emissions to show an emissions scenario in which the conservation efforts did not occur. The amount of emissions saved varies between years even if total acre feet conserved is consistent. This is due to annual variations in the emissions factor per acre-foot.

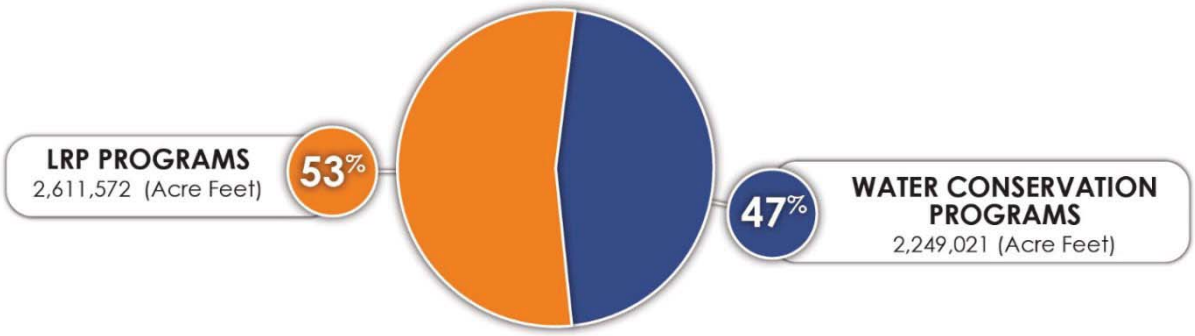
Figure 7 Emissions Avoided through Conservation Efforts



[38] Per Senate Bill 60, Metropolitan has filed annual progress reports with the California Legislature detailing water conservation achievements and progress.

As shown in Figure 7, emissions offsets from conservation efforts have grown from 9.8 percent (35,093 MT of CO_2e) in 2005 to 25 percent (74,714 MT of CO_2e) in 2017. Figure 8 shows the total acre feet of water conserved by the LRP and other water conservation programs between 2005 and 2017.

Figure 8 Acre Feet Saved by Conservation Programs (2005-2017)



4 Forecast

The GHG inventory provides accurate reference points for emissions levels in past years. However, annual emissions change over time due to external factors such as hydrology, climate, population growth, operational changes, and construction projects. An emissions forecast accounts for these projected changes and presents an estimate of GHG emissions in a future year. Calculating the difference between the forecasted GHG emissions and the reduction targets set by Metropolitan determines the gap to be closed through Metropolitan's CAP policies.

GHG emissions associated with Metropolitan operations are influenced by where water is sourced. Metropolitan has two sources of imported water supply: the Colorado River through the CRA and the SWP. Water pumped from the Colorado River results in substantially higher electrical usage as it requires additional pumping to bring the water to Lake Mathews. In contrast, SWP water does not require significant additional pumping. Because of the variability in electricity usage, and therefore, GHG emissions, three scenarios were modeled for each forecast: Dry-year SWP with high CRA pumping (high emissions); average-year SWP with average CRA pumping (average emissions); and wet-year SWP with low CRA pumping (low emissions). The three scenarios capture the full range of possible future emissions. In reality, Metropolitan's GHG emissions will continue to oscillate around the average emissions trend as they have in the past.

4.1 Forecast Results Summary

California has enacted several regulations which will assist in reducing Metropolitan's emissions over time. The impact of these regulations was quantified and incorporated into an adjusted forecast to provide a more accurate estimate of Metropolitan's future emissions. These projections include emissions associated with the construction and operation of the proposed RRWP as well as expected annual construction emissions associated with other CIP construction projects. Figure 9 presents the projected emissions for Metropolitan through 2045 associated with the three different GHG reduction scenarios (high, average, low). Table 20 includes a comparison of the projected emissions for each scenario in each target year (2030 and 2045) compared to the 1990 emissions baseline.

Figure 9 Adjusted Emissions Forecast 1990-2045

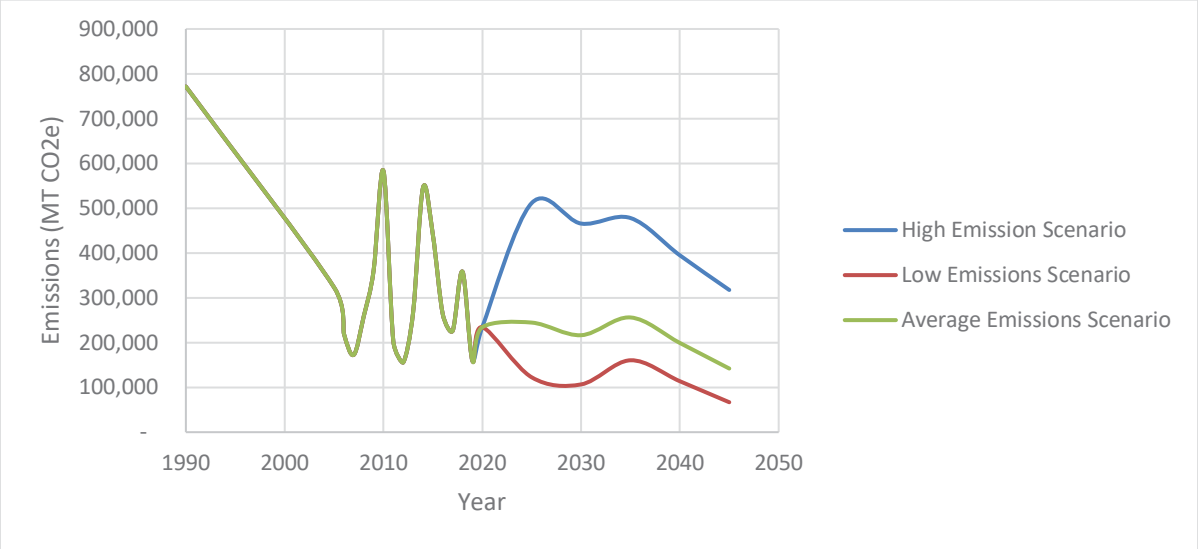


Table 20 Anticipated Changes to Mass GHG Emissions between 1990 and 2045 (MT CO2e)

Emissions Scenario	1990 Emissions	2030 Forecast Emissions	Percent Reduction	2045 Forecast Emissions	Percent Reduction
High	771,514	465,664	40%	317,441	59%
Average	771,514	216,460	72%	142,059	82%
Low	771,514	106,615	86%	66,812	91%

In addition to the mass emissions inventory and forecast, Rincon also conducted a per capita GHG emissions analysis on both historical and forecasted emissions. This analysis considers the substantial population growth occurring in Metropolitan's service area and the past and ongoing water conservation efforts made by Metropolitan. Since 1990, population in the Metropolitan service area has increased by nearly 3.95 million people.[39] Table 21 presents the historical service population of Metropolitan and the projected population from 2020 through 2045. Additionally, Table 21 presents emissions per capita for historical data and the projected emissions per capita based on the three forecasted scenarios.

[39] 2020 UWMP

Table 21 Absolute and Per Capita Emissions Forecast

Year	Population	Absolute Emissions (MT CO_2e)	Per Capita (MT CO_2e)
Historical			
1990	14,961,310	771,514	0.05157
2005	17,617,613	323,224	0.01835
2006	17,676,282	219,355	0.01241
2007	17,757,684	172,768	0.00973
2008	17,862,613	258,419	0.01447
2009	17,936,649	360,457	0.02010
2010	18,042,021	582,952	0.03231
2011	18,186,668	202,374	0.01113
2012	18,347,771	155,637	0.00848
2013	18,499,407	267,352	0.01445
2014	18,623,266	545,830	0.02931
2015	18,732,068	440,400	0.02351
2016	18,808,234	263,420	0.01401
2017	18,906,970	226,036	0.01196
2018	18,962,475	358,287	0.01889
2019	18,998,737	159,200	0.00838
2020	19,035,000	234,329	0.01231
Projected		**Emission Range (Low - High)**	**Emission per Capita Range**
2025	20,089,000	122,519 – 511,428	0.00610 - 0.01218
2030	20,634,000	106,615 – 465,664	0.00517 - 0.02257
2035	21,145,000	160,515 – 478,049	0.00759 - 0.02261
2040	21,610,000	113,728 – 394,783	0.00526 - 0.01827
2045	22,026,000	66,812 – 317,441	0.00303 - 0.01441

MT CO_2e: metric tons of carbon dioxide equivalent

As shown in Figure 10 and Table 22, emissions per capita have decreased substantially and are expected to continue to decline. When comparing emissions reductions from Table 20 (mass emissions only) with Table 22 (per capita emissions), the effect of increased water conservation is clear. For example, under the average emissions scenario, total emissions are expected to decrease by 72% compared to 1990 by 2030. However, on a per capita basis (which captures the increase in conservation efforts) reductions are expected to be 80%.

Figure 10 Historical and Forecasted Per Capita Emissions

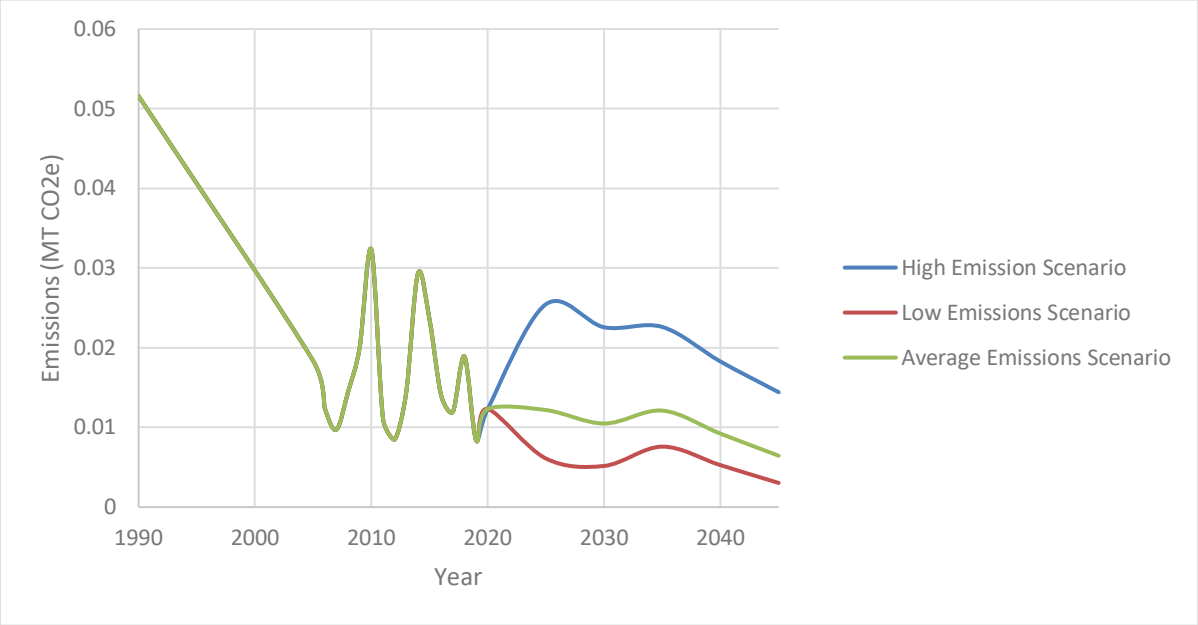

Table 22 Per Capita Emissions Reductions Over Time

Emission Scenario	1990 Emissions (MT/person/year)	2030 Forecast (MT/person/year)	Percent Reduction	2045 Forecast (MT/person/year)	Percent Reduction
High	0.0516	0.0226	56%	0.0144	72%
Average	0.0516	0.0105	80%	0.0064	87%
Low	0.0516	0.0052	90%	0.0030	94%

Population assumptions for the Metropolitan service area are as follows: 1990 population = 14,961,310; 2030 population = 20,634,000; 2045 population = 22,026,000

4.2 State Legislation

The forecast presented here estimates future Metropolitan emissions under codified GHG reduction strategies currently being implemented at the State and federal level. The 2017 Scoping Plan Update identified several existing State programs and targets, or known commitments required by statute which can be assumed to achieve GHG reductions without Metropolitan action. However, since State regulations such as clean car standards may or may not impact Metropolitan directly, many of these reductions were not quantified as part of the forecast. The one exception is SB 100 which has had and will continue to have a significant impact on Metropolitans GHG emissions into the future.

Renewables Portfolio Standard & Senate Bill 100

Established in 2002 under SB 1078, California's Renewables Portfolio Standard (RPS) was accelerated in 2006 under SB 107 by requiring 20 percent of electricity retail sales be served by renewable energy resources by 2010. Subsequent recommendations in California energy policy reports advocated a goal of 33 percent by 2020, and on November 17, 2008, Governor Arnold Schwarzenegger signed Executive Order S-14-08 setting the goal that "...[a]ll retail sellers of electricity shall serve 33 percent of their load with renewable energy by 2020." Senate Bill X1-2 was signed by Governor Edmund G. Brown, Jr. in April 2011 setting the RPS target at 33 percent by 2020.

This new RPS applied to all electricity retailers in the State including publicly-owned utilities, investor-owned utilities, electricity service providers, and community choice aggregators. All retail power providers were required to adopt the new RPS goals of 20 percent of retail sales from renewables by the end of 2013, 25 percent by the end of 2016, and 33 percent by the end of 2020. The State is currently on track to meet these goals.

Most recently, Governor Edmund G. Brown, Jr. signed into law SB 100 in September 2018, which requires retail sellers and publicly-owned utilities to procure 60 percent of their electricity from eligible renewable energy resources by 2030 and 100 percent of their electricity from eligible renewable energy by 2045.[40]

Because SB 100 requirements are only applicable to California utilities, wholesale purchases made by Metropolitan from out-of-state electricity suppliers would not be affected. However, many other states also have their own RPS standards. To incorporate these emissions reductions, Rincon conducted a complete contribution analysis of the RPS standards for each state contributing power to the AZNM eGrid region and applied those reductions to the portion of power purchased from out-of-state providers. AZNM is the eGrid factor which is used in Metropolitan's TCR reporting methodology for out-of-state electricity purchases. The percent carbon free electricity assumed for this analysis is shown in Table 23. No additional GHG reductions beyond those levels were assumed. Texas for example has already surpassed 10 percent renewables. Therefore, no adjustment was made to that emission factor into the future.

Table 23 State Level Renewable Commitments Included in the Metropolitan Forecast

State	Percent Carbon Free	Target Year
Arizona	15%	2025
California	100%	2045
Colorado	30%	2020
New Mexico	100%	2045
Nevada	25%	2025
Texas	10%	2025
Utah	20%	2025
Wyoming	None	N/A

The ratio of electricity Metropolitan purchases changes year to year. The forecast applied a different ratio of out-of-state versus in-state electricity purchases for each of the three emissions scenarios (high, average, and low). This ratio was calculated by analyzing historical energy purchases. For the high emissions scenario, year 2010 was used since it represents a year of high out of state electricity purchases and therefore, emissions. For the average emissions scenario, year 2017 was used, and for the low emissions scenario the 2011 data year was used. The ratio of electricity used for each year only included electricity sources with GHG emissions (i.e., hydropower was excluded).

Overall, both retail and wholesale electricity and water/wastewater sectors all experience a strong downward trend, approaching near-zero GHG emissions in 2045 due to extremely stringent RPS from SB 100.

4.3 Forecast Scenario Methodology

Because a majority of Metropolitan emissions are associated with electricity for importing water, Metropolitan emissions are highly dependent on where water is sourced. Metropolitan's 2020 Urban Water Management Plan (UWMP) provided historical data on water delivery from 1990 to 2020, which was used as a proxy to develop an emission factor for future deliveries.[41] Emissions factors for water delivery were calculated for years spanning 2005 to 2020 based on the historical water deliveries and the developed inventory discussed in Section 3, which included Metropolitan Scope 1 and 2 emissions and Rincon calculated Scope 3 emissions. Table 24 summarizes the historical water delivery emission factors.

Table 24 Historical Water Delivery Emissions

Year	Water Deliveries (AF)	Absolute Emissions (MT CO_2e)	Emission Factor (MT CO_2e/AF)
2005	2,044,000	323,224	0.15813
2006	2,202,000	219,355	0.09962
2007	2,415,000	172,768	0.07154
2008	2,094,000	258,419	0.12341
2009	1,860,000	360,457	0.19379
2010	1,642,000	582,952	0.35503
2011	1,618,000	202,374	0.12508
2012	1,756,000	155,637	0.08863
2013	1,956,000	267,352	0.13668
2014	2,018,000	545,830	0.27048
2015	1,740,000	440,400	0.25310
2016	1,660,000	263,420	0.15869
2017	1,450,000	226,036	0.15589
2018	1,558,000	358,287	0.22997
2019	1,327,000	159,200	0.11997
2020	1,374,000	234,329	0.17054
Average	**1,794,625**	N/A	**0.16941**

AF: acre-foot; MT CO_2e: metric tons of carbon dioxide equivalent

Forecasted emissions are based on the 2020 UWMP projected deliveries for 2025, 2030, 2035, and 2040. Although not included in the 2020 UWMP, to forecast for 2045, it was assumed that deliveries in 2045 would remain consistent with those projected for 2040. Deliveries were projected in the 2015 UWMP for three hydrological conditions: a single dry year, multiple dry years, and an average year. In the Section 4.3.1, the emission factors and forecasted emissions for each of the three scenarios are discussed and results are summarized. Emission factors applied to forecasted years were further adjusted to account for anticipated reductions associated with electricity use due to SB 100 and other states' carbon-free electricity goals. GHG reductions from these electricity targets were calculated based on the electricity consumption in the representative years (2010, 2011, and 2017) and the percent emissions attributed to electricity consumption in those years. The percent

[41] The Metropolitan Water District of Southern California (2021). 2020 Urban Water Management Plan.

GHG emissions from electricity was then adjusted based on the forecasted reduction in GHG emissions from electricity. In addition to forecasting the GHG emissions from current operations and construction projects, the expected construction and operational emissions from the proposed RRWP were also modeled and included in the forecast. The section below discusses and summarizes the methodology related to the inclusion of RRWP related emissions in the forecast.

Forecasting Scenarios

Dry-year SWP with High CRA Pumping (High Emissions)

Under the high emissions scenario, the water delivery demands for multiple dry years as defined in Metropolitan's 2020 UWMP were used.[42] The high emissions factor (0.3550 MT CO_2e/AF) was derived by calculating the MT of CO_2e per acre-foot of delivered water from the highest emissions year from 2005 to 2020 (calendar year 2010). This emission factor was further adjusted based on the forecasted year, where approximately 85 percent of the operational emission factor will be reduced due to SB 100. Table 25 summarizes the forecasted water deliveries, associated emission factors, and total emissions anticipated for a high emissions scenario. This scenario provides the highest potential GHG emissions.

Table 25 Forecasted Emissions for Dry-Year SWP with High CRA Pumping

Year	Water Deliveries (AF)	Emission Factor (MT CO_2e/AF)	Absolute Emissions (MT CO_2e)
2025	1,629,000	0.314	511,428
2030	1,610,000	0.289	465,664
2035	1,575,000	0.304	478,049
2040	1,568,000	0.252	394,783
2045	1,591,000	0.200	317,441

Numbers may not sum due to rounding

AF: acre-foot; MT CO_2e: metric tons of carbon dioxide equivalent

Average-year SWP with Average CRA Pumping (Average Emissions)

Under the average emissions scenario, the water delivery demands of a single dry year as defined in the 2020 UWMP were used. The average emissions factor (0.1694 MT CO_2e/AF) was calculated by averaging the MT of CO_2e per acre-foot delivered during the period of 2005 to 2020. Similar to the above discussed scenario, the emission factor was further adjusted to account for SB 100 impacts on emissions associated with electricity. Table 26 summarizes the forecasted water deliveries, associated emission factors, and total emissions anticipated for an average emissions scenario.

[42] The Metropolitan Water District of Southern California (2021). 2020 Urban Water Management Plan.

Table 26 Forecasted Emissions for Average-Year SWP with Average CRA Pumping

Year	Water Deliveries (AF)	Emission Factor (MT CO_2e/AF)	Absolute Emissions (MT CO_2e)
2025	1,597,000	0.1532	244,645
2030	1,548,000	0.1398	216,460
2035	1,505,000	0.1702	256,089
2040	1,524,000	0.1307	199,141
2045	1,551,000	0.0916	142,059

Numbers may not sum due to rounding

AF: acre foot; MT CO_2e: metric tons of carbon dioxide equivalent

Wet-year SWP with Low CRA Pumping (Low Emissions)

Under the low emissions scenario, the water delivery demands for the average year as defined in the 2020 UWMP were used. The emissions factor (0.0886 MT CO_2e/AF) was derived by calculating the MT of CO_2e per acre-foot delivered water from the lowest emissions year between 2005 and 2020 (calendar year 2012). Similar to the other scenarios, the emission factor was further adjusted to account for SB 100 impacts on emissions associated with electricity. Table 27 summarizes the forecasted water deliveries, associated emission factors, and total emissions anticipated for a low emissions scenario. This scenario provides the lowest expected emissions forecast.

Table 27 Forecasted Emissions for Wet-Year SWP with Low CRA Pumping

Year	Water Deliveries (AF)	Emission Factor (MT CO_2e/AF)	Absolute Emissions (MT CO_2e)
2025	1,469,000	0.08340	122,520
2030	1,420,000	0.07508	106,615
2035	1,379,000	0.11640	160,515
2040	1,394,000	0.08158	113,728
2045	1,418,000	0.04712	66,812

Numbers may not sum due to rounding

AF: acre foot; MT CO_2e: metric tons of carbon dioxide equivalent

Forecasting Regional Recycled Water Program

Construction of the RRWP is a future program and therefore has been included in the emissions forecast, but not the inventory. The methodology calculating RRWP construction and operation emissions is discussed below along with the results.

RRWP Construction

A conservative estimate of construction emissions associated with the construction of the advanced water treatment plant (AWTP), pipelines, pump stations, and groundwater injection wells were all included in the analysis. Estimates include emissions from projected construction equipment fuel consumption, labor travel, material travel, and temporary electric power usage.

Emissions from pipeline construction were estimated by calculating the emissions from eight different pipeline/trenching methods on a linear foot basis to develop an emissions factor for each construction method. The total linear feet of each pipeline construction type was then multiplied by

the corresponding emissions factor to calculate the total GHG emissions from pipeline construction. All estimates were based on industry standards and/or data provided by Metropolitan.

Regardless of the duration of construction or start date of construction, the same total amount of emissions will be generated. To approximate annual construction emissions, total construction emissions were divided by an assumed 6-year construction schedule which is modelled to begin in 2025 and with completion during 2030 (Table 28). Operational emissions were assumed to begin in 2031 (Table 29). This construction schedule assumes the fastest feasible start to the project. However, as previously mentioned, if a shift in the project start date or overall construction duration does occur, the total impacts of construction and operation will remain unchanged. The emissions would simply shift to a later date while overall volume of emissions would remain constant.

Table 28 Total Construction Emissions for RRWP

System	Absolute Emissions (MT CO_2e)
Advanced Water Treatment	10,895
Pipelines	70,506
Pump Stations	633
Well Facilities	383
Total	**82,417**
6 Year Annual	13,736

RRWP Operations

Operational emissions included an analysis of both electricity use and process emissions due to consumption of MicroC2000® and N_2O generation as shown in Table 29. Emissions associated with electricity were modeled assuming 100 percent of electricity purchased would be from the retail market. With the implementation of SB 100, GHG emissions from electricity consumed at the AWTP would be reduced to zero MT of CO_2e by 2045. Operational electricity demand was estimated to be 264,988 MWh per year for operations at the AWTP and an additional 329,687 MWh per year to operate the pump stations which will move water from the AWTP to the spreading grounds and injection wells. This value represents a worst-case scenario for pump electricity use based on pumping all 150 MGD to Weymouth and may not represent actual final design. Changes to projected annual electricity emissions are shown in Table 30.

Table 29 Process Operational Emissions for RRWP

System	Process Emissions (MT CO_2e)	
Process N_2O	5,340	(non-biogenic)
MicroC2000®	22,271	(biogenic)

MT CO_2e = metric tons of carbon dioxide equivalent; N_2O = nitrous oxide

Table 30 Electricity Emissions Over Time for RRWP Operation

Year	Emissions (MT CO_2e)
2031	84,090
2035	60,064
2040	30,032
2045	–

MT CO_2e = metric tons of carbon dioxide equivalent

Overall emissions for the RRWP for each milestone year are included in Table 31. In 2025 construction is underway so the annual construction estimate of 13,736 MT of CO_2e was applied. By 2031 the plant is assumed to be fully operational (150 MGD) which is reflected in the larger emissions total. These dates do not reflect actual construction and operational start dates. Since, a shift in these dates would not affect the GHG emissions in the target years of 2030 and 2045 and a modelling an earlier start date provides a more conservative emissions forecast, the earlier timeline was used. Over time, GHG emissions associated with electricity use will decrease due to SB 100 while process emissions at the AWTP will remain constant.

Table 31 Overall Estimated RRWP Emissions

Year	Emissions (MT CO_2e)
2025 (construction)	13,736
2030 (construction)	13,736
2035 (operational)	87,675
2040 (operational)	57,643
2045 (operational)	27,611

MT = metric tons

CO_2e = carbon dioxide equivalent

The forecasted emissions for the RRWP were included in each of the Metropolitan emissions forecast scenarios and therefore, are mitigated by the overall CAP which charts a clear pathway for Metropolitan to reach its GHG reduction targets consistent with State goals.

5 Targets and Carbon Budget

5.1 GHG Reduction Targets

As noted in Section 1.2, CARB has issued several guidance documents concerning the establishment of GHG emission reduction targets for CAPs to comply with legislated GHG emissions reductions targets and California Environmental Quality Act Guidelines (CEQA) § 15183.5(b). In the first California *Climate Change Scoping Plan,*[43] the CARB encouraged local governments to adopt a reduction target for community emissions that parallels the State commitment to reduce GHG emissions. In 2016, the State adopted SB 32 mandating a reduction of GHG emissions by 40 percent below 1990 levels by 2030 and in 2017 the CARB published the SB 32 Scoping Plan Update.[44] With the release of the *2017 Climate Change Scoping Plan Update*, the CARB recognized the need to balance population growth with emissions reductions and in doing so, provided a new methodology for proving consistency with State GHG reduction goals through the use of per capita efficiency targets. These targets are generated by dividing a jurisdiction's GHG emissions for each horizon year by the jurisdiction's total population for that target year.

In addition to SB32, Metropolitan has also set a long term goal of achieving carbon neutrality consistent with EO B-55-18. Table 32 shows Metropolitan's GHG reduction targets for the milestone years of 2030 and 2045 as well as several interim years. In order to better prepare for the goal of carbon neutrality, Metropolitan has set a GHG reduction target more aggressive than the SB32 by reducing its emissions along a linear trajectory from 2017 emission levels to carbon neutrality in 2045.

Table 32 Metropolitan's GHG Reduction Targets

Target	Per Capita Emissions (MT CO_2e)	Associated Mass Emissions[2] (MT CO_2e)	Percent Reduction (Below 1990)
Metropolitan's 1990 Per Capita Emissions	0.0516	771,514	N/A
Minimum Per Capita Reduction Target for SB 32 Consistency (40% below 1990 levels)	0.0309	638,423	40%
Metropolitan's Per Capita 2030 GHG Emissions Target[2]	0.0141	290,192	73%
Metropolitan's 2045 Per Capita Goal	0.0000	0	100%
California's EO B-55-18 Per Capita Goal	0.0000	0	100%

MT CO_2e = metric tons of carbon dioxide equivalent

[1] Pending final population numbers

[2] Associated Mass Emissions are calculated by multiplying the per capita emissions target by the projected population in that year. Final mass emission values will be updated based on actual population data.

[43] 2008 Climate Change Scoping Plan https://www.arb.ca.gov/cc/scopingplan/document/adopted_scoping_plan.pdf

[44] CARB. November 2017. California's 2017 Climate Change Scoping Plan. https://www.arb.ca.gov/cc/scopingplan/scoping_plan_2017.pdf

Figure 11 describes the complete reduction pathway. The figure shows Metropolitan's targets meet the per capita emissions target for all three California goals described by AB 32, SB 32, and EO B-55-18. Metropolitan exceeds all per capita emissions (in MT CO_2e) at all targets and meets the EO B-55-18 goal of zero per capita emissions by year 2045. The use of per capita reduction targets to show progress towards GHG reduction goals was established and promoted by the State in the 2017 Scoping Plan Update.[45]

Figure 11 Metropolitan's GHG Reduction Targets

Figure 12 illustrates the per capita reduction pathway translated into mass emissions. Per capita emissions are translated to mass emissions by multiplying by the population in each year. As shown in Figure 12, Metropolitan's target pathway exceeds the State's emissions reduction goal in 2020 and 2030 before ultimately reaching carbon neutrality in line with the State's long-term goal in 2045. The current population values are projected and will need to be updated over time as final population numbers are established. This will change the allowable emissions (MT CO_2e) in each year by effectively including a variable that considers the actual service population in determining the emission reductions. Normalizing the emissions by removing population as a variable allows Metropolitan to focus on deep decarbonization over time. Furthermore, achieving the 2045 target of carbon neutrality will be an iterative process and require revisions between now and 2045, with changes to policy or new statewide GHG emissions targets established by the California legislature.

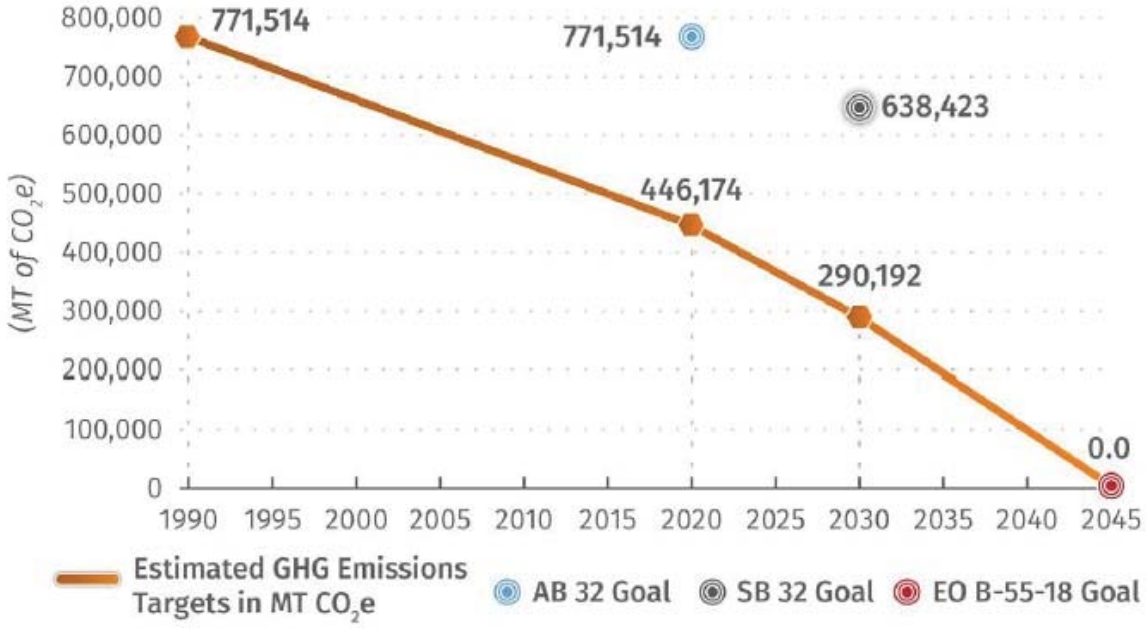
Figure 12 Metropolitan's GHG Emissions Targets Translated to MT CO_2e



Metropolitan's estimated emissions in 2030 are well below the State's 2030 target. However, due to the variability associated with Metropolitan's GHG emissions (as shown in Section 3.0), using any individual year to gain an understanding of Metropolitan's GHG emissions reduction progress would not provide a clear picture of overall emissions reduction trends. Therefore, Metropolitan intends to implement a carbon budget approach to determine GHG emissions reduction progress.

5.2 Carbon Budget Methodology

In order to calculate Metropolitan's carbon budget (really a greenhouse gas budget since it incorporates all greenhouse gases normalized to CO_2e), the sum of the area underneath Metropolitan's target trajectory is summed. Table 33 shows the target emissions for each individual year between 2005 and 2045 (the years for which the carbon budget was calculated). The 2005 target was calculated based on a linear reduction in per capita emissions to carbon neutrality in 2045 from the 1990 per capita number. The start year for the carbon budget is 2005 because it is the first year for which Metropolitan has annual GHG inventories, which are required to track the carbon budget accurately. As shown in Table 33, Metropolitan was below its milestone budget for the period of 2005-2020. During this period, it had a total of 8,924,539 MT CO_2e which could be emitted, but it only emitted 4,770,038 MT CO_2e. This means that Metropolitan has a remaining budget of 4,154,596 MT CO_2e from that period and a total budget remaining of 9,890,437 MT CO_2e which can be emitted between 2021 and 2045. Metropolitan plans to be carbon neutral by 2045 regardless of the remaining carbon budget.

Table 33 Data Used for Calculating Metropolitan's Carbon Budget

Year	Annual GHG Emissions Targets	Actual GHG Emissions	Remaining Budget
2005	660,722	323,224	337,498
2006	646,349	219,355	426,994
2007	632,676	172,768	459,908
2008	619,667	258,419	361,247
2009	605,418	360,457	244,961
2010	592,059	582,952	9,107
2011	579,754	202,374	377,379
2012	567,687	155,637	412,050
2013	555,034	267,352	287,682
2014	541,289	545,830	(4,541)
2015	526,888	440,400	86,488

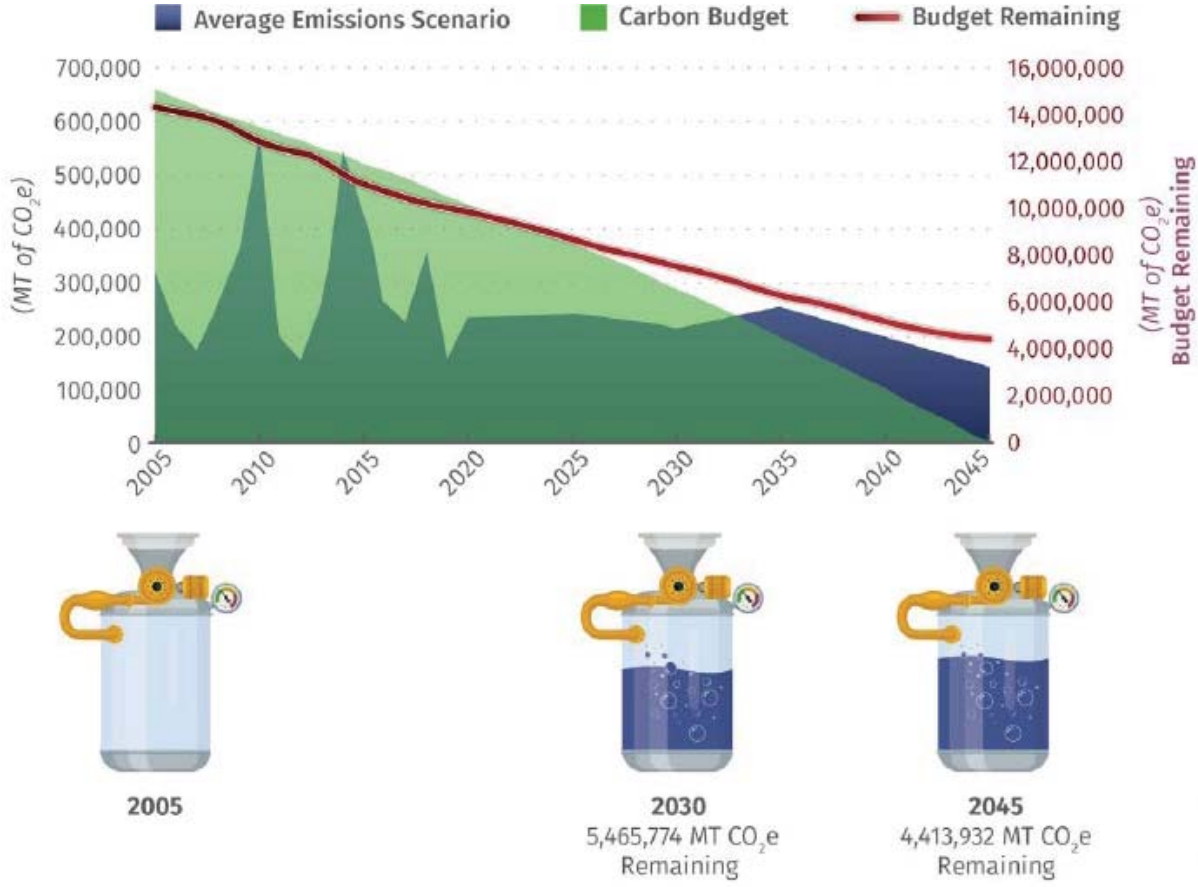
Numbers may not sum due to rounding

[1] The total carbon budget used and budget remaining will be calculated by Metropolitan as GHG inventories for each year are completed.

[2] This number represents the total carbon budget left in the corresponding milestone year on current carbon usage. These totals will be reduced as Metropolitan completes GHG inventories over time. The goal in each milestone year will be considered complete as long as the carbon budget does not reach zero.

Figure 13 shows the carbon budget for Metropolitan's per capita targets based on the average emissions forecast. Under this scenario Metropolitan never exceeds the carbon budget (through 2045). This is only one of the scenarios that Metropolitan may experience. Metropolitan has developed a CAP that provides a pathway to stay within the carbon budget through 2030 under even the highest emission scenario. However, as noted above, emissions would need to fall to carbon neutral by 2045 in order to meet the intent of EO B-55-18 and Metropolitan's stated GHG emissions goal. Metropolitan will need to continue to update its GHG reduction strategy over time to respond to and incorporate the newest science, technologies, and legislation.

Figure 13 Metropolitan's Carbon Budget Using Mass Emissions Methodology and a Straight Line to Carbon Neutrality by 2045 Target (Average Emissions Forecast)



Based on the data presented in the inventory and forecast Metropolitan has developed a suite of GHG reduction measures to stay within the carbon budget through 2030 and establish substantial progress towards the 2045 goal of carbon neutrality. A full description of the GHG reduction measures can be found in the CAP and Appendix C.

Table 34 Complete List of Metropolitan CIP Projects and Associated GHG Emissions

	Policy Changes and Other Projects Without Emissions		
Program	**Program Name**	**Project Name**	**Emissions**
Cost Efficiency & Productivity	Business Operations Improvement	Budget System Replacement System	
Cost Efficiency & Productivity	Enterprise Content Management	Enterprise Content Management Phase II	
CRA Reliability	CRA - Reliability for FY2018/19 through FY2023/24	CRA Desert Region Security Improvements	
CRA Reliability	CRA Main Pump Reliability	CRA Main Pump Rehabilitation (Stage 1) - Design Phase for Demonstration Project	
PCCP Reliability	PCCP Rehabilitation and Replacement	PCCP Rehabilitation - Program Management	
PCCP Reliability	Second Lower Feeder PCCP Rehab	Chief Administrative Officer Group Labor Adjustment	
PCCP Reliability	Second Lower Feeder PCCP Rehab	ESG Labor Adjustment
