Real Property and Asset Management Committee

Meeting with Board of Directors *

June 13, 2022

12:30 p.m.

Monday, June 13, 2022 Meeting Schedule
09:30 am - F&I
10:30 am - E&O
12:00 pm - Break
12:30 pm - RP&AM
01:00 pm - C&L
02:00 pm - WP&S

Teleconference meetings will continue until further notice. Live streaming is available for all board and committee meetings on mwdh2o.com (Click Here)

A listen only phone line is also available at 1-877-853-5257; enter meeting ID: 831 5177 2466. Members of the public may present their comments to the Board on matters within their jurisdiction as listed on the agenda via teleconference only. To participate call (833) 548-0276 and enter meeting ID: 815 2066 4276.

MWD Headquarters Building • 700 N. Alameda Street • Los Angeles, CA 90012

* The Metropolitan Water District's meeting of this Committee is noticed as a joint committee meeting with the Board of Directors for the purpose of compliance with the Brown Act. Members of the Board who are not assigned to this Committee may participate as members of the Board, whether or not a quorum of the Board is present. In order to preserve the function of the committee as advisory to the Board, members of the Board who are not assigned to this Committee will not vote on matters before this Committee.

1. Opportunity for members of the public to address the committee on matters within the committee's jurisdiction (As required by Gov. Code Section 54954.3(a))

MINUTES

REAL PROPERTY AND ASSET MANAGEMENT COMMITTEE

May 9, 2022

Vice Chair Peterson called the teleconference meeting to order at 12:46 p.m.

Committee Members present: Vice Chair Peterson, Directors Camacho, Dick, Erdman, Record and Smith.

Members absent: Directors Kassakhian, Kurtz and Sutley

Other Board Members present: Chairwoman Gray, Directors Abdo, Ackerman, Atwater, Blois, DeJesus, Dennstedt, Faessel, Fellow, Goldberg, Jung, Lefevre, McCoy, Miller, Morris and Ramos.

Committee Staff present: Chapman, Hagekhalil, Otake, Tucker, Upadhyay and Holland

1. OPPORTUNITY FOR MEMBERS OF THE PUBLIC TO ADDRESS THE COMMITTEE ON MATTERS WITHIN THE COMMITTEE'S JURISDICTION

None

CONSENT CALENDAR ITEMS — ACTION

2. CONSENT CALENDAR OTHER ITEMS – ACTION

A. Approval of the Minutes of the Meeting of the Real Property and Asset Management Committee held April 11, 2022.

3. CONSENT CALENDAR ITEMS – ACTION

7-8 Subject: Authorize granting a new five-year license agreement to West Air Gases and Equipment, Inc., for vehicle parking on Metropolitan fee-owned property in the city of Anaheim, identified as Orange County Assessor Parcel No. 344-221-01; the General Manager has determined that the proposed action is exempt or otherwise not subject to CEQA

Motion: Authorize granting a five-year license agreement to West Air Gases and Equipment, Inc., for employee vehicle parking.

No presentation was given, Director Record made a motion, seconded by Director Erdman to approve the consent calendar consisting of items 2A and 7-8.

The vote was:

Ayes: Directors Camacho, Dick, Erdman, Peterson, Record and Smith

Noes: None

Abstentions: None

Absent: Kassakhian, Kurtz and Sutley

The motion for items 2A and 7-8 passed by a vote of 6 ayes, 0 noes,0 abstention, and 3 absent.

7-10 Subject: Authorize the General Manager to update the landlord termination provision for leases with Coxco, LLC and HayDay Farms Venture, LLC; the General Manager has previously determined that the proposed action is exempt or otherwise not subject to CEQA [Conference with real property negotiators; properties identified as Property Group 1: Riverside County Assessor Parcel Nos. 821-100-018; 821-100-019; 821-150-018; 821-160-012; 821-160-013; 824-200-048; 863-140-002; 863-150-001; 863-170-005; 863-170-006; 863-180-003; 863-180-004; 863-180-005; 863-220-005; 866-040-004; 866-040-005; 866-040-007; 866-040-008; 866-080-001; 866-080-002; 866-080-003; 866-080-005; 866-080-012; 866-090-002; 866-090-009; 866-090-010; 866-090-013; 866-090-014; 872-150-005; 872-160-006; 872-160-007; 872-160-008; 872-160-009; 872-180-006; 872-180-009; 878-020-004; 878-020-005; 878-020-008; 878-030-009; 878-030-016; 878-091-001; 878-091-005; 878-091-006; 821-140-002; 821-140-007; 830-110-001 (a portion of); 830-110-002; 830-120-009; 836-031-007; 836-031-008; 863-120-005; 863-170-003; 863-170-009; 863-180-001 (a portion of); 863-180-002; 879-130-010; 879-130-011; Property Group 2: Riverside County Assessor Parcel Nos. 878-081-001; 878-081-002; 878-081-004; 878-081-005; 878-081-006; 878-081-012; 878-082-001; 878-082-007; 878-111-017; 878-112-014; 878-112-015; 878-120-013; 878-120-015; 878-130-010; 878-130-011; 878-161-014; 878-161-015; 878-162-002; 878-162-003; 878-191-004; 878-192-001; 878-192-002; 878-193-007; 878-193-011; 878-193-013; 878-201-001; 878-220-005; 878-220-014; 878-220-015; 878-230-006; 878-230-007; 878-230-008; 878-240-021; 879-210-026; 879-240-007; 879-240-029; 879-240-032; 879-240-033; 879-261-004; 879-262-005; 879-262-011; 879-262-014; 866-130-001; 866-130-002; 866-130-003; 866-130-004; 866-210-006; 866-210-010; 866-240-004; 866-240-009; 866-250-008; 866-250-009; 866-250-011; 869-130-001; 869-270-006; 869-270-010; 869-291-002; 869-291-003; 869-291-005; 869-291-009; 869-292-001; 869-292-002; 869-292-003; 872-080-006; 872-080-007; 872-080-008; 872-090-005; 872-090-006; 872-090-007; 872-090-008; 872-100-001; 872-340-014; 872-340-018; 872-352-003; 872-352-010; 872-352-017; 872-360-001; 872-360-003; 872-370-002; 872-370-008; 872-370-013; 872-370-014; 872-370-016; 872-370-018; 875-021-001; 875-021-002; 875-021-006; 875-021-007; 875-021-008; 875-021-013; 875-021-014; 875-022-003; 875-022-004; 875-022-005; 875-022-006; 875-022-012; 875-030-012; 875-030-014; 875-030-027; 875-030-028; 875-040-006; 875-071-001; 875-071-002; 875-071-003; 875-071-004; 875-071-005; 875-

Code Section 54956.8]

Motion: Authorize the General Manager to update the landlord termination without cause provision by extending the written notice to three years for leases with Coxco, LLC and HayDay Farms Venture, LLC.

Presentation was given, Director Dick made a motion, seconded by Director Erdman to approve item 7-10.

After a staff request for clarification, Vice Chair Peterson confirmed that the motion was to authorize Real Property Negotiators for Metropolitan to update the lease termination time or lease termination provisions in the lease agreement, and the voting commenced.

The vote was:

Ayes:	Directors Camacho, Dick, Erdman, Peterson, Record, Smith and Sutley
Noes:	None
Abstentions:	None
Absent:	Kassakhian, Kurtz and Sutley

The motion for item 7-10 passed by a vote of 6 ayes, 0 noes,0 abstention, and 3 absent.

Item 7-10 passed by a vote of 6 ayes, 0 noes, 0 abstention, and 3 absent.

BOARD ACTION

- **Board of Directors**
  Real Property and Asset Management Committee

6/14/2022 Board Meeting

7-11

Subject

Review and consider the U.S. Bureau of Land Management's Final Environmental Impact Statement certified to satisfy CEQA and take related CEQA actions, and authorize the General Manager to grant a permanent easement for transmission line purposes to Delaney Colorado River Transmission, LLC on Metropolitan-owned property near Blythe, California in the county of Riverside

Executive Summary

This action authorizes the General Manager to grant a permanent easement to Delaney Colorado River Transmission (DCRT) for an above-ground 500kV transmission line traversing Metropolitan fee-owned property in the Palo Verde Valley near Blythe, California, in the county of Riverside.

Staff has determined that the easement, as conditioned, will not damage, delay, hinder, or otherwise obstruct the safe and effective use, operation, or maintenance of Metropolitan lands and facilities for water-related purposes. Board authorization is required because the real property interest being granted exceeds five years.

Details

Background

Metropolitan owns approximately 30,000 acres of fee-owned property in the Palo Verde Valley region. The proposed 22.90-acre easement area is located approximately five miles south of Blythe and four miles west of the Colorado River **(Attachment 1)**. The easement, as conditioned, would provide for a permanent right-of-way to construct, operate, maintain, alter, repair, replace, inspect, relocate or remove an above-ground 500 kilovolt (kV) electric transmission line.

The transmission line is part of Ten West Link, a planned energy infrastructure project owned by DCRT, that was recently approved by the California Public Utilities Commission (CPUC). On November 5, 2021, the Commission granted DCRT a certificate of public convenience and necessity for Ten West Link, which includes the right to take condemnation action for the acquisition of property rights if the action is required. DCRT is a joint venture between the Starwood Energy Group Global (Starwood Energy) and Atlantica Yield PLC, with Starwood Energy serving as managing member of DCRT.

Ten West Link will span 125 continuous miles between California and Arizona, beginning at the Arizona Public Service Company Delaney Substation near Tonopah, Arizona, and terminating at the Southern California Edison (SCE) Colorado River Substation near Blythe, California. DCRT asserts the project will have a conductor capacity to transmit 3,200 megawatts, thereby providing improved system reliability and interconnection capability for new energy projects in the Desert Southwest region. Its 21.5-mile California route will run through the central Palo Verde Valley and parallel the existing SCE-owned Colorado River 500kV transmission line along Metropolitan's fee property.

The proposed easement area is encumbered with a long-term lease to HayDay Farms Venture, LLC, and the tenant will continue its existing farming operations beneath the proposed transmission line. The transmission line will also traverse one of the remaining two parcels Metropolitan currently has under escrow to purchase from Cox Family Farms, LLC (Cox). Should this sale be consummated, agreement terms between Cox and DCRT will

match the terms of Metropolitan's agreement for this proposed easement. The purchase price paid by Metropolitan to Cox will be discounted as a result of this new easement encumbrance.

Proposed Easement

The easement area totals 22.90 acres and is 200 feet wide, 0.91 miles long, and contains defined access rights totaling 1.56 acres. The easement runs in an east-west direction and is located on two non-contiguous parcels that are approximately two miles apart **(Attachment 2)**. The eastern parcel comprises 13.67 acres, is 0.52 miles long, and is accessible via Defrain Boulevard on the east and by a Metropolitan-owned access road to the west. The western parcel's easement area totals 9.23 acres and is 0.39 miles long. It is accessible on the east by a Metropolitan-owned access road and by Neighbours Boulevard on the west.

When completed, the easement area will contain a 500kV transmission line with appurtenances and appendages, including foundations, towers, supporting structures, and communications equipment to support the main transmission line use.

To ensure the use of the easement area by DCRT and its successors would not hinder or otherwise obstruct the safe and effective use, operation, and maintenance of Metropolitan's lands, staff has negotiated the following key provisions for the Board's consideration:

- A paramount rights provision that protects Metropolitan's use of its lands for water-related purposes, including water conservation, augmentation of water supply, forbearing and fallowing activities, local agricultural production, and other water quality, supply, management, conveyance, and treatment-related activities now and in the future.
- DCRT will defend, indemnify and hold harmless Metropolitan, its directors, officers, employees, agents, and tenants from and against any liability or expenses arising from the use of the transmission easement.
- DCRT shall have the right to sell, assign, collaterally assign, mortgage, encumber, lien, transfer, lease and/or convey to others, and each other, the transmission line easement.
- Any modifications to the easement area and prescribed uses will be subject to Metropolitan's review and approval.
- All plans for installation and construction or reconstruction shall be reviewed and approved in advance by Metropolitan.
- DCRT shall, at its sole cost and expense, keep the easement area that is not farmable free of noxious weeds and trash.

Fair market value for the permanent easement is $316,000 and is based on a recent third-party appraisal. Metropolitan will also receive a one-time processing fee of $8,500.

Policy

Metropolitan Water District Administrative Code Section 8230: Grants of Real Property Interests

Metropolitan Water District Administrative Code Section 8231: Appraisal of Real Property Interests

Metropolitan Water District Administrative Code Section 8232: Terms and Conditions of Management

By Minute Item 48766, dated August 16, 2011, the Board adopted fair market value policies for managing Metropolitan's real property assets.

California Environmental Quality Act (CEQA)

CEQA determination for Option #1

Pursuant to the provisions of CEQA and the State CEQA Guidelines, the U.S. Bureau of Land Management (BLM), acting as the federal Lead Agency, certified a Final Environmental Impact Statement on November 21, 2019, for the Ten West Link 500 Kilovolt Transmission Line Project and Resources Management Plan Amendment (Final EIS). On November 4, 2021, pursuant to an agreement between BLM and the CPUC and State CEQA Guidelines Section 15225(a), the CPUC, acting as the state Lead Agency for the Project, certified that the Final EIS met the requirements of CEQA and relied on it for approval of the Project. Metropolitan, acting

as a Responsible Agency under CEQA, is required to certify that it has reviewed and considered the information in the Final EIS, and adopt the Lead Agency's findings, and mitigation measures, relevant to Metropolitan's approval of the proposed easement. See **Attachment 3** for the Final EIS, **Attachment 4** for the Final EIS Appendices (includes 1C – CEQA and Mitigation Monitoring Reporting Program), and **Attachment 5** for the CPUC CEQA decision.

CEQA determination for Option #2:

None required

Board Options

Option #1

Review and consider the Bureau of Land Management's Final Environmental Impact Statement certified to satisfy CEQA and take related CEQA actions; and authorize the General Manager to grant a permanent transmission line easement to Delaney Colorado River Transmission, LLC.

Fiscal Impact: Metropolitan will receive positive revenue in the form of a one-time processing fee of $8,500 and $316,000 as the fair market value for the proposed easement.
Business Analysis: The granting of the easement is mutually compatible with Metropolitan's use of the subject property. The easement, as conditioned, does not hinder or otherwise interfere with the activities and objectives for Metropolitan's property in the Palo Verde Valley and supports a utility company in conducting their mission.

Option #2

Do not authorize the permanent easement.
Fiscal Impact: Metropolitan will forego the one-time transaction and conveyance fees of $324,500.
Business Analysis: DCRT will likely use its eminent domain authority to obtain the easement should Metropolitan not grant DCRT the permanent right-of-way and easement.

September 2019

Dear Reader:

Enclosed is the Final Environmental Impact Statement (FEIS) and Proposed Resource Management Plan Amendment (RMPA) for the Ten West Link Transmission Line Project (Project). The FEIS/Proposed RMPA was prepared by the Bureau of Land Management (BLM) in consultation with various government agencies and organizations, taking into account public comments received during this planning effort.

The BLM is considering an application by DCR Transmission, LLC, for a right-of-way (ROW) on public lands to construct, operate, maintain, and decommission a 114 mile, 500 kilovolt transmission line between the Delaney Substation in Maricopa County, Arizona, and the Colorado River Substation in Riverside County, California. The FEIS/Proposed RMPA analyzes the potential impacts of authorizing the Project, including amending the BLM's Yuma Field Office RMP and California Desert Conservation Area (CDCA) Plan to allow for its construction.

The Proposed Action and alternatives presented in the FEIS are the same as those presented and analyzed in the Draft EIS released in August 2018. The FEIS addressed public comments on the Draft EIS released in August 2018. The FEIS also analyzes more refined Project engineering and design information provided by the Project proponent, specifically locations and types of transmission structures; and location, size and scope of access roads needed to build and maintain the Project. The discussion of the land use plan amendments considered by the BLM is also clarified in the FEIS.

Pursuant to BLM's planning regulations at 43 CFR 1610.5-2, any person who participated in the planning process for this Proposed RMPA and has an interest which is or may be adversely affected by the planning decisions may protest approval of the planning decisions contained therein. Specifically, the BLM's proposed RMPA decisions would amend the Yuma RMP to allow for consideration of rights of way outside of designated corridors on a case-by-case basis and amend the CDCA to allow for construction of the Project within 0.25 mile of occurrences of the Harwood's eriastrum, a BLM-sensitive plant species.

The FEIS/Proposed RMPA is open for a 30-day protest period beginning the date the U.S. Environmental Protection Agency publishes its Notice of Availability of the FEIS in the *Federal Register*.

The regulations specify the required elements of your protest. Take care to document all relevant facts. As much as possible, reference or cite the planning documents or available planning records (e.g. meeting minutes or summaries, correspondence, etc.).

Instructions for filing a protest with the Director of the BLM regarding the FEIS and Proposed RMPAs may be found online at https://www.blm.gov/programs/planning-and-nepa/public-participation/filing-a-plan-protest and at 43 CFR 1610.5-2. All protests must be in writing and mailed to the appropriate address, as set forth below, or submitted electronically through the BLM ePlanning project website. Protests submitted electronically by any means other than the ePlanning project website protest section will be invalid unless a protest is also submitted in hard copy. Protests submitted by fax will also be invalid unless also submitted either through ePlanning project website protest section or in hard copy.

All protests submitted in writing must be mailed to one of the following addresses:

Regular Mail:
Director (210)
Attn: Protest Coordinator
P.O. Box 71383 Washington,
D.C. 20024-1383

Overnight Delivery:
Director (210)
Attn: Protest Coordinator
20 M Street SE, Room
2134LM Washington, D.C.
20003

The BLM Director will render a written decision on each land use plan protest. The decision will be in writing and will be sent to the protesting party by certified mail, return receipt requested. The decision of the BLM Director shall be the final decision of the Department of the Interior on each land use plan protest. Responses to land use plan protest issues will be compiled and formalized in a Director's Protest Resolution Report made available following issuance of the decisions.

Upon resolution of all land use plan protests, the BLM will issue a Record of Decision, which will include information on any further opportunities for public involvement.

Sincerely,

WILLIAM MACK Digitally signed by WILLIAM MACK

Ten West Link Transmission Line Project
Final Environmental Impact Statement and
Proposed Resource Management Plan Amendments

U.S. Department of the Interior
Bureau of Land Management
Arizona State Office
Phoenix, Arizona
September 2019

Lead Agency:	U.S. Department of the Interior, Bureau of Land Management
Type of Action:	( ) Draft (X) Final
Cooperating Agencies:	Bureau of Reclamation; California Public Utilities Commission; Environmental Protection Agency; Department of Defense, Yuma Proving Ground; U.S. Fish and Wildlife Service; U.S. Army Corps of Engineers; Western Area Power Administration; Arizona Game and Fish Department; Arizona State Land Department; Maricopa Association of Governments; La Paz County, Arizona; Town of Quartzsite, Arizona
Project Location:	Maricopa and La Paz Counties, Arizona; Riverside County, California
Responsible Official:	Raymond Suazo, BLM Arizona State Director
For Further Information Contact:	Lane Cowger Project Manager, BLM Arizona State Office One North Central Avenue, Suite 800 Phoenix, AZ 85004 602-417-9612 TenWestLink@blm.gov
Comments must be received by:	30 days after publication in the Federal Register

Abstract

This Final Environmental Impact Statement (EIS) evaluates the anticipated environmental effects of the construction, operation, maintenance, and decommissioning of the Ten West Link Transmission Line Project (Project) proposed by DCR Transmission, LLC. The proposed Project includes construction of a 500-kilovolt electric transmission line and associated infrastructure, from the Delaney Substation near Tonopah, Arizona, to the Colorado River Substation near Blythe, California. The Final EIS analyzes the Proposed Action, four Action Alternative routes, the Agency Preferred Alternative, and a No Action Alternative; and addresses public comments received on the Draft EIS, which was published in August 2018. The Proposed Action is 114.3 miles long and generally follows the existing Devers to Palo Verde transmission line, including a 24.9-mile long crossing of the Kofa National Wildlife Refuge (NWR). The Agency Preferred Alternative is 125.0 miles long, utilizes BLM utility corridors, and does not cross the Kofa NWR. The Proposed Action and all Action Alternatives include proposed amendments to BLM land use plans, specifically the Yuma Field Office Resource Management Plan and the California Desert Conservation Area Plan, to accommodate the Project. Amendment of the Lake Havasu Field Office Resource Management Plan is also considered in some Action Alternatives. Under the No Action Alternative, the BLM would not approve the ROW grant on BLM-administered public lands and no BLM land use plans would be amended.

Executive Summary

EXECUTIVE SUMMARY

ES-1 INTRODUCTION

The Ten West Link Transmission Line Project (the Project) proposed by DCR Transmission, Limited Liability Corporation (DCRT) would consist of a single-circuit, series-compensated, 500 kilovolt (kV) transmission line between the Arizona Public Service (APS) Delaney Substation in Maricopa County, Arizona and the Southern California Edison (SCE) Colorado River Substation in Riverside County, California. The Project would be designed with a conductor capacity to transmit 3,200 megawatts (MW) and provide interconnection capability for new energy projects located in the region.

The Bureau of Land Management (BLM) is the lead Federal agency responsible for preparing this Environmental Impact Statement (EIS) and associated analyses. This EIS also addresses the requirements of the California Environmental Quality Act (CEQA) for use by the California Public Utilities Commission (CPUC) and, as applicable, other California state and local agencies in connection with the Project. The CPUC and eleven other cooperating agencies have participated in the preparation of this EIS, including the Environmental Protection Agency (EPA); Department of Defense, Yuma Proving Ground; Bureau of Reclamation (Reclamation); U.S. Fish and Wildlife Service (USFWS); Western Area Power Administration (WAPA); U.S. Army Corps of Engineers (USACE); Arizona Game and Fish Department (AGFD); Arizona State Land Department (ASLD); Maricopa Association of Governments, Arizona; the town of Quartzsite, Arizona, and La Paz County, Arizona.

ES-2 BLM'S PURPOSE AND NEED FOR ACTION

The purpose of the BLM action is to respond to DCRT's request for a right-of-way (ROW) across public land to construct, operate, maintain, and decommission the Project over an estimated 50-year life of Project. The need for the BLM action is established by the BLM's responsibility under the Federal Land Policy and Management Act (FLPMA) of 1976 and the Energy Policy Act of 2005 to respond to applications that promote energy production including electricity.

Portions of the Proposed Action and/or Action Alternatives would not be in conformance with the Yuma Resource Management Plan (RMP), Lake Havasu RMP, or the California Desert Conservation Area Plan of 1980, as amended (CDCA Plan). Therefore, BLM must consider amending these plans in connection with its consideration of DCRT's ROW application.

ES-3 DECISIONS TO BE MADE AND OTHER AUTHORIZING ACTIONS

BLM

The BLM will decide whether to issue a ROW grant to DCRT on land administered by the BLM, and if so, what terms and conditions should be applied. If the selected alternative does not conform to one or more of the BLM RMPs, the Project would require RMP amendments before it could be approved. If the BLM selects an Action Alternative route, the BLM would decide whether to issue a ROW to APS to construct, operate, and maintain a 12kV distribution line to power an alternative Series Compensation Station (SCS) location.

CPUC

DCRT has filed an application for a Certificate of Public Necessity and Convenience (CPCN) to site the Project's transmission infrastructure in California. The CPUC will decide whether to approve or deny DCRT's CPCN application.

OTHER AGENCIES

Other agencies, including Department of Defense, Bureau of Reclamation, USFWS, USACE, WAPA, and the Arizona Corporation Commission will have permitting or regulatory decisions to make on the Project. This is further described in Chapter 1.

ES-4 PUBLIC INVOLVEMENT

Public and agency input was solicited to identify the range or scope of issues to be addressed during the environmental analysis and in the EIS. Initiation of the EIS process and the public scoping meetings for the EIS were announced through the *Federal Register*, Volume 81, No. 56, Page 15556 on March 23, 2016; BLM news releases and a Legal Notice in Arizona and California media; and postings on the BLM's ePlanning website for the Project (https://go.usa.gov/xU6Be).

The BLM sent scoping letters and/or emails to 778 potentially interested members of the public and 219 interested agency and tribal representatives. Three public scoping meetings were held to inform the public of the proposed Project and solicit feedback and comments. The meetings were held April 12 - 14, 2016 in Tonopah, Arizona, Quartzsite, Arizona, and Blythe, California. An agency-only scoping meeting was held in Phoenix, Arizona. An Economic Strategies Workshop was held in Quartzsite, Arizona to identify potential social and economic issues and potential opportunities that might enhance or expand the social and economic goals of area communities.

BLM sent notification of availability of the DEIS to people on the mailing list, publicized availability of the DEIS via news releases, and published a Notice of Availability in the Federal Register on August 31, 2018. Three public meetings to discuss the DEIS were held October 9 - 11, 2018 in Phoenix, Arizona, Quartzsite, Arizona, and Blythe, California. Comments were accepted throughout a 90-day comment period, ending November 29, 2018. A total of 50

comment letters and emails were received from the public. Comments and responses are provided in Appendix 8 of this FEIS.

Comments on the DEIS included such topics as use of BMPs and MMs, property values, wildlife, recreation, land use, and avoiding the Kofa NWR.

ES-5 CHANGES BETWEEN DRAFT AND FINAL EIS

In response to public comments on the DEIS, information related to impacts to Sonoran pronghorn and lands with wilderness characteristics were clarified. Also, Project specific plans were included in Appendix 2B. Additionally, the BLM removed the Visual Resource Management Class RMP amendments from the Agency Preferred Alternative to maintain manageability of the utility corridor and made various editorial changes to the EIS, such as fixing several figures, clarifying analyses, and making minor corrections.

Between the DEIS and FEIS, design and engineering of the Project were refined and presented in an updated POD (DCRT 2019); therefore, acreages of new surface disturbance and water required for construction was adjusted to reflect this information in the FEIS. Of note, the POD was revised by the applicant to reflect the Agency Preferred Alternative, rather than the Proposed Action.

ES-6 APPLICANT PROPOSED ROW ACTIONS AND PROPOSED PLAN AMENDMENTS

APPLICANT PROPOSED ROW ACTIONS

The Proposed Action route would be 114 miles long with approximately 97 miles in Arizona and 17 miles in California. Of the total length, 83 miles would be on Federal land. The Proposed Action route would parallel the existing SCE Devers Palo Verde #1 (DPV1) 500kV line and, in some areas, other linear corridors such as transmission lines and natural gas pipeline ROWs.

DCRT proposes to acquire a 200-foot-wide ROW for construction, operation, maintenance, and decommissioning of the 500kV line and associated SCS; and a 20-foot-wide ROW for a 12kV distribution line servicing the SCS, should an alternative other than the Proposed Action be selected. ROWs have been designed to allow for the safe movement and operation of equipment during construction and maintenance[1], the safe construction of the Project facilities, and to allow for sufficient clearance between conductors and the ROW edge as required by the National Electrical Safety Code (2017). DCRT has requested an initial 50-year grant from the BLM for the purposes of constructing, operating, maintaining, and decommissioning the Project. In addition to the BLM, ROWs would need to be acquired from other Federal, state, and local entities, as well as private landowners.

[1] While most access roads would be located within the 200-foot ROW, other access roads would be outside of the transmission line ROW in order to optimize the use of existing roads and trails.

RMP AMENDMENTS

The Proposed Action and all Action Alternatives include amendments to the Yuma RMP and CDCA Plan. In addition, some alternatives include an amendment to the Lake Havasu RMP as further described in Chapter 2.

AMENDMENT OF THE YUMA RMP

The Yuma RMP designates visual resource management (VRM) classes for lands managed within the boundaries of the Yuma Field Office. Portions of the Proposed Action do not conform to the VRM classes on some segments; analysis of these segments includes an amendment to the RMP. In addition, the Yuma RMP would require an amendment to permit a ROW for any segment outside designated BLM utility corridors.

AMENDMENT OF THE CDCA PLAN

The CDCA Plan would be amended to authorize construction of the Project within 0.25-mile of occurrences of Harwood's eriastrum (*Eriastrum harwoodii*), provided that a Rare Plant Linear ROW Protection Plan for Harwood's eriastrum is developed and approved by the BLM California State Director. The Rare Plant Linear ROW Protection Plan would meet the CDCA Plan's goal to promote ecological processes in the BLM Decision Area that sustain BLM Focus and Special Status Species and their habitat.

ES-7 ALTERNATIVES

The EIS analyzes the Applicant Proposed Action, four Action Alternative routes consisting of combinations of Proposed Action segments and Alternative segments, 36 Subalternatives to the Action Alternatives, the Agency Preferred Alternative, and the No Action Alternative (Figures ES-1 and ES-2). The Action Alternative routes were formed by combining proposed and alternative segment combinations that linked together logically, while meeting certain objectives of the BLM, cooperating agencies, and stakeholders; and addressing public concerns. The Action Alternatives represent the best combination of segments to achieve these objectives. The Action Alternatives consider amendments to the Yuma RMP and CDCA Plan, similar to those identified for the Proposed Action, as further described in Chapter 2.

ALTERNATIVE 1: I-10 ROUTE

Alternative 1 would be 111.6 miles long and would generally follow I-10. This alternative route was developed to utilize BLM utility corridors while avoiding the Kofa NWR, Johnson Canyon, YPG, Copper Bottom Pass area, and the area of dense cultural resources associated with the Mule Mountains south of Blythe; and also meet public requests for a route that follows I-10 and minimize crossings of VRM Class II lands.

ALTERNATIVE 2: BLM UTILITY CORRIDOR ROUTE

Alternative 2 would be 125.8 miles long and would be primarily within designated BLM utility corridors. This alternative route was developed to emphasize the use of BLM utility corridors while avoiding the Kofa NWR, Johnson Canyon, Ehrenberg Sandbowl area, the area of dense cultural resources associated with the Mule Mountains south of Blythe, and residential and other

development south of Blythe; minimize impacts to the Colorado River Indian Tribes (CRIT) reservation and use of private land in California; and place the majority of route crossing VRM Class III lands.

ALTERNATIVE 3: AVOIDANCE ROUTE

Alternative 3 would be 123.0 miles long and was developed to avoid Kofa NWR, Johnson Canyon, the CRIT reservation, the Town of Quartzsite, Ehrenberg Sandbowl area, biologically important backwaters of the Colorado River, the southern end of Blythe, and the area of dense cultural resources associated with the Mule Mountains south of Blythe; and place the majority of the route crossing VRM Class III lands.

ALTERNATIVE 4: PUBLIC LANDS EMPHASIS ROUTE

Alternative 4 would be 120.3 miles long and generally is on public lands, minimizing Arizona state trust lands. This alternative route was developed to avoid the Kofa NWR, state trust land along I-10, the CRIT reservation, the Ehrenberg Sandbowl area, the southern end of Blythe, and the area of dense cultural resources associated with the Mule Mountains south of Blythe; and also maximize use of BLM utility corridors in the Copper Bottom Pass area, while placing the majority of route crossing VRM Class III lands.

AGENCY PREFERRED ALTERNATIVE

The BLM has identified Alternative 2, the BLM Utility Corridor Route, utilizing Subalternative 4D (Segments x-05 and p-07), as the Agency Preferred Alternative for the Project, to include the alternative SCS located along Segment i-03 adjacent to I-10 (Figure ES-2); along with design features, applicant proposed measures (APMs), best management practices (BMPs), and mitigation measures, with modifications, as necessary. It is 125.0 miles long, with impacts similar to those identified for Alternative 2; and includes route modifications further minimizing impacts to recreation, tourism, towns, and other sensitive resources along the Project route. The Agency Preferred Alternative does not include amendments to the visual resource management classes in the Yuma RMP in order to maintain consistency in management along the entire length of the utility corridors used by the Project. Visual impacts are minimized through project design and implementation of BMPs.

NO ACTION ALTERNATIVE

Under the No Action Alternative, the BLM would not approve the ROW grant on BLM-administered public lands and no BLM RMP would be amended. The 500kV transmission line would not be constructed across Federal lands as proposed by DCRT.

ES-8 PROPOSED FACILITIES AND INFRASTRUCTURE

Transmission structures are proposed to be comprised of steel lattices of various configurations. The structures would be between 72 and 195 feet in height, depending on the span length required and topography, with most being shorter than 142 feet. Span lengths between structures would vary from 400 to 2,300 feet, depending upon terrain conditions, current land use, structure type used, and to achieve site-specific mitigation objectives.

The Project would require a transmission line SCS located at the approximate midpoint of the route. Under the Proposed Action, a new SCS system would be located within the 200-foot-wide ROW parallel to the existing SCS associated with the DPV1 line, approximately 47 miles from the APS Delaney Substation. Two alternative locations for the SCS, less than 75 feet apart, have also been identified located south of I-10 to the north of the New Water Mountains. Specifications for the alternative location SCS would be the same regardless of the route selected or SCS location. The SCS would be fenced and access would be restricted.

Five types of access would be used for this transmission line: existing maintained public or private roads, upgraded existing roads, new centerline access, spur roads, and helicopter access.

ES-9 PROPOSED OPERATION, MAINTENANCE, AND DECOMMISSIONING

After construction, Project operation and maintenance would be an ongoing activity including ROW safety requirements, transmission line inspections, preventative and emergency maintenance, distribution line maintenance, vegetation management including trimming and removal of vegetation within the ROW, SCS maintenance, substation maintenance, and long-term access to the ROW through general road maintenance and installation of signs and markers.

Should the ROW and facilities no longer be needed, the transmission lines and associated facilities would be decommissioned and removed. All areas of long-term disturbance on BLM-managed lands would be reclaimed in accordance with a Decommissioning Plan approved by the BLM prior to issuance of the ROW grant. A performance and reclamation bond for BLM-managed lands, would also be required per BLM bonding policy. Access routes and other sites disturbed during decommissioning would be reclaimed and revegetated in accordance with the Decommissioning Plan.

ES-10 MONITORING AND MITIGATION

In addition to the Project design features, DCRT's APMs, and BLM-required BMPs (which are included as part of the Applicant Proposed Action, Agency Preferred Alternative, and Action Alternatives), additional monitoring and mitigation measures (MMs) may be necessary. These additional measures would be in response to potential environmental impacts identified in Chapter 4. Additionally, WAPA would require preparation of a Mitigation Action Plan if impacts were not addressed through implementation of BMPs, APMs, and MMs.

ES-11 ENVIRONMENTAL SETTING AND ENVIRONMENTAL CONSEQUENCES

ENVIRONMENTAL SETTING

The Project Area extends across southwestern Arizona into southeastern California. It is within the North American Deserts Ecoregion (Level I division) (Commission for Environmental Cooperation n.d. [no date]) and the Sonoran Basin and Range subdivision (Level III division) (EPA 2013a), which is distinguished by palo verde-cactus vegetation including saguaro, cholla, and agave cacti. This region has large tracts of Federally owned lands. The climate is

characterized by being the driest in the US. The topography is characterized by valley basins and mountain ranges that are roughly parallel.

The economy of the region has historically been based on irrigated agriculture, livestock grazing, and mining (Commission for Environmental Cooperation 1997). Federal and state trust land uses include commercial, recreational, and livestock. Private land users include residential, commercial, and industrial. The primary type of land within the analysis areas and adjacent to the Project Area are undeveloped natural areas.

ENVIRONMENTAL CONSEQUENCES

Resources that were not key to distinguishing between alternatives or the decision-making process were briefly described in Chapter 4. Non-key resources include air quality and climate change; geology and minerals; paleontological resources; grazing and rangeland special designations, management allocations, and wilderness resources; noise; hazards and hazardous materials; public health and safety; traffic and transportation; and water resources. The environmental consequences of key resources are summarized below.

SOIL RESOURCES

Direct impacts to soil resources as a result of construction activities include the loss of soil productivity due to the removal of soils during new surface disturbance. Clearing vegetation and topsoil, as well as grading, could result in newly exposed, disturbed soils that could be subject to accelerated erosion by wind and water. Any soil removal associated with development of structure foundations and at the SCS would be long-term and would be a loss of soil productivity. One of the primary impacts of concern for construction is disturbance to soil biological crusts. During operations, the primary concern to soils is the interference with sand transport and dune formation. Because of the open design of lattice structures that would be used in areas of active windblown deposits, impacts to sand transport would be negligible to minor depending on the location of the Project.

Indirect impacts associated with topsoil removal may include invasive plant colonization, soil erosion, and reduction of soil water retention. Implementation of APMs, BMPs, reclamation, and other conservative measures would minimize loss of topsoil and soil productivity to short-term and minor to moderate.

Overall, when combined with past, present, and reasonably foreseeable projects, there would be negligible to minor cumulative effects to soils, except in the case of sand transport areas. When combined with past, present, and reasonably foreseeable projects, such as solar facilities, these could have a minor to major cumulative effect on the transport of sand.

BIOLOGICAL RESOURCES

Biological resources include vegetation communities, general wildlife, special status species of plants and wildlife, Wildlife Habitat Management Areas, wildlife waters, and other features that are important for conserving biodiversity in and near the Project.

Vegetation, including Noxious and Invasive Weeds, and Special Status Plants

The Project would involve the removal of vegetation during construction activities, resulting in the direct reduction in the representation of plant communities. Vegetation removal and disturbance of soils could have a variety of effects on vegetation communities, ranging from changes in community structure and species composition to alteration of soil moisture or nutrient regimes. Removal of protective vegetation would also expose soil to potential wind and water erosion. Fugitive dust from construction traffic has the potential to affect photosynthetic rates and decrease plant productivity. Clearing and grading could also result in the alteration of soil conditions, including the loss of native seed banks and change in topography and drainage of a site such that the capability of the habitat to support native vegetation is impaired. Though portions of each alternative pass through developed agricultural areas at the east and west ends of the Project, the majority of each alternative is within the Sonoran desertscrub community. Trimming or removal of tall vegetation for conductor clearance would alter some of the more robust plants within the vegetation community and can leave these plants more susceptible to disease and possibly result in the death of those plants. The vegetation communities and plant associations within the Sonoran Desert are very slow to re-grow perennial species following disturbance, often taking decades to recover, if at all.

The Project would remove native vegetation and disturb soils at structure construction sites, storage areas, along access roads, and wherever heavy equipment is used, providing suitable conditions for infestation by non-native plants. Project implementation would have direct and indirect impacts on the spread of noxious and invasive plant species within areas disturbed by construction activity and these invasive species would directly and indirectly impact native plant communities and special status plants. These potential impacts would be minimized through implementation of various APMs and BMPs.

No plant species listed under the Federal Endangered Species Act (ESA) are known or expected in the Project Area. However, in Arizona more than 200 species protected by the Arizona Native Plant Law, and, in California, as many as 16 plant species considered rare by the California Native Plant Society and one plant species considered sensitive by the BLM (Harwood's eriastrum) have the potential to be impacted by Project activities. Except for Harwood's eriastrum, the Project could have direct and indirect impacts on special status plant species located within areas disturbed by construction activity; however, these potential impacts would be either eliminated or minimized through implementation of various APMs and BMPs.

Based on the distribution of potentially suitable habitat, Harwood's eriastrum is expected to be present along all Project alternatives crossing the Palo Verde Mesa. Therefore, the CDCA Plan would be amended to allow Project construction to proceed, provided a Linear Right-of-Way Rare Plant Protection Plan with the appropriate BMPs for Harwood's eriastrum is developed. Implementation of BMPs would be required to achieve the objectives of this plan.

Wildlife, Including Special Status Wildlife & Migratory Birds

Direct impacts on wildlife anticipated as a result of the Project includes removing vegetation that would result in the long-term loss of wildlife habitat, displacing and/or killing resident wildlife species, especially those that are less mobile such as snakes, lizards, and small mammals; and altering, displacing, or disrupting the breeding and foraging behavior of wildlife. Construction

may also result in fragmentation and degradation of adjacent native habitats due to use and development of access roads, noise, vibration, dust, increased human presence, increased vehicle traffic, exhaust emissions from heavy equipment, and possible spillage of fuels and other hazardous substances. Use of and improvements to existing roads, and creation of new roads to access construction sites and support long-term Project maintenance provides opportunities for increased human presence and disturbance to wildlife habitat by recreationists, especially by off-highway vehicle (OHV) enthusiasts. The Project's relatively short construction period (e.g., duration of disturbance), limited acres of long-term habitat loss, and implementation of APMs/BMPs would be expected to result in generally minor effects limited to individual plants and animals within a localized area (i.e., no measurable population level impacts). These potential impacts would be minimized through implementation of various APMs and BMPs.

Special status species include the Sonoran desert tortoise and Sonoran pronghorn in Arizona and the Mojave desert tortoise and Mojave fringe-toed lizard in California. Project activities could impact these species in much the same way as discussed for common wildlife species. The amount of habitat that would be impacted by Project activities would be small in comparison to available habitat, and the loss of individuals would not impact local populations. Indirect impacts to specific special status wildlife range from negligible to major depending upon the segments. The APMs and BMPs identified for general wildlife would minimize Project-related impacts (as well as applicable MMs).

The Project has the potential to negatively impact migratory birds due to removal of nesting habitat during the breeding season, collision, and disturbance. Potential impacts to migratory birds would be minimized through implementation of various APMs and BMPs.

The Project, when combined with other past, present, and reasonably foreseeable future actions, would not be the cause of a significant degradation of vegetation or wildlife resources (including special status species) or affect the potential to sustain current population levels. The degree of change on a cumulative basis would be negligible once MMs have been implemented and disturbed areas are restored.

CULTURAL RESOURCES

Based on the scope of the Project, the BLM has determined that the development of a Project-specific Programmatic Agreement (PA) in consultation with interested Tribes, land-managing and permitting agencies, and other stakeholders is required. The PA would refine the Area of Potential Effects based on design plans for the selected alternative. The Project's analysis area for cultural resources in this document is the ROW itself, defined as a 200-feet wide corridor, centered on the ROW centerline for all alternatives, where the construction of Project elements such as structures, access and spur roads, and other ancillary elements would occur. Direct impacts due to construction could range between negligible (if eligible sites could be avoided by Project design) and major (if eligible sites could not be avoided by Project design). Potential adverse effects to historic properties would be mitigated according to the Historic Properties Treatment Plan (HPTP) stipulated by the PA. Avoidance of cultural resources by final design and construction would be the preferred form of mitigation.

Indirect effects to historic properties could occur in areas where the construction of new roads into the Project Area would provide improved access into previously inaccessible areas.

Improved access could lead to site damage by OHV and recreational use of these areas. Such damage could consist of vehicular damage to surface archaeological sites and vandalism to sensitive areas. Measures to mitigate potential adverse effects to historic properties as a result of improved access would be included in the HPTP.

Indirect visual impacts could occur from the presence of structures in sight of National Register of Historic Places (NRHP)-listed historic properties or properties eligible for inclusion in the NRHP under Criterion A, B, or C by altering the setting of the properties. Resolution measures to minimize the potential adverse effects of visual intrusions would be contained in the HPTP and implemented by Project design. If effects to NRHP qualities are measurable this would constitute a permanent cumulative effect.

CONCERNS OF INDIAN TRIBES

Ground disturbance during construction may affect areas of Indian tribal concern. Specific Indian tribal concerns include limitations to Tribal access, degradation of Native infrastructure and cultural landscapes, new development in areas that are predominantly pristine, degradation of Traditional Cultural Properties (TCPs), and how the inadvertent discovery of human remains would be treated.

Measures to mitigate potential adverse effects to areas of Indian concern as a result of Project construction would be contained in the HPTP. Avoidance of impacts by final design and construction would be the preferred form of mitigation.

Indirect effects to cultural resource sites of tribal concern would be similar to those described under cultural resources. Indirect impacts would occur from the presence of structures in sight of TCPs and other areas of Indian concern by altering their setting. The number and types of historic properties affected would vary by alternative. MMs to minimize the potential adverse effects of visual intrusions would be contained in the HPTP and implemented by Project design.

Past and present development has had the effect of substantially altering the native landscape of affiliated Indian tribes. In particular, the DPV1 transmission corridor crosses the viewshed of the NRHP-listed Mule Mountains Petroglyph and Intaglio District. Additional structures in the line of sight of this resource would continue to cumulatively affect the viewshed. The increase in visual degradation, combined with all previous disturbances and developments, may result in a moderate to major cumulative impact on the Mule Mountains Petroglyph and Intaglio District.

Future projects in the western portion of the Project Area include large solar facilities, all of which cumulatively affect issues of concern to Indian tribes. These cumulative effects are manifest in terms of the loss of pristine environment, erasure of the tribal footprint on the landscape, vandalism of archaeological sites due to increased OHV traffic and visitation, potential restriction to areas of elevated spiritual importance for Indian tribal ceremonies, and the disruption of Native infrastructure. The development of the Project further contributes to these cumulative effects.

LAND USE

The implementation of the Project would not alter existing land ownership. Temporary use areas would be returned to their existing condition in accordance with BLM standards following

construction. BLM-authorized ROWs such as roadways, transmission lines, utilities, and pipelines; oil, gas, solar energy, and mining leases; and other permits, leases, and easements may be temporarily affected by changes in access, but there would be no long-term impact to these ROWs. For non-BLM lands, ROWs would be obtained as easements or leases, as appropriate. Other authorized land uses, such as grazing and recreation, may experience minor displacement during construction but no long-term impacts are expected. The primary land use change associated with the Project would be the development of currently natural or undeveloped land for a new transmission line and ancillary facilities (i.e., SCS, access roads). The Agency's Preferred Alternative would not cross either the La Posa Long Term Visitor Area or the Dome Rock Camping Area.

The analysis area is located within 14 Federal, state, and local planning areas; the Project would be in compliance with these plans except for the Yuma RMP, Lake Havasu RMP, CDCA Plan, La Paz County Zoning Plan, and Town of Quartzsite General Plan. La Paz County and the Town of Quartzsite have expressed support for the Agency Preferred Alternative.

In terms of cumulative effects, an increase in development would contribute to changes in land use and the modification of the character of the cumulative effects area. As development occurs, the rural environment would become increasingly more residential, commercial, and industrial. The cumulative effects of past, present, and reasonably foreseeable projects to land use would be minor to moderate, although this Project would contribute only negligibly to this overall cumulative effect.

RECREATION

Construction of the Project would not permanently preclude the use of, or access to, any existing recreation opportunities or activities; however, some temporary effects to these resources would occur during the construction phases of the Project. This may cause adjacent recreation areas not directly impacted by the construction, whether developed and/or available for dispersed recreation, to become temporarily more crowded while construction in the area is active.

Dispersed recreation activities would be temporarily affected as construction noises, visual disturbances, vehicle and equipment travel, and/or the presence of other humans within approximately one mile of a recreation area or opportunity could detract from these recreation opportunities and activities. For segments traversing Johnson Canyon, the unavoidable adverse effect on the Arizona Peace Trail in Johnson Canyon would be reduced to minor by constructing the Project outside of the peak OHV season (between the months of July and September).

The presence of a transmission line after construction would not be likely to eliminate a recreational use or access to recreation but the quality of, or experience associated with a recreational use may be altered. In particular, the effect of the Project on segments not already occupied by the DPV1 or other transmission lines would be greater than on segments within existing transmission ROWs, and this effect would be negligible to moderate and long term.

Short-term unavoidable adverse effects to recreation would result from temporary closure of OHV use in portions of the Copper Bottom Pass area and in proximity to the long-term visitor area (LTVA) during construction, affecting OHV users on the proposed Arizona Peace Trail and

other OHV routes. In the long term, the main unavoidable adverse effect would be increased development in natural areas heavily used for recreation.

The cumulative impact of the Project on the recreation setting would be minor since recreation settings would be available in adjacent areas, and other cumulative actions would be far-removed and would not affect adjacent lands along the entire ROW. Operation and maintenance activities of the Project would result in minor cumulative effects, since the Project would already be constructed and standard operation and maintenance activities would be so periodic as to not affect recreation opportunities, experiences, or desired settings.

SOCIOECONOMICS

During construction, the Project would provide several hundred jobs for both local workers and workers from outside the local area; drive local purchasing of materials and services; have a negligible impact on local services and housing; and have a positive impact on governmental revenues through property taxes and sales and use taxes. These impacts would all be considered short-term, beneficial, and of minor to moderate intensity.

In contrast to the large workforce and expenditures required for construction, ongoing operations and maintenance would require few workers and have relatively little direct economic impact in the project area. There is some evidence that transmission lines can lower residential property values in the immediate vicinity by a minor to moderate amount; this effect, which is unlikely to occur due to the Project, seldom exceeds 15 percent.

Ongoing operations and maintenance should have little or no long-term effect on the tourism- and recreation-related economy. It has been widely demonstrated that impacts from visual disturbance dissipate quickly with distance from transmission lines; given the vast area available for high-quality recreation the transmission line and its associated facilities should have negligible impact on the recreation and tourism economy.

Increased property taxes would be an ongoing benefit. By improving the reliability of the electrical grid in California and Arizona, the Project would increase the ability of the grid to meet demand growth in the region and facilitate potential energy generation development in the region. The long-term economic impacts from these impacts would be beneficial.

Given the current workforce in the area and the amount of available housing, cumulative impacts as a result of construction workers on the local housing market are considered to be negligible to moderate during Project construction. Construction of the Project transmission line in conjunction with energy generation projects would facilitate the transmission of energy to consumers and may encourage additional development of energy sources. The Project in conjunction with reasonably foreseeable energy, utility, and other infrastructure projects could support population increases in the area in the foreseeable future.

ENVIRONMENTAL JUSTICE

Low-income or minority populations (environmental justice populations) would likely experience disproportionate adverse effects on a localized basis from construction, operation, and maintenance of the Project. These impacts would include construction noise and other disruptions and impacts to visual resources and property values during operations. Any impacts

would likely be negligible to minor due to the predominantly low-density rural setting and the presence of existing transmission and utility lines nearby. Also, the Proposed Action route and all Action Alternative routes are adjacent or nearly adjacent to existing transmission lines, interstate highways, or other utility corridors as a means of minimizing new disturbance to either the natural or human environment. Consequently, these adverse effects are all expected to be minor. Low-income and minority populations may also be positively affected by the benefits of the Project, including the short-term economic stimulus from construction activities and expenditures, short-term and longer-term increases in tax revenues, and added capacity and reduced congestion for electricity transmission.

There would be no short- or long-term displacement of low-income or minority businesses or residents under the Project to contribute to potential cumulative effects on minority populations. The health and safety of these populations would be protected during both construction and operation at the same levels as other populations by implementing the safety measures described in the APMs, BMPs, and other protocols, as well as other resource-specific plans, such as the Hazardous Materials Management Plan. It is assumed that future projects would be required to address any significant impacts on these populations; therefore, cumulative impacts on minority and low-income populations as a result of the Project in combination with reasonably foreseeable future projects also would be minimal.

VISUAL RESOURCES

During construction, visual impacts would result from the introduction of construction vehicles, equipment, and construction materials within staging areas, access roads, and within the transmission line ROW. The presence of work crews, vehicles and other equipment, and dust generated by construction activities would be visible in views toward the Project Area from the surrounding area at varying distances depending on local conditions. Motion, dust, and activity would attract attention in certain circumstances. Where the Project would be in closer proximity to viewers and there is a lack of intervening topography or vegetation, ground disturbance from access routes and at structure bases could be visible to observers.

Disturbance resulting from construction would be temporary and largely short in duration, and visible effects from active construction would diminish subsequent to clean up and reclamation of the temporary staging areas and access roads. Reclamation of desert vegetation can take years to complete and conditions in areas of disturbance are expected to change over the years as reclamation takes place. Because of the small scale of vegetation disturbance required, there would be minimal visible contrasts that would be reduced over time.

Sensitive viewers would be affected in the short term by the Project construction impacts. The transmission line structures would cause a major, long-term change to scenery. Landform modification would be noticeable and create visual contrast within the viewshed. This reduction in scenic quality would vary across the Proposed Action route and Action Alternative routes according to the number of sensitive viewers and the current scenic rating of the units.

Cumulatively, the Project would add to the change in visual character in undeveloped or rural areas when combined with visual impacts of other past, present, and reasonably foreseeable projects.

Chapter 1 Introduction, Purpose and Need

CHAPTER 1 INTRODUCTION, PURPOSE AND NEED

1.1 INTRODUCTION

DCR Transmission (DCRT), Limited Liability Corporation filed a right-of-way (ROW) application (SF-299) with the Bureau of Land Management (BLM) in September 2015, to construct, operate, maintain, and decommission a series-compensated, 500 kilovolt (kV) alternating current (AC) overhead transmission line traversing approximately 114 miles in western Arizona and eastern California (the Project). The Project, also referred to as the Ten West Link Transmission Line Project, is designed to transmit 3,200 megawatts (MW), provide connection capability for new energy projects in the region, and would require new ROWs or easements on a combination of Federal, state trust, and private lands. Because ROWs over public lands would be needed for the Project, the action triggers the National Environmental Policy Act (NEPA). To comply with NEPA, the BLM determined that an Environmental Impact Statement (EIS) is needed.

This EIS was prepared to satisfy requirements of NEPA for use by the BLM and, as applicable, other Federal agencies in connection with the proposed Project. This EIS also addresses the requirements of the California Environmental Quality Act (CEQA) for use by the California Public Utilities Commission (CPUC) and, as applicable, other California state and local agencies in connection with the Project.

References, Acronyms, Abbreviations, Glossary, and Index are located in Appendix 6. All figures not contained in the EIS chapters are contained in Appendix 7.

1.2 PROJECT BACKGROUND, OVERVIEW, AND LOCATION

1.2.1 Project Overview and Location

The Project would begin at the Arizona Public Service Company (APS) Delaney Substation near Tonopah, Arizona, and terminate at the Southern California Edison (SCE) Colorado River Substation near Blythe, California. The Project would be located in Maricopa and La Paz Counties in Arizona, and Riverside County in California (Figure 1-1). The applicant-proposed route would parallel an existing transmission line and other linear facilities[1], primarily within designated utility corridors.

As proposed, approximately 97 miles of the Project would be in Arizona, and 17 miles would be in California; the majority of the route would cross Federal land, including lands managed by the BLM, Bureau of Reclamation (Reclamation), and the United States Fish and Wildlife Service (USFWS)-managed Kofa National Wildlife Refuge (NWR or “the Kofa”). The Project also would include a series compensation station (SCS) and overhead 12kV electric distribution line located approximately in the middle of the route. The applicant-proposed SCS would be placed parallel to an existing SCS for DPV1 south of Vicksburg, Arizona (Figure 1-1).

[1] In 1982, SCE constructed the Devers to Palo Verde No. 1 (DPV1) transmission line between the Devers Substation (near Palm Springs, California) and the Palo Verde Nuclear Generating Station (PVNGS) (near Tonopah, Arizona).

The portions of the Project outside of designated utility corridors or that would otherwise be inconsistent with BLM resource management plans (RMPs) would require RMP amendments for the Project to be approved.

A ROW term of 50 years is requested to construct, operate, maintain, and decommission the transmission line and associated infrastructure.

1.2.2 Applicant's Project Objectives

In 2014, the California Independent System Operator (CAISO), an independent non-profit electricity grid operator for California, identified that an additional high-voltage transmission connection between the Delaney and Colorado River substations was needed for reliability and efficiency of the California and western electricity grid, and for renewable energy resources in support of state policy. Through a competitive bid process, CAISO selected DCRT to construct, operate, and maintain the Project, maximizing the use of existing or expanded transmission line ROWs.

The Project would:

- Respond to the CAISO's request to increase capacity by connecting the Delaney and Colorado River substations.
- Facilitate development of new renewable energy: The Project would create new transmission infrastructure needed to interconnect future renewable energy resources in both Arizona and California to the bulk transmission grid. The solar Investment Tax Credit supports development of solar energy projects in the U.S. that start construction prior to December 31, 2021.
- Use existing developed transmission or utility corridors wherever possible, thereby minimizing impacts while maximizing the use of existing access roads and infrastructure.
- Improve system economics: The Project would increase the capability of the system to deliver energy. The increase in cost-effective transfer of energy enhances competition among energy suppliers and reduces energy costs to customers.
- Enhance operational flexibility: The Project would create a diverse transmission network serving Arizona and California that would afford the transmission system operators the operational flexibility to redirect the power flows under normal and emergency conditions, improving system reliability and deferring transmission upgrades.
- Improve regional collaboration: This interstate transmission line would facilitate efficient and increased sharing of generation resources; it would enable both Arizona and California to better integrate renewable resources, share reliability services, and increase supply diversity under normal and emergency conditions.

Figure 1-1
Ten West Link
Proposed Action
Overview

- Strengthen regional reliability and enhance system efficiency: The Project would strengthen the regional transmission system in Arizona and California by adding additional capacity and alleviating grid congestion. The Project would improve transmission line reliability in compliance with the North American Electric Reliability Corporation (NERC) and Western Electricity Coordinating Council (WECC) standards.
- Contribute to the regional economy: The Project would provide economic benefits through spending on goods and services during construction activities, payment of ROW fees, and property tax revenues.
- Benefit Arizona electric consumers: As the Project would be paid for by the CAISO customers, the Arizona electric consumers would receive system benefits without long-term capital responsibility for the critical infrastructure.

1.3 BLM'S PURPOSE AND NEED FOR ACTION

The purpose of the BLM action is to respond to DCRT's request for a ROW across public land to construct, operate, maintain, and decommission a 114 mile, 500kV transmission line between the APS Delaney Substation in Maricopa County, Arizona, and the SCE Colorado River Substation in Riverside County, California.

The need for the BLM action is established by the BLM's responsibility under the Federal Land Policy and Management Act (FLPMA) of 1976 and the Energy Policy Act of 2005 to respond to applications that promote energy production including electricity, and to designate corridors for electricity transmission and distribution facilities.

Portions of the Proposed Action and/or Action Alternatives would not be in conformance with the Yuma RMP and the California Desert Conservation Area (CDCA) Plan. Therefore, BLM must consider amending these plans in connection with its consideration of DCRT's ROW application.

1.4 LEAD AND COOPERATING AGENCIES

The BLM is the lead Federal agency responsible for preparing this EIS. The Colorado River District Office is the lead BLM office, responsible for consultations required by Section 7 of the Endangered Species Act of 1973 (ESA), as amended, and the National Historic Preservation Act of 1966 (NHPA, 54 U.S.C. 300101 et seq.), as amended (referred to hereafter as Section 106 of the NHPA).

The following agencies have formally agreed to be cooperating agencies as part of the NEPA process for the Project:

- Environmental Protection Agency (EPA)
- Department of Defense (DOD), Yuma Proving Ground (YPG)
- USFWS
- Reclamation
- United States Army Corps of Engineers (USACE)
- Arizona Game and Fish Department (AGFD)

- CPUC
- Arizona State Land Department (ASLD)
- Maricopa Association of Governments (MAG)
- La Paz County (Arizona)
- Town of Quartzsite (Arizona)
- Western Area Power Administration (WAPA)

1.5 DECISIONS TO BE MADE AND AUTHORIZING ACTIONS

1.5.1 BLM

The BLM will decide whether to issue ROWs to DCRT on land administered by the BLM, and if so, what terms and conditions should be applied.

Should an Action Alternative route be selected, a 12kV distribution line would be required to power the alternative SCS location. The BLM would decide whether to issue a ROW to APS to construct, operate, maintain, and decommission this 12kV distribution line.

If any alternative other than the No Action is selected, the Project would require an RMP amendment before it could be approved.

1.5.2 DOD

The DOD will decide whether to grant an aerial ROW (to include coordination of airspace and land space, as required by the DOD) to DCRT to construct, operate, maintain, and decommission the Project on the YPG.

1.5.3 Reclamation

The Lower Colorado Regional Director for Reclamation will decide whether to issue a land use authorization for DCRT to construct, operate, maintain, and decommission the Project on Reclamation land.

1.5.4 USFWS

The USFWS first determines if the Project would be considered an appropriate use within the Kofa NWR. The USFWS determined that the Project would not be an appropriate use within the Kofa NWR on January 26, 2017, and therefore the USFWS cannot authorize a ROW for the Project across the Kofa NWR (USFWS 2017) (Appendix 1A). USFWS is the responsible agency for issuing a Biological Opinion for the action.

1.5.5 USACE

The USACE will decide whether to authorize the Project under Section 404 of the Clean Water Act and Section 10 of the Rivers and Harbors Act of 1899.

1.5.6 WAPA

DCRT filed an application with WAPA for funding to construct the Project, in whole or in part, under the authority granted by WAPA by § 301 of the Hoover Power Plant Act of 1984 (Public Law 98-381), as amended (§ 301, "Western Area Power Administration Borrowing Authority").

WAPA needs to consider DCRT's application for funding under § 301 and the Transmission Infrastructure Program. Section 301 authorizes WAPA to borrow funds from the U.S. Treasury to construct, finance, facilitate, plan, operate, maintain, and/or study construction of new or upgraded electric power transmission lines and related facilities. These transmission lines and related facilities must have at least one terminus within the area served by WAPA and deliver or facilitate the delivery of power generated by renewable resources. Those decisions constitute a Federal action requiring NEPA review and are the basis for WAPA's involvement in this EIS process as a cooperating agency. Additionally, WAPA is considering whether to take an ownership interest in fiber optic communication links over the Project's fiber optic overhead ground wire.

1.5.7 ACC

The Arizona Corporation Commission (ACC), which governs electrical transmission line siting and issues permits for large transmission and other power facilities in the state regardless of land ownership, requires environmental analysis to be performed for new transmission lines. The Arizona Power Plant and Transmission Line Siting Committee, part of the ACC, is responsible for the environmental review on state trust lands in Arizona. Pursuant to Arizona Revised Statute (ARS) 40-360 et seq., the ACC will conduct the environmental review of the Arizona portion of the Project.

DCRT has filed an application for a Certificate of Environmental Compatibility (CEC) to site the Project's transmission infrastructure in Arizona. The ACC approval or denial of DCRT's CEC application is a discretionary decision.

1.5.8 CPUC

The CPUC regulates privately owned electric, natural gas, telecommunications, water, railroad, rail transit, and passenger transportation companies in California. The CPUC regulates utility services, stimulates innovation, and promotes competitive markets, where possible (CPUC 2017), and therefore regulates CAISO-requested projects (Section 1.2.2).

DCRT has filed an application for a Certificate of Public Convenience and Necessity (CPCN) to site the Project's transmission infrastructure in California. The CPUC approval or denial of DCRT's CPCN application is a discretionary decision. Under California law, the CPUC would be required to comply with CEQA before issuing the CPCN.

In April 2016, the BLM and CPUC entered into a Memorandum of Understanding (MOU, Appendix 1B) whereby the BLM, as the Lead Agency under NEPA, will coordinate with the CPUC to assist with CPUC's compliance with CEQA. Information specific to the CEQA process, CPUC decisions, and analysis specific to CEQA requirements are contained in Appendix 1C and are not discussed in the body of this document.

1.5.9 Other Agencies

Several other Federal, state, and local agencies will rely on the information in this EIS to inform their decisions regarding issuance of specific authorizations and permits related to the Project. Tables 1.5-1 and 1.5-2 (Appendix 1) list the tribal, Federal, state, and local agencies' authorizations and permits that would be required for the Project.

1.6 ENVIRONMENTAL REVIEW PROCESS

This EIS analyzes and discloses the environmental impacts of the Proposed Action, 45 route segments that have been combined into alternatives to the Proposed Action, and the No Action Alternative. The EIS analyzes the Proposed Action, compares it to the full route Action Alternatives, and identifies an Agency Preferred Alternative. Additionally, the EIS describes design features such as Applicant Proposed Measures (APMs) and BLM-required Best Management Practices (BMPs) that have been incorporated into the Proposed Action and Action Alternatives, as well as suggested mitigation measures (MMs) identified to avoid and/or reduce environmental impacts of the Proposed Action or Action Alternatives.

1.7 RELATIONSHIP TO FEDERAL, STATE, AND LOCAL POLICIES, PLANS, PROGRAMS, AND LAWS

1.7.1 Federal Policies, Plans, and Programs

1.7.1.1 West-wide Energy Corridors

In 2008, the U.S. Department of Energy (DOE), the BLM, the U.S. Forest Service (USFS), and U.S. DOD issued a Final Programmatic Environmental Impact Statement (PEIS) that evaluated the designation of energy corridors, known as West-wide Energy Corridors (WWECs) or Section 368 corridors (after the section of the Energy Policy Act of 2005 that required agencies to designate them), on Federal lands in 11 western states, including Arizona and California. The PEIS identified energy transportation corridors for oil, gas, and hydrogen pipelines and electricity transmission and distribution facilities, and developed interagency operating procedures applicable to planning, construction, operation, and decommissioning of such projects. The Secretaries of the Interior and Agriculture signed Records of Decision (RODs) in 2009 designating Section 368 corridors on BLM and USFS-managed lands in the 11 western states. Based upon the Project route alternatives being considered, a portion of the Project would be within WWEC corridor 30-52.

1.7.1.2 BLM Resource Management Plans

The following RMPs provide management direction for the public lands administered by the BLM that may be crossed by the Proposed Action or Alternatives. While the RMPs allow for multiple uses of public lands, amendments to the RMPs may be necessary to accommodate the Project. Section 3.7 addresses the conformance with the applicable plans. Section 4.7 addresses the environmental consequences associated with applicable plan amendment(s).

- Lower Sonoran Resource Management Plan (BLM 2012a)

- Bradshaw-Harquahala Resource Management Plan (BLM 2010b)
- Lake Havasu Resource Management Plan (BLM 2007)
- Yuma Resource Management Plan (BLM 2010a)
- California Desert Conservation Area Plan (BLM 1980) as amended (BLM 2002, 2016a)

1.7.1.3 Kofa NWR Management Plan

The Kofa NWR and Wilderness and New Water Mountains Wilderness Interagency Management Plan provides long-term management direction for the USFWS-managed Kofa NWR (BLM, USFWS, and AGFD 1996). The New Water Mountains Wilderness is now managed under the Yuma RMP. The Kofa NWR utilizes USFWS policies on appropriateness (USFWS 2006) and compatibility (USFWS 2000) when processing ROW applications.

1.7.1.4 YPG Integrated Natural Resources Management Plan

The YPG Integrated Natural Resources Management Plan guides and documents how the YPG will sustain the military mission while maintaining the health of natural resources. Natural resources management is integrated into the YPG environmental program and military testing and training. The plan's goals and objectives promote sound land management; protection of the environment; and compliance with all relevant laws, regulations, and applicable state and Federal management plans (YPG 2012).

1.7.2 Applicable Federal Laws, Statutes, and Executive Orders

The Proposed Action and Action Alternatives must comply with numerous Federal laws, statutes, executive orders (EO), and regulations as outlined in Tables 1.7-1 through 1.7-3 in Appendix 1.

1.7.3 Relationship to State and Local Policies, Plans, Programs, and Laws

1.7.3.1 Arizona

By Arizona state law, public service utilities are regulated monopolies given the opportunity to earn a fair and reasonable return on their investments (ACC 2014). The ACC has jurisdiction over the quality of service and rates charged by public service utilities.

The ACC's Renewable Energy Standard and Tariff Rules (ACC R14-2-1801–1815), along with other renewable energy mandates, call on the state's electric utilities to produce 15 percent of their electricity from renewable sources by 2025 (ACC 2006). Additional export and scheduling capability are necessary to facilitate delivery of proposed renewable energy to load centers in Arizona; therefore, the Proposed Action and Action Alternatives would assist the state's electric utilities in meeting this goal and would be consistent with the State of Arizona objectives related to renewable energy development. The Project could carry energy from current and future renewable energy projects facilitating renewable energy development and assisting with meeting the state's renewable energy goals.

1.7.3.2 California

The California Renewable Energy Transmission Initiative (RETI) Version 2.0 is a statewide planning process that builds off the science, data, and analysis efforts of the original 2008 RETI process to identify the transmission projects needed to accommodate California's renewable energy goals. Phases 1 and 2 of the 2008 RETI project resulted in the identification and refinement of Competitive Renewable Energy Zones (CREZ), which are areas determined to hold the greatest potential for cost-effective and environmentally responsible renewable energy development. The terminus of the Project (Colorado River Substation) is located within the Riverside East CREZ (California Energy Commission 2008). Therefore, the Proposed Action and Action Alternatives would assist the state in meeting its renewable energy goals.

1.7.3.3 County and Local

Each of the local jurisdictional plans reviewed for this EIS are listed below. Other planning documents were reviewed for additional context or information related to the future uses that were identified in the general plans.

- Riverside County General Plan (Riverside County 2017)
- Riverside County Palo Verde Area Plan (Riverside County 2014)
- Maricopa County Comprehensive Plan (Maricopa County 2016)
- Tonopah/Arlington Area Plan (Maricopa County 2000)
- La Paz County Zoning Plan (La Paz County Zoning Regulations, last updated in 2012)
- City of Blythe General Plan 2025 (City of Blythe 2007a)
- City of Blythe Colorado River Corridor Plan (City of Blythe 2007b)

1.8 TRIBAL CONSULTATION AND COORDINATION

The BLM is consulting with Indian tribes with jurisdiction or interest in the Project (Section 5.3). NHPA Section 106 consultation and coordination is summarized in Chapter 5 (Section 5.5 and Appendix 5).

1.9 ISSUES IDENTIFIED DURING SCOPING

Scoping and public involvement activities are described in detail in the Ten West Link 500kV Transmission Line Project Scoping Report (BLM 2016b; project record) and in Section 5.4.

Comments received during the scoping period were used to develop issues to be addressed in the EIS and were also used to refine and/or create alternatives to the Proposed Action that are addressed in the EIS. Forty-four responses were received with 389 substantive issues within the scope of this EIS identified and categorized into 44 main issue categories (Table 1.9-1 in Appendix 1).

The issues help to make reasoned choices between the alternatives and to ensure impacts are addressed in the EIS.

1.10 SUMMARY OF CHANGES BETWEEN DRAFT AND FINAL

Comments on the Draft EIS (DEIS) (Appendix 8) included such topics as use of BMPs and MMs, property values, wildlife, recreation, land use, and avoiding the Kofa NWR. In response to public comments on the DEIS, information related to impacts to Sonoran pronghorn and lands with wilderness characteristics were clarified. Also, Project specific plans were included in Appendix 2B. Additionally, the BLM removed the Visual Resource Management Class RMP amendments from the Agency Preferred Alternative to maintain manageability of the utility corridor and made various editorial changes to the EIS, such as fixing several figures, clarifying analyses, and making minor corrections.

Between the DEIS and Final EIS (FEIS), design and engineering of the Project was refined and presented in an updated Plan of Development (POD) (DCRT 2019); therefore, acreages of new surface disturbance and the amount of water required for construction was adjusted to reflect this updated information in the FEIS. Of note, the POD was revised by the applicant to reflect the BLM Preferred Alternative, rather than the Proposed Action.

This page intentionally left blank.

Chapter 2 Description of the Proposed Action and Alternatives

CHAPTER 2 DESCRIPTION OF THE PROPOSED ACTION AND ALTERNATIVES

2.1 INTRODUCTION

This chapter describes the Proposed Action – the requested 200-foot-wide ROW for a 114-mile long transmission line, and associated features along the route proposed by DCRT – and the Action Alternatives.

Detailed information specifically referenced in the sections below is located in Appendix 2. Additional detailed Project information is provided in the Technical Environmental Study (TES), available on the BLM's ePlanning website.

2.2 PROPOSED ACTION AND ALTERNATIVES

2.2.1 ROW Actions

DCRT proposes to acquire a 200-foot-wide ROW for construction, operation, maintenance, and decommissioning of the 500kV line and associated Series Compensation Station (SCS); access roads; and a 20-foot-wide ROW for a 12kV distribution line servicing the SCS. DCRT has estimated a centerline and infrastructure requirements for the Proposed Action and Action Alternatives, taking into account topography, existing development, and other identified design challenges. The proposed Project ROW for the transmission line would include 100 feet on either side of the centerline, for a total width of 200 feet. In some areas the ROW may need to be wider or narrower to accommodate terrain, slope, and/or other facilities. The proposed ROW would likely be adjusted further as a result of final engineering by the Proponent. These potential variations in the ROW are within the scope of the EIS analysis. Duration of the Project disturbance has been described in terms of short term (generally, during construction, projected to be approximately 2 years, and up to 10 years) and long term (generally for the life of the Project anticipated to be up to 50 years, and could be renewed). As proposed, the Project would result in approximately 709 acres of short-term disturbance and 410 acres of long-term disturbance (Appendix 2).

The ROW has been designed to allow for the safe movement and operation of equipment during construction and maintenance, the safe construction of the Project facilities, and to allow for sufficient clearance between conductors and the ROW edge as required by the National Electrical Safety Code (NESC) (2017). While some access roads would be located within the 200-foot corridor, other access roads would be outside of it, however, with the intent to optimize the use of existing roads and trails. DCRT has requested a 50-year ROW grant from the BLM for the purposes of constructing, operating, maintaining, and decommissioning the Project. In addition to the BLM ROW, ROWs and easements would need to be acquired from other Federal, state, and local entities (Section 1.5), as well as private landowners.

2.2.2 Proposed Action

The Proposed Action route is shown on Figure 1-1 and Table 2-1 provides a breakdown of land jurisdictions crossed by the Proposed Action. A description of the proposed facilities, infrastructure, and construction is provided in Section 2.2.5.

Table 2-1 Land Jurisdictions Crossed by the Project in Arizona and California

JURISDICTION	MILES	% OF TOTAL ROUTE DISTANCE
BLM	56.5	49.4
USFWS	24.9	21.8
DOD	0.2	0.2
Reclamation	1.5	1.3
Arizona State Trust	8.1	7.1
Private	23.1	20.2
TOTAL	114.3	100.0

The Proposed Action route is divided into 19 segments (Table 2.2-1 in Appendix 2 and Figure 2-1) to effectively evaluate the Proposed Action in relation to the Action Alternatives. The segment names of the Proposed Action route carry the letter "p" as an identifier, then each segment is numbered sequentially east to west from the APS Delaney Substation to the SCE Colorado River Substation. Division of the Proposed Action route into segments allows for the potential combination of Proposed Action segments with other Action Alternative segments.

2.2.2.1 Amendment of the Yuma RMP

Portions of the Proposed Action route that would not conform to the Visual Resource Management (VRM) classes for lands designated by the Yuma RMP, would include an amendment of the RMP. These potential RMP amendments are detailed in Table 2-2 and Figure 2-2.

Table 2-2 Proposed Action Yuma RMP VRM Class Amendments

SEGMENT*	LENGTH	VRM CLASS	AMENDED VRM CLASS	LENGTH AMENDED (MILES)
p-06	35.7	III	IV	0.6**
p-07	2.1	III	IV	2.1
p-08	0.6	III	IV	0.6
p-09	6.9	III	IV	6.9
p-10	1.1	III	IV	1.1
p-11	4.1	III	IV	3.9
p-12	2.5	III	IV	1.1
p-13	3.5	III	IV	3.5

*Segments only listed if an RMP amendment is included for VRM class within the YFO.

**Only the portion of Segment p-06 west of the Kofa NWR would be amended.

2.2.2.2 Amendment of the CDCA Plan

The LUPA-BIO-PLANT-2 conservation management action (CMA), a requirement of the CDCA Plan, would apply to the Project, due to known occurrences of Harwood's eriastrum (*Eriastrum harwoodii*) within all alternatives in the California section. LUPA-BIO-PLANT-2 states, "Implement an avoidance setback of 0.25 mile for all Focus and BLM Special Status Species occurrences. Setbacks will be placed strategically adjacent to occurrences to protect ecological processes necessary to support the plant Species (see Appendix Q, Baseline Biology Report, in the Proposed LUPA and Final EIS [BLM 2015a], or the most recent data and modeling)" (BLM 1980).

The purpose of the LUPA-BIO-PLANT-2 CMA is to protect the ecological process of special status plant species in order to sustain viable, healthy populations. Ecological processes include, but are not limited to, pollinator access and movement, habitat change and movement (sand movement in the case of Hardwood's eriastrum), response to climate change, and gene flow. While LUPA-BIO-PLANT-2 prescribes a specific buffer to occurrences, it can be shown that the Project can avoid impacts to the ecological processes that support Harwood's eriastrum populations by incorporation of certain minimization measures (BMPs) into the Project design.

Section II.4.2, Conservation and Management Action LUPA-BIO-PLANT-2 is proposed to be amended to state:

The CDCA Plan of 1980, as amended, is further amended to authorize construction of the Ten West Link Project within 0.25-mile of occurrences of Harwood's eriastrum, provided that a Rare Plant Linear ROW Protection Plan for Harwood's eriastrum is developed and approved by the BLM California State Director. The Rare Plant Linear ROW Protection Plan would meet the DRECP [Desert Renewable Energy Conservation Plan] goal of promotion of the ecological processes in the BLM Decision Area that sustain vegetation types of Focus and BLM Special Status Species and their habitat. The Rare Plant Linear ROW Protection Plan would have the objectives of:

- *Avoidance of take of Harwood's eriastrum individuals to the maximum extent practical; and*
- *Avoidance of impacts to Harwood's eriastrum suitable habitat to the maximum extent practical.*

The California State Director would approve the Harwood's Eriastrum Rare Plant Linear ROW Protection Plan (to be completed before the Notice to Proceed [NTP] is issued) prior to ground or vegetation disturbing activities commencing on public lands in California.

2.2.3 Alternatives and Subalternatives

Four Action Alternatives (which includes the Preferred Alternative described below) to the Proposed Action (Figure 2-3), along with associated subalternatives, are analyzed in this EIS. Action alternatives consist of individual segments (Figure 2-4) that have been compiled into full Alternative Routes and Subalternatives.

2.2.3.1 RMP Amendments

Some of the segments comprising the Alternative and Subalternatives would not be in compliance with the applicable BLM land use plan and would include an RMP amendment for the alternative.

The Yuma RMP (BLM 2010a) would include an amendment to establish a ROW for any segment outside designated BLM utility corridors. The Yuma RMP decision LR-031 would be changed as follows:

To the extent possible, locate new ROWs within or parallel to existing ROWs or ROW Corridors to minimize resource impacts. Consider ROWs outside of corridors on a case-by-case basis through project-specific analysis.

Any amendments would also be included for portions of routes that do not conform to the VRM classes for lands designated by the Yuma RMP. These potential RMP amendments are detailed in Table 2-3 and Figure 2-5 for alternative segments. The CDCA Plan of 1980 would also be amended for alternative segments as described for the Proposed Action in Section 2.2.2.2 and Appendix 2. Several alternatives or subalternatives would include an amendment to the Lake Havasu RMP to include a segment that crosses VRM Class II designated lands in the Lake Havasu FO; such amendment to this RMP would not be necessary under the Proposed Action.

Table 2-3 Proposed RMP Amendments by Action Alternative Segment in Arizona

SEGMENT*	LENGTH (MILES)	VRM CLASS	WITHIN UTILITY CORRIDOR?	RMPA REQUIRING AMENDMENT	RMP AMENDMENT DESCRIPTION
cb-01	3.2	II	No	Yuma RMP	Establish ROW outside of utility corridor; and change from VRM Class II to VRM Class IV outside BLM utility corridor within 0.3-mile either side of the centerline of segments, or in an area bounded by the viewshed where the segment would be within canyons.
cb-02	2.2	II	No	Yuma RMP	Establish ROW outside of utility corridor; and change to VRM Class IV within 0.3-mile either side of the centerline of segment, or in an area bounded by the viewshed where the segment would be within canyons, for conformance outside utility corridor; or expand existing utility corridor to contain this segment, and in conjunction with other corridor changes, change VRM class to Class IV.

SEGMENT*	LENGTH (MILES)	VRM CLASS	WITHIN UTILITY CORRIDOR?	RMPA REQUIRING AMENDMENT	RMP AMENDMENT DESCRIPTION
cb-03	4.3	II	Yes - Partial	Yuma RMP	Change to VRM Class IV on portion of BLM-administered public lands within the utility corridor within the viewshed of the canyon.
cb-04	1.9	II & III	No	Yuma RMP	Establish ROW outside of utility corridor; and change to VRM Class IV for the area within 0.3-mile either side of the centerline of the segment, or in an area bounded by the viewshed where the segment would be within canyons.
cb-05	4.4	II & III	Yes - Partial	Yuma RMP	Establish ROW outside of utility corridor; and change to VRM Class IV for the area within 0.3-mile either side of the centerline of the segment.
cb-06	1.9	III	Yes - Partial	Yuma RMP	Establish ROW outside of utility corridor; and change from VRM Class II to VRM Class IV for the area within 0.3-mile either side of the centerline of the segment.
i-03	19.9	III	Yes - Partial	Yuma RMP	Establish ROW in areas outside the BLM utility corridor to encompass the i-03 route.
i-04	10.5	III	Yes	Yuma RMP	Change the VRM from Class III to Class IV within the BLM utility corridor.
i-05	2.8	III	Yes	Yuma RMP	Change the VRM to Class IV within the BLM utility corridor.
i-06	7.2	III	Yes	Yuma RMP	Change the VRM from Class III to Class IV within the BLM utility corridor.
qn-02	10.8	III & IV	Yes - Partial	Yuma RMP	Change to VRM Class IV 0.3-mile either side of centerline and establish ROW outside of utility corridor.
qs-01	3.1	III & IV	Yes - Partial	Yuma RMP	Change to VRM Class IV 0.3-mile either side of centerline and establish ROW outside of utility corridor.
qs-02	4.8	IV	Yes - Partial	Yuma RMP	Establish ROW in areas outside the utility corridor to encompass the qs-02 route and change to VRM Class IV within the BLM utility corridor.

SEGMENT*	LENGTH (MILES)	VRM CLASS	WITHIN UTILITY CORRIDOR?	RMPA REQUIRING AMENDMENT	RMP AMENDMENT DESCRIPTION
x-01	4.7	II	No	Yuma RMP	Establish ROW outside of utility corridor.
x-02b	3.4	II	Yes - Partial	Yuma RMP	Establish ROW outside of utility corridor.
x-03	5.6	III	Yes - Partial	Yuma RMP	Establish ROW outside of utility corridor.
x-04	22.7	III	Yes - Partial	Yuma RMP	Establish ROW outside of utility corridor.
x-05	10.2	III	Yes - Partial	Yuma RMP	Establish ROW outside of utility corridor.
x-06	9.2	III	Yes - Partial	Yuma RMP	Establish ROW outside of utility corridor and change to VRM Class IV 0.3-mile either side of segment centerline.
x-07	7.7	III	Yes	Yuma RMP	Change the VRM in areas of Class III to Class IV within the BLM utility corridor.
in-01	13.9	II and IV	Yes	Lake Havasu RMP	Change the VRM in areas of Class II to Class IV within the BLM utility corridor.

2.2.3.2 Alternative 1: I-10 Route

Alternative 1 would be 111.6 miles long and would generally follow Interstate 10 (I-10) (Figure 2-6, Table 2-4). This alternative route was developed to utilize BLM utility corridors while avoiding the Kofa NWR, Johnson Canyon, YPG, Copper Bottom Pass area, and the area of dense cultural resources in Mule Mountains south of Blythe; and also meet public request for a route that follows I-10 and minimize crossings of VRM Class II land.

Table 2-4 Alternative 1 Jurisdiction

LAND MANAGEMENT LANDS CROSSED	MILES (#)	% OF TOTAL ROUTE DISTANCE
BLM	58.8	52.7
USFWS	0	0
Reclamation	6.4	5.7

Figure 2-6
Ten West Link
Alternative 1: I-10 Route

Appendix 2 details:

- The 18 segments that comprise Alternative 1 in Table 2.2-3;
- The five subalternatives that would also meet the objectives of Alternative 1 in Table 2.2-4; and
- Segment descriptions in Table 2.2-2.

Figures 2.2-1 through 2.2-3, which show the five subalternatives to Alternative 1, are located in Appendix 7.

In addition to the RMP amendments described above, Subalternative 1C includes a segment (Segment in-01, Table 2-3) in the Lake Havasu FO that crosses VRM Class II designated lands. An amendment to the Lake Havasu RMP (BLM 2007) would be included to change the portion of this segment designated VRM Class II to Class IV within the BLM utility corridor.

2.2.3.3 Alternative 2: BLM Utility Corridor Route

Alternative 2 would be 125.8 miles long and would be primarily within existing BLM utility corridors (Figure 2-7, Table 2-5). This alternative route was developed to emphasize the use of BLM utility corridors while avoiding the Kofa NWR, Johnson Canyon, Ehrenberg Sandbowl area, the area of dense cultural resources in Mule Mountains south of Blythe, and residential and other development south of Blythe; minimize impacts to the CRIT reservation and use of private land in California; and place the majority of route crossing VRM Class III.

Table 2-5 Alternative 2 Jurisdiction

LAND MANAGEMENT LANDS CROSSED	MILES (#)	% OF TOTAL ROUTE DISTANCE
BLM	80.1	63.7
USFWS	0	0
Reclamation	1.7	1.3
DOD	0.2	0.2
State Trust	17.6	14.0
Private	26.2	20.8
Indian Lands	0	0
Total length of route:	125.8	100.0

Appendix 2 details:

- The 20 segments that comprise Alternative 2 in Table 2.2-5;
- The five subalternatives that would also meet the objectives of Alternative 2 in Table 2.2-6; and
- Segment descriptions in Table 2.2-2.

Figures 2.2-4 through 2.2-6, which show the five subalternatives to Alternative 2, are located in Appendix 7.

2.2.3.4 Alternative 3: Avoidance Route

Alternative 3 would be 123.0 miles long and was developed to avoid Kofa NWR, Johnson Canyon, the CRIT reservation, the Town of Quartzsite, Ehrenberg Sandbowl area, biologically important backwaters of the Colorado River, the southern end of Blythe, and the area of dense cultural resources in Mule Mountains south of Blythe; and place the majority of the route crossing VRM Class III (Figure 2-8, Table 2-6).

Table 2-6 Alternative 3 Jurisdiction

LAND MANAGEMENT LANDS CROSSED	MILES (#)	% OF TOTAL ROUTE DISTANCE
BLM	82.6	67.1
USFWS	0	0
Reclamation	0.7	0.6
DOD	0.2	0.2
State Trust	14.0	11.4
Private	25.5	20.7
Indian Lands	0	0
Total length of route:	123.0	100.0

Appendix 2 details:

- The 23 segments that comprise Alternative 3 in Table 2.2-7;
- The twelve subalternatives that would also meet the objectives of Alternative 3 in Table 2.2-8; and
- Segment descriptions in Table 2.2-2.

Figures 2.2-7 through 2.2-10, which show the twelve subalternatives to Alternative 3, are located in Appendix 7.

In addition to the RMP amendments described above, Subalternative 3D includes a route segment in the Lake Havasu FO that crosses VRM Class II designated lands in the Lake Havasu FO (Table 2-3). An amendment to the Lake Havasu RMP (BLM 2007) would be included to change the portion of this segment designated VRM Class II to Class IV within the BLM utility corridor.

2.2.3.5 Alternative 4: Public Lands Emphasis Route

Alternative 4 would be 120.3 miles long and generally is on public lands, minimizing state trust lands (Figure 2-9, Table 2-7). This alternative route was developed to avoid the Kofa NWR, state trust land along I-10, the CRIT reservation, the Ehrenberg Sandbowl area, the southern end of Blythe, and the area of dense cultural resources in Mule Mountains south of Blythe; and also maximize use of BLM utility corridors in the Copper Bottom Pass area while placing the majority of route crossing VRM Class III, with slightly less Class II than Alternative Routes 2 or 3.

Table 2-7 Alternative 4 Jurisdiction

LAND MANAGEMENT LANDS CROSSED	MILES (#)	% OF TOTAL ROUTE DISTANCE
BLM	84.6	70.3
USFWS	0	0
Reclamation	0.8	0.7
DOD	0.2	0.2
State Trust	6	4.9
Private	28.7	23.9
Indian Lands	0	0
Total length of route:	120.3	100.0

Appendix 2 details:

- The 23 segments that comprise Alternative 4 in Table 2.2-9;
- The fourteen subalternatives that would also meet the objectives of Alternative 4 in Table 2.2-10; and
- Segment descriptions in Table 2.2-2.

Figures 2.2-11 through 2.2-14, which show the fourteen subalternatives to Alternative 4, are located in Appendix 7.

In addition to the RMP amendments described above, Alternative 4 includes a route segment in the Lake Havasu FO that crosses VRM Class II designated lands in the Lake Havasu FO (Table 2-3). An amendment to the Lake Havasu RMP (BLM 2007) would be included to change the portion of this segment designated VRM Class II to Class IV within the BLM utility corridor.

2.2.3.6 No Action Alternative

NEPA regulations require the No Action Alternative to be included in the alternatives analysis of an EIS (CEQ Regulation Section 1502.14(d)). The No Action Alternative forms the baseline against which the potential impacts of the Proposed Action and Action Alternatives are compared.

Under the No Action Alternative, the BLM would not approve the ROW grant on BLM-administered public lands and none of the BLM RMPs would be amended. The 500kV transmission line would not be constructed across BLM-administered lands as proposed by DCRT.

2.2.4 Agency Preferred Alternative

The BLM has identified Alternative 2, the BLM Utility Corridor Route, utilizing Subalternative 4D, as the Agency Preferred Alternative route (Figure 2-10) for the proposed transmission line, to include the alternative SCS location along Segment i-03 adjacent to I-10 and north of the New Water Mountains; along with design features, APMs, BMPs, and MMs. The Agency Preferred Alternative includes the proposed CDCA Plan amendment (Section 2.2.2.2), proposed Yuma

RMP amendment for authorizing ROWs outside of utility corridors (Segments i-03 and x-05, as discussed in Section 2.2.3.1), and does not include the proposed RMP amendment for VRM class, in order to maintain consistent management of this resource for the length of the corridor in Arizona. Table 2-8 presents affected jurisdiction.

Table 2-8 Agency Preferred Alternative Jurisdiction

LAND MANAGEMENT LANDS CROSSED	MILES (#)	% OF TOTAL ROUTE DISTANCE
BLM	79.3	63.5
USFWS	0.0	0
Reclamation	1.7	1.3
DOD	0.2	0.2
State Trust	17.6	14.1
Private	26.2	20.9
Indian Lands	0.0	0
Total length of route:	125.0	100

Table 2-9 is a summary of short- and long-term disturbance, respectively for the Agency Preferred Alternative. The summary of short- and long-term disturbance (Table 2-9) takes into account changes to structure types on Segments p-07 through p-13, i-04, and x-05 that were made to reduce safety issues associated with high OHV use along those segments.

Table 2-9 Short- and Long-Term Disturbance for the Agency Preferred Alternative

COMPONENT	SHORT-TERM[1] DISTURBANCE (ACRES)	LONG-TERM DISTURBANCE (ACRES)	TOTAL DISTURBANCE (ACRES)
Access Roads		430.8	430.8
Material Staging, Laydown Yards, and Batch Plants	34.5	0	34.5
Fly Yards	33.4		33.4
Structure Foundations and Erection[2]	468.6	41.1	468.6*
Wire Stringing (snubbing and pulling sites)	167.4	0	169.7
Crossings (roads, transmission/power lines, water)	53.3	0	53.3
Series Compensation Station	0	1.7	1.7
Distribution Line	0.8	<0.1	0.8
Total	**758.0**	**473.7**	**1,190.5**
Total Water Requirements - Construction (gallons)	**60,205,532.2**		

[1] Temporary use areas would be located in conformance with BMP-MISC-04 (Appendix 2A, Section 2A.14), disturbed during construction, their use would be temporary, and the acreage reclaimed; however, due to the desert environment, the disturbance effects may be long-term.

[2] Includes mitigation to replace structures with guy lines with self-supporting (no guy lines) structures to mitigate safety issues in areas of high OHV use.

*Long-term foundation disturbance would be within and a subset of the short-term disturbance; therefore, it is not additive to the short-term disturbance in totals.

* = The Proposed Action is offset 600 meters to the South for display purposes.

Figure 2-10
Ten West Link
Agency Preferred Alternative

2.2.4.1 RMP Amendments

Under the Agency Preferred Alternative, the BLM would amend the Yuma RMP to allow approximately 13.5 miles of 200-foot wide ROW on public lands managed by the BLM outside of designated utility corridors for portions of Segments i-03 and x-05.

Under the Agency Preferred Alternative, the BLM would amend the CDCA Plan to allow Project construction within 0.25 mile of occurrences of Harwood's eriastrum as identified in Section 2.2.2.2.

Agency Preferred Alternative Route details are shown on Figure 2.10. Appendix 2 provides additional details:

- Describing the Agency Preferred Alternative route;
- Requiring or recommending changes to reduce impacts; and
- Outlining the benefits of the route.

2.2.5 Proposed Facilities, Infrastructure, and Construction

2.2.5.1 Preconstruction and Construction Activities Overview

Preconstruction activities include refinement of Project design, preconstruction environmental surveys, materials procurement, design, contracting, ROW acquisition from other Federal, state, local (Section 1.5), and private entities; and permitting efforts. Appendix 2 contains additional details regarding preconstruction activities.

Construction of the transmission line(s) would include the following sequence of activities:

- Surveying and staking the transmission centerline, structure locations, new or upgraded access roads, environmental cultural resources sensitive areas, other Project features, and work areas;
- Upgrading or constructing short- and long-term access roads;
- Clearing and grading the structure sites, and short- and long-term work areas;
- Excavating and installing foundations;
- Assembling and erecting structures with short- and long-term work areas;
- Stringing conductors and shield wires;
- Installing counterpoise (structure grounds), where needed;
- Post-construction cleaning up;
- Constructing the SCS and associated power connection to the distribution line; and
- Reclamation

In addition to these activities, other preconstruction and construction components include:

- Conducting preconstruction resource surveys and aerial photography;
- Preparing construction material storage, laydown yards, and concrete batch plants located in previously disturbed areas and areas of lesser ecological sensitivity to the extent practicable;
- Preparing equipment staging areas located in previously disturbed areas and areas of lesser ecological sensitivity to the extent practicable;
- Preparing equipment refueling areas collocated with staging and storage areas where possible and in conformance with the Project Spill Prevention, Control, and Countermeasure Plan;
- Installing flagging, fencing, and signs in areas of active construction activities or where required for employee and public safety;
- Implementing transportation management for Project access and public safety as in conformance with the Project Traffic and Transportation Management Plan;
- Implementing fire protection as identified in the Project Fire Protection Plan;
- Blasting in areas of hard rock not removable by heavy excavators; in conformance with the Project Blasting Plan;
- Implementing erosion/dust control and air quality management in conformance with the Project Erosion, Dust Control, and Air Quality Plan;
- Implementing hazardous materials management in conformance with the Project Hazardous Materials Management Plan;
- Implementing emergency preparedness and response in conformance with the Project Emergency Preparedness and Response Plan; and
- Implementing control of noxious weeds in conformance with the Project Noxious Weed Management Plan.

Appendix 2 contains detailed descriptions of environmental safety and training requirements, construction management measures and controls, including APMs and BMPs (Appendix 2A) for vegetation, weeds, lighting, blasting, topsoil management, and dust control. All of the above referenced plans are listed in Appendix 2B or would be completed before a possible NTP is issued.

2.2.5.2 Transmission Structures

Support structures are proposed to be steel lattice of various configurations; including self-supporting lattice, H-frame lattice, and guyed V (Figure 2.2-15, Appendix 7). In certain high off-highway vehicle (OHV) use areas, self-supporting lattice structures would replace guyed V structures to eliminate hazards to those recreationists (Section 2.4 in Appendix 2). While monopoles are not proposed for the Project, they may be considered for private property if requested by landowners. The structures would be between 72 and 195 feet in height, depending on the span length required and topography, with most being shorter than 142 feet. Span lengths between structures would vary from 400 to 2,300 feet, depending upon terrain conditions, current land use, structure type used, and to achieve site-specific mitigation objectives. However, the typical span would be approximately 1,500 feet. On average, three to eight structures would be placed per mile, depending on the structure type, topography, and angles of the route. Appendix 2 contains additional details regarding structure design and configurations.

2.2.5.3 Foundations and Structure Construction

Each structure type requires specific foundation configurations. The approximate foundations by structure type are as follows (note that soil conditions and environmental and engineering considerations may change the foundation size and depth):

- Guyed V Structure (Tangent): precast concrete foundation 9 by 9 feet by 24 feet deep (one per structure); additional 4 grouted or helical anchors for the guys. If dictated by engineering, 3 foot by 24-foot deep concrete piers could be utilized for guys. Guys would be located within the ROW limits and would include a 1-foot square footprint, typically. Guy anchors would add four 1-foot square disturbance footprints.
- H Frame Steel Lattice (Tangent): pier foundations 3 feet in diameter by 25 feet deep (eight piers per structure or four per tower leg).
- Self-supporting Tangent and Dead-end Structures: pier foundation 4 and 6 feet, respectively, in diameter by 38 feet deep (four per structure).
- Drilled pier (steel monopole): foundation 4 to 6 feet in diameter by 38 feet deep (one per structure).

Helicopter-only foundation construction may result in excavations that must be "hand dug" (i.e., jackhammers and shovels). Foundation dimensions increase when dug by hand due to shoring requirements, safety harness requirements, and retrieval equipment requirements. Additional information is provided in Appendix 2.

A short-term disturbance area of approximately 1.1 acres is estimated for each structure site. The number of structure sites for alternatives would be roughly proportional to the comparative length of each alternative route. Short-term disturbance associated with the Proposed Action, Action Alternative segments, and the Agency Preferred Alternative is detailed in Tables 2.2-11 through 2.2-13 in Appendix 2. Total short-term structure disturbance associated with the Proposed Action and Action Alternatives ranges from approximately 424 acres to 468 acres.

A long-term work area at the base of each structure would be required for long-term maintenance. These areas would be somewhat larger than the structure foundations. The dimensions of the long-term work area for each structure type would be:

- Guyed V Structure: 9 feet by 9 feet (81 square feet), 4 anchors: 1 foot by 1 foot (1 square foot) each;
- H Frame Lattice: two 12 by 18-foot foundation areas (432 square feet);
- Self-supporting Structure: 50 feet by 50 feet (2,500 square feet);
- Steel Monopole: 12 feet by 12 feet (144 square feet).

Each support structure would require the installation of foundations, which are typically drilled concrete piers. The foundation for the structures would be long-term disturbance for the life of the Project. The long-term work area at the base of each structure would be required for long-term maintenance. In addition to the long-term footprint and foundation of the proposed structure, each structure would require a separate permanent work area anticipated to be 50 by 50 feet (<0.1 acre). While revegetation would occur in these work areas, minimal contouring would be performed.

A typical short-term disturbance area of 200 feet by 200 feet (0.9 acre) has been assumed for each structure work area, which would be used for assembly, erection, and crane pads. Short-term disturbance estimates are based on this assumption; however, actual disturbance would be reduced to the minimum size required to the extent practicable, based on site-specific conditions, during field staking prior to construction (see BMP-MISC-02; Appendix 2A, Section 2A.14). Actual dimensions of the temporary area of disturbance may vary, depending on factors such as terrain, structure size, and vegetation but would disturb a maximum of 1.1 acres. Short-term disturbance areas would be specifically identified in conjunction with structure locations and the Access Road Plan in the final POD, which would receive final approval from the BLM prior to construction. Long-term disturbance associated with the Proposed Action, Action Alternative segments, and the Agency Preferred Alternative is detailed in Tables 2.2-11 through 2.2-13 in Appendix 2. Total long-term disturbance from structures associated with the Proposed Action and Action Alternatives ranges from approximately 33.4 to 36.9 acres (Table 2-11).

Appendix 2 contains details of:

- Structure foundations associated with the Project;
- Structure and Foundation Construction;
- Structure types and estimated disturbance for the Proposed Action segments (Table 2.2-11);
- Structure types and estimated disturbance for the Action Alternative segments (Table 2.2-12); and
- Structure types and estimated disturbance for the Agency Preferred Alternative segments (Table 2.2-13).

2.2.5.4 Conductors

The conductors are the wire cables strung between transmission line structures over which the electric current flows. The transmission line would consist of three phases for the single circuit, including a bundle containing multiple conductors per phase. The conductors are typically spaced approximately 18 inches apart in an equilateral triangle configuration. The bundle configuration would be designed to provide adequate current-carrying capacity while minimizing interference from audible noise and radio operations. The minimum conductor height above ground for the transmission line would be 36.25 feet for most of the route and 51.25 feet for the Colorado River crossing, based on NERC, NESC, CPUC GO 95, and DCRT's design standards.

In the process of conductor installation, insulators and stringing sheaves would be installed on the structures (short-term disturbance already accounted for at structure sites), pulling the pilot line through the sheaves, which would connect to and pull the conductor; and pulling/tensioning of the conductor. Short-term disturbance work areas for conductor, ground wire, and optical ground wire (OPGW) pulling, and snubbing sites (where a conductor is temporarily fixed or attached to the ground for conductor-sagging purposes) associated with the Proposed Action and Action Alternatives would range from approximately 152.6 to 176.1 acres.

Appendix 2 provides additional details regarding:

- Short-term disturbance and work areas for conductor, ground wire, and OPGW, pulling and snubbing sites, which are discussed;

- Estimated short-term disturbance for pulling and snubbing for the Proposed Action segments detailed in Table 2.2-14;
- Estimated short-term disturbance for pulling and snubbing for Action Alternative segments detailed in Table 2.2-15; and
- Estimated short-term disturbance for pulling and snubbing for the Agency Preferred Alternative segments detailed in Table 2.2-16.

2.2.5.5 Insulators, Grounding, and Other Hardware

Insulators, which are made of an extremely low conducting material such as porcelain, glass, or polymer, would be used to suspend the conductors from each structure to inhibit the flow of electrical current from the conductor to the ground, the structure, or another conductor.

To protect conductors from lightning strikes, two overhead ground wires would be installed on top of the structures. Current from lightning strikes would be transferred through the ground wires and structures into the ground.

Upon completion of each structure installation, DCRT would measure the structure footing resistance to determine whether its grounding target is met. If structure footing resistance is reached, ground rods would not be required. If the structure footing resistance is not reached, a 5/8-inch by 10-foot ground rod(s) would be installed until the target resistance is reached. If ground rods cannot be driven, or the target resistance cannot be achieved, alternate grounding procedures would be undertaken.

In addition to the conductors, insulators, and overhead ground wires, other hardware would be installed on the transmission structures as part of the insulator assembly to support the conductors and shield wires composed mostly of galvanized steel and aluminum. To the extent possible, electrical hardware would be specified as “corona-free” to reduce the effects of audible noise and electrical stress caused by corona in high-voltage applications.

Other hardware, such as bird flight diverters, not associated with the transmission of electricity may be installed as part of the Project, particularly in the Colorado River crossing area. This hardware may include aerial marker spheres, structure painting, or aircraft warning lighting, as required for the conductors or structures by Federal Aviation Administration (FAA) regulations. Structure proximity to airports and structure height are the main factors determining whether FAA regulations would apply, based on an assessment of wire/structure strike risk (Appendix 2).

2.2.5.6 Series Compensation Station and Distribution Line

A new SCS system would be located within the 200-foot-wide ROW parallel to the existing SCS associated with the DPV1 line and under the Proposed Action, approximately 47 miles from the APS Delaney Substation.

A general layout of the SCS is shown in Figure 2.2-16 (Appendix 7). In this design, the SCS is integrated into the footprint of the transmission line with a 200-foot by 315-foot (1.5 acre) fenced area. Any portion of the SCS disturbance that would be outside the 200-foot wide ROW would be separately authorized. Clearing of all vegetation would be required for the entire SCS area, including a distance of 10 feet outside the fence, for a total long-term disturbance of 1.7 acres. Under the Proposed Action, the new SCS would be connected to the same APS 12kV distribution line used for the existing DPV1 SCS within a 20-foot-wide ROW approximately 1,000 feet long.

Access roads for the transmission lines would be utilized for access to the SCS. The entire perimeter of the SCS would be enclosed with security fencing to protect equipment and prevent accidental contact with energized electrical equipment. A grounding system would be required at the SCS for fault protection and personnel safety. The SCS would not be lighted at night; however, it would have installed lighting to facilitate maintenance and repairs under emergency conditions during nighttime hours. Storm water runoff containment ponds may be installed to moderate the discharge of storm water offsite if determined to be necessary in the course of design.

Two alternative locations for the SCS have been identified. Both alternative locations would be on BLM-administered public land, as shown in Figure 2.2-17 (Appendix 7), less than 75 feet apart (due to scale, maps show one symbol for the alternative SCS location). Specifications for the SCS would be the same under the Proposed Action and Action Alternatives. Either alternative SCS site would be powered via a distribution line connecting to the existing APS 12kV distribution line near the town of Brenda, Arizona. The distribution line for either alternative location would be approximately 3.2 miles long with a 20-foot-wide ROW. A crossing of I-10 would be required for the distribution line. Appendix 2 contains additional details regarding:

- The design of the SCS;
- A description of SCS construction;
- The alternative SCS locations;
- A description of SCS 12kV distribution line construction.

2.2.5.7 Substation Upgrades

The equipment required to interconnect the Project to the Delaney and Colorado River substations is expected to be similar in type and size to the existing equipment at each substation. There would be no new disturbance associated with these installations. Appendix 2 contains additional details regarding the substation upgrades.

2.2.5.8 Access

Access to the ROW would be provided by existing roads and trails, such as those associated with the DPV1 transmission line and nearby pipelines, to the extent practicable. Access for the Project would be in accordance with an Access Road Plan that would be part of the final POD (listed in Appendix 2B).

For analysis purposes, access is divided into the following categories:

- Access Type A – Type A access roads would include existing public or private roads that are parallel to the ROW, or a patchwork of existing roads in the area that would provide access to or would be crossed by Project segments. These roads consist of well-maintained county dirt roads, private roads, and all paved roads. Improvements to Type A roads may include repairs to the roadbed on dirt roads without additional disturbance beyond the existing roadbed width. Surface improvements to the roadbed would only be completed to allow for safe travel conditions.
- Access Type B – Type B access roads would require some level of upgrade to allow sufficient access. In conditions required for construction passage, these roads may be bladed, compacted, and widened to a maximum of 18 feet for travel surface with up to 30 feet of total disturbance overall. This includes the 16-foot travel surface, 2-foot berms on either side, and 5 feet of material displacement on either side of the travel surface in steep terrain. In flat terrain with the exclusion of wash-crossings this total disturbance would be much less, with an approximate 18 feet of total disturbance. In moderate terrain, with the exclusion of wash-crossings, this total disturbance would be approximately 25 feet. In steep terrain with the exclusion of wash-crossings this total disturbance would be approximately 30 feet.
- Access Type C – Type C access roads consist of newly bladed access roads down either side of the centerline of the conductor but within the 200-foot ROW corridor as much as possible. These roads would consist of 16 to 22 feet of travel surface, 2-foot berms on either side, with a maximum of 50 feet of material displacement in steep areas. In areas of flat terrain, except in wash crossings, disturbance would most likely not exceed 22 feet total for travel surface, berms, and material displacement. In areas of moderate terrain, except in wash crossings, disturbance would most likely not exceed 50 feet total for travel surface, berms, and material displacement. Where possible, areas that can support construction activities by drive-and-crush and/or clear-and-cut practices would be implemented.
- Access Type D - Type D access spur roads would be constructed in areas where Type A, B, and C roads provide access to the vicinity of the ROW but are not adequate to provide access to structure locations. These roads would be new spur roads that would be bladed from the main access road to access the structure work areas. New spur roads would consist of native material displacement, and thus require larger disturbance areas in steeper terrain. Travel surfaces for new spur roads would range from 16 to 22 feet with 2-foot berms on either side excluding material displacement. For spur roads in flat terrain, material displacement would not exceed 3 feet on either side for a total of 22 feet if utilizing a 16-foot travel surface. For spur roads in moderate terrain, material displacement would not exceed seven feet on either side for a total of 30 feet if utilizing a 16-foot travel surface. In steep terrain, material displacement would not exceed 76 feet of total disturbance, this includes a 22-foot travel surface, 2-foot berms on either side, and 25 feet of cut/fill on either side. Steep terrain is defined as slopes greater than or equal to 15 percent. Long-term disturbance would consist of the cut, fill, and road base travel surface required for continued operation and maintenance of the line. Total disturbances are estimated and would be calculated during the reclamation period. Where terrain and soil conditions are suitable, non-graded overland access (“drive-and-crush”) would be

utilized. When drive-and-crush cannot be used, vegetation would be cleared, and roads would be cut as determined by terrain, soil, and vegetation ("clear-and-cut"). To the maximum extent possible, roads would cross drainages at grade (low-level crossing). In some cases, road cutting may be needed to drop access roads to the grade of the drainage bottom. Any material moved by road cutting would be cast upland and not deposited in washes.

- Access Type E – Helicopter Access – In areas of particular biological, topographical, archaeological, or visual concerns, a helicopter may be used to assist with Project construction. Areas where helicopters would be used would also include the use of the other types of access roads (Types B, C, D), as possible. Roads would be used by light pick-up trucks or OHV for crew and tool access, and/or equipment whose tracks can adequately stay within the confines of the road disturbance boundaries without risk of roll-over or equipment failure due to stress loading of slope. However, all activities required for transmission line construction that would require large vehicles and equipment such as semi-trucks, tractor-trailers, and lo-boys would be conducted by helicopter application. Currently helicopter construction is expected for Segments p-10, p-11, cb-01, and cb-02.

Access routes are displayed on Figures 2.2-18 through 2.2-21 (Appendix 7).

Appendix 2 contains additional details regarding:

- Access associated with the Project;
- Access types and associated widths provided in Table 2.2-17;
- Proposed Action segments access disturbance estimates provided in Table 2.2-18;
- Action Alternatives segments access disturbance estimates provided in Table 2.2-19;
- Agency Preferred Alternative segments access disturbance estimates provided in Table 2.2-20; and
- Helicopter access.

2.2.5.9 Induced Currents on Adjacent Facilities

AC transmission lines, such as the Project, have the potential to induce currents on adjacent metallic structures such as other transmission lines, railroads, pipelines, fences, or structures that are parallel to or cross the transmission line(s). Conducted currents on these facilities (directly to ground) occur during fault conditions. Prior to initiation of construction activities, an electrical study would be conducted to determine the extent and type of anti-corrosion mitigation that would be required. The gradient wires that may be required could be installed by different methods; trenching, ripping, or a combination of both. Appendix 2 contains additional detail regarding the induced currents, construction details for gradient control wires, and distribution supply lines for cathodic protection.

2.2.5.10 Temporary Use Areas

Temporary use areas would be required for material staging, laydown yards, and helicopter fly yards during construction. These areas would be selected based upon the final Project alignment and located in previously disturbed areas to the extent practicable. Material laydown yards and staging yards would be utilized during construction. An average of one material staging/crew

show-up area per 20 line-miles is expected for the Project, currently identified in Tonopah, Quartzsite, Salome, and Blythe. Material laydown areas, not to exceed four, would be within or adjacent the ROW. Staging areas would be fenced with locked gates and may have security. Temporary staging areas would be powered by local distribution lines if available and necessary, or by diesel generator; in California, renewable energy sources would be used where feasible and available. Some staging areas would also be used for concrete batch plant operations. Batch plants would be co-located with material staging and laydown yards to the extent feasible and would not require additional short-term disturbance.

Because the length of the Action Alternative routes is not substantially different from the Proposed Action route, there would not be a difference in disturbance from temporary use areas anticipated.

Appendix 2 contains additional details regarding:

- Temporary use areas associated with the Project.

2.2.5.11 Existing Utility Lines and ROW Crossings

A number of existing electric utility ROWs are present near the Project which would require spanning or encroachment. The Proposed Action would cross the Central Arizona Project (CAP), major roadways, including I-10, Arizona State Route (SR) 95, California SR 78, and local roads in Maricopa, La Paz, and Riverside Counties, where structures would need to be placed outside of existing ROWs.

Appendix 2 provides additional details regarding:

- Existing utility lines and ROW crossings;
- Estimated disturbance for guard structures for the Proposed Action segments in Table 2.2-21;
- Estimated disturbance for guard structures for the Action Alternative segments in Table 2.2-22; and
- Estimated disturbance for guard structures for the Agency Preferred Alternative segments in Table 2.2-23.

Figure 2.2-22 (Appendix 7) illustrates a typical guard crossing.

2.2.5.12 Construction Water Requirements

Water would be required for concrete structure foundation construction at the batch plants and dust control during construction. Water would be obtained from private wells and/or municipal supplies with permitted and allocated water rights. Foundation and concrete details pertaining to water use are provided in Table 2.2-24. Water requirements for the Proposed Action, Action Alternatives segments, and the Agency Preferred Alternative are estimated in Tables 2.2-25 through 2.2-27 in Appendix 2.

2.2.5.13 Disposal and Cleanup

Construction would generate non-hazardous solid wastes, including material packaging, concrete, hardware and scrap metal. However, the volume of these wastes is not expected to be substantial. Personal trash would be removed from the ROW on a daily basis. Construction waste (boxes, crates, etc.) would be removed from the transmission ROW shortly after each crew completes their specific task on site. The solid wastes generated during construction would be hauled away for recycling or disposal at approved disposal sites.

2.2.5.14 Construction Reclamation

Construction reclamation, including cleanup, soil stabilization, and revegetation would occur at the end of the construction process, as described in Appendix 2.

2.2.5.15 Construction Workforce and Schedule

The Project is expected to be constructed in two simultaneous work fronts with over 100 workers on each work front. The SCS construction effort would require approximately 40 workers. Crew parking would be located at one of the material storage yards closest to the work area. Appendix 2 includes the estimated number of workers and types of equipment required to construct the proposed transmission line and SCS, presented in Tables 2.2-28 and 2.2-29, and equipment trip estimates for construction and reclamation, presented in Table 2.2-30. DCRT would commence construction upon timely receipt of necessary permits and ROW approvals. Construction is estimated to require 585 days for the transmission and distribution lines; and 472 days for the SCS. Table 2.2-31 in Appendix 2 outlines the construction task, phase, and anticipated duration.

2.2.5.16 Project Construction Closeout

Upon completion of construction and commissioning for the Project, DCRT and the construction contractor(s) would coordinate with the Compliance Inspection Contractor (CIC), BLM, and other permitting agencies to conduct final on-the-ground inspections of Project conditions. After BLM's determination of successful construction completion on BLM-administered lands, the CIC would submit a final summary report to the BLM Authorized Officer documenting the construction process. When the BLM Authorized Officer determines that construction (including initial reclamation activities) has been completed in compliance with the ROW grant, ROD, POD, and any other applicable permits, the CIC, construction contractor(s), and DCRT's construction roles would be considered complete. This determination would initiate the post-construction monitoring phase for reclamation success for which DCRT would remain responsible.

2.2.5.17 Estimated Disturbance Summary

Tables 2-10 and 2-11 summarize the total disturbance acreages and water requirements for the Proposed Action and Action Alternative routes.

2.2.6 Project Operation and Maintenance

After construction, Project operation and maintenance would be an ongoing activity including ROW safety requirements, transmission line inspections, preventative and emergency maintenance, distribution line maintenance, vegetation management including trimming and removal of vegetation within the ROW (wire zone as shown in Figures 2.2-23 a and b, Appendix 7), SCS maintenance, substation maintenance, and long-term access to the ROW through general road maintenance and installation of signs and markers. More information on energy use during operations and maintenance, radio or television interference, contingency planning, emergency procedures, and compatible uses is provided in Appendix 2.

Table 2-10 Short-Term Disturbance by Alternative

SHORT-TERM[1] DISTURBANCE (ACRES)								
ALTERNATIVE	STRUCTURES	MATERIAL STAGING AREA	SCS DIST LINE	HELICOPTER STAGING	GUARD CROSSINGS	SNUBBING AND PULLING SITES	TOTAL SHORT-TERM DISTURBANCE	TOTAL WATER USE - CONSTRUCTION
Proposed Action	426.8	34.5	<0.1	33.4	42.8	171.5	709.1	56,803,096.2
Alternative 1	423.5	34.5	0.8	0	36.9	152.6	648.3	56,082,251.9
Alternative 2	469.7	34.5	0.8	33.4	49.0	167.4	754.8	59,760,221.8
Alternative 3	462.0	34.5	0.8	49.3	47.6	173.9	768.1	59,054,799.3
Alternative 4	455.4	34.5	0.8	56.9	37.6	175.2	760.4	56,744,282.2
Preferred Alternative	468.6	34.5	0.8	33.4	53.3	167.4	758.0	59,639,956.0

[1] Temporary use areas would be disturbed during construction, their use would be temporary, and the acreage reclaimed; however, due to the desert environment, the disturbance effects may be long-term.

Table 2-11 Long-Term Disturbance by Alternative

LONG-TERM DISTURBANCE (ACRES)						
ALTERNATIVE	LINE MILES	SCS	SCS DIST LINE	ACCESS ROADS	STRUCTURES	TOTAL LONG-TERM DISTURBANCE
Proposed Action	114.3	1.7	<0.1	375.2	33.1	410.0
Alternative 1	111.6	1.7	<0.1	354.9	33.6	390.3
Alternative 2	125.8	1.7	<0.1	424.5	36.5	462.8
Alternative 3	123.0	1.7	<0.1	429.2	35.4	466.4
Alternative 4	120.3	1.7	<0.1	435.1	31.2	468.1
Preferred Alternative	125.0	1.7	<0.1	430.8	41.1	473.7

2.2.7 Termination and Decommissioning

Should the ROW and facilities no longer be needed, the transmission lines and associated facilities would be decommissioned. Subsequently, conductors, insulators, concrete pads for the SCS and associated facilities, and hardware would be dismantled and removed from the ROW. Transmission structures would be removed, and foundations broken off at least 2 feet below ground surface. All areas of long-term disturbance on BLM-managed lands would be reclaimed in accordance with the Decommissioning Plan approved by the BLM prior to issuance of the ROW grant[1]. A performance and reclamation bond for BLM-managed lands, based on a reclamation cost estimate provided by the applicant and reviewed, modified as needed, and approved by the BLM, is required per BLM bonding policy.

Access routes and other sites disturbed during decommissioning would be reclaimed and revegetated in accordance with a Decommissioning Plan for BLM-managed lands to be approved by BLM. Additional details regarding termination and decommissioning are provided in Appendix 2.

2.2.8 Applicant Proposed Measures and BLM Best Management Practices

Design features for the Project include BMPs, standard operating procedures, APMs, and requirements from RMPs and BLM manuals. These design features would be applied to reduce and minimize impacts to resources from the Project.

Current BLM mitigation policy would be applied to address impacts of the Project that cannot be avoided or minimized to an acceptable level. Project APMs and BMPs are described in Appendix 2A.

The CDCA Plan, as amended, contains CMAs, which include a specific set of avoidance, minimization, and compensation measures. The applicability of those measures to the Project was determined using a CMA checklist. Those CMA measures that were determined to be applicable to the Project are described in Appendix 2C.

2.2.9 Alternative Segments Considered but Eliminated from Detailed Analysis

Alternative segments were identified by BLM through a combination of both internal and public scoping (Table 2.2-2, Appendix 2). Public scoping comments that resulted in alternative segments being identified included: segments that avoid the Town of Quartzsite, segments within BLM utility corridors, segments that avoid sensitive cultural resources, and segments that avoid Johnson Canyon and the Kofa NWR. Public scoping also raised other potential alternatives that did not result in alternative segments being identified, since the suggested alternative was either not applicable (i.e., the Proposed Action segments already avoided wilderness) or not relevant to the Project (i.e., development of a route and substation for the Brenda Solar Energy Zone).

[1] There would be reclamation of lands with long-term, Project disturbance, but the majority of reclamation would occur once construction is completed and the transmission line is energized (Section 2.2.5.14 and Appendix 2).

Screening of the alternative segments against screening criteria identified potential alternative segments, or portions thereof, that did not meet the criteria for reasonable alternatives, and therefore, these alternative segments will not be carried forward in the EIS. Reasons for elimination of alternatives included identification of known conflicts with a use or sensitive resource, redundancy with an alternative already included in the EIS for detailed study, and technical infeasibility. Additional information regarding the alternative segments considered but eliminated from detailed analysis is provided in the Project record. Appendix 2 provides a summary of alternative segments not carried forward for detailed analysis in Table 2.2-32 and these are shown on Figures 2.2-24 through 2.2-27 (Appendix 7).

2.3 COMPARISON OF IMPACTS OF ALTERNATIVES CONSIDERED

Table 2-12 provides a summary of the key resource (Section 4.1) impacts of the combined segments for the Proposed Action and each Action Alternative route, as well as the Agency Preferred Alternative, as presented in detail in Chapter 4.

Appendix 2 contains a comparison of impacts by segment, and by alternative and subalternatives, in Tables 2.2-33a-b, 2.2-34a-b, 2.2-35a-c, and 2.2-36a-d; and Tables 2.2-37 through 2.2-41, respectively.

Table 2-12 Comparison of Alternatives and Impacts

CHARACTERISTIC OR RESOURCE IMPACT		PROPOSED ACTION	ALTERNATIVE 1	ALTERNATIVE 2	ALTERNATIVE 3	ALTERNATIVE 4	AGENCY PREFERRED ALTERNATIVE
Land ownership (miles)	BLM	56.5	58.8	80.1	82.6	84.6	79.4
	Reclamation	1.5	6.4	1.7	0.7	0.8	1.7
	USFWS	24.9	0.0	0.0	0.0	0.0	0.0
	DOD	0.2	0.0	0.2	0.2	0.2	0.2
	Arizona State Trust	8.1	19.4	17.6	14.0	6.0	17.6
	Private	23.1	25.6	26.2	25.5	28.7	26.2
	Indian Lands	0.0	1.4	0.0	0.0	0.0	0.0
	Total Length	114.3	111.6	125.8	123.0	120.3	125.0
Ground disturbance	Short-term Acres	709.1	648.3	754.8	768.1	760.4	758.0
	Long-term Acres	410.0	390.3	462.8	466.4	468.1	473.7
BLM RMP Conformance	VRM	8 segments include amendments	1 segment includes amendment	5 segments include amendments	6 segments include amendments	7 segments include amendments	No amendments
	Corridors	Conform	3 segments with amendment	2 segments with amendment	5 segments with amendment	5 segments with amendment	3 segments with amendment
	RMP Amendments and Conformance	Amendments Included (Yuma RMP, CDCA Plan)	Amendments Included (Yuma RMP, CDCA Plan)	Amendments Included (Yuma RMP, CDCA Plan)	Amendments Included (Yuma RMP, CDCA Plan)	Amendments Included (Yuma and Lake Havasu RMPs, CDCA Plan)	Amendments Included (Yuma RMP, CDCA Plan)
Other Plan conformance (Federal, county, municipal)		USFWS Kofa NWR determined not appropriate; would conform with all others.	Not consistent with La Paz County Zoning Plan and Town of Quartzsite General Plan.	Same as Alternative 1.	Not consistent with La Paz County Zoning Plan.	Same as Alternative 3.	Same as Alternative 3.
Soil Resources	Soils disruption of sand transport and dunes	Soil loss/erosion risk negligible to minor, short-term to long-term; adherence to APMs & BMPs reduces risks to negligible. Uses Segments p-17 and p-18. Negligible disruption of sand transport or dunes during construction and operation.	Soil loss/erosion risk similar to Proposed Action. Uses Segments ca-07, ca-09, and x-19 which would have negligible to minor impact on sand transport and dunes during construction and operation.	Same as Alternative 1.	Same as Alternative 1.	Same as Alternative 1.	Same as Alternative 1.
	Total acres of soil disturbance	1,086.0	1,004.9	1,181.0	1,199.0	1,197.2	1,190.5
	Susceptibility to wind erosion	High west of Colorado River.	Same as the Proposed Action.	Same as the Proposed Action.	Same as the Proposed Action.	Same as the Proposed Action.	Same as the Proposed Action.

CHARACTERISTIC OR RESOURCE IMPACT		PROPOSED ACTION	ALTERNATIVE 1	ALTERNATIVE 2	ALTERNATIVE 3	ALTERNATIVE 4	AGENCY PREFERRED ALTERNATIVE
Biological Resources (Vegetation Resources, Wildlife, including Special Status Species and Migratory Birds)	Loss of native habitat/ communities	Some minor long-term habitat loss for structures and access roads, but entire Project would occur in an area where linear facilities and roads already exist. Short- and long-term impacts from clearing of temporary use areas pending restoration but impacts reduced due to adjacency of existing disturbances. Microphyll wash habitat would not be affected.	Similar to the Proposed Action, but in areas where no linear facilities and few roads exist these impacts would be moderate. Up to 0.5 acre of microphyll wash would be crossed but there would be a 200-foot setback and would be spanned through micrositing.	Similar to the Proposed Action, but in areas where no linear facilities and few roads exist these impacts would be moderate. Up to 2.6 acre of microphyll wash would be crossed but there would be a 200-foot setback and would be spanned through micrositing.	Similar to the Proposed Action, but in areas where no linear facilities and few roads exist these impacts would be moderate. This route crosses more undeveloped areas, therefore the loss of native habitat/communities is greater than the other alternatives. Up to 0.5 acre of microphyll wash would be crossed but there would be a 200-foot setback and would be spanned through micrositing.	Same as Alternative 1.	Same as Alternative 2.
	Noxious weeds	Negligible to minor impact with APMs and BMPs but increased abundance of existing invasives that are already present.	Negligible to minor long-term impacts due to facilitating increased abundance of non-native plants, especially in dune habitats. APMs and BMPs would reduce impact.	Minor long-term impacts due to facilitating increased abundance of non-native plants, especially in dune habitats. APMs and BMPs would reduce impact.	Moderate long-term impacts due to facilitating spread and increased abundance of non-native plants into new areas, especially into the Dome Rock Mountains and dune habitats. APMs and BMPs would reduce impact.	Same as Alternative 3.	Same as Alternative 2.
	Special Status Plant Species	Approximately 0.6 mile of proposed access roads would cross suitable Harwood's eriastrum habitat; in total, approximately 3.3 acres of suitable habitat would be impacted by Project activities. Negligible to minor impact with APMs and BMPs.	Approximately 5.6 mile of proposed access roads would cross suitable Harwood's eriastrum habitat; in total, approximately 27.3 acres of suitable habitat would be impacted by Project activities. Minor to moderate impact with APMs and BMPs.	Similar to Alternative 1.	Similar to Alternative 1.	Similar to Alternative 1.	Similar to Alternative 1.
	Increased avian electrocution risk	Electrocution risk for raptors reduced by APMs, BMPs, and APLIC standards. Increased hazard of collision at the Colorado River crossing and over agricultural lands would be reduced by matching structure spacing and conductor heights with existing facilities.	Similar to the Proposed Action. However, the collision risk at the Colorado River crossing is higher than under the Proposed Action because the crossing is not adjacent to existing facilities.	Similar to the Proposed Action.	Similar to the Proposed Action. However, the collision risk at the Colorado River crossing is higher than under the Proposed Action because the crossing is not adjacent to existing facilities.	Similar to the Proposed Action.	Similar to the Proposed Action.

CHARACTERISTIC OR RESOURCE IMPACT		PROPOSED ACTION	ALTERNATIVE 1	ALTERNATIVE 2	ALTERNATIVE 3	ALTERNATIVE 4	AGENCY PREFERRED ALTERNATIVE
	Increased predation potential from artificial perches	Increased predation on desert tortoise and small mammals, reptiles, and invertebrates from raptors due to artificial perch sites; minimized by use of APMs and BMPs.	Similar to the Proposed Action.	Similar to the Proposed Action.	Similar to the Proposed Action.	Similar to the Proposed Action.	Similar to the Proposed Action.
	Displacement via construction	Loss of habitat, small mammal and tortoise burrow crushing under vehicles, displacement due to disturbance for tortoise. Minor short-term construction displacement impact to bighorn sheep in Copper Bottom Pass. Impacts minimized through use of APMs and BMPs.	Similar to the Proposed Action. Negligible impacts to bighorn sheep.	Similar to the Proposed Action.	Similar to the Proposed Action. quality habitat.	Similar to the Proposed Action. Route would be close to a wildlife water in Johnson Canyon.	Similar to the Proposed Action.
	Increased access to remote areas resulting in displacement via human activity including increased recreation access	Negligible long-term impacts to wildlife and habitats; area already impacted by transmission lines and pipeline corridors.	Negligible long-term impacts to wildlife and habitats by facilitating increased recreational access to remote areas.	Similar to Alternative 1.	Major long-term impacts to bighorn sheep in the Dome Rock Mountains by facilitating increased recreational access to remote areas.	Major long-term impacts to bighorn sheep in the Dome Rock Mountains by degrading high quality habitat and facilitating increased recreational access to remote areas.	Similar to Alternative 1.
	Impacts to native wildlife habitat and designated management areas	Project would cross approximately 25 miles of quality habitat for Sonoran desert tortoise, 0.6 mile of Mojave fringe-toed lizard habitat, and is within habitat used by reintroduced Sonoran pronghorn. Passes through Cunningham Peak, a bighorn sheep lambing area. Impacts to wildlife habitats minimized through use of APMs and BMPs. According to USFWS, major, unmitigable, adverse effect to management of Kofa NWR for wildlife, including Sonoran pronghorn and bighorn sheep.	Project would cross only a minor amount of mostly degraded habitat for Sonoran desert tortoise and is not within Sonoran pronghorn habitat. Negligible impacts to bighorn sheep. Minor short- and long-term impact to Mojave fringe-toed lizard due to possible mortality by Project activities and habitat impacts on 4 miles of habitat.	Minor impact on Sonoran desert tortoise habitat, and negligible impact on Sonoran pronghorn. Avoids Mojave desert tortoise habitat. Passes through Cunningham Peak, which is nearly pristine bighorn sheep habitat and a bighorn sheep lambing area (major impact). Impacts to wildlife habitats minimized through use of APMs and BMPs.	Minor impact on Sonoran desert tortoise habitat, and negligible impact on Sonoran pronghorn. Passes through Cunningham Peak, which is nearly pristine bighorn sheep habitat and a bighorn sheep lambing area (major impact). Impacts to wildlife habitats minimized through use of APMs and BMPs.	Minor impact on Sonoran desert tortoise and Sonoran pronghorn habitat. Passes through Cunningham Peak, which is nearly pristine bighorn sheep habitat and a bighorn sheep lambing area (major impact). Impacts to wildlife habitats minimized through use of APMs and BMPs.	Same as Alternative 2.

CHARACTERISTIC OR RESOURCE IMPACT		PROPOSED ACTION	ALTERNATIVE 1	ALTERNATIVE 2	ALTERNATIVE 3	ALTERNATIVE 4	AGENCY PREFERRED ALTERNATIVE
	Migratory birds	Negligible to minor impacts from noise of construction causing displacement, increased predation from raptors, loss of nests, risk of collision with towers and lines (especially at Colorado River crossing and over agricultural lands); minimized by use of APMs and BMPs.	Similar to Proposed Action. Additional hazard at the Colorado River crossing because there are no existing structures to match.	Similar to Proposed Action.	Similar to Proposed Action. Minor short- and long-term impacts to migratory birds due to potential collision hazard with structures, conductors, and guy lines, and additional hazard at the Colorado River.	Similar to Proposed Action.	Similar to Proposed Action.
	Special Status Animal Species	Sonoran pronghorn potential major impact on Kofa NWR. Crosses Mojave and Sonoran desert tortoise habitat, Mojave fringe-toed lizard potential impacts (crushing, displacement) from construction and increased predation by ravens; minimized by APMs and BMPs.	Similar to Proposed Action, except impacts to special status species on Kofa NWR would not occur.	Similar to Alternative 1. Increased, minor short- and long-term impact to Mojave fringe-toed lizard due to possible mortality by Project activities and habitat impacts on 4 miles of habitat.	Similar to Alternative 1.	Similar to Alternative 1.	Similar to Alternative 1. Increased, minor short- and long-term impact to Mojave fringe-toed lizard due to possible mortality by Project activities and habitat impacts on 4 miles of habitat.
Cultural Resources	Damage or loss of a cultural site or potential site under federal or state registers; degradation of the setting for a cultural site where setting is significant to its listing eligibility; increased access leading to potential vandalism; disturbance of human remains. Note: Continued consultation with Native American tribes and/or other interested parties potentially may identify additional resources of concern.	Known National Register of Historic Places (NRHP)-eligible sites and sites requiring NRHP evaluation: 66 (cultural resources survey coverage: 39.3%). Known site density: 11.3 sites per 100 acres. Projected NRHP-eligible sites or sites requiring NRHP evaluation: 164. Key resources include trails, intaglios, and prehistoric habitation sites with potential human remains, particularly along Segments p-17 and p-18 that cross the eastern base of the Palo Verde Mesa. Areas of tribal concern (NRHP-listed Ripley Intaglio Site, NRHP-listed Mule Tank Discontinuous Rock Art District, Limekiln Wash Intaglio Site, and	Known NRHP-eligible sites and sites requiring NRHP evaluation: 23 (cultural resources survey coverage: 30.7%). Known site density: 5.0 sites per 100 acres. Projected NRHP-eligible sites or sites requiring NRHP evaluation: 75. Key resources projected to occur include trails and intaglios.	Known NRHP-eligible sites and sites requiring NRHP evaluation: 50 (cultural resources survey coverage: 32.5%). Known site density: 7.8 sites per 100 acres. Projected NRHP-eligible sites or sites requiring NRHP evaluation: 150. Key resources projected to occur include trails and intaglios. Areas of tribal concern (NRHP-listed Ripley Intaglio Site and Limekiln Wash Intaglio Site) are in the vicinity of this alternative route.	Known NRHP-eligible sites and sites requiring NRHP evaluation: 35 (cultural resources survey coverage: 24.4%). Known site density: 9.4 sites per 100 acres. Projected NRHP-eligible sites or sites requiring NRHP evaluation: 134. Key resources projected to occur include trails.	Known NRHP-eligible sites and sites requiring NRHP evaluation: 41 (cultural resources survey coverage: 23.2%). Known site density: 10.3 sites per 100 acres. Projected NRHP-eligible sites or sites requiring NRHP evaluation: 170. Key resources projected to occur include trails. Areas of tribal concern (NRHP-listed Ripley Intaglio Site, NRHP-listed Eagle tail Petroglyph Site, and Limekiln Wash Intaglio Site) are in the vicinity of this alternative route.	Known NRHP-eligible sites or sites requiring NRHP evaluation: 49 (cultural resources survey coverage: 30.0%). Known site density: 8.1 sites per 100 acres. Projected NRHP-eligible sites or sites requiring NRHP evaluation: 132. Key resources projected to occur include trails and intaglios. Areas of tribal concern NRHP-listed Ripley Intaglio Site and Limekiln Wash Intaglio Site) are in the vicinity of this alternative route.

CHARACTERISTIC OR RESOURCE IMPACT		PROPOSED ACTION	ALTERNATIVE 1	ALTERNATIVE 2	ALTERNATIVE 3	ALTERNATIVE 4	AGENCY PREFERRED ALTERNATIVE
		Indian Well Site) are in the vicinity of this proposed route.					
Issues of Concern to Indian Tribes	Existing and new access	Potential impacts to areas of Indian tribal concern due to new access or access restrictions will be studied in an access analysis that will be a required stipulation of the Programmatic Agreement (PA; Appendix 2D).	Same as Proposed Action.	Same as Proposed Action.	Same as Proposed Action.	Same as Proposed Action.	Same as Proposed Action.
	Native infrastructure* and the interconnectedness of the landscape.	10 segments contain relevant concerns, including trails.	4 segments contain relevant concerns, including trails and intaglios.	12 segments contain relevant concerns, including trails.	13 segments contain relevant concerns, including trails.	11 segments contain relevant concerns, including trails.	12 segments contain relevant concerns, including trails.
	Places of elevated spiritual importance	5 segments contain relevant concerns, including intaglio or petroglyph sites. Two segments pass through a prehistoric cultural landscape that include the Mule Tank Discontinuous Rock Art District.	4 segments contain relevant concerns, including intaglios.	2 segments contain relevant concerns including intaglios.	1 segment contains relevant concerns.	3 segments contain relevant concerns.	2 segments contain relevant concerns, including intaglios.
	Colorado River	1 segment crosses the Colorado River; concerns were expressed about the Colorado River, and its influence on their spiritual belief and cultural history.	Same as Proposed Action.	Same as Proposed Action.	Same as Proposed Action.	Same as Proposed Action.	Same as Proposed Action.
	Treatment of human remains	1 segment includes a site with calcined bone consistent with a human cremation.	No known concerns to Indian tribes.	No known concerns to Indian tribes.	No known concerns to Indian tribes.	No known concerns to Indian tribes.	No known concerns to Indian tribes.
	Intrusion on pristine landscapes	No known concerns to Indian tribes.	No known concerns to Indian tribes.	No known concerns to Indian tribes.	3 segments would be an intrusion on pristine landscapes.	3 segments would be an intrusion on pristine landscapes.	1 segment would be an intrusion on pristine landscapes.

CHARACTERISTIC OR RESOURCE IMPACT		PROPOSED ACTION	ALTERNATIVE 1	ALTERNATIVE 2	ALTERNATIVE 3	ALTERNATIVE 4	AGENCY PREFERRED ALTERNATIVE
Land Use	Land use authorizations and ROWs and other Plan compliance	Short-term conflict with access to ROWs during construction; minor with Quartzsite; noncompliant with Kofa NWR Plan.	Same as Proposed Action except Alternative 1 would avoid the Kofa NWR and the YPG, would cross through more ASLD land. It would not be consistent with Town of Quartzsite or La Paz County plans.	Same as the Proposed Action except inconsistent with La Paz County Zoning Plan and the Quartzsite General Plan. Avoids the Kofa NWR.	Same as the Proposed Action except avoids Kofa NWR. Inconsistent with La Paz County Zoning Plan.	Same as the Proposed Action except would not cross Kofa NWR. Inconsistent with La Paz County Zoning Plan.	Same as the Proposed Action except avoids Kofa NWR; non-compliant with La Paz County Zoning Plan.
Recreation	Physical, access, use, or functional changes to established, designated, or planned recreation areas, resources, experiences, or activities; conflicts with Federal, state, or local policies; affect OHV designations, access, or routes; impacts to hunting access.	Negligible to minor effects to recreation areas short-term due to access restrictions; negligible effects long-term as already impacted by DPV1 line. Negligible to moderate effects to OHV routes and Arizona Peace Trail short-term, and negligible long-term, with MMs. Negligible effects to hunting.	Greater impacts to long-term recreation where route varies from Proposed Action as power lines would be new and may impact the quality of the recreation experience. Minor to major effects to La Posa long-term visitor area (LTVA), Dome Rock Camping Area, and the Ehrenberg Sandbowl OHV area. Kofa NWR would not be crossed. Otherwise the Same as Proposed Action.	Long-term recreation quality similar to Proposed Action except in Quartzsite area where powerline would be new to the landscape (negligible to minor). Two Alternative 2 segments would cross the La Posa LTVA (minor to moderate impact), but, by comparison to Alternative 1, Dome Rock Camping Area would not be crossed by Alternative 2.	Long-term recreation quality similar to Proposed Action except where powerline would be new to the landscape (negligible to minor). Would not cross the La Posa LTVA, Dome Rock Camping Area, Kofa NWR, Copper Bottom Pass, or Johnson Canyon. Otherwise similar to the Proposed Action.	Long-term recreation quality similar to Proposed Action except where powerline would be new to the landscape (negligible to minor). Would run adjacent to the La Posa LTVA but would avoid Dome Rock Camping Area and Kofa NWR. Would run through Johnson Canyon. Otherwise similar to the Proposed Action.	Negligible to minor effects to recreation areas short-term due to access restrictions; negligible effects long-term as already impacted by DPV1 line. Avoids LTVA. Negligible to moderate effects to OHV route and Arizona Peace Trail short-term, negligible long-term, with MMs. Negligible effects to hunting.
Socioeconomics & Environmental Justice (EJ)	Employment; Tax collection & revenue; Population or population displacement; Non-market values and ecosystem services; Revenue from recreation sector; Local economy; Reductions in property values; EJ Populations; disproportionate adverse impacts to EJ populations.	Short-term increase in employment; increased revenue from taxes short and long-term; short-term negligible impacts to recreation sector, non-market values. Short-term negligible impacts to property values. Negligible long-term impact to population. Local economic impacts would include short-term increase in employment and long-term facilitation of renewable energy generation facilities. EJ populations present but would not experience disproportionate adverse impacts.	Same as Proposed Action.	Same as Proposed Action.	Same as Proposed Action.	Same as Proposed Action.	Same as Proposed Action.

CHARACTERISTIC OR RESOURCE IMPACT		PROPOSED ACTION	ALTERNATIVE 1	ALTERNATIVE 2	ALTERNATIVE 3	ALTERNATIVE 4	AGENCY PREFERRED ALTERNATIVE
Visual Resources	Conflicts with visual standards, ordinances, or policies established; major and unmitigated visual changes that degrade or disrupt views of scenic landscapes from highly sensitive viewing locations.	The Proposed Action route would avoid visual impacts to the Town of Quartzsite. Additionally, the Proposed Action route would avoid direct visual impacts to CRIT land and to sensitive recreational users of Johnson Canyon. This route would not meet VRM Class objectives and would include amendment of the Yuma RMP for Segments p-13 through p-16. In California, this route would follow the existing transmission line across private agricultural lands and cross BLM lands into the Colorado River Substation, meeting VRM Class objectives.	The Alternative 1 route would consolidate disturbance and development along I-10, large portions of which would be within BLM utility corridors. This route would have greater visual impacts to the Town of Quartzsite and would have the greatest visual impact to numbers of viewers in the Project Area, due to proximity along I-10. However, a greater portion of the route on BLM-administered lands would meet VRM Class objectives, with only Segments i-03 through i-06 including amendment of the Yuma RMP to ensure conformance with VRM Class objectives. In California, this route would cross private agricultural lands north of the existing transmission line, impacting a new set of residential viewers and road users. On BLM lands, VRM Class objectives would be met.	The Alternative 2 route would visually impact the portion of the Project east of Quartzsite similar to Alternative 1, and the portion of the Project west of Quartzsite similar to the Proposed Action. Views of recreationists in the LTVA and travelers on SR 95 would be impacted by the Project paralleling SR 95; however, the portion of the route in this area would be within a BLM utility corridor. This alternative would include an amendment of the Yuma RMP for Segments x-07 and p-09 through p-13 to ensure conformance with VRM Class objectives. In California, this route would follow the existing transmission line across private agricultural lands and cross BLM lands in utility corridors into the Colorado River Substation, meeting VRM Class objectives.	The Alternative 3 route would impact the portion of the Project east of Quartzsite similar to Alternative 1; except it would reduce the visual effects to travelers along I-10. The Project would avoid visual impacts to the Town of Quartzsite and minimize visual impacts to recreationists in the LTVA. West of US 95, visual impacts would be similar to the Proposed Action, except it would include an amendment of the Yuma RMP for Segments cb-01, cb-04, and cb-05 to ensure conformance with VRM Class objectives. In California, this route would shift the visual impacts of the Colorado River crossing north and would visually impact a different set of local residents and road users. Segments located on BLM-administered land would meet the VRM Class objectives and be within utility corridors.	Alternative 4 would minimize visual impacts to travelers on I-10. However, the route would follow the boundary of the LTVA, impacting the views of recreationists in that area West of US 95, visual impacts would be similar to the Proposed Action, except the Project would be routed through Johnson Canyon, impacting the views of recreationists in that area. This alternative would include amendment of the Yuma RMP for Segments x-06 and p-13 to ensure conformance with VRM Class objectives. In California, the visual impacts would be the same as the Proposed Action, until the Alternative 4 route turns north on Segments x-12 and 13, connecting to Segment ca-06. This portion of the route would not follow other existing transmission infrastructure and would be on private land visually impacting a different set of local residents and road users. Impacts from Segments ca-07, ca-09, and x-19 would meet the VRM Class objectives within utility corridors.	East of Quartzsite, the Agency Preferred Alternative would have the same impacts as Alternatives 1 and 2. The Agency Preferred Alternative would avoid visual impacts to the Town of Quartzsite, the LTVA, and travelers along US 95. This alternative would follow the Proposed Action route and have the same visual resource impacts through the Copper Bottom Pass area. Impacts for the remainder of the route would be the same as those described for Alternative 2. This alternative does not include any RMP amendments for VRM Class. Instead, for management consistency the corridor would remain VRM Class III and impacts to visual resources would be addressed through application of APMs, BMPs, and MMs. These measures would serve to reduce impacts to visual resources to the extent practical. However, in some areas the VRM Class may not be met, especially for sensitive viewers.

Sources: Jurisdiction from Table 2-1, and Appendix 2 – Tables 2.2-1 and 2.2-2; Disturbance from Appendix 2 - Tables 2.2-37 through 2.2-41.

* Native infrastructure: Elements of the landscape, either cultural or natural, important to Indian tribes. Elements of Native infrastructure on the landscape may include, but are not limited to, prehistoric trail networks and cultural resources sites, natural landmarks, and areas used for resource procurement.

This page intentionally left blank.

2.4 MONITORING AND MITIGATION

Appendix 2A provides Project design features, the APMs proposed by DCRT, and BMPs provided by BLM, which are included as part of the Proposed Action and any Action Alternative; however, additional monitoring and MM would be necessary (Appendix 2, Section 2.4). These MM are in response to potential environmental impacts identified in Chapter 4 or Appendix 4 and are above and beyond identified APMs and BMPs. They would be included and apply to the Agency Preferred Alternative (Section 2.2.4). Additionally, WAPA would require a Mitigation Action Plan (to be completed before the NTP is issued), if impacts were not addressed through implementation of BMPs, APMs, and MMs.

Those CMAs that are addressed by MMs are provided in parenthesis following the measures.

No mitigation would be required by the BLM for: air quality and greenhouse gases; geology, minerals, or soil resources; paleontological resources; land use; special designations, management allocations, or wilderness resources; noise; socioeconomics; environmental justice; and water resources. The APMs and BMPs would adequately address these resources.

Chapter 3 Affected Environment

CHAPTER 3 AFFECTED ENVIRONMENT

3.1 INTRODUCTION

Detailed information specifically referenced in the sections below is located in Appendix 3. All figures with in-text references with three-digit figure numbers (i.e., 3.X-X) not shown in this chapter are contained in Appendix 7. All figures with two-digit in text references (3-X) are contained within this chapter. References, Acronyms, Abbreviations, Glossary, and Index are located in Appendix 6. Additional baseline data is provided in the TES available on the BLM's ePlanning website.

3.1.1 General Setting of Project Area

The Project Area extends across southwestern Arizona into southeastern California. It is within the North American Deserts Ecoregion (Level I division) (Commission for Environmental Cooperation n.d. [no date]) and the Sonoran Basin and Range subdivision (Level III division) (EPA 2013a), which is distinguished by palo verde-cactus vegetation including saguaro, cholla, and agave cacti. This region has large tracts of Federally owned lands. Winter rainfall decreases from west to east, while summer rainfall decreases from east to west (EPA 2013b). The climate is characterized by being the driest in the US.

The Project Area is within the Basin and Range Physiographic Province, Sonoran Desert subdivision, with approximately 20 percent mountains and 80 percent plains. The topography is characterized by mountain ranges that are roughly parallel. The basins between the ranges are relatively flat with gentle slopes next to the mountains (Fenneman 1931) that vary from hills and buttes up to mountains rising 4,000 feet above sea level (asl). The desert plains mostly lie below 2,000 feet elevation (Fenneman 1931).

The economy of the region has historically been based on irrigated agriculture, livestock grazing, and mining (Commission for Environmental Cooperation 1997). Federal and state trust lands include commercial, recreational, range, and undeveloped lands. Private land includes residential, commercial, industrial, and undeveloped areas. The primary types of land within the study areas and adjacent to the Project Area are undeveloped lands and rural areas. The Project location is shown in Figure 1-1.

3.1.2 Resources Brought Forward for Analysis

Based on internal (agency and cooperator) and external (public) scoping, or issue identification, a number of issues and concerns were identified for analysis in this EIS (Appendix 1, Table 1.9).

The study area varies by resource value or use, depending on the geographic extent of the resource or use and the extent of the effects of the Proposed Action and Action Alternatives on a resource or use.

Current conditions are characterized within the study areas. The study areas were determined to allow routing flexibility for final design, to allow adequate geographic coverage for where direct and indirect impacts could occur, and to characterize the broader environment where the Project would be located.

While all resources identified for analysis in the EIS are required to be addressed, some resources are "key" to distinguishing between alternatives and to the decision-making process: soil resources, biological resources, cultural resources, concerns of Indian tribes, land use, recreation, socioeconomics, environmental justice, and visual resources. Brief summaries of baseline conditions for "non-key" resources follow in the section below (Section 3.2), while more detailed descriptions of "key" resources are provided in the sections that follow (Sections 3.3 through 3.11).

3.2 NON-KEY RESOURCES

3.2.1 Air Quality and Climate Change

The air quality study area is a 31-mile (50 kilometer [km]) radius around the Proposed Action and Action Alternatives. A 31-mile radius was chosen to be consistent with minimum air quality analyses required by the EPA's Prevention of Significant Deterioration regulations. For purposes of greenhouse gas assessment, the existing conditions in each state are described. Current air quality conditions in the study area were obtained from the EPA's AirData website for the nearest monitor locations for each pollutant considered (carbon monoxide [CO], nitrogen oxides [NO_x], ozone, particulate matter less than 10 micrometers [PM_{10}], particulate matter less than 2.5 micrometers [$PM_{2.5}$], and sulfur dioxide [SO_2]). Given the rural, unpopulated nature of the study area, concentrations of most pollutants are well below the National Ambient Air Quality Standards (NAAQS). The exception is ozone; the eastern portion of the study area near Phoenix is in a nonattainment area. EPA estimated that Arizona greenhouse gas (GHG) (CO_{2e}) emissions were approximately 92.3 million metric tons per year for calendar year 2000. The California Air Resources Board estimated 440.4 million metric tons of CO_{2e} emissions in that state in 2015 (CARB 2017a).

3.2.2 Geology and Minerals

The study area for geology and mineral resources is a 4,000-foot corridor encompassing the Proposed Action and Action Alternatives. The study area for geologic hazards is 50 miles from the Project Area for historic seismicity, 20 miles from the Project Area for Quaternary faulting, and a 2-mile corridor encompassing the Proposed Action and Action Alternative segments for other geologic hazards. The study area extends from the Mojave Desert Province of southern California and into the Basin and Range Province. The Mojave Desert Province is a broad interior region of isolated mountain ranges separated by expanses of desert plains. The Basin and Range Province is characterized by northwest-trending, block-faulted mountain ranges separated by deep, alluvium-filled basins. The basins generally consist of sedimentary deposits and the mountain ranges consist of granitoid and metamorphic rock. The surface geology of the study area crosses both alluvial deposits and sedimentary, metamorphic, and igneous bedrock formations, with approximately 85 percent of the area consisting of unconsolidated surficial deposits and approximately 15 percent of the area consisting of bedrock. No unique geologic features are within the study area.

Potential geologic hazards in the study area include seismic-related hazards (earthquakes, faults, and soil liquefaction) and landslides, land subsidence, and flooding. Earthquake hazard values range from a relatively low risk at the Delaney Substation in Maricopa County, Arizona, to a moderate risk at the Colorado River Substation in Riverside County, California. No Quaternary-age active faults are mapped within the study area. Liquefaction hazard has been mapped in California and most of the study area west of the Colorado River has a very high to moderate liquefaction risk. Liquefaction hazard maps are not available for the Arizona portion of the study area. Based on changes in topography east of the Palo Verde Valley, greater depths to groundwater, and lower seismic risk, the liquefaction hazard is likely less overall in the Arizona portion of the Project area. The US Geological Survey (USGS) landslide risk database indicates that the relative risk for landslides in the study area is low, but locally there may be potential for slope movement in areas of steep topography depending on site-specific conditions. Land subsidence from groundwater withdrawal or karst dissolution has not been known to occur or been reported in the study area. While underground mines and mine shafts are present in the study area, it is not known whether any have collapsed.

Mineral resources in the study area include gold, silver, copper, marble, limestone, tungsten, and aggregates, although none of the instances reported appear to be active. For leasable minerals, there is potential for geothermal, oil, and gas development in the future, but no current development. Locatable metallic and nonmetallic minerals are known to occur in the study area, with much of the area having moderate to high potential. Additional mining activities could occur within the study area based on market conditions. Saleable minerals such as aggregate, sand, gravel, or crushed stone have a moderate to high potential to occur in most of the study area. There are numerous borrow or gravel pits (inactive, active, or proposed) within the Arizona part of the study area.

3.2.3 Paleontological Resources

The study area for paleontological resources is a 2-mile corridor that encompasses the Proposed Action and Action Alternatives. The Potential Fossil Yield Classification (PFYC) system (BLM Instruction Manual 2016-114) was utilized for identifying fossil potential in the study area. The geologic units crossed by the Proposed Action and Action Alternatives were reviewed to determine which units could potentially contain sensitive paleontological (fossil) resources. Paleontological resources may occur in sedimentary rocks and unconsolidated sediments greater than 10,000 years old. No previously recorded paleontological localities are located directly within the study area; however, at least six significant fossil localities have been recorded nearby or in geologic units that underlie the study area (Applied Earthworks 2018). Most of the geologic units in the study area have a very low to low or unknown paleontological sensitivity with some areas of high sensitivity (Figure 3.2-1, Appendix 7). Therefore, fossil potential in the study area, for all Action Alternative routes, varies from very low to high and unknown.

3.2.4 Grazing and Rangeland

The grazing and rangeland study area is a 4,000-foot-wide corridor encompassing the Proposed Action and Action Alternatives. There are five available BLM grazing allotments in the study area, all of them in Arizona. Four additional allotments present in the study area have been made unavailable by land use planning decisions. There are also a number of parcels administered by the ASLD and leased for multiple purposes, including grazing. The BLM also manages portions

of its land as wild horse and burro (WHB) herd areas and herd management areas (HMAs) under the Wild Free-roaming Horses and Burros Act of 1971; the Cibola-Trigo HMA overlaps the study area.

3.2.5 Special Designations, Management Allocations, and Wilderness Resources

The special designations, management allocations, and wilderness resources study area includes a 4,000-foot-wide corridor encompassing the Proposed Action and Action Alternatives. Specially designated areas are those lands that are managed for specific conservation, preservation, or recreational uses, and are typically public lands managed by a governmental entity. Wilderness Areas (WAs), Wildlife Habitat Management Areas (WHMAs), and lands with wilderness characteristics are the types of federal specially designated areas, management allocations, or wilderness resources found in the special designations, management allocations, and wilderness resources study area. Development Focus Areas (DFAs) are a management allocation in California that identifies areas for renewable energy development.

3.2.5.1 Wilderness Areas

There are three designated WAs (Figures 3.2-2a through 3.2-2c, Appendix 7) within the study area: Big Horn Mountains; Kofa; and Eagletail Mountains. A fourth WA (New Water Mountains) is outside of the study area but adjacent to the Kofa WA.

3.2.5.2 Wildlife Habitat Management Areas

WHMAs have been established in the study area for habitat type (i.e., riparian) and for specific species (i.e., Sonoran desert tortoise, Sonoran pronghorn, and bighorn sheep). Designated WHMAs in the study area include the Colorado and Gila River Riparian Area, Desert Mountains, Palomas Plain, the Wildlife Movement Corridor, and the Lake Havasu Field Office WHMAs (Figures 3.2-2a through 3.2-2c, Appendix 7).

3.2.5.3 Lands with Wilderness Characteristics

Lands with wilderness characteristics is not a special or administrative designation but rather a description of areas that have been inventoried and identified as possessing wilderness characteristics. Lands with wilderness characteristics are generally roadless BLM-administered public land areas greater than 5,000 acres (or less if they adjoin a designated WA or a Wilderness Study Area) that have maintained their natural character and are primarily undeveloped; they have the presence of wilderness character. Additionally, they may provide outstanding opportunities for solitude and for primitive and unconfined recreation. After an evaluation of the study area for potential lands with wilderness characteristics, six polygons were identified that have wilderness characteristics (Figure 3.2-3, Appendix 7). All of these areas are within the BLM Yuma Field Office, and none of them have been identified in the Yuma RMP to be managed to maintain wilderness characteristics.

3.2.5.4 Development Focus Areas

The DRECP land use plan amendment (LUPA) included land use allocations that supported the DRECP's overall renewable energy and conservation goals, as well as measures designed to protect other values and uses of the public lands. One key allocation is that DFAs are public lands that are available for solar, wind, and geothermal development and ancillary facilities (Figure 3.2-2c, Appendix 7). Applications benefit from a streamlined permitting process with predictable survey requirements and simplified mitigation measures.

3.2.6 Noise

The noise study area includes a 4,000-foot-wide corridor encompassing the Proposed Action and Action Alternatives. Existing noise sources in the study area include highways, roadways, OHV use, agricultural activities, population centers, and natural noise-producing sources such as wind, insects, and other animals. Another low-level source of noise is from existing transmission lines that emit corona noise under certain atmospheric conditions. Corona is an electrical discharge associated with transmission lines produced by the ionization of fluid (most often humidity in the air) surrounding an electrically charged conductor. Corona is not a steady source of noise; rather, it varies with humidity conditions. Based on the rural nature of most of the study area, proximity to major surface transportation corridors and population density, existing noise levels are very low in the noise study area, although areas in and around Blythe are projected to have slightly higher noise levels.

A noise-sensitive receptor is defined as a single home, mobile home, or building that could include a nursing home, church, hospital, school, or day care center. Residents or users of those buildings are not counted individually as receptors. Most of the noise-sensitive receptors in the study area are residential, which includes long term visitor areas (LTVAs) or mobile home parks. Noise-sensitive receptors were identified within the study areas encompassing the Proposed Action and Action Alternatives; they are located in and around the Town of Quartzsite, including the La Posa LTVA, and the City of Blythe.

3.2.7 Hazards and Hazardous Materials

The hazardous materials study area is defined as a 1-mile-wide corridor encompassing the Proposed Action and Action Alternatives, which encompasses the extent of potential new Project-related access roads and any other construction-related disturbance areas. The Proposed Action and Action Alternatives would traverse lands classified under a variety of land uses, including open space, recreation and preserve, agricultural, commercial, military, and rural and suburban residential uses. Current or historical land use activities provide indicators of potential hazardous materials use and storage. Agricultural lands, both active and inactive, are within and adjacent to the Proposed Action and Action Alternatives. There is potential for encountering contaminated soils in these areas based on the storage, transport, and use of pesticides and herbicides in the study area. Identified sites of potential environmental and human health concerns due to the possible presence of hazardous materials or waste include utility infrastructure, aboveground storage tanks and underground storage tanks, historical mining sites, past and present agricultural use, and industrial/commercial facilities known to store, generate, transport, or dispose of hazardous materials. Generally, the number of identified sites of concern

increases in the area of Blythe because of agricultural operations using pesticides, herbicides, and fuels used for aircraft, industrial equipment, and vehicles.

3.2.8 Public Health and Safety

The study area for general public health and safety is a 4,000-foot-wide corridor encompassing the Proposed Action and Action Alternatives, which is sufficient to capture the potential health and safety issues that may come into play due to the Project. The study area for the assessment of fire and fuels management includes areas within 1 mile of the Proposed Action and Action Alternatives. The study area for the assessment of electromagnetic fields (EMF) is based on an analysis of electric and magnetic field strengths at the center and at the edge of the proposed 200-foot-wide ROW as well as an area extending 100 feet on each side of the ROW. In relation to public health and safety, a sensitive receptor is defined as a single home, mobile home, or building that could include a nursing home, hospital, or daycare center, as well as schools and churches. No sensitive receptors were identified for most of the study area, except around Quartzsite and west of the Colorado River in California. Public health and safety hazards related to the Project include fire, EMF, radio interference with military operations, and dust-related illness (i.e., valley fever [*coccidioidomycosis*]).

The risk of wildland fire is related to weather conditions, potential fire ignition sources, the presence and condition of fuels (vegetation), and associated fire regimes. Fire management and protection responsibility in and near the study area is assigned to Federal, tribal (on Federal and tribal land), state (on state and most unincorporated county land), or local jurisdiction.

Extremely low frequency EMF is the type associated with transmission lines. Extremely low frequency EMF are invisible lines of force that surround electrical equipment, power cords, wires that carry electricity, and outdoor power lines. Electric and magnetic fields can occur together or separately and are a function of voltage and current. On a daily basis people around the world are exposed to extremely low frequency EMF as a result of using electricity.

Noticeable radio and TV interference may occur in close proximity to an AC transmission line due to corona or gap discharges. This interference is typically limited to AM radio and analog TV. FM radio frequencies and cable TV are not sensitive to transmission line interference (Radio Noise Subcommittee 1971).

Intentional destructive acts include acts of sabotage, terrorism, vandalism, and theft that sometimes occur at power facilities, including transmission lines and substations; these acts have the potential to create health and safety hazards. Vandalism and thefts are the most common intentional destructive act, especially theft of metal and other materials that can be sold when the price of construction materials is high on the salvage market. The majority of the study area is within sparsely populated rural or undeveloped terrain with the most common adjacent developed areas or infrastructure limited to transportation and utility infrastructure.

Valley fever is a naturally occurring potential public health hazard in the study area. Valley fever spores survive in soils in many parts of Arizona and California.

3.2.9 Traffic and Transportation

The traffic and transportation study area includes a 5-mile buffer on either side of the Proposed Action and Action Alternative segments to create a 10-mile-wide corridor, which allows for the identification of roadways and facilities that could potentially be affected by the Project from the perspective of traffic and roadway operations and provides some flexibility of Project routing and design. There are no active railroad facilities within the study area, but there are many roads of various types. The roadway network in the study area includes I-10, US 95, US 60, SR 95, SR 78, Business Route 10, roads and streets in the Town of Quartzsite and the City of Blythe, utility/recreation access roads, and various local roads and dirt trails on BLM-administered land and private property. I-10 extends from Tonopah, Arizona, on the eastern end of the study area through Quartzsite and across the Colorado River through Blythe, California, to the Colorado River Substation at the western end of the study area; it is the major freight facility in the area. US 95 and SR 95 travel north-to-south through the study area, crossing through the Town of Quartzsite. SR 78 travels north-to-south through Blythe. Business Route 10 travels east to west through the study area in Quartzsite parallel to and on the north side of I-10. Much of the study area is characterized by rural and uninhabited areas served by maintained local roads, most of which are lightly traveled one- or two-lane gravel or dirt roads. These roads have various types of vehicle usage, levels of service, and traffic counts.

Most of the aviation facilities within the study area are used for general aviation and non-primary commercial service airports. Requirements for vertical and horizontal clearances for runways at public airports vary by airport class and physical characteristics, which in turn control the setback distance of transmission line structures that the FAA requires. The Blythe Airport is the only public airport in the study area and there are plans for its northward expansion. There are also several privately-owned airports, airstrips, and airfields in the study area; these are regulated differently than public airports.

The AGFD utilizes helicopters and fixed-wing aircraft to conduct aerial wildlife surveys in the Plomosa and Dome Rock Mountains. Also, the YPG has restricted portions of airspace in the study area for training flights in low-altitude conditions, which are conducted along military training routes (MTRs). One of these generally parallels the entire Project Area, while others cross it (Figure 3.2-4, Appendix 7).

3.2.10 Water Resources

The water resources study area includes a 4,000-foot-wide corridor encompassing the Proposed Action and Action Alternative segments. There is one perennial surface water (the Colorado River, Figure 1-1) and numerous ephemeral washes, canals (including the CAP canal, Appendix 7 Figure 2.2-24), irrigation ditches, stock ponds, wetlands, floodplains, groundwater basins, wells, springs, and water rights in the study area. Waters used by wildlife are presented on Figure 3.4-3 (Appendix 7). Except for the Colorado River, channels are generally dry for long periods of time; streamflow results from high-intensity, short duration summer thunderstorms and during less intense, longer duration winter storms; and runoff is typically erratic and sediment-laden; in addition, springs are few and limited in extent; and wetlands and shallow groundwater are localized.

3.3 SOIL RESOURCES

3.3.1 Study Area

The study area for soils is a 2-mile wide corridor encompassing the Proposed Action and Action Alternatives. Sources of data and inventory methods are provided in the Geology, Mineral Resources, Soils, and Paleontology Baseline Technical Report (HDR 2017b).

3.3.2 Existing Conditions

3.3.2.1 Soils

The soils in the study area are associated with a variety of climates, vegetative cover, topography, and geology (BLM 2008a). Their properties vary depending on environmental conditions, but area soils were typically developed under hot, dry conditions characterized as having thermic or hyperthermic temperature regimes and arid or semi-arid moisture regimes.

The Natural Resource Conservation Service (NRCS) develops and maintains several soil geographic databases. The relatively general State Soil Geographic Data Base (STATSGO) data is being used in this EIS, and where available, the more detailed Soil Survey Geographic Data Base (SSURGO) data is also used. STATSGO soil associations within the study area (Figure 3-1; Table 3.3-1 in Appendix 3) are generally characterized as having moderate to severe water erosion potential and slight to high wind erosion potential.

Sensitive soils in the study area include desert pavement, biological soil crusts, calcareous soils, and wetland soils (BLM 2008a). Sand dunes are mapped along the western end of the study area near the Colorado River Substation and are described further under the active windblown sand, dunes, and sand transport corridors subheading, below. Wetland soils in the study area are limited to only small areas along the Colorado River and across several low-lying basins associated with agricultural fields near the towns of Tonopah and Blythe. Similarly, alluvial soils can be found in the alluvial bottom lands associated with rivers and ephemeral drainage channels.

3.3.2.2 Segment-Specific Soil Conditions

Figure 3-1 maps the STATSGO soils described below, by Proposed Action and Action Alternative segments. Additional details are provided in Appendix 3, Table 3.3-1.

Figure 3-1
Ten West Link
STATSGO Mapped Soils in the Study Area

Proposed Action Route Segments p-01 through p-06

Two of the eight STATSGO soil associations (Ligurta-Gunsight-Cristobal, Schenco-Rock outcrop-Laposa) mapped along Segments p-01 through p-06 include deep, well drained to somewhat excessively drained, soils. Generally, the soils are on fan terraces, stream terraces, floodplains, mountains, and hills.

Several other soil associations (Hyder-Coolidge-Cipriano-Cherioni, Momoli-Denure-Carrizo, Pahaka-Estrella-Antho, Valencia-Estrella-Cuerda, Rock outcrop-Quilotosa-Hyder-Gachado, Rock outcrop-Lehmans-Gran) include very shallow and shallow to moderately deep, well drained to somewhat excessively drained soils formed in slope alluvium from schist, granite, gneiss, rhyolite, and eolian deposits. The soils are on hill slopes, hills, and mountains. The remaining soil association (Rillito-Gunsight-Denure-Chuckwalla) is also very shallow and shallow, well drained soils formed in slope alluvium-colluvium from volcanic rock, generally located on pediments, hill slopes, and mountain slopes.

Of these soil associations, the Momoli-Denure-Carrizo, Valencia-Estrella-Cuerda, and Rillito-Gunsight-Denure-Chuckwalla have a moderate susceptibility to wind erosion.

Alternative Segments d-01, i-01 through i-04, in-01, and x-01 through x-04

The STATSGO soils mapped along the above-noted Action Alternative segments are the same as the Proposed Action Segments p-01 through p-06.

Proposed Action Route Segments p-07 and p-08

The STATSGO soils (Ligurta-Gunsight-Cristobal) mapped for Segments p-07 and p-08 consist of very deep, well drained to somewhat excessively drained, strongly saline soils that formed in fan alluvium weathered from a wide variety of rocks. The soils are on fan terraces or stream terraces. Susceptibility to wind erosion is low to moderate.

Alternative Segments qn-01 and qn-02, qs-01 and qs-02, i-05, x-05, x-06 and x-07

Two STATSGO soils (Ligurta-Gunsight-Cristobal and Schenco-Rock outcrop-Laposa) are mapped for these segments. The Ligurta-Gunsight-Cristobal association is very deep, well drained to somewhat excessively drained, strongly saline soils that formed in fan alluvium weathered from a wide variety of rocks. The soils are on fan terraces or stream terraces. The Schenco-Rock outcrop-Laposa consists of very shallow and shallow to moderately deep, well drained to somewhat excessively drained soils formed in slope alluvium from schist, granite, gneiss, rhyolite, and aeolian deposits. The soils are on hill slopes, hills, and mountains. Susceptibility to wind erosion is low. In addition, Rock outcrop-Lehmans-Gran is mapped along Segment x-05 and consists of very shallow and shallow, well drained soils formed in slope alluvium-colluvium from volcanic rock. The soils are on pediments, hill slopes, and mountain slopes. Of these soils associations, none have a high susceptibility to wind erosion.

Proposed Action Segments p-09 through p-14

Two STATSGO soil associations (Ligurta-Gunsight-Cristobal and Schenco-Rock outcrop-Laposa) are mapped for Segments p-09 through p-14. The Ligurta-Gunsight-Cristobal association is very deep, well drained to somewhat excessively drained, strongly saline soils that formed in fan alluvium weathered from a wide variety of rocks. The soils are on fan terraces or stream terraces. The Schenco-Rock outcrop-Laposa consists of very shallow and shallow to moderately deep, well drained to somewhat excessively drained soils formed in slope alluvium from schist, granite, gneiss, rhyolite, and aeolian deposits. The soils are on hill slopes, hills, and mountains. These soil associations have a low to moderate susceptibility to wind erosion.

Alternative Segments cb-01 through cb-06, i-06, i-07, i-08s, and x-08

The STATSGO soil associations mapped for the Action Alternative segments are the same as the Proposed Action route segments.

Proposed Action Segments p-15e through p-18

Five of the STATSGO soil associations (Rositas-Ripley-Indio-Gilman, Rositas-Orita-Carrizo-Aco, Rillito-Gunsight, Rositas-Dune land-Carsitas, and Ligurta-Gunsight-Cristobal) mapped along Segments p-15e through p-18 generally include very deep, well, or moderately well to excessively drained soils that formed in stratified stream alluvium, alluvium from mixed rock sources, or from sandy aeolian material. The soils are on floodplains and alluvial fans, fan remnants and terraces, lacustrine basins, floodplains, dunes or sand sheets. The Vaiva-Quilotosa-Huder-Cipriano-Cherioni soil association consists of very shallow and shallow, well drained to somewhat excessively drained soils formed in slope alluvium from granite and gneiss, and alluvium from rhyolite and related volcanic rocks. The soils are on hills and mountains, or fan terraces.

Of these soil associations, Rositas-Ripley-Indio-Gilman, Rositas-Orita-Carrizo-Aco, and Rositas-Dune land-Carsitas have a high susceptibility to wind erosion.

Alternative Segments ca-01, ca-02, ca-04 through ca-07, ca-09, cb-10, i-08s, x-09 through x-16, and x-19

The Rositas-Ripley-Indio-Gilman, Rositas-Orita-Carrizo-Aco, Rositas-Dune land-Carsitas, and Ligurta-Gunsight-Cristobal STATSGO soil associations mapped along the segments listed above generally consist of very deep, well, or moderately well to excessively drained soils that formed in stratified stream alluvium, alluvium from mixed rock sources or from sandy aeolian material. The soils are on floodplains and alluvial fans, fan remnants and terraces, lacustrine basins, floodplains, dunes or sand sheets, and valley fills. Other soils (Vaiva-Quilotosa-Huder-Cipriano-Cherioni) consist of very shallow and shallow, well drained to somewhat excessively drained soils formed in slope alluvium from granite and gneiss, and alluvium from rhyolite and related volcanic rocks. The soils are on hills and mountains, or fan terraces.

Of these soil associations, Rositas-Ripley-Indio-Gilman, Rositas-Orita-Carrizo-Aco, and Rositas-Dune land-Carsitas have a high susceptibility to wind erosion.

Active Windblown Sand, Dunes, and Sand Transport Corridors

The Chuckwalla Valley of the Mojave Desert, located along I-10 between Blythe and Desert Center, contains several sand transport corridors. This valley supports sand dune habitats that depend upon delivery of fine sand from aeolian (wind-driven) and fluvial (river-driven) processes. These sand dunes have an active layer of mobile sand and exist in a state of dynamic equilibrium as they continuously lose sand downwind and gain sand upwind. Dunes move within sand transport corridors, as wind direction and other factors change. Active sand dunes also provide important habitat for species that rely on regular supply of wind-blown sand (BLM 2015a).

The DRECP (BLM 2015a) identifies the entire western portion of the Project Area on BLM-administered land west of Blythe as dune systems and aeolian sand transport corridors. Figure 3-2 identifies the areas of active windblown sand as Qe and Qe/Qal. Sand transport corridors and sand dunes move over time (Philip Williams & Associates [PWA] 2011), so the figure is approximate. PWA (2011) concludes that sand transport corridors and areas of active windblown sand, such as the one just north of the Colorado River Substation, are sensitive to development.

3.4 BIOLOGICAL RESOURCES

3.4.1 Study Area

The biological study area includes a corridor 2 miles to each side of the Proposed Action and Action Alternative Segments (a 4-mile wide corridor). This biological study area was selected to identify biological resources that could be directly affected by the transmission line (for example, by ground disturbance and the presence of workers) or that could be indirectly affected by noise or other stressors.

3.4.2 Existing Conditions

3.4.2.1 Vegetation Resources, Including Special Status Plants, and Noxious and Invasive Weeds

Introduction

The study area is in the northern part of the Sonoran Biogeographical Province (Brown et al. 1988; Lowe and Brown 1994; Weinstein et al. 2003). Vegetation typical of the Sonoran Desert is present there from about 100 to 4,000 feet in elevation (Lowe 1964; Turner and Brown 1994).

The Sonoran Desert has a bimodal rainfall pattern, with rain from frontal systems occurring in the late fall and winter, and convection systems causing thunderstorms during the summer. Average annual rainfall across the Project Area is generally less than 5 inches. Average monthly temperatures range from a low of about 52 degrees Fahrenheit (°F) in December and January to a high of 93°F in July and August (ADWR 2009).

The vegetation associations and other land cover types along the Proposed Action and Action Alternative segments in Arizona are illustrated in Figure 3.4-1 (Appendix 7).

To describe patterns of vegetation distribution along Proposed Action route and Alternative Segments in California, a fine-scale map of vegetation alliances in portions of the Mojave and Sonoran deserts was used (Menke et al. 2013) (Figure 3.4-2, Appendix 7).

Vegetation Communities and Habitat Features

The entire Project Area is included within two subdivisions of the Sonoran Desert: Lower Colorado River Valley and Arizona Uplands, represented by various plant associations and habitat types (including physical features).

The Proposed Action and Action Alternative segments do not cross any BLM-designated Vegetation Habitat Management Areas or Areas of Critical Environmental Concern identified in an RMP (BLM 2010a, Figure 2-5; BLM 2010b; BLM 2012a; BLM 2007).

Sand dunes

The Colorado River Substation and the routes that approach the substation are in or near a series of sand sheets and dunes (Section 3.3.2) Recent research has posited that over the last several thousand years the dune system has become increasingly stable and in places, degrading (Kenney 2017). Dune vegetation can strongly influence sand transport by providing surface and subsurface roughness that helps to stabilize dunes. The dominant vegetation in these sand dunes includes creosote bush (*Larrea tridentata*.), white bursage (*Ambrosia dumosa*), brittlebush (*Encelia farinosa*), white ratany (*Krameria grayi*), cheesebush (*Hymenoclea salsola*), big galleta (*Pleuraphis rigida*), and birdcage evening primrose (*Oenothera deltoides*) (CPUC 2011, Section D.2.1 and Figure D-2; HDR 2017c). Sahara mustard (*Brassica tournefortii*) is a persistent, dominant non-native invasive weed. Numerous rare plants and animals, such as the plant Harwood's eriastrum (*Eriastrum hardwoodii*) and the Mojave fringe-toed lizard (*Uma scoparia*), are found on sand dunes.

Springs and other watering sites

Numerous wildlife species depend on maintained or natural water sources during dry periods, and vegetation is often more abundant and diverse along the outflows of springs. Figure 3.4-3 (Appendix 7) shows the location of wildlife waters in Arizona within the biological study area (AGFD 2016a). Table 3.4-1 in Appendix 3 lists the approximate distance from the route segments to wildlife waters that are within the 4-mile-wide (2 miles to each side of the corridor) biological study area. No wildlife waters are within the biological study area in California.

Special Status Plant Species

ESA Threatened, Endangered, and Proposed Plant Species

No plant species currently listed or proposed for listing under the ESA have been documented or would be expected to be present in the Project Area.

Aeolian System Map of Palo Verde Mesa

Other Special Status Plant Species – Arizona

The Arizona Department of Agriculture (ADA) maintains a list of plants protected under the Arizona Native Plant Law. That list includes four categories of protected plants: Highly Safeguarded, Salvage Restricted, Salvage Assessed, and Harvest Restricted. Highly Safeguarded plants include rare species; many of the species under other classifications are widespread throughout the Project Area. Seven plants classified as sensitive by the BLM are present in the BLM Yuma Planning Area and elsewhere in southwestern Arizona. The seven species listed are either unlikely or not expected to be present in the Project Area. Table 3.4-2 in Appendix 3 lists plants protected under the Arizona Native Plant Law and Arizona BLM Sensitive plants and their potential to be present in the Project Area.

Table 3.4-3 in Appendix 3 lists BLM Yuma Field Office priority plant species and the likelihood that they may be found in or near the Project Area. The majority of the route segments in Arizona are in the BLM Yuma Planning Area. Of the ten listed species, six are present in the Project Area.

Other Special Status Plant Species – California

In addition to BLM designated sensitive plant species (BLM 2015b), the BLM confers sensitive status on California State endangered, threatened, and candidate species, and rare plant species with a California Rare Plant Rank of 1B (rare, threatened, or endangered in California and elsewhere) that are on BLM-administered land or affected by BLM actions (LUPA).

Of the sixteen special status plant species identified in Table 3.4-4, Appendix 3, two have been found during surveys and an additional ten could be present in the Project Area or in the surrounding region. However, none of those species are classified as endangered, threatened, or rare by the California Fish and Game Commission (California Department of Fish and Wildlife [CDFW] 2016a, CDFW 2016b).

Noxious and Invasive Weeds

Invasive annual and perennial plant species have become widespread throughout the Sonoran Desert and are common in some parts of the biological study area. Common invasive plants found in the area include Mediterranean grass (*Schismus* spp.), cheatgrass (*Bromus tectorum*), buffelgrass (*Pennisetum ciliare*), red brome (*Bromus madritensis* spp. *rubens*), fountain grass (*Pennisetum alopecuroides*), wild oat (*Avena fatua*), prickly Russian thistle (*Salsola tragus*), and Sahara mustard (BLM 2002, 2006, 2008a; Weinstein et al. 2003; YPG 2017). BLM's Land Use Plan Amendments (BLM 2002 and 2008a) have identified salt cedar (*Tamarisk* sp.) as a pernicious and widespread invasive species in riparian areas. This nonnative tree is the dominant riparian plant species where route segments would cross the Colorado River.

The ADA (2005) and the California Department of Food and Agriculture (2016) maintain lists of noxious weeds in those states. The Arizona classification system for noxious weeds identifies the 14 species (Table 3.4-5, Appendix 3) on those lists that are known to be present in the BLM planning areas that are crossed by route segments.

Rare and Sensitive Vegetation Alliances

For California, the California Department of Fish and Wildlife (CDFW) has assigned state-level rarity rankings to many vegetation alliances that are dominated by native species (CDFW 2010). The DRECP classifies vegetation alliances (an alliance is defined by one or a group of diagnostic plant species) on BLM land with a state ranking of S1, S2, or S3 (critically imperiled, imperiled, and vulnerable, respectively) as rare vegetation alliances, and provides protection measures in the LUPA. CDFW rankings and DRECP classification of vegetation alliances show three rare plant alliances on the Palo Verde Mesa that are crossed by one or more route segments (Figure 3-3): *Pleuraphis rigida* (big galleta) Alliance (S2, imperiled); *Prosopis glandulosa* (honey mesquite) Alliance (S3, vulnerable); and *Pluchea sericea* (arrowweed) Alliance (S3, vulnerable). The *Prosopis glandulosa* (honey mesquite) Alliance, *Pluchea sericea* (arrowweed) Alliance, *Parkinsonia florida–Olneya tesota* (blue paloverde-ironwood) Alliance (S3, vulnerable but not rare), and *Suaeda moquinii* (bush seepwood) Alliance (S3, vulnerable but not rare) are also crossed by one or more route segments and are included in the semi-desert wash woodland riparian vegetation type, often referred to as microphyll woodlands. These rare vegetation alliances and dry desert wash woodland communities are considered sensitive in the California BLM planning area (BLM 2015a). Appendix 3, Table 3.4-6 identifies the Project segments and distance, in miles, of intersection for rare vegetation alliances on the Palo Verde Mesa.

Palo Verde Mesa

West of the agricultural fields, the route segments cross areas with very sandy soil on Palo Verde Mesa to reach the Colorado River Substation. The amount of sand in the soil increases, and the stability of the soil surface decreases from east to west. Segments ca-07, ca-09, and x-19 cross an area of active windblown sand deposition where Harwood's eriastrum appears to be present in relatively high numbers; Segments p-17 and p-18 cross sparse stands of creosote and white bursage (*Larrea tridentata* and *Larrea tridentata–Ambrosia dumosa* Alliances) and a small number of protected washes with blue paloverde, mesquite, smoketree (*Psorothamnus spinosus*), and ironwood. The north-to-south-oriented Segments x-15 and x-16 and the west end of Segment ca-02 along the eastern edge of the Palo Verde Mesa cross a band of vegetation dominated by big galleta (*Pleuraphis rigida* Alliance), classified as imperiled and protected under the LUPA. Segments p-17 and p-18 do not cross soils classified as having active aeolian deposits, although a small area of active deposition is adjacent to Segment p-17, and dune obligate species have been recorded along a portion of Segment p-18.

On the Palo Verde Mesa, segments cross vegetation alliances within vegetation types that have a state ranking of S2 or S3 (imperiled or vulnerable) (Figure 3-3). In addition, the semi-desert wash woodland vegetation type is considered sensitive by BLM (BLM 2002). The *Parkinsonia florida–Olneya tesota* Alliance (blue palo verde–ironwood woodland) and *Prosopis glandulosa* Alliance (mesquite bosque, mesquite thicket) are both included in the Coloradan semi-desert wash woodland/scrub vegetation type and have a state ranking of 3.2 (vulnerable). Specifically, Segments p-17 and p-18 cross 0.3-mile of these washes. Segment ca-02 crosses 0.1-mile of narrow bands of mesquite near the western edge of cultivated lands at the edge of the Palo Verde Mesa.

Figure 3-3
Ten West Link
Palo Verde Mesa
Vegetation Alliances

Sahara mustard, an invasive plant species, is scattered about the Palo Verde Mesa and is locally abundant in the more-sandy areas. No ESA-listed plant species, or plant species classified as endangered, threatened, or rare by the CDFW (2016c) in California. Harwood's eriastrum, a BLM sensitive species, and Harwood's milkvetch (*Astragalus insularis* var. *harwoodii*), a California Native Plant Society (CNPS) rare plant, are most common on dunes and other areas with loose sandy soils, and either one or both species have been documented within Segments ca-07, ca-09, p-16, p-17 p-18, x-16, and x-19, especially in areas that include active windblown sand deposits (Figure 3-2 and Figure 3-4).

Two special status plants with a CNPS rare plant ranking of 1 or 2 have been found along segments on the Palo Verde Mesa. Harwood's eriastrum and Harwood's milkvetch, considered rare by the CNPS but not a BLM sensitive species, occur in sand dunes and other sandy soils (BLM 2012b, Appendix G; BLM and Riverside County Planning Department 2015, Appendix C1; Power Engineers 2012). Surveys of Proposed Action route segments in 2016 did not locate these species (HDR 2016a), but in 2017, a total of 2,975 Harwood's milkvetch plants and 94 Harwood's eriastrum plants were recorded during surveys of route segments on the Palo Verde Mesa. Figure 3-4 shows where rare plants were located during 2017 surveys (Transcon Environmental 2017); these surveys were restricted to a 200-foot-wide corridor centered on route segments. Both of these species are herbaceous annuals with highly variable year to year germination rates, generally dependent on rainfall; winter precipitation in 2016/2017 was well above average resulting in ideal conditions for surveys conducted in spring 2017 (Transcon Environmental 2017). Plant locations may shift among years reflecting scattered rainfall events and shifting sand dune habitat. Other projects have previously documented 3,402 Harwood's eriastrum plants from deep sandy soils on the Palo Verde Mesa, and over 25,000 Harwood's milkvetch plants (Ironwood Consulting Inc. 2016).

Harwood's eriastrum has special management requirements. A habitat model for this species was developed as part of the DRECP (BLM 2016c), and much of the Palo Verde Mesa is included as suitable for the species (Figure 3-5). However, the DRECP model is based on general habitat conditions and includes areas where the plant is not expected to be found. When known locations of Harwood's eriastrum on the Palo Verde Mesa from California Natural Diversity Database (CNDDB) and occurrences documented by Project surveys are plotted with the California Geologic Survey surficial geology map (Figure 3-2), there is a close correlation with active wind-blown sand deposits. But some locations do not fall within the mapped dune system, perhaps reflecting the dynamics of sand sediment and the patchy nature of these habitats not evident due to the mapping scale. In an effort to more accurately map suitable Harwood's eriastrum habitat on the Palo Verde Mesa, the locations from the CNDDB of Mojave fringe-toed lizards, another sand dune obligate species, was plotted with the plant occurrences and surficial geological data. These data tended to cluster observations and polygons of presumed suitable Harwood's eriastrum habitat (Figure 3-5). This map was used to calculate the linear distance of potentially suitable Harwood's eriastrum habitat that would be crossed by each route segment on the Palo Verde Mesa (Table 3.4-7 in Appendix 3).

3.4.2.2 Wildlife, Including Special Status Wildlife and Migratory Birds

Wildlife in the Arizona portions of the Project Area is generally similar to wildlife in the California portion of the biological study area.

Amphibians and Reptiles

More than 40 species of reptiles are present in southwestern Arizona. Lizards and snakes are common, and some of the more common and widespread species are desert iguana (*Dipsosaurus dorsalis*), western whiptail (*Aspidoscelis tigris*), Great Basin collared lizard (*Crotaphytus bicinctores*), long-nosed leopard lizard (*Gambelia wislizenii*), zebra-tailed lizard (*Callisaurus draconoides*), desert spiny lizard (*Sceloporus magister*), desert horned lizard (*Phrynosoma platyrhinos*), common side-blotched lizard (*Uta stansburiana*), coachwhip snake (*Masticophis flagellum*), gopher snake (*Pituophis catenifer*), common kingsnake (*Lampropeltis getula*), western diamondback rattlesnake (*Crotalus atrox*), and Mojave rattlesnake (*Crotalus scutulatus*). Sonoran desert tortoises (*Gopherus morafkai*) are found primarily on rocky slopes and upper bajadas in the Arizona Upland subdivision, and the nonnative spiny softshell turtles (*Apalone spinifera*) are found in the Colorado River.

Couch's spadefoot toad (*Scaphiopus couchii*) is found in uplands throughout much of the Project Area and generally is active after summer rains. Other amphibians, such as the Sonoran desert toad (*Incilius alvarius*), Woodhouse's toad (*Anaxyrus woodhousii*), and red-spotted toad (*Anaxyrus punctatus*) are more common near water sources.

Birds

More than 350 species of birds have been documented in southwestern Arizona (BLM 2006, 2008a; YPG 2017). Most of those species are protected under the Migratory Bird Treaty Act (MBTA). Many species of raptors are known to nest in the region, as well as several wintering migrant raptor species (BLM 2008c; YPG 2017). There are three major habitats for the conservation of birds that are present in or near the Project Area: Sonoran desertscrub, low-elevation riparian habitat (including xeroriparian washes), and freshwater marshes. Sonoran desertscrub and xeroriparian washes are found throughout the Project Area; riparian habitat and freshwater marshes are present only along the Colorado River.

Mammals

More than 60 mammalian species are present in southwestern Arizona (BLM 2008a). Desert bighorn sheep are present in Arizona in mountain ranges throughout the region, including the Saddle, Big Horn, Eagletail, Little Harquahala, Plomosa, New Water, and Dome Rock Mountains (AGFD 2016a; BLM 2008a, 2008b, 2011). Bighorn sheep depend on and are found near permanent water during dry and hot months. There are numerous water sources within the biological study area (Figure 3.4-3, Appendix 7) within or near habitat for bighorn sheep (AGFD 2016a). Lambing occurs year-round but peaks in January through April (BLM 2002, 2008a). Important lambing areas in the region include rugged and isolated areas in the Plomosa Mountains, Livingston Hills, and New Water Mountains, within the Kofa NWR, and in the Dome Rock Mountains in the area surrounding Copper Bottom Pass (BLM 2008a; USFWS 1996; Weinstein et al. 2003). No known bat roosts or abandoned mines occur within Project's segments; however, bats may use nearby cliffs and crevices for roosting.

Figure 3-5
Ten West Link
Presumed Harwood's Eriastrum Habitat

Segments p-01 and p-04 cross an area near habitat for desert bighorn sheep in the Big Horn and Eagletail mountains, and Segment d-01 passes near bighorn habitat in the Eagletail Mountains. Segment p-01 also crosses an important wildlife dispersal corridor south of the Big Horn Mountains.

Segment p-06 crosses through and is near an extensive area of habitat for desert bighorn sheep in the Livingston Hills and New Water Mountains on the Kofa NWR, as well as crossing through a wildlife dispersal corridor in the northwestern corner of the refuge. Segments in-01 and i-04 cross desert bighorn sheep habitat and a dispersal corridor along I-10 through the Plomosa Mountains. Segment x-05 also crosses a dispersal corridor through the La Posa Plain between the New Water and Dome Rock mountains.

The following route segments cross important dispersal corridors for desert bighorn sheep and are important linkages among blocks of undisturbed wildlife habitat in the region (AGFD 2016a; BLM 2008a, 2008b; Weinstein et al. 2003):

- Segments i-01 and i-04 are located along I-10 through the Plomosa Mountains;
- Segment i-07 along I-10 through the Dome Rock Mountains;
- Segment p-01 between Burnt Mountain and Saddle Mountain to the south and the Big Horn Mountains to the north;
- Segment p-06 through Livingston Hills and the New Water Mountains in the northwestern corner of Kofa National Wildlife Refuge; and
- Segment x-05 through the La Posa Plain between the New Water and Dome Rock mountains.

Special Status Wildlife Species

ESA Threatened, Endangered, and Proposed Wildlife Species

Seven threatened and endangered species were identified that are known to be present or that could be present in or near the Project Area (Table 3.4-8 in Appendix 3**)**. All species protected under the Federal ESA are classified as special status species by the BLM.

Sonoran pronghorn occupy desert plains and bajadas, and occasionally rocky hills and mountainous habitats. These animals are nomadic and require large expanses of land to survive as localized droughts are frequent and summer rains are sporadic. They must be able to move across the landscape during all seasons to locate areas with sufficient food and water. Sonoran pronghorn are very wary, capable of seeing long distances across the open desert, and flee the area when disturbed.

Sonoran pronghorn are classified as endangered, and a nonessential experimental population has been established to reintroduce this subspecies in the Kofa NWR and a large surrounding area (USFWS 2011). When evaluating the effects of Federal actions as required under Section 7 of the ESA, Federal agencies must treat nonessential experimental populations on national wildlife refuges or units of the National Park Service (NPS) as they would treat threatened species, and as a proposed species elsewhere. The route segments in Arizona south of I-10 are within that

designated nonessential experimental population area. The Sonoran pronghorn is classified as a Species of Great Conservation Need (SGCN) in Arizona.

A nonessential experimental population of Sonoran pronghorn (endangered) is being established in King Valley on the Kofa NWR. About 70 Sonoran pronghorn were released into King Valley on the Kofa NWR from 2013 through January 2016. Most of those animals have remained in that valley on the Kofa NWR and the YPG, more than 10 miles south of the route segments. About ten individuals have been found outside of the Kofa NWR west of US 95, and a small number of other individuals have moved outside of the Kofa NWR and into or through the Palomas Plain, the southern Ranegras Plain, and north of and near the Little Horn and Eagletail mountains (AGFD 2014, 2015, 2016b).

Potential route segments in the eastern portion of the study area south of I-10 are within the experimental nonessential population area established for the Sonoran pronghorn. Though reintroductions are occurring in the King Valley on the Kofa NWR and most animals remain many miles from Project segments, some animals have moved long distances, possibly as far as the Harquahala Plain, and have repeatedly been documented within portions of the proposed ROW (USFWS 2017). As the number of animals increase through augmentation and reproduction, the range of the population would be expected to expand and perhaps regularly encounter portions of the Project.

On the Cabeza Prieta NWR and in Sonora, Mexico, Sonoran pronghorn are present in open valley bottoms during cool and wetter months and in areas closer to dense vegetative cover during summer. Little has been written about the habitat use and movements of Sonoran pronghorn in the introduced population on and near the Kofa NWR.

Three bird species, the western yellow-billed cuckoo (threatened), the southwestern willow flycatcher (endangered), and the Yuma Ridgway's rail (endangered), are known to be present around waterways in the western portion of the Project Area. There is no suitable nesting habitat for the western yellow-billed cuckoo or southwestern willow flycatcher in the Project Area, and only small stands of suitable nesting habitat (too small to provide nesting) for the Yuma Ridgway's rail is present. The razorback sucker fish (endangered) is now found in Lake Mohave, Lake Mead, and the mainstream river channel below Lake Havasu, including the section of the Colorado River to be crossed by the Project (LCRMSCP 2016). Hatchery reared bonytail chub (endangered) have been released into backwater channels near the Project crossing of the Colorado River.

The Mojave desert tortoise is known to be present on the Palo Verde Mesa around the Colorado River substation. Mojave desert tortoises occur on the Palo Verde Mesa west of the agricultural areas. Though the sandiest areas are typically not well suited to support Mojave desert tortoise burrows, sign of Mojave desert tortoises representing a low-density population have been found in the vicinity of the Colorado River Substation and elsewhere on the mesa. Habitat conditions tend to improve closer to the Mule Mountains, about 2 miles south of the substation.

Other Special Status Wildlife Species – Arizona

Tables 3.4-9 through 3.4-13 in Appendix 3 provides information on special status wildlife species (not including Federal ESA-listed species) that are present or could be present in and near the Project Area in Arizona.

Amphibians and Reptiles

Sonoran desert tortoises are found in southwestern Arizona, primarily in the Arizona Upland subdivision on rocky slopes, canyons, bajadas, and other rugged terrain. They are less common or absent from valley bottoms dominated by creosote-bursage. Sonoran desert tortoises are managed in accordance with the Candidate Conservation Agreement for the Sonoran Desert Tortoise in Arizona (USFWS 2015). Habitat for the Sonoran desert tortoise on land managed by the BLM has been mapped and classified into three categories (BLM 2008a, Map 3-11) (Figure 3-6):

- **Category 1**: Habitat area essential to maintenance of large, viable populations, where conflicts are resolvable; there are medium- to high-density or low-density populations contiguous with medium- or high-density populations and increasing, stable, or decreasing population.
- **Category 2**: Habitat area may be essential to maintenance of viable population, where most conflicts are resolvable; there are medium- to high-density or low-density populations contiguous with medium- or high-density populations and stable or decreasing population.
- **Category 3**: Habitat area not essential to maintenance of viable populations, where most conflicts are not resolvable; there are low- to medium-density populations not contiguous with medium- or high-density populations and stable or decreasing population.

The route segments located on land managed by the BLM do not cross any Category 1 Sonoran desert tortoise habitat.

The only Category 2 habitat crossed by the Project is in the Ranegras Plain and in the Plomosa Mountains just north of I-10. Route segments cross Category 3 habitat in the Harquahala Plain at the southern end of the Big Horn Mountains, in the Ranegras Plain at the southern end of the Little Harquahala Mountains, in the La Posa Plain west of Quartzsite, and throughout the Dome Rock Mountains. Route segments through the Kofa NWR cross good-quality Sonoran desert tortoise habitat in the New Water Mountains and Livingston Hills, but habitat on the refuge has not been classified based on BLM rankings. Segment p-06 crosses areas on the refuge that has a habitat potential index as high as 0.8 (Nussear et al. 2009) (Figure 3-6).

Birds

At least 36 special status bird species, in addition to the threatened and endangered birds could be present in or near the Project Area. Golden eagle nest locations are widely scattered across the region in Arizona (Figure 3.4-4, Appendix 7) and have been documented nesting in the New Water, Eagletail, and Plomosa mountains, and potential nest sites have been identified elsewhere near the Project Area (G. Ritter, AGFD, personal communication. February 10, 2016). No known nest sites are within 1 mile of Project segments; the entire study area is considered potential foraging habitat.

Mammals

There is a total of 21 special status mammal species present in or near the Project Area (Table 3.4-9, Appendix 3).

Other Special Status Wildlife Species – California

Special status wildlife species are listed at Tables 3.4-14 through 3.4-16 in Appendix 3 (not including Federal ESA-listed species) that are present or could be present in and near the Project Area in California.

The Mojave fringe-toed lizard, a BLM sensitive species and DRECP LUPA focus species, is only found in habitats with loose sand, and is considered common on the Palo Verde Mesa. The habitat model developed for the DRECP maps most of the Palo Verde Mesa as potentially suitable habitat for the Mojave fringe-toed lizard. However, the DRECP model is based on general habitat conditions and includes areas where the Mojave fringe-toed lizard is not expected to be found. To refine the model, documented occurrence records and habitat maps from the CNDDB were plotted with the California Geologic Survey surficial geology map (Figure 3-2) showing a close correlation with active wind-blown sand deposits. However, some locations do not fall within the mapped dune system, perhaps reflecting the dynamics of sand deposits and the patchy nature of these habitats not evident due to the mapping scale. In an effort to more accurately map suitable Mojave fringe-toed lizard habitat on the Palo Verde Mesa, the locations from the CNDDB of Harwood's eriastrum, another sand dune obligate species, was plotted with the Mojave fringe-toed lizard occurrences and surficial geology data. These data tended to cluster, and polygons of presumed suitable Mojave fringe-toed lizard habitat were mapped (Figure 3-7). This map was used to calculate the linear distance of potentially suitable Mojave fringe-toed lizard habitat that would be crossed by each route segment on the Palo Verde Mesa (Table 3.4-17 in Appendix 3).

Wildlife Corridors and Wildlife Management Areas

The length of wildlife corridors and Wildlife Habitat Management Areas (WHMAs) crossed by segments in the study area are listed in Table 3.4-18 in Appendix 3 and are shown on Figure 3.4-5 (Appendix 7).

3.5 CULTURAL RESOURCES

Cultural Resources are defined as including archaeological sites; historic buildings, structures, or places; and places of traditional cultural or religious significance.

Information contained in this section is largely summarized from Brodbeck et al. (2017).

3.5.1 Analysis Area

The analysis area for the Project consists of a 200-foot-wide corridor where direct and indirect effects to cultural resources may occur. Direct effects are defined by areas where ground disturbance would be required for Project construction, such as structure locations, access roads, lay down areas, and spur roads. Indirect effects, such as visual, auditory, or atmospheric changes, were also considered in the development of the cultural resources analysis area. The Area of Potential Effects (APE) under Section 106 differs from the cultural resources analysis area discussed in this FEIS.

Cultural resources site information collected and compiled for this Project by the Class I inventory are presented in two tiers: (1) an area measuring 1 mile (0.5 mile on either side of the centerline) encompassing the Proposed Action and Action Alternatives; and (2) a 200-foot-wide corridor (measuring 100 feet on either side of the centerline) encompassing the Proposed Action and Action Alternatives. This level of investigation was considered to provide the most useful quantification of existing cultural resources data for analyses.

The analysis area for indirect effects to known places of tribal concern includes 5 miles on either side of the Proposed Action and Action Alternative segments.

3.5.1.1 Class I Inventory

The Class I inventory includes the type, number, and NRHP status of previously recorded cultural resources; the presence of NRHP-listed historic properties; and areas of cultural significance to tribal communities with ties to the Project Area. The Class I inventory provides data on the nature and density of existing cultural resources so that likely effects of new ground disturbance can be evaluated as part of the basis for recommending further cultural resource work.

Cultural Resources Sensitivity Analysis

The Class I inventory data available for the California portion of the Project has been compiled into a sensitivity analysis (Kline 2017). The results of the sensitivity analysis are discussed in association with relevant Action Alternatives and subalternatives. The sensitivity analysis is a specific Project requirement for compliance with the CDCA Plan as amended (BLM 1980) and the DRECP PA (BLM 2016a). The sensitivity analysis is included in the Project record.

3.5.1.2 Indirect Effects Assessment Methodology

As a Federal agency, BLM is required to consider all effects of the Project to historic properties, including indirect auditory, atmospheric, and visual effects.

3.5.2 Existing Conditions

3.5.2.1 Cultural History

The cultural history is provided in Section 3.6.3.1 of the TES.

3.5.2.2 Project-Specific Conditions

A total of 919 cultural sites were identified by the Class I investigations (607 in Arizona and 312 in California). The NRHP status of these sites is detailed in Tables 3.5-1 and 3.5-2 in Appendix 3. Previously recorded prehistoric site types include artifact scatters of different compositions (lithics, ceramics, and groundstone), quarries, rock rings and alignments, cairns, hearths, milling stations, ceramic scatters/pot drops, intaglios, petroglyphs, and trails. Previously recorded historic sites include trash dumps/scatters, historic campsites, agricultural canals and drains, a check dam, roads, transmission lines, railroad grade, military sites, mine pits and waste piles, mining camps, and structural remnants.

The information on cultural resources provided for Segments cb-03, i-06, i-07, and x-08 does not include any potential cultural resources or project data from the CRIT. Tribal data is sensitive information and can only be accessed through the Tribe.

Proposed Action

A total of 66 NRHP-eligible or unevaluated sites have been previously recorded within the 200-foot analysis corridor of the Proposed Action. Sensitive sites known to occur in the study area include trails, intaglios, and prehistoric habitation sites with human remains. Segments p-17 and p-18 of the Proposed Action cross the eastern base of the Palo Verde Mesa, a culturally sensitive area (AECOM 2012). Known cultural features in this area include plants of medicinal value, seasonal cultural habitation sites, calcined bone consistent with cremated human remains, trails, and important natural resource collection areas (Bean and Vane 1978). Of particular importance are mineral sources and plants used for medicinal purposes and basketry.

Alternative 1

A total of 23 NRHP-eligible or unevaluated sites have been previously recorded within the 200-foot analysis corridor of Alternative 1. Sensitive sites known to occur in the study area include prehistoric trails and intaglios.

Alternative 2

A total of 50 NRHP-eligible or unevaluated sites have been previously recorded within the 200-foot analysis corridor of Alternative 2. Sensitive sites known to occur in the study area include prehistoric trails and intaglios.

Alternative 3

A total of 35 NRHP-eligible or unevaluated sites have been previously recorded within the 200-foot analysis corridor of Alternative 3. Sensitive sites known to occur in the study area include prehistoric trails.

Alternative 4

A total of 41 NRHP-eligible or unevaluated sites have been previously recorded within the 200-foot analysis corridor of Alternative 4. Sensitive sites known to occur in the study area include prehistoric trails.

Agency Preferred Alternative

A total of 49 NRHP-eligible or unevaluated sites have been previously recorded within the 200-foot analysis corridor of the Agency Preferred Alternative. Sensitive sites known to occur in the study area include prehistoric trails and intaglios.

Cultural Resources of Concern to Indian Tribes

Petroglyph sites are recorded along Segment i-06.

Site AZ-050-0764 is located within the 200-foot-wide corridor of Segment i-07. The site consists of an intaglio and has not been evaluated for NRHP significance.

Site AZ R:7:55(ASM)/Limekiln Wash Intaglio, is located within the 200-foot-wide corridor of Segment p-13. The site consists of an intaglio and has been determined eligible for inclusion in the NRHP.

An anthropomorphic intaglio present at site AZ-050-0822 is located within the 200-foot-wide corridor of Segment p-13. This site has not been evaluated for NRHP significance.

One site of particular concern along Segment p-17 is CA-RIV-1821 (also identified as CA-RIV-1821/H), which includes calcined bone consistent with cremated human remains. The site was originally recorded in 1980 by the BLM during the Southern California Edison Devers–Palo Verde cultural resources survey (Day et al. 1980) and was subsequently revisited and updated several times. Applied EarthWorks revisited the site in 2017 during the survey for this Project (Gardner et al. 2018). The boundaries of the site were expanded significantly to incorporate 18 smaller previously recorded cultural resources, including a continuous scatter of prehistoric and historic artifacts and numerous associated prehistoric and historic features. The calcined bone reported by previous researchers (Lerch et al. 2016; Way and Eckhardt 2004) was not identified by the Gardner et al. (2018) fieldwork.

Another cultural resource of special note near Segment p-17 is the Mule Tank Discontiguous Rock Art District, containing archaeological sites CA- RIV-504 and CA-RIV-773. The district is listed on the NRHP and is of known significance to Indian tribes. It is located outside the 1-mile-wide corridor but is close enough for consideration of potential indirect and cumulative effects.

Cultural Resources Sensitive to Indirect Effects

Specific cultural resources were identified as resources that the Project could potentially affect indirectly because of their sensitivity to visual changes.

On Segment p-06, the Indian Well Site, AZ-050-1445 consists of two groups of petroglyphs near a spring or seep. Petroglyph sites associated with natural water sources are typically places of

elevated cultural significance to Indian tribes. The other is an area of previously undocumented rock rings just west of site AZ-0502592.

The Eagletail Petroglyph Site, an NRHP-listed property, is located within the 5-mile indirect effects analysis area of Segment d-01 in the Eagletail Mountains. The site's NRHP eligibility and cultural significance to Indian tribes may include a visual component.

A recorded intaglio, site AZ-050-1887, is located within the 1-mile-wide corridor of Segment qn-02. The site has not been evaluated for NRHP eligibility.

Site AZ-050-1309 exhibits an intaglio, and prehistoric and historic petroglyphs. This site has been recommended eligible for inclusion in the NRHP and is within the 1-mile-wide corridor of Segment qs-02.

Petroglyph sites are recorded within the 1-mile-wide corridor of Segment i-08s.

Site AZ R:10:1(ASM)/Ripley Intaglio Site, is listed in the NRHP (#75000368; 11/20/1975). It is situated on the terraces overlooking the Colorado River on the Arizona side of the state line (Ezzo 1993; Holmlund 1993). In this zone, the site is located within the 5-mile indirect effects analysis area of Segment p-15e and includes a set of large anthropomorphic, geometric, and abstract figures etched into the desert surface.

Mule Tank Discontiguous Rock Art District, containing archaeological sites CA- RIV-504 and CA-RIV-773, is located in the northern Mule Mountains to the southwest of Segments p-17 and p-18. It consists of an archaeological district that is listed in the NRHP and is culturally significant for the Indian tribes along the Colorado River. The district includes a natural water catchment and was/is an important junction of indigenous travel routes and a focal point of human activity. Numerous trails extend away from this district and are related to the intaglios and petroglyphs.

Site CA-RIV-000661 is a multicomponent site that consists of a cobble rock alignment and possible intaglio. It is located within the 1-mile corridor of Segments ca-07 and ca-09. The status of the site's NRHP eligibility is unknown.

Site CA-RIV-000662 consists of a cobble rock alignment and possible intaglio. It is located within the 1-mile corridor of Segment ca-09 and has not been evaluated for NRHP eligibility.

One previously unrecorded cultural resource is the Salome Emergency Airfield along Segment x-03. Identified on historic aerials, the airfield was built by American Airlines as an emergency landing strip for its Phoenix-Los Angeles route sometime in the 1920s or early 1930s. The airfield is listed in the 1934 US Department of Commerce, Bureau of Air Commerce *Description of Airports and Landing Fields in the United States,* as an "American Airline Field, auxiliary." Such sites would be evaluated under historic contexts related to early air transportation.

Previously recorded cultural resources that contain prehistoric trail segments are located on Proposed Action Segments p-04, p-06, p-07, p-09, p-10, p-11, p-12, p-13, p-14, p-15e, and p-17, as well as Action Alternative Segments d-01, i-03, i-07, i-08s, qn-02, qs-01, cb-01, cb-02, cb-03, cb-05, cb-06, cb-10, x-02, x-04, x-05, x-06, x-07, x-08, x-15 and x-16.

3.6 CONCERNS OF INDIAN TRIBES

Government-to-government consultation with tribes, as well as Section 106 consultation with interested communities and parties is currently ongoing to identify properties of concern and other issues. The BLM, as the lead Federal agency, is conducting these consultation efforts.

3.6.1 Analysis Area

The analysis area for concerns of Indian tribes is the same as that described in Section 3.5.1.

3.6.2 Existing Conditions

The Project is within ancestral lands of Indian tribes, and tribal communities have maintained a spiritual stewardship and cultural connection to the landscape. The numerous natural and cultural resources in and around the Project Area contain cultural and spiritual significance for Indian tribes, and continues to play fundamental roles in cultural traditions, group identities, and ongoing religious and ceremonial traditions. Consultation and coordination with several of the tribes suggests that the Project Area is both a traditional cultural landscape and there may be traditional cultural properties (TCPs) present.

Information provided by tribes about areas of specific tribal concern has been and will continue to be identified during Section 106 and government-to-government consultation processes and considered during the evaluation and assessment of effects under Section 106 and NEPA. An ethnographic overview has been prepared to present baseline information on tribal cultural connections within the Project Area. As the Project develops, new cultural sites and places become known, and input from Indian tribes is gathered and integrated into Project planning; the resulting information has been and will continue to be incorporated into resource assessments.

Given the physical length of the Project, several Indian tribes with affiliation to the greater Project Area have been identified during the initial consultation process (Section 3.6.2.2).

3.6.2.1 Potential Resource Types of Cultural Significance

In addition to more traditionally defined sites that may be evaluated under the NRHP criteria for eligibility (Section 3.5), other types of cultural resources that may be of cultural and religious significance to Indian tribes within the Project Area are addressed and evaluated. Tribal cultural resources can include a site, feature, place, cultural landscape, sacred place, or an object of cultural value. The following cultural resources types are borrowed from AECOM's (2012) ethnographic assessment for the McCoy Solar Energy Project. Though cultural resources of these types may not qualify as eligible under the NRHP, or sometimes even as archaeological sites, certain types of cultural resources may still be considered significant. Such cultural resource types significant to Indian tribes include, but are not limited to:

A. *Traditional Origin and Mythological Places.* Such places are locations associated with beliefs concerning tribal origins and mythology or the nature of the world. Physical archaeological evidence may not exist at such locations and they may consist only of geographic features.

B. *Ceremonial Locations.* Ceremonial locations include places where religious practitioners go, either in the past or present, to perform ceremonial activities based on the traditions of the culture. Examples could include rock art sites, dance sites, hot springs, and places where objects have been ritually placed. These locations may or may not show evidence of archaeological use; and, even if archaeological remains are present, the function of the site may not be readily apparent.

C. *Historical Tribal Locations.* Historical tribal locations are places where an important historical event has occurred relating to particular Indian tribes. This category might include battle sites, sites associated with historic tribal members, or locations where treaties were negotiated.

D. *Ethnohistoric Habitation Sites.* These are habitation sites known to have been used by a particular tribe or culture. The location of such sites may be known through either written or oral histories. Most of these sites will likely contain archaeological evidence.

E. *Trails.* Trails, particularly those associated with migration or traded routes, are considered culturally significant by many Indian tribes. Trails represent links between various tribes and regions and may also lead to places of spiritual significance. The act of following a trail can be a spiritual journey in itself.

F. *Burial Sites.* Burial sites are culturally significant to Indian tribes. The exact locations of burial sites are not always known or divulged.

G. *Resource Collection Areas.* Resource collection areas include a wide variety of places from which plants, animals, minerals, and water are gathered for medicinal or other subsistence purposes. It is sometimes difficult to establish concise boundaries for these locations. Examples of resource collection areas include groves of ethnobotanically important plant materials, quarries, lakes, and springs.

Given the nature of cultural resources of these types, it can be concluded that not all of these sites are tangible or observable locations and, as such, may or may not be readily identifiable during an archaeological survey or meet NRHP eligibility. Nevertheless, such site types may be culturally significant to Indian tribes, regardless of NRHP eligibility, and therefore should be taken into consideration. Certain locations may only be known through oral traditions or recorded through ethnographic work.

3.6.2.2 Project-Specific Concerns of Indian Tribes

Based on communications with Indian tribal representatives from the CRIT, Quechan Tribe of the Fort Yuma Indian Reservation, Twenty-Nine Palms Band of Mission Indians, and the Gila River Indian Community, several issues of tribal concern were identified. These are not all inclusive, and other areas of tribal concerns may be identified during continued Section 106 consultation.

- Existing Access: Tribal representatives from the CRIT, Quechan Tribe of the Fort Yuma Indian Reservation, and the Twenty-Nine Palms Band of Mission Indians all expressed concerns regarding construction of the Project limiting existing access into areas of spiritual use, especially in the Mule Mountains.

- New Access: Tribal representatives from the CRIT, Quechan Tribe of the Fort Yuma Indian Reservation, and the Twenty-Nine Palms Band of Mission Indians all expressed concerns regarding construction of the Project providing new access into areas that were previously inaccessible. Concerns were expressed that new access routes would lead to increased OHV use and lead to the damage and vandalism of historic properties.
- Native Infrastructure and the Interconnection of the Cultural and Natural Environment: the CRIT, Quechan Tribe of the Fort Yuma Indian Reservation, the Torres Martinez Desert Cahuilla Indians, and Twenty-Nine Palms Band of Mission Indians all expressed concerns regarding the interconnectedness of cultural resource sites, natural features of the landscape, and prehistoric trail networks. Concern was expressed regarding the cumulative effects of projects erasing the ancestral footprint of the tribes from the landscape.
- Places of Elevated Spiritual Importance to Tribes: the CRIT, Quechan Tribe of the Fort Yuma Indian Reservation, and Twenty-Nine Palms Band of Mission Indians all expressed concerns regarding specific culturally-sensitive areas, especially in the Mule Mountains. Concern was expressed regarding visual impacts to other areas of elevated spiritual importance to tribes, such as the Ripley Intaglio Site. Formal evaluation and consultation on these specific areas as TCPs would need to be conducted by BLM. In consultation (Madrigal [Twenty-Nine Palms Band of Mission Indians] to MacDonald [BLM], 5/12/2017), the Twenty-Nine Palms Band of Mission Indians additionally noted that the Project may cross into a culturally sensitive area, and that a culturally sensitive site not previously identified by the background research was located within or near the Project. Formal consultation would need to be conducted by the BLM to identify and evaluate these locations, as applicable.
- The Colorado River: the CRIT, the Quechan Tribe of the Fort Yuma Indian Reservation, and the Twenty-Nine Palms Band of Mission Indians all expressed concern about the Colorado River, and its influence on their spiritual belief and cultural history. As such, the Colorado River crossing and the indirect and direct effects of its siting on the landscape and potential impact to historic properties are of great concern to Indian tribes.
- Treatment of Human Remains: The CRIT expressed concern regarding the treatment of human remains and mortuary items. It is their belief that if human remains are encountered, they should not be removed but avoided entirely and left in place.
- Intrusion on Pristine Landscapes: The CRIT, the Quechan Tribe of the Fort Yuma Indian Reservation, and the Twenty-Nine Palms Band of Mission Indians all expressed desire to restrict Project disturbance to areas already disturbed in order to limit impacts to pristine landscapes. Pristine and undisturbed landscapes are important to Tribal spiritual life and are high-energy places that should be preserved.

3.6.2.3 Project-Specific Conditions

The following is not a comprehensive list of cultural resources of tribal concern; it is expected that additional resources would be identified during the life of the Project through ongoing Section 106 consultation.

Intaglio/Rock Art/Petroglyphs

Intaglio, petroglyph, and rock art sites are often of significance to tribal groups. Several such sites are within the study area.

One site located along Segment p-06 is reported as containing petroglyphs. Petroglyph sites may have a ceremonial function and are typically places of elevated cultural importance to Indian tribes.

Eagletail Petroglyph Site

The Eagletail Petroglyph Site is located in the Eagletail Mountains within the 5-mile indirect effects analysis area of Segment d-01. The Eagletail Mountains are a culturally important feature of the environment, and the petroglyph site is of particular importance as a node of cultural activity (Berry 1978). Information on the Eagletail site is restricted; however, the site is well-known among the general public for its impressive collection of petroglyphs, which number in the thousands. The visual setting could be an integral component of the site's importance.

Indian Well Site

The Indian Well Site, AZ-050-1445, consists of two groups of petroglyphs near a spring or seep. Petroglyph sites associated with natural water sources are typically places of elevated cultural importance to Indian tribes. It is located within the 5-mile indirect effects analysis area of Segment p-06. Little information about the site was included in the Class I data.

Limekiln Wash Intaglio

Site AZ R:7:55(ASM)/Limekiln Wash Intaglio, is located within the 200-foot-wide corridor of Segment p-13. The site consists of an intaglio.

Ripley Intaglio Site

Site AZ R:10:1(ASM)/Ripley Intaglio Site is situated on the terraces overlooking the Colorado River on the Arizona side of the state line (Ezzo 1993; Holmlund 1993). The site is located within the 5-mile indirect effects analysis area of the Proposed Action and includes a set of large anthropomorphic, geometric, and abstract figures etched into the desert surface. The Ripley Intaglio Site may represent a healing dance area (Johnson 1985).

Other Sites

Site AZ-050-1887, an unevaluated intaglio site, is within the 1-mile corridor of Segment qn-02.

Site AZ-050-1309 exhibits an intaglio, and prehistoric and historic petroglyphs. This site is within the 1-mile corridor of Segment qs-02.

Site AZ-050-0764 is located within the 200-foot-wide corridor of Segment i-07. The site consists of an intaglio.

Petroglyph sites are also recorded along Segments cb-05 and i-08s.

Site CA-RIV-000661 is a multicomponent site that consists of a cobble rock alignment and possible intaglio. It is located within the 1-mile corridor of Segments ca-07 and ca-09.

Site CA-RIV-000662 consists of a cobble rock alignment and possible intaglio. It is located within the 1-mile corridor of Segment ca-09.

Trails

Trails are of potential significance to Indian tribes as part of traditional native infrastructure associated with travel across the landscape. The significance of specific trails can be understood in their relationship to specific geomorphological settings, connection to known resource areas, and habitation sites in the regional settlement pattern. These occur along Proposed Action Segments p-04, p-06, p-07, p-09, p-10, p-11, p-12, p-13, p-14, p-15e, p-16, and p-17; and along Action Alternative Segments d-01, i-03, qn-02, qs-01, cb-01, cb-02, cb-03, cb-05, cb-06, cb-10, i-06, i-07, i-08s, ca-01, ca-02, x-02, x-04, x-05, x-06, x-07, x-08, x-15, and x-16.

The Coco-Maricopa Trail

The Coco-Maricopa Trail was a heavily traveled east-west trade route connecting the Los Angeles Basin with the Colorado River at the Palo Verde Valley. It also continued eastward to the Maricopa villages on the Gila and Salt rivers in the Phoenix area. The trail was first noted by Euro-Americans in the early 1800s as a route used by the Halchidhoma (Lerch et al. 2016). The physical location of the entire trail is not known and only a few segments have been recorded.

Unnamed North-South Trails

While the Coco-Maricopa Trail is the most well-known trail through the area, AECOM (2012) also notes the likely presence of north-south running trails through the Palo Verde Mesa. North-south trails have been associated with a specific mourning ritual, or *keruk*, that involved following the path between two spiritual peaks: *Akikwalal* at Pilot Knob near Yuma and *Avikwami* in the Newberry Mountains near Needles. This trail is also referred to as *Xam Kwatcan* Trail (Lerch et al. 2016).

Salt Song Trail

In addition to these known and recorded trail systems, the Project Area is within the general area described by the Salt Song Trail (Lerch et al. 2016; AECOM 2012). The Salt Song Trail is considered to be the path to the afterlife used by the Chemehuevi, Southern Paiute, and Hualapai. The Salt Song Trail is described in the Salt Songs, which are a series of songs sung at funerals. The path is metaphysical and the locations identified in the Salt Songs can be considered to be Traditional Origin and Mythological Places. While the trail itself is not considered an on-the-ground cultural resource, consultation received from the Twenty-Nine Palms Band of Mission Indians notes that locations named in the Salt Songs may be tied to physical locations of importance in or around the Project (Madrigal [Twenty-Nine Palms Band of Mission Indians] to MacDonald [BLM], 5/12/2017).

CRIT Cultural Resources

Cultural resources located on CRIT lands have not been identified, as their locations are confidential, and the distribution of confidential data requires special consideration from the CRIT Tribal Council. For segments that include CRIT lands, more information would be required to ensure the identification of cultural resources and potential historic properties. Further information on CRIT cultural resources or historical properties was not provided by the CRIT; therefore, the affected environment of these resources on CRIT lands is unknown and cannot be evaluated further.

Colorado River

Many of the most sensitive tribal cultural resources are located around the Colorado River. The high density of known cultural resource sites in the Mule Mountains and on the Palo Verde Mesa indicates that this area was significant in the prehistoric past and continues to be important to Indian tribal communities today. Significant known cultural resources include trails and intaglio/petroglyph/rock art sites. The types of prehistoric sites, their distribution and density, as well as the environmental setting of this area offers an insight into the regional settlement and land use pattern operating during prehistory and demonstrate the interconnectedness of the cultural and natural environment. Two cultural properties, AZ R:10:1(ASM)/Ripley Intaglio Site and the Mule Tank Discontiguous Rock Art District, containing archaeological sites CA-RIV-504 and CA-RIV-773, are located in this area.

The Mule Mountains

The Mule Mountains are south of the Project Area within line-of-sight of Segments p-17 and p-18. Previous research has suggested that the Mule Mountains contain sensitive archaeological sites including trails and ceremonial sites (AECOM 2012, AECOM 2016). The mountains also form the center of a regional trail network (Leard and Brodbeck 2017). Bean and Vane (1978) describe “A rock tank in this area stores up water when it rains and may have been a permanent water source in past years. Consequently, this is a site where travelers, traders, and ritualists probably stopped off regularly.”

The Mule Tank Discontiguous Rock Art District, containing archaeological sites CA-RIV-504 and CA-RIV-773, is located in the northern Mule Mountains southwest of Segments p-17 and p-18. The district includes a natural water catchment and was—and is—an important junction of indigenous travel routes and a focal point of human activity. Numerous trails extend away from this site district and are related to the intaglios and petroglyphs (Brodbeck et al. 2017).

Government-to-government consultation with tribes for this Project have identified the Mule Mountains and surrounding area as a traditional cultural landscape. The consulting tribes’ consider natural resources to be cultural resources, and that together these resources constitute a cultural landscape that provide a sense of place and identity and are important to their cultural heritage. In addition, the Project analysis area is within the ancestral territory of the consulting tribes' that contains multiple, linked features that have cultural and historical meanings attached to them by the peoples who have traveled, used, and interwoven these places into generations of practice that are integral to their way of life.

Palo Verde Mesa

While not a specific property, AECOM (2012) describes the eastern base of the Palo Verde Mesa as a culturally and biologically sensitive area of great importance. Known features in this area include plants, seasonal habitation sites, graves, trails, and important natural resource collection areas (Bean and Vane 1978). Of particular importance are mineral sources and plants used for medicinal purposes and basketry. Mineral resources can include clay for ceramic production and crystal sources for ceremonial purposes.

CA-RIV-1821, an artifact scatter with thermal features and cremated human remains, is a known area of sensitivity to the CRIT and Quechan Tribe of the Fort Yuma Indian Reservation. It is located along an existing access road in Segment p-17.

3.7 LAND USE

3.7.1 Study Area

The general land use study area is a 4,000-foot corridor encompassing the Proposed Action route and Action Alternative segments. A 2-mile-wide study area was used for military land because typically the DOD requests large buffers around their properties to both protect the public and provide secure grounds for military uses. The land use study area also encompasses 200-feet on either side of the alternative SCS 12kV distribution line.

3.7.2 Existing Conditions

3.7.2.1 Land Jurisdiction and Plans

Federal land use plans that govern federal land in the Arizona portion of the land use study area are identified in Section 1.7.1.2.

In California, Federal land in the land use study area is governed by the Yuma RMP and the 1980 CDCA Plan (BLM 1980), as amended by the DRECP (BLM 2016a). The DRECP (BLM 2016a) LUPA uses land use allocations. The Project would cross a land use allocation called a DFA identified in the DRECP (Figure 3.2-2c, Appendix 7). Each land use allocation has CMAs, as do certain types of use. CMAs are the specific set of avoidance, minimization, and compensation measures, and allowable and non-allowable uses for siting, design, pre-construction, construction, maintenance, implementation, operation, and decommissioning activities on BLM land. DFAs are available for energy transmission outside of utility corridors and streamline development through consistent and predictable mitigation requirements identified in the CMAs.

The USFWS and the BLM developed the Kofa National Wildlife Refuge and Wilderness and New Water Mountains Wilderness Interagency Management Plan and Environmental Assessment to describe the management objectives for the refuge (USFWS and BLM 1997). The Kofa NWR utilizes USFWS policies on appropriateness (USFWS 2006a) and compatibility (USFWS 2000) when processing ROW applications.

The La Paz County Comprehensive Plan (La Paz County 2005) does not expressly identify utility corridors for transmission infrastructure, it states that “[a]ny new industrial development

should be located along a major arterial corridor, rail connection, [or] state highway, or in close proximity to the Interstate corridor."

The Town of Quartzsite General Plan (Town of Quartzsite 2014) does not identify particular corridors for utilities, the strategy supporting this goal is to coordinate infrastructure improvement with existing and projected development activity and, therefore, place utilities in areas that are beneficial to the community and complement the plan.

3.7.2.2 Land Uses

The land use study area includes mainly rural, sparsely populated lands under Federal management (Figures 3.7-1 through 3.7-4, Appendix 7).

Where the Proposed Action and Action Alternative segments cross Federal lands, they are mostly within designated utility corridors. Of the 58.3 miles of Proposed Action segments that fall on BLM or Reclamation land, 98 percent also overlap designated utility corridors. Of the 183.3 miles of Action Alternative segments that fall on BLM or Reclamation land, 62 percent also overlap designated utility corridors. Where the Proposed Action segments cross non-Federal lands, or lands managed by the USFWS or DOD, they are entirely located parallel to the existing DPV1 ROW. While some of the Action Alternative segments are located parallel to existing utility ROWs, several Action Alternative segments cross outside designated utility corridors between the Proposed Action and Action Alternative segments routed along I-10.

Residential

The land use study area as a whole includes large areas of public land and relatively little private residential land. Residences are typically scattered on large lots (1 to 40-plus acres) and generally increase in density in the vicinity of cities and towns within the Project Area.

Agriculture including Williamson Act Lands

Agricultural lands are present throughout the land use study area. The BLM and ASLD have authorized grazing on their rangelands, and ASLD also leases some state trust land for agricultural purposes (Figures 3.7-5 and 3.7-6, Appendix 7).

Other Land Uses in the Study Area

Commercial land uses are typically assigned to areas that are used or planned for general commerce. Industrial land use in the study area includes several existing and approved, but not yet constructed, solar energy facilities.

The YPG is the only military installation within the military land use study area. The YPG is a center for testing military equipment including vehicles, unmanned aerial systems, air delivery, electronic warfare, artillery, rockets and other weapon systems. Testing on the YPG consists of both developmental testing for new equipment and operational testing to prepare equipment for fielding by military units. The Army's Free Fall School is also located on the YPG. Land use within the YPG is not entirely restricted to military equipment and artillery testing. General Motors operates a test track on the YPG under an Enhanced Use Lease. Different regions within the YPG are used for different purposes (YPG 2017). Where compatible with the military

mission, for example, in coordination with the AGFD, the YPG administers public access for hunting in certain parts of the installation by permit.

Colorado River Indian Tribes Land

The study area for land use includes the southeastern tip of the CRIT reservation (Figure 1-1).

Public Facilities, Utilities, and Rights-of Way

Federal and state roads are public facilities located within the land use study area. A variety of existing utilities are present in the land use study area, including water, oil, natural gas pipelines and smaller distribution lines; underground and aboveground electricity transmission lines; and buried fiber optic cables. These utilities may or may not utilize designated corridors. Utilities that occur on BLM land are generally authorized under a ROW grant.

3.7.2.3 Land Use Study Area Overview

High level land use issues associated with the Proposed Action and Action Alternative segments are listed below.

- Segment p-06 crosses Kofa NWR for about 24 miles, crossing about 2 miles south of the northern boundary of the refuge and adjacent to the DPV1 ROW.
- Segments qn-01, qn-02, qs-01, and qs-02 pass through the Quartzsite incorporated boundaries north and south of the most developed part of town.
- Portions of the land use study areas (4,000-foot corridor) for Proposed Action Segment p-11 and Action Alternative Segments cb-03, i-06, i-07, and x-08 overlap with the CRIT reservation.
- As the majority of Proposed Action Segments p-15e through p-18 and Action Alternative Segments ca-01, ca-02, ca-04 through ca-07, ca-09, i-08s, x-09 through x-14, and x-19 are on privately owned land, they do not coincide with designated utility corridors. However, the majority of Action Alternative Segments ca-07, ca-09, and a portion of x-19 overlap with the WWEC 30-52 west of Blythe.
- BLM-administered land in California crossed by Proposed Action Segments p-16 through p-18 and Action Alternative Segments ca-02, ca-05 through ca-07, ca-09, x-09 through x-16, and x-19 are classified as a DFA (Figure 3.2-2c, Appendix 7), where activities associated with solar and wind development and operation will be allowed, streamlined, and incentivized (BLM 2016a). There is one existing solar energy facility in these land use study areas: the NRG Blythe solar energy facility.

3.8 RECREATION

3.8.1 Study Area

The recreation study area is a 2-mile-wide corridor encompassing the Proposed Action and Action Alternative segments. However, the area used for the description of the affected environment for recreational resources includes the entirety of recreation areas intersected by the

Proposed Action and Action Alternative segments, adjacent recreation areas (within 1 mile), and areas that could be directly or indirectly affected by the Project.

3.8.2 Existing Conditions

Recreational activities in the recreation study area include camping, nature viewing, amateur geology (i.e., rockhounding), team sports, water sports, OHV use, hiking and backpacking, rock climbing, and hunting.

3.8.2.1 Recreation Management

The BLM uses a planning tool known as the Recreation Opportunity Spectrum (ROS) to inventory, classify, and map public lands according to their suitability for various types of recreational activity based on the presence of physical setting characteristics. The system defines six classes of recreation opportunity ranging from natural, low-use areas to highly developed, intensive use areas: these include Rural Natural, Rural Developed, Urban, Suburban, and Semi-Primitive. The classes are defined by setting, the types of recreational activities appropriate to that setting, and the types of recreation experience the setting offers to visitors. BLM designates Special Recreation Management Areas (SRMAs) to help direct management priorities in areas with a high amount of recreational activity and increased resource values and public concern (Figure 3.8-1, Appendix 7). BLM also issues Special Recreation Permits (SRPs) for LTVA use (Section 3.8.2.3).

3.8.2.2 Recreation Areas

Recreation areas are used by the public for both dispersed and developed recreation and are managed by a Federal, state, or municipal agency. There are many recreation areas located within the study area.

3.8.2.3 Long-term Visitor Areas

LTVAs are specially designated areas on BLM-administered land that allow visitors to stay for longer periods of time than are typically spent camping on Federal lands. Only one LTVA is located within the recreation study area: the La Posa LTVA near Quartzsite.

3.8.2.4 Hunting

The AGFD manages hunting within seven game management units (GMUs) in the recreation study area in Arizona (Figure 3.8-2, Appendix 7). The CDFW manages hunting in the study area in California within its Inland Desert Region.

3.8.2.5 Off-Highway Vehicles

OHV use is popular in both Arizona and California in the recreation study area. Use is generally classified as “heavy” use in the BLM’s route inventory for the study area. OHV activities include day use and multiday overnight trips along historic routes and in remote natural areas, such as the proposed Arizona Peace Trail.

In managing OHV use on BLM-administered land, lands are designated as “Open”, “Open to All Uses”, “Limited to Authorized Use”, or “Closed”. The BLM does not maintain specific data regarding unauthorized or illegal OHV use of BLM lands, but some problems exist with illegal OHV use (Personal Communication, Ron Morfin, 8/6/2016).

3.8.2.6 Recreation Study Area Overview

Recreation facilities associated with the Proposed Action and Action Alternative segments are shown on Figures 3.8-1 through 3.8-6 (Appendix 7), highlights include:

- The proposed Arizona Peace Trail is crossed by Proposed Action Segments p-06 and Action Alternative Segments i-03 and x-04. Proposed Action Segments p-10 through p-13 run parallel to a portion of the proposed Arizona Peace Trail, just north of the YPG.
- The La Posa SRMA is crossed by Proposed Action Segments p-07, p-08, p-09, p-10, and p-11, as well as Action Alternative Segments p-13 and i-06.
- Action Alternative Segments i-05, qn-01 and qn-02, qs-01 and qs-02, x-05, x-06 and x-07 pass through the La Posa Destination SRMA and Action Alternative Segments qs-01, qs-02, x-06, and x-07 are along or within the La Posa LTVA.
- Action Alternative Segments cb-01 through cb-06, i-06, i-07, and x-08 cross the La Posa Destination and Colorado River Destination SRMAs.
- The proposed Arizona Peace Trail is crossed by Action Alternative Segment qn-02 north of Quartzsite. In addition, while the proposed Arizona Peace Trail is within the La Posa LTVA, it runs along Action Alternative Segment qs-01 for less than 1 mile and is crossed by Action Alternative Segments x-07 and qs-02.
- Action Alternative Segment cb-02 runs parallel to a portion of the proposed Arizona Peace Trail and Johnson Canyon, and the trail is crossed by Action Alternative Segment cb-05.
- Action Alternative Segments qn-02, qs-02, and i-06 pass through the Dome Rock 14-Day Camping Area.
- The Proposed Action and Action Alternative segments cross the proposed Arizona Peace Trail, including Johnson Canyon, in the Copper Bottom Zone at various points, with the greatest parallel length to Johnson Canyon being with Segment cb-02.
- Proposed Action Segments p-11 through p-14 cross the Colorado River Destination SRMA.
- The Mule Mountains ACEC is 0.8 mile from Proposed Action Segment p-17.
- The Colorado River Corridor Destination SRMA is 0.5 mile from Action Alternative Segment x-11.
- The alternative SCS 12kV distribution line would run adjacent to the Ramsey Mine Road dispersed camping area.

3.9 SOCIOECONOMICS

3.9.1 Study Area

The study area for the socioeconomics resource analysis is the entirety of the three counties (Maricopa and La Paz Counties, Arizona; Riverside County, California) containing the Proposed Action and Action Alternative segments. Socioeconomic data are readily available for counties and most urban areas but are sometimes not readily available for rural areas. Some elements of the analysis look at socioeconomic resources (i.e., population, age distribution, and housing units) specifically in the US Census block groups that are within 0.5 mile of the route segments or resources in municipalities or census designated places (CDPs). This latter area is called the block group study area.

3.9.2 Existing Conditions

3.9.2.1 Population

Table 3.9-1 in Appendix 3 presents the population of the socioeconomics study area by US, state, county, and block group for 2000, 2010, and 2014. Figure 3.9-1 (Appendix 7) shows the block groups analyzed. As of 2014, the three counties in the socioeconomics study area had a total population of 6.2 million. More than 63 percent of this population resides in Maricopa County, and Riverside County accounts for just over 36 percent of the total population in the study area. La Paz County accounts for the smallest share, with 20,348 residents, or about 0.3 percent of the total for the socioeconomics study area, but it is more representative of the rural nature of the Project Area. As of 2014, the population in the block group study area was 21,710.

While the population of the overall socioeconomics study area increased from 2010 to 2014, the population of the block group study area decreased by 0.9 percent (203 residents). Within the block group study area, the block groups in Maricopa and La Paz Counties lost residents overall, while the block groups in Riverside County gained residents overall. Although this percentage change is small compared to the trends in the counties, states, and US, the size of the population in the block group study area is very small to begin with, so even small changes could be substantive locally.

The population data do not reflect the winter visitors and part-time residents in the socioeconomics study area, notably important for Quartzsite in La Paz County. However, much like the declining population of permanent residents in La Paz County, the Quartzsite area has also seen a decline in long-term winter visitors.

Local governments provide public services such as police, fire, and emergency medical services; education; and waste management services to the permanent residents, as well as the winter tourists and temporary residents. These services are primarily based out of the Town of Quartzsite and the City of Blythe for the residents within the socioeconomics study area.

In 2014, the median age in Maricopa County was 35.3 years, while in Riverside County it was 34.2 years. However, in La Paz County, the median age was much higher at 54.6 years. Given that the US median age was 37.4 years, the population in La Paz County is much older than the national average, while the populations in Maricopa and Riverside Counties are slightly younger

than the national average. Again, these figures do not reflect the long-term winter visitors, many of whom are above the average age for La Paz County.

From 2000 to 2014, the median age increased in all jurisdictions and the median age in the socioeconomics study area increased faster than in the US as a whole. In Maricopa and La Paz Counties, it increased by 7.0 percent and 16.7 percent, respectively, while in Riverside County it increased by 3.3 percent. This compares with an increase of 5.9 percent in the US overall, a rate that is lower than in the Arizona counties but higher than in Riverside County.

Population age distribution and its change over time in the socioeconomics study area, in the block group study area, and across the US is illustrated in Table 3.9-2 in Appendix 3. The table demonstrates that, except for La Paz County, the largest population group in both 2010 and 2014 was younger working adults ages 18 to 44, while seniors 65 years and older were the smallest population age group. Similar to La Paz County as a whole, the block group study area has a relatively higher share of older population and smaller shares of younger working adults and children than the comparison areas. Since the 2010 Census, the share of the population in the block group study area under age 18 has decreased, while the share of the population 65 years or older has increased. This trend toward an older population decreases the size of the workforce available in this rural area.

3.9.2.2 Housing

From 2000 to 2014, the number of housing units in the socioeconomics study area increased from 1.85 million to about 2.46 million, which is an increase of about 34 percent. The largest portion of this increase occurred in Maricopa and Riverside Counties, which also account for the larger shares of housing units. This increase, however, occurred outside of the vicinity of the Project Area.

As of 2014, there were 13,750 permanent housing units in these block groups in the block group study area. This accounts for 0.55 percent of the total housing units in the socioeconomics study area, an indication of the rural nature of the socioeconomics study area. The number of housing units in the block group study area declined from 2010 to 2014. Details are provided in Table 3.9-3 in Appendix 3.

Trends in housing stock are frequently compared against trends in household formation. The relative magnitude and changes in the two series can provide some insight regarding the housing market situation and possible pressures on the demand (buying) or supply (selling) sides. Table 3.9-4 in Appendix 3 shows the number of households in 2000, 2010, and 2014. During this time, the number of households in the US and in the block group study area declined, while the number of households in Arizona, California, and the three counties increased slightly. The decline in the number of households nationally despite the increased population is likely due to an increase in the average household size, which suggests that, on average, dwelling units had more people living in them in 2014 than in 2010. In the block group study area, the average household size has generally decreased during this time, as has the overall population.

Table 3.9-5 in Appendix 3 shows trends in the average property prices (ownership residential housing units) in the socioeconomics study area as well as overall trends in the US. The table shows that Riverside County had the highest property values in the study area, followed by

Maricopa County. These property values tended to be much higher than the US average. The higher property values in both Riverside and Maricopa Counties are skewed by areas that are outside of the immediate Project Area and closer to Los Angeles and Phoenix, respectively.

From 2007 to 2014, property values declined in all of the areas examined here; however, the socioeconomics study area had much greater declines than did the US on average. In Riverside County, property values fell by more than 40 percent; in Maricopa County, they fell by more than 29 percent. La Paz County had a smaller decline of 4.3 percent (though from a much lower base price). This latter decline is similar to the average reduction of 3.4 percent across the US.

Housing vacancy rates were examined separately for ownership housing and for rental housing, though both rates consider seasonally vacant properties as vacant. The vacancy rates for both property types in Quartzsite and La Paz County are noticeably higher than the state and national averages, due at least in part to the seasonal nature of housing occupancy in the area.

3.9.2.3 Employment

The following data is drawn from the Bureau of Labor Statistics and the Bureau of Economic Analysis (BEA; BEA 2016) at the county level. The county-level data presented likely does not reflect the exact local conditions in the socioeconomics study area adjacent to the Proposed Action and Action Alternatives. The information for La Paz County is likely to best represent the overall study area conditions, since the parts of Maricopa and Riverside Counties in the study area are rural and are more similar to La Paz County than to the urban centers that dominate the Maricopa and Riverside data.

In all three counties, using data from 2001 through 2014 (Table 3.9-6 in Appendix 3), employment peaked in 2007 and declined from 2008 to 2010. Employment started increasing again in 2011. La Paz County, which is the most representative of the study area, has added a net of more than 800 new jobs compared to 2001, but that is still 275 fewer jobs than the peak in 2007 of 8,173. Employment in La Paz County has not yet returned to pre-recession levels. The annual data compiled by the BEA do not include the seasonal fluctuations associated with Quartzsite and its seasonal economy. As further shown in the table, from 2001 to 2014, employment increased more in Arizona and California (by 21.9 percent and 13.5 percent, respectively) than in the US as a whole (12.3 percent). La Paz County was the only area that had lower employment growth (11.5 percent) than the national level.

Trends in unemployment rates in the socioeconomics study area are given in Table 3.9-7 in Appendix 3. From 2000 to 2015, Maricopa County had the lowest unemployment rate (below the national rate). The unemployment rates in La Paz and Riverside Counties exceeded the relevant state averages and the national average. These study area trends were broadly consistent with national trends, with La Paz County exceeding the state and national unemployment rates. During the economic recession, unemployment rates in all of Riverside County exceeded 10 percent, with a peak of 13.8 percent in 2010, compared with rates of less than 10 percent in Maricopa County and the US. The Riverside County unemployment rate declined to 6.7 percent in 2015, but still remains above the US average and the Maricopa County rate. The La Paz County unemployment rate ran around 8 percent during the economic recession of 2008 and rose to a high of about 10 percent in 2010. Since 2010, the unemployment rate in La Paz County has dropped to 7.6 percent, which is higher than the US average and the Arizona average.

Table 3.9-8 in Appendix 3 and associated text show total employment by industry in the socioeconomics study area in 2001 and 2014. The tables demonstrate that the industrial structure of employment and trends in the socioeconomics study area are broadly consistent with the structure and trends in the US overall. The key characteristics of this structure are the following:

- Government or retail trade is the largest employment source in every area examined, with health care and social assistance the second or third largest employment source.
- Except for Maricopa County and the three-county socioeconomic study area, the largest share of employment is in government (Federal, state, and local).
- The second-largest share of employment was in retail trade and/or health care services, at over 10 percent of total employment (for each geographic area in the table).
- The share of the manufacturing industry in the socioeconomics study area is smaller than the US average (about 5 percent versus 7.5 percent in 2014).
- The number of construction jobs also declined from 2001 to 2014 in all areas.
- The share of the finance and insurance industry in Maricopa County is larger than the share in the other counties and larger than the Arizona share and the US average share. This share increased from 2001 to 2014. The many finance and insurance industry jobs in Maricopa County are likely in the Phoenix area rather than the part of the county along the Proposed Action and Action Alternative segments.
- Farm employment plays a larger role in La Paz County than in the other counties, Arizona, and the US as a whole. As of 2014, farm employment accounted for 4 percent of the total La Paz County employment.

3.9.2.4 Income

Average personal income data (including earnings, dividends, interest, rent, and transfer payments[1]) per capita in the socioeconomics study area is provided in Table 3.9-9 in Appendix 3. The data show that, from 2001 to 2014, average per-capita personal income in the study area was, with the exception of Maricopa County in 2006, lower than the average for the US overall. The data for Maricopa County reflect the well-paying jobs in the Phoenix metropolitan area, with Maricopa County exceeding the Arizona average every year, while the average for rural La Paz County was consistently well below both the Arizona and US averages. California consistently had higher average per-capita personal income than the US average, but Riverside County's average fell short of both the California and US averages.

In 2014, Maricopa County had the highest average per-capita personal income in the three-county socioeconomic study area at $41,222, followed by Riverside County at $33,590 and La Paz County at $29,219. For the same year, the US average was $46,049. This is an income difference between the US average and averages in the socioeconomics study area of about $4,800 for Maricopa County, about $12,460 for Riverside County, and $16,830 for La Paz County. The per-capita income gap between the counties in the socioeconomics study area and the US has grown over time, from a difference of $13,808 for La Paz County in 2001 to $16,830

[1] Transfer payments are government redistribution programs and include Social Security, the Supplemental Nutrition Assistance Program, Women Infants and Children, and other similar programs.

in 2014. The gap in Riverside County has doubled from $6,057 in 2001 to $12,459 in 2014. The gap in Maricopa County has grown from $1,118 in 2001 to $4,827 in 2014, even though the county exceeds the state average.

Earnings generate the largest share of personal income in all geographic areas evaluated here, and the breakdown of per-capita personal income composition (earnings; dividends, interest, and rent income; and transfer payments) is included in Appendix 3, Table 3.9-10 and associated text. Of the counties, states, and US, La Paz County has the lowest share of income from earnings (44.7 percent) and the highest share from transfer payments (36.4 percent). This is a much higher share of transfer payments than in Arizona (20.4 percent) and the US (17.2 percent).

3.9.2.5 Tax Revenues

Similar to employment and income data, tax revenues cannot readily be examined below the county level. For this reason, this information is presented at the county level only, with the information for La Paz County being the most relevant to the study area.

The key components of tax revenues available to local governments are property taxes and sales taxes. Details on each of these are included in Table 3.9-11 in Appendix 3 in this section shows that, in Maricopa and Riverside Counties, tax distributions increased initially (from 2006 to 2007). However, from 2008 to 2010, they decreased each year compared to the previous year. In 2011, tax distributions started increasing again. However, in Maricopa County, they have not fully recovered to the pre-recession 2007 peak. In La Paz County, tax distributions also decreased over the same period but recovered more quickly to the pre-recession level. Municipal distributions to Quartzsite have not recovered to the pre-recession level, while those to Blythe exceeded their pre-recession levels two of the last three years.

Property tax revenues and assessed property values as used for tax calculations in the socioeconomics study area from 2006 to 2015 are also provided in Tables 3.9-12 and 3.9-13 in Appendix 3. In La Paz County, tax revenues remained stable or increased over this period; in Maricopa and Riverside Counties, property tax revenues increased until 2009 and then started decreasing. In Maricopa County, property tax revenues reached a bottom minimum in 2013 and increased in 2014 and again in 2015. However, they have not fully recovered to the 2009 peak. In Riverside County, property tax revenues fluctuated somewhat from 2010 to 2013, and by 2015 they exceeded the pre-recession 2009 peak. Assessed property values increased until 2008–2010 (with some differences across the three counties) and then started decreasing. In Maricopa and Riverside Counties, property values started increasing again within the last 2 years with available data (that is, 2014 and 2015), but they have not fully recovered to the pre-recession level.

While the majority of the Proposed Action and Action Alternative segments avoid incorporated and other populated areas, they are located near the Town of Quartzsite, Arizona and the City of Blythe, California. The Town of Quartzsite General Plan details growth areas out to the year 2035 and beyond. None of the Proposed Action segments cross Tier II growth areas, which are indicated in the plan to be used for water, sewer, and roadway expansion. Segment qn-02 crosses a Town of Quartzsite General Plan Tier III growth area, which is slated for development and town growth in the year 2035 and beyond.

Payments in Lieu of Taxes from the Federal Government

Payments in lieu of taxes (PILT) are payments made to certain counties by the Federal government to account for losses in property taxes due to the presence of Federally-owned land within the county. Federally-owned lands are not taxable. The PILT program, which is administered by the US Department of the Interior's (DOI's) Office of the Secretary and PILT amounts paid to each county between 2000 and 2016. Federal land accounts for 68 percent of the land base in the Project Area in La Paz, Maricopa, and Riverside Counties. As such, the PILT received by each of the counties in the Project Area is important. PILT payments totaled $1,848763, $2,434,825, and 2,389,185 in 2016 for La Paz, Riverside, and Maricopa Counties, respectively (Table 3.9-14 in Appendix 3).

3.9.2.6 Nonmarket Values and Ecosystem Services

Non-Market Values

The Proposed Action and Action Alternative segments were designed to minimize impacts to urban areas and population centers, though the construction of any new transmission line would alter the natural landscape. These changes in the natural landscape may be noticeable for residents and visitors who place a high value on the natural beauty of the environment, including the beauty of the natural landscape and access to hunting, fishing, and other recreational opportunities, as part of their quality of life. These are considered non-market value resources – those that are not easily quantified or monetized but may contribute to and affect the economic success of the region.

Ecosystem Services

The nature of the non-market resources in the study area substantially overlaps with the topic of recreation opportunities, which are discussed in Section 3.8. The Proposed Action and Action Alternative segments are within the diverse ecosystem of the Colorado River Basin. Construction of any new infrastructure may alter production or delivery of current levels of ecosystem services to the population, both locally and regionally. Ecosystem services drive much of the recreation-based economy in the study area, including OHV usage, camping, hiking, wildlife viewing, and hunting. The availability of these resources is critical to the regional economy in the study area, in addition to farther-reaching functions such as carbon cycling, air quality, water quality, and wildlife habitat. As with non-market values, it is difficult to place a monetary value on many ecosystem services. Further, while not labeled as such, the current conditions of these ecosystem services are discussed at length in their resource sections of this EIS and respective baseline technical reports (HDR 2016b-d, 2017a-k).

3.9.2.7 Tourism and Recreation's Contribution to Local Economies

All three counties in the socioeconomics study area have a range of tourism and recreation uses and resources including hunting, fishing, wildlife watching, OHV use, and recreation on the Colorado River and its tributaries. Statistics on the total number of visitors to the socioeconomics study area and their impact on the local economy have been estimated in several studies. Some of the studies are targeted on specific forms of recreation (i.e., hunting, fishing, wildlife

watching, OHV use) and include both residents and non-residents. Other studies focus on non-residents, regardless of their motivation for visiting.

Tourism-related visitor spending and tax revenues for 2014 (Arizona Office of Tourism 2016; Visit California 2016), shown in Table 3.9-15 in Appendix 3 shows that spending ranged from about $137 million in La Paz County to $6.6 billion in Riverside County to $9.5 billion in Maricopa County. In La Paz County, this equates to visitor spending per resident of nearly $6,800. In Maricopa and Riverside Counties, this per-resident spending was much lower but still well above $2,000 per resident.

Tourism-related tax collections ranged from about $10 million in La Paz County to $557.6 million in Riverside County to $946 million in Maricopa County. Table 3.9-15 in Appendix 3 provides sales tax information and demonstrates that these tourism-related tax receipts by the states are substantially larger than the taxes distributed to each county by the state government. La Paz County receives just under 30 percent of the sales taxes that are levied and Riverside County receives just under 45 percent of the sales taxes collected.

Employment in 2014 in tourism-related industries that could be directly attributed to serving visitors is tabulated in Table 3.9-16 in Appendix 3 and shows that this employment amounted to 1,385 jobs in La Paz County, 94,200 jobs in Maricopa County, and 72,800 jobs in Riverside County.

3.9.2.8 Summary

Overall, the block group areas along the Proposed Action and Action Alternative segments are economically depressed when compared with the county, state, and country as a whole. The Proposed Action and Action Alternative segments have generally been designed to follow existing ROWs and avoid population centers and sensitive socioeconomic areas, though some of the Action Alternative segments cross near population centers in the Town of Quartzsite and City of Blythe.

Winter tourism and recreation play a substantial role in the economy of the socioeconomics study area, particularly in La Paz County, which is the most representative of the Project Area out of the three counties. Although precise data are difficult to locate, the RV parks and the BLM's LTVAs house thousands of temporary residents during the winter months (Wolinsky 2016). These visitors are essential to the local economy; however, they are not included in population estimates due to their temporary presence in the area.

3.10 ENVIRONMENTAL JUSTICE

3.10.1 Study Area

The environmental justice (EJ) study area is a 1-mile corridor encompassing the Proposed Action and Action Alternative segments. The study area includes all census block groups crossed by the Proposed Action and Action Alternative segments. This study area was designated due to the linear nature of the Proposed Action and is intended to include all adjacent and nearby communities that may be impacted.

3.10.2 Existing Conditions

3.10.2.1 Block Groups

The block groups within 0.5 mile on either side of the Proposed Action and Action Alternative segments comprise the EJ study area, as shown on Figure 3.9-1 (Appendix 7).

3.10.2.2 Minority Populations

Population and minority data are presented Table 3.10-1 in Appendix 3 for the two states, three counties, relevant cities and CDPs, census county division (CCD) areas, the EJ comparison area, and the individual block groups. The data in this table will be used for comparison purposes to determine whether the individual block groups have potential EJ populations.

In Maricopa County, Arizona, based on aerial imagery, it does not appear that there are any residential, commercial, or industrial uses within a 1-mile corridor along the Proposed Action and Action Alternative segments.

In La Paz County, Arizona, a review of aerial photographs showed that, within a 1-mile corridor along the Proposed Action and Action Alternative segments in Block Group 3, Census Tract 201, there is a largely undeveloped natural area with very few residential, commercial, or industrial uses (Figure 3.10-1, Appendix 7). Block Group 2, Census Tract 206.02, and Block Group 2, Census Tract 9403, both run along the eastern bank of the Colorado River, with the first mostly south of I-10 and the second mostly north of I-10 on CRIT lands. A review of aerial imagery shows some development within the EJ study area, or within the 1-mile corridor, for the area of Block Group 2, Census Tract 206.02. This includes open space, agricultural lands, RV parks, and commercial areas.

In Riverside County, California, as shown in Figure 3.10-1 (Appendix 7), there are commercial and recreational uses, including those along the Colorado River banks, as well as residences and agricultural uses.

Environmental Justice Comparison Area

The percentage of minorities in the overall EJ comparison area (sum of the three counties) is 49.3 percent, which is slightly higher than Arizona (43.1 percent) and lower than California (60.8 percent). It is also lower than two of the four CCD areas and higher than five of the eight cities and places (CDPs).

State, County, Census County Division, and Census Designated Places

The states of Arizona and California have overall minority populations of 43.1 and 60.8 percent, respectively. Riverside County has a minority population (61.7 percent) that is slightly (1.5 percent) greater than the state percentage, while La Paz and Maricopa Counties have minority populations (39.1 and 42.2 percent, respectively) slightly lower than that of Arizona as a whole. The city of Blythe (CDP) and the CCD area of Blythe both have percentages of minorities around 70 percent. Ripley CDP, which is south of Blythe, has a very high percentage of minorities (95 percent).

Block Groups

The block groups with relatively high minority populations are shaded in red on Figure 3.10-1 (Appendix 7). The following block groups have EJ minority populations with percentages at least 10 percent greater than the EJ comparison area percentage of 49.3: Maricopa County, Arizona (Block Group 3 in Census Tract 506.03); La Paz County, Arizona (Block Group 2 in Census Tract 9403); and Riverside County, California (Block Group 1 in Census Tracts 459 and 469, and Block Group 2 in Census Tracts 459 and 462.

Colorado River Indian Tribes

Within the EJ study area, Block Group 2, Census Tract 9403, with a minority percentage of 98.0 percent, includes CRIT lands. However, there are no residential or commercial areas that have been identified on CRIT lands within the 1-mile Project corridor. Census Tract 206.02 (including Block Groups 1 and 2) does not show a population of minorities greater than the total percentage of minorities within the total EJ comparison area. The Proposed Action and Action Alternative segments that are under CRIT jurisdiction include part of Segment p-11 and Segment cb-03.

3.10.2.3 Low Income Population

Relevant population and poverty data are presented in Table 3.10-2 in Appendix 3. The data in this table will be used for comparison purposes to determine whether the individual block groups have potential EJ populations with respect to low-income status. The EJ comparison area has an average of 17 percent of the population recorded as low-income individuals (Appendix 3 Table 3.10-2).

State, County, Census County Division, and Census Designated Places

For Arizona and California, the percentages of their respective populations living below the poverty level are 18.4 and 16.4 percent, which are close to the study's comparison area value. The City of Blythe (CDP) and the CCD area of Blythe both have a low-income population of about 24 percent. Ripley CDP, which is south of Blythe, has the highest low-income population percentage at 33.7 percent, while Mesa Verde CDP has the second highest (24.6 percent) out of the CDPs and CCDs evaluated. These local areas along the Proposed Action and Action Alternatives have low-income percentages that are substantially greater than the EJ comparison area.

Low-income Data from Block Groups

The block groups with relatively high minority populations are shaded in purple on Figure 3.10-2 (Appendix 7). The following block groups have percentages of low-income populations greater than the EJ comparison area percentage of 17: Maricopa County, Arizona (Block Group 3 in Census Tract 506.03); La Paz County, Arizona (Block Group 3 in Census Tract 201 and Block Group 2 in Census Tract 206.02); and Riverside County, California (Block Group 2 in Census Tracts 459, 462, and 470 and Block Group 1 in Census Tract 469.

3.10.2.4 Environmental Justice Communities

Over the entire Proposed Action and Action Alternative segments, potential EJ populations for both minority and low-income data were identified at the block group level. Regionally, potential EJ populations were identified in Arizona between Delaney Substation and Quartzsite and east of the Colorado River, while in California, potential EJ populations were identified in five of the six block groups in the EJ study area in Blythe. These are shown in Figure 3.10-3 (Appendix 7). Table 3.10-3 in Appendix 3 identifies those block groups that are potential EJ populations for low-income and/or minorities, as well as the applicable Proposed Action and Action Alternative segments.

Block Groups with Higher Percentages of Minority and Low-Income Populations than the Environmental Justice Comparison Area (EJ Populations)

In Maricopa County, Arizona, one block group out of three was identified with a minority population percentage greater than the overall minority population percentage in the EJ comparison area. In La Paz County, Arizona, three block groups out of ten were identified with minority or low-income population percentages greater than the EJ comparison area percentages; two had higher percentages of low-income population percentage and one had a higher percentage of racial or ethnic minority population. In Riverside County, California, five of the six block groups have minority and/or low-income populations greater than the EJ comparison area percentages. Four of the block groups have minority population percentages substantially greater than the EJ comparison area's minority population percentage, and four of the block groups have a low-income population percentage substantially greater than the comparison area's low-income population.

For the Town of Quartzsite, Arizona CDP, the census data show 4.1 percent minority representation and a low-income population of 9.6 percent. Data for the city of Blythe CDP and the CCD area of Blythe reveal that both have a low-income population of about 24 percent. Ripley CDP, which is south of Blythe, has the highest low-income population percentage, at 33.7 percent, while Mesa Verde CDP has the second highest (24.6 percent) of the CDPs and CCDs evaluated. These local areas have low-income percentages that are substantially greater than those of the EJ comparison area (Appendix 3, Table 3.10-2).

Colorado River Indian Tribes

A portion of Segment p-11 is adjacent to CRIT reservation lands, and Segments i-06 and cb-03 would cross CRIT reservation lands. The block group data covering this area show a 98 percent minority population, with 26.5 percent Native Americans. The lands crossed by all three of these segments are undeveloped.

As a Federally recognized Indian tribe, the CRIT are considered an EJ Population under BLM policy and guidance, as well as Council on Environmental Quality (CEQ) and EPA guidelines (CEQ 1997; EPA 2014). Should the CRIT be adversely and disproportionately impacted by the Proposed Action, ongoing consultation, as documented in Section 5.3.2, will be used to address tribal concerns. Previous consultation with the CRIT resulted in a request for further, detailed consultation regarding its lands and adjacent areas (Section 3.6, Concerns of Indian Tribes; Section 5.3, Consultation with Indian Tribes). Consultation and coordination with the CRIT

suggests that the Project Area is both a traditional cultural landscape and there may be TCPs present.

3.11 VISUAL RESOURCES

3.11.1 Study Area

The study area for visual resources encompasses the Proposed Action and Action Alternative segments. This study area includes an area 5 miles from the centerline of each Proposed Action and Action Alternative segment to cover an area 10 miles wide around each potential route.

3.11.1.1 KOP Identification and Selection

Measuring or rating the degree of contrast is done from the selected critical viewpoints or Key Observation Points (KOPs). KOPs are stationary points, or linear travel routes that are used to describe impacts to visual resources. KOPs typically are areas that have a public sensitivity (scenic vista, scenic highway, recreational trail, etc.). Multiple sources of information regarding public sensitivity to the study area were considered and field reconnaissance was conducted in the process of identification and selection locations for KOPs (Figure 3-8).

3.11.2 Existing Conditions

3.11.2.1 VRI & VRM in Study Area

Visual resource inventory (VRI) classes have been defined for BLM-administered land under the Hassayampa, Palm Springs, and Yuma Field Offices. VRI classes are unavailable for BLM-administered land under the Lake Havasu and Lower Sonoran Field Offices. The data collected on scenic quality, viewer sensitivity, distance zones, and VRI classifications describe much of the study area in both Arizona and California and aided in describing the environment around the KOPs.

The VRI for the BLM YFO (EPG 2016) and the Palm Springs Field Office included areas where the Proposed Action and Action Alternative segments are located within the boundaries of the YFO and Palm Springs Field Office, respectively. VRI classes were assigned to these areas based on factors of scenic quality, sensitivity level, and distance zones. These classes and factors are shown in Figures 3.11-1, 3.11-2, 3.11-3, and 3.11-4 (Appendix 7).

VRM Classes in the study area are presented in Figure 3-8.

3.11.2.2 Visual Resources Study Area Overview

Mountains frame the study area and include Harquahala Mountain to the north of the first Proposed Action segment and Saddle Mountain located just south of the Delaney Substation. Harquahala Mountain is the tallest mountain visible—at over 5,600 feet in elevation (BLM 2014a)—and is in the seldom-seen distance from all primary travel routes. Saddle Mountain is in the foreground-middleground to background distances for the start of the Proposed Action and Action Alternative segments near Delaney Substation.

* = Existing DPV1 follows the Proposed Action. DPV1 and the Proposed Action are cartographically offset for display purposes. Because the routes are cartographically offset, in some cases, the routes do not precisely depict the estimated TWL alignment.

Figure 3-8
Ten West Link
KOPs and VRM Classes

The characteristic landscape in the study area consists of desert vegetation and major cultural modifications such as the towns of Tonopah and Quartzsite and the city of Blythe; surrounding agricultural land; existing transmission and distribution lines; and major roadways that include I-10, SR 95 in Arizona, and US 95 in California. The vegetation and soil colors represented in the undeveloped landscape consist of earth tones: browns, tans, grays, and greens.

The Proposed Action and Action Alternative segments would be visible from several areas, including I-10, state highways, local roads, residential developments, and recreational areas. Some of the closest residences to the routes in the study area are houses in Blythe, recreational vehicles (RVs) in McIntyre County Park, and Snow Bird West RV Park.

Some of the major features in or near the study area (such as prominent landscape features, major tourist attractions/outdoor recreation areas, and important utilities, etc.) include the Kofa NWR southeast of Quartzsite; YPG south of Copper Bottom Pass; the Colorado River Indian Reservation; Eagletail WA; Central Arizona Project Canal; and the Colorado River. Many recreationalists use the Copper Bottom Area located southwest of Quartzsite. Johnson Canyon is one of the most visited areas within the Copper Bottom Area, with several OHV trails open for use. The proposed Arizona Peace Trail winds through the study area, generally trending north-south, and follows or is in close proximity to several Proposed Action and Action Alternative segments in the Copper Bottom area.

The eastern portion of the study area is distinguished by a broad desert plain rimmed with rugged angular mountains. Mountain features within three WAs are visible: Big Horn Mountains WA, Eagletail Mountains WA, and New Water Mountains WA. Additionally, a portion of the Kofa NWR is intersected by a segment of the Proposed Action.

I-10 runs east and west across the northern portion of the study area, while numerous two-track, gravel, and hardened surface local routes crisscross the plain. I-10 offers distant scenic views of the mountain ranges rimming the plain. The area is dotted with a few residences and agricultural operations, and a few businesses are located at or near I-10 exits. The main development is the Delaney Substation, the DPV1 transmission line, and a power plant with monopole transmission lines connecting to the substation. The largest number of sensitive viewers are travelers on I-10, along with travelers on local routes, recreationists, and the few residents of this sparsely populated area.

The Proposed Action and Action Alternative segments would cross a north-south trending valley between two mountain ranges with the Town of Quartzsite located along I-10 in the northern portion of the valley. The eastern side of the valley is delineated by mountains that enclose around I-10, creating a somewhat tight pass as travelers move between the broad open desert approaching the Town of Quartzsite. In addition to I-10 (east-west), the main transportation route through the valley is US 95 (north-south), although there are a myriad of dirt roads and two-track routes throughout the area. Vegetation communities vary in diversity and visual interest by elevation and scenic mountain ranges attract attention. The valley is attractive and heavily used for winter tourism and recreation, including the BLM's La Posa LTVA, extensive areas of BLM-administered land open for 14-day camping, OHV routes and trails, the Town of Quartzsite Rock and Gem Show, and more than 25 campgrounds and RV parks. As such, the largest number of sensitive viewers in this area are tourists and recreationists, along with travelers on I-10.

The Copper Bottom Pass Area is scenic, mostly rugged and mountainous, and is valued and heavily used for winter recreation in conjunction with tourism and recreation. I-10 passes through the northern portion of the area and the Copper Bottom Pass Road traverses the Dome Rock Mountains. While there are a myriad off-road trails and routes in the area, aside from Copper Bottom Pass Road, the only other route through the Dome Rock Mountains is through Johnson Canyon, which is valued for the technical OHV route it offers. Vegetation is denser and uniform at the lower elevations surrounding the mountains and becomes more diverse and contributes to the scenic value. The main developments in the Copper Bottom Pass area are the DPV1 transmission line, a communications site atop Cunningham Peak, and a distribution power line on monopoles providing power to the communications site. A small residential development is located west of US 95 and off of Pipeline Road. The largest number of sensitive viewers in this area would be travelers on I-10; however, recreationists in this heavily used area would be more sensitive to visual changes. West of the Colorado River, the floodplain is private land that is irrigated and cultivated for a variety of agriculture uses. The area around the Colorado River is scenic and contains residential developments. The western end of the study area near the Colorado River Substation is BLM-administered lands that are flat desert plain with deep sands between the Mule Mountains to the south and the McCoy Mountains to the north. Native vegetation in this portion of the desert plain is very sparse and homogenous, which does not contribute to scenic values in the area. I-10 traverses the northern portion of the study area in California, while numerous gravel and hardened surface local routes crisscross the agricultural floodplain, which appears rural and pastoral. The area offers broken views of distant rugged mountains in all directions. Visible development in the area includes a gas pipeline crossing the river, the City of Blythe, the Blythe Airport west of Blythe, the town of Ripley south of Blythe, the DPV1 transmission line, the Colorado River Substation, a power plant, a solar generating facility, gen-tie lines, and numerous other transmission lines connecting to the substation. Other development in Blythe is concentrated at the I-10 exits and along the main route through town. Also notable are proposals for development of new solar generating facilities east of, west of, and surrounding the Colorado River Substation. The largest number of sensitive viewers in the area is travelers on I-10, along with residents and workers in the City of Blythe and Ripley areas.

Sources of nighttime light and glare include the Delaney Substation, the existing DPV1 line with its Federal Aviation Administration-required safety lights, lights from the occasional rural residence and agricultural operations, the lights from vehicles along I-10 and other highways; Town of Quartzsite businesses and residential development; during the winter visitor use season, campers using the surrounding BLM-administered land; the City of Blythe and surrounding rural communities with rural residential and commercial development; and the Colorado River Substation.

3.11.2.3 KOP Overview and KOP Descriptions

There are 61 KOPs selected for analysis (Figure 3-8), some of which have views in multiple directions, providing representative views of the Proposed Action and Action Alternative segments. Figures 3.11-5, 3.11-6, 3.11-7, and 3.11-8 (Appendix 7) present a more detailed look at KOP locations and relationships to VRM Classes. Table 3.11-1 in Appendix 3 provides a detailed overview of the KOPs that were examined for the Project and Tables 3.11-2 through 3.11-5 in Appendix 3 provide BLM VRM and VRI information by segment. Those KOPs that are key to evaluating the Proposed Action and Action Alternative segments and/or are needed for

potential VRM Class changes and RMP amendments are described in the sections that follow. Visual Contrast Rating Forms have been completed through Section B (Characteristic Landscape Description) for each KOP and are included in the project record. Information for confidential sites relative to sensitive cultural resources and concerns of Indian tribes is also contained in the project record.

KOP 20 – Gold Nugget Road

KOP 20 is located east of Quartzsite along Gold Nugget Road south of I-10 on BLM-administered land designated VRM Class III. The area is used for dispersed camping and other recreational uses, and therefore represents the views of recreationists in the area that would be looking north-northwest at Segment in-01 and south-southeast at Segment i-04, which are both on BLM-administered land designated VRM Classes III. Segment in-01 would be on BLM-administered land that are VRI Class II and III, comprised of scenic quality B and C, and high sensitivity, within the foreground-middleground distance zone. Segment i-04 would be on BLM-administered land that are VRI Class II and III, comprised of scenic quality B and C, and high sensitivity, within the foreground-middleground distance zone. The view from KOP 20 looking north-northwest (Figure 3.11-9a, Appendix 7) is somewhat enclosed to the east by rocky low hills and mountains. There are dark brown rocky hills and mountains in the foreground-middleground, with faint distant views of blue-gray mountains in the distant background. There is an open, light gray and relatively flat and smooth, largely unvegetated area in the foreground surrounded by sparse clumped wispy vegetation. Green, yellow-green, and gray-green vegetation becomes lumpy to uniform with distance. The mountains form a rough and jagged horizontal line at the skyline, while the flat unvegetated plain and vegetation band in the foreground create distinct flat horizontal lines. A few isolated saguaros create short vertical lines. Development visible included a few white structures in the foreground-middleground that appear as white dots. Overall, the scene is very natural and only minimally impacted by development but may appear more developed and disturbed with the presence of RVs when used for dispersed camping.

The view from KOP 20 looking south-southeast (Figure 3.11-9b, Appendix 7) is somewhat enclosed by rocky low hills and mountains. There are dark brown rocky hills and mountains in the foreground-middleground, with distant views of rugged dark mountains in the middleground to background. The immediate foreground consists of rolling and undulating rocky to pebbly light tan to gray desert with sparse clumped wispy vegetation and punctuated by occasional saguaros. Green, yellow-green, and gray-green vegetation becomes lumpy to uniform with distance. The mountains form a rough and jagged horizontal line at the skyline. The exposed earth and vegetation band in the foreground create subtle horizontal lines at the base of the mountains. Evidence of off-road travel creates curvilinear lines in the exposed earth. Aside from evidence of off-road travel, no development is visible.

KOP 59 – I-10 South of Brenda

KOP 59 (Figure 3.11-10, Appendix 7) is located along the shoulder of eastbound I-10 south of Brenda, Arizona. The KOP represents the views of travelers on eastbound I-10 looking east-northeast at Segment in-01 crossing from BLM-administered land on the south to the north side of I-10. Segment in-01 would be on BLM-administered land that are VRI Class II and III, comprised of scenic quality C and B, and high sensitivity, within the foreground-middleground distance zone. The view from KOP 59 is slightly enclosed to the north by a gently rising rugged

domed mountain in the distant foreground-middleground. The domed mountain is coarsely textured rock and drainages that are softened by vegetation growing on the slopes. The exposed earth in the immediate foreground is light gray-tan and rocky to stippled. Vegetation is shades of yellow-green, dark green, gray-green, and light gold; densely clumped and wispy but punctuated by occasional cylindrical saguaros; and becomes uniform and indistinct with distance. A gently undulating horizontal line is created by the domed mountain at the skyline and a short less distinct horizontal line occurs where dense vegetation in the foreground meets the skyline. The black freshly paved I-10 and its associated tan gray shoulder create strong horizontal and diagonal lines that draw the viewers eye to the east. With exception of I-10, the landscape is soft, mounded, and horizontal, with the only vertical elements provided by the short vertical lines of the saguaros.

KOP 22 – BLM LTVA #1

KOP 22 (Figure 3.11-11, Appendix 7) is located southeast of Quartzsite on BLM-administered land, within the BLM's La Posa LTVA, which is designated VRM Class IV. KOP 22 represents the views of users at the eastern edge of the LTVA looking east-southeast at Segments x-05 and x-06, also on BLM-administered land. Segment x-05 would be on BLM-administered land that is designated VRM Class II and/or IV, comprised of VRI Class III lands, scenic quality B and C, and high sensitivity, within the foreground-middleground distance zone. Segment x-06 would be on BLM-administered land that are designated VRM Class III, IV, and II comprised of VRI Class III lands, scenic quality C and high sensitivity, within the foreground-middleground distance zone. The view from KOP 22 looking east-southeast is open, flat desert plain in the foreground stretching to the base of tan to brown rugged and Rocky Mountains in the middleground. Exposed tan to gray earth in the foreground is rocky to pebbly with textures ranging from course to stipple to smooth. The immediate foreground is sparsely vegetated with wispy green, yellow-green, and gray green vegetation that is punctuated by scattered saguaros and becomes lumpy to uniform in the distance. Two-track routes create light tan-gray banded horizontal lines in the immediate foreground. Vegetation on the plain at the base of the mountains creates a subtle horizontal line that is further emphasized by vegetation in the immediate foreground; while the mountains themselves create a rough and jagged horizontal line at the skyline. Aside from the two-track routes, no development is visible. This KOP is located at the eastern edge of the LTVA. During the heavy use visitor season, it is possible that RVs, associated camping accoutrements, and OHVs would be visible, making the view appear more developed and busy.

KOP 24 – RV Park Quartzsite

KOP 24 (Figure 3.11-12, Appendix 7) is located outside an RV park on private property south of Quartzsite, Arizona and north of the BLM's La Posa LTVA. The KOP represents the views of RV park residents looking south-southeast who would be viewing Segments qs-01 or x-06 on BLM-administered land designated VRM Class III. Both Segments qs-01 and x-06 would be on BLM-administered land designated either VRM Class II, III, or IV, comprised of VRI Class III lands, and comprised of scenic quality C and high sensitivity, within the foreground-middleground distance zone. The view from KOP 24 is open and panoramic. Viewers are looking at flat desert plain in the immediate foreground, with a rugged mountainous middleground to background. Sparse green, dark green, and yellow-green native vegetation is clumped and rounded in the foreground, becomes more uniform with distance to form an

irregular green horizontal line at the base of the mountains. Variations in the light gray, dark gray-brown and light tan exposed earth create irregular but subtly horizontal lines and give the foreground a banded appearance. The rugged mountains create a jagged and broken irregular horizontal line at the skyline. The light gray to dark gray paved roads and their shoulders create distinct horizontal lines in the immediate foreground. Brown fence posts create short distinct vertical lines that are regularly repeated and connected by short undulating horizontal lines of chain. The series of metal monopoles of the WAPA 161kV transmission line create a series of repeated strong vertical lines that are reduced in intensity by background topography and intervening vegetation, and fade into the distance. The associated power lines are faintly visible as diagonal and undulating.

KOP 26 – Quartzsite Civic Event Parcel

KOP 26 (Figure 3.11-13, Appendix 7) is located along the gravel frontage road on the south side of I-10 south of Quartzsite, Arizona and north of the BLM's La Posa LTVA. The KOP represents the views of drivers on the frontage road and RV park residents looking southwest, who would be viewing Segment qs-02 weaving through the mountains within an area designated VRM Class III, and a portion of which would cross the LTVA. Segment qs-02 would be on BLM-administered land that are VRI Class II and III, comprised of scenic quality B and C, and high sensitivity, within the foreground-middleground distance zone. The view from KOP 26 is open and panoramic. Viewers at the KOP are looking at a gravel parking lot within an RV park in the immediate foreground; however, viewers within the RV park may be closer. Dark brown low hills and rugged mountains are in the middleground, and gray-blue rugged mountains are in the background. The parking lot is flat and uniformly light tan-gray and stippled. Sparse golden tan rounded shrubs line the frontage road and sparse clumped green, dark green, and yellow-green native vegetation quickly becomes more uniform with distance to form an irregular green horizontal line at the base of the low hills and mountains. The hills and rugged mountains create a jagged and broken irregular horizontal line at the skyline. Tire tracks in the gravel of the frontage road create converging vertical lines in the foreground. Brown fence posts create short distinct vertical lines that are irregularly repeated and occasionally connected by short undulating diagonal lines of chain. Numerous single wood power poles create scattered strong vertical lines that are faded with distance. A lattice structure with a cylindrical tank on top is in the immediate foreground, while road signs and colored business signs line I-10. Several small cubical buildings and white RVs are visible. During the winter heavy visitor season, the RV park would likely be full of RVs, which would partially block the view of the low hills and mountains.

KOP 27 – Boyer Road – Quartzsite North Side

KOP 27 (Figure 3.11-14, Appendix 7) is located on Boyer Road on the north edge of Quartzsite, Arizona. The KOP represents the views of residents of a neighborhood block looking northeast, north, and northwest, who would be viewing Segment qn-02 that would cross BLM-administered lands designated VRM Class III and IV to the northeast and northwest, and state trust lands to the north. Segment qn-02 would be on BLM-administered land that are VRI Class III and II, comprised of scenic quality C and B, and high sensitivity, within the foreground-middleground distance zone. The view from KOP 27 is open and panoramic. Viewers are looking at flat desert plain framed by rugged mountains in the background to the northeast and northwest. Exposed tan-gray earth in the foreground has been heavily impacted by a maintained dirt road and off-road travel. Native vegetation is absent in the immediate foreground, and is sparse green, dark

green, and yellow-green, clumped and rounded in the distant foreground; becoming dotted to uniform to create a green horizontal line at skyline and base of the mountains. The rugged mountains create a jagged and broken irregular horizontal line at the skyline. The edges of the dirt road and tracks from off-road travel create converging diagonal to curvilinear lines going into the distance. The communications tower is a prominent vertical focus of attention, while the short vertical lines of the WAPA 161kV monopoles are barely visible to the northeast.

KOP 28 – Highway 95 LTVA

KOP 28 (Figure 3.11-15, Appendix 7) is located at the intersection of US 95 and North 53rd Street south of Quartzsite, Arizona. The KOP represents the views of travelers on US 95 or 53rd Street at the intersection, looking south viewing Segment x-07 on BLM-administered land designated VRM Class III. Segment x-07 would be on BLM-administered land that are designated VRM Class III, comprised of VRI Class III lands, scenic quality C and high sensitivity, within the foreground-middleground distance zone. The view from KOP 28 is open and panoramic. Viewers are looking at flat desert plain with rugged mountains in the middleground to background. Exposed tan-gray earth in the foreground is stippled. Native vegetation is very sparse in the immediate foreground, and is sparse green, dark green, and yellow-green, clumped and rounded with distance; becoming dotted to uniform and punctuated with saguaros, forming an irregular green horizontal line at skyline and base of the mountains. The rugged mountains create a jagged and broken irregular horizontal line at the skyline. The light gray and white striped road surface creates clear horizontal and diagonal lines in the foreground, with the color banding in the road shoulders repeating some lines. The WAPA 161kV H-frame structures create strong vertical and geometric repeated lines going into the distance, while the monopoles on the opposite side of the road also somewhat repeat vertical lines. The transmission line itself is faintly visible, horizontal to curvilinear. Road signs and other signs at the intersection add colors and irregular short vertical lines that look jumbled.

KOP 29 – Highway 95 Crossing

KOP 29 (Figure 3.11-16, Appendix 7) is located south of Quartzsite, Arizona at the intersection of US 95 and the gravel road that travels west-northwest through Copper Bottom Pass, or east providing access along the DPV1 line. The KOP represents the views of travelers on Highway 95 or Copper Bottom Pass Road at the intersection, looking southeast, viewing Segments x-07, x-06, x-05, p-07, and p-08 on BLM-administered land. Segments x-05, 06, and 07, and p-07 and 08 would all be on BLM-administered land that are VRI Class III, comprised mostly of scenic quality C and high sensitivity, within the foreground-middleground distance zone, and on lands designated either as VRM Class II, III, or IV. The view from KOP 29 is open and panoramic. Viewers are looking at flat desert plain with rugged mountains in the middleground to background. Exposed tan-gray earth in the foreground is stippled. Vegetation is very sparse in the immediate foreground, and is sparse green, dark green, and yellow-green, clumped and rounded with distance; becoming dotted to uniform and punctuated with saguaros, forming an irregular green horizontal line at skyline and base of the mountains. The rugged tan, dark brown, black, and blue-gray mountains create a jagged and broken irregular horizontal line at the skyline. The gravel road texture variation creates diagonal and slightly curvilinear banding. The WAPA 161kV H-frame structures, monopole distribution structures, and DPV1 lattice structures create strong vertical and geometric repeated lines, but the scene appears cluttered jumbled with differing structure types and intervals. The transmission line itself is horizontal and curvilinear.

Overall, the scene is developed with the lines created by the various structure types. The naturalness of the surroundings is diminished by the amount and variety of development.

KOP 61 – I-10 Eastbound West of Quartzsite

KOP 61 (Figure 3.11-17, Appendix 7) is located along eastbound I-10 west of Quartzsite, Arizona. The KOP represents the views of eastbound I-10 travelers looking east at Segments i-06, qn-02, or qs-02, all of which would be located on BLM-administered land. The portion of Action Alternatives viewed from this KOP would all be on BLM-administered land that are comprised of scenic quality B and C, and high sensitivity, within the foreground-middleground distance zone, and VRM Class III & IV. The extent of the view from KOP 61 is limited by views of rugged blue-gray mountains in the background and smaller rugged light tan to dark brown hills in the distant foreground-middleground. Viewers are looking at a light tan slightly rolling desert plain in the immediate foreground that appears coarse and rocky to stippled, and sparsely vegetated. Vegetation is shades of yellow-green, dark green, and gray-green, mostly clumped and wispy, that becomes uniform and indistinct with distance. The desert plain gently slopes lower in elevation and the Town of Quartzsite (approximately 5 miles away) appears as a horizontal elongated cluster of dots in the middleground. A series of subtle horizontal lines are created in the foreground where vegetation follows undulation in the desert plain and meets the base of the nearest rugged hills, while the mountains create a jagged and undulating horizontal line at the skyline. The diagonal and flat gray paved I-10 is prominent in the view and leads the viewer to look east into the distance. Fence posts provide a series of short vertical lines barely noticeable in the vegetation to the south. Vehicles are dotted in the distance on I-10.

KOP 30 – Copper Bottom Pass Road #1

KOP 30 (Figure 3.11-18, Appendix 7) is located south of Quartzsite, Arizona along the gravel road that travels west-northwest through Copper Bottom Pass, west of the intersection with US 95. The KOP represents the views of travelers on Copper Bottom Pass Road looking west-northwest, viewing Segments p-09 and p-10 on BLM-administered land designated VRM Class III. Segment p-09 is within either VRI Class II or III (or both), comprised of scenic quality B and high sensitivity, within the foreground-middleground distance zone, and are on BLM-administered land designated VRM Class II. The view from KOP 30 is views flat desert plain with rugged mountains in the middleground to background enclosing the view. Exposed tan-gray earth in the foreground is stippled to coarse and rocky. Vegetation is very sparse in the immediate foreground, and is sparse green, dark green, and yellow-green, clumped and rounded with distance; becoming dense and uniform, forming a soft green horizontal line at the base of the mountains. The rugged tan, dark brown, and black mountains create a jagged and broken irregular horizontal line at the skyline. Tire tracks in the gravel road and other changes in texture create diagonal and curvilinear tan-gray banding. The monopole structures and DPV1 lattice structures create strong vertical and geometric repeated lines, but with slightly different intervals. The transmission line itself is horizontal and curvilinear. As travelers move through the landscape along the road, the utility structures become sky lined and visible, and attract more attention than the picture might otherwise indicate.

KOP 32 – Copper Canyon

KOP 32 (Figure 3.11-19, Appendix 7) is located in the Copper Bottom Pass area, west-southwest of Quartzsite, Arizona. The KOP represents the views of travelers on the gravel road through Copper Bottom Pass looking at Segments p-09, p-10, and cb-01 on BLM-administered land. Segments p-09 and p-10 are designated either VRM Class II, III, or both, comprised of VRI Class II and III, or both, have scenic quality of either C and B or both, comprised of lands with high sensitivity in the foreground-middleground zone Viewers are looking at the canyon bottom in the foreground enclosed by rugged mountains on either side, focusing the view on the middleground where the canyon opens up to the open desert plain with distant rugged blue-gray mountains at the skyline in the background. Horizontal to diagonal striations in the geology of the canyon walls converge at the mouth of the canyon emphasizing the focus on the distant views. Exposed tan-gray earth in the foreground is rocky to stippled. Native vegetation is dotted on the sides of the canyon, clumped in the foreground, becoming more uniform in the canyon bottom, in shades of green, dark green, and yellow-green. The rugged distant mountains create a short faint jagged horizontal line at the skyline. There are two existing power lines that are visible but not noticeable in the landscape from this KOP: a distribution line on monopoles delivering power to the communications site on Cunningham Peak and the DPV1 line on lattice structures. However, while driving along the gravel road, both the monopoles and lattice structures are more visible, obvious, and attract attention in a way that is not conveyed from this KOP. The KOP demonstrates how well the existing power infrastructure blends with the landscape under certain circumstances.

KOP 33 – Johnson Canyon

KOP 33 (Figure 3.11-20, Appendix 7) is located in Johnson Canyon in the Copper Bottom Pass area, west-southwest of Quartzsite, Arizona. The KOP represents the views of hikers and OHV recreationists looking at Segment cb-02 (which would be upslope to the left within the canyon) on BLM-administered VRI Class II and III land, comprised of scenic quality B and high sensitivity, within the foreground-middleground distance zone; and VRM Class II and III. Viewers are looking west-southwest at the enclosed landscape of the meandering canyon bottom in the foreground, enclosed by rugged mountains on either side, focusing the view where the canyon walls converge at the wash bottom. Landforms in the canyon are bold, angular, and somewhat conical. Repeated diagonal striations in the geology of the canyon walls and the diagonal slope lines point to the wash bottom, focusing the convergence. Exposed tan-gray earth in the foreground contains boulders and is rocky to stippled. Vegetation is dotted on the sides of the canyon, clumped in the foreground, punctuated by occasional saguaros, becoming more uniform with distance along the wash bottom, in shades of green, dark green, and yellow-green. The canyon walls form a sharp jagged horizontal line in the foreground-middleground. The wash bottom creates a light gray-tan irregular and indistinct curvilinear band. No development is visible, and despite the fact that the canyon is favored for OHV recreation, there are only minimally noticeable signs of use.

KOP 34 – Copper Bottom Alternatives Intersection

KOP 34 (Figure 3.11-21, Appendix 7) is located southwest of Quartzsite, Arizona, west of Copper Bottom Pass. The KOP represents the views of recreationists and backroad travelers looking east-northeast at the point where either Segment cb-01 or cb-02 would join with Segment cb-04 on BLM-administered VRI Class II land, comprised of scenic quality B and high sensitivity, within the foreground-middleground and seldom seen distance zones; and VRM Class II and III. The view from KOP 34 is enclosed by rugged angular pyramidal mountains in the foreground-middleground sloping down to the desert plain and lower angular rugged hills in the foreground. The rough and rocky to stippled wash bottom in the foreground is dotted with rounded shrubby green and yellow-green vegetation that becomes more uniform at the base of the mountains, and again becomes dotted on the hillsides. Occasional saguaros and ocotillos are visible and add to the diversity of vegetation. Vegetation at the base of the mountains forms a faint horizontal line that becomes sharp and distinct for a short distance at the horizon. The mountains create a jagged and undulating horizontal line at the horizon. A short segment of a rough two-track dirt road, along with rocks and vegetation along the wash create gently curvilinear gray-tan banding in the scene. Communication towers on top of Cunningham Peak are faintly visible as short thin vertical lines.

KOP 35 – Copper Bottom Pass Road #2

KOP 35 (Figure 3.11-22, Appendix 7) is located in the Copper Bottom Pass area, west-southwest of Quartzsite, Arizona. The KOP represents the views of travelers on the gravel road through Copper Bottom Pass looking at Segment p-11 on BLM-administered VRI Class II and III land, comprised of scenic quality B and high sensitivity, within the foreground-middleground and seldom seen distance zones; and VRM Class III. Viewers are looking at the canyon bottom in the foreground enclosed by rugged mountains on either side, focusing the view on the middleground where the canyon opens up to the open desert plain with distant rugged mountains at the skyline in the background. Diagonal striations in the geology of the canyon walls converge at the bottom of the canyon emphasizing the focus on the distant views. Exposed tan-gray earth in the foreground is rocky to stippled. Native vegetation is dotted on the sides of the canyon, sparsely clumped in the foreground, becoming more uniform in the canyon bottom, in shades of green, dark green, and yellow-green. The rugged distant mountains create a short faint jagged horizontal line at the skyline. The gravel road is visible as tan-gray curvilinear banding in the canyon bottom going into the distance. The existing DPV1 transmission line and lattice structures are noticeable in the foreground, and continue on down the canyon, but blend with the landscape to the point of being barely noticeable. However, while driving along the gravel road, the lattice structures are more visible, obvious, and attract attention in a way that is not fully conveyed from this KOP. The KOP helps to demonstrate how well the existing power infrastructure blends with the landscape under certain circumstances.

KOP 36 – Dome Rock Mountains

KOP 36 (Figure 3.11-23, Appendix 7) is located southwest of Quartzsite, Arizona, west of Copper Bottom Pass on Reclamation-managed public lands. The KOP represents the views of recreationists and backroad travelers looking north at Segment cb-05 or cb-06 on Reclamation-managed public lands. Segments cb-05 and 06 would both be on BLM-administered land that are comprised of scenic quality B and C, and moderate sensitivity. Portions would also be within

either the foreground-middleground and seldom seen distance zones and VRI Class III and/or IV, and VRM Class II and/or III. The view from KOP 36 is open and panoramic with flat desert plain in the foreground-middleground and low hills and rugged angular pyramidal mountains in the middleground and background. The gravely to stippled exposed earth in the foreground has clumped rounded shrubby green, yellow-green, and gray green vegetation that becomes more uniform with distance. Vegetation at the base of the low hills and mountains forms a distinct horizontal line. Another irregular horizontal line is created by light tan vegetation or exposed earth. The mountains create a jagged and undulating horizontal line at the skyline. Communication towers on top of Cunningham Peak are faintly visible as short thin vertical lines. Lattice structures of the DPV1 line are regularly spaced and faintly visible at the horizon in the distance. Rocks have been arranged to create a fire ring in the immediate foreground.

KOP 37 – Ehrenberg Cibola Road

KOP 37 (Figure 3.11-24, Appendix 7) is located southeast of Ehrenberg, Arizona, on BLM-administered land. The KOP represents the views of recreationists and backroad travelers looking south-southeast at Segments p-13 or cb-05 on BLM-administered land. Segment p-13 would be within VRI Class III and/or IV lands, comprised of scenic quality C and/or B and moderate sensitivity, within the foreground-middleground and seldom seen distance zones; and designated VRM Class II and/or III. The view from KOP 37 is open and panoramic with flat desert plain in the immediate foreground, low hills in the foreground-middleground, and rugged angular pyramidal mountains in the background. The gravely to stippled exposed earth in the foreground has sparse clumped rounded shrubby green and yellow-green vegetation that becomes dotted with distance. Vegetation at the low hills and mountains is not discernable. The mountains create a jagged and undulating horizontal line at the horizon. Lattice structures of the DPV1 line are regularly spaced geometric structures that attract attention in the foreground and run perpendicular to Ehrenberg Cibola Road. Transmission lines are soft horizontal curvilinear lines. The graded dirt road is visible in the foreground as a strong horizontal linear feature that disappears into the middleground. However, as it is simply bladed native materials, the color blends with the surrounding landscape. The road, tracks in the dirt, and shoulders create banding in shades of tan-gray. The associated fence line is faint in the foreground-middleground.

KOP 38 – Ehrenberg Wash

KOP 38 (Figure 3.11-25, Appendix 7) is located east-southeast of Ehrenberg, Arizona, in Ehrenberg Wash on Reclamation-managed public lands. The KOP represents the views of recreationists and backroad travelers looking south-southeast to southwest at Segment p-12 and Segment cb-06 or Segment cb-05 on BLM-administered land. Segments p-12 and cb-05 would be within VRI Class II, III, and IV lands; comprised of scenic quality C and B, and moderate or high sensitivity, within the either the foreground-middleground and seldom seen distance zones, and designated VRM Class III. The view from KOP 38 is open and panoramic with flat desert plain in the foreground-middleground and hills and rugged angular pyramidal mountains in the background, which form a jagged line at the horizon. The gravely to stippled exposed earth in the immediate foreground is devoid of vegetation, transitioning to clumped rounded shrubby green, yellow-green, and gray green vegetation in the foreground that becomes dense and uniform with distance. Vegetation forms a broken and irregular horizontal line at the horizon west of the mountains. A diagonal line is created by a bladed road in the foreground. There are two yellow road signs visible in the foreground, one along the road and the other in the vegetation indicating

the presence of another road. Lattice structures of the DPV1 line are regularly spaced and faintly visible in the foreground-middleground with transmission lines that form faint undulating horizontal lines.

3.11.2.4 Linear KOPs

I-10 Linear KOP

Traveling westbound along I-10 at highway speeds and entering the study area from the east, there are low rough hills on either side of the highway. The viewer can see the DPV1 structures crossing the highway, coming out from behind the hills to the south, then going north in front of the hills. Once the viewer crosses under the eastern crossing of I-10 by the DPV1 line and through the hills either side of the highway, the view opens up to a wide desert plain. The Delaney Substation is tucked slightly behind the hills south of I-10, and is difficult for westbound travelers to see, but is more clearly visible for eastbound travelers. Figure 3.11-2 (Appendix 7) shows that the scenic quality ratings for the area visible around I-10 are higher to the south than to the north. While mountainous terrain is visible in both directions, the higher scenic quality to the south, including views of Saddleback Mountain, Courthouse Rock, and mountains areas of the Kofa NWR attract the attention of viewers traveling along I-10.

Continuing west on I-10, viewers see the DPV1 line merging with and crossing I-10 from north to south, then diverging from I-10 as viewers continue to travel west. Views remain open and unimpeded except for a slight enclosure where the highway passes through another small range of low rugged hills. Views to the south continue to demand attention and evolve as the viewer comes closer to the New Water Mountains WA, Kofa NWR, and Kofa WA. Views along westbound I-10 gradually become enclosed by mountains. KOP points representing views of travelers on I-10 in the eastern portion of the Project Area include KOPs 3, 8, 17, 18, 20, 59, and 60.

Viewers emerge from the enclosed views of the Plomosa Mountains looking across a north-south trending valley that dips down to the Town of Quartzsite, then increases in elevation as I-10 continues westward through the Dome Rock Mountains. While views are scenic looking both north and south, southern views of the Kofa WA and NWR attract viewers' attention.

During the winter months (roughly October through March) viewers traveling along I-10 will notice individual, clustered RVs in campsites in the low hills or wash areas; and densely occupied areas of RVs on the desert plain as they approach Quartzsite. Also, while approaching Quartzsite from the east, viewers will see monopole structures and conductors of the WAPA 161kV transmission line crossing I-10 after circumnavigating Quartzsite to the north, then briefly crossing the BLM La Posa LTVA to the south.

Passing through Quartzsite, the scene is typical of small towns along interstate or other major highways, with fast food restaurants, gas stations, truck stops, lodging, and residences. In the winter months, Quartzsite appears bustling and congested with packed RV parks, people, and vehicles in the area, especially during the Gem and Rock Show in January. The small town enjoys a backdrop of scenic mountains near the highway and enclosing views to the south, and somewhat more distant to the north. West of Quartzsite, the view becomes rapidly enclosed as

the highway enters the Dome Rock Mountains. KOP points representing the views along I-10 in the vicinity of Quartzsite include KOPs 26 and 61.

West of Quartzsite, views are enclosed to the north and south by the rugged and scenic Dome Rock Mountains. Emerging from the Dome Rock Mountains to the west, the scene opens up and becomes panoramic, offering views of the west side of the Dome Rock Mountains and the desert plain to the west, approaching the Colorado River. When traveling east on I-10 through the Copper Bottom Pass area, viewers can look southeast up Copper Bottom Pass and see the DPV1 transmission line emerging from and approaching I-10, before diverging from the highway and fading into the distance. Westbound travelers see the DPV1 line approaching and diverging from I-10, but because of the angle of view, cannot easily see up Copper Bottom Pass. This area is also used for dispersed camping and may be dotted with individual or groups of RVs during the heavy visitor use season. KOP points representing the views of travelers on I-10 in the area of Copper Bottom Pass include KOPs 39 and 40.

Westbound travelers on I-10 see the desert plain transitioning to agricultural areas and riparian vegetation approaching Ehrenberg and the Colorado River. Travelers crossing the Colorado River looking south see residential and commercial development along the banks of the river, and a pipeline bridge also crossing the river. Once across the river, looking south the view is of the river floodplain that is developed for agriculture. Traveling through the City of Blythe is similar to Quartzsite in that I-10 is rimmed with fast food establishments, restaurants, gas stations, truck stops, lodging, and residential areas; however, the backdrop to the City is mostly agricultural with distant mountain views.

West of the City development, the agricultural plain rises to desert bluffs, that become desert plain. Development becomes more industrial in nature, with views of the Blythe Airport, a power plant, a solar generating facility, and several transmission lines leading to the Colorado River Substation. Just south of the Highway and Airport is the small residential community of Nichols Warm Springs. The Colorado River Substation comes into view approximately 1 mile south of I-10, along with numerous gen-tie and transmission lines. The DPV1 transmission line can be seen distantly approaching the substation.

Because the Proposed Action would be approximately 6 miles south of I-10, and the majority of the Action Alternatives would be a few miles south of I-10, KOPs were mainly established to view the Colorado River Substation area. Therefore, KOP points representing the views of travelers along I-10 include KOPs 55 and 56.

US 95 Linear KOP

US 95 travels north-south through the north-south trending valley containing the Town of Quartzsite. The stretch of US 95 south of Quartzsite in the study area is heavily used for recreation access in the Quartzsite area. The La Posa LTVA is accessed from US 95 just south of Quartzsite, and gravel roads from US 95 offer access to the Kofa NWR to the east and the Copper Bottom Pass area in the Dome Rock Mountains to the west.

Southbound travelers on US 95 south of Quartzsite are looking at the relatively narrow desert plain between the Plomosa and New Water Mountains on the east and Dome Rock Mountains on the west. On the east side of the highway are monopole and H-frame structures of the WAPA

161kV transmission line. On the west side of the highway are single wood pole structures for local distribution and/or telephone lines. The La Posa LTVA is located on both the east and west sides of US 95, with occasional visitor contact stations. In winter months, the area would be densely occupied with RVs. In times outside of the heavy visitor use season, the area appears even more sparsely vegetated than the surrounding landscape and dotted with occasional RVs. Pipeline Road west of US 95 provides access to a small residential community that is distantly visible from the Highway. KOP points representing the views along Highway 95 south of Quartzsite include KOPs 28 and 29.

3.12 PAST, PRESENT, AND REASONABLY FORESEEABLE FUTURE PROJECTS

3.12.1 Introduction

NEPA identifies three types of potential impacts: direct, indirect, and cumulative. A cumulative impact is the impact on the environment that results from the incremental impact of the Proposed Action when added to other past, present, and reasonably foreseeable future actions regardless of what agency (Federal or non-Federal) or person undertakes such other actions. Cumulative impacts can result from individually minor but collectively significant actions taking place over a period of time (40 CFR §1508.7).

Within the cumulative effects areas (CEAs), a list of past, present, and reasonably foreseeable future projects that could result in related or cumulative impacts was developed. To collect data for the past, present, and reasonably foreseeable future projects list, general plans and other publicly available documents were reviewed, agency and county representatives were contacted, and developers were contacted to gather additional information on planned projects (HDR 2017k). Agencies contacted include the BLM field offices, Reclamation, DOD YPG, ASLD, California State Lands Commission (SLC), as well as Maricopa, La Paz, and Riverside Counties.

3.12.2 Cumulative Effects Areas

For most resources, the CEA is an area that includes the Proposed Action and the Action Alternative segments, and a buffer of 2 miles from the outermost segments. This was selected because it is equal to the resource's study area and the impacts identified for those resources would not have an effect outside of the area. However, the range of the CEA for some resources is larger than the general 2-mile buffer due to the nature of the resource and the impact study area. Air quality has a CEA with a 31-mile radius because air impacts can affect the entire basin in which they occur. The traffic and transportation, visual, cultural resources, and Concerns of Indian tribes' CEA is up to 5 miles from the outermost segment. For the EJ and socioeconomic resource areas, the CEA encompasses the entire three county areas. Figure 3.12-1 (Appendix 7) presents the CEAs for these environmental resource areas.

3.12.3 Past, Present, and Reasonably Foreseeable Actions

Land ownership plays an important role in how land is managed and the types of activities that take place. All CEAs for the Project include a mix of Federal, state, Indian, and private lands. Public lands managed by the BLM are used for a variety of purposes including dispersed recreation, wildlife, livestock grazing, mining, and transportation and utility corridors. Public

lands are also managed for special values, including the Big Horn Mountains WA, Hummingbird Springs WA, New Water Mountains WA, Kofa NWR, Dripping Springs Area of Critical Environmental Concern (ACEC), and Mule Mountains ACEC. Public lands managed by Reclamation are managed to operate dams, power plants, and canals providing water and hydroelectric power. State trust lands are generally managed for commercial uses that generate revenue for the benefit of Arizona or California schools, or managed for wildlife (and their habitat), or recreation. State trust lands are also developed for public purposes such as roads, utilities, and other infrastructure. Private lands have been developed for residential and commercial purposes, agriculture, roads, highways, landfills, airports, etc. The lands included in all of the CEAs contain a mixture of undeveloped lands, agriculture, cities and towns, roads and highways, utilities, commercial and residential development, military facilities, and mining.

Table 3-1 details the land ownership by CEA. The information in Table 3-1 is referred to throughout the discussions by resource topic in the proceeding sections.

Table 3-1 Land Ownership within the 2-Mile and 5-Mile CEAs

LAND OWNERSHIP	TOTAL 2-MILE CEA		TOTAL 5-MILE CEA	
	AC	%[1]	ACRES	%[2]
BLM	395,687.5	55.6	655,709.2	55.8
Reclamation	12,828.1	1.8	13,109.5	1.1
USFWS	68,583.4	9.6	116,008.6	9.9
Military	14,618.1	2.1	39,866.8	3.4
Indian Lands	8,718.0	1.2	27,957.7	2.4
County	15.5	<0.1	15.5	<0.1
Private	148,933.9	20.9	237,617.8	20.2
State Trust – Arizona	62,138.7	8.7	84,350.6	7.2%
State – California	49.2	<0.1	924.2	<0.1
Total All Owners	711,573.1	100	1,175,643.6	100.0

[1]percentages based on the total acres within the 2-Mile CEA.

[2]percentages based on the total acres within the 5-Mile CEA.

Past, or existing, land uses from which disturbance can be inferred have been quantified (Table 3-2) for the General CEA (2-mile) and the 5-mile CEA. These calculations provide a baseline for general conditions within the CEAs. Specific present and reasonably foreseeable future projects that could contribute to cumulative impacts are listed in Table 3.12-1 and Table 3.12-2 in Appendix 3. These tables indicate the project name and project type, as well as its location and status. Each project is identified by a map number, keyed to Figure 3.12-1 (Appendix 7). This figure shows the locations of projects that could result in impacts within the CEAs.

Table 3-2 Quantifiable Land Use within the 2-Mile and 5-Mile CEAs

LAND USE	TOTAL 2-MILE CEA		TOTAL 5-MILE CEA	
	ACRES	%[1]	ACRES	%[2]
Agriculture[3]	43,976.6	6.2	76,796.9	6.5
Public Lands (BLM)[4]	387,009.3	54.4	636,423.9	54.1
Reclamation[3]	12,645.8	1.8	12,916.9	1.1
Commercial[3]	2,953.0	0.4	4,615.8	0.4
County	15.5	<0.1	15.5	0
Indian Reservation	8,633.4	1.2	27,572.5	2.4
Industrial[3]	3,261.9	0.5	3,273.6	0.3
Local	527.4	0.1	751.6	0.1
Military	14,663.7	2.1	39,885.1	3.4
Mixed Use[3, 5]	4,544.5	0.6	6,010.8	0.5
Open Space	5,630.7	0.8	9,465.3	0.8
Open Water	212.4	<0.1	265.2	<0.1
Public/Semi-public[3]	2,649.1	0.4	3,921.6	0.3
Urban Residential[3]	7,988.8	1.1	22,496.1	1.9
Rural Residential[3]	65,819.5	9.3	95,291.8	8.1
Solar Facility[3]	12,291.7	1.7	23,399.6	2.0
Special Designation Lands	39.3	<0.1	211.9	<0.1
State Trust Lands	61,557.4	8.7	84,475.1	7.2
Transmission Lines[3,6]	995.0	0.1	1,107.2	0.1
Transportation[3,6]	8,071.2	1.1	11,515.8	1.0
USFWS	68,077.0	9.6	115,231.3	9.8
Totals	711,573.1	100.0	1,175,643.6	100.0
Total Acres Disturbance[3]	165,197.1	23.2	261,346.1	22.2

[1]percentages based on the total acres within the 2-Mile CEA.

[2] percentages based on the total acres within the 5-Mile CEA.

[3]for purposes of quantification, these categories are considered disturbances.

[4]land use either undeveloped or unspecified in GIS data

[5]mixed use includes multi-family commercial use, employment centers, neighborhood commercial, planning development, and undetermined uses.

[6]Road centerlines were buffered from 10 (i.e., driveway) to 60 feet (i.e., freeway) depending on road type; transmission lines assume 50-foot ROW

Collectively, these projects represent known and anticipated activities that may occur in the general Project vicinity and that have the potential to contribute to a cumulative impact. Because the Project would be linear, most of the projects in Table 3.12-1 and Table 3.12-2 in Appendix 3 would not contribute to cumulative impacts along the entire route. These projects are limited in their geographic extent. Others, such as the DPV1 and the El Paso National Gas pipeline, are linear facilities that would parallel or overlap with segments of the Project over great geographic distances, in multiple counties. The majority of the planned projects in the CEA are located in Riverside County, California (Figure 3.12-1, Appendix 7).

3.12.4 Cumulative Project Scenario by Resource

3.12.4.1 Soil Resources

Geographic Scope

The CEA for soils is the area that includes the Proposed Action and Action Alternative segments, and a 2-mile-wide buffer surrounding them. The CEA for Soil Resources encompasses 711,573 acres.

Cumulative Conditions

The primary source of impacts to soils is surface disturbance which is directly tied to land use. Disturbed soil loses its structure and porosity when disturbed through displacement or compaction by heavy equipment. Consequently, the soil is more prone to erosion by water or wind and may be less able to support some kinds of vegetation (loss of productivity).The types of past and present disturbances that have affected soils in the CEA include , utility corridors, road construction, , energy development, mineral extraction, livestock grazing, agricultural activities and recreational use. These activities and other types of developments could modify surface topography, thus altering drainage and erosion. (Table 3-2 above and Table 3.12-1 in Appendix 3).

Numerous utility and energy development projects have occurred in the CEA, including the DPV1 transmission line, WAPA transmission line, El Paso natural gas pipeline system, and numerous solar facilities and gas power plants (Appendix 3, Table 3.12-1). Known active existing mines in the general vicinity of the Project include the West Port Gold Project, the Ehrenberg Wash pit, and the Plomosa Mine Quarry.

3.12.4.2 Biological Resources

Geographic Scope

The CEA for biological resources, including vegetation and wildlife resources, is the general CEA which includes the Proposed Action and Action Alternative segments and a 2-mile-wide buffer (711,573 acres).

Lower Sonoran Desert

- Approximately 43 percent of the Lower Sonoran region is in Federal ownership, 23 percent is private, 10 percent is state trust lands, and 24 percent is tribal land.

Upper Sonoran Desert

- Approximately 47 percent of the Upper Sonoran region is in Federal ownership, 12 percent is private, 17 percent is state trust lands, and 24 percent is tribal land.

Cumulative Conditions

Past and present land uses have altered the extent, structure, and composition of native vegetation communities in the CEA. Vegetation communities adjacent and near existing highway corridors have largely been degraded by long-term impacts associated with easy access off the highways for recreation; commercial, residential, and agricultural development adjacent to I-10, including the presence of roads, canals, and various utility lines; and the LTVA along US 95. Evidence of OHV use is present throughout, resulting in damage to and loss of vegetation. Highway corridors function as dispersal routes for non-native invasive plants. Commercial and residential developments and associated infrastructure, as well as agricultural development, results in clearing native vegetation; grazing by livestock can contribute to increased competition with native species for forage, facilitating the spread of noxious and non-native invasive weeds, changing the structure and composition of native plant communities, and degrading water quality. Undeveloped lands generally retain their native vegetation communities, with noxious and invasive weed species often taking root, especially in areas near roads and other disturbances.

Past and present actions in the CEA (Table 3-2 above and Table 3.12-1 in Appendix 3) have resulted in negative impacts to wildlife at various levels. The primary impact to wildlife resources within the CEA include habitat loss and fragmentation, and displacement of wildlife as a result of human presence and habitat changes associated with past and present community development, roads, grazing, agricultural development, utility development (electric, water, gas, etc.), recreation, and mining. High traffic volume on interstate highways has fragmented habitat and impeded wildlife movement across the landscape; facilitated human access to adjacent areas resulting in disturbance to wildlife and damage to habitats, especially by off road vehicles; and caused repeated loss of individual animals to road mortality over the long-term, resulting in reduced population numbers. Smaller less mobile wildlife species are susceptible to crushing and mortality by vehicle traffic and other development activities.

The AGFD (2012) has summarized existing conditions and stressors that are important for the conservation of biodiversity in the Sonoran Desert region. The following summary is from that document and is generally applicable in most of western Arizona and eastern Riverside County in California.

Lower Sonoran Desert

- More than 21 percent of lower Sonoran desertscrub has been replaced by development or agriculture; this region is being further reduced by urban expansion and energy development.
- Much of the area has been degraded by livestock grazing.

Upper Sonoran Desert

- About 8 percent of this region has been replaced by development or agriculture.
- Invasion of nonnative plants and a resulting increase in the risk of wildfire in areas where fire was not a natural occurrence is an important threat to this region.

Potential impacts or threats to vegetation in the CEA and surrounding region include the following:

- Altered surface hydrology
- Disease
- Invasive plant and animal species
- Fire
- Power lines
- OHVs (especially in xeroriparian washes)
- Climate change
- Drought
- Canals and pipelines
- Military activities

Reasonably foreseeable future actions (Table 3.12-2 in Appendix 3) in the CEA include: additional transmission lines, roads, and other linear disturbances (e.g., transmission lines); large-scale energy development (i.e., solar facilities and a power plant); mine development; and additional OHV use and other dispersed and concentrated recreational activities. With the presence of the Project and added transmission capacity, the CEA may be more attractive to new utility scale energy development than without the Project.

3.12.4.3 Cultural Resources

Geographic Scope

The CEA for the analysis of cultural resources is the Proposed Action and Action Alternative segments, and a 5-mile-wide buffer (1,175,644 acres). This is the area in which direct and indirect impacts to cultural and historic resources could occur through physical disturbance, encroachment, or visual impacts. A 5-mile buffer should encompass the extent of the visual analysis and the vantage points from which the Proposed Action and Action Alternative segments, and other past, present, and reasonably foreseeable disturbances can be discerned. Although the CEA for cultural resources was generally within 0.5-mile of the Proposed Action and Action Alternative segments, aerial photos for traditional and cultural properties within 5 miles of the segments were reviewed to take into account cultural, historic, and visual impacts.

Cumulative Conditions

Land ownership is detailed in Table 3-1 and shows that 70.2 percent of the CEA is under Federal regulatory oversight, subject to Section 106 of NHPA. An additional 84,350 acres (7.2 percent) are Arizona state trust lands and 924 acres (less than 0.1 percent) are California state lands, subject to state regulatory oversight.

Past and present disturbances to cultural resources in the CEA have been the result of utility installation, road development, ranching/agriculture, residential and commercial development, archaeological excavation, recreational activities, and likely vandalism and unauthorized artifact collection. The past and present land uses in the CEA have resulted in the loss, disturbance, theft,

and burial of cultural artifacts and sites, as well as the modification and alteration of the setting of cultural sites and resources. The incremental degradation of cultural resources reduces the information and interpretive potential of historic properties. Development on state and Federal lands requires that cultural resource surveys be conducted to determine the presence of cultural resource sites eligible for listing on the NRHP. As directed by Section 106 of the NHPA, NRHP-eligible sites are generally avoided or mitigated if avoidance is not possible for projects with a Federal or state nexus. Projects/development disturbances conducted prior to 1966 (i.e., prior to NHPA) and/or those without a Federal or state nexus generally did not identify/quantify cultural resource sites or impacts to them.

Sites that have been determined to be ineligible for the NRHP did not require avoidance, have been discharged from management, and therefore have likely been impacted by the activities requiring the cultural resource inventory (i.e., development, utility installation, fence projects, road construction, etc.).

Impacts to cultural and historic resources would occur during construction if NRHP-eligible resources are disturbed or destroyed as a result of excavation and/or removal. Further ongoing impacts could occur as a result of visual impacts. Increased access to remote areas as a result of Project construction could result in increased vandalism of cultural resources.

Current and future development would contribute to cumulative cultural resources adverse effects in the region.

3.12.4.4 Concerns of Indian Tribes

Geographic Scope

The CEA for the analysis of concerns of Indian tribes includes the Proposed Action and Action Alternative segments and a 5-mile-wide buffer surrounding them (1,175,644 acres). This is based on the scale of the Project and the vantage points from which the Proposed Action and Action Alternative segments, and other past, present, and reasonably foreseeable disturbances can be discerned from potential areas of importance to the tribes. Consultation and coordination with several of the tribes suggests that the CEA is both a traditional cultural landscape and there may be TCPs present.

Cumulative Conditions

Various tribes have been consulted and informed of the Project. Tribes have expressed interest and concern about potential effects to the native landscape, the viewshed, trails and elements of Native infrastructure across the desert, cultural resource sites, and TCPs that are within their traditional territories and may have been inhabited or used by their ancestors. Noted concerns include the many transmission lines and renewable energy projects within the viewshed (Appendix 3, Table 3.12-1). Past actions affecting concerns of Indian tribes include vandalism and looting of prehistoric sites, unauthorized excavation of prehistoric sites, recreational use, roadway and infrastructure construction, and urban and rural developments. Current and future development (Appendix 3, Tables 3.12-1 and 3.12-2; Figure 3.12-1, Appendix 7) would contribute to cumulative impacts to concerns of Indian tribes in the region.

3.12.4.5 Land Use

Geographic Scope

The CEA for land use is the Proposed Action and Action Alternative segments and a 2-mile-wide buffer surrounding them, encompassing 711,573 acres.

Cumulative Conditions

Tables 3-1 and 3-2 present land ownership and land uses in the CEA from which land management and disturbances can be inferred. The dominant developed land uses (Table 3-2) in the CEA consist of 73,808 acres of residential lands (10.4 percent of CEA) and 43,977 acres of agricultural land (6.2 percent of CEA). Transmission lines and solar facility development total 13,287 acres (1.9 percent of the CEA).

Past and present developments and disturbances related to land use were presented in Section 3.7. In general, the CEA is characterized by open, desert lands used for grazing, mining, utilities, recreation, and dispersed residential development. In some areas, open desert has been converted to residential, commercial, and industrial uses (e.g., YPG, power plants, electrical substations, mines). Reclamation managed lands include the CAP canal (which itself is managed by the Central Arizona Water Conservation District).

Reasonably foreseeable future development in the region includes additional transmission lines, gas pipelines, roads, and other linear disturbances; large-scale energy development, especially in California; and additional OHV use and other dispersed and concentrated recreational activities. Placement of transmission line alternatives near towns and cities could reduce the number of options for compatible uses on nearby lands. The cumulative analysis will evaluate the Project's contribution to cumulative visual, recreational, residential, and agricultural impacts which could affect local land uses important to local economies.

3.12.4.6 Recreation

Geographic Scope

The CEA for the analysis of recreation is the general CEA that includes the Proposed Action and Action Alternative segments and a 2-mile-wide buffer (711,573 acres).

Cumulative Conditions

Lands with special designations provide opportunities for solitude and primitive, unconfined recreation and protect natural or undeveloped landscapes and resources. Lands within the CEA provide opportunities for dispersed and developed recreation. Dispersed recreation includes camping, hunting, wildlife observation, photography, backpacking, horseback riding, hiking, and backcountry driving. Developed recreation includes parks and OHV trails. Portions of the proposed Arizona Peace Trail are located within the CEA.

Residential and commercial developments have led to surface disturbances and converted native vegetation communities to urban landscaping. Population growth has increased traffic and pressure in recreational areas. The mixture of land use development in the CEA has altered the land, its character, and the viewshed.

Reasonably foreseeable projects in the CEA include roads and other linear disturbances; large-scale energy development, especially in California; and OHV use and other dispersed and concentrated recreational activities.

3.12.4.7 Socioeconomics and Environmental Justice

Geographic Scope

The CEA for socioeconomics and EJ is Maricopa and La Paz Counties in Arizona and Riverside County, California. This is the geographic extent of the cumulative impact analysis because socioeconomic factors such as public services and utilities are provided by local jurisdictions or districts, and the local labor force is expected to come primarily from within these counties. In addition, public services and utilities plans and population and housing demand projections are prepared at the county level. The Environmental Justice CEA includes the three-county area and the Block Groups used for evaluating impacts for this topic area.

Cumulative Conditions

The range of potential cumulative impacts that should be considered in the cumulative socioeconomics and EJ analysis includes effects on local economies and local labor force demand. Future foreseeable projects such as planned solar energy projects and associated utilities in combination with the Project may require construction workers from within the same local labor force if they are constructed concurrently with the Project. The development of these projects in combination with the construction of the Project could result in an impact to the local housing market if construction workers were to relocate into the area.

Past development and population growth within the CEA have impacted employment, public services, utilities, and housing demands. Population increases have increased development in Riverside County and Maricopa County (mainly in incorporated areas), expanded the demand for housing, and increased the available workforce. Additional development both increases pressure on existing public services and utility systems and provides additional infrastructure to increase capacity and change employment opportunities.

The Project in conjunction with reasonably foreseeable energy, utility, and other infrastructure projects could support population increases in the area for the foreseeable future. The CEA has a rural character and local communities rely on that character to draw visitors that support their local economy.

As expressed by the CRIT, they have a deep connection to the landscape, natural and cultural resources, and wildlife. Continued development could result in impacts to the cultural landscape and linkage.

3.12.4.8 Visual Resources

Geographic Scope

The CEA for the analysis of visual resources includes the Proposed Action and Action Alternative segments and a 5-mile-wide buffer surrounding them. This is based on the scale of the Project and the diminution of the apparent size of objects at greater distances. In general, taller structures can be viewed from greater distances.

Cumulative Conditions

Cumulative effects to visual resources occur where built facilities or activities occupy the same field of view as other built facilities or impacted landscapes, and an adverse change in the visible landscape character is perceived. These are often categorized as local viewshed effects. A cumulative effect could also occur if a viewer perceives that the general visual quality or landscape character of a localized or regional area (I-10 corridor) is diminished by the proliferation of visible similar structures or construction effects, even if the changes are not within the same field of view as existing (or future) structures or facilities. The result is a perceived "industrialization" or "urbanization" of the existing rural or undeveloped landscape character. These are often categorized as regional viewshed effects.

The types of past and present disturbances that have affected visual resources in the CEA include large scale energy development, transmission lines and other utility corridors, road construction, agricultural activities, residential development, and mining activity (Table 3-2). Specific projects and disturbances that have affected visual resources are described in Table 3.12-1 in Appendix 3. Specifically, in the western portion of the CEA, there are 7 existing solar facilities, along with their associated gen-tie lines; 6 transmission lines, and 1 combined cycle power plant that visually contribute to a sense of industrialization, particularly in the vicinity of the Colorado River Substation.

Reasonably foreseeable future disturbances that may affect visual resources in the CEA include additional large scale solar facilities, a power plant, and mining activity (Table 3.12-2 in Appendix 3). Specifically, in the western portion of the CEA, an additional 3 solar facilities, along with their associated gen-tie lines are proposed; and an additional combined cycle power plant.

Chapter 4 Environmental Consequences

CHAPTER 4 ENVIRONMENTAL CONSEQUENCES

4.1 INTRODUCTION

Section 4.1 provides an introduction to the chapter and the definitions for terms used to describe environmental effects.

Section 4.2 presents the non-key resource impact summaries for resources that are not key to distinguishing between alternatives or the decision-making process.

Sections 4.3 through 4.11 discuss the environmental consequences for each key resource, including direct, indirect, and cumulative effects. Residual, unavoidable adverse effects, irreversible and irretrievable impacts, relationship of short-term use versus long-term productivity, and MMs are also presented. Additional resource data analysis is provided in the TES, available on the BLM's ePlanning website.

4.1.1 Impact Assessment

The No Action Alternative forms the baseline against which the potential impacts of the Proposed Action and Action Alternatives on the human environment are compared., Under all alternatives, including the No Action Alternative, changes to the current baseline of the human environment by ongoing natural and anthropogenic processes would occur.

Many concepts and terms used when discussing impacts assessment may not be familiar to the average reader. The following sections clarify some of these concepts.

4.1.2 Environmental Effect Categories

The following environmental effect categories (Table 4-1) are presented to define relative levels of effect intensity and context and to provide a common language when describing effects. Duration of Project disturbance is generally described as short-term (during construction) and long-term (life of Project, projected to be about 50 years). The magnitude of a Project impact can be negligible, minor, moderate, or major (Table 4-1). However, specific durations and magnitudes appropriate to individual resources are defined in the following resource sections where it differs from Table 4-1.

Table 4-1 Summary of Terms Used to Describe Environmental Effects in the EIS

ATTRIBUTE OF EFFECT		DESCRIPTION
Magnitude (Intensity)	No impact	There would be no change to the current condition of resource as a result of Project construction, operation, maintenance, or decommissioning.
	Negligible	No measurable change in current conditions.
	Minor	A small, but measurable change in current conditions.
	Moderate	An easily discernible and measurable change in current conditions.
	Major	A large, easily measurable change in current conditions. A significant impact.
Duration	Short-term	During construction (1.5 – 2 years), up to 10 years.
	Long-term	More than 10 years.

4.1.3 APMs, BMPs, and CMAs

Appendix 2A contains APMs and BMPs that have been identified and described for the Project. The CDCA Plan of 1980 as amended contains CMAs, which include a specific set of avoidance, minimization, and compensation measures. The applicability of those measures to the Project was determined using a CMA checklist (Appendix 2C). Those CMA measures that were determined to be applicable to the Project are included in the Project APMs/BMPs (Appendix 2A) and are cross-referenced to the CMA checklist in Appendix 2C. Certain APM/BMPs may be called out specifically in the resource sections, however, for a complete list of applicable APM/BMPs see Appendix 2A. CMAs required for CDCA Plan compliance are identified within each resource section.

4.1.4 Avoidance, Minimization, and Mitigation of Impacts

The impact analysis in this EIS assumes avoidance of impacts to sensitive resources where possible and implementation of all APMs and BMPs (Appendix 2A) as part of the applicant's Project description. Where impacts are identified that are not precluded or adequately minimized by these APMs or BMPs (derived from RMPs), additional Mitigation Measures (MMs) are identified and analyzed as being implemented. The MMs presented in this EIS are identified in the mitigation monitoring, compliance, and reporting tables at the end of each resource analysis. If residual effects remain after the mitigation is applied, those effects are described as well. Mitigation measures are a means to address environmental impacts that are applied in the impact analysis to reduce intensity or eliminate the impacts.

Any compensatory mitigation identified in the EIS is either a requirement of the existing land use plan (CDCA Plan, as amended) or in order to comply with state or Federal law.

For cultural resources and concerns of Indian tribes, mitigation would be part of the suite of approaches used to address or resolve adverse effects in accordance with the provisions of the PA (Appendix 2D). Avoidance of cultural resource sites, followed by minimizing impacts, is the preferred method to address potential impacts to cultural resources and Indian concerns, followed by other types of mitigation or data recovery.

4.1.5 Organization of Analysis

Segments are the building blocks of the full route alternatives; therefore, analysis of segments is foundational to analysis of the full route alternatives. First, impacts common to all Action Alternative segments are disclosed. Then impacts are analyzed by segment. Then each full-route alternative is analyzed with differences in impacts, if any, by subalternative following full-route discussions.

Chapter 4 includes a discussion of direct and indirect effects specific to Project segments to identify distinguishing characteristics associated with specific segments. If a specific segment is not identified, it should be assumed that the general impacts described in Direct and Indirect Effects Common to All Action Alternatives for each resource would occur.

Brief summaries of impact analysis for "non-key" resources follow in the section below (Section 4.2). Additional information, including comparison of impacts to the No Action Alternative for "non-key" resources can be found in the TES. More detailed impact analyses of "key" resources are provided in the sections that follow (Sections 4.3 through 4.11).

4.2 NON-KEY RESOURCES

Decommissioning activities would have generally the same impacts to non-key resources as described for construction, unless otherwise noted.

4.2.1 Air Quality and Climate Change

All the Action Alternatives would result in emissions of criteria pollutants, hazardous air pollutants (HAPs), and GHGs, but operational and maintenance emissions and impacts would be much lower than construction and decommissioning phase emissions (Appendix 4, Tables 4.2-1 through 4.2-3). Fugitive dust, engine exhaust, concrete batch plant emissions, and sulfur hexafluoride (SF_6) emissions from gas-insulated circuit breakers in the switchyards would be the sources of air quality impacts. The emissions of criteria air pollutants would not exceed the conformity emissions thresholds for the Phoenix Nonattainment/maintenance Area and the criteria pollutant emissions would not exceed the daily and annual Mojave Desert Air Quality Management District (MDAQMD) significance thresholds for the Riverside corridor. CO, $PM_{2.5}$, SO_2, and volatile organic compounds (VOCs) would not exceed the Arizona Department of Environmental Quality (ADEQ) Permitting Exemption thresholds, indicating that those emissions would not exceed the NAAQS. NO_x and PM_{10} emissions would exceed the ADEQ Permitting Exemption Thresholds, but they would not exceed the applicable ambient air quality standards.

There would not be an adverse impact on climate change because: construction GHG emissions would be less than the 25,000 metric tons (MT) CO2e reporting thresholds and would be short-term; operational emissions would be long-term, but substantially below the reporting thresholds.

Because under any Action Alternative, air quality and climate change impacts would be negligible and similar, this resource is not considered key to distinguishing between the Action Alternatives or decision-making.

CMAs LUPA-AIR-1 through LUPA-AIR-3, LUPA-AIR-5, LUPA-BIO-6, and LUPA-BIO-13 would apply to the Project (Appendix 2C). The Project would comply with these CMAs through APM-AQ-01 and APM-AQ-02 and BMP-AQ-01, BMP-AQ-02, and BMP-AQ-05 (Appendix 2A, Section 2A.1). Further, the Project would not be a major stationary source of air quality or visibility deterioration (LUPA-AIR-1) (Appendix 2C).

4.2.2 Geology and Minerals

Because Project activities would have no means of influencing seismicity, the frequency and magnitude of earthquakes would not be directly or indirectly impacted from construction of any Action Alternative. Further, Project engineering would consider seismic hazards in design; therefore, potential impacts to the Project operations from earthquakes would be negligible and long-term. Because the Project would be designed to avoid steep slopes where possible and engineered solutions to mitigate for the potential for landslide/mass wasting events would be identified in geotechnical studies, the potential for landslides would not likely be changed by construction. Direct or indirect effects to the potential for landslides would not be anticipated, so impacts related to landslides would be short-term and negligible. Liquefaction potential would also be determined by geotechnical studies and would be considered in engineering and design. Even where risk is potentially high west of the Colorado River, potential impacts to the Project from liquefaction would be negligible and long-term.

Construction would cause no direct or indirect impacts to operating mines and mining districts. Transmission lines typically have little impact to mining operations since span lengths are such that access to minerals typically can be accomplished between spans. The Project ROW would be on the surface only. It would not affect any claims or entries unless the presence of the line limited access to develop the claim or occurrence during construction. Operation and maintenance of the Project would not directly impact active mines or mining districts. The location of a valid mining claim gives a mining claimant possessory rights to the lands superior to any subsequent appropriations.

This resource is not considered key to distinguishing between the Action Alternatives or decision-making because the resource would be considered in Project engineering.

There are no CMAs related to geology and minerals that would apply to the Project.

4.2.3 Paleontological Resources

Ground disturbance during construction is expected with all Action Alternatives and may result in the damage or loss of paleontological resources; however, the number and types of resources affected would vary depending on the individual alternative. Although the potential for fossils to be present (PFYC) has been identified across the study area (HDR 2017b); specific impacts are unknown until identification studies of the selected route are completed. As a result, specific direct or indirect impacts to particular paleontological resources is not known. Direct effects common to all Action Alternatives include possible damage to paleontological resources and possible loss of associated data due to construction activities. The scientific information provided by fossils is maximized by discovery of fossil specimens preserved in place within the host geologic formations. Construction disturbance activities could result in the discovery of fossil specimens. While some fossils may be damaged during construction, they may otherwise remain undiscovered. Construction could have direct negative (i.e., damage) and positive (i.e., discovery) effects on paleontological resources. Impacts to paleontological resources would be negligible to minor and long-term due to the limited extent of project ground disturbance and project micrositing to avoid identified resources. No direct effects to paleontological resources due to operations, maintenance, or decommissioning would be anticipated.

Once a route is selected, assessment and mitigation of adverse effects to paleontological resources would be conducted according to the Project's Paleontological Resource Monitoring and Discovery Plan and Treatment Plan (Appendix 2B, Section 2B.13), which would comply with the Paleontological Resources Preservation Act (P.L. 111-11, Title VI, Subtitle D).

Paleontological surveys would be conducted to identify fossil locations in areas of high or unknown sensitivity, micrositing would be done to avoid fossil locations by the Project, and monitoring would be conducted during construction activities. Because under any Action Alternative, impacts would be similar, this resource is not considered key to distinguishing between the Action Alternatives or decision-making.

CMAs LUPA-PALEO-1 and LUPA-PALEO-2 would apply to the Project (Appendix 2C) and would be satisfied by PFYC Figure 3.2-1 provided in Appendix 7 and compliance with applicable Federal laws, regulations, policies, and plans, respectively. LUPA-PALEO-3 and LUPA-PALEO-4 would also apply to the Project (Appendix 2C). The Project would comply with these CMAs through APM-PALEO-01 and BMP-PALEO-02 (Appendix 2A, Section 2A.3).

4.2.4 Grazing and Rangeland

Construction activities could have minor, short-term effects on livestock and WHB access to grazing, water sources, and seasonal movement of herds by causing temporary fragmentation of grazing allotments, ASLD lease lands, or the HMA. Construction activities involving helicopters could displace livestock and WHB grazing in the area. In addition, disturbance within grazing allotments would cause a negligible reduction of the forage available in the allotment until revegetation is successful on disturbance sites. Degradation of forage by noxious weed encroachment during construction would be prevented by implementation of the Noxious Weed Management Plan (Appendix 2B, Section 2B.11). MM-GR-01 (Appendix 2, Section 2.4) would provide alternate livestock water sources during construction which would reduce impacts to negligible.

During Project operations, rangeland and pasture replaced by support structures, the SCS, or access roads would not be available for grazing. Maintenance activities would be unlikely to affect grazing and rangelands. Once successful final reclamation is complete, areas would be restored to the prior range condition.

Because under any Action Alternative, APMs and BMPs would require disturbance to be reclaimed and revegetated, and range improvements maintained, thereby minimizing impacts under any of the Action Alternatives, this resource is not considered key to distinguishing between the Action Alternatives or decision-making.

There are no CMAs related to grazing and rangeland that would apply to the Project.

4.2.5 Special Designations, Management Allocations, and Wilderness Resources

Potential direct effects from construction activities on special designations, management allocations, and wilderness resources would include direct ground disturbance. Increases in ambient noise levels, the presence of equipment, and dust would be short-term indirect effects in areas adjacent to special designations, management allocations, and wilderness resources and would decrease with the completion of construction activities. Access to special designations, management allocations, and wilderness resources may be temporarily rerouted during construction, which would be a short-term indirect effect. Effects to special designations, management allocations, and wilderness resources during construction would be minor since the activities would be temporary in nature. The Project's control measures, APMs, and BMPs would minimize the potential for these effects; therefore, construction related impacts would be negligible.

Potential long-term effects to special designations, management allocations, and wilderness resources due to operations, maintenance, and decommissioning could occur where Project facilities would be sited near or within WAs, WHMAs, or lands with wilderness characteristics.

4.2.5.1 Wilderness Areas

There would be no direct effects on WAs, as the Project would not be within WA boundaries. Some alternatives would have indirect effects on BLM- and USFWS-managed WAs due to noise, dust, and the proposed presence of heavy equipment during construction.

4.2.5.2 Wildlife Habitat Management Areas

Direct effects to the designation of WHMAs would be unlikely because the designation of the WHMAs would not be changed by the presence of the Project. Indirect effects could occur due to potential changes in the character of the surrounding lands (e.g., visual changes, increase use due to access roads) but are considered to be negligible to minor. Effects to wildlife habitat within WHMAs are discussed in Section 4.4.4.

4.2.5.3 Lands with Wilderness Characteristics

Under Alternatives 3 and 4, there would be a direct, long-term, major effect on the wilderness characteristics of Polygon 23, because new roads and/or transmission facilities associated with segments under these alternatives would fracture the acreage of Polygon 23 to below the 5,000-acre lands with wilderness characteristics requirement, and Polygon 23 is not adjacent to a WA. Therefore, Polygon 23 would no longer meet the criteria for lands with wilderness characteristics under Alternatives 3 and 4. This area is not included in the Proposed Action, Alternative 2, or Agency Preferred Alternative; therefore, this direct effect to lands with wilderness characteristics would not occur under those alternatives. Under the Preferred Alternative, lands with wilderness characteristics Polygon 23 would be reduced by 9 acres; however, this acreage loss would not otherwise affect the wilderness characteristics of Polygon 23.

4.2.5.4 Development Focus Areas

There would not be effects to DFAs under any of the alternatives. All of the alternatives would be located within a DFA and are an appropriate development within this allocation.

4.2.5.5 Summary

Under any Action Alternative, APMs and BMPs would require disturbance to be reclaimed and revegetated, thereby minimizing impacts to WAs and WHMAs. While lands with wilderness characteristics polygons could be eliminated, the analysis assumed that lands with wilderness characteristics in the study area would remain as “not managed for wilderness characteristics, and this resource is not considered key to distinguishing between the Action Alternatives or decision-making.

CMAs DFA-REC-1, DFA-REC-2, DFA, REC-4, DFA-REC-5, DFA-REC-7 would apply to the Project (Appendix 2C). The Project would comply with these CMAs through BMP-REC-01 (Appendix 2A, Section 2A.7).

4.2.6 Noise

Under any of the Action Alternatives, direct and indirect impacts from construction noise would be negligible to minor for the following reasons: construction impacts would be of limited duration (short-term); construction activity needs to comply with local noise ordinances; expected noise levels near noise sensitive receptors are expected to be similar to existing levels of noise; and construction of the transmission line would primarily be limited to daytime hours so it is unlikely that construction equipment noise levels would cause sleep disruption for residents at the identified noise sensitive receptors. Further, in general there are few residents along the Project route and construction activities at any given location would be brief.

During operations, corona noise could occur throughout the length of the Project. The Project location is generally considered to have fair weather during most of the year; however, foul weather, or rain conditions, occurs periodically and seasonally and this is when coronal noise could manifest. Predicted Project noise levels are in line with existing levels of ambient noise at the noise-sensitive receptors and the modeled results suggest some minor variation in audible

noise with no significant impact expected. Noise impacts during operations would be long-term but negligible.

Maintenance activities associated with the Project would be anticipated to occur less frequently, include fewer individual noise point sources, and would be of shorter duration.

Because under any Action Alternative construction would be short-term and required to comply with local noise ordinances, this resource is not considered key to distinguishing between the Action Alternatives or decision-making.

CMA LUPA-BIO-12 would apply to the Project (Appendix 2C). The Project would comply with this CMA through APM-NO-01 and BMP-NO-07 (Appendix 2A, Section 2A.8).

4.2.7 Hazards and Hazardous Materials

For all Action Alternatives, the implementation of the Project would result in the use of regulated and hazardous materials and creation of solid waste during construction. The specific chemicals and materials, and their quantities, have not yet been determined. A “hazardous material,” as defined by the EPA, is any physical, biological, or chemical item, which has the potential to cause harm to living organisms or the environment. Examples of regulated or hazardous materials associated with construction, operations, maintenance, and/or decommissioning activities could include solvents, petroleum products (i.e., fuels, lubricants, oils, degreaser, etc.), paint, wood-treated products, detergents, sanitary waste, and other products typically associated with construction sites. Hazardous materials may also include pesticides (i.e., insecticides, fungicides, herbicides, rodenticides, etc.) and wash water associated with these products. Solid wastes may include paper, wood, metal, and general trash. With adherence to laws, ordinances, and regulations, as well as implementation of the APMs and BMPs described in Appendix 2A (Section 2A.9), there would be negligible impacts from construction-related hazardous materials. Use of rodenticides is prohibited in the CDCA Plan area where Focus and BLM Sensitive Species (including Mojave desert tortoise, Mojave fringe-toed lizard, and desert kit fox) are known or suspected to occur (BLM 2016a).

The Project would not impair or impede implementation of, or physically interfere with, an existing or adopted emergency hazardous materials spill response plan or emergency evacuation plan. Structures would not be located in roadways or block transportation routes. Therefore, no impacts to adopted emergency hazardous materials spill response plans or emergency evacuation plans are anticipated.

APMs and BMPs for the Project (Appendix 2A, Section 2A.9) include APM-HAZ-01, the implementation of the BLM’s Hazardous Substance and Emergency Response Procedures on BLM lands. These procedures identify methods and techniques to minimize the exposure of the public and site workers to potentially hazardous materials during all phases of Project construction through decommissioning. APM-HAZ-01 is believed to be adequate to address all potential concerns currently identified, including hydrocarbons, agricultural chemicals, and natural gas facilities. APM-HAZ-02, Fire Avoidance and Suppression, ensures that workers would minimize the risk of igniting wildfires through their actions.

Once an Action Alternative is selected, micrositing would be done to avoid any existing hazards and hazardous materials by the Project, thereby reducing impacts to negligible. Because under any Action Alternative, hazards and hazardous materials impacts would be negligible and similar, this resource is not considered key to distinguishing between the Action Alternatives or decision-making.

CMAs LUPA-BIO-9, LUPA-SW-6, LUPA-SW-7, and DFA-VPL-BIO-FIRE-1 would apply to the Project (Appendix 2C). The Project would comply with these CMAs through APM-HAZ-01 and APM-HAZ-02, and BMP-HAZ-03 (Appendix 2A, Section 2A.9).

4.2.8 Public Health and Safety

For any of the Action Alternatives, the Project's worker environmental awareness program would be used to communicate environmental issues and appropriate work practices specific to this Project. This awareness would include proper implementation of BMPs as described in Appendix 2A (Section 2A.10). The training would emphasize site-specific physical conditions to improve hazard prevention and would include a review of all site-specific BMPs, the Health and Safety Plan (to be completed before NTP would be issued), and the Hazardous Substance Control and Emergency Response Plan (to be completed before NTP would be issued). Considering that construction impacts would be short-term, direct and indirect impacts to public health and safety in general during construction are expected to be negligible to minor.

During construction, operation, maintenance, and/or decommissioning, activities such as refueling, welding, or blasting, and sparks from vehicles and other equipment could cause fires. Fuel and ignition sources would be addressed through vegetation management, fire prevention practices, planning, and education provided in the construction safety program and as standard safety practices. The implementation of APMs and BMPs (Appendix 2A, Section 2A.9), such as APM-HAZ-02, Fire Avoidance and Suppression, ensures that workers would minimize the risk of igniting wildfires through their actions. A Fire Protection Plan would be prepared for the Project (Appendix 2B, Section 2B.14). Considering that construction impacts would be short-term, direct and indirect impacts to public health and safety from fire during construction are expected to be negligible to minor.

Public health issues associated with operating a transmission would also include the potential to be exposed to EMF and corona noise. EMF levels were modeled (Appendix 4, Tables 4.2-4 and 4.2-5) and would be at levels comparable to typical magnetic fields associated with common household appliances with EMF levels decreasing rapidly at increasing distance from the Project. Direct and indirect impacts to public health and safety due to EMF are expected to be long-term negligible to minor.

Radio and television interference from a transmission line are based on the electrical and physical characteristics of the transmission line. Therefore, potential interference is considered in the design of higher voltage lines (345kV and above). Radio noise from the Project would not occur until the transmission lines are actually energized. The level of interference would decrease with distance from the transmission line. The Project would operate under Federal Communications Commission (FCC) regulations (FCC 1988: Vol II, part 15. 47CFR, Ch.1), which require that best engineering principles be used to guard against harmful interference to authorized radio users. In the event that interference occurs, the regulations require that the

source be discontinued or adjusted to remedy the interference. Therefore, regulations require that the Project would minimize radio interference to a negligible level.

Structures with guy wires could pose safety risks in recreation areas (Section 4.8); mitigation measures would require different structure types in these areas. During operations, direct and indirect impacts to public health and safety due to guy wires are expected to be negligible to minor.

It is not possible to predict with certainty whether the transmission line, SCS, and ancillary facilities would be the target of an intentional act of destruction and what type of intentional act of destruction would occur. Whereas individual acts of vandalism and theft (i.e., metal theft from a substation) could most likely cause a localized temporary impact to the applicant, acts of sabotage and terrorism could most likely cause a larger and longer-term impact to the general public. An intentional act of destruction from sabotage or terrorism on the electrical infrastructure of all action alternatives would have the same direct and indirect impacts on public health and safety. In general, the electricity infrastructure proposed by all of the action alternatives could potentially be targets of an act of sabotage or terrorism. However, the addition of transmission lines and associated facilities generally strengthens the reliability of delivering electricity to the general public, because if one line is affected by an intentional act of destruction or any other disruption, other lines would be available to continue the delivery of electricity. The potential impacts from the unlikely event of an act of terrorism or sabotage from any of the Action Alternatives would be considered minor and long-term.

Workers, residents, or visitors to an area under construction have the potential to contract valley fever from exposure to disturbed soils that may contain the fungus *coccidioides* sp. fungus. Soil disturbance for structure construction, road building, and various work and staging areas would locally increase valley fever risk. APM-AQ-01, BMP-AQ-01, and APM-AQ-04 (Appendix 2A, Section 2A.1) would minimize the risk of exposure to valley fever for workers and the public as a result of Project construction to a minor, short-term effect.

Because under any Action Alternative, a Health and Safety Plan, Fire Protection Plan, Environmental Health and Safety Plan, Emergency Preparedness and Response Plan, and many others would be implemented (to be completed before NTP would be issued or provided in Appendix 2B), this resource is not considered key to distinguishing between the Action Alternatives nor decision-making.

CMAs DFA-VPL-BIO-FIRE-1 and DFA-VPL-BIO-DUNE-1 would apply to the Project (Appendix 2C). The Project would comply with these CMAs through APM-HAZ-02 and BMP-PHS-02 (Appendix 2A, Sections 2A.9 and 2A.10).

4.2.9 Traffic and Transportation

Direct effects common to all Action Alternatives during the construction phase would consist of construction-related traffic including include large trucks and potentially oversized loads. Increased traffic would occur on all types of roads in the Project Area, but would be phased, occurring at different locations at different times. An estimated total of 160 additional personal vehicles would be added to the roadway network before and after each shift under a maximum-case trip scenario. The intensity of traffic impact from construction in the Quartzsite area in

particular would depend on the unique influx of visitors each winter; this minor to moderate effect would be site-specific and short-term. Construction would not cause severe road damage because construction would be short-term, and roads used for construction would either already be at the appropriate design level for the construction traffic, or roads would be modified to the appropriate design level. In areas where the Project would cross roadways, Federal, state, or county encroachment permits would be obtained, as applicable. Short-term traffic delays during construction could occur at locations where the transmission line crosses roads or where improvements might be needed at local roads, intersections, and bridges to accommodate overweight or oversize delivery vehicles. After construction of the Project, traffic generated by operation and maintenance activities would be intermittent, only require a small number of vehicles, and deliveries would not generally occur. Construction using helicopters could cause a hazard if AGFD was concurrently conducting aerial wildlife surveys in Copper Bottom Pass; however, BMP-TT-10 (Appendix 2A, Section 2A.11) would require DCRT to coordinate with AGFD in such case to avoid this hazard. Operation and maintenance traffic would not increase traffic on primary roads, and, subsequently, would not decrease the level of service for any primary roads.

Operation of the Project may represent a collision hazard to pilots accessing private aviation facilities, such as the Cyr Aviation Airport for structures within 0.5-mile of the facility. This would be a moderate to major, long-term impact on such private aviation facilities, no impacts are expected to the Blythe Airport. This would be a moderate to major, long-term impact on such private aviation facilities. Marking of structures and lines at these locations would reduce the impact to minor to moderate (Appendix 2, Section 2.4, MM-TT-01). Additionally, structures and lines within Segments in-01 and i-04 where they pass through the Plomosa Mountains and Segments i-06, cb-01, cb-02, cb-03, and cb-04 in the Dome Rock Mountains would constitute a moderate to major, long-term effect on the safety of AGFD aircraft conducting aerial wildlife surveys. The marking of structures and lines in these locations would reduce this effect to minor to moderate (Appendix 2, Section 2.4, MM-TT-02).

Because under any Action Alternative, additional mitigation would be required to further reduce operational impacts to a private airport or aviation safety related to aerial surveys, this resource is not considered key to distinguishing between the Action Alternatives or decision-making.

CMAs LUPA-BIO-13 and DFA-VPL-BIO-DUNE-1 would apply to the Project (Appendix 2C). The Project would comply with these CMAs through BMP-TT-04, BMP-TT-05, BMP-TT-06, BMP-TT-07, and BMP-TT-08 (Appendix 2A, Section 2A.11).

4.2.10 Water Resources

Construction activities could have effects to surface water quality due to inadvertent releases of petroleum products or other hazardous materials or due to sediment loading from ground disturbances. During both construction and operations, the functions of ephemeral channels (e.g., providing adequate capacity for flood control, energy dissipation, and sediment movement) could be affected. The Project's control measures, APMs, and BMPs would minimize the potential for these effects, and therefore impacts would be negligible. Impacts to the Colorado River and its adjacent wetlands and floodplain, common to all alternatives, would also be minimized by control measures, APMs, and BMPs. There are groundwater wells along all of the

Action Alternatives; however, it is assumed that they could be avoided or would be replaced with no impact. Shallow groundwater may be found near the Colorado River and encountered during structure placement. Flexibility with structure placement would eliminate or reduce impacts to water resources. Water sources for the Project would be widely distributed along the project alignment, over a 2-year construction period. Such a wide distribution of sources, including private wells and/or municipal supplies, and over a long period of time, would minimize the potential for overdraft of any individual water supply. Proper implementation of design features, APMs, and BMPs (Appendix 2A, Section 2A.13) would protect groundwater quantity and quality; therefore impacts, if any, would be short-term and negligible.

Because under any Action Alternative, APMs and BMPs would require disturbance to be reclaimed and revegetated, and other permits such as Section 404 and storm water permits would be required that would protect water resources including water quality, this resource is not considered key to distinguishing between the Action Alternatives or decision-making.

CMAs LUPA-BIO-9, LUPA-BIO-13, LUPA-BIO-14, LUPA-SW-16, LUPA-SW-18, LUPA-SW-21, LUPA-SW-22, LUPA-BIO-DUNE-2, and LUPA-BIO-DUNE-3 would apply to the Project (Appendix 2C). The Project would comply with these CMAs through APM-WQ-01 and BMP-WQ-04, BMP-WQ-05, BMP-WQ-06, and BMP-WQ-07 (Appendix 2A, Section 2A.13). Requirements for floodplain management and protection of wetlands would be met. Compliance with LUPA-SW-20 is demonstrated by the fact that no residual impacts are identified.

4.3 SOIL RESOURCES

4.3.1 Introduction

Impacts to soil resources are discussed in terms of acreage impacted and percent of disturbance.

4.3.2 Methods for Analysis

4.3.2.1 Analysis Area

The analysis area for soils resources is the 200-foot ROW for all of the Action Alternatives plus ancillary Project components resulting in new surface disturbance located outside the ROW.

4.3.2.2 Assumptions

Use of the NRCS STATSGO data (NRCS 2009), and SSURGO data where available, assumes mapped soil conditions are representative of actual conditions in the field (Appendix 3, Section 3.3). As with any mapped data, there is a certain amount of uncertainty related to the accuracy and scale of mapping; therefore, the actual soil conditions could vary substantially from those described at any particular location. The data used represent the best available information for evaluating soil resources. The inherent limitations of soil survey data are resolved with site-specific soil investigations within the actual Project footprint that are part of the permitting and construction design process.

4.3.2.3 Environmental Effect Indicators, Magnitude, and Duration

The following impact indicators were considered when analyzing potential impacts to soil resources:

- loss of topsoil due to construction, operation, maintenance, and decommissioning activities (i.e., removal or mixing of topsoil);
- loss of soil productivity;
- soil compaction from vehicular traffic;
- soil erosion due to water and wind; and,
- loss of active sand dune habitat.

In order to determine impacts to soil resources from wind erosion, the Wind Erodibility Group index (WEG) was analyzed using the STATSGO database (Appendix 3, Table 3.3-1) and the SSURGO database. The WEG index groups soils that have similar properties affecting their resistance to wind erosion. The soils assigned to group 1 are the most susceptible to wind erosion, and those assigned to group 8 are the least susceptible.

Under any of the Action Alternatives, there would be negligible to minor short- and long-term effects to soils. There would be long-term loss of soil productivity on acres not reclaimed during the life of the Project. Other soils disturbed but reclaimed after construction or as part of decommissioning would likely have long-term loss of soil productivity that would improve over time because of reclamation efforts. Impacts to areas of wind-blown sand would range from no impacts if avoided to long-term negligible to minor impacts to dune habitat because of the intermittent nature of the structure foundations, and the spacing between structures.

4.3.3 No Action Alternative

Under the No Action Alternative, there would no direct or indirect impacts to soil resources from the Project.

4.3.4 Construction of Action Alternative Segments

4.3.4.1 Direct and Indirect Effects Common to All Action Alternatives

At the batch plant and lay-down sites, topsoil would be stockpiled and covered during construction and reapplied during reclamation in order to minimize topsoil loss (Appendix 2A, Section 2A.2). Direct impacts to soil resources as a result of construction activities include the loss of soil productivity due to the removal of soils during new surface disturbance. Limited clearing of vegetation and topsoil, as well as grading, would be required and these activities could result in newly exposed, disturbed soils that could be subject to accelerated erosion by wind and water. Any soil removal associated with development of structure foundations and at the SCS would be permanent and would be a loss of soil productivity. One of the primary impacts of concern for construction is disturbance to soil biological crusts. It is expected that soils within the ROW have the ability to support soil biotic crust; therefore, it is expected that disturbance caused by excavation and compaction during construction may directly affect biological soil crusts. Clearing of the SCS site, ancillary facilities, and access roads could also

adversely affect any soil biological crusts in the immediate vicinity. As described in Chapter 2, large portions of the Project have been routed to parallel existing linear infrastructure, thus reducing impacts to previously undisturbed soils.

Indirect impacts associated with topsoil removal may include invasive plant colonization, soil erosion, and reduction of soil water retention. Construction activities may also cause disturbance to fragile biological crusts, which could increase wind and water erosion and delay reestablishment of plant communities post construction. Other indirect effects are associated with the sediment redistribution of the soil resource as a result of wind and water erosion, which could cause damages to WOUS, prime farmlands, and air quality. Implementation of BMPs, APMs, reclamation, and other conservative measures would minimize loss of topsoil and soil productivity to minor but long-term due to the slow recovery of soils in desert environments.

Physical Changes to Soil Resources

Surface disturbance, including the removal of topsoil resources for replacement during reclamation, would result in direct impacts. Physical and chemical changes to the soil would be expected to be long-term and minor and would occur as a result of topsoil salvage and reclamation operations. Topsoil that is used to reclaim disturbed areas immediately after construction activities would begin to revert to more natural conditions.

Direct physical impacts to soil resources include compaction and crushing of the topsoil by equipment during salvage, stockpiling, construction, and reclamation activities. Potential physical effects of soil compaction may include reduced permeability and porosity, damage to microbiotic crusts, increased bulk density, decreased available water holding capacity, and increased erosion potential. With adherence to APMs and BMPs (notably BIO-38 and SOIL-02 [Appendix 2A, Sections 2A.4 and 2A.2), physical effects of soil compaction would be short-term, minor to moderate. Soil microorganisms such as bacteria and fungi, important in the decomposition of biological materials and the formation and improvement of soil, would be impacted. Natural processes, such as wind and water transport of soil particles from surrounding areas would continually inoculate the site with these microorganisms.

Soil Loss/Erosion

Soil erosion potential is determined based on physical soil characteristics, k-factor rating, and slope. Areas located on steep slopes are inherently susceptible to erosion. The majority of reclaimed areas for all Action Alternatives would incorporate a generally flat to gently sloped surface during regrading and reclamation activities. Potential for erosion would be increased on disturbed areas after soil salvage operations due to removal of the vegetative cover and the loss of surface soil structure. Soil erosion after redistribution on re-graded sites would also have a greater potential until the soil is stabilized by successful revegetation. Soil characteristics identified in Section 3.3.2.2 and Appendix 3 Table 3.3-1 suggest that all segments west of the Colorado River include soils that have a high susceptibility for wind erosion. Windblown dust would result from the disturbance of fine-textured soils during construction and reclamation activities through the completion of the Project.

The majority of the impacts to soil resources would be short-term, until reclamation was complete. The footprints of the structures, the SCS site, and new access roads would result in

long-term impacts to soil resources. Cutting and removal of vegetation may occur; however, where practicable, downed vegetation and undisturbed low vegetation would be left in place within the disturbance areas to serve as soil protection and erosion control. Vegetation would only be cleared to the extent necessary, minimizing impacts to soil resources. Adherence to APM-GEO-01 and APM-WQ-01 (Appendix 2A, Sections 2A.2 and 2A.13) would minimize water erosion through implementation of a SWPPP. Further, Project engineering would consider soil characteristics and hazard in design. Impacts from soil loss/erosion would be negligible to minor and short- to long-term as areas revegetate.

4.3.4.2 Direct and Indirect Segment-specific Effects

The following sections identify distinguishing characteristics associated with specific segments. If a specific segment is not identified, it should be assumed that the general impacts described in Section 4.3.4.1 would occur.

Perhaps the most sensitive issue for soils occurs on BLM administered lands west of Blythe and north of the Colorado Substation, due to the sand dunes' value as habitat for sensitive species (Section 3.4.2.1). Objects as low as 30 cm above the ground surface can interfere with sand transport, creating a "sand shadow" and reducing the size of downwind dunes (PWA 2011). The Colorado Substation was initially proposed to be constructed in the center of the sand dunes, but ultimately was constructed at its current site south of the dunes specifically to avoid impacting sand transport.

Segments p-17 and p-18 or ca-07, ca-09, and x-19 would be used to access the Colorado River Substation from the east. Tangent lattice structures are proposed to be used, regardless of the route taken (Figure 3-2). Because of their open design, tangent lattice structures would allow winds to essentially blow through the structure, minimizing the impact on sand transport (as compared to solid structures, like buildings or walls).

The foundations for the lattice tangent structures along Segments p-17 and p-18 (Figure 3-2) would run south of the active windblown deposits and would disturb 2.6 acres for the long-term. The portions of the foundations that extend above ground level would intermittently interrupt sand transport on the upwind side. Access roads, as required, would be at grade and only minimally impact sand transport on 18.3 acres. These intermittent disruptions of the flow of sand across the surface of the landscape for short distances would have a very localized impact on sand transport in the immediate area of the access roads and structure foundations in the long term. Therefore, because of the distance between these segments and the active windblown deposits to the north, impacts to active windblown deposits would be negligible.

Alternatively, Segments ca-07, ca-09, and x-19 (Figure 3-2) would have a similar foundation footprint for tangent lattice, guyed-v, and dead-end lattice structures of 2.1 acres over a linear distance of 6.6 miles (Appendix 2, Table 2.2-12), portions of which travel through the dunes. Access roads for these segments would impact 26.5 acres. These segments would have a greater impact on active windblown deposits because portions of the segments would cross more active areas of the dunes, but because of the widely spaced nature of the individual foundations and associated roads, that impact would be considered long-term and negligible to minor.

4.3.5 Operations, Maintenance, and Decommissioning

Impacts to soil resources as a result of operation and maintenance activities are expected to be minimal. Minimal soil resource management would be needed during transmission line operation and most inspection activities would be carried out aerially. On-the-ground inspection would cause negligible damage to existing soil resources because vehicle use would be confined to existing roadways. No indirect effects are expected during the operation and maintenance activities.

Decommissioning activities, if and when they occur in the future, would have impacts similar to project construction except where established access roads and other permanent impact areas would be used.

4.3.6 Mitigation Measures

APMs and BMPs that would be implemented as part of the Project would minimize impacts to soil resources. Therefore, there are no MMs identified for soil resources for any of the specific segments and thus, no MMs have been identified for any of the full-route alternatives or subalternatives described below.

4.3.7 Construction of Full Route Alternative and Subalternative Effects

The types of impacts to soils are described above. The magnitude of those impacts varies by the acreage disturbed. Table 4-2 shows the construction (short-term) disturbance and operations (long-term) disturbance associated with each of the Action Alternatives.

Table 4-2 Soil Disturbance by Full Route Alternative in Acres

FULL ROUTE ALTERNATIVE	CONSTRUCTION DISTURBANCE (SHORT -TERM)	OPERATIONS AND MAINTENANCE DISTURBANCE (LONG-TERM)	TOTAL DISTURBANCE
Proposed Action	709.1	410.1	1,086.0
Alternative 1: I-10 Route	648.3	390.3	1,004.9
Alternative 2: BLM Utility Corridor	754.8	462.8	1,181.0
Alternative 3: Avoidance Route	768.1	466.4	1,199.0
Alternative 4: Public Lands Emphasis Route	760.4	468.1	1,197.2
Preferred Alternative	758.0	473.7	1,190.5

* Long-term foundation disturbance would be within and a subset of the short-term disturbance; therefore, it is not additive to the short-term disturbance in totals (Section 2.2.5.3).

4.3.7.1 Proposed Action

Under the Proposed Action, there would be negligible to minor short- and long-term effects to soils, and the effects would differ because of soil types. Approximately 1,086 acres of soils would be disturbed associated with transmission line construction, access roads, temporary use areas, and the SCS. Long-term loss of soil productivity would occur on 410 acres of disturbance that would not be restored during the term of the ROW permit. The remaining 709 acres would likely have long-term loss of soil productivity, but productivity would improve during the term of the ROW permit because of reclamation efforts that would be required. The Proposed Action west of the Colorado River includes soils that have a high susceptibility for wind erosion.

As shown in Figure 3-2, the Proposed Action route south of the Colorado River Substation would avoid active windblown sand areas and habitat. Consequently, as described in Section 4.3.4.2, impacts to areas of active windblown sand would be negligible and long-term.

4.3.7.2 Alternative 1: I-10 Route

Under Alternative 1, there would be negligible to moderate short- and long-term effects to soils and the effects would differ because of soil types. Approximately 1,005 acres of soils would be disturbed associated with transmission line construction, access roads, temporary use areas, and the SCS, a decrease in disturbance compared to the Proposed Action. Long-term loss of soil productivity would occur on 390 acres of disturbance that would not be restored during the term of the ROW permit. The remaining 648 acres would likely have long-term loss of soil productivity, but productivity would improve during the term of the ROW permit because of reclamation efforts that would be required. Alternative 1 west of the Colorado River includes soils that have a high susceptibility for wind erosion.

As shown in Figure 3-2, Alternative 1 approaching the Colorado River Substation from the east would pass through portions of an active area of windblown sand. As described in Section 4.3.4.2, because of the intermittent nature of the structure foundations, and the spacing between structures, this would constitute a long-term, negligible to minor impact to the dune habitat.

Subalternatives to Alternative 1 (1A through 1E)

There would be minimal differences in the amounts of acres of soil disturbed between the Alternative 1 subalternatives (1A through 1E) and Alternative 1 as indicated in Chapter 2.

4.3.7.3 Alternative 2: BLM Utility Corridor Route

Under Alternative 2, there would be negligible to moderate short- and long-term effects to soils and the effects would differ because of soil types. Approximately 1,181 acres of soils would be disturbed associated with transmission line construction, access roads, temporary use areas, and the SCS, an increase in disturbance compared to the Proposed Action and Alternative 1. Long-term loss of soil productivity would occur on 463 acres of disturbance that would not be restored during the term of the ROW permit. The remaining 755acres would likely have long-term loss of soil productivity, but productivity would improve during the term of the ROW permit because of reclamation efforts that would be required. Alternative 2 west of the Colorado River includes soils that have a high susceptibility for wind erosion.

As shown in Figure 3-2, Alternative 2 approaching the Colorado River Substation from the east would pass through portions of an area of active windblown sand. As described in Section 4.3.4.2, because of the intermittent nature of the structure foundations, and the spacing between structures, this would constitute a long-term, negligible to minor impact to the dune habitat.

Subalternatives to Alternative 2 (2A through 2E)

There would be minimal differences in the amounts of acres of soil disturbed between the Alternative 2 subalternatives (2A through 2E) and Alternative 2 as indicated in Chapter 2.

4.3.7.4 Alternative 3: Avoidance Route

Under Alternative 3, there would be negligible to moderate short- and long-term effects to soils and the effects would differ because of soil types. Approximately 1,199 acres of soils would be disturbed associated with transmission line construction, access roads, temporary use areas, and the SCS, an increase in disturbance compared to the Proposed Action and Alternative 1 and similar to Alternative 2. Long-term loss of soil productivity would occur on 466 acres of disturbance that would not be restored during the term of the ROW permit. The remaining 768 acres would likely have long-term loss of soil productivity, but productivity would improve during the term of the ROW permit because of reclamation efforts that would be required. Alternative 3 west of the Colorado River includes soils that have a high susceptibility for wind erosion.

As shown in Figure 3-2, Alternative 3 approaching the Colorado River Substation from the east would pass through portions of an area of active windblown sand. As described in Section 4.3.4.2, because of the intermittent nature of the structure foundations, and the spacing between structures, this would constitute a long-term, negligible to minor impact to the dune habitat.

Subalternatives to Alternative 3 (3A through 3M)

There would be minimal differences in the amounts of acres of soil disturbed between the Alternative 3 subalternatives (3A through 3M) and Alternative 3 as indicated in Chapter 2.

4.3.7.5 Alternative 4: Public Lands Emphasis Route

Under Alternative 4, there would be negligible to moderate short- and long-term effects to soils and the effects would differ because of soil types. Approximately 1,197 acres of soils would be disturbed associated with transmission line construction, access roads, temporary use areas, and the SCS, a decrease in disturbance compared to all alternatives, except for Alternative 1. Long-term loss of soil productivity would occur on 468 acres of disturbance that would not be restored during the term of the ROW permit. The remaining 760 acres would likely have long-term loss of soil productivity, but productivity would improve during the term of the ROW permit because of reclamation efforts that would be required. Alternative 4 west of the Colorado River includes soils that have a high susceptibility for wind erosion.

As shown in Figure 3-2, Alternative 4 approaching the Colorado River Substation from the east would pass through portions of an area of active windblown sand. As described in Section 4.3.4.2, because of the intermittent nature of the structure foundations, and the spacing between structures, this would constitute a long-term, negligible to minor impact to the dune habitat.

Subalternatives to Alternative 4 (4A through 4P)

There would be minimal differences in the amounts of acres of soil disturbed between the Alternative 4 subalternatives (4A through 4P) and Alternative 4 as indicated in Chapter 2. However, Subalternative 4P would utilize the Proposed Action Segments p-17 and p-18, thus avoiding the area of active windblown sand; consequently, Subalternative 4P would have less impact on the areas of windblown sand than Alternative 4 and Subalternatives 4A through 4N.

4.3.7.6 Agency Preferred Alternative

Under the Preferred Alternative, there would be negligible to moderate short- and long-term effects to soils; the effects would differ by soil type. Approximately 1,191 acres of soils would be disturbed associated with transmission line construction, access roads, temporary use areas, and the SCS, which would be more soil disturbance compared to the Proposed Action and Alternative 1. Long-term loss of soil productivity would occur on 473.7 acres of disturbance that would not be restored during the term of the ROW permit. The remaining 758 acres would likely have long-term loss of soil productivity, but productivity would improve during the term of the ROW permit because of reclamation efforts that would be required. The Preferred Alternative west of the Colorado River includes soils that have a high susceptibility for wind erosion

As shown in Figure 3-2, the Preferred Alternative approaching the Colorado River Substation from the east would pass through portions of an area of active windblown sand. As described in Section 4.3.4.2, because of the intermittent nature of the structure foundations, and the spacing between structures, this would constitute a long-term, negligible to minor impact to the dune habitat.

4.3.8 Residual Impacts

The APMs and BMPs described in Appendix 2A (Section 2A.2) would likely alleviate most impacts to the soil resources as a result of the Project, except for impacts to areas of active windblown sand under the Action Alternatives, where impacts would be negligible to minor following Project construction, as described in Section 4.3.4.2. Maintenance activities aimed at precluding soil erosion would be ongoing; therefore, impacts would be negligible following the Project construction.

4.3.9 CDCA Plan Compliance

Under LUPA-BIO-DUNE-1, evaluation of the Project found that:

- Portions of Segments ca-07, ca-09, and x-19 would cross areas of active windblown sand.
- Because portions of Segments ca-07, ca-09, and x-19 would cross areas of active windblown sand, those segments would be subject to dune/aeolian sand transport corridor CMAs.
- Thus, alternatives exist that would avoid crossing identified areas of active windblown sand, and thus reduce impacts.

Under LUPA-BIO-DUNE-2, evaluation of the Project found that Segments p-17 and p-18 would result in fewer impacts to windblown sand than the Action Alternative segments, and thus better maintaining the quality and function of aeolian transport corridors. However, the long-term impacts to areas of windblown sand from Segments ca-07, ca-09, and x-19 would be negligible to minor. Portions of LUPA-BIO-DUNE-2 and LUPA-BIO-DUNE-3 would be satisfied by application of BMP-WQ-06 and BMP-WQ-07 (Appendix 2A, Section 2A.13).

CMAs LUPA-SW-1, LUPA-SW-2, and LUPA-SW-5 would apply to the Project (Appendix 2C) and would be satisfied by information provided in Section 2.2.8; Appendix 4, Section 4.3; and Appendix 4, Section 4.2.10, respectively. LUPA-SW-6 through LUPA-SW-11 would also apply to the Project (Appendix 2C). The Project would comply with these CMAs through APM-GEO-01 and BMP-HAZ-01 and BMP-SOIL-04 through BMP-SOIL-07 (Appendix 2A, Sections 2A.2 and 2A.9).

4.3.10 Unavoidable Adverse Effects

Residual unavoidable impacts to soil productivity and areas of active sand transport in the Project area would remain after mitigation. The impacts would occur in those areas with structures and other permanent facilities, e.g., the SCS, permanent access roads, and transmission structures. Decreased soil productivity would result.

4.3.11 Cumulative Effects

The past uses in the CEA have had a direct effect on the soils, as described in Chapters 3. Within the 711,573-acre CEA, approximately 165,197 acres (23.2 percent) have been disturbed (Table 3-2). The use of land through activities such as mining, ranching, roads, solar projects, transmission lines, and OHV use have all shaped the current condition of the soil resources. The impacts of present actions in the CEA would be very similar to the past actions.

Reasonably foreseeable actions in the CEA that, when combined with the Project construction, may have cumulative impacts to the soil resources, including increased wind and water erosion rates in areas where ground surface disturbance occurs. The reasonably foreseeable actions within the CEA are described in Appendix 3, Table 3.12-2.

The reasonably foreseeable future projects (Table 3.12-2) have the potential to disturb an estimated 20,596 acres (2.9 percent of CEA). Any disturbance to surface soils through grading or other ground disturbance can potentially result in accelerated erosion at any one project site. Current and reasonably foreseeable projects would result in a total disturbance of 26.1 percent of the CEA representing a moderate impact to soils.

With incorporation of APMs and BMPs, similar to those implemented by the Project to address erosion and loss of topsoil, and MMs if needed, impacts to soil resources can be mitigated.

Climate change could impact soils, in particular due to intense wind or water erosion from extreme weather events, and when combined with already disturbed soils could lead to greater erosion impacts than might have been expected in the past (Brevik 2012).

Overall, when combined with past, present, and reasonably foreseeable projects, this project would result in a negligible increase to cumulative effects to soils, except in the case of sand transport areas. The Project itself would have a negligible to minor impact on sand transport, as there would be only a few structures in the sand area. However, when combined with past, present, and reasonably foreseeable projects, such as the solar facilities (Blythe Energy Power Plant/Sonoran Energy Project, Blythe Mesa Solar Project, Desert Quartzite Solar Project, and Crimson Solar Project, as described in Appendix 3, Table 3.12-2), these could have a minor to major cumulative effect on the transport of sand.

4.3.12 Irreversible and Irretrievable Commitment of Resources

Environmental impacts that have irreversible negative effects on soil resources are situations where vegetation and topsoils are impacted and not restored. In most cases, reclamation efforts would be made, and irreversible impacts to the soil resources and associated vegetation would be minor, including unavoidable adverse impacts and residual impacts discussed above. However, because soils in desert environments can be slow to recover, these minor impacts could be long-term.

4.3.13 Relationship of Short-term Uses and Long-term Productivity

The productivity or function of soil resources would be affected by both short-term impacts and long-term impacts. Short-term impacts to soil resources would be present until reclamation is conducted. Following reclamation, short-term impacts would be alleviated to the soil resources given the suitable climate conditions. Desert environments are typically slow to recover following disturbance unless adequate precipitation is received. Relative to short-term impacts, long-term loss of soil resources would be minimal in spatial scale.

4.4 BIOLOGICAL RESOURCES

4.4.1 Introduction

The impacts described in this section are discussed in terms of impacts on vegetation communities, wildlife species, special status species of plants and animals and their habitats, special habitat management areas, and noxious weeds.

4.4.2 Methods for Analysis

4.4.2.1 Analysis Area

The analysis area for the purpose of evaluating impacts to biological resources includes the 200-foot-wide ROW for all of the Action Alternatives plus ancillary Project components that would result in new surface disturbance outside of the ROW.

4.4.2.2 Assumptions

This analysis assumes that the APMs and BMPs included as part of the Proposed Action and all of the Action Alternatives would be fully implemented to avoid, minimize, or mitigate impacts to

biological resources. In the following analysis of Project-related impacts, the applications of these specific measures, as detailed in Appendix 2A, may be referenced by resource category and number (e.g., APM/BMP-BIO-#).

4.4.2.3 Environmental Effect Indicators, Magnitude, and Duration

Indicators used to assess Project-related impacts due to construction, operation, maintenance, or decommissioning of the Project include:

- Loss of natural, native species dominated vegetation communities or associations;
- Loss or degradation of aquatic, wetland, or riparian habitats caused by reduction in water quality, diversion of water sources, erosion or sedimentation from altered drainage patterns, or chemical contamination;
- Loss or degradation of terrestrial habitats due to clearing of vegetation, increased soil erosion, alteration in sand deposition, or introduction of invasive non-native plants;
- Loss of or impacts to rare vegetation communities or habitats that have a special designation by a Federal, state, or local agency;
- Introduction or increased spread of noxious weeds and other invasive exotic weed species;
- Loss of native vegetation communities, plants, and wildlife due to increased risk of wildfire from the spread of invasive and noxious weed species;
- Increased risk of collision of migratory birds due to presence of transmission line and associated structures;
- Increased risk of predation resulting from subsidized predator populations (increased food availability) or due to presence of transmission-related structures (perches and hiding structures);
- Loss of individuals or habitat of a plant or animal species that has been designated as special status by a Federal, state, or local agency;
- Displacement of, or disturbance to wildlife species due to noise and human activity associated with Project activities;
- Disturbance to wildlife from increased recreational access to remote areas accommodated by Project features;
- Increased risk of mortality to wildlife due to vehicle use and construction activities;
- Impacts to special designated management areas;
- Habitat fragmentation, including a decrease in function of wildlife corridors, due to Project features; and,
- Lack of compliance with Federal or state statutes or policies.

Impact analyses are discussed in terms of short-term (construction period up to 2 years), long-term (greater than 2 years but less than 50 years), or permanent (continues for the 50-year life of the Project). Note that Section 4.1.2 defines short-term impacts as those that may last for up 10

years; however, the DRECP defines short-term impacts to biological resources as up to 2 years, which is the timeframe used for this analysis of Biological Resources.

4.4.3 No Action Alternative

Under the No Action Alternative, no ROW would be granted for the Project and the transmission line, SCS, and ancillary facilities would not be constructed. Current biological resource conditions in the analysis area would continue under the No Action Alternative. Biological resources would not be altered beyond current conditions by the Project. The Project Area would remain undisturbed unless unrelated actions occur.

4.4.4 Construction of Action Alternative Segments

4.4.4.1 Direct and Indirect Effects Common to All Action Alternatives

Project construction and related activities associated with all Action Alternatives could result in temporary damage to and/or permanent loss of vegetation, habitat loss and mortality of general wildlife species, and temporary disturbance to and/or loss of individuals or habitats of special status plant and animal species. Other potential impacts include disruption of wildlife movements, and impacts to designated wildlife management areas including loss of habitat due to the footprints of tower structures and access roads (e.g., USFWS wildlife refuge and BLM WHMAs). Temporary disturbance includes short-term impacts (less than 2 years) associated with construction, such as noise and the presence of construction workers.

Given that restoration of desert habitats following vegetation removal and disturbance of surface soils takes many years, for purposes of analysis of impacts to biological resources, all ground disturbance is considered long-term, which also includes all loss of habitat associated with permanent Project features (e.g., new transmission structures, SCS, access roads) that would remain throughout the life of the Project (i.e., 50 years for the life of the transmission line). For analysis purposes, it is assumed that each structure would impact 1.1 acres during construction, though more than 90 percent of ground disturbance associated with structures is expected to be reclaimed, as required by the BLM under the Habitat Reclamation and Monitoring Plan (Appendix 2B, Section 2B.10) (APM/BMP-BIO-15; Appendix 2A, Section 2A.4). The plan would specify processes for reclamation with the goal of restoration.

Tables 4.4-1 through 4.4-3 in Appendix 4 provide acres of long-term disturbance associated with each route segment (this is the combined acres of short- and long-term disturbance reported in Appendix 2, less the acres of permanent structure foundations that were included as a subset of short-term disturbance), length of the line segment in miles, and the number of structures associated with each segment. The long-term disturbance acreages estimate the generalized disturbance to wildlife and habitat along each segment.

Vegetation Communities

The Project would involve the removal of vegetation during construction activities, resulting in the direct reduction in the representation of plant communities. Vegetation removal and disturbance of soils could have a variety of effects on vegetation communities, ranging from changes in community structure and species composition to alteration of soil moisture or nutrient

regimes. Removal of protective vegetation would also expose soil to potential wind and water erosion. This could result in further loss of soil and vegetation, as well as increased sediment input to water resources.

Fugitive dust from construction traffic has the potential to affect photosynthetic rates and decrease plant productivity. Clearing and grading could also result in the alteration of soil conditions, including the loss of native seed banks, and change the topography and drainage of a site such that the capability of the habitat to support native vegetation is impaired.

Though portions of each alternative pass through developed agricultural areas at the east and west ends of the Project, the majority of each alternative is within the Sonoran desertscrub biotic community. Trimming or removal of tall vegetation for conductor clearance would alter some of the more robust plants within the vegetation community and can leave these plants more susceptible to disease and possibly result in the death of those plants. The vegetation communities and plant associations within the Sonoran Desert are very slow to re-grow perennial species following disturbance, often taking decades to recover, if at all. These disturbed lands are highly susceptible to colonization and expansion of invasive annual plant species (especially red brome and Sahara mustard). The introduction and colonization of disturbed areas by invasive exotic plant species also could lead to changes in species composition of vegetation communities, including the possible shift to more wildfire-prone vegetation that favors invasive exotic species over native species.

Project implementation would have direct and indirect impacts on vegetation resources located within areas disturbed by construction activity; however, these potential impacts would be minimized through implementation of various APMs and BMPs (Appendix 2A, Section 2A.4).

Special Status Plant Species

The impacts described for general vegetation apply to special status plant species. As noted in Section 3.4, no plant species listed under the Federal ESA would be expected to occur in the Project Area; therefore, no impacts to listed plant species would occur. However, in Arizona more than 200 species protected by the Arizona Native Plant Law, including blue paloverde, foothill paloverde, velvet mesquite, desert ironwood, ocotillo, and various cacti (e.g., saguaro, cholla, barrel, hedgehog, and prickly pear) occur within the Project Area. In California, as many as 16 species considered rare by the CNPS and two plant species considered sensitive by the BLM have the potential to be impacted by Project activities.

Noxious and Invasive Weeds

The inadvertent introduction of non-native plant species is a threat to native desert plant communities. Since noxious and invasive weeds are typically effective competitors with native plants, disturbance of vegetative cover that facilitates their introduction, spread, and proliferation could alter plant community composition, reduce native plant species cover, and alter natural fire regimes. Because these weeds are often fire-adapted, they perpetuate increased fire risk once established. Noxious and invasive weed species of particular concern known to occur in the Project Area include Russian knapweed, diffuse knapweed, Russian thistle, brome grasses, and Sahara mustard.

The Project would remove native vegetation and disturb soils at structure construction sites, storage areas, along access roads, and wherever heavy equipment is used, providing suitable conditions for infestation by non-native plants. An influx of vehicles and machinery for construction of any of the Action Alternatives could facilitate weed introduction and spread into the ROW. Non-native plant seeds or plant parts could be transported on vehicles, construction equipment, or in materials such as dirt, straw bales, and wattles. Enhanced public access to the Project corridor during and after construction could also contribute to the spread of non-native plants. The Noxious Weed Management Plan (Appendix 2B, Section 2B.11) (APM-BIO-12; Appendix 2A, Section 2A.4), to be approved by BLM, would require pre-construction surveys and regular monitoring for invasive and noxious weeds within the ROW, along permanent and temporary access roads, and any other sites where Project activities result in soil disturbance. The plan would include prevention and treatment methods that include cleaning equipment to prevent the spread of noxious weeds into or out of the Project Area. Chemical treatment for control of noxious weeds or invasive species within or adjacent to the ROW would only be applied if absolutely necessary by using only BLM-approved products, limiting applications within floodplains and washes, and conducting all activities in accordance with the Noxious Weed Management Plan (Appendix 2B, Section 2B.11.

Through Project implementation, direct and indirect impacts would occur to native desert plant communities and special status plants as a result of the spread of noxious and invasive plant species within areas disturbed by construction activity; however, these potential impacts would be minimized through implementation of various APMs and BMPs (Appendix 2A, Section 2A.4).

Wildlife

Direct impacts on wildlife anticipated as a result of the Project include the removal of vegetation that would result in the long-term loss of wildlife habitat along with the displacement and/or potential mortality of resident wildlife species, especially those that are less mobile such as snakes, lizards, and small mammals. Clearing and grading would generate the greatest construction impacts on wildlife. Injury or death of wildlife would result primarily from the use of construction vehicles, and the grading of access roads and laydown areas for structure erection. Fossorial species, such as small burrowing animals (e.g., lizards, snakes, and small mammals) may be harmed through the crushing of burrows, the loss of refugia, and direct mortality from construction activities. Various wildlife species could be trapped in holes or trenches created for construction purposes. Though there is little aquatic habitat, amphibians (e.g., Sonoran desert toad and Couch's spadefoot toad) may be present throughout the Project Area and especially near ephemeral washes following rain events, when they may be crushed by construction equipment, or be trapped in water-filled holes at construction sites. Construction could also result in an increase in accidental road-killed wildlife due to increased vehicle traffic along the construction corridor. Diurnally active reptiles (e.g., lizards and some snakes) and mammals (e.g., rabbits and ground squirrels) are the most likely to be subject to mortality from construction vehicles. More mobile species like birds and larger mammals are expected to disperse into adjacent habitat areas during the land clearing and grading phases associated with Project construction.

Removal of vegetation during Project construction would reduce the amount of habitat available for wildlife in a particular area. Individuals displaced from areas cleared of native vegetation

could be lost if adjacent habitats are at carrying capacity or if they are exposed to an increased risk of predation.

Construction may also result in fragmentation and degradation of adjacent native habitats due to use of and improvement to existing access roads, disturbance, noise, vibration, dust, increased human presence, and increased vehicle traffic. Use of and improvements to existing roads, and creation of new roads to access construction sites and support long-term Project maintenance, provides opportunities for increased human presence and disturbance to wildlife habitat by recreationists, and especially by off-highway vehicle enthusiasts.

Construction activities and human presence can alter, displace, or disrupt the breeding and foraging behavior of wildlife. Wildlife species are most vulnerable to construction-related disturbances during their breeding seasons when disturbances could result in nest, roost, or territory abandonment, and subsequent loss of reproductive effort. The use on lights for construction activities during the night may attract insects that could attract foraging bats. Though construction activities are a potential source of disturbance, it is unlikely that roosting areas would be disturbed except perhaps if blasting occurs nearby and bats are temporarily frightened from their roosts.

Local wildlife populations along the ROW could temporarily decline or disperse during the construction phase of the Project but are expected to return to their pre-construction levels once construction workers leave the area and disturbed habitats are restored. For portions of the Project that would be constructed adjacent to existing roads, most of the wildlife present would be considered common, wide-ranging species already likely habituated to some level of on-going disturbance. Also, since construction is of short duration and limited to relatively small areas within a large expanse of desert habitats, wildlife would likely quickly return to the ROW as work crews move to new work locations. Nocturnally active wildlife would be affected less by construction than would diurnally active species. Construction activities associated with Project implementation would have direct and indirect impacts on general wildlife located within areas disturbed by construction activity; however, these potential impacts would be minimized through implementation of various APMs and BMPs (Appendix 2A, Section 2A.4).

Special Status Wildlife Species

Project activities could impact special status wildlife species in much the same way as discussed for common wildlife species. The APMs and BMPs identified for general wildlife would apply to special status wildlife species, minimizing Project-related impacts. These include pre-construction presence/absence surveys would be conducted for special status wildlife species, including nesting migratory birds such as the burrowing owl. Qualified biologists would follow established survey protocols and would conduct the surveys in locations where special status wildlife species are likely to occur within the Project ROW, and specifically locations where vegetation would be impacted. Though this approach should result in locating and moving animals present in construction areas out of harm's way, it is likely individuals of small, fossorial, and cryptic species such as small mammals, snakes, and amphibians would be missed. However, the amount of habitat that would be impacted by Project activities would be small in comparison to available habitat, and the loss of individuals would not impact local populations.

Project construction activities could frighten Sonoran pronghorn if they are in the area. These individuals would move away from construction activities. Construction activities may keep Sonoran pronghorn from water sources or may cause them to avoid the areas entirely. Sonoran pronghorn need to move widely across the landscape as habitat conditions may vary dramatically between different locations based on sporadic and localized rainfall. Because there are large areas of similar habitat for those individuals, and construction activities would occur for a relatively short amount of time, this effect would be negligible.

Small stands of emergent vegetation are adjacent to the Colorado River and associated backwater channels. Though too small for nesting, Yuma Ridgway's rail or California black rail could occasionally use and forage in these and other stands of emergent vegetation along canals and drains in the agricultural areas. Though no suitable nesting habitat is within the Project area for southwestern willow flycatcher or western yellow-billed cuckoo, preconstruction surveys for nesting migratory birds would detect (and protect) these species, if present. No large trees would be removed within the Colorado River corridor, reducing potential impacts to proposed critical habitat for the western yellow-billed cuckoo.

Project-related impacts to desert tortoise are similar to those discussed for less mobile wildlife species that are susceptible to being killed during vegetation removal, crushed in burrows, and run over by construction equipment and vehicles. The desert tortoise is a long-lived species, taking many years to reach reproductive maturity. Micrositing would reduce the effects of the Project on Mojave desert tortoise habitat.

The Project presents other potential threats to the desert tortoise. Removal of vegetation and disturbance to soils increases the probability of invasion and spread of non-native plant species, especially annual brome grasses. These non-native plants provide poor quality forage for the desert tortoise and crowd out many native, more nutritious forage species.

Common ravens are known to perch and nest on transmission structures, and they are also known to be opportunistic predators of various wildlife species, including juvenile desert tortoises. The potential of raven predation is a management concern for the desert tortoise. Improving existing roads and grading new roads into remote areas can lead to increased recreational access to remote areas and increase the potential for encounters (including illegal collection) between people and tortoises.

Construction activities associated with the Project could have direct and indirect impacts on the desert tortoise located within areas disturbed by construction activity; however, these potential impacts would be minimized through implementation of various APMs and BMPs (Appendix 2A, Section 2A.4).

Between potential Project crossing locations, a backwater channel east of and parallel to the river channel would be avoided by spanning the aquatic habitat. There would be no direct impact to fishes (e.g., razorback sucker and bonytail chub). Areas designated as critical habitat for the razorback sucker would be spanned by the Project; therefore, there would be negligible impact on razorback sucker critical habitat.

Wildlife Corridors, Wildlife Habitat Management Areas, and Wildlife Waters

Construction activities in the Plomosa Mountains, Livingston Hills, and New Water Mountains, within Kofa NWR, and in the Dome Rock Mountains in the area surrounding Copper Bottom Pass areas could deter desert bighorn sheep from crossing into favored lambing grounds, keep them from water sources, or may cause them to disperse from the area entirely. Desert bighorn sheep need to move widely across the landscape as habitat conditions may vary dramatically between different locations based on sporadic and localized rainfall. Long-term impacts to the function of WHMAs and wildlife movement corridors, and disturbance to wildlife seeking access to watering sites may result from facilitating access to remote areas for recreational use.

Construction activities associated with Project implementation could have direct and indirect impacts on the use of wildlife corridors by desert bighorn sheep and other wildlife located within areas disturbed by construction activity; however, these potential impacts would be minimized through implementation of various APMs and BMPs (Appendix 2A, Section 2A.4).

Migratory Birds and Raptors

Impacts could occur if trees and/or shrubs were removed that contained an active nest. The removal of habitat or substantial disturbance (e.g., helicopter fly yard activity) during the breeding season would likely result in the displacement of breeding birds and the abandonment of active nests. Burrowing owls may use their burrows throughout the year, where they could be crushed by heavy equipment.

The presence of transmission structures would provide perches as well as nesting sites for some raptor species. In some areas, the transmission line structures may be the only suitable nesting structures allowing some species to utilize areas that would otherwise be unsuitable.

Noise-related construction activities and increased human presence could affect raptor nesting, roosting, and foraging activities; some species such as golden eagles are especially sensitive to disturbance. Changes to behavior could include increased alertness, turning toward the disturbance, fleeing the disturbance, changes in activity patterns, and nest abandonment. Raptors would be especially susceptible to disturbance early in the breeding season, possibly resulting in nest abandonment and failure. Soaring birds may collide with the transmission line, especially during poor weather conditions and along elevated terrain where soaring raptors would be at greater risk for collisions.

While night lighting associated with the Project would be minimal, constant-burn lighting on structures increases collision risk for night migrating birds.

Transmission lines crossing the Colorado River and its historic floodplain are a potential collision hazard for birds following the river corridor, especially during migration. Guy wires (associated with guyed V structures) are often difficult for birds to detect due to its narrow diameter compared to conductor bundles and are a collision hazard to birds in flight.

The Project has the potential to negatively impact migratory birds due to removal of nesting habitat during the breeding season, collision, and disturbance. Potential impacts to migratory birds would be minimized through implementation of various APMs and BMPs such as an Avian Protection Plan and Bird and Bat Conservation Strategy (APP/BBCS) (Appendix 2B, Section

2B.5), seasonal restrictions, utilizing APLIC guidelines (APLIC 2012), and modifying structures at river crossings (Appendix 2A, Section 2A.4).

4.4.4.2 Direct and Indirect Segment-and Species-Specific Impacts

Direct and Indirect Segment-specific Effects

Appendix 4, Tables 4.4-1 through 4.4-3 detail the acreage of long-term disturbance by segment, which would be the generalized disturbance to wildlife and habitat along each segment.

Segment p-01

Segment p-01 passes across a desert bighorn sheep dispersal corridor between Burnt Mountain and the Big Horn Mountains and would temporarily disrupt movement for forage.

Segment d-01

Where Sonoran desertscrub communities are well represented along Segment d-01, Sonoran desert tortoise could experience some loss of habitat.

Segments p-04 and p-05

Habitat suitability improves for Sonoran desert tortoise and other wildlife closer to the Eagletail Mountains; consequently, development of these segments could contribute to additional habitat degradation.

Segments in-01 and i-04

Project development of segments adjacent to I-10 would have minimal impact on biological resources due to the on-going influence I-10 has on wildlife in the area.

Segment p-06

This segment is almost 36 miles long and follows the existing DPV1 line and corridor with approximately 25 miles crossing the Kofa NWR. Construction along this segment has the potential to alter habitats of various special status species including Gila monster, elf owl, gilded flicker, LeConte's thrasher, and Lucy's warbler. The portion of this segment near and through the Kofa NWR has the potential to disrupt desert bighorn sheep movement and habitat use, as well as impact good quality habitat for the Sonoran desert tortoise, and disturb golden eagles. Three wildlife waters (New Water Well, Scott Well, and Twelve Mile Well), developed primarily for desert bighorn sheep, are within 0.7-mile of the route, and wildlife may avoid these sources of water during the construction period. The route crosses between the Livingston Hills and New Water Mountains, an identified desert bighorn sheep dispersal corridor, temporarily disrupting movement for forage. This segment, along with most alternative segments to Segment p-06 are within the designated experimental nonessential population area for the Sonoran pronghorn; except within the Kofa NWR where the Sonoran pronghorn is protected as a threatened species. Sonoran pronghorn may avoid the area during construction, thereby disrupting natural movement patterns, and forage habitat and access to water sources would be lost in the short term until construction areas are revegetated.

Construction activities associated with Segment p-06 would not be in compliance with the National Wildlife Refuge System Administration Act of 1966, as amended by the National Wildlife Refuge System Improvement Act of 1997 and could have significant direct and indirect impacts on the continued management of the Kofa NWR for the conservation and development of natural wildlife. These impacts would be major, with both short- and long-term effects, and cannot be mitigated. The USFWS states (USFWS 2017) that the construction of a new transmission line across the Kofa NWR should not be considered as a viable alternative.

Segment i-05

Each of these segments parallel or cross I-10 in the vicinity of Quartzsite. The corridor has been subject to long-term disturbance due to the highway, traffic, and presence of people. The Sonoran desertscrub community would largely be inhabited by low to moderate densities of common wildlife species. Additional disturbance associated with the Project would be largely indistinguishable from current conditions.

Segment x-05

Though Segment x-05 would be close to long-term visitor camping areas (approximately 1.2 miles from the centerline of the segment), and the presence of numerous unimproved roads, various special status species may occur in the Sonoran desertscrub habitat, mostly due to the proximity to the Plomosa Mountains and the Kofa NWR. Golden eagles may be present and may be impacted by segment development.

Segment cb-01

The area that would be crossed by Segment cb-01 is used by desert bighorn sheep, including as lambing areas. The segment passes within 0.6- and 0.7-mile of wildlife waters Dome Rock and Tule Tank, respectively. Project development may impact important desert bighorn sheep use area.

Segments p-11 and cb-03

The area that would be crossed by these segments is a desert bighorn sheep use and lambing area, and a movement corridor within the Dome Rock Mountains. Both routes pass within 0.1-mile of wildlife water Dome Rock Mountain #1 and within 1 mile from Dome Rock wildlife water. The impacts of Project development would be additive to the existing habitat fragmentation through the narrow Copper Bottom Pass.

Segments cb-02 and cb-04

These segments cross through remote, almost pristine mountain habitats northwest of Cunningham Peak. Segment cb-02 parallels a portion of Johnson Canyon, with well represented desert wash vegetation, likely providing habitat for special status species such as Gila monster, Sonoran desert tortoise, and Lucy's warbler. A developed wildlife water in Johnson Canyon (Dome Rock) is used by desert bighorn sheep and mule deer. This is a desert bighorn sheep lambing area. Project-related construction within Johnson Canyon would only occur from July through September, outside of peak OHV season. However, this is a critical period for wildlife, which is subjected to very harsh conditions during the summer months when water is often in

limited supply. Concentrating construction activities during these months may reduce access by desert bighorn sheep and mule deer to reliable water sources, and limit use of favored habitat areas. There is developed water (Dome Rock Mountain #1) about 1 mile away on the opposite side of the road through Copper Bottom Pass; another water source (Tule Tank) is about 2.5 miles away on the opposite side of Cunningham Peak. Project development would impact near-pristine desert in this area and may result in disturbance to desert bighorn sheep and mule deer during a critical time period.

Segments i-06 and i-07

Desert bighorn sheep may use the steep slopes on both sides of I-10 through the pass, and the pass provides for movement by wildlife through the Dome Rock Mountains, even with the presence of the interstate highway. However, Project development of segments adjacent to I-10 would have minimal impact due to the on-going influence I-10 has on wildlife in the area.

Segments p-15w, p-16, ca-01, ca-02, ca-05, ca-06, x-09, x-10, x-11, x-12, x-13

Agricultural areas and associated canals and water features close to and crossed by these segments are frequently used by waterfowl, sandhill cranes, raptors, and a wide range of other species. Development in agricultural areas could result in avian mortality due to collision with transmission lines and structures. Though all segments would place conductor bundles in a horizontal, parallel configuration to reduce collision hazard, Segment p-15w parallels DPV1 and would match the existing structure spacing and conductor heights thereby further reducing the collision hazard.

Segments p-17, p-18, ca-07, ca-09, x-15, x-16, and x-19

West of the agricultural fields to the Colorado River Substation, route segments cross areas with very sandy soil on the Palo Verde Mesa. The amount of sand in the soil increases, and the stability of the soil surface decreases, from east to west. These segments are within the sand and dune system as mapped by the DRECP, as well as modeled habitat for Harwood's eriastrum and Mojave fringe-toed lizard. Though the entire mesa is considered part of a sand and dune system, Segments ca-07, ca-09, and a portion of x-19 cross an area of active windblown sand deposition (Figure 3-2). This is where Hardwood's eriastrum has been located and Mojave fringe-toed lizards are more common. These segments pass through about 3.5 miles of sand dune habitat, and about 18 structures would be constructed. Development of Segments ca-07, ca-09, and x-19 would impact 22.7 acres (Appendix 4, Table 4.4-5) of BLM dune habitat (plus another 4.7 acres on private land) and have substantively more potential to impact suitable habitat for both Harwood's eriastrum and Mojave fringe-toed lizard than other routes leading to the substation.

Segments p-17 and p-18, the southernmost route segments heading to the Colorado River Substation, cross sparse stands of creosote and white bursage, and cross three protected washes classified as the *Parkinsonia florida–Olneya tesota* (blue paloverde-ironwood) Alliance; 1.4 acres would be impacted on BLM-administered lands, while impacts to 0.3 acre of wash habitat would be on private land and not subject to BLM requirements. Segment ca-07 also has one crossing of a wash possibly impacting approximately 0.1 acre of BLM land. Soils along part or most of Segments p-17 and p-18 are quite sandy, though these segments do not cross areas classified as having active aeolian deposits (a small area of active deposition is adjacent to

Segment p-17). Segments p-17 and p-18 approach the Mule Mountains, where some of the more suitable habitat for the threatened Mojave desert tortoise is found.

Helicopter fly yards for Segments p-09, p-10, p-11, and cb-01/cb-02 would generate greater amounts of fugitive dust than for segments where helicopters are not used; therefore, the potential to affect photosynthetic rates and decrease plant productivity would be higher in the vicinity of the fly yards. The Erosion, Dust, and Air Quality Plan (Appendix 2B, Section 2B.12) would include information about the reduction of dust emissions generated from helicopter use. The noise and dust associated with the helicopter fly yards would also cause a higher level of wildlife disturbance; however, adherence to seasonal wildlife restrictions per the AGFD, CDFW, and/or applicable RMPs (BMP-BIO-32; Appendix 2A, Section 2A.4) would eliminate these effects during sensitive periods. Wildlife would be expected to return after helicopter use had ceased and habitat was restored. Therefore, these effects would be negligible to minor and short-term.

Direct and Indirect Species-specific Effects

Sonoran Pronghorn

Additional development of the utility corridor through the Kofa NWR could facilitate increasing use of the surrounding remote areas by off-highway vehicle enthusiasts, increasing the possibility of disrupting Sonoran pronghorn movements and use of the area over the long-term. Preventing the invasion and spread of non-native species is important to maintaining the quality of Sonoran pronghorn habitat and preventing wildfire. The experimental nonessential status of the Sonoran pronghorn population allows for regulatory flexibility under the ESA and other lawful activities continue unaffected; however, on a NWR a higher standard of protection is required where the Sonoran pronghorn is protected under the same standards as for a threatened species.

Construction activities associated with the Project could have negligible direct and indirect impacts on Sonoran pronghorn located within the experimental nonessential population area off the Kofa NWR, and major indirect effects to Sonoran pronghorn on the Kofa NWR. Construction activities may keep Sonoran pronghorn from water sources or may cause them to avoid the areas entirely. Sonoran pronghorn need to move widely across the landscape as habitat conditions may vary dramatically between different locations based on sporadic and localized rainfall. These potential impacts would be minimized through implementation of various APMs and BMPs (Appendix 2A, Section 2A.4).

Rare and Sensitive Vegetation Alliances

Three rare plant alliances on the Palo Verde Mesa are crossed by one or more route alternatives (Figure 3-3 and Appendix 4, Table 4.4-4). Initial Project planning indicates that structure placement and access road use on BLM-administered land could result in impacts to the *Pleuraphis rigida* (big galleta) Alliance and/or *Prosopis glandulosa* (honey mesquite) Alliance, depending on route segment selection. The *Pleuraphis rigida* Alliance is a sand dune vegetation alliance; impacts would be minimized through BMPs (Appendix 2A, Section 2A.4). Any required mitigation in California would be addressed during micrositing for the Project. These

potential impacts would be minimized through implementation of various APMs and BMPs (Appendix 2A, Section 2A.4).

In California on BLM lands, specific protection measures for four desert riparian woodland alliances (*Prosopis glandulosa* Alliance [also rare], *Pluchea sericea* Alliance, *Parkinsonia florida–Olneya tesota* Alliance, and *Suaeda moquinii* Alliance) (Figure 3-3) include a 200-foot setback from the outer perimeter of these alliances for ground disturbing (and vegetation disturbing) activities. Minor incursions would be allowed to balance avoiding the need for vegetation trimming while maintaining an appropriate buffer (BMP-BIO-52; Appendix 2A, Section 2A.4). Any loss of desert riparian woodland would be compensated at a 5:1 ratio.

Harwood's Eriastrum

Harwood's eriastrum is the only BLM designated sensitive plant species known to be present on the Palo Verde Mesa.

Ground-disturbing activity, including structure pad preparation and construction, grading of new access roads, clearing of staging areas, and use or improvement of existing access roads have the potential to disturb or destroy individual plants and seed bank of this annual herbaceous species. As an inhabitant of wind deposited dune habitat, project facilities, structures, and construction practices (e.g., equipment stockpiles, access road stabilization) could interfere with wind-driven sand transport mechanisms and alter the condition, distribution, and quality of the aeolian dune system. Dunes can be stabilized or partially stabilized where sand becomes somewhat anchored by both native and non-native plants, and fine, loose sand is blown away while not being replaced by sand transported from upwind. Project impacts to active and stabilized sand dunes include the potential introduction and spread of non-native vegetation, clearing of native vegetation, short- or long-term interruption of sand transport, and resulting compaction of soils due to development of access roads and clearing of work areas, potentially altering the structure of the dune community.

Though the DRECP LUPA, maps most of the Palo Verde Mesa as part of a sand and dune system (Figure 3-2), active sand transport is limited primarily to a corridor north of the Colorado River Substation that is about 1-mile-wide extending to the east a distance of about 5 miles (Figure 3-2), consistent with where Harwood's eriastrum has been located. In accordance with BMP-BIO-53 and BMP-BIO-54 (Appendix 2A, Section 2A.4), within aeolian corridors that transport sand to dune formations, activities are to be designed and operated to facilitate the flow of sand, and roads would be at grade (e.g., no berms) to avoid trapping or diverting sand from the corridor. Footings would be 6 feet in diameter and extend about 2 feet above ground level, and would cause intermittent, localized disruptions of the flow of sand for short distances. Tangent lattice structures would be used, which would minimize obstruction to sand transport. Tangent lattice structures would allow winds to essentially blow through the structure, minimizing the impact on sand transport. Because of the small size and configuration of the structure foundations, the long distances between structures, and the linear west to east Project alignment consistent with wind direction, the impacts to sand transport are considered negligible to minor. Structures and roads are not expected to interfere with sand transport in a manner that would impact associated ecological processes. Maintenance of sand dune habitats are more dramatically affected by the presence of Sahara mustard, which in strong bloom years may virtually shut

down aeolian sand migration; climate change and altered storm patterns; and changes in hydrology due to flood control measures associated with I-10 and other roads (Kenney 2017).

The DRECP LUPA prescribes specific CMAs for Harwood's eriastrum and its dune habitat to avoid and minimize impacts on BLM lands. These measures include implementing an avoidance setback of 0.25-mile from all occurrences of the plant to protect ecological processes and establishing a limit (cap) for impacts to suitable habitat to a maximum of 1 percent throughout all BLM lands included within the DRECP. However, based on the distribution of potentially suitable habitat (Figure 3-5), Harwood's eriastrum is expected to be present along all Project alternatives crossing the Palo Verde Mesa such that a 0.25-mile setback would preclude the Project from connecting with the Colorado River Substation. Therefore, if Project design is not consistent with DRECP LUPA specifications, exceptions can be allowed through an amendment to the CDCA Plan as long as the goals established by the LUPA are met. Since it can be shown that the linear nature of the Project can avoid impacts to the ecological processes (i.e., sand movement) that support populations of this plant species, and meet the DRECP goal of promotion of the ecological processes that sustain special vegetation types and BLM sensitive species, the CDCA Plan, as amended, is further amended to allow Project construction to proceed provided a Linear Right-of-Way Rare Plant Protection Plan (to be completed before a NTP would be issued) for Harwood's eriastrum is developed with the objectives of:

1) Avoidance of take of individual plants to the maximum extent practical; and
2) Avoidance of impacts to Harwood's eriastrum suitable habitat to the maximum extent practical.

To achieve these objectives, implementation of BMP-BIO-31 (Appendix 2A, Section 2A.4) is required in Harwood eriastrum suitable habitat.

Appendix 4, Table 4.4-5 details disturbance to suitable Harwood's eriastrum habitat by segment based upon the presumed habitat.

Initial Project planning indicates that structure placement and access road use could result in impacts within Harwood's eriastrum suitable habitat (Appendix 4, Table 4.4-5). However, it is expected that these impacts would be further reduced to the maximum extent practical based on micrositing and implementation of BMP-BIO-31 (Appendix 2A, Section 2A.4).

For the purposes of implementing BMP-BIO-31, occupied habitat is defined as the location of a live Harwood's eriastrum plant. Upon the death and desiccation of the annual plant, or the absence of germination due to lack of precipitation, the area would be included as suitable habitat but would not be considered occupied habitat. Even though the DRECP mapped the range-wide distribution of Harwood's eriastrum, a more accurate representation of suitable habitat on the Palo Verde Mesa was derived using soil maps (e.g., aeolian surficial deposits), known locations of Harwood's eriastrum, and Mojave fringe-toed lizard distribution—a sympatric, dune obligate species (Figure 3-5). This mapping defines suitable habitat on the Palo Verde Mesa and is used for Project-specific impact assessment. However, a similar range-wide map for Harwood's eriastrum is not available. To evaluate the 1 percent limit on impacts to Harwood's eriastrum range-wide on BLM lands, the distribution model developed for the DRECP was applied.

The DRECP modeled 288,404 acres, including most of the Palo Verde Mesa, which is on the east end of the approximately 50-mile long, east-west trending Chuckwalla Valley, as the distribution of Harwood's eriastrum on BLM lands addressed by the DRECP LUPA. Using the DRECP model, all Project-related ground disturbance activities (e.g., structure construction, access road development) were calculated by Project Alternative. Based upon the modeled habitat, Alternative 2 would potentially disturb 60.2 acres of Harwood's eriastrum habitat (0.02 percent of the total modeled habitat range-wide), more than any other Alternatives, and this estimate for Project impact acres does not consider additional reduction in area of impact that would be achieved through micrositing. Other BLM-approved projects have occurred within the Chuckwalla Valley, including the Colorado River Substation, Desert Sunlight, and Genesis. A total of 313.6 acres of modeled Harwood's eriastrum habitat has been impacted by these past projects (Colorado River Substation 77.3 acres; Desert Sunlight 0 acres; Genesis 236.3 acres), and together with the Project would impact 373.8 acres of DRECP modeled habitat. There is a total of 103,958 acres of modeled Harwood's eriastrum habitat in the Chuckwalla Valley; all projects in Chuckwalla Valley combined result in impacts to 0.36 percent of DRECP modeled Harwood's eriastrum habitat within Chuckwalla Valley, or 0.12 percent of modeled habitat range wide. The sum of impacted habitat from these projects on BLM land is below the 1 percent cap (i.e., 2,884 acres).

Project implementation could have direct and indirect impacts on special status plant species located within areas disturbed by construction activity; however, these potential impacts would be either eliminated and/or minimized through implementation of various APMs and BPMs (Appendix 2A, Section 2A.4).

Mojave Fringe-toed Lizard

Project-related impacts to the Mojave fringe-toed lizard are similar to those discussed for less mobile wildlife species that are susceptible to being killed during vegetation removal, crushed in burrows, and run over by construction equipment and vehicles. When frightened, Mojave fringe-toed lizards will flee and then bury themselves in the loose sand, increasing the potential that Project activities could unknowingly crush individuals, including mortality from use of access roads.

By definition, dune habitat shifts on the landscape in response to wind patterns and may create small (unmapped) patches of suitable Mojave fringe-toed lizard habitat throughout the sand field. Dunes can be stabilized or partially stabilized where sand becomes somewhat anchored by both native and non-native plants, and fine, loose sand is blown away while not being replaced by sand transported from upwind. Project impacts to active and stabilized sand dunes include the potential introduction and spread of non-native vegetation, and the clearing of native vegetation and resulting compaction of sands to establish access roads and clear work areas, potentially altering the structure of the dune community. Because of the small size and configuration of the structure foundations, the long distances between structures, and the linear west to east Project alignment consistent with wind direction, the impacts to sand transport are considered negligible to minor.

Construction activities associated with the Project could have direct and indirect impacts on Mojave fringe-toed lizards located within areas disturbed by construction activity; however,

these potential impacts would be minimized through implementation of various APMs and BMPs (Appendix 2A, Section 2A.4).

The habitat model developed for the DRECP maps most of the Palo Verde Mesa as potentially suitable habitat for the Mojave fringe-toed lizard (Figure 3-2). However, a more accurate representation of suitable habitat on the Palo Verde Mesa was derived using soil maps (e.g., aeolian surficial deposits), known locations of the Mojave fringed-toed lizard from the CNDDB, and occurrence records for Harwood's eriastrum—a sympatric, dune obligate species. These data tended to cluster and polygons of presumed suitable Mojave fringe-toed lizard habitat were mapped (Figure 3-7). This mapping defines suitable habitat on the Palo Verde Mesa and is used for Project-specific impact assessment for implementation of clearance surveys on BLM land. The anticipated Project impacts to Mojave fringe-toed lizard habitat by segment is identical to Harwood's eriastrum, as provided in Appendix 4, Table 4.4-5, using the presumed habitat.

Alternative 2 would potentially disturb 60.2 acres of DRECP modeled Mojave fringe-toed lizard habitat, more than any other Action Alternative, and this estimate for Project impact acres does not consider additional reduction in areas of impact that would be achieved through micrositing. These acres account for 0.048 percent of all modeled Mojave fringe-toed lizard habitat across the Chuckwalla Valley (i.e., 132,117 acres).

Appendix 4, Table 4.4-6 details the acreage of long-term disturbance by segment in the western portion of the Project Area, which would be the generalized disturbance to wildlife and habitat along each segment.

4.4.5 Operations, Maintenance, and Decommissioning

The anticipated operations and maintenance duration is 50 years. Though most impacts to biological resources are expected to occur in association with construction, some Project-related activities and Project effects would continue. Noise and human presence that would disturb wildlife could result from many on-going Project activities. The use of vehicles and occasionally heavy equipment could result in crushing and removal of plants, collisions with animals, collapsing burrows, and loss of refugia. The long-term presence of structures and guy lines remain a collision threat to birds. The transmission line would be inspected annually or as required by using fixed-wing aircraft, helicopters, ground vehicles, all-terrain vehicles, or on foot. Maintenance of the line and facilities would be performed as needed. Maintenance vehicles would generally require access to the ROW once yearly, and where long-term access is required for maintenance and operation, a regular maintenance program may include, but would not be limited to, blading, ditching, culvert installation, and surfacing. The SCS would require minor maintenance over a 3-to 5-day period once each year.

Repair and maintenance, including replacement of conductors, and decommissioning may require the same types of equipment used during construction, including power augers for hole boring, backhoes for excavation, and/or concrete trucks and cranes for structure erection. Other required equipment may include power tensioners, pullers, wire trailers, crawler tractors, and trucks and pickups for hauling materials, tools, and workers. Helicopters may be used in some circumstances. The frequency and duration of repair activities is unknown but would be a short-term impact.

4.4.5.1 Vegetation

As part of maintenance and operations activities, vegetation within the ROW may be selectively removed or trimmed in accordance with the Vegetation Management Plan (Appendix 2B, Section 2B.11) (APM/BMP-BIO-11; Appendix 2A, Section 2A.4) to provide the required minimum conductor clearance. Maintenance crews would routinely trim vegetation and remove brush within the ROW, as necessary, to prevent accidental grounding contact with conductors.

The potential introduction of non-native plant species would be less likely than during construction but would continue during operation and maintenance phases of the Project.

Where access is required for nonemergency maintenance and repairs, the same precautions against ground disturbance that were taken during construction would be followed and applicable APMs and BMPs would be implemented. Restoration and reclamation procedures following completion of repair work would be similar to those prescribed during construction, and any necessary temporary staging areas outside the ROW would require authorization.

During operations, maintenance, and decommissioning:

- Project operations may result in negligible impacts to vegetation resources;
- Project maintenance may result in minor impacts to vegetation resources; and,
- Project decommissioning may result in moderate impacts to vegetation resources.

4.4.5.2 Wildlife

Project operations require occasional presence of people and activities for annual line and facilities inspection, and maintenance of facilities conducted on an as needed basis. Site visits may occur to monitor and treat invasive plants, monitor restoration sites, and to conduct other resource management actions. Site visits, including helicopter inspection of the lines, may result in wildlife temporarily fleeing an area, but within the animal's normal behavior patterns. Some individuals of small wildlife (e.g., rodents, rabbits, snakes, lizards) may be run over by vehicles. However, these visits are infrequent, and consistent with current use of roads throughout the Project Area open for public use. Any new roads built and not reclaimed would provide vehicle access in areas previously precluded due to lack of roads.

Successful habitat restoration may take many years before wildlife would use these areas at the level prior to impact and restoration. The presence of utility lines and structures may provide on-going opportunities for raptors and ravens to perch and possibly nest, increasing their presence and enhancing their ability to capture prey that includes a variety of wildlife species, most notably juvenile Mojave desert tortoises. Application of Avian Power Line Interaction Committee recommendations (APLIC 2006 and 2012), could reduce the likelihood of collisions of birds during Project operations. An APP/BBCS (Appendix 2B, Section 2B.5) (APM-BIO-21 and BMP-BIO-29; Appendix 2A, Section 2A.4), required for the Project, would include a monitoring program to determine the effectiveness of the design to protect birds that utilize power lines and structures for perching and nesting, and to establish implementation measures for the use of flight diverters and other means to make lines more visible to reduce bird collisions. The guyed V structures, up to 190 feet tall, require four guy wires for support. Guy

wires are often difficult for birds to detect and represent a continuing collision hazard for birds, and to a lesser extent, bats.

During operations, maintenance, and decommissioning:

- Project operations may result in minor impacts to wildlife resources;
- Project maintenance may result in minor impacts to wildlife resources; and,
- Project decommissioning may result in moderate impacts to wildlife resources.

4.4.6 Mitigation Measures

The applicant has committed to APMs, and the BLM developed required BMPs that would further reduce impacts to biological resources. Requirements for mitigation would be determined in coordination with micrositing and final design and could include habitat improvement. In California, any mitigation for permanent loss of habitat would be developed to meet the CDCA Plan requirements and approval.

4.4.7 Construction of Full Route Alternative and Subalternative Effects

Appendix 4, Tables 4.4-7 and 4.4-8 summarize disturbance information for each of the full route alternatives individually discussed in the following sections. Descriptions of the impacts common to all alternatives and mitigation common to all alternatives apply and are not repeated here.

The acres of Harwood's eriastrum and Mojave fringe-toed lizard habitat estimated to be impacted based on Project-specific mapping of presumed habitat on the Palo Verde Mesa would likely provide a more accurate assessment of actual acres impacted by alternative (Appendix 4, Table 4.4-5), and these acres identified where impacts may occur have not been subject to micrositing adjustments. However, no similar range-wide assessment of Harwood's eriastrum and Mojave fringe-toed lizard habitat is available. The Project habitat mapping of suitable acres impacted shown in Appendix 4, Table 4.4-8 also applies to the Mojave fringed-toed lizard as the habitats are identical.

4.4.7.1 Proposed Action

Impacts to biological resources from implementation of the Proposed Action would range from negligible to major.

Vegetation

The entire length of the Proposed Action route would parallel the existing DPV1 line and unimproved roads, as well as an adjacent buried pipeline for much of the way. The impacts from past vegetation removal during construction of DPV1 in 1982 is evident, with perhaps limited success of restoration efforts. The Proposed Action would add to this disturbance and loss of vegetation but would not really extend it into otherwise undisturbed areas, since the Project would occur immediately adjacent to existing disturbance areas. Invasive species such as Russian thistle, annual brome grasses, and non-native mustards are present along the existing

linear facilities, limiting the likelihood that the Proposed Action would lead to infestations in areas where these plants are not already present, though the Project may contribute to their increased abundance. The Proposed Action would not affect microphyll wash habitat (Appendix 4, Table 4.4-4). Protected native plants would be avoided or salvaged, and impacts to the sand dune habitat of Harwood's eriastrum would be minimized by following Segments p-17 and p-18. Approximately 0.6 mile of proposed access roads would cross suitable Harwood's eriastrum habitat under the Proposed Action; in total, approximately 3.3 acres of suitable habitat would be impacted by Project activities (Appendix 4, Tables 4.4-5 and 4.4-8). Application of APMs and BMPs would protect the plant from loss of individuals and maintain the ecological processes (e.g., sand transport) that sustain its habitat; therefore, these impacts would be negligible to minor. The Proposed Action would have the least amount of Project mapped suitable acres and modeled acres of impacts to Harwood's eriastrum of all full route alternatives.

The Proposed Action would result in:

- Minor short-term and long-term impacts to native vegetation pending successful restoration;
- Negligible long-term impacts due to facilitating increased abundance of non-native plants; and,
- Minor short- and long-term impacts of ground disturbance on protected and special status plants and plant communities.

Wildlife

Segment p-06 would cross the Kofa NWR. Development of Segment p-06 would disrupt desert bighorn sheep movement and habitat use within and outside the NWR, and incrementally increase habitat fragmentation in an area already impacted by the presence of high-voltage utility and buried pipeline corridors, including the DPV1, the EPNG line, the existing SCS, etc.

Segment p-06 crosses about 25 miles of good quality habitat for the Sonoran desert tortoise and is within an area used by a reintroduced population of the endangered Sonoran pronghorn.

Segments p-10 and p-11 go through Copper Bottom Pass below Cunningham Peak. Although a road, transmission line, and buried pipeline are present through Copper Bottom Pass, APM-BIO-18 (Appendix 2A, Section 2A.4) is required to ensure that construction traffic in the pass is limited to only that which is necessary in order to minimize disturbance to desert bighorn sheep. In addition, APM-BIO-27 (Appendix 2A, Section 2A.4) places seasonal restrictions on construction activities in desert bighorn sheep lambing areas, such as Copper Bottom Pass, to be determined annually by AGFD and BLM.

The proposed crossing of the Colorado River (Segment p-15e) is immediately north of the existing DPV1 crossing. Matching structure spacing and conductor heights with the existing line is expected to reduce the potential for birds to collide with the transmission line in this migratory bird flyway. Transmission lines over agricultural lands present a threat to the many birds that use agricultural lands and the associated water features. In these areas, conductor bundles would be in a horizontal, parallel configuration, and would match existing structure spacing and conductor heights to reduce the potential for bird collisions. On the Palo Verde Mesa, Segment p-17 and Segment p-18 approach the Mule Mountains, where some of the more suitable habitat for the

threatened Mojave desert tortoise is found. Segments p-17 and p-18 avoids the best sand dunes used by the BLM sensitive species Mojave fringe-toed lizard, but crosses through 0.6-mile of habitat. The Proposed Action route parallels other high-voltage utility lines, buried pipeline, and established roads such that access to much of the Proposed Action corridor is already open to non-Project personnel; the exception is on Palo Verde Mesa where only limited access exists.

The Proposed Action would result in:

- Major long-term impacts to the management of the Kofa NWR, and to desert bighorn sheep and Sonoran pronghorn on the refuge;
- Minor short-term impacts to desert bighorn sheep in the Copper Bottom Pass area;
- Negligible long-term impacts to wildlife and habitats by facilitating increased recreational access to remote areas;
- Minor long-term impacts to wildlife habitat (especially Sonoran desert tortoise habitat in Kofa NWR) by contributing to an increase in abundance of non-native plants;
- Negligible short-term impacts to Mojave fringe-toed lizard due to possible mortality by Project activities;
- Negligible short- and long-term impacts to sensitive wildlife species, including nests of migratory birds; and,
- Minor short- and long-term impacts to migratory birds due to potential collision hazard with structures, conductors, and guy lines.

4.4.7.2 Alternative 1: I-10 Route

Impacts to biological resources from implementation of Alternative 1 would range from negligible to minor. All proposed APMs and BMPs apply except APM-BIO-18 (Appendix 2A, Section 2A.4) because Alternative 1 does not go through Copper Bottom Pass, and APM/BMP-BIO-19 (Appendix 2A, Section 2A.4) because the crossing of the Colorado River is not adjacent to existing high-voltage lines so matching conductor heights to reduce impacts to migratory birds is not applicable.

Vegetation

Vegetation communities adjacent to and near the existing interstate highway corridor have largely been degraded by long-term impacts associated with easy access off of I-10; and commercial, residential, and agricultural development adjacent to I-10, including the presence of roads, canals, and various utility lines. Evidence of OHV use is present throughout, resulting in damage to and loss of vegetation. The interstate functions as a corridor for dispersal of non-native invasive plants. In California, rare plant alliances, including desert washes, are protected by setbacks of 200 feet. Alternative 1 would impact 0.5 acre of microphyll wash (Appendix 4, Table 4.4-4); however, there would be a 200-foot setback and microphyll washes would be spanned through micrositing. Approximately 5.6 miles of proposed access roads would cross suitable Harwood's eriastrum habitat under Alternative 1; in total, approximately 27.3 acres of suitable habitat would be impacted by Project activities (Appendix 4, Tables 4.4-5 and 4.4-8).Application of APMs and BMPs would protect the plant from loss of individuals and maintain

the ecological processes (e.g., sand transport) that sustain its habitat; therefore, these impacts would be minor to moderate.

Alternative 1 access roads would cross more suitable Harwood's eriastrum habitat than the Proposed Action and the same as Alternatives 2 through 4; would have the same amount of Project-mapped suitable acres of impacts to Harwood's eriastrum as Alternatives 2 through 4; the same amount of modeled acres of impacts to Harwood's eriastrum as Alternatives 3 and 4; but fewer modeled acres of impacts than Alternative 2 (Appendix 4, Tables 4.4-5 and 4.4-8).

The construction of Alternative 1 adjacent to the I-10 corridor, in addition to the current uses, would not alter the current situation regarding the overall degraded condition of vegetation resource. Segments ca-07, ca-09, and x-19 are more likely to encounter Harwood's eriastrum than the Proposed Action. Surveys would be conducted in all disturbance areas and plants would be avoided during construction, but there would likely be some loss of suitable habitat.

Alternative 1 would result in:

- Minor short- and long-term impacts to native vegetation pending successful restoration;
- Minor long-term impacts due to facilitating increased abundance of non-native plants, especially in dune habitats; and,
- Moderate short- and long-term impacts of ground disturbance on protected and special status plants and plant communities.

Wildlife

Alternative 1 goes through passes in the Plomosa Mountains and Dome Rock Mountains that are important wildlife movement corridors, especially for desert bighorn sheep. However, both of these passes are already impacted by I-10, utility lines, and pipelines. On the Palo Verde Mesa, Segments ca-07 and ca-09 cross about 3.5 miles of sand dunes, habitat for the Mojave fringe-toed lizard. Preconstruction exclusion surveys would be conducted to minimize possible mortality; impacts to habitat would recover due to lack of disruption of the sand transport corridor. Given the current status of wildlife populations and habitat along the majority of the Alternative 1 corridor, the additional impacts to wildlife from the development of Alternative 1 would largely be negligible.

In comparison to the Proposed Action, Alternative 1 would have no impact on the Kofa NWR because it would avoid the refuge; would impact only a minor amount of mostly degraded Sonoran desert tortoise habitat; and would not impact the Sonoran pronghorn. Potential impacts to desert bighorn sheep due to habitat fragmentation, impeding animal movement, and interference with lambing grounds would be reduced to negligible levels. The crossing of the Colorado River is not adjacent to the existing DPV1 line, creating an additional collision hazard for birds. Impacts to general wildlife and habitats would be negligible due to existing degraded habitat conditions.

Alternative 1 would result in:

- Negligible impacts to desert bighorn sheep;

- Negligible long-term impacts to wildlife and habitats by facilitating increased recreational access to remote areas;
- Minor short- and long-term impact to Mojave fringe-toed lizard due to possible mortality by Project activities and habitat impacts;
- Negligible short- and long-term impacts to sensitive wildlife species (excluding Mojave fringe-toed lizard), including nests of migratory birds;
- Negligible long-term impacts associated with contributing to an increase in abundance of non-native plants degrading wildlife habitat; and,
- Minor short- and long-term impacts to migratory birds due to potential collision hazard with structures, conductors, and guy lines, and additional hazard at the Colorado River crossing.

Subalternatives to Alternative 1 (1A through 1E)

There would be minimal differences in biological resources impacts between the Alternative 1 subalternatives (1A through 1E) and Alternative 1.

4.4.7.3 Alternative 2: BLM Utility Corridor Route

Impacts to biological resources from implementation of Alternative 2 would range from negligible to minor.

Vegetation

Alternative 2, where it is parallel to I-10 and US 95, would have similar impacts to vegetation as described for Alternative 1 following the I-10 corridors. Alternative 2 impacts to vegetation through Copper Bottom Pass would be as described for the Proposed Action.

Alternative 2 on the Palo Verde Mesa is almost twice as long as either the Proposed Action or Alternative 1, adding Segments x-15 and x-16 to the other segments included in Alternative 1. Segments x-15 and x-16 pass through sandy soil habitat, though not active dunes. Together these segments are 3.7 miles in length and intersect approximately 0.8 mile of the *Pleuraphis rigida* (big galleta) Alliance, which would be protected by a 200-foot setback. Alternative 2 would impact 2.6 acre of microphyll wash (Appendix 4, Table 4.4-4); however, there would be a 200-foot setback and microphyll washes would be spanned through micrositing. Approximately 5.6 mile of proposed access roads would cross suitable Harwood's eriastrum habitat under Alternative 2; in total, approximately 27.3 acres of suitable habitat would be impacted by Project activities (Appendix 4, Tables 4.4-5 and 4.4-8).Application of APMs and BMPs would protect the plant from loss of individuals and maintain the ecological processes (e.g., sand transport) that sustain its habitat; therefore, these impacts would be minor to moderate.

Alternative 2 access roads would cross more suitable Harwood's eriastrum habitat than the Proposed Action and the same as Alternatives 1, 3, and 4; would have the same amount of Project mapped suitable acres of impacts to Harwood's eriastrum as Alternatives 1, 3, and 4; and more modeled acres of impacts to Harwood's eriastrum as Alternatives 1, 3, and 4 (Appendix 4, Table 4.4-8).

Surveys for vegetation would be conducted in all disturbance areas and sensitive plants and rare alliances would be avoided. The increase in Project activities on Palo Verde Mesa may also further facilitate the spread of non-native plant species.

Alternative 2 would result in:

- Minor short- and long-term impacts to native vegetation pending successful restoration; Minor long-term impacts due to facilitating increased abundance of non-native plants, especially in dune habitats; and,
- Moderate short- and long-term impacts of ground disturbance on protected and special status plants and plant communities.

Wildlife

As discussed for Alternative 1, wildlife resources associated with Project segments along highways have been impacted in many ways, resulting in reduced populations of most wildlife species. Alternative 2, similar as with Alternative 1, parallels I-10 through the pass in the Plomosa Mountains—an important desert bighorn sheep movement corridor. Alternative 2, similar to the Proposed Action, would go through Copper Bottom Pass below Cunningham Peak, a rugged and remote area used by desert bighorn sheep, including as a lambing area. APM-BIO-18 and APM-BIO-27 (Appendix 2A, Section 2A.4) are intended to minimize disturbance to desert bighorn sheep in the Copper Bottom Pass area.

In comparison to the Proposed Action, Alternative 2 would have no direct impact on the Kofa NWR because the route avoids the refuge and is adjacent to I-10; would have negligible impacts to the Sonoran pronghorn; would impact a minor amount of Sonoran desert tortoise habitat in the Plomosa and Dome Rock mountains; and avoid the more suitable habitat for the Mojave desert tortoise near the Mule Mountains. Due to the increased length of Alternative 2 over that of Alternative 1, the possibility that shifting patches of Mojave fringe-toed lizard habitat may be impacted is increased.

Alternative 2 would result in:

- Minor short-term impacts to desert bighorn sheep in the Copper Bottom Pass area;
- Minor short- and long-term impacts to Mojave fringe-toed lizard due to possible mortality by Project activities and habitat impacts;
- Negligible short- and long-term impacts to sensitive wildlife species (excluding Mojave fringe-toed lizard), including nests of migratory birds;
- Minor long-term impact to wildlife habitat by contributing to an increase in abundance of non-native plants, especially in dune habitat; and,
- Minor short- and long-term impacts to migratory birds due to potential collision hazard with structures, conductors, and guy lines.

Subalternatives to Alternative 2 (2A through 2E)

There would be minimal differences in biological resources impacts between the Alternative 2 subalternatives (2A through 2E) and Alternative 2.

4.4.7.4 Alternative 3: Avoidance Route

Impacts to biological resources from implementation of Alternative 3 would range from negligible to major. All APMs and BMPs apply except APM/BMP-BIO-19 (Appendix 2A, Section 2A.4) because the crossing of the Colorado River is not adjacent to existing high-voltage lines so matching conductor heights to reduce impacts to migratory birds is not applicable.

Vegetation

Impacts to vegetation from Alternative 3 would be as described for the Proposed Action from the Delaney Substation to where Alternative 3 would diverge from following the existing DPV1 line and proceed north to the I-10 corridor. Along I-10, Alternative 3 would have the same impacts as described for Alternative 1. When Alternative 3 turns south along the Plomosa Mountains it does not follow an existing utility corridor. Though there are unpaved roads crossing this segment, new, albeit temporary, access roads and work areas would impact existing Sonoran desertscrub communities where similar impacts have not occurred. Disturbance to soils could increase the possibility of spreading non-native plants to the area. Alternative 3 impacts to vegetation are similar to the Proposed Action from US 95 to Copper Bottom Pass.

Alternative 3 turns from Copper Bottom Pass near Cunningham Peak, passing high on the mountain slope into a rugged and remote portion of the Dome Rock Mountains. The area is in largely pristine condition, with few unimproved roads leading to the toe slope of the mountains. Construction of Alternative 3 would remove native vegetation and could facilitate spread of non-native plants into an area that has had little impact from human activities. From the Colorado River crossing to the substation, the impacts of Alternative 3 to vegetation resources are similar to that described for Alternative 1. Alternative 3 would cross 0.5 acre of microphyll wash (Appendix 4, Table 4.4-4); however, there would be a 200-foot setback and microphyll washes would be spanned through micrositing. Approximately 5.6 mile of proposed access roads would cross suitable Harwood's eriastrum habitat under Alternative 3; in total, approximately 27.3 acres of suitable habitat would be impacted by Project activities (Appendix 4, Tables 4.4-5 and 4.4-8).Application of APMs and BMPs would protect the plant from loss of individuals and maintain the ecological processes (e.g., sand transport) that sustain its habitat; therefore, these impacts would be minor to moderate.

Alternative 3 access roads would cross more suitable Harwood's eriastrum habitat than the Proposed Action and the same as Alternatives 1, 2, and 4; would have the same amount of Project mapped suitable acres of impacts to Harwood's eriastrum as Alternatives 1, 2, and 4; but less modeled acres of impacts than Alternative 2 (Appendix 4, Table 4.4-8).

Alternative 3 would result in:

- Moderate short-term impacts to native vegetation due to ground disturbance during construction pending restoration, and moderate long-term impacts to vegetation in areas where no linear facilities and few roads exist;
- Moderate long-term impacts due to facilitating spread and increased abundance of non-native plants into new areas, especially into the Dome Rock Mountains and dune habitats;

- Moderate short- and long-term impacts of ground disturbance on protected and special status plants and plant communities; and,
- Moderate short- and long-term impacts in areas where there are no existing linear facilities and few roads resulting in impacts to near-pristine examples of desert wash communities.

Wildlife

Impacts to wildlife from implementation of Alternative 3 would be similar to effects described for the Proposed Action and Alternative 1, with the exception of Segment x-05 along the west side of the Plomosa Mountains, and Segments cb-01, cb-04, and cb-05 that pass near Cunningham Peak to cross the Dome Rock Mountains.

Segment x-05 passes mostly north-south along the foothills and alluvial fan on the west side of the Plomosa Mountains. Though close to the LTVA, and the presence of numerous unimproved roads, various special status species may occur in the Sonoran desertscrub habitat within the corridor, mostly due to proximity of the Plomosa Mountains. Golden eagle, Sonoran pronghorn, Gila monster, elf owl, gilded flicker, and Lucy's warbler may be present.

Segment cb-01 passes high on the remote, steep mountain slopes of Cunningham Peak. Segment cb-04 crosses the Dome Rock Mountains through largely undisturbed desert wash vegetation that likely provides habitat for special status species such as Sonoran pronghorn, Gila monster, Sonoran desert tortoise, and Lucy's warbler. Segment cb-05 passes between the west side of the Dome Rock Mountains and the Colorado River in an area with very harsh desert conditions and large areas of desert pavement. There are few roads into this area of the Dome Rock Mountains, which is in largely pristine condition. The area is prime desert bighorn sheep habitat, which is often used for lambing grounds. Development of Alternative 3 could facilitate public access that would increase disturbance to wildlife in these remote habitats and may permanently alter the character and function of the area for wildlife, especially desert bighorn sheep.

In comparison to the Proposed Action, Alternative 3 would have no direct impact on the Kofa NWR because the route avoids the refuge and would have reduced impacts to the Sonoran pronghorn. Implementation of Alternative 3 would result in:

- Major long-term impacts to desert bighorn sheep in the Dome Rock Mountains by degrading nearly pristine habitat and facilitating increased recreational access to remote areas;
- Minor short- and long-term impacts to Sonoran pronghorn due to the vicinity to Kofa NWR;
- Minor short- and long-term impacts to Mojave fringe-toed lizard due to possible mortality by Project activities and habitat impacts;
- Negligible short- and long-term impacts to sensitive wildlife species (excluding Mojave fringe-toed lizard), including nests of migratory birds;
- Moderate long-term impact to wildlife habitat by contributing to an increase in abundance of non-native plants into remote areas and dune habitat; and,

- Minor short- and long-term impacts to migratory birds due to potential collision hazard with structures, conductors, and guy lines, and additional hazard at the Colorado River.

Subalternatives to Alternative 3 (3A through 3M)

There would be minimal differences in biological resources impacts between the Alternative 3 subalternatives (3A through 3M) and Alternative 3.

4.4.7.5 Alternative 4: Public Lands Emphasis Route

Impacts to biological resources from implementation of Alternative 4 would range from negligible to major.

Vegetation

There is good representation of Sonoran desertscrub communities west of the Delaney Substation, past the agricultural fields and across the alluvial fan of the Eagletail Mountains. The area has been impacted by a buried natural gas pipeline and roads and has scattered invasive species such as red brome and non-native mustards. Alternative 4 continues through another 20 miles of good quality desert habitats to where it turns to parallel I-10. After entering Copper Bottom Pass, the route turns near the head of Johnson Canyon north of Cunningham Peak into a rugged and remote portion of the Dome Rock Mountains. The area is in largely pristine condition, with well represented desert wash vegetation and few unimproved roads leading to the toe slope of the mountains. Development of Alternative 4 may facilitate spread of invasive plant species to this very remote area, which could be exacerbated by increased access to the area by recreationists.

Alternative 4 would cross 0.5 acre of microphyll wash (Appendix 4, Table 4.4-4); however, there would be a 200-foot setback and microphyll washes would be spanned through micrositing. Approximately 5.6 mile of proposed access roads would cross suitable Harwood's eriastrum habitat under Alternative 4; in total, approximately 27.3 acres of suitable habitat would be impacted by Project activities (Appendix 4, Tables 4.4-5 and 4.4-8). Application of APMs and BMPs would protect the plant from loss of individuals and maintain the ecological processes (e.g., sand transport) that sustain its habitat; therefore, these impacts would be minor to moderate. Alternative 4 access roads would cross more suitable Harwood's eriastrum habitat than the Proposed Action and the same as Alternatives 1, 2, and 3; would have the same amount of modeled acres of impacts to Harwood's eriastrum as Alternatives 1 and 3; but fewer modeled acres of impacts than Alternative 2 (Appendix 4, Table 4.4-8).

Alternative 4 would result in:

- Moderate short- and long-term impacts to native vegetation pending restoration, and increased degradation of existing good quality habitats;
- Moderate long-term impacts due to facilitating spread and increased abundance of non-native plants into new areas, especially into the Dome Rock Mountains and dune habitats; and,
- Moderate short- and long-term impacts of ground disturbance on protected and special status plants and plant communities.

Wildlife

Alternative 4 extends across more than 40 miles of desert from north of the Eagletail Mountains to I-10 near the Bear Hills south of the town of Brenda, where there is good representation of quality Sonoran desertscrub vegetation, providing habitat for diverse Sonoran desert biotic communities. In Copper Bottom Pass, in the vicinity of Cunningham Peak at the head of Johnson Canyon, the area is in largely pristine condition, with few unimproved roads, providing prime desert bighorn sheep habitat that is often used for lambing grounds. Because Alternative 4 would bring human presence and noise closer to a developed wildlife water in Johnson Canyon used by desert bighorn sheep and mule deer, some animals may experience more stress as they seek water elsewhere. Development of Alternative 4 could lead to degraded habitat conditions by facilitating the spread of non-native vegetation, increase public access into remote habitats resulting in disturbance to wildlife, and may permanently alter the character and function of the area for wildlife, especially desert bighorn sheep.

Because Alternative 4 leaves the existing DPV1 corridor and crosses into near-pristine desert bighorn sheep habitat, the impacts to wildlife associated with Alternative 4 are substantially greater than the Proposed Action.

Implementation of Alternative 4 would result in:

- Major long-term impacts to desert bighorn sheep in the Dome Rock Mountains by degrading nearly pristine habitat and facilitating increased recreational access to remote areas;
- Minor short-term impacts to Sonoran pronghorn south of I-10;
- Minor short- and long-term impacts to Mojave fringe-toed lizard due to possible mortality by Project activities and habitat impacts;
- Negligible short- and long-term impacts to sensitive wildlife species (excluding Mojave fringe-toed lizard), including nests of migratory birds;
- Moderate long-term impact to wildlife habitat by contributing to an increase in abundance of non-native plants into remote areas and dune habitat; and,
- Minor short- and long-term impacts to migratory birds due to potential collision hazard with structures, conductors, and guy lines.

Subalternatives to Alternative 4 (4A through 4P)

There would be minimal differences in impacts between the Alternative 4 subalternatives (4A through 4P) and Alternative 4. However, subalternative 4D passes along the foothills and alluvial fan on the west side of the Plomosa Mountains. Various special status species may occur in the Sonoran desertscrub habitat within the corridor, mostly due to its proximity to the Plomosa Mountains. This subalternative would replace Segment x-06 that follows the east perimeter of the La Posa LTVA, an area disturbed by persistent human presence and subject to high levels of recreation use, including OHV use. Implementing Subalternative 4D would result in additional impacts to vegetation and wildlife resources than would occur under Alternative 4.

4.4.7.6 Agency Preferred Alternative

Vegetation

As with Alternative 1, vegetation communities adjacent and near existing highway corridors have largely been degraded by long-term impacts associated with easy access off the highways for recreation; commercial, residential, and agricultural development adjacent to I-10, including the presence of roads, canals, and various utility lines. Evidence of OHV use is present throughout, resulting in damage to and loss of vegetation. Highway corridors function as dispersal routes for non-native invasive plants. The Preferred Alternative, where it is parallel to I-10, would have similar impacts to vegetation as described for Alternative 1 following the I-10 corridors. The impacts to vegetation under the Preferred Alternative through Copper Bottom Pass would be as described for the Proposed Action.

The Preferred Alternative is almost twice as long as either the Proposed Action or Alternative 1 on the Palo Verde Mesa. Segments x-15 and x-16 pass through sandy soil habitat of the big galleta Alliance, though not active dunes. Together these segments intersect more than 1 mile of the big galleta Alliance, which would be protected by a 200-foot setback. The impacts of the Preferred Alternative on the Palo Verde Mesa would be similar to that described for Alternative 1, plus the added impacts associated with Segments x-15 and x-16; this increases the likeihood that shifting pockets of suitable Harwood's eriastrum habitat or rare plant alliances may be impacted.

The Preferred Alternative would have the same amount of Project mapped suitable acres of impacts to Harwood's eriastrum as Alternatives 1, 3, and 4; more modeled acres of impacts to Harwood's eriastrum as Alternatives 1, 3, and 4 (Appendix 4, Table 4.4-8).

However, surveys for vegetation would be conducted in all disturbance areas and sensitive plants and rare alliances would be avoided. The increase in Project activities on Palo Verde Mesa may also further facilitate the spread of non-native plant species.

The Preferred Alternative would result in:

- Minor short- and long-term impacts to native vegetation pending successful restoration; Minor long-term impacts due to facilitating increased abundance of non-native plants, especially in dune habitats; and,
- Moderate short- and long-term impacts of ground disturbance on protected and special status plants and plant communities.

Wildlife

As with Alternative 1, wildlife resources associated with Project segments along highways have been impacted in many ways, resulting in reduced populations of most wildlife species. Similar to Alternative 1, the Preferred Alternative parallels I-10 through the pass in the Plomosa Mountains—an important desert bighorn sheep movement corridor. A portion of the Preferred Alternative also passes along the foothills and alluvial fan on the west side of the Plomosa Mountains. Various special status species may occur in the Sonoran desertscrub habitat within the corridor, mostly due to its proximity to the Plomosa Mountains.

The Preferred Alternative, similar to the Proposed Action, would go through Copper Bottom Pass below Cunningham Peak, a rugged and remote area used by desert bighorn sheep, including as a lambing area. APM-BIO-18 and APM-BIO-27 (Appendix 2A, Section 2A.4) are intended to minimize disturbance to desert bighorn sheep in the Copper Bottom Pass area.

In comparison to the Proposed Action, the Preferred Alternative would have no direct impact on the Kofa NWR because the route avoids the refuge and is adjacent to I-10; would have reduced impacts to the Sonoran pronghorn; would impact a minor amount of Sonoran desert tortoise habitat in the Plomosa and Dome Rock mountains; and avoid the more suitable habitat for the Mojave desert tortoise near the Mule Mountains. Due to the increased length of the Preferred Alternative over that of Alternative 1, the possibility that shifting patches of Mojave fringe-toed lizard habitat may be impacted is increased.

The Preferred Alternative would result in:

- Minor short-term impacts to desert bighorn sheep in the Copper Bottom Pass area;
- Minor short- and long-term impacts to Mojave fringe-toed lizard due to possible mortality by Project activities and habitat impacts;
- Negligible short- and long-term impacts to sensitive wildlife species (excluding Mojave fringe-toed lizard), including nests of migratory birds;
- Minor long-term impact to wildlife habitat by contributing to an increase in abundance of non-native plants, especially in dune habitat; and,
- Minor short- and long-term impacts to migratory birds due to potential collision hazard with structures, conductors, and guy lines.

4.4.8 Residual Impacts

APMs and BPMs would not alleviate all environmental impacts to vegetation and wildlife. Residual impacts of this Project would include a permanent loss of vegetation due to the development of access roads, structure pads, and other permanent facilities resulting in a loss of wildlife breeding and foraging habitat. The likelihood of increased vehicle use on access roads and increased access into remote habitats could result in disturbance to wildlife. Additional residual impacts would result from the loss of primary plant production due to clearing of temporary work areas pending restoration efforts. In harsh desert conditions, the success of restoration often depends on rainfall, and slow growing vegetation may take many years (or decades) to achieve stature and function prior to ground clearing. The residual impacts to biological resources are not expected to be major, dependent to some degree on the selected route.

4.4.9 CDCA Compliance

Compliance with the CDCA is achieved through consistency with CMAs. Numerous LUPA CMAs have been determined to be applicable to the Project relative to the conservation of biological resources (Appendix 2C). Compliance with the CMAs is achieved through

implementation of Project-specific APMs/BMPs addressing biological and vegetation resources (Appendix 2A, Section 2A.4).

Specific CMAs address Harwood's eriastrum and its dune habitat. These measures include implementing an avoidance setback of 0.25-mile from all occurrences of the plant to protect ecological processes and establishing a limit (cap) for impacts to suitable habitat to a maximum of 1 percent throughout all BLM lands included within the CDCA. However, based on the distribution of potentially suitable habitat on the Palo Verde Mesa, Harwood's eriastrum is expected to be present along all Project alternatives crossing the Palo Verde Mesa. Therefore, if Project design is not consistent with CMA specifications, exceptions can be allowed through an amendment to the CDCA Plan, as long as the goals established by the LUPA are met. Since it can be shown that the linear nature of the Project can avoid impacts to the ecological processes (i.e., sand movement) that support plant populations, and meet the goal of promotion of the ecological processes, the CDCA Plan is further amended to allow Project construction to proceed. Specific measures for the conservation on Harwood's eriastrum are required under the conditions of this amendment that are implemented through BMP-BIO-31 (Appendix 2A, Section 2A.4).

Compliance with biological CMAs is demonstrated in Appendix 2C, with details of applicable APMs/BMPs provided in Appendix 2A, Section 2A.4.

4.4.10 Unavoidable Adverse Effects

Some environmental impacts resulting from the Project would be unavoidable. These impacts include increased mortality to avian species due to collisions with the transmission line and structure guy wires, and facilitating predation of small mammals, reptiles, and invertebrates by corvids and raptors that use transmission lines and structures as hunting perches. Mortality of fossorial wildlife is expected and mostly unavoidable during site clearing, and individual animals could be lost due to vehicle strikes during construction and maintenance activities. These unavoidable adverse effects to biological resources are not expected to be major.

4.4.11 Cumulative Effects

Development of the Project, in conjunction with other past development and current and foreseeable future projects (Appendix 3, Table 3.12-2), would contribute incrementally to the ongoing fragmentation and loss of natural habitats, increased mortality for some wildlife species, increased spread and abundance of non-native plants, increased noise/vibration during construction activities, and increased human presence in remote areas. Cumulative effects to vegetation and wildlife would be additive and proportional to the amount of ground disturbance, and loss and degradation of habitat for each individual project. All Project alternatives would have similar cumulative impacts, though the degree of impact could vary depending on the selected segments (e.g., a new corridor in an otherwise near pristine area). Cumulative impacts on biological resources would be minimized through surveys, design, and engineering, as well as APMs and BMPs. Similar measures would likely be required for most future projects.

Where linear utilities are collocated, the cumulative impacts are generally less than when utility corridors follow separate routes. However, on the Palo Verde Mesa, new structures in addition to

existing power lines, the Colorado River Substation, and solar energy development can cumulatively impact dune systems due to subtle changes in wind patterns and structures interrupting sand transport across the mesa.

In the case of the Kofa NWR, the proposed development of Segment p-06 would more than double the width of the existing utilities corridor resulting in greater fragmentation of habitat for desert bighorn sheep, Sonoran pronghorn, Sonoran desert tortoise, and other wildlife (USFWS 2017). Human activity associated with construction and maintenance, habitat disturbance and destruction, and visual separation caused by the transmission line can discourage wildlife from crossing the disturbed area and lead to greater fragmentation and isolation of the north part of the refuge from the remainder. The cumulative and incremental impacts of the Project in addition to the existing utilities may pose the greatest impact to the refuge (USFWS 2017).

The BLM sensitive plant species Harwood's eriastrum is restricted to active windblown sand dune habitat. The DRECP LUPA CMAs for sensitive plant species apply to Harwood's eriastrum, and include a cumulative limit (i.e., cap) for impacts to suitable habitat to a maximum of 1 percent from all projects throughout all BLM lands included within the DRECP. According to the DRECP distribution model for Harwood's eriastrum, there is 288,404 acres of Harwood's eriastrum habitat on BLM lands. Using the same model, Project-related ground disturbance on the Palo Verde Mesa with the implementation of Alternative 2 (the alternative with the greatest potential to impact Harwood's eriastrum) were calculated to potentially disturb 60.2 acres of Harwood's eriastrum habitat. Maximum Project-related impacts based on the DRECP model would constitute 0.02 percent of Harwood's eriastrum distribution range-wide, and this estimate for Project impact acres does not consider additional reduction in area of impact that would be achieved through micrositing. Other projects have occurred in Harwood's eriastrum modeled habitat on the Palo Verde Mesa and Chuckwalla Valley, and new structures in addition to existing power lines (e.g., DPV1), the Colorado River Substation, and solar energy development (e.g., Desert Quartzite Solar and gen-tie line) can cumulatively impact dune systems due to subtle changes in wind patterns and structures interrupting or altering sand transport across the mesa. Additional projects approved by BLM within Chuckwalla Valley together with the proposed Project may impact up to 373.8 acres of DRECP modeled habitat within Chuckwalla Valley; a total of 0.36 percent of modeled habitat in Chuckwalla Valley or 0.12 percent range wide. The cumulative impact cap of 1 percent to DRECP modeled Harwood's eriastrum habitat is applied to the species' entire distribution on BLM lands. The sum of impacted habitat from these various projects on BLM land would not collectively approach the 1 percent cap (i.e., 2,884 acres) (impacts on private land to not contribute to calculation of the impact cap).

The Mojave fringe-toed lizard, also restricted to wind-blown sand habitats, would lose up to 60.2 acres of habitat due to Project implementation. Other BLM-approved projects within the Chuckwalla Valley resulted in loss of DRECP modeled habitat for the Mojave fringe-toed lizard, such as the Colorado River Substation (77.3 acres), Desert Sunlight (1,293.4 acres), and Genesis (1,035.2 acres), and together with the proposed Project (60.2 acres) would impact a total of 2,465.7 acres of DRECP modeled habitat, or 1.9 percent of all modeled Mojave fringe-toed lizard habitat in Chuckwalla Valley (i.e., 132,117.6 acres).

Overall the past, present, and reasonably foreseeable future actions in the CEA are expected to result in:

- Long-term minor cumulative impacts where the proposed segments would be collocated or near past/present disturbances and/or existing linear facilities with some exceptions.
- Major, long-term cumulative impacts where Segment cb-01, Segment cb-02, and Segment cb-04 would enter remote and near-pristine areas where existing linear facilities are not present.
- Major, long-term cumulative impacts would occur were Segment p-06 would be collocated with existing utility corridors across the Kofa NWR. The cumulative effect of expanding the width of the utility corridor would conflict with the purposes for which the NWR was established by interfering with wildlife movement and habitat use.

Overall, the contribution by the Project to cumulative impacts to biological resources is dependent on the selected route segments. Routes through the Kofa NWR (Segment p-06), and through the remote, near pristine areas of the Dome Rock Mountains (Segments cb-01, cb-02, cb-04) would result in a greater contribution to cumulative impacts because these segments would result in greater disruption to wildlife than previously disturbed routes where wildlife has been exposed to persistent disturbances, habitat has been degraded, and animal populations are often reduced. Such contributions would result in significant degradation of biological resources that could not be fully mitigated, and this would be a more notable loss of habitat because past and present projects have already limited the availability of pristine landscapes with uncompromised biological conditions. Cumulatively, the indirect effects of this Project that facilitate human access into remote landscapes has a greater consequence than the direct impact to habitat and would make a negligible contribution to the total past, present, and reasonably foreseeable future disturbance in the CEA.

While many cumulative impacts to wildlife are foreseeable, the addition of the Project itself (excluding the Kofa NWR and pristine areas of the Dome Rock Mountains) when combined with other past, present, and reasonably foreseeable future actions, would not be the cause of a significant degradation of wildlife resources or affect the potential for wildlife resources, including special status species, to sustain current population levels. The Project's relatively short construction period (e.g., duration of disturbance), limited acres of permanent habitat loss, and implementation of all APMs/BMPs would be expected to result in generally minor effects limited to individual plants and animals within a localized area (i.e., no measurable population level impacts). The degree of change on a cumulative basis would be negligible once mitigation measures have been implemented and disturbed areas start to heal.

4.4.12 Irreversible and Irretrievable Commitment of Resources

4.4.12.1 Vegetation Communities

Environmental impacts that have irreversible negative effects on vegetation are situations where vegetation and topsoil are impacted and not restored. In most cases, reclamation efforts would be made, and irreversible impacts to vegetation would be minor, including unavoidable adverse impacts and residual impacts.

In areas of structure foundations, access roads, and SCS construction, vegetation communities and their habitat (topsoil) would be destroyed, but these areas would be minimal in extent, and vegetation community loss minimal relative to the acreage of each community in the region and would focus on low-sensitivity or low-value communities. Vegetation would take many decades to recover in such locations and may never recover under current climate regimes without soil nutrient enhancements and multiple seedings.

4.4.12.2 Special Status Species

Although environments of special status species throughout the analysis area have been recognized and would be avoided to the greatest extent, avoidance of every individual of all special status species is unlikely. Where individuals would be impacted, reclamation should mitigate such impacts, but relocation to suboptimal habitats or inadequate habitat reclamation could result in permanent declines for the species in those locations.

4.4.12.3 Noxious Weeds

Despite reclamation and control efforts, introduction and colonization of noxious weeds and other exotic invasive plant species could occur and persist in some areas.

4.4.12.4 Wildlife

Irreversible and irretrievable commitment of resources would occur in cases of wildlife mortality due to collisions with construction equipment, transmission lines, or structures. No other irreversible and/or irretrievable commitments of wildlife would occur.

4.4.13 Relationship of Short-term Uses and Long-term Productivity

4.4.13.1 Vegetation Communities

The productivity or function of vegetation would be affected by both short- and long-term impacts.

Short-term impacts to vegetation communities would be present until reclamation is conducted, resulting in short-term production loss. Following reclamation, short-term impact effects would be alleviated to vegetation communities and long-term productivity would be reestablished. However, even when vegetation is established during reclamation efforts, the composition of plant species in the recovery area is often different than the original vegetation community. Typically, grasses establish early on, whereas shrubs take much longer to reestablish. Because of the desert environment, reclamation and revegetation to pre-disturbance conditions is extremely difficult, if not impossible. Reclamation of herbaceous vegetation (e.g., perennial native grasses) should take less than 5 years, depending on weather during that time. Long-term establishment of native woody species (e.g., shrubs and riparian trees) would take longer periods of time, from 5 to 20 years to restore long-term woody vegetation productivity. Relative to short-term impacts that would include both short-term and long-term reclamation of native vegetation production, permanent loss of vegetation communities would be minimal in spatial scale. Vegetation of semi-arid regions generally takes years (herbaceous) to decades (woody) to recover from

disturbances that impact the aboveground plants themselves, but not the topsoil. Such recovery is very dependent on rainfall and temperature conditions during the recovery period.

4.4.13.2 Special Status Species

A Reclamation, Vegetation, and Monitoring Plan (Appendix 2B, Section 2B.10) would be prepared to address the reconstruction of disturbed ecosystems by returning the land to a stable and productive condition. If reclamation and relocation methods are employed for any special status plant species, the short-term impacts would be during the reclamation activities. Productivity of such plants would be reduced in the short-term but would be unaffected in the long-term once such plants have become reestablished. Permanent impacts to those plant species (individuals) would be based on survival of transplanted individuals, and persistence of restored habitat. Long-term loss of productivity would result if such plants do not survive, or suffer reduced growth following relocation. Given the importance of special status species, all efforts would be made to ensure the survival and continued productivity levels of such plants.

The long-term loss of productivity related to Project activities to special status wildlife species would be similar as discussed for common wildlife species, below. The APMs and BMPs identified for general wildlife would apply to special status wildlife species minimizing Project-related impacts.

4.4.13.3 Noxious Weeds

The introduction and colonization of noxious weeds and other exotic invasive plant species would be minimized with implementation of monitoring and control.

4.4.13.4 Wildlife

Construction of the Project would result in some short- and long-term impacts to wildlife resources and habitat. During construction, breeding and foraging within the area may decrease due to temporary habitat loss, construction noise, and human presence. In addition, there may be increased mortality due to collisions with construction equipment. The decrease in productivity during construction would be expected to be short-term; breeding and foraging within the Project ROW would commence following construction activities. Long-term productivity of some species may be impacted by collisions with power lines, as well as by long-term habitat loss, and increased mortality due to predation. Some predator species, especially raptors and corvids, would benefit from the increased perches provided by the transmission line.

4.5 CULTURAL RESOURCES

4.5.1 Introduction

This analysis of cultural resources provides an overview of potential direct and indirect impacts by the construction, operation, maintenance, and decommissioning of the Project. As stated in the PA, given the length of time of the Project's operational life before being decommissioned, decommissioning is considered as a separate undertaking to be addressed by future Section 106 analyses, but is included as part of this NEPA analysis. As noted in the PA, the ROW would stipulate, and the BLM shall ensure, that decommissioning would be considered a new action for

Section 106 review, and that historic properties potentially affected by decommissioning would be considered in accordance with the pertinent laws, regulations, and policies extant at the time.

Cultural resources that demonstrate integrity and significance under Criteria A, B, C, and/or D of the NRHP, are further classified as *historic properties*. Those cultural resources that have not been previously evaluated for eligibility for the NRHP are treated as eligible for the purposes of this analysis.

The BLM is using the substantial available Class I data, sensitivity model, and ethnographic information, including feedback from the tribes, as baseline data to inform the analysis of alternatives. This information has been summarized in tabular format in Section 4.5.4.2, as well as in Appendix 4 Tables 4.5-1 through 4.5-4 and provides the foundation for the impact analysis. A Class III inventory would be conducted on the selected route prior to issuance of any NTP for the Project per Section 106 requirements.

4.5.2 Methods for Analysis

4.5.2.1 Analysis Area

The analysis for the Project consists of areas where direct effects to cultural resources may occur. For the purposes of this discussion "analysis area" is defined as a 200-foot-wide corridor where direct effects are projected to occur.

In addition to direct impacts, indirect impacts to cultural resources as a result of the Project may occur, which could include visual, atmospheric, and auditory effects. Indirect atmospheric and auditory effects may occur in an area measuring 0.5-mile from each Action Alternative. From a visual standpoint, potential indirect effects to cultural resources were delineated to include 5 miles on either side of the Proposed Action and Action Alternatives. In certain situations, the 5-mile visual analysis area was adjusted based on the presence of topography that restricts the viewshed. The analysis identifies historic properties within the indirect visual effects analysis area whose character-defining properties could be adversely impacted.

4.5.2.2 Assumptions

The cultural resources data for this analysis are based on the results of Class I baseline data and ethnographic information; additional Class III survey data was gathered for Segments p-17 and p-18, and a portion of Segment p-16 in California (Gardiner et al. 2018). Based on the scope of the Project, the BLM has determined that the development of a Project-specific PA in consultation with interested Indian tribes, land-managing and permitting agencies, and other consulting parties is required (Appendix 2D). The Section 106 process is on-going; additional impacts may be identified through PA consultation efforts.

The PA would refine the direct and indirect APE based on design plans for the selected alternative. The Project's direct effects APE, defined as a corridor along the selected alternative where the construction of Project elements such as structures, access and spur roads, and other ancillary elements would occur, would be intensively investigated at the Class III survey level and all cultural resources evaluated per NRHP criteria.

Potential adverse effects to historic properties would be resolved in accordance with the provisions of the PA and specific Historic Property Treatment Plans (HPTPs). Avoidance of cultural resources by final design and construction would be the preferred adverse effect resolution measure.

Several approaches to the analysis of direct and indirect impacts to cultural resources are presented in this section. These consist of:

- Amount of short- and long-term disturbance within the 200-foot-wide analysis area corridor (direct effect);
- Number of structures within the 200-foot-wide analysis area corridor (indirect visual effect);
- Number of known historic properties within the 200-foot-wide analysis area (direct effect);
- Number of historic properties projected to occur within the 200-foot-wide analysis area corridor (direct effect);
- In the subalternative analysis, the acreage of previous Class III inventory survey is presented to provide comparable discussion of site density and survey coverage; and,
- Number and type of known locations of concern to Indian tribes within indirect effect analysis areas.

4.5.2.3 Environmental Effect Indicators, Magnitude, and Duration

The following impact indicators (and impact magnitude duration and definitions in Table 4-3) considered to constitute major impacts to cultural resources if they result from the construction, operation, maintenance, or decommissioning of the Project:

- Damage to or loss of a historic property that is listed, or eligible for listing, on the NRHP, Arizona Register of Historic Places (ARHP), or California Register of Historic Resources (CRHR);
- An activity would directly or indirectly alter the characteristics of the historic property that qualify it for inclusion in the NRHP, ARHP, or CRHR or impact its aspects of integrity (location, design, setting, materials, workmanship, feeling, or association);
- Loss or degradation would also include cases in which access to the historic property is restricted for future use (i.e., a sacred site);
- Increased access to historic properties that increases potential for vandalism or unauthorized collecting;
- A substantial increase in the potential for erosion or other natural processes that could affect historic properties;
- Increased deterioration of a historic property, except where such deterioration is a recognized quality of a property of religious and cultural significance to an Indian tribe; and,

- Disturbance of any human remains, including those interred outside of formal cemeteries.

Impact magnitude and duration definitions specific to cultural resources are defined in Table 4-3.

Table 4-3 Cultural Resources Impact Magnitude and Duration Definitions

ATTRIBUTE OF IMPACT		DESCRIPTION SPECIFIC TO CULTURAL RESOURCES
Magnitude	No impact	None
	Negligible	No measurable change to the current condition of cultural resources would result from Project construction, operation, maintenance, or decommissioning. There would be no effect to the existing NRHP/ARHP/CRHR qualities of individual historic properties.
	Minor	There would be a small, but measurable change to the current condition of historic properties as a result of Project construction, operation, maintenance, or decommissioning. While a change to a historic property would occur, it would not affect any of the NRHP/ARHP/CRHR qualities of individual historic properties, and the eligibility of the property to the NRHP/ARHP/CRHR would not be altered.
Magnitude	Moderate	An easily discernable and measurable change to the existing NRHP/ARHP/CRHR qualities of historic properties would occur as a result of Project construction, operation, maintenance, or decommissioning. While the existing qualities of an NRHP/ARHP/CRHR property may be diminished, it would not be to a degree that the properties' NRHP/ARHP/CRHR eligibility would be altered.
	Major	A large, easily measurable change in the current conditions would result in significant impacts to historic properties as a result of Project construction, operation, maintenance, and decommissioning and would substantially alter the NRHP/ARHP/CRHR qualities and eligibility status of individual historic properties.
Duration	Temporary	Limited to active construction or maintenance.
	Short-term	During construction (1.5 to 2 years), up to 10 years.
	Long-term	More than 10 years.

4.5.3 No Action Alternative

Under the No Action Alternative, no ROW would be granted for the Project and the transmission line, SCS, and ancillary facilities would not be constructed. Historic properties would not be affected by the Project from any forms of ground disturbance. Because no access improvements would be made, the risk of damage to historic properties associated with vehicular access to areas currently without roads would not change. Project-related support structures and other

facilities would not be constructed, so resources sensitive to visual change would not be affected. Current conditions in the analysis area would continue under the No Action Alternative and there would be no changes that would alter historic properties beyond current conditions. The Project Area would remain undisturbed unless unrelated actions occur.

4.5.4 Construction of Action Alternative Segments

4.5.4.1 Direct and Indirect Effects Common to All Action Alternatives

Ground disturbance during construction is expected with all Action Alternatives and may result in the damage or loss of historic properties; however, the number and types of resources affected would vary depending on the individual alternative. Historic properties would be avoided by the Project as the primary means of precluding impacts. The primary contributor of permanent ground disturbance would be related to structure and SCS construction, as well as the construction of/improvements to access and spur roads. Temporary disturbance may also have direct effects to historic properties and would be related to temporary use areas utilized during Project construction, such as staging areas that would be reclaimed following construction.

Specific impacts to historic properties are unknown until Class III identification studies and indirect effect analyses of the selected route are completed, and additional information regarding engineering design is available. As a result, evidence is currently insufficient to state specific direct or indirect impacts to particular historic properties or to discuss specific measures to resolve potential effects to those properties.

General measures to resolve potential adverse direct and indirect effects to historic properties as a result of Project construction would be contained in the PA, and specific measures would be outlined in HPTPs. The HPTPs would be developed following Class III survey identification efforts following the signing of the ROD. Avoidance of historic properties by final design and construction would be the preferred measure for the resolution of potential direct impacts.

With the exceptions of Segments p-17, p-18, qs-01, x-10, and ca-09, which are discussed in Section 4.5.7, direct impacts due to construction could range between negligible (if eligible sites could be avoided by Project design) and major (if eligible sites could not be avoided by Project design). With the exception of the five noted segments, the range of direct impacts due to construction and the resolution of potential adverse effects are common to all segments; therefore, the impacts and resolution are not repeated for the segment-specific effects.

Indirect effects to historic properties could occur in areas where the construction of new roads into the Project Area would provide improved access into previously inaccessible areas. Improved access could lead to site damage by off-road vehicles and recreational use of these areas. Such damage could consist of vehicular damage to surface archaeological sites, and vandalism to sensitive areas where rock art is present. Measures to resolve potential adverse effects to historic properties as a result of improved access would be included in the PA and the ROD.

Indirect visual impacts could occur from the presence of structures in sight of NRHP-listed historic properties or properties eligible for inclusion in the NRHP under Criterion A, B, or C by altering the setting of the properties. The historic properties affected would vary by alternative.

Resolution measures to minimize the potential adverse effects of visual intrusions would be contained in the PA and HPTPs and implemented by Project design. For example, during Project design, support structures may be positioned so that they are not visible from the historic properties sensitive to visual intrusion.

Site types that are known to occur in the Project Area and known to be potentially sensitive to visual impacts include prehistoric trails, petroglyph sites, and intaglios. If sites of this type exhibit a high degree of integrity of setting, feeling, and association, and also qualify as NRHP-eligible historic properties, an assessment of indirect visual effects of the Project features (such as transmission line structures and access roads) on their NRHP qualities would be required and specified in HPTPs.

Additionally, other historic properties sensitive to indirect effects may be identified by future Class III survey field work of the direct effects analysis area and/or future studies of indirect effects to historic properties in the indirect effects analysis area. When identified, these properties would be subject to additional analysis to be specified in HPTPs.

The range of indirect impacts outlined above, and the resolution of potential adverse indirect effects is common to all segments; therefore, these are not repeated for the segment-specific effects.

4.5.4.2 Direct and Indirect Segment-specific Effects

Table 4-4 presents known cultural resources data from a 200-foot analysis corridor defined as the "direct effects analysis area" for the purposes of this document. The extent of previous cultural resources survey, counts of known historic properties, counts of cultural resources for which NRHP eligibility is unknown, and projections of total numbers of historic properties and sites of undetermined eligibility is presented by segment.

For analysis purposes, minimum survey coverage of 25 percent or more is considered to be adequate to estimate the projected number of cultural resources by eligibility category for each Project segment. In cases where survey coverage of at least 25 percent can be demonstrated with negative findings, the projected sensitivity for cultural resources is considered to be low. However, this does not take into account potential environmental variations that may affect the distribution of cultural resources on the landscape per segment.

Table 4-4 Known Survey and Anticipated Cultural Resources in Segments

SEGMENT NO.	ACRES (200-FT CORRIDOR)	PERCENTAGE OF SEGMENT SURVEYED (%)	DENSITY OF KNOWN SITES (PER 100 ACRES)[1]	COUNT OF KNOWN DETERMINED OR RECOMMENDED ELIGIBLE SITES	COUNT OF KNOWN UNEVALUATED / UNKNOWN ELIGIBILITY SITES	DENSITY (PER 100 ACRES)/ PROJECTED COUNT OF NRHP-ELIGIBLE SITES[2]	DENSITY (PER 100 ACRES)/ PROJECTED COUNT OF SITES TO BE EVALUATED[2]

SCS DISTRIBUTION LINE							
12kV Line[3]	7.6	5.3	0.0	0	0	0.0/0	0.0/0

Note: See Appendix 4, Section 4.5 for a discussion of how the density of projected sites was calculated.

[1]Density of known sites/100 acres includes sites that are previously recommended/determined ineligible for listing in the NRHP.

[2] (/) is used in this column to indicate a separation of data values.

[3]12kV Line corridor is 20-ft. wide.

4.5.5 Operations, Maintenance, and Decommissioning

Though most impacts to historic properties are expected to occur in association with construction, some continuing project-related activities would affect historic properties.

The maintenance and operating activities would have the potential to affect historic properties if they take place in sensitive areas identified by Class III survey. Areas requiring cultural resources monitoring during these activities would be identified and discussed in the PA. No Project activities requiring new ground disturbance would proceed without a cultural resources Class III survey to identify and evaluate any potential historic properties that may be present.

In addition, new roads established to support construction may result in increased access into areas that were previously inaccessible and/or used only intermittently. This increased access could result in unanticipated adverse effects to, or vandalism of, historic properties. Measures to resolve potential adverse effects to historic properties as a result of improved access would be included in the PA and the ROD.

Impacts associated with decommissioning would be similar to those identified for construction of the Proposed Action or Action Alternatives. The ROW would stipulate, and the BLM shall ensure, that decommissioning would be considered a new action for Section 106 review, and that historic properties potentially affected by decommissioning would be considered in accordance with the pertinent laws, regulations, and policies extant at the time.

4.5.6 Measures for the Resolution of Adverse Effects

Resolution measures for adverse effects to historic properties would be outlined in the PA and HPTPs (APM-CULT-01, APM-CULT-03; Appendix 2A, Section 2A.6). The PA has been developed (Appendix 2D) and would direct resolution measures. The PA ensures the priority of avoidance of historic properties during construction phases, and ensures the process of identifying, evaluating, and avoiding or mitigating is followed and would continue even after the NEPA process is complete. HPTPs would be developed in accordance with the stipulations contained in the PA following the Class III survey identification efforts and indirect studies. Measures contained in the PA and HPTPs would be implemented prior to and during construction and post-construction during maintenance activities and operations (APM-CULT-01, BMP-CULT-02, BMP-CULT-04; Appendix 2A, Section 2A.6). Resolution measures for adverse effects to historic properties located within the CDCA Plan area are further outlined by specific compliance requirements discussed in Section 4.5.9. Tribal consultation is on-going.

APMs and BMPs for cultural resources are contained in Appendix 2A, Section 2A.6.

4.5.7 Construction of Full Route Alternative and Subalternative Effects

In the following section, discussion of the percentage of previous Class III survey coverage is presented in a combined total of acreage examined to provide a cumulative percentage. In this way, the percentage of Class III survey coverage is comparable for comparison between alternative and subalternative segments.

4.5.7.1 Proposed Action

A total of 66 NRHP-eligible and unevaluated sites have been previously recorded within the 200-foot analysis corridor of the Proposed Action. Based on an extrapolation of the number of known cultural resource sites in the acreage surveyed, a total of 164 NRHP-eligible or unevaluated sites are projected to occur within the 200-foot analysis corridor of the Proposed Action (Appendix 4, Tables 4.5-1 through 4.5-4). Direct impacts due to construction could range between negligible (if eligible sites could be avoided by Project design) and major (if eligible sites could not be avoided by Project design). The Proposed Action has the potential to affect more known cultural resources sites than the other Action Alternatives.

Segments p-17 and p-18 of the Proposed Action cross the eastern base of the Palo Verde Mesa, a culturally and biologically sensitive area (AECOM 2012). Direct impacts due to construction could range between negligible (if eligible sites could be avoided by Project design) and major (if eligible sites could not be avoided by Project design). However, any impact to human remains would be major and subject to protocol and processes as presented in the Native American Graves Protection and Repatriation Act (NAGPRA) on Federal land and under the California Health and Safety Code Section 7050.5, "Discovery of Human Remains," on state or private land.

Indirect visual effects from the construction of the Proposed Action could occur for the following if they qualify as NRHP-eligible historic properties and exhibit a high degree of integrity of setting, feeling, and association:

- The Indian Well Site, located within the 1-mile-wide corridor of the Proposed Action.
- An undocumented rock ring site, located within the 1-mile-wide corridor of the Proposed Action.
- The Limekiln Wash Intaglio, located in the 200-foot analysis corridor of the Proposed Action.
- The NRHP-listed Ripley Intaglio Site, located within the 5-mile indirect effects analysis area of the Proposed Action.
- The NRHP-listed Mule Tank Discontiguous Rock Art District, a prehistoric district, located approximately within the 5-mile indirect effects analysis area of the Proposed Action.
- Other sensitive sites known or projected to occur in the 200-foot Proposed Action analysis corridor such as trails, intaglios, and prehistoric habitation sites with human remains.

The Proposed Action parallels the existing DPV1 transmission line. The construction of additional transmission structures may create additional visual intrusions on individual properties' NRHP qualities of integrity. Prehistoric trail segments have been recorded within 0.5-mile of Segments p-04, p-06, p-07, p-09, p-10, p-11, p-12, p-13, p-14, and p-15e. If these trails qualify as NRHP-eligible properties and exhibit a high degree of setting, feeling, and association, the construction of additional structures may create additional visual intrusions that affect their NRHP character-defining qualities. These potential effects would be assessed as part of the

indirect effects analysis. The indirect effects analysis would occur after the execution of the PA and signing of the ROD.

Other indirect effects to historic properties could occur if Project roads enhance accessibility, potentially making previously inaccessible properties more vulnerable to increased visitation and vandalism.

Resolution Measures

Potential adverse effects to historic properties would be resolved in accordance with the provisions of the PA and the development of specific HPTPs. Avoidance of cultural resources by final design and construction would be the preferred adverse effect resolution measure. APM-CULT-01 and BMP-CULT-03 (Appendix 2A, Section 2A.6) would be applicable to the resolution of potential adverse effect. For portions of the Project within the CDCA, adverse effect resolution measures as outlined in LUPA-CUL-4 would also be applicable.

4.5.7.2 Alternative 1: I-10 Route

A total of 23 NRHP-eligible and unevaluated sites have been previously recorded within the 200-foot analysis corridor of Alternative 1. Based on an extrapolation of the number of known cultural resources sites in acreage surveyed, a total of 75 NRHP-eligible or unevaluated sites are projected to occur within the 200-foot analysis corridor of Alternative 1 (Appendix 4, Tables 4.5-1, through 4.5-4). However, this projected count may be influenced by skewed metrics resulting from lower Class III survey coverage (less than 5 percent) of Segments i-03 (4.2 percent) and ca-05 (3.4 percent). Direct impacts due to construction could range between negligible (if NRHP-eligible sites could be avoided by Project design) and major (if NRHP-eligible sites could not be avoided by Project design). Alternative 1 would affect fewer cultural resources than the Proposed Action, Alternatives 2-4, or the Preferred Alternative.

Sensitive sites projected to occur in the 200-foot Alternative 1 analysis corridor include prehistoric trails and intaglios. These site types have been recorded within 0.5-mile of Segments i-03, qs-01, qs-02, i-06, i-07, i-08s, and ca-09. The NRHP eligibility of these sites is not known at this time. If these trails and intaglios qualify as NRHP-eligible properties and exhibit a high degree of setting, feeling, and association, the construction of structures may create visual intrusions that affect the NRHP character-defining qualities of these sites.

Other indirect effects to historic properties could occur if Project roads enhance accessibility, potentially making previously inaccessible properties more vulnerable to increased visitation and vandalism.

Resolution Measures

Resolution measures for Alternative 1 and all of the subalternative routes (1A through 1E) would be the same as those described for the Proposed Action.

Subalternative 1A

Subalternative 1A would result in a reduced visual impact (fewer planned transmission structures) and less potential to affect historic properties by ground disturbance (smaller footprint of short- and long-term disturbance).

A total of 7.6 percent of the segments of Subalternative 1A have been investigated by Class III survey, while 13.3 percent of Segment i-01 (Alternative 1) has been previously investigated. A total of 26 NRHP-eligible sites or sites requiring NRHP evaluation are projected to occur within Subalternative 1A, and 19 NRHP-eligible cultural resource sites or sites requiring NRHP evaluation are projected to occur along the portion of Alternative 1 that Subalternative 1A would replace.

While the data suggest that Subalternative 1A has a higher potential to affect historic properties based on the disturbance footprint, projected site counts for both Subalternative 1A and Alternative 1 may be the result of low representative Class III survey samples.

Subalternative 1B

Compared to Alternative 1, Subalternative 1B results in a greater visual impact (higher count of transmission structures) and a greater potential to affect historic properties by ground disturbance (larger footprint of short- and long-term disturbance).

A total of 2.5 percent of the segments of Subalternative 1B have been investigated by Class III survey, while 13.3 percent of Segment i-01 (Alternative 1) has been previously investigated. Eighty-two NRHP-eligible sites or sites requiring NRHP evaluation are projected to occur within Subalternative 1B, and 19 NRHP-eligible cultural resource sites or sites requiring NRHP evaluation are projected to occur along the portion of Alternative 1 that Subalternative 1B would replace.

While the data suggest that Subalternative 1B has a higher potential to affect historic properties based on projected site counts and the disturbance footprint, projected site counts for Subalternative 1B and Alternative 1 may be the result of low representative Class III survey samples.

Subalternative 1C

Compared to Alternative 1, Subalternative 1C results in a greater visual impact (higher count of transmission structures) and a greater potential to affect historic properties by ground disturbance (larger footprint of short- and long-term disturbance).

A total of 2.0 percent of the segments of Subalternative 1C have been investigated by Class III survey, while 9.2 percent of Segments i-04 and i-05 (Alternative 1) has been previously investigated. A total of 102 NRHP-eligible sites are projected to occur within Subalternative 1C, and a total of 3 sites requiring NRHP evaluation are projected to occur along the portion of Alternative 1 that Subalternative 1C would replace.

While the data suggest that Subalternative 1C has a higher potential to affect historic properties based on the disturbance footprint, projected site counts for Subalternative 1C and Alternative 1 may be the result of low representative Class III survey sample.

Subalternative 1D

Compared to Alternative 1, Subalternative 1D would result in a reduced visual impact (fewer count of transmission structures) and less potential to affect historic properties by ground disturbance (smaller footprint of temporary and permanent disturbance).

A total of 89.6 percent of Subalternative 1D has been investigated by Class III survey, while only 2.0 percent of Segment i-04 (Alternative 1) has been previously investigated. Two NRHP-eligible sites or sites requiring NRHP evaluation are projected to occur within Subalternative 1D, and no NRHP-eligible cultural resource sites or sites requiring NRHP evaluation are projected to occur along the portion of Alternative 1 that Subalternative 1D would replace.

The data suggest that Subalternative 1D and Alternative 1 would have a comparable potential to affect historic properties based on projected site counts and the disturbance footprint.

Subalternative 1E

Compared to Alternative 1, Subalternative 1E would result in a greater visual impact (higher count of transmission structures) and a greater potential to affect historic properties by ground disturbance (greater footprint of short- and long-term disturbance).

A total of 10.6 percent of Subalternative 1E has been investigated by Class III survey, while only 3.4 percent of Segment ca-05 (Alternative 1) has been previously investigated. A total of 104 cultural resource sites requiring NRHP evaluation are projected to occur within Subalternative 1E, and 177 cultural resource sites NRHP-eligible cultural resource sites or sites requiring NRHP evaluation are projected to occur along the portion of Alternative 1 that Subalternative 1E would replace.

While the data suggests that Subalternative 1E has a lower potential to affect historic properties based on the disturbance footprint, projected site counts for Subalternative 1E and for Alternative 1 may be the result of low representative Class III survey samples.

4.5.7.3 Alternative 2: BLM Utility Corridor Route

A total of 50 NRHP-eligible and NRHP-unevaluated cultural resources sites have been previously recorded within the 200-foot analysis corridor of Alternative 2. A total of 150 NRHP-eligible or NRHP-unevaluated cultural resources sites are projected to occur within the 200-foot analysis corridor of Alternative 2 (Appendix 4, Tables 4.5-1 through 4.5-4). However, this high projected count may be influenced by skewed metrics resulting from lower Class III survey coverage of Alternative 2 Segment x-07 (3.0 percent) and Segment i-03 (4.2 percent). Direct impacts due to construction could range between negligible (if NRHP-eligible sites could be avoided by Project design) and major (if NRHP-eligible sites could not be avoided by Project design). Alternative 2 would impact more known cultural resources sites than Alternatives 1, 3, and 4, less than the Proposed Action, and approximately the same as the Preferred Alternative.

Sensitive sites projected to occur in the Alternative 2 corridor include prehistoric trails and intaglios. These site types have been recorded within 0.5-mile of Segments i-03, qs-01, p-09, p-10, p-11, p-12, p-13, p-14, p-15e, p-16, x-07, x-15, x-16, and ca-09. The NRHP eligibility of all of these sites is not known at this time. If these trails and intaglios qualify as NRHP-eligible properties and exhibit a high degree of setting, feeling, and association, the construction of structures may create visual intrusions that affect the NRHP character-defining qualities of these sites. These potential effects would be assessed as part of the indirect effects analysis.

Other indirect effects to historic properties could occur if Project roads enhance accessibility, potentially making previously inaccessible properties more vulnerable to increased visitation and vandalism.

Indirect visual effects from the construction of Alternative 2 could occur to the following historic properties:

- The Limekiln Wash Intaglio, located within the 200-foot analysis corridor of Alternative 2 Segment p-13.
- The NRHP-listed Ripley Intaglio Site, within the 5-mile indirect effects analysis area of Alternative 2 Segment p-15e.

Both Segments p-13 and p-15e parallel the existing DPV1 transmission line. The construction of additional transmission structures may create additional visual intrusions on individual properties' NRHP qualities of integrity.

Resolution Measures

Resolution measures for Alternative 2 and all of the subalternative routes (2A through 2E) would be the same as those described under the Proposed Action.

Subalternative 2A

Compared to Alternative 2, Subalternative 2A would result in a greater visual impact (higher count of transmission structures) but a comparable amount of ground disturbance (comparable footprint of short- and long-term disturbance).

A total of 5.4 percent of the segments of Subalternative 2A has been investigated by Class III survey, while 37.9 percent of Segments p-01 and i-01 (Alternative 2) have been previously investigated. A total of 37 NRHP-eligible cultural resource sites are projected to occur within Subalternative 2A, and 38 NRHP-eligible sites or sites requiring NRHP evaluation are projected to occur along the portion of Alternative 2 that Subalternative 2A would replace.

While the data suggest that Subalternative 2A has a slightly lower potential to affect historic properties based on the disturbance footprint, projected site counts for Subalternative 2A may be the result of low representative Class III survey sample.

Subalternative 2B

Compared to Alternative 2, Subalternative 2B would result in a greater visual impact (higher count of transmission structures) and a greater potential to affect historic properties by ground disturbance (greater footprint of short- and long-term disturbance).

A total of 12.7 percent of the segments of Subalternative 2B have been investigated by Class III survey, while 13.3 percent of Segment i-01 (Alternative 2) has been previously investigated. A total of 40 NRHP-eligible cultural resource sites or sites requiring NRHP evaluation are projected to occur within Subalternative 2B, and 19 NRHP-eligible cultural resource sites or sites requiring NRHP evaluation are projected to occur along the portion of Alternative 2 that Subalternative 2B would replace.

While the data suggest that Subalternative 2B has a higher potential to affect historic properties based on the disturbance footprint, projected site counts for both Subalternative 2B and Alternative 2 may be the result of low representative Class III survey samples.

Subalternative 2C

Compared to Alternative 2, Subalternative 2C would result in a comparable visual impact (comparable count of transmission structures) and a lower potential to affect historic properties by ground disturbance (smaller footprint of short- and long-term disturbance).

A total of 29.9 percent of the segments of Subalternative 2C have been investigated by Class III survey, while 41.3 percent of Segments p-11 and p-12 (Alternative 2) have been previously investigated. Ten sites requiring NRHP evaluation are projected to occur within Subalternative 2C, and two NRHP-eligible cultural resource sites are projected to occur along the portion of Alternative 2 that Subalternative 2C would replace.

The data suggest that Subalternative 2C has a higher potential to affect historic properties based on projected site counts and the disturbance footprint.

Subalternative 2D

Compared to Alternative 2, Subalternative 2D would result in a greater visual impact (higher count of transmission structures) but a reduced potential to affect historic properties by ground disturbance (smaller footprint of short- and long-term disturbance).

A total of 15.6 percent of the segments of Subalternative 2D have been investigated by Class III survey, while 61.4 percent of Segment p-11 (Alternative 2) has been previously investigated. Six NRHP-eligible sites are projected to occur within Subalternative 2D, and two NRHP-eligible cultural resource sites are projected to occur along the portion of Alternative 2 that Subalternative 2D would replace.

The data suggests that Subalternative 2D has a higher potential to affect historic properties than Alternative 2 based on projected site counts and the disturbance footprint.

Subalternative 2E

Compared to Alternative 2, Subalternative 2E would result in a reduced visual impact (lower count of transmission structures) and reduced potential to affect historic properties by ground disturbance (smaller footprint of short- and long-term disturbance).

A total of 7.6 percent of the segments of Subalternative 2E have been investigated by Class III survey, while 14.1 percent of Segments p-16 and x-16 (Alternative 2) has been previously investigated. For Subalternative 2E, 53 sites requiring NRHP evaluation are projected to be present, while 42 are projected to occur along the portion of Alternative 2 that Subalternative 2E would replace.

While the data suggest that Subalternative 2E has a slightly higher potential to affect historic properties based on the disturbance footprint, projected site counts for both Subalternative 2E and Alternative 2 may be the result of low representative Class III survey samples.

4.5.7.4 Alternative 3: Avoidance Route

A total of 35 NRHP-eligible or NRHP-unevaluated cultural resources sites have been previously recorded within the 200-foot analysis corridor of Alternative 3. A total of 134 NRHP-eligible or NRHP-unevaluated cultural resources sites are projected to occur within the 200-foot analysis corridor of Alternative 3 (Appendix 4, Tables 4.5-1 through 4.5-4). This high count of projected sites is likely inflated due to low representative Class III sample size, especially in Segments x-03, x-05, x-11, and ca-01, which have a combined sample size of less than 6.1 percent. Direct impacts due to construction could range between negligible (if NRHP-eligible sites could be avoided by Project design) and major (if eligible sites could not be avoided by Project design). Alternative 3 would impact fewer known cultural resource sites than the Proposed Action, Alternative 2, Alternative 4, and the Preferred Alternative but more than Alternative 1.

Sensitive sites projected to occur in the 200-foot Alternative 3 analysis corridor include prehistoric trails. These site types have been recorded within 0.5-mile of Segments i-03, p-07, p-09, p-14, x-05, cb-01, cb-05, ca-09, and cb-10. The NRHP eligibility of all of these sites is not known at this time. If these trails and intaglios qualify as NRHP-eligible properties and exhibit a high degree of setting, feeling, and association, the construction of structures may create visual intrusions that affect the NRHP character-defining qualities of these sites.

Other indirect effects to historic properties could occur if Project roads enhance accessibility, potentially making previously inaccessible properties more vulnerable to increased visitation and vandalism.

Resolution Measures

Resolution measures for Alternative 3 and all of the subalternative routes (3A through 3M) would be the same as those described under the Proposed Action.

Subalternative 3A

Compared to Alternative 3, Subalternative 3A would result in a greater visual impact (higher count of transmission structures) and a greater potential to affect historic properties (greater footprint of short- and long-term disturbance).

Only 5.0 percent of the segments of Subalternative 3A have been investigated by Class III survey, while 37.9 percent of Segments p-01 and i-01 (Alternative 3) has been previously investigated. Forty-one sites requiring NRHP evaluation are projected to occur within Subalternative 3A, while 38 NRHP-eligible site or sites requiring NRHP evaluation are projected to occur along the portion of Alternative 3 that Subalternative 3A would replace.

While the data suggests that Subalternative 3A has a higher potential to affect historic properties based on the disturbance footprint, projected site counts for Subalternative 3A may be the result of low representative Class III survey sample.

Subalternative 3B

Compared to Alternative 3, Subalternative 3B would result in a reduced visual impact (lower count of transmission structures) and less ground disturbance (smaller footprint of short- and long-term disturbance).

Only 7.5 percent of the segments of Subalternative 3B have been investigated by Class III survey, while 12.7 percent of Segments p-02, p-03, p-04, x-03 (Alternative 3) has been previously investigated. A total of 19 NRHP-eligible or NRHP unevaluated cultural resources sites are projected to occur within Subalternative 3B, while 39 sites are projected to occur along the portion of Alternative 3 that Subalternative 3B would replace.

While the data suggest that Alternative 3 has a lower potential to affect historic properties based on the disturbance footprint, projected site counts for Subalternative 3B and Alternative 3 may be the result of low representative Class III survey sample.

Subalternative 3C

Compared to Alternative 3, Subalternative 3C would result in a comparable visual impact (comparable count of transmission structures) and a lower potential to affect historic properties by ground disturbance (smaller footprint of short- and long-term disturbance).

A total of 5.9 percent of the segments of Subalternative 3C have been investigated by Class III survey, while only 3.6 percent of Segments i-03 and x-03 (Alternative 3) been previously investigated. Thirty-four NRHP-eligible sites or sites requiring NRHP evaluation are projected to occur within Subalternative 3C, while a total of 111 cultural resources sites requiring NRHP evaluation are projected to occur along the portion of Alternative 3 that Subalternative 3C would replace.

While the data suggest that Subalternative 3C has a lower potential to affect historic properties based on the disturbance footprint, projected site counts for both Subalternative 3C and Alternative 3 may be the result of low representative Class III survey samples.

Subalternative 3D

Compared to Alternative 3, Subalternative 3D would result in a greater visual impact (higher count of transmission structures) and a greater potential to affect historic properties by ground disturbance (greater footprint of short- and long-term disturbance).

Only 2.0 percent of Subalternative 3D has been investigated by Class III survey, and only 2.0 percent of Segment i-04 (Alternative 3) has been previously investigated. A total of 102 NRHP-eligible sites are projected to occur within Subalternative 3D, and no cultural resources sites are projected to occur along the portion of Alternative 3 that Subalternative 3D would replace.

While the data suggest that Subalternative 3D has a higher potential to affect historic properties based on the disturbance footprint, projected site counts for both Subalternative 3C and Alternative 3 may be the result of low representative Class III survey samples.

Subalternative 3E

Compared to Alternative 3, Subalternative 3E would result in a comparable visual impact (comparable counts of transmission structures) but a greater potential to affect historic properties by ground disturbance (larger footprint of short- and long-term disturbance).

A total of 29.0 percent of Subalternative 3E has been investigated by Class III survey, while only 2.4 percent of Segment x-05 (Alternative 3) has been previously investigated. A total of 21 cultural resources sites requiring NRHP evaluation are projected to occur within Subalternative 3E, while a total of 93 cultural resources sites are projected to occur along the portion of Alternative 3 that Subalternative 3E would replace.

While the data suggest that Subalternative 3E has a lower potential to affect historic properties based on the disturbance footprint, projected site counts for Subalternative 3E may be the result of low representative Class III survey sample. These effects must be also further evaluated in conjunction with the pairing of Subalternative 3E with Subalternatives 3D and 3G, or 3J.

Subalternative 3F

Compared to Alternative 3, Subalternative 3F would result in a comparable visual impact (comparable count of transmission structures) but less potential to affect historic properties by ground disturbance (smaller footprint of short- and long-term disturbance).

A total of 23.7 percent of Subalternative 3F has been investigated by Class III survey, while only 1.0 percent of Segment x-05 (Alternative 3) has been previously investigated. A total of 21 NRHP-eligible or NRHP-unevaluated sites are projected to occur within Subalternative 3F, and 104 NRHP-eligible or NRHP-unevaluated sites are projected to occur along the portion of Alternative 3 that Subalternative 3F would replace.

The data suggest that Alternative 3 would have a higher potential to affect historic properties based on projected site counts and the disturbance footprint. These effects must also be further evaluated in conjunction with the pairing of Subalternative 3F with Subalternatives 3D and 3G, or 3J.

Subalternative 3G

Subalternative 3G consists of Segment qn-01. It does not replace a specific segment; for that reason, it is presented in terms of its standalone attributes. A total of 89.6 percent of Subalternative 3G has been investigated by Class III survey. Two NRHP-eligible sites or sites requiring NRHP evaluation are projected to occur within Subalternative 3G, which demonstrates a low sensitivity for cultural resources in the 200-foot analysis corridor.

The potential effect to historic properties by Subalternative 3G must be further evaluated in conjunction with the pairing of Subalternative 3G with Subalternatives 3D, 3E, 3F, 3H, and/or 3J.

Subalternative 3H

Subalternative 3H consists of Segment qn-02. It does not replace a specific segment; for that reason, it is presented in terms of its standalone attributes. A total of 56.6 percent of Subalternative 3H has been investigated by Class III survey. A total of seven NRHP-eligible cultural resources sites or sites requiring NRHP evaluation are projected to occur within Subalternative 3H.

The potential effect to historic properties by Subalternative 3H must be further evaluated in conjunction with the pairing of Subalternative 3H with Subalternatives 3D and 3L.

Subalternative 3J

Subalternative 3J consists of Segment i-05. It does not replace a specific segment; for that reason, it is presented in terms of its standalone attributes. A total of 36.3 percent of Subalternative 3J has been investigated by Class III survey. A total of three cultural resources sites requiring NRHP evaluation are projected to occur within Subalternative 3J.

The potential effect to historic properties by Subalternative 3J must be further evaluated in conjunction with the pairing of Subalternative 3J with Subalternatives 3E, 3F, or 3G and 3H.

Subalternative 3K

Compared to Alternative 3, Subalternative 3K would result in a greater visual impact (higher count of transmission structures) but less potential to affect historic properties by ground disturbance (smaller footprint of short- and long-term disturbance).

A total of 44.8 percent of Subalternative 3K has been investigated by Class III survey, while 4.9 percent of Segment cb-01 (Alternative 3) has been previously investigated. Two cultural resources sites are projected to occur within Subalternative 3K and none along the portion of Alternative 3 that Subalternative 3K would replace.

The data suggest that Subalternative 3K would have a higher potential to affect historic properties than Alternative 3.

Subalternative 3L

Compared to Alternative 3, Subalternative 3L would result in a greater visual impact (higher count of transmission structures) and a greater potential to affect historic properties by ground disturbance (larger footprint of short- and long-term disturbance).

A total of 45.5 percent of Subalternative 3L has been investigated by Class III survey, while 70.6 percent of Segments p-09, p-10, p-11 (Alternative 3) has been previously investigated. A total of 7 NRHP-eligible cultural resource sites are projected to occur within Subalternative 3L, and a total of 7 NRHP-eligible cultural resources sites are projected to occur along the portion of Alternative 3 that Subalternative 3L would replace.

The data suggests that Subalternative 3L has a comparable potential to affect historic properties based on the projected site counts and disturbance footprint. However, effects must be further evaluated in conjunction with the pairing of Subalternative 3L with Subalternatives 3D and 3H or 3J, 3G, and 3H.

Subalternative 3M

Compared to Alternative 3, Subalternative 3M would result in a comparable visual impact (comparable count of transmission structures) but a greater potential to affect historic properties by ground disturbance (larger footprint of short- and long-term disturbance).

A total of 27.0 percent of Subalternative 3M has been investigated by Class III survey, while 4.1 percent of Segments cb-10, x-11, ca-01 (Alternative 3) has been previously investigated. A total of 65 sites requiring NRHP evaluation are projected to occur within Subalternative 3M, and a total of 244 sites requiring NRHP evaluation are projected to occur along the portion of Alternative 3 that Subalternative 3M would replace. This inflated site count for Alternative 3 is the result of a low representative Class III survey sample in Segment ca-01.

While the data suggest that Alternative 3 has a higher potential to affect historic properties than Subalternative 3M based on projected site counts and the disturbance footprint, projected site counts for Alternative 3 may be the result of low representative Class III survey sample.

4.5.7.5 Alternative 4: Public Lands Emphasis Route

A total of 41 NRHP-eligible or NRHP-unevaluated cultural resources sites have been previously recorded within the 200-foot analysis corridor of Alternative 4. A total of 170 NRHP-eligible or NRHP-unevaluated cultural resources sites are projected to occur within the 200-foot analysis corridor of Alternative 4 (Appendix 4, Tables 4.5-1 through 4.5-4). The projected count of sites may be influenced by skewed metrics resulting from lower Class III survey coverage (2 percent) of Alternative 4 Segment in-01. Direct impacts due to construction could range between negligible (if NRHP-eligible sites could be avoided by Project design) and major (if eligible sites could not be avoided by Project design). Alternative 4 would impact fewer cultural resource sites than the Proposed Action, Alternative 2, and the Preferred Alternative; but more than Alternative 1 and Alternative 3.

Sensitive sites projected to occur in the 200-foot Alternative 4 analysis corridor include prehistoric trails. These site types have been recorded within 0.5-mile of Segments d-01, x-04,

x-06, x-09, p-10, p-13, p-14, cb-02, cb-06, and ca-09. If these trails qualify as NRHP-eligible properties and exhibit a high degree of setting, feeling, and association, the construction of additional structures may create additional visual intrusions that affect their NRHP character-defining qualities.

Indirect visual effects from the construction of Alternative 4 could occur for the following properties:

- The Limekiln Wash Intaglio, located within the 200-foot analysis corridor of Alternative 4 Segment p-13.
- The NRHP-listed Eagletail Petroglyph Site, located within the 5-mile indirect effects analysis area of Alternative 4 Segment d-01.
- The NRHP-listed Ripley Intaglio Site, located within the 5-mile indirect effects analysis area of Alternative 4 Segment p-15e.

Alternative 4 Segments p-13 and p-15e parallel the existing DPV1 transmission line. The construction of additional transmission structures may create additional visual intrusions on the Limekiln Wash and Ripley Intaglio Site NRHP qualities of integrity.

The landscape of Alternative 4 Segment d-01 is largely native desert and the construction of structures would visually impact this area. Depending on the viewshed, the construction of structures may create visual intrusions that affect the NRHP character-defining qualities of the Eagletail Petroglyph Site.

Other indirect effects to historic properties could occur if Project roads enhance accessibility, potentially making previously inaccessible properties more vulnerable to increased visitation and vandalism.

Resolution Measures

Resolution measures for Alternative 4 and all of the subalternative routes (4A through 4P) would be the same as those described under the Proposed Action.

Subalternative 4A

Compared to Alternative 4, Subalternative 4A would result in a greater visual impact (higher count of transmission structures) and a greater potential to impact historic properties by ground disturbance (larger footprint of short- and long-term disturbance).

A total of 43.2 percent of Subalternative 4A has been investigated by Class III survey, while only 5.7 percent of Segment d-01 (Alternative 4) has been previously investigated. A total of 33 NRHP-eligible sites or sites requiring NRHP evaluation are projected to occur within Subalternative 4A, while 35 cultural resources sites requiring NRHP evaluation are projected to occur along the portion of Alternative 4 that Subalternative 4A would replace. In addition, one NRHP-listed property, the Eagletail Petroglyph Site, is located within the 5-mile indirect effects analysis area of Segment d-01.

While the data suggest that Subalternative 4A has a comparable potential to affect historic properties based on the disturbance footprint, projected site counts for Alternative 4 may be the result of low representative Class III survey sample.

Subalternative 4B

Compared to Alternative 4, Subalternative 4B would result in a greater visual impact (higher count of transmission structures) and a greater potential to affect historic properties by ground disturbance (larger footprint of short- and long-term disturbance).

Only 3.6 percent of Subalternative 4B has been investigated by Class III survey, and only 1.9 percent of Segment x-04 (Alternative 4) has been previously investigated. A total of 111 NRHP-eligible sites or sites requiring NRHP evaluation are projected to occur within Subalternative 4B, whereas no cultural resources sites requiring NRHP evaluation are projected to occur along the portion of Alternative 4 that Subalternative 4B would replace.

While the data suggest that Subalternative 4B has a higher potential to affect historic properties based on the disturbance footprint, projected site counts for Subalternative 4B and Alternative 4 may be the result of low representative Class III survey samples.

Subalternative 4C

Subalternative 4C consists of Segment i-04. It does not replace a specific segment; for that reason, it is presented in terms of its standalone attributes. A total of 2.0 percent of Subalternative 4C has been investigated by Class III survey. No cultural resources sites are projected to occur within Subalternative 4C. However, this projected site count must be viewed with caution in consideration of the small representative Class III sample size. The potential effect to affect historic properties by Subalternative 4C must be further evaluated in conjunction with the pairing of Subalternative 4C with Subalternatives 4D or 4J.

Subalternative 4D

Subalternative 4D would result in a comparable visual impact (comparable count of transmission structures) and a lower potential to affect historic properties by ground disturbance (greater footprint of short- and long-term disturbance).

A total of 5.7 percent of Subalternative 4D has been investigated by Class III survey, and 26.7 percent of Segments i-05 and x-06 (Alternative 4) have been previously investigated. A total of 122 NRHP-eligible or NRHP-unevaluated sites are projected to occur within Subalternative 4D, whereas 22 NRHP-eligible or NRHP-unevaluated sites are projected to occur along the portion of Alternative 4 that Subalternative 4D would replace.

While the data suggests that Subalternative 4D has a higher potential to affect historic properties based on ground disturbance, the high projected site counts for Subalternative 4D are likely due to a low percentage of Class III survey. Any effects must be further evaluated in conjunction with the pairing of Alternative 4 with Subalternative 4C.

Subalternative 4E

Compared to Alternative 4, Subalternative 4E would result in the same visual impact (same count of transmission structures) and comparable potential to impact historic properties by ground disturbance (comparable footprint of short- and long-term disturbance).

A total of 4.8 percent of Subalternative 4E has been investigated by Class III survey, while 44.8 percent of Segments p-10 and cb-02 (Alternative 4) has been previously investigated. No NRHP-eligible sites or sites requiring NRHP evaluation are projected to occur within Subalternative 4E. Two NRHP-eligible sites or sites requiring NRHP evaluation are projected to occur along the portion of Alternative 4 that Subalternative 4E would replace.

The data suggest that Alternative 4 has a slightly greater potential to affect historic properties based on projected site counts and the disturbance footprint.

Subalternative 4F

Compared to Alternative 4, Subalternative 4F would result in the same visual impact (same count of transmission structures) but a lower potential to impact historic properties by ground disturbance (smaller footprint of short- and long-term disturbance).

A total of 8.7 percent of Subalternative 4F has been investigated by Class III survey, while 62.6 percent of Segments cb-06 and p-13 (Alternative 4) has been previously investigated. No NRHP-eligible sites or sites requiring NRHP evaluation are projected to occur within Subalternative 4F, whereas three cultural resources NRHP-eligible sites are projected to occur along the portion of Alternative 4 that Subalternative 4F would replace.

The data suggest that Subalternative 4F would have a lower potential to affect historic properties based on the disturbance footprint than Alternative 4. However, the null value of projected site counts for Subalternative 4F may be the result of low representative Class III survey sample.

Subalternative 4G

Compared to Alternative 4, Subalternative 4G would result in a comparable visual impact (comparable count of transmission structures) but a lower potential to affect historic properties by ground disturbance (smaller footprint of short- and long-term disturbance).

A total of 43.7 percent of Subalternative 4F has been investigated by Class III survey, while 29.9 percent of Segments cb-02, cb-04, and cb-06 (Alternative 4) has been previously investigated. A total of two NRHP-eligible sites are projected to occur within Subalternative 4G, whereas a total of ten NRHP-eligible sites are projected to occur along the portion of Alternative 4 that Subalternative 4G would replace.

The data suggest that Subalternative 4G would have a lower potential to affect historic properties based on projected site counts and disturbance footprint than Alternative 4.

Subalternative 4H

Subalternative 4H consists of Segments x-08 and i-07. It does not replace a specific segment; for that reason, it is presented in terms of its standalone attributes. A total of 31.6 percent of

Subalternative 4H has been investigated by Class III survey. A total of 12 NRHP-eligible cultural resources sites or sites requiring NRHP evaluation are projected to occur within Subalternative 4H. The potential effect to historic properties by Subalternative 4H must be further evaluated in conjunction with the pairing of Subalternative 4H with Subalternatives 4G and 4K.

Subalternative 4J

Subalternative 4J consists of Segment i-05. It does not replace a specific segment; for that reason, it is presented in terms of its standalone attributes. A total of 36.3 percent of Subalternative 4J has been investigated by Class III survey. A total of three cultural resources sites requiring NRHP evaluation are projected to occur within Subalternative 4J. The potential effect to historic properties by Subalternative 4J must be further evaluated in conjunction with the pairing of Subalternative 4J with Subalternative 4C.

Subalternative 4K

Subalternative 4K consists of Segments i-08s, ca-04, and x-09. It does not replace a specific segment; for that reason, it is presented in terms of its standalone attributes. A total of 28.2 percent of Subalternative 4K has been investigated by Class III survey. No cultural resources sites are projected to occur within Subalternative 4K. The potential effect to historic properties by Subalternative 4K must be further evaluated in conjunction with the pairing of Subalternative 4K with Subalternative 4H and 4N.

Subalternative 4L

Subalternative 4L consists of Segments cb-10 and x-11. It does not replace a specific segment; for that reason, it is presented in terms of its standalone attributes. A total of 7.5 percent of Subalternative 4L has been investigated by Class III survey. A total of 13 sites requiring NRHP evaluation are projected to occur within Subalternative 4L. However, this high projected site count is the result of low representative Class III survey sample in Segment x-11 of Subalternative 4L (1.5 percent). The potential effect to historic properties by Subalternative 4L must be further evaluated in conjunction with the pairing of Subalternative 4L with Subalternative 4M.

Subalternative 4M

Compared to Alternative 4, Subalternative 4M would result in a comparable visual impact (comparable count of transmission structures) and a comparable potential to disturb historic properties based on ground disturbance (comparable footprint of short- and long-term disturbance).

A total of 2.0 percent of Subalternative 4M has been investigated by Class III survey, and 32.4 percent of Segment p-15w (Alternative 4) has been previously investigated. A total of 442 NRHP-unevaluated sites are projected to occur within Subalternative 4M, while 25 NRHP-eligible sites are projected to occur along Segment p-15w.

The data suggest that Subalternative 4M has a higher potential to effect historic properties based on ground disturbance; however, the high projected site counts for Subalternative 4M may be the

result of low representative Class III survey sample. These effects must be also further evaluated in conjunction with the pairing of Subalternative 4M with Subalternative 4L.

Subalternative 4N

Subalternative 4N consists of Segment x-10. It does not replace a specific segment; for that reason, it is presented in terms of its standalone attributes. A total of 60.8 percent of Subalternative 4N has been investigated by Class III survey with negative results. No cultural resources sites are projected to occur within Subalternative 4N. The potential effect to historic properties by Subalternative 4N must be further evaluated in conjunction with the pairing of Subalternative 4N with Subalternatives 4H, 4K, and 4M.

Subalternative 4P

Compared to Alternative 4, Subalternative 4P would result in a higher visual impact (greater count of transmission structures), but a lower potential to affect historic properties by ground disturbance (smaller footprint of short- and long-term disturbance).

A total of 60.4 percent of Subalternative 4P has been investigated by Class III survey, while 54.0 percent of Segments x-13, x-12, ca-06, ca-07, ca-09, and x-19 (Alternative 4) have been previously investigated. A total of 36 NRHP-eligible sites or sites requiring NRHP evaluation are projected to occur within Subalternative 4P, whereas 74 NRHP-eligible sites or sites requiring NRHP evaluation are projected to occur along the portion of Alternative 4 that Subalternative 4P would replace. Additionally, one NRHP-listed property, the Mule Tank Discontiguous Rock Art District, is within the 1-mile analysis area of Segment p-17 and would need to be evaluated to determine how the visual impacts affect the integrity of the setting and its NRHP status.

The data suggest that Subalternative 4P demonstrates a higher potential to affect historic properties than Alternative 4 segments it would replace.

4.5.7.6 Agency Preferred Alternative

A total of 49 NRHP-eligible or NRHP-unevaluated cultural resources sites have been previously recorded within the 200-foot analysis corridor of the Preferred Alternative. A total of 132 NRHP-eligible or NRHP-unevaluated cultural resources sites are projected to occur within the 200-foot analysis corridor of the Preferred Alternative (Appendix 4, Tables 4.5-1 through 4.5-4). However, this high projected count may be influenced by skewed metrics resulting from lower Class III survey coverage of Segment i-03 (4.2 percent). Direct impacts due to construction could range between negligible and major, if NRHP-eligible sites could not be avoided by Project design. The Preferred Alternative has the potential to affect more cultural resource sites than Alternative 1, Alternative 3, and Alternative 4, about the same as Alternative 2, and less than the Proposed Action.

Sensitive sites projected to occur in the Preferred Alternative's 200-foot analysis corridor include prehistoric trails and intaglios. These site types have been recorded within 0.5-mile of Segments i-03, p-09, p-10, p-11, p-12, p-13, p-14, p-15e, p-16, x-15, x-16, and ca-09. The NRHP eligibility of all of these sites is not known at this time. If these trails and intaglios qualify as NRHP-eligible properties and exhibit a high degree of setting, feeling, and association, the construction of structures may create visual intrusions that affect the NRHP character-defining qualities of

these sites. Other indirect effects to historic properties could occur if Project roads enhance accessibility, potentially making previously inaccessible properties more vulnerable to increased visitation and vandalism.

Indirect visual effects from the construction of the Project under the Preferred Alternative could occur to the following historic properties:

- The Limekiln Wash Intaglio, located within the 200-foot analysis corridor of Segment p-13.
- The NRHP-listed Ripley Intaglio Site, within the 5-mile indirect effects analysis area of Segment p-15e.

Both Segments p-13 and p-15e parallel the existing DPV1 transmission line. The construction of additional transmission structures may create additional visual intrusions on individual properties' NRHP qualities of integrity.

Resolution Measures

Resolution measures for the Preferred Alternative would be the same as those described under the Proposed Action.

4.5.8 Residual Impacts

For historic properties that are determined eligible for the NRHP or listed on the NRHP under Criterion D, provided that the provisions of a HPTP for data recovery are followed, no residual impacts would occur. For those historic properties determined eligible for or listed on the NRHP under Criteria A, B, or C, impacts to their NRHP qualities of setting, feeling, and/or association may be considered to be residual. However, it is anticipated that these properties would at least partially retain the NRHP qualities that make them eligible under Criteria A, B, or C. As a result, the residual impact to these properties would be moderate.

4.5.9 CDCA Plan Compliance

CMAs LUPA-CUL-4, LUPA-TRANS-CUL-1 through LUPA-TRANS-CUL-6, and DFA-VPL-CUL-1 through DFA-VPL-CUL-7 would apply to the Project (Appendix 2C). DFA-VPL-CULT-7 would also apply to the Project (Appendix 2C) and would be satisfied by identifying the need for specific compliance with the NHPA in Chapters 3, Sections 5.3 and 5.5, and Appendix 5, Table 5.3-1, as well as Appendix 2D.

LUPA-CUL-4 is specific to the Project design to minimize impacts on cultural resources, including those places of elevated cultural or spiritual significance to Federally recognized tribes. Compliance with LUPA-CUL-4 would be satisfied with BMP-CULT-03, which states that the applicant would follow avoidance and stipulations outlined in the PA (Appendix 2D) and appropriate HPTPs, and APM-CULT-01 and APM-CULT-02 (Appendix 2A, Section 2A.6), in which the applicant commits to following those stipulations.

LUPA-TRANS-CUL-1 and DFA-VPL-CUL-1 are specific to the responsibility of the applicant to pay for costs associated with the Project's cultural resources compliance. Compliance with

LUPA-TRANS-CUL-1 and DFA-VPL-CUL-1 would be satisfied by APM-CULT-01 and APM-CULT-02 (Appendix 2A, Section 2A.6), in which the applicant commits to conducting a cultural resources inventory of the direct and indirect APE, preparing HPTPs, and conducting cultural resource monitoring during Project construction, operations, maintenance, and decommissioning (as appropriate) to meet stipulations outlined in the PA (Appendix 2D).

LUPA-TRANS-CUL-2 and DFA-VPL-CUL-2 are specific to the applicant's payment of compensatory mitigation fees for cumulative and indirect effects to historic properties as a result of Project construction, operations, maintenance, and decommissioning. Compliance with LUPA-TRANS-CULT-2 and DFA-VPL-CUL-2 would be satisfied by BMP-CULT-05 (Appendix 2A, Section 2A.6), which outlines the fee structure of the compensatory mitigation fee. The compensatory mitigation fee structure is also outlined in the stipulations contained within the PA (Appendix 2D).

LUPA-TRANS-CUL-3 and DFA-VPL-CUL-3 are specific to the applicant's payment of management fees as part of the compensatory mitigation fee contained in LUPA-TRANS-CUL-2 and DFA-VPL-CUL-2, respectively. Compliance with LUPA-TRANS-CUL-3 and DFA-VPL-CUL-3 would be satisfied by BMP-CULT- 05 (Appendix 2A, Section 2A.6), which outlines the fee structure of the management fee as part of the compensatory mitigation fee. The management fee and compensatory mitigation fee structure is also outlined in the stipulations contained within the PA (Appendix 2D).

LUPA-TRANS-CUL-4 and DFA-VPL-CUL-4 are specific to the development of a cultural resources sensitivity model based on existing cultural resources data in the CDCA Plan area for consideration in Project planning and alternative selection. (Appendix 2D) Compliance with LUPA-TRANS-CUL-4 and DFA-VPL-CUL-4 would be satisfied with BMP-CUL-06 (Appendix 2A, Section 2A.6). This compliance measure has been met.

LUPA-TRANS-CUL-5 and DFA-VPL-CUL-5 are specific to the provision of a statistically significant cultural resources sample survey to be used in Project planning (Appendix 2D). Compliance with LUPA-TRANS-CUL-5 and DFA-VPL-CUL-5 would be satisfied by BMP-CULT-07 (Appendix 2A, Section 2A.6), which requires cultural resources Class III survey of Segments p-17 and p-18 to be conducted during the NEPA and CEQA analyses to meet the conditions of LUPA-TRANS-CUL-5 and DFA-VPL-CUL-5. This compliance measure has been met.

LUPA-TRANS-CUL-6 and DFA-VPL-CUL-6 are specific to the applicant's justification to include culturally sensitive areas through NEPA and CEQA analyses (Appendix 2D). Compliance with LUPA-TRANS-CUL-6 and DFA-VPL-CUL-6 would be satisfied by BMP-CULT-08 (Appendix 2A, Section 2A.6), which requires such justification from the Project applicant. This compliance measure has been met.

DFA-VPL-CUL-7 addresses completion of the Section 106 process (Appendix 2D). Compliance with DFA-VPL-CUL-7 is satisfied by identifying the need for specific compliance with the NHPA in Chapters 3 and 5. Chapter 5 summarizes the process of drafting the PA and the consultation process and efforts of tribal consultation with Indian tribes, respectively. Appendix 2D is the PA for the Project.

4.5.10 Unavoidable Adverse Effects

If historic properties cannot be avoided by Project design and construction, the disturbance, damage, or loss to that property as a result of ground disturbance is considered to be an unavoidable adverse effect.

4.5.11 Cumulative Effects

The Project Area is crossed by numerous utility and transportation corridors, including I-10, US 95, SR 95, the CAP canal, the DPV1 transmission line, the EPNG line, as well as local roads. The landscape has been further altered by the development of the Town of Quartzsite and the City of Blythe, and the expansion of historic and modern agriculture. The scope of this development has resulted in the loss of historic properties by construction, as well as visual impacts to historic properties on the landscape. Large linear projects, such as DPV1, I-10, and the CAP canal have had the effect of altering the viewshed of the native landscape and disrupting the prehistoric trails and elements of traditional native infrastructure across the desert, all of which contribute to cumulative effects.

Reasonably foreseeable future actions include the development of large solar facilities in the western portion of the Project Area (Table 4-5), all of which have the potential to cumulatively impact cultural resources. These cumulative effects are manifest in terms of the loss of historic properties due to ground disturbance associated with construction or operations and maintenance, and the changes to the viewshed of historic properties. Those historic properties considered to be especially sensitive to indirect effects are typically those for which integrity of setting, feeling, and association are contributors to the property's NRHP eligibility and its ability to convey a sense of its own significance. Increased visual degradation to properties that are eligible under NRHP Criteria A, B, and C, and that retain integrity of setting, feeling, and association, would result in permanent cumulative impacts. If effects to NRHP qualities are measurable this would constitute a permanent cumulative effect.

Table 4-5 Potential Disturbance in 5-Mile CEA from Reasonably Foreseeable Projects

ZONE	PROJECT	TYPE	ACRES
EP&K	Harquahala Solar Project	Solar Facility	3,514
EP&K	La Paz County land conveyance	Solar Facility	5,935
QTZ	Plomosa 9 Placer Claim	Mine	20
QTZ	Quartzsite WWTP Renovations	Infrastructure	16.7*
CB	West Port Gold	Mine	40
CR&CA	Blythe Energy Power Plant/Sonoran Energy Project	Power Plant	76
CR&CA	Blythe Mesa Solar Project	Solar Facility	7,025
CR&CA	Desert Quartzite Solar	Solar Facility	4,800
CR&CA	Crimson Quartzsite Solar	Solar Facility	2,700
Total			24,110

* expansion would be within the existing footprint and is therefore not included in total.

The La Paz County Land Conveyance would remove 5,935 acres from Federal oversight. However, most of the land in the Project Area would remain under Federal jurisdiction and therefore be subject to protection afforded by cultural resource laws and evaluation of effects in accordance with NEPA. While the loss of cultural sites eliminates the potential to preserve the sites in place or to study the sites at a later time period when new evaluation techniques might exist, the impact to historic properties would be resolved through data recovery and other methods and would have the benefit of increasing scientific knowledge regarding the past lifeways of prehistoric, protohistoric, and historic populations in the region.

In the western Project Area, within the boundary of the CDCA, the BLM has addressed the reasonably foreseeable cumulative effect of construction and development on public lands through the development of the DRECP PA. This PA contains measures to address cumulative effects not addressed by data recovery or other traditional adverse effect resolution measures.

4.5.12 Irreversible and Irretrievable Commitment of Resources

Because cultural resources are non-renewable resources, any disturbance, damage, or loss to a resource that is or may be eligible for the NRHP would constitute an irreversible and irretrievable impact to that resource. However, archaeological data recovery of sites along the transmission line would increase knowledge and understanding about the history of southwestern Arizona and southeastern California, which would be a benefit (positive impact) to science. Data recovery along the Project would contribute to our understanding of prehistoric cultures, as well as to our understanding of historic era transportation, settlement, and mining. Investigations in these areas could help contribute our understanding and knowledge of the use and formation of the landscape in southwestern Arizona and southeastern California.

4.5.13 Relationship of Short-term Uses and Long-term Productivity

The short-term use of the ROW during construction of the Project would result in ground disturbance. If that ground disturbance results in the disturbance, damage, or loss of cultural resources that are or may be eligible for the NRHP, the long-term potential of that resource is reduced or eliminated. This is primarily true of resources eligible under Criterion D; however, if a resource eligible under Criterion A, B, or C is damaged or lost due to construction that would also affect its long-term potential.

4.6 CONCERNS OF INDIAN TRIBES

4.6.1 Introduction

The Project is within ancestral lands of Indian tribes, and tribal communities have maintained a spiritual stewardship and cultural connection to the landscape. The natural and cultural resources within and near the Project Area contain cultural and spiritual energy for Indian tribes, and continue to play fundamental roles in cultural traditions, group identities, and ongoing religious and ceremonial traditions.

Indian tribes with ancestral ties to the Project Area include:

- Agua Caliente Band of Cahuilla Indians
- Ak-Chin Indian Community
- Augustine Band of Cahuilla Indians
- Cabazon Band of Mission Indians
- Chemehuevi Tribe of the Chemehuevi Indian Reservation
- Cocopah Indian Tribe of Arizona
- Colorado River Indian Tribes (CRIT)
- Fort McDowell Yavapai Nation
- Fort Mojave Indian Tribe
- Fort Yuma Quechan Tribe
- Gila River Indian Community
- Hopi Tribe of Arizona
- Moapa Band of Paiute Indians
- Morongo Band of Mission Indians
- Salt River Pima-Maricopa Indian Community
- San Manuel Band of Mission Indians
- Soboba Band of Luiseño Indians
- Tohono O'odham Nation
- Torres-Martinez Desert Cahuilla Indians
- Twenty-Nine Palms Band of Mission Indians
- Yavapai-Apache Nation of the Camp Verde Indian Reservation
- Yavapai-Prescott Indian Tribe
- Pueblo of Zuni

Discussion of the concerns of Indian tribes relevant to the Project including regulatory requirements, tribal land use and cultural affiliation, and areas of potential significance and sensitivity to Indian tribes are presented in Chapter 3. The status of consultation in accordance with Section 106 of the NHPA of 1966, as amended, is presented in Appendix 5, Table 5.3-1.

4.6.2 Methods for Analysis

4.6.2.1 Analysis Area

The analysis area for the Project consists of areas where direct effects to places of Indian tribal concern may occur. Direct effects are defined by areas where ground disturbance would occur for Project construction, such as structure locations, access roads, lay down areas, and spur roads, among others. The analysis area is defined as a 200-foot-wide corridor where direct effects are expected to occur. Baseline data for the analysis area are presented in Section 3.6 and are considered to provide an appropriate measure for the analysis of potential direct effects of the Project. For Section 106 purposes, the APE for direct effects is defined differently (Appendix 2D).

In addition to direct impacts, indirect impacts to resources as a result of the Project may occur. Indirect impacts to resources include visual, atmospheric, and auditory effects. As presented in Section 4.5, indirect atmospheric and auditory effects may occur in an area measuring 0.5-mile from each Action Alternative or subalternative. Potential indirect visual effects were delineated to include resources within 5 miles on either side of the alternatives and subalternatives. In certain situations, the 5-mile visual analysis area was adjusted based on the presence of topography that restricts the viewshed.

4.6.2.2 Assumptions

The PA and ROD would outline protocols for minimizing impacts to areas of concern to Indian tribes, such as options for regulating access, provisions for the inclusions of tribal members in cultural resources investigations and fieldwork, and the preparation of ethnographic studies, among other provisions, as required.

The following assumptions underlie the Section 106 consultation process:

- Indian tribes may choose not to divulge particularly sensitive information outside of the tribal community.
- Community members may have their own beliefs, which may not necessarily be shared by members of the tribal council.
- BLM can only address areas of concern to Indian tribes that are made known.
- Indian tribes may share new concerns during the Section 106 and NEPA process, and the BLM will attempt to address these in the PA.
- Some tribes may defer to other tribes in the decision-making process.

4.6.2.3 Environmental Effects Indicators, Magnitude, and Duration

To date, the BLM has invited affiliated Indian tribes to participate in the Section 106 consultation, established formal lines of communication for scheduled meetings and conference calls, held Section 106 and PA development meetings, and sponsored a tribal tour of Project alternatives. As a result of those communications, impact indicators have been developed specific to issues of tribal concern. These are not all inclusive, and other areas of concern to Indian tribes may be identified during continued Section 106 consultation.

Based on the result of Section 106 consultation and Project outreach, the following issues have been identified specific to issues of concern to Indian tribes:

- Existing Access: Tribal representatives from the CRIT, Fort Yuma Quechan Tribe, and the Twenty-Nine Palms Band of Mission Indians expressed concerns regarding construction of the Project limiting existing access into areas of tribal spiritual use, especially in the Mule Mountains. For example, DCRT may need to restrict non-Project personnel from entering the work area. While this may temporarily limit access, other access routes outside of the construction zone could continue to be used to accommodate entry to areas of spiritual use. If tribes communicate special occasions when access for religious ceremonies are planned, BLM can include provisions in the PA or the ROD that would limit construction activities in a particular area for short periods of time to accommodate the access (if an alternate route is not available).
- New Access: Tribal representatives from the CRIT, Fort Yuma Quechan Tribe, and the Twenty-Nine Palms Band of Mission Indians all expressed concerns regarding construction of the Project providing new access into sensitive areas that were previously inaccessible because of difficult entry. Tribal concerns were specific to increased OHV use that could lead to the vandalism and damage of cultural resources as a consequence of the Project. Effect resolution measures can be included in the PA and HPTPs.
- Native Infrastructure and Interconnection of the Cultural and Natural Environment: The CRIT, Fort Yuma Quechan Tribe, and Twenty-Nine Palms Band of Mission Indians expressed concerns regarding the interconnectedness of cultural resource sites, natural features of the landscape, and prehistoric trail networks. Concern was expressed regarding the cumulative effects of projects erasing the ancestral footprint of the tribes from the landscape. The direct and indirect effects of the Project on prehistoric properties and features of Native infrastructure (such as trails) are presented in Section 4.5. Effect resolution measures can be included in the PA and HPTPs.
- Places of Elevated Spiritual Importance to Tribes: The CRIT, Fort Yuma Quechan Tribe, and Twenty-Nine Palms Band of Mission Indians all expressed concerns regarding specific culturally sensitive areas, especially in the Mule Mountains and the Palo Verde Mesa. Concern was expressed regarding visual impacts of Project infrastructure to areas of elevated spiritual importance, such as the Ripley Intaglio Site. The direct and indirect effects of the Project on known places of elevated spiritual importance to tribes are discussed in Section 4.5.

- The Colorado River: The CRIT, Fort Yuma Quechan Tribe, and Twenty-Nine Palms Band of Mission Indians all expressed concern about the influence of the Colorado River on their spiritual belief and cultural history. As such, the Colorado River crossing and the indirect and direct effects of its siting on the landscape and potential impact to cultural resources are of great concern to the Indian tribes. Effect resolution measures can be included in the PA and HPTPs.
- Treatment of Human Remains: The CRIT expressed concern regarding the treatment of human remains and mortuary items. It is their belief that if human remains are encountered, they should not be removed but avoided entirely and left in place.
- Intrusion on Pristine Landscapes: The CRIT, Fort Yuma Quechan Tribe, and Twenty-Nine Palms Band of Mission Indians all expressed desire to restrict Project disturbance to areas already disturbed in order to limit impacts to pristine landscapes. Pristine and undisturbed landscapes are important to tribal spiritual life and are high-energy places that should be preserved.

The following are impact indicators identified specific to these issues of concern to Indian tribes:

- Project-related changes that would restrict Indian tribal access into traditional use areas and areas of elevated spiritual significance.
- Project-related changes that result in new access into areas where access had previously been limited. This would be the result of new access roads that would open up areas to OHV traffic and could result in vandalism of cultural resources.
- Project ground disturbance that results in the loss or destruction of prehistoric properties and erases the connection between individual sites and natural features of the landscape.
- Project-related changes that modify visual aspects of areas of elevated spiritual importance.
- Project-related changes that would modify visual aspects of the Colorado River.
- Project-related changes resulting in new disturbance in pristine environments that would affect the spiritual energy of a natural landscape.

Non-NRHP eligible cultural resources may be of importance to the tribes and must be considered when assessing impacts to Indian tribes. Impact magnitude and duration definitions specific to concerns to Indian tribes are defined in Table 4-6.

Table 4-6 Impacts of Concern to Indian Tribes: Magnitude and Duration Definitions

ATTRIBUTE OF IMPACT		DESCRIPTION SPECIFIC TO INDIAN CONCERNS
Magnitude	No impact	There would be no change to the current condition of areas of concern to Indian tribes as a result of Project construction, operation, maintenance, or decommissioning. There would be no effect to the existing access of specific areas; prehistoric or ethnohistoric cultural resources, areas of elevated spiritual importance,or the Colorado River; human remains; or pristine qualities of existing undeveloped landscapes.
Magnitude	Negligible	There would be no measurable change to the current condition of areas of concern to Indian tribes as a result of Project construction, operation maintenance, and decommissioning. While a change to the existing access of specific areas may occur, it would not affectthat access. Prehistoric or ethnohistoric cultural resources, areas of elevated spiritual concern and the Colorado River would not be affected to a measurable degree. There would be no measurable change to the pristine qualities of existing undeveloped landscapes.
	Minor	There would be a small, but measurable, change to the current condition of areas of concern to Indian tribes as a result of Project construction, operation maintenance and decommissioning. While a small change to the existing access of specific areas may occur, it would not negatively affect that access. While prehistoric or ethnohistoric cultural resources, areas of elevated spiritual concern, the Colorado River, and pristine qualities of existing undeveloped landscapes would be affected, it would not negatively affect those areas of concern.
	Moderate	An easily discernable and measurable change to the current condition of areas of concern to Indian tribes as a result of Project construction, operation, maintenance and decommissioning would occur. Changes to existing access would occur that would require a general effect resolution measure to minimize impacts. Prehistoric or ethnohistoric cultural resources, areas of elevated spiritual importance, the Colorado River, and the pristine qualities of existing undeveloped landscapes would be affected to a measurable degree.
	Major	A large, easily measurable change in condition to areas of concern to Indian tribes would occur as a result of Project construction, operation maintenance and decommissioning. Changes to existing access would occur that would require specific resolution measures to minimize impacts. Prehistoric or ethnohistoric cultural resources, areas of elevated spiritual importance, the Colorado River, and the pristine qualities of existing desert landscapes would be substantially altered. Human remains would be encountered by the Project.
Duration	Temporary	Limited to active construction or maintenance.
	Short-term	During construction (1.5–2 years), up to 10 years.
	long-term	More than 10 years.

4.6.3 No Action Alternative

Under the No Action Alternative, no ROW would be granted for the Project and the transmission line, SCS, and ancillary facilities would not be constructed. The Project Area would not be affected by Project-related ground disturbance, and no effect to traditional native infrastructure and the interconnected natural landscape would occur. There would be no change to existing access, and new access would not be implemented. The Colorado River, pristine areas, and areas of elevated spiritual importance to tribes would not be affected. Changes in the environment would be limited to ongoing current actions or from disturbance associated with new actions unrelated to the Project.

4.6.4 Construction of Action Alternative Segments

4.6.4.1 Direct and Indirect Effects Common to All Action Alternatives

Direct Effects

Ground disturbance during construction is expected with the Proposed Action and all Action Alternatives and may affect areas of tribal concern. The magnitude and duration of any potential effect would vary depending on the type of disturbance and the area of tribal concern affected. The primary contributor of permanent ground disturbance would be related to structure and SCS construction as well as the construction of/improvements to access and spur roads. Temporary disturbance during Project construction may also have direct effects to areas of tribal concern. The effects of construction on areas of specific tribal concern are:

- Limitations to tribal access;
- Effects on traditional native infrastructure and the interconnected cultural and natural environment (i.e., traditional cultural landscape);
- New development in areas that are predominantly pristine;
- The location of the crossing of the Colorado River;
- Effects on areas of elevated spiritual importance; and
- Discovery and treatment of human remains.

Impacts to cultural resource sites would be the same as discussed in section 4.5. Should a tribal cultural landscape be identified during additional study, impacts to the landscape would be evaluated. Measures to resolve potential adverse effects to areas of tribal concern as a result of Project construction would be contained in the PA (Appendix 2D), HPTP, and the Tribal Participation Plan. Avoidance of impacts by final design and construction would be the preferred adverse effect resolution measure.

Indirect Effects

Indirect effects to cultural resources and areas of tribal concern could occur in areas where the construction of new roads into the Project Area would provide improved access into previously inaccessible areas. Improved access could lead to site damage by OHV and recreational use of these areas. Such damage could consist of vehicular damage to surface archaeological sites, and vandalism to sensitive areas. However, the number and types of cultural resources affected would vary by segment and alternative and would be assessed in detail when an alternative is selected. Effect resolution measures to minimize or resolve potential adverse effects to cultural resources and areas of tribal concern as a result of improved access would be included in the PA, ROD, and Project APMs and BMPs.

Indirect impacts would occur from the presence of structures in sight of areas of tribal concern by altering their setting, feeling, and association. However, the number and types of cultural resources affected would vary by segment and alternative and would be assessed in detail when an alternative is selected. Effect resolution measures to minimize the potential adverse effects of visual intrusions would be contained in the Project-specific PA, ROD, Project APMs and BMPs, and implemented by Project design.

Petroglyphs and intaglios are often areas of elevated spiritual importance to Indian tribes and are considered to be sensitive to indirect visual effects. Trails are of significance to Indian tribes as part of traditional native infrastructure associated with the interconnectedness of the cultural and natural environment, and also considered to be sensitive to indirect visual effects. To the extent that a site or prehistoric feature exhibits a high degree of integrity of setting, feeling, and association, the Project could affect its character-defining qualities. These potential effects would be assessed as part of the more detailed indirect effects analysis after BLM selects either a specific Action Alternative or discontinues further study by selecting the No Action Alternative. With selection of an Action Alternative, if effects to prehistoric or ethnohistoric cultural resource character-defining qualities are measurable beyond a small change, this would constitute a moderate to major long-term effect. While the features identified as concerns of Indian tribes are described in the segment and full-route alternative analysis, the nature of the effects are common to all (unless specified in the detailed effects analysis) and are not repeated in the segment analysis or full-route alternative analysis.

4.6.4.2 Direct and Indirect Segment-specific Effects

Potential effects to cultural resource sites by segment are discussed in Section 4.5 and Appendix 4, Tables 4.5-1 through 4.5-4. Direct and indirect segment-specific effects to areas of concern to Indian tribes are summarized in Table 4-7. This table summarizes information itemized in the cultural resources assessments of each segment (Section 4.5) and known tribal concerns (Section 3.6). Consultation and coordination with tribes is ongoing, therefore additional areas of concern to Indian tribes may be identified in the future.

Table 4-7 Direct and Indirect Segment-Specific Effects to Areas of Concern to Indian Tribes

Additional trails are known to be present in the Project Area and were utilized by the Mohave people and others. Major trails include the Coco-Maricopa Trail and the Salt Song Trail.

While the Salt Song Trail is metaphysical, and is not physically present on the landscape, consultation received from the Twenty-Nine Palms Band of Mission Indians notes that locations named in the Salt Songs may be tied to physical locations of importance in or around the Project (Madrigal [Twenty-Nine Palms Band of Mission Indians] to MacDonald [BLM], 5/12/2017).

Segments cb-10, ca-04, and p-15e cross the Colorado River. The CRIT, Fort Yuma Quechan Tribe, and Twenty-Nine Palms Band of Mission Indians all expressed concern about the Colorado River, and its influence on their spiritual belief and cultural history. As such, the Colorado River crossing and the indirect and direct effects of its siting on the landscape and potential impact to cultural resources are of great concern to the Indian tribes and should be addressed by an indirect effects analysis and continued government-to-government Section 106 consultation.

4.6.5 Operations, Maintenance, and Decommissioning

Though most impacts are expected to occur in association with construction, continuing Project-related activities and Project effects to areas of tribal concern would continue after construction, including periodic access and occasional ground disturbance as described in Chapter 2.

These maintenance and operating activities would have the potential to affect tribal concern if they take place in culturally sensitive areas by restricting access, or when scheduled at times of years that are spiritually significant to Indian tribes. Such activities should be scheduled in communication with the Indian tribes as to not interfere with tribal ceremonial functions or restrict access to places of tribal importance. These measures should be addressed in the PA or the ROD.

Ground disturbance associated with operation and maintenance activities may have the potential to affect areas of tribal concern if they take place in sensitive areas. These activities would be addressed in the PA.

In addition, Project operation and maintenance may result in the maintenance of access roads established during construction that provide the opportunity for continued access into areas that were previously inaccessible and/or used only intermittently. The maintenance of an expanded road network that could accommodate increased access should be regularly assessed to ensure that no unanticipated adverse effects or vandalism of sensitive cultural resources occur.

Given the length of time of the Project's use life and decommissioning, decommissioning would require further analysis in the future. It is anticipated that decommissioning activities would be addressed by future Section 106 analyses (Section 4.5.5).

4.6.6 Resolution Measures for the Resolution of Adverse Effects

Resolution measures for adverse effects to cultural resources and areas of concern to Indian tribes would be outlined in the PA and HPTPs developed for the treatment of adverse effects to specific historic properties (APM-CULT-01, APM-CULT-03; Appendix 2A, Section 2A.6) and

ongoing government-to-government Section 106 consultation. The PA would be finalized prior to the issuance of the Project ROD, and measures contained in the PA and HPTPs would be implemented prior to and during construction and post-construction during maintenance and operation activities (APM-CULT-01, BMP-CULT-02, BMP-CULT-04) (Appendix 2A, Section 2A.6).

Resolution measures for adverse effects to historic properties located within the CDCA Plan area are further outlined by specific compliance requirements discussed in Section 4.5.9. APMs and BMPs for minimizing effects to areas of tribal concern are contained in Appendix 2A, Section 2A.6.

4.6.7 Construction of Full Route Alternative and Subalternative Effects

4.6.7.1 Proposed Action

The Proposed Action follows the existing DPV1 transmission line; as a result, concerns to Indian tribes regarding new disturbance, access considerations, and intrusion on culturally significant environments would be minimized with the following exceptions:

Segment p-17 includes a site with exposed human remains and may indicate an increased potential for encountering additional human remains with ground disturbing activities; Indian tribes have indicated that human remains should not be disturbed and should remain in place. Impacts to concerns to Indian tribes would be major and long-term and could be resolved only through avoidance.

Segments p-17 and p-18 pass through a culturally significant area that Indian tribes do not want physically disturbed by construction, made more accessible to the public through new access roads, nor changed by visual intrusions of Project structures or facilities. Impacts to areas of concern to Indian tribes would be major and long-term.

Other segments associated with the Proposed Action are near intaglio sites and petroglyphs, both of which are site types of elevated spiritual importance to Indian tribes. If these features are measurably affected by visual changes, the sites would be permanently affected from a perspective of Indian tribes. Depending on the viewshed and structure placement, indirect visual impacts to intaglio sites and petroglyphs could range between negligible and major. If there are measurable effects, they would be long-term.

Previously recorded cultural resources sites that contain prehistoric trail segments are located on Segments p-04, p-06, p-07, p-09, p-10, p-11, p-12, p-13, p-14, and p-15e. Additional trails are known to be present in the western portion of the Project Area and were utilized by the Mohave people and others. Major trails include the Coco-Maricopa Trail and the Salt Song Trail (a metaphysical trail). Trails are of significance to Indian tribes as part of traditional native infrastructure associated with travel across the landscape. Trails may also be potentially sensitive to indirect visual effects. Depending on the viewshed and structure placement, indirect visual impacts to trail segments could range between negligible and major. If there are measurable effects, they would be long-term.

Segment p-15e crosses the Colorado River, which is of spiritual importance to Indian tribes. Visual considerations of the river crossing should be considered in an indirect effects analysis. Given that Segment p-15e parallels the existing DPV1 transmission line, visual effects may be minor to moderate, but would be long-term.

The Mule Tank Discontiguous Rock Art District containing petroglyphs and intaglios is located within the 1-mile analysis corridor of Segments p-17 and p-18. The Ripley Intaglio Site is located within the 5-mile indirect effects analysis area of Segment p-15e. Potential visual effects to this site have been expressed by the Quechan Tribe of the Fort Yuma Indian Reservation.

Resolution Measures

Resolution measures for concerns to Indian tribes would be developed and outlined in the PA, HPTPs, or the ROD, and identified during ongoing Section 106 government-to-government consultation. The PA would be finalized prior to the issuance of the Project ROD, and measures contained in the PA and HPTPs would be implemented prior to and during construction and post-construction during maintenance activities and operations.

In addition, APMs and BMPs as well as stipulations that would be a part of the ROD outline specific protocols for areas of tribal concern. These APMs, BMPs, and stipulations address, but are not limited to, protocols specific to coordination and communication with Indian tribes, roads and access, compliance with applicable laws, and confidentiality, among other procedures that may resolve potential adverse effects.

4.6.7.2 Alternative 1: I-10 Route

Previously recorded cultural resources sites that contain prehistoric trail segments are located on Alternative 1 Segments i-03, qs-01, i-06, i-07, i-08s, and ca-09. The importance of trails to Indian tribes and the type and magnitude of effects would be the same as those described for the Proposed Action.

Two sites located along Segment i-07 (a component of Alternative 1) contain intaglios. In addition, a site with an intaglio and prehistoric and historic petroglyphs is located within the 1-mile analysis corridor of Segment qs-02 and petroglyph sites are located within the 1-mile analysis corridor of Segment i-06. The importance of intaglios and petroglyphs to Indian tribes and the type and magnitude of effects would be the same as those described for the Proposed Action.

Segment ca-04 crosses the Colorado River. The Colorado River is of spiritual importance to Indian tribes. Visual considerations of the river crossing should be considered in an indirect effects analysis. Given that Segment ca-04 parallels the existing I-10 freeway corridor, visual effects may be minor to moderate, but would be long-term.

Resolution Measures

Resolution measures for concerns to Indian tribes would be the same as those described for the Proposed Action.

Subalternatives to Alternative 1

Subalternative 1A

Previously recorded cultural resources sites that contain prehistoric trail segments are located within 0.5-mile of Segments x-02a and x-02b. Segment i-01 (Alternative 1) has no known concerns to Indian tribes. As a result, Subalternative 1A has a greater potential to impact areas of known concern to Indian tribes.

Subalternative 1B

Previously recorded cultural resources sites that contain prehistoric trail segments are located within the 1-mile corridor of Segments x-02a and x-02b. Segment i-01 has no known concerns to Indian tribes. As a result, Subalternative 1B has a greater potential to impact areas of known concern to Indian tribes.

Subalternatives 1C, 1D, and 1E.

No concerns to Indian tribes have been identified for Subalternatives 1C, 1D, and 1E.

4.6.7.3 Alternative 2: BLM Utility Corridor Route

Previously recorded cultural resources sites that contain prehistoric trail segments are located on Segments i-03, qs-01, p-09, p-10, p-11, p-12, p-13, p-14, p-15e, p-16, x-07, x-15, x-16, and ca-09. The importance of trails to Indian tribes and the type and magnitude of effects would be the same as those described for the Proposed Action.

Alternative 2 includes segments near intaglios. The Ripley Intaglio Site is located within the 5-mile indirect effects analysis area of Segment p-15e. Another site containing an intaglio is within the 200-foot analysis corridor of Segment p-13. The importance of intaglios to Indian tribes and the type and magnitude of effects would be the same as those described in the Proposed Action.

Segment p-15e crosses the Colorado River. The Colorado River is of spiritual importance to Indian tribes. Visual considerations of the river crossing should be considered in an indirect effects analysis. Given that Segment p-15e parallels the existing DPV1 transmission line, visual effects may be minor to moderate, but would be long-term.

Resolution Measures

Resolution measures for concerns to Indian tribes would be the same as those described for the Proposed Action.

Subalternatives to Alternative 2

Subalternative 2A

Trails may potentially exist in Segments d-01, x-02a, and x-02b. Additionally, the Eagletail Petroglyph Site, is within the 5-mile indirect effects analysis area of Segment d-01. Segments p-01 and i-01 (Alternative 2) have no known concerns to Indian tribes. As a result, Subalternative 2A has a greater potential to impact areas of known concern to Indian tribes.

Subalternative 2B

Trails may potentially exist in Segment p-04. Segment i-01 (Alternative 2) has no known concerns to Indian tribes. As a result, Subalternative 2B has a greater potential to impact areas of known concern to Indian tribes.

Subalternative 2C

Trails may potentially exist in Segments cb-02, cb-06, p-11, and p-12. As a result, potential impacts to areas of concern to Indian tribes are comparable between Subalternative 2C and Alternative 2.

Subalternative 2D

Trails may potentially exist in Segments cb-03 and p-11. As a result, potential impacts to areas of concern to Indian tribes are comparable between Subalternative 2D and the segment it replaces.

Subalternative 2E

Trails may potentially exist in Segment ca-02. As a result, potential impacts to areas of Indian tribal concern are comparable between Subalternative 2E and the segments it replaces.

4.6.7.4 Alternative 3: Avoidance Route

Segments cb-01, x-05, and cb-04 cross through areas of largely undisturbed desert where new access and new visual intrusions would be introduced. As a result, potential impacts to concerns to Indian tribes regarding new access and intrusion on pristine landscapes would be moderate to major and long-term.

Previously recorded cultural resources that contain prehistoric trail segments are potentially located on Segments i-03, p-07, p-09, p-14, x-05, cb-01, cb-05, ca-09, and cb-10. The importance of trails to Indian tribes and the type and magnitude of effects would be the same as those described in the Proposed Action.

Segment cb-10 crosses the Colorado River, which is of spiritual importance to Indian tribes. Visual considerations of the river crossing should be considered. Given that Segment cb-10 is located in an agricultural landscape, visual effects may be moderate to major, but would be long-term.

Resolution Measures

Resolution measures for concerns to Indian tribes would be the same as those described for the Proposed Action.

Subalternatives to Alternative 3

Subalternative 3A

Trails may potentially exist in Segments d-01, x-02a, and x-02b. Additionally, the Eagletail Petroglyph Site, is within the 5-mile indirect effects analysis area of Segment d-01. Segments p-

01 and i-01 (Alternative 3) have no known concerns to Indian tribes. As a result, Subalternative 3A has a greater potential to impact areas of known concern to Indian tribes.

Subalternative 3B

There are no known issues of concern to Indian tribes in Segments i-01 or i-02. Trails may potentially exist in Segment p-04 (Alternative 3). As a result, Subalternative 3B has a lower potential to impact areas of known concern to Indian tribes.

Subalternative 3C

Trails may potentially exist in Segment x-04 and i-03. As a result, potential impacts to areas of concern to Indian tribes are comparable between Subalternative 3C and Alternative 3.

Subalternative 3D

No issues of concern to Indian tribes have been identified for Subalternative 3D or Alternative 3, and effects to areas of concern to Indian tribes would be comparable.

Subalternative 3E

Subalternative 3E consists of Segments qs-01 and x-07. It would replace Segment x-05, and must be combined with Subalternatives 3D and 3G, or 3J. Subalternative 3E and Segment x-05 may all contain trails; however, Segment x-05 crosses through an undeveloped landscape that would potentially impact concerns to Indian tribes regarding new access and intrusion on pristine landscapes. As a result, Subalternative 3E appears to have a lesser impact to areas of concern to Indian tribes. While Subalternative 3E needs to be assessed in conjunction with its pairing with Subalternatives 3D and 3G, or 3J, none of these subalternatives have known issues of concern to Indian tribes.

Subalternative 3F

Subalternative 3F consists of Segment x-06. It would replace Segment x-05 (Alternative 3) and would need to be combined with Subalternatives 3D and 3G, or 3J. Subalternative 3F and Segment x-05 contain trails, however, Segment x-05 crosses through an undeveloped landscape and that would potentially impact concerns to Indian tribes regarding new access and intrusion on pristine landscapes. As a result, Subalternative 3F appears to have a lesser impact to areas of concern to Indian tribes. While Subalternative 3F needs to be assessed in conjunction with its pairing with Subalternatives 3D and 3G, or 3J, none of these subalternatives have known issues of concern to Indian tribes.

Subalternative 3G

Subalternative 3G consists of Segment qn-01. No known issues of concern to Indian tribes are present on Segment qn-01. However, Subalternative 3G should be further assessed in conjunction with its pairing with Subalternatives 3D, 3E, 3F, 3H, and/or 3J.

Subalternative 3H

Subalternative 3H consists of Segment qn-02. No known issues of concern to Indian tribes are present on Segment qn-02, although one site located within the 1-mile analysis corridor of Segment qn-02 contains an intaglio. However, Subalternative 3H should be further assessed in conjunction with its pairing with Subalternatives 3D and 3L.

Subalternative 3J

Subalternative 3J consists of Segment i-05. No known issues of concern to Indian tribes are present on Segment i-05. However, Subalternative 3J should be further assessed in conjunction with its pairing with Subalternatives 3E, 3F, or 3G, and 3H.

Subalternative 3K

Trails may potentially exist on Subalternative 3K. There are no known issues of concern to Indian tribes on Segment cb-04 (Alternative 3). As a result, Subalternative 3K has a greater potential to impact areas of known concern to Indian tribes.

Subalternative 3L

Trails may potentially exist in Subalternative 3L and the segments of Alternative 3 it replaces. As a result, potential impacts to areas of concern to Indian tribes are comparable between Subalternative 3L and the segments it replaces. Potential impacts must be assessed in conjunction with its pairing with Subalternative 3H, although Subalternative 3H has no known areas of concern to Indian tribes.

Subalternative 3M

The crossing at the Colorado River in Segment p-15e parallels the existing DPV1 transmission line so the visual impact of the crossing would be less intrusive than that of Alternative 3. Subalternative 3M appears to have a similar potential to impact areas of known concern to Indian tribes.

4.6.7.5 Alternative 4: Public Lands Emphasis Route

Previously recorded cultural resources sites that contain prehistoric trail segments are potentially located on Segments d-01, x-04, x-06, x-09, p-10, p-13, p-14, cb-02, cb-06, and ca-09. The importance of trails to Indian tribes and the type and magnitude of effects would be the same as those described in the Proposed Action.

The Eagletail Petroglyph Site, potentially sensitive to indirect visual impacts, is located within the 5-mile indirect effects analysis area of Segment d-01 in the Eagletail Mountains. Depending on the viewshed and structure placement, indirect visual impacts to this property could range between negligible and moderate. If there is a measurable effect, it would be long-term.

With the exception of Segment x-04, the eastern portion of Alternative 4 crosses through areas largely disturbed by prior actions, including existing utilities such as transmission lines, the I-10 corridor, agricultural areas, and the CAP canal. Existing access could be utilized through much of this area, thus minimizing new access. The proximity of new transmission line structures near

existing utilities and transportation corridors would not eliminate the visual effect but may create additional intrusions.

Segment x-04 crosses through an area of largely undisturbed desert where new access and new visual intrusions would be introduced. As a result, potential impacts of tribal concerns could occur and would require a more detailed assessment by an indirect effects analysis in consideration of Project design details. If these effects are measurable beyond a small change, they would constitute a moderate to major long-term effect.

Alternative 4 includes segments near intaglios. The Ripley Intaglio Site is located within the 5-mile indirect effects analysis area of Segment p-15e. Another site containing an intaglio is within the 200-foot analysis corridor of Segment p-13. The importance of intaglios to Indian tribes and the type and magnitude of effects would be the same as those described in the Proposed Action.

Segments cb-02 and cb-04 cross through areas of largely undisturbed desert where new access and new visual intrusions would be introduced. As a result, potential impacts to concerns to Indian tribes regarding new access and intrusion on pristine landscapes would be moderate to major and long-term.

Segment p-15e crosses the Colorado River, which is of spiritual significance to Indian tribes. Visual considerations of the river crossing should be considered in an indirect effects analysis. Given that Segment p-15e parallels the existing DPV1 transmission line, visual effects may be minor to moderate, but would be long-term.

Resolution Measures

Resolution measures for concerns to Indian tribes would be the same as those described for the Proposed Action.

Subalternatives to Alternative 4

Subalternative 4A

There are no known issues of concern to Indian tribes on Subalternative 4A and is less likely to impact areas of known concern to Indian tribes.

Subalternative 4B

Subalternative 4B would have impacts to areas of concern to Indian tribes that are comparable between Subalternative 4B and the segment of Alternative 4 it replaces.

Subalternative 4C

Subalternative 4C has no known issues of concern to Indian tribes on Subalternative 4C. However, potential impacts must be further assessed in conjunction with pairing Subalternative 4C with Subalternatives 4D or 4J.

Subalternative 4D

Both segments of Subalternative 4D are projected to contain trails; in addition, Segment x-05 crosses through an undeveloped landscape that would potentially impact concerns to Indian

tribes regarding new access and intrusion on pristine landscapes. Subalternative 4D would be paired with Subalternatives 4C or 4J, which have no known concerns to Indian tribes. Because it crosses through an undeveloped landscape, Subalternative 4D would have a greater potential to impact areas of known concern to Indian tribes than the segments of Alternative 4 it would replace.

Subalternative 4E

Subalternative 4E is projected to contain trails and both Segments cb-01 and cb-02 (Alternative 4) cross through undeveloped landscapes that would potentially impact concerns to Indian tribes regarding new access and intrusion on pristine landscapes. As a result, potential impacts to areas of concern to Indian tribes are comparable between Subalternative 4E and the segments of Alternative 4 it replaces.

Subalternative 4F

Subalternative 4F is projected to contain trails. As a result, potential impacts to areas of concerns to Indian tribes are comparable between Subalternative 4F and the segments of Alternative 4 it replaces.

Subalternative 4G

Both segments of Subalternative 4G are projected to contain trails, as does Segment cb-02 of Alternative 4. However, Segment cb-02 and cb-04 of Alternative 4 cross through undeveloped landscapes that would potentially impact concerns to Indian tribes regarding new access and intrusion on pristine landscapes. As a result, Subalternative 4G would have a lesser potential to impact areas of known concern to Indian tribes than the segments of Alternative 4 it replaces.

Subalternative 4H

Subalternative 4H, which includes Segment i-07, is projected to contain trails, and the Limekiln Wash Intaglio is within the segment's 200-foot analysis corridor. As a result, Subalternative 4H has high potential to have a major to moderate effect on areas of concern to Indian tribes. These potential impacts must be further assessed in conjunction with the pairing of Subalternative 4H with Subalternatives 4G and 4K, which also are identified as including features of concern to Indian tribes.

Subalternative 4J

There are no known issues of concern to Indian tribes on Subalternative 4J. Any potential impacts must be further assessed in conjunction with the pairing of Subalternative 4J with Subalternative 4H, which has a high potential to have a moderate to major effect on areas of concern to Indian tribes.

Subalternative 4K

Subalternative 4K is projected to contain trails; as a result, Subalternative 4K demonstrates the potential to impact areas of known concern to Indian tribes. The potential effect to areas of concern to Indian tribes by Subalternative 4K must be further evaluated in conjunction with its

potential pairing with Subalternative 4H, which also has areas of concern to Indian tribes, and Subalternative 4N.

Subalternative 4L

Subalternative 4L contains trails and crosses the Colorado River in an agricultural landscape. Because the Colorado River is of spiritual significance to Indian tribes, the visual impacts of this crossing would need to be assessed. As a result, Subalternative 4L would have potential to impact areas of known concern to Indian tribes. The potential effect to areas of concern to Indian tribes by Subalternative 4L must be further evaluated in conjunction with its pairing with Subalternative 4M, although no areas of concern have been identified for Subalternative 4M.

Subalternative 4M

There are no known issues of concern to Indian tribes on Subalternative 4M or the segment of Alternative 4 it replaces. The potential effect to areas of concern to Indian tribes by Subalternative 4M must be further evaluated in conjunction with its pairing with Subalternative 4L.

Subalternative 4N

There are no known issues of concern to Indian tribes on Subalternative 4N. The potential effect to areas of concern to Indian tribes by Subalternative 4N must be further evaluated in conjunction with the concerns to Indian tribes identified for Subalternatives 4H, 4K, and 4M.

Subalternative 4P

Segments p-17 and p-18 of Subalternative 4P contain numerous issues of concern to Indian tribes. Human remains are known to exist along Segment p-17, and the area surrounding both segments is still utilized by modern Indian tribes. Additionally, the Mule Tank Discontiguous Rock Art District, is located within the 1-mile analysis corridor of Segment p-17 and would need to be evaluated for visual impacts. While trails are projected to occur along Alternative 4, the potential impact to areas of concern to Indian tribes is substantially greater on Subalternative 4P.

4.6.7.6 Agency Preferred Alternative

Within the Preferred Alternative, previously recorded cultural resources sites that contain prehistoric trail segments are located on Segments i-03, p-09, p-10, p-11, p-12, p-13, p-14, p-15e, p-16, x-15, x-16, and ca-09. The importance of trails to Indian tribes and the type and magnitude of effects would be the same as those described in Section 4.6.7.1. In addition, Segment x-05 crosses through an undeveloped landscape that would potentially impact concerns to Indian tribes regarding new access and intrusion on pristine landscapes.

The Preferred Alternative includes segments near intaglios. The Ripley Intaglio Site is located within the 5-mile indirect effects analysis area of Segment p-15e. Another site containing an intaglio (Limekiln Wash) is within the 200-foot analysis corridor of Segment p-13. The importance of intaglios to Indian tribes and the type and magnitude of effects would be the same as those described in the Proposed Action.

Segment p-15e crosses the Colorado River. The Colorado River is of spiritual importance to Indian tribes. Visual considerations of the river crossing should be considered in an indirect effects analysis. Given that Segment p-15e parallels the existing DPV1 transmission line, visual effects may be minor to moderate, but would be long-term.

Resolution Measures

Resolution measures for concerns to Indian tribes would be the same as those described for the Proposed Action.

4.6.8 Residual Impacts

The construction of a new transmission line on the landscape would have some residual effect on issues of concern to Indian tribes because of the permanence of the infrastructure for the life of the Project. In particular, the visual effects of the transmission line infrastructure would have a residual impact on the environment and continue to contribute to the erasing the ancestral footprint of the Indian tribes from the landscape. The residual effect would be more pronounced in locations where the transmission line does not parallel existing infrastructure. Visual aspects can also be addressed through Project design and resolution of adverse effects, but the changes to environmental conditions cannot be avoided.

Secondly, the access requirements for operations and maintenance leave the residual possibility of increasing recreational access into areas that may currently be visited infrequently. This increases the risk of inadvertent damage or vandalism to features significant to Indian tribes. Access concerns may be addressed in the PA or the ROD by including specific protocols to restrict access into sensitive areas by barrier placement or providing regular patrols to prevent damage or vandalism.

4.6.9 CDCA Plan Compliance

The same CMAs, BMPs, and APMs discussed under Section 4.5.9 above are applicable to areas of concern of Indian tribes. CMAs LUPA-CUL-4, LUPA-TRANS-CUL-1 through LUPA-TRANS-CUL-6, and DFA-VPL-CUL-1 through DFA-VPL-CUL-7 would apply to the Project (Appendix 2C). DFA-VPL-CULT-7 would also apply to the Project (Appendix 2C) and would be satisfied by information provided in Chapter 3 and Chapter 5, Sections 5.3 and 5.5.2, as well as Appendix 2D.

LUPA-CUL-4 is specific to the Project design to minimize impacts on cultural resources, including those places of elevated cultural or spiritual significance to Federally recognized tribes. Compliance with LUPA-CUL-4 would be satisfied with BMP-CULT-03, which states that the applicant would follow avoidance and stipulations outlined in the PA and appropriate HPTPs, and APM-CULT-01 and APM-CULT-02 (Appendix 2A, Section 2A.6), in which the applicant commits to following those stipulations.

LUPA-TRANS-CUL-1 and DFA-VPL-CUL-1 are specific to the responsibility of the applicant to pay for costs associated with the Project's cultural resources compliance. Compliance with LUPA-TRANS-CUL-1 and DFA-VPL-CUL-1 would be satisfied by APM-CULT-01 and APM-CULT-02 (Appendix 2A, Section 2A.6), in which the applicant commits to conducting a cultural

resources inventory of the direct and indirect APE, preparing HPTPs, and conducting cultural resource monitoring during Project construction, operations, maintenance, and decommissioning (as appropriate) to meet stipulations outlined in the PA (Appendix 2D).

LUPA-TRANS-CUL-2 and DFA-VPL-CUL-2 are specific to the applicant's payment of compensatory mitigation fees for cumulative and indirect effects to historic properties as a result of Project construction, operations, maintenance and decommissioning. Compliance with LUPA-TRANS-CULT-2 and DFA-VPL-CUL-2 would be satisfied by BMP-CULT-05 (Appendix 2A, Section 2A.6), which outlines the fee structure of the compensatory mitigation fee. The compensatory mitigation fee structure is also outlined in the stipulations contained within the PA (Appendix 2D).

LUPA-TRANS-CUL-3 and DFA-VPL-CUL-3 are specific to the applicant's payment of management fees as part of the compensatory mitigation fee contained in LUPA-TRANS-CUL-2 and DFA-VPL-CUL-2, respectively. Compliance with LUPA-TRANS-CUL-3 and DFA-VPL-CUL-3 would be satisfied by BMP-CULT-05 (Appendix 2A, Section 2A.6), which outlines the fee structure of the management fee as part of the compensatory mitigation fee. The management fee and compensatory mitigation fee structure is also outlined in the stipulations contained within the PA (Appendix 2D).

LUPA-TRANS-CUL-4 and DFA-VPL-CUL-4 are specific to the development of a cultural resources sensitivity analysis based on existing cultural resources data in the CDCA Plan area for consideration in Project planning and alternative selection. Compliance with LUPA-TRANS-CUL-4 and DFA-VPL-CUL-4 would be satisfied with BMP-CULT-06 (Appendix 2A, Section 2A.6). The BLM has prepared a sensitivity analysis (Kline 2017).

LUPA-TRANS-CUL-5 and DFA-VPL-CUL-5 are specific to the provision of a statistically significant cultural resources sample survey to be used in Project planning. Compliance with LUPA-TRANS-CUL-5 and DFA-VPL-CUL-5 would be satisfied by BMP-CULT-07 (Appendix 2A, Section 2A.6), which requires cultural resources Class III survey of Segments p-17 and p-18 to be conducted during the NEPA and CEQA analyses to meet the conditions of LUPA-TRANS-CUL-5 and DFA-VPL-CUL-5. The Class III survey of Segments p-17 and p-18 has been conducted.

LUPA-TRANS-CUL-6 and DFA-VPL-CUL-6 is specific to the applicant's justification to consider areas sensitive to cultural resources in NEPA and CEQA analyses. Compliance with LUPA-TRANS-CUL-6 and DFA-VPL-CUL-6 would be satisfied by BMP-CULT-08 (Appendix 2A, Section 2A.6), which requires such justification from the Project applicant.

DFA-VPL-CUL-7 speaks to completion of the Section 106 process. Compliance with DFA-VPL-CUL-7 is satisfied in Appendix 3, Section 3.6.1.1 and Appendix 5, Section 5.3. Appendix 3, Section 3.6.1.1 presents the regulatory requirement of the NHPA that includes Section 106. Appendix 5, Section 5.5.2 summarizes the process of drafting the PA. Appendix 5, Section 5.3 presents the efforts of consultation with Indian tribes. Appendix 2D is the PA for the Project.

4.6.10 Unavoidable Adverse Effects

Changes to the landscape and access changes would be an unavoidable adverse effect if concerns to Indian tribes cannot be avoided by Project design, APMs, BMPs, and resolution measures. The CRIT have expressed that the Project would result in adverse impacts on the CRIT that appreciably exceed those of the general population, as development impacts their ancestral ties to the land.

Prior to construction, continuing Section 106 consultation would be required to identify areas of elevated spiritual importance to Indian tribes to identify these areas for avoidance. Class III cultural resource surveys would be conducted to identify sites that need to be avoided or addressed by adverse effect resolution measures. Monitoring during construction would minimize the potential for inadvertent damage to intact subsurface deposits that could not be identified during Class III surveys. However, if excavation damages cultural features or disturbs human remains, the damage done would be unavoidable.

Areas of concern to Indian tribes that are sensitive to visual change would need to be assessed so that impacts could be minimized through analysis of the viewshed and structure placement. An unavoidable impact would occur to the extent that transmission line infrastructure can be seen from intaglios, petroglyphs, or other resources of elevated concern to Indian tribes. Project elements that introduce intrusion to pristine landscapes and the crossing of the Colorado River would also constitute an unavoidable adverse effect to Indian tribes.

Unavoidable adverse effects may also occur if the Project changes existing access to culturally important areas to tribes, or if new access results in damage to resources that have previously been largely inaccessible.

4.6.11 Cumulative Effects

The Project Area is crossed by numerous utility and transportation corridors, including the I-10 corridor, SR 78, US 95, SR 95, the DPV1 transmission line, numerous local transmission and distribution lines, solar facilities, and the El Paso natural gas pipeline, as well as local roads. The landscape has been further altered by the development of the Town of Quartzsite and the City of Blythe, and the expansion of historic and modern agriculture. Future plans for the area include the development of additional large solar facilities in the western portion of the Project Area (Appendix 3, Table 3.12-2).

Various tribes have been consulted and informed of the Project. Tribes have expressed interest and concern about potential effects to the native landscape, the viewshed, trails and elements of Native infrastructure across the desert, cultural resource sites, and areas of elevated spiritual importance that are within their traditional territories and may have been inhabited or used by their ancestors. Noted concerns include the transmission lines and solar facilities within the viewshed. Past actions affecting concerns of Indian tribes include vandalism and looting of prehistoric sites, unauthorized excavation of prehistoric sites, recreational use that impacts cultural resources, roadway and infrastructure construction, and urban and rural developments. Past, present, and reasonably foreseeable future development (Appendix 3, Tables 3.12-1 and 3.12-2; and Appendix 7, Figure 3.12-1,) would contribute to cumulative impacts to concerns of Indian tribes in the region.

All of this development has had the effect of substantially altering the native landscape of affiliated Indian tribes. Large linear projects, such as DPV1 and the construction of I-10 and the CAP canal have had the effect of altering the viewshed of the native landscape and disrupting the trails and elements of traditional native infrastructure across the desert. In particular, the DPV1 transmission corridor crosses the viewshed of the Mule Tank Discontiguous Rock Art District. Additional structures along Segments p-17 and p-18 in the line of site of this resource would continue to cumulatively affect the viewshed. The increase in visual degradation, combined with all previous disturbances and developments, may result in a moderate to major cumulative impact on the Mule Tank Discontiguous Rock Art District.

Future projects in the western portion of the Project Area include large solar facilities (Blythe Mesa Solar, Desert Quartzite Solar, and Crimson Solar Projects) and the Blythe Energy Power Plant and Sonoran Energy Project, all of which cumulatively affect issues of concerns to Indian tribes, including potential visual impacts to the Mule Mountains, an area of importance to the tribes. These cumulative effects are manifest in terms of the loss of pristine environment, erasure of the tribal footprint on the landscape, vandalism of archaeological sites due to increased OHV traffic and visitation, potential restriction to areas of elevated spiritual importance for Indian tribal ceremonies, and the disruption of Native infrastructure. Cumulative impacts to cultural resource sites would be the same as those described in Section 4.5.11. Impacts to prehistoric cultural resources that convey the significance of the landscape, including those not eligible for the NRHP and historic properties mitigated through data recovery, cumulatively impact the cultural landscape and linkage. The development of the Project further contributes to these cumulative effects. Minimization of cumulative effects of this Project would be addressed through implementation of the PA which directs avoidance of sites and minimization of the Project footprint before any consideration of mitigation of sites and data recovery.

4.6.12 Irreversible and Irretrievable Commitment of Resources

Given the strong ancestral ties of Indian communities to the landscape of the Project, construction related to the Project that would measurably affect existing tribal access into spiritual areas; enhance public access into previously remote areas and increase the risk of resource damage; result in the loss or diminishment of the Indian cultural landscapes, TCPs, and pristine areas; or result in the disturbance of human remains would constitute an irreversible and irretrievable impact to Indian values. Impacts to cultural resources, including those not eligible for the NRHP, as well as sites mitigated, represent an irreversible and irretrievable commitment of those resources. However, provisions of the PA (Appendix 2D) requiring detailed ethnographic and ethnobotanical studies, and cultural landscape overviews, would be a benefit (positive impact) to the tribes by compiling their traditional use of the landscape into a reference for future generations.

4.6.13 Relationship of Short-term Uses and Long-term Productivity

The short-term use of the ROW during construction of the Project could result in measurable effects to areas of tribal concern by altering existing tribal access into spiritual areas; enhancing public access into previously remote areas; the loss or diminishment of the tribal cultural landscapes, TCPs, and pristine areas; or the disturbance of human remains. If the short-term use

of the ROW results in the measurable alteration of these areas of concern to Indian tribes, the long-term potential of their qualities would be reduced or eliminated.

4.7 LAND USE

4.7.1 Introduction

Potential impacts to land use in this section are discussed in terms of land ownership, compliance with management of lands, and land use authorizations and ROWs (including lands and realty actions).

4.7.2 Methods for Analysis

4.7.2.1 Analysis Area

The analysis area for land use includes a 4,000-foot corridor encompassing the Project. Because there is some flexibility in final siting of the temporary use areas (construction), Project structures, and SCS, this analysis area includes all potential disturbance areas along with areas where indirect effects could occur.

4.7.2.2 Assumptions

No assumptions were made when performing the analysis of Project impacts on land use.

4.7.2.3 Environmental Effect Indicators, Magnitude, and Duration

Impacts to land use described in this section would occur if the Project would:

- Conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the Project (including but not limited to the general plan, specific plan, or zoning ordinance) adopted for the purpose of avoiding or mitigating an environmental effect;
- Conflict with existing utility ROWs;
- Conflict with existing or authorized land uses, specifically where the Project would create a direct long-term impact;
- Physical conflict with existing residential, commercial, industrial, military, or agricultural uses (i.e., displacement of homes, businesses, solar energy facilities, center-pivot irrigation agriculture fields);
- Conflict with planned land uses, specifically residential subdivisions or other sensitive land uses at the final plat approval stage;
- Existing land uses not being restored to allow for pre-construction uses or activities (for areas disturbed and not containing permanent structures);
- Significant nuisance impacts to existing land uses; or
- Interference with military operations at the YPG.

Impacts to land use may be negligible, minor, moderate, or major, and may have durations that are qualified as temporary, short term, or long term (Table 4-8).

Table 4-8 Land Use Impact Magnitude and Duration Definitions

ATTRIBUTE OF IMPACT		DESCRIPTION SPECIFIC TO LAND USE
Magnitude	Negligible	Very little effect on land uses such that the effect would not be perceptible to a human observer or user. Action would be in compliance with land management plans and zoning and would not conflict with existing ROWs or other authorized uses. Less than 5 percent of a land area associated with a particular use would be affected.
	Minor	Action would be in compliance with land management plans and zoning and would not conflict with existing ROWs or other authorized uses. Less than 10 percent of a land area associated with a particular use would be affected.
Magnitude	Moderate	Action may or may not be in compliance with land management plans and zoning and may or may not conflict with existing ROWs or other authorized uses. Less than 25 percent of a land area associated with a particular use would be affected.
	Major	Action would not be in compliance with land management plans and zoning or would conflict with existing ROWs or other authorized uses. More than 25 percent of a land area associated with a particular use would be affected.
Duration	Temporary	Limited to active construction or decommissioning.
	Short-term	10 years or less.
	Long-term	More than 10 years.

4.7.3 No Action Alternative

Under the No Action Alternative, no ROW would be granted for the Project and the transmission line, SCS, and ancillary facilities would not be constructed. The BLM-administered land on which the Project is proposed would continue to be managed as it currently exists. Lands in the analysis area would remain as is, which is primarily undeveloped desert land available for grazing, subject to existing closures or restrictions. Current land uses in the analysis area described in Section 3.7 would continue under the No Action Alternative. There would be no changes that would alter existing land uses beyond current conditions.

4.7.4 Construction of Action Alternative Segments

4.7.4.1 Direct and Indirect Effects Common to All Action Alternatives

Construction

BLM-authorized land uses such as roadways, transmission lines, utilities, and pipelines; oil, gas, solar energy, and mining leases; and other permits, leases, and easements (HDR 2017d); may be temporarily affected by changes in access, but these uses would not be precluded by construction of the Project. For non-BLM lands, ROWs would be obtained as easements or leases, as appropriate. Encroachment permits would be obtained for the crossing of Federal, state, and county roadways, as applicable.

4.7.4.2 Direct and Indirect Segment-specific Effects

Segment-specific discussions that follow are broken out by Proposed Action and Action Alternatives, and are presented for:

- Those segments that were found not to meet the criteria of an appropriate use on the Kofa NWR and would not be compatible with the goals of the refuge;
- Segments that would not be within a designated utility corridor; and,
- Segments that would conflict with a land use plan.

An amendment to the CDCA Plan would be required for all California segments to be in compliance with CMA LUPA-BIO-PLANT-2 (Appendix 2C). Segments that would include a land use plan amendment to address issues with visual resources management are described in Section 4.11.8.

Proposed Action Segments Segment p-06 would cross 24 miles of the Kofa NWR; however, the Project was not found to be an appropriate use within the goals of the refuge and therefore approval to cross the Kofa NWR would not be granted to DCRT (Appendix 1A). The authorization of a ROW within the Kofa NWR requires a “Finding of Appropriateness of a Refuge Use” to determine whether the use meets the criteria for an appropriate use. The Kofa NWR was established in 1939 “for the conservation and development of natural wildlife resources, with an emphasis on conservation of desert bighorn sheep” (USFWS 2017). Management objectives include to “maintain and enhance the natural diversity of flora and fauna…” and to “recover population and maximize genetic diversity of desert bighorn sheep; reintroduce Sonoran pronghorn and establish a viable population; manage fire; manage wildlife waters; and prevent establishment of invasive species” (USFWS 2017). Upon review of the application for the ROW for this segment, the USFWS determined that the Project does not meet the criteria for an appropriate use because it “does not promote wildlife-dependent recreation and does not support the purpose for which the refuge was established and the mission of the NWR System” (USFWS 2017).

The USFWS (2017) found that the construction and maintenance of the Project on the Kofa NWR:

- "May cause habitat fragmentation, degrade habitat quality through introduction of contaminants, disrupt wildlife movement corridors, alter hydrology, facilitate introduction of invasive species, and disturb wildlife";
- "Would conflict with the legal requirements to maintain biological integrity, diversity, and environmental health";
- "Will create additional traffic on the east-west road across the northern part of Kofa NWR…" that "will increase the likelihood of off-road vehicular incursions";
- "Would increase fire danger from the power line directly";
- Would be "damaging and detrimental to the quality of wildlife-dependent recreation including hunting, wildlife viewing, wildlife photography, and interpretation"; and that
- The cumulative and incremental impacts of the new proposed ROW in addition to the existing power line and pipeline ROWs may pose the greatest impact to the refuge (USFWS 2017).

The Project was found not to be an appropriate use of the refuge; therefore, this would be a major impact on land use if the Project were approved.

Alternative Segments

- Segments x-01, x-02b, x-03 and x-04 cross BLM-administered land that is not within a designated utility corridor.
- Segments qn-02, x-05, and x-06, and a portion of the BLM-administered land in Segments qs-01 and qs-02, would not be within a designated utility corridor.
- None of the BLM-administered land in Segments cb-01, cb-02, cb-04, cb-05, and cb-06 would be within a designated utility corridor.
- A portion of Segment i-03 would fall approximately 0.2-mile outside of a designated corridor
- Alternative Segments x-01 through x-04, Segments x-05 and x-06, and Segments cb-01, cb-02, cb-04, cb-05, and cb-06, would not be consistent with the La Paz County Zoning Plan.
- Alternative Segment qn-02 crosses a Tier III growth area, which is identified for growth beyond 2035. This would be a minor, long-term impact on land use and this segment would not be in compliance with the Town of Quartzsite General Plan.

4.7.5 Operations, Maintenance, and Decommissioning

The presence of the Project during operations would have effects on land use plan compliance and land use authorizations and rights. The presence of the Project would also have negligible to minor long-term effects on residential, agricultural, military, and industrial uses. Maintenance

activities would not affect land use plan compliance or land uses. After decommissioning, previous land uses could be restored.

4.7.5.1 Land Use Plan Compliance

The analysis area is located within 14 Federal, state, and local planning areas; the Project would be in compliance with these plans except for the Yuma RMP, Lake Havasu RMP, CDCA Plan (LUPA-BIO-PLANT-2), La Paz County Zoning Plan, and Town of Quartzsite General Plan (Appendix 4, Table 4.7-1).

Land Use Plan Amendments

Yuma RMP

The acreage of BLM-administered land that would be required for the Project outside of a designated utility corridor is 2,122 acres in aggregate (Appendix 4, Table 4.7-2). This would affect less than 0.1 percent of the 1.3 million acres of lands managed under the Yuma RMP. The impacts of the RMP amendment to land use is that these additional lands would be open to ROW development.

CDCA Plan

None of the Proposed Action or Action Alternative segments in California would be in compliance with CMA LUPA-BIO-PLANT-2 (Section 4.4.9). The amendment to the CDCA Plan to bring the Project into compliance with CMA LUPA-BIO-PLANT-2 would not result in any effects on current land uses in the study area. This amendment would not conflict with any other management direction in the CDCA Plan.

Designated Utility Corridors, Land Use Authorizations and Rights-of-Way

The Project would be authorized on BLM-managed land with a ROW grant containing terms and conditions the holder must comply with to prevent undue and unnecessary degradation, including that the Project will not conflict with any valid any existing authorizations. The terms and conditions would come from DRECP's CMAs (Appendix 2C), applicable Interagency Operating Procedures within the WWEC corridor 30-52, ROW regulation and policy, APMs, and BMPs, as necessary. Further, the designation of the utility corridor is for the use proposed. Thus, there would not be significant impacts to designated utility corridors.

4.7.6 Mitigation Measures

There are no MMs identified for land use for any of the specific segments and thus, no MMs have been identified for any of the full-route alternatives or subalternatives described below. The applicant has committed to APMs, and the BLM developed required BMPs, that would further reduce impacts to land use.

4.7.7 Construction of Full Route Alternative and Subalternative Effects

4.7.7.1 Proposed Action

Segment p-06 was determined to not be an appropriate use on the Kofa NWR (USFWS 2017); therefore, the USFWS would not issue approval for a ROW for Segment p-06.

No amendment to the Yuma RMP would be necessary to grant the Project ROW under the Proposed Action, as all proposed segments would be within designated corridors. The Proposed Action segments in California would not be in compliance with the CDCA Plan (CMA LUPA-BIO-PLANT-2); therefore, an amendment to the CDCA Plan would be necessary for the Project to be in compliance with CMA LUPA-BIO-PLANT-2 (Appendix 4, Table 4.7-1).

4.7.7.2 Alternative 1: I-10 Route

Alternative 1 would avoid the Kofa NWR but would not be consistent with the Town of Quartzsite General Plan where the alternative passes through the Dome Rock 14-Day Camping Area within the Quartzsite planning area, and portions of it would not be consistent with the La Paz County Zoning Plan for segments outside existing corridors (Appendix 4, Table 4.7-1). Overall, besides avoiding the Kofa NWR, Alternative 1 would have greater impacts to land use (as described in Section 4.7.4) than the Proposed Action.

Unlike the Proposed Action, a Yuma RMP amendment would be necessary prior to granting the project ROW under Alternative 1, because three alternative segments would not be within a designated corridor. As under the Proposed Action, the Proposed Action and Action Alternative segments in California would not be in compliance with the CDCA Plan (CMA LUPA-BIO-PLANT-2); therefore, an amendment to the CDCA Plan would be necessary for the Project to be in compliance with CMA LUPA-BIO-PLANT-2 (Appendix 4, Table 4.7-1).

Subalternatives to Alternative 1 (1A through 1E)

One additional segment than under Alternative 1 would require a Yuma RMP amendment for a ROW under Subalternatives 1A and 1B.

4.7.7.3 Alternative 2: BLM Utility Corridor Route

Alternative 2 would avoid the Kofa NWR but would not be consistent with the La Paz County Zoning Plan where the alternative would not occur along the DPV1 or I-10 in the La Paz County planning area. Alternative 2 would not be consistent with the Town of Quartzsite General Plan where the alternative passes through the La Posa LTVA and Dome Rock 14-Day Camping Area within the Quartzsite planning area, and portions of it would not be consistent with the La Paz County Zoning Plan for segments outside existing corridors (Appendix 4, Table 4.7-1). Overall, besides avoiding the Kofa NWR Alternative 2 would have greater impacts to land use (as described in Section 4.7.4) than the Proposed Action.

Unlike the Proposed Action, a Yuma RMP amendment would be necessary to grant the ROW under Alternative 2, because two alternative segments would not be within a designated corridor. As under the Proposed Action, the Proposed and Alternative Segments in California would not be in compliance with the CDCA Plan (CMA LUPA-BIO-PLANT-2); therefore, an amendment

to the CDCA Plan would be necessary for the Project to be in compliance with CMA LUPA-BIO-PLANT-2 (Appendix 4, Table 4.7-1).

Subalternatives to Alternative 2 (2A through 2E)

Under Subalternative 2A, the route would pass through an area classified as a low known sensitivity area which indicates it does not undermine proposed allocations. Subalternative 2A would also include more NRCS-classified farmland in California. Under Subalternatives 2A and 2B, one additional segment than under Alternative 2 would require an RMP amendment to grant a ROW and under Subalternative 2C three additional segments than under Alternative 2 would require an RMP amendment prior to granting the project ROW. The impacts under Subalternatives 2D and 2E would not differ from Alternative 2.

4.7.7.4 Alternative 3: Avoidance Route

Alternative 3 would avoid the Kofa NWR but would not be consistent with the La Paz County Zoning Plan where the alternative would not occur along the DPV1 or I-10 in the La Paz County planning area (Appendix 4, Table 4.7-1). Overall, besides avoiding the Kofa NWR Alternative 3 would have greater impacts to land use (as described in Section 4.7.4) than the Proposed Action.

Unlike the Proposed Action, a Yuma RMP amendment would be necessary to grant the ROW under Alternative 3, because five alternative segments would not be within a designated corridor. As under the Proposed Action, the Proposed and Alternative Segments in California would not be in compliance with the CDCA Plan (CMA LUPA-BIO-PLANT-2); therefore, an amendment to the CDCA Plan would be necessary for the Project to be in compliance with CMA LUPA-BIO-PLANT-2 (Appendix 4, Table 4.7-1).

Subalternatives to Alternative 3 (3A through 3M)

Alternative 3 subalternatives 3A and 3H would require an additional Yuma RMP amendment. Subalternative 3E would not be consistent with the Town of Quartzsite General Plan.

4.7.7.5 Alternative 4: Public Lands Emphasis Route

Alternative 4 would not cross the Kofa NWR but would not be consistent with the La Paz County Zoning Plan where the alternative would not occur along the DPV1 or I-10 in the La Paz County planning area (Appendix 4, Table 4.7-1). Overall, besides avoiding the Kofa NWR Alternative 4 would have greater impacts to land use (as described in Section 4.7.4) than the Proposed Action.

Unlike the Proposed Action, a Yuma RMP amendment would be necessary to grant the ROW under Alternative 4, because five alternative segments would not be within a designated corridor. As under the Proposed Action, the Proposed Action and Action Alternative segments in California would not be in compliance with the CDCA Plan (CMA LUPA-BIO-PLANT-2); therefore, an amendment to the CDCA Plan would be necessary for the Project to be in compliance with CMA LUPA-BIO-PLANT-2 (Appendix 4, Table 4.7-1).

Subalternatives to Alternative 4 (4A through 4P)

One additional segment than under Alternative 4 would require an RMP amendment prior to granting the project ROW under Subalternatives 4B and 4D.

4.7.7.6 Agency Preferred Alternative

The Preferred Alternative would avoid the Kofa NWR. The Preferred Alternative would not be consistent with the La Paz County Zoning Plan (Appendix 4, Table 4.7-1) where the alternative would not occur along the DPV1 or I-10 in the La Paz County planning area. However, La Paz County and the Town of Quartzite have expressed support for the Preferred Alternative in their written comments. The Preferred Alternative would affect more solar energy facilities than the Proposed Action. Overall, the Preferred Alternative would have less impacts to land use (as described in Sections 4.7.4.1 and 4.7.5) than the Proposed Action.

Unlike the Proposed Action, a Yuma RMP amendment would be necessary to grant the ROW under the Preferred Alternative, because Segment x-05 and a portion of Segment i-03 would not be within a designated corridor. As under the Proposed Action, the portion of the Preferred Alternative in California would not be in compliance with the CDCA Plan (CMA LUPA-BIO-PLANT-2); therefore, an amendment to the CDCA Plan would be necessary for the Project to be in compliance with CMA LUPA-BIO-PLANT-2 (Appendix 4, Table 4.7-1).

4.7.8 Residual Impacts

There would not be any mitigation for land use; therefore, there would not be any residual impacts.

4.7.9 CDCA Plan Compliance

CMA LUPA-LANDS-8 would apply to the Project; all new transmission lines of 161kV or greater must be located in a designated utility corridor unless it would be located within a DFA (Appendix 2C). Because all Proposed Action and Action Alternative segments would be located within a DFA (Appendix 7, Figure 3.2-2c), the Project would be in compliance with this CMA.

Except for CMA LUPA-BIO-PLANT-2, the Project would be in compliance with all of the CMAs in the CDCA Plan that apply to the Project (Appendix 2C). CDCA Plan compliance with CMA LUPA-BIO-PLANT-2 would be achieved through BMP-BIO-31 (Section 4.4.9; Appendix 2A, Section 2A.4).

4.7.10 Unavoidable Adverse Effects

There would not be any moderate or major unavoidable adverse effects associated with the Project.

4.7.11 Cumulative Effects

The past and present land uses in the CEA (Table 3.12-1) have had a direct effect on the conversion of lands from one use to another (i.e., undeveloped land that is converted to a power plant, transmission line ROW, solar energy facility, etc.).

Reasonably foreseeable actions in the CEA that, when combined with the Project, may have cumulative land use effects include solar energy facilities, a power plant, and mines (Appendix 4, Table 4.7-3). The overall cumulative impact of these developments is generally consistent with the long-term management planning tools such as BLM RMPs and numerous state, county, and municipal-level long-range planning documents.

The Project would have moderate, short-term cumulative impacts to the management of lands and future or planned land uses since the Project would limit non-compatible future or planned land uses such as other transmission lines, pipelines, or renewable energy development from being located within the same footprint as the Project. This would also be true for other similar projects provided in Appendix 3, Table 3.12-2 since they would also limit other projects from being located in the same footprint. As development occurs, the rural environment would become increasingly more residential, commercial, and industrial; however, the limited availability of water would limit expansive future residential, commercial, and water-dependent industrial development, as it has in the past.

In general, an increase in development would contribute to changes in land use and the modification of the character of the CEA. As development occurs, the rural environment would become increasingly more residential, commercial, and industrial. If populations increase as a result of development, the use of designated recreation areas and dispersed recreation within the CEA also could increase. The cumulative effects of past, present, and reasonably foreseeable projects to land use would be minor to moderate, although this Project would contribute only negligibly to this overall cumulative effect.

4.7.12 Irreversible and Irretrievable Commitments of Resources

There would not be any irreversible or irretrievable commitments related to land use.

4.7.13 Relationship of Short-term Uses and Long-term Productivity

The short-term changes to land use would not affect the long-term productivity related to existing and future land uses.

4.8 RECREATION

4.8.1 Introduction

Effects to recreation resources are discussed in this section in terms of adjacent recreation areas and OHV use. Impacts would be minor and similar for each alternative.

4.8.2 Methods for Analysis

4.8.2.1 Analysis Area

The analysis area for recreation would include all potential disturbance areas along with all portions of the study area where indirect effects could occur.

4.8.2.2 Assumptions

The following assumption was made when performing the analysis of Project effects on recreation:

- OHV routes in Johnson Canyon would need to be closed for the duration of Project construction except for Alternative 1.

4.8.2.3 Environmental Effect Indicators, Magnitude, and Duration

Effects to recreational resources described in this section would occur as a result of:

- Project-related changes that alter or otherwise physically affect established, designated, or planned recreation areas, resources, experiences, or activities;
- Increased demand for recreation activities due to the influx of people during construction and operation that would exceed capacity for that activity in a given area such as a campground, wilderness, or hunting area and/or trails;
- Conflicts with applicable Federal, state, or local recreation policies;
- Conflicts with established recreational areas;
- Decreased accessibility to areas established, designated, or planned for recreation;
- An activity that would result in an effect to existing recreational OHV designations/routes, which results in the activity being incompatible with OHV designations (open, closed, closed except for administrative use, etc.) and/or OHV routes;
- Prevents long-term recreational use or use during peak season or impedes or discourages existing recreational activities; or
- Physically degrade existing recreation resources.

4.8.3 No Action Alternative

Under the No Action Alternative, no ROW would be granted for the Project and the transmission line, SCS, and ancillary facilities would not be constructed. The BLM-administered land on which the Project is proposed would continue to be managed as it currently exists. Lands in the analysis area would remain as is, which is primarily undeveloped desert land available for dispersed and developed recreation, subject to existing closures or restrictions. Current recreational use (recreation opportunities and activities, recreation settings, desired recreation experiences, and adjacent recreation areas) in the analysis area described in Section 3.8 would continue under the No Action Alternative. There would be no changes that would alter existing

recreation opportunities and activities, settings, desired experiences, or adjacent recreation areas in the analysis area beyond current conditions and recreation trends.

4.8.4 Construction of Action Alternative Segments

4.8.4.1 Direct and Indirect Effects Common to All Action Alternatives

Construction

Potential construction related effects would be localized, short-term, and negligible to moderate. Construction of the Project would not permanently preclude the use of or access to any existing recreation opportunities or activities, but some temporary effects to these resources would occur during the construction phases of the Project. Recreation use would be temporarily affected as construction noises, visual disturbances, vehicle and equipment travel, and/or the presence of other humans within approximately 1 mile of a recreation area or opportunity could detract from these recreation opportunities and activities. Recreation users that seek opportunities for solitude commonly seek areas where they would be less likely to see other humans. Access to developed and dispersed recreation areas may be temporarily precluded, restricted, or more cumbersome at locations with active construction.

As described in Appendix 2A, temporary signs directing vehicles to alternative park access and parking would be posted in the event construction temporarily obstructs parking areas near trailheads (BMP-REC-01, BMP-REC-02; Appendix 2A, Section 2A.7). Temporary signs advising recreation users of construction activities and directing them to alternative recreation routes, as appropriate, would be posted on both sides of all recreation route intersections or as determined through DCRT coordination with the respective jurisdictional agencies. This may cause adjacent recreation areas unaffected by the construction, whether developed and/or available for dispersed recreation, to become temporarily more crowded while construction in the area is active. For example, those wishing to camp in an area affected by the construction would be more likely to concentrate in campsites unaffected by construction, causing those areas to be more crowded than they might normally be. This would be a short-term, moderate effect on other recreation areas that due to its short duration would not lead to an accelerated deterioration of these areas.

A schedule of construction activities would be posted near entrances to recreational areas as well as the Project website. Signs would be installed near access roads notifying the public of construction activities in the area, as well as to the eventual presence of permanent Project facilities (BMP-REC-01, BMP-REC-02; Appendix 2A, Section 2A.7).

OHV users may be temporarily affected by construction noises, visual disturbances, vehicle and equipment travel, and/or the presence of construction workers. Access to designated OHV routes may be temporarily precluded, restricted, or more cumbersome during active construction. As described for Recreation Opportunities/Activities above, BMP-REC-01 and BMP-REC-02 (Appendix 2A, Section 2A.7) would inform OHV riders of alternative parking areas and OHV routes.

The recreation experience may be affected for some OHV users, in particular those that were familiar with the area prior to construction of the Project. Some unauthorized OHV use could

occur during construction when workers are not present (such as on weekends or in between construction phases).

4.8.4.2 Direct and Indirect Segment-specific Effects

Segment-specific discussions that follow are broken out by Proposed Action and Action Alternatives, and are presented for:

- Segments that could cause temporary disruption to access to recreation areas during construction;
- Segments that could impact the recreation experience for users of recreation areas;
- Segments that would affect access to OHV routes;
- Segments that could affect the recreation experience of OHV users; and
- Segments that could pose a safety hazard to OHV users.

Proposed Action Segments

- Segment p-01 would affect recreation access to the Big Horn Mountains WA, and by extension, the Hummingbird Springs WA.
- Segments p-03 through p-06 would affect recreation access in the eastern portion of the Project Area on the Yuma East Undeveloped, La Posa Destination, and Plomosa SRMAs.
- Segment p-06 would affect recreation access on the Kofa NWR.
- Segment p-06 has substantially more OHV routes located within 0.5-mile of the proposed route than the other Proposed Action segments in the eastern portion of the Project Area, and the most proposed Arizona Peace Trail. Therefore, this segment would affect the recreation experience on more OHV routes than the other Proposed Action segments in the eastern portion of the Project Area and would also have the potential for the most increase in illegal OHV use. The ROW would include none or very little OHV routes or the proposed Arizona Peace Trail for Segments p-01 or p-02.
- Segment p-07 has substantially more OHV routes located within 0.5-mile of the proposed route in the Quartzsite area than the other Proposed Action segments and therefore would affect the recreation experience on more OHV routes than the other Proposed Action segments near Quartzsite. It would also have the potential for the most increase in illegal OHV use.
- Segments p-07 through p-09 and p-12 would require self-supporting structures to reduce the safety hazards to OHV users (MM-REC-02).
- Segment p-09 has substantially more OHV routes located within 0.5-mile of the proposed route in the Copper Bottom Pass area than the other Proposed Action segments, but Segment p-13 has substantially more proposed Arizona Peace Trail within 0.5-mile of the proposed route in the Quartzsite Zone than the other proposed segments. Proposed Action Segments p-09 and p-13 would affect the recreation experience on more OHV routes than the other Proposed Action segments in the Quartzsite Zone, and would also have the

potential for the most increase in illegal OHV use. Proposed Action Segment p-14 would include very few OHV routes.

- Segment p-17 would affect relatively more classified OHV routes in the area near the Colorado River and in California of the Proposed Segments. Therefore, this segment would affect the recreation experience on more OHV routes than the other Proposed Segments in this area and would also have the potential for the most increase in illegal OHV use.
- Segments p-09, p-10, and p-11 would include helicopter fly yards during construction which could decrease the recreation experience for some users of the La Posa and Colorado River SRMAs and OHV users in the vicinity of the fly yards.
- The construction of segments associated with the crossing of the Colorado River would temporarily inhibit boating activity during wire stringing and pulling. These restrictions would be temporary in nature and boat traffic would be allowed to resume after each wire stringing activity was completed.

Alternative Segments

- With the exception of Segments x-01, i-01, and i-02, all other Action Alternative segments in the eastern portion of the Project Area would affect recreation access to the Yuma East Undeveloped, La Posa Destination, and Plomosa SRMAs.
- Segments qn-02, qs-01, qs-02, and x-07 would have substantially more effects to recreation areas near Quartzsite than the other Action Alternative segments. All of these segments would cross both the La Posa LTVA and Dome Rock Camping Areas.
- Segment i-06 would bisect the Dome Rock Camping Area and Segment i-08s would cross the Ehrenberg Sandbowl OHV Area; therefore, these segments would have substantially more effect on recreation areas in the Copper Bottom area than the other Action Alternative segments.
- Segment in-01 has the greatest amount of OHV routes located with 0.5-mile of the Action Alternative segments in the eastern portion of the Project Area. Segments i-03 and x-04 have the largest portion of proposed Arizona Peace Trail. Therefore, these Action Alternative segments would affect the recreation experience on more OHV routes than the other Action Alternative segments in the eastern portion of the Project Area and would also have the potential for the most increase in illegal OHV use. The ROW would include none or very little OHV routes or proposed Arizona Peace Trail for Segments i-01 and x-02a.
- Segment qn-02 has the greatest amount of OHV routes located with 0.5-mile of the Action Alternative segments near Quartzsite. Alternative Segments qs-01 and qs-02 have the largest portion of proposed Arizona Peace Trail. Therefore, these segments would affect the recreation experience on more OHV routes than the other Action Alternative segments near Quartzsite and would also have the potential for the most increase in illegal OHV use.
- Segments i-06 and i-07 have substantially more OHV routes located within 0.5-mile of the Project than the other Action Alternative segments in the Copper Bottom area.

Segment cb-02 has the largest portion of proposed Arizona Peace Trail of the Action Alternative segments. Therefore, these segments would affect the recreation experience on more OHV routes than the other Action Alternative segments in the Copper Bottom area and would also have the potential for the most increase in illegal OHV use.

- Segment cb-02 includes Johnson Canyon; in addition to having high OHV recreational value in the Copper Bottom area, the proposed Arizona Peace Trail and other OHV routes along this segment would be closed temporarily during construction.
- Segments x-15 and x-16 would affect relatively more classified OHV route in the area near the Colorado River and in California of the Alternative Segments. Therefore, these segments would affect the recreation experience on more OHV routes than the other Alternative Segments in this area and would also have the potential for the most increase in illegal OHV use.
- Segments i-04, i-06, qn-02, qs-02, cb-05, cb-06, and cb-07 would require self-supporting structures to reduce the safety hazards to OHV users (MM-REC-02).
- A helicopter fly yard for Segments cb-01/cb-02 could decrease the recreation experience for some users of the La Posa and Colorado River SRMAs and OHV users in the vicinity of the fly yard.
- The construction of segments associated with the crossing of the Colorado River would temporarily inhibit boating activity during wire stringing and pulling. These restrictions would be temporary in nature and boat traffic would be allowed to resume after each wire stringing activity was completed.

4.8.5 Operations, Maintenance, and Decommissioning

The ROW would generally be open to recreation where on public land unless specifically prohibited by the BLM or other regulatory authority (e.g., OHV use). As described in Appendix 2A, Section 2A.7, plastic mesh or paint would be used to mark guy wires in areas used for recreation. Permanent high visibility guy markers would be installed during construction (BMP-REC-03; Appendix 2A, Section 2A.7).

The presence of a transmission line after construction would not be likely to eliminate a recreational use or access to recreation but the quality of, or experience associated with, a recreational use may be altered. In particular, the effect of the Project on segments not already occupied by the DPV1 or other transmission lines would be greater than on segments within existing transmission ROWs. For example, OHV riding in Johnson Canyon is a popular recreation pursuit because its pristine qualities and technical challenges that are unique to the area; OHV users in this area may experience more impacts to their recreational experience than in other areas.

Depending on the perception of the decreased quality to an individual – and the extent of familiarity with the area pre- and post-Project – this effect would be negligible to moderate and long-term. Effects to the recreation experience related to views of the Project structures are provided in Section 4.11.

Maintenance activities could result in disturbance to recreationists and would be generally limited to vehicular traffic associated with routine inspections of the line and traffic and noise resulting from scheduled or unscheduled maintenance as well as periodic trimming and removal of vegetation. Maintenance or repair activities would occur intermittently over the life of the Project; however, the effects would be temporary as maintenance would occur only once in many months to years and the effects would cease upon completion of the maintenance or repair activity.

In areas not previously occupied by a transmission line, there would be an increased safety risk to OHV users of collision with guy wires and other Project structures. This would be a minor to moderate effect on the safety risk to OHV users. The operation of the Project in the presence of the current DPV1 or other transmission lines may increase the risk for some users (by increasing the number of guy lines and structures) or decrease the risk for some users (because users are already aware of the safety risk from these features). Using self-supporting lattice structures or monopole structures would mitigate this risk to negligible to minor (MM-REC-02).

Following construction activities, the presence of permanent new or widened roads that would be used for operation and maintenance of the Project could change the OHV use patterns in the area, subject to Federal, state, and local OHV and traffic laws and regulations. New access roads constructed for the Project would be signed and would be closed to the public, but illegal OHV use would not be entirely preventable on the new and widened access roads. This would result in an increased chance for user-created route proliferation. An increase in user-created trails would conflict with the BLM's OHV-use strategies, creating management challenges and potentially increasing user conflicts. The resultant effect from increased OHV use would be a minor to moderate effect to recreation opportunities/activities.

Decommissioning and removal of the transmission line upon completion of the Project would result in relinquishing the ROW. Land previously occupied by the ROW and associated transmission line structures would be available for other land uses and the effect to the recreation experience due to the infrastructure would be removed.

4.8.6 Mitigation Measures

The following MMs have been identified for recreation:

MM-REC-01: To mitigate effects related to the temporary construction closure of the proposed Arizona Peace Trail and other OHV routes through Johnson Canyon, MM-REC-01 would require that construction of the Project occur outside of peak OHV season. Construction in Johnson Canyon would occur between the months of July and September when there are fewer recreational users in the area.

MM-REC-02: In areas of high OHV use, such as in Copper Bottom Pass and the Ehrenberg Sandbowl OHV Area, Project structures with guy lines would be replaced with self-supporting (no guy lines) lattice structures or monopoles. Additionally, in all other areas where guyed V structures are used, the anchor position would be placed no less than 50 feet from any trail or road, and the lowest guy line would be at least 15 feet above any road or trail crossed by a guy wire. This would reduce the safety risk to OHV users.

MM-REC-03: New access roads will be gated where appropriate, and signage including road status will be posted at all new access road junctions. This would preclude and/or minimize recreational use of access roads.

In addition, the BLM developed required BMPs that would further reduce impacts to recreation resources (Appendix 2A, Section 2A.7).

4.8.7 Construction of Full-Route Alternative and Subalternative Effects

4.8.7.1 Proposed Action

There would be negligible to minor effects to recreation areas under the Proposed Action. The most substantial effect would be related to temporary changes in access to recreation areas. Under the Proposed Action, the long-term effects to recreation would be negligible because of the presence of the existing DPV1; there would be little change to the present condition.

There would be negligible to moderate effects on OHV routes and the proposed Arizona Peace Trail. The Project would not preclude use of existing OHV routes, but the ROW and associated new or widened access roads may increase illegal OHV use, in particular in portions of the analysis area and ROW with higher current OHV route densities. Because the Proposed Action would follow the existing DPV1, the Project would have negligible changes on the recreation experience of OHV users on OHV routes and the proposed Arizona Peace Trail.

4.8.7.2 Alternative 1: I-10 Route

Under Alternative 1, the temporary changes in access to recreation areas during construction would be similar to the Proposed Action. However, the long-term effects to recreation quality on recreation areas in the Project Area except in the eastern portion (where Alternative 1 would be the same as the Proposed Action) would be greater than those under the Proposed Action, because the Project would be a new, substantial feature on the landscape that would change a recreational user's experience from the current condition.

The most substantial difference in recreation effects between Alternative 1 and the Proposed Action is to camping areas near Quartzsite and to the Ehrenberg Sandbowl OHV Area. The La Posa LTVA and the Dome Rock Camping Area would be crossed by several Alternative 1 segments. There would be minor to major effects to these recreation areas under Alternative 1. Also, the north end of the Ehrenberg Sandbowl OHV Area would be crossed by Alternative 1, but it would not be crossed by the Proposed Action. This would be a minor effect on the Ehrenberg Sandbowl OHV Area. The Kofa NWR would not be crossed, thus no impacts to recreation areas or uses in this area would occur.

The effects to OHV routes and the proposed Arizona Peace Trail under Alternative 1 would be the similar to those under the Proposed Action.

Subalternatives to Alternative 1 (1A through 1E)

There would not be any differences in recreation effects between the Alternative 1 subalternatives (1A through 1E) and Alternative 1.

4.8.7.3 Alternative 2: BLM Utility Corridor Route

Under Alternative 2, the temporary changes in access to recreation areas during construction would be similar to the Proposed Action. The long-term effects to recreation quality on recreation areas would be the same as under the Proposed Action in all areas except near Quartzsite, which would be greater than those under the Proposed Action because the Project would be a new, substantial feature on the landscape that would change a recreational user's experience from the current condition.

A substantial difference in recreation effects between Alternative 2 and the Proposed Action is to the La Posa LTVA near Quartzsite. The La Posa LTVA would be crossed by two Alternative 2 segments. There would be minor to moderate effects to the La Posa LTVA under Alternative 2. However, in comparison to Alternative 1, Alternative 2 would avoid the Dome Rock Camping Area and the Ehrenberg Sandbowl OHV Area.

The effects to OHV routes and the proposed Arizona Peace Trail under Alternative 2 would be the similar to those under the Proposed Action.

Subalternatives to Alternative 2 (2A through 2E)

The only subalternative that would have differences in effects to recreation from Alternative 2 is Subalternative 2C; the route would go through Johnson Canyon (Segment cb-02) rather than Copper Bottom Pass, which would have a larger effect on OHV use because Johnson Canyon is undeveloped, and the Project could take away from the user's experience. Also, during construction of Segment cb-02 the proposed Arizona Peace Trail and other OHV routes would be temporarily closed, which would have moderate effects on OHV users. Mitigation would reduce this to a minor effect (Section 4.8.6).

4.8.7.4 Alternative 3: Avoidance Route

Under Alternative 3, the temporary changes in access to recreation areas during construction would be similar to the Proposed Action. The long-term effects to recreation quality on recreation areas would be the same where Alternative 3 includes Proposed Action segments and greater where Alternative 3 includes Action Alternative segments because within the Action Alternative segments, the Project would be a new, substantial feature on the landscape that would change a recreational user's experience from the current condition. This alternative would avoid the Kofa NWR. Unlike Alternatives 1 or 2, Alternative 3 would not affect the Dome Rock Camping Area, La Posa LTVA, or the Ehrenberg Sandbowl OHV Area.

Alternative 3 would avoid both Johnson Canyon and Copper Bottom Pass, which would be less of an effect to OHV routes in this area than the Proposed Action.

Subalternatives to Alternative 3 (3A through 3M)

Subalternatives 3E and 3F would go through the La Posa LTVA, which would result in greater impacts to recreation than Alternative 3. Subalternative 3K would go through Johnson Canyon (Segment cb-02) rather than Copper Bottom Pass, which would have a larger effect on OHV use than Alternative 3 because Johnson Canyon is undeveloped and the Project could take away from the user's experience. Also, during construction of Segment cb-02 the proposed Arizona Peace

Trail and other OHV routes would be temporarily closed, which would have moderate effects on OHV users. Mitigation would reduce this to a minor effect (Section 4.8.6). Subalternative 3L would go through the Dome Rock Camping Area, which would result in greater impacts to recreation than Alternative 3.

4.8.7.5 Alternative 4: Public Lands Emphasis Route

Under Alternative 4, the temporary changes in access to recreation areas during construction would be similar to the Proposed Action. The long-term effects to recreation quality on recreation areas would be the same where Alternative 4 includes Proposed Action segments and greater where Alternative 4 includes Action Alternative segments because within these Action Alternative segments, the Project would be a new, substantial feature on the landscape that would change a recreational user's experience from the current condition. This alternative would avoid the Kofa NWR. Alternative 4 would avoid the Ehrenberg Sandbowl OHV Area and Dome Rock Camping Area but would run adjacent to the La Posa LTVA.

Alternative 4 would run through Johnson Canyon, which would be more of an effect to OHV routes in this area than the Proposed Action.

Subalternatives to Alternative 4 (4A through 4P)

The only subalternative that would have differences in effects to recreation resources from Alternative 4 is Subalternative 4E: the route would avoid Johnson Canyon and instead go over Cunningham Peak; this would reduce OHV effects.

4.8.7.6 Agency Preferred Alternative

Under the Preferred Alternative, the temporary changes in access to recreation areas during construction would be similar to the Proposed Action. The long-term effects to recreation quality on recreation areas would be the same as under the Proposed Action except on Segment x-05 where the Project would be a new, substantial feature on the landscape that would change a recreational user's experience from the current condition; in this location the effects on recreation would be greater than those under the Proposed Action. Similar to the Proposed Action, the Preferred Alternative would avoid the La Posa LTVA and the Dome Rock Camping Area.

The effects to OHV routes and the proposed Arizona Peace Trail under the Preferred Alternative would be the similar to those under the Proposed Action.

4.8.8 Residual Effects

Depending on the alternative (Section 4.8.7), after implementation of MMs, there would be residual negligible to minor effects from illegal OHV use, minor to moderate effects related to the temporary construction closure of the proposed Arizona Peace Trail through Johnson Canyon, and residual negligible to minor increase in safety risk to OHV users, respectively. Additionally, there would be minor to major residual recreation effects under some alternatives from the crossing of the La Posa LTVA and Dome Rock Camping Area near Quartzsite and

minor residual recreation effects on the Ehrenberg Sandbowl OHV Area, because these effects (other than safety risk to OHV users) would not be mitigated.

4.8.9 CDCA Plan Compliance

CMAs DFA-REC-1, DFA-REC-2, DFA, REC-4, DFA-REC-5, DFA-REC-7 would apply to the Project (Appendix 2C). The Project would comply with these CMAs through BMP-REC-01 (Appendix 2A, Section 2A.7).

4.8.10 Unavoidable Adverse Effects

Under some alternatives (Section 4.8.7), during construction the temporary closure of OHV use in portions of the Copper Bottom Pass area, and the proximity to Quartzsite camping areas would be an unavoidable, short-term, adverse, moderate effect on OHV users on the proposed Arizona Peace Trail and other OHV routes. The effect of temporary OHV closures and the safety risk to OHV users would be mitigated to a minor effect (Section 4.8.6).

In the long term, under all alternatives the main unavoidable adverse effect would be increased development in natural areas heavily used for recreation. The addition of the Project would impact the scenic views of recreationists, increasing the perception of development and clutter in conjunction with the existing DPV1 transmission line. New or expanded access routes would remain after construction, increasing the access in and around otherwise natural areas, which would affect the character of the recreation environment in some areas. This would be an unavoidable, long-term, adverse negligible to moderate impact.

4.8.11 Cumulative Effects

Historic proliferation of authorized and unauthorized roads and trails, the establishment of Federal, state, county and private lands, and community development have all shaped the recreation opportunities, settings, and desired experiences in the CEA. Though land in the analysis area is largely undeveloped, it is characterized by both developed (i.e., utility ROWs) and undeveloped desert, agricultural lands, and by areas used for grazing, transportation corridors, utilities, recreation, and widely dispersed, low-density residential development. In general, construction activities from the Project, when considered with other linear ROW projects (e.g., solar energy facility generation tie-in lines, transmission lines, and pipeline projects) would contribute to the modification of the character of the recreation setting, which would contribute to potentially detracting from desired recreation experiences. Construction activities of the Project and other reasonably foreseeable actions may detract from or temporarily hamper access to recreational opportunities.

Where the Project would occur in existing ROWs and currently developed/disturbed areas, the likelihood that users are currently pursuing primitive or unconfined recreational settings and solitude is low, therefore no cumulative impacts are anticipated. However, it is more possible that users will be pursuing primitive and unconfined recreational opportunities and solitude in currently undeveloped areas of the CEA. In conjunction with the Project, reasonably foreseeable future actions in undeveloped areas would have a minor cumulative effect on the recreation experience and availability of primitive or unconfined recreational settings and solitude in the

CEA. Larger projects, such as solar facilities, and specifically the proposed 5,935-acre La Paz County land conveyance, would permanently remove lands from recreation.

The Proposed Action and portions of the other alternative routes would be constructed adjacent to the existing DPV1. The DPV1 was constructed across or adjacent to recreation areas in La Paz and Maricopa Counties in Arizona, and Riverside County in California, including the Kofa NWR. Adding the Project adjacent to this existing ROW would intensify the overall development that crosses these recreational resources. Any additional projects that may traverse these recreational areas would further increase the industrial development and further reduce the undeveloped, natural landscape of the recreational areas.

OHV riders may have cumulatively more opportunities available as a result of the Project and other past transmission line and pipeline development projects, since these projects required new access roads just as the Project would. New access roads used for construction (as well as maintenance) provide additional avenues for riders to gain access to locations that were previously unavailable. Adding the Project structures with guy wires adjacent to a ROW that already contains the DPV1 or other transmission lines would cumulatively add to the safety risk to OHV riders in some cases; however, MM-REC-02 would reduce this cumulative effect (Appendix 2, Section 2.4). Both increasing authorized and unauthorized OHV use is likely to result in increasing complaints from landowners and the public. As the Project adds to road density at the same time OHV use increases, there would be a need for additional enforcement and physical barriers to protect some areas.

The quality of the recreational setting and desired experiences could be degraded by the loss of undeveloped landscape character and visual intrusion on the landscape as a result of the cumulative impact of the Project construction and the past, present, and reasonably foreseeable actions identified in Appendix 3, Tables 3.12-1 and 3.12-2. The cumulative impact of this alteration of the recreation setting would be minor since recreation settings would be available in adjacent settings, and other cumulative actions would be far-removed and would not affect adjacent lands along the entire ROW. Operation and maintenance activities of the Project would result in minor cumulative effects, since the Project would already be constructed and standard operation and maintenance activities would be so periodic as to not affect recreation opportunities, experiences, or desired settings.

4.8.12 Irreversible and Irretrievable Commitment of Resources

There would not be any irreversible or irretrievable adverse effects on recreation related to the Project.

4.8.13 Relationship of Short-term Uses and Long-term Productivity

The short-term changes to recreation would not affect the long-term productivity related to existing and future recreation.

4.9 SOCIOECONOMICS

4.9.1 Introduction

Impacts to socioeconomics are discussed in terms of effects on the economy, population, housing, tax revenues, public services, property values, and the tourism and recreation related economy.

4.9.2 Methods for Analysis

4.9.2.1 Analysis Area

Impacts to socioeconomics are analyzed at the county level and/or at the census block group geographic level, as appropriate. Economic effects from the Project were estimated using the RIMS II regional economic model (BEA 1997).

4.9.2.2 Assumptions

The construction phase of the Project would have a greater impact on socioeconomic factors than the operations and maintenance phase. The decommissioning phase would be similar to the construction phase relative to anticipated socioeconomic impacts.

4.9.2.3 Environmental Effect Indicators, Magnitude, and Duration

Potential impacts to socioeconomic conditions may be either positive or negative. The following types of potential impacts were included in the socioeconomic impact analysis to determine presence, duration, and intensity:

- Change in employment opportunities, directly or indirectly, resulting from the Project, compared to current and historic trends;
- Change in taxes resulting from the Project, compared to current and historic trends;
- Change in population, increased infrastructure, or other change that induces growth resulting from the Project;
- Physical division of an established community resulting from the Project;
- Displace substantial numbers of people or existing housing on a permanent basis, necessitating the construction of replacement housing outside the local region;
- Project-related induced long-term population growth to an extent that could not be accommodated by existing local housing, local services, and infrastructure;
- Project-related substantial long-term reduction in revenue for local businesses, government agencies, or Indian tribes;
- Project impacts that would substantially alter the lifestyles or quality of life, including non-market values, of populations using, or residing in proximity to, the Project;

- Project impacts that would substantially alter production or delivery of current levels of ecosystem services to local and regional populations;
- Conflict with applicable land use plans and policies associated with socioeconomics, public services, or utilities created by the Project;
- Percent change in property values; and,
- Change in revenue generated by recreation.

4.9.3 No Action Alternative

Under the No Action Alternative, no ROW would be granted for the Project and the transmission line, SCS, and ancillary facilities would not be constructed. Current conditions in the analysis area described in Chapter 3 would continue under the No Action Alternative.

4.9.4 Construction of Action Alternative Segments

4.9.4.1 Direct and Indirect Effects Common to All Action Alternatives

The Project would involve a relatively short-term construction phase followed by long-term (50 years) operation and maintenance of a new transmission line and appurtenant facilities, including the SCS and substation equipment. During the construction phase, crews responsible for specific construction tasks would likely not remain in any one area for the full duration of the construction period, which is estimated by DCRT to be approximately 24 months. Thus, impacts at any one location along the construction route would be for a shorter time period than the full construction phase.

Overall, the Project could contribute to future economic development and long-term job growth in the region by improving reliability of the electrical grid and increasing the ability of the grid to meet the demand of future growth such as facilitating solar and other new electrical generating facilities.

Economic Effects

As shown in Appendix 2, Table 2.2-28, the construction crew for the transmission line would consist of approximately 120 workers and take a year and a half to two years to complete. Substation work would require a crew of about 40 workers over a year.

Construction of the Project is projected to support approximately 160 short-term construction jobs for up to two years, as well as another 63 indirect jobs that would be supported by local purchases of supplies and materials for construction, based on the RIMS II multipliers for the three-county region (Appendix 4, Table 4.9-1). An additional 100 new positions would be supported by (induced) household expenditures by the construction workforce (local and non-local) during the construction period. Further, as detailed in Appendix 4, Table 4.9-2, Project construction would impact local earnings, based on the RIMS II multipliers, in addition to the earnings of the construction workforce (direct earnings), roughly doubling this amount.

The third impact that can be calculated using the RIMS II model is the change in "final demand" or overall economic benefit to the local region. Based on a $241 million direct construction cost and the RIMS II multiplier of 2.0214[1] to capture the direct, indirect, and induced economic impacts, there would be an overall economic impact of $487.2 million related to construction of the Project.

Population and Housing

Approximately 55 percent of the construction workforce is expected to consist of non-local employees who would reside in the analysis area during the construction period but very few of these employees are expected to be accompanied by their families. Two scenarios regarding indirect and induced jobs and associated population and housing impacts were considered. At the low end (Scenario One) the indirect and induced jobs are assumed to be filled entirely by local residents and estimates of population effects include only the direct Project construction workers and their accompanying families. At the high end (Scenario 2) half the indirect and induced jobs are assumed to be filled by workers who migrate to the analysis area.

Under Scenario One, approximately 92 construction workers and family members would move into the area for the duration of the Project, including about eight children. Under Scenario Two, approximately 190 workers and family members would move into the area for the duration of the Project, including about 16 children. Appendix 4, Tables 4.9-3 and 4.9-4 provide a breakdown of these estimates and the resultant percentage increases in population, respectively. Due to the low percentages (less than 0.1 percent for each area considered), the Project's impact on population would be considered negligible and short-term.

Non-local workers would require housing in the analysis area. For purposes of considering potential effects on housing conditions, the number of projected non-local workers is compared to the estimated availability of rental housing, motel/hotel rooms, and RV sites within the analysis area. As detailed in Appendix 4, Table 4.9-5, for Scenario One, only 77 housing units would be required and for Scenario Two, 158 housing units would be required. Vacancy rates described in that same section suggest that the Project's impact on available housing would negligible.

Tax Revenue Effects

Construction-related economic activity would also generate additional tax revenues for state and local governments in the Project Area. Sources of new tax revenues would be sales and use taxes, and property taxes. Tax rates vary depending on whether the land is leased or owned, public or private, so it would be difficult to estimate what the tax proceeds would be from the Project before a final route is selected. In any case, income from taxes generated by the Project could be considered a positive impact for local units of government.

Effects on Public Services

In addition to the temporary increase in demand for housing described above, the non-local construction workforce and any non-local workers and families who migrate to the area to fill

[1] This multiplier is based on the RIMS II 2007 Benchmark Input-Output Table for the Nation and 2015 regional data.

indirect employment opportunities, would also create additional short-term demands for public services such as police and fire protection, education, and medical services. Much like the housing situation, these added demands are unlikely to create substantial challenges in the Project Area due to the comparatively small numbers of non-local workers. The effects on public services during the construction period should be negligible to minor and short-term.

Effects on Property Values

The primary impacts to residential and other developed properties during construction are from noise, dust, heavy equipment, and perhaps access. An inventory of land use within the analysis area for the Proposed Action and Action Alternatives was completed. Residential or Rural Residential land accounted for 8 percent of the total area within the land use analysis area. The majority of that is classified as Rural Residential (just under 12,000 acres out of 12,799 acres), indicating that the land use analysis area is primarily rural in nature with few residences present. Construction phase impacts would be short-term as construction in any specific area would be accomplished fairly quickly. Therefore, it is unlikely that the construction phase would have a lasting impact on property values.

Effects on Recreation and Tourism Economy

Based on the recreation impact analysis provided in Section 4.8, impacts to recreation and recreation areas would be localized and short-term and primarily related to noise, dust, visual disturbance and restricted access during construction. Considering the large number of recreational opportunities and their areal extent, the reduction in recreation users coming to the area should be minor, as most users would likely move to other nearby locations not impacted by construction activities.

Recreation activities, such as OHV riding, hunting, wildlife viewing, hiking and equestrian activities, might be temporarily affected in some locations or displaced to other locations for short periods of time. These short-term, localized impacts are unlikely to result in a discernible impact to the tourism- and recreation-related economy.

4.9.5 Operations, Maintenance, and Decommissioning

In contrast to the large workforce and expenditures required for construction, ongoing operations and maintenance would require few workers (DCRT 2019) and have relatively little direct economic impact in the Project Area. Decommissioning the Project would require more workers than during operations and maintenance, but it is unlikely the workforce and expenditures would be as large as that associated with construction. After decommissioning, there would be no further economic or social effects associated with the Project.

4.9.5.1 Economic Effects

The operations and maintenance phase would require a minimal workforce with an annual payroll of $195,000 (DCRT 2017). There would be comparatively few other expenditures for materials or supplies. In contrast to the No Action Alternative; however, each of the Action Alternatives would meet the purpose and need for the Project in improving reliability of the electrical grid in California and Arizona, increasing the ability of the grid to meet demand

growth in the region, or facilitating potential renewable generation development in the region. The long-term economic impacts from these aspects cannot be modeled in RIMS II, but would be positive and could be major.

4.9.5.2 Tax Revenue Effects

The transmission line and appurtenant facilities could produce more substantial property tax revenues for local governments once fully constructed. It would be difficult to accurately estimate property taxes before a final route is selected. Property tax revenues would decrease over time during the period of operations due to depreciation in the value of the facilities.

4.9.5.3 Population Effects

Ongoing operations and maintenance would require relatively few workers. The Project would have negligible to minor long-term effects on the population of the Project Area.

4.9.5.4 Housing Effects

The Project would have negligible to minor, long-term effects on housing within the Project Area.

4.9.5.5 Effects on Public Services

The Project would have negligible to minor long-term effects on most public services within the Project Area during the operations and maintenance phase. However, to the extent the Project improves reliability of the electrical grid in southern California and Arizona and increases the ability of the grid to meet demand growth in the region, it could provide long-term improvements for the area in terms of electric utility service. Taxes collected on the transmission line and associated facilities have the potential to improve public services.

4.9.5.6 Effects on Property Values

The concern that transmission lines may cause long-term decreases in property values has led to extensive research on the subject, but the conclusions are not clear or consistent. Instead the research indicates that the effects of transmission lines on property values appear to differ depending on the situation. The majority of the existing literature has focused on urban residential properties in densely populated northern regions. This, in conjunction with the inconsistent results, makes it difficult to directly apply the findings to the largely rural Project Area.

Property owners allowing the use of a portion of their property for the transmission line ROW would be compensated by DCRT for the encumbrance the line creates upon their land and potential reductions in their property values.

In general, because of the small amount of residential land in the analysis area, its distance from the Project, and the nature of rural residential properties, loss of property value is anticipated to range from negligible to moderate.

4.9.5.7 Effects on Recreation and Tourism Economy

Ongoing operations and maintenance should have little or no long-term effect on the tourism- and recreation-related economy. As noted in the previous section on property values, it has been demonstrated that impacts from visual disturbance dissipate quickly with distance from transmission lines; given the vast area available for high-quality recreation the transmission line and its associated facilities should have negligible impact on the recreation and tourism economy.

4.9.6 Mitigation Measures

There are no MMs identified for socioeconomics for any of the specific segments. No MMs have been identified for any of the full-route alternatives or subalternatives described below.

4.9.7 Construction of Full Route Alternative and Subalternative Effects

4.9.7.1 Proposed Action

Two areas of local concern during scoping were impacts to residential property values and to the recreation and tourism economy. In both cases the Proposed Action probably produces the lowest negative impacts as it crosses fewer residential areas overall, and, being located adjacent to the existing DPV1 line over a large distance, it would likely have a lower visual impact on currently undeveloped areas. Among the five full-route alternatives, the Proposed Action would impact the second lowest acreage of residential and rural residential lands within 2,000 feet of the line (the land use study area), at 1,833 acres over the full length of the line.

4.9.7.2 Alternative 1: I-10 Route

Socioeconomic impacts for Alternative 1 would be largely the same as for the Proposed Action, with the exceptions of impacts to residential properties, and recreation and tourism in the Project Area. Regarding residential properties, Alternative 1 would impact the greatest amount of residential acreage among the five full-route alternatives at 3,960 acres. Regarding recreation and tourism, the I-10 route would follow I-10 and avoid impacts to the Copper Bottom Pass area, but would cross through the Dome Rock Camping Area, both of which are heavily used for recreation. However, Alternative 1 likely would not change the contribution of recreation and tourism to local economies in the Project Area.

Subalternatives to Alternative 1 (1A through 1E)

Impacts anticipated from Subalternatives to Alternative 1 are substantially similar to those listed above.

4.9.7.3 Alternative 2: BLM Utility Corridor Route

Socioeconomic impacts for Alternative 2 would be largely the same as for the Proposed Action, with the exceptions of impacts to residential properties, and recreation and tourism in the Project Area. Regarding residential properties, Alternative 2 would impact the second greatest amount of residential acreage among the five full-route alternatives at 3,315 acres. Regarding recreation and

tourism, Alternative 2 would place the Project parallel to SR 95, east of the highway and within the eastern portion of the La Posa LTVA. The presence of the Project within the LTVA could impact the quality of the recreational experience, either resulting in condensing use in other portions of the LTVA or a reduction in LTVA users. A reduction in LTVA users could, in turn, could change the contribution of recreation and tourism to local economies in the Project Area.

Subalternatives to Alternative 2 (2A through 2E)

Impacts anticipated from Subalternatives to Alternative 2 are substantially similar to those listed above.

4.9.7.4 Alternative 3: Avoidance Route

Socioeconomic impacts for Alternative 3 would be largely the same as for the Proposed Action, with the exceptions of impacts to residential properties, and recreation and tourism in the Project Area. Regarding residential properties, Alternative 3 would impact the third greatest amount of residential acreage among the five full-route alternatives at 3,229 acres. Regarding recreation and tourism, Alternative 3 would impact Cunningham Peak and currently undeveloped portions of the Dome Rock Mountains, while avoiding the actual Copper Bottom Pass area. However, Alternative 3 likely would not change the contribution of recreation and tourism to local economies in the Project Area.

Subalternatives to Alternative 3 (3A through 3M)

Impacts anticipated from Subalternatives to Alternative 3 are substantially similar to those listed above.

4.9.7.5 Alternative 4: Public Lands Emphasis Route

Socioeconomic impacts for Alternative 4 would be largely the same as for the Proposed Action, with the exceptions of impacts to residential properties, and recreation and tourism in the Project Area. Regarding residential properties, Alternative 4 would impact the least amount of residential acreage among the five full-route alternatives at 1,371 acres. Regarding recreation and tourism, Alternative 4 would impact Johnson Canyon and associated undeveloped portions of the Dome Rock Mountains, while avoiding the actual Copper Bottom Pass area. If the technical OHV qualities of Johnson Canyon were perceived by recreation users to have been degraded, recreational use of the Canyon would reduce and could change the contribution of recreation and tourism to local economies in the Project Area. However, it is more likely that this recreational use would shift to other trails within the local area.

Subalternatives to Alternative 4 (4A through 4P)

Impacts anticipated from Subalternatives to Alternative 4 are substantially similar to those listed above.

4.9.7.6 Agency Preferred Alternative

Socioeconomic impacts for the Preferred Alternative would be largely the same as for the Proposed Action.

4.9.8 Residual Impacts

From a socioeconomic perspective, the primary residual impact would be the ongoing collection of taxes for the life of the Project.

4.9.9 CDCA Plan Compliance

There are no CMAs related to socioeconomics that would apply to the Project.

4.9.10 Unavoidable Adverse Effects

No unavoidable adverse effects are anticipated.

4.9.11 Cumulative Effects

The CEA for socioeconomics is Maricopa and La Paz Counties in Arizona and Riverside County, California. This geographic extent was selected as the CEA because socioeconomic factors, such as public services and utilities are often provided at the county level, and the local labor force is expected to come primarily from within these counties. In addition, statistical data on population, housing demand, and other socioeconomic indicators are typically provided at the county level.

Past, past development and population growth have expanded the demand for housing and increased the available workforce. The Project would not cause existing housing or persons to be displaced or necessitate the construction of replacement housing elsewhere. In addition, there would be no impact from construction workers requiring housing that exceeds the supply of local housing or temporary housing facilities and minimal potential changes in the demand for labor or in local employment. As growth has been accounted for in various local and regional plans and projections and no changes to that growth would be likely to occur as a result of the Project, displacement of and demand for housing and changes in the local labor market would not be considered as cumulative effects and are not discussed further. Given the current workforce in the area and the amount of available housing, cumulative impacts as a result of construction workers on the local housing market are considered to be negligible to moderate during Project construction. A cumulative effect would result if the interaction among the effects of the Project and other past, present, and reasonably foreseeable actions combined.

Construction of the Project transmission line in conjunction with renewable energy generation projects (such as solar generating stations) would facilitate the transmission of energy to consumers and may encourage additional development of renewable energy sources.

The Project in conjunction with reasonably foreseeable energy, utility, and other infrastructure projects could support population increases in the area in the foreseeable future. While from a socioeconomic viewpoint this could be positive within the CEA, some members of the public have expressed concern about impacts to the traditional tourism and recreation-based economy. The CEA has a rural character and local communities rely on that character to draw visitors that support their local economy.

4.9.12 Irreversible and Irretrievable Commitment of Resources

The Project would not result in irreversible or irretrievable commitments of socioeconomic resources.

4.9.13 Relationship of Short-term Uses and Long-term Productivity

The Project does not involve trade-offs between short-term uses and long-term productivity from a socioeconomic standpoint.

4.10 ENVIRONMENTAL JUSTICE

4.10.1 Introduction

One census block group in Maricopa County, three in La Paz County, and five in Riverside County have been identified as containing EJ populations of concern. These EJ populations are enumerated in Appendix 3, Table 3.10-3 and shown in Figure 3.10-1, Figure 3.10-2, and Figure 3.10-3 (Appendix 7). Due to their status as a single Federally recognized tribal entity, the CRIT have been identified as an EJ population (Section 3.10.2.4).

4.10.2 Methods for Analysis

4.10.2.1 Analysis Area

The EJ study area for this EIS is the area within 0.5-mile of the Proposed Action and Action Alternatives (Figure 3.9-1, Appendix 7). This is a commonly used buffer distance for EJ study areas. The analysis area includes the study area and all census block groups crossed by the Proposed Action and Action Alternatives; therefore, it extends beyond 0.5 mile. The analysis area includes adjacent and nearby communities that may be affected by the final route.

4.10.2.2 Assumptions

Evaluation of EJ impacts involves assessment of the potential for disproportionately high and adverse impacts on minority or low-income populations. Minority and low-income populations in proximity to the ROW for the Project Action and Action Alternatives were identified in Chapter 3.

The analysis assumes that all appropriate design features, APMs, and BMPs would be implemented (Appendix 2A).

4.10.2.3 Environmental Effect Indicators, Magnitude, and Duration

The following indicator was considered when analyzing potential impacts to EJ populations:

- Construction or operation of the Project would have a disproportionately high and adverse effect on identified EJ populations in the area (as defined by EO 12898).

The magnitudes and durations used to describe impacts to EJ populations are the same as those provided in Table 4-1.

4.10.3 No Action Alternative

Under the No Action Alternative, no ROW would be granted for the Project and the transmission line, SCS, and ancillary facilities would not be constructed. Current conditions in the analysis area (Section 3.10) would continue under the No Action Alternative.

4.10.4 Construction of Action Alternative Segments

4.10.4.1 Direct and Indirect Effects Common to All Action Alternatives

Several census block groups in the analysis area can be defined as EJ populations under CEQ and BLM guidelines because they either have a proportion of minority residents that is greater than average for the state in which they are located, they have a greater proportion of individuals or families that are living below the poverty level, or both. Most of the potential short-term, negligible to minor adverse impacts on EJ populations associated with construction of the Project would be localized in nature, including noise and other types of disruption occurring during construction; longer term impacts may affect visual resources and property value. Potential adverse impacts on local housing conditions and the demand for public services during construction, discussed in Section 4.9, would be somewhat more dispersed.

Given these characteristics of the area and the Project, low-income and minority populations would be affected by the Project, regardless of which Action Alternative is selected. Any reasonably direct route between the two substations crosses two of the four block groups in Arizona where there are EJ populations; any less direct route taken to avoid these block groups would require several times more disturbance, particularly in currently undisturbed or pristine areas. In California, where five of the six block groups in the analysis area contain EJ populations, and the Colorado Substation is surrounded by EJ populations, there is no route that would eliminate impacts to EJ populations.

The analysis of effects by resource area provided in this chapter indicates that few, if any, of these impacts would be “high,” for the purpose of this analysis. In fact, the Action Alternatives are adjacent or nearly adjacent to existing transmission lines, interstate highways, or other utility corridors as a means of minimizing new disturbance to either the natural or human environment.

In the case of the Action Alternatives considered in this EIS, construction impacts would occur over a relatively short duration. Visual and air quality impacts are related to EJ populations would not constitute a disproportionate adverse impact.

Low-income and minority populations may also be positively affected by the Project, including the short-term economic stimulus from construction activities and expenditures, short-term and longer-term increases in tax revenues, and added capacity and reduced congestion for electricity transmission. These impacts are likely to be more geographically dispersed than the localized adverse impacts.

The BLM LTVA and private RV parks in and around Quartzsite have seasonal (that is, temporary) and long-term residents that would not be represented by US Census Bureau data, and as such, it is possible there could be minority and low-income representation exceeding the comparable populations within the EJ comparison area. For the Town of Quartzsite, Arizona

CDP, the census data show 4.1 percent minority representation and a low-income population of 9.6 percent.

The CRIT have expressed that the Project would constitute an adverse impact to the Tribe that exceeds that of the general population, as they have greater ties to the specific environments and lands encompassing the Project Area. This is discussed in further detail in Section 4.6.

A portion of Segment p-11 is adjacent to CRIT reservation lands, and Segments i-06 and cb-03 would cross CRIT reservation lands. The block group data covering this area show a 98 percent minority population, with 26.5 percent Native Americans. The lands crossed by Segments p-11, i-06, and cb-03 are all undeveloped and do not include residences. For tribes and tribal members, EJ population issues, if any, are addressed through the consultation process (Sections 3.6 and 4.6). Scoping consultation with the CRIT resulted in a request for further, detailed consultation regarding its lands and adjacent areas.

Direct and indirect impacts from construction would be short-term and minor. Given the extent of the Project, impacts such as noise and other disruption would occur relatively briefly at any one locale.

4.10.5 Operations, Maintenance, and Decommissioning

During operations and maintenance there would be negligible activity on the ground, and, therefore, negligible impacts to EJ populations. Decommissioning impacts would be similar to those described for construction.

4.10.6 Mitigation Measures

There are no MMs identified for EJ populations for any of the specific segments and, thus, no MMs have been identified for any of the Action Alternatives or subalternatives described below. The Project has been designed to utilize existing utility corridors and avoid environmentally sensitive areas to the extent possible.

4.10.7 Construction of Full Route Alternative and Subalternative Effects

4.10.7.1 Proposed Action and Alternatives 1 through 4

While there is some difference among the Proposed Action and Action Alternatives, including applicable subalternatives, the short-term, negligible to minor impacts on EJ populations would be similar between all alternatives.

4.10.7.2 Agency Preferred Alternative

The impacts on EJ populations under the Preferred Alternative would be similar to the Proposed Action and Action Alternatives. These impacts would be negligible to minor but generally short-term.

4.10.8 Residual Impacts

Development of the new transmission line may have some residual impacts on property values near the transmission line. Any impacts would likely be minor due to the predominantly low-density rural setting and the presence of existing transmission and utility lines nearby.

4.10.9 CDCA Plan Compliance

There are no CMAs related to environmental justice that would apply to the Project.

4.10.10 Unavoidable Adverse Effects

Identified EJ populations would likely experience adverse impacts on a localized basis from construction, operation, maintenance, and decommissioning of the Project. As discussed previously, these adverse impacts are all expected to be minor at most and distributed equally among EJ and non-EJ populations (i.e., not disproportionately). Since EJ population areas would need to be crossed regardless of the Action Alternative selected, this would be an unavoidable adverse impact.

As noted in Section 4.6.10, the CRIT have expressed that the Project would result in adverse impacts on the CRIT that appreciably exceed those of the general population, as development impacts their ancestral ties to the land. Consultation with the CRIT will be ongoing in an effort to address impacts.

4.10.11 Cumulative Effects

The EJ CEA includes the three-county area and the block groups used for evaluating impacts. Like most proposed transmission lines, the proposed routes, under the various alternatives, would use the corridors of existing linear features (such as transmission lines, roads, pipelines, and railroads) as much as possible. Co-locating with existing linear infrastructure tends to minimize environmental and social impacts and avoid relatively undisturbed areas.

Co-locating a new transmission line in an area that already has existing transmission facilities or other linear infrastructure would add incrementally to any existing impacts from that infrastructure on visual resources, quality of life, property values, and other aspects of nearby properties. It is likely, however, that the incremental impact of adding an additional transmission line in areas that already have linear infrastructure in place would not be a major cumulative effect since visual and property value impacts would have already taken place, therefore co-location would result in less impact than adding a new transmission line in an area without existing linear facilities.

Almost all the EJ communities that could be affected by construction and operation of the Project already have existing transmission lines in place. Development of a new transmission line in these areas would likely have a smaller cumulative impact than in areas without such existing linear features.

There would be no permanent or temporary displacement of low-income or minority businesses or residents under the Project to contribute to potential cumulative impacts on minority

populations. The health and safety of these populations would be protected during both construction and operation at the same levels as other populations by implementing the safety measures described in the APMs and BMPs, and other protocols described in Chapter 2, as well as other resource-specific mitigations plans, such as the Hazardous Materials Management Plan (to be completed before NTP would be issued). It is assumed that future projects would be required to mitigate any significant impacts on these populations; therefore, cumulative impacts on minority and low-income populations as a result of the Project in combination with reasonably foreseeable future projects also would be minimal.

As noted in Section 4.6.11, the cumulative development within and around the CEA has had the effect of substantially altering the native landscape of affiliated Indian tribes, including the CRIT. Consultation with the CRIT is ongoing. As expressed by the CRIT, the continued development and alteration of the landscape cumulatively contributes to impacts on the cultural landscape and the deep connection the CRIT have with the land, natural and cultural resources, and wildlife.

4.10.12 Irreversible and Irretrievable Commitment of Resources

The Project would not result in irreversible or irretrievable commitments to EJ populations.

4.10.13 Relationship of Short-term Uses and Long-term Productivity

There would be no short-term uses versus long-term productivity conflicts to EJ as a result of the implementation of the Project.

4.11 VISUAL RESOURCES

4.11.1 Introduction

Impacts to visual resources are discussed in terms of the visual impact of contrast between the Project and surrounding landscape, conformance with established Federal and local requirements for management of visual resources, and plan amendments included to address RMP non-conformance.

4.11.2 Methods for Analysis

4.11.2.1 Analysis Area

Impacts to visual resources are analyzed for portions of the study area (Section 3.11.1) where the Project would be visible, as documented by the KOPs.

4.11.2.2 Assumptions

The analysis assumes that:

- All appropriate design features, APMs, BMPs, and any additional monitoring and MMs included in Section 4.11.6 would be implemented. All categories of these would be mandatory, and where applicable would be in place before construction begins.
- The selected KOPs are representative of the views of the majority of sensitive viewers in the Project Area.

4.11.2.3 Environmental Effect Indicators, Magnitude, and Duration

Impacts to visual resources would occur if:

- Project-related changes would reduce scenic quality rating scores based on the BLM visual resource inventory system;
- The Project results in major and unmitigated visual changes that degrade or disrupt views of scenic landscapes from highly sensitive viewing locations such as parks, residences, historic monuments, scenic trails, community gateways, and other culturally or regionally important viewpoints;
- The Project conflicts with visual standards, ordinances, or policies established by the BLM (VRM Classes), other potentially affected Federal entities, or other state, county, or local agencies;
- The Project results in visual intrusion or disruption to a viewshed of recognized cultural significance (e.g., eligible for registration with the NRHP, or identified as a TCP);
- The Project results in visual resource contrast ratings that conflict with the management goals of assigned VRM or interim VRM classes;
- The RMP Amendment associated with the Project reduces VRM class objectives that would be required for future projects proposed in the area;
- The Project has a substantial adverse effect on a scenic vista;
- The Project substantially degrades the existing visual character or quality of the site and its surroundings; or
- The Project creates a new source of substantial light or glare which would adversely affect day or nighttime views in the area.

Units of measures include:

- Scenic Quality Classification – Classes A, B, & C;
- Sensitivity Classification – high, medium, and low;
- Distance zones – foreground-middle ground, background, seldom seen;
- VRI Classes I, II, III, & IV;
- Level of visual contrast; and,
- Conformance to VRM class objectives for Classes I, II, III, & IV.

4.11.2.4 Visual Contrast Rating

The BLM performs a process called contrast rating, as described in Manual H-8431-1 (BLM 1986), Visual Resource Contrast Rating, to analyze potential visual impacts of proposed projects and activities. The degree to which a management activity affects the visual quality of a landscape depends on the visual contrast created between a project and the existing landscape. The basic design elements of form, line, color, and texture are used to make this comparison and to describe the visual contrast created by the Project. This assessment process provides a means for determining visual impacts and for identifying measures to mitigate these impacts. The 10 environmental factors were analyzed to determine specific effects observed from each KOP. When the views from KOPs were found to not meet the VRM classes established for the viewed area that would be impacted by the Project, analysis was used to determine the scope of the effect and establish boundaries for VRM class changes, which would both address the issue of Project non-conformance as well as provide for future manageability of the area by the BLM. Visual Contrast Rating Worksheets were completed for all KOPs, which provide detailed analysis of visual impacts as determined from each KOP.

4.11.2.5 Simulations

KOPs were selected for simulation to aid in analysis of:

- Segments perceived to be non-conforming to VRM class objectives,
- Non-BLM publicly sensitive areas, and,
- Generally representative areas.

Simulations were used to aid in visualization and description of Project impacts, and determinations for appropriate MMs and RMP amendments. Simulations were prepared using models of proposed structure types and estimated structure locations placed along the centerline for the simulated segments. Due to the desert environment where the Project is proposed, reclamation and revegetation would be a slow and long-term prospect, with limited expected recovery. Where possible and estimated to be visible, ground disturbance at the bases of the structures was also simulated. In many cases, access disturbance would be required for structure construction, and would have long-term visual effects similar to ground disturbance at the structure bases. However, specific access routes have not been proposed or estimated for the Project, and due to the level of subjectivity, could not be simulated.

The majority of structures for the Project are proposed to be guyed V structures. Analysis of impacts to recreation found that guyed V structures pose an unacceptable human health and safety risk to OHV recreationists in heavily used recreation areas, such as the vicinity of the LTVA and Copper Bottom Pass. To address this safety risk, self-supporting lattice structures with matching color and span lengths to match the existing DPV1 structures or monopoles would replace the guyed V structures in certain locations as mitigation to eliminate the hazards associated with guy wires. However, these required changes in structures in certain areas also affect the visual resources analysis. Where structure changes would be required in areas simulated, additional simulations were prepared showing the replacement structure types.

4.11.2.6 Analysis of KOPs/Segments not Simulated

Simulations were also used to be representative of visual impacts as a guide to analysis of KOPs/segments not simulated. While the 10 environmental factors were evaluated in the visual contrast rating process for each KOP, in collectively reviewing Project simulations, it was found that the distance between the viewer and the Project (proximity), structure form contrast, background/skylining of infrastructure, and intervening vegetation/topography had relatively consistent, and therefore predictable visual impacts. Therefore, these visual elements were used to estimate visual impacts for KOPs/segments not simulated.

Appendix 4, Section 4.11 provides details regarding the process used for analysis of KOPs/segments not simulated.

4.11.3 No Action Alternative

Under the No Action Alternative, a ROW would not be granted for the Project and the transmission line, SCS, and ancillary facilities would not be constructed. The visual resources of the lands on which the Project is proposed would continue to be managed as it currently directed by the various applicable BLM RMPs and other local planning ordinances and guidelines. Lands in the analysis area would remain as is, which is primarily undeveloped desert or agricultural land. Current visual resources in the analysis area described in detail in Chapter 3, Section 3.11 would be unchanged under the No Action Alternative. There would be no changes that would alter views, view sheds, scenic quality, or sensitivity levels of the scenic resources beyond current conditions.

4.11.4 Construction of Action Alternative Segments

4.11.4.1 Direct and Indirect Effects Common to All Action Alternatives

During construction, visual impacts would result from the introduction of construction vehicles, equipment, and construction materials within staging areas, access roads, and within the transmission line ROW. The presence of work crews, vehicles and other equipment, and dust generated by construction activities would be visible in views toward the Project Area from the surrounding area at varying distances depending on local conditions. Motion, dust, and activity would attract attention in certain circumstances. Where the Project would be in closer proximity to viewers and there is a lack of intervening topography or vegetation, ground disturbance from access routes and at structure bases could be visible to observers.

Disturbance resulting from construction would be largely short-term in duration, and visible effects from active construction would diminish subsequent to clean up and reclamation of the temporary staging areas and access roads. Reclamation of desert vegetation can take years to complete and conditions in areas of disturbance are expected to change over the years as reclamation takes place. Because of the small scale of vegetation disturbance required, there would be minimal visible contrasts that would be reduced over time.

Sensitive viewers would be affected by the short-term Project construction impacts. However, the transmission line structures would cause a major, long-term change to scenery, while construction of the structures and facilities would be temporary. Landform modification would

be noticeable and create visual contrast within the viewshed. Examples of transmission structure visibility are provided in Appendix 4, Section 4.11.

The Project would be visible to some degree from many locations within the eastern portion of the Project Area. The vast majority of sensitive viewers would be traveling along I-10; substantially fewer viewers would be traveling Salome Road, and fewer still would be traveling the relatively limited number of local routes. A large portion of the lands in this area are BLM-administered land, but there are also large areas of private lands with isolated residences that could be impacted visually.

The majority of the BLM-administered land in the area is rated scenic quality C. While portions of any of the Action Alternatives may reduce the scenic quality, overall, because the scenic quality in the units containing the Action Alternatives in this area is C, impacts to scenic quality would not further reduce the scenic quality rating of the units.

Because of the north-south linear nature of the Project Area in the vicinity of Quartzsite, visibility of the Project would be limited to those area within approximately 3 miles of the viewer, with the more distant area becoming faded, camouflaged, or obscured by atmospheric conditions, and intervening topography, human developments, and/or vegetation. The majority of the visual impacts in this area would be to Federal lands managed by the BLM. However, some of the Action Alternatives on BLM-administered land surround the community of Quartzsite and have potential to impact the views of private landowners.

Similar to the eastern portion of the Project Area, the majority of the BLM-administered lands are rated scenic quality C. While the Project in this area may reduce the scenic quality, overall, because the scenic quality in the units containing the segments is C, impacts to scenic quality would not further reduce the scenic quality rating of the units. However, where the sensitivity of the eastern portion of the Project Area is largely moderate, the sensitivity in the vicinity of Quartzsite is high, making any changes to scenic quality more noticeable to viewers in the area.

Visibility of the Project in the vicinity of Copper Bottom Pass varies and would be located in deep and narrow V-shaped canyons within the Dome Rock Mountains, limiting the extent of views, but placing viewers in close proximity. Portions of the Proposed Action and Action Alternatives would be located in open areas outside the Dome Rock Mountains, with more panoramic views and greater opportunity for long-distance visibility. However, this area is heavily used for OHV recreation, with routes ranging from maintained gravel roads to two-track routes, to a technical OHV route through Johnson Canyon. The result is viewers would frequently be placed in close proximity and in some cases, the Project would be viewed in conjunction with the existing DPV1 transmission line. For all segments that would be viewed in conjunction with the existing DPV1 transmission line, spans and structure locations would be matched to the extent possible, and the surface of the structures would be dulled to match the existing infrastructure, if not treated to color blend with the mountainous backdrop, which could help reduce contrast.

This portion of the Project Area is almost exclusively Federal land managed predominantly by the BLM, but also managed by Reclamation. Further, a portion of this part of the Project Area includes CRIT tribal land. The visual effects would be felt by those traveling across or recreating on public lands, with little or no impacts expected to the views of private landowners.

The scenic quality in this portion of the Project Area is rated mostly B with high sensitivity. Of the entire Project Area, Federal lands in the Copper Bottom Pass area have the greatest potential for reductions in scenic quality of the unit(s) and noticeable impact to viewers, which is heavily used for recreation. Consequently, the VRI and VRM Classes in this area tend to be the highest within the Project Area, meaning the area has the least tolerance for visual change without major impacts and is more sensitive to changes in VRM Class.

Visually, where the Project approaches the Colorado River it would be viewed in context of the river and the bluff where the river gives way to the floodplain. Crossing into eastern California would be viewed in the context of the cultivated river floodplain, with sporadic residential development. Generally speaking, the Project in these areas would be visible for long distances but may be partially obscured or overwhelmed by other intervening visual features, such as trees. The westernmost portion of the Project Area rises over a bluff above the floodplain to be on sandy, sparsely vegetated desert plain, where the Project would be viewed in the context of numerous existing or proposed energy production or transmission facilities, including the Colorado River Substation.

The scenic quality of BLM-administered land in the westernmost portion of the Project Area is rated mostly B, and most of the areas have high sensitivity. However, the area in the vicinity of the Colorado River Substation contains large utility corridors and areas slated for energy development, with numerous solar projects either under review or approved. The VRM class for this area is Class IV.

Appendix 2A, Section 2A.12 lists APMs and BMPs that would be applied to the Project to minimize visual impacts.

4.11.4.2 Direct and Indirect Segment-specific Effects

Appendix 4, Tables 4.11-1 through 4.11-4 summarize segment-specific visual impacts and mitigation by KOP for all segments. Completed visual contrast rating forms for all KOPs provide detailed analysis of visual impacts as determined from each KOP. Segment-specific discussions that follow are broken out by Proposed Action and Action Alternative, and are presented for:

- Those segments that would not conform to established VRM Classes,
- Those segments that would require mitigation or have mitigation from other resources that would affect visual resource impact analysis;
- Those segments for which BLM is considering an RMP amendment; or
- Those segments that would affect the views of private landowners (presented under a separate heading below).

Appendix 4, Tables 4.11-5 and 4.11-6 provides a summary of the visual resource-related RMP Amendments to the Yuma RMP and Lake Havasu RMP under consideration in certain alternatives.

Proposed Action Segments

All Proposed Action segments in the eastern portion of the Project Area would conform to BLM VRM class objectives. However, the Yuma RMP would need to be amended to change the VRM class of Segment p-06 west of the Kofa NWR.

Segments p-08 and p-09 would primarily be viewed by travelers on US 95; however, OHV recreationists on the access road paralleling the DPV1 transmission line or on any number of OHV routes east of US 95 would also be viewing these segments. Views of these segments from US 95 are represented by KOP 29 (Figure 4.11-1a, Appendix 7, showing the proposed guyed V structures). Segments p-08 and p-09 would be readily viewed from KOP 29 directly east and west of and crossing US 95. In addition to the DPV1 transmission line, at this intersection the WAPA 161kV H-frame structures, monopole structures of the distribution line providing power to the Cunningham Peak communications site, associated conductors, and pipeline infrastructure are visible, making the area look visually cluttered and developed. Because of the presence of the large self-supporting lattice structures of the DPV1 transmission line, the addition of the Project structures would be a relatively minor addition.

Because guyed V structures would pose an unacceptable human health and safety risk to OHV recreationists in heavily used recreation areas, such as the vicinity of the LTVA and Copper Bottom Pass, in this location, self-supporting lattice structures with matching color and span lengths to match the existing DPV1 structures would replace the guyed V structures as mitigation to eliminate the hazards associated with guy wires (Figure 4.11-1b, Appendix 7). However, regardless of structure type and application of additional MMs, taken together, this level of development would be a major modification to the visual environment and dominate the view. Thus, VRM Class III objectives would not be met.

An amendment to the Yuma RMP to change the VRM class of Segments p-07, p-08, and p-09 from Class III to Class IV would ensure conformance. Consequently, amendment of the RMP to similarly change the VRM class of Segment p-06 west of the Kofa NWR would be implemented (Figure 4.11-2, Appendix 7).

Proposed Action Segments p-09, p-10, p-11, p-12, and p-13, as viewed from KOPs 30, 32, 35, 37, and 38 (simulated, Figures 4.11-3, 4.11-4, 4.11-5a and b, 4.11-6, 4.11-7a and b, respectively, Appendix 7) would be within the BLM utility corridor designated VRM Class III. The existing DPV1 transmission line and the Proposed Action would follow Copper Bottom Pass Road, placing travelers on the road (primarily recreationists) within approximately 0.1- and 0.2-mile of the Project. Additionally, west of the Dome Rock Mountains, a variety of gravel roads, two tracks, and OHV trails wind around through the area, greatly varying distances between viewers and infrastructure. Along the Proposed Action, viewers would be observing the Project in the context of the DPV1 transmission line. As viewers move through the landscape, when the Project would be in closest proximity to the viewers, the structures would outsize the landscape features and portions would be skylined. Further, due to steeper than average slopes in Copper Bottom Pass, access roads (upgraded existing roads, new centerline access roads, or access spur roads) would range from 18 – 22 feet in width for relatively flat areas (0 – 7.9 percent slope), 25 – 30 feet in width for moderately sloped lands (8 – 14.9 percent slope), and 30 – 76 feet in width for steep lands (>15 percent slope). Areas allowing for vehicular turning radius would also be placed at intervals along Copper Bottom Pass Road. Such alterations would be visible in the views from

KOP 32 and 35 (simulated; Appendix 1, Figure 4.11-4 and 4.11-5a and b, respectively), though current simulations do not reflect maximum potential width of the roads. As viewed in that situation, the Project, in conjunction with the DPV1 infrastructure, would be a major modification to the landscape and would dominate the view, thus not conforming to VRM Class III objectives.

DCRT proposes a combination of guyed V and self-supporting lattice structures for these Proposed Action segments (Figure 4.11-8a, Appendix 7). Because guyed V structures would pose an unacceptable human health and safety risk to OHV recreationists in heavily used recreation areas, such as the Copper Bottom Pass area, along these segments, self-supporting lattice structures would replace the guyed V structures as mitigation to eliminate the hazards associated with guy wires and also match the existing DPV1 structures, decreasing visual impacts (Figures 4.11-8b, 4.11-3, and 4.11-6, Appendix 7).

This level of development along these segments does not meet VRM Class III objectives. An amendment to the Yuma RMP to change the VRM class of these segments from Class III to Class IV would ensure conformance.

Alternative Segments

The only Action Alternative segments in the eastern portion of the Project Area that would not conform to BLM VRM class objectives are Segment i-04, which is viewed from KOP 20 (simulated, Figure 4.11-10a, Appendix 7) and Segment in-01, viewed from KOPs 19, 20, and 59.

Segment i-04 would range in distance from viewers on I-10 from 0.1-mile to 0.4-mile. Portions of Segment i-04 are used for OHV recreation during the heavy visitor use season, which would put recreationists in close proximity to the Project infrastructure. Because guyed V structures would pose an unacceptable human health and safety risk to OHV recreationists in heavily used recreation areas, in this location, self-supporting lattice structures or monopoles would replace the guyed V structures as mitigation to eliminate the hazards associated with guy wires (Figure 4.11-10b, Appendix 7). However, regardless of structure type and application of additional MMs, taken together, this level of development would be a major modification to the visual environment and dominate the view. Thus, VRM Class III objectives would not be met. An amendment to the Yuma RMP to change the VRM class of Segment i-04 from Class III to Class IV would ensure conformance (Figure 4.11-11, Appendix 7).

Segment in-01 (Figure 4.11-12, Appendix 7) would be on the north side of I-10 divided between the Yuma and Lake Havasu FOs. The portion of the route within the YFO would be within a BLM designated utility corridor and would be approximately 0.2-mile from viewers on I-10 at the closest point, and slightly less than 0.3-mile along the majority of that portion of the segment; all of which would be designated VRM Class III. Because the Project would be less than 0.3-mile from viewers along I-10, the infrastructure would be expected to outsize surrounding landforms, be a major modification and dominate view; amendment of the Yuma RMP to change the VRM Class from III to IV would ensure conformance (Figure 4.11-11, Appendix 7).

The portion of Segment in-01 within the Lake Havasu FO would be within a BLM utility corridor, crossing approximately 3 miles of lands designated VRM Class II and 5 miles of lands designated VRM Class IV. Segment in-01 within the Lake Havasu FO would be approximately

0.1-mile from viewers along I-10 at its closest point, but most portions would be approximately 0.2-mile away. The segment would meet VRM Class IV objectives; however, would not meet VRM Class II objectives given proximity to the Project in that area. Therefore, an amendment of the Lake Havasu RMP to change the VRM Class from II to IV along this segment would ensure conformance. In the Quartzsite area, Segment x-06 would be primarily viewed from within the LTVA; however, OHV recreationists on the access road paralleling the DPV1 transmission line or on any number of OHV routes east of US 95 and the LTVA would also be viewing this segment. Views of this segment from within the LTVA are represented by KOPs 22 (simulated, Figure 4.11-13a, Appendix 7, showing the proposed guyed V structures). Views of the Project along Segment x-06 would be most impacted for those occupiers of the outer eastern edge of the LTVA, where the segment would be a few hundred feet away. During the heavy visitor use season, views would become more blocked and muted as viewers move into the central portion of the LTVA, where RVs would intervene in the view.

Segment x-07 would parallel the east side of US 95 and the existing WAPA 161kV transmission line. This segment would be viewed either from the highway or from within the LTVA, as represented by KOPs 28 (simulated, Figure 4.11-14, Appendix 7). Similar to Segment x-06, views would become more blocked and muted as viewers move into the central portion of the LTVA, where RVs would intervene in the view.

The structures and conductors along these segments would pose a large, dominating presence that would be a major modification to the visual environment (Figure 4.11-14, Appendix 7).

Because guyed V structures would pose an unacceptable human health and safety risk to OHV recreationists in heavily used recreation areas, such as the vicinity of the LTVA and Copper Bottom Pass, along Segment x-06, either self-supporting lattice structures or monopoles would replace the guyed V structures (Figures 4.11-13b and c, Appendix 7) as mitigation to eliminate the hazards associated with guy wires (Figures 4.11-15a and b, Appendix 7). Along Segment x-07, lattice H-frame structures would replace the guyed V structures to more closely resemble the WAPA 161kV structures, as well as eliminate guy wires.

Regardless of structure type and application of any additional MMs, taken together, this level of development along Segments x-06 or x-07 would result in major modifications to the visual environment and dominate the view. Thus, VRM Class III objectives would not be met. An amendment to the Yuma RMP to change the VRM class of Segment x-06 from Class III to Class IV for 0.3-mile either side of segment centerline would ensure conformance. An amendment to the Yuma RMP to change the VRM class of Segment x-07 from Class III to Class IV, where applicable would ensure conformance.

Segment qs-01 (Figure 3.11-12, Appendix 7) would also be located in the northern portion of the LTVA east of US 95 and south of I-10, in a heavily recreated area southeast of Quartzsite. Similar to Segments x-06 and x-07, proposed guyed V structures would be replaced with other structures to eliminate the hazards associated with guy wires. Because the structures would be replaced with a different type, it is recommended that in this location the guyed V structures be replaced with monopoles to more closely match the WAPA 161kV structures, which would also reduce contrast and visual clutter.

Segment i-06 (Figure 3.11-17, Appendix 7) would range between 0.1- and 0.2-mile from viewers traveling on I-10, in close proximity to the heavily recreated areas south of Quartzsite and Copper Bottom Pass. Similar to Segment i-04, proposed guyed V structures would be replaced with other structures to eliminate the hazards associated with guy wires. However, regardless of structure type and application of additional MMs, due to proximity of viewers, this level of development would be a major modification to the visual environment and dominate the view. Thus, VRM Class III objectives would not be met. An amendment to the Yuma RMP to change the VRM class of Segment i-06 from Class III to Class IV would ensure conformance for the portion of the segment located on BLM-administered land.

The construction of Segments cb-01/cb-02 would require a helicopter fly yard, which would require crushing, mowing, or removal of vegetation and would disturb soil on 43.5 acres. In the short term, these locations would cause a visual change to the landscape due to the movement of the helicopters and an increase in fugitive dust. In the long term, the disturbed soil and crushed or mowed vegetation would be noticeable on the landscape until fully recovered.

Segments cb-01, cb-02, and cb-03 would all be located in narrow canyon settings with limited visibility. Of these Action Alternative segments, only the portion of Segment cb-03 on BLM-administered land would be located within the BLM utility corridor along the Proposed Action route and Copper Bottom Pass Road; however, it would be on the opposite side of the canyon from the DPV1 transmission line, as viewed from KOP 35 (simulated, Figure 4.11-5b, Appendix 7). Similar to the Proposed Action segments, travelers (recreationists) on the road would be in relatively close proximity to the Project along Segment cb-03 where the closest structures would outsize the surrounding landscape features and portions may be skylined. Despite the fact that the DPV1 infrastructure would be on the opposite side of the road, the Project would still be viewed in the context of the DPV1 transmission line, and taken together, would be a major modification to the landscape and would dominate the view, thus not conforming to VRM Class III objectives. In certain alternatives the Yuma RMP would be amended to VRM Class IV with the extent of the change limited to the viewshed where both the Project and DPV1 would be visible (bounded by the adjacent ridgetops), while the rest of the utility corridor would remain VRM Class III (Figure 4.11-9[2], Appendix 7). Mitigation measures similar to those described above for portions of Segment cb-03 located within the BLM utility corridor would also be recommended for the portion of Segment cb-03 located on CRIT lands; however, the CRIT would ultimately be responsible for determining required mitigation for portions of the segment on CRIT land.

Portions of Segments cb-01 and cb-02 would be within the BLM utility corridor designated VRM Class III, where they would connect to the Proposed Action route. The portion of these segments outside of the utility corridor would be located exclusively within VRM Class II areas, as viewed from KOPs 33 and 34 (simulated, Figures 4.11-16 and 4.11-17a and b, Appendix 7, respectively). Segment cb-01 would cross the flank of Cunningham Peak to the west side of the Dome Rock Mountains and connect to Segment cb-04. Distant views contain Cunningham Peak and the communications site on its top; however, from areas outside of the Copper Bottom Pass area, the transmission infrastructure would either not be visible or minimally visible but

[2] For purposes of the EIS, location of the VRM Class III/IV boundary as discussed here has been estimated. Should this segment be included in the selected alternative, the boundary would be precisely located using a viewshed analysis.

indistinguishable, due to distance from viewers. Segment cb-02 would follow a portion of Johnson Canyon, then cross a ridge to connect to Segment cb-04.

As described for the Proposed Action segments, the closest structures to viewers along Segments cb-01 or cb-02 would outsize the landscape features and portions would be skylined. Because either of these segments would be a new addition in a heavily used, relatively scenic, and visually sensitive area, the Project would be a major modification to the landscape and would dominate the view, thus not conforming to VRM Class II objectives. To reduce visual impacts in these visually sensitive areas, no access would be constructed, surface disturbance would be minimized, and color treating for both disturbed rock surfaces and the structures to reduce contrast with the surrounding landscape would occur. In certain alternatives the Yuma RMP would be amended to VRM Class IV (both inside and outside the utility corridor) with the extent of the change limited to the viewshed where either segment would be visible (bounded by the adjacent ridgetops), while the rest of the utility corridor unaffected by the Project would remain VRM Class III.

Segment cb-04, as viewed from KOP 34 (simulated, Figures 4.11-17a and b, Appendix 7), would cross VRM Class II and III designated lands west of the Dome Rock Mountains, the eastern portion of which would have enclosed views of deep canyons connecting to Segments cb-01 or cb-02, then opening up to broader views of the west side of the Dome Rock Mountains and points west. The proposed structures for Segment cb-04 are guyed V structures, but because this is in the heavily recreated Copper Bottom Pass area, guyed V structures would be replaced with self-supporting lattice structures to eliminate potentially hazardous guy wires. Similar to Segments cb-01 and cb-02, the structures closest to viewers would outsize surrounding landscape features, a portion would be skylined, and the Project would be new development in a previously undeveloped area, and thus would not conform to VRM class objectives. In certain alternatives, the Yuma RMP would be amended to change the VRM to Class IV in an area 0.3-mile either side of the centerline of Segment cb-04.

Segments cb-05 and cb-06, as viewed from KOPs 36 and 38 (simulated, Figures 4.11-18 and 4.11-12b, Appendix 7, respectively) would offer alternative connections from Segment cb-04 to the Proposed Action route. On BLM-administered land, Segment cb-05 would cross VRM Class III designated lands while Segment cb-06 would cross lands primarily designated VRM Class II. Both segments would occur in areas with predominantly open panoramic views that are heavily used for OHV recreation, which would place viewers in close proximity to the infrastructure. Because of the heavy recreation use, proposed guyed V structures would be replaced with self-supporting lattice structures to eliminate potentially hazardous guy wires. These lattice structures would also reduce contrast with the existing DPV1 infrastructure, where viewed in conjunction with the Project. These segments would not conform to VRM Class II and III objectives. An amendment to the Yuma RMP to Class IV in an area 0.3-mile either side of the centerline of these segments would ensure conformance.

Residents and Local Viewers

Potential impacts to residents in the easternmost portion of the Project Area are represented by KOPs 5, 7, 19 (Figures 4.11-19, 4.11-20, and 4.11-21, Appendix 7, respectively). Potential impacts to travelers and other viewers on private lands are represented by KOPs 2 and 6 (Figures 4.11-22a and b and 4.11-23, respectively; Appendix 7), along Salome Road, and KOP 18

(simulated, Figures 4.11-24a and b, Appendix 7) near developments at the Vicksburg Road exit off I-10.

Segments qs-01 and qs-02, represented by KOPs 24 and 26 (Figure 3.11-12 and simulated Figure 4.11-25, Appendix 7, respectively); and qn-02, represented by KOP 27 (Figure 3.11-14, Appendix 7), would be in relatively close proximity to the community of Quartzsite and would be visible from private lands.

Segment qs-01 would be on BLM-administered land approximately 0.25-mile away at its nearest point from the RV Park where KOP 24 is located. Because the Project along this segment would be less than 0.3-mile away from the viewer, the existing infrastructure begins to outsize the surrounding landscape features and dominate the view, and the Project would add to visual clutter. The Project along Segment qs-01 is proposed to use guyed V structures; however, those structures would be replaced with monopoles to eliminate potential hazards to OHV recreation from guy wires. This replacement would also reduce the contrast between the Project and the existing WAPA 161kV monopole structures. Addition of the Project along this segment with monopole structures would have a moderate to major impact to the views of RV park residents by increasing the sense of development and visual clutter.

Segment qs-02 would be on BLM-administered land approximately 0.75-mile away from the RV Park where KOP 26 is located. The Project along Segment qs-02 is proposed to use guyed V structures; however, those structures would be replaced with monopoles to eliminate potential hazards to OHV recreation from guy wires. This replacement would also reduce the visual clutter of the guy wires in the view. Addition of the Project along this segment with monopole structures would have a negligible to minor impact to the views of RV park residents as the vertical structures would blend well with the other single pole vertical elements in the view.

Segment qn-02 would be on BLM and ASLD lands northeast, north, and northwest of Quartzsite. The nearest residence would be approximately 0.2-mile south of the segment, and the segment would be new development in an undeveloped area north and northwest of the residences. Northeast of the KOP, the segment would be paralleling the existing WAPA 161kV transmission line. As previously described, at distances less than approximately 0.3-mile from the Project, the Project is estimated to be outside the surrounding landscape features and dominate the view. Therefore, the Project along Segment qn-02 would have a moderate to major impact on views of private landowners in this area.

4.11.5 Operations, Maintenance, and Decommissioning

The structures, conductors, permanent access roads, and SCS, would increase visual contrast, mainly during the operational phase of the Project. Visual impacts would be most evident where cleared areas created scars, barren areas, or unnatural lines and contrast resulting from clearing which would remain for the life of the Project. The most evident and long-term visual contrasts result from the presence of structures and conductors within the landscape. These vertical structures, conductors, guy wires, and access roads would introduce long, linear disturbance that would contrast in areas where the Project would be relatively close to the KOP and in relatively natural areas where no development or existing infrastructure is visible or noticeable in the landscape. After decommissioning, these visual contrasts would no longer be present.

During maintenance, types of activities would be similar to but smaller in scope, and less noticeable than during construction (for example, structure or conductor maintenance or repair may require similar types or levels of effort to construction, but would occur in more discrete areas, requiring less equipment and/or disturbance that would be noticeable). During decommissioning, activities (types and levels of effort, and extent of disturbance) would be similar to construction, and likely equally noticeable.

Impacts to VRI were analyzed based on Scenic Quality Rating Unit (SQRU) scores (Appendix 4A). Most SQRU scores were solidly within the range such that any reductions in scenic quality that would result from the Project would not change the overall rating for the unit.

4.11.6 Mitigation Measures

The applicant has committed to APMs, and the BLM developed required BMPs, that would minimize impacts to visual resources (Appendix 2A, Section 2A.12). However, the following MMs would be required, as appropriate, for VRM compliance and/or to reduce impacts to visual resources:

MM-VIS-01: Minimize disturbance at structure bases.

MM-VIS-02: No access routes would be constructed to structure sites, and thus structure sites be accessed by foot or helicopter.

MM-VIS-03: Apply surface treatments (such as Permeon, or an approved equal) to newly exposed rock and gravel to blend with surrounding rock face and minimize visual impact of attention-attracting disturbance.

MM-VIS-04: Limit height of structures to that absolutely necessary for safety and operation in order to minimize skylining and reduce the need for beacons to protect dark sky resources and maintain astronomical viewing opportunities.

MM-VIS-05: Shorten span lengths and design the route to follow canyon routes to minimize elements (conductors in particular) that would be overhead of viewers and skylined.

MM-VIS-06: Use structure type to match existing structures and reduce form contrast.

4.11.7 Resource Management Plan Amendments

RMP Amendments to address issues with visual resources management would only be included for the Yuma and Lake Havasu RMP. The following Proposed Action and Action Alternative segments (but not the Agency Preferred Alternative) include RMP amendments for VRM class changes as shown on Figure 4-1:

- Segments p-06 through p-13
- Segments cb-01 through cb-06
- Segments i-03 through i-06
- Segment in-01

- Segments qs-01, qs-02, and qn-01
- Segments x-06 and x-07

Appendix 4, Tables 4.11-5 and 4.11-6 summarize potential visual resource-related RMP amendments by segment to the Yuma RMP and Lake Havasu RMP, respectively.

The impact of these proposed RMP amendments would be to change the visual management standards for the design and management of future projects and for the rehabilitation of existing projects from the current VRM Class II or III to VRM Class IV, which allows for major modifications to the landscape.

4.11.8 Construction of Full Route Alternatives and Subalternative Effects

4.11.8.1 Proposed Action

Full Route Analysis Summary

The Proposed Action route would parallel the existing DPV1 transmission line and minimize associated visual impacts by utilizing existing access. This route would avoid visual impacts to the Town of Quartzsite. Additionally, the Proposed Action route would avoid direct impacts to CRIT land and to sensitive recreational users of Johnson Canyon. This route would not meet VRM class objectives and would include amendment of the Yuma RMP for Segments p-13 through p-16.

Linear KOP

The Proposed Action would impact the linear KOP along I-10 in the eastern portion of the Project Area approaching and between the two I-10 crossings of Segment p-01. Scenic quality in this area is rated B, except for a very small area near the easternmost crossing; and sensitivity is moderate. At the crossings, the infrastructure would appear as a major modification and dominate views within approximately 0.3-mile either side of each crossing, and north and south of each crossing location.

However, travelers on I-10 going 75 miles per hour (mph) would only be viewing each crossing in close proximity for a few seconds. The crossings would be within the Arizona Department of Transportation (ADOT) easement for I-10 and on a combination of ASLD and private lands on either side of the easement. The BLM recommends structure changes in these locations to reduce contrast and the sense of visual clutter; however, ultimately, the type of structures used would be determined between DCRT and the landowner.

4.11.8.2 Alternative 1: I-10 Route

Full Route Analysis Summary

The I-10 full route would utilize only a small portion of the Proposed Action route (Segment p-01), then from the westernmost I-10 crossing, follow I-10 until turning south to connect to the Colorado River Substation. Placing the transmission line along I-10 would consolidate disturbance and development along the existing highway, large portions of which would be within BLM utility corridors. This route would result in direct impacts to more state trust,

private, and CRIT lands along I-10, would have greater visual impacts to the Town of Quartzsite, and would have the greatest visual impact to numbers of viewers in the Project Area, due to proximity along I-10. However, a greater portion of the route on BLM-administered lands would meet VRM class objectives, with only Segments i-03 through i-06 including amendment of the Yuma RMP.

Linear KOP

From the western crossing of I-10 by Segment p-01, Alternative 1 would continue west, paralleling the south side of I-10. With the exception of Segment p-01, most of the segments along the I-10 route would involve adding new transmission line infrastructure in areas where there is no existing infrastructure. Many of these areas are open lands with minimal or no perceived development. Addition of the transmission line along these routes would add a visible and, in many cases, noticeable development. However, most of the areas crossing BLM-administered land would meet established VRM class objectives. For the majority of the route, the Project would be 0.3-mile or more away from viewers traveling along I-10, which at its nearest points would place the Project within the context of the surrounding landscape. Under Alternative 1, the Alternative SCS location would be used, connected by Segments i-03 and i-04; however, the Alternative SCS would meet VRM Class III objectives as viewed by travelers along I-10 (Figures 4.11-26 and 4.11-27, Appendix 7). In addition, the alternate 12kV SCS distribution line would be visible crossing I-10 and extending south of the interstate to the Alternative SCS.

Views along I-10 crossing CRIT lands would be similarly impacted. East of the Colorado River, the Project infrastructure along I-10 would generally range between 0.3- and 0.7-mile away from viewers on I-10, with exception of a few segments; therefore, the relative size of the infrastructure in the landscape would minorly fluctuate (Figure 4.11-23 and Figure 4.11-28, Appendix 7) as travelers move along the highway.

Near the Colorado River, the I-10 route would diverge from I-10 to the south, placing the Project 0.5-mile to 1.5 miles south of the Interstate, further reducing the visibility and visual effects of the Project on I-10 travelers. With greater distance, the infrastructure would be better absorbed by the surrounding landscape and less noticeable. Intervening vegetation or other development may occasionally block or blend the Project views (Figure 4.11-24a and b, Appendix 7).

Along the I-10 linear KOP, scenic quality on Federal lands is mostly B with notable exceptions of the Big Horn Mountains Wilderness. The New Water Mountains, the Dome Rock Mountains, and in the general vicinity of the Colorado River Substation, which are A. Visual sensitivity along I-10 is almost evenly divided between moderate and high, with areas of high sensitivity being in the general vicinity of Quartzsite and west of Blythe in the vicinity of the Colorado River Substation. Impacts to viewers along I-10 are going to be minor in areas of lower scenic quality and sensitivity and moderate in areas of higher scenic quality and sensitivity. Additionally, there are larger areas of higher scenic quality south of I-10 than there are to the north, meaning that viewers along I-10 attracted to the distant scenic views to the south would be viewing these areas with the Project in the intervening landscape. In areas of moderate impact, the visibility of distant scenic quality A areas may further increase the adverse visual impact of the Project, notably Segment i-04.

Figure 4-1
Ten West Link
Segments that Would Include VRM Class Change RMP Amendment

Subalternatives

Subalternatives 1A, 1B and 1E would locate the project further away from I-10 viewers, thus reducing visual impacts in those areas, as compared to the Alternative 1 route. Subalternative 1C would move the transmission line to the north side of I-10 such that I-10 viewers in an area of high sensitivity would not be viewing the distant high-quality scenery with the Project in the immediate foreground, reducing visual impacts in a portion of the I-10 linear KOP. Additionally, this subalternative would move the Project out of a heavily recreated area where structure change would not be required. Subalternative 1D would blend with existing infrastructure, result in minor impacts, and includes a VRM Class change from III to IV.

4.11.8.3 Alternative 2: BLM Utility Corridor Route

Full Route Analysis Summary

The Alternative 2 route would impact the portion of the Project east of Quartzsite similar to Alternative 1, and the portion of the Project west of Quartzsite similar to the Proposed Action. An amendment to the Yuma RMP would be included for Segments p-09 through p-13 to ensure conformance. Unlike the Proposed Action and Alternative 1, views of recreationists in the LTVA and travelers on SR 95 would be impacted by the Project paralleling SR 95; whereas neither the Proposed Action nor Alternative 1 would affect this group of sensitive viewers. However, the portion of the route in this area would be within a BLM utility corridor but includes an amendment of the Yuma RMP for Segment x-07 to ensure conformance with VRM class objectives.

Linear KOPs

The I-10 linear KOP encompassing Segments i-01 through i-05 would be the same as described for Alternative 1.

Segment x-07 would impact the linear KOP along US 95 south of Quartzsite. The views of travelers on US 95 currently include the WAPA 161kV transmission line, including H-frame structures on the east side of the highway, and single-pole distribution lines on the west side of the highway. The Project would add lattice H-frame structures east of and parallel to the existing WAPA 161kV infrastructure within the BLM utility corridor, that would remain a relatively consistent distance from US 95 viewers traveling at highway speeds. The segment would connect to Segment p-09, convert to self-supporting lattice structures, and turn west to follow Copper Bottom Pass Road, crossing over US 95. The large lattice H-frame structures would be a major modification and would dominate the views for travelers on US 95, particularly in conjunction with the existing utility infrastructure.

Subalternatives

Subalternatives 2A and 2B would locate the project further away from I-10 viewers, thus reducing visual impacts in those areas, as compared to the Alternative 2 route. Subalternatives 2C and 2D would have no effect on visual resource impacts as viewed within the I-10 linear corridor. Additionally, this subalternative would move the Project out of a heavily recreated area where structure change would not be required. Subalternative 1E would have no discernable change in visual impacts, as compared to the Alternative 2 route.

4.11.8.4 Alternative 3: Avoidance Route

Full Route Analysis Summary

The Alternative 3 route would impact the portion of the Project east of Quartzsite similar to Alternative 1; except Segments p-02, p-03, p-04, and x-03 would route the Project away from private and state trust lands along I-10 and reduce the visual effects to travelers along that portion of I-10. The Project would avoid visual impacts to the Town of Quartzsite and minimize visual impacts to recreationists in the LTVA by routing the Project along Segment x-05. West of US 95, visual impacts would be similar to the Proposed Action, except the Project would be routed over Cunningham Peak, including an amendment of the Yuma RMP for Segments cb-01, cb-04, and cb-05 to ensure conformance with VRM class objectives. At the Colorado River, this route would follow Segment cb-10, shifting the visual impacts of river crossing north and separate from the existing DPV1 infrastructure. Segment cb-10 would connect with Segments x-11, ca-01, x-12, and ca-06; this portion of the route would not follow other existing transmission infrastructure and would visually impact a different set of local residents and road users. Segments ca-07 and 09 would be located on BLM-administered land, meeting the VRM class objectives within utility corridors, and would connect to the Colorado River Substation via Segment x-19.

Linear KOP

Under Alternative 3, the I-10 linear KOP in the eastern portion of the Project Area would be impacted as described under the Proposed Action. Segment x-03 would connect the Proposed Action Route from Segment p-04 up to the I-10 route at Segment i-03, continuing through Segment i-04, where impacts to the linear KOP would be as described under Alternative 2. Alternative 3 would diverge from the I-10 linear KOP at Segment x-05, which would also avoid any impacts to the US 95 linear KOP. The Alternative 3 route would not be visible from I-10 until Segments ca-06, ca-07, and ca-09, where the Project would be approximately 1.5 miles south of I-10 for approximately 8 miles before turning south along Segment x-19 to connect to the Colorado River Substation. Impacts to this portion of the I-10 linear KOP would be as described under Alternative 2.

Subalternatives

Subalternative 3A would further reduce impacts to visual resources, as compared to the Alternative 3 route. Subalternative 3B would have the same impact to the affected portion of the I-10 linear KOP as described for Alternative 1. Portions of Subalternative 3C would virtually eliminate visual impacts in some areas, while increasing visual impacts in others. Subalternative 3D would move the transmission line to the north side of I-10 such that I-10 viewers in an area of high sensitivity would not be viewing the distant high-quality scenery with the Project in the immediate foreground, reducing visual impacts in a portion of the I-10 linear KOP. Subalternative 3E would result in minor impacts to the views of I-10 travelers, while possibly resulting in moderate to major impacts to nearby residents. Subalternatives 3F, 3J, and 3L would have the same impacts as described under Alternative 1. Subalternative 3G would blend with existing infrastructure, result in minor impacts, and include a VRM class change from III to IV. Subalternative 3H would have impacts to visual resources of I-10 travelers similar to Alternative 3 and increase the visual impacts in other areas, as compared to Alternative 3. Subalternative 3K

and 3M would have no effect on visual resource impacts as viewed within the I-10 linear corridor.

4.11.8.5 Alternative 4: Public Lands Emphasis Route

Full Route Analysis Summary

Alternative 4 would be a combination of other full routes. The route would minimize visual impacts to travelers on I-10 by limiting the route to Segment in-01. However, the route would follow Segment x-06 along the boundary of the LTVA, impacting the views of recreationists in that area and include an amendment of the Yuma RMP to ensure conformance with VRM class objectives. West of US 95, visual impacts would be similar to the Proposed Action, except the Project would be routed through Johnson Canyon, along Segments cb-02, cb-04, and cb-05, impacting the visual resources of recreationists in that area. Following the Proposed Action route west of Johnson Canyon, this full route alternative would include amendment of the Yuma RMP for Segment p-13 to ensure conformance with VRM class objectives. In California, the visual impacts would be the same as the Proposed Action, until the Alternative 4 route turns north on Segments x-12 and 13, connecting to Segment ca-06. This portion of the route would not follow other existing transmission infrastructure and would visually impact a different set of local residents and road users. Impacts from Segments ca-07, ca-09, and x-19 would be the same as described for Alternative 3.

Linear KOP

The Alternative 4 route would remain south and not impact the visual resources along the I-10 linear KOP until Segment i-04. Under Alternative 4, the Alternative SCS location would be used, connected by Segments x-04 and i-04; however, the Alternative SCS would meet VRM Class III objectives as viewed by travelers along I-10. Other impacts were previously described as follows:

- Segment in-01 – Subalternative 1C
- Segments ca-06, ca-07, ca-09, x-19 – Alternative 3

All other segments would not impact views along the I-10 linear KOP.

Subalternatives 4A, 4E, 4F, 4G, 4K, 4L, 4M, 4N, and 4P would have no effect on visual resource impacts as viewed within the I-10 linear corridor. Subalternative 4B would have the same impacts as described for Alternative 2. Subalternative 4C would virtually eliminate visual impacts in some areas, while increasing visual impacts in others. Subalternatives 4D and 4I would have the same impacts as described under Alternative 1. Subalternative 4H would impact visual resources similar to impacts in the eastern portion of the Project Area on Reclamation-managed public lands.

4.11.8.6 Agency Preferred Alternative

Full Route Analysis Summary

East of Quartzsite, the Preferred Alternative would have the same impacts as Alternative 1. By following Segment x-05, the Preferred Alternative would avoid visual impacts to the Town of

Quartzsite, the LTVA, and travelers along US 95. West of the intersection of Segment x-05 with Segment p-07, the route would follow the Proposed Action route through the Copper Bottom Pass area. Impacts for the remainder of the route would be the same as those described for Alternative 2. This alternative does not include any RMP amendments for VRM Class. Instead, for management consistency the corridor would remain VRM Class III and impacts to visual resources would be addressed through application of APMs, BMPs, and MMs. These measures would serve to reduce impacts to visual resources to the extent practical. However, in some areas the VRM class may not be met, especially for sensitive viewers.

Linear KOP

Impacts to the I-10 linear KOP for Segments i-01 through i-04 would be the same as described for Alternative 1. The Preferred Alternative would cross and not follow US 95, and therefore there would be no impacts to that linear KOP.

Subalternatives

The portion of the Preferred Alternative containing Subalternative 4D would have the same impacts as described under Alternative 1.

4.11.8.7 Mitigation Summary

Table 4-9 summarizes the mitigation required for the Proposed Action and the full route Action Alternatives. Additional detail by KOP is provided in Appendix 4, Tables 4.11-1 through 4.11-4.

Table 4-9 Mitigation Summary for Full Route Alternatives

ALTERNATIVE	VIS-01	VIS -02	VIS-03	VIS -04	VIS-05	VIS-06
Proposed Action	X	X	X	X		X
Alternative 1	X		X			X
Alternative 2	X		X	X		X
Alternative 3	X	X	X	X		X[1]
Alternative 4	X	X	X	X	X	X[1]
Preferred Alternative	X	X	X	X	X	X[1]

[1]Any structure changes on non-BLM lands would be negotiated between the DCRT and landowner.

4.11.9 Residual Impacts

After the application of mitigation, non-conforming segments would continue to not conform to established VRM class objectives. Even where structure changes are required to address potential recreation hazards from guy wires, and where structures are changed to match any existing structures, segments would continue to be a major modification on the landscape and dominate views. However, implementation of mitigation would reduce the contrasts and overall impacts, even if the VRM class objectives could not be met.

4.11.10 CDCA Plan Compliance

CMAs LUPA-VRM-1, LUPA-VRM-2, DFA-VRM-1, and DFA-VPL-VRM-1 would apply to the Project (Appendix 2C) and would be satisfied by information provided in Appendix 4, Section 4.11. DFA-VPL-VRM-3, LUPA-TRANS-BIO-1, LUPA TRANS-BIO-3, LUPA TRANS-BIO-4 would also apply to the Project (Appendix 2C). The Project would comply with these CMAs through APM-AES-04 through APM-AES-06, and BMP-AES-04 and BMP-AES-06 through BMP-AES-08 (Appendix 2A, Section 2A.12).

4.11.11 Unavoidable Adverse Effects

The Project would be visible in the landscape within approximately 3 miles of viewers; and noticeable between 1 and 2 miles away, particularly where there is no existing development. Where the Project would follow the existing DPV1 transmission line, the Project, in combination with the existing infrastructure would result in increased visual clutter and would result in contrast in structure form when guyed V structures would be used adjacent to the existing self-supporting lattice structures of the DPV1 transmission line. Where visible, ground disturbance would be obvious and noticeable for many years, if not permanently because of the desert environment and difficulty with revegetation and reclamation.

4.11.12 Cumulative Effects

The Project in conjunction with past, present, and reasonably foreseeable future projects would incrementally contribute to changes in the visual character and the scenic quality of the natural landscapes in the CEA.

To the extent that construction of the Project would be visible within the same field of view as one or more of the existing projects, those under construction, or reasonably foreseeable future projects, adverse cumulative visual impacts could result. The Project and the past, present, and reasonably foreseeable future projects combined would result in a perceived increase in industrialization of the landscape, diminution of visual quality, and increase in visual contrast. Also, in the cases where there appear to be multiple corridors due to greater separation between facilities, the projects would contribute to a sense of proliferation of energy infrastructure within the I-10 corridor.

The Project, in combination with the existing infrastructure of the DPV1 transmission line would result in increased visual clutter, and contrast in structure form when guyed V structures would be used adjacent to the existing self-supporting lattice structures of the DPV1 transmission line. Within the BLM utility corridor along I-10, the combination of the highway and transmission infrastructure would increase the sense of development within the corridor as viewed by travelers along I-10. Appendix 3, Tables 3.12-1 and 3.12-2 list past, present, and foreseeable projects within the CEA. Of the 12 reasonably foreseeable future projects noted, 6 are utility scale renewable energy projects totaling 27,714 acres which would substantially increase developed human use of land.

Two large-scale solar facilities are planned in the easternmost portion of the CEA, the Harquahala Solar Project in Maricopa County and the La Paz County land conveyance for solar development in La Paz County, both would be south of I-10. The Harquahala Solar Project

would be in an area currently under agricultural use, while the La Paz County land conveyance would be in an undeveloped desert area. However, both facilities could not be viewed simultaneously in conjunction with the Project. For travelers along I-10, these future facilities, in conjunction with the Project and the existing Harquahala Power Plant, would change the character of the landscape from either undeveloped or rural to heavy energy infrastructure.

South of Quartzsite along Segments qs-02 and x-07, the combination of the Project with the existing transmission infrastructure would intensify the visual sense of energy infrastructure, and increase the level of visual clutter, similar to the DPV1 transmission line. However, southwest of Quartzsite, the transmission line would be viewed in context of development along the edge of Quartzsite, which would help the addition of the Project to blend and be less noticeable.

Similar to the Quartzsite area, the Project in conjunction with the existing DPV1 infrastructure in the Copper Bottom Pass area, would intensify the visual sense of energy infrastructure and increase the level of visual clutter. Along I-10, the combination of the highway and transmission infrastructure would increase the sense of development within the corridor as viewed by travelers along I-10. If visible from I-10, the reasonably foreseeable West Port Gold Project would increase the industrial character as well.

The majority of future development would occur in California, in the vicinity of the Colorado River Substation. The addition of four solar projects and associated gen-tie lines, and the Blythe Energy Power Plant/Sonoran Energy Project in conjunction with the Project and existing energy infrastructure, would change the character of the landscape in that area; but in the context of heavy energy infrastructure, the Project would blend and not be individually noticeable.

4.11.13 Irreversible and Irretrievable Commitment of Resources

The main irreversible or irretrievable commitment of resources with regard to visual resources would be the effects of ground disturbance. Because of the desert environment, reclamation and revegetation to achieve a visually naturalized state is extremely difficult, if not impossible. While structures, foundations, and conductors can all be physically removed at the end of the life of the Project, disturbance from cleared bases and access routes may never fully visually recover.

4.11.14 Relationship of Short-term Uses and Long-term Productivity

Short-term impacts on viewsheds in the Project Area would be tied to temporary visual intrusions from construction activities and structures. The visual intrusion of the transmission line and landscape contrast created by the Project infrastructure would remain for the operational life of the Project. Ground disturbance may remain visible and indefinitely impact the viewshed to varying degrees.

Chapter 5 Consultation, Coordination, and Preparation

CHAPTER 5 CONSULTATION, COORDINATION, PREPARATION

5.1 INTRODUCTION

CEQ regulations implementing NEPA require that Federal agencies provide meaningful opportunities for the public and stakeholders to provide input and identify their concerns with regard to the EIS process. Federal laws, such as the ESA, the CWA, and the NHPA, mandate public involvement and consultation with agencies and/or Federally recognized tribal governments. This chapter provides an overview of consultation and coordination efforts undertaken by the BLM throughout the entire process of developing this EIS.

5.2 INTERRELATIONSHIPS BETWEEN AGENCIES (OTHER FEDERAL, TRIBES, STATE, LOCAL)

Agencies, tribes, and organizations that have jurisdiction and/or specific interest in the Project were contacted at the beginning of scoping, during the resource inventories, and prior to the publication of this EIS to inform them of the Project, verify the status and availability of existing environmental data, request data and comments, and solicit their input regarding the Project. Additional contact was made to clarify or update information provided by the agencies and organizations.

5.2.1 Cooperating Agency Coordination

The entities who formally agreed to participate as Cooperating Agencies for this EIS are listed in Table 5-1.

Table 5-1 Cooperating Agencies

USACE		

5.3 CONSULTATION WITH INDIAN TRIBES

5.3.1 Applicable Laws, Regulations, Policies, and Plans

The United States has a unique legal relationship with Federally recognized Indian tribes established through and confirmed by the Constitution of the United States, treaties, statutes, executive orders, and judicial decisions. In accordance with that relationship, the BLM engages in regular and meaningful consultation and collaboration with Federally recognized tribes in the development of policy and land-use decisions that have tribal implications. The numerous laws,

regulations, and policies pertaining to cultural resources are listed in Tables 1.7-1 and 1.7-2 in Appendix 1.

5.3.2 Federal Consultation Process

As lead Federal agency, the BLM consults with Federally recognized Indian tribes and California Native American tribes under Section 106 of the NHPA as part of the process to identify historic properties, including properties to which consulting Indian tribes ascribe traditional religious and cultural significance, also referred to as Traditional Cultural Properties (TCP). In addition, the CPUC must consider whether the Project would impact Traditional Cultural Resources eligible for listing in the California Register of Historical Resources (CRHR) as historical resources, as required by CEQA and its 2014 amendment known as AB 52. The BLM invited 23 Federally recognized tribes and California Native American tribes to participate in the Section 106 review of the Project based on information provided by the Yuma, Lake Havasu, Hassayampa, and Lower Sonoran field offices in Arizona and the Palm Springs–South Coast field office in California. The BLM in Arizona also reviewed the consultation maps maintained by the Arizona SHPO in its government-to-government consultation toolkit (https://sites.google.com/view/az-consultation-toolkit/consultation-map), on which tribes have self-identified their areas of interest for agency consultation. The CPUC contacted the Native American Heritage Commission in California and initiated consultation with California Native American tribes identified in that file search, pursuant to AB 52.

The BLM's tribal relations policy consists of notification through letters and outreach, coordination through email, telephone, and conference calls, and formal government-to-government consultation between agency officials and tribal leaders in face-to-face meetings and field trips to project areas. In addition, the BLM requested tribal input throughout the NEPA process (scoping and DEIS review), as well as during the socioeconomic workshop.

BLM consulted with the following 23 Indian tribes with jurisdiction or interest in the Project:

Agua Caliente Band of Cahuilla Indians
Ak-Chin Indian Community
Augustine Band of Cahuilla Indians
Cabazon Band of Mission Indians
Chemehuevi Tribe
Cocopah Indian Tribe
Colorado River Indian Tribes
Fort McDowell Yavapai Nation
Fort Mojave Tribe
Gila River Indian Community
Hopi Tribe
Moapa Band of Paiute Indians
Morongo Band of Mission Indians
Fort Yuma Quechan Tribe
Salt River Pima-Maricopa Indian Community
San Manuel Band of Mission Indians
Soboba Band of Luiseno Indians
Tohono O'odham Nation
Torres Martinez Desert Cahuilla Indians
Twenty-Nine Palms Band of Mission Indians
Yavapai-Apache Nation
Yavapai-Prescott Indian Tribe
Pueblo of Zuni

Efforts to initiate government-to-government consultation with these tribes have been undertaken and are ongoing. The tribal responses to the request for government-to-government consultation are in the Project record and available upon request. Appendix 5, Table 5.3-1 summarizes the consultation to date.

5.4 PUBLIC PARTICIPATION SUMMARY

To collect agency and public input for the Project environmental review, the BLM administered a public notice and participation program. The intent of scoping and public outreach is to provide information about the Project to stakeholders and the public, and solicit information from public agencies, governmental representatives, tribal representatives, and the public to aid the environmental review.

5.4.1 Scoping Process

The NOI to Prepare an EIS was published in the *Federal Register*, Volume 81, No. 56, Page 15556 on March 23, 2016. The publication of the NOI initiated the 45-day formal scoping period from March 23 through May 9, 2016.

A BLM Arizona State Office website for the Project was launched concurrently with publication of the NOI (https://www.blm.gov/site-page/programs-planning-and-nepa-project-arizona-10-west-link). The BLM's ePlanning website for the Project is located at https://go.usa.gov/xU6Be.

Legal notices and/or advertisements informing the public about scoping for the Project were published in the appropriate newspapers in Arizona and California (Appendix 5, Table 5.4-1).

The BLM mailed scoping letters describing the project proposal and proposed Federal actions, and public involvement opportunities. The mailing list of potentially interested parties was compiled from several sources, including mailing lists from prior projects located in the Project area; local field office mailing lists; DCRT outreach mailing lists and landowner mailing addresses along the proposed route based on tax assessor records; the CPUC consultation list; and local special interest groups. The mailing list also includes additional parties who might be interested in the Project such as adjacent landowners or land managers. In addition to the invitation letter, the BLM emailed notifications of both the agency-only scoping meeting and the public scoping meetings to interested parties who provided email addresses.

Three public scoping meetings were held in Tonopah, Arizona; Quartzsite, Arizona; and Blythe, California from April 12-14, 2016, to introduce the proposed Project and solicit feedback and comments. Representatives from the BLM, the proponent (DCRT), and their contractors were present at each meeting to discuss the project and answer questions. A total of 49 individuals attended the meetings and 44 comment letters were submitted.

Tables of agencies and organizations consulted are presented in Appendix 5 Table 5.4-2 through Table 5.4-6.

5.4.2 Additional Public Participation Opportunities

5.4.2.1 Agency Scoping Meeting

An agency-only scoping meeting was held on April 12, 2016, at the BLM National Training Center in Phoenix, Arizona, to solicit comments from tribal, Federal, state, and local agencies with jurisdiction or interest in the Project. Twenty-five tribal and agency representatives attended, including representatives from the Colorado River Indian Tribes, Fort Yuma Quechan Tribe, Gila River Indian Community , USFWS, U.S. Department of Energy/Western Area Power Administration, U.S. House of Representatives, ASLD, AGFD, Arizona State Parks, CPUC, CDFW, and Maricopa County (BLM 2016b).

5.4.2.2 Economic Strategies Workshop

An Economic Strategies Workshop was held on June 14, 2016, in Quartzsite, Arizona. The purpose of the workshop was to identify potential social and economic challenges posed by the Project and potential opportunities that might enhance or expand the social and economic goals of area communities. The workshop provided an opportunity for local and regional businesses, tribes, governments, individuals, and community organizations to identify, clarify, and discuss economic and social effects that could result from the Project. Forty people from 22 organizations attended the workshop.

5.4.2.3 Public Notification of DEIS Availability

BLM sent notification of availability of the DEIS to the project mailing list, publicized availability of the DEIS via news releases, and published a NOA in the *Federal Register*, 83 FR 44625, on August 31, 2018. Three public meetings were held in Phoenix, Arizona, Quartzsite, Arizona, and Blythe, California between October 9 - 11, 2018, to discuss the proposed Project and solicit feedback and comments on the DEIS. The DEIS was available online at https://go.usa.gov/xU6Be for a 90-day public comment period. Hardcopies were available for review at associated BLM offices and at other select locations such as libraries (Appendix 5, Table 5.4-7). The formal comment period ended November 29, 2018. A total of 50 comment letters and emails were received from the public. Comments and responses are provided in Appendix 8 of this FEIS.

5.5 CONSULTATION PROCESS FOR ESA SECTION 7 AND NHPA SECTION 106

5.5.1 ESA Section 7 Compliance

Pursuant to Section 7(c)(1) of the ESA the BLM prepared a draft BA based on the Agency Preferred Alternative and provided it to the USFWS and cooperating agencies for a courtesy review in February 2019. The draft BA was updated based on agency comments and coordination from February to March 2019. The final BA was submitted to the USFWS in June 2019.

Portions of the Project in California that are not within the Colorado River corridor are subject to a 2017 Programmatic Biological Opinion (BO) completed in conjunction with adoption of the DRECP. Future projects in conformance with all applicable CMAs addressed in the DRECP are covered for activities pertaining to the Mojave desert tortoise and its critical habitat. Incidental take would be requested, as appropriate, using the 2017 Programmatic BO Activity Request Form and covered under the 2017 CDCA Programmatic BO for Mojave Desert Tortoise. However, species occurring within the Colorado River corridor were not included within the DRECP consultation, and potential effects to listed species within the river corridor and in Arizona were not included in past consultations.

5.5.2 NHPA Section 106 Compliance

Section 106 of the NHPA and its implementing regulations found at 36 CFR 800.14 provide Federal agencies with the authority to negotiate PAs to govern the implementation of their Section 106 responsibilities. A draft PA establishing the APE for Section 106 review and outlining the methods of identification, evaluation, and treatment of historic properties has been prepared for the Project. Both the Arizona and California State Historic Preservation Offices (SHPOs) participated in drafting the PA.

Federal agencies must demonstrate compliance with the NHPA (54 U.S.C. 300101). Section 106 of the NHPA requires a Federal agency with jurisdiction over a project to evaluate the effect of the proposed project on properties included on, or eligible for, the NRHP. SHPOs and Tribal Historic Preservation Officers (THPOs), as well as cultural resources departments and tribal cultural specialists, play important roles in the review of impacts on historic properties (places included in or eligible for inclusion in the NRHP) under Section 106 of the NHPA and its implementing regulations at 36 CFR § 800. Federal agencies must also provide the ACHP an opportunity to comment on the effects of the proposed project on historic properties. The BLM notified the ACHP on February 15, 2017 that the Project was likely to have an adverse effect and invited them to participate in consultations. ACHP declined in a letter dated March 9, 2017. The BLM requested that the ACHP participate as a party to the PA on January 11, 2018; and the ACHP accepted on January 25, 2018.

A draft PA establishing the APE for Section 106 review and outlining the methods of identification, evaluation, and treatment of historic properties has been prepared for the Project. Any adverse effects that the Project or alternatives may have on historic properties would be resolved through compliance with the terms of a PA under Section 106 of the NHPA (54 U.S.C. § 306108). The PA covers a considerable amount of policies, procedures, and timeframes, and serves as a legally binding document for the Project.

As defined in 36 CFR § 800.6, there are three tiers of participation in a PA document: Signatories, Invited Signatories, and Concurring Parties; all have varying levels of responsibility. The tribes, agencies, governmental bodies, etc. who are Participants in the Ten West Link Draft PA are on file in the Project record. A smaller subset of the Participants came together as the Writing Group for the PA.

In their role as Lead Agency responsible for Project cultural resources compliance, the BLM developed the draft PA with assistance from agency and tribal stakeholders through a series of writing group meetings. The draft PA developed through the writing group was distributed for review and comment to all consulting parties prior to inclusion in the DEIS.

The draft PA was included for public comment in the DEIS as Appendix 2D. Based upon the comments received during the DEIS comment review period and further discussion among the consulting parties, revisions have been made to the PA. A revised draft PA is included as an appendix in this FEIS.

Implementation of the Project also would require local and state agencies in California to demonstrate compliance with CEQA (Appendix 1C), for which specific guidance regarding cultural resources is presented in the CEQA Guidelines. In Arizona, local and state agencies must comply with the Arizona antiquities laws. The list of consulting parties under Section 106 are on file in the Project record.

5.6 LIST OF PREPARERS

Preparers and contributors involved in the EIS and other aspects of the Project included staff from BLM, the CPUC, Dudek (CPUC's consultant), Stantec (BLM's NEPA consultant), Galileo Project, LLC (BLM's administrative/project management consultant), and HDR Inc. (DCRT's environmental consultant). The actual personnel who contributed to the preparation, and how they contributed, are provided in Appendix 5, Table 5.6-1 through Table 5.6-4.

Bureau of Land Management
Bureau of Reclamation
Department of Defense

Table 1.5-1 Tribal and Federal Permits/Authorizations Required or Potentially Required

AGENCY	JURISDICTION AND/OR AUTHORIZING LAW	AUTHORIZATION/PERMIT
Colorado River Indian Tribes/Bureau of Indian Affairs (BIA)	Tribal lands	Land Occupational Use Conditional use permits for construction access, laydown areas, and predevelopment activities ROW Easement (BIA) THPO consultation under NHPA Section 106 Signatory to NHPA programmatic agreement
BLM	FLPMA – ROW grants on land administered by BLM	POD ROW Grant RMP Amendments
	(Lead Agency) NEPA	Prepare EIS, RMP Amendments, ROD
	NHPA (54 United States Code [U.S.C.] 300101), Section 106 review (54 U.S.C. 306108); EO 11593, EO 13007, EO 13084, EO 13175	Compliance with Section 106. Obtain concurrence from the State Historic Preservation Offices (SHPOs).
	Endangered Species Act	Consult and obtain an Incidental Take Permit from USFWS of any potential take of threatened or endangered species that could occur, and obtain concurrence for any decisions that listed species would not be adversely affected.
Reclamation	43 CFR Part 429 – land use authorization	Land use authorization (SF-299)
U.S. DOD – Army	U.S. Army Military Facilities	Aerial ROW Grant on YPG
USFWS	National Wildlife Refuge System Administration Act of 1966, as amended by the National Wildlife Refuge System Improvement Act of 1997 (16 U.S.C. 668dd[d]; 50 CFR Part 29, Subpart B)	Finding of Appropriateness (Appendix 1A) Certificate of Environmental Compatibility for the Kofa NWR ROW Grant
	ESA Section 7 Consultation, Biological Assessment	Consultation for Section 7 of the ESA Biological Opinion/Incidental Take Permit
USACE	Clean Water Act (CWA), Section 404/Rivers and Harbors Appropriation Act, Section 10 – Construction or operation of facilities that may result in any discharge into U.S. navigable waters	Section 404 Permit Preconstruction Notification for Nationwide Permit (NWP) Section 10 Permit – Power transmission line crossing of navigable waters (Colorado River)

AGENCY	JURISDICTION AND/OR AUTHORIZING LAW	AUTHORIZATION/PERMIT
FAA	Safe, Efficient Use and Preservation of the Navigable Airspace, 14 CFR Part 77	Determination of No Hazard based on an application Notice of Proposed Construction or Alteration
FCC	Licenses/permits related to FCC frequencies and paths	Telecommunication Permit (as required)
FERC	Ratemaking for transmission facilities	Federal Power Act, Section 219, authorization for transmission rate incentives Federal Power Act, Section 205, acceptance of transmission revenue requirement and tariff FERC Stats. and Regs Order No. 679, pricing reform for interstate transmission
WAPA	Title III, Section 301 of the American Recovery and Reinvestment Act of 2009 (Public Law 111-5) (“Western Area Power Administration Borrowing Authority)	Provide funding for the purpose of constructing, financing, facilitating, planning, operating, maintaining, or studying construction of new or upgraded electric power transmission lines and related facilities.

Table 1.5-2 State and Local Government and Other Entity Permits Required or Potentially Required

AGENCY	JURISDICTION AND/OR AUTHORIZING LAW	AUTHORIZATION/PERMIT
ACC	ARS Title 40, Chapter 2, Article 6.2 (§§ 40-360 to 40-360.13), ACC Rules of Practice and Procedure Revised Statutes related to transmission, substation, and generation projects	CEC needed for transmission lines greater than two poles and greater than 115kV, or power generation facilities 100MW or larger
	ARS Title 40, Chapter 2, Article 4 (§§ 40-281 to 40-287), ACC Rules of Practice and Procedure Revised Statutes related to certificates for public service corporations	CPCN should the power of eminent domain be necessary
Arizona Department of Transportation	Arizona streets and highways: ARS § 28-7053, Arizona Administrative Code (AAC) R17-3-501 to 509	Utility Crossing Permit Permit for Use of Highway ROW (US 95 and I-10) Oversize/Overweight Class C Permit Encroachment permit Rules and permits for outdoor advertising
Arizona Department of Agriculture	Native Plant Law (ARS §§ 3-901 to 916)	Notice of Intent to Remove or Destroy Protected Native Plants
Arizona SHPO	ARS §§ 41-861 to 864 (applies to any archaeological and paleontological work)	Compliance with State Historic Preservation Act (SHPA) and Compliance with Section 106 of the NHPA
Arizona State Museum	ARS § 41-865	Permit to Disturb Human Remains or Funerary Objects
ASLD	ARS § 37-461	ROW/Right-of-Entry Permit required for survey and construction of transmission line within ROWs on state trust land
ADEQ	ARS § 49-0255; AAC Title 18, Chapter 11	Arizona Pollutant Discharge Elimination System (APDES) Stormwater Permit for construction and operation activities affecting 1 acre or more
	CWA (33 CFR Parts 320, 322, 323, 325)	State Water Quality Certification (Section 401) for construction across water resources (state review required for all Federal Section 404 permits)
	AAC Title 18, Chapter 2, Article 6	Dust Control Plan (for La Paz County)
	AAC Title 18, Chapter 14, Articles 102 and 103	Aquifer Protection Permit
	AAC Title 18, Chapter 8	Hazardous Waste Generator Registration Air Quality Permit for Harquahala Mountain Engine/Generator (if greater than 325 horsepower) – prior to engine installation
	AAC Title 18, Chapter 2, Article 3	Class I Air Permit

AGENCY	JURISDICTION AND/OR AUTHORIZING LAW	AUTHORIZATION/PERMIT
Maricopa County	County roads and highways, flood control/ drainage channels	Road/Highway Encroachment/Crossing Permit Flood Control/Drainage Channel Encroachment/Crossing Permit Floodplain Use Permit Oversize Permit Stationary Dust-Generating Source Class I Air Permit
La Paz County	County roads and highways, flood control/ drainage channels	Overhead Utility Road Crossing Flood Control/Drainage Channel Encroachment/Crossing Permit
Harquahala Irrigation District	District irrigation/drainage channels	Encroachment/Crossing Permit
Maricopa County Air Quality Department	Maricopa County	Earthmoving Permit
SCE	SCE tariff	Interconnection Approval, Colorado River Substation Approval for crossing(s) of SCE facilities
APS	APS wire interconnection process	Interconnection Approval, Delaney Substation
CAISO	Purpose and need for new transmission, substation, and generation projects	Selection of the Project Sponsor - DCRT
California State Lands Commission	Division 6 of the California Public Resources Code – Construction of a transmission line on state lands	ROW Easement Public Trust Land Use Lease (if applicable) Right-of-Entry
CDFW	California Fish and Game Commission (CFGC) Code Section 1600 et seq. – Alteration of any streambed, drainage, or lake	1601/1603 Permit, Lake or Streambed Alteration
	California Endangered Species Act – Take of state-listed threatened or endangered species	Consultation for take avoidance Incidental take permit (as required); no incidental take permit available for Fully Protected Species (FPS)
	CFG Code Sections 3511, 4700, 5050, and 5515	Consultation for take avoidance
	CFG Code Section 3503 – Migratory Bird Protection	Consultation
	Native Plant Protection Act – Taking of endangered native plants	Consultation Take permit

AGENCY	JURISDICTION AND/OR AUTHORIZING LAW	AUTHORIZATION/PERMIT
	Natural Community Conservation Planning Program – Impacts to areas identified for conservation of natural communities and ecosystems	Consultation
California Department of Transportation (Caltrans), District 8	California Vehicle Code Section 35780 California streets and highways Code 660-711.21 CCR 1411.1–1411.6	Oversize/overweight loads Permit Road/Highway Encroachment/Crossing Permit (SR-78; as required)
California Department of Water Resources	Water crossings	Encroachment/Crossing Permit (as required)
California Department of Toxic Substations Control	Hazardous Waste Control Act of 1972	EPA Hazardous Waste Generator ID
CPUC	California Public Utilities Code	CPCN
	CEQA	Issuance of a CPCN requires the CPUC to conduct an environmental review pursuant to CEQA.
California SHPO	Section 106 of the NHPA Review – Impacts to historic properties, including those eligible for or listed on the National Register of Historic Places	Section 106 consultation, Cultural Resource Management Plan
California Air Resources Board (CARB)	Statewide	Portable Engine Registration for Specified Non-Mobile Portable Engines
Riverside County	Riverside County Code of Ordinances, Section 12.08.020 and 10.08.010 County roads and highways flood control/drainage channels	Road/Highway Encroachment/Crossing Permit Transportation Permit (for oversize and overweight vehicles) Flood Control/Drainage Channel Encroachment/Crossing Permit

AGENCY	JURISDICTION AND/OR AUTHORIZING LAW	AUTHORIZATION/PERMIT
Colorado River Regional Water Quality Control Board (RWQCB), Region 7	CWA, Section 401 – Impacts to surface water quality from construction activities	401 Certification/Storm Water Construction General Permit 99-08-DWD
	CWA, Section 402 – Construction-related discharges to waters of the state, including construction projects that disturb more than 1 acre	Notice of Intent – California General Permit for Stormwater Discharges Associated with Construction and Land Disturbance Activities National Pollutant Discharge and Elimination System (NPDES) Permit
	Porter-Cologne Act – Construction-related discharge to waters of the state	Waste Discharge Requirements
Metropolitan Water District of Southern California	Activities on land holdings, owned or leased	Easements
Mojave Desert Air Quality Management District	Eastern Riverside County Rule 403.2	Authority to Construct (ATC) permit and/or Permit to Operate (PTO) portable engines greater than 50 horsepower not registered under the CARB Portable Engine Registration Program (prior to installation of engine) Fugitive Dust Control Plan
Palo Verde Irrigation District	District irrigation/drainage channels	Encroachment/Crossing Permit
Kinder Morgan	Activities in area of pipeline	Pipeline Encroachment/Crossing Permit
El Paso Natural Gas	Activities in area of pipeline	Pipeline Encroachment/Crossing Permit
Southern California Gas	Activities in area of pipeline	Pipeline Encroachment/Crossing Permit
AT&SF Railroad	Activities in area of railroad	Encroachment/Crossing Permit
Central Arizona Water Conservation District	Activities in area of Central Arizona Project (CAP) canal and associated infrastructure	Crossing permit

Table 1.9-1 Issues Identified During Public and Agency Scoping

COMPONENT OR RESOURCE	ISSUE
Proposed Action	Would the Project result in new disturbance with associated resource impacts?
	Would the Project be compatible with the missions or needs of other jurisdictions?
Alternatives	Do the Action Alternatives reduce or avoid impacts, such as avoiding the need for a Section 404 permit, and impacts to the Kofa NWR, the YPG, Johnson Canyon, and state trust lands?
	Would the Action Alternatives take advantage of identified utility corridors?
Monitoring and Mitigation	Have or will appropriate and resource-specific monitoring programs and mitigation been developed in conjunction with the Project?
Air Quality and Greenhouse Gases	Would construction and operation of the Project result in generation of emissions and cause a change in ambient air conditions?
	Would the Project impact, or be impacted by, climate change, including GHG emissions?

COMPONENT OR RESOURCE	ISSUE
Vegetation Resources including Noxious and Invasive Weeds and Special Status Species	Would the Project remove native vegetation and impact plant habitat, including rare, native, and special status plant species?
	Would the Project influence the spread of invasive and noxious plants?
Wildlife including Special Status Wildlife, Migratory Birds, and Fisheries	Would the Project adversely affect wildlife, including special status species, by direct disturbance, stressing populations, and fragmentation of wildlife corridors and linkages?
	Would the Project increase predation by providing numerous perches for predatory birds to detect prey?
	Would the Project cause direct mortality to wildlife during construction due to construction vehicle traffic, vegetation removal, and excavation activities?
	Would the Project affect ESA-listed fish species and their habitat at the Colorado River crossing?
	How would adverse impacts to threatened, endangered, and sensitive wildlife species be minimized or avoided?
Cultural Resources	Would cultural resource sites be impacted by the Project?
Tribal Relationships and Treaty Rights	Would the BLM conduct government-to-government consultation with affected Indian tribes and adhere to NHPA Section 106 requirements?
	Would the Project impact the ability of tribal members to exercise their treaty rights in the Project Area?
Hazardous Materials and Hazardous and Solid Waste	How would the Project protect soil, groundwater, and communities in the Project Area from hazardous materials or petroleum products that would be used during construction and operation?
Land Use, Agriculture, Special Designations, and Wilderness	Would the Project impact military operations and training on the YPG through the transmission line EMFs, which could affect YPG radio frequencies and make the facility less secure?
	Would the Project interfere with agricultural operations and efficiency?
	Would the Project affect the wilderness values of naturalness, undeveloped quality, and opportunities for primitive recreation and solitude, both within designated wilderness and lands with wilderness characteristics?
	Would the Project be consistent with the Kofa NWR mission and purpose?
Recreation	What would be the effect of the Project on hunting, recreation access, and recreational experiences within the Project Area?
	What would be the effect of Project on the pristine qualities and technical challenge of Johnson Canyon and the Arizona Peace Trail, which could detract from the recreation experience in these areas?
	Would the Project affect recreational vehicle camping in the Quartzsite area?

COMPONENT OR RESOURCE	ISSUE
Socioeconomics	What would the Project's effect be on access to and cost of environmentally friendly energy sources?
	Would the Project affect property rents and values?
	Would the Project impact some recreation experiences that could lead to impacts on economic opportunities related to tourism and recreation in the Project Area?
	Would the Project impact the tax base in affected counties and/or the counties' ability to fund services for residents?
	Would Project construction affect employment opportunities?
	Would the transmission line affect revenue generation by other utilities?
	Should direct adverse economic impacts to local communities result from the Project, would there be indirect social impacts or impacts to future economic development options?
	Would indirect impacts from mitigation adversely impact economics in the Project Area?
Socioeconomics	Would social and economic conditions and impacts be broken out and identifiable by county?
Transportation, Public Health, and Safety	Would construction of new roads associated with the Project impact the level of OHV use within the Project Area and/or spread OHV use into new areas?
	Would the use of new and existing roads for access to the transmission line impact the potential for trespass on the YPG by OHV riders and unauthorized individuals?
	Would construction of the Project impact the threat of contracting valley fever via fugitive dust, which carries the virus?
	Would EMFs from the transmission line affect the health of those near the line or create the perception of potential adverse health effects?
	Would the Project affect the operation of existing utilities in the Project Area?
Visual Resources	How would the Project affect the quality of the visual landscape?
Water Resources	Would the Project could affect washes, stream channels, hydrologic function, and future flood control?
	Would the Project impact the quality and/or quantity of surface and groundwater?
	Would the Project affect agricultural irrigation, thus impacting groundwater and surface water supply?

Appendix 1A USFWS Finding of Appropriateness of Refuge Use

United States Department of the Interior

FISH AND WILDLIFE SERVICE

Post Office Box 1306
Albuquerque, New Mexico 87103

In Reply Refer To:
FWS/R2/NWRS/AZ-NM/064736

January 26, 2017

Ms. Jennifer Rouda
Vice President, Environmental Development
Abengoa Transmission & Infrastructure
2929 North Central, Suite 1000
Phoenix, Arizona 85012

Dear Ms. Rouda:

The U.S. Fish and Wildlife Service (Service) has completed the enclosed Finding of Appropriateness of a Refuge Use (Finding) for the project proposed by Delaney Colorado River Transmission to construct a 500 kV transmission line across about 25 miles of Kofa National Wildlife Refuge (NWR).

The Finding was conducted pursuant to policy in the Service Manual (Chapter 603 FW 1). As previously advised, for a use to be found appropriate, it must be a wildlife-dependent recreational use; contribute to fulfilling the refuge purpose(s), National Wildlife Refuge System (NWRS) mission, or goals or objectives described in a refuge management plan; or meet the criteria addressed in the enclosed FWS Form 3-2319. This proposed transmission line it outside of any permitted right of way and based on our evaluation, the proposed project does not meet the criteria for an appropriate use and would interfere with and detract from fulfilling the NWRS mission and purpose of Kofa NWR. As such, the Service has found that the proposed project cannot be authorized and a right of way permit will not be granted for this project on Kofa NWR.

If you have questions, please contact me at 928-783-7861.

Sincerely,

Elaine E. Johnson

Elaine Johnson, Complex Manager

FINDING OF APPROPRIATENESS OF A REFUGE USE

Refuge Name: Kofa National Wildlife Refuge

Use: 500 KV transmission line Right Of Way (ROW) request

This form is not required for wildlife-dependent recreational uses, take regulated by the State, or uses already described in a refuge CCP or step-down management plan approved after October 9, 1997.

Decision Criteria:	YES	NO
(a) Do we have jurisdiction over the use?	✓	
(b) Does the use comply with applicable laws and regulations (Federal, State, tribal, and local)?	✓	
(c) Is the use consistent with applicable Executive orders and Department and Service policies?		✓
(d) Is the use consistent with public safety?	✓	
(e) Is the use consistent with goals and objectives in an approved management plan or other document?		✓
(f) Has an earlier documented analysis not denied the use or is this the first time the use has been proposed?		✓
(g) Is the use manageable within available budget and staff?		✓
(h) Will this be manageable in the future within existing resources?		✓
(i) Does the use contribute to the public's understanding and appreciation of the refuge's natural or cultural resources, or is the use beneficial to the refuge's natural or cultural resources?		✓
(j) Can the use be accommodated without impairing existing wildlife-dependent recreational uses or reducing the potential to provide quality (see section 1.6D, 603 FW 1, for description), compatible, wildlife-dependent recreation into the future?		✓

Where we do not have jurisdiction over the use ("no" to (a)), there is no need to evaluate it further as we cannot control the use. Uses that are illegal, inconsistent with existing policy, or unsafe ("no" to (b), (c), or (d)) may not be found appropriate. If the answer is "no" to any of the other questions above, we will generally not allow the use.

If indicated, the refuge manager has consulted with State fish and wildlife agencies. Yes ___ No ✓

When the refuge manager finds the use appropriate based on sound professional judgment, the refuge manager must justify the use in writing on an attached sheet and obtain the refuge supervisor's concurrence.

Based on an overall assessment of these factors, my summary conclusion is that the proposed use is:

Not Appropriate ✓ Appropriate ____

Refuge Manager: Elaine E Johnson Date: 21 Oct 2016

If found to be Not Appropriate, the refuge supervisor does not need to sign concurrence if the use is a new use.

If an existing use is found Not Appropriate outside the CCP process, the refuge supervisor must sign concurrence.

If found to be Appropriate, the refuge supervisor must sign concurrence.

Refuge Supervisor: [signature] Date: 1/24/17

A compatibility determination is required before the use may be allowed.

FWS Form 3-2319
02/06

Finding of Appropriateness of a Refuge Use

Proposed Use: Issuance of new right-of-way permit to DCR Transmission, LLC for construction and operation of Ten West Link 500 kV transmission line through the Kofa National Wildlife Refuge

DCR Transmission, LLC (DCRT), a California-based electric company, is proposing to construct a segment of a 500 kV line from east to west across the 24.8-mile width of Kofa National Wildlife Refuge (NWR). This would be part of the 114-mile, 500 kV Ten West Link transmission line that originates at the Delaney Substation in Maricopa County (AZ), traverses through La Paz County, and crosses the Colorado River into the Southern California Edison Colorado River Substation in Riverside County, CA. DCRT is requesting a new right-of-way (ROW) permit from the U.S. Fish and Wildlife Service (Service) for this proposed line which would be constructed on Kofa NWR adjacent to an existing Southern California Edison (SCE) transmission line (Devers Palo Verde 1). This new ROW request is from a different company (DCRT). It cannot be accommodated within the exiting SCE ROW and therefore, would require a new ROW.

The ROW requested would include a 24.8-mile long, 180-foot wide easement (90 feet on each side of the proposed transmission line). The requested ROW totals about 542 acres. It would be separated from the existing SCE ROW which is 160 feet wide by an 80-foot wide gap. The cumulative width of the existing SCE ROW (160ft), the gap (80ft), and the ROW requested by DCRT (180ft) would be 420 feet.

In May 2016, the Service's Southwest Regional Realty Division received an April 16, 2016 letter from DCRT requesting a "Certificate of Compatibility and Right of Way". Prior to review of a proposed use of a National Wildlife Refuge for compatibility, the use must first be found to be an Appropriate Use as outlined in 603 FW 1.

For a potential use of a refuge to be found appropriate, the use must meet at least one of the following conditions: (1) it is one of the six wildlife-dependent recreational uses identified in the National Wildlife Refuge System Improvement Act of 1997; (2) the use contributes to fulfilling the refuge purpose, the National Wildlife Refuge System mission, or goals and objectives of a refuge management plan; (3) the use involves the take of fish and wildlife under State regulations; or (4) the Refuge Manager has evaluated the use and found it to be appropriate.

Construction of a transmission line is clearly not a wildlife-dependent recreational use; it does not contribute to fulfilling the refuge purpose, NWR System mission, or goals and objective of a refuge management plan; and it does not involve hunting or fishing under State regulations. This proposed transmission line has not previously been evaluated for appropriateness and has thus not previously been found to be appropriate.

Based on these criteria and the justifications presented below for responding to the questions in the "Finding of Appropriateness of a Refuge Use" form (see attached), this proposed use is not appropriate and construction of a new transmission line across Kofa NWR should not be considered as a viable alternative in the Environmental Impact Statement under preparation by

the U.S. Bureau of Land Management (BLM). Further consideration by the Service of the ROW permit application submitted by DCRT should be discontinued.

The following discussion provides our reasoning for addressing each of the decision criteria in the attached Finding of Appropriateness checklist:

(a) Does the Service have jurisdiction over the use?

YES - Portions of the proposed electrical transmission line would be on lands managed as part of the Kofa NWR and owned in fee title. The Service has full jurisdiction over all uses proposed on this land. Service policy 340 FW3 states, "It is the policy of the Service to discourage the types of uses embodied in right-of-way requests. On areas in the National Wildlife Refuge System (System), if a right-of-way cannot be certified as compatible with the purposes for which a unit was established, it cannot be granted without authorization by Congress (50 CFR 29.21(g))."

(b) Does the use comply with applicable laws and regulations (Federal, State, tribal, and local)?

YES - It is unknown if the proposed electrical transmission line would be compliant with all applicable laws and regulations. It is assumed that construction of a new electrical transmission line at any location would only be permitted if it were consistent with all applicable laws and regulations.

(c) Is the use consistent with applicable Executive orders and Department and Service policies?

NO - It is the policy of the Service to discourage the types of uses embodied in ROW requests. If a ROW cannot be certified as compatible with the purposes for which a refuge was established and the mission of the NWR System, it cannot be granted without authorization by Congress (340 FW 3, Rights-of Way and Road Closings). In this case, Kofa NWR was established for the conservation of natural wildlife resources with an emphasis on conservation of desert bighorn sheep. Before any project is evaluated regarding its compatibility, it must first be determined by the Refuge Manager to be an appropriate use.

This proposed ROW would also be inconsistent with the NWR System Improvement Act of 1997 which mandates maintaining biological integrity, diversity and environmental health. Each refuge is required to protect and where appropriate, restore natural, historic ecological conditions including associated processes (e.g., native semi-desert grassland succession and regeneration). Historic conditions are those which were present prior to substantial, human-related changes to the landscape (601 FW 3.6D - Biological Integrity, Diversity, and Environmental Health).

ROWs and other construction projects may cause habitat fragmentation, degrade habitat quality through introduction of contaminants, disrupt wildlife movement corridors, alter hydrology, facilitate introduction of invasive species, and disturb wildlife. Proposed uses which would conflict with the legal requirement to maintain ecological integrity are not considered appropriate or compatible. Service policy (603 FW 2.5A) further states that proposed refuge uses that would

conflict with the legal requirements to maintain biological integrity, diversity, and environmental health are not compatible. This proposed use does not support these criteria.

(d) Is the use consistent with public safety?

YES - While likely no direct threat to public safety, the establishment of a new ROW for the construction and long term maintenance of a new transmission line will create additional traffic on the east-west road across the northern part of Kofa NWR. Additional traffic will increase the likelihood of off-road vehicular incursions and the potential for accidents involving motor vehicles, bicycles, horseback riders, and pedestrians on the refuge. In addition, the construction of a new transmission line would increase fire danger from the power line directly, and by maintenance activities such as vegetation clearing near and under the transmission line. Potential health effects of exposure to electromagnetic fields are unknown and may be a concern to some visitors.

(e) Is the use consistent with goals and objectives in an approved management plan or other document?

NO - The proposed project is contrary to specific refuge objectives, the establishment purpose of the refuge, the mission of the NWR System, and Service policy regarding management of wilderness.

Construction of a 500kV transmission line would be in conflict with the specific goals and objectives outline in the 1996 Kofa NWR and Wilderness and New Water Mountains Wilderness Interagency Management Plan and Environmental Assessment (Interagency Management Plan and EA). Refuge management programs are designed to protect natural resources and values of the refuge for the long-term and to provide for public appreciation of the refuge as appropriate and compatible with the refuge establishment purposes.

Management objectives and issues identified in the 1996 Interagency Management Plan and EA include:

- Preservation of Wilderness Values: Maintain or enhance the wilderness values of naturalness; maintain outstanding opportunities for solitude and primitive recreation and special features; and preserve and enhance scenic qualities.

- Wildlife and Habitat Management: Within a dominant wilderness context, maintain and enhance the natural diversity of flora and fauna, in particular listed and candidate species, sensitive species and special status species; recover population and maximize genetic diversity of desert bighorn sheep; reintroduce Sonoran pronghorn and establish a viable population; manage fire; manage wildlife waters; and prevent establishment of invasive species.

- Recreation and Public Access: Maintain high quality opportunities for recreation and wildlife dependent and/or primitive recreation that is compatible with the purposes for which

Kofa NWR was established including wildlife observation, hunting, camping, photography and wilderness opportunities for solitude.

Kofa NWR encompasses just over 666,000 acres of Sonoran desert habitat. It was established in 1939, and was "…reserved and set apart for the conservation and development of natural wildlife resources" (Executive Order 8039, 4 FR 438), with an emphasis on improving the population of desert bighorn sheep.

The overall management of the Kofa NWR focuses on providing for a diversity of plants and wildlife that currently exists or historically occurred on the refuge. The various habitats throughout the refuge are home to over 193 bird species, 43 species of reptiles and amphibians, 50 mammal species, including desert bighorn sheep, mule deer, bobcats, mountain lions and the endangered Sonoran pronghorn. The Sonoran desert tortoise, although not currently listed, still remains a species of concern.

Kofa NWR was established for the recovery of desert bighorn sheep populations. While the sheep have largely done well on the refuge, a recent population decline of nearly half the historic population of 800 sheep prompted investigations into possible causes of the decline and management actions targeted specifically toward recovery. Increased habitat fragmentation and construction activities that would occur as a result of a ROW for a transmission line, may slow population recovery and restrict sheep movements between mountain ranges. North-south movement between mountain ranges is important for sheep to maintain genetic diversity and since habitat conditions may vary dramatically between different locations based on sporadic and localized rainfall. It is important for the long-term survival of desert bighorn sheep to be able to move to areas with sufficient food and water, particularly during dry seasons or dry years and prolonged droughts.

The mission of the NWR System is "To administer a national network of lands and waters for the conservation, management, and where appropriate, restoration of the fish, wildlife, and plant resources and their habitats within the United States for the benefit of present and future generations of Americans." Construction of a 500kV transmission line would not support nor be consistent with this mission.

The Wilderness Act of 1964, as amended, established the National Wilderness Preservation System and mandates that wilderness areas be administered for the use and enjoyment of the American people in such a manner as will leave them unimpaired for future use and enjoyment as wilderness. Congress designated 547,719 acres or over 80 percent of Kofa NWR, as wilderness through the 1990 Arizona Desert Wilderness Act. For refuges that encompass Congressionally-designated wilderness, the purposes of the Wilderness Act are additional purposes of the wilderness portion of that refuge (603 FW 2 2.6). While the proposed ROW would not lie directly within wilderness, it would be in close proximity and a project of this magnitude will inevitably have negative effects on the wilderness values and character of the refuge.

At least 22 species of plants protected under the Arizona Native Plant Law (Arizona Revised Statutes Title 3) have been documented or are highly likely to occur within the potential ground-

disturbing area. One endangered species has been documented and 10 wildlife species considered a Sensitive Species by BLM or Arizona Game and Fish Department (AGFD) Wildlife of Special Concern have moderate to high potential to occur in the area. Ground disturbance, construction and maintenance activities, and subsequent increase in traffic will increase possible introduction and dispersal of invasive species and disturbance to cryptobiotic soils and desert "pavement".

In 2011, the refuge began work to re-establish a population of the endangered Sonoran pronghorn on Kofa NWR which lies within the historic range of the species. This was undertaken to support recovery and down-listing of the species. The wild population has reached about 70 animals through reproduction and supplemental releases. Sonoran pronghorn are nomadic and require large expenses of land to survive as localized droughts are frequent and summer rains are sporadic. These animals must be able to move to areas with sufficient food and water throughout the year. Sonoran pronghorn have repeatedly been documented within the area of the proposed ROW and may be negatively impacted by general human disturbance, construction and maintenance activities, and associated habitat loss and fragmentation.

The Sonoran desert tortoise is a species of concern. Past surveys on Kofa NWR have indicated a healthy but low density tortoise population. Density and diversity of vegetation are important to tortoise distribution. An additional powerline would alter plant communities and reduce already limited cover, further fragment habitat, and increase the potential for encounters between people and tortoises.

Construction of spur roads and expansion of the utility corridor would impact small mammals and herpetofauna through habitat fragmentation and potential isolation of populations. Species affected may include BLM Sensitive Species or AGFD Wildlife of Special Concern such as the rosy boa and Gila monster. Construction activities would result in unavoidable direct mortality of a number of mammals and reptiles. Construction and maintenance activities associated with the ROW could negatively impact the four Arizona Partners in Flight Priority Species that occur on the refuge (Lucy's warbler, Le Conte's thrasher, lesser nighthawk, gilded flicker) by destroying nesting or foraging habitat or disrupting nesting activities. Collisions with towers and associated power lines would result in direct mortalities of migratory birds passing through the refuge. An increased width of disturbed area would affect the ability of small animals to move from one area of cover to another.

The cumulative and incremental impacts of the new proposed ROW in addition to the existing power line and pipeline ROWs may pose the greatest impact to the refuge. An expanded corridor of over 2.5 times the width of the existing power line ROW plus an additional high-voltage line would result in greater fragmentation of habitat for desert bighorn sheep, Sonoran pronghorn, Sonoran desert tortoise and other wildlife. Human activity associated with construction and maintenance, habitat disturbance and destruction, noise and dust from construction and maintenance, and the transmission line itself, as well as visual separation can discourage wildlife from crossing the disturbed area. As has been well documented with roads, the width and traffic level on a road largely determines the ability of wildlife to move from one area to another. Expansion of the disturbed area and increased activity could lead to greater separation of the north part of the refuge from the remainder, leading to reduced values for wildlife, increased

potential of accidents between wildlife and people, and reduced wilderness and recreational values for visitors.

Establishing a ROW for construction and long-term maintenance of a transmission line through Kofa NWR would not contribute to the purposes of the refuge nor the NWR System mission. In fact, a new ROW would detract from the refuge purposes. It is anticipated that such a ROW would have significant negative effects on wilderness values (e.g. noise impacts) and overall scenic qualities of the area; native plant and wildlife species, including desert bighorn sheep and endangered Sonoran pronghorn; nationally important species including the Sonoran desert tortoise and migratory birds; and would promote expansion of invasive plants and habitat fragmentation.

(f) Has an earlier documented analysis not denied the use or is this the first time the use has been proposed?

NO - The Ten West Link transmission line is a new project and DCRT's request for a ROW through Kofa NWR has not previously been considered.

(g) Is the use manageable within available budget and staff?

NO – A new ROW for a transmission line would require routine vegetation control and road maintenance. These activities would typically be conducted by the utility company but require oversight by refuge staff to ensure compliance with any stipulations in the ROW or special use permits. The commitment of staff may be significant, particularly in the vicinity of important natural resources and in proximity to wilderness. We would anticipate increased traffic from a ROW and potential widening of the road. This would necessitate increased law enforcement to prevent off-road violations and wilderness incursions and provide general oversight of the new activity. Resources required to oversee these additional activities are currently not available at the refuge and unlikely to be available in the future.

(h) Will this be manageable in the future within existing resources?

NO - Current resources are not available to manage these activities (see justification above for g) and are unlikely to become available in the future.

(i) Does the use contribute to the public's understanding and appreciation of the refuge's natural or cultural resources, or is the use beneficial to the refuge's natural or cultural resources?

NO - The construction of a transmission line through Kofa NWR would not contribute to the public's understanding and appreciation of refuge natural and cultural resources; nor is it beneficial to the refuge natural or cultural resources. The proposed use would be damaging to natural and cultural resources including fragile desert habitats, wildlife, and scenic landscapes. In particular, the scenic quality and wilderness values of the refuge would be compromised by the ROW. Due to their close proximity, activities associated with the proposed use would

detract from the values of nearby designated wilderness that the refuge is mandated to preserve and degrade the visitor experience in the vicinity of the transmission line.

(j) Can the use be accommodated without impairing existing wildlife-dependent recreational uses or reducing the potential to provide quality (see section 1.6D, 603 FW 1, for description), compatible, wildlife-dependent recreation into the future?

NO - A new ROW and associated construction and maintenance on Kofa NWR would be damaging and detrimental to the quality of wildlife-dependent recreation including hunting, wildlife viewing, wildlife photography, and interpretation. The scenic quality and wilderness values of the refuge would be compromised by the ROW and wildlife and visitors engaged in hiking or camping would be disturbed by construction and maintenance activities, increased traffic, degradation of scenic refuge view sheds, and reduced opportunities to view wildlife due to disturbance and fragmentation and destruction of habitat.

The refuge encompasses approximately 666,000 acres and provides a wide range of wildlife-dependent recreation for visitors. Eleven criteria for "quality" wildlife-dependent recreation are defined in the Service Manual (605 FW 1, Section 1.6) and include providing opportunities for visitors to experience wildlife. Although open to visitors, Kofa NWR is largely designated wilderness and does not offer improved access (i.e. paved roads and trails) that support high visitor use. Therefore, the refuge provides a unique opportunity for wildlife-dependent recreation in a relatively isolated setting. Allowing a new ROW would impact wildlife-dependent recreational opportunities due to reduced habitat quality which directly impacts wildlife species upon which recreation is based. Additionally, the wilderness and scenic qualities of Kofa NWR would be compromised by the presence of a new ROW and the large size of the proposed transmission line. Allowing a new ROW would impair the quality of the visitor experience, lead to an increase in vehicle trespass into wilderness and other parts of the refuge, and likely reduce the opportunity of visitors to experience wilderness and wildlife.

In addition, the additional refuge resources needed to manage and oversee the new ROW activities would further reduce resources available for protecting wilderness values, native wildlife, endangered species, and providing for future wildlife dependent recreation.

Decision Justification

The proposal to construct a 500kV transmission line across nearly 25 miles of Kofa NWR does not meet the criteria for an appropriate use. As this proposed project does not promote wildlife-dependent recreation and does not support the purpose for which the refuge was established and the mission of the NWR System or the goals and objectives of the Interagency Management Plan and EA, we do not find it an appropriate use of the refuge.

Appendix 1B Memorandum of Understanding between BLM and CPUC

BLM Agreement No. _____
Cooperator's No. _____

MEMORANDUM OF UNDERSTANDING

between

THE BUREAU OF LAND MANAGEMENT

and

STATE OF CALIFORNIA PUBLIC UTILITIES COMMISSION
on the

Ten West Link 500kV Transmission Project

This **MEMORANDUM OF UNDERSTANDING** (MOU) is hereby entered into by and between the Bureau of Land Management, hereinafter referred to as the BLM, and the State of California Public Utilities Commission, hereinafter referred to as the CPUC. The BLM and CPUC are hereinafter referred together as the Parties.

A. INTRODUCTION and PURPOSE:

Delaney-Colorado River Transmission, LLC (DCR Transmission) is proposing to build the Ten West Link 500kV Transmission Project, a new 500 kV transmission line between the Arizona Public Service (APS) Delaney Substation, in Tonopah, Arizona, extending west to Southern California Edison's (SCE) Colorado River Substation, just west of Blythe in Riverside County, California (the Project). The Project involves the reintroduction of a portion of the transmission project previously proposed by SCE and referred to as the Devers-Palo Verde 500 kV No. 2 Transmission Line Project (DPV2 project). DCR Transmission submitted an Application for Transportation and Utility Systems and Facilities on Federal Land with BLM on September 14, 2015. The Project would span approximately 114 miles, including 97 miles in Arizona and 17 miles in California, largely following the existing DPV1 transmission line in an established utility corridor. The proposed route largely follows BLM-designated utility corridors, which are 1 mile in width, and the transmission line would be considered a compatible use within these corridors. DCR Transmission would require a 200 foot ROW for the transmission line and would be required to maintain a 250 foot separation from the existing DPV1 line in accordance with requirements set forth by CAISO. To the extent possible, DCR Transmission proposes to use existing access roads currently used to maintain the DPV1 transmission line. The Project also would include requisite transmission line series compensation located approximately in the middle of the route. The proposed series compensation substation would be arranged parallel to an existing compensation substation for DPV1 in Vicksburg, Arizona.

BLM Agreement No. _____
Cooperator's No. _____

Because the CPUC is required to make a discretionary decision to determine if DCR Transmission can construct the Project in accordance with California Environmental Quality Act (CEQA) guidelines, CEQA is triggered. The BLM also has a decision to make concerning the ROW grant and also one or more plan amendments concerning the project. The BLM will begin preparing an Environmental Impact Statement (EIS) in 2016 in compliance with 1508.11 of the National Environmental Policy Act of 1969 (NEPA), CEQA Statutes Section 21061 and CEQA Guidelines Section 15221 and 15120 to 15132 and all other applicable laws, executive orders, regulations, and direction. The BLM personnel will work with CPUC staff to write the EIS in a manner that complies with both CEQA and NEPA.

The purpose of this MOU is to provide a framework for cooperation between the BLM and the CPUC to work together as lead agency and cooperating agency, in that order, in preparing and completing a joint environmental analysis and document that is in compliance with NEPA, CEQA, and all applicable laws, executive orders, regulations, direction, and guidelines. Work would include, but is not limited to, environmental and technical information collection, analysis and reporting. This Memorandum of Understanding includes meetings and/or conference calls as necessary for planning, information sharing, gathering and incorporating comments to the draft EIS to ensure CEQA compliance. Should the decision be made to authorize the Project, this Memorandum of Understanding continues the cooperation during construction of the Project, including the implementation of the mitigation measures and monitoring developed through the NEPA process. This cooperation serves the mutual interest of the Parties and the public.

B. STATEMENT OF MUTUAL BENEFIT AND INTERESTS:

The Council on Environmental Quality (CEQ) regulations (40 CFR 1506.2) direct federal agencies to cooperate with State and local agencies to the fullest extent possible to reduce duplication between NEPA and State and local requirements, including joint planning processes, environmental research and studies, public hearings, and environmental impact statements. The CEQ regulations (40 CFR 1501.6) provide for and describe both lead and cooperating agency status, and emphasize agency cooperation early in the NEPA process. For the purposes of this effort, BLM will be the lead agency developing one document in coordination with the CPUC acting as Cooperating Agency. CPUC will retain its approval authority for all aspects of the Project within its jurisdiction. CEQA Guidelines Sections 15222 and 15226 encourage similar cooperation by state and local agencies with federal agencies when environmental review is required under both CEQA and NEPA.

BLM Agreement No. _____
Cooperator's No. _____

This MOU meets the intent of these regulations and provides guidance on the roles each agency will take. In consideration of the above premises, the Parties agree as follows:

C. BLM SHALL:

1. As lead Federal agency, be responsible for ensuring compliance with the requirements of NEPA, and the CEQ, and BLM regulations implementing NEPA, along with all applicable federal laws, executive orders, regulations and direction, and shall be responsible for the EIS and the scope and content of the portion of the EIS that relates to all necessary federal law and regulatory requirements.

2. Provide to the CPUC for review and comment a draft of the Project Description and Alternatives section as soon as they are available to ensure that adequate detail is included to support CPUC's review, analysis and decision.

3. Provide the administrative draft of the EIS to the CPUC for its review and comment prior to the release of the public draft.

4. Schedule meetings as necessary with the CPUC to discuss status updates, related findings, schedules and planning associated with the EIS.

5. Ensure that the BLM approved EIS contractor will complete the environmental analysis and prepare the EIS in a form and in substance that is consistent with this MOU and agreeable to the Parties;

6. Act as the intermediary, when necessary, for communications between the CPUC and the contractor related to the EIS;

7. Provide updated mailing lists to the contractor for distributing the Notice of Availability of the EIS to the public and to other Federal, State, and local agencies as required under NEPA. The BLM shall provide updated mailing lists of the EIS, and Record of Decision to the public and to other Federal, State, and local agencies as required by law;

8. Approve contractor's draft newspaper advertisements, public notices, and Notice of Availability of the document and ensure publication in appropriate periodicals;

9. Will ensure that the contract incorporates the condition that the contractor will provide all graphic handouts and presentations for public meetings/hearings. The contractor shall submit any such graphic presentations and/or handouts to the BLM for approval prior to distributing them at public meetings/hearings;

BLM Agreement No. _____
Cooperator's No. _____

10. Be responsible for conducting public meetings and provide CPUC with sufficient advanced notice of these hearings so that the CPUC can attend in a cooperating role;

11. Will use its best efforts to ensure that the MOU between DCR Transmission and BLM incorporates all of the following conditions:
    (a) The contractor agrees to hold harmless and indemnify the BLM and CPUC with respect to any and all claims, demands, cause(s) of action, and liabilities which may arise from the contractor's performance, purchases, or services utilized in the preparation of the EIS.
    (b) The contractor will sign a disclosure statement specifying that they have no financial or other interest in the outcome of the Project.
    (c) The contractor shall cooperate in defense of any appeal and/or suit involving the legality or adequacy of the BLM's or CPUC's compliance with NEPA or CEQA with regard to this EIS.
    (d) The contractors will be responsible for all stenographic, clerical, graphics, layout, printing, and like work.
    (f) The contractor shall produce an internal administrative Draft EIS for review by the BLM and CPUC prior to publication of the Draft EIS. The administrative draft shall include all text, maps, appendices, tables, charts, and other materials that will be incorporated in the Draft EIS for publication. As determined by both the BLM and CPUC, the contractor shall provide a reasonable number of copies to each party to meet internal review needs.
    (g) The Draft EIS will include evaluation of potential routes, alternative designs, and impacts. The Draft and Final EIS will apply whichever NEPA and CEQA requirement is more stringent in the California portion of the analysis. The Draft and Final EIS will describe any inconsistencies between Federal plans or laws as they pertain to the proposed action and describe the extent to which the BLM would reconcile the proposed action with the plan or law.
    (h) Subject to Parties' comments during the environmental analysis and responses to the administrative Draft and Final EIS, the contractor shall have primary responsibility for writing and rewriting all sections, parts, and chapters of the EIS.
    (i) The CPUC is a third-party beneficiary to the MOU that DCR Transmission and the BLM with the right to enforce contract provisions affecting its interests.

12. Provide oversight to the consultant in filing the Draft and Final EIS with the U.S. Environmental Protection Agency (US EPA).

BLM Agreement No. _____
Cooperator's No. _____

13. Reserve the right to prepare, at its option, selected sections of the Administrative Draft and/or Final EIS; as appropriate, the BLM will provide such prepared material in a time and manner consistent;

14. Be responsible for consulting with the United States Fish and Wildlife Service for a Section 7 Consultation and the California State Historic Preservation Officer for a Section 106 Consultation regarding the proposed federal action; at the discretion of the BLM, the consultant shall furnish such data or information required to accomplish such consultation; the BLM shall include CPUC staff in these meetings and discussions, as required; act as the lead for Native American consultation;

15. As required, the BLM will be responsible for consulting with the California Department of Fish and Wildlife;

16. Should the decision be made to authorize the Project, delegate to the CPUC field inspection responsibility along with BLM's and the proponent's consultant for ensuring implementation of the mitigation and monitoring activities adopted in the Record of Decision for the substation and transmission line interconnection portion of the project and provide CPUC and its representatives access to the ROW area and project land (without further authorization), as requested by CPUC, for this purpose; and,

17. To the extent that CEQA or NEPA guidelines may preclude, or are potentially inconsistent with, construction of the proposed Project that is the subject of this MOU, the BLM will identify such potential inconsistencies at the beginning of the EIS process, and shall collaborate with the CPUC and the contractor to ensure that sufficient information is collected during the course of the environmental assessment process to allow the BLM to begin an EIS for the Project to remove such inconsistencies and allow the Project to be carried forward.

D. CPUC SHALL:

1. As the cooperating State agency, be responsible to ensure that the EIS is in compliance with all requirements of CEQA and shall be responsible for the scope and content of the EIS that relates to all necessary aspects of CEQA.

2. Should the level of detail in the administrative draft EIS be found insufficient in meeting CEQA standards or CPUC Orders, the CPUC will inform the BLM of this insufficiency and allow them to rectify the document. If at the end of the EIS process the insufficiency remains, the BLM will continue the EIS development, and the CPUC will create an Environmental Impact Report or

BLM Agreement No. _____
Cooperator's No. _____

Mitigated Negative Declaration (whichever is required) separately, hiring its own consultants.

E. IT IS MUTUALLY AGREED AND UNDERSTOOD BY ALL PARTIES THAT:

1. Schedule of Deadlines. The BLM intends to make a decision on the Final EIS by the fourth quarter of 2017. Both Parties will attempt to meet this timeframe. Attached to this MOU is a draft detailed schedule, which the Parties intend to serve as a template for the actual schedule of deadlines that they intend to adhere to in completing the environmental review that is the subject of this MOU. The parties agree to modify and reach final agreement on the details of this draft schedule, which will include specific dates establishing the deadlines for expected deliverables from the BLM/BLM's contractor, as well as deadlines for the BLM and the CPUC to respond to all materials provided by the BLM/BLM's contractor, *within one month.* Once the details of this schedule are agreed to, the Parties shall undertake their best efforts to comply with *all* deadlines set forth in said schedule.

2. Contractor Selection. Stantec has been mutually chosen by BLM and DCR Transmission as BLM's 3rd party contractor who will prepare the NEPA document as directed by the BLM.

3. Agency Project Representatives. For the purpose of coordinating the responsibilities of the Parties for the preparation of the EIS on the Project, the persons listed below are the designated Agency Project Representatives of the Parties. Actual delivery of written notice to the following representatives, or such substitute representatives as the respective Parties may hereinafter designate, shall constitute notice to that organization. The principal contacts for this instrument are:

BLM National Project Manager	CPUC Cooperator Project Representative
Joe Incardine	Eric Chiang
Bureau of Land Management Lands & Minerals c/o Lane Cowger	California Public Utilities Commission
One North Central Ave., Suite 800	505 Van Ness Ave, 4th Floor
Phoenix, AZ 85004	San Francisco, CA 94102
Phone: 801-560-7135	Phone: 415-703-1956
FAX: 602-417-9452	FAX: 415-703-2200
E-Mail: jincardi@blm.gov	E-Mail: eric.chiang@cpuc.ca.gov

BLM Agreement No. _____
Cooperator's No. _____

4. Regular Coordination between Parties. The successful preparation of the EIS requires complete and full communication between all Parties involved. It is the duty of the Agency Project Representatives to ensure close coordination throughout the document preparation and review process. Accordingly:
   (a) BLM will lead regular monthly conference calls with the Cooperating Agencies to insure that communications occur on the Project.
   (b) Additionally, the Agency Project Representatives shall keep each other advised of the developments affecting the preparation of the Draft EIS. Toward this end, and to ensure close consultation and coordination, the Agency Project Representatives shall conduct conference calls as necessary, and shall meet face-to-face as deemed necessary.
   (c) In the event that either Agency Project Representative is unable to participate in any such regularly scheduled conference call or meeting, an alternate shall be delegated to represent that Agency Project Representative's party in said call or meeting.
   (d) The BLM also recognizes the need for the CPUC to work directly with BLM's contractors with regard to the Project and CEQA requirements. The CPUC will keep the BLM informed of these discussions (via email notification) and will involve the BLM when appropriate.
   (e) Consistent with existing laws and regulations, the Parties agree to share all relevant information.
   (f) Any and all media releases and/or public mail-outs shall be made with the joint approval and at the direction of the BLM and the CPUC.

5. Scope and Content of the EIS. The BLM shall schedule and conduct scoping meetings at the beginning of the process, according to NEPA. These meetings will be held to determine the areas of public and agency concerns pertaining to the proposed Project, and guide the Parties in scoping the EIS. The BLM in coordination with the CPUC as a cooperating agency shall determine the final scope of the EIS. The Agency Project Representatives shall determine (with approval, if necessary, from the signatories to this MOU or their delegates):
   (a) the scope and content of the EIS for the Project is to ensure that the requirements of the various federal and state statutes (i.e. - NEPA, CEQA, CPUC Orders and policies) are met and that the statutory findings required of the BLM and CPUC for their respective decision on the Project can be made;
   (b) whether the work performed by the consultant is satisfactory, and if not, how best to correct the deficiencies in the work; and
   (c) the division of responsibilities among the lead agency and cooperating agencies.

6. CPUC may request revision of the administrative draft with further agency review.

BLM Agreement No. _____
Cooperator's No. _____

7. Consultation with Other Agencies. The BLM and CPUC reserve the right to consult directly, without notice or report, with other Federal, State, and local officials regarding their areas of specific responsibility outlined in Section C and D above during the preparation of the EIS to ensure objectivity and compliance with NEPA and CEQA. The Parties will immediately notify each other and the necessary contractors if matters discussed at any such consultation will require significant changes in the development of the EIS or require significant costs pursuant to this Memorandum of Understanding.

8. Privileged and Confidential Information. The BLM and the contractor will, upon request, provide CPUC with procedures and underlying data used in developing submitted sections of the Draft and/or Final EIS including, but not limited to, final reports, subcontractor reports, and interviews with concerned private and public parties, whether or not such information is contained in the working papers or the Draft or Final EIS. The Parties intend that information that is otherwise protected from disclosure under the attorney-client privilege, work-product privilege, and deliberative process privilege and/or any other applicable privilege may be exchanged without waiving or compromising such privileges or doctrines. The Parties agree that privileged information received from the other party shall be treated and maintained as confidential to the extent allowed by federal and state laws, regulations and policies. Parties agree to label as "Confidential" documents that they believe are privileged and should not be disclosed. Neither Party will disclose privileged information received from the other Party, regardless of whether it is labeled "Confidential," without first notifying other Party. The BLM will obtain information that they maintain as confidential directly from BLM.

9. Freedom of Information Act. Any information furnished to the BLM under this Memorandum of Understanding is subject to the Freedom of Information Act (5 U.S.C. 552). The BLM acknowledges that the Cooperator is subject to the California Public Records Act. However, the Cooperator agrees not to release these materials to individuals or entities other than the Parties to this MOU and their contractors, without prior consultation with the BLM. The BLM may withhold from the Cooperator those documents that would otherwise be available for public release under the California Public Records Act if those documents are otherwise exempt from disclosure under a specific provision of FOIA.

10. Effective Dates. This MOU is executed as of the date of the last signature and is effective through, or the date on which all mitigation measures required in connection with approval of the Project have been fully implemented, whichever date is earlier, at which time it will expire unless extended.

BLM Agreement No. _____
Cooperator's No. _____

11. Modification. Modifications to this MOU shall be made by mutual consent of the Parties, by the issuance of a written instrument, signed and dated by all Parties.

12. Termination. Either of the Parties, in writing, may terminate this MOU in whole, or in part, at any time before the date of expiration upon 30 days written notice to the other party. During any such 30-day waiting period, the Parties will actively attempt to resolve any disagreement between them. In the event of termination of this MOU, both the BLM and CPUC shall have access to all documentation, reports, analyses, and data developed by the contractor.

13. Rights and Responsibilities of Parties. This MOU sets forth the Parties' rights and responsibilities for preparing the EIS, and for subsequent activities related to the document. This MOU in no way restricts the BLM or the CPUC from participating in similar activities with other public or private agencies, organizations, and individuals. This MOU does not authorize the transfer of funds between parties. Each Party is responsible for its own acts and omissions in connection with activities undertaken pursuant to this MOU.

1.0 INTRODUCTION

DCR Transmission, LLC (DCRT) filed a right-of-way (ROW) application (SF-299) with the Bureau of Land Management (BLM) on September 14, 2015 to construct, operate, maintain, and decommission an electric transmission project in western Arizona and eastern California. The Ten West Link (TWL) Transmission Line Project (the Project) would consist of a 500 kilovolt (kV) transmission line traversing approximately 114 miles within California and Arizona, 16.75 miles of which are located in California.

On April 11, 2016, the BLM and California Public Utilities Commission (CPUC) entered into a Memorandum of Understanding (MOU; Appendix 1B) whereby the BLM will serve as the Lead Agency under the National Environmental Policy Act (NEPA), coordinating with the CPUC, acting as a cooperating State agency. As the NEPA Lead Agency, the BLM will oversee the preparation of an Environmental Impact Statement (EIS). Consistent with the MOU, the CPUC may rely on the EIS and its appendices to make subsequent discretionary decisions pursuant to California Environmental Quality Act (CEQA) Guidelines (Section 15221). As NEPA and CEQA provide different requirements, this appendix is intended to focus on CEQA requirements and the CEQA analysis that is expressly limited to California but is not and should not be considered a separate and distinct CEQA document (i.e. Mitigated Negative Declaration [MND] or an Environmental Impact Report [EIR]), as the CPUC has not deemed DRCT's application complete and initiated formal environmental evaluation under CEQA (Section 15060(b)). As specified in the MOU, if the level of detail included in the EIS and its appendices fails to meet the CPUC's environmental review standards, the CPUC reserves the right to initiate its own formal environmental review pursuant to the CEQA Guidelines.

On October 12, 2016, DCRT filed an application for a Certificate of Public Convenience and Necessity (CPCN; A. 16-10-12) with the CPUC. The CPUC is still in the process of reviewing DCRT's CPCN application, which contains a request to waive the requirement under Rule 2.4 and General Order 131-D that DCRT provide a Proponents Environmental Assessment (PEA) as part of their application. The CPUC has yet to rule on DCRT's waiver request; therefore, the CPUC does not have a complete application that would allow them to initiate an independent environmental review pursuant CEQA or participate in a joint environmental review pursuant to Section 15222 of the CEQA Guidelines.

The BLM is preparing an EIS to satisfy their NEPA requirements and for use by other Federal agencies, as applicable. In cooperation with the CPUC, as outlined in the MOU, the BLM has produced this appendix to bolster the environmental impact discussion found in the TWL EIS to clearly address environmental issues that are unique to CEQA. To do so, this analysis relies on:

- The baseline environmental information found in Chapter 3 of the EIS and the TWL Technical Environmental Study (TES) (BLM 2019);
- The resource-specific environmental impact analysis found in Chapter 4 of the EIS and TES;
- The applicant's technical reports; and

- CPUC's comments on the Draft EIS, including this appendix, which address the environmental impact criteria found in Appendix G of the CEQA Guidelines.

As stated in the MOU, "CPUC Will: (1) As the cooperating State agency, be responsible to ensure that the EIS is in compliance with all requirements of CEQA and will be responsible for the scope and content of the EIS that relates to all necessary aspects of CEQA." This appendix incorporates the environmental analysis conducted in the EIS by reference, while providing supplemental analysis needed to address issues that may be unique to CEQA. This includes describing those environmental effects resulting from Project implementation identified in Chapter 4, Environmental Impact Analysis that may be considered significant and that cannot be mitigated to a less than significant level under CEQA. The analysis also identifies cumulative impacts, the potential to foster economic or population growth either directly or indirectly in the Project study area and surrounding environment, and an environmentally superior alternative.

Should the CPUC decide to issue a CPCN based on environmental analysis presented in the EIS, pursuant to Section 15221 of the CEQA Guidelines, the MOU provides for the CPUC's continued involvement during the Project's construction and operation phases. This involvement includes, but is not limited to, enforcement of Mitigation Measures (MMs) presented in the Mitigation Monitoring and Reporting Program (MMRP; Section 6.0).

1.1 CEQA SIGNIFICANCE DETERMINATION

One of the major structural differences between environmental analysis under CEQA and the NEPA analysis found in the EIS is the use of significance criteria during the environmental impact review. The significance criteria used for this analysis of environmental impacts are based on Appendix G of the CEQA Guidelines, as well and input from Cooperating Agencies, such as the CPUC. The criteria serve as a benchmark for determining if the Project would result in significant impacts when evaluated against the baseline conditions established in the EIS and TES. According to the CEQA Guidelines (Section 15382), a "'significant effect on the environment' means a substantial, or potentially substantial, adverse change in any of the physical conditions within the area affected by the project." The impact analysis for each environmental factor evaluated in Section 2.0 outlines the significance criteria that will be evaluated, provides an analysis of each factor posed in the form of a question, and concludes with a statement that clearly outlines if significant impacts would occur under a given criterion.

1.2 MITIGATION MEASURES

The function of MMs under CEQA differs from the function of MMs in the EIS. For instance, in the EIS, mitigation can be applied to any potentially adverse effect, where feasible, regardless of the severity or duration of the effect. Under CEQA, MMs are applied to reduce potential environmental impacts to less than significant levels (Section 15126.4 (a) 1). Under CEQA, a MM must be a specific, enforceable, feasible action that can be shown to reduce significant impacts (Section15126.4 (a) 2). The effectiveness of the measure should be demonstrable and capable of being monitored with specific performance standards. Unlike NEPA, MMs under CEQA are only applied to avoid or reduce impacts that would otherwise be significant (Section 15126.4 (a) 3).

Project-related environmental impacts can also be reduced or avoided through design features, Applicant-Committed Environmental Protection Measures (APMs), and BLM stipulated Best Management Practices (BMPs) that are required by current design standards and guidelines or are already part of ordinary operating procedures. DCRT has included APMs as part of the Action and Action Alternatives as described in the EIS, and applicable BLM BMPs have also been identified; such measures are described in Appendix 2A of the EIS. A number of these measures were identified or developed based on Conservation and Management Actions (CMAs) from the California Desert Conservation Area (CDCA) Plan. The CMAs that are applicable to the Project are listed in Appendix 2C of the EIS, where they are cross-referenced with the APMs and BMPs that address them. The CMAs are also incorporated into this analysis.

If after the incorporation of design features, APMs, and BMPs, a potential impact would result, this analysis identifies CEQA-specific MMs to reduce the impacts of the Project to a level below the "significant" threshold. The CEQA-specific measures are intended to bolster and clarify the underlying APMs, BMPs, and CMAs. For portions of the Project in California, the Applicant will be held to the standards outlined in the CEQA-specific measures, as opposed to the underlying APMs, BMPs, and CMAs. Unless otherwise specified, the CPUC would be responsible for enforcing the CEQA-specific measures. An MMRP is included in Section 6.0 of this Appendix. The MMRP summarizes the CEQA-specific MMs, APMs, BMPs, and CMAs; assigns a responsible party for enforcement of each measure; identifies when a given measure is necessary; and defines success criteria for each measure.

1.3 ALTERNATIVES

This analysis provides an environmental review of alternatives to the Project, based on the reasonable range of alternatives discussed in the EIS, refined by the significant impacts identified below. The alternatives discussion in this analysis focuses on reducing or avoiding potentially significant impacts that would result from the Project through implementation of an alternative. Additionally, this analysis compares the environmental advantages and disadvantages of the Project with those of the alternatives, and identifies an Environmentally Superior Alternative, pursuant to CEQA (Section 15126.6).

In addition to the No Action Alternative required under NEPA, the CPUC Section 1002.3 requires that the CPUC consider cost-effective alternatives to transmission facilities, referred to as "no wires" alternatives, when evaluating Project applications for a CPCN. Alternatives that meet the CPUC's "no wires" mandate include some combination of programs such as Demand Response (DR) and Energy Efficiency (EE); generation and storage and are only described and considered in this appendix and not in the EIS.

A comparison of environmental impacts, by alternative, is provided in impact summary tables in Chapter 2 and Appendix 2 of the EIS and described by resource in Chapter 4 and Appendix 4 of the EIS. The Alternatives Section (Section 4.0) of this appendix summarizes impact determinations, as outlined in the CEQA Guidelines, by resource, for both the Project and its action alternatives.

This page intentionally left blank.

2.0 ENVIRONMENTAL ANALYSIS

This section contains an evaluation of each environmental factor outlined in Appendix G of the CEQA Guidelines. The following impact analysis is largely based on the Environmental Setting and Regulatory Overview Sections found in Chapter 3 of the EIS and the TES and incorporates background material from the EIS and TES by reference, as appropriate.

As outlined in the EIS, for those resource areas where impacts will not be reduced to less than significant thresholds after the incorporation of design features, APMs, BMPs, and CMAs, CEQA-specific MMs will be implemented.

2.1 AESTHETICS

This section describes the impacts to aesthetic resources that could potentially occur during construction, operation, and decommissioning of the Project in terms of CEQA significance thresholds disclosed below in Section 2.1.4. As disclosed in Section 4.18 of the TES (BLM 2019), construction and operation of the Project could result in changes to the aesthetic character of the surrounding area. Additionally, this section responds to issues raised during the public scoping process, which are presented in Appendix 1 of the EIS. However, impacts have been determined to be less than significant with mitigation incorporated.

2.1.1 Thresholds and Methodology

The Project's effects are compared to CEQA Guidelines "Thresholds of Significance" to determine whether the Project would result in a significant change (Section 15065, 15126, and Appendix G). The analysis relies on existing conditions and proposed activities described in the TES, specifically: identification of important visual resources in the vicinity of the portion of the Project within California based on review of applicable planning documents; existing views toward the Project site from representative views, selected in part based on review of applicable planning documents and identification of sensitive visual receptors; and photo-simulations of selected views showing the Project.

2.1.2 Applicant Proposed Measures and BLM Best Management Practices

APMs have been identified and would be implemented by the proposed Project applicant. In addition, the BLM would require implementation of BMPs, which are intended to further minimize Project impacts. The Project APMs and BMPs are described in EIS Appendix 2A. Of these, the following would apply to the portion of the Project located within California and have therefore been incorporated into the Project for evaluation of significant impact to aesthetics under CEQA. Within the California portion of the Project, "visually sensitive areas" refer to areas adjacent to scenic roadways, designated or eligible. Interstate 10 and California State (State) Route 95 within the Palo Verde Valley have been identified by Riverside County for potential future nomination as scenic highways (Riverside County 2015a). The APMs and BMPs related to aesthetics referring to visually sensitive areas are referring to lands adjacent to these roadways.

- **APM AES-01: Vegetation Removal and Grading.** During Project construction activities, grading and the amount of existing vegetation cleared from the route would be kept to the minimum required for access by Project construction as much as practicably possible. This approach is further described in the BIO-14. Grading would occur as minimally as practicable and would follow the existing land contours as much as possible.

- **APM AES-02: Work Area Reclamation.** On completion of the Project, all construction material and debris from the permanent ROW and temporary staging areas would be removed and the areas restored. All work areas, and areas around new transmission structures, would be re-graded to previous land contours and re-vegetated to and restored them to an appearance that would blend into the overall landscape context. This approach is further described in the BIO-15 to as close to pre-construction conditions as feasible.

- **BMP AES-02: Work Area Reclamation.** Work area reclamation would include pulling and tensioning sites; all disturbed work areas associated with the Project.

- **BMP AES-04: Visual Contrast.** Color treatment of transmission structures would be applied in all areas deemed necessary by the BLM. The BLM would select/approve the color treatment to be applied under AES-04. Color treatment would be applied to Project components, such as the Series Compensation Station (SCS) and fencing. All conductor would be non-specular, and all structures, whether color treated or not, would have a dull, non-reflective surface.

- **APM AES-05: Location.** Collocate the transmission line as close as possible to existing transmission lines of similar size and design (while maintaining the required 250-foot setback) to minimize the overall visual impact of the Project on the surrounding areas. Keeping the proposed transmission line within the same general corridor as existing transmission lines would reduce the spread of visual impacts from areas previously not affected. Collocating with existing transmission lines would also reduce the need to construct new access roads and their associated visual impacts. (Captures BLM BMP for Reducing Visual Impacts of REFs 6.2.10 – Collocate Linear Features in Existing ROWs or Corridors)

- **APM AES-06: Siting and Laydown Areas.** The Project will avoid siting, staging and laydown areas in visually sensitive areas to the extent practicable. Staging areas would be located close to transportation access points and would be sited to take advantage of previously disturbed areas to the extent practicable. Staging areas would be located close to transportation access points and would be sited to take advantage of previously disturbed areas to the extent practicable.

- **BMP AES-06: Siting and Laydown Areas.** Additionally, AES-06 would apply to all Project work areas. Also, work areas would be located to minimize impacts, including but not limited to biological and visual.

- **BMP AES-07: Avoid Siting Linear Features in the Centers of Valley Bottoms and on Ridgetops.** The eye follows strong natural lines in the landscape, and these lines

and associated landforms can "focus" views on particular landscape features. For this reason, linear facilities associated with renewable energy projects, such as transmission line ROWs, should be sited to avoid running across the centers of valley bottoms, and to avoid ridgetop bisection (i.e., routing the ROWs perpendicular to and over ridgelines).

- **BMP AES-08: Avoid Skylining.** "Skylining" of transmission/communication towers and other structures should be avoided. Transmission/communication towers and other structures should not be placed on ridgelines, summits, or other locations where they would be silhouetted against the sky. Skylining draws visual attention to the Project elements and can greatly increase visual contrast. Siting should take advantage of opportunities to use topography as a backdrop for views of facilities and structures to avoid skylining. Roads may be less visible if located along ridgetops, but if they are located on the ridge face, they can be highly visible because of increased cut, fill, and side cast material.

- **BMP AES-09: Site Linear Facilities along Natural Lines within the Landscape.** Siting of facilities, especially linear facilities (e.g., transmission lines, pipelines, roads), should take advantage of natural lines within the landscape (e.g., natural breaks in the landscape topography, the edges of clearings, or transitions in vegetation). Siting of facilities on steep slopes should be avoided. Siting linear facilities along naturally occurring lines in the landscape can reduce apparent contrast through repetition of the line element or through combination of multiple line elements into a single line element. Facilities sited on steep slopes are often more visible (particularly if either the project or viewer is elevated); they may also be more susceptible to soil erosion, which could also contribute to negative visual impacts.

- **BMP AES-10: Use Monopole, Guyed, and Lattice Electric Transmission Towers Appropriately.** Consideration should be given to the appropriate choice of monopoles versus guyed or lattice towers for a given landscape setting. Lattice or guyed towers are less visually obtrusive on the rural landscape than monopoles, especially when placed half a mile or more from Key Observation Points (KOPs) and against a landscape backdrop. When transmission towers are placed within a half mile or less from KOPs, then monopoles would occupy a smaller field of view than lattice towers. Monopoles are often more appropriate within built or partially built environments, while lattice or guyed towers tend to be more appropriate for less-developed rural landscapes, where the latticework would be more transparent against natural background textures and colors. Where transmission facilities are to be collocated in ROWs or corridors, and the existing ROW or corridor has either lattice towers only, guyed towers only, or monopoles only, the same tower type should be selected for new transmission facilities within the ROW/corridor.

- **BMP AES-11: Use Air Transport to Erect Transmission Towers.** In areas of the highest visual sensitivity, air transport capability should be used to mobilize equipment and materials for clearing, grading, and erecting transmission towers. The use of air transport capability preserves the natural landscape conditions between tower locations and may reduce the need for construction roads.

- **BMP AES-12: Reclamation to Reduce Visual Impacts.** The Reclamation Plan for the Project would include measures designed to reduce long-term impacts to visual resources.

- **BMP AES-13: Shifts in Alignment to Reduce Visual Impacts.** The specific location of the Project within the study area would be determined based on micrositing of Project components and new disturbance associated with access and work areas to reduce, minimize, or eliminate visual impacts.

- **APM AES-15: Lighting.** Limited lighting would be used during night construction to ensure safe working conditions while limiting the overall lighted area. To the extent practicable, lighting would be directed in a downward position to minimize impacts to night sky.

2.1.3 Conservation and Management Actions

The CDCA Plan, as amended, contains CMAs, which include a specific set of avoidance, minimization, and compensation measures. The applicability of those measures to the Project was determined using a CMA checklist (EIS Appendix 2C). The CMAs applicable to the Project and related to aesthetics are listed below and Project compliance with CDCA CMAs is addressed in the analysis portion of this section.

- **CMA LUPA-VRM-1.** Manage visual resources in accordance with the Visual Resource Management (VRM) Classes shown on Figure 9 (See CDCA Plan).

- **CMA LUPA-VRM-2.** Ensure that activities within each of the VRM Class polygons meets the VRM objectives described above, as measured through a visual contrast rating process.

- **CMA LUPA-VRM-3.** Ensure that transmission facilities are designed and located to meet the VRM Class objectives for the area in which they are located. New transmission lines routed through designated corridors where they do not meet VRM Class Objectives will require Resource Management Plan (RMP) amendments to establish a conforming VRM Objective. All reasonable effort must be made to reduce visual contrast of these facilities in order to meet the VRM Class before pursing RMP amendments. This includes changes in routing, using lattice towers (vs. monopole), color treating facilities using an approved color from the BLM Environmental Color Chart CC-001 (dated June 2008, as updated on April 2014, or the most recent version) (vs. galvanized) on towers and support facilities, and employing other BMPs to reduce contrast. Such efforts will be retained even if an RMP amendment is determined to be needed. Visual Resource BMPs that reduce adverse visual contrast will be applied in VRM Class conforming situations. For a reference of BMPs for reducing visual impacts see the "*Best Management Practices for Reducing Visual Impacts of Renewable Energy Facilities on Bureau of Land Management-Administered Lands"*, or the most recent version of the document or BMPs for VRM, as determined by BLM.

- **CMA DFA-VPL-VRM-1.** Encourage development in a planned fashion within Development Management Areas (DFAs) (e.g., similar to the planned unit development concept used for urban design—i.e., in-fill vs. scattered development, use of common road networks, Generator Tie Lines etc., use of similar support facility designs materials and colors etc.) to avoid industrial sprawl.

- **CMA DFA-VPL-VRM-2.** Development in DFAs and Variance Process Lands (VPLs) are required to incorporate visual design standards and include the best available, most recent BMPs, as determined by BLM (e.g. Solar, Wind, West Wide Energy Corridor, and Geothermal PEISs, the "*Best Management Practices for Reducing Visual Impacts of Renewable Energy Facilities on BLM-Administered Lands*", and other programmatic BMP documents).

- **CMA DFA-VPL-VRM-3.** Required visual resource BMPs. All development within the DFAs and VPLs will abide by the BMPs addressed in the most recent version of the document *"Reducing Visual Impacts of Renewable Energy Facilities on BLM-Administered Lands"*, or its replacement, including, but not limited to the following:

  - Transmission:

    - Color-treat monopoles Shadow Gray per the BLM Environmental Color Chart CC001 unless a more effective color choice is selected by the local Field Office VRM specialist.

    - Lattice towers and conductors will have non-specular qualities.

    - Lattice Towers will be located a minimum of 3/4-mile away from KOPs such as roads, scenic overlooks, trails, campgrounds, navigable rivers, and other areas people tend to congregate and located against a landscape backdrop when topography allows.

- **CMA DFA-VRM-1.** Manage all DFAs as VRM Class IV to allow for industrial scale development. Employ BMPs to reduce visual contrast of facilities.

- **CMA DFA-VRM-2.** Regional mitigation for visual impacts is required in DFAs. Mitigation is to be based on the VRI Class and the underlying visual values (scenic quality, sensitivity, and distance zone) for the activity area as it stands at the time the Record of Decision (ROD) is signed for the Desert Renewable Energy Conservation Plan (DRECP) Land Use Plan Amendment (LUPA). Compensatory mitigation may take the form of reclamation of other BLM lands to maintain (neutral) or enhance (beneficial) visual values on VRI Class II and III lands. Other considerations may include acquisition of conservation easements to protect and sustain visual quality within the viewshed of BLM lands. A VRI Class II 1:1 mitigation ratio will be applied in DFAs.

2.1.4 CEQA Significance Criteria

Appendix G of CEQA Guidelines (14 CCR 15000 et seq.) provides guidance on assessing whether a Project would have significant impacts on the environment. Consistent with Appendix G, the Project would result in a significant environmental impact if it would:

a. Have a substantial adverse effect on a scenic vista?

b. Substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway?

c. Degrade the existing visual character or quality of the site and its surroundings?

d. Create a new source of substantial light or glare which would adversely affect day or nighttime views in the area?

2.1.5 Aesthetics Analysis

Impact AES-1 - Would the project have a substantial adverse effect on a scenic vista?

Less Than Significant – No Mitigation Required

There are no officially designated scenic vistas or overlooks in the Project area.

Scenic vistas are generally considered expansive views that afford unobstructed visibility of scenic resources or areas. Local planning documents call for the identification and conservation of skylines, view corridors, and outstanding scenic vistas within the County (Riverside County 2003), as well as the maintenance of existing views of the Mesa and Colorado River from roadways and public uses and other ROW upon the valley floor whenever feasible (City of Blythe 2007).

The Project would appear alongside the existing Devers-Palo Verde 500 kV No. 1 (DPV1) transmission line in views toward the Palo Verde Mesa and Colorado River from Interstate 10 and other locations within and in the vicinity of Blythe, including State highways, local roads, residential developments, and recreational areas. Some of the closest residences to the routes in the study area are houses in Blythe and recreational vehicles (RVs) in McIntyre County Park.

Appendix 3C in the TES (BLM 2019) includes visual contrast rating forms that describe existing conditions and conditions during Project operation for the portion of the Project within California. The western end of the study area near the Colorado River Substation is BLM-Administered Lands that are flat desert plain with deep sands between the Mule Mountains to the south and the McCoy Mountains to the north. Native vegetation in this portion of the desert plain is very sparse and homogenous, which does not contribute to scenic values in the area. The area offers broken views of distant rugged mountains in all directions.

The Project segments visible from Interstate 10 west of Blythe would appear within a broad desert landscape alongside a number of other transmission facilities, including the barely discernable DPV1 structures and the Colorado River Substation. The proposed structures would appear in elevated views against a desert floor backdrop and in views from the interstate against an intermittent, jagged mountain backdrop. They would appear as a series of detectable but

relatively small vertical, angular forms repeating across the desert valley, connected by undulating conductors, which would likely be barely discernable from this distance.

From views closer to Blythe, transmission structures visible across the horizon in views to the southeast would appear as minor encroachments upon the skyline, where the tops of proposed structures would seem to extend above the distant mountains. Views of the Project to the southwest would be obscured or intermittent in views. Alternative segments would appear further away from this area, relegating visibility to very low portions of the horizon. The Project would not substantially affect any expansive, long-distance views in the area.

In proximate viewing locations, the Project would shape the skyline, appearing above distant mountains. However, it would not appear as a substantial alteration to existing conditions, in which DPV1 transmission structures are currently prominently visible. In views from the interstate or within Blythe, the Project would appear absorbed into a broader agricultural or desert setting, which contains transmission infrastructure including DPV1, Colorado Substation, and numerous other utility transmission and distribution facilities. The Project's potential effects to this existing character is addressed below. With regard to scenic vistas, the Project would have a less than significant impact.

Impact AES-2 - Would the project substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway?

No Impact

According to the California Department of Transportation (Caltrans) Scenic Highway Mapping System for Riverside County, there are no officially designated State scenic highways in the Project area or from which the Project would be visible in long-distance views (Caltrans 2018).

The segments of Interstate 10 and State Route 95 within the Palo Verde Valley have been identified by Riverside County for potential future nomination as scenic highways (Riverside County 2015a). These roadways do not cross the Project route; Interstate 10 is approximately 2 miles north of Colorado River Substation and is further away from the majority of the Project route in Riverside County, and State Route 95 extends north from Interstate 10 just west of the Colorado River, over 4.5 miles north of the Project route. Potential effects of the Project to views from roadways to the north are addressed below.

Visual contrast rating analyses included in Appendix 3C of the TES (BLM 2019) state that Project segments would be intermittently or partially visible from Interstate 10 west of Blythe (KOP 55) and from Interstate 10 near its crossing of the Colorado River (KOP 41), which approximates views from the southernmost segment of State Route 95. In views from Interstate 10, Project structures would appear in elevated views against a desert floor backdrop and against an intermittent, jagged mountain backdrop. They would likely appear as a series of detectable but relatively small vertical, angular forms repeating across the desert valley, connected by undulating conductors, which would likely be barely discernable from the interstate for both Project and alternative segments. In views from State Route 95, where visible, the structures would appear along the horizon, within a broader collection of vertical features. Resources considered scenic with regard to State scenic highways are not detectable from these locations.

Further, Caltrans Scenic Highway Guidelines (Caltrans 2008) indicate that power lines not easily visible from the road are “minor” intrusions on scenic highways and that power lines which are visible, but which do not dominate scenic views are “moderate” intrusions. Therefore, there would be no impact to scenic resources within a State scenic highway.

Impact AES-3 - Would the project substantially degrade the existing visual character or quality of the site and its surroundings?

Less than Significant with Mitigation

Section 3.18.3.7 in the TES (BLM 2019) describes the Project setting within California. The area through which the Project would pass is a landscape that transitions from river bluffs in the east to an agricultural floodplain south of Blythe, and eventually to the sparsely developed desert plain within which the Colorado River Substation is located. Visually, the western terminus of the Project area is characterized by the gradual decline in areas of visual interest; while the Colorado River corridor affords varied and sometimes scenic views, the agricultural lands are fairly uniform in appearance and the desert appears homogenous by comparison. Interstate 10 and the existing DPV1 transmission line are the area’s dominant linear features, visible within a broader area containing other transmission and distribution facilities generally aligned with the rectilinear road network that crosses the rural lands south and west of Blythe.

Evaluation in Appendix 3C of the TES (BLM 2019) of views from within Blythe indicate limited visibility or effects. Visitors to McIntyre Park (KOP 45) would see Project structures at some distance and structures would appear against an open sky and mountain backdrop, adjacent to and in front of the existing DPV1 Project. The Project structures would be identifiable against an open sky backdrop by visitors to Miller Park (KOP 48), but would, as view elements, be absorbed into the broader landscape, which includes numerous foreground features, very few of which are natural in appearance, and most of which are indicative of industrial and agricultural uses in the area. Residents along Lovekin Boulevard (KOP 51) would likely be able to discern intermittent segments of the Project, though it would appear beyond the existing DPV1 transmission line. From Interstate 10 near Blythe (KOP 55), Project structures would appear against an intermittent, jagged mountain backdrop, and would be seen as a series of detectable but relatively small vertical, angular forms.

Section 4.18.4.5 in the TES (BLM 2019) describes potential visual effects of the Project outside of Blythe. Given the mostly flat terrain and low degree of development outside of Blythe and portions of the interstate corridor, the Project would generally be visible in relatively long-distance views and could result in a potential impact to the existing visual character or quality of the surroundings prior to mitigation. However, it would appear as part of a landscape dedicated, to varying degrees, to energy generation and transmission. Along with the Colorado River Substation, numerous power plants (e.g., fossil fuel and solar-powered) are visible in the Project vicinity, as are additional transmission lines. With incorporation of MM VIS-CEQA-1, which includes implementing APM AES-05 and BMP AES-04, the Project would appear alongside, aligned with, and as close as possible to the existing DPV1 transmission line and would minimize visual contrast due to the use of non-reflective surfaces, thus reducing potential impacts to a less than significant level. The DPV1 H-frame and tangent lattice style structures are present in views from throughout the Project vicinity and are dominant features in close-in views of the transmission corridor.

MM VIS-CEQA-1 also includes implementation of BMP AES-10, which would result in tower types varying appropriately. Concurrent implementation of BMP BIO-19 under MM VIS-CEQA-1 would result in conductor bundles being in a horizontal, parallel configuration, and matching existing structure spacing and conductor heights to the greatest extent practical to reduce the potential for bird collisions with the power line. Additionally, MM VIS-04 would be implemented in order to limit the height of structures to what is absolutely necessary for safety and operation. MM VIS-04 would effectively minimize skylining and reduce the need for beacons within the Project area. No guyed structures would be used at these locations. Therefore, where the Project would cross agricultural lands, beginning just west of the Colorado River and extending through the majority of Segment p-16, Project towers would be H-Frame lattice structures, which would closely match existing transmission structures. The three westernmost Segment p-16 towers would be self-supporting lattice structures. West of the agricultural area and extending the rest of the way to Colorado River Substation, Project structures would be mostly guyed-V structures. Therefore, impacts related to the tower heights would be less than significant with mitigation incorporated.

Transmission infrastructure is an established component of views within and toward the Project area, where DPV1 towers and conductors are prominent existing features. Development of a new transmission line could result in potential impacts if they do not match the existing visual character of the surrounding area. MM VIS-CEQA-06 would be incorporated into the Project and would include measures to use structure type to match the existing structures and reduce contrast with the exiting visual character of the area. Therefore, new structures would not substantially alter the existing visual character in the Project area because these new structures would be of similar type to existing structures and the Project would be more readily absorbed into the existing landscape. The Project towers and conductors would repeat the vertical and undulating horizontal elements in existing views toward the Project area. Therefore, impacts related to the placement of new structures matching the exiting visual environment would be less than significant with mitigation incorporated.

Further, implementation of APMs and BMPs through MM VIS-CEQA-1 would ensure that the Project would be consistent with management objectives for BLM-Administered Lands, which include VRI Class II and III lands and a DFA. Specifically, applicable CMAs would be addressed with implementation of: APM AES-05 (transmission line collocation; avoidance of staging and laydown areas in visually sensitive areas); BMP AES-13 (micrositing to reduce, minimize or eliminate visual impacts); BMP AES-10 (appropriate use of monopoles or guyed or lattice towers, based on landscape setting); BMP AES-04 (color treatment where necessary, and dull, non-reflective finish on all structures); BMP AES-07 (avoid siting across center of a valley bottom); BMP AES-08 (avoidance of skylining); and BMP AES-12 (reclamation to reduce visual impacts).

While the TES or underlying Visual Contrast Rating Forms do not use the term “scaring,” the TES does discuss the short- and long-term impacts of ground disturbance at structure bases and from access road construction, such as in Section 4.18.4.1, which effectively constitute scaring. To clarify, during construction, newly exposed rock or clearing of vegetation could result in long term land scaring, and thus a potential impact prior to mitigation, if not treated appropriately. As described in the TES, MM VIS-3 would be implemented and would require appropriate surface treatments to newly exposed rock and gravel and additional AMPs and BMPs implemented

through MM VIS-CEQA-1 would be required to reduce potential impacts related to the existing visual character of the site and surroundings from Project construction and operation. These would include APM AES-01 which would require minimization of grading and clearing of vegetation; APM AES-02/BMP AES-02 which would require removal of construction material and debris from Project areas and restoration of disturbed areas; APM AES-06/BMP AES-06 which would require avoiding the placement of staging areas in visually sensitive areas (i.e., areas adjacent to scenic roadways, designated or eligible), and instead siting staging areas near previously disturbed transportation access points; BMP AES-09 which would require sitting permanent linear facilities within existing natural lines within the landscape; and BMP AES-11 which would require the use of air transport to mobilize equipment in visually sensitive areas, thus requiring less need for construction roads. Implementation of MM VIS-CEQA-1 and MM VIS-3 would reduce visual impacts from Project construction and long-term changes in the existing visual character of the area to a less than significant level.

In summary, the Project would appear to expand slightly the footprint of an existing transmission corridor. The new structures and conductors, aligned with existing structures and conductors at the crossing of the Colorado River and appearing generally in tandem with existing facilities as they extend across desert landscapes and similar in style within the agricultural area, would intensify the presence of an already existing, prominently visible feature. As such, effects on the existing visual character or quality of the site and its surroundings would be less than significant with the implementation of MM VIS-CEQA-1, MM VIS-03, MM VIS-04, and MM VIS-06. These CEQA MMs would reduce potential effects of the Project on existing visual character or quality to less than significant levels.

Impact AES-4 - Would the project create a new source of substantial light or glare which would adversely affect day or nighttime views in the area?

Less than Significant with Mitigation

The Project would not be a new source of substantial light. Federal Aviation Administration (FAA) lighting or other lighting required for air traffic safety is not required for transmission structures in the proposed route. Any nighttime lighting associated with construction would be temporary and used in order to provide safe working conditions while limiting light spillover outside of the construction area. However, in order to ensure that impacts related to nighttime lighting associated with construction activities does not result in a significant impact to nearby sensitive receptors that may have views of construction activities, MM VIS-CEQA-1 would be required and would implement APM AES-15, which would ensure that any nighttime lighting required for construction activities, would be directed in a downward position to minimize impacts to night sky. MM VIS-CEQA-1 would effectively reduce potential impacts related to nighttime lighting from construction to a less than significant level.

Additionally, operational impacts associated with steel transmission structures are potential sources of glare, particularly in desert environments where insularity is typically high and long-distance lines-of-sight between sources of glare and potential viewers can be unobstructed. As such MM VIS-CEQA-1 would also be required in order to implement BMP AES-04, which would result in the use of flat, non-reflective finish structures to minimize reflectivity and reduce visual contrast. Implementation of BMP AES-04 through MM VIS-CEQA-1 would reduce potential effects related to glare to less-than-significant levels. Therefore, impacts related to light

or glare resulting from proposed Project construction and operation would be less than significant with mitigation incorporated.

2.1.6 Aesthetics Mitigation

The following MMs are among those included in Section 4.18.6 of the TES (BLM 2019) where they are presented as being required for compliance with the BLM VRM objectives and/or to reduce impacts to visual resources. Of those MMs, the following would apply to segments within California:

MM VIS-03: Apply surface treatments (such as Permeon, or an approved equal) to newly exposed rock and gravel to blend with surrounding rock face and minimize visual impact of attention-attracting disturbance

MM VIS-03 Implementation

Responsible Party: The Applicant shall ensure that appropriate surface treatment is utilized throughout ground disturbing activities to prevent long-term land scaring.

Timing: The use of surface treatments shall be utilized throughout any ground disturbing activities.

Mitigation Monitoring and Reporting Program: The Applicant shall verify that Permeon will be used throughout construction. If Permeon is not available, then the Applicant shall identify a suitable replacement treatment that is approved by the CPUC and BLM prior to any ground disturbing activities.

Standards for Success: Long-term land scaring is prevented during construction and the surface treatment shall blend with the exiting natural environment, not detract from the existing visual environment.

MM VIS-04: Limit height of structures to what is absolutely necessary for safety and operation in order to minimize skylining and reduce the need for beacons to protect dark sky resources and maintain astronomical viewing opportunities.

MM VIS-04 Implementation

Responsible Party: The Applicant shall be responsible for implementation of this measure during the design phase, to avoid design conflicts that could result in unnecessary heights of transmission lines.

Timing: Heights of structures shall be determined during the design phase, prior to construction.

Mitigation Monitoring and Reporting Program: The Applicant shall submit design plans to the CPUC who shall review the plans and approve heights. If heights are required that will include the use of night beacons; the Applicant shall incorporate these lighting requirements consistent with APM AES-15.

Standards for Success: Prevention of long-term impacts associated with unnecessary heights for the transmission lines and/or reduction of operational lighting impacts.

MM VIS-06: Use structure type to match existing structures and reduce form contrast.

MM VIS-06 Implementation

Responsible Party: The Applicant shall be responsible for implementation of this measure prior to construction, during the design phase, to avoid design conflicts that could result in Project structures that do not match the existing visual environment.

Timing: Structure type and finishes shall be determined during the design phase, prior to construction.

Mitigation Monitoring and Reporting Program: The Applicant shall ensure that structures are built to blend with surrounding structures (if any) including buildings, other transmission lines (such as monopole, guyed, or lattice electric transmission lines), and roadways which shall be consistent with BMP AES-10. Colors and finishes of Project structures shall consist of natural colors (i.e., browns and greys).

Standards for Success: Prevention of long-term impacts associated with structures standing out in the natural visual environment. Instead, any structures shall blend with the existing visual environment.

In addition to the above TES measures, the following CEQA MM has been developed to reduce and/or avoid aesthetics impacts:

MM VIS-CEQA-1: Implement Aesthetics Applicant Proposed Measures, Best Management Practices, and Conservation and Management Actions.

The APMs, BMPs, and CMAs in Sections 2.1.2 and 2.1.3 above provide a suite of measures, practices, and actions that shall be implemented as part of the Project. AMPs, BMPs, and CMAs shall be implemented prior to, or during all ground disturbance and construction related activities to avoid or minimize Project related impacts to aesthetic and visual resources. These APMs, BMPs, and CMAs include; APM AES-01, APM AES-02, BMP AES-02, BMP AES-04, APM AES-05, APM AES-06, BMP AES-06, BMP AES-07, BMP AES-08, BMP AES-09, BMP AES-10, BMP AES-11, BMP AES-12, APM AES-15, CMA LUPA-VRM-1, CMA LUPA-VRM-2, CMA LUPA-VRM-3, CMA DFA-VPL-VRM-1, CMA DFA-VPL-VRM-2, CMA DFA-VPL-VRM-3, CMA DFA-VRM-1, and CMA DFA-VRM-2. If an APM, BMP, or CMA is subjective, such as containing text that states; “where appropriate,” “where applicable,” “where feasible,” or similar language, the BLM and CPUC shall be consulted to determine the applicability of each measure prior to the disturbance of a covered resource. Compliance with AMPs, BMPs, and CMAs shall be documented, and a weekly report shall be provided to the BLM and CPUC. The Applicant shall provide a synopsis of the weekly reports to the BLM and CPUC monthly. The report shall include a summary of the construction activities completed, a list of compliance actions and any remedial actions taken to correct any actions, and the status of ongoing mitigation efforts.

MM VIS-CEQA-1 Implementation

Responsible Party: The Applicant shall ensure that all APMs, BMPs, and CMAs are implemented during construction. If an APM, BMP, or CMA is subjective, the Applicant shall consult with the BLM and/or the CPUC to determine the applicability of each measure.

Timing: APMs, BMPs, and CMAs shall be implemented throughout construction activities.

Mitigation Monitoring and Reporting Program: The Applicant shall develop a weekly report that shall include all applicable APMs, BMPs, and CMAs and the related actions taken in order to be in compliance with these measures. These weekly reports shall be compiled and submitted to the BLM and CPUC monthly.

Standards for Success: Compliance with all applicable APMs, BMPS, and CMAs is achieved throughout construction of the Project.

2.2 AGRICULTURE

This section describes the impacts to agricultural resources associated with the construction, operation, maintenance, and decommissioning of the proposed transmission line, substations, and ancillary facilities in terms of CEQA significance thresholds disclosed below in Section 2.2.4. Additionally, this section responds to issues raised during the public scoping process, which are presented in Appendix 1 of the EIS.

As disclosed in Section 4.8.4 of the TES (BLM 2019), construction activities may temporarily disrupt agricultural activities and remove croplands, Natural Resource Conservation Service (NRCS)-classified Farmlands (Farmland), and Williamson Act Farmlands from production. Similarly, operation of the Project would remove agricultural, NRCS-classified Farmlands, and Williamson Act Farmlands from production during the life of the Project. The impacts to Prime Farmlands would be the same as during construction, and would occur within, not in addition to, the construction disturbance area. These effects would be long term, but minor because the actual acreage of Prime Farmlands affected would be substantially less than that available in the analysis area.

2.2.1 Thresholds and Methodology

Existing conditions described in Section 3.8 TES (BLM 2019) have been evaluated with regard to their potential to be affected by proposed Project construction, operation, maintenance, and decommissioning activities. The potential impacts associated with the proposed Project are evaluated on a qualitative and quantitative basis through a comparison of the anticipated Project effects on agricultural activities. The evaluation of Project impacts is based on professional judgment, analysis of Riverside County's agricultural resources polices, and the significance criteria established by Appendix G of the CEQA Guidelines.

2.2.2 Applicant Proposed Measures and BLM Best Management Practices

There are no APMs or BMPs applicable to agricultural resources.

2.2.3 Conservation and Management Actions

There are no CMAs applicable to agricultural resources.

2.2.4 CEQA Significance Criteria

Appendix G of CEQA Guidelines (14 CCR 15000 et seq.) provides guidance on assessing whether a project would have significant impacts on the environment. Consistent with Appendix G, the Project would have significant impacts to agriculture and forestry if it would:

a. Convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance, as shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program (FMMP) of the California Department of Conservation (CDC), to nonagricultural use.

b. Conflict with existing zoning for agricultural use or a Williamson Act contract.

c. Conflict with existing zoning for, or cause rezoning of, forest land (as defined in Public Resources Code (PRC) Section 12220(g)), timberland (as defined in PRC Section 4526), or timberland zoned Timberland Production (as defined in California Government Code (CGC) Section 51104 (g)).

d. Result in the loss of forest land or conversion of forest land to non-forest use.

e. Involve other changes in the existing environment that, due to their location or nature, could result in conversion of farmland to nonagricultural use or conversion of forest land to non-forest use.

2.2.5 Agricultural Resources Analysis

Impact AG 1 - Convert Farmland as shown on the maps prepared pursuant to the FMMP of the California Resources Agency, to non-agricultural use?

Less Than Significant – No Mitigation Required

As discussed in Section 3.8.3 of the TES (BLM 2019), the primary farming areas related to the Project area in California are in the Palo Verde Valley area of Riverside County. As noted in Section 3.8.3.3 of the TES, in California there are 2,330 acres of Farmland of Statewide importance and 4,009 acres of Prime Farmland within the Project area.

Potential impacts related to the conversion of prime, unique, or farmland of Statewide importance could occur if permanent Project features would remove farmland from future use. As evaluated in Sections 4.8.4 through 4.8.8 of the TES, construction impacts to agricultural lands for all zones would be less than significant, because the actual acreage of prime farmlands affected would be substantially less than that available in the analysis area.

Section 4.8.5.5 of the TES states that operational impacts to Prime Farmlands would be less than significant as the actual acreage occupied by support structures or access roads would be a less than three percent of the available farmlands. In addition, micrositing the transmission line should allow the Project to avoid crossing most fields with these features and reduce the potential for this type of disruption. If crossing a field is necessary, structures would be placed on the outside edges of the field or parallel to the rows, and diagonal field crossings would be avoided where possible.

As indicated in Section 3.8.3.3 of the TES, the Project would temporarily affect 121 acres of agricultural land in California. The areas of temporary impact would be returned to pre- Project uses and would be available for agricultural use following construction. Staging of materials requires temporary vegetation removal and minor surface smoothing but would not substantially change the soil conditions or quality of the site. Temporary impacts to FMMP-designated Farmland would not convert designated Farmland to a nonagricultural use because staging activities and other temporary impacts by their nature do not involve any permanent land conversion. None of the staging areas of temporary impact are currently used for agricultural activity; therefore, impacts would be less than significant. No mitigation is required.

A total of approximately 34 acres of agricultural lands would be permanently converted to nonagricultural use. However, most of these areas are currently located within existing ROW and are not currently in conflict with agricultural operations due to State laws regulating electrical infrastructure and easement restrictions. Transmission lines are generally viewed as a compatible use with farmlands since they don't require conversion of large portions of farmland. Specifically, as stated in the CGC Section 51238, the erection, construction, alteration, or maintenance of any electrical facilities, including transmission lines, are considered a compatible use within any agriculture preserve.

Therefore, since the Project requires the permanent conversion of less designated Farmland than the remaining designated farmland in the Project area and transmission lines are considered a compatible use, the Project’s potential to convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance to non-agricultural use is considered less than significant and no mitigation is required.

Impact AG 2 - Conflict with existing zoning for agricultural use or a Williamson Act contract?

Less Than Significant – No Mitigation Required

As noted in Section 4.8.4.5 TES (BLM 2019), the majority of the Colorado River and California Zone is agricultural land. Of these agricultural lands, approximately 1,263 acres are under Williamson Act lands and have the status of Agricultural Reserves. Chapter 12.16 of the Riverside County Zoning Code provides the regulatory framework for Agricultural Preserves. Compatible uses with an agricultural reserve under both the Riverside County Zoning Code and CGC Section 51238 include gas, electric, water and communication utility facilities, and public service facilities of like nature operated by a public agency or mutual water company (Riverside County 1988). Therefore, the transmission lines and associated Project features would not conflict with the existing zoning for agriculture use and Williamson Act contract lands.

The Project would involve temporary and permanent impacts to land zoned or designated for agricultural activities as determined by the Riverside County Zoning Ordinance and General Plan. Construction would temporarily impact approximately 98 acres of land with the Riverside County land use designation of agriculture and approximately 18 acres with the Riverside County land use designation of Open Space Rural. Areas of temporary impacts would be available for agricultural activities following construction. Temporary impacts to land with an agricultural land use and zoning designation would not conflict with zoning for agricultural use and impacts would be less than significant. No mitigation would be required.

Operation and maintenance of the Project would permanently impact approximately 6 acres of the agriculture land use and approximately 3 acres of Open Space Rural. The Project would have approximately 22 acres of temporary impacts and approximately one acre of permanent impacts to lands zoned agriculture. While the Project is close to the City of Blythe it is outside of the City's planning boundaries and the Project would have no impact on agricultural lands within the City planning area.

While the Project would have permanent impacts to Riverside County agriculture lands (including agricultural zoned areas and agricultural land uses), temporarily disturbed agriculturally zoned lands would be restored upon Project completion and transmission lines are a compatible use under both the Riverside County Zoning Code and CGC Section 51238. Therefore, impacts related to conflicting with existing zoning for agriculture and Williamson Act contract lands would be less than significant.

Impact AG 3 - Conflict with existing zoning for, or cause rezoning of, forestland (as defined in Public Resources Code section 12220(g)), timberland (as defined by Public Resources Code section 4526), or timberland zoned Timberland Production (as defined by Government Code section 51104(g))?

No impact

In California, the zoning designations along the Project include agriculture and rural residential. This condition precludes the possibility of conflicts with forest land zoning as a result of Project implementation. The Project would not conflict with existing zoning for, or cause rezoning of, forest land (as defined in PRC Section 12220(g)), timberland (as defined by Public Resources Code Section 4526)), or timberland zoned Timberland Production (as defined by CGC Section 51104(g)). No impacts would occur.

Impact AG 4 - Result in the loss of forestland or conversion of forestland to non-forest use?

No impact

The Project would not result in the loss of forest land or conversion of forest land to non-forest use. The Project would not be located on land zoned specifically as either forest land or timberland. The Project would be located primarily on Federal lands in Arizona and agricultural lands in California. There is no commercial forestry or timber production industry within Riverside County (Riverside County 2014). This condition precludes the possibility of conversion of forest land to non-forest use. No impacts would occur.

Impact AG 5 - Involve other changes in the existing environment which, due to their location or nature, could result in conversion of Farmland to non-agricultural use or conversion of forestland to non-forest use?

Less than Significant with Mitigation

The Project is surrounded by lands zoned for agriculture. However, the Project would not introduce a non-agricultural use that is sensitive to or incompatible with agricultural operations. The proposed transmission line would not remove any barriers to development or cause changes to water supply, drainage, or other resources.

The Project has the potential to temporarily interfere with active agricultural operations during staging of materials and conductor stringing operations. Construction could temporarily impact existing operations at agricultural uses from use of the staging yard during the estimated two-year construction period and during overhead conductor stringing. However, this conversion would be temporary and would not result in a permanent conversion of agricultural land. Therefore, temporary impacts related to changes in the existing environment which could convert farmland to non-farmland use would be less than significant.

Section 4.8.5.5 of the TES summarizes potential impacts to agriculture from Project operations, mentioning crop production that involves mechanical irrigation, automated farming methods, or farming equipment. Comments provided by the Metropolitan Water District (MWD) of Southern California on the DEIS (Appendix 8 of the EIS), specifically note impacts to agricultural lands that are within the MWD fee properties or other private properties currently enrolled in a Fallowing Program could occur during Project construction activities and operation, and thus, have the potential to result in a significant impact prior to mitigation. Potential impacts to these lands could include increases in soil erosion or compaction, creation or introduction of weeds or other pests, interference of movement of agricultural equipment and activities, prevention of consolidation of farm fields or subdividing lands, or restriction of Palo Verde Irrigation District operations within canal and drains. Specifically, the placement of Project features within lands enrolled in a Fallowing Program could result in the potential of all or a portion of these lands to become permanently non-producing which would affect the remainder of the lands within such Fallowing Program. Therefore, implementation of MM AG-CEQA-1 would be incorporated in order to require consultation and coordination with the MWD of Southern California and CPUC to avoid and reduce potential impacts resulting from Project work within MWD fee properties or properties enrolled in a Fallowing Program to a less than significant level. As such, impacts related to these agriculture lands would be less than significant with mitigation incorporated.

Some of the impacted areas would revert back to agriculture upon Project decommissioning. The Project would not involve other changes in the existing environment which may result in the conversion of other agricultural lands to non-agricultural uses. Therefore, the overall impacts with regard to conversion of farmlands due to other changes in the exiting environment would be less than significant with mitigation incorporated.

2.2.6 Agricultural Resources Mitigation

Additionally, the following CEQA MMs has been developed to reduce and/or avoid agricultural impacts:

MM AG-CEQA-1: Coordination with the Metropolitan Water District of Southern California.

The Applicant shall consult with the MWD of Southern California for any Project work occurring within lands under this jurisdiction of the MWD of Southern California during the development of the Project design phase. If Project work shall occur within lands designated as under the jurisdiction of the MWD of Southern California, the Applicant will work with the MWD of Southern California to locate transmission structures adjacent to existing electrical infrastructure to consolidate potential obstructions to the movement of agriculture machinery or other agricultural activities, locate access roads and staging areas away from agricultural lands and operations, and limit the use of pesticides near agricultural lands. Further, if dust control measures (see MM AQ-CEQA-1 under Section 2.3.7 below) or weed control measures (see MM VEG-CEQA-1 under Section 2.4.6 below) are required for Project work occurring within MWD of Southern California's jurisdiction, these measures will also require review and approval by the MWDSC for work within agricultural lands under their jurisdiction. Specifically, if Project work will occur within MWD of Southern California lands that are used for farming organic crops, chemicals used within these lands shall be prohibited. The Applicant will work with the MWD of Southern California to identify these lands during the Project design phase and avoid use of chemicals through weed control in these lands.

The Applicant shall inform the MWD of Southern California 30-days prior to the start of construction activities that may occur within agricultural lands under the jurisdiction of the MWDSC and follow with a report submitted to the MWD of Southern California upon completion of the construction activities within these lands. Successful implementation of this MM shall prevent short and long-term impacts to agricultural lands under the jurisdiction of the MWD of Southern California.

MM AG-CEQA-1 Implementation

Responsible Party: The Applicant shall be responsible for consultation and coordination with MWD of Southern California.

Timing: Consultation with MWD of Southern California shall occur during the design phase of the Project and notification of construction shall be given to MWD of Southern California 30-days prior to the start of construction activities that will occur within agricultural lands under the jurisdiction of MWD of Southern California.

Mitigation Monitoring and Reporting Program: The Applicant shall keep a record of consultation with MWD of Southern California, including during design and Project implementation. If any further measures are identified and/or actions are taken for construction work within agricultural lands under jurisdiction of MWD of Southern California, these measures and/or actions will be documented and kept on file by the Applicant.

Standards for Success: Prevention of short- and long-term impacts associated with agricultural lands under the jurisdiction of the MWD of Southern California.

2.3 AIR QUALITY AND CLIMATE CHANGE

This section describes the impacts to air quality associated with the construction, operation, maintenance, and decommissioning of the Project in terms of CEQA significance thresholds disclosed below in Section 2.3.4 below. As disclosed in Section 4.2 of the TES (BLM 2019), impacts to air quality would occur from the emissions of criteria pollutants, hazardous air pollutants (HAPs), and greenhouse gases (GHGs); however, no air quality standards would be exceeded. Additionally, this section responds to issues raised during the public scoping process, which are presented in Appendix 1 of the EIS.

As concluded in Section 4.2.4.1 of the TES, Project construction and, to a lesser extent, operation would result in some increase to ambient air pollutant concentrations, even though construction emissions would be temporary in nature. The primary indicators for determining whether or not the Project emissions would result in a significant impact to air quality are as follows:

- Estimated Project emissions exceed conformity de minimis thresholds; and/or
- The increase in ambient pollutant concentrations for a particular area as a result of the Project emissions would result in an exceedance of the National Ambient Air Quality Standards (NAAQS) for that area.
- The TES determined that these types of significant impacts could result from:
- Fugitive dust from earth-moving associated with construction activities in support of the upgrade and new build of the transmission line, series compensation station, and ancillary facilities;
- Fugitive dust from vehicle movement on paved and unpaved roads accessing various segments of the line route;
- Engine exhaust (tailpipe emissions) from both on-road and non-road vehicles/equipment, including construction worker commuting, delivery of materials and supplies, and onsite construction activities;
- Emissions from concrete batch plants used to mix the concrete needed for structure and equipment foundations.

2.3.1 Thresholds and Methodology

The Mojave Desert Air Quality Management District (MDAQMD) has developed these Guidelines and has dedicated assets to reviewing projects to ensure that they will not: (1) cause or contribute to any new violation of any air quality standard; (2) increase the frequency or severity of any existing violation of any air quality standard; or (3) delay timely attainment of any air quality standard or any required interim emission reductions or other milestones of any Federal attainment plan. The MDAQMD Guidelines are intended to provide background information and guidance on the preferred analysis approach as well as provide significance thresholds for evaluation under CEQA. All emissions would be created in Riverside County

only, and therefore, a formal evaluation would not be required; there is potential for emissions to reach Imperial County.

Pursuant to the MDAQMD Guidelines and thresholds (Table 2.3-1), any project involves significant impacts if it triggers or exceeds the most appropriate evaluation criteria. The MDAQMD will clarify upon request which threshold is most appropriate for a given project; in general, the following emissions comparison (criteria number 1) is sufficient:

a. Generates total emissions (direct and indirect) in excess of the thresholds given in Table 2-1 below;

b. Generates a violation of any ambient air quality standard when added to the local background;

c. Does not conform with the applicable attainment or maintenance plan(s);

d. Exposes sensitive receptors to substantial pollutant concentrations, including those resulting in a cancer risk greater than or equal to 10 in a million and/or a Hazard Index (HI) (non-cancerous) greater than or equal to 1.

Table 2.3-1 MDAQMD Thresholds of Significance

POLLUTANT	SIGNIFICANCE (TONS/YEAR)	SIGNIFICANCE (LBS/DAY)
CO	100	548
NO_x	25	137
PM_{10}	15	82
$PM_{2.5}$	12	65
SO_x	25	137
VOC	25	137
CO_2e	100,000	548,000

Source: MDAQMD 2016

A significant project impact must incorporate mitigation sufficient to reduce its impact to a level that is not significant. A project that cannot be mitigated to a level that is not significant must incorporate all feasible mitigation. Note that the emission thresholds are given as a daily value and an annual value, so that a multi-phased project (such as project with a construction phase and a separate operational phase) with phases shorter than one year can be compared to the daily value.

A portion of the Project is located within Riverside County. As part of its General Plan Amendment, Riverside County adopted a Climate Action Plan in December 2015 to address global climate change and consistency with State Assembly Bill (AB) 32. Riverside County established a goal to reduce their greenhouse gas inventory 15 percent below 2008 levels by the year 2020. Riverside County also established a screening threshold for CEQA projects of 3,000

Metric Tons Carbon Dioxide Equivalent ($MTCO_2e$). This is the threshold that the County determined would result in less than significant impacts to climate change provided the Project incorporated energy efficiency five percent greater than the 2010 Title 24 requirements and water conservation measures that match the California Green Building Code (CALGreen) in effect as of January 2011, as applicable.

For purposes of this analysis, the 3,000 $MTCO_2e$ screening threshold will be applied to the Project for the Riverside County portion of the Project.

2.3.2 Applicant Proposed Measures and BLM Best Management Practices

APMs have been identified and would be implemented by the Project applicant. In addition, BLM would require implementation of BMPs, which are intended to further minimize Project impacts. APMs and BMPs addressing air quality impacts are outlined below and are applied to Project by MM AQ-CEQA-1. These APMs and BMPs are based on the Project APMs and BMPs described in EIS Appendix 2A; some have been revised to ensure they provide adequate mitigation for CEQA purposes under MM AQ-CEQA-1. The following APMs and BMPs would apply to the portion of the Project located within California and have therefore been applied to mitigate significant impacts to air quality and GHGs under CEQA.

- **APM AQ-01: Fugitive Dust (quantitatively included in the emissions estimate).** The following control measures would be implemented, as applicable, to reduce PM10 and PM2.5 emissions during construction, in conjunction with an Erosion, Dust Control, and Air Quality Plan and Fugitive Dust Control Plan for the Project.

Basic control measures

The following measures would be implemented at all construction sites:

- Water active construction areas sufficiently to minimize fugitive dust.
- Water for dust control would include three 2,000-gallon water trucks that would water access roads twice a day, 5 days a week, for 18 months.
- Cover trucks hauling soil, sand, and other loose materials and require all trucks to maintain at least 6 inches of freeboard.
- Pave, apply water, or apply nontoxic soil stabilizers on all unpaved access roads, parking areas, and staging areas at construction sites to minimize fugitive dust.

Enhanced control measures

In addition to the "basic" control measures listed above, the following control measures may be implemented at all construction sites greater than 4 acres:

- Water, hydroseed, or apply nontoxic soil stabilizers to inactive construction areas to minimize fugitive dust.
- Enclose, cover, water twice daily, or apply nontoxic soil binders to exposed stockpiles.

- Limit traffic speeds on unpaved roads.
- Install sandbags or other erosion-control measures to prevent silt runoff to public roadways.
- Replant vegetation in disturbed areas as quickly as possible, consistent with seasonal survival considerations.

Optional control measures

Depending on the extent of dust generation, implementation of the following APMs may occur at larger construction sites, near sensitive receptors (residences or other occupied buildings, parks, or trails within 1,000 feet of earthmoving operations that are substantial; for example, more than excavation for tower foundations), or in situations which for any other reason may warrant additional emissions reductions:

- Install wheel washers for all existing trucks or wash off the tires or tracks of all trucks and equipment leaving the site.
- Suspend excavation and grading activity when winds (instantaneous gusts) exceed 25 miles per hour (mph).
- Limit the area subject to excavation, grading, and other construction activity at any one time.

- **BMP AQ-01: Dust Palliatives (quantitatively included in the emissions estimate).** Dust palliatives would be applied, in lieu of water, to inactive construction areas (disturbed lands or soil stockpiles that are unused for 14 consecutive days). Dust palliatives would be chosen by the Dust Control Site Coordinator and or construction contractor. Dust palliatives would be environmentally safe; comply with Federal, State, and local regulations; and would not produce a noxious odor or contaminate surface water or groundwater and, therefore, would not pose runoff concerns during rain events. Application rates for dust palliatives would follow the manufacturer's recommendations. Material Safety Data Sheets (MSDS/SDS) for any palliatives would be available on site and provided to the BLM 14 days prior to use.

- **APM AQ-02: Exhaust Emissions (qualitatively included in the emissions estimate).** The following measures would be implemented during construction to further minimize greenhouse gas emissions (carbon dioxide, methane, and nitrous oxide) per California AB 32 and criteria air pollutants from vehicle and machinery and in conjunction with the Construction Emissions Mitigation Plan for the Project:

  - Minimize unnecessary construction vehicle idling time. The ability to limit construction vehicle idling time depends on the sequence of construction activities and when and where vehicles are needed or staged. Certain vehicles, such as large diesel-powered vehicles, have extended warm-up times that limit their availability for use following startup. Where such diesel-powered vehicles are required for repetitive construction tasks, these vehicles may require more idling time. The Project would apply a "common sense" approach to vehicle use, such that idling is

reduced as far as possible below the maximum of 5 consecutive minutes required under Title 13 of California Code of Regulations (CCR) Section 2485 (13 CCR 2485). If a vehicle is not required for use immediately or continuously for construction activities or other safety-related reasons, its engine would be shut off.

- Encourage use of natural gas- or electric-powered vehicles for light-duty trucks where feasible and available.

- **APM AQ-03: Minimize Potential Naturally Occurring Asbestos Emissions (qualitatively included in the emissions estimate).** The following measures would be implemented prior to and during construction to minimize the potential for naturally occurring asbestos emissions, in conjunction with an Asbestos Dust Mitigation Plan:

  - Prior to construction, samples of the construction area would be analyzed for the presence of asbestos, serpentinite, or ultramafic rock.

  - If asbestos, serpentinite, or ultramafic rock is determined to be present, all applicable provisions of the Airborne Toxic Control Measure (ATCM) for construction, grading, quarrying, and surface mining operations (17 CCR 93105) would be implemented, including the following:

  - For disturbed areas of 1 acre or less:

    - Construction vehicle speed at the work site would be limited to 15 mph or less.

    - Prior to any ground disturbance, sufficient water would be applied to the area to be disturbed to prevent visible emissions from crossing the property line.

    - Areas to be graded or excavated would be kept adequately wet to prevent visible emissions from crossing the property line.

    - Storage piles would be kept adequately wetted, treated with a chemical dust suppressant, or covered when material is not being added to or removed from the pile.

    - Equipment would be washed down before moving from the property onto a paved public road.

- Visible track-out on the paved public road would be cleaned using wet sweeping or a high-efficiency particulate air-filter-equipped vacuum device within 24 hours.

  - For disturbed areas of greater than 1 acre:

    - Prepare an Asbestos Dust Mitigation Plan and obtain approval prior to construction.

  - Implement and maintain the provisions of the approved Asbestos Dust Mitigation Plan from the beginning of construction through the duration of the construction activity.

- APM AQ-04: Minimize Potential Emissions of Naturally Occurring *Coccidioides immitis* Fungal Spores (qualitatively included in the emissions estimate). In addition to the APM AQ-01 measures to control general fugitive dust emissions, the following measures would be implemented prior to and during construction to create awareness of the risks and inhalation prevention procedures with respect to *Coccidioides immitis* fungal spores, which are naturally present in soils in the desert southwest, and inhalation of which can cause Valley Fever:
  - Prior to construction, and for each phase of construction, implement an Environmental Awareness Program for workers to ensure they are informed of the risks of contracting Valley Fever and the protective measures needed to minimize personal exposure to fugitive dust, as well as to minimize possible dust exposure of nearby residents and the general public.
  - Inform workers of the possible symptoms of Valley Fever and encourage them to seek medical treatment if these symptoms manifest.
- **BMP AQ-05: Air Quality Regulation and Standard Conformance.** All activities would meet the requirements of the Clean Air Act (CAA) (Sections 110, 118, 160, and 176[c]) and the applicable local Air Quality Management (AQM) jurisdiction(s). Fugitive dust cannot exceed local standards and requirements.

2.3.3 Conservation and Management Actions

The CDCA Plan, as amended, contains CMAs, which include a specific set of avoidance, minimization, and compensation measures. The applicability of those measures to the Project was determined using a CMA checklist (EIS Appendix 2C). The CMAs applicable to the Project and related to air quality and greenhouse gases are listed below and Project compliance with CDCA CMAs is addressed in the analysis portion of this section.

- **CMA LUPA-AIR-1**. All activities must meet the following requirements:
  - Applicable NAAQS (Section 109);
  - State Implementation Plans (SIP) (Section 110);
  - Prevention of Significant Deterioration (PSD), including visibility impacts to mandatory Federal Class I Areas (Section 160 et seq.);
  - Conformity Analyses and Determinations (Section 176[c]); and
  - Apply BMPs on a case by case basis.

- **CMA LUPA-AIR-3.** Where impacts to air quality may be significant under NEPA, requiring analysis through an EIS, require documentation for activities to include a detailed discussion and analysis of Ambient Air Quality conditions (baseline or existing), NAAQS, criteria pollutant nonattainment areas, and potential air quality impacts of the Project (including cumulative and indirect impacts and GHGs emissions). This content is necessary to disclose the potential impacts from temporary or cumulative degradation of air quality. The discussion will include a description and estimate of air emissions from potential construction and maintenance activities, and MMs to minimize net PM10 and PM2.5 emissions. The documentation will specify the emission sources by pollutant from mobile sources, stationary sources, and ground disturbance. A Construction Emissions Mitigation Plan will be developed.

- **CMA LUPA-AIR-4.** Because fugitive dust is the number one source of PM10 and PM2.5 emissions in the Mojave and Sonoran Deserts, fugitive dust impacts to air quality must be analyzed for all activities/projects requiring an EIS and Environmental Assessment (EA).

    - The NEPA air quality analysis may include modeling of the sources of PM10 and PM2.5 that occur prior to construction and/or ground disturbance from the activity/project, and show the timing, duration and transport of emissions off site. When utilized, the modeling will also identify how the generation and movement of PM10 and PM2.5 will change during and after construction and/or ground disturbance of the activity/project under all activity/project specific NEPA alternatives. The BLM air resource specialist and Authorizing Officer will determine if modeling is required as part of the NEPA analysis based on estimated types and amounts of emissions.

- **CMA LUPA-AIR-5.** A Fugitive Dust Control Plan will be developed for all projects where the NEPA analysis shows an impact on air quality from fugitive dust.

2.3.4 CEQA Significance Criteria

Appendix G of CEQA Guidelines (14 CCR 15000 et seq.) provides guidance on assessing whether a project would have significant impacts on the environment. Consistent with Appendix G, the Project would have significant air quality and greenhouse gas emissions impacts if it would:

2.3.4.1 Air Quality

a. Conflict with or obstruct implementation of the applicable air quality plan?

b. Violate any air quality standard or contribute substantially to an existing or projected air quality violation?

c. Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable Federal or State ambient air quality standard (including releasing emissions, which exceed quantitative thresholds for ozone precursors)?

d. Expose sensitive receptors to substantial pollutant concentrations?

e. Create objectionable odors affecting a substantial number of people?

2.3.4.2 Greenhouse Gas Emissions

a. Generate GHGs emissions, either directly or indirectly, that may have a significant impact on the environment?

b. Conflict with any applicable plan, policy or regulation of an agency adopted for the purpose of reducing the emissions of GHGs.

2.3.5 Air Quality Impact Analysis

Impact AIR 1 - Conflict with or obstruct implementation of the applicable air quality plan?

Less than Significant with Mitigation

The MDAQMD is responsible for reviewing projects to ensure that they will not: (1) cause or contribute to any new violation of any air quality standard; (2) increase the frequency or severity of any existing violation of any air quality standard; or (3) delay timely attainment of any air quality standard or any required interim emission reductions or other milestones of any Federal attainment plan. The MDAQMD CEQA and Air Federal Conformity Guidelines provides guidance on methodology and criteria to evaluate whether the Project would exceed significance thresholds.

The MDAQMD Guidelines state, “A project is non-conforming if it conflicts with or delays implementation of any applicable attainment or maintenance plan. A project is conforming if it complies with all applicable MDAQMD rules and regulations, complies with all control measures that are not yet adopted from the applicable plan(s), and is consistent with the growth forecasts in the applicable plan(s) (or is directly included in the applicable plan).”

The Project would comply with applicable MDAQMD rules related to fugitive dust (rule 403.2) and visible emissions (rule 401). In addition, the MDAQMD would need to issue an air quality permit under Regulation II of their rules for any portable concrete batch plants located in Riverside County (Blythe area). Any such batch plant would need to meet the particulate matter emissions limitations of MDAQMD Rules 404 and 405. Accordingly, the Project would be in compliance with all applicable MDAQMD rules.

As discussed in Section 4.2 of the TES (BLM 2019), the Mojave Desert Planning Area Federal Particulate Matter Attainment Plan requires the preparation of a Dust Control Plan for projects, such as this Project, that disturb more than 100 acres. Pursuant to Rule 403.2, the Applicant would be required to prepare and submit a site-specific Fugitive Dust Control Plan for the Project prior to commencing earth-moving activities in order to reduce potential impacts to a less than significant level. As such, MM AQ-CEQA-1 (which includes implementation of APM AQ-01 and BMP AQ-05) would be implemented and would require the preparation and implementation of a Fugitive Dust Control Plan for the Project in order to reduce potential impacts resulting from fugitive dust to a less than significant level. This Fugitive Dust Control Plan would be consistent with dust control strategies recommended in the Mojave Desert

Planning Area Federal Particulate Matter Attainment Plan as well as BMP AQ-05 which requires conformance with the CAA (i.e., local standards and requirements). Therefore, the Project would not conflict with or obstruct implementation of the Mojave Desert Planning Area Federal Particulate Matter Attainment Plan. As such, this impact would be less than significant for potential to violate applicable Federal plans.

The emission control measures in the MDAQMD 1995 PM10 Plan and the 2004 Ozone Attainment Plan were all adopted into MDAQMD rules; the Project would be in compliance with control measures in attainment plans through compliance with applicable rules. As discussed in Section 4.15 of the TES (BLM 2019), growth has been accounted for in various local and regional plans and projections and no changes to that growth would be likely to occur as a result of the Project. As such, the Project would be consistent with the growth forecasts in the applicable plans.

According to the California Ambient Air Quality Standards (CAAQS), the MDAQMD region is in nonattainment status for ozone and PM10. Therefore, if Project-generated emissions of either of the ozone precursor pollutants (volatile organic compounds [VOC] and nitrogen oxides [NOx]) or PM10 exceed the MDAQMD's significance thresholds, then the Project would be considered to conflict with the attainment plan since it could contribute to an air quality violation.

As described in Section 4.2 of the TES, VOC, NOx, and PM10 emissions resulting from the Project would be below the MDAQMD's thresholds listed in Table 2.3-1 and would be consistent with the MDAQMD's air quality plans. However, MM AQ-CEQA-1 (which includes implementation of APM AQ-02) would be implemented to further ensure that construction emissions from the Project do not exceed the MDAQMD's thresholds throughout construction through the development and implementation of a Construction Emissions Mitigation Plan. This Plan would include measures to reduce emissions through reduction in idling times and encourage the use of natural gas or electric powered light-duty vehicles. Therefore, emissions of VOC, NOx, and PM10 associated with the construction and operation of the Project would not contribute to air quality violations and would not exceed the MDAQMD's significance thresholds. As such, this impact would be less than significant with mitigation incorporated.

The overall impact would be less than significant with mitigation incorporated.

Impact AIR 2 - Violate any air quality standard or contribute substantially to an existing or projected air quality violation?

Less Than Significant – No Mitigation Required

The MDAQMD recommends that ambient air quality modeling be conducted when project emissions exceed their significance thresholds (Table 4.2-4 in the TES). If the emissions do not exceed the thresholds it is assumed that there would not be a violation of the CAAQS.

As shown in Table 4.2-4 of the TES, the Project's criteria pollutant emissions would not exceed the MDAQMD annual or daily significance thresholds for CO, NOx, PM10, PM2.5, SOx, and VOC, thus no ambient air quality modeling is required. Because the Project's emissions do not exceed the MDAQMD thresholds, it can be concluded that the Project would not result in or contribute to short-term exceedances of ozone, CO, PM10, and PM2.5 CAAQS. Therefore, the

Project would not violate or contribute to violation of any air quality standards and impacts would be less than significant.

The California Supreme Court's Sierra Club v. County of Fresno decision (referred to herein as the Friant Ranch decision) addresses the need to correlate mass emission values for criteria air pollutants to specific health consequences, and contains the following direction from the California Supreme Court: "The EIR must provide an adequate analysis to inform the public how its bare numbers translate to create potential adverse impacts or it must explain what the agency does know and why, given existing scientific constraints, it cannot translate potential health impacts further." As the project does not exceed applicable air quality thresholds, it would not cause adverse health impacts to receptors proximate to the project.

Impact AIR 3 - Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard (including releasing emissions, which exceed quantitative thresholds for ozone precursors)?

Less Than Significant – No Mitigation Required

By its very nature, air pollution is largely a cumulative impact. The nonattainment status of regional pollutants is a result of past and present development. Future attainment of State and Federal ambient air quality standards is a function of successful implementation of the MDAQMD's attainment plans. Consequently, the MDAQMD's application of thresholds of significance for criteria pollutants is relevant to the determination of whether a project's individual emissions would have a cumulatively significant impact on air quality.

A lead agency may determine that a project's incremental contribution to a cumulative effect is not cumulatively considerable if the project will comply with the requirements in a previously approved plan or mitigation program, including, but not limited to an air quality attainment or maintenance plan that provides specific requirements that will avoid or substantially lessen the cumulative problem within the geographic area in which the project is located [CCR §15064(h)(3)].

Thus, if project specific emissions exceed the thresholds of significance for criteria pollutants the project would be expected to result in a cumulatively considerable net increase of any criteria pollutant for which the MDAQMD is in non-attainment under applicable Federal or State ambient air quality standards. Similarly, if a project's emissions do not exceed the project-level thresholds of significance and it is consistent with attainment plans, the project would not result in a cumulatively considerable net increase in emissions.

If an area is in nonattainment for a criteria pollutant, then the background concentration of that pollutant has historically exceeded the ambient air quality standard. The State has designated the Riverside County portion of the Project area as being in nonattainment with CAAQS for ozone and PM10, and either in attainment or unclassified for all other pollutants regulated under CAAQS.

Short-term construction-related emissions would not exceed the MDAQMD significance thresholds for any VOC, NOx, and PM10 (Table 4.2-4 of the TES), therefore VOC, NOx, and PM10 emissions would not result in a significant cumulative impact relative to potential

exceedances of CAAQS for ozone and PM10. Similarly, CO emissions would also not exceed the MDAQMD significance thresholds and Mojave Desert Air Basin (MDAB) is in attainment for CO CAAQS. As discussed in the TES, the NAAQS standards would not be violated and would be in attainment. Furthermore, Section 4.2.10 of the TES evaluated potential cumulative effects and found that each of the Project alternatives would contribute a negligible amount ranging from 0.001 percent to 0.073 percent when compared to the cumulative criteria pollutant totals. Additionally, each of the full-route alternative emissions would not exceed the Federal conformity determination thresholds, which have been established to demonstrate there would be no increase in emissions in the nonattainment or maintenance area from the Federal action that could cause new violations of the standards and/or no increase in the frequency or severity of previous violations. Therefore, there would be a less than significant impact during Project construction.

Long-term operation-related emissions are substantially less than the construction-related emissions (see Air Quality and Climate Change Baseline Technical Report (HDR 2017b)). Since the construction related emissions do not exceed MDAQMD threshold and contribute negligible amounts to the cumulative criteria totals, it follows that the long-term emissions would also not exceed the MDAQMD's significance thresholds. The Project's long-term emissions would likewise not be cumulatively considerable. Therefore, the Project would have a less than significant impact.

Impact AIR 4 - Expose sensitive receptors to substantial pollutant concentrations?

Less than Significant with Mitigation

2.3.5.1 Construction VOC, NO_x, PM_{10}, and CO

As discussed in Impact AIR-2, emissions during construction would not exceed the MDAQMD significance thresholds and would not be expected to result in concentrations that would exceed ambient standards or contribute substantially to an existing exceedance of an ambient air quality standard. Impacts to sensitive receptors would be less than significant.

The Project is not anticipated to create a CO impact or hotspot during construction as emissions of CO would not be concentrated in any one area or intersection. There would be minimal CO emissions during operation as there is little to no activity generating CO emissions during operation.

2.3.5.2 Construction Toxic Air Contaminants

The construction of the Project would emit toxics air contaminants (TAC) emissions principally in the form of diesel particulate matter (DPM as PM10 exhaust). DPM has been identified by the California Air Resources Board (CARB) as a carcinogenic substance. The DPM emissions would result from the operation of the various pieces of off-road construction equipment. Short-term emissions of DPM generated from construction would be limited to the 16-month construction period and would be dispersed throughout the length of the transmission line. In addition, on-site long-term emissions that would be associated with operation and maintenance would be negligible. Therefore, emissions would not be concentrated near any existing residences. Table 4.14-1 in the TES identifies the sensitive receptors along the various Project

segments. For the majority of the Project and the alternatives, there are no sensitive receptors within 2,000-foot buffers or greater. The only exceptions are in the communities of Quartzite and Ehrenburg, where receptors would be located slightly over 1,000 feet and 1,200 feet, respectively from the route. Given the limited duration of exposure and the spatial distribution of emissions, there would be little health risk to the nearby residences from exposure to Project-related DPM emissions. Additionally, MDAQMD does not consider the Project an industrial project because there are no industrial emissions, as it is a passive infrastructure project. Proximity to sensitive receptors for operational emissions is not an issue and need not be addressed. Therefore, the impact would be less than significant.

The Project would not be a substantial source of TAC emissions during operations. Potential TAC emissions would be generated by minimal vehicle traffic during maintenance activities. Given the limited emissions and distance to the nearest receptor the impact would be less than significant.

2.3.5.3 Valley Fever

Project-related construction (and, to a far lesser extent, operation) fugitive-dust emissions could include emissions of spores from the fungus *Coccidioides amities*, which lives in the soil of arid areas in the southwestern United States that could be emitted in substantial concentrations if fugitive-dust emissions are not limited. Therefore, the Project is designed to be constructed in a way that reduces fugitive-dust emissions. Which, in turn, would also reduce potential emissions of the fungal spores that could be present in each area. The implementation of measures APM AQ-01, APM AQ-03, and APM AQ-04 through MM AQ-CEQA-01 would control fugitive-dust emissions (thus controlling *Coccidioides amities* spores and naturally occurring asbestos) and provide workers with a Worker Environmental Awareness Program (WEAP) to ensure the workers are informed of the risks of contracting Valley Fever and the protective measures needed to minimize personal exposure to fugitive dust associated with Project construction. Since the Project mitigation and construction practices would control the emission of any potential for substantial pollutant concentrations, the impact would be less than significant.

Impact AIR 5 - Create objectionable odors affecting a substantial number of people?

Less Than Significant – No Mitigation Required

The Project is not expected to generate any objectionable odors. There would be some potential for detectable odors from vehicle exhausts, both diesel and gasoline, from both on-road and non-road construction equipment used on the Project. Any such odors would be similar to, but less prevalent than, odors experienced in busy urban areas from both on-road and nonroad vehicles and thus would not be significant. Additionally, populated areas along the Project are limited to the area surrounding the community of Blythe, where construction would take place for a short period of time further limiting the potential for a substantial number of people to be exposed to objectionable odors created from Project-specific vehicle exhaust. Therefore, construction-related impacts would be less than significant.

Land uses typically considered associated with odors include wastewater treatment facilities, waste-disposal facilities, or agricultural operations. The Project does not contain land uses typically associated with emitting objectionable odors during operations. There would be a less than significant impact.

2.3.6 Greenhouse Gas Emissions Impact Analysis

Impact GHG 1 - Generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?

Less Than Significant – No Mitigation Required

The Project would not generate GHG emissions, either directly or indirectly, that may have a significant impact on the environment. The primary source of GHG emissions is from CO2. Emissions of methane and N2O would be a fraction of the CO2 emissions. As shown in Table 4.2-2 of the TES, the maximum annual GHG emissions that would be associated with construction of the Project would be up to 31,723 tons of carbon dioxide equivalents (CO2e). The total project is 114.3 miles in length, and the California portion is approximately 20 miles in length, thus total Project emissions are multiplied by 20/114.3 except for the batch plants. The total emissions within California would be 3,770 tons of CO2e (3,420 metric tons (MT)) and the total annual long-term GHG emissions that would be associated with operation and maintenance would be 934.3 MT CO2e. Even doubling these emissions estimates to account for methane and N2O, these emissions levels would still be well below the MDAQMD's annual tons of CO2e CEQA significance threshold of 100,000 tons of CO2e (MDAQMD 2016).

Riverside County has a Climate Action Plan (RCCAP) with a threshold of 3,000 MT CO2e per year for development projects. The Project has only temporary construction emissions within Riverside County. Pursuant to CAP Screening Tables document, construction emissions are amortized over 30 years (average economic life of a development project). Amortizing 3,420 MT CO2e construction emissions across 30 years results in 114 MT CO2e/year. Adding construction emissions to operation and maintenance emissions equals 1,048 MT CO2e/yr. Riverside County determined projects below the 3,000 MT CO2e screening threshold are considered less than significant. Therefore, GHG emissions associated with the Project would result in a less-than-significant impact on the environment as it pertains to the Riverside County CAP.

Project emissions do not exceed the MDAQMD CO2e CEQA significance threshold; therefore, GHG emissions associated with the Project would result in a less-than-significant impact on the environment**.**

Impact GHG 2 - Conflict with any applicable plan, policy or regulation of an agency adopted for the purpose of reducing the emissions of greenhouse gases.

Less Than Significant – No Mitigation Required

The Project has been evaluated relative to its potential to conflict with the RCCAP and GHG reduction goals set forth in AB 32, including the applicable Recommended Actions identified by CARB in its Scoping Plan.

2.3.6.1 Riverside County Climate Action Plan

With respect to GHG emissions, the RCCAP sets goals and policies to drive virtually all activities of county government and residents and businesses toward reduction of these emissions (Riverside County 2015). The RCCAP contains ambitious targets to reduce countywide emissions from all sectors by 2020 by slightly more than 50 percent below the 2020 business-as-usual estimates. The 2020 emission goal in the RCCAP is 5,960,998 metric tons of CO2e, representing a 15 percent reduction from 2008 levels. As discussed previously, Riverside County established a screening threshold for CEQA project of 3,000 MTCO2e. This is the threshold that the County determined would result in less than significant impacts to climate change. Project's emitting less than 3,000 MTCO2e would not need to complete a consistency analysis with the RCCAP. Furthermore, the GHG reduction measures included in the RCCAP are not applicable to the Project. The RCCAP does not explicitly address construction-related equipment exhaust GHG emissions that would be the primary source of GHGs for the Project. However, any increase in GHG construction emissions may be offset to the extent the Project allows for the displacement of fossil fuel energy generation with renewable energy sources through the provision of new transmission infrastructure to interconnect future renewable energy resources in both Arizona and California. As such, there may be a beneficial contribution to anthropogenic climate change.

2.3.6.2 AB 32 – Climate Change Scoping Plan

Emission reductions in California alone will not be able to stabilize the concentration of GHGs in the earth's atmosphere. However, California's actions have set an example and continue to drive progress towards a reduction in GHGs elsewhere. If other States and countries were to follow California's emission reduction targets, this could avoid medium or higher ranges of global temperature increases that would lead to the most severe consequences of climate change.

The CARB Governing Board approved a Climate Change Scoping Plan (Scoping Plan) in December 2008. The Scoping Plan outlines the State's strategy to achieve the 2020 GHG emissions limit. The Scoping Plan "proposes a comprehensive set of actions designed to reduce overall GHG emissions in California, improve our environment, reduce our dependence on oil, diversify our energy sources, save energy, create new jobs, and enhance public health" (CARB 2008). The measures in the Scoping Plan were all in place by 2012. The First Update of the CARB Scoping Plan adopted in May 2014 (CARB 2014) includes no new measures or targets that would require additional consistency analysis. The Second Update of the CARB Scoping Plan was approved in December 2017. The Project's consistency with applicable strategies in the Scoping Plan is assessed in Table 2.3-2.

Table 2.3-2 Consistency with Applicable Scoping Plan Reduction Measures

SCOPING PLAN REDUCTION MEASURE	PROJECT APPLICABILITY/CONSISTENCY DISCUSSION
California Light-Duty Vehicle. Greenhouse Gas Standards. Implement adopted standards and planned second phase of the program. Align zero-emission vehicle, alternative and renewable fuel and vehicle technology programs with long-term climate change goals.	**Consistent.** This is a Statewide measure that cannot be implemented by a project applicant or lead agency. However, when this measure is initiated, the standards would be applicable to the light-duty vehicles that would access the Project site during construction and operation. The Project would not conflict or obstruct this program.
Renewable Portfolio Standard. Achieve 33 percent renewable energy mix Statewide. Renewable energy sources include (but are not limited to) wind, solar, geothermal, small hydroelectric, biomass, anaerobic digestion, and landfill gas.	**Consistent.** One of the purposes of the Project is to develop new transmission infrastructure to interconnect future renewable energy resources in both Arizona and California. This would help California achieve the RPS Standard.
Low Carbon Fuel Standard. Develop and adopt the Low Carbon Fuel Standard.	**Consistent.** This is a Statewide measure that cannot be implemented by a project applicant or lead agency. When this measure is initiated, the standard would be applicable to the fuel used by vehicles that would access the Project site during construction and operation. The Project would not conflict or obstruct this program.
Vehicle Efficiency Measures. Implement light-duty vehicle efficiency measures.	**Consistent**. When this measure is initiated, the standards would be applicable to the light-duty vehicles that would access the Project site. The Project would not conflict or obstruct this program.
Medium/Heavy-Duty Vehicles. Adopt medium and heavy-duty vehicle efficiency measures.	**Consistent.** This is a Statewide measure that cannot be implemented by a project applicant or lead agency. When this measure is initiated, the standards would be applicable to the vehicles that access the Project site during construction or operation. The Project would not conflict with or obstruct this program.
High Global Warming Potential Gases. Adopt measures to reduce high global warming potential gases.	**Consistent.** Scoping Plan Measure H-6: High Global Warming Potential Gas Reductions from Stationary Sources – SF6 Leak Reduction and Recycling in Electrical Applications. This measure would reduce emissions of SF6 within the electric utility sector and at particle accelerators by requiring the use of best achievable control technology for the detection and repair of leaks and the recycling of SF6. On June 17, 2011, the approved Final Regulation Order associated with Scoping Plan Measure H-6 for reducing SF6 emissions from gas insulated switchgear became effective. The regulation establishes maximum annual SF6 emission rates for gas insulated switchgear, starting in 2011 at 10 percent of the owners' total equipment capacity. The required emission rates will steadily decline by 1 percent per year until 2020, at which time the maximum annual SF6 emission rate would be set at 1 percent. The

SCOPING PLAN REDUCTION MEASURE	PROJECT APPLICABILITY/CONSISTENCY DISCUSSION
	regulation also requires gas insulated switchgear owners to annually report their SF6 emissions and emission rate to CARB. The Project would include installation of SF6-containing circuit breakers that would have a fugitive emissions leak rate of less than 1 percent per year per engineering specifications (HDR 2017b). This would ensure that there would be little potential for the Project to conflict with compliance of this regulation and there would be no impact.
Recycling and Waste. Reduce methane emissions at landfills. Increase waste diversion, composting, and commercial recycling. Move toward zero-waste.	**Consistent.** The Project would include the recycling of construction waste at approved disposal facilities.

Source of California Air Resources Board Scoping Plan Reduction Measure: CARB 2008.

Because the Project would cause no impacts related to a conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing GHG emissions, it could not cause or contribute to any cumulative effect in this regard.

2.3.7 Air Quality and Climate Change Mitigation

The following CEQA MMs have been developed to reduce and/or avoid air quality and greenhouse gas impacts:

MM AQ-CEQA-1: Implement Air Quality Applicant Proposed Measures, Best Management Practices, Conservation and Management Actions.

The APMs, BMPs, and CMAs in Sections 2.3.2 and 2.3.3 above provide a suite of measures, practices, and actions that shall be implemented as part of the Project. APMs, BMPs, and CMAs shall be implemented prior to, or during all ground disturbance and construction related activities to avoid or minimize Project related impacts to air quality and greenhouse gasses. These APMs, BMPs, and CMAs include; APM AQ-01, BMP AQ-01, APM AQ-02, APM AQ-03, APM AQ-04, BMP AQ-05, CMA LUPA-AIR-1, CMA LUPA-AIR-3, CMA LUPA-AIR-4, CMA LUPA-AIR-5.

If an APM, BMP, or CMA is subjective, such as containing text that states; “where appropriate,” “where applicable,” “where feasible,” or similar language, the BLM and CPUC shall be consulted to determine the applicability of each measure prior to the disturbance of a covered resource. Compliance with APMs, BMPs, and CMAs shall be documented, and a weekly report shall be provided to the BLM and CPUC. The Applicant shall provide a synopsis of the weekly reports to the BLM and CPUC monthly. The report shall include a summary of the construction activities completed, a list of compliance actions and any remedial actions taken to correct any actions, and the status of ongoing mitigation efforts. For those instances (only) where an APM,

BMP, and/or CMA conflicts, or does not meet required specificity pursuant to CEQA, the following BMPs have been modified to meet CEQA requirements:

- **APM AQ-01: Fugitive Dust (quantitatively included in the emissions estimate).** Consistent with APM AQ-01, and MDAQMD Rule 403.2, a Fugitive Dust Control Plan shall be prepared for the Project prior to the start of construction and shall be implemented throughout all construction phases of the Project. This Fugitive Dust Control Plan shall be prepared by the Applicant at least 30 days prior to construction which shall be approved by the CPUC and MDAQMD. The Applicant shall ensure that the Fugitive Dust Control Plan is implemented throughout construction activities and shall keep records of compliance on site and submit monthly reports to CPUC and MDAQMD. This Fugitive Dust Control Plan shall comply with the MDAQMD Guidelines and include all of the control measures listed in APM AQ-01. In addition to these control measures, the Fugitive Dust Control Plan shall also include signage related to fugitive dust that will include the following specifications:

    - A minimum 48 inch high by 96 inch wide sign containing the following shall be located within 50 feet of each Project site entrance, meeting the specified minimum text height, black text on white background, on one inch A/C laminated plywood board, with the lower edge between six and seven feet above grade, with the contact name of a responsible official for the site and a local or toll-free number that is accessible 24 hours per day:

        - [Site Name] {four-inch text]
        - [Project Name/Project Number] {four-inch text}
        - IF YOU SEE DUST COMING FROM {four-inch text}
        - THIS PROJECT CALL: {four-inch text}
        - [Contact Name], PHONE NUMBER XXX-XXXX {six-inch text}
        - If you do not receive a response, Please Call {three-inch text}
        - The MDAQMD at 1-800-635-4617 {three-inch text}

  Additionally, the following control measures shall be included in the Fugitive Dust Control Plan:

    - Traffic speeds on unpaved roads shall not exceed 15 miles per hour;
    - Drop heights from excavators and loaders shall be minimized to distances no more than 5 feet;
    - Appoint a construction relations officer to act as a community liaison concerning on-site construction activity, including resolution of issues related to PM10 and PM2.5 generation from combustion emissions and fugitive dust generation;

- An on-site supervisor with a current fugitive dust control class certification shall be present who is available within 30 minutes to respond to any fugitive dust control issue at the site during normal business hours;
- The operation shall keep on-site records of specific dust control actions taken;
- All perimeter fencing shall be wind fencing or the equivalent of four feet of height or the top of all perimeter fencing (this wind fencing requirement may be superseded by local ordinance, rule, or Project-specific biological mitigation prohibiting wind fencing); and
- A wheel washing system shall be installed and used to remove bulk material from tires and vehicle undercarriages before vehicles exit the unpaved construction site.

Responsible Party: The Applicant shall be responsible for ensuring the Fugitive Dust Control Plan is prepared and implemented throughout construction activities.

Timing: The Fugitive Dust Control Plan shall be prepared at least 30-days prior to the start of construction and implemented throughout all construction activities.

Mitigation Monitoring and Reporting Program: Monthly reports shall be prepared by the Applicant and submitted to the CPUC and MDAQMD. These monthly reports shall include a summary of any calls received regarding fugitive dust and all compliance actions taken.

Standards for Success: Fugitive dust will be minimized throughout all construction activities and compliance with MDAQMD Rule 403.2 shall be achieved.

- **APM AQ-02: Exhaust Emissions (qualitatively included in the emissions estimate).** Consistent with APM AQ-02 a Construction Emissions Mitigation Plan shall be developed by the Applicant for the Project at least 30-days prior to the start of construction activities and shall be implemented by the Applicant throughout all construction activities. The Construction Emissions Mitigation Plan shall be approved by the CPUC and MDAQMD and the Applicant shall keep records of compliance with this Plan on site and submit monthly reports to CPUC and MDAQMD. Successful implementation of with measure would result in minimization of exhaust emissions from worker vehicles, construction equipment, and vehicles. The Construction Emissions Mitigation Plan may include the following measures:
  - Use ultra-low sulfur diesel fuel (e.g., <15 ppm);
  - Use clean-burning on- and off-road diesel engines. Heavy-duty diesel-powered construction equipment manufactured after 1996 (with Federally mandated “clean” diesel engines) shall be utilized;
  - The Applicant shall develop a program and require construction workers to carpool to construction sites;
  - Restrict construction vehicle idling time to less than 5 minutes;

- Properly maintain mechanical equipment;
- Use particle traps and appropriate controls to reduce diesel particulate matter. Other equipment includes devices such specialized catalytic converters (oxidation catalysts) control approximately 20 percent of diesel particulate matter, 40 percent of carbon monoxide, and 50 percent of hydrocarbon emissions;
- Provide temporary traffic controls, such as a flag person, during all phases of construction to maintain a smooth traffic flow (See MM TRANS-CEQA-2 under Section 2.17 for more details);
- During Project construction, all off-road diesel-powered construction equipment greater than 50 horsepower (hp) shall meet the Tier 4 Final emissions standards, where available. In addition, all construction equipment shall be outfitted with the Best Available Control Technology (BACT) devices certified by CARB. Any emissions control device used by the contractor shall achieve emissions reductions that are no less than what could be achieved by a level 4 diesel emissions control strategy for a similarly sized engine as defined by CARB regulations (i.e., if Project construction goes beyond the anticipated schedule); and
- A copy of each unit's certified tier specification, BACT documentation, and CARB or MDAQMD operating permit shall be provided to the CPUC at the time of mobilization for each applicable unit of equipment.

Responsible Party: The Applicant shall be responsible for ensuring the Construction Emissions Mitigation Plan is prepared and implemented throughout construction activities.

Timing: The Construction Emissions Mitigation Plan shall be prepared at least 30-days prior to the start of construction and implemented throughout all construction activities.

Mitigation Monitoring and Reporting Program: Monthly reports shall be prepared by the Applicant and submitted to the CPUC and MDAQMD. These monthly reports shall include a summary of any compliance actions taken and a list of equipment used on site. Any associated vehicle tier specifications, BACT documentation, or CARB or MDAQMD operating permits shall be kept on site and made available upon request.

Standards for Success: Construction emissions will be minimized and would not exceed MDAQMD significance thresholds. Additionally, any State standards regulating construction emissions would be met (i.e. CARB Tier 4 final emission standards and Title 1. California Code of Regulations Section 2485 standards).

- **APM AQ-03: Minimize Potential Naturally Occurring Asbestos Emissions (qualitatively included in the emissions estimate).** Consistent with APM AQ-03 an Asbestos Dust Mitigation Plan shall be developed for the Project in conjunction with the Fugitive Dust Control Plan that shall also be developed for the Project only if the results of the asbestos, serpentine, or ultramafic rock are positive in the Project area. The Asbestos Dust Mitigation Plan would be developed by the Applicant at least 30-

days prior to the start of construction activities and shall be submitted and approved by the CPUC and MDAQMD. The plan shall be prepared and implemented according to the requirements of Title 17 California Code of Regulations 93105, CARB Asbestos Airborne Toxic Control Measure for Construction, Grading, Quarrying, and Surface Mining Operations. Successful implementation of this APM will result in compliance with the CARB-required Asbestos Toxic Control Measures.

Responsible Party: The Applicant shall be responsible for ensuring the Asbestos Dust Mitigation Plan is prepared and implemented throughout all construction activities.

Timing: The Asbestos Dust Mitigation Plan shall be prepared at least 30-days prior to the start of construction and implemented throughout all construction activities.

Mitigation Monitoring and Reporting Program: Monthly reports shall be prepared by the Applicant and submitted to the CPUC and MDAQMD. These monthly reports shall include a summary any compliance actions taken related to asbestos control.

Standards for Success: Construction dust will be minimized, and Project activities will comply with the CARB-required Asbestos Toxic Control Measures.

MM AQ-CEQA-1 Implementation

Responsible Party: The Applicant shall ensure that all APMs, BMPs, and CMAs are implemented during construction. If an APM, BMP, or CMA is subjective, the Applicant shall consult with the BLM and/or the CPUC to determine the applicability of each measure.

Timing: APMs, BMPs, and CMAs shall be implemented throughout construction activities.

Mitigation Monitoring and Reporting Program: The Applicant shall develop a weekly report that shall include all applicable APMs, BMPs, and CMAs and the related actions taken in order to be in compliance with these measures. These weekly reports shall be compiled and submitted to the BLM and CPUC monthly.

Standards for Success: Compliance with all applicable APMs, BMPS, and CMAs is achieved throughout construction of the Project.

2.4 BIOLOGICAL RESOURCES

This section describes the impacts to biological resources associated with the construction, operation, and maintenance of the proposed transmission line, substations, and ancillary facilities in terms of CEQA significance thresholds provided below in Section 2.4.4. Impacts to biological resources are discussed in terms of impacts on vegetation communities, wildlife species, special-status species of plants and animals, special habitat management areas, and invasive and noxious weeds.

2.4.1 Thresholds and Methodology

Existing conditions described in Section 3.5 of the TES (BLM 2019) have been evaluated with regard to their potential to be affected by Project construction, operation, maintenance, and decommissioning activities. Additionally, this section responds to issues raised during the public scoping process, which are presented in Appendix 1 of the EIS. The potential impacts associated with the Project are evaluated on a qualitative and quantitative basis through a comparison of the anticipated Project effects on biological resources. The evaluation of Project impacts is based on the significance criteria established by Appendix G of the CEQA Guidelines (refer to Section 2.4.4 below for additional information), and additional criteria including:

- Long-term loss of wetland or riparian vegetation, or sensitive natural community caused by degradation of water quality, diversion of water sources, or erosion and sedimentation from altered drainage patterns;
- Introduction or increased spread of noxious weeds;
- Loss of individuals or habitat of a plant or wildlife species that would result in the elimination of a local population of that species;
- Loss of individuals or habitat of a plant or wildlife species that would result in that species being listed or proposed for listing as endangered or threatened under the Federal Endangered Species Act (FESA) or California Endangered Species Acts (CESA), or being added to an agency list of sensitive species;
- Any activity that would result in "take" under the Federal Endangered Species Act (ESA), Migratory Bird Treaty Act (MBTA), or the Bald and Golden Eagle Protection Act (BGEPA)[1];
- Any activity that would result in impacts to species that meet the criteria for endangered, rare, or threatened, regardless of whether it is listed under FESA or CESA (CEQA Guidelines §15380 (d).)
- Any activity that would result in "take" under the CESA or the California Fish and Game Code (CFGC)[2];
- Adverse modification of Designated Critical Habitat (DCH) or jeopardy to a species listed under the ESA;
- Pollution of waters that could cause adverse effects on wildlife;
- Long-term interference with the movement of native resident or migratory species, disruption in the function of wildlife movement corridors, or impeding the use of wildlife nursery sites or water sources;

[1] Following new guidance (Deputy Solicitor Memoranda), USFWS no longer covers incidental take of birds covered under the MBTA.
[2] The CDFW's November 29,2019 Advisory includes incidential take of birds covered under the CFGC Section 3503.

- Impacts to special designated management areas (e.g., wilderness area, habitat management area, Area of Critical Environmental Concern (ACEC), wildlife refuge) that compromise the intent of that designation;
- Modification of habitat of a special-status species of plant or wildlife used for any purpose (e.g., breeding, rearing, foraging, dispersal, etc.) that would result in population level impacts (i.e., as opposed to impacts to individuals), a reduction in the potential viability of the population, or a loss in the range of occurrence of the species;
- Interference with nesting or breeding periods of any species;
- Reduction in the range of occurrence of any special-status species;
- Conflict with State or local statutes, policies, or ordinances protecting biological resources, such as native plant provisions; and
- Conflict with the provisions of a National Wildlife Refuge (NWR), Habitat Conservation Plan (HCP), Candidate Conservation Agreement (CCA), Natural Communities Conservation Plan (NCCP), or other approved local, regional, or State conservation program.

2.4.2 Applicant Proposed Measures and BLM Best Management Practices

APMs have been identified that avoid and minimize Project impacts and would be implemented by the Project Applicant. In addition, BLM requires implementation of BMPs, which are intended to further avoid and minimize Project impacts. Project APMs and BMPs are described in EIS Appendix 2A. Of these, the following would apply to the portion of the Project located within California; and, therefore, have been incorporated into the Project evaluation as it relates to biological resources impacts under CEQA. The CPUC requires additional compensatory mitigation that have been incorporated to ensure impacts are reduced to a less than significant level, which are included in Section 2.4.6.

- **APM BIO-1: Worker Environmental Awareness Program.** Before starting any work, including mowing, staging, installing stormwater control structures, implementing other BMPs, removing trees, construction, and restoration, all employees and contractors performing activities and new construction would receive training on environmental requirements that apply to their job duties and work. If additional crewmembers arrive later in the job, they would be required to complete the training before beginning work. Training would include a discussion of the avoidance and minimization measures being implemented and would include information on the FESA and CESA and the consequences of not complying with these Acts. An educational brochure would be provided to construction crews working on the Project. This brochure would include color photographs of special-status species as well as a discussion of avoidance and minimization measures.
- **BMP BIO-1: Worker Environmental Awareness Program.** The worker education program would provide interpretation for non-English speaking workers.

- **APM BIO-2: Biological Monitoring and Pre-construction Survey.** A qualified biological monitor would be present on the Project site during all work activities within habitat of special-status animal species. The qualified biologist would conduct a pre-construction survey of those areas immediately before work activities begin and would locate and fence off any present individuals of special-status plant species.

- **BMP BIO-02: Biological Monitoring and Pre-construction Survey.** Multiple biological monitors would be provided so any work site within habitat of special-status species is monitored concurrently if needed.

- **APM BIO-3: Approved Work Areas.** To the extent practicable, stockpiling of material would be allowed only within the established work area. Vehicles and equipment would be parked on pavement, existing roads, and previously disturbed areas within identified work areas or access roads.

- **BMP BIO-03: Approved Work Areas.** The BLM would approve areas to be used for stockpiling, vehicle parking, or other construction support activity that would occur outside established work areas.

- **APM BIO-4: Environmentally Sensitive Areas and Fencing.** Environmentally sensitive areas, such as the riparian areas, xeroriparian washes, and other habitat of special-status species, would be identified in the field. Barrier fences or stakes would be installed at the edge of the easement or around the sensitive area to minimize the possibility of inadvertently encroaching into sensitive habitat.

- **APM BIO-5: Additional Prohibitions.** Trash dumping, firearms, open fires, and pets would be prohibited at all work locations and access roads. Smoking would be prohibited along the Project alignment.

- **APM BIO-6: Trash Handling.** All food scraps, wrappers, food containers, cans, bottles, and other trash from the work area would be disposed of in closed trash containers.

- **APM BIO-7: Monofilament Plastic.** No monofilament plastic would be used for erosion control (for example, matting, fiber roll, wattles, silt fencing backing). Appropriate materials include burlap, coconut fiber, or other materials as identified in the general and site-specific Storm Water Pollution Prevention Plan (SWPPP).

- **APM BIO-8: Refueling.** Vehicular and equipment refueling should not occur within 100 feet of a wetland or drainage unless secondary containment is constructed, for example, a berm and lined refueling area. Proper spill prevention and cleanup equipment would be maintained in all refueling areas in accordance with the Spill Prevention, Control, and Countermeasures Plan (SPCC) for the Project.

- **APM BIO-9: Escape Ramps.** All excavated steep-walled holes or trenches more than 1-foot-deep would be covered at the end of each working day with plywood or similar materials or would be provided with one or more escape ramps constructed of earth fill or wooden planks. Each trench or hole would be inspected for wildlife at the

beginning of each workday and before such holes or trenches are filled. Wildlife found trapped in trenches or holes would be relocated to suitable habitat outside the work area. If possible, pipes and culverts greater than 3 inches in diameter would be stored on dunnage to prevent wildlife from taking refuge in them, to the extent feasible.

- **APM BIO-10: Erosion and Dust Control.** The BMPs included in the SWPPP would be implemented during construction to minimize impacts associated with erosion. Watering for dust control during construction would also be used as described previously (AQ-01). Watering shall not result in prolonged ponding of surface water that could attract wildlife to the work area. Minimal or no vegetation clearing and/or soil disturbance would be conducted for site access and construction in areas with suitable topography (i.e., overland driving/overland access).

- **APM BIO-11: Vegetation Management Plan.** The Vegetation Management Plan (EIS Appendix 2B) would be approved by the BLM and implemented. That Plan describes the surveys, permitting, fee payments, and plant protection to be conducted in areas where Project design would not eliminate the need for vegetation control for the Project to be in compliance with North American Electric Reliability Corporation (NERC) requirements. Vegetation would be trimmed or otherwise controlled for safe operation of the transmission line and would be designed to minimize impacts on special-status species to the extent practicable. At a minimum, vegetation treatments shall incorporate the measures identified in the 2016 Memorandum of Understanding regarding vegetation management along ROW for electrical transmission and distribution facilities (USDA 2016). The Plan also would describe how vegetation would be salvaged, as needed, in order to comply with the applicable Arizona Native Plant Law and California regulations.

- **BMP BIO-11: Vegetation Management Plan.** In addition to the description of the Vegetation Management Plan in the corresponding APM BIO-11, the plan would also:

  - Meet BLM Guidelines for mapping and surveying of cacti, yuccas, and succulents.

  - Include a wire zone/border zone/effective border zone approach to vegetation maintenance as described in Ballard et al. 2007.

  - Identify tall vegetation species by geographic reach and growth rates, from relevant scientific literature (such as Drezner 2003), to be used to determine maximum allowable vegetation heights in the context of wire zone/border zone/effective border zone concepts, to accommodate identified growth periods (e.g., ten years) based on the specific vegetation community. Species examples include, but are not limited to, saguaro cactus, ironwood, palo verde, cottonwood, and Gooding willow.

- **APM BIO-12: Invasive Species Control.** A Noxious Weed Control Plan (EIS Appendix 2B) that addresses specific requirements in CMA LUPA-BIO-11 would be developed, approved by the BLM, and implemented prior to initiation of ground

disturbing activities. That Plan would identify noxious and invasive species to be addressed in the Project Area, describe measures to conduct pre-construction weed surveys, reduce the potential introduction or spread of noxious weeds and invasive species during construction, and monitor and control weeds during operation of the transmission line. It would be designed to minimize impacts on special-status species to the extent practicable. Coordination with resource agencies regarding invasive plant species would be conducted before construction. BMPs would include use of weed-free straw, fill, and other materials; requirements for washing vehicles and equipment arriving on site; proper maintenance of vehicle inspection and wash stations; requirements for managing infested soils and materials; requirements and practices for the application of herbicides.

- **APM BIO-13: Riparian Habitat Avoidance.** Riparian areas and xeroriparian drainages that occur within the ROW would be denoted as environmentally sensitive areas and would be avoided during construction to the extent practicable. Existing topography would be restored to pre-Project conditions to the extent possible.

- **APM BIO-14: Minimizing Vegetation Clearing.** In areas with suitable topography, minimal or no vegetation clearing, and soil disturbance would be conducted for site access and construction (i.e. overland driving/overland access). Overland driving/overland access would be used in areas that support the necessary construction equipment. Upgrading of existing access roads and construction of new access roads would be implemented as necessary for the safe construction activities.

- **APM BIO-15: Reclamation and Restoration.** A Habitat Restoration and Monitoring Plan would be developed, approved by BLM, and implemented for construction and operation of the Project. Revegetate all sites disturbed during construction that would not be required for operation of the transmission line, and restore disturbed areas to the extent practicable, given the arid desert environment. The Plan would describe in detail methods for surveying and characterizing vegetation in disturbed areas before construction; topsoil salvage and management, erosion control, post-construction recontouring and site preparation, seeding and planting, and post-construction watering, monitoring, and remediation. It would be designed to reduce impacts on special-status species to the extent practicable.

- **BMP BIO-15: Reclamation and Restoration.** As a part of the Habitat Restoration and Monitoring Plan, the soil horizons would be stored separately for the areas where the success of restoration could be crucial for rare plant species.

- **APM BIO-16: Treatment of Saguaro Cactus.** Measures would be implemented to minimize the number of saguaro cacti that must be relocated for the safe construction and operation of the transmission line. In accordance with the Vegetation Management Plan (EIS Appendix 2B), a survey of saguaros within the ROW would be conducted before construction and where possible, the transmission line would be designed to minimize the number of saguaros affected by adjusting tower locations and conductor height. The Plan would address plant salvaging, storing, and replanting requirements and methods, only those saguaros that are within 50-feet of the outermost conductors and could be tall enough to pose a hazard would be removed if

they cannot be avoided through Project design. When possible, saguaro that must be removed would be relocated as directed by the BLM and state agency protocols. Monitoring and management of saguaros during operations would occur as described in the Vegetation Management Plan.

- **APM BIO-17: Limit Off-road Vehicle Travel.** Vehicular travel would be limited to established roads to the maximum extent practicable.

- **BMP BIO-19: Colorado River.** In the vicinity of the Colorado River, existing structure spacing, and conductor heights would be matched to the greatest extent practical to reduce the potential for bird collisions with the power line. The transmission line would span the Colorado River and the minimum number of structures possible would be located within the undeveloped floodplain. The term, "vicinity of the Colorado River" is defined to mean the river crossing, floodplain, and associated agricultural lands. In these areas, conductor bundles would be in a horizontal, parallel configuration, and match existing structure spacing and conductor heights to the greatest extent practical to reduce the potential for bird collisions with the power line. No guyed structures would be used at these locations.

- **APM BIO-20: Migratory Bird Protection During Construction.** If construction is scheduled during the nesting bird season (generally February 1 through August 31), the work area would be surveyed for birds protected under the MBTA and California Fish and Game (CFG) Code. Active nests identified during pre-construction surveys would require protective buffers or visual barriers to ensure compliance with those regulations. If the qualified biologist determines that construction activities would cause distress to nearby nesting birds, larger buffers or construction delays might be necessary to allow the birds to successfully fledge from the nest.

- **APM BIO-21: Reduction of Avian Collisions and Electrocution.** Current Avian Power Line Interaction Committee (APLIC) guidelines and methodologies (APLIC 2006, 2012) would be used in the design of the proposed transmission facilities to minimize the potential for raptors and other birds to collide with the transmission line during operations and be electrocuted. For example, aerial marker balls or other visibility markers would be placed at and near the crossing of the Colorado River to increase the visibility of the transmission line to birds using that movement corridor. Further, placement of lines significantly above existing transmission lines, topographic features, or tree lines would be avoided. These measures would be implemented, where practicable, in conjunction with an Avian Protection Plan (APP) for the Project. The APP would include requirements for monitoring the effectiveness of anti-collision design.

- **BMP BIO-21: Reduction of Avian Collision.** Aerial marker balls or other visibility markers would be placed on overhead ground wires (not conductors) at crossing of the Colorado River and floodplain to increase visibility to birds using that movement corridor and marking any other static wires to improve visibility and reduce collisions. Deterrents would be added to reduce nesting and perching by ravens and other predatory birds. The APP would include requirements for monitoring the effectiveness of anti-electrocution design.

- **APM BIO-23: Mojave Desert Tortoise Protection (California).** A qualified-biologist would be present during all ground-disturbing and other construction activities in non-cultivated areas in California, in order to survey areas before they are disturbed, monitor construction sites for the presence of desert tortoises, and move tortoises from harm's way in accordance with U.S. Fish and Wildlife Service (USFWS) protocols. Burrows near construction sites would be clearly delineated. Road, footing, and work area alignments would be modified to the extent possible to avoid adversely affecting any tortoise burrows. Where burrows would be unavoidably destroyed, they would be excavated carefully using hand tools under the supervision of a field biologist with demonstrated prior experience with this species. Other measures, as required by the USFWS in any applicable Biological Opinion (BO), would also be implemented.

- **BMP BIO-23: Mojave Desert Tortoise Protection (California).** A designated biologist would inspect construction pipes, culverts, or similar structures: (a) with a diameter greater than 3 inches, (b) stored for one or more nights, (c) less than 8 inches aboveground and (d) within desert tortoise habitat (such as, outside the long-term fenced area), before the materials are moved, buried, or capped. As an alternative, such materials shall be capped before storing outside the fenced area or placing on pipe racks. Pipes stored within the long-term fenced area after completing desert tortoise clearance surveys would not require inspection.

- **BMP BIO-24: Sensitive Plant Surveys.** On BLM lands and other lands where access is secured by the owner, a survey would be conducted during the appropriate time of year of the selected route to identify special-status plant species and imperiled or sensitive vegetation alliances. Where possible, and as required by the BLM, special-status species and vegetation alliances would be avoided during construction. This survey would be restricted to non-cultivated land.

- **BMP BIO-25: Sensitive Animal Surveys.** A survey would be conducted of the selected route prior to construction of all work areas to identify special-status animal species, including Mojave Desert tortoises, burrowing owls, and Mojave fringe-toed lizards. Where possible, and as required by the BLM, special-status species and vegetation alliances would be avoided during construction.

- **APM BIO-27: Bighorn Sheep Lambing Areas.** Construction activities would be limited from January 1 to March 31 in active bighorn sheep lambing areas identified by BLM and Arizona Game and Fish Department (AGFD).

- **BMP BIO-28: Raven Management Plan.** The Raven Management Plan would be implemented for all activities to address food and water subsidies and roosting and nesting sites specific to the common raven. These include identification of monitoring reporting procedures and requirements; strategies for refuse management; as well as design strategies and passive repellant methods to avoid providing perches, nesting sites, and roosting sites for common ravens. Compensatory mitigation would be provided that contributes to LUPA-wide raven management associated with lands in the DRECP.

- **BMP BIO-29: Bird and Bat Conservation Strategy.** The Bird and Bat Conservation Strategy (BBCS) would provide guidance on conservation measures applicable to bird and bat species present in the Project Area, including a nesting bird management plan and a nest management plan.

- **BMP BIO-30: Burrowing Owl Nesting Management Plan.** The Plan would include management direction consistent with LUPA-BIO-IFS-12, LUPA-BIO-IFS-13, and LUPA-BIO-IFS-14.

- BMP BIO-31: Treatment of Harwood's eriastrum.

1. Pre-construction surveys would be required for non-agricultural areas in California.
2. Avoid Harwood's eriastrum individuals through micrositing facilities to the maximum extent practical.
3. Within suitable habitat for Harwood's eriastrum, use overland travel (drive and crush) in-lieu of road construction to pad sites to the maximum extent practical.
4. On non-agricultural Public Lands in California, an authorized botanist would be on site for all construction activities involving surface disturbance or overland travel.
5. Within suitable habitat for Harwood's eriastrum, keep equipment to the minimum necessary to accomplish the necessary work.
6. On public lands in California, avoid establishing features that would interfere with the movement of sand to the maximum extent practical.
7. Laydown and temporary use sites would not be located within suitable habitat for Harwood's eriastrum.
8. On public lands in California, use existing roads or routes to the maximum extent practical.
9. Develop and implement an Invasive Species Management Plan (specific to the rare plant habitat) that California State Director would approve prior to a notice to proceed for work on public lands in California.
10. No surface disturbance or overland travel would occur within occupied habitat for Harwood's eriastrum from 15 February through the 31 July. This stipulation does not apply to verified, unoccupied habitat.
11. No take of Harwood's eriastrum individuals would be allowed without California BLM State Director approval.
12. Prepare a Harwood's eriastrum Linear ROW Protection Plan.
13. Project impacts to suitable habitat combined with current impacts shall be limited (capped) to a maximum of 1 percent of Harwood's eriastrum habitat across all BLM lands included within the DRECP.

- **BMP BIO-33: Construction Lighting.** All long-term nighttime lighting would be directed away from riparian and wetland vegetation, occupied habitat, and suitable habitat areas for sensitive species. Long-term nighttime lighting, if required, would be

directed and shielded downward to avoid interference with the navigation of night-migrating birds and to minimize the attraction of insects as well as insectivorous birds and bats to Project infrastructure. Long-term nighttime lighting would avoid the use of constant-burn lighting.

- **BMP BIO-34: Prevention of Puddles During Dust Abatement.** The application of water and/or other palliatives for dust abatement in construction areas and during Project operations and maintenance would be done with the minimum amount of water necessary to meet safety and air quality standards and in a manner that prevents the formation of puddles, which could attract wildlife and wildlife predators.

- **BMP BIO-35: Presence of Wildlife in Construction Materials or Equipment.** All construction materials and equipment would be visually checked for the presence of wildlife prior to their movement or use. Any wildlife encountered during the course of these inspections would be allowed to leave the construction area unharmed.

- **BMP BIO-36: Feeding or Harassment of Wildlife.** The intentional feeding or harassment of wildlife on site is prohibited.

- **BMP BIO-37: Native Plant Collection.** The collection of native plants on site is prohibited without required permits and tags.

- **BMP BIO-38: Use of State-of-the-Art and Commercially Available Technology.** Use state-of-the-art, commercially available construction and installation techniques, as approved by BLM, appropriate for the specific activity/Project and site, that minimize new site disturbance, soil erosion and deposition, soil compaction, disturbance to topography, and removal of vegetation.

- **BMP BIO-40: Project Activity Siting Near Bat Maternity Roosts.** Activities would not be sited within 500 feet of any occupied maternity roost or presumed occupied maternity roost for BLM Focus and Special Status Bat Species.

- **BMP BIO-41: Succulent Management.** Management of cactus, yucca, and other succulents would adhere to current up-to-date BLM policy. All activities would follow applicable BLM state and national regulations and policies for salvage and transplant of cactus, yucca, and other succulents. Pre-construction surveys of disturbance zones would include preparation of maps delineating special vegetation features. BLM may consider disposal of succulents through public sale, as per current up-to-date state and national policy.

- **BMP BIO-42: Dead and Downed Wood.** Promote appropriate levels of dead and downed wood on the ground, outside of campground areas, to provide wildlife habitat, seed beds for vegetation establishment, and reduce soil erosion, as determined appropriate on an activity-specific basis.

- **BMP BIO-43: Collection of Plant Material.** Allow for the collection of plant material consistent with the maintenance of natural ecosystem processes.

- BMP BIO-44: Mojave Desert Tortoise Protection.

- All culverts for access roads or other barriers would be designed to allow unrestricted access by desert tortoises and would be large enough that desert tortoises are unlikely to use them as shelter sites (e.g., 36 inches in diameter or larger). Desert tortoise exclusion fencing may be utilized to direct tortoise use of culverts and other passages.

- Biological monitoring would occur with any geotechnical boring or geotechnical boring vehicle movement to ensure no desert tortoises are killed or burrows are crushed.

- A designated biologist would accompany any geotechnical testing equipment to ensure no tortoises are killed and no burrows are crushed.

- The ground would be inspected under vehicles for the presence of desert tortoise any time a vehicle or construction equipment is parked in desert tortoise habitat. If a desert tortoise is seen, it may move on its own. If it does not move within 15 minutes, a designated biologist may remove and relocate the animal to a safe location.

- Vehicular traffic would not exceed 15 miles per hour within the areas not cleared by protocol-level surveys where desert tortoise may be impacted.

- **BMP BIO-45: Protection from Loss and Harassment of Golden Eagles.** Provide protection from loss and harassment of active golden eagle nests through activities identified LUPA-BIO-IFS-24 through -31.

- **BMP BIO-46: Compensation for Loss of Desert Riparian Woodland.** The loss of desert riparian woodland would be compensated at a ratio of 5:1. Compensation acreage requirements may be fulfilled through non-acquisition (i.e., restoration and enhancement), land acquisition (i.e., preserve), or a combination of these options, depending on the activity specifics and BLM approval/authorization.

- **BMP BIO-48: Flight Diverters.** Bird flight diverters would be installed on the Colorado River and associated floodplain crossings and other areas of high bird use as recommended by BLM in consultation with USFWS, AGFD, and CDFW

- **BMP BIO-49: Fringe-toed Lizard Linear ROW Protection Plan.** A Fringe-toed Lizard Linear ROW Protection Plan would be prepared that identifies specific conservation measures to minimize Project-related impacts to sand dunes and sand transport areas, to map suitable habitat within construction zones, and methods to achieve clearance surveys within suitable habitat so animals are not killed by construction activities.

- **BMP BIO-50 Engineering Controls.** Appropriate engineering controls would be used to minimize impacts on dry wash, dry wash woodland, and chenopod scrub, including downstream occurrences, resulting from surface water runoff, erosion, sedimentation, altered hydrology, accidental spills, or fugitive dust deposition to these habitats. Appropriate buffers and engineering controls would be determined through agency consultation.

- **BMP BIO-51: Conductor Clearance.** To minimize vegetation trimming, micrositing and design considerations (including tower height) would be applied so the catenary formed by the conductors (the bottom of the sag) avoids saguaros and is not directly over wash vegetation (microphyll woodlands), to the extent practicable.

- **BMP BIO-52: California Riparian Habitat and Rare Plant Alliance Avoidance.** In California, as part of micrositing towers, a 200-foot setback from the outer perimeter of Coloradan semi-desert wash woodland/scrub vegetation community (microphyll woodlands) would be applied. Pre-construction surveys of disturbance zones would include preparation of maps delineating special vegetation features. Minor incursions would be allowed to balance minimizing vegetation trimming (see BMP BIO-51) while maintaining an appropriate setback, as determined based on site-specific conditions. No structure would be placed within, and no new access roads would pass through, these washes to the extent practicable.

- **BMP BIO-53: Protection of Dune Vegetation.** Project facilities would be sited to avoid dune vegetation. Unavoidable impacts to dune vegetation would be limited and Project facilities would be sited to minimize unavoidable impacts. Access roads would be designed and constructed to be at grade with the ground surface to avoid inhibiting sand transportation.

- **BMP BIO-54: Protection of Sand Transport.** Within Aeolian corridors that transport sand to dune formations and vegetation types downwind all activities would be designed and operated to facilitate the flow of sand across activity sites and avoid the trapping or diverting of sand from the Aeolian corridor. Structures would take into account the direction of sand flow and, to the extent feasible, build and align structures to allow sand to flow through the site unimpeded. Fences would be designed to allow sand to flow through and not be trapped.

- **BMP BIO-55: Access within Focus and BLM Special-Status Species Suitable Habitat.** Construction of new roads and/or routes would be avoided to the extent practicable within focus and BLM special-status species suitable habitat within identified linkages for those focus and BLM special-status species, unless the new road and/or route is beneficial to minimize net impacts to natural or ecological resources of concern.

- **BMP BIO-56: Sonoran Pronghorn.** Measures, as required by the USFWS in any applicable BO, would be implemented.

- **BMP VEG-01: Removal of Vegetation.** Any removal of vegetation resources would be conducted in accordance with BLM Information Bulletin (IB) 2012-097.

- **BMP VEG-02: Avoid Vegetation Removal.** Minimize natural vegetation removal through implementation of crush and drive or cut or mow vegetation rather than removing entirely.

2.4.3 Conservation and Management Actions

The CDCA Plan, as amended, contains CMAs, which include a specific set of avoidance, minimization, and compensation measures. The applicability of those measures to the Project was determined using a CMA checklist (EIS Appendix 2C). The CMAs applicable to the BLM lands portion of the Project located within the CDCA and related to biological resources are listed below; and Project compliance with CDCA CMAs is addressed in the analysis portion of this section.

- **CMA DFA-BIO-IFS-1.** Conduct surveys as applicable in the DFAs as shown in Table 21 of the DRECP.
- **CMA DFA-BIO-IFS-2.** Implement setbacks shown below in Table 22 of the DRECP as applicable in the DFAs.
- **CMA DFA-VPL-BIO-DUNE-1.** Activities in DFAs and VPLs, including transmission substations, will be sited to avoid dune vegetation (i.e., North American Warm Desert Dune and Sand Flats). Unavoidable impacts (see "unavoidable impacts to resources" in the Glossary of Terms, EIS Appendix 6) to dune vegetation will be limited to transmission projects, except transmission substations, and access roads that will be sited to minimize unavoidable impacts.
    - For unavoidable impacts (see "unavoidable impacts to resources" in the Glossary of Terms, EIS Appendix 6) to dune vegetation, the following will be required:
        - Access roads will be unpaved.
        - Access roads will be designed and constructed to be at grade with the ground surface to avoid inhibiting sand transportation.
- **CMA LUPA-BIO-1.** Conduct a habitat assessment (see Glossary of Terms, EIS Appendix 6) of focus and BLM special-status species suitable habitat for all activities and identify and/or delineate the DRECP vegetation types, rare alliances, and special features (e.g., Aeolian sand transport resources, Joshua tree, microphyll woodlands, carbon sequestration characteristics, seeps, climate refugia) present using the most current information, data sources, and tools (e.g., DRECP land cover mapping, aerial photos, DRECP species models, and reconnaissance site visits) to identify suitable habitat (see Glossary of Terms, EIS Appendix 6) for focus and BLM special-status species. If required by the relevant species-specific CMAs, conduct any subsequent protocol or adequate presence/absence surveys to identify species occupancy status and a more detailed mapping of suitable habitat to inform siting and design considerations. If required by relevant species-specific CMAs, conduct analysis of percentage of impacts to suitable habitat and modeled suitable habitat.
    - BLM will not require protocol surveys in sites determined by the designated biologist to be unviable for occupancy of the species, or if baseline studies inferred absence during the current or previous active season.

- Utilize the most recent and applicable assessment protocols and guidance documents for vegetation types and jurisdictional waters and wetlands that have been approved by BLM, and the appropriate responsible regulatory agencies, as applicable.

- **CMA LUPA-BIO-2.** Designated biologist(s) (see Glossary of Terms, EIS Appendix 6), will conduct, and oversee where appropriate, activity-specific required biological monitoring during pre-construction, construction, and decommissioning to ensure that avoidance and minimization measures are appropriately implemented and are effective. The appropriate required monitoring will be determined during the environmental analysis and BLM approval process. The designated biologist(s) will submit monitoring reports directly to BLM.

- **CMA LUPA-BIO-3.** Resource setbacks (see Glossary of Terms, EIS Appendix 6) have been identified to avoid and minimize the adverse effects to specific biological resources. Setbacks are not considered additive and are measured as specified in the applicable CMA. Allowable minor incursions (see Glossary of Terms, EIS Appendix 6), as per specific CMAs do not affect the following setback measurement descriptions. Generally, setbacks (which range in distances for different biological resources) for the appropriate resources are measured from:

  - The edge of each of the DRECP desert vegetation types, including but not limited to those in the riparian or wetland vegetation groups (as defined by alliances within the vegetation type descriptions and mapped based on the vegetation type habitat assessments described in LUPA-BIO-1).

  - The edge of the vegetation extent for specified focus and BLM sensitive plant species.

  - The edge of suitable habitat or active nest substrates for the appropriate focus and BLM special-status species.

- **CMA LUPA-BIO-4.** For activities that may impact focus and BLM special-status species, implement required species-specific seasonal restrictions on pre-construction, construction, operations, and decommissioning activities. Species-specific seasonal restriction dates are described in the applicable CMAs. Alternatively, to avoid a seasonal restriction associated with visual disturbance, installation of a visual barrier may be evaluated on a case-by-case basis that will result in the breeding, nesting, lambing, fawning, or roosting species not being affected by visual disturbance from construction activities subject to seasonal restriction. The proposed installation and use of a visual barrier to avoid a species seasonal restriction will be analyzed in the activity/Project specific environmental analysis.

- **CMA LUPA-BIO-5.** All activities, as determined appropriate on an activity-by-activity basis, will implement a worker education program that meets the approval of the BLM. The program will be carried out during all phases of the Project (i.e., site mobilization, ground disturbance, grading, construction, operation, closure/decommissioning or Project abandonment, and restoration/reclamation

activities). The worker education program will provide interpretation for non-English speaking workers and provide the same instruction for new workers prior to their working on site. As appropriate based on the activity, the program will contain information about:

- Site-specific biological and non-biological resources.
- Information on the legal protection for protected resources and penalties for violation of Federal and State laws and administrative sanctions for failure to comply with LUPA CMA requirements intended to protect site-specific biological and nonbiological resources.
- The required LUPA and Project-specific measures for avoiding and minimizing effects during all Project phases, including but not limited to resource setbacks, trash, speed limits, etc.
- Reporting requirements and measures to follow if protected resources are encountered, including potential work stoppage and requirements for notification of the designated biologist.
- Measures that personnel can take to promote the conservation of biological and non-biological resources.

- **CMA LUPA-BIO-6.** Subsidized predator standards, approved by BLM, in coordination with the USFWS and CDFW, will be implemented during all appropriate phases of activities, including but not limited to renewable energy activities, to manage predator food subsidies, water subsidies, and breeding sites including the following:
  - Common raven management actions will be implemented for all activities to address food and water subsidies and roosting and nesting sites specific to the common raven. These include identification of monitoring reporting procedures and requirements; strategies for refuse management; as well as design strategies and passive repellant methods to avoid providing perches, nesting sites, and roosting sites for common ravens.
  - The application of water and/or other palliatives for dust abatement in construction areas and during Project operations and maintenance will be done with the minimum amount of water necessary to meet safety and air quality standards and in a manner that prevents the formation of puddles, which could attract wildlife and wildlife predators.
  - Following the most recent national policy and guidance, BLM will take actions to not introduce, dispose of, or release any non- native species into areas of native habitat, suitable habitat, and natural or artificial waterways/water bodies containing native species.

    All activity work areas will be kept free of trash and debris. Particular attention will be paid to “micro-trash” (including such small items as screws, nuts, washers, nails, coins, rags, small electrical components, small pieces of plastic, glass or

wire, and any debris or trash that is colorful or shiny) and organic waste that may subsidize predators. All trash will be covered, kept in closed containers, or otherwise removed from the Project site at the end of each day or at regular intervals prior to periods when workers are not present at the site.

- In addition to implementing the measures above on activity sites, each activity will provide compensatory mitigation that contributes to LUPA-wide raven management.

- **CMA LUPA-BIO-7.** Where DRECP vegetation types or focus or BLM special-status species habitats may be affected by ground- disturbance and/or vegetation removal during pre-construction, construction, operations, and decommissioning related activities but are not converted by long-term (i.e., more than two years of disturbance, see Glossary of Terms, EIS Appendix 6) ground disturbance, restore these areas following the standards, approved by BLM authorized officer, following the most recent BLM policies and procedures for the vegetation community or species habitat disturbance/impacts as appropriate, summarized below:

  - Implement site-specific habitat restoration actions for the areas affected including specifying and using:

    - The appropriate seed (e.g., certified weed- free, native, and locally and genetically appropriate seed).

    - Appropriate soils (e.g., topsoil of the same original type on site or that was previously stored by soil type after being salvaged during excavation and construction activities).

    - Equipment.

    - Timing (e.g., appropriate season, sufficient rainfall).

    - Location.

    - Success criteria.

    - Monitoring measures.

    - Contingency measures, relevant for restoration, which includes seeding that follows BLM policy when on BLM- Administered Lands.

  - Salvage and relocate cactus, nolina, and yucca from the site prior to disturbance using BLM protocols. To the maximum extent practicable for short-term disturbed areas (see Glossary of Terms, EIS Appendix 6), the cactus and yucca will be re-planted back to the original site.

  - Restore and reclaim short-term (i.e. 2 years or less, see Glossary of Terms, EIS Appendix 6) disturbed areas, including pipelines, transmission projects, staging areas, and short-term construction-related roads immediately or during the most biologically appropriate season as determined in the activity/Project specific

environmental analysis and decision, following completion of construction activities to reduce the amount of habitat converted at any one time and promote recovery to natural habitats and vegetation as well as climate refugia and ecosystem services such carbon storage.

- **CMA LUPA-BIO-8.** All activities that are required to close and decommission the site (e.g., renewable energy activities) will specify and implement Project-specific closure and decommissioning actions that meet the approval of BLM, and that at a minimum address the following:
  - Specifying and implementing the methods, timing (e.g., criteria for triggering closure and decommissioning actions), and criteria for success (including quantifiable and measurable criteria).
  - Recontouring of areas that were substantially altered from their original contour or gradient and installing erosion control measures in disturbed areas where potential for erosion exists.
  - Restoring vegetation as well as soil profiles and functions that will support and maintain native plant communities, associated carbon sequestration and nutrient cycling processes, and native wildlife species.
  - Vegetation restoration actions will identify and use native vegetation composition, native seed composition, and the diversity to values commensurate with the natural ecological setting and climate projections.
- **CMA LUPA-BIO-9.** Implement the following general LUPA CMA for water and wetland dependent resources:
  - Implement construction site standard practices to prevent toxic chemicals, hazardous materials, and other fluids from entering vegetation type streams, washes, and tributary networks through water runoff, erosion, and sediment transport by, at a minimum, implementing the following:
    - On Project sites, vehicles and other equipment will be maintained in proper working condition and only stored in designated containment areas where runoff is collected or controlled and that are located outside of streams, washes, and distributary networks to minimize accidental fluids and hazardous materials spills.
    - Hazardous material leaks, spills, or releases will be immediately cleaned, and equipment will be repaired upon identification. Removal and disposal of spill and related clean-up materials will occur at an approved off-site landfill.
    - Maintenance and operations vehicles will carry the appropriate equipment and materials to isolate, clean up, and repair any hazardous material leaks, spills, or releases.

- Activity-specific drainage, erosion, and sedimentation control actions, which meet the approval of BLM and the applicable regulatory agencies, will be carried out during all appropriate phases of the approved Project. These actions, as needed, will address measures to ensure the proper protection of water quality, site-specific stormwater and sediment retention, and design of the Project to minimize site disturbance, including the following:
  - Identify site-specific surface water runoff patterns and implement measures to prevent excessive and unnatural soil deposition and erosion.
  - Implement measures to maintain natural drainages and to maintain hydrologic function in the event drainages are disturbed.
  - Reduce the amount of area covered by impervious surfaces through use of permeable pavement or other pervious surfaces. Direct runoff from impervious surfaces into retention basins.
  - Stabilize disturbed areas following grading in the manner appropriate to the soil type so that wind or water erosion is minimized.
  - Minimize irrigation runoff by using low or no irrigation native vegetation landscaping for landscaped retention basins.
  - Conduct regular inspections and maintenance of long-term erosion control measures to ensure long-term effectiveness.

- **CMA LUPA-BIO-10.** Consistent with BLM state and national policies and guidance, integrated weed management actions will be carried out during all phases of activities, as appropriate, and at a minimum will include the following:
  - Thoroughly clean the tires and undercarriage of vehicles entering or reentering the Project site to remove potential weeds.
  - Store Project vehicles on site in designated areas to minimize the need for multiple washings whenever vehicles re-enter the Project site.
  - Properly maintain vehicle wash and inspection stations to minimize the introduction of invasive weeds or subsidy of invasive weeds.
  - Closely monitor the types of materials brought onto the site to avoid the introduction of invasive weeds and non-native species.
  - Reestablish native vegetation quickly on disturbed sites.
  - Monitor and quickly implement control measures to ensure early detection and eradication of weed invasions to avoid the spread of invasive weeds and non-native species on site and to adjacent off-site areas.
  - Use certified weed-free mulch, straw, hay bales, or equivalent fabricated materials for installing sediment barriers.

- **CMA LUPA-BIO-11.** Implement the following CMAs for controlling nuisance animals and invasive species:
  - No fumigant, treated bait, or other means of poisoning nuisance animals including rodenticides will be used in areas where focus and BLM special-status species are known or suspected to occur.
  - Manage the use of widely spread herbicides and do not apply herbicides effective against dicotyledonous plants within 1,000 feet from the edge of a 100-year floodplain, stream and wash channels, and riparian vegetation or to soils less than 25 feet from the edge of drains. Exceptions will be made when targeting the base and roots of invasive riparian species such as tamarisk and *Arundo donax* (giant reed). Manage herbicides consistent with the most current national and California BLM policies.
  - Minimize herbicide, pesticide, and insecticide treatment in areas that have a high risk for groundwater contamination.
  - Clean and dispose of pesticide containers and equipment following professional standards. Avoid use of pesticides and cleaning containers and equipment in or near surface or subsurface water.
  - When near surface or subsurface water, restrict pesticide use to those products labeled safe for use in/near water and safe for aquatic species of animals and plants.
- **CMA LUPA-BIO-12.** For activities that may impact focus or BLM special-status species, implement the following LUPA CMA for noise:
  - To the extent feasible and determined necessary by BLM to protect focus and BLM sensitive wildlife species, locate stationary noise sources that exceed background ambient noise levels away from known or likely locations of and BLM sensitive wildlife species and their suitable habitat.
  - Implement engineering controls on stationary equipment, buildings, and work areas including sound-insulation and noise enclosures to reduce the average noise level, if the activity will contribute to noise levels above existing background ambient levels.
  - Use noise controls on standard construction equipment including mufflers to reduce noise.
- **CMA LUPA-BIO-13.** Implement the following CMA for Project siting and design:
  - To the maximum extent practicable site and design projects to avoid impacts to vegetation types, unique plant assemblages, climate refugia as well as occupied habitat and suitable habitat for focus and BLM special-status species (see “avoid to the maximum extent practicable” in Glossary of Terms, EIS Appendix 6).

- The siting of projects along the edges (i.e. general linkage border) of the biological linkages identified in Appendix D of the CDCA Plan, as amended (Figures D-1 and D-2) will be configured (1) to maximize the retention of microphyll woodlands and their constituent vegetation type and inclusion of other physical and biological features conducive to focus and BLM special-status species dispersal, and (2) informed by existing available information on modeled focus and BLM Special-Status Species habitat and element occurrence data, mapped delineations of vegetation types, and based on available empirical data, including radio telemetry, wildlife tracking sign, and road-kill information. Additionally, projects will be sited and designed to maintain the function of special-status species connectivity and their associated habitats in the following linkage and connectivity areas:

  - Within a 5-mile-wide linkage across Interstate 10 centered on Wiley's Well Road to connect the Mule and McCoy mountains (the majority of this linkage is within the Chuckwalla ACEC and Mule-McCoy Linkage ACEC).

- **CMA LUPA-BIO-14.** Delineate the boundaries of areas to be disturbed using temporary construction fencing and flagging prior to construction and confine disturbances, Project vehicles, and equipment to the delineated Project areas to protect vegetation types and focus and BLM special-status species.

  - Long-term nighttime lighting on Project features will be limited to the minimum necessary for Project security, safety, and compliance with FAA requirements and will avoid the use of constant-burn lighting.

  - All long-term nighttime lighting will be directed away from riparian and wetland vegetation, occupied habitat, and suitable habitat areas for focus and BLM special-status species. Long- term nighttime lighting will be directed and shielded downward to avoid interference with the navigation of night-migrating birds and to minimize the attraction of insects as well as insectivorous birds and bats to Project infrastructure.

  - To the maximum extent practicable (see Glossary of Terms, EIS Appendix 6), restrict construction activity to existing roads, routes, and utility corridors to minimize the number and length/size of new roads, routes, disturbance, laydown, and borrow areas.

  - To the maximum extent practicable (see Glossary of Terms, EIS Appendix 6), confine vehicular traffic to designated open routes of travel to and from the Project site, and prohibit, within Project boundaries, cross- country vehicle and equipment use outside of approved designated work areas to prevent unnecessary ground and vegetation disturbance.

  - To the maximum extent practicable (see Glossary of Terms, EIS Appendix 6), construction of new roads and/or routes will be avoided within focus and BLM special-status species suitable habitat within identified linkages for those focus and BLM special-status species, unless the new road and/or route is beneficial to

minimize net impacts to natural or ecological resources of concern. These areas will have a goal of “no net gain” of Project roads and/or routes.

- Use nontoxic road sealants and soil stabilizing agents.

- **CMA LUPA-BIO-15.** Use state-of-the-art, as approved by BLM, construction and installation techniques, appropriate for the specific activity/Project and site, that minimize new site disturbance, soil erosion and deposition, soil compaction, disturbance to topography, and removal of vegetation.

- **CMA LUPA-BIO-16.** For activities that may impact focus and BLM sensitive birds, protected by the FESA and/or MBTA, and bat species, implement appropriate measures as per the most up-to-date BLM state and national policy and guidance, and data on birds and bats, including but not limited to activity specific plans and actions. The goal of the activity -specific bird and bat actions is to avoid and minimize direct mortality of birds and bats from the construction, operation, maintenance, and decommissioning of the specific activities.

  Activity-specific measures to avoid and minimize impacts may include, but are not limited to:

  - Siting and designing activities will avoid high bird and bat movement areas that separate birds and bats from their common nesting and roosting sites, feeding areas, or lakes and rivers.

  - For activities that impact bird and bat focus and BLM special-status species, during Project siting and design, conducting monitoring of bird and bat presence as well as bird and bat use of the Project site using the most current survey methods and best procedures available at the time.

  - Reusing or co-locating new transmission facilities and other ancillary facilities with existing facilities and disturbed areas to reduce habitat destruction and avoid additional collision risks.

  - Reducing bird and bat collision hazards by utilizing techniques such as unguyed monopole towers or tubular towers. Where the use of guywires is unavoidable, demarcate guywires using the best available methods to minimize avian species strikes.

  - When fencing is necessary, use bird and bat compatible design standards.

  - Using lighting that does not attract birds and bats or their prey to Project sites including using non-steady burning lights (i.e., red, dual red and white strobe, strobe- like flashing lights) to meet FAA requirements, using motion or heat sensors and switches to reduce the time when lights are illuminated, using appropriate shielding to reduce horizontal or skyward illumination, and avoiding the use of high-intensity lights (e.g., sodium vapor, quartz, and halogen).

- Implementing a robust monitoring program to regularly check for wildlife carcasses, document the cause of mortality, and promptly remove the carcasses.
- Incorporating a bird and bat use and mortality monitoring program during operations using current protocols and best procedures available at time of monitoring.

- **CMA LUPA-BIO-17.** For activities that may result in mortality to focus and BLM special-status bird and bat species, a Bird and Bat Conservation Strategy (BBCS)[3] will be prepared with the goal of assessing operational impacts to bird and bat species and incorporating methods to reduce documented mortality. The BBCS actions for impacts to birds and bats during these activities will be determined by the activity-specific bird and bat operational actions. The strategy shall be approved by BLM in coordination with USFWS, and CDFW as appropriate, and may include, but is not limited to:
  - Incorporating a bird and bat use and mortality monitoring program during operations using current protocols and best procedures available at time of monitoring.
  - Activity-specific operational avoidance and minimization actions that reduce the level of mortality on the populations of bird and bat species, such as:
    - Evaluation and installation of the best available bird and bat detection and deterrent technologies available at the time of construction.
- **CMA LUPA-BIO-BAT-1.** Activities, except wind projects, will not be sited within 500 feet of any occupied maternity roost or presumed occupied maternity roost as described below. Refer to CMA DFA-VPL-BIO-BAT-1 for distances within DFAs and VPLs.
- **CMA LUPA-BIO-COMP-1.** Impacts to biological resources, identified and analyzed in the activity specific environmental document, from activities in the LUPA DA will be compensated using the standard biological resources compensation ratio (Table 2.4-1), except for the biological resources and specific geographic locations listed as compensation ratio exceptions, specifics in CMAs LUPA-BIO-COMP-2, and previously listed CMAs. Compensation acreage requirements may be fulfilled through non-acquisition (i.e., restoration and enhancement), land acquisition (i.e., preserve), or a combination of these options, depending on the activity specifics and BLM approval/authorization.

Refer to CMA LUPA-COMP-1 and 2 for the timing requirements for initiation or completion of compensation.

[3] The BBCS will include a component for a NBBMP.

Table 2.4-1 Biological Resources Compensation Ratio for the Impacts of Activities in the DRECP LUPA Decision Area

STANDARD BIOLOGICAL RESOURCES COMPENSATION RATIO	EXCEPTIONS TO THE BIOLOGICAL RESOURCE STANDARD COMPENSATION RATIO	
1:1	Desert tortoise designated critical habitat	5:1 in same CH unit
	Mohave ground squirrel: key population centers	2:1
	Flat-tailed horned lizard: FTHL Management Areas	RMS
	Wetlands	2:1
	Desert riparian woodland vegetation types	5:1

RMS = Flat-tailed Horned Lizard Rangewide Management Strategy

- **CMA LUPA-BIO-COMP-2.** Birds and Bats – The compensation for the mortality impacts to bird and bat focus and BLM special-status species from activities will be determined based on monitoring of bird and bat mortality and a fee re-assessed every 5 years to fund compensatory mitigation. The initial compensation fee for bird and bat mortality impacts will be based on pre-Project monitoring of bird use and estimated bird and bat species mortality from the activity. The approach to calculating the operational bird and bat compensation is based on the total replacement cost for a given resource, a Resource Equivalency Analysis (REA). This involves measuring the relative loss to a population (debt) resulting from an activity and the productivity gain (credit) to a population from the implementation of compensatory mitigation actions. The measurement of these debts and gains (using the same "bird years" metric as described in Appendix D of the DRECP) is used to estimate the necessary compensation fee.

  - Each activity, as determined appropriate by BLM in coordination with USFWS, and CDFW as applicable, will include a monitoring strategy to provide activity-specific information on mortality effects on birds and bats in order to determine the amount and type of compensation required to offset the effects of the activity, as described above and in detail in Appendix D of the DRECP. Compensation will be satisfied by restoring, protecting, or otherwise improving habitat such that the carrying capacity or productivity is increased to offset the impacts resulting from the activity. Compensation may also be satisfied by non-restoration actions that reduce mortality risks to birds and bats (e.g., increased predator control and protection of roosting sites from human disturbance). Compensation will be consistent with the most up to date DOI mitigation policy.

- **CMA LUPA-BIO-DUNE-1.** Because DRECP sand dune vegetation types and Aeolian sand transport corridors are, by definition, shifting resources, activities that potentially occur within or bordering the sand dune DRECP vegetation types and/or Aeolian sand transport corridors must conduct studies to verify the location [refer to Appendix D, Figure D-7 of the DRECP] and extent of the sand resource(s) for the activity-specific environmental analysis to determine:

- Whether the proposed activity(s) occur within a sand dune or an Aeolian sand transport corridor
- If the activity(s) is subject to dune/Aeolian sand transport corridor CMAs
- If the activity(s) needs to be reconfigured to satisfy applicable avoidance requirements

- **CMA LUPA-BIO-DUNE-2.** Activities that potentially affect the amount of sand entering or transported within Aeolian sand transport corridors will be designed and operated to:
  - Maintain the quality and function of Aeolian transport corridors and sand deposition zones, unless related to maintenance of existing (at the time of the DRECP LUPA ROD) facilities/operations/activities.
  - Avoid a reduction in sand-bearing sediments within the Aeolian system.
  - Minimize mortality to dune associated focus and BLM special-status species.
- **CMA LUPA-BIO-DUNE-3.** Any facilities or activities that alter site hydrology (e.g., sediment barrier) will be designed to maintain continued sediment transport and deposition in the Aeolian corridor in a way that maintains the Aeolian sorting and transport to downwind deposition zones. Site designs for maintaining this transport function must be approved by BLM in coordination with USFWS and CDFW as appropriate.
- **CMA LUPA-BIO-DUNE-4.** Dune formations and other sand accumulations (i.e., sand ramps, sand sheets) with suitable habitat characteristics for the Mojave fringe-toed lizard (i.e., unconsolidated blow-sand) will be mapped according to mapping standards established by the BLM National Operations Center (NOC).

  For minor incursions (see “minor incursion” in the Glossary of Terms, EIS Appendix 6) into sand dunes and sand transport areas the activity will be sited in the mapped zone with the least impacts to sand dunes and sand transport and Mojave fringe-toed lizards.
- **CMA LUPA-BIO-DUNE-5.** If suitable habitat characteristics are identified during the habitat assessment, clearance surveys (see Glossary of Terms, EIS Appendix 6) for Mojave fringe-toed lizard will be performed in suitable habitat areas.

The following CMAs will be implemented for bat focus and BLM special-status species, including but not limited to those listed below:

- California leaf-nosed bat;
- Pallid bat; and
- Townsend’s big-eared bat.

- **CMA LUPA-BIO-IFS-3.** All culverts for access roads or other barriers will be designed to allow unrestricted access by desert tortoises and will be large enough that desert tortoises are unlikely to use them as shelter sites (e.g., 36 inches in diameter or larger). Desert tortoise exclusion fencing may be utilized to direct tortoise use of culverts and other passages.

- **CMA LUPA-BIO-IFS-5.** Following the clearance surveys (see Glossary of Terms, EIS Appendix 6) within sites that are fenced with long-term desert tortoise exclusion fencing a designated biologist (see Glossary of Terms, EIS Appendix 6) will monitor initial clearing and grading activities to ensure that desert tortoises missed during the initial clearance survey are moved from harm's way.

    - A designated biologist will inspect construction pipes, culverts, or similar structures: (a) with a diameter greater than 3 inches, (b) stored for one or more nights, (c) less than 8 inches aboveground, and (d) within desert tortoise habitat (such as, outside the long-term fenced area), before the materials are moved, buried, or capped.

    - As an alternative, such materials shall be capped before storing outside the fenced area or placing on pipe racks. Pipes stored within the long-term fenced area after completing desert tortoise clearance surveys will not require inspection.

- **CMA LUPA-BIO-IFS-6.** When working in areas where protocol or clearance surveys are required (Appendix D of the DRECP), biological monitoring will occur with any geotechnical boring or geotechnical boring vehicle movement to ensure no desert tortoises are killed or burrows are crushed.

- **CMA LUPA-BIO-IFS-7.** A designated biologist (see Glossary of Terms, EIS Appendix 6) will accompany any geotechnical testing equipment to ensure no tortoises are killed and no burrows are crushed.

- **CMA LUPA-BIO-IFS-8.** Inspect the ground under the vehicle for the presence of desert tortoise any time a vehicle or construction equipment is parked in desert tortoise habitat outside of areas fenced with desert tortoise exclusion fencing. If a desert tortoise is seen, it may move on its own. If it does not move within 15 minutes, a designated biologist may remove and relocate the animal to a safe location.

- **CMA LUPA-BIO-IFS-9.** Vehicular traffic will not exceed 15 miles per hour within the areas not cleared by protocol-level surveys where desert tortoise may be impacted.

- **CMA LUPA-BIO-IFS-11.** If Bendire's thrasher is present, conduct appropriate activity-specific biological monitoring (see Glossary of Terms, EIS Appendix 6) to ensure that Bendire's thrasher individuals are not directly affected by operations (i.e., mortality or injury, direct impacts on nest, eggs, or fledglings).

- **CMA LUPA-BIO-IFS-12.** If burrowing owls are present, a designated biologist (see Glossary of Terms, EIS Appendix 6) will conduct appropriate activity-specific biological monitoring (see Glossary of Terms, EIS Appendix 6) to ensure avoidance

of occupied burrows and establishment of the 656 feet (200 meter) setback to sufficiently minimize disturbance during the nesting period on all activity sites, when practical.

- **CMA LUPA-BIO-IFS-13.** If burrows cannot be avoided on-site, passive burrow exclusion by a designated biologist (see Glossary of Terms, EIS Appendix 6) through the use of one-way doors will occur according to the specifications in Appendix D of the DRECP or the most up-to-date agency BLM or CDFW specifications. Before exclusion, there must be verification that burrows are empty as specified in Appendix D of the DRECP or the most up-to-date BLM or CDFW protocols. Confirmation that the burrow is not currently supporting nesting or fledgling activities is required prior to any burrow exclusions or excavations.

- **CMA LUPA-BIO-IFS-14.** Activity-specific active translocation of burrowing owls may be considered, in coordination with CDFW.

- **CMA LUPA-BIO-IFS-24.** Provide protection from loss and harassment of active golden eagle nests through the following actions:

  - Activities that may impact nesting golden eagles, will not be sited or constructed within 1-mile of any active or alternative golden eagle nest within an active golden eagle territory, as determined by BLM in coordination with USFWS as appropriate.

- **CMA LUPA-BIO-IFS-25.** Cumulative loss of golden eagle foraging habitat within a 1- to 4-mile radius around active or alternative golden eagle nests (as identified or defined in the most recent USFWS guidance and/or policy) will be limited to less than 20 percent. See CONS-BIO-IFS-5 for the requirement in Conservation Lands.

- **CMA LUPA-BIO-IFS-26.** For activities that impact golden eagles, applicants will conduct a risk assessment per the applicable USFWS guidance (e.g., the Eagle Conservation Plan Guidance) using best available information as well as the data collected in the pre-Project golden eagle surveys.

- **CMA LUPA-BIO-IFS-27.** If a permit for golden eagle take is determined to be necessary, an application will be submitted to the USFWS in order to pursue a take permit.

- **CMA LUPA-BIO-PLANT-1.** Conduct properly timed protocol surveys in accordance with the BLM's most current (at time of activity) survey protocols for plant focus and BLM special-status species.

- **CMA LUPA-BIO-PLANT-2.** Implement an avoidance setback of 0.25 mile for all focus and BLM special-status species occurrences. Setbacks will be placed strategically adjacent to occurrences to protect ecological processes necessary to support the plant species (Appendix Q, Baseline Biology Report, in the proposed LUPA and Final EIS [2015], or the most recent data and modeling).

- **CMA LUPA-BIO-PLANT-3.** Impacts to suitable habitat for focus and BLM special-status plant species should be avoided to the extent feasible and are limited [capped] to a maximum of 1 percent of their suitable habitat throughout the entire LUPA DA. The baseline condition for measuring suitable habitat is the DRECP modeled suitable habitat for these species utilized in the EIS analysis (2014 and 2015), or the most recent suitable habitat modeling.

- **CMA LUPA-BIO-RIPWET-1.** The riparian and wetland DRECP vegetation types and other features listed in Table 2.4-2 will be avoided to the maximum extent practicable, except for allowable minor incursions (see Glossary of Terms for "avoidance to the maximum extent practicable" and "minor incursion," EIS Appendix 6) with the specified setbacks.

  For minor incursion (see "minor incursion" in the Glossary of Terms, EIS Appendix 6) to the DRECP riparian vegetation types, wetland vegetation types, or encroachments on the setbacks listed in Table 17, the hydrologic function of the avoided riparian or wetland communities will be maintained.

  - Minor incursions in the riparian and wetland vegetation types or other features including the setbacks listed in Table 17 will occur outside of the avian nesting season, February 1 through August 31 or otherwise determined by BLM, USFWS and CDFW if the minor incursion(s) is likely to result in impacts to nesting birds.

Table 2.4-2 Riparian and Wetland Avoidance and Setbacks

RIPARIAN AND WETLAND VEGETATION TYPES OR FEATURES	SETBACK
Riparian Vegetation Types[1]	
Madrean Warm Semi-Desert Wash Woodland/Scrub	200 feet
Mojavean Semi-Desert Wash Scrub	200 feet
Sonoran-Coloradan Semi-Desert Wash Woodland/Scrub	200 feet
Southwestern North American Riparian Evergreen and Deciduous Woodland	0.25 mile
Southwestern North American Riparian/Wash Scrub	0.25 mile
Wetland Vegetation Types[1]	
Arid West freshwater emergent marsh	0.25 mile
Californian Warm Temperate Marsh/Seep	0.25 mile
Other Riparian and Wetland Related Features	
Managed Wetlands[2]	0.25 mile

RIPARIAN AND WETLAND VEGETATION TYPES OR FEATURES	SETBACK
Mojave River[3]	0.25 mile
Undifferentiated Riparian land cover[4]	200 feet

[1]Setbacks are measured from the edge of the mapped riparian or wetland vegetation or water feature per LUPA-BIO-3.
[2]Setback is from managed wetlands including USFWS Refuges, state managed wetlands, and duck clubs in Imperial Valley. See specifications for the Salton Sea below.
[3]Setback is measured from the edge of mapped riparian or edge of FEMA 100-year floodplain of the Mojave River, whichever is further from the center line of the Mojave River channel.
[4]Undifferentiated "Riparian" land cover includes portions of major river courses (Mojave River and Colorado River) within the main channels where riparian vegetation groups were not mapped.

- **CMA LUPA-BIO-RIPWET-3.** For activities that occur within 0.25 mile of a riparian or wetland DRECP vegetation type and may impact BLM special-status riparian and wetland bird species, conduct a pre-construction/activity nesting bird survey for BLM Special-Status riparian and wetland birds according to agency-approved protocols.
    - Based on the results of the nesting bird survey above, setback activities that are likely to impact BLM Special-Status riparian and wetland bird species, including but not limited to pre-construction, construction and decommissioning, 0.25 mile from active nests special-status during the breeding season (February 1 through August 31 or otherwise determined by BLM, USFWS and CDFW). For activities in areas covered by this provision that occur during the breeding season and that last longer than one week, nesting bird surveys may need to be repeated, as determined by BLM, in coordination with USFWS and CDFW, as appropriate. No pre-activity nesting bird surveys are necessary for activities occurring outside of the breeding season.

- **CMA LUPA-BIO-SVF-1.** For activity-specific NEPA analysis, a map delineating potential sites and habitat assessment of the following special vegetation features is required: yucca clones, creosote rings, Saguaro cacti, Joshua tree woodland, microphyll woodland, crucifixion thorn stands. BLM Guidelines for mapping/surveying cacti, yuccas, and succulents shall be followed.

- **CMA LUPA-BIO-SVF-6.** Microphyll woodland: impacts to microphyll woodland (see Glossary of Terms, EIS Appendix 6) will be avoided, except for minor incursions (see Glossary of Terms, EIS Appendix 6).

- **CMA LUPA-BIO-VEG-1.** Management of cactus, yucca, and other succulents will adhere to current up-to-date BLM policy.

- **CMA LUPA-BIO-VEG-2.** Promote appropriate levels of dead and downed wood on the ground, outside of campground areas, to provide wildlife habitat, seed beds for vegetation establishment, and reduce soil erosion, as determined appropriate on an activity-specific basis.

- **CMA LUPA-BIO-VEG-3**. Allow for the collection of plant material consistent with the maintenance of natural ecosystem processes.

- **CMA LUPA-BIO-VEG-5.** All activities will follow applicable BLM state and national regulations and policies for salvage and transplant of cactus, yucca, other succulents, and BLM Sensitive plants.

- **CMA LUPA-BIO-VEG-6.** BLM may consider disposal of succulents through public sale, as per current up-to-date state and national policy.

- **CMA LUPA-SW-13.** BLM will manage all riparian areas to be maintained at, or brought to, proper functioning condition.

- **CMA LUPA-SW-16.** The 100-year floodplain boundaries for any surface water feature in the vicinity of the Project will be identified. If maps are not available from the Federal Emergency Management Agency (FEMA), these boundaries will be determined via hydrologic modeling and analysis as part of the environmental review process. Construction within, or alteration of, 100-year floodplains will be avoided where possible, and permitted only when all required permits from other agencies are obtained.

- **CMA LUPA-TRANS-BIO-1.** Where feasible and appropriate for resource protection, site transmission activities along roads or other previously disturbed areas to minimize new surface disturbance, reduce perching opportunities for the common raven, and minimize collision risks for birds and bats.

- **CMA LUPA-TRANS-BIO-2.** Flight diverters will be installed on all transmission activities spanning or within 1,000 feet of stream and wash channels, canals, ponds, and any other natural or artificial body of water. The type of flight diverter selected will be subject to approval by BLM, in coordination with USFWS and CDFW as appropriate, and will be based on the best available scientific and commercial data regarding the prevention of bird collisions with transmission and guy wires.

- **CMA LUPA-TRANS-BIO-3.** When siting transmission activities, the alignment should avoid, to the maximum extent practicable, being located across canyons or on ridgelines. Site and design sufficient distance between transmission lines to prevent electrocution of condors.

- **CMA LUPA-TRANS-BIO-4.** Siting of transmission activities will be prioritized within designated utility corridors, where possible, and designed to avoid, where possible, and otherwise minimize and offset impacts to sand transport processes in Aeolian corridors, rare vegetation alliances and focus and BLM Special-Status species. Transmission substations will be sited to avoid Aeolian corridors, rare vegetation alliances, and sand-dependent focus and BLM special-status species habitats.

- **CMA DFS-VPL-BIO-FIRE-1.** Implement the following standard practice for fire prevention/protection:
  - Implement site-specific fire prevention/protection actions particular to the construction and operation of renewable energy and transmission Project that include procedures for reducing fires while minimizing the necessary amount of vegetation clearing, fuel modification, and other construction-related activities. At a minimum these actions will include designating site fire coordinators, providing adequate fire suppression equipment (including in vehicles), and establishing emergency response information relevant to the construction site.

2.4.4 CEQA Significance Criteria

Appendix G of CEQA Guidelines (14 CCR 15000 et seq.) provides guidance on assessing whether a project would have significant impacts on the environment. Consistent with Appendix G, the Project would have significant biological resource impacts if it would:

a. Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special-status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Game (CDFG) or USFWS?

b. Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the CDFG or USFWS?

c. Have a substantial adverse effect on state or federally protected wetlands (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?

d. Interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?

e. Conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?

f. Conflict with the provisions of an adopted HCP, NCCP, or other approved local, regional, or State HCP?

2.4.5 Biological Resources Impact Analysis

Impact BIO 1 - Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special-status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service?

Less than Significant with Mitigation

2.4.5.1 Plants

Federal and State ESA-Listed Plant Species

No plant species currently listed as threatened or endangered, or proposed for listing, under the FESA or CESA would be expected within the California portion of the Project area. Therefore, no impacts to Federal or State listed plants would occur.

Other Special-Status Plant Species

Based on searches of the CDFW's Biogeographic Information and Observation System (BIOS) (CDFW 2016a) and California Natural Diversity Database (CNDDB) a review of the California Native Plant Society (CNPS) online inventory for rate and endangered plants of California (CNPS 2016), and 2016/2017 surveys of the Proposed Action route (HDR 2016; Transcon 2017), a total of 16 special-status and/or rare plant species (FEIS Appendix 3, Table 3.4-4) have been found or could be present in the Project area.

A total of 12 species are present or have at least a moderate potential to occur in the Project area. These species include- Abrams' spurge (*Euphorbia abramsiana* [California Rare Plant Rank {CRPR} 2B.2]), desert unicorn plant (*Proboscidea althaeifolia* [CRPR 4.3]), dwarf germander (*Teucrium cubense* ssp. *depressum* [CRPR 2B.2]), flat-seeded spurge (*Euphorbia platysperma* [CRPR 1B.2 and BLM Sensitive]), glandular ditaxis (*Ditaxis claryana* [CRPR 2B.2]), gravel milkvetch (*Astragalus sabulonum* [CRPR 2B.2]), Harwood's eriastrum (*Eriastrum harwoodii* [CRPR 1B.2 and BLM Sensitive]), Harwood's milkvetch (*Astragalus insularis var. harwoodii* [CRPR 2B.2]), ribbed cryptantha (*Cryptantha costata* [CRPR 4.3]), saguaro (*Carnegiea gigantea* [CRPR 2B.2]), Utah vine milkweed (*Funastrum utahense* [CRPR 4.2]), and winged cryptantha (*Cryptantha holoptera* [CRPR 4.3]). None of these species are classified as endangered, threatened, or rare (CDFW 2016b).

Four other special-status plant species that are not expected or have a low potential to occur include: pink fairy-duster (*Calliandra eriophylla* [CRPR 2B.3]), Las Animas colubrina (*Colubrina californica* [CRPR 2B.3]), California ditaxis (*Ditaxis serrata* var. *californica* [CRPR 3.2]), and bitter hymenoxys (*Hymenoxys odorata* [CRPR 2B.1]) (CDFW 2016b).

Direct impacts to listed or special-status plant species could occur from construction activities that remove vegetation, grade soils, or cause sedimentation, including tower/pole site preparation, and the construction, grading, and creation of access roads. Indirect impacts could include the disruption of native seed banks through soil alterations, the accumulation of fugitive dust, increased erosion and sediment transport, and the colonization of non-native, invasive plant species. Operational impacts could include trampling or crushing due to use of new access roads, increased erosion, and the colonization and spread of noxious weeds. Direct and indirect impacts to listed and/or CRPR 1 and 2 species (should they be present), as a result of Project construction would be considered significant prior to mitigation under this criterion.

Under Section 15380 of the CEQA Guidelines, a species may be considered endangered, rare or threatened, if it can be shown to meet the criteria for State or Federal listing. CEQA Section 15380 provides that a plant or animal species may be treated as 'rare or endangered' even if not on one of the official lists if, for example, it is likely to become endangered in the foreseeable future" (CPUC 2016).

CRPR plants known or with the potential to occur in the Project area are also included in the CDFW Special Vascular Plants List and are tracked by CDFW's CNDDB. The CNPS Inventory has been a broadly recognized and accepted source of science-based information on the rarity, endangerment, and distribution of California special-status plants since its first edition in 1974. By CNPS's standards, the plants ranked as CRPR 1A, 1B and 2 meet the definitions of Sections 2062 and 2067 (CESA) of the CFGC and are eligible for state listing. The CPUC considers those plants ranked as CRPR 1 or 2 to meet CEQA's Section 15380 criteria, and adverse effects to these species are generally considered "significant" except where substantial data may show otherwise (CPUC 2016).

For the purposes of this analysis, it is assumed that a total of approximately 149.2 acres of natural vegetation communities that have the potential to support special-status plants could be potentially impacted as a result of the Project's implementation. The following special-status plant species would be assumed impacted by the Project: Abrams' spurge, bitter hymenoxys, dwarf germander, flat-seeded spurge, glandular ditaxis, gravel milkvetch, Harwood's eriastrum, Harwood's milkvetch, Las Animas colubrine, pink fairy-duster, and saguaro.

The most effective mechanism for reducing impacts to special-status species is to avoid or minimize on-site impacts. Therefore, the mitigation strategy is to require surveys and avoid populations of rare listed and special-status plants, where detected. As outlined in APM BIO-12, APM BIO-15, BMP BIO-16, BMP BIO-24, BMP BIO-31, BMP BIO-51, BMP BIO-52, BMP BIO-53, and BMP BIO-55, the Project would be designed to minimize impacts to special-status plant species through avoidance. Pre-construction surveys and monitoring will be conducted to avoid impacts by determining the location of succulents (BMP BIO-41), Harwood's eriastrum (BMP BIO-31), and other special-status plant species (APM/BMP BIO-2, BMP BIO-52, MM BIO-CEQA-3, MM- VEG-CEQA-1, and MM VEG-CEQA-2) within the vicinity of work areas. Other measures that would be implemented to avoid and minimize impacts during construction include:

- Implementation of a WEAP (APM/BMP BIO-1 and MM BIO-CEQA-2);
- Limiting activities to established work areas (APM/BMP BIO-3);
- Establishing environmentally sensitive areas (APM BIO-4);
- Minimizing vegetation clearing (APM BIO-14);
- Limiting off-road vehicular travel (APM BIO-17);
- Prohibiting native plant collection without a permit (BMP BIO-37);
- Succulent management (BMP BIO-41);
- Promote dead and downed wood (BMP BIO-42);
- Protection of dune vegetation (BMP BIO-53);
- Limit vegetation removal (BMP VEG-01 and BMP VEG-02); and

- Implement biological resources best management practices (MM BIO-CEQA-1).

It is assumed that Project-related impacts would result in the loss of special-status plant species with a California Rare Plant Rank (CRPR) of 1 or 2 and compensation for these impacts would be required. Compensation for permanent impacts to potential special-status plant species habitat will include off-site creation, enhancement, and/or preservation at a minimum 3:1 replacement ratio. Individuals and/or plant populations that cannot be avoided will be mitigated through a combination of efforts including seed collection for restoration, enhancement of known populations, and/or preservation of occupied habitat in accordance with the Vegetation Management Plan (APM BIO-11 and MM VEG-CEQA-1) and the Special-Status Plant Transplantation and Compensation Plan (MM VEG-CEQA-4) that would be developed and implemented as part of the Project.

A Vegetation Management Plan that addresses control of noxious weeds shall be prepared and implemented to address potential impacts associated with the colonization and spread of noxious weeds (APM BIO-12 and MM VEG-CEQA-1). All disturbed habitat will include restoration with similar species compositions to those present prior to construction at a ratio of 1.5:1. Restoration of conditions of the impacted areas within the Project footprint shall be at 1:1. Creation, restoration, or enhancement of similar vegetation communities offsite shall be 0.5:1, as approved by CDFW and CPUC. Alternatively, payments would be made into an appropriate mitigation program or other mitigation funding mechanism. The Vegetation Management Plan described in MM VEG-CEQA-1 will outline the planting/seeding methodologies, qualitative/quantitative monitoring requirements, success criteria, and reporting procedures.

To reduce impacts to special-status plant species to less than significant levels, and meet CEQA requirements, the following CEQA specific mitigation measures have been developed (incorporating applicable APMs, BMPs, and CMAs provided under Section 2.4.5.3): MM BIO-CEQA-1, MM BIO-CEQA-2, MM BIO-CEQA-3, MM VEG-CEQA-1, MM VEG-CEQA-2, MM VEG-CEQA-3, and MM VEG-CEQA-4. Therefore, impacts to special-status plants would be less than significant with mitigation.

2.4.5.2 Wildlife

Federal and State-Listed Species

Species that are classified as threatened, endangered, or proposed and protected under the FESA that could be present in the Project area were identified by querying the USFWS's Information for Planning and Conservation (IPaC) database (USFWS 2016), reviewing BLM RMPs and related documents, and evaluating published and unpublished information about the listed species. Five threatened and endangered species were identified that are known to be present or have at least a moderate potential to occur in or near the California portion of the Project Area, including Mojave Desert tortoise (*Gopherus agassizii*, threatened), razorback sucker (*Xyrauchen texanus*, endangered), southwestern willow flycatcher (*Empidonax traillii extimus*, endangered), western yellow-billed cuckoo (*Coccyzus americanus occidentalis*, threatened), and Yuma Ridgway's rail (*Rallus obsoletus yumanensis*, endangered). Species protected under the FESA are classified as special-status species by the BLM.

Four other listed and proposed species are present in the region but are very rare or absent, with marginal habitat present within the California portion of the Project area: California least tern (*Sterna antillarum browni*, endangered), northern Mexican gartersnake (*Thamnophis eques megalops*, threatened), roundtail chub (*Gila robusta*, proposed threatened), and bonytail chub (*Gila elegans*, endangered).

Special-status wildlife species listed under the CESA that could be present in or near the Project area (FEIS Appendix 3, Table 3.4-15) were identified by searching the CDFW's BIOS and CNDDB (CDFW 2016a), reviewing BLM land use plans (BLM 2002c, 2015, 2016a), and reviewing analyses of other projects that have occurred in the area (BLM 2012, 2014, 2015; Riverside County 2015a, 2015b; CPUC-BLM 2006; CPUC 2011). The analysis of potential Project-related impacts to federal and state-listed species was based on information obtained from applicable reports and databases, a field reconnaissance survey, and information provided by staff of the BLM and CDFW (HDR 2017c). Extensive surveys for wildlife have been conducted on the undeveloped areas of the Palo Verde Mesa (BLM 2012, 2014; BLM and Riverside County Planning Department 2015; BLM & CPUC 2006: CPUC 2011). Additionally, habitat models developed as part of the DRECP and desert tortoise suitability throughout the Mojave Desert were used to evaluate the potential for species to occur (BLM 2016b and Nussear et al. 2009).

Six wildlife species classified as threatened, endangered, or candidates by the CESA are known to be present or have at least a moderate potential to occur in the California portion of the Project area, including: California black rail (*Laterallus jamaicensis coturniculus*, threatened and fully protected), greater sandhill crane (*Grus canadensis tabida*, threatened and fully protected), Mojave Desert tortoise (threatened), razorback sucker (endangered and fully protected), Swainson's hawk (*Buteo swainsoni*, threatened), and Yuma Ridgway's rail (threatened and fully protected). Six other CESA listed species are present in the region, but are very rare or absent with marginal habitat existing within the California portion of the Project area: Arizona Bell's vireo (*Vireo bellii arizonae*, endangered), elf owl (*Micrathene whitneyi*, endangered), Gila woodpecker (*Melanerpes uropygialis*, endangered), gilded flicker (*Colaptes chrysoides*, endangered), southwestern willow flycatcher (endangered), and western yellow-billed cuckoo (endangered).

Greater sandhill crane

Direct impacts from the Project to greater sandhill crane include potential loss of individuals as a result of encounters with construction vehicles and equipment on access roads, staging areas, and work areas; ground disturbance and vegetation removal; and general disturbance due to increased human activity. Construction of the Project could result in permanent and temporary impacts to habitat for the species, thus resulting in a potential impact prior to mitigation. For the purposes of this analysis, it is assumed that a total of 14.2 miles of the proposed alignment could support greater sandhill crane and could be potentially impacted as a result of the Project's implementation (FEIS Appendix 3, Table 3.4-15). Indirect impacts could include collisions with transmission lines, alterations to existing topographical and hydrological conditions, increased erosion and sediment transport, compaction of soils, fugitive dust, increased noise levels from construction activities, and the introduction and establishment of noxious, invasive plant species. Operational impacts include mortalities from construction vehicles and equipment on access roads during routine maintenance and inspection activities, increased human presence, and the

spread of noxious, invasive plant species due to use of new or improved access roads. These impacts would be considered significant prior to mitigation under this criterion.

APMs and BMPs would be implemented to avoid impacts to and/or take of Greater sandhill crane (APM BIO-12, APM BIO-15, BMP BIO-51, and BMP BIO-55). Pre-construction surveys and monitoring would be conducted to avoid impacts by determining the location of special-status species (APM/BMP BIO-2, APM BIO-20, BMP BIO-25, and MM BIO-CEQA-3 and MM WIL-CEQA-1, MM WIL-CEQA-6, and MM WIL-CEQA-8) within the vicinity of work areas. Additionally, focused protocol survey for riparian-dependent birds (MM WIL-CEQA-6 and MM WIL-CEQA-9) and additional avoidance measures would be implemented as outlined in BMP BIO-25, and MM WIL-CEQA-1 (NBBMP).

Other measures that would be implemented to avoid impacts during and after construction include:

- Implementation of a worker environmental awareness program (APM/BMP BIO-1 and MM BIO-CEQA-2);
- Limiting activities to established work areas (APM/BMP BIO-3);
- Establishing environmentally sensitive areas (APM BIO-4);
- Establishing prohibited activities along the Project alignment (APM BIO-5 through APM BIO-8);
- Installing escape ramps (APM BIO-9);
- Erosion and dust control (APM BIO-10);
- Minimizing vegetation clearing (APM BIO-14);
- Limiting off-road vehicular travel (APM BIO-17);
- Reduce bird collisions and other protections (BMP BIO-19 through APM/BMP BIO-21, and BMP BIO-48);
- Implement a NBBMP (BMP BIO-29), manage construction lighting, water, and materials to benefit wildlife (BMP BIO-33 through BMP BIO-36);
- Promote dead and downed wood (BMP BIO-42); and
- Limit vegetation removal (BMP VEG-01 and BMP VEG-02) and implement biological resources best management practices (MM BIO-CEQA-1 and MM VEG-CEQA-1).

Compensation for temporary impacts to greater sandhill crane habitat would include habitat restoration with similar species compositions to those present prior to construction at a minimum ratio of 1.5:1 (MM VEG-CEQA-1). Restoration of conditions of the impacted areas within the Project footprint shall be at 1:1; and creation, restoration, or enhancement of similar vegetation communities offsite shall be 0.5:1, as approved by CDFW and CPUC. Alternatively, payments would be made into an appropriate mitigation program or other mitigation funding mechanism.

Permanent impacts to greater sandhill crane habitat would be compensated at a ratio of 3:1, which may be fulfilled through non-acquisition (i.e., restoration and enhancement), land acquisition (i.e., preserve), or a combination of these options, depending on the activity specifics and BLM approval/authorization. The Vegetation Management Plan (APM BIO-11 and MM VEG-CEQA-1) shall outline the planting/seeding methodologies, qualitative/quantitative monitoring requirements, success criteria, and reporting procedures. Further, the Vegetation Management Plan shall serve as the required Habitat Restoration, Mitigation, and Monitoring Plan (HRMMP) (APM/BMP BIO-15) and Noxious Weed Control Plan to address potential impacts associated with the colonization and spread of noxious weeds (APM BIO-12). Implementation of BMP BIO-19 through APM/BMP BIO-21, and BMP BIO-48 would reduce bird collisions and offer other protections for the greater sandhill crane. Additional mitigation may be required by each agency during the regulatory permitting process. Mitigation for impacts to listed species habitat shall consider and overlap with compensation for special-status plants, sensitive vegetation communities, and jurisdictional waters and wetlands.

To reduce potential impacts to the greater sandhill crane to less than significant levels, and meet CEQA requirements, the following CEQA specific mitigation measures have been developed (incorporating applicable BMPs APMs, and CMAs provided under Section 2.4.5.3): MM BIO-CEQA-1, MM BIO-CEQA-2, MM BIO-CEQA-3, MM BIO-CEQA-4, MM VEG-CEQA-1, MM WIL-CEQA-1 and MM WIL-CEQA-6. Therefore, impacts to the greater sandhill crane would be less than significant with mitigation.

Mojave Desert tortoise

Direct impacts from the Project to Mojave Desert tortoise include loss of individuals as a result of encounters with construction vehicles and equipment on access roads, staging areas, and work areas (crushed in burrows or overland areas during vegetation removal); ground disturbance and vegetation removal; and general disturbance due to increased human activity. Common ravens are known to perch and nest on transmission structures. Ravens are opportunistic predators of various wildlife species, including juvenile desert tortoises. Improving existing roads and grading new roads into remote areas can lead to increased recreational access to remote areas and increase the potential for encounters (including illegal collection) between people and tortoises. Construction of the Project could also result in permanent and temporary impacts, and thus a potential impact prior to mitigation, to habitat for the species. Indirect impacts could include alterations to existing topographical and hydrological conditions, increased erosion and sediment transport, compaction of soils, fugitive dust, increased noise levels from construction activities, increased predation from common ravens, and the introduction and establishment of noxious, invasive plant species, all of which could adversely affect the Mojave Desert tortoise. Operational impacts include mortalities from construction vehicles and equipment on access roads during routine maintenance and inspection activities, increased human presence, and the spread of noxious, invasive plant species due to use of new or improved access roads. These impacts would be considered significant prior to mitigation under this criterion.

For the purposes of this analysis, it is assumed that a total of 8.16 miles of the proposed alignment could support desert tortoises and would be impacted as a result of the proposed Project’s implementation.

APMs and BMPs would be implemented to avoid impacts to desert tortoise. The Project would be designed to avoid impacts to individuals and/or their habitats, including the desert tortoise, unless absolutely necessary (APM BIO-12, APM BIO-15, BMP BIO-51, BMP BIO-52, and BMP BIO-55). Pre-construction surveys and monitoring would be conducted to avoid impacts by determining the location of desert tortoise and other special-status species within the vicinity of work areas (APM/BMP BIO-2, APM/BMP BIO-23, APM BIO-25, MM WIL-CEQA-6). Other measures that would be implemented to avoid and minimize impacts during construction include:

- Implementation of a worker environmental awareness program (APM/BMP BIO-1 and MM BIO-CEQA-2);
- Limiting activities to established work areas (APM/BMP BIO-3);
- Establishing environmentally sensitive areas (APM BIO-4);
- Establishing prohibited activities along the Project alignment (APM BIO-5 through APM BIO-8);
- Installing escape ramps (APM BIO-9);
- Erosion and dust control (APM BIO-10);
- Minimizing vegetation clearing (APM BIO-14);
- Limiting off-road vehicular travel (APM BIO-17);
- Preparation and implementation of a Raven Management Plan (BMP BIO-28);
- Manage construction lighting, water, and materials to benefit wildlife (BMP BIO-33 through BMP BIO-36);
- Promote dead and downed wood (BMP BIO-42);
- Other desert tortoise protections (BMP BIO-44);
- Limit vegetation removal (BMP VEG-01 and BMP VEG-02); and
- Implement biological resources best management practices (MM BIO-CEQA-1).

Compensation for all impacts to desert tortoise habitat would be provided at a minimum 2:1 ratio. Compensation for impacts to desert tortoise potential/modeled habitat would include off-site creation, enhancement, and/or preservation, and/or participation in an established mitigation bank program sufficient to satisfy MM WIL-CEQA-10. The Applicant shall coordinate with CPUC, BLM, and CDFW to determine the appropriate mitigation strategy and final replacement ratios and acreages. All mitigation shall be approved by the appropriate Federal and State regulatory agencies prior to Project activities. The Vegetation Management Plan (APM BIO-11 and MM VEG-CEQA-1) shall outline the planting/seeding methodologies, qualitative/quantitative monitoring requirements, success criteria, and reporting procedures. Further, the Vegetation Management Plan shall serve as the HRMMP (APM/BMP BIO-15, MM BIO-CEQA-4) and Noxious Weed Control Plan to address potential impacts associated with the

colonization and spread of noxious weeds (APM BIO-12). Additional mitigation may be required by each agency during the regulatory permitting process. Mitigation for impacts to listed species habitat shall consider and overlap with compensation for special-status plants, sensitive vegetation communities, and jurisdictional waters and wetlands.

To ensure that the applicable BMPs, APMs, and CMAs as outlined in Section 2.4.5.3 meet CEQA requirements, and they reduce impacts to less than significant for the Mojave Desert tortoise, the following MMs have been developed (MM BIO-CEQA-1, MM BIO-CEQA-2, MM BIO-CEQA-3, MM BIO-CEQA-4, MM WIL-CEQA-2, and MM WIL-CEQA-10). Therefore, impacts to the Mojave Desert tortoise would be less than significant with mitigation.

Razorback sucker

This species has been documented within the mainstem of the Colorado River and nearby backwaters in and near the Project area. The Project would span potential aquatic habitat (and USFWS-designated critical habitat) for this species. The Project-related impacts to razorback sucker would be limited to indirect impacts associated with construction activities, such as the accumulation of trash. For the purposes of this analysis, it is assumed that a total of 2.5 acres of the proposed alignment could support razorback sucker and would be avoided during the Project's implementation. These impacts would not be considered significant.

Regardless, APMs and BMPs would be implemented to avoid impacts to razorback sucker including design considerations to span habitat (APM BIO-12, APM BIO-15, BMP BIO-19, BMP BIO-51, and BMP BIO-55). Other measures that would be implemented to avoid impacts during construction include;

- Implementation of a worker environmental awareness program (APM/BMP BIO-1 and MM BIO-CEQA-2);
- Limiting activities to established work areas (APM/BMP BIO-3);
- Establishing environmentally sensitive areas (APM BIO-4);
- Establishing prohibited activities along the Project alignment (APM BIO-5 through APM BIO-8);
- Erosion and dust control (APM BIO-10);
- Riparian habitat avoidance (APM BIO-13);
- Ensuring riparian functioning conditions (BMP BIO-47 and BMP BIO-50);
- Conduct biological construction monitoring (MM BIO-CEQA-3);
- Implement biological resources best management practices (MM BIO-CEQA-1); and
- Avoid/compensate for impacts to jurisdictional waters/wetlands (MM BIO-CEQA-4).

Additional mitigation may be required by each agency during the regulatory permitting process. Mitigation for impacts to listed species habitat shall consider and overlap with compensation for special-status plants, sensitive vegetation communities, and jurisdictional waters and wetlands.

Although mitigation is not required to reduce direct impacts to the razorback sucker because its habitat is being avoided, to meet CEQA requirements, the applicable BMPs, APMs, and CMAs (identified separately under Section 2.4.5.3 below) have been incorporated into MM BIO-CEQA-1, MM BIO-CEQA-2, MM BIO-CEQA-3, and MM BIO-CEQA-4 to ensure there are no indirect impacts to the razorback sucker.

Southwestern willow flycatcher

Southwestern willow flycatchers have been documented along the lower Colorado River within dense stands of willow or salt cedar are adjacent to water or saturated soil. However, this species is not expected to nest within or near the Project area due to the lack of suitable habitat. The proposed Project alignment is characterized by short, patchy overstory of nonnative salt cedar and little or no understory. The species could utilize the Colorado River during migration or other movements along the river. Therefore, the Project-related impacts to southwestern willow flycatcher, if present, would be limited to loss of individuals as a result of collisions with transmission lines and loss of foraging habitat. Due to the temporary nature of the impacts and the availability of foraging habitat in adjacent areas the loss of foraging habitat for wildlife resulting from the construction of the Project would be considered less than significant.

Implementation of BMP BIO-19 through APM/BMP BIO-21, and BMP BIO-48 would reduce bird collisions and offer other protections for the southwestern willow flycatcher. Additional mitigation may be required by each agency during the regulatory permitting process. Mitigation for impacts to listed species habitat shall consider and overlap with compensation for special-status plants, sensitive vegetation communities, and jurisdictional waters and wetlands.

Additionally, APMs and BMPs would be implemented to avoid and minimize impacts to southwestern willow flycatcher during construction including:

- Implementation of a worker environmental awareness program (APM/BMP BIO-1 and MM BIO-CEQA-2);
- Limiting activities to established work areas (APM/BMP BIO-3);
- Establishing environmentally sensitive areas (APM BIO-4);
- Establishing prohibited activities along the Project alignment (APM BIO-5 through APM BIO-8);
- Erosion and dust control (APM BIO-10);
- Minimizing vegetation clearing (APM BIO-14);
- Limiting off-road vehicular travel (APM BIO-17);
- Implement a NBBMP (BMP BIO-29);

- Manage construction lighting, water, and materials to benefit wildlife (BMP BIO-33 through BMP BIO-36);
- Promote dead and downed wood (BMP BIO-42);
- Limit vegetation removal (BMP VEG-01 and BMP VEG-02); and
- Implement biological resources best management practices (MM BIO-CEQA-1).

Pre-construction surveys and monitoring would be conducted to avoid impacts by determining the location of special-status species (APM/BMP BIO-2, APM BIO-20, BMP BIO-25, MM BIO-CEQA-3, and MM WIL-CEQA-6) within the vicinity of work areas. Additional avoidance measures would be implemented as outlined in the BBCS, which includes the NBBMP (MM WIL-CEQA-1). The Vegetation Management Plan (APM BIO-11) and the HRMMP (APM/BMP BIO-15 and MM VEG-CEQA-1) would outline the planting/seeding methodologies, qualitative/quantitative monitoring requirements, success criteria, and reporting procedures. Further, a Vegetation Management Plan that addresses control of noxious weeds shall be prepared and implemented to address potential impacts associated with the colonization and spread of noxious weeds (APM BIO-12 and MM VEG-CEQA-1).

To ensure that the applicable BMPs, APMs, and CMAs as outlined in Section 2.4.5.3 meet CEQA requirements, and they reduce impacts to less than significant for the southwestern willow flycatcher, the following MMs have been developed (MM BIO-CEQA-1, MM BIO-CEQA-3, MM WIL-CEQA-1, and MM WIL-CEQA-6). Therefore, impacts to the southwestern willow flycatcher would be less than significant with mitigation.

Swainson’s hawk

Swainson’s hawks were observed 1 to 10 miles northwest of the Blythe airport during surveys for a proposed solar plant (BLM 2012, Appendix C). However, this species is not expected to nest within or near the Project area. The Project-related impacts to Swainson’s hawk, if present, would be limited to loss of individuals as a result of collisions with transmission lines and loss of foraging habitat. Due to the temporary nature of the impacts and the availability of foraging habitat in adjacent areas the loss of foraging habitat for wildlife resulting from the construction of the Project would be considered less than significant.

Implementation of BMP BIO-19 through APM/BMP BIO-21, and BMP BIO-48 would reduce bird collisions and offer other protections for the Swainson’s hawk. Additional mitigation may be required by each agency during the regulatory permitting process. Mitigation for impacts to listed species habitat shall consider and overlap with compensation for special-status plants, sensitive vegetation communities, and jurisdictional waters and wetlands.

Additionally, APMs and BMPs would be implemented to avoid and minimize impacts to Swainson’s hawk during construction including:

- Implementation of a worker environmental awareness program (APM/BMP BIO-1 and MM BIO-CEQA-2);
- Limiting activities to established work areas (APM/BMP BIO-3);

- Establishing environmentally sensitive areas (APM BIO-4);
- Establishing prohibited activities along the Project alignment (APM BIO-5 through APM BIO-8);
- Erosion and dust control (APM BIO-10);
- Minimizing vegetation clearing (APM BIO-14),
- Limiting off-road vehicular travel (APM BIO-17);
- Reduce bird collisions and other protections (BMP BIO-19 through APM/BMP BIO-21, and BMP BIO-48),
- Implement a NBBMP (BMP BIO-29),
- Manage construction lighting, water, and materials to benefit wildlife (BMP BIO-33 through BMP BIO-36);
- Promote dead and downed wood (BMP BIO-42);
- Limit vegetation removal (BMP VEG-01 and BMP VEG-02), and
- Implement biological resources best management practices (MM BIO-CEQA-1).

Pre-construction surveys and monitoring would be conducted to avoid impacts by determining the location of special-status species (APM/BMP BIO-2, APM BIO-20, BMP BIO-25, MM BIO-CEQA-3, and MM WIL-CEQA-6) within the vicinity of work areas. Additional avoidance measures would be implemented as outlined in BBCS which includes the NBBMP (MM WIL-CEQA-1). The Vegetation Management Plan (APM BIO-11 and MM VEG-CEQA-1) shall outline the planting/seeding methodologies, qualitative/quantitative monitoring requirements, success criteria, and reporting procedures. Further, the Vegetation Management Plan shall serve as the HRMMP (APM/BMP BIO-15) and Noxious Weed Control Plan to address potential impacts associated with the colonization and spread of noxious weeds (APM BIO-12). Additional mitigation may be required by each agency during the regulatory permitting process. Mitigation for impacts to listed species habitat shall consider and overlap with compensation for special-status plants, sensitive vegetation communities, and jurisdictional waters and wetlands.

Although mitigation is not required to reduce direct impacts to the Swainson’s hawk to less than significant because of the temporary nature of the impacts and the availability of foraging habitat in adjacent areas, to ensure that the applicable BMPs, APMs, and CMAs as outlined in Section 2.4.5.3 meet CEQA requirements, the following MMs have been developed: MM BIO-CEQA-1, MM BIO-CEQA-3, MM WIL-CEQA-1, and MM WIL-CEQA-6.

Western yellow-billed cuckoo

Western yellow-billed cuckoo have been documented along the Colorado River within relatively large patches of riparian woodlands (generally greater than 50 acres) that typically have a well-developed riparian overstory canopy. The Project would span USFWS-designated critical habitat for the species. However, this species is not expected to nest within or near the Project area due

to the lack of suitable habitat. The proposed Project alignment is characterized by short, patchy overstory of nonnative salt cedar and little or no understory. The species could utilize the Colorado River during migration or other movements along the river. Therefore, the Project-related impacts to western yellow-billed cuckoo, if present, would be limited to loss of individuals as a result of collisions with transmission lines and loss of foraging habitat. Due to the temporary nature of the impacts and the availability of foraging habitat in adjacent areas the loss of foraging habitat for wildlife resulting from the construction of the Project would be considered less than significant.

Implementation of BMP BIO-19 through APM/BMP BIO-21, and BMP BIO-48 would reduce bird collisions and offer other protections for the western yellow-billed cuckoo. Additional mitigation may be required by each agency during the regulatory permitting process. Mitigation for impacts to listed species habitat shall consider and overlap with compensation for special-status plants, sensitive vegetation communities, and jurisdictional waters and wetlands.

Additionally, APMs and BMPs would be implemented to avoid and minimize impacts to western yellow-billed cuckoo during construction including;

- Implementation of a worker environmental awareness program (APM/BMP BIO-1 and MM BIO-CEQA-2);
- Limiting activities to established work areas (APM/BMP BIO-3);
- Establishing environmentally sensitive areas (APM BIO-4);
- Establishing prohibited activities along the Project alignment (APM BIO-5 through APM BIO-8);
- Erosion and dust control (APM BIO-10);
- Minimizing vegetation clearing (APM BIO-14);
- Limiting off-road vehicular travel (APM BIO-17);
- Implement a NBBMP (BMP BIO-29);
- Manage construction lighting, water, and materials to benefit wildlife (BMP BIO-33 through BMP BIO-36);
- Promote dead and downed wood (BMP BIO-42);
- Limit vegetation removal (BMP VEG-01 and BMP VEG-02); and
- Implement biological resources best management practices (MM BIO-CEQA-1).

Pre-construction surveys and monitoring would be conducted to avoid impacts by determining the location of special-status species (APM/BMP BIO-2, APM BIO-20, BMP BIO-25, MM BIO-CEQA-3, and MM WIL-CEQA-6) within the vicinity of work areas. Additional avoidance measures would be implemented as outlined in the BBCS which includes the NBBMP (MM WIL-CEQA-1). The Vegetation Management Plan (APM BIO-11) and the HRMMP (APM/BMP

BIO-15 and MM VEG-CEQA-1) would outline the planting/seeding methodologies, qualitative/quantitative monitoring requirements, success criteria, and reporting procedures. Further, a Vegetation Management Plan that addresses control of noxious weeds shall be prepared and implemented to address potential impacts associated with the colonization and spread of noxious weeds (APM BIO-12 and MM VEG-CEQA-1).

To ensure that the applicable BMPs, APMs, and CMAs as outlined in Section 2.4.5.3 meet CEQA requirements, and they reduce impacts to less than significant for the western yellow-billed cuckoo, the following MMs have been developed (MM BIO-CEQA-1, MM BIO-CEQA-3, MM WIL-CEQA-1, and MM WIL-CEQA-6). Therefore, impacts to the western yellow-billed cuckoo would be less than significant with mitigation.

California Black Rail and Yuma Ridgway's rail

Direct impacts from the Project to California black rail and Yuma Ridgway's rail include loss of individuals as a result of encounters with construction vehicles and equipment on access roads, staging areas, and work areas; ground disturbance and vegetation removal; and general disturbance due to increased human activity. Construction of the Project could result in permanent and temporary impacts to habitat for the species.

For the purposes of this analysis, it is assumed that a total of 1.2 miles of the proposed alignment could support California black rail and Yuma Ridgway's rail and could be potentially impacted as a result of the Project's implementation (FEIS Appendix 3, Table 3.4-15). Indirect impacts could include alterations to existing topographical and hydrological conditions, increased erosion and sediment transport, compaction of soils, fugitive dust, increased noise levels from construction activities, and the introduction and establishment of noxious, invasive plant species. Operational impacts include mortalities from construction vehicles and equipment on access roads during routine maintenance and inspection activities, increased human presence, and the spread of noxious, invasive plant species due to use of new or improved access roads. These impacts would be considered significant without mitigation.

APMs and BMPs would be implemented to avoid impacts to and/or take of California black rail and Yuma Ridgway's rail. The Project would be designed to avoid impacts to individuals and/or their habitats (APM BIO-12, APM BIO-15, BMP BIO-51, and BMP BIO-55). Pre-construction surveys and monitoring would be conducted to avoid impacts by determining the location of special-status species (APM/BMP BIO-2, APM BIO-20, BMP BIO-25, MM BIO-CEQA-3, MM WIL-CEQA-1, and MM WIL-CEQA-6) within the vicinity of work areas. Additionally, focused protocol survey for riparian-dependent birds (MM WIL-CEQA-1 and MM WIL-CEQA-6) and additional avoidance measures would be implemented as outlined in BMP BIO-25 and MM WIL-CEQA-1 (BBCS/NBBMP). Other measures that would be implemented to avoid impacts during construction include:

- Implementation of a worker environmental awareness program (APM/BMP BIO-1 and MM BIO-CEQA-2);
- Limiting activities to established work areas (APM/BMP BIO-3);
- Establishing environmentally sensitive areas (APM BIO-4);

- Establishing prohibited activities along the Project alignment (APM BIO-5 through APM BIO-8);
- Installing escape ramps (APM BIO-9);
- Erosion and dust control (APM BIO-10);
- Minimizing vegetation clearing (APM BIO-14);
- Limiting off-road vehicular travel (APM BIO-17);
- Reduce bird collisions and other protections (BMP BIO-19 through APM/BMP BIO-21, and BMP BIO-48);
- Implement a NBBMP (BMP BIO-29);
- Manage construction lighting, water, and materials to benefit wildlife (BMP BIO-33 through BMP BIO-36);
- Promote dead and downed wood (BMP BIO-42);
- Limit vegetation removal (BMP VEG-1 and BMP VEG-2); and
- Implement biological resources best management practices (MM BIO-CEQA-1).

Compensation for temporary impacts to potential habitat would include on-site habitat creation or enhancement with similar species compositions to those present prior to construction at a ratio of 1.5:1. Restoration of conditions of the impacted areas within the Project footprint shall be at 1:1; and creation, restoration, or enhancement of similar vegetation communities offsite shall be 0.5:1, as approved by CDFW and CPUC. Alternatively, payments would be made into an appropriate mitigation program or other mitigation funding mechanism. Compensation for permanent impacts to habitat would include a) off-site creation, enhancement, and/or preservation, and/or b) participation in an established mitigation bank program at a minimum 3:1 ratio. The Vegetation Management Plan (APM BIO-11 and MM VEG-CEQA-1) shall outline the planting/seeding methodologies, qualitative/quantitative monitoring requirements, success criteria, and reporting procedures. Further, the Vegetation Management Plan shall serve as the HRMMP (APM/BMP BIO-15) and Noxious Weed Control Plan to address potential impacts associated with the colonization and spread of noxious weeds (APM BIO-12). Additional mitigation may be required by each agency during the regulatory permitting process. Mitigation for impacts to listed species habitat shall consider and overlap with compensation for special-status plants, sensitive vegetation communities, and jurisdictional waters and wetlands.

To ensure that the applicable BMPs, APMs, and CMAs as outlined in Section 2.4.5.3 meet CEQA requirements, and reduce potential impacts to the California black rail and Yuma Ridgeway’s rail to less than significant levels, the following MMs have been developed: MM BIO-CEQA-1, MM BIO-CEQA-2, MM BIO-CEQA-3, MM WIL-CEQA-1, MM WIL-CEQA-6, MM VEG-CEQA-1, and MM VEG-CEQA-4. Therefore, impacts to the California black rail and Yuma Ridgeway’s rail would be less than significant with mitigation.

Other Special-Status Wildlife Species

Similar to the Federal and state-listed species, the analysis of potential Project-related impacts to other special-status wildlife species (including, but not limited to, BLM Sensitive Species, CDFW Special Animals, and CDFW Species of Special Concern) was based on information obtained from applicable reports and databases, a field reconnaissance survey, extensive surveys, and information provided by staff of the BLM and CDFW (HDR 2017c, BLM 2012, 2014; BLM and Riverside County Planning Department 2015; BLM & CPUC 2006: CPUC 2011). Additionally, habitat models developed as part of the DRECP were used to evaluate the potential for species to occur (BLM 2016b). Another 32 special-status wildlife species (California Species of Special Concern, California Fully Protected, or BLM Sensitive) are present or could occur within the California portion of the Project area. A total of 14 special-status wildlife species are present or have at least a moderate potential to occur, including: American badger (*Taxidea taxus*), burrowing owl (*Athene cunicularia*), Couch's spadefoot (*Scaphiopus couchii*), Le Conte's thrasher (*Toxostoma lecontei*), loggerhead shrike (*Lanius ludovicianus*), Mojave fringe toed lizard (*Uma scoparia*), mountain plover (*Charadrius montanus*), northern harrier (*Circus cyaneus*), Townsend's big-eared bat (*Corynorhinus townsendii*), vermilion flycatcher (*Pyrocephalus rubinus*), western yellow bat (*Lasiurus xanthinus*), yellow-headed blackbird (*Xanthocephalus xanthocephalus*), and Yuma myotis (*Myotis yumanensis*). Other special-status wildlife species that are not expected or have a low potential to occur include Arizona myotis (*Myotis occultus*), Bendire's thrasher (*Toxostoma bendirei*), California leaf-nosed bat (*Macrotus californicus*), cave myotis (*Myotis velifer*), Colorado River cotton rat (*Sigmodon arizonae plenus*), crissal thrasher (*Toxostoma crissale*), desert bighorn sheep (*Ovis canadensis nelsoni*), golden eagle (*Aquila chrysa*etos), long-eared owl (*Asio otus*), pallid bat (*Antrozous pallidus*), pocketed free-tailed bat (*Nyctinomops femorosaccus*), short-eared owl (*Asio flammeus*), Sonoran mud turtle (*Kinosternon sonoriense*), Sonoran pronghorn (*Antilocapra americana sonoriensis*), Sonora yellow warbler (*Setophaga petechia sonorana*), summer tanager (*Piranga rubra*), yellow-breasted chat (*Icteria virens*), and Yuma mountain lion (*Felis concolor brownii*). These species will not be analyzed further. Refer to FEIS Appendix 3 Table 3.4-14 for a complete list of these species.

Amphibians and Reptiles

Direct impacts to Couch's spadefoot toad and Mojave fringe-toed lizard could include loss of individuals as a result of encounters with construction vehicles and equipment on access roads, staging areas, and work areas (crushed in burrows or overland areas during vegetation removal); ground disturbance and vegetation removal within modeled habitat; and general disturbance due to increased human activity. Construction of the Project could also result in permanent and temporary impacts to habitat for the species. For the purposes of this analysis, it is assumed that a total of 16.7 miles of the proposed alignment could support Couch's spadefoot toad and 8.1 miles of sand dune and partially stabilized sand dune habitat (as identified in the DRECP and other renewable projects in the vicinity) could support Mojave fringe-toed lizard and could be potentially impacted as a result of the Project's implementation (FEIS Appendix 3, Table 3.4-15). Indirect impacts could include alterations to existing topographical and hydrological conditions, increased erosion and sediment transport, disruption of geomorphic processes (e.g., sand transportation), compaction of soils, fugitive dust, increased noise levels from construction activities, and the introduction and establishment of noxious, invasive plant species. Operational

impacts include mortalities from construction vehicles and equipment on access roads during routine maintenance and inspection activities, increased human presence, and the spread of noxious, invasive plant species due to use of new or improved access roads. These impacts would be considered significant without mitigation.

APMs and BMPs would be implemented to avoid impacts to Couch's spadefoot toad and Mojave fringe-toed lizard. The Project would be designed to avoid impacts to individuals and/or their habitats unless absolutely necessary (APM BIO-12, APM BIO-15, BMP BIO-51, BMP BIO-52, and BIO BIO-55). Pre-construction surveys and monitoring would be conducted to avoid impacts by determining the location of special-status species within the vicinity of work areas (APM/BMP BIO-2, APM BIO-25, MM WIL-CEQA-11, and MM BIO-CEQA-3). Other measures that would be implemented to avoid and minimize impacts during construction include:

- Implementation of a worker environmental awareness program (APM/BMP BIO-1 and MM BIO-CEQA-2);
- Limiting activities to established work areas (APM/BMP BIO-3);
- Establishing environmentally sensitive areas (APM BIO-4);
- Establishing prohibited activities along the Project alignment (APM BIO-5 through APM BIO-8);
- Installing escape ramps (APM BIO-9);
- Erosion and dust control (APM BIO-10);
- Minimizing vegetation clearing (APM BIO-14);
- Limiting off-road vehicular travel (APM BIO-17);
- Manage construction lighting, water, and materials to benefit wildlife (BMP BIO-33 through BMP BIO-36);
- Promote dead and downed wood (BMP BIO-42);
- Limit vegetation removal (BMP VEG-01 and BMP VEG-02); and
- Implement biological resources best management practices (MM BIO-CEQA-1).

Other measures to address potential indirect impacts specifically for the Mojave fringe-toed lizard and associated with alterations to existing topographical and hydrological conditions, increased erosion and sediment transport, disruption of sand transportation, and compaction of soils include: preparing and implementing a Fringe-toed Lizard Linear ROW Protection Plan (BMP BIO-49), protecting dune vegetation and sand transport processes (BMP BIO-53 and BMP BIO-54), and replacement of habitat lost (MM WIL-CEQA-9).

Compensation for temporary impacts to potential/modeled Couch's spadefoot toad and Mojave fringe-toed lizard habitat would include habitat restoration or enhancement with similar species compositions to those present prior to construction at a minimum ratio of 1.5:1 (MM WIL-

CEQA-9). Restoration of conditions of the impacted areas within the Project footprint shall be at 1:1; and creation, restoration, or enhancement of similar vegetation communities offsite shall be 0.5:1, as approved by CDFW and CPUC. Alternatively, payments would be made into an appropriate mitigation program or other mitigation funding mechanism. Compensation for permanent impacts to potential/modeled habitat would include a) off-site creation, enhancement, and/or preservation, and/or b) participation in an established mitigation bank program at a minimum 3:1 ratio (MM WIL-CEQA-9). The Applicant shall coordinate with CPUC, BLM, and CDFW to determine the appropriate mitigation strategy and final replacement ratios and acreages. All mitigation shall be approved by the appropriate Federal and State regulatory agencies prior to Project activities. The Vegetation Management Plan (APM BIO-11 and MM VEG-CEQA-1) shall outline the planting/seeding methodologies, qualitative/quantitative monitoring requirements, success criteria, and reporting procedures. Further, the Vegetation Management Plan shall serve at the HRMMP (APM/BMP BIO-15) and Noxious Weed Control Plan to address potential impacts associated with the colonization and spread of noxious weeds (APM BIO-12). Additional mitigation may be required by each agency during the regulatory permitting process. Mitigation for impacts to listed species habitat shall consider and overlap with compensation for special-status plants, sensitive vegetation communities, and jurisdictional waters and wetlands. Implementation of the above-referenced APMs, BMPs, and CEQA MMs would reduce impacts on special-status amphibians and reptiles to less than significant levels.

Birds

Direct impacts to burrowing owl, Le Conte’s thrasher, loggerhead shrike, mountain plover, northern harrier, vermilion flycatcher, and yellow-headed blackbird include loss of individuals as a result of collisions with construction vehicles and equipment on access roads, staging areas, and work areas; ground disturbance and vegetation removal; and general disturbance due to increased human activity. Construction of the Project could also result in permanent and temporary impacts to habitat for these species. For the purposes of this analysis, it is assumed that a total of 149.2 acres of natural habitat that could support these species would be potentially impacted as a result of the Project’s implementation. Indirect impacts to these special-status birds could include collisions with transmission lines, increased noise levels from heavy equipment, human disturbance, exposure to fugitive dust, the spread of noxious weeds, and disruption of breeding or foraging activity due to routine inspection and maintenance activities. Weed abatement through herbicide application or mechanized tools could also affect bird nesting.

Construction during the breeding season could result in the displacement of breeding birds and the abandonment of active nests. The increased noise levels resulting from the construction of the Project would likely temporarily alter and/or preclude the breeding activities for many common and sensitive bird species known to occur along the Project route. Some species of birds however will likely nest in and adjacent to the Project during construction and maintenance activities. Depending on the species, birds may actively nest on the ground close to equipment or even on idle construction equipment. In other arid ecosystems in southern California, birds have been documented nesting on vehicles, foundations, construction trailers, and other equipment left overnight or during a long weekend. In areas where construction may be phased birds may quickly utilize these features as nest sites. Many of the birds that would be likely to use these types of nesting substrates are common species such as ravens, house finches, and doves (CPUC 2016).

When possible, construction and maintenance activities would occur outside of the recognized breeding season (generally February – September [as early as January for some raptors]). However, if construction activities would occur during the breeding season, it is possible that these activities would exclude some species of birds that are less tolerant of anthropogenic disturbance. If birds elect to nest in areas within close proximity to on-going construction activities during the breeding season the qualified avian biologist (refer to MM WIL-CEQA-1 and MM WIL-CEQA-6 [Conduct pre-construction surveys for nesting and breeding birds and implement avoidance measures] below) will implement a standard avoidance buffer (300 feet [500 feet for raptors]) around the nest and no activities will be allowed within the buffer(s) until the young have fledged from the nest or the nest fails. The prescribed buffers may be adjusted by the qualified avian biologist based on existing conditions around the nest, planned construction activities, tolerance of the species, and other pertinent factors. With the exception of a few non-native birds such as European starling (*Sturnus vulgaris*) and house sparrow (*Passer domesticus*), the loss of active bird nests or young is regulated by the Federal MBTA and California Fish and Game Code Section 3503 and would be considered a significant impact without mitigation.

Unless the Fish and Game Code or its implementing regulations provide otherwise, under California law it is unlawful to:

- Take a bird, mammal, fish, reptile, or amphibian (Fish and Game Code § 2000);
- Take, possess, or needlessly destroy the nest or eggs of any bird (Fish and Game Code § 3503);
- Take, possess, or destroy any bird of prey in the orders Strigiformes (owls) and Falconiformes (such as falcons, hawks and eagles) or the nests or eggs of such bird (Fish and Game Code § 3503.5);
- Take or possess any of the thirteen fully protected bird species listed in Fish and Game Code section 3511;
- Take any non-game bird (i.e., bird that is naturally occurring in California that is not a gamebird, migratory game bird, or fully protected bird) (Fish and Game Code § 3800);
- Take or possess any migratory non-game bird as designated in the MBTA2 or any part of such bird, except as provided by rules or regulations adopted by the Secretary of the Interior under the MBTA (Fish and Game Code § 3513);

Take, import, export, possess, purchase, or sell any bird (or products of a bird), listed as an endangered or threatened species under the California Endangered Species Act unless the person or entity possesses an Incidental Take Permit or equivalent authorization from CDFW (Fish and Game Code § 2050 et seq.).

APMs and BMPs would be implemented to avoid impacts to special-status bird species. The Project would be designed to avoid impacts to individuals and/or their habitats, unless absolutely necessary (APM BIO-12, APM BIO-15, BMP BIO-51, and MM BIO-CEQA-4, MM WIL-CEQA-1, and MM WIL-CEQA-6). In particular, APM BIO-13 requires that riparian areas and

xeroriparian drainages that occur within the easement would be denoted as environmentally sensitive areas and would be avoided during construction to the extent practicable. This would avoid and/or minimize impacts to riparian-dependent species. Pre-construction surveys and monitoring would be conducted to avoid impacts by determining the location of special-status species (APM/BMP BIO-2, APM BIO-20, BMP BIO-25, and MM BIO-CEQA-3 and MM WIL-CEQA-6) within the vicinity of work areas. Additionally, focused protocol survey for riparian-dependent birds (MM WIL-CEQA-6 and MM WIL-CEQA-8) and additional avoidance measures would be implemented as outlined in BMP BIO-25, MM WIL-CEQA-1, and MM WIL-CEQA-1 (BBCS/NBBMP). Other measures that would be implemented to avoid and minimize impacts during construction include:

- Implementation of a worker environmental awareness program (APM/BMP BIO-1 and MM BIO-CEQA-2);
- Limiting activities to established work areas (APM/BMP BIO-3);
- Establishing environmentally sensitive areas (APM BIO-4);
- Establishing prohibited activities along the Project alignment (APM BIO-5 through APM BIO-8);
- Installing escape ramps (APM BIO-9), erosion and dust control (APM BIO-10);
- Minimizing vegetation clearing (APM BIO-14);
- Limiting off-road vehicular travel (APM BIO-17);
- Implement a BBCS/NBBMP (BMP BIO-29);
- Prepare and implement a management plan for burrowing owls (BMP BIO-30);
- Manage construction lighting, water, and materials to benefit wildlife (BMP BIO-33 through BMP BIO-36);
- Promote dead and downed wood (BMP BIO-42);
- Protect active golden eagle nests (BMP BIO-45);
- Limit vegetation removal (BMP VEG-1 and BMP VEG-2); and
- Implement biological resources best management practices (MM BIO-CEQA-1).

Additionally, implementation of BMP BIO-19 through APM/BMP BIO-21, and BMP BIO-48 would reduce indirect impacts associated with bird collisions and offer other protections for the special-status birds.

Compensation for temporary impacts to special-status bird habitat will include on-site habitat restoration with similar species compositions to those present prior to construction at a minimum ratio of 1.5:1. Restoration of conditions of the impacted areas within the Project footprint shall be at 1:1; and creation, restoration, or enhancement of similar vegetation communities offsite

shall be 0.5:1, as approved by CDFW and CPUC. Alternatively, payments would be made into an appropriate mitigation program or other mitigation funding mechanism. Permanent impacts to special-status bird habitat would be compensated at a minimum ratio of 2:1, which may be fulfilled through non-acquisition (i.e., restoration and enhancement), land acquisition (i.e., preserve), or a combination of these options, depending on the activity specifics and BLM approval/authorization (MM BIO-CEQA-4 and MM WIL-CEQA-1). The Vegetation Management Plan (APM BIO-11 and MM VEG-CEQA-1) shall outline the planting/seeding methodologies, qualitative/quantitative monitoring requirements, success criteria, and reporting procedures. Further, the Vegetation Management Plan shall serve as the HRMMP (APM/BMP BIO-15) and Noxious Weed Control Plan to address potential impacts associated with the colonization and spread of noxious weeds (APM BIO-12). Additional mitigation may be required by each agency during the regulatory permitting process. Mitigation for impacts to listed species habitat shall consider and overlap with compensation for special-status plants, sensitive vegetation communities, and jurisdictional waters and wetlands. Implementation of the above-referenced APMs, BMPs, and CEQA MMs would reduce impacts on avian species to less than significant levels.

Mammals

Direct impacts to American badger, Townsend's big-eared bat, western yellow bat, and Yuma myotis include loss of individuals as a result of encounters with construction vehicles and equipment on access roads, staging areas, and work areas; ground disturbance and/or vegetation removal; and general disturbance due to increased human activity. Construction of the Project could also result in permanent and temporary impacts to foraging habitat for these species. For the purposes of this analysis, it is assumed that a total of 16.7 miles of the proposed alignment could support American badger, and 8.1 miles could support Townsend's big-eared bat, western yellow bat, and Yuma myotis (FEIS Appendix 3, Table 3.4-15). These portions of the alignment could be potentially impacted as a result of the Project's implementation. Indirect impacts could include alterations to existing topographical and hydrological conditions, increased erosion and sediment transport, compaction of soils, fugitive dust, increased noise levels from construction activities, and the introduction and establishment of noxious, invasive plant species. Operational impacts include mortalities from construction vehicles and equipment on access roads during routine maintenance and inspection activities, increased human presence, and the spread of noxious, invasive plant species due to use of new or improved access roads. These impacts would be considered significant without mitigation.

APMs and BMPs would be implemented to avoid impacts to special-status mammals. The Project would be designed to avoid impacts to special-status species and/or their habitats unless absolutely necessary (APM BIO-13, APM BIO-15, BMP BIO-40, BMP BIO-51, BMP BIO-52, and BMP BIO-55); the majority of Project-related impacts would occur within agricultural areas that provide limited suitable habitat (breeding/nesting/denning) for most special-status species. In particular, BMP BIO-40 would require a 500-foot buffer around any occupied maternity roost or presumed occupied maternity roost. Additionally, APM BIO-13 requires that riparian areas and xeroriparian drainages that occur within the easement would be denoted as environmentally sensitive areas and would be avoided during construction to the extent practicable. A pre-construction survey and monitoring for special-status mammal species would be implemented as outlined in APM BIO-02 and BMP BIO-25. Pre-construction surveys for roosting bats would be

conducted during the maternity season (1 March to 31 July) within 300 feet of the Project's activities and active maternity roosts or hibernacula would be avoided (MM WIL-CEQA-4 and MM WIL-CEQA-5). If avoidance is not possible, then the species would be safely evicted per MM WIL-CEQA-4 and MM WIL-CEQA-5. Other measures that would be implemented to avoid and minimize impacts during construction include:

- Implementation of a worker environmental awareness program (APM/BMP BIO-1 and MM BIO-CEQA-2);
- Limiting activities to established work areas (APM/BMP BIO-3);
- Establishing environmentally sensitive areas (APM BIO-4);
- Establishing prohibited activities along the Project alignment (APM BIO-5 through APM BIO-8);
- Installing escape ramps (APM BIO-9);
- Erosion and dust control (APM BIO-10);
- Minimizing vegetation clearing (APM BIO-14);
- Limiting off-road vehicular travel (APM BIO-17);
- Manage construction lighting, water, and materials to benefit wildlife (BMP BIO-33 through BMP BIO-36);
- Promote dead and downed wood (BMP BIO-42);
- Limit vegetation removal (BMP VEG-01 and BMP VEG-02); and
- Implement biological resources best management practices (MM BIO-CEQA-1).

Compensation for temporary impacts to special-status mammal species habitat would include on-site habitat restoration with similar species compositions to those present prior to construction at a minimum ratio of 1.5:1 (MM VEG-CEQA-1). Restoration of conditions of the impacted areas within the Project footprint shall be at 1:1; and creation, restoration, or enhancement of similar vegetation communities offsite shall be 0.5:1, as approved by CDFW and CPUC. Alternatively, payments would be made into an appropriate mitigation program or other mitigation funding mechanism. Permanent impacts to special-status mammal species habitat would be compensated at a minimum ratio of 2:1, which may be fulfilled through non-acquisition (i.e., restoration and enhancement), land acquisition (i.e., preserve), or a combination of these options, depending on the activity specifics and BLM approval/authorization (MM BIO-CEQA-4). The Vegetation Management Plan (APM BIO-11 and MM VEG-CEQA-1) shall outline the planting/seeding methodologies, qualitative/quantitative monitoring requirements, success criteria, and reporting procedures. Further, the Vegetation Management Plan shall serve as the HRMMP (APM/BMP BIO-15) and Noxious Weed Control Plan to address potential impacts associated with the colonization and spread of noxious weeds (APM BIO-12). Additional mitigation may be required by each agency during the regulatory permitting process. Mitigation for impacts to

listed species habitat shall consider and overlap with compensation for special-status plants, sensitive vegetation communities, and jurisdictional waters and wetlands. Implementation of the above-referenced APMs, BMPs, and CEQA MMs would reduce impacts on special-status mammal species to less than significant levels.

2.4.5.3 Compliance with CDCA CMAs Applicable to Special-Status Plants and Wildlife

The following CMAs would be applicable to special-status plants and wildlife, and would be addressed by the noted Project APMs, BMPs, and MMs.

CMA DFA-BIO-IFS-1 and CMA DFA-BIO-IFS-2 are specific to survey and setback requirements for a discrete list of wildlife species (i.e., desert tortoise). Compliance with these CMAs would be satisfied with implementation of APM-BIO-2 and MM BIO-CEQA-1 and MM WIL-CEQA-10 which require pre-construction surveys prior to the start of Project activities and setback buffers for specific listed and/or special-status species, APM BIO-23 and BMP-23 which require protection measures specific to desert tortoise, APM BIO-20 and MMs WIL-CEQA-1 and WIL-CEQA-6 which require protection for nesting birds during construction and the development of a NBBMP. Compliance would also be met with BMP BIO-30 and MM WIL-CEQA-7 which require the development of a management plan and focused pre-construction surveys and avoidance measures for burrowing owl.

CMA DFA-VPL-BIO-DUNE-1 is specific to the avoidance of dune vegetation. Compliance with this CMA would be satisfied with the implementation of BMP BIO-53 which would site Project facilities to avoid dune vegetation. Unavoidable impacts to dune vegetation would be limited and access roads that would be sited to minimize unavoidable impacts. Access road would be unpaved, and access roads would be designed and constructed to be at grade with the ground surface to avoid inhibiting sand transport.

CMA LUPA-BIO-1 is specific to conducting a habitat assessment of focus and BLM special-status species suitable habitat, delineation of the DRECP vegetation types, rare alliances, and special features. Compliance with this CMA is achieved through data contained in the Biological Resources Technical Reports (including rare plant studies), which is incorporated into Chapter 3 of the TES. Further compliance is achieved by APM BIO-24 and BMP BIO-31 which include pre-construction surveys for sensitive plants, focused surveys for Harwood’s eriastrum, and protection measures for Harwood’s eriastrum. Additional compliance is achieved with BMP BIO-11 which would require the development of a Vegetation Management Plan, APM BIO-13 which requires the avoidance of riparian habitat, APM BIO-25 which requires pre-construction surveys for sensitive wildlife, and BMP BIO-49 that requires a Fringe-toed Lizard Linear ROW Protection Plan. APM BIO-23 and BMP BIO-23 achieve compliance by establishing desert tortoise protection measures while BMP BIO-30 and MM WIL-CEQA-7 require a NBBMP, focused pre-construction survey for burrowing owl, and avoidance measures. MM WIL-CEQA-4 would require focused pre-construction survey efforts for nesting and breeding birds and MM WIL-CEQA-8 requires protocol surveys for Arizona Bell’s vireo, southwestern willow flycatcher, and willow flycatcher.

CMA LUPA-BIO-2 specifies that a designated biologist(s) conduct and oversee Project activities requiring biological monitoring during pre-construction and decommissioning. Compliance with

this CMA is achieved through application of APM BIO-02, BMP BIO-02, and MM BIO-CEQA-3 which require that qualified/designated biologists be retained to monitor construction of the Project.

CMA LUPA-BIO-3 specifically addresses setbacks for sensitive resources. Compliance with this CMA is achieved, in part, through application of APM BIO-04 and APM BIO-11 which require the development of a Vegetation Management Plan and the fencing/field identification of sensitive resources, BMP BIO-31 which provides protection measures for Harwood's eriastrum, and BMP BIO-50 and BMP BIO-52 which require setbacks and buffers for sensitive habitat, including riparian communities.

CMA LUPA-BIO-4 is specific to activities that may impact focus and BLM special-status species and establishes seasonal restrictions on Project activities. Compliance with this CMA is achieved through application of APM BIO-20, BMP BIO-31, MM VEG-CEQA-1, MM VEG-CEQA-3, and MM WIL-CEQA-6 which require seasonal nesting surveys, provide restrictions for working within occupied Harwood's eriastrum habitat, provide for species specific seasonal restriction dates, preparation of a NBBMP.

CMA LUPA-BIO-5 specifies the need for a worker education program. Compliance with this CMA is achieved through application of APM BIO-1, BMP BIO-01 and MM BIO-CEQA-2 which require the development/implementation of a Worker Environmental Awareness Program.

CMA LUPA-BIO-6 is specific to the needs for subsidized predator standards, approved by the BLM, in coordination with the USFWS and CDFW. Compliance with this CMA is achieved through application of APM BIO-05, APM BIO-06, and BMP BIO-28 which prohibit trash dumping and firearms, provide specifics for refuse disposal, and require the development of a Raven Management Plan. Compliance is also achieved through application of APM BIO-12 and BMP BIO-31 which require the development of a Noxious Weed Control Plan and specifics for the treatment of Harwood's eriastrum. Further compliance would be achieved by BMP AQ-01 that would require that dust palliatives be applied, in lieu of water, to inactive construction areas and BMP BIO-34 which would provide for the prevention of puddles during dust abatement.

CMA LUPA-BIO-7 and CMA LUPA-BIO-8 are specific to restoration of impacted areas from Project construction, operation, and decommissioning. Compliance with this CMA is achieved through application of APM BIO-15 and MM VEG-CEQA-1 which require the development of a Habitat Restoration, Mitigation, and Monitoring Plan.

CMA LUPA-BIO-8 specifies that all activities that are required to close and decommission the Project would specify and implement Project-specific closure and decommissioning actions that meet the approval of BLM. Compliance with this CMA is achieved through application of APM BIO-11, BMP BIO-11, APM BIO-15, BMP BIO-15, and MM VEG-CEQA-1 which require the development of a Vegetation Management Plan and development of a Habitat Restoration, Mitigation, and Monitoring Plan.

CMA LUPA-BIO-9 is specific to the implementation of practices pertaining to water and wetlands dependent resources. Compliance with this CMA is achieved through application of APM BIO-08, APM BIO-07, APM BIO-10, BMP HAZ-03, and APM HAZ-01 which require that no monofilament plastic fencing be used, erosion and dust control measures be

implemented, the Applicant to provide the BLM with an inventory of equipment and materials to cover each hazardous material used at any time during the life of the Project, and that the Project would implement its hazardous substance control and emergency response procedures as needed in conjunction with a Hazmat Containment Plan and Emergency Response Plan for the Project.

CMA LUPA-BIO-10 specifies policies and guidance on integrated weed management actions during all phases of Project activities. Compliance with this CMA is achieved through application of APM BIO-12 which requires the development of a Noxious Weed Control Plan that is approved by the BLM.

CMA LUPA-BIO-11 is specific to control measures for nuisance animals and invasive species. Compliance with this CMA is achieved through application of APM BIO-12 and MM VEG-CEQA-1 which requires the development of a Noxious Weed Control Plan that is approved by the BLM and development of a plan to address nuisance animals.

CMA LUPA-BIO-12 specifies practices and controls related to noise effects on wildlife. Compliance with this CMA is achieved through application of BMP NO-07 which to the extent feasible, requires the location of stationary noise sources that exceed background ambient noise levels away from known or likely locations of and BLM sensitive wildlife species and their suitable habitat. Compliance is also achieved through application of APM NO-2 which requires that in areas in close proximity to sensitive receptors, quiet equipment (for example, equipment that incorporates noise control elements into the design; quiet model air-compressors or generators can be specified) would be used during construction whenever possible.

CMA LUPA-BIO-13 is specific to the implementation of measures related to siting and design of the Project. Compliance with this CMA is achieved through application of APM BIO-11, BMP BIO-11, APM BIO-13, and BMP BIO-31 which require the preparation of a Vegetation Management Plan, the avoidance of riparian habitat, measures specific to the protection of Harwood's eriastrum, and the avoidance of rare plant alliances. BMP BIO-52 serves to minimize impacts to microphyll woodlands. Compliance is also achieved with the implementation of APM BIO-4, APM BIO-22, and APM BIO-23 which require fencing or other field identification of environmentally sensitive areas, and protection measures specific to desert tortoise. BMP BIO-33 requires that all long-term night lighting would be directed away from riparian and wetland vegetation, occupied habitat, and suitable habitat areas for sensitive species. Compliance with this CMA is also achieved through application of APM BIO-03, BMP BIO-03, APM BIO-17, BMP BIO-53, BMP BIO-55, and BMP TT-04 which requires the stockpiling of material only within approved work areas, limiting of vehicular traffic to establish roads, protection of dune vegetation and sand transport corridors, and the development of an Access Plan to identify all routes where new disturbance and/or cross-country travel is proposed. BMP TT-08 would, within Project boundaries, prohibit cross- country vehicle and equipment use outside of approved designated work areas to prevent unnecessary ground and vegetation disturbance. Lastly, compliance with this CMA is also achieved through application of BMP WQ-04, APM AQ-01, and BMP AQ-01 which require palliatives be used for dust control would be non-petroleum products in addition to non-toxic, and the implementation of basic and advanced control measures to manage dust within the Project.

CMA LUPA-BIO-15 specifies that state-of-the-art construction and installation techniques be used to minimize site disturbance, soil erosion, and compaction. Compliance with this CMA is

achieved through application of BMP BIO-38 and BMP VEG-01 which require the use of state-of-the-art construction and installation techniques where appropriate and the that the removal of vegetation resources would be conducted in accordance with BLM IB 2012-097.

CMA LUPA-BIO-16 specifies activity specific measures to avoid and minimize impacts to focus and BLM sensitive birds, FESA and MBTA protected birds, and bats. Compliance with this CMA is achieved through application of BMP BIO-19, APM BIO-21, BMP BIO-21, BMP BIO-29, BMP BIO-30, and BMP BIO-45 which require specific measures when working near the Colorado River, measures for the reduction of avian collision and electrocution, development of a NBBMP, and protection measures for loss of and harassment of golden eagles. Compliance is also achieved through the implementation of MM BIO-CEQA-4, MM VEG-CEQA-1, and MM WIL-CEQA-1 which requires the development of a Habitat Restoration, Mitigation and Monitoring Plan, conducting pre-construction surveys for nesting and breeding birds and the implementation of avoidance measures, and the development of a NBBMP. BMP BIO-33 would also assist in achieving compliance by placing restrictions on construction lighting for the Project and require the use of bird and bat friendly fencing.

CMA LUPA-BIO-17 is specific to measures related to activities that may result in mortality to focus and BLM special–Status bird and bat species. Compliance with this CMA is achieved through application of BMP BIO-19, APM BIO-21, BMP BIO-21, BMP BIO-29, BMP BIO-30, and BMP BIO-45 which require specific measures when working near the Colorado River, measures for the reduction of avian collision and electrocution, development of a NBBMP, and protection measures for loss of and harassment of golden eagles. Compliance is also achieved through the implementation of MM BIO-CEQA-4 and MM WIL-CEQA-1 which requires the development of a Habitat Restoration, Mitigation and Monitoring Plan, conducting pre-construction surveys for nesting and breeding birds and the implementation of avoidance measures, and the development of a NBBMP. BMP BIO-33 would also assist in achieving compliance by placing restrictions on construction lighting for the Project and require the use of bird and bat friendly fencing.

Compliance with this CMA is also achieved through application of BMP BIO-20, BMP BIO-46, BMP BIO-47, BMP BIO-50, BMP BIO-51, and BMP BIO-52 which require protection for migratory birds during construction, compensation for loss of desert riparian woodland, management of all riparian areas, engineering controls to minimize impacts on dry wash, dry wash woodland, and chenopod scrub, micrositing of structures to achieve adequate conductor clearance, and avoidance of riparian habitat and rare plant alliances.

CMA LUPA-BIO-BAT-1 specifies that the Project shall not be sited within 500 feet of an occupied maternity roost or presumed occupied maternity roost. Compliance with this CMA is achieved through application of BMP BIO-40 and MM WIL-CEQA-4 and MM WIL-CEQA-5 which require siting of Project components 500 feet from occupied maternity roost or presumed occupied maternity roosts and surveys for maternity colonies or hibernaculum for BLM Focus and Special Status Bat Species.

CMA LUPA-BIO-COMP-1 is specific to compensation requirements for impacts to biological resources. Compliance with this CMA would be achieved through implementation of BMP BIO-46, MM BIO-CEQA-4, MM VEG-CEQA-1, and MM VEG-CEQA-4 which require compensation for loss of desert riparian woodland, transplantation and/or compensation for

impacts to State and Federally threatened, proposed, petitioned, and Candidate plants, compensation for impacts to special-status plant species, and the compensation for impacts to sensitive vegetation communities.

CMA LUPA-BIO-COMP-2 specifies requirements pertaining to compensation for the mortality impacts to bird and bat focus and BLM special-status species from activities. Compliance with this CMA would be achieved through implementation of BMP BIO-46, MM BIO-CEQA-5, MM WIL-CEQA-1, MM WIL-CEQA-4, and MM WIL-CEQA-5 which require compensation for loss of desert riparian woodland, compensation for impacts to State and Federally threatened, proposed, petitioned, and Candidate plants, compensation for impacts to special-status plant species, development of a bird and bat mortality compensatory mitigation fee, and the compensation for impacts to sensitive vegetation communities.

CMA LUPA-BIO-DUNE-1 is specific to required studies pertaining to Aeolian sand transport corridors. Compliance with this CMA is partially achieved through data contained in the Biological Resources Technical Reports, which is incorporated into Chapter 3 of the TES and analysis presented in Chapter 4 of the TES. To further achieve compliance implementation of BMP BIO-53 and BMP BIO-54 would require the protection of dune vegetation, and that all activities would be designed and operated to facilitate the flow of sand across activity sites to avoid the trapping or diverting of sand from the Aeolian corridor. Structures would take into account the direction of sand flow and, to the extent feasible, build and align structures to allow sand to flow through the site unimpeded. Fences would be designed to allow sand to flow through and not be trapped.

CMA LUPA-BIO-DUNE-2 specifies restrictions for Project activities that potentially affect the amount of sand entering or transported within Aeolian sand transport corridors. Compliance with this CMA is achieved through application of BMP BIO-54, BMP BIO-31, BMP BIO-49, and BMP BIO-53 which would require the protection of dune vegetation and sand transport, measures for the protection/treatment of Harwood's eriastrum, pre-construction surveys, avoidance of Harwood's eriastrum individuals through micrositing of facilities, and development of a Fringe-toed Lizard Linear ROW Protection Plan. In addition, APM BIO-2 and BMP BIO-2 require the presence of a biological monitor who will clear work areas prior to the start of construction activities and would relocate if necessary.

CMA LUPA-BIO-DUNE-3 specifies that facilities or activities that alter site hydrology (e.g., sediment barrier) will be designed to maintain continued sediment transport and deposition in the Aeolian corridor in a way that maintains the Aeolian sorting and transport to downwind deposition zones. Compliance with this CMA is achieved through application of BMP WQ-06, BMP WQ-07, and BMP BIO-49 which will require the avoidance of hydrologic alterations, no permanent structures would be placed in floodplains that are narrower at the ROW crossing than the typical span width of 1,200 feet (i.e., it is assumed that such floodplains could be spanned and avoided), and development of a Fringe-toed Lizard Linear ROW Protection Plan.

CMA LUPA-BIO-DUNE-4 is specific to the mapping of dune formations and other sand accumulations according to mapping standards established by the BLM National Operations Center. Compliance with this CMA is achieved through application of BMP BIO-49, BMP BIO-53, BMP BIO-54, and BMP BIO-55 which would require the development of a Fringe-toed Lizard Linear ROW Protection Plan, the protection of dune vegetation and sand transport and

that new roads/routes avoid focus and BLM special-status species suitable habitat within identified linkages for those focus and BLM special-status species, unless the new road and/or route is beneficial to minimize net impacts to natural or ecological resources of concern. MM WIL-CEQA-9 would require that dune formations and other sand accumulations (i.e., sand ramps, sand sheets) with suitable habitat characteristics for the Mojave fringe-toed lizard (i.e., unconsolidated blow-sand) will be mapped according to mapping standards established by the BLM National Operations Center.

CMA LUPA-BIO-DUNE-5 specifies clearance surveys for Mojave fringe-toed lizard within suitable habitat. Compliance with this CMA is achieved through application of BMP BIO-02, APM BIO-25, BMP BIO-49, MM WIL-CEQA-9, and MM BIO-CEQA-3 which require biological monitoring, pre-construction surveys, and surveys for sensitive species, the development of a Fringe-toed Lizard Linear ROW Protection Plan.

CMA LUPA-BIO-IFS-3 is specific to design of culverts to allow unrestricted access by desert tortoises. Compliance with this CMA is achieved through application of BMP BIO-44 which presents desert tortoise protection measures, including culvert design requirements.

CMA LUPA-BIO-IFS-5 specifies that sites that are fenced with long-term desert tortoise exclusion fencing are monitored by a designated biologist during initial clearing and grading activities. Compliance with this CMA is achieved through application of APM BIO-23, BMP BIO-23, BMP BIO-44, and MM WIL-CEQA-10 which require the implementation of desert tortoise protection measures and the biological monitoring during initial site clearance activities.

CMA LUPA-BIO-IFS-6 and CMA LUPA-BIO-IFS-7 are specific to the requirement for protocol or clearance surveys and monitoring for desert tortoise during geotechnical testing activities. Compliance with this CMA is achieved through application of APM BIO-02, APM BIO-23, APM BIO-25, BMP BIO-44, MM BIO-CEQA-3, MM BIO-CEQA-4, and MM WIL-CEQA-10 which require biological monitoring, pre-construction surveys, and desert tortoise protection measures.

CMA LUPA-BIO-IFS-8 specifies that the ground under vehicles be checked for the presence of desert tortoise any time a vehicle or construction equipment is parked in desert tortoise habitat outside of areas fenced with desert tortoise exclusion fencing. Compliance with this CMA is achieved through application of APM BIO-23 and BMP BIO-44 which provide for desert tortoise protection measures.

CMA LUPA-BIO-IFS-9 specifies that vehicular traffic will not exceed 15 miles per hour within the areas not cleared by protocol-level surveys where desert tortoise may be impacted. Compliance with this CMA is achieved through application of BMP BIO-44, MM BIO-CEQA-3, MM BIO-CEQA-4, and MM WIL-CEQA-10 which require the implementation of desert tortoise protection measures and the implementation of biological resources BMPs.

CMA LUPA-BIO-IFS-11 specifies that if Bendire’s thrasher is present, the Applicant conduct appropriate activity-specific biological monitoring (see Glossary of Terms, EIS Appendix 6) to ensure that Bendire’s thrasher individuals are not directly affected by operations (i.e., mortality or injury, direct impacts on nest, eggs, or fledglings). Though Bendire’s thrasher is not expected to be present in the Project area, ground disturbance during the nesting season requires surveys

for, and protection of all active bird nests, including Bendire's thrasher. If nests are found protective buffers will be applied. Compliance with this CMA would be achieved through APM BIO-20, BMP BIO-29, MM BIO-WIL-1, and MM WIL-CEQA-6 which would require protection for migratory birds, development of a NBBMP and pre-construction surveys for nesting birds.

CMA LUPA-BIO-IFS-12 is specific to activity-specific biological monitoring to ensure avoidance of occupied burrowing owl burrows. Compliance with this CMA is achieved through application of APM BIO-02, APM BIO-25, BMP BIO-29, BMP BIO-30, MM WIL-CEQA-1, MM WIL-CEQA-6, and MM WIL-CEQA-7 which would require protection for migratory birds, development of a NBBMP pre-construction surveys for nesting birds, and focused pre-construction surveys and avoidance measures for burrowing owl.

CMA LUPA-BIO-IFS-13 specifies that if active burrowing owl burrows cannot be avoided on-site, passive burrow exclusion by a designated biologist using one-way doors. Compliance with this CMA is achieved through application of BMP BIO-30, MM WIL-CEQA-3, and MM WIL-CEQA-7 which require the development of a NBBMP, and focused pre-construction surveys and avoidance measures for burrowing owl.

CMA LUPA-BIO-IFS-14 specifies that activity-specific active translocation of burrowing owls may be considered, in coordination with CDFW. Compliance with this CMA is achieved through application of BMP BIO-30, MM WIL-CEQA-3, and MM WIL-CEQA-7 which require the development of a NBBMP, and focused pre-construction surveys and avoidance measures for burrowing owl.

CMA LUPA-BIO-IFS-24 is specific to the protection from loss and harassment of active golden eagle nests. Compliance with this CMA is achieved through application of BMP BIO-45 and MM WIL-CEQA-1 which provide protection measures for golden eagles and the development of a NBBMP.

CMA LUPA-BIO-IFS-25, CMA LUPA-BIO-IFS-26 and CMA LUPA-BIO-IFS-27 specify hat cumulative loss of golden eagle foraging habitat within a 1- to 4-mile radius around active or alternative golden eagle nests (as identified or defined in the most recent USFWS guidance and/or policy) will be limited to less than 20%, applicants will conduct a risk assessment per the applicable USFWS guidance, and if a permit for golden eagle take is determined to be necessary, an application will be submitted to the USFWS in order to pursue a take permit. Compliance with this CMA is achieved through application of BMP BIO-45 and MM WIL-CEQA-1 which provide protection measures for golden eagles and the development of a NBBMP.

CMA LUPA-BIO-PLANT-1 specifies that properly timed protocol surveys in accordance with the BLM's most current (at time of activity) survey protocols for plant focus and BLM special-status species. The rare plant surveys previously conducted, in conjunction with planned pre-construction surveys will meet the BLM's survey requirements. Compliance with this CMA is also achieved by APM BIO-24 which requires surveys to be conducted during the appropriate time of year of the selected route to identify special-status plant species and imperiled or sensitive vegetation alliances.

CMA LUPA-BIO-PLANT-2[4] specifies that an avoidance setback of 0.25 mile for all focus and BLM Special-Status species occurrences. Compliance with this CMA is achieved through application of BMP BIO-31 and MM VEG-CEQA-3 which provides for guidance on the protection/treatment of Harwood's eriastrum, the only BLM special-status species documented in the Project area and setbacks for all focus and BLM special-status species occurrences.

CMA LUPA-BIO-PLANT-3 specifies that impacts to suitable habitat for focus and BLM special-status plant species should be avoided to the extent feasible and are limited (capped) to a maximum of 1% of their suitable habitat throughout the entire LUPA DA. Compliance with this CMA is achieved through application of BMP BIO-31 which provides for guidance on the protection/treatment of Harwood's eriastrum, the only BLM special-status species documented in the Project area.

CMA LUPA-BIO-RIPWET-1 is specific to the avoidance of riparian and wetland DRECP vegetation types. Compliance with this CMA is achieved through application of APM BIO-11, BMP BIO-11, BMP BIO-19, APM BIO-20, BMP BIO-29, BMP BIO-47, BMP BIO-50, BMP BIO-51, and BMP BIO-52 which require the development of a Vegetation Management Plan, specific measures when working near the Colorado River, development of a NBBMP, management of all riparian areas, implementation of engineering controls, micrositing of structures for adequate structure clearance, and riparian habitat and rare plant alliance avoidance.

CMA LUPA-BIO-RIPWET-3 specifies the requirement for pre-construction surveys for Project activities within 0.25-mile of a riparian or wetland DRECP vegetation type. Compliance with this CMA is achieved through application of APM BIO-02, APM BIO-20, APM BIO-25, MM BIO-CEQA-4, MM WIL-CEQA-1, and MM WIL-CEQA-6 which require biological monitoring, protection for migratory birds during construction, sensitive species surveys, and pre-construction nesting bird surveys.

CMA LUPA-BIO-SVF-1 specifically requires a map delineating potential sites and habitat assessment of the following special vegetation features is required: Yucca clones, creosote rings, Saguaro cacti, Joshua tree woodland, microphyll woodland, Crucifixion thorn stands. Compliance with this CMA is achieved through application of APM BIO-11 and BMP BIO-11 which requires the development of a Vegetation Management Plan.

CMA LUPA-BIO-SVF-6 specifies that impacts to microphyll woodland will be avoided, except for minor incursions. Compliance with this CMA is achieved through application of BMP BIO-50, BMP BIO-51, and BMP BIO-52 which require the implementation of engineering controls, micrositing of structures for adequate conductor clearance, and avoidance of riparian habitats and rare plant alliances.

CMA LUPA-BIO-VEG-1 specifies that the management of cactus, yucca, and other succulents will adhere to current up-to-date BLM policy. Compliance with this CMA is achieved through application of APM BIO-11, BMP BIO-11, and BMP BIO-41 which requires the development of a Vegetation Management Plan and succulent management.

[4] The CDCA Plan would be amended to authorize construction of the proposed Project within 0.25-mile of occurrences of Harwood's eriastrum (*Eriastrum harwoodii*), provided that a Rare Plant Linear ROW Protection Plan for the Harwood's eriastrum is developed and approved by the BLM California State Director.

CMA LUPA-BIO-VEG-2 specifies that appropriate levels of dead and downed wood on the ground, outside of campground areas, to provide wildlife habitat, seed beds for vegetation establishment, and reduce soil erosion, as determined appropriate on an activity-specific basis. Compliance with this CMA is achieved through application of BMP BIO-42 which requires the placement of dead and downed wood in the Project area.

CMA LUPA-BIO-VEG-3 specifically allows for the collection of plant material consistent with the maintenance of natural ecosystem processes. Compliance with this CMA is achieved through application of BMP BIO-43 which specifies the collection of plant materials.

CMA LUPA-BIO-VEG-5 specifies that all activities will follow applicable BLM state and national regulations and policies for salvage and transplant of cactus, yucca, other succulents, and BLM Sensitive plants. Compliance with this CMA is achieved through application of BMP BIO-41 which requires succulent management within the Project area.

CMA LUPA-BIO-VEG-6 specifies that the BLM may consider disposal of succulents through public sale, as per current up-to-date state and national policy. Compliance with this CMA is achieved through application of BMP BIO-41 which requires succulent management within the Project area.

CMA LUPA-SW-13 specifies that the BLM will manage all riparian areas to be maintained at, or brought to, proper functioning condition. Compliance with this CMA is achieved through application of BMP BIO-19 and BMP BIO-47 which provides for specific measures when working in the vicinity of the Colorado River and states that the BLM will manage all riparian areas to be maintained at, or brought to, proper functioning condition.

CMA LUPA-SW-16 is specific to the identification of the 100-year floodplain boundary for any surface water feature in the vicinity of the Project. Compliance with this CMA is also achieved through application of APM BIO-19 which provides for specific measures when working in the vicinity of the Colorado River.

CMA LUPA-TRANS-BIO-1 specifies that, where feasible and appropriate for resource protection, site transmission activities along roads or other previously disturbed areas to minimize new surface disturbance, reduce perching opportunities for the common raven, and minimize collision risks for birds and bats. Compliance with this CMA is achieved through application of APM AES-06, BMP BIO-19, BMP AES-06, BMP BIO-21, and BMP BIO-28 which require that the Project would avoid siting Staging and Laydown Areas in visually sensitive areas to the extent practicable, implement specific protection measures when working near the Colorado River, implement measures to reduce avian collisions, and develop a Raven Management Plan.

CMA LUPA-TRANS-BIO-2 specifies that flight diverters will be installed on all transmission activities spanning or within 1,000 feet of stream and wash channels, canals, ponds, and any other natural or artificial body of water. Compliance with this CMA is achieved through application of APM BIO-21 and BMP BIO-48 which require the use of current guidelines and methodologies to reduce avian collisions and electrocution and install flight diverters on all transmission activities spanning or within 1,000 feet of stream and wash channels, canals, ponds, and any other natural or artificial body of water.

CMA LUPA-TRANS-BIO-3 specifies that when siting transmission activities, the alignment should avoid, to the maximum extent practicable, being located across canyons or on ridgelines. Compliance with this CMA is achieved through application of APM BIO-21, BMP BIO-21, BMP AES-07, and BMP AES-08 which require the use of current guidelines and methodologies to reduce avian collisions and electrocution, avoid siting linear features in the centers of valley bottoms and on ridgetops, and avoid skylining.

CMA LUPA-TRANS-BIO-4 specifies that siting of transmission activities will be prioritized within designated utility corridors, where possible, and designed to avoid, where possible, and otherwise minimize and offset impacts to sand transport processes in Aeolian corridors, rare vegetation alliances and focus and BLM Special-Status species. Compliance with this CMA is achieved through application of APM AES-05, BMP BIO-53, and BMP BIO-54 which require that the Project would avoid siting Staging and Laydown Areas in visually sensitive areas to the extent practicable, protection of dune vegetation, and protection of sand transport.

CMA DFS-VPL-BIO-FIRE-1 is specific to the implementation of a standard practice for fire prevention/protection. Compliance with this CMA is achieved through application of APM BIO-11, BMP BIO-11, BMP PH&S-02, and BMP HAZ-02 which require the development of a Vegetation Management Plan, development of a Fire Prevention Plan (FPP), and implementation of fire avoidance and suppression measures.

The Applicant shall comply with the above CMAs. Therefore, there would be no impact under this criterion.

Impact BIO 2 - Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the California Department of Fish and Game or US Fish and Wildlife Service?

Less than Significant with Mitigation

The majority of Project related impacts (permanent and temporary) would occur within agricultural lands. The Project does however occur within areas where rare plant alliances have been mapped. CDFW has assigned state-level rarity rankings to many vegetation alliances that are dominated by native species (CDFW 2010). The DRECP classifies vegetation alliances (an alliance is defined by one or a group of diagnostic plant species) on BLM land with a state ranking of S1, S2, or S3 (critically imperiled, imperiled, and vulnerable, respectively) as rare vegetation alliances, and provides protection measures in the LUPA. Three rare plant alliances on the Palo Verde Mesa are crossed by one or more route segments within California (FEIS Appendix 7, Figure 3.5-3; FEIS Appendix 3, Table 3.4-6). The *Suaeda moquinii* (bush seepweed scrub) has a rank of S3, vulnerable. The *Parkinsonia florida–Olneya tesota* (blue paloverde-ironwood woodland) Alliance and *Prosopis glandulosa* (Mesquite thickets) Alliance are included in the semi-desert wash woodland riparian vegetation type, often referred to as microphyll woodlands, and have been ranked as S3, vulnerable. These dry desert wash woodland communities and rare vegetation alliances are considered sensitive in the California BLM planning area (BLM 2015a). Table 3.4-6 of the FEIS Appendix 3 identifies the Project segments and distance, in miles, of intersection for rare vegetation alliances on Palo Verde Mesa. Table 2.4-3 below identifies the acreage of each community occurring within a 200-ft wide corridor where the Project occurs in California. Without a final design/Project footprint this table presents

the “worst case scenario” of the entire 200-foot wide corridor being impacted. Actual impacts from the Project would be much less than the acreages reported in Table 2.4-3.

Table 2.4-3 Vegetation Communities/Land Cover Types

VEGETATION COMMUNITY	STATUS	ACREAGE IMPACTED IN PROJECT AREA*
Agriculture	n/a	252.5
Fourwing saltbush scrub (*Atriplex canescens*)	n/a	0.7
Irrigated Row and Field Crops	n/a	0.4
Creosote bush scrub (*Larrea tridentata*)	n/a	17.5
Creosote bush - white bursage scrub (*Larrea tridentata - Ambrosia dumosa*)	n/a	121.7
Open Water	n/a	1.8
Blue palo verde - ironwood woodland (*Parkinsonia florida - Olneya tesota*)	S3	7.5
Mesquite thickets (*Prosopis glandulosa*)	S3	1.3
Bush seepweed scrub (*Suaeda moquinii*)	S3	0.5
Urban	n/a	1.4
Total Acreage		405.3

* Assumes a maximum impact area of 200ft (100ft on either side of the proposed transmission line)

S3 = Vulnerable—Vulnerable in the state due to a restricted range, relatively few populations (often 80 or fewer), recent and widespread declines, or other factors making it vulnerable to extirpation from the state.

The only permanent water and associated riparian vegetation in the Project area is along the Colorado River and in canals and drains adjacent to irrigated fields in California; the Project proposes to span the Colorado River and other aquatic features. South of Blythe, the Colorado River is channelized in most places, and riparian vegetation is restricted to the immediate banks of the river. However, in some places, including along proposed crossings of the river, riparian vegetation in the floodplain extends up to 0.7 mile from the river. The dominant vegetation in the riparian area within the floodplain is salt cedar (*Tamarix* spp.), honey mesquite (*Prosopis glandulosa*), screwbean mesquite (*Prosopis pubescens*), and saltbush. Stands of arrowweed (*Pluchea sericea*) are found along the river corridor and in association with canals and drains in the agricultural areas. There are some small stands of cottonwood (*Populus fremontii*) and willow (*Salix gooddingii*) along the section of the river south of Blythe (LCRMSCP 2004).

Riparian vegetation and associated aquatic areas, especially riparian habitat with native vegetation, have a high diversity of plants and animals. Numerous species found in the region, including many special-status species, are riparian obligates. The BLM estimates that more than

400 species in the region either are directly dependent on riparian habitats or use them more than other habitats (BLM 2010, Section 3.4.2).

In an otherwise arid landscape, primary productivity in riparian habitats is high due to year-round soil moisture. High plant productivity leads to increased habitat structural diversity and high food availability for herbivorous and (in turn) predatory animals. Insect productivity is also high, among both aquatic and terrestrial species. Insect numbers are very high during warm months and serve as a prey base for a diverse breeding bird fauna, including several special-status birds. Habitat structure in riparian vegetation is also more diverse than in most regional uplands (CPUC 2016).

Riparian woodlands tend to have multiple-layered herb, shrub and tree canopies, whereas most upland shrublands are relatively simple in structure. The varied vertical habitat structure provides a greater diversity of nesting and feeding sites for birds compared with non-riparian communities. Similarly, mammal diversity is greater in riparian communities due to high biological productivity, denning site availability, thermal cover, and water availability (CPUC 2016).

Direct impacts associated with the Project include the removal of vegetation during construction activities, resulting in the direct reduction in the representation of plant communities. Vegetation removal and disturbance of soils could have a variety of effects on vegetation communities, ranging from changes in community structure and species composition to alteration of soil moisture or nutrient regimes. Removal of protective vegetation would also expose soil to potential wind and water erosion. This could result in further loss of soil and vegetation, as well as increased sediment input to water resources.

Clearing and grading could also result in the alteration of soil conditions, including the loss of native seed banks, and change the topography and drainage of a site such that the capability of the habitat to support native vegetation is impaired. Indirect impacts associated with the Project include fugitive dust from construction traffic that has the potential to affect photosynthetic rates and decrease plant productivity. Direct and indirect impacts to riparian or other sensitive vegetation communities (blue palo verde - ironwood woodland, mesquite thickets, and bush seepweed scrub) as a result of Project construction would be considered significant prior to mitigation under this criterion.

To minimize and/or avoid impacts to riparian habitat and sensitive habitat communities a suite of APMs, BLM BMPs, and MMs have been developed for the Project. The Project would be designed to avoid impacts to special-status vegetation communities and other special-status biological resources (APM BIO-12, APM BIO-15, APM BIO-16, BMP BIO-24, BMP BIO-31, BMP BIO-50, BMP BIO-51, BMP BIO-53, and BMP BIO-55). Pre-construction surveys of disturbance zones would include preparation of maps delineating special vegetation features (BMP BIO-52). Other measures that would be implemented to avoid and minimize impacts during construction include:

- Implementation of a worker environmental awareness program (APM/BMP BIO-1 and MM BIO-CEQA-2);
- Limiting activities to established work areas (APM/BMP BIO-3);

- Establishing environmentally sensitive areas (APM BIO-4);
- Establishing prohibited activities along the Project alignment (APM BIO-5 through APM BIO-8);
- Minimizing vegetation clearing (APM BIO-14), limiting off-road vehicular travel (APM BIO-17);
- Prohibiting native plant collection without a permit (BMP BIO-37);
- Succulent management (BMP BIO-41);
- Promote dead and downed wood (BMP BIO-42);
- Avoidance of California riparian habitat and rare plant alliances (BMP BIO-52);
- Protection of dune vegetation (BMP BIO-53);
- Limit vegetation removal (BMP VEG-1 and BMP VEG-2); and
- Implement biological resources construction monitoring (MM BIO-CEQA-3) and best management practices (MM BIO-CEQA-1).

To further minimize and/or avoid impacts to riparian habitat and sensitive habitat communities MM VEG-CEQA-4 has been identified to further reduce potential impacts. These measures include compensation for impacts to special-status plant species and compensation for permanent impacts to riparian habitats and other sensitive vegetation communities. Refer to Section 2.4.6 below for a complete list and full description of all MMs noted above. Implementation of these APMs, BMPs, and CEQA specific MMs would minimize impacts to riparian habitat and sensitive habitat communities and would reduce impacts to a less-than-significant level.

Compensation for temporary impacts to sensitive vegetation communities (blue palo verde-ironwood woodland, mesquite thickets, and bush seepweed scrub) would include on-site habitat restoration with similar species compositions to those present prior to construction at a ratio of 1.5:1 (MM VEG-CEQA-4). Restoration of conditions of the impacted areas within the Project footprint shall be at 1:1; and creation, restoration, or enhancement of similar vegetation communities offsite shall be 0.5:1, as approved by CDFW and CPUC. Alternatively, payments would be made into an appropriate mitigation program or other mitigation funding mechanism. Compensation for permanent impacts to desert riparian woodland (blue palo verde-ironwood woodland, mesquite thickets, and bush seepweed scrub) would be compensated at a ratio of 5:1, which may be fulfilled through non-acquisition (i.e., restoration and enhancement), land acquisition (i.e., preserve), or a combination of these options, depending on the activity specifics and BLM approval/authorization (BMP BIO-46 and MM VEG-CEQA-4). Priority will be given to expand the size and/or quality of existing microphyll woodlands within protected areas on BLM lands. Specifically, based on the above ratios and the worst-case impacts, the Project would be required to create or restore up to the amounts listed below:

- Blue palo verde - ironwood woodland – 37.80 acres (7.5 acres impacted)

- Mesquite thickets – 6.80 acres (1.3 acres impacted)
- Bush seepweed scrub – 1.35 acres (0.5 acres impacted)

Further, the Vegetation Management Plan (APM BIO-11 and MM VEG-CEQA-1) shall outline the planting/seeding methodologies, qualitative/quantitative monitoring requirements, success criteria, and reporting procedures. The Vegetation Management Plan shall also serve as the HRMMP (APM/BMP BIO-15) and Noxious Weed Control Plan to address potential impacts associated with the colonization and spread of noxious weeds (APM BIO-12).

To reduce impacts to less than significant, and to meet CEQA requirements, the following MMs have been developed (incorporating BMPs, APMs, and CMAs as outlined in Table 2.4-4 applicable to Sensitive Vegetation Communities): MM BIO-CEQA-1, MM BIO-CEQA-2, MM BIO-CEQA-3, and MM BIO-CEQA-4. Therefore, impacts to riparian habitats and sensitive habitat communities would be less than significant with mitigation.

Compliance with CDCA CMAs Applicable to Sensitive Vegetation Communities

Table 2.4-4 presents a list of CMAs applicable to sensitive vegetation communities that have already been addressed in detail above under Impact BIO-1.

Table 2.4-4 CMAs Addressed Under Impact BIO-1 Applicable to Sensitive Vegetation Communities

CMA	APPLICABLE APM, BMP, AND/OR MM
CMA DFA-VPL-BIO-DUNE-1	BMP BIO-53
CMA LUPA-BIO-1	APM BIO-24, BMP BIO-31, BMP BIO-11, APM BIO-13, APM BIO-25, BMP BIO-49, APM BIO-23, BMP BIO-23, BMP BIO-30, MM WIL-CEQA-6, MM WIL-CEQA-7, and MM WIL-CEQA-8
CMA LUPA-BIO-3	APM BIO-04, APM BIO-11, BMP BIO-31, BMP BIO-50, and BMP BIO-52
CMA LUPA-BIO-5	APM BIO-1, BMP BIO-01 and MM BIO-CEQA-1
CMA LUPA-BIO-7	APM BIO-15 and MM BIO-CEQA-4
CMA LUPA-BIO-8	APM BIO-11, BMP BIO-11, APM BIO-15, BMP BIO-15, and MM BIO-CEQA-4
CMA LUPA-BIO-9	APM BIO-08, APM BIO-07, APM BIO-10, BMP HAZ-03, and APM HAZ-01
CMA LUPA-BIO-10	APM BIO-12

Impact BIO 3 - Have a substantial adverse effect on state or federally protected wetlands (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?

Less than Significant with Mitigation

The aquatic and associated wetland habitats that are crossed by the Project are the Colorado River and various canals and drains serving agricultural areas west of the Colorado River. A backwater channel east of and parallel to the mainstem river is present between potential Project crossing locations, which would be avoided by spanning the aquatic habitat.

The primary assumptions for analyzing impacts to wetlands, WOUS, and CDFW jurisdictional waters are:

- Ephemeral drainages/washes are regulated under Sections 404 and 401 of the Clean Water Act and Section 1600 of the California Fish and Game Code. Linear water features crossed by the ROW would be a potential WOUS or CDFW jurisdictional water that could be impacted are identified in Section 3.19.3.1 of the TES (BLM 2019).

- Wetlands crossed by the ROW that could be impacted are identified in Section 3.19.3.1 of the TES.

Final design and placement of the ROW and the permitting process that is required under Sections 404 and 401 of the Clean Water Act (CWA) would attempt to avoid wetlands, WOUS, and CDFW jurisdictional waters, thus impacting only those where disturbance is unavoidable.

For example, a WOUS, wetland, or CDFW jurisdictional water would be considered unavoidable if it is large enough or configured such that it cannot be spanned with the typical span length of 1,200 feet. Most Project segments have potential non-wetland WOUS and CDFW jurisdictional crossings and would require Section 404/401 and Section 1600 permitting if avoidance is not possible. In addition to complying with Section 404 of the Clean Water Act, construction in segments that cross the Colorado River would also need to comply with Section 10 of the Rivers and Harbors Act, which would ensure that any physical alterations of the associated channel, wetland, or floodplain would not have a substantial adverse effect on wetlands and ensure continuing functioning of these areas. TES Table 3.19-4 shows the number of crossings in these segments, which make up the combined lengths in TES Table 4.19-4. Although a formal jurisdictional delineation of waters and wetlands was not conducted, the vegetation communities typically associated with riparian systems that are often regulated by the U.S. Army Corps of Engineers (ACOE) and Regional Water Quality Control Board (RWQCB) under Sections 404 and 401 of the Clean Water Act (respectively) and the CDFW under Section 1600 of the California Fish and Game Code include blue palo verde - ironwood woodland, mesquite thickets, and bush seepweed scrub. As presented above, a total of 7.5 acres of blue palo verde - ironwood woodland, 1.3 acres of mesquite thickets, and 0.5 acres of bush seepweed scrub could be impacted based on a worst-case scenario (entire 200-ft wide corridor being impacted). Prior to conducting any activities, a formal delineation shall be conducted following current guidance and standards to identify aquatic resources that would be subject to the jurisdiction of the ACOE, RWQCB, and/or the CDFW to ensure avoidance and impact minimization (MM BIO-CEQA-4).

The importance of intermittent and ephemeral streams to wildlife in arid environments is well known (Levick et al. 2008). Ephemeral drainages, such as those occurring in the Project area, provide unique habitat that is distinct from the surrounding uplands providing more continuous vegetation cover and micro-topographic diversity than the surrounding uplands. Ephemeral and intermittent streams in the arid west provide important habitat for wildlife and are responsible for much of the biotic diversity (Levick et al. 2008). They have higher moisture content and provide shade and cooler temperatures within the channel. In cases where the habitat is distinct in species composition, structure, or density, wash communities provide habitat values not available in the adjacent uplands (CPUC 2016).

Direct temporary and permanent impacts to State jurisdictional waters (CDFW, RWQCB), and Federal waters would include the removal of native riparian vegetation and the discharge of fill material into receiving waters. Other direct temporary impacts during construction activities include increased runoff, sedimentation, soil erosion, and pollutants that may result in degradation of water quality within receiving waters. Indirect impacts could include alterations to the existing topographical and hydrological conditions and the introduction of non-native, invasive plant species. Operational impacts to wetland habitats would be similar to direct and indirect impacts. As required by law, the Project would comply with the regulations regarding conducting Project activities in water courses and habitats under the jurisdiction of the State and Federal government. Therefore, the Project would obtain required permits pursuant to Section 401 and 404 of the CWA, the State Porter-Cologne Act, and Fish and Game Code Section 1602. Due to the importance of riparian habitats and ephemeral/perennial drainages and their suitability to support special-status species, any loss of the habitats described above associated with the Project would be considered a significant impact without mitigation. Therefore, impacts to State

jurisdiction waters (CDFW, RWQCB), and Federal waters would be significant prior to the implementation of mitigation under this criterion.

The Project would be designed to avoid impacts to riparian habitats and other special-status biological resources (APM BIO-13, APM BIO-15, BMP BIO-50, and BMP BIO-51). Pre-construction surveys of disturbance zones would include preparation of maps delineating special vegetation features including jurisdictional waters for avoidance (BMP BIO-52 and MM BIO-CEQA-4). Other measures that would be implemented to avoid and minimize impacts during construction include:

- Implementation of a worker environmental awareness program (APM/BMP BIO-1 and MM BIO-CEQA-2);
- Limiting activities to established work areas (APM/BMP BIO-3);
- Establishing environmentally sensitive areas (APM BIO-4);
- Establishing prohibited activities along the Project alignment (APM BIO-8);
- Erosion and dust control (APM BIO-10, APM BIO-15, BMP BIO-38, BMP BIO-42, and BMP BIO-50);
- Minimizing vegetation clearing (APM BIO-14);
- Limiting off-road vehicular travel (APM BIO-17);
- Limit vegetation removal (BMP VEG-1 and BMP VEG-2); and
- Implement biological resources construction monitoring (MM BIO-CEQA-3) and best management practices (MM BIO-CEQA-1).

Implementation of the above-referenced APMs, BMPs, and CEQA MMs would reduce impacts on wetland features to less than significant levels. Compensation for temporary impacts to jurisdictional waters/wetlands would include on-site habitat restoration with similar species compositions to those present prior to construction at a ratio of 1.5:1 (MM BIO-CEQA-4 and MM VEG-CEQA-3). Restoration of conditions of the impacted areas within the Project footprint shall be at 1:1; and creation, restoration, or enhancement of similar vegetation communities offsite shall be 0.5:1, as approved by CDFW and CPUC. Alternatively, payments would be made into an appropriate mitigation program or other mitigation funding mechanism. Compensation for permanent impacts to jurisdictional waters/wetlands would include a) on-site habitat creation or enhancement with similar species compositions to those present prior to construction, b) off-site creation, enhancement, and/or preservation or c) participation in an established mitigation bank program (MM BIO-CEQA-4). Desert riparian woodland (blue palo verde-ironwood woodland and mesquite thickets) would be compensated at a ratio of 5:1 (MM BIO-CEQA-4). The Applicant shall coordinate with CPUC, BLM, and CDFW to determine the appropriate mitigation strategy and final replacement ratios and acreages. All mitigation shall be approved by the appropriate Federal and State regulatory agencies prior to Project activities. The Vegetation Management Plan (APM BIO-11 and MM VEG-CEQA-1) shall outline the planting/seeding methodologies, qualitative/quantitative monitoring requirements, success criteria, and reporting

procedures. Further, the Vegetation Management Plan shall serve as the HRMMP (APM/BMP BIO-15) and Noxious Weed Control Plan to address potential impacts associated with the colonization and spread of noxious weeds (APM BIO-12).

To meet CEQA requirements, the following mitigation measures have been developed (incorporating APMs, BMPs, and CMAs as outlined in Table 2.4-5): MM BIO-CEQA-4 and MM VEG-CEQA-1. Therefore, impacts to State jurisdictional waters (CDFW, RWQCB), and Federal waters would be less than significant with mitigation.

Compliance with CDCA CMAs Applicable to Jurisdictional Waters/Wetlands

Table 2.4-5 presents a list of CMAs applicable to jurisdictional waters/wetlands that have already been addressed above in detail under Impact BIO-1.

Table 2.4-5 CMAs Addressed Under Impact BIO-1 Applicable to Jurisdictional Waters/Wetlands

CMA LUPA-BIO-RIPWET-1.	APM BIO-11, BMP BIO-11, BMP BIO-19, APM BIO-20, BMP BIO-29, BMP BIO-47, BMP BIO-50, BMP BIO-51, and BMP BIO-52
CMA LUPA-BIO-RIPWET-3	APM BIO-02, APM BIO-20, APM BIO-25, MM BIO-CEQA-1, and MM BIO-CEQA-3
CMA LUPA-SW-16	APM BIO-19

Impact BIO 4 - Interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?

Less than Significant with Mitigation

The Project site is identified as a wildlife movement corridor that provides linkage across I-10 between the Mule and McCoy mountains; refer to Figure D-1 in Appendix D of the DRECP LUPA for a graphical depiction of this corridor. Migratory songbirds use riparian vegetation associated with the Colorado River and various canals, drainages, and canals serving agricultural areas west of the Colorado River for breeding, nesting, and foraging. Migratory songbirds may also use this corridor as transient rest sites during migration flights and are likely to use the Project site for foraging opportunities and as a rest site. Additionally, terrestrial wildlife may disperse from the Colorado River riparian corridor and cross through the Project site; however, the existing agricultural operations west of the Colorado River may limit wildlife activity in this general area.

Direct impacts resulting from the construction of the Project would include the placement of physical structures such as poles/towers, transmission lines, access roads, and fencing across

mapped wildlife corridors. Ground-disturbing activity including vegetation removal and tower/pole site preparation, may temporarily interfere with terrestrial wildlife movement during construction of the Project. All of the physical structures, with the exception of fenced areas, would present an impermeable barrier to wildlife movement, as species would be able to navigate around Project infrastructure.

The Project could also indirectly impact wildlife in adjacent habitats by interfering with movement patterns or causing animals to temporarily avoid areas adjacent to the construction zone. Indirect impacts include human disturbance, colonization or expansion of invasive weeds, bird collisions with the transmission line, and vehicle traffic. Operational impacts would be the same as described for direct and indirect impacts. Construction activities may temporarily limit terrestrial wildlife movement within the Project area; however, the broad geographic range and habitat that occurs in the region would remain available to wildlife. Birds and larger mammals would likely disperse into adjacent habitat areas during ground disturbing activities.

Migrating birds are known to use the Colorado River corridor. Additionally, the agricultural areas and various canals and drains support many resident and migrant species. However, the Project's activities and operation are not expected to preclude use of the area. Most avian species will continue to fly through the Project alignment during north and southbound migrations. Since the Project has an east-west orientation, avian species would be primarily flying perpendicular to the transmission lines and may collide with the lines.

Infrastructure would not be placed in potential fish habitat, therefore impacts on fish movement would not occur.

The Project would introduce infrastructure perpendicular to the paths of north-south migrating wildlife. Project impacts would be most severe during construction when the noise and presence of construction personnel and equipment would be added to the impacts of Project infrastructure. During construction, the Project would substantially interfere with migrating wildlife, especially birds. Therefore, impacts to migrating wildlife would be significant prior to implementation of mitigation under this criterion.

APMs and BMPs would be implemented to ensure that impacts to wildlife movement are reduced to a less-than-significant level. The Project would be designed to avoid impacts to special-status biological resources (APM BIO-12, APM BIO-15, BMP BIO-50, BMP BIO-51, BMP BIO-53, and BMP BIO-55). In particular, APM BIO-13 requires that riparian areas and xeroriparian drainages that occur within the easement would be denoted as environmentally sensitive areas and would be avoided during construction to the extent practicable. This would avoid and/or minimize impacts to riparian-dependent species. Other measures that would be implemented to avoid and minimize impacts include:

- Limiting activities to established work areas (APM/BMP BIO-3);
- Installing escape ramps (APM BIO-9);
- Erosion and dust control (APM BIO-10);
- Limiting off-road vehicular travel (APM BIO-17);

- Reduce bird collisions and other protections (BMP BIO-19 through APM/BMP BIO-21, and BMP BIO-48);
- Implement a NBBMP (BMP BIO-29);
- Manage construction lighting, water, and materials to benefit wildlife (BMP BIO-33 through BMP BIO-36); and
- Implement biological resources best management practices (MM BIO-CEQA-1).

Implementation of the compensation for impacts to sensitive vegetation (MM VEG-CEQA-4) and preparation and implementation of the Vegetation Management Plan (MM VEG-CEQA-1) would mitigate for the impacts to habitat used by terrestrial wildlife for movement. Preparation and implementation of the APP (MM WIL-CEQA-1) and the BBCS (MM WIL-CEQA-4) would address the effects of the Project on the movement of birds and bats.

To meet CEQA requirements, the following mitigation measures have been developed (incorporating APMs, BMPs, and CMAs as outlined in Table 2.4-6): MM BIO-CEQA-1, MM VEG-CEQA-1, MM VEG-CEQA-4, MM WIL-CEQA-1, and MM WIL-CEQA-4. Therefore, impacts to wildlife movement would be less than significant with mitigation.

Table 2.4-6 CMAs Addressed Under Impact BIO-4 Applicable to Wildlife Movement

CMA	APPLICABLE APM, BMP, AND/OR MM
CMA LUPA-BIO-13	APM BIO-11, BMP BIO-11, APM BIO-13, BMP BIO-31, BMP BIO-52, APM BIO-4, BMP BIO-33, APM BIO-03, BMP BIO-03, APM BIO-17, BMP BIO-53, BMP BIO-55, BMP TT-04, MM BIO-CEQA-1, MM VEG-CEQA-1, MM VEG-CEQA-4, MM WIL-CEQA-1, MM WIL-CEQA-4

Impact BIO 5 - Conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?

No Impact

County of Riverside Ordinance No. 559 regulates the removal of trees within the County. This ordinance states:

> *No person shall remove any living native tree on any parcel or property greater than one-half acre in size, located in an area above 5,000 feet in elevation and within the unincorporated area of the County of Riverside, without first obtaining a permit to do so, unless exempted by the provisions of Section 4 of this ordinance.*

Since the Project area is below 5,000 feet in elevation the Project would not remove any trees covered by this ordinance. Additionally, activities conducted by a public utility, subject to the jurisdiction of the Public Utilities Commission or any other constituted public agency, are exempt from local land use requirements. Therefore, the Project would not conflict with any

local policies or ordinances protecting biological resources such as a tree preservation policy or ordinance and the Project would have no impact under this criterion.

Impact BIO 6 - Conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan?

No Impact

The Project would comply with state laws, regulations, and orders in the conservation and management of biological resources, including the California Endangered Species Act (California Fish and Game Code [CFGC] 2050, et seq.), California Native Plant Protection Act of 1977 (CFGC 1900–1913), California Fish and Game Code 1600–1603, Streambed Alteration Agreement, California Fish and Game Code 3511, 4700, 5050, and 5515, Fully Protected Wildlife, California Fish and Game Code 3500–3516, Protection of Birds. Additionally, no lands within the study area were specifically addressed by the California Desert Protection Act of 1994.

The Project does not cross areas designated under the DRECP (BLM 2016a) or other applicable BLM management plans (BLM 1980, 2002a) as Areas of Critical Environmental Concern or as other areas designated for the conservation or focused management of biological resources or their habitat. BLM-managed lands in California that are crossed by the Project are classified in the DRECP as Development Focus Areas. DRECP and CDCA/NECO, are described below, as they both allow for utility uses within designated corridors. The Project would not cross lands covered by an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or lands covered by other approved local, regional, or state habitat conservation plans; therefore, there would be no impact under this criterion.

California Desert Conservation Plan (CDCA) amended by Northern and Eastern Colorado Desert Coordinated Management Plan (NECO)

As discussed in Section 3.8.3.1 of the TES (BLM 2019), the BLM's management of Federal lands within the land use study area in California is directed by the 1980 CDCA Plan (BLM 1980), which was amended in 2002 by the Northern and Eastern Colorado Desert Coordinated Management (NECO) Plan (BLM 2002b). This plan applies to Federal lands in the Palm Springs Field Office planning area and includes BLM-managed lands. The NECO planning area is located primarily in the Sonoran Desert of San Bernardino, Riverside, and Imperial counties in southeastern California.

Desert Renewable Energy Conservation Plan (DRECP)

As discussed in Section 3.8.3.1 of the TES, the DRECP Land Use Plan Amendment (BLM 2016a) further amended the CDCA Plan. This land use plan amendment was developed to help manage Federal lands in compliance with the 2013 Presidential goal to approve an additional 10,000 MW of energy generation on public land by 2020. Along with the management considerations in the land use plan amendment, the BLM will continue to manage resources and uses on BLM-managed lands by following existing land use planning decisions under the NECO Plan. In preparing the CDCA Plan, the NECO Plan, and the DRECP land use plan amendment, the Palm Springs Field Office coordinated with Federal, state, local, and tribal officials and

reviewed several plans that outline policies and guide activities of the agencies and organizations. The Palm Springs Field Office has identified 12 utility corridors in its planning area. To minimize impacts on BLM-managed lands, new infrastructure should be within these designated corridors, each of which is between 1 and 2 miles wide.

Section 2.4.2 above presents a suite of APMs and BMPs that have been developed/identified to comply with the CMAs contained in the CDCA of the DRECP; specific MMs presented in Section 2.4.6 below also provide compliance with the CMA's of the CDCA. A complete list of CMAs applicable to the Project are presented in EIS Appendix 2C. An analysis of which APMs, BMPs, or MMs provide compliance with the CDCA is provided under each impact discussion presented in Section 2.4.5.

With the implementation of the above mentioned APMs, BMPs, and MMs the Project complies with provisions of an all applicable Habitat Conservation Plans, Natural Community Conservation Plans, or other approved local, regional, or state habitat conservation plans and therefore no impacts to applicable plans would occur.

2.4.6 Biological Resources Mitigation

To meet CEQA requirements, biological resource MMs, below, have been developed (incorporating applicable APMs, BMPs, and CMAs) to reduce impacts to less than significant. Biological resource MMs shall be implemented prior to, during, and post-construction activities, operations, and decommissioning.

MM BIO-CEQA-1: Implement Biological Resources Applicant Proposed Measures, Best Management Practices, and Conservation and Management Actions.

The APMs, BMPs and CMAs in Sections 2.4.2 and 2.4.3 above provide a suite of measures, practices, and actions that shall be implemented as part of the Project. APMs, BMPs, and CMAs shall be implemented prior to, during, and after Project activities to avoid or minimize Project related impacts on biological resources. If an APM, BMP, or CMA is subjective, such as containing text that states; "where appropriate," "where applicable," "where feasible," or similar language, the BLM and CPUC shall be consulted to determine the applicability of each measure prior to the disturbance of a covered resource. Compliance with APMs, BMPs, and CMAs shall be documented, and a weekly report shall be provided to the BLM and CPUC. The Applicant shall provide a synopsis of the Weekly Compliance Report to the BLM and CPUC Monthly Compliance Report. Each report shall include a summary of the construction activities completed, a review of the sensitive plants and wildlife encountered, a list of compliance actions and any remedial actions taken to correct the actions, and the status of on-going mitigation efforts.

MM BIO-CEQA-1 Implementation

Responsible Party: The Applicant shall ensure that all APMs, BMPs, and CMAs are implemented during construction. If an APM, BMP, or CMA is subjective, the Applicant shall consult with the BLM and/or the CPUC to determine the applicability of each measure.

Timing: APMs, BMPs, and CMAs shall be implemented throughout construction activities.

Mitigation Monitoring and Reporting Program: The Applicant shall develop a weekly report that shall include all applicable APMs, BMPs, and CMAs and the related actions taken in order to be in compliance with these measures. These weekly reports shall be compiled and submitted to the BLM and CPUC monthly.

Standards for Success: Compliance with all applicable APMs, BMPS, and CMAs is achieved throughout construction of the Project.

MM BIO-CEQA-2: Implement a Worker Environmental Awareness Program (WEAP).

BMP-BIO 1 and CMA LUPA-BIO-5 shall be incorporated within this MM BIO-CEQA-2.

- Prior to any work activities on the Project site, including surveying, mobilization, fencing, grading, or construction, a WEAP shall be prepared and implemented by the Applicant. Prior to implementation the WEAP will be approved by the CPUC with a final version completed prior to the issuance of construction permits. The WEAP shall be implemented throughout the duration of Project, including O&M phases. Successful implementation of the WEAP will result in all on-site Project personnel being properly informed and educated on the pertinent environmental concerns related to the Project. One of the main goals of the WEAP, is that it shall reduce unintentional impacts to biological resources within the Project area and ensure that all workers are trained in accordance with this MM. The WEAP shall include, at a minimum, the following items: Maps showing the known locations of listed and/or special-status wildlife, populations of listed and special-status plants and sensitive vegetation communities, riparian habitats, seasonal depressions and known waterbodies, wetland habitat, exclusion areas, and other construction limitations.

- A discussion of measures to be implemented for avoidance of sensitive resources discussed in the EIS (including this appendix) and the identification of an onsite contact in the event of the discovery of sensitive species on the Project site; this shall include a discussion on micro trash.

- Training materials and briefings shall include, but not be limited to: a discussion of the FESA and CESA; the BGEPA; the MBTA; the APLIC Guidelines; the consequences of non-compliance with these regulations; identification and values of plant and wildlife species and significant natural plant community habitats; hazardous substance spill prevention and containment measures; a contact person and phone number in the event of the discovery of dead or injured wildlife; and a review of mitigation requirements.

- Protocols to be followed when roadkill is encountered in the work area, or along access roads, and the identification of an onsite representative to whom the roadkill shall be reported. Roadkill shall be reported to the appropriate local animal control agency, the CPUC within 24 hours. Roadkill of special-status species shall also be reported to

the CDFW and/or USFWS within 24 hours or otherwise specified in Project-specific permits.

- Literature and photographs or illustrations of potentially occurring special-status plant and/or wildlife species shall be provided to all Project contractors and heavy equipment operators.
- A special hardhat sticker or wallet size card shall be issued to all personnel completing the training, which shall be carried with the trained personnel at all times while on the Project site.
- All new personnel shall receive this training and may work in the field for no more than 5 days without participating in the WEAP.
- A log of all personnel who have completed the WEAP training shall be kept on site.
- A copy of the WEAP shall be kept at an easily accessible location within the Project site (i.e., foreman's vehicle, construction trailer, etc.) for the duration of the Project.
- A standalone version of the WEAP shall be developed, that covers all previously discussed items above, and that can be used as a reference for maintenance personnel during Project operations.
- The Applicant shall ensure that interpretation of the WEAP is available for all non-English speaking workers.

MM BIO-CEQA-2 Implementation

Responsible Party: The Applicant shall ensure that a qualified biologist (approved by the CPUC) prepares the WEAP and that it is implemented for all on-site Project personnel.

Timing: Prior to construction, and during construction for all new on-site Project personnel.

Mitigation Monitoring and Reporting Program: The WEAP shall be developed by a qualified biologist designated by the Applicant and approved by the CPUC. A copy of the WEAP shall be kept at an easily accessible location within the Project site for the duration of the Project. A log of all personnel who have completed the WEAP training shall be kept on site.

Standards for Success: All construction/Project related personnel are trained in the key characteristics for identifying and avoiding impacts to special-status species and sensitive habitats.

MM BIO-CEQA-3: Implement Biological Construction Monitoring.

APM BIO-2, BMP BIO-02, and CMA LUPA BIO-2 shall be incorporated within this MM BIO-CEQA-3.

No more than 30 days prior to the start of site mobilization or ground disturbing activities, the Applicant shall designate a qualified biologist(s) to monitor construction of the Project. Multiple qualified biologists shall be designated by the Applicant, as needed. Designated qualified biologists must be approved by the CPUC, BLM, and CDFW prior to conducting construction monitoring. The biologist(s) must be knowledgeable with the life history and habitat requirements of Federal and State listed and special-status plants, mammals, reptiles, amphibians, and birds. The qualified biologist(s) shall conduct clearance surveys for listed and special-status species prior to the start of construction activities each workday during initial site disturbance; clearance surveys can be conducted on a weekly basis thereafter. Any handling of special-status species must be approved by the appropriate Federal and State agencies and be done in accordance with species-specific handling protocols. During initial site disturbance, and for the duration of construction, the qualified biologist(s) shall remain on-site at all times when activities shall occur immediately adjacent to, or within, habitat that supports populations of listed and/or special-status species. The designated biologist(s) shall relocate terrestrial special-status species that would be impacted by the Project. An exception to this would be for Fully Protected species, which would require avoidance. Additionally, Federal and state-listed species would require FESA and CESA authorization to handle or relocate. All locations of listed and/or special-status plants shall be flagged for avoidance or salvage, relocation, or transplanting as described in MM VEG-CEQA-4. Similarly, locations of listed and/or special-status wildlife shall be flagged for avoidance and appropriate avoidance buffers established as described in MM WIL-CEQA-1 through MM WIL-CEQA-11. Results of all monitoring shall be recorded on daily site observation reports and include details the construction activities. The daily monitoring reports shall be compiled and submitted to the CPUC, BLM, and CDFW for review on a weekly basis. Contents of the reports shall include at a minimum the date, time of monitoring, location, qualified biologists name, construction activities, biological conditions and species detections, and any issues encountered during the monitoring effort.

If dead or injured special-status wildlife species and/or impacted special-status plant are detected on the construction site, the qualified biological monitor shall, immediately upon finding the remains or injured animal, coordinate with the onsite construction foreman to discuss the events that caused the mortality or injury, if known, and implement measures to prevent future incidents. Details of these measures shall be included within a separate monitoring incident report. Species remains shall be collected and frozen as soon as possible, and CDFW and USFWS, as well as all other appropriate Federal and State regulatory agencies, shall be contacted regarding ultimate disposal of the remains. The incident report shall be sent to the CPUC, CDFW and/or USFWS (as appropriate), as well as any other appropriate Federal and State agencies, within five calendar days. The construction biological monitoring report shall at a minimum include: the date, time of the finding or incident (if known), and location of the carcass, injured animal or other impacted species, and the circumstances of its death or injury (if known). Injured animals shall be taken immediately to the nearest appropriate veterinary or wildlife rehabilitation facility.

MM BIO-CEQA-3 Implementation

Responsible Party: The Applicant is responsible for designating qualified biologists to monitor Project construction activities that are within and/or adjacent sensitive habitats, and/or have the potential to impact special-status species.

Timing: During all Project phases if biological resources are pertinent or monitoring is required by the appropriate Federal or State regulatory agency.

Mitigation Monitoring and Reporting Program: Copies of daily monitoring reports shall be compiled and submitted to the CPUC, BLM, and CDFW on a weekly basis. Separate incident reports shall be compiled and submitted to the appropriate Federal and State agencies if observations of dead, injured or impacted special-status species are observed during monitoring within five calendar days.

Standards for Success: Sensitive biological resources are avoided and/or impacts are reduced to a less than significant level throughout all construction activities.

MM BIO-CEQA-4: Avoidance Measures and Compensation for Impacts to Jurisdictional Waters/Wetlands and/or Sensitive Natural Communities.

The following APMs, BMPs, and CMAs shall be incorporated within this MM BIO-CEQA-4: APM BIO-2; BMP BIO-2; APM BIO-4; APM BIO-11; BMP BIO-11; APM BIO-13; APM BIO-14; APM BIO-15; BMP BIO-15; APM BIO-16; BMP BIO-24; BMP BIO-25; BMP BIO-52; BMP BIO-53; BMP BIO-55; BMP VEG-01; BMP VEG-02; CMA DFA-BIO-IFS-1; CMA DFA-BIO-IFS-2; CMA DFA-VPL-BIO-DUNE-1; CMA LUPA-BIO-1; CMA LUPA-BIO-2; CMA LUPA-BIO-3; CMA LUPA-BIO-4; CMA LUPA-BIO-7; CMA LUPA-BIO-9; CMA LUPA-BIO-13; CMA LUPA-BIO-14; CMA LUPA-BIO-DUNE-1; CMA LUPA-BIO-DUNE-3; CMA LUPA-BIO-DUNE-5; CMA LUPA-BIO-PLANT-1; CMA LUPA-BIO-PLANT-2; CMA LUPA-BIO-RIPWET-1; CMA LUPA-BIO-RIPWET-3; CMA LUPA-BIO-SVF-1; CMA LUPA-BIO-SVF-6; CMA LUPA-SW-13; and CMA LUPA-SW-16.

To avoid, minimize disturbance, and restore impacts to jurisdictional waters/wetlands and sensitive natural communities the following shall be implemented:

- Prior to conducting any Project activities, a formal jurisdictional delineation and mapping of sensitive natural communities shall be conducted following current protocols, guidance, and standards, as defined by the ACOE, RWQCB, and CDFW. The Applicant shall ensure that a formal delineation is conducted, and all required regulatory permits are obtained prior to the start of Project construction activities.

- Implement APMs and BMPs to prevent prohibited materials from entering jurisdictional waters/wetlands and/or causing disturbance to sensitive natural communities.

- Construction activities shall be done in such a manner as to avoid and minimize the removal and impacts to jurisdictional waters/wetlands and sensitive natural communities to the extent feasible.

- If jurisdictional waters/wetlands and/or sensitive natural communities are present within the Project area, then they shall be identified as environmentally sensitive areas and flagged by an Applicant designated qualified biologist prior to construction activities.

- If jurisdictional waters/wetlands and/or sensitive natural communities are present within the Project area, then the Applicant shall ensure that the designated qualified biologist is on-site at all times during active work in these areas; including but not limited to

within the floodplain, adjacent to and/or in jurisdictional waters/wetlands, and/or in sensitive natural communities. All on-site personnel shall be instructed on the importance of avoiding and minimizing disturbance in these areas if present within the Project area.

- If impacts to jurisdictional waters/wetlands or sensitive natural communities cannot be avoided, the Applicant shall coordinate with the appropriate Federal and State regulatory agencies to obtain authorization from the ACOE through a CWA Section 404 ACOE Nationwide Permit (NWP) or Individual Permit (IP); the RWQCB through a CWA Section 401 Water Quality Certification (WQC); and the CDFW through a California FGC Section 1602 Lake and Streambed Alteration (LSA) Notification.

- The Applicant shall restore all temporary impacts at a ratio of 1.5:1 as described in the Vegetation Management Plan (MM-VEG-CEQA-1). Restoration of conditions of the impacted areas within the Project footprint shall be at 1:1; and creation, restoration, or enhancement of similar vegetation communities offsite shall be 0.5:1, as approved by CDFW and CPUC. Alternatively, payments would be made into an appropriate mitigation program or other mitigation funding mechanism.

- To compensate for permanent impacts to jurisdictional waters/wetlands, the impacted areas shall be replaced at a minimum ratio of 2:1 but will vary depending on the mitigation strategy used. Permanent impacts to riparian desert woodland habitats (e.g., blue Palo Verde-ironwood woodland, mesquite thickets, bush seepweed) that are jurisdictional shall be mitigated at a ratio of 5:1 (e.g., desert riparian woodland). Additional mitigation may be proposed by each Federal and/or State agency during the regulatory permitting process. The mitigation strategy to compensate for the loss of jurisdictional habitats may be achieved by (a) on-site habitat creation or enhancement with similar species compositions to those present prior to construction; (b) off-site creation, enhancement, and/or preservation; and/or (c) participation in an established mitigation bank program. If offsite lands are used as part of the mitigation strategy, then they shall be permanently protected by establishing a conservation easement. The Applicant shall coordinate with CPUC, BLM, and CDFW to determine the conditions of the conservation easement, including the required acreage to be conserved and the required monitoring and management of the conserved lands, as appropriate. All mitigation for temporary and/or permanent impacts to jurisdictional waters/wetlands and/or sensitive natural communities shall be approved by the appropriate Federal and State regulatory agencies prior to Project activities.

- All created or restored habitats shall be monitored per the requirements in the Vegetation Management Plan (MM-VEG-CEQA-1), and the Special-Status Plant and Sensitive Vegetation Community Mitigation and Monitoring Plan (MM-VEG-CEQA-4). All lands identified for preservation would require the recordation of a conservation easement. The easement could be held by CDFW or an approved land management entity. All lands identified for preservation shall require approval from the appropriate Federal and/or State regulatory agency.

MM BIO-CEQA-4 Implementation

Responsible Party: The Applicant shall ensure that a designated qualified biologist (approved by the CPUC, BLM, and CDFW) conducts pre-construction surveys (i.e., delineation and mapping) for jurisdictional waters/wetlands and sensitive natural communities. The Applicant is responsible for the implementation of environmentally sensitive area exclusion fencing and mitigation from potential impacts of these features.

Timing: Pre-construction surveys to delineate jurisdictional aquatic resource features and/or map sensitive vegetation communities shall be completed prior to Project commencement and all required permits have been obtained. Environmentally sensitive area exclusion fencing (at appropriate buffer distances) shall be implemented in the appropriate locations prior to Project activities. All temporary and permanent mitigation shall be approved by the appropriate Federal and/or State regulatory agencies prior to Project commencement.

Mitigation Monitoring and Reporting Program: A Preliminary Jurisdictional Wetlands/Waters Delineation Report shall be prepared and approved by the ACOE and CDFW prior to Project commencement; all required regulatory permits must be obtained prior to the start of Project activities. All jurisdictional waters/wetlands and sensitive natural communities shall be identified (including measures for avoidance and mitigation), mapped, and included in the Vegetation Management Plan (MM VEG-CEQA-1). Specific mitigation and monitoring requisites for temporarily and/or permanently impacts jurisdictional waters/wetlands and/or sensitive natural communities shall also be documented in the Special-Status Plant and Sensitive Vegetation Community Mitigation and Monitoring Plan (MM-VEG-CEQA-4). Subsequent follow-up reporting measures are as defined in the Vegetation Management Plan (MM VEG-CEQA-1) and Special-Status Plant and Sensitive Vegetation Community Mitigation and Monitoring Plan (MM-VEG-CEQA-4).

Standards for Success: No net loss of jurisdictional waters/wetlands and/or sensitive natural communities. Disturbance to all jurisdictional waters/wetlands and/or sensitive natural communities shall be minimized and avoided to the extent feasible. Temporary impacts shall be restored at a 1.5:1 ratio. Restoration of conditions of the impacted areas within the Project footprint shall be at 1:1; and creation, restoration, or enhancement of similar vegetation communities offsite shall be 0.5:1, as approved by CDFW and CPUC. Alternatively, payments would be made into an appropriate mitigation program or other mitigation funding mechanism. Permanent impacts to jurisdictional waters/wetlands shall be mitigated at a ratio that varies from 2:1 to 5:1 depending on the resource impacted and mitigation strategy used. All temporary and/or permanent impacts to jurisdictional waters/wetlands and/or sensitive natural communities shall be mitigated and approved by the appropriate Federal and State regulatory agencies.

MM VEG-CEQA-1: Develop and Implement a Vegetation Management Plan.

The following APMs, BMPs, and CMAs shall be incorporated within this MM VEG-CEQA-1: APM BIO-4; APM BIO-10; APM BIO-11; BMP BIO-11; APM BIO-12; APM BIO-13; APM BIO-14; APM BIO-15; BMP BIO-15; APM BIO-16BMP BIO-37; BMP BIO-41; BMP BIO-41; BMP BIO-43; BMP BIO-51; BMP BIO-52; BMP BIO-53, BMP BIO-54; BMP BIO-55; BMP VEG-01; BMP VEG-02; CMA DFA-BIO-IFS-1; CMA DFA-BIO-IFS-2; CMA LUPA-BIO-1; CMA LUPA-BIO-3; CMA LUPA-BIO-4; CMA LUPA-BIO-7; CMA LUPA BIO-8; CMA LUPA-BIO-10; CMA LUPA-BIO-11; CMA LUPA-BIO-14; CMA LUPA-BIO-15; CMA LUPA-BIO-COMP-1; CMA LUPA-BIO-PLANT-1; CMA LUPA-BIO-PLANT-2; CMA LUPA-BIO-PLANT-3; CMA LUPA BIO-SVF-1; CMA LUP-BIO-VEG-1; CMA LUP-BIO-VEG-2; CMA LUP-BIO-VEG-3; CMA LUP-BIO-VEG-5; CMA LUP-BIO-VEG-6; CMA LUPA-SW-13; CMA LUPA-TRANS-BIO-4; and CMA DFS-VPL-BIO-FIRE-1.Prior to the start of ground disturbance, the Applicant shall develop and implement a Vegetation Management Plan for the Project. The Vegetation Management Plan shall be approved by the BLM, CPUC, and CDFW prior to the start of any Project activities (i.e., mobilization). The purpose of the Vegetation Management Plan is to provide guidance and outline a Project-specific protocol to ensure that the Applicant restores all temporarily disturbed areas to pre-construction conditions, or better, and provide for habitat preservation, creation, and/or restoration resulting from permanent impacts to special-status species habitat, sensitive vegetation communities, and/or jurisdictional waters/wetlands.

The Vegetation Management Plan shall detail procedures to manage, monitor, mitigate, and restore native vegetation and habitat, as well as provide controls for noxious and invasive weed species. The Vegetation Management Plan shall incorporate the APMs, BMPs, and CMAs, by including the specifications detailed in the Habitat Restoration and Monitoring Plan, the Noxious Weed Management Plan/Invasive Species Management/Control Plan, and all other applicable vegetation management mitigation and monitoring plans associated with the Project.

The Vegetation Management Plan shall also reference and integrate protocols and requirements detailed in the most up-to-date State and Federal laws, policies and guidance regarding vegetation management including, but not limited to:

- Integrated Vegetation Management Handbook (BLM 2008);
- Integrated Weed Management Plan (BLM 2015b);
- Memorandum of Understanding on Vegetation Management for Powerline Rights-of-Way (USDA 2016);
- New Diagrams and Applications for the Wire Zone-border Zone Approach to Vegetation Management on Electric Transmission Line ROWs (Ballard et al. 2007);
- Saguaro (Carnegiea gigantea, Cactaceae) Age-Height Relationships and Growth: The Development of a General Growth Curve (Drezner 2003);
- The Step-Pointe Method of Sampling- A Practical Tool in Range Research (Evans et al. 1957); and

- Transmission Vegetation Management, NERC Standard FAC-003-2 Technical Reference (NERC 2009-2011).

The Vegetation Management Plan shall include, at a minimum, an overview of the following technical items:

- **Vegetation Management Goals and Objectives.** The goals of Project vegetation management shall be defined in the Project Vegetation Management Plan. At a minimum, Project vegetation management shall be consistent with the following objectives:
  - Vegetation management measures and BMPs pertaining to sensitive vegetation species and habitats, seeding, soils, restoration and revegetation, noxious and invasive weeds, equipment, schedule and implementation timing, success criteria, monitoring and reporting will be specifically outlined and be consistent with the aforementioned protocols and methodologies set forth by the appropriate State and Federal regulatory agencies;
  - Vegetation will be trimmed, cleared, or otherwise controlled, to minimize and reduce impacts to the extent practicable;
  - Avoidance and minimization shall be employed to ensure the reduction, introduction, and spread of noxious and invasive weed species;
  - The Project will restore and revegetate affected areas;
  - Habitat enhancement and preservation shall be applied to the extent practical (e.g., promote appropriate levels of dead and downed woody debris to provide habitat and sees bed establishment); and
  - Mitigation and contingency measures will be employed on an as needed basis.
- **Plan Submittal and Approval Process.** A process for proposing Vegetation Management Plan modifications to the appropriate Federal and State regulatory agencies for review and approval shall be outlined**.**
- **Avoidance, Minimization, Restoration, and Mitigation Criteria.** Documentation shall include the avoidance, minimization, restoration, and mitigation criteria terms, stipulations, and general conditions required by the appropriate Federal and State regulatory agencies. All disturbed Project areas shall be restored and revegetated to the extent practicable, given the arid desert environment.
- **Pre-Construction Project Site Conditions.** Provide a description of the pre-Project conditions. Describe other site characteristics relevant to the management of vegetation (e.g., composition of plants, topography and drainage patterns, soil types, geomorphic and hydrologic processes important to the site or species, pre-construction anthropogenic factors, etc.). This shall also include ecological characteristics and factors **(**e.g., total population, reproduction, distribution, pollinators, etc.).

- **Methods**. Describe the methods that will be used (e.g., invasive exotics control, site protection, seedling protection, propagation techniques, crush and drive-cut-mow removal techniques, etc.) and the long-term maintenance required.

- **Discussion.** The Vegetation Management Plan will include a discussion section that, at a minimum, considers specifications for habitat preservation and enhancement, adaptive management, use of conservation easements (e.g., Desert Wildlife Management Area, Wildlife Habitat Management Area), and other land use protections and restrictions applicable to the management of vegetation within the Project area.

- **Schedule.** A proposed schedule for all vegetation management, including vegetation pre- and post- construction surveys, monitoring, mitigation, restoration, and Project construction activities. The following is recommended as part of the Vegetation Management Plan schedule:

    - Species-specific seasonal restriction dates will be outlined in the Vegetation Management Plan and observed during implementation. At a minimum, this shall incorporate timeframes for breeding and nesting birds, lambing, fawning, or roosting of species, bloom periods for special-status species, and periods of highest precipitation and rainfall (i.e., to maximize irrigation requisites and implement erosion controls).

    - The Project area should be broken up into sections based on the required construction activities;

    - When applicable, restoration or habitat enhancement activities shall be implemented once construction activities are complete within a specific area; and

    - Restoration and/or creation of habitat should occur within an appropriate window for each specific community and species makeup (i.e., impacts to habitat during the summer months may not be initiated until the fall to promote native seed germination).

- **Pre-Construction Survey.** Pre-construction vegetation surveys will consist of up to three survey events, to capture the annual species only present at specific times of the year, to document the presence of special-status species, to identify and map the locations and extent of sensitive vegetation communities, and a general vegetation inventory survey for all vegetation species, including invasive and noxious weeds. Measures for conducting and completing floristic surveys to support the Vegetation Management Plan are specified in MM VEG-CEQA-2—Conduct Pre-Construction Floristic Surveys.

- **Post-Construction Surveys, Monitoring, and Reporting.** The Applicant shall appoint a qualified biologist to complete post-construction surveys. Monitoring surveys shall be conducted within following vegetation management activities within the Project area (e.g., restoration, re-contouring, etc.). Areas subject to vegetation management shall be monitored to assess progress and to make recommendations for successful

revegetation, habitat enhancement, etc. Monitoring surveys shall be performed by a qualified biologist knowledgeable in the area of vegetation management and restoration specific to the Project vegetation communities and jurisdictional waters/wetlands.

Monitoring

- Qualitative Monitoring: Qualitative monitoring surveys shall be performed monthly in all vegetation management areas for the one year following the completion of Project activities and subsequent vegetation management implementation. Qualitative monitoring shall be on a quarterly schedule thereafter, until final completion and approval by the appropriate Federal and State regulatory agencies. Qualitative monitoring shall assess native plant species performance, including growth and survivorship, germination success, reproduction, plant fitness and health, and pest or invasive plant problems. Monitoring at this stage shall indicate need for remediation or maintenance work well in advance of final success/failure determination. Post-Construction Vegetation Management Quarterly Monitoring Progress Reports shall be prepared for the first year of monitoring and are further described below.

- Quantitative Monitoring: Quantitative monitoring shall occur annually for year one through five, or for additional years until the success criteria are met. Within each vegetation management area, the qualified biologist shall collect data in a series of 1 m^2 quadrats to estimate absolute and relative cover and density of each plant species. In year 2 or 3, depending on the growth within the vegetation management, the qualitative monitoring methods may deviate from the quadrat methodology to toe-point transects (Evans et al. 1957). Data shall be used to measure native species growth performance, to estimate native and non-native species coverage, seed mix germination, native species recruitment and reproduction, and species diversity. Based on these results, the designated biologist shall make recommendations for maintenance, adaptive management, or remedial work efforts that may be needed to meet success criteria for the Project area vegetation management requisites.

Reporting

- Quarterly Reporting: For the first year, a Post-Construction Vegetation Management Quarterly Monitoring Progress Report shall be compiled by the Applicant detailing the post-construction results for areas where vegetation management has occurred within the Project area. The Post-Construction Vegetation Management Quarterly Monitoring Progress Reports shall include results for monthly qualitative monitoring; specifically, summarizing site status and recommended remedial measures. Each Post-Construction Vegetation Management Quarterly Monitoring Progress Report shall list estimated species coverage and diversity, species health and overall vigor, the establishment of volunteer native species, topographical/soils conditions, problem weed species, the use of the site by wildlife, significant drought stress, and any recommended

remedial and/or adaptive management measures deemed necessary to ensure compliance with specified vegetation management success criteria.

- Annual Reporting: Every year, for years one through five, the results of annual quantitative monitoring shall be compiled into an Annual Post-Construction Vegetation Management Report by the Applicant. Each annual report shall list plant species coverage and diversity measured during yearly quantitative surveys, compliance/non-compliance with required vegetation management success criteria, species health and overall vigor, the establishment of volunteer native species, hydrological and topographical conditions, use of the site by wildlife, and the presence of invasive weed species. In the event of where the required vegetation management success criteria are not fulfilled, the Annual Post-Construction Vegetation Management Report shall include remedial and/or adaptive management measures to ensure future success (CPUC 2016). These annual reports shall be forwarded by the qualified biologist to the appropriate State and Federal regulatory agencies (e.g., CPUC, BLM, and CDFW) at the end of each year following implementation of the Vegetation Management Plan, until the established success criteria have been met. Each Post-Construction Vegetation Management Annual Report shall include, at the minimum:

  - The name, title, and company of all persons involved in restoration monitoring and report preparation;
  - Maps or aerials showing vegetation management (i.e., restoration and invasive weed management areas), transect locations, and photos documentation with locations;
  - An explanation of the methods used to perform vegetation management, including, but not limited to, the number of acres for restoration and/or areas treated for removal of non-native plants; and
  - An assessment of the treatment success.

- **Planting Methodology and Palette**. Revegetation plantings shall be implemented in all areas impacted by Project activities. A description of the preferred methods for seeding shall be provided within the Vegetation Management Plan (e.g., hydroseeding, drill seeding, broadcast seeding, etc.). Additionally, a discussion on proposed timing of seeding, type and duration of irrigation system proposed (if needed), and erosion controls for revegetation activities, shall be included.

Several different plant palettes shall be developed depending on the vegetation communities proposed to be restored. The plant palettes shall include an appropriate native seed mix representative of the current species composition in the Project area.

Seed should be sourced from genetic stock appropriate to the Project vicinity. In additional, all plant materials used in Project revegetation shall be consistent with the maintenance of natural ecosystem processes. Supply of seed material and container plants will be purchased by the Contractor. If commercial seed mixes are purchased, they shall be native and free of noxious weeds. If seed from genetic stock appropriate to the Project

vicinity is not available, seeds can be collected within the Project vicinity with the appropriate permits and tags for native plant collection. The source of available seed must be approved by the BLM and CPUC prior to use in any species palates. Seeding and revegetation shall begin after construction has and will occur within 30 days post-construction. Supply of seed material and container plants will be purchased by the Contractor(s).

- **Noxious Weed and Invasive Species Management.** The Vegetation Management Plan will identify noxious and invasive weed species to be addressed in the Project area, describe measures to conduct pre-construction weed surveys, reduce the potential introduction or spread of noxious weeds and invasive species during construction, and monitor and control weeds during operation of the transmission line. Specifically, an inventory of invasive and noxious weeds shall be compiled following pre-construction floristic surveys and disposed of at an appropriate off-site location (MM VEG-CEQA-2). If weeds are detected in the Project area following removal, then remedial actions shall be employed to eradicate noxious or invasive weed species and to prevent their subsequent spread.

All equipment, tools, and tires shall be properly cleaned and decontaminated of noxious weeds before entering the Project region. Prior to construction activities (i.e., including clearing, grubbing, etc.), a Weed Decontamination Form will be submitted to the Project Designated Biologist. The Weed Decontamination Form shall verify that construction related equipment used by the contractor(s), has been cleaned and deemed weed free, before entering the Project region. Vehicle and equipment wash, and inspection stations will be utilized minimize the introduction of invasive weeds or subsidy of invasive weeds.

Weed removal activities such as noxious/ invasive weed removal, and other varied management practices, are recommended before (e.g., topsoil weed removal) and after construction.

When installing sediment barriers, the use of certified weed-free mulch, straw, hay bales, or equivalent fabricated materials shall be prescribed.

The use of pesticides and/or herbicides is restricted in areas associated with waterways, wetlands, or areas that could impact water quality. Weed removal in jurisdictional areas adjacent to streams or wetlands shall be done using hands tools. Application of pesticides and/ or herbicides must be approved by the Project Designated Biologist, the appropriate local, State, and Federal regulatory agencies.

- **Soils and Contouring.** Native soils will be salvaged to the extent feasible. Specifically, soil horizons will be separated for the spoils, stored during construction, and returned to their native sites to ensure revegetation and restoration success. Restoring and preserving vegetation, as well as soil, will support and maintain native vegetation communities, associated carbon sequestration and nutrient cycling processes, and habitat for wildlife species. Erosion control measures will be implemented during all Project ground disturbance, including vegetation management activities.

Recontouring of areas that were altered from their original contour or gradient is required.

- **Treatment of Succulents.** Measures would be implemented to minimize the number of succulents (e.g., saguaro cacti) that must be relocated for the safe construction and operation of the transmission line. The Vegetation Management Plan shall detail requirements and methods for the salvage, storage, and replanting of succulent species. Saguaro cacti that are within 50-feet of the outermost conductors and could be tall enough to pose a hazard would be removed if they cannot be avoided through Project design. When possible, succulent species that must be removed would be relocated as directed by the appropriate State and Federal agencies (i.e., the BLM). Monitoring and management would be detailed in the Vegetation Management Plan.

- **Success Criteria.** A description of the success criteria and methods for achieving success of vegetation management, specifically restoration/revegetation efforts, and supplemental activities to be conducted. Success criteria in the Vegetation Management Plan shall address include the following components:

  - Compliance Success: evaluates compliance with Project scope, permits, contracts, etc.

  - Functional Success: evaluates habitat integrity and determines if restoration of the designated ecosystem(s) has been successful.

  - Landscape Success: measures functional success and how restoration, management, maintenance, and monitoring of Project vegetation has contributed to the ecological integrity of overall landscape and has further maintained and/or enhanced biodiversity. Success will be based on the establishment of seeded and planted species and the exclusion of exotic and ruderal species as compared to reference or neighboring sites.

- **Figures.** The Vegetation Management Plan shall include detailed figures indicating the locations and vegetation types of areas proposed for management (i.e., areas of temporary or permanent disturbance, mitigation areas, etc.).

  - The location of special-status plant species shall be consistent with the floristic inventory conducted as part of MM VEG-CEQA-2. Specifically, these figures shall meet the specific BLM Guidelines for mapping of succulent species (e.g., cacti, yuccas, etc.);

  - Mapped habitats for other species shall be consistent with the survey requirements;

  - Avoidance setbacks for sensitive vegetation species and habitats shall be delineated on the Vegetation Management Plan figures. Setbacks shall be consistent with appropriate distances outlined in the APM, BMP, and CMA measures, as well as those defined by State and Federal requisites for the Project; and

  - Vegetation Management Plan figures shall be updated, as necessary, to reflect current site conditions should they change.

- **Supplemental References.** In addition to the incorporation of the most-up-to-date State and Federal protocols, policies and guidance pertaining to vegetation management, the following Project-specific plans shall be referenced and/or included as supplemental attachments to the Vegetation Management Plan.
  - Erosion Control Plan (ECP)/ Erosion, Dust Control, and Air Quality Plan;
  - Fire Prevention Plan;
  - Project grading plans;
  - SPCC; and
  - SWPPP

MM VEG-CEQA-1 Implementation

Responsible Party: The Applicant shall ensure that a qualified biologist (approved by the CPUC, BLM, and CDFW) familiar with special-status species, sensitive vegetation communities, noxious and invasive vegetation species, and jurisdictional waters/wetlands present in the Project region, is appointed to oversee vegetation management activities.

Timing: Vegetation management shall be conducted, as needed, within the Project area prior to construction, during construction, and following the completion of Project activities; special attention will be paid to avoid nesting/breeding seasons for special-status wildlife and blooming periods for status plants where practicable.

Mitigation Monitoring and Report Program: Prior to Project commencement, pre-construction vegetation surveys shall be conducted by an Applicant designated qualified biologist. A Vegetation Management Plan shall be prepared by the Applicant and approved by the appropriate Federal and State regulatory agencies prior to Project commencement. Following Project completion, the Applicant shall ensure post-construction vegetation management surveys are completed quarterly and annually. Post-Construction Vegetation Management Quarterly Monitoring Reports, and Post-Construction Vegetation Management Annual Monitoring Reports shall be prepared by the Applicant and submitted to the appropriate Federal and State regulatory agencies.

Standards for Success: Restore temporarily disturbed areas to pre-construction conditions, or better, and provide for habitat preservation/creation/restoration resulting from permanent impacts to sensitive vegetation species, sensitive vegetation communities, and jurisdictional waters/wetlands. Reduce the spread and introduction of noxious and invasive vegetation species. Ensure all Project vegetation management success criteria are met. Remedial and/or adaptive management measures shall be implemented to meet vegetation management success criteria for the Project, as needed.

MM VEG-CEQA-2: Conduct Pre-Construction Floristic Surveys.

The following APMs, BMPs, and CMAs shall be incorporated within this MM BIO-VEG-CEQA-2: APM BIO-2; BMP BIO-02; APM BIO-4; APM BIO-11; BMP BIO-11; BMP BIO-24; BMP BIO-41; BMP BIO-52; BMP BIO-53; CMA DFA-BIO-IFS-1; and CMA LUPA-

BIO-1.Prior to the start of ground disturbance, including fencing, grading, or construction, the Applicant shall designate a qualified biologist/botanist (approved by the CPUC, BLM, and CDFW) to conduct pre-construction floristic surveys for the Project. The purpose of the pre-construction floristic surveys is to identify if and/where special-status plant species occur within the Project area. The pre-construction floristic surveys shall also adhere to the following protocols and requisites detailed by the BLM, and the most up-to-date State and Federal protocols, policies, and guidance:

- CNPS Botanical Survey Guidelines (CNPS 2001); General Rare Plant Survey Guidelines (Cypher 2002);
- Guidelines for Conducting and Reporting Botanical Inventories for Federally Listed, Proposed and Candidate Plant (USFWS 1996);
- Protocols for Surveying and Evaluating Impacts to Special-Status Native Plant Populations and Sensitive Natural Communities (CDFW 2018a);
- Survey Protocols Required for NEPA/ESA Compliance for BLM Special-Status Plant Species (BLM 2009).

Reconnaissance-level surveys, floristic in nature, will be conducted to inventory plants occurring within the Project area. The surveys shall be completed prior to Project commencement. It is recommended that the surveys be conducted concurrently with blooming periods for all special-status species known to occur in the Project and surrounding area as detailed below. The purpose of the surveys is to identify and record all observable plant species (at a minimum to the genus level); identify and map areas where special-status plant species occur and to support pre-construction requisites detailed in the Vegetation Management Plan (MM VEG-CEQA-1) (e.g., avoidance areas, occurrences of invasive and noxious weeds, etc.).

A complete inventory of observed plant species will be compiled and included as an appendix in the Vegetation Management Plan (MM VEG-CEQA-1). In addition, ACOE national wetland indicator status, and the native/non-native status of each species observed shall be included. For invasive and noxious plant species, their State and Federal ranks shall be listed using up-to-date information provided by the U.S. Department of Agriculture (USDA) and the California Invasive Plant Council (Cal-IPC).

a) Surveys for Sensitive Plant Species: To avoid and/or minimize impacts to endangered, threatened, rare, and/or special-status plant species within the Project area, the designated qualified biologist/botanist will conduct pre-construction floristic surveys for sensitive plant species. The pre-construction floristic surveys shall be at a reconnaissance-level and timed to cover the appropriate bloom period(s) for the sensitive plant species that have known occurrences and/or have a moderate potential to occur in the Project area. Specifically, for the Project, three pre-construction bloom-period floristic surveys are recommended to be conducted to maximize the potential for observations during the appropriate bloom-period for special-status species that have known occurrences or the potential to occur in the Project area, which include reference populations for each special-status species shall be checked to ensure surveys are conducted during appropriate blooming periods. If special-status plants

are determined to have no presence within the Project area, then no further action or mitigation is required.

b) If special-status plant species are determined present within the Project area during pre-construction floristic surveys, Project activities shall be reduced and minimized to avoid impacts to the extent feasible.

In addition, mapping the population and placing flagging and/or exclusion fencing to protect the special-status plant species within the Project area during construction shall be implemented. Installation of environmentally sensitive area fencing and appropriate signage at an appropriate setback or buffer distance, starting from the edge of the individual and/or population. Signage should indicate the area is environmentally sensitive and not to be disturbed. Specifically, if any Federal or State listed threatened or endangered plant species are detected in the Project area that may be impacted, a buffer zone shall be implemented of sufficient size to prevent direct or indirect disturbance to the special-status plants from construction activities, erosion, inundation, or dust. The size of the buffer will depend upon the proposed use of the immediately adjacent lands and the plant's ecological requirements to be specified by the designated qualified biologist/botanist. At a minimum, the buffer for trees or shrubs species shall be equal to twice the drip line (i.e., two times the distance from the trunk to the canopy edge) to protect and preserve the root systems. The buffer for herbaceous species shall be a minimum of 50 feet from the perimeter of the occupied habitat or the individual. If a smaller buffer is necessary due to other Project constraints, then the Applicant shall develop and implement site-specific monitoring and put other measures in place to avoid species impacts.

If special-status plants are determined present in the Project area during pre-construction floristic surveys and direct and/or unavoidable impacts to special-status plant species shall result from Project activities, then consultation with appropriate Federal and State agencies will be required to develop acceptable mitigation (e.g., agency recommended mitigation may include translocation of individual plants, rectification of impact by seed collecting and stockpiling for replanting/replacement, mitigation fees, and/or permitting). Once mitigation has been determined by the appropriate State and Federal agencies, then a Special-Status Plant and Sensitive Vegetation Community Mitigation and Monitoring Plan shall be developed and implemented upon approval of the agencies. Specifications for the Special-Status Plant and Sensitive Vegetation Community Mitigation and Monitoring Plan are detailed in MM VEG-CEQA-4 below. Additional reporting and protocol-level survey requirements will be detailed in the Vegetation Management Plan criteria (MM VEG-CEQA-1) and in the Special-Status Plant and Sensitive Vegetation Community Mitigation and Monitoring Plan.

In addition, as part of the Special-Status Plant and Sensitive Vegetation Community Mitigation and Monitoring Plan, if special-status species individuals and/or populations are identified within the Project area, then the designated qualified biologist/botanist will collect specific ancillary data using the *General Instruction for Filling Out CNDDB Field Forms* (CDFW 2018b). The Applicant is responsible for ensuring submittal of all special-status plant species observations to CDFW CNDDB.

MM VEG-CEQA-2 Implementation

Responsible Party: Supervision, guidance, and verification of the implementation of these measures shall be achieved by the Applicant and the designated qualified biologist/botanist.

Timing: A series of three floristic surveys, to capture different blooming periods, will be conducted prior to the start of construction activities; surveys will be conducted in February, May, and September.

Monitoring and Reporting Program: Surveys and monitoring of special-status plants, if identified, shall be conducted by a designated qualified biologist/botanist. The Applicant shall produce a Pre-Construction Floristic Survey Report documenting the results of the floristic survey(s) and submit to the BLM and CPUC, as well as all other appropriate State and Federal agencies.

If special-status plants are determined present in the Project area during pre-construction and impacts are unavoidable, then consultation with appropriate Federal and State agencies will be completed and Special-Status Plant and Sensitive Vegetation Community Mitigation and Monitoring Plan will be developed and implemented.

Standards for Success: No net loss of special-status plant species and/or habitat.

MM VEG-CEQA-3: Conduct Focused Surveys for Harwood's Eriastrum

MM VEG-CEQA-3 will incorporate the following BMPs and CMAs: BMP BIO-24; BMP BIO-31; BMP BIO-49; BMP BIO-53; BMP BIO-54; LUPA-BIO-DUNE-2; CMA LUPA-BIO-PLANT-2; and CMA LUPA-BIO-PLANT-3.

Harwood's eriastrum is an annual herb that is native to California. It is ranked as: CRPR 1B.2 (e.g., fairly endangered in California), a California State Rank of S2 (e.g., imperiled), and is ranked 'sensitive' by the BLM (CNPS 2016).

The Applicant shall designate a qualified botanist (approved by the CPUC, BLM, and CDFW) to conduct pre-construction floristic surveys prior to the commencement of any activities that may modify vegetation (e.g., clearing, mowing, or ground-breaking activities). Pre-construction floristic surveys shall be conducted in a manner which maximizes the likelihood of locating Harwood's eriastrum that may be present. As such, floristic surveys should be conducted in the Project area during the appropriate bloom-period (i.e., March to June) and may be conducted in conjunction with the floristic surveys required in MM VEG-CEQA-2. Pre-construction floristic surveys should be 'floristic in nature', meaning that every plant taxon that occurs on site is identified to the taxonomic level necessary to determine species and listing status. The pre-construction floristic surveys shall also adhere to the following protocols and requisites detailed by most up-to-date State and Federal protocols, policies, and guidance:

- Guidelines for Conducting and Reporting Botanical Inventories for Federally Listed, Proposed and Candidate Plant (USFWS 1996);

- Protocols for Surveying and Evaluating Impacts to Special-Status Native Plant Populations and Sensitive Natural Communities (CDFW 2018a); and

- Survey Protocols Required for NEPA/ESA Compliance for BLM Special-Status Plant Species (BLM 2009).

If individuals and/or populations of Harwood's eriastrum are determined present within the Project area during pre-construction floristic surveys, Project activities shall be reduced and minimized to avoid impacts to the extent feasible. At a minimum, the following avoidance and minimization BMPs shall be implemented:

- Avoid Harwood's eriastrum individuals through micrositing facilities to the maximum extent feasible;

- Within suitable habitat for Harwood's eriastrum, keep equipment to the minimum necessary to accomplish the necessary work;

- On BLM lands, use existing roads or routes. Avoid establishing feature that shall interfere with Harwood's eriastrum habitat or with the movement of sand;

- Staging and temporary-use sites shall not be located within suitable habitat for Harwood's eriastrum;

- Specification for the avoidance, minimization, and protection of Harwood's eriastrum shall be detailed in in the Project specific Vegetation Management Plan (MM VEG-CEQA-1) and the Special-Status Plant and Sensitive Vegetation Community Mitigation and Monitoring Plan (MM-VEG-CEQA-4).

Mapping the population and placing flagging and/or exclusion fencing to protect Harwood's eriastrum within the Project area during construction shall be implemented. Installation of environmentally sensitive area fencing and appropriate signage, starting from the edge of the individual and/or population, shall be implemented. Signage should indicate the area is environmentally sensitive and not to be disturbed. At a minimum, a buffer zone shall be developed for the Harwood's eriastrum of sufficient size to prevent direct or indirect disturbance to the species from construction activities, erosion, inundation, or dust. The size of the buffer will depend upon the proposed use of the immediately adjacent lands and the plant's ecological requirements to be specified by the designated qualified biologist/botanist. The buffer for the Harwood's eriastrum shall be a minimum of 50 feet from the perimeter of the occupied habitat or the individual. If a smaller buffer is necessary due to other Project constraints, then the Applicant shall develop and implement site-specific monitoring and put other measures in place to avoid species impacts.

If Harwood's eriastrum are determined present in the Project area during pre-construction floristic surveys and direct and/or unavoidable impacts will result from Project activities, then occupied lands will be replaced at a minimum 3:1 ratio and consultation with appropriate Federal and State agencies will be required to develop acceptable mitigation (e.g., agency recommended mitigation may include translocation of individual plants, rectification of impact by seed collecting and stockpiling for replanting/replacement, mitigation fees, and/or permitting). Once mitigation has been determined by the appropriate State and Federal agencies, then specifications

for Harwood's eriastrum, including reporting specifications and additional surveying and monitoring, shall be incorporated into the Special-Status Plant and Sensitive Vegetation Community Mitigation and Monitoring Plan (MM VEG-CEQA-4), and the Vegetation Management Plan criteria (MM VEG-CEQA-1).

In addition, as part of the Special-Status Plant and Sensitive Vegetation Community Mitigation and Monitoring Plan, if new occurrences of Harwood's eriastrum are identified within the Project area during construction, then a designated qualified botanist will collect specific ancillary data using the *General Instruction for Filling Out CNDDB Field Forms* (CDFW 2018b). The Applicant is responsible for ensuring submittal of all special-status plant species observations to CDFW CNDDB.

MM VEG-CEQA-3 Implementation

Responsible Party: Supervision, guidance, and verification of this measure shall be achieved the Applicant. Surveys and monitoring for Harwood's eriastrum shall be conducted by the designated qualified botanist (approved by the CPUC, BLM, and CDFW).

Timing: One pre-construction floristic survey shall be conducted during the appropriate bloom-period for Harwood's eriastrum (i.e., March to June).

Monitoring and Reporting Program: The Applicant shall produce a Pre-Construction Harwood's Eriastrum Floristic Survey Report, documenting the results of the floristic survey and submit to the appropriate Federal and State agencies. Floristic survey results for Harwood's eriastrum will also be documented in both the Vegetation Management Plan and the Special-Status Plant and Sensitive Vegetation Community Mitigation and Monitoring Plan. In addition, measures to reduce impacts, protection species individuals and populations, mitigate, and restore for Harwood's eriastrum will be documented in the aforementioned report and plans, if necessary.

Standards for Success: No net loss of Harwood's eriastrum. If Harwood's eriastrum is determined present in the Project area during pre-construction floristic surveys, and impacts are unavoidable, then consultation with appropriate the Federal and State agencies will be completed.

MM VEG-CEQA-4: Compensation for Impacts to Special-Status Plant Species and Sensitive Communities.

The following APMs, BMPs, and CMAs shall be incorporated within this MM VEG-CEQA-4: APM BIO-2; BMP BIO-2; APM BIO-4; APM BIO-11; BMP BIO-11; APM BIO-13; APM BIO-14; APM BIO-15; BMP BIO-15; APM BIO-16; BMP BIO-24; BMP BIO-25; BMP BIO-31; BMP BIO-37; BMP BIO-41; BMP BIO-43; BMP BIO-52; BMP BIO-53; BMP BIO-55; BMP VEG-01; BMP VEG-02; CMA DFA-BIO-IFS-1; CMA DFA-BIO-IFS-2; CMA DFA-VPL-BIO-DUNE-1; CMA LUPA-BIO-1; CMA LUPA-BIO-2; CMA LUPA-BIO-3; CMA LUPA-BIO-4; CMA LUPA-BIO-7; CMA LUPA-BIO-9; CMA LUPA-BIO-13; CMA LUPA-BIO-14; CMA LUPA-BIO-DUNE-1; CMA LUPA-BIO-DUNE-3; CMA LUPA-BIO-DUNE-5; CMA LUPA-BIO-PLANT-2A; CMA LUPA-BIO-8; CMA LUPA-BIO-COMP-1; CMA LUPA-BIO-PLANT-1; CMA LUPA-BIO-PLANT-2; CMA LUPA-BIO-PLANT-3; CMA LUPA-BIO-RIPWET-1;

CMA LUPA RIPWET-3; CMA LUPA-BIO-SVF-1; CMA LUPA-BIO-SVF-6; CMA LUPA-SW-13; and CMA LUPA-SW-16.

If special-status plant species are identified during pre-construction floristic surveys (MM VEG-CEQA-2 and MM VEG-CEQA-3), and there is the potential for impacts, then the Applicant shall implement the measures listed below. Mitigation shall be accordance with Federal and State agencies requisites, as well as with the *Policy on Mitigation Guidelines Regarding Impacts to Rare, Threatened, and Endangered Plants* (CNPS 1998), and developed and approved by the appropriate Federal and State regulatory agencies. Mitigation for impacts to special-status plant species shall consider and overlap with compensation for special-status wildlife, sensitive vegetation communities, and jurisdictional waters and wetlands.

Documentation: The Applicant shall develop and implement a Special-Status Plant and Sensitive Vegetation Community Mitigation and Monitoring Plan. The Special-Status Plant and Sensitive Vegetation Community Mitigation and Monitoring Plan shall summarize the results of the pre-construction floristic surveys and describe any conditions that may have prevented target species from being located or identified, even if they are present as dormant seed or below-ground rootstock (e.g., poor rainfall, recent grazing, or wildfire). The plan will include management considerations for Harwood's eriastrum and serve as the Harwood's Eriastrum Linear ROW Protection Plan, as described by BMP BIO-31 and referenced by MM BIO-CEQA-1. The Special-Status Plant and Sensitive Vegetation Community Mitigation and Monitoring Plan shall at a minimum include:

- Species and locations (i.e., figures) of plants identified for salvage;
- Criteria for determining whether an individual plant is appropriate for salvage;
- The appropriate season for salvage;
- Equipment and methods for collection, transport, and re-planting plants or seed banks, to retain intact soil conditions and maximize success;
- Planting methodology for off-site introduction mitigation methods;
- For shrubs, cacti, and yucca, a requirement to mark each plant to identify the north-facing side prior to transport, and replant it in the same orientation;
- Details regarding storage of plants or seed banks for each species;
- Location of the proposed recipient site, and detailed site preparation and plant introduction techniques for topsoil storage, as applicable;
- A description of the irrigation, weed control, and other maintenance activities;
- Success criteria, including specific timeframe for survivorship and reproduction of each species;
- A schedule for all mitigation activities; and
- A detailed monitoring program, commensurate with the goals detailed in the Vegetation Management Plan (MM VEG-CEQA-1).

- **Onsite Avoidance and Minimization**: Minimizing impacts by limiting the degree or magnitude of the action, and avoidance of special-status plant species is the preferred strategy, wherever feasible.

Specifically, Project work areas shall be located to avoid or minimize impacts to special-status plants. Effective avoidance through Project design shall include a buffer area surrounding each avoided occurrence, where no Project activities will take place. The buffer area will be clearly staked, flagged, and signed for environmentally sensitive area avoidance prior to the beginning of ground-disturbing activities, and maintained throughout the active construction phase(s). The buffer zone shall be of sufficient size to prevent direct or indirect disturbance to the plants from construction activities, erosion, inundation, or dust. The size of the buffer will depend upon the proposed use of the immediately adjacent lands and the plant's ecological requirements to be specified by the designated qualified biologist/botanist. At a minimum, the buffer for trees or shrubs species shall be equal to twice the drip line (i.e., two times the distance from the trunk to the canopy edge) to protect and preserve the root systems. The buffer for herbaceous species shall be a minimum of 50 feet from the perimeter of the occupied habitat or the individual. If a smaller buffer is necessary due to other Project constraints, then the Applicant shall develop and implement site-specific monitoring and put other measures in place to avoid species impacts.

- **Onsite Compensation:** Compensation for unavoidable temporary impacts to special-status plant species shall include on-site habitat restoration with similar species compositions to those present prior to construction at a ratio of 1.5:1. Restoration measures shall be documented in the Vegetation Management Plan (MM-VEG-CEQA-1), as well as the Special-Status Plant and Sensitive Vegetation Community Mitigation and Monitoring Plan.

- **Off-Site Compensation.** Compensation for permanent impacts to special-status plant species based on the results of the floristic surveys shall include off-site creation, enhancement, and/or preservation or participation in an established mitigation bank program at a minimum 3:1 replacement ratio. The Applicant shall coordinate with CPUC, BLM, and CDFW to determine the appropriate mitigation strategy and final replacement ratios and acreages. All mitigation shall be approved by the appropriate Federal and State regulatory agencies prior to Project activities.

The Applicant shall restore all temporary impacts to sensitive vegetation communities (e.g., blue Palo Verde-ironwood woodland, mesquite thickets, bush seepweed scrub, etc.) and special-status species habitat at a minimum ratio of 1.5:1, as detailed in the Vegetation Management Plan (MM-VEG-CEQA-1) and the Special-Status Plant and Sensitive Vegetation Community Mitigation and Monitoring Plan (MM-VEG-CEQA4). Restoration of conditions of the impacted areas within the Project footprint shall be at 1:1; and creation, restoration, or enhancement of similar vegetation communities offsite shall be 0.5:1, as approved by CDFW and CPUC. Alternatively, payments would be made into an appropriate mitigation program or other mitigation funding mechanism.

To compensate for permanent impacts to sensitive vegetation communities and special-status species habitat, the Applicant shall provide the creation and/or restoration of habitat at the following ratios:

- Permanent impacts to sensitive vegetation communities, (e.g., riparian desert woodland habitats, blue Palo Verde-ironwood woodland, mesquite thickets, etc.) shall be mitigated at a ratio of 5:1;
- Permanent impacts to other sensitive vegetation communities shall also be mitigated at a ratio of 5:1; and
- Permanent impacts to jurisdictional waters/wetlands shall be mitigated at a minimum ratio of 2:1, or as otherwise specified by the appropriate Federal and State regulatory agencies.

Off-site compensation lands and/or established mitigation bank program will be identified, if available, in coordination with the appropriate Federal and State regulatory agencies. Off-site compensation lands will consist of habitat occupied by the impacted special-status plants at the appropriate ratio of acreage and the number of plants for any occupied habitat affected by the Project. Occupied habitat will be calculated on the Project site and on the compensation lands as including each special-status plant occurrence. Off-site compensation shall be documented in the Project-specific Special-Status Plant and Sensitive Vegetation Community Mitigation and Monitoring Plan and approved in consultation with the appropriated Federal and State regulatory agencies.

The Applicant shall provide for open space/conservation easements on all acquired lands or provide the required funds for the acquisition of easements to a “qualified easement holder”; the CDFW is a qualified easement holder. To qualify as a “qualified easement holder” a private land trust must have substantial experience managing open space/conservation easements that are created to meet mitigation requirements for impacts to special-status species, have adopted the Land Trust Alliance’s Standards and Practices, and have a stewardship endowment fund to pay for its perpetual stewardship obligations. The Applicant shall also provide the “qualified easement holder” with adequate funds to cover administrative costs incurred during the creation of the easement, funds in the form of a non-wasting endowment to cover the cost of monitoring and enforcing the terms of the easement in perpetuity.

For special-status plant restoration or enhancement activities, several techniques can be applied including:

- **Salvage.** The Applicant shall consult with the designated qualified biologist/botanist, as well as the appropriate Federal and State regulatory agencies, regarding the feasibility and likely success of salvage efforts for each special-status plant species. If salvage is deemed to be feasible, then Applicant shall incorporate salvage measures into the Project-specific Special-Status Plant and Sensitive Vegetation Community Mitigation and Monitoring Plan, which shall be approved by the appropriate Federal and State regulatory agencies prior to implementation.

- **Propagation and Off-Site Introduction.** If salvage and relocation is not believed to be feasible for special-status plants, then Applicant shall consult with appropriate Federal and State agencies, as well as other qualified entities if needed, to develop an appropriate experimental propagation and relocation strategy, based on the life history of the species affected. The strategy will include at minimum: (a) a planting methodology including strategies for species specific collection and salvage measures for plant materials (e.g., cuttings), seed, or seed banks, to maximize success likelihood; (b) details regarding storage of plant, plant materials, or seed banks; (c) location of the proposed propagation facility, and proposed methods; (d); time of year that the salvage and other planting or transplantation practices will occur; (e) irrigation; (f) erosion controls; (g) success criteria; and (h) a detailed monitoring program. All propagation and off-site introductions strategies shall be documented in the Special-Status Plant and Sensitive Vegetation Community Mitigation and Monitoring Plan for the Project.
- **Restoration:** Restoration can be used to mitigate impacts and depending upon the degree of impact, habitat restoration may be as simple as removing debris and controlling public access. In more complex situations, however, partial or total restoration of degraded habitat may require extensive revegetation, and soil protection and stabilization programs. The strategy will include at a minimum: (a) BLM approved genetically and ecologically appropriate native plant materials suitable for the site; (b) a description of any required topsoil salvage, plant salvage, seeding techniques, and methods to stabilize and shape soil surface to reduce soil erosivity; (c) monitoring and reporting protocols; and (d) success criteria. Restoration must be tailored to the specific project site based on the habitat and species involved (CNPS 1998).

- **Monitoring and Maintenance:** All mitigation for special-status plant species shall be monitored to assess progress and to make recommendations for successful establishment. Monitoring shall be performed by a qualified biologist/botanist that the Applicant has designated. At a minimum, Monitoring shall include qualitative and quantitative methods as described in MM VEG-CEQA-1 for the Vegetation Management Plan and MM VEG-CEQA-4 Special-Status Plant and Sensitive Vegetation Community Mitigation and Monitoring Plan. Monitoring shall identify the need for remediation or maintenance work well in advance of final success/failure determination. Monitoring and maintenance progress toward achieving success criteria, conditions, and all observations pertinent to eventual success shall be documented in the Post-Construction Vegetation Management Quarterly Monitoring Progress Reports, and the Annual Post-Construction Vegetation Management Report, as described in the Vegetation Management Plan measure (MM-VEG-CEQA-1). In addition to the Vegetation Management Plan annual and quarterly reporting specifications, reporting for mitigation monitoring and maintenances shall also include Progress reports shall include: (a) estimated species survival; (b) species health and overall vigor; (c) the establishment of volunteer native species; (d) topographical/soils conditions; (e) problem weed species; (f) the use of the site by wildlife; (g) significant drought stress; and (h) recommended remedial measures deemed necessary to ensure compliance with specified success criteria. If Federally

and/or State listed plant species are identified within Project disturbance areas, then consultation with the appropriate resource agencies will be required to develop acceptable mitigation prior to construction, which may include additional measures. Conservation measures to protect or restore listed special-status plant species, or their habitat, may be required by the appropriate Federal and State regulatory agencies before impacts are authorized.

MM VEG-CEQA-4 Implementation

Responsible Party: Supervision, guidance, and verification of compensation for impacts to special-status plants and sensitive vegetation communities, as outlined in this measure, shall be achieved by the Applicant.

Timing: Prior to construction, if special-status plant species or sensitive vegetation communities will be impacted by the Project, then the Applicant shall develop and implement mitigation, with the approval by the appropriate Federal and State regulatory agencies.

Monitoring and Reporting Program: The Applicant shall develop and implement a Special-Status Plant and Sensitive Vegetation Community Mitigation and Monitoring Plan.

Standards for Success: No net loss of special-status plant species, and/or habitat, or sensitive vegetation communities. If special-status plant species or sensitive vegetation communities are determined present in the Project area during pre-construction floristic surveys and impacts are unavoidable, then establishment of a new viable occurrence, equal or greater in extent and numbers, to the affected occurrence shall be met. Additionally, consultation with the appropriate Federal and State agencies will be completed.

MM WIL-CEQA-1: Develop and Implement an APP and BBCS.
The following APMs, BMPs, and CMAs shall be incorporated within this MM WIL CEQA-1: BMP BIO-19, APM BIO-20, APM BIO-21, BMP BIO-21, BMP BIO-29, BMP BIO-30, BMP BIO-33, BMP BIO-40, BMP BIO-45, BMP BIO-48, CMA LUPA-BIO-14, CMA LUPA-BIO-16, CMA LUPA-BIO-17, CMA LUPA-BIO-COMP-2, CMA LUPA-BIO-IFS-11, CMA-LUPA-BIO-IFS-12, CMA LUPA-BIO-BAT-1, CMA LUPA-BIO-COM-2, CMA LUPA-BIO-DUNE-5, CMA LUPA-BIO-IFS-13, CMA LUPA-BIO-IFS-14, CMA LUPA-BIO-IFS-24, CMA LUPA-BIO-IFS-25, CMA LUPA-BIO-IFS-26, CMA LUPA-BIO-IFS-27, CMA LUPA-TRANS-BIO-1, CMA LUPA-TRANS-BIO-2, and CMA LUPA-TRANS-BIO-3.

The Project Applicant shall prepare an APP and BBCS, which will also include a component for a NBNMP, as identified in the BBCS in BMP BIO-29, in coordination with and approval by the applicable permitting/resource agencies (i.e., BLM, CDFW, USFWS, CPUC) prior to the start of construction. Additionally, the components of the Burrowing Owl Avoidance, Minimization, and Mitigation Plan (MM WIL-CEQA-3) and the Bat Management and Protection Plan (MM WIL-CEQA-4) will also be included under the overarching APP/BBCS Plan. The specifics of the APP and BBCS will include the following:

- APP: The APP will follow the APLIC/USFWS 2005 APP Guidelines which specifies program design for transmission projects in order to reduce operational avian risks that result from interactions with transmission lines. This goal of this guidance is to reduce avian mortality from electrocution and collision with the transmission lines. The APP Guidelines state that although each APP developed for a specific project may be different, the overall goal of reducing avian mortality is the same across all developed APPs. The APP developed for the Project shall include, at a minimum, the following consideration and evaluation of principals identified in the APP Guidance:

1. **Corporate policy:** Confirming the company's commitment to work cooperatively towards the protection of migratory birds;
2. **Training:** All appropriate utility personnel, including managers, supervisors, line crews, engineers, etc. shall be properly trained in avian issues (which shall be enforced through MM BIO-CEQA-2, Implement a Worker Environmental Awareness Program);
3. **Permit Compliance:** Identify the process in which the Applicant will obtain and comply with all necessary permits related to avian issues;
4. **Construction Design Standards**: Avian interactions shall be considered in the design and installation of the transmission line as well as during operations and maintenance of the facility. Construction configurations from the *Suggested Practices for Raptor on Power Lines; The State of the Art in 1996* and *Mitigating Bird Collisions with power Lines: The State of the Art in 1994*, or the most current editions of these documents shall be consulted during the design phase of the Project to ensure new construction is avian-safe;
5. **Nest Management:** Procedures for net management on the transmission lines shall be explained to employees during training to ensure uniform treatment of avian nest issues among personnel;
6. **Avian Reporting System:** Development of a reporting system which shall include reporting of any avian mortalities, as required by any federal or State permits. The reporting system can also help pinpoint areas of concerns by tracking both the specific locations where mortalities may be occurring, as well as the extent of such mortalities;
7. **Risk Assessment Methodology:** A focus on the areas with the highest risk to migratory birds shall be the focus of the APP and therefore, a method for evaluating the risks posed to migratory birds in a manner that identified areas and issues of particular concern shall be developed;
8. **Mortality Reduction Measures:** After completing the risk assessment, the efforts for avian protection shall be focused on areas of concern. A mortality reduction plan may need to be implemented depending on the results of the risk assessment. This approach could be implemented through direction of where monitoring should occur, where retrofits should be focused, and where new construction warrants special attention to raptor and other bird issues.
9. **Avian Enhancement Options:** In addition to taking steps to reduce mortality risk to avian species, the developed APP also may include opportunities to enhance avian populations or habitat, including developing nest platforms, managing habitats to benefit migratory birds, or working cooperatively with agencies or organizations in such efforts;

10. **Quality Control:** The developed APP may also include a mechanism to review existing practices, ensuring quality control;
11. **Public Awareness:** The developed APP shall include a method to educate the public about the avian electrocution issues, the developed APP, as well as its success in avian protection.
12. **Key Resources:** The developed APP shall identify key resources to address avian protection issues including, for example, a list of experts who may be called upon to aid in resolving avian issues.

- BBCS: The purpose of the BBCS is to outline measures/methods to minimize potential Project effects to nesting birds and avoid unauthorized take as defined by both the MBTA and the CDFC, the latter which covers incidental take. The NBBMP (developed as a part of the BBCS) shall be approved by the above noted agencies prior to the site disturbance or pre-construction activities and be implemented by the Applicant throughout construction activities. Additionally, the current APLIC guidelines shall be incorporated into the NBBMP, which includes protections for nocturnal migrants (i.e., lighting controls) and species along the Colorado River and near agricultural fields (APLIC 2006, 2012) (See BMP BIO-33). Specifically, these guidelines will be used to minimize the potential for attracting birds and bats to the proposed infrastructure (transmission lines and facilities). Any nighttime lighting associated with construction will be temporary and shielded in order to provide safe working conditions while limiting light spillover outside of the construction area. Implementation of APM AES-15 will also ensure that lighting, will be directed in a downward position. Pre-construction surveys shall be completed in accordance with MM WIL-CEQA-6 below and if breeding birds with active nests are found prior to or during construction, a qualified avian biologist shall establish a minimum 300-foot buffer (500 foot for raptors) around the nest and no activities shall be allowed within the buffer(s) until the young have fledged from the nest or the nest fails (CPUC 2016). The prescribed buffers may be adjusted by a qualified avian biologist based on existing conditions around the nest, planned construction activities, tolerance of the species, and other pertinent factors. Buffer reductions for listed or special-status species may require coordination with the USFWS and/or CDFW. The qualified avian biologist shall conduct regular monitoring of the nest to determine success/failure and to ensure that Project activities are not conducted within the buffer(s) until the nesting cycle is complete or the nest fails. An avian biologist shall be responsible for documenting the results of the surveys (MM WIL-CEQA-6 below), nest buffers implemented, and the results of ongoing monitoring and shall provide a copy of the monitoring reports for impact areas to the appropriate resource agencies (i.e., USFWS and CDFW) (CPUC 2016).

- If trees with nests are to be removed as part of Project construction activities, they shall be done so outside of the nesting season to avoid additional impacts to nesting raptors. If removal during the nesting season cannot be avoided all trees shall be inspected for active nests by the avian biologist. If nests are found within these trees, and contain eggs or young, no activities within a 300-foot buffer for nesting birds and/or a 500-foot buffer for raptors shall occur until the young have fledged the nest

(CPUC 2016). At a minimum, the NBBMP (as a part of the BBCS) shall include the following:

- Definitions of standard nest buffers for each species or group of species, depending on characteristics and conservation status for each species.
- A notification procedure for buffer distance reductions should they become necessary under special circumstances.
- A monitoring protocol including qualifications of monitors, monitoring schedule, and field methods, to ensure that any Project-related effects to nesting birds shall be minimized.
- A protocol for documenting and reporting any inadvertent contact or effects to birds or nests.
- A summary of applicable State and Federal laws and regulations, including definition of what constitutes a nest or active nest under State and Federal law. Under the USFWS' Migratory Bird Permit Memorandum, active nests are defined as nests with eggs or young (USFWS 2003). CFGC Section 3503 states that it is unlawful to take, possess, or needlessly destroy the nest or eggs of any bird. The CFGC does not provide a definition for active nests, but previous regulatory actions by the CDFW have interpreted this term to refer to nests that are at least 25 percent built.
- A list of bird species potentially nesting on or near the Project area, indicating approximate nesting seasons, nesting habitat, typical nest locations (e.g., ground, vegetation, structures, etc.), tolerance to disturbance (if known) and any conservation status for each species.
- A discussion of how construction of the Project has been scheduled, to avoid or minimize Project impacts to nesting birds. Activities that may adversely affect breeding birds shall be scheduled outside the nesting season, as feasible.
- Discussion on nest buffer modification or reduction guidelines, including reporting procedures to the appropriate agencies (i.e., CDFW, USFWS, and CPUC).
- Discussion on use of nest deterrents and communication protocols for on-site monitors.
- Monitoring and reporting requirements.
- Detailed noise monitoring guidelines for active breeding territories and/or nests for special-status species that may occur within 500-feet of the Project area.
- Procedures for the calculation of a fee, to be reassessed every five years, to fund compensatory mitigation for bird and bat mortality impacts; this shall be based on requirements described in CMA LUPA-BIO-COMP-2.

MM WIL-CEQA-1 Implementation

Responsible Party: The APP/BBCS shall be developed and implemented by the Applicant and approved by the BLM, CDFW, USFWS, and CPUC.

Timing: The APP/BBCS shall be prepared/approved prior to the start of construction activities and shall be implemented throughout the duration of construction. The APP specifically shall be implemented throughout the life of the Project while the BBCS shall focus on the construction and maintenance of the Project.

Mitigation Monitoring and Reporting Program: The Applicant shall retain a qualified avian biologist (approved by the CPUC) to perform monitoring surveys within 500-feet of the Project area. The qualified avian biologist shall report any inadvertent contact or effects to birds or nests within the Project area to the BLM, CDFW, USFWS, and CPUC. The Applicant shall develop a monthly report documenting compliance with this measure and any actions taken regarding the NBBMP. This report shall be made available to the BLM, CDFW, USFWS, and the CPUC. The monitoring requirements for the APP shall conform to the APLIC Guidance including identifying and responding promptly to any avian mortality and including adaptive management for avian issues related to the Project.

Standards for Success: Adverse effects to birds shall be avoided or minimized to less than significant levels as determined by the qualified avian biologist in consultation with the BLM, CDFW, USFWS, and CPUC.

MM WIL-CEQA-2: Develop and Implement a Raven Management Plan.

The following BMPs, and CMAs shall be incorporated within this MM WIL-CEQA-2: BMP BIO-28, CMA LUPA-BIO-6, and CMA-LUPA-TRANS-BIO-1.

A Raven Management Plan shall be submitted to the BLM, CDFW, and County for approval prior to the start of ground disturbance and issuance of a County grading permit. The Raven Management Plan shall address Project characteristics and activities that may attract or subsidize common ravens. The Raven Management Plan shall include measures designed to: 1) minimize attracting and subsidizing ravens, 2) provide education to Project personnel (MM BIO-CEQA-2) 3) remove raven nests and offending ravens, and 4) implement adaptive management. The Applicant shall also provide funding for implementation of the USFWS Regional Raven Management Program, as described below.

The Raven Management Plan shall:

- Identify conditions associated with the Project that might provide raven subsidies or attractants;
- Describe management practices to avoid or minimize conditions that might increase raven numbers and predatory activities;
- Describe control practices for ravens;
- Establish thresholds that would trigger implementation of control practices; and

- Address monitoring and nest removal during construction and for the life of the Project.

The Applicant shall submit payment into an account established for the Project held by the National Fish and Wildlife Foundation (NFWF) to support the USFWS Regional Raven Management Program. The one-time fee shall be as described in the cost allocation methodology or more current guidance as provided by USFWS. The contribution to the regional raven management plan will be $105 per acre impacted.

MM WIL-CEQA-2 Implementation

Responsible Party: The Raven Management Plan shall be developed and implemented by the Applicant and approved by the CPUC, BLM, and CDFW.

Timing: The Raven Management Plan shall be prepared prior to the start of construction activities and shall be implemented throughout the duration of construction.

Mitigation Monitoring and Reporting Program: The Applicant shall develop a monthly report documenting compliance with this measure and any actions taken regarding the implementation of the Raven Management Plan or the USFWS Regional Raven Management Plan. This report shall be made available to the BLM and the County.

Standards for Success: The Raven Management Plan is implemented, and ravens are, to the extent possible, deterred from nesting/foraging within the Project area.

MM WIL-CEQA-3: Develop and Implement Burrowing Owl Avoidance, Minimization, and Mitigation Plan The following BMPs and CMAs shall be incorporated within this MM WIL-CEQA-3 and MM WIL-CEQA-7: BMP BIO-30, CMA-LUPA-BIO-IFS-12, CMA LUPA-BIO-IFS-13, and CMA LUPA-BIO-IFS-14.

The Burrowing Owl Avoidance, Minimization, and Mitigation Plan (BOAMMP) would include management direction consistent with LUPA-BIO-IFS-12, LUPA-BIO-IFS-13, and LUPA-BIO-IFS-14 and will be developed as a part of the APP/BBCS (MM WIL-CEQA-1). The Applicant shall submit a BOAMMP to BLM and CPUC for approval prior to any ground disturbing activities in California. The BLM and CPUC will include CDFW in the review process and incorporate their comments as appropriate. The BOAMMP will include direction for burrowing owls which shall include a combination of active and passive relocation efforts consistent with LUPA BIO-IFS-12, LUPA BIO-IFS-13, and LUPA-BIO-IFS-14. Any relocation shall include follow up monitoring procedures.

If burrowing owls, or burrowing owl habitat is found within the Project area during pre-construction surveys as described in MM WIL-CEQA-7, the following measures shall be implemented and enforced by the BLM and CPUC throughout construction of the Project.

If pre-construction focused burrowing owl surveys determine that burrowing owls occupy the Project area, a tiered approach referred to as an Avoidance and Relocation Strategy shall be implemented to avoid burrowing owls, relocate burrowing owls, and prevent recolonization of areas (where needed, such as construction and/or substation areas) by burrowing owls, as outlined below. These methods generally adhere to the recommendations contained in the *Staff*

Report on Burrowing Owl Mitigation currently used by CDFW to guide burrowing owl mitigation measures. The four avoidance and relocation strategy tiers are:

- Tier 1 – Avoidance Buffers
- Tier 2 – Passive Relocation
- Tier 3 – Prevention of Recolonization
- Tier 4 – Active Relocation (Optional)

Methods to avoid impacts to burrowing owls shall take precedence over passive or active relocation. If pre-construction focused burrowing owl surveys determine that burrowing owls occupy the Project area, including within the 150-meter buffer, the qualified Project biologist will evaluate each occupied burrow to determine whether the Project is likely to directly impact or substantially indirectly impact the burrow such that injury or death of a burrowing owl could occur. Avoidance buffers can be implemented to avoid direct and substantial indirect impacts to owl burrows and individuals. A substantial indirect impact would be a situation where even though the burrow is not directly impacted during construction, the construction activities could potentially cause injury or mortality of owls, including from collisions with nearby construction equipment, vehicles, fences, or walls. The Project biologist will have discretion in determining whether an indirect impact is substantial.

If occupied burrowing owl burrows are found within the Project disturbance footprint or survey buffer during pre-construction surveys, or if burrowing owls arrive on site after construction activities commence, a qualified biologist shall assess the risk of construction activities to the burrowing owl. This risk assessment shall consider several factors, including, but not limited to, the following:

- Location of the burrow (e.g., inside the disturbance footprint, within 5 meters (16.4 feet) of the disturbance footprint, more than 40 meters (131.2 feet) from the disturbance footprint);
- Type of burrow use (i.e., occupied nest burrow or non-nesting roost burrow that may include wintering or satellite burrows, referred to herein simply as “roost burrow”);
- Type of construction activity and level of potential disturbance (e.g., high disturbance, such as mass grading and excavation versus low disturbance, such as painting and landscaping); and
- Timing of burrow use (e.g., occupation of a burrow after construction has been started versus prior to construction).

Avoidance buffers shall be strictly required for occupied nest burrows so that nesting activities are not disturbed, and nesting pairs have the opportunity to rear and successfully fledge young. Per the guidelines outlined by the *Staff Report on Burrowing Owl Mitigation*, a standard minimum avoidance buffer ranging between 200 meters (656 feet) and 500 meters (1,640 feet) depending on the level of disturbance will be initially applied to occupied nest sites between April 1 and October 15, and 50 meters (164 feet) to 500 meters (1,640 feet) between October 16

and March 31. Burrows will be monitored by a qualified biologist to determine if a smaller buffer would be adequate to protect the active nest site. A smaller buffer may be implemented, but only after consultation with and approval from CDFW.

Establishing avoidance buffers from occupied roost burrows during October 16 through March 31 or from burrows that have been determined to not support nesting (through the non-invasive methods cited above) during the breeding season will initially be based on the buffers described in the *Staff Report on Burrowing Owl Mitigation*. Burrows will be monitored by a qualified biologist to determine if a smaller buffer would be adequate to protect the active nest site. A smaller buffer may be implemented, but only after consultation with and approval from CDFW. Roost burrows detected during pre-construction surveys fall into three categories: (1) burrows within the proposed Project disturbance footprint, (2) burrows in close proximity to the disturbance footprint, and (3) burrows farther from the disturbance footprint, but still potentially within the impact area for burrowing owl.

The Applicant shall report any special-status species and natural communities detected during Project surveys to the CNDDB.

MM WIL-CEQA-3 Implementation

Responsible Party: The BOAMMP shall be developed and implemented by the Applicant and approved by the BLM, CPUC, and CDFW.

Timing: The BOAMMP shall be prepared prior to the start of construction activities and shall be implemented throughout the duration of construction.

Mitigation Monitoring and Reporting Program: The Applicant shall develop a monthly report documenting compliance with this measure and any actions taken regarding the BOAMMP. This report shall be made available to the BLM, CPUC, and CDFW.

Standards for Success: Any significant impacts to nesting or burrowing owls shall be avoided or minimized to less than significant levels.

MM WIL-CEQA-4: Develop and Implement a Bat Management and Protection Plan

The following BMPs and CMAs shall be incorporated within this MM WIL-CEQA-4: BMP BIO-29, BMP BIO-33, BMP BIO-40, CMA LUPA-BIO-14, CMA LUPA-BIO-16, CMA LUPA-BIO-17, CMA LUPA-BIO-BAT-1, CMA LUPA-BIO-COMP-2, CMA LUPA-BIO-DUNE-5, and CMA LUPA-TRANS-BIO-1.

The Bat Management and Protection Plan will be developed as a part of the BBCS (MM WIL-CEQA-1). The Bat Management and Protection Plan shall be submitted to the BLM, CPUC, and CDFW for approval prior to any ground disturbing activities. The Bat Management and Protection Plan will include direction for roosting bats and shall include, at a minimum, the following:

- If non-breeding bat hibernacula are found in trees scheduled to be removed or in crevices in rock outcrops within the grading footprint, the bats shall be safely evicted,

under the direction of a qualified bat biologist, by opening the roosting area to allow airflow through the cavity or other means determined appropriate by the bat biologist. Roosts that need to be removed shall first be disturbed by various means at the direction of the bat biologist at dusk to allow bats to escape during the darker hours, and the roost tree shall be removed or the grading shall occur the next day (i.e., there shall be no less or more than one night between initial disturbance and the grading or tree removal).

- If active maternity roosts or hibernacula are found, the rock outcrop or tree occupied by the roost shall be avoided (i.e., not removed) by the Project. If avoidance of the maternity roost is not feasible, the bat biologist shall survey (through the use of radio telemetry or other CDFW approved methods) for nearby alternative maternity colony sites. If the bat biologist determines in consultation with and with the approval of the CDFW, BLM, and CPUC that there are alternative roost sites used by the maternity colony and young are not present, then no further action is required, and it will not be necessary to provide alternate roosting habitat. However, if there are no alternative roosts sites used by the maternity colony, substitute bat roosting habitat shall be provided, as detailed below. If an active maternity roost is located in an area to be impacted by the Project, and alternative roosting habitat is available, the demolition of the roost site must commence before maternity colonies form (i.e., prior to 1 March) or after young are flying (i.e., after 31 July) using the exclusion techniques described above.

- If a maternity roost will be impacted by the Project, and no alternative maternity roosts are in use near the site, substitute roosting habitat for the maternity colony shall be provided on, or in close proximity to, the Project site no less than three months prior to the eviction of the colony. Alternative roost sites will be constructed in accordance with the specific bat's requirements in coordination with CDFW. By making the roosting habitat available prior to eviction, the colony will have a better chance of finding and using the roost. Large concrete walls (e.g., on bridges) on south or southwestern slopes that are retrofitted with slots and cavities are an example of structures that may provide alternative roosting habitat appropriate for maternity colonies. Alternative roost sites must be of comparable size and proximal in location to the impacted colony. The CDFW shall also be notified of any hibernacula or active nurseries within the construction zone.

- If special-status bat species occur at these roosting/nursery sites, then construction activities shall avoid these sites and a surrounding buffer distance of 500 feet. If construction activities cannot avoid these sites, construction at these sites shall be delayed until the breeding cycles for the special-status bats are completed. The Applicant shall consult with a bat specialist in order to determine when the breeding cycle for the special-status bats is completed. The Applicant shall consult with CDFW regarding eviction of non-breeding special-status bats.

- If roosting bats occur within bridges on existing dirt or paved roadways within 500 feet of construction activities, construction may be allowed, provided that the construction

activities occur only from 9:00 a.m. to 4:00 p.m. to avoid disturbance to nocturnal feedings.

MM WIL-CEQA4 Implementation

Responsible Party: The Bat Management and Protection Plan shall be developed and implemented by the Applicant and approved by the BLM, CPUC, and CDFW.

Timing: The Bat Management and Protection Plan shall be prepared prior to the start of construction activities and shall be implemented throughout the duration of construction.

Mitigation Monitoring and Reporting Program: The Applicant shall develop a monthly report documenting compliance with this measure and any actions taken regarding the Bat Management and Protection Plan. This report shall be made available to the BLM, CPUC, and CDFW.

Standards for Success: Any significant impacts from construction activities to bat species shall be avoided or minimized to result in less than significant levels.

MM WIL-CEQA-5: Conduct Pre-Construction Surveys for Maternity Colonies or Hibernaculum for Roosting Bats.

The following BMPs and CMA shall be incorporated within this MM WIL-CEQA-5: APM BIO-2, BMP BIO-02, BMP BIO-25, CMA DFA-BIO-IFS-1, CMA LUPA-BIO-1, CMA LUPA-BIO-16, and CMA LUPA-BIO-DUNE-5.

The Applicant shall conduct surveys for roosting bats within 500 feet of Project activities, within 14 days prior to any grading of rocky outcrops or removal of trees with loose bark or other cavities. Surveys shall be conducted during the breeding season (1 March to 31 July) and the non-breeding season. Surveys shall be performed by a qualified bat biologist (i.e., a biologist holding a CDFW collection permit and a Memorandum of Understanding with CDFW allowing the biologist to handle bats). The resume of the biologist shall be provided to the CPUC and BLM for concurrence in consultation with CDFW and USFWS prior to the biologist beginning field duties on the Project. Surveys shall include a minimum of one day and one evening.

The Bat Management and Protection Plan (MM WIL-CEQA-4) shall be implemented throughout construction for any active bat roosts within the area. The Applicant shall submit documentation providing pre-construction survey results and any avoidance of roosting and nursery sites to the CPUC, BLM, and CDFW for review and approval.

MM WIL-CEQA-5 Implementation

Responsible Party: The surveys for maternity colonies or hibernaculum for roosting bats shall be completed by a qualified biologist (i.e. a biologist holding CDFW collection permit and a Memorandum of Understanding with CDFW allowing the biologist to handle bats).

Timing: The surveys shall be completed within 14 days prior to any grading activities or removal of trees within 500 feet of the Project.

Mitigation Monitoring and Reporting Program: The Applicant shall submit documentation in the form of a report or technical memorandum that provides the pre-construction survey results and any avoidance of roosting and nursery sites to the CPUC, BLM, and CDFW for review and approval.

Standards for Success: Surveys for bat roosting and nursery sites are completed within the Project area and required buffer distances.

MM WIL-CEQA-6: Conduct Pre-construction Surveys for Nesting and Breeding.

The following APMs, BMPs, and CMAs shall be incorporated within this MM WIL-CEQA-6: APM BIO-2, BMP BIO-02, APM BIO-20, BMP BIO-25, CMA DFA-BIO-IFS-1, CMA LUPA-BIO-1, CMA LUPA-BIO-16, CMA LUPA-BIO-IFS-26, and CMA LUPA-BIO-RIPWET-3. The Applicant shall retain a qualified avian biologist(s) (approved by the CPUC, BLM, and CDFW) to conduct pre-construction nesting bird surveys, within the recognized breeding season (generally 15 Feb – 15 Sep [1 Jan – 15 Aug for raptors]), for all areas within 500 feet of construction activities; construction activities include mobilization, staging, grading, and/or construction. These survey dates may only be modified with the approval of CDFW and USFWS (where applicable). Measures intended to exclude nesting birds shall only be implemented with the prior approval by the CDFW and/or USFWS. If breeding birds with active nests are found prior to or during construction, the qualified avian biologist shall establish a minimum 300-foot buffer (500 foot for raptors) around the nest and no activities shall be allowed within the buffer(s) until the young have fledged from the nest or the nest fails. The prescribed buffers may be adjusted by the qualified avian biologist based on existing conditions around the nest, planned construction activities, tolerance of the species, and other pertinent factors. Buffer reductions for listed or special-status species may require coordination with the USFWS and/or CDFW. The qualified avian biologist shall conduct regular monitoring of the nest to determine success/failure and to ensure that Project activities are not conducted within the buffer(s) until the nesting cycle is complete or the nest fails. The avian biologist shall be responsible for documenting the results of the surveys, implementing nest buffers, and documenting the results of ongoing monitoring by providing a copy of the monitoring reports for impact areas to the appropriate resource agencies (i.e., USFWS and CDFW). If trees with nests are to be removed as part of Project construction activities, they shall be done so outside of the nesting season to avoid additional impacts to nesting raptors. If removal during the nesting season cannot be avoided, all trees shall be inspected for active nests by the avian biologist. If nests are found within these trees, and contain eggs or young, no activities within a 300-foot buffer for nesting birds and/or a 500-foot buffer for raptors shall occur until the young have fledged the nest.

MM WIL-CEQA-6 Implementation

Responsible Party: The surveys for nesting and breeding avian species shall be completed by a qualified avian biologist (approved by the CPUC, BLM, and CDFW).

Timing: The surveys shall be completed within the recognized breeding season prior to construction activities for all areas within 500 feet of construction.

Mitigation Monitoring and Reporting Program: The Applicant shall submit documentation in the form of a report or technical memorandum that provides the pre-

construction survey results and any avoidance of nesting recommended to the CPUC, CLM, and CDFW for review and approval.

Standards for Success: Nesting and breeding bird surveys are conducted within the Project site and required buffer distances prior to ground disturbing activities.

MM WIL-CEQA-7: Conduct Focused Pre-Construction Burrowing Owl Surveys.

To meet CEQA requirements, the following APMs, BMPs, and CMAs are incorporated within this MM BIO-CEQA-7: APM BIO-2, BMP BIO-02, BMP BIO-25, CMA DFA-BIO-IFS-1, CMA LUPA-BIO-1, CMA LUPA-BIO-12, and CMA LUPA-BIO-16.Prior to initial ground disturbance (no more than 14 days prior) the Project Applicant shall conduct focused surveys for burrowing owls within suitable burrowing owl habitat. Surveys will be completed by a qualified biologist(s) with proven burrowing owl experience. Focused burrowing owl surveys shall be conducted in accordance with the *Staff Report on Burrowing Owl Mitigation* (2012 Staff Report; CDFG 2012), with the exception of the survey buffers, which follows the California Burrowing Owl Consortium (1993). Surveys shall be conducted by walking 20-meter transects. Pre-construction surveys shall be conducted not only within construction area, but also within a reasonable buffer around the area, generally 150 meters (492 feet). If burrowing owls, including any active burrowing owl burrows, are not found during the pre-construction survey, no further action is required. If burrowing owls or active burrows are found, then the appropriate avoidance setbacks depending on the and level of disturbance shall be implemented as defined in the Burrowing Owl Avoidance, Minimization, and Mitigation Plan (MM WIL-CEQA-3).

The only exception to the above requirements would be if any given construction area has become inactive for more than 14 days. Because burrowing owls can recolonize a site after a few days, if time lapses between Project activities for 14 days or more, this shall trigger subsequent pre-construction avoidance surveys, including, but not limited to an additional survey within 24 hours of ground-disturbing activities.

MM WIL-CEQA-7 Implementation

Responsible Party: The focused pre-construction surveys for burrowing owls shall be conducted by a qualified biologist (approved by the CPUC, BLM, and CDFW).

Timing: The focused pre-construction burrowing owl surveys shall be completed no more than 14 days prior to the start of construction activities.

Mitigation Monitoring and Reporting Program: The Applicant shall submit documentation in the form of a report of technical memorandum that provides the pre-construction survey results and any avoidance or relocation recommendations to the CPUC, BLM, and CDFW for review and approval.

Standards for Success: Burrowing owl surveys are completed within all suitable habitats in the Project area and required buffer distances.

MM WIL-CEQA-8: Conduct Pre-Construction Protocol Surveys for Arizona Bell's Vireo, Southwestern Willow Flycatcher, and Willow Flycatcher; Avoid Occupied Habitat; Compensate Impacts.

The following APMs, BMPs, and CMAs shall be incorporated within this MM WIL-CEQA-8: APM BIO-20; APM BIO-21; BMP BIO-21; BMP BIO-29; BMP BIO-35; BMP BIO-36; BMP BIO-40; BMP BIO-48; BMP BIO-55; CMA LUPA-BIO-1; CMA LUPA-BIO-2; CMA LUPA-BIO-3; CMA LUPA-BIO-4; CMA LUPA-BIO-12; CMA LUPA-BIO-16; CMA LUPA-BIO-17; CMA LUPA-BIO-COMP-2; CMA LUPA-TRANS-BIO-1; and CMA LUPA-TRANS-BIO-2.

If Project related activities are scheduled to occur during the breeding season (generally 15 Feb – 15 Sep) the Applicant shall have a qualified avian biologist, approved by the CPUC, BLM, and CDFW, conduct protocol surveys prior to the start of construction for Arizona Bell's vireo , southwestern willow flycatcher, and willow flycatcher in suitable habitat within the Project area and 500 feet of disturbance areas. The surveys shall follow all current agency protocols (i.e., CDFW, USFWS). Prior to construction, documentation shall be submitted providing the results of the pre-construction focused surveys for Arizona Bell's vireo, southwestern willow flycatcher, and willow flycatcher to the CPUC for review and approval in consultation with USFWS and CDFW. Protocol or focused nest location surveys, as appropriate, shall be conducted within one year prior to the start of construction and shall continue annually until completion of construction and restoration activities. If an active breeding territory or nest is confirmed, the CPUC, USFWS, and CDFW shall be notified immediately. All active nests shall be monitored on a weekly basis until the nestlings fledge or the nest becomes inactive. The Applicant shall provide monitoring reports to the CPUC for review on a weekly basis. In coordination with the USFWS and CDFW, a minimum 300-foot disturbance-free ground buffer shall be established around the active nest and demarcated by fencing or flagging. No construction or vehicle traffic shall occur within nest buffers.

The qualified biologist shall have the authority to halt construction activities and shall devise methods to reduce the noise and/or disturbance in the vicinity. This may include methods such as, but not limited to, turning off vehicle engines and other equipment whenever possible to reduce noise, installing a protective noise barrier between the nest site and the construction activities, and working in other areas until the young have fledged. All active nests shall be monitored on a weekly basis until the nestlings fledge.

Impacts and mitigation for Federal- and State-listed species shall be addressed through either the Section 7 or Section 10(a)(1)(B) process under the FESA with the USFWS, and either the Section 2081 or Section 2080.1 process under the CESA with the CDFW. Additionally, direct impacts to Federally listed species' critical habitat that cannot be avoided shall also be addressed through either the FESA Section 7 or Section 10(a)(1)(B) process. Formal FESA consultation for Federally listed species that have at least a moderate potential to occur and may be impacted by the Project include the Mojave Desert tortoise, razorback sucker, southwestern willow flycatcher, western yellow-billed cuckoo, and Yuma Ridgway's rail. CESA consultation for State-listed species that have at least a moderate potential to occur and may be impacted by the Project include California black rail, greater sandhill crane, Mojave Desert tortoise, razorback sucker, Swainson's hawk, southwestern willow flycatcher, western yellow-billed cuckoo, and Yuma Ridgway's rail. Additional mitigation may be required by each agency during the regulatory permitting process. Mitigation for impacts to listed species habitat shall consider and overlap

with compensation for special-status plants, sensitive vegetation communities, and jurisdictional waters and wetlands.

MM BIO-CEQA-8 Implementation

Responsible Party: The focused protocol surveys for Arizona Bell's vireo, southwestern willow flycatcher, and willow flycatcher shall be conducted by a qualified biologist(s).

Timing: The focused surveys shall be conducted during the required protocol windows should construction activities occur between 15 Feb and 15 Sep.

Mitigation Monitoring and Reporting Program: The Applicant shall submit documentation in the form of a report of technical memorandum that provides the survey results and any avoidance or relocation recommendations to the CPUC, BLM, and CDFW for review and approval. Responsible parties for the consultation include USFWS and CDFW.

Standards for Success: Protocol Arizona Bell's vireo, southwestern willow flycatcher, and willow flycatcher surveys are completed within all suitable habitats in the Project area and required buffer distances.

MM WIL-CEQA-9: Compensation for Impacts to Mojave Fringe-Toed Lizard.

To meet CEQA requirements, the following APMs, BMPs, and CMAs are incorporated within this MM WIL-CEQA-9: APM BIO-3; BMP BIO-03; APM BIO-9; APM BIO-10; APM BIO-17; BMP BIO-25; BMP BIO-35; BMP BIO-36; BMP BIO-49; BMP BIO-53; BMP BIO-54; BMP BIO-55; CMA DFA-BIO-IFS-1; CMA DFA-VP; CMA LUPA-BIO-11L-BIO-DUNE-1; CMA LUPA-BIO-1; CMA LUPA-BIO-15 CMA LUPA-BIO-3 CMA LUPA-BIO-4; CMA LUPA-BIO-13; CMA LUPA-BIO-14; CMA LUPA-BIO-COMP-1; CMA LUPA-BIO-DUNE-1; CMA LUPA-BIO-DUNE-2; CMA LUPA-BIO-DUNE-3; CMA LUPA-BIO-DUNE-4; and CMA LUPA-BIO-DUNE-5.

Specifically, the following shall be implemented by the Applicant to protect and compensate for impacts to Mojave fringe-toed lizard.

- **Field Surveys:** Prior to construction, field surveys shall be conducted by an Applicant designated qualified biologist, approved by the CPUC, BLM, and CDFW, to assess for Mojave fringe-toed lizard habitat (e.g., dune systems, Aeolian sand, scattered vegetation).

- **Avoidance and Minimization:** If Mojave fringe-toed lizard habitat is present within the Project site and/or adjacent areas, at a minimum, the following avoidance and minimization measures shall be employed to reduce potential species impacts:

  - An Applicant designated qualified biologist shall conduct pre-construction clearance surveys for Mojave fringe-toed lizard in the Project area;

  - Mojave fringe-toed lizard suitable habitat, if present, shall be mapped using the BLM NOC habitat mapping standards;

- If potential habitat is identified in or adjacent to the Project site, then a biological monitor shall be on-site during all Project activities, as necessary;
- ESA signage and exclusion fencing shall be installed at the appropriate buffer distance (i.e., resource setback), if suitable habitat is within or encroaches into the Project site;
- Project-specific, construction-related BMPs shall be implemented to reduce the amount of Aeolian sand transport within work areas;
- New roads/routes shall avoid Mojave fringe-toed lizard suitable habitat within identified linkages, unless the new road and/or route is beneficial to minimize net impacts to natural or ecological resources of concern; and
- Project-specific CMAs shall be implemented to ensure the control of invasive and nuisance animal species that could indirectly impact Mojave fringe-toed lizard species.

- **Compensation for Permanent Impacts:** Permanent habitat loss and direct impacts to Mojave fringe-toed lizards shall be subject to compensatory mitigation at a minimum ratio of 3:1 and overlap with the mitigation for impacts to special-status plant species, and particularly Harwood's eriastrum, as part of MM VEG-CEQA-4. Compensation for permanent impacts to suitable habitat for the Mojave fringe-toed lizard shall include (a) preservation through acquisition of offsite lands with an attached conservation easement or purchase of credits from an approved bank, or (b) onsite or offsite enhancement of lands that support known populations of Mojave fringe-toed lizard. Off-site compensation lands and/or established mitigation bank program shall be identified, if available, in coordination with the appropriate Federal and State regulatory agencies. The Applicant shall provide for open space/conservation easements on all acquired lands or provide the required funds for the acquisition of easements to a "qualified easement holder"; the CDFW is a qualified easement holder. To qualify as a "qualified easement holder" a private land trust must have substantial experience managing open space/conservation easements that are created to meet mitigation requirements, have adopted the Land Trust Alliance's Standards and Practices, and have a stewardship endowment fund to pay for its perpetual stewardship obligations. The Applicant shall also provide the "qualified easement holder" with adequate funds to cover administrative costs incurred during the creation of the easement, funds in the form of a non-wasting endowment to cover the cost of monitoring and enforcing the terms of the easement in perpetuity. The Applicant shall coordinate with CPUC, BLM, and CDFW to determine the appropriate mitigation strategy and final replacement ratios and acreages. All mitigation shall be approved by the appropriate Federal and State regulatory agencies prior to Project activities.

- At a minimum, the compensation lands selected for acquisition shall meet the following criteria:
  - Be deposits of Aeolian or fine windblown sands typically associated with dunes, washes, hillsides, and margins of dry lakes, with potential to contribute to Mojave

fringe-toed lizard habitat connectivity and build linkages between known populations of Mojave fringe-toed lizards and preserve lands with suitable habitat;

- To the extent feasible, be connected to lands currently occupied by Mojave fringe-toed lizard;
- To the extent feasible, be near larger blocks of lands that are either already protected or planned for protection, or which could feasibly be protected long-term by a public resource agency or a non-governmental organization dedicated to habitat preservation;
- Provide quality habitat for Mojave fringe-toed lizard, that has the capacity to regenerate naturally when disturbances are removed;
- Not have a history of intensive recreational use or other disturbance that might make habitat recovery and restoration infeasible;
- Not be characterized by high densities of invasive species, either on or immediately adjacent to the parcels under consideration, that might jeopardize habitat recovery and restoration;
- Not contain hazardous wastes that cannot be removed to the extent the site is suitable for habitat;
- Not be subject to property constraints (i.e. mineral leases, cultural resources); and
- Be on land for which long-term management is feasible (BLM 2019).

- **Documentation:** The Applicant shall prepare a Fringe-Toed Lizard Linear ROW Protection Plan, as detailed by BMP BIO-49 and referenced in MM BIO-CEQA-1. This plan shall be in accordance with Federal and State regulatory agencies policies, guidance, and protocols. In addition, this plan shall be approved by the appropriate regulatory agencies prior to Project commencement, and implemented, as necessary, during all Project phases. The Fringe-Toed Lizard Linear ROW Protection Plan, shall at a minimum, discuss potential for Mojave fringe-toed lizard to occur in the Project area (e.g., known occurrences, locations for potential suitable habitat, etc.); provide an overview related to the potential for indirect and/or direct permanent impacts; outline methods and measures for avoidance, minimization, translocation, compensation, and mitigation.

MM WIL-CEQA-9 Implementation

Responsible Party: Supervision, guidance, and verification of mitigation as outlined in this measure shall be achieved the Applicant.

Timing: Field surveys shall be conducted prior to construction. All potential indirect and direct impacts shall be evaluated, and avoidance, minimization, compensation, and mitigation shall be approved by the appropriate Federal and State regulatory agencies prior to Project commencement.

Mitigation Monitoring and Reporting Program: The Applicant shall prepare a Fringe-Toed Lizard Linear ROW Protection Plan.

Standards for Success: Compensation implemented for Mojave fringe-toed lizard that results in a no net loss of suitable habitat.

MM WIL-CEQA-10: Compensation for Impacts to Mojave Desert Tortoise.

To meet CEQA requirements, the following APMs, BMPs, and CMAs are incorporated within this MM WIL-CEQA-10: APM BIO-2; BMP BIO-02; APM BIO-3; BMP BIO-03; APM BIO-4; APM BIO-17; APM BIO-23; BMP BIO-23; BMP BIO-35; BMP BIO-36; BMP BIO-44; BMP BIO-55; CMA DFA-BIO-IFS-1; CMA DFA-VPL-BIO-DUNE-1; CMA LUPA-BIO-1; CMA LUPA-BIO-2; CMA LUPA-BIO-3; CMA LUPA-BIO-4; CMA LUPA-; CMA LUPA-BIO-IFS-3BIO-7; CMA LUPA-BIO-12; CMA LUPA-BIO-13; CMA LUPA-BIO-14; CMA LUPA-BIO-IFS-5; CMA LUPA-BIO-IFS-6; CMA LUPA-BIO-IFS-7; CMA LUPA-BIO-IFS-8; and CMA LUPA-BIO-IFS-9.

Specifically, the following shall be implemented by the Applicant to protect and compensate for impacts to Mojave Desert tortoise:

- **Compensation for Impacts:** To fully mitigate for habitat loss and potential take of Mojave Desert tortoise, the Applicant shall provide compensatory mitigation at a minimum ratio of 3:1. For the purposes of this measure, the Project site (i.e., footprint) means all lands directly disturbed in the construction and operation of the Project, including all linear features, as well as undeveloped areas inside the Project's boundaries that will no longer provide viable long- term habitat for the Mojave Desert tortoise. To satisfy this measure, the Applicant shall acquire, protect and transfer two acres of Mojave Desert tortoise habitat for every acre of habitat within the final Project footprint, and provide associated funding for the acquired lands, as specified below (BLM 2018). The Applicant shall coordinate with CPUC, BLM, and CDFW to determine the appropriate mitigation strategy and final replacement ratios and acreages. All mitigation shall be approved by the appropriate Federal and State regulatory agencies prior to Project activities.

- The Applicant has another option for satisfying some or all of the requirements in this measure, in lieu of acquiring lands itself. The Applicant may satisfy the requirements of this measure by depositing funds into an account established with the NFWF.

- Applicant shall acquire the land, in fee or in easement, within 12 months from the time the resource impact occurs, unless a 6-month extension is approved by the Authorizing Officer.

- If compensation lands are acquired in fee title or in easement, the requirements for acquisition, initial improvement and long-term management of compensation lands include all of the following:

    - Be within the appropriate Habitat Unit or, if sufficient land is unavailable, in other locations within approved by the appropriate Federal and State regulatory agencies;

- Provide habitat for Mojave Desert tortoise with capacity to regenerate naturally when disturbances are removed;
- Be prioritized near larger blocks of lands that are either already protected or planned for protection, or which could feasibly be protected long-term by a public resource agency or a non-governmental organization dedicated to habitat preservation;
- Be connected to lands with Mojave Desert tortoise habitat equal to or better quality than the Project site, ideally with populations that are stable, recovering, or likely to recover;
- Not have a history of intensive recreational use or other disturbance that does not have the capacity to regenerate naturally when disturbances are removed or might make habitat recovery and restoration infeasible;
- Not be characterized by high densities of invasive species, either on or immediately adjacent to the parcels under consideration, that might jeopardize habitat recovery and restoration;
- Not contain hazardous wastes that cannot be removed to the extent that the site could not provide suitable habitat; and
- Have water and mineral rights included as part of the acquisition, unless consultation with the appropriate Federal and State agencies occurs and there is an agreement in writing to the acceptability of land.

- **Documentation:** The Applicant shall prepare a Mojave Desert Tortoise Protection and Compensation Plan. This plan shall be in accordance with Federal and State regulatory agencies policies, guidance, and protocols. In addition, this plan shall be approved by the appropriate regulatory agencies prior to Project commencement, and implemented, as necessary, during all Project phases. The Plan, shall at a minimum, discuss the potential for Mojave Desert tortoise to occur in the Project area (e.g., known occurrences, locations for potential suitable habitat, locations of burrows, fencing locations, etc.); provide an overview related to the potential for indirect and/or direct permanent impacts; outline methods and measures for avoidance, minimization, translocation, compensation, mitigation, and requirements for maintenance and monitoring.

- In addition, the Applicant shall also prepare a Mojave Desert Tortoise Quarterly Compliance Report. The first Mojave Desert Tortoise Quarterly Compliance Report shall be complete prior to Project commencement and include a narrative describing species-specific pre-construction compliance measures completed. After the initial Mojave Desert Tortoise Quarterly Compliance Report is submitted prior to construction, subsequent reports shall be prepared and submitted quarterly until the completion of Project activities. If during construction, Mojave Desert tortoise are encountered, and/or relocated, then the following details shall be included in the Mojave Desert Tortoise Quarterly Compliance Report, as necessary.

- The locations (i.e., maps) and dates of observation;
- The location moved from and location moved to (i.e., exact coordinates);
- Ambient temperature when handled and released;
- Digital photograph(s) of each handled Mojave Desert tortoise;
- General condition and health, including injuries, state of healing and whether Mojave Desert tortoise voided their bladders; and
- Gender, carapace length, and diagnostic markings (i.e., identification numbers or marked lateral scutes).

MM WIL-CEQA-10 Implementation

Responsible Party: Supervision, guidance, and verification of mitigation as outlined in this measure shall be achieved the Applicant.

Timing: Prior to construction, field surveys shall be conducted by the Applicant (refer to MM WIL-CEQA-11 below) designated qualified biologist to assess for Mojave Desert tortoise habitat. Additionally, the Applicant designated qualified biologist shall conduct pre-construction clearance surveys for Mojave Desert tortoise in the Project area during the period when they are most active (i.e., March through May, or September through mid-November).

Mitigation Monitoring and Reporting Program: The Applicant shall prepare a Mojave Desert Tortoise Protection and Compensation Plan. In addition, the Applicant shall also prepare a Mojave Desert Tortoise Quarterly Compliance Report.

Standards for Success: Compensation implemented for desert tortoise that results in a no net loss of suitable habitat.

MM WIL-CEQA-11: Conduct Pre-construction Surveys for Listed and Special-Status Terrestrial Herpetofauna and Compensation for Impacts.

The following APMs, BMPs, and CMAs shall be incorporated within this MM WIL-CEQA-11: APM BIO-2; BMP BIO-02; APM BIO-3; BMP BIO-03; APM BIO-4; APM BIO-9; APM BIO-10; APM BIO-17; APM BIO-23; BMP BIO-23; BMP BIO-25; BMP BIO-35; BMP BIO-36; BMP BIO-44; BMP BIO-49; BMP BIO-53; BMP BIO-54; BMP BIO-55; CMA DFA-BIO-IFS-1; CMA DFA-VP; CMA LUPA-BIO-11L-BIO-DUNE-1; CMA LUPA-BIO-1; CMA LUPA-BIO-2; CMA LUPA-BIO-3 CMA LUPA-BIO-4; CMA LUPA-BIO-IFS-7; CMA LUPA-BIO-12; CMA LUPA-BIO-13; CMA LUPA-BIO-14; CMA LUPA-BIO-15; CMA LUPA-BIO-COMP-1; CMA LUPA-BIO-DUNE-1; CMA LUPA-BIO-DUNE-2; CMA LUPA-BIO-DUNE-3; CMA LUPA-BIO-DUNE-4; and CMA LUPA-BIO-DUNE-5; CMA LUPA-BIO-IFS-3; CMA LUPA-BIO-IFS-5; CMA LUPA-BIO-IFS-6; CMA LUPA-BIO-IFS-7; CMA LUPA-BIO-IFS-8; and CMA LUPA-BIO-IFS-9.

Conduct Pre-Construction Surveys for Listed and Special Status Terrestrial Herpetofauna and Compensate Impacts Prior to ground disturbance or vegetation clearing within the Project site, the Applicant shall retain an approved/qualified biologist to conduct surveys for special-status

terrestrial herpetofauna (i.e., lizards, snakes, tortoise, etc.) where suitable habitat is present and directly impacted by construction vehicle access, or maintenance. Focused surveys shall consist of a minimum of three daytime surveys and one nighttime survey within one week of vegetation clearing. The qualified biologist shall be present during all activities immediately adjacent to or within habitat that supports special-status terrestrial herpetofauna. Clearance surveys for special-status terrestrial herpetofauna shall be conducted by the qualified biologist prior to the initiation of construction each day in suitable habitat. Special-status terrestrial herpetofauna found within the area of disturbance or potentially affected by the Project shall be relocated to the nearest suitable habitat that shall not be affected by the Project.

Desert Tortoise Specific Surveys

- **Field Surveys:** Prior to construction, field surveys shall be conducted by the Applicant designated qualified biologist to assess for Mojave Desert tortoise habitat (e.g., desert scrub vegetation communities dominated, cover sites- soil burrows, pallets, caliche caves, etc.).

- Additionally, the Applicant designated qualified biologist, approved by the CPUC, BLM, and CDFW, shall conduct pre-construction clearance surveys for Mojave Desert tortoise in the Project area during the period when they are most active (i.e., March through May, or September through mid-November). During pre-construction clearance survey, the qualified biologist shall inspect construction pipes, culverts or similar structures with (a) with a diameter greater than 3 inches, (b) stored for one or more nights, (c) less than 8 inches aboveground, and (d) within Mojave Desert tortoise habitat, before the materials are moved, buried, or capped. As an alternative, such materials shall be capped before storing outside the fenced area or placing on pipe racks. Pipes stored within the long-term fenced area after completing desert tortoise clearance surveys would not require inspection.

- Pre-construction habitat surveys and clearance surveys for Mojave Desert tortoise shall be conducted using techniques outlined in the *Desert Tortoise (Mojave Population) Field Manual (Gopherus agassizii)* (USFWS 2009).

- **Avoidance and Minimization:** If Mojave Desert tortoise habitat is present within the Project site and/or adjacent areas, at a minimum, the following avoidance and minimization measures shall be employed to reduce potential species impacts:

    - Mojave Desert tortoise habitat and burrows, if present, shall be mapped using the BLM NOC habitat mapping standards;

    - If potential habitat is identified in or adjacent to the Project site, then a qualified biological monitor shall be on-site during all Project activities, as necessary. The qualified biological monitor shall directly monitor site clearing and shall be onsite during grading activities to find and move Mojave Desert tortoises missed during the initial pre-construction tortoise clearance survey. Should a tortoise be discovered, it shall be relocated or translocated as described in the Mojave Desert Tortoise Protection and Compensation Plan;

- Environmentally sensitive area signage and exclusion fencing shall be installed at the appropriate buffer distance (i.e., resource setback), if suitable habitat is within or encroaches into the Project site (see further details under “fencing” below);

- During Project activities, including on specific linear features (e.g., fencing, transmission lines, and access roads, etc.) and during operation and maintenance (O&M), all live Mojave Desert tortoises and active burrows shall be avoided to the extent possible. The Applicant shall ensure that the qualified biologist and biological monitor monitors any Project activities in unfenced areas for presence of Mojave Desert tortoises. If an active burrow cannot be avoided by construction activities, the burrow shall be excavated using protocols in *Desert Tortoise (Mojave Population) Field Manual (Gopherus agassizii)* (USFWS 2009). If a tortoise wanders into an unfenced, active Project work area, does not leave the area on its own accord (i.e., within 15 minutes), and cannot be avoided by Project activities, the Applicant shall ensure that that the qualified biologist captures the Mojave Desert tortoise, implements a health assessment of the tortoise, relocates it to previously identified appropriate Project-adjacent habitat away from any active, unfenced Project work areas, and monitor the individual via telemetry, in accordance with the aforementioned Protocol. The qualified biologist and biological monitor shall have a copy of all measures, Federal and State permits, when monitoring Project activities. The qualified biologist and biologist monitor shall have the authority to halt all non-emergency activities that are in violation of the measures. Work shall proceed only after hazards to Mojave Desert tortoise are removed, the species is no longer at risk, or the individual has been moved from harm’s way by the qualified biologist. A Mojave Desert Tortoise Quarterly Compliance Report will be submitted quarterly to the appropriate Federal and State regulatory agencies (BLM 2018); and

- Vehicular traffic would not exceed 15 miles per hour within the areas not cleared by protocol-level surveys where desert tortoise may be impacted.

- **Fencing:** The Applicant shall ensure that temporary and/or permanent tortoise exclusionary fencing is installed around active portions of the Project area following the pre-construction tortoise survey. The exclusionary fencing, whether temporary or permanent in nature, and shall be installed according to specifications in the *Desert Tortoise (Mojave Population) Field Manual (Gopherus agassizii)* (USFWS 2009). Specifications requires fencing to be buried 12 inches below the ground surface and extend to 22 to 24 inches above the ground surface. If a phased approach is implemented during the construction phase, the exclusionary fencing may be installed in phases, with pre-construction surveys conducted prior-to and clearance surveys conducted immediately after installation of the exclusionary fence. The Applicant shall also ensure that tortoise exclusionary fencing is maintained during the decommissioning phase to keep tortoises from accessing active work areas. Throughout the construction and decommissioning phases, the tortoise exclusionary fence shall be checked regularly to ensure its integrity (BLM 2018).

- Security Gates- For security fencing, the Applicant shall ensure that the Project's perimeter security fence includes exclusionary fencing that prevents Mojave Desert tortoises, and other burrowing animals, from accessing the Project site. The exclusionary fencing shall be installed at the base of the security in accordance with the protocols listed above, and cattle guards shall be installed at entrances to the Project. Specifically, security gates shall be designed with minimal ground clearance to deter ingress by tortoises. Tortoise guards shall be installed at gate locations. (BLM 2018)

- Fence Flagging- All fencing installation corridors shall be flagged to assist the qualified biologist in studying the fence route and surveying within 24 hours prior to the initiation of fence construction. Prior to the surveys the Applicant shall provide all appropriate Federal and State regulatory agencies map figures clearly depicting the limits of construction disturbance for the proposed fence installation (BLM 2018).

- Fence Installation- The exclusion fencing shall be installed prior to the onset of site clearing and grubbing. The fence installation shall be supervised by the qualified biologist and monitored to ensure the safety of any tortoise present (BLM 2018).

- Fence Inspections- Following installation of the Mojave Desert tortoise exclusion fencing, the fencing shall be regularly inspected during construction, operations, and decommissioning. If Mojave Desert tortoise were moved out of harm's way during fence construction, fencing shall be inspected daily for the first 7 days to ensure a recently moved Mojave Desert tortoise has not been trapped within the fence. Thereafter, fencing shall be inspected quarterly and during and within 24 hours following major rainfall events. A major rainfall event is defined as one for which flow is detectable within the fenced drainage. Any damage to the fencing shall be temporarily repaired immediately to keep Mojave Desert tortoises out of the site, and permanently repaired within 48 hours of observing damage. Inspections of site fencing shall occur for the life of the Project.

- Temporary fencing shall be inspected weekly and, where drainages intersect the fencing, during and within 24 hours following major rainfall events. All temporary fencing shall be repaired immediately upon discovery and, if the fence may have permitted Mojave Desert tortoise entry while damaged, the qualified biologist shall inspect the area for Mojave Desert tortoise (BLM 2018).

- Tortoise Encounters- If a tortoise is encountered along the inside or outside of the fence, the qualified biologist shall capture and relocate in accordance with the protocols listed above (i.e., USFWS 2009, Chapter 7), perform a health assessment, attach a radio transmitter to the tortoise in accordance, and release the Mojave Desert tortoise in a previously identified Project-adjacent relocation areas supporting Mojave Desert tortoise habitat in accordance with USFWS and all other appropriate Federal and State regulatory agencies (BLM 2018).

- Fence Removal- Temporary exclusionary fencing shall be removed following completion of the construction and decommissioning phases.

With the exception of desert tortoise, compensation for temporary impacts to special-status terrestrial herpetofauna (including Couch's spadefoot toad and Mojave fringe-toed lizard) potential/modeled habitat shall include on-site habitat restoration at a minimum 1.5:1 ratio. Restoration of conditions of the impacted areas within the Project footprint shall be at 1:1; and creation, restoration, or enhancement of similar vegetation communities offsite shall be 0.5:1, as approved by CDFW and CPUC. Alternatively, payments would be made into an appropriate mitigation program or other mitigation funding mechanism. Compensation for permanent impacts to desert tortoise and special-status wildlife on-site surveyed habitat shall include a) off-site creation, enhancement, and/or preservation, and/or b) participation in an established mitigation bank program at a minimum 3:1 ratio. Compensation for temporary and permanent impacts for all other special-status wildlife habitat shall include a combination of a) on-site habitat creation or enhancement with similar species compositions to those present prior to construction, b) off-site creation, enhancement, and/or preservation, and/or c) participation in an established mitigation bank program at a 2:1 minimum ratio. The Applicant shall coordinate with CPUC, BLM, and CDFW to determine the appropriate mitigation strategy and final replacement ratios and acreages. All mitigation shall be approved by the appropriate Federal and State regulatory agencies prior to Project activities.

Compensation for impacts to desert tortoise are detailed above in MM WIL-CEQA-10. Impacts and mitigation for the Mojave Desert tortoise shall be addressed through either the Section 7 or Section 10(a)(1)(B) process under the FESA with the USFWS, and either the Section 2081 or Section 2080.1 process under the CESA with the CDFW. Mitigation for impacts to all listed and special-status species habitat shall consider and overlap with compensation for special-status plants, sensitive vegetation communities, and jurisdictional waters and wetlands.

MM WIL-CEQA-11 Implementation
Responsible Party: Supervision, guidance, and verification of mitigation as outlined in this measure shall be achieved the Applicant.

Timing: General surveys shall be conducted year-round with desert tortoise surveys focused on the periods of expected activity. Prior to construction, field surveys shall be conducted by an Applicant designated qualified biologist to assess for Mojave Desert tortoise habitat. Additionally, the Applicant designated qualified biologist shall conduct pre-construction clearance surveys for Mojave Desert tortoise in the Project area during the period when they are most active (i.e., March through May, or September through mid-November).

Mitigation Monitoring and Reporting Program: The Applicant shall prepare a technical report detailing the results of all terrestrial herpetofauna and desert tortoise surveys.

Standards for Success: Compensation implemented for all listed/special-status terrestrial herpetofauna, including desert tortoise, that results in a no net loss of suitable habitat.

2.5 CULTURAL RESOURCES

This section describes the impacts to cultural resources associated with the construction, operation, and maintenance of the proposed transmission line, substations, and ancillary facilities

in terms of CEQA significance thresholds disclosed below in Section 2.5.4. Additionally, this section responds to issues raised during the public scoping process, which are presented in Appendix 1 of the EIS. Tribal concerns are addressed in Section 2.6 (Tribal Cultural Resources) of this appendix.

As disclosed in Section 4.6.3.1 of the TES (BLM 2019), the analysis area for the Project consists of areas where direct effects to cultural resources may occur. Direct effects are defined by areas where ground disturbance would occur for Project construction, such as tower locations, access roads, lay down areas, and spur roads, among others. In addition to direct impacts, indirect impacts to cultural resources as a result of the Project may occur. Indirect impacts to cultural resources include visual, atmospheric, and auditory effects.

As concluded in Section 4.6.7 of the TES, potential adverse effects to historic properties would be mitigated in accordance with the provisions of the Programmatic Agreement (PA). Through the PA under the National Historic Preservation Act (NHPA), Section 106 enforceable obligations are imposed on a project to avoid, minimize, and mitigate adverse effects on historic properties such that the execution and implementation of the PA will reduce impacts to cultural resources to less than significant levels for purposes of CEQA. Per CEQA, potential impacts to historical resources and to archaeological resources would also be mitigated in accordance with the provisions of the PA. The CEQA terms “historical resources” and “unique archaeological resources” will be used throughout this CEQA appendix.

Avoidance of cultural resources by final design and construction would be the preferred form of mitigation. See Chapter 3.6 of the TES (BLM 2019) for further discussion.

2.5.1 Thresholds and Methodology

Existing conditions described in Section 3.6 of the TES (BLM 2019) have been evaluated with regard to their potential to be affected by Project construction, operation, maintenance, and decommissioning activities. The potential impacts associated with the Project are evaluated on a qualitative and quantitative basis through a comparison of the anticipated Project effects on cultural resources. Resources can experience impacts, these impacts can be considered significant under CEQA, or constitute an effect under Section 106. Under Section 15064.5 of CEQA, an important archaeological or historical resource is an object, artifact, structure, site, or district that is listed on, or eligible for listing on, the California Register of Historical Resources (CRHR). Eligibility and Significance can be assumed for properties that are already listed on the National Register of Historic Places (NRHP), if evidence supporting the decision is verified and applied. The evaluation of Project impacts is based on the significance criteria established by Appendix G of the CEQA Guidelines (refer to section 2.5.4 below for additional information), and additional criteria including:

- Damage to or loss of a site of a cultural resource that is listed, or eligible for listing, on the NRHP, or CRHR;
- An activity would directly or indirectly alter the characteristics of the cultural resource that qualify it for inclusion in the NRHP, or CRHR (design, setting, materials, workmanship, or feeling);

- The Project results in visual changes to a viewshed of recognized cultural significance under the NRHP, or CRHR, or identified as a Traditional Cultural Property (TCP)/Tribal Cultural Resource (TCR);
- Loss or degradation would also include cases in which access to the cultural resource is restricted for future use (i.e. a sacred site);
- Exposure of cultural resources to vandalism or unauthorized collecting;
- A substantial increase in the potential for erosion or other natural processes that could affect cultural resources;
- Neglect of a cultural resource that causes its deterioration, except where such neglect and deterioration are recognized qualities of a property of religious and cultural significance to a Native American tribe;
- Disturbance of any human remains, including those interred outside of formal cemeteries; and,
- An activity that would affect a cultural resource for which setting is an important aspect of its NRHP, or CRHR eligibility (causing a high degree of visual impacts, as determined through the visual resource analysis).

2.5.2 Applicant Proposed Measures and BLM Best Management Practices

APMs have been identified and would be implemented by the Project applicant. In addition, BLM would require implementation of BMPs, which are intended to further minimize Project impacts. All Project APMs and BMPs are described in EIS Appendix 2A. Of these, the following would apply to the portion of the Project located within California and have therefore been incorporated into the Project for evaluation of significant impacts to Cultural Resources under CEQA.

- **APM CULT-01: Cultural Resources Inventory.** A cultural inventory would be conducted that would document cultural resources within the area of potential effects for the Project. Based on results of this inventory, a Historic Properties Treatment Plan (HPTP) would be developed to specifically address direct and indirect impacts that may result from Project construction.
- **APM CULT-02: Monitoring and Discovery Plan.** DCRT's contractor would prepare a Monitoring and Discovery Plan (MDP) that would describe procedures to be followed in the event of the discovery of cultural resources or human remains during implementation of the Project. The Draft MDP would be reviewed by BLM and consulting state and Federal agencies, the California and Arizona State Historic Preservation Offices (SHPOs), and local tribes. Upon approval of the MDP, DCRT would follow the procedures set forth in that plan during implementation of the Project.

- **BMP CULT-03: Cultural Resources Avoidance and Stipulations.** DCRT would follow the avoidance procedures and other stipulations outlined in the PA and in the appropriate State HPTP for each historic property identified in the HPTP.

- **BMP CULT-04: Worker Cultural Resources Awareness Program.** Before starting any work, including mowing, staging, sediment and erosion control installation, tree removal, construction, and restoration, all employees and contractors performing activities and construction would receive training on the NHPA, the Archaeological Resources Protection Act, and the Native American Graves Protection and Repatriation Act and the consequences of noncompliance with these acts. Training would also include cultural sensitivity to Native American concerns, since tribal monitors would be present during construction.

- **BMP CULT-05: Compensatory Mitigation Fee.** DCRT would pay a compensatory mitigation fee for cumulative and indirect effects to historic properties as a result of construction. The fee structure of the compensatory mitigation fee would be calculated in a manner that is commensurate to the size and regional impacts of the Project and would include a management fee. This fee structure would be determined by BLM and contained in the Project-specific PA.

- **BMP CULT-06: Sensitivity Model.** BLM would develop a sensitivity model for cultural resources using the DRECP geodatabase for the purpose of selecting Project footprints to minimize impacts to recorded historic properties and areas that are culturally sensitive to Tribes.

- **BMP CULT-07: Sample Survey.** BLM will ensure that a statistically significant cultural resources sample survey is conducted for consideration in Project planning in locations within the CDCA boundary.

- **BMP CULT-08: Project Planning.** DCRT would consider the results of the BLM's cultural resources sensitivity model in Project planning and provide justification if it is not considered to be feasible.

- **APM PALEO-01: Paleontological Resources Treatment Plan.** DCRT would prepare a Paleontological Resources Treatment Plan that would describe procedures to be followed in the event of the discovery of paleontological resources during implementation of the Project. Upon approval of the draft plan, DCRT would follow the procedures set forth in that Plan during implementation of the Project.

- **BMP PALEO-02: Paleontological Resources Monitor.** A qualified paleontologist would provide monitoring for paleontological resources during construction in areas of high or unknown fossil potential.

2.5.3 Conservation and Management Actions

The CDCA Plan, as amended, contains CMAs, which include a specific set of avoidance, minimization, and compensation measures. The applicability of those measures to the Project was determined using a CMA checklist (EIS Appendix 2C). The CMAs applicable to the Project

and related to Cultural Resources and Tribal Interests are listed below and Project compliance with CDCA CMAs is addressed in the analysis portion of this section.

- **CMA LUPA-CUL-4: Cultural Resources and Tribal Interests**. Design activities to minimize impacts on cultural resources including places of traditional cultural and religious importance to federally recognized Tribes.

- **CMA LUPA-TRANS-CUL-1: Cultural Resources and Tribal Interests**. For transmission (and renewable energy) activities, require the applicant to pay all appropriate costs associated with the following processes, through the appropriate BLM funding mechanism:

  - All appropriate costs associated with the BLM's analysis of the DRECP geodatabase and other sources for cultural resources sensitivity.

  - All appropriate costs associated with preliminary sensitivity analysis.

  - All appropriate costs associated with the Section 106 and CEQA processes including the identification and defining of cultural resources. These costs may also include logistical, travel, and other support costs incurred by tribes in the consultation process.

  - All appropriate costs associated with updating the DRECP cultural resources geodatabase with project specific results.

- **CMA LUPA-TRANS-CUL-2.** Consistent and in compliance with the NHPA PA, signed February 5, 2016, or the most up to date signed version – for transmission (and renewable energy) activities, a compensatory mitigation fee will be required within the LUPA DA to address cumulative and some indirect adverse effects to historic properties. The mitigation fee will be calculated in a manner that is commensurate to the size and regional impacts of the project. Refer to the NHPA PA for details regarding the mitigation fee.

- **CMA LUPA-TRANS-CUL-3.** For transmission (and renewable energy) activities, the management fee rate will be determined through the NHPA programmatic Section 106 consultation process that will be completed as part of the DRECP land use plan amendment.

- **CMA LUPA-TRANS-CUL-4.** For transmission (and renewable energy) activities, demonstrate that results of cultural resources sensitivity, based on the DRECP geodatabase, and other sources, are used as part of the initial planning pre-application process and to select of specific footprints for further consideration.

- **CMA LUPA-TRANS-CUL-5.** For transmission (and renewable energy) activities, provide a statistically significant sample survey as part of the pre-application process, unless the BLM determines the DRECP geodatabase and other sources are adequate to assess cultural resources sensitivity of specific footprints.

- **CMA LUPA-TRANS-CUL-6.** For transmission (and renewable energy) activities, provide justification in the application why the project considerations merit moving forward if the specific footprint lies within an area identified or forecast as sensitive for cultural resources by the BLM.

- **CMA DFA-VPL-CUL-1.** For renewable energy activities and transmission, require the applicant to pay all appropriate costs associated with the following processes, through the appropriate BLM funding mechanism:

  - All appropriate costs associated with the BLM's analysis of the DRECP geodatabase and other sources for cultural resources sensitivity.

  - All appropriate costs associated with preliminary sensitivity analysis.

  - All appropriate costs associated with the Section 106 process including the identification and defining of cultural resources. These costs may also include logistical, travel, and other support costs incurred by tribes in the consultation process.

  - All appropriate costs associated with updating the DRECP cultural resources geodatabase with project specific results.

- **CMA DFA-VPL-CUL-2.** Consistent and in compliance with the NHPA PA, signed February 5, 2016, or the most up to date signed version -for renewable energy activities and transmission, a compensatory mitigation fee will be required within the LUPA DA to address cumulative and some indirect adverse effects to historic properties. The mitigation fee will be calculated in a manner that is commensurate to the size and regional impacts of the project. Refer to the PA for details regarding the mitigation fee.

- **CMA DFA-VPL-CUL-3.** For renewable energy activities and transmission, the management fee rate will be determined through the NHPA programmatic Section 106 consultation process that will be completed as part of the DRECP land use plan amendment.

- **CMA DFA-VPL-CUL-4.** For renewable energy activities and transmission, demonstrate that results of cultural resources sensitivity, based on the DRECP geodatabase, and other sources, are used as part of the initial planning pre-application process and to select of specific footprints for further consideration.

- **CMA DFA-VPL-CUL-5.** For renewable energy activities and transmission, provide a statistically significant sample survey as part of the pre-application process, unless the BLM determines the DRECP geodatabase and other sources are adequate to assess cultural resources sensitivity of specific footprints.

- **CMA DFA-VPL-CUL-6.** For renewable energy activities and transmission, provide justification in the application why the project considerations merit moving forward if the specific footprint lies within an area identified or forecast as sensitive for cultural resources by the BLM.

- **CMA DFA-VPL-CUL-7.** For renewable energy activities and transmission, complete the NHPA Section 106 Process as specified in 36 CFR Part 800, or via an alternate procedure, allowed for under 36 CFR Part 800.14 prior to issuing a ROD or ROW grant on any utility-scale renewable energy or transmission project. For utility-scale solar energy developments, the BLM may follow the Solar PA.

2.5.4 CEQA Significance Criteria

Appendix G of CEQA Guidelines (14 CCR 15000 et seq.) provides guidance on assessing whether a project would have significant impacts on the environment. Consistent with Appendix G, the Project would have significant cultural resource impacts if it would:

a. Cause a substantial adverse change in the significance of a historical resource as defined in § 15064.5?

b. Cause a substantial adverse change in the significance of an archaeological resource pursuant to § 15064.5?

c. Directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?

d. Disturb any human remains, including those interred outside of formal cemeteries?

2.5.5 Cultural Resources Impact Analysis

Impact CUL 1 - Cause a substantial adverse change in the significance of a historical resource as defined in § 15064.5?

Less than Significant with Mitigation

Cultural resources are non-renewable resources and any disturbance, damage, or loss to a resource that is or may be eligible for the NRHP or CRHR would constitute an irreversible and irretrievable and significant impact to that resource, as outlined in Section 4.20.3 of the TES (BLM 2019). As detailed in Section 4.6 of the TES (BLM 2019), impacts on cultural resources would result if ground-disturbing activities cause damage, destruction, or alteration of historic properties or resources. Ground-disturbing activities include Project-related excavation, grading, trenching, vegetation clearing, operation of heavy equipment, and other surface and subsurface disturbance that could damage or destroy surficial or buried archaeological resources including prehistoric and historic resources or human burials. Though most impacts to historic properties would be expected to occur in association with construction, some Project-related activities could affect historic properties during operations and maintenance.

The selected route would be inventoried for cultural resources through archival review and pedestrian survey prior to any ground-disturbing activities, all cultural resources that may be directly or indirectly affected or impacted would be evaluated for eligibility to the CRHR as historical resources and to the NRHP as historic properties, and a HPTP and MDP developed to address potential direct and indirect effects or impacts to all historic properties/historical resources. This would be implemented through MM CUL-CEQA-1 and MM CUL-CEQA-2 which include implementation of cultural resources APMs, BMPs, and CMAs as well as s

cultural resources inventory required for the Project, respectively. The PA will implement actions identified as measures to resolve adverse effects. The Project would adhere to MM CUL-CEQA-1, which includes the implementation of BMP CULT-03 (which provides compliance with CMA LUPA-CUL-4) during Project activities that would require avoidance procedures and appropriate treatment of each historic property identified in the HPTP (APM CULT-01). These requirements would be further implemented through MM CUL-CEQA-3 which incorporates avoidance of cultural resources. Additionally, with the implementation of MM CUL-CEQA-1, which includes APM CULT-02 and BMP CULT-04, if prehistoric or historic-period materials are encountered during ground disturbing work at any of the Project work sites, all work in the immediate vicinity of the discovery would be halted until a qualified archaeologist can evaluate the significance of the find. If the find is determined to be significant, a qualified archaeologist and the lead agency would determine the appropriate avoidance measures or other suitable mitigation in consultation with the appropriate SHPO. Significant cultural materials would be curated according to current professional standards.

As discussed in Section 4.6.5 of the TES (BLM 2019), indirect effects to historic properties or significant historical resources could occur in areas where the construction of new roads into the Project area would provide improved access into previously inaccessible areas. Improved access could lead to site damage by off-highway vehicles (OHVs) and recreational use of these areas. Such damage could consist of vehicular damage to surface archaeological sites, and vandalism to sensitive areas where rock art is present. Measures to mitigate potential adverse effects to historic properties as a result of improved access would be included in the Project-specific PA (PA; Appendix 2D of the EIS).

Additionally, the following CMAs (implemented through MM CUL-CEQA-1) identified below would be applicable and would be addressed by the noted Project APMs and BMPs and would be required in order to reduce potential impacts related to cultural resources to a less than significant level:

CMA LUPA-CUL-4 is specific to the Project design to minimize impacts on cultural resources, including those places of elevated cultural or spiritual significance to federally recognized tribes. Compliance with CMA LUPA-CUL-4 would be satisfied with BMP-CULT-03, which states that the Proponent would follow avoidance and stipulations outlined in the PA (Appendix 2D of the EIS) and appropriate HPTPs, and APM-CULT-01 and APM-CULT-02, in which the Proponent commits to following those stipulations.

LUPA-TRANS-CUL-1 and DFA-VPL-CUL-1 are specific to the responsibility of the Project Proponent to pay for costs associated with the Project’s cultural resources compliance. Compliance with CMA LUPA-TRANS-CUL-1 and DFA-VPL-CUL-1 would be satisfied by APM-CULT-01 and APM-CULT-02, in which the Proponent commits to conducting a cultural resources inventory of the direct and indirect analysis area, preparing HPTPs, and conducting cultural resource monitoring during Project construction, operations, and maintenance (as appropriate) to meet stipulations outlined in the PA (Appendix 2D of the EIS).

LUPA-TRANS-CUL-2 and DFA-VPL-CUL-2 are specific to the Proponent’s payment of compensatory mitigation fees for cumulative and indirect effects to historic properties as a result of Project construction, operations, and maintenance. Compliance with CMA LUPA-TRANS-CULT-2 and DFA-VPL-CUL-2 would be satisfied by BMP-CULT-05, which outlines the fee

structure of the compensatory mitigation fee. The compensatory mitigation fee structure is also outlined in the stipulations contained within the PA (Appendix 2D of the EIS).

LUPA-TRANS-CUL-3 and DFA-VPL-CUL-3 are specific to the Proponent's payment of management fees as part of the compensatory mitigation fee contained in CMA LUPA-TRANS-CUL-2 and DFA-VPL-CUL-2, respectively. Compliance with LUPA-TRANS-CUL-3 and DFA-VPL-CUL-3 would be satisfied by BMP-CULT-05, which outlines the fee structure of the management fee as part of the compensatory mitigation fee. The management fee and compensatory mitigation fee structure is also outlined in the stipulations contained within the PA (Appendix 2D of the EIS).

LUPA-TRANS-CUL-4 and DFA-VPL-CUL-4 are specific to the development of a cultural resources sensitivity model based on existing cultural resources data in the CDCA for consideration in Project planning and alternative selection. Compliance with CMA LUPA-TRANS-CUL-4 and DFA-VPL-CUL-4 would be satisfied with BMP-CUL-06. The BLM has prepared a sensitivity model (Kline 2017).

LUPA-TRANS-CUL-5 and DFA-VPL-CUL-5 are specific to the provision of a statistically significant cultural resources sample survey to be used in Project planning. Compliance with CMA LUPA-TRANS-CUL-5 and DFA-VPL-CUL-5 would be satisfied by BMP-CULT-07, which requires a sensitivity analysis and cultural resources Class III survey of segments p-17 and p-18 to be conducted during the NEPA and CEQA analyses to meet the conditions of CMA LUPA-TRANS-CUL-5 and DFA-VPL-CUL-5. The Class III survey of the segments in the CDCA that require inventory, identified as Segments p-17 and p-18 has been conducted.

The Class I cultural resources data available for the California portion of the Project has been compiled into a Sensitivity Analysis (Kline 2018). The results of the Sensitivity Analysis are discussed in association to relevant segments, alternatives, and sub-alternatives located in the Colorado River and California Zone (Section 3.6.3.2 and Sections 4.6.1 and 4.6.5.5 of the TES [BLM 2019]). The Sensitivity Analysis is a specific Project requirement for compliance with LUPA-TRANS-CUL-5. The results of the Sensitivity Analysis are discussed within the contexts of the relevant Project segments located in the Colorado River and California Zone.

LUPA-TRANS-CUL-6 and DFA-VPL-CUL-6 is specific to the Proponent's justification to move areas identified as sensitive to cultural resources forward through NEPA and CEQA analyses. Compliance with CMA LUPA-TRANS-CUL-6 and DFA-VPL-CUL-6 would be satisfied by BMP-CULT-08, which requires such justification from the Project proponent.

With the implementation MM CUL-CEQA-1, MM CULT-CEQA-2, and MM CUL-CEQA-3 the Project would result in a less than significant impact to historical resources as defined in Section 15064.5.

Impact CUL 2 - Cause a substantial adverse change in the significance of an archaeological resource pursuant to § 15064.5?

Less than Significant with Mitigation

As discussed under Impact CUL 1 above, the selected route would be inventoried for cultural resources, including archaeological resources, prior to any ground-disturbing activities. All

archaeological resources would be required to be evaluated for eligibility to the NRHP and CRHR, and a HPTP developed to address potential direct and indirect affects/impacts to historic properties under Section 106 and historical resources under CEQA. This would be implemented through MM CUL-CEQA-2 which would require a cultural resource inventory, and development of a HPTP and MDP for the Project in order to ensure that impacts related to archaeological resources are reduced to a less than significant level.

The Project would also implement MM CUL-CEQA-3, which would require avoidance of any archaeological resources identified within the Project area as well as appropriate treatment measures for each archaeological resource identified in the HPTP. Through implementation of this MM, as well as MM CUL-CEQA-1, which requires implementation of BMP CULT-03/CMA LUPA-CUL-4, impacts related to archaeological resources would be less than significant.

Further, with the implementation of MM CUL-CEQA-1, which requires implementation of APM CULT-02 (provides compliance with CMA LUPA-TRANS-CUL-1), if prehistoric or historic-period materials are encountered during ground disturbing work at any of the Project work sites, all work in the immediate vicinity of the discovery would be halted until a qualified archaeologist can evaluate the significance of the find. If the find is determined to be significant, or qualify as a unique archaeological resource under CEQA, a qualified archaeologist and the lead agency would determine the appropriate avoidance measures or other suitable mitigation in consultation with the appropriate SHPO. Significant cultural materials would be curated according to current professional standards. Therefore, direct Project impacts to archaeological resources would be less than significant with mitigation incorporated.

As discussed in Section 4.6.2 of the TES (BLM 2019), indirect effects to archaeological resources under Section 106 and archaeological resources under CEQA could occur in areas where the construction of new roads into the Project Area would provide improved access into previously inaccessible areas. Improved access could lead to site damage by off-road vehicles and recreational use of these areas. Such damage could consist of vehicular damage to surface archaeological sites, and vandalism to sensitive areas where rock art is present. Measures to mitigate potential adverse effects to historic properties under Section 106 and historical resources under CEQA as a result of improved access would be included in the Project-specific PA (Appendix 2D of the EIS).

Because cultural resources are non-renewable resources, any disturbance, damage, or loss to a resource that is or may be eligible for the NRHP or CRHR would constitute an irreversible and irretrievable impact to that resource, as outlined in Section 4.20.3 of the TES. However, avoidance and mitigation would reduce impacts to less than significant.

The same CMAs, implemented through MM CUL-CEQA-1, would be applicable and would be addressed by the noted Project APMs and BMPs as described under Impact CUL-1.

With the implementation MM CUL-CEQA-1, MM CUL-CEQA-2, and MM CUL-CEQA-3 the Project would result in a less than significant impact to archaeological resources as defined in Section 15064.5.

Impact CUL 3 - Directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?

Less than Significant with Mitigation

As indicated in Section 4.4.7.1 of the TES, a portion of the Project would cross an area (Segment p-16) with high potential to encounter fossils. Further, the majority of the route would cross land with unknown fossil potential. Direct loss of scientifically important fossils and indirect loss of access to scientifically important fossils could occur if fossils are present. Construction within the ROW would include clearing and grading and the excavation for the structure foundations, which could result in a significant impact prior to mitigation. However, MM CUL-CEQA-1 and MM CUL-CEQA-4 would be required and would include adherence to the BLM IM 2009-11 standards for protection of paleontological resources, including monitoring, salvage procedures, and the development of a Paleontological Resources Management Plan for the Project. Specifically, the Paleontological Resources Treatment Plan would describe procedures to be followed if vertebrate or noteworthy occurrences of invertebrate or plant fossils are discovered, which would include that the user/operator will suspend all operations that further disturb such materials and immediately contact the authorized officer. Work in the area will not resume until written authorization to proceed is issued by the authorized officer. Within five working days, the authorized officer will evaluate the discovery and inform the operator of actions that would be necessary to prevent loss of significant scientific values. Upon verification from the authorized officer that the required mitigation has been completed, the operator would be allowed to resume operations. Implementation of this MM, as well as the above mentioned APMs and BMPs, impacts to paleontological resources would be reduced to less than significant.

Therefore, the overall impacts related to paleontological resources would be less than significant with MM CUL-CEQA-1 and MM CUL-CEQA-4 incorporated.

Impact CUL 4 - Disturb any human remains, including those interred outside of formal cemeteries?

Less than Significant with Mitigation

As indicated in Section 4.7.7.1 of the TES, Segment p-17 includes a site with exposed human remains and may indicate an increased potential for encountering additional human remains during ground disturbing activities. If human remains are discovered during construction of the Project, this could result in a potential impact prior to mitigation. Specifically, the Colorado River Indian Tribe (CRIT) expressed concern regarding the treatment of human remains and mortuary items. It is their belief that if human remains are encountered, they should not be removed but avoided entirely and left in place. MM CUL-CEQA-1 would be implemented, which requires implementation of BMP CULT-08 (provides compliance with CMA LUPA-TRANS-CUL-6), requiring the proponent to consider such sites in Project planning and BMP CULT-03 which includes avoidance procedures and other stipulations for such sites. Specifically, if human remains are discovered on non-federal land within California, the Project must comply with the standards identified within Public Resources Code Section 5097.98 and Health and Safety Code Section 7050.5, and if human remains are discovered on federal lands, the Project must comply with the standards outlined in the Native American Graves Protection and Repatriation Act.

Further, with the implementation of MM CUL-CEQA-1 would also require compliance with APM CULT-02, if construction or other Project personnel discover what may be human remains, funerary objects, or items of cultural patrimony on BLM-administered land, all construction activities would cease within 100 feet of the discovery. The location of the find would not be publicly disclosed, and the remains would be secured and preserved in place. DCRT or its contractors would immediately notify the BLM Authorized Officer and the appropriate sheriff's office of the discovery, followed by written notification. The BLM would then notify the Native American Parties of interest and the SHPO. If the remains were found on private land, the SHPO would be notified immediately after the tribes. How to proceed from there would be determined through consultation with the appropriate agencies. If the remains can be left safely in place, that would be the preferred option. Construction would not resume in the area of the discovery until the BLM Authorized Officer has issued a Notice to Proceed.

In California, if the human remains are of Native American origin, the coroner must notify the Native American Heritage Commission within 24 hours of such identification. The most likely descendant would work with the Cultural Resource Specialist to develop a program for re-interment or other disposition of the human remains and any associated artifacts. No additional work would take place in the immediate vicinity of the find until the appropriate actions have been implemented.

In addition, MM CUL-CEQA-1 would also require the implementation of CMAs. Specifically, CMA LUPA-CUL-4 would be implemented during construction through MM CUL-CEQA-1. CMA LUPA-CUL-4 is specific to the Project design to minimize impacts on cultural resources, including those places of elevated cultural or spiritual significance to Federally recognized tribes. Compliance with CMA LUPA-CUL-4 would be satisfied with BMP-CULT-03, which states that the Proponent would follow avoidance and stipulations outlined in the PA and appropriate HPTPs, and APM-CULT-01 and APM-CULT-02, in which the Proponent commits to following those stipulations.

With implementation MM CUL-CEQA-1 the Project would result in a less than significant impact to human remains.

2.5.6 Cultural Resources Mitigation

MMs for cultural resources are outlined in the draft PA (Appendix 2D of the EIS). The draft PA has been developed prior to the issuance of the ROD for public review, and measures contained in the final PA would be implemented prior to and during construction and post-construction during maintenance activities, operations, and decommissioning. CEQA mitigation measures would be implemented in accordance with the PA and the ROD.

MM CUL-CEQA-1: Implement Cultural Resources Applicant Proposed Measures, Best Management Practices, Conservation and Management Actions.

The APMs, BMPs, and CMAs in Sections 2.5.2 and 2.5.3 above provide a suite of measures, practices, and actions that shall be implemented as part of the Project. APMs, BMPs, and CMAs shall be implemented prior to, or during all ground disturbance and construction related activities to avoid or minimize Project related impacts to cultural resources. These APMs, BMPs, and CMAs include; APM CULT-01, APM CULT-02, BMP CULT-03, BMP CULT-04, BMP

CULT-05, BMP CULT-06, BMP CULT-07, BMP CULT-08, APM PALEO-01, BMP PALEO-02, CMA LUPA-CUL-4, CMA LUPA-TRANS-CUL-1, CMA LUPA-TRANS-CUL-2, CMA LUPA-TRANS-CUL-3, CMA LUPA-TRANS-CUL-4, CMA LUPA-TRANS-CUL-5, CMA LUPA-TRANS-CUL-6, CMA DFA-VPL-CUL-1, CMA DFA-VPL-CUL-2, CMA DFA-VPL-CUL-3, CMA DFA-VPL-CUL-4, CMA DFA-VPL-CUL-5, CMA DFA-VPL-CUL-6, CMA DFA-VPL-CUL-7. If an APM, BMP, or CMA is subjective, such as containing text that states; "where appropriate," "where applicable," "where feasible," or similar language, the BLM and CPUC shall be consulted to determine the applicability of each measure prior to the disturbance of a covered resource. Compliance with APMs, BMPs, and CMAs shall be documented, and a weekly report shall be provided to the BLM and CPUC. The Applicant shall provide a synopsis of the weekly reports to the BLM and CPUC monthly. The report shall include a summary of the construction activities completed, a list of compliance actions and any remedial actions taken to correct any actions, and the status of ongoing mitigation efforts. For those instances (only) where an APM, BMP, and/or CMA conflicts, or does not meet required specificity pursuant to CEQA, the following BMPs have been modified to meet CEQA requirements:

- **APM CULT-01: Cultural Resources Inventory.** See MM CUL-CEQA-2 below for more details on the cultural resources inventory.
- **APM CUL-02: Monitoring Discovery Plan.** See MM CUL-CEQA-2 below for more details on the Monitoring Discovery Plan.
- **BMP CULT-03: Cultural Resources Avoidance and Stipulations.** See MM CUL-CEQA-3 below for more details on cultural resources avoidance stipulations.
- **BMP CULT-04: Worker Cultural Resources Awareness Program.** See MM CUL-CEQA-2 below for more details on the worker cultural resources awareness program.
- **APM PAELO-01: Paleontological Resources Treatment Plan.** See MM CUL-CEQA-4 below for more details on the Paleontological Resources Treatment Plan required for the Project.

MM CUL-CEQA-1 Implementation

Responsible Party: The Applicant shall ensure that all APMs, BMPs, and CMAs are implemented during construction. If an APM, BMP, or CMA is subjective, the Applicant shall consult with the BLM and/or the CPUC to determine the applicability of each measure.

Timing: APMs, BMPs, and CMAs shall be implemented throughout construction activities.

Mitigation Monitoring and Reporting Program: The Applicant shall develop a weekly report that shall include all applicable APMs, BMPs, and CMAs and the related actions taken in order to be in compliance with these measures. These weekly reports shall be compiled and submitted to the BLM and CPUC monthly.

Standards for Success: Compliance with all applicable APMs, BMPS, and CMAs is achieved throughout construction of the Project.

MM CUL-CEQA-2: Cultural Resources Inventory.

The Applicant shall preform a cultural resources inventory prior to the start of construction activities. The cultural inventory (which is further required by APM-CULT-01) shall include archival and pedestrian surveys to identify cultural resources, as well as an evaluation of the significance of those resources that cannot be avoided, in order to determine eligibility for listing in the CRHR, or that meet the qualifications to be considered unique archaeological resources under CEQA. A technical memorandum or report shall be completed, documenting the cultural resources within the Project area, and the associated eligibility listing. Avoidance of cultural resources within the Project area (as required through MM CUL-CEQA-2 below) shall be the preferred option when handling cultural resources that may be impacted by construction. If avoidance is not possible, then a HPTP and MDP will be prepared and implemented by the Applicant throughout construction activities to ensure proper treatment of the significant or unique resources, as specified in the PA. This HPTP and MDP will, at a minimum, include the following:

- Training of workers to recognize cultural resources (as specified in BMP CULT-04);
- A brief description of all known cultural resources within the Project area;
- A description of all avoidance measures such as flagging or fencing, and specific timeframes during which these MMs would be required to protect cultural resources;
- Preparation and implementation of an MDP (as specified in APM CULT-02). This MDP shall include the following specifications:
    - The MDP shall map all cultural resources within the Project analysis area;
    - The MDP shall detail how resource are determined eligible or resources that are unevaluated but are avoided by Project design and would be marked and protected as Environmentally Sensitive Areas during construction;
    - Th MDP shall also map additional areas that are considered to be of high sensitivity for discovery of buried significant cultural resources including burials, cremations, or sacred features; and
    - The MDP shall detail procedures for halting construction, making appropriate notifications to agencies, officials, and Native American tribes, and assessing NRHP and CRHR eligibility in the event of unknown archaeological resources are discovered during construction;
- Recording procedures and documentation for all cultural resources identified within the Project area; and
- Policies for any collection, retention, and/or disposal of cultural resources uncovered during construction.

MM CUL-CEQA-2 Implementation

Responsible Party: The Applicant shall be responsible for ensuring the Cultural Resources Inventory and HPTP/MDP is prepared and implemented prior to and during construction activities.

Timing: The Cultural Resources Inventory shall be completed prior to the start of construction activities and the HPTP/MDP shall be implemented throughout all construction activities.

Mitigation Monitoring and Reporting Program: Known cultural resources shall be documented and mapped prior to the start of construction. Monthly reports shall be prepared by the Applicant and submitted to the CPUC. These monthly reports shall include a summary of compliance measures taken regarding the HPTP/MDP and a list of any cultural resources encountered during construction.

Standards for Success: Known cultural resources will be avoided in accordance with this measure. Impacts to unknown cultural resources will be minimized to a less than significant level and treated appropriately throughout all construction activities.

MM CUL-CEQA-3: Cultural Resources Avoidance and Stipulations.

The Applicant shall first consider avoidance of impacts for all known cultural resources identified in the Project analysis area, through the cultural resources inventory. If the resource cannot be avoided, then the Applicant shall evaluate the resources for significance and eligibility for listing in the CRHR, to determine whether the resource qualifies as a unique archaeological resource under CEQA. As stated in BMP CULT-03, the Applicant would follow the avoidance procedures and other stipulations outlined in the PA and in the appropriate State HPTP. It shall do so for each cultural resource identified in the Project analysis area. If cultural resources cannot be avoided, then the Applicant shall implement MM CUL-CEQA-2 and any resources shall be evaluated for significance and eligibility for listing in the CRHR. Potential impacts on sites that qualify as historical resources or unique archaeological resources shall be mitigated in accordance with the provisions of the HPTP. HPTPs for historic properties shall comply with the requirements of CEQA Guidelines Section 15064.5(a)(3)(C) and (D).

MM CUL-CEQA-3 Implementation

Responsible Party: The Applicant shall be responsible for ensuring that all known cultural resources are avoided in conformance with this mitigation measure.

Timing: Cultural resources avoidance shall be implemented throughout all construction activities or treated with the provisions of the HPTP (MM CUL-CEQA-2) if avoidance is not possible.

Mitigation Monitoring and Reporting Program: Monthly reports shall be prepared by the Applicant and submitted to the CPUC. These monthly reports shall include a summary of compliance measures taken regarding the cultural resources avoidance stipulations and a list of any known or unknown cultural resources encountered during construction.

Standards for Success: Impacts to know or unknown cultural resources will be minimized to a less than significant level throughout all construction activities.

MM CUL-CEQA-4: Protect Paleontological Resources.

The mitigation actions required by APM PALEO-01 and BMP PALEO-02 shall be accomplished by following the guidance within BLM IM 2009-11, which the CPUC has accepted as appropriate for CEQA (DRECP EIS/EIR). The Applicant shall develop a Paleontological Resources Management Plan prior to the start of construction activities, which shall be implemented throughout all construction activities associated with the Project. The Paleontological Resources Management Plan shall include the following steps:

- Project developers shall document in a paleontological resources assessment report whether paleontological resources exist in a Project area on the basis of the following: the geologic context of the region and site and its potential to contain paleontological resources (including the PFYCs on site), a records search of institutions holding paleontological collections from California desert regions, a review of published and unpublished literature for past paleontological finds in the area, and coordination with paleontological researchers working locally in potentially affected geographic areas (or studying similar geologic strata).

- If the potential fossil yield classification (PFYC) of the geologic units to be encountered during Project construction has not been determined, the Project developer shall use the best available data and field surveys, as applicable, to develop a site-specific map of the PFYC ratings. The PFYC map shall be at a scale equal to or more detailed than 1:100,000. Depending on the extent of existing information available and the sensitivity of the site, development of the resource assessment and PFYC map could require the completion of a paleontological survey.

- If paleontological resources are present at the site or if the geologic units to be encountered by the Project (at the surface or the subsurface) have a PFYC Class of 3, 4, or 5, a Paleontological Resources Management Plan shall be developed. The elements of the plan shall be consistent with BLM IM 2009-11 and shall be prepared and implemented by a professional paleontologist as defined under the Society of Vertebrate Paleontology standards. The plan shall include the following:

  - The qualifications of the principal investigator and monitoring personnel

  - Construction crew awareness training content, procedures, and requirements;

  - Any measures to prevent potential looting, vandalism, or erosion impacts;

  - The location, frequency, and schedule for on-site monitoring activities;

  - Criteria for identifying and evaluating potential fossil specimens or localities;

  - A plan for the use of protective barriers and signs, or implementation of other physical or administrative protection measures;

  - Collection and salvage procedures;

- Identification of an institution or museum willing and able to accept any fossils discovered; and
- Compliance monitoring and reporting procedures.

The Paleontological Resources Management Plan shall also identify if all geologic units that would be affected by the Project have been determined to be within an area with a PFYC Class of 1 or 2, the lead agency shall include paleontological resources as an element in construction worker awareness training and shall include measures to be followed in the event of unanticipated discoveries, including suspension of construction activities in the vicinity. The measure shall stipulate that the site be protected from further earth moving or damage until a qualified paleontologist can assess the significance and importance of the find and until the fossil specimen or locality can be recorded and salvaged, if necessary.

The Paleontological Resources Management Plan shall evaluate all of the construction methodologies proposed on a site, including destructive excavation techniques. Where applicable, the principal investigator shall include in the plan an evaluation of the potential for such techniques to disturb or destroy paleontological resources, an evaluation of whether loss of such fossils would represent a significant impact, and discussion of mitigation or compensatory measures (such as recordation/recovery of similar resources elsewhere on the site) that are necessary to avoid or substantially reduce the impact. Successful implementation of this MM will result in a less than significant impact to paleontological resources.

MM CUL-CEQA-4 Implementation

Responsible Party: The Applicant shall be responsible for ensuring the Paleontological Resources Management Plan is prepared and implemented throughout construction activities.

Timing: The Paleontological Resources Management Plan shall be developed prior to the start of construction activities and be implemented throughout all construction activities.

Mitigation Monitoring and Reporting Program: Monthly reports shall be prepared by the Applicant and submitted to the CPUC. These monthly reports shall include a summary of compliance measures taken regarding the Paleontological Resources Management Plan and a list of any paleontological resources encountered, if any.

Standards for Success: Impacts to known or unknown paleontological resources will be minimized to a less than significant level throughout all construction activities.

2.6 TRIBAL RESOURCES

This section describes the impacts to TCRs associated with the construction, operation, and maintenance of the proposed transmission line, substations, and ancillary facilities in terms of CEQA significance thresholds disclosed below in Section 2.6.4 below. Additionally, this section responds to issues raised during the public scoping process, which are presented in Appendix 1 of the EIS. Cultural Resources are addressed in Section 2.5 of this CEQA appendix.

As discussed in Section 4.7.2.2 of the TES (BLM 2019), BLM has determined a Project-specific PA developed in consultation with interested Tribes, land-managing and permitting agencies,

and other stakeholders is required for the Project (Appendix 2D of the EIS). As stated in the PA, there is a procedure for finalizing and/or modifying the analysis area for the inventory of direct and indirect impacts to historic properties and TCPs that may be affected by the Project. The Project's direct analysis area has been defined as a 200-foot-wide corridor where the construction of Project elements such as structures, access and spur roads, and other ancillary elements would occur. In addition, the PA would outline protocols for minimizing impacts to areas of Native American concern, such as options for regulating access, inclusion of tribal members in cultural resources investigations and fieldwork, and the preparation of ethnographic studies to address the Project's cultural landscape, among other provisions, as required. As concluded in Section 4.6.2 of the TES, potential adverse effects to historic properties would be mitigated in accordance with the provisions of the PA. These same provisions provide adequate mitigation under CEQA to reduce significant impacts to historical resources and TCRs to a level less than significant. Avoidance of cultural resources by final design and construction would be the preferred form of mitigation. As the lead Federal agency responsible for ensuring compliance with the provisions of Section 106 of the NHPA, and other regulatory requirements specific to historic properties and tribal concerns, the BLM has initiated consultation with affiliated Native American tribes. Affiliated tribes were identified by BLM Field Offices (Yuma, Palm Springs, Lake Havasu, Hassayampa, and Lower Sonoran), as well as through communication with the Native American Heritage Commission in California.

The BLM's consultation protocols include formal Government-to-Government and Section 106 consultation through letters and outreach, and face-to-face meetings and conference calls. In addition, the BLM has requested tribal input through the NEPA scoping process and workshops.

Efforts to initiate government-to-government consultation with Native American tribes with jurisdiction or interest in the Project have been undertaken. Section 106 consultation has been summarized in Section 5.3 of the EIS.

In California, AB 52 changes sections of the public resources code to add consideration of Native American culture within CEQA. The goal of AB 52 is to promote the involvement of California Native American Tribes in the decision-making process when it comes to identifying and developing mitigation for impacts to resources of importance to their culture. To reach this goal, the bill establishes a formal role for tribes in the CEQA process. CEQA lead agencies are required to consult with tribes about potential TCRs in the project area, the potential significance of project impacts, the development of project alternatives, and the type of environmental document that should be prepared. AB 52 specifically states that a project that may cause a substantial adverse change in the significance of a TCR is a project that may have a significant effect on the environment.

A TCR, as defined in section 21074 of the PRC, defined TCRs as either:

1) Sites, features, places, cultural landscapes, sacred places, and objects with cultural value to a California Native American tribe that are either of the following:
    a. Included or determined to be eligible for inclusion in the CRHR.
    b. Included in a local register of historical resources as defined in subdivision (k) of Section 5020.1.
2) A resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in subdivision (c) of Section

5024.1. In applying the criteria set forth in subdivision (c) of Section 5024.1 for the purposes of this paragraph, the lead agency shall consider the significance of the resource to a California Native American tribe.

a. A cultural landscape that meets the criteria of subdivision (a) is a tribal cultural resource to the extent that the landscape is geographically defined in terms of the size and scope of the landscape.

b. A historical resource described in Section 21084.1, a unique archaeological resource as defined in subdivision (g) of Section 21083.2, or a "nonunique archaeological resource" as defined in subdivision (h) of Section 21083.2 may also be a tribal cultural resource if it conforms with the criteria of subdivision (a).

AB 52 establishes a consultation process for CEQA lead agencies with all California Native American Tribes, both Federally and non-Federally recognized tribes. AB 52 requires tribal notification, meaningful consultation, and consideration of Tribal Cultural Values in determination of project impacts and mitigation.

As the CEQA lead agency, the CPUC has initiated the AB 52 process in connection with DCRT's CPNC application. AB 52 consultation is ongoing with each tribe that responded to the invitation to consult. AB 52 consultation will continue until inventories are completed, thus ensuring that consulting tribes continue to be involved given that they're identified as having "unique knowledge" to identify TCRs. When appropriate, CPUC will reach out to the tribes separately regarding conclusion of the AB 52 consultation process.

Table 2.6-1 summarizes the CPUC's tribal consultation and coordination to date. This will be ongoing during the CEQA (and NEPA) process.

Table 2.6-1 AB 52 Tribal Consultation

DATE	TRIBE	DESCRIPTION
11/4/16	Cabazon CRIT Torres Martinez Twenty-Nine Palms	Letter to tribes providing formal notification of the Project.
7/17/17	Twenty-Nine Palms	Letter to tribe providing an update on status consultation and the Project in general.
7/28/17	CRIT	Letter from tribe requesting an in-person meeting.
9/1/17	Twenty-Nine Palms	Letter from tribe expressing their continued interest in the Project.

2.6.1 Thresholds and Methodology

Existing conditions described in Section 3.7 of the TES (BLM 2019) have been evaluated with regard to their potential to be affected by Project construction, operation, maintenance, and decommissioning activities. The potential impacts associated with the Project are evaluated on a qualitative and quantitative basis through a comparison of the anticipated Project effects on tribal resources. The evaluation of Project impacts is based on the significance criteria established by

Appendix G of the CEQA Guidelines, listed below. Additionally, this section responds to issues raised during the public scoping process, which are presented in Appendix 1 of the EIS.

The evaluation of Project impacts is based on the significance criteria established by Appendix G of the CEQA Guidelines (refer to section 2.6.4 below for additional information), and additional criteria identified specific to these issues of Native American concerns, as discussed in Section 4.7.2.3 of the TES (BLM 2019):

- Project-related changes that would restrict Native American access into traditional use areas and TCPs, and by direct extension, TCRs under CEQA and CPUC's Tribal consultation.
- Project-related changes that result in new access into areas where access had previously been limited. This would be the result of new access roads that would open up areas to OHV traffic and could result in vandalism of cultural resource sites.
- Project ground disturbance that results in the loss or destruction of cultural resource sites and erases the connection between individual cultural resource sites on the landscape. (Specific information regarding potential effects to cultural resource sites are discussed in Section 4.6 of the TES.)
- Project-related changes that modify visual aspects of TCPs, TCRs, and the cultural landscape, especially specific to the Salt Song Trail.
- Project-related changes resulting in new disturbance in pristine environments that would affect the energy of a natural landscape.
- The following assumptions underlie the Section 106 and CPUC's consultation process:
- Native American tribes may choose not to divulge particularly sensitive information outside of the tribal community
- Community members may have their own beliefs, which may not necessarily be shared by members of the Tribal council
- BLM and CPUC can only address Native American areas of concern that are made known
- Tribes may share new concerns during the Section 106 and NEPA process, and the CEQA process; the BLM and CPUC will attempt to address these in the Project and Resource-specific HPTPs, as identified in the PA.
- Some Tribes may defer to other Tribes in the decision-making process.

2.6.2 Applicant Proposed Measures and BLM Best Management Practices

APMs have been identified and would be implemented by the Project applicant. In addition, BLM would require implementation of BMPs, which are intended to further minimize Project impacts. All Project APMs and BMPs are described in EIS Appendix 2A.

By giving consulting tribes information on resources that may be identified as CRHR- or NRHP-eligible, and hence meeting the AB 52 definition of a TCR, the following BMPs would apply to the portion of the Project located within California. They have, therefore, been incorporated into the Project for evaluation of significant impacts to concerns of Native American Tribes.

- **APM CULT-01: Cultural Resources Inventory.** A cultural inventory would be conducted that would document cultural resources within the area of potential effects for the Project. Based on results of this inventory, a HPTP would be developed to specifically address direct and indirect impacts that may result from Project construction.

- **APM CULT-02: Monitoring and Discovery Plan.** DCRT's contractor would prepare an MDP that would describe procedures to be followed in the event of the discovery of cultural resources or human remains during implementation of the Project. The Draft MDP would be reviewed by BLM and consulting state and federal agencies, the California and Arizona SHPOs, and local tribes. Upon approval of the MDP, DCRT would follow the procedures set forth in that plan during implementation of the Project.

- **BMP CULT-03: Cultural Resources Avoidance and Stipulations.** DCRT would follow the avoidance procedures and other stipulations outlined in the PA and in the appropriate State HPTP for each historic property identified in the HPTP.

- **BMP CULT-04: Worker Cultural Resources Awareness Program.** Before starting any work, including mowing, staging, sediment and erosion control installation, tree removal, construction, and restoration, all employees and contractors performing activities and construction would receive training on the NHPA, the Archaeological Resources Protection Act, and the Native American Graves Protection and Repatriation Act and the consequences of noncompliance with these acts. Training would also include cultural sensitivity to Native American concerns, since tribal monitors would be present during construction.

- **BMP CULT-06: Sensitivity Model.** BLM would develop a sensitivity model for cultural resources using the DRECP geodatabase for the purpose of selecting Project footprints to minimize impacts to recorded historic properties and areas that are culturally sensitive to Tribes.

- **BMP CULT-07: Sample Survey.** The BLM shall ensure that a statistically significant cultural resources sample survey is conducted for consideration in Project planning in locations within the CDCA boundary.

- **BMP CULT-08: Project Planning.** DCRT would consider the results of the BLM's cultural resources sensitivity model in Project planning and provide justification if it is not considered to be feasible.

2.6.3 Conservation and Management Actions

The CDCA Plan, as amended, contains CMAs, which include a specific set of avoidance, minimization, and compensation measures. The applicability of those measures to the Project was determined using a CMA checklist (EIS Appendix 2C). The CMAs applicable to the Project related to Tribal Interests are listed below and Project compliance with CDCA CMAs is addressed in the analysis portion of this section.

- **CMA LUPA-CUL-4.** Cultural Resources and Tribal Interests. Design activities to minimize impacts on cultural resources including places of traditional cultural and religious importance to Federally recognized Tribes.

- **CMA LUPA-TRANS-CUL-1: Cultural Resources and Tribal Interests**. For transmission (and renewable energy) activities, require the applicant to pay all appropriate costs associated with the following processes, through the appropriate BLM funding mechanism:

  - All appropriate costs associated with the BLM's analysis of the DRECP geodatabase and other sources for cultural resources sensitivity.

  - All appropriate costs associated with preliminary sensitivity analysis.

  - All appropriate costs associated with the Section 106 process including the identification and defining of cultural resources. These costs may also include logistical, travel, and other support costs incurred by tribes in the consultation process.

  - All appropriate costs associated with updating the DRECP cultural resources geodatabase with project specific results.

- **CMA LUPA-TRANS-CUL-4.** For transmission (and renewable energy) activities, demonstrate that results of cultural resources sensitivity, based on the DRECP geodatabase, and other sources, are used as part of the initial planning pre-application process and to select of specific footprints for further consideration.

- **CMA LUPA-TRANS-CUL-5**. For transmission (and renewable energy) activities, provide a statistically significant sample survey as part of the pre-application process, unless the BLM determines the DRECP geodatabase and other sources are adequate to assess cultural resources sensitivity of specific footprints.

- **CMA LUPA-TRANS-CUL-6.** For transmission (and renewable energy) activities, provide justification in the application why the project considerations merit moving forward if the specific footprint lies within an area identified or forecast as sensitive for cultural resources by the BLM.

- **CMA DFA-VPL-CUL-1.** For renewable energy activities and transmission, require the applicant to pay all appropriate costs associated with the following processes, through the appropriate BLM funding mechanism:

- All appropriate costs associated with the BLM's analysis of the DRECP geodatabase and other sources for cultural resources sensitivity.
- All appropriate costs associated with preliminary sensitivity analysis.
- All appropriate costs associated with the Section 106 process including the identification and defining of cultural resources. These costs may also include logistical, travel, and other support costs incurred by tribes in the consultation process.
- All appropriate costs associated with updating the DRECP cultural resources geodatabase with project specific results.

- **CMA DFA-VPL-CUL-4**. For renewable energy activities and transmission, demonstrate that results of cultural resources sensitivity, based on the DRECP geodatabase, and other sources, are used as part of the initial planning pre-application process and to select of specific footprints for further consideration.
- **CMA DFA-VPL-CUL-5**. For renewable energy activities and transmission, provide a statistically significant sample survey as part of the pre-application process, unless the BLM determines the DRECP geodatabase and other sources are adequate to assess cultural resources sensitivity of specific footprints.
- **CMA DFA-VPL-CUL-6**. For renewable energy activities and transmission, provide justification in the application why the project considerations merit moving forward if the specific footprint lies within an area identified or forecast as sensitive for cultural resources by the BLM.
- **CMA DFA-VPL-CUL-7**. For renewable energy activities and transmission, complete the NHPA Section 106 Process as specified in 36 CFR Part 800, or via an alternate procedure, allowed for under 36 CFR Part 800.14 prior to issuing a ROD or ROW grant on any utility-scale renewable energy or transmission project. For utility-scale solar energy developments, the BLM may follow the Solar PA.

2.6.4 CEQA Significance Criteria

Appendix G of CEQA Guidelines (14 CCR 15000 et seq.) provides guidance on assessing whether a project would have significant impacts on the environment. Consistent with Appendix G, the Project would have significant tribal impacts if it would:

a. Would the project cause a substantial adverse change in the significance of a tribal cultural resource, defined in Public Resources Code section 21074 as either a site, feature, place, cultural landscape that is geographically defined in terms of the size and scope of the landscape, sacred place, or object with cultural value to a California Native American tribe, and that is:
    1. Listed or eligible for listing in the CRHR, or in a local register of historical resources as defined in Public Resources Code section 5020.1(k); or

2. A resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in subdivision (c) of Public Resources Code Section 5024.1. In applying the criteria set forth in subdivision (c) of Public Resource Code Section 5024.1, the lead agency shall consider the significance of the resource to a California Native American tribe.

2.6.5 Tribal Cultural Resources Impact Analysis

Impact TCR 1 - Would the project cause a substantial adverse change in the significance of a tribal cultural resource, defined in Public Resources Code section 21074 as either a site, feature, place, cultural landscape that is geographically defined in terms of the size and scope of the landscape, sacred place, or object with cultural value to a California Native American tribe, and that is:

I. Listed or eligible for listing in the CRHR, or in a local register of historical resources as defined in Public Resources Code section 5020.1(k); or

II. A resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in subdivision (c) of Public Resources Code Section 5024.1. In applying the criteria set forth in subdivision (c) of Public Resource Code Section 5024.1, the lead agency shall consider the significance of the resource to a California Native American tribe.

Less than Significant with Mitigation

Segments p-17 and p-18 are of elevated tribal concern in terms of new and existing access, and areas of elevated spiritual importance. Segment p-17 additionally contains known human remains. These segments have also been identified as areas of high sensitivity for cultural resources and resources of tribal importance according to the Project's cultural resources sensitivity analysis (Kline 2018). The resources along these segments are considered by the tribes to be sensitive to both direct effects and indirect visual effects. MMs identified in the PA would be required in order to assess indirect effects and implement measures to avoid tribal resources where possible, and mitigate impacts if avoidance is not possible. Implementation of the MMs identified within the PA would reduce potential impacts to a less than significant level.

In addition to segments p-17 and p-18, segments cb-10, ca-04, i-08s, p-15e, p-15w, and x-11 cross the Colorado River which is an important tribal resource for local tribes. Specifically, the CRIT, Quechan Tribe of the Fort Yuma Indian Reservation, and Twenty-Nine Palms Band of Mission Indians all expressed concern about the Colorado River, and its influence on their spiritual belief and cultural history. As such, the Colorado River crossing and the indirect and direct effects of its siting on the landscape and potential impact to historic properties are of great concern to the Native American tribes. MMs identified within the PA, as well as continued government-to-government Section 106 consultation would reduce potential impacts through avoidance of tribal resources, where possible, and implementation of measures to address tribal resources where avoidance is not possible. Therefore, impacts related to tribal resource would be less than significant with mitigation incorporated.

Further, as noted in Section 4.7.6 of the TES (BLM 2019), if impacts to Native American concerns cannot be avoided by Project design, MM TCR-CEQA-1 would be required and would implement APMs, BMPs, and CMAs, to reduce potential impacts related to changes to the landscape.

Prior to construction, Class III cultural resource surveys would be conducted to identify sites that need to be avoided or mitigated through data recovery. Monitoring during construction would minimize the potential for inadvertent damage to intact subsurface deposits that could not be identified during Class III surveys.

Visual impacts on cultural sites that are sensitive to visual change would be assessed so that impacts could be minimized through analysis of the viewshed and tower placement. An unavoidable impact would occur to the extent that transmission line infrastructure can be seen from intaglios, petroglyphs, TCPs/TCRs, or other resources of elevated concern to Native Americans., however, MM TCR-CEQA-1 would be required and would implement APMs, BMPs, and CMAs in order to reduce visual impacts to a less than significant level.

Pursuant to Section 4.7.8 of the TES (BLM 2019), the construction of a new transmission line on the landscape, would likely have some residual effect on issues of Native American concern because of the permanence of the infrastructure for the life of the Project. In particular, the visual effects of the transmission line infrastructure would have a residual visual impact on the landscape and continue to contribute to the erasing the ancestral footprint of the Tribes from the landscape. The residual effect would be more pronounced in locations where the transmission line does not parallel existing infrastructure. While visual impacts, to the extent practicable, would be addressed through Project design and mitigation, the changes to the landscape cannot be avoided and thus could result in a potential impact prior to mitigation.

In additional to visual impacts to tribal resources, the access requirements for operations and maintenance leave the residual possibility of increasing recreational access into areas that may currently be visited infrequently. This increases the risk of inadvertent damage or vandalism to features important to Tribes, and thus could result in a potential impact prior to mitigation. Access concerns may be addressed in the PA by including specific protocols to restrict access into sensitive areas by barrier placement or providing regular patrols to prevent damage or vandalism, but the effectiveness of these MMs may not be as efficient as avoiding the introduction of any new access.

Further, MM TCR-CEQA-1 would be required in order to implement APMs, BMPs, and CMAs into the Project to reduce potential impacts to tribal resources to a less than significant level. Specifically, CMAs LUPA-CUL-4, LUPA-TRANS-CUL-1, LUPA-TRANS-CUL-4 through LUPA-TRANS-CUL-6, DFA-VPL-CUL-1, and DFA-VPL-CUL-4 through DFA-VPL-CUL-6 would apply to the Project (Section 2.6.3 of this appendix, as well as Appendix 2C of the EIS). DFA-VPL-CULT-7 would also apply to the Project (Appendix 2C of the EIS) and would be satisfied by information provided in Sections 3.6.1.1 of the TES (BLM 2019), as well as Appendix 2D of the EIS.

LUPA-CUL-4 is specific to the Project design to minimize impacts on cultural resources, including those places of elevated cultural or spiritual significance to federally recognized tribes. Compliance with LUPA-CUL-4 would be satisfied with BMP-CULT-03, which states that the

Proponent would follow avoidance and stipulations outlined in the PA and appropriate HPTPs, and APM-CULT-01 and APM-CULT-02, in which the Proponent commits to following those stipulations.

LUPA-TRANS-CUL-1 and DFA-VPL-CUL-1 are specific to the responsibility of the Project Proponent to pay for costs associated with the Project's cultural resources compliance. Compliance with LUPA-TRANS-CUL-1 and DFA-VPL-CUL-1 would be satisfied by APM-CULT-01 and APM-CULT-02, in which the Proponent commits to conducting a cultural resources inventory of the direct and indirect analysis area, preparing HPTPs, and conducting cultural resource monitoring during Project construction, operations, and maintenance (as appropriate) to meet stipulations outlined in the PA (Appendix 2D).

LUPA-TRANS-CUL-4 and DFA-VPL-CUL-4 are specific to the development of a cultural resources sensitivity model based on existing cultural resources data in the CDCA for consideration in Project planning and alternative selection. Compliance with LUPA-TRANS-CUL-4 and DFA-VPL-CUL-4 would be satisfied with BMP-CUL-06. The BLM has prepared a sensitivity model (Kline 2017).

LUPA-TRANS-CUL-5 and DFA-VPL-CUL-5 are specific to the provision of a statistically significant cultural resources sample survey to be used in Project planning. Compliance with LUPA-TRANS-CUL-5 and DFA-VPL-CUL-5 would be satisfied by BMP-CULT-07, which requires cultural resources Class III survey of Segments p-17 and p-18 to be conducted during the NEPA and CEQA analyses to meet the conditions of LUPA-TRANS-CUL-5 and DFA-VPL-CUL-5. The Class III survey of Segments p-17 and p-18 has been conducted.

LUPA-TRANS-CUL-6 and DFA-VPL-CUL-6 is specific to the Proponent's justification to move areas identified as sensitive to cultural resources forward through NEPA and CEQA analyses. Compliance with LUPA-TRANS-CUL-6 and DFA-VPL-CUL-6 would be satisfied by BMP-CULT-08, which requires such justification from the Project proponent.

DFA-VPL-CUL-7 speaks to completion of the Section 106 process. Compliance with DFA-VPL-CUL-7 is satisfied in Sections 3.6.1.1 of the TES (BLM 2019). Section 3.6.1.1 of the TES presents the regulatory requirement of the NHPA that includes Section 106. Section 5.2 of the EIS summarizes the process of drafting the PA. Section 5.3 of the EIS presents the efforts of consultation with Native American tribes. Appendix 2D of the EIS contains the draft PA for the Project.

With the implementation of MM TCR-CEQA-1, as well as MMs required and included within the PA (Appendix 2D of the EIS), impacts would be less than significant with mitigation incorporated.

2.6.6 Tribal Cultural Resources Mitigation

MMs for Native American concerns will be outlined in the PA and/or the ROD. The draft PA (Appendix 2D of the EIS) has been developed prior to the issuance of the Project ROD. Measures contained in the PA would be implemented prior to and during construction and post-construction during maintenance activities and operations. CEQA mitigation measures would be implemented in accordance with the PA and the ROD.

In addition, APMs and BMPs in Appendix 2A of the EIS and stipulations that would be a part of the ROD outline specific protocols for Native American TCPs/TCRs. These APMs, BMPs, and stipulations address, but are not limited to, protocols specific to coordination and communication with Tribes, roads and access, compliance with applicable laws, and confidentiality, among other procedures that may mitigate effects and will be implemented into the Project through the following MM:

MM TCR-CEQA-1: Implement Tribal Cultural Resources Applicant Proposed Measures, Best Management Practices, Conservation and Management Actions.

The APMs, BMPs, and CMAs in Sections 2.6.2 and 2.6.3 above provide a suite of measures, practices, and actions that shall be implemented as part of the Project. APMs, BMPs, and CMAs shall be implemented prior to, or during all ground disturbance and construction related activities to avoid or minimize Project related impacts to tribal cultural resources. These APMs, BMPs, and CMAs include: APM CULT-01, APM CULT-02, BMP CULT-03, BMP CULT-04, BMP CULT-06, BMP CULT-07, BMP CULT-08, CMA LUPA-CUL-4, CMA LUPA-TRANS-CUL-1, CMA LUPA-TRANS-CUL-4, CMA LUPA-TRANS-CUL-5, CMA LUPA-TRANS-CUL-6, CMA DFA-VPL-CUL-1, CMA DFA-VPL-CUL-4, CMA DFA-VPL-CUL-5, CMA DFA-VPL-CUL-6, CMA DFA-VPL-CUL-7. If an APM, BMP, or CMA is subjective, such as containing text that states; “where appropriate,” “where applicable,” “where feasible,” or similar language, the BLM and CPUC shall be consulted to determine the applicability of each measure prior to the disturbance of a covered resource. Compliance with APMs, BMPs, and CMAs shall be documented, and a weekly report shall be provided to the BLM and CPUC. The Applicant shall provide a synopsis of the weekly reports to the BLM and CPUC monthly. The report shall include a summary of the construction activities completed, a list of compliance actions and any remedial actions taken to correct any actions, and the status of ongoing mitigation efforts.

For those instances (only) where an APM, BMP, and/or CMA conflicts, or does not meet required specificity pursuant to CEQA, the following APMs and BMPs have been modified to meet CEQA requirements:

- **APM CULT-01: Cultural Resources Inventory.** See MM CUL-CEQA-2 (Section 2.5.6) for more details on the cultural resources inventory.
- **APM CULT-02: Monitoring Discovery Plan.** See MM CUL-CEQA-2 (Section 2.5.6) for more details on the Monitoring Discovery Plan.
- **BMP CULT-03: Cultural Resources Avoidance and Stipulations.** See MM CUL-CEQA-3 (Section 2.5.6) for more details on cultural resources avoidance stipulations.
- **BMP CULT-04: Worker Cultural Resources Awareness Program.** See MM CUL-CEQA-2 (Section 2.5.6) for more details on the worker cultural resources awareness program.

MM TCR-CEQA-1 Implementation

Responsible Party: The Applicant shall ensure that all APMs, BMPs, and CMAs are implemented during construction. If an APM, BMP, or CMA is subjective, the Applicant

shall consult with the BLM and/or the CPUC to determine the applicability of each measure.

Timing: APMs, BMPs, and CMAs shall be implemented throughout construction activities.

Mitigation Monitoring and Reporting Program: The Applicant shall develop a weekly report that shall include all applicable APMs, BMPs, and CMAs and the related actions taken in order to be in compliance with these measures. These weekly reports shall be compiled and submitted to the BLM and CPUC monthly.

Standards for Success: Compliance with all applicable APMs, BMPS, and CMAs is achieved throughout construction of the Project.

2.7 GEOLOGY AND SOILS

This section describes the impacts to geology and soil resources that could potentially occur during construction, operation, and maintenance of the Project. Environmental impacts presented in Section 4.3 of the TES (BLM 2019) are discussed in terms of CEQA significance thresholds disclosed in Section 2.7.4. Additionally, this section responds to issues raised during the public scoping process, which are presented in Appendix 1 of the EIS.

2.7.1 Thresholds and Methodology

Section 4.3 of the TES (BLM 2019) discloses adverse environmental effects that may result from construction and operation of the Project. This CEQA analysis uses information and data from available published resources, including journals, maps, and government websites. This information was collected and reviewed to bolster the environmental impact analysis found in Section 4.3 of the TES within the context of the impact thresholds found in Appendix G of the CEQA Guidelines.

This analysis assumes that the applicant would comply with the following environmental factors and components of the Project Description (Chapter 2) when evaluating the effects of the Project on geology and soils:

- A geotechnical engineering study would be completed prior to final design and construction of the Project to identify site-specific geological conditions and potential geological hazards. The data collected from the study would be used to guide sound engineering practices, and foundation design would be consistent with geological conditions for each tower site.

- Existing fault lines, land subsidence areas, earth fissures, mining claims, oil/gas reserves, areas of mineral resources of economic value, and other pertinent geological and mineral-related features have been accurately mapped.

- Operation and maintenance of the Project, as it relates to geological and mineral resources, would primarily be the presence of transmission structures and

transmission lines and how they could preclude access to underground resources in the immediate vicinity.

- Transmission lines typically have little impact to mining operations. Span lengths are such that access to minerals can be accomplished between spans. Should open pit mining be planned, structures can be left on 'islands,' or the mining interests can have the transmission line locally re-routed (personal communication, Mark Wieringa, Western, 2013).

2.7.2 Applicant Proposed Measures and BLM Best Management Practices

APMs have been identified and would be implemented by the Project applicant. In addition, BLM would require implementation of BMPs, which are intended to further minimize Project impacts. All Project APMs and BMPs are described in EIS Appendix 2A. Of these, the following would apply to the portion of the Project located within California and have therefore been incorporated into the Project for evaluation of significant impact to geology and soils under CEQA.

- **APM WQ-01: SWPPP Development and Implementation.** Following Project approval, DCRT would prepare and implement a SWPPP or an amendment to an existing SWPPP to minimize construction impacts on surface water and groundwater quality. Implementation of the SWPPP would help stabilize graded areas and reduce erosion and sedimentation. The Plan would designate BMPs that would be adhered to during construction activities. Erosion and sediment control measures, such as straw wattles, covers, and silt fences, would be installed prior to ground disturbance, based on the anticipated volume and intensity of precipitation, the nature of stormwater runoff in the Project area, and the soil types within the Project area. Suitable stabilization measures would be used to protect exposed areas during construction activities, as necessary and final stabilization would be completed when construction materials, waste, and temporary erosion and sediment control measure have been removed. During construction activities, measures would be implemented to prevent contaminant discharge from vehicles and equipment, including complying with the Spill Prevention, Control, and Countermeasures requirements in 40 CFR 112.

The Project SWPPP would include erosion control and sediment transport BMPs to be used during construction. BMPs, where applicable, would be designed by using specific criteria from recognized BMP design guidance manuals. Erosion-minimizing efforts may include measures such as the following:

- defining ingress and egress within the Project site
- implementing a dust control program during construction
- properly containing stockpiled soils

Erosion control measures identified would be installed in an area before construction begins and would be properly maintained until construction is complete and final stabilization begins.

Temporary measures such as silt fences or wattles, intended to minimize sediment transport from temporarily disturbed areas, would remain in place until disturbed areas have stabilized.

The Plan would be updated during construction as required by the State Water Resources Control Board (SWRCB) and the Arizona Department of Environmental Quality (ADEQ). The Plan would include the following components, in accordance with ADEQ requirements for coverage under the General Permit:

- stormwater team qualifications and contact information
- identification of operators
- nature of construction activities
- sequence and estimated dates of construction activities
- site description
- site map(s)
- receiving waters
- control measures to be used during construction activity
- summary of potential pollutant sources
- use of treatment chemicals
- pollution prevention procedures, including spill prevention and response and waste management procedures

- **BMP SOIL-01.** During reclamation and revegetation efforts, a BLM soil scientist and/or botanist would assist reclamation crews with determining type and location of any scarification.

- **BMP SOIL-02.** During reclamation and revegetation efforts, the BLM would work with reclamation crews to determine where soil compaction would be appropriate, to avoid potential adverse conditions created by compaction.

- **BMP SOIL-03.** Covers for topsoil stockpiles would be of materials resistant to damage and/or degradation from exposure to ultraviolet light and other elements and would be replaced (as needed) if they deteriorate, become worn, or damaged.

- **BMP SOIL-04.** The disruption of desert pavement shall be minimized to the extent feasible. Grading for new access roads or work areas in areas covered by desert pavement shall be avoided if possible.

- **BMP SOIL-05.** Desert pavement in activity areas in California shall be assessed by biological monitors prior to construction. If disturbance from an activity is likely to exceed 10% of the desert pavement identified within the activity boundary, the BLM

would determine whether the erosional and ecologic impacts of exceeding the 10% cap by the proposed amount would be insignificant and/or whether the activity should be redesigned to minimize desert pavement disturbance.

- **BMP SOIL-06.** Side-casting of soil during road construction shall be avoided.
- **BMP SOIL-07.** To the extent possible, avoid disturbance of desert biologically intact soil crusts, and soils highly susceptible to wind and water erosion.
- **APM BIO-12. Noxious and Invasive Species Control.** A Noxious Weed Control Plan that addresses specific requirements in CMA LUPA-BIO-11 would be developed, approved by the BLM, and implemented prior to initiation of ground disturbing activities. That Plan would identify noxious and invasive species to be addressed in the Project Area, describe measures to conduct pre-construction weed surveys, reduce the potential introduction or spread of noxious weeds and invasive species during construction, and monitor and control weeds during operation of the transmission line. It would be designed to minimize impacts on special status species to the extent practicable. Coordination with resource agencies regarding invasive plant species would be conducted before construction. BMPs would include use of weed-free straw, fill, and other materials; requirements for washing vehicles and equipment arriving on site; proper maintenance of vehicle inspection and wash stations; requirements for managing infested soils and materials; requirements and practices for the application of herbicides; and other requirements in applicable BLM Weed Management Plans.

2.7.3 Conservation and Management Actions

The CDCA Plan, as amended, contains CMAs, which include a specific set of avoidance, minimization, and compensation measures. The applicability of those measures to the Project was determined using a CMA checklist (EIS Appendix 2C). The CMAs applicable to the Project and related to geology and soils are listed below and Project compliance with CDCA CMAs is addressed in the analysis portion of this section.

- **CMA LUPA-SW-8**. As determined necessary on an activity specific basis, prepare a site plan specific to major soil types present (≥5% of footprint or laydown surfaces) in Wind Erodibility Groups 1 and 2 and in Hydrology Soil Class D as defined by the USDA NRCS to minimize water and air erosion from disturbed soils on activity sites.
- **CMA LUPA-BIO-9.** Implement the following general LUPA CMA for water and wetland dependent resources:
  - Implement construction site standard practices to prevent toxic chemicals, hazardous materials, and other fluids from entering vegetation type streams, washes, and tributary networks through water runoff, erosion, and sediment transport by, at a minimum, implementing the following:
    - On project sites, vehicles and other equipment will be maintained in proper working condition and only stored in designated containment areas where

runoff is collected or controlled and that are located outside of streams, washes, and distributary networks to minimize accidental fluids and hazardous materials spills.

- Hazardous material leaks, spills, or releases will be immediately cleaned, and equipment will be repaired upon identification. Removal and disposal of spill and related clean-up materials will occur at an approved off-site landfill.
- Maintenance and operations vehicles will carry the appropriate equipment and materials to isolate, clean up, and repair any hazardous material leaks, spills, or releases.

o Activity-specific drainage, erosion, and sedimentation control actions, which meet the approval of BLM and the applicable regulatory agencies, will be carried out during all appropriate phases of the approved project. These actions, as needed, will address measures to ensure the proper protection of water quality, site-specific stormwater and sediment retention, and design of the project to minimize site disturbance, including the following:

- Identify site-specific surface water runoff patterns and implement measures to prevent excessive and unnatural soil deposition and erosion.
- Implement measures to maintain natural drainages and to maintain hydrologic function in the event drainages are disturbed.
- Reduce the amount of area covered by impervious surfaces through use of permeable pavement or other pervious surfaces. Direct runoff from impervious surfaces into retention basins.
- Stabilize disturbed areas following grading in the manner appropriate to the soil type so that wind or water erosion is minimized.
- Minimize irrigation runoff by using low or no irrigation native vegetation landscaping for landscaped retention basins.
- Conduct regular inspections and maintenance of long-term erosion control measures to ensure long-term effectiveness.

• **CMA LUPA-SW-9.** The extent of desert pavement within the proposed boundary of an activity shall be mapped if it is anticipated that the activity may create erosional or ecologic impacts. Mapping will use the best available data and standards, as determined by BLM. Disturbance of desert pavement within the boundary of an activity shall be limited to the extent possible. If disturbance from an activity is likely to exceed 10% of the desert pavement mapped within the activity boundary, the BLM will determine whether the erosional and ecologic impacts of exceeding the 10% cap by the proposed amount would be insignificant and/or whether the activity should be redesigned to minimize desert pavement disturbance.

- **CMA LUPA-SW-10.** The extent of additional sensitive soil areas (cryptobiotic soil crusts, hydric soils, highly corrosive soils, expansive soils, and soils at severe risk of erosion) shall be mapped if it is anticipated that an activity will impact these resources. To the extent possible, avoid disturbance of desert biologically intact soil crusts, and soils highly susceptible to wind and water erosion.

- **CMA LUPA-SW-11.** Where possible, side casting shall be avoided where road construction requires cut- and-fill procedures.

2.7.4 CEQA Significance Criteria

Appendix G of CEQA Guidelines (14 CCR 15000 et seq.) provides guidance on assessing whether a project would have significant impacts on the environment. Consistent with Appendix G, the Project would have significant geology and soils impacts if it would:

a. Expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death, involving:
    1. Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault?
    2. Strong seismic ground shaking?
    3. Seismic-related ground failure, including liquefaction?
    4. Landslides? Violate any air quality standard or contribute substantially to an existing or projected air quality violation?
b. Result in substantial soil erosion or the loss of topsoil?
c. Be located on strata or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction, or collapse?
d. Be located on expansive soil, as defined in Table 18 1 B of the Uniform Building Code, creating substantial risks to life or property?
e. Have soils incapable of adequately supporting the use of septic tanks or alternative wastewater disposal systems where sewers are not available for the disposal of wastewater?

2.7.5 Geology and Soils Analysis

Impact GEO 1 - Expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death, involving:

a. Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault?

b. Strong seismic ground shaking?

c. Seismic-related ground failure, including liquefaction?

d. Landslides?

Less Than Significant – No Mitigation Required

This impact evaluates potential exposure of the Project to seismic hazards, including fault rupture, strong ground shaking, ground failure and liquefaction, and landslides.

(i) Fault Rupture

Based on review of the 2015 Alquist-Priolo Earthquake Fault Zoning Map, there are no Alquist-Priolo Earthquake Fault Zones that underlie the Project segments in Riverside County (California Department of Conservation 2015). As discussed in Section 3.3.3.3 of the TES (BLM 2019), the closest Alquist-Priolo Earthquake Fault Zone is about 70 miles west of the Project area. In addition, no Quaternary-age active faults (active faults that have been recognized at the surface and that have evidence of movement in the past 1.6 million years) are mapped within the 20-mile study area for faults (HDR 2017a). Because there are no Alquist-Priolo Earthquake Fault Zones or other known active earthquake faults within the study area, impacts would be less than significant under this criterion.

(ii) Strong Ground Shaking

The seismic hazard is relatively low (“moderate to low” to “low”) for the region that encompasses the Project. Seismic risk can be quantified by the motions experienced by the ground surface or structures during a given earthquake as expressed in terms of g (the acceleration due to gravity), or peak ground acceleration (PGA) [5]. The United States Geologic Survey (USGS) has developed maps for the US that describe the likelihood for shaking of varying degrees to occur in a given area (USGS 2014). The seismic hazard potential in the study area, as determined from the USGS seismic hazard maps, is shown as the PGA for an earthquake with a 2 percent probability of exceedance in 50 years. Values range from a relatively low risk of 6 to 8 percent at the Delaney Substation in Maricopa County, Arizona, to a moderate risk of 16 to 18 percent at the Colorado River Substation in Riverside County, California.

Transmission structures in California are required to be designed in accordance with CPUC General Order (GO) 95, which requires overhead line construction to be capable of withstanding wind, temperature, and wire tension loads. Specifically, section IV of the GO 95 covers mechanical strength requirements for each class of line, either alone or involved in crossings, conflicts, or joint use of poles. The order specifies safety factors for electrical line construction that are the minimum allowable ratios of ultimate strengths of materials to the maximum working stresses. The order also specifies strength requirements for construction materials, and minimum wood pole setting depths for various site conditions. It should be noted that wind-loading design requirements for overhead lines generally result in far greather strength requirements than those necessary to address strong seismic ground shaking. The completion of a geotechnical engineering study prior to final design and construction of the Project is standard practice to identify site-specific geological conditions, so that such information can be used to guide sound engineering practices, and so that foundation design is consistent with geological conditions for each tower site.

[5] The PGA for a given component of motion is the largest value of horizontal acceleration obtained from a seismograph. PGA is expressed as the percentage of the acceleration due to gravity (g), which is approximately 980 centimeters per second squared.

In addition to the requirements of GO 95, foundations and structures for electrical substation and transmission facilities are constructed in accordance with applicable industry building codes and standards. For example, applicable industry building codes and standards require substations to be designed and equipped according to qualification requirements described in the Institute of Electrical and Electronics Engineers (IEEE) Standard 693-2005, Recommended Practice for Seismic Design of Substations. IEEE Standard 693-2005 exists to ensure that substations do not experience damage or loss of function during and after seismic events. Other applicable IEEE standards include (but are not limited to) IEEE 691-2001 (transmission structure foundation design and testing) and IEEE 977-2010 (guide to installation of foundations for transmission line structures).

Given the seismic risk of the area is low, and the application of standard industry building codes and standards (inlcuding GO 95 and IEEE standards), the risk of seismic damage to the Project would be minimal. Furthermore, in the unlikely event of an extreme earthquake scenario, the consequence of damage to Project structures on public safety and the environmental would be low. None of the Project components would be used for human occupancy and the Project would not appreciably increase public exposure to seismic risks since the right-of-way consists of open space and/or agriculture. If a strong earthquake were to occur in the Project area, the operator would send crews to inspect the lines and repair any damage detected, in accordance with existing practice and procedures. The potential impact from strong ground shaking is to the Project itself and would represent and inspection, repair, and maintenance issue for the Applicant rather than a significant impact to public safety or the surrounding environment. Accordingly, potential impacts associated with ground shaking would less than significant under this criterion.

(iii) Ground Failure and Liquefaction

Liquefaction occurs when saturated soil loses shear strength and deforms as a result of increased pore water pressure induced by strong ground shaking during an earthquake. As the excess pore pressure dissipates, volume changes are produced within the liquefied soil layer that can manifest at the ground surface as settlement of structures, floating of buried structures, and failure of retaining walls.

As discussed in Section 4.3.4.5 of the TES (BLM 2019), the Project segment in California would cross an area mapped as having very high to moderate liquefaction potential (Figure 3.3-5 of the TES [BLM 2019]). Maps depicting liquefaction potential are based solely on the character of underlying soils and the prevailing depth to groundwater, i.e., whether the preconditions necessary for liquefaction to occur exist. Liquefaction potential is different from liquefaction hazard because liquefaction potential maps do not incorporate the likelihood that an earthquake with sufficient magnitude to trigger liquefaction effects would occur. Given the low to moderate seismicity of the Project area, as described above, the hazard from liquefaction is relatively low.

As discussed above under the discussion of strong ground shaking (item ii), the application of standard industry building codes and standards (inlcuding GO 95 and IEEE standards) means the risk of seismic damage to the Project, including earthquake-induced liquefaction, would be minimal. As outlined in Chapter 2 of the TES, the applicant would conduct a Project-specific geotechnical engineering study to identify site-specific geological conditions and potential geological hazards. The completion of a geotechnical engineering study prior to final design and construction of the Project is standard practice to identify site-specific geological conditions, so

that such information can be used to guide sound engineering practices, and so that foundation design is consistent with geological conditions for each tower site. Additionally, the consequences of liquefaction within the study area would be minor, because the Project does not involve structures for human occupancy and because the right-of-way consists of open space and/or agriculture, and is closed off to the public aside from public road crossings. Should liquefaction or seismically induced ground movement (e.g., lateral spreading) cause damage to Project components, it would be an inspection and repair issue for the operator rather than a safety risk to the public or offsite property. For this reason, impacts from liquefaction would be less than significant.

(iv) Landslides

As discussed in Section 3.3.3.3 of the TES, the relative risk for landslides in the analysis area is low, with less than a 1.5 percent incidence. Locally there may be potential for slope movement in areas of steep topography (Table 3.3-2 of the TES) depending on site-specific conditions. The Project would be designed to avoid steep slopes where possible, and the portion within California would pass along the portion of the Palo Verde Valley at the base of the Mule Mountains, avoiding steep topography. Additionally, the Project would not involve road-cutting, ground disturbance, or other activities that would exacerbate the potential for landslides to occur. The Project would be constructed pursuant to preparation of a geotechnical report that may include recommendations for construction near any areas of potential landslide, if present. Given the relatively flat topography, aside from an ascent onto the Palo Verde Mesa, and the flexibility in siting of transmission tower bases, construction would be avoided where it would undercut slopes. In addition, construction would comply with the International Building Code and California Building Code. Given the application of appropriate engineering standards, the flexibility in siting transmission towers away from steep slopes, and the fact that the Project does not involve structures for human occupancy, the Project's impacts on public exposure to landslide risks would be less than significant.

Impact GEO 2 - Result in substantial soil erosion or the loss of topsoil?

Less than Significant with Mitigation

Direct impacts to soil resources that may occur as a result of construction activities include the loss of soil productivity due to the removal of soils during new surface disturbance. Clearing of vegetation and topsoil, as well as grading, would be required during the construction phase of the Project, and these activities could result in newly exposed, disturbed soils that could be subject to accelerated erosion by wind and water. Any soil removal during the construction of the transmission structures would be permanent, resulting in a permanent loss of soil productivity. As such, potential impacts related to soils erosion and loss of topsoil could occur prior to mitigation.

One of the primary impacts of concern for construction is disturbance to soil biological crusts. It is expected that soils within the ROW have the ability to support soil biotic crust; therefore, it is expected that disturbance caused by excavation and compaction during construction may directly affect biological soil crusts. Clearing of the SCS site, ancillary facilities, and access roads could also adversely affect any soil biological crusts in the immediate vicinity, thus resulting in a potential impact prior to mitigation. As such, MM GEO-CEQA-1 would be implemented and

includes the incorporation of APMs and BMPs to reduce impacts related to soil biological crusts to a less than significant level. Specifically, BMP SOIL-07 requires that Project activities avoid biologically intact crusts and other soils highly susceptible to wind and water erosion. As described in Chapter 2 of the TES (BLM 2019), large portions of the Project have been routed to parallel existing linear infrastructure, thus reducing impacts to previously undisturbed soils. Additionally, during construction the use of roads already found within the ROW is expected to reduce impacts to soil resources within the ROW. Therefore, impacts related to soil biological crusts would be less than significant with mitigation incorporated.

Old roads which are not maintained are more susceptible to erosion by wind and water; therefore, any improvements to these roads would be a benefit to the soil resources. However, the potential for wind induced soil erosion is rated as moderate to high west of Colorado River in Riverside County, California (Riverside County 2015a) and could result in a potential impact prior to mitigation. Potential for erosion would be increased on disturbed areas after soil salvage operations due to removal of the vegetative cover and the loss of surface soil structure. Erosion of growth medium after redistribution on re-graded sites would also have a greater potential until the soil is stabilized by successful revegetation. Soil characteristics identified in Table 3.3-6 in the TES suggest that disturbed areas would experience low to high erosion potential either by wind or water. Windblown dust would result from the disturbance of fine-textured soils during construction and reclamation activities through the completion of the Project. As such, MM GEO-CEQA-2 would be required and includes the development and implementation of an Erosion Control Plan for the Project (part of the Erosion, Dust Control, and Air Quality Plan). This Erosion Control Plan would include measures to reduce potential impacts related to soil erosion and loss of topsoil during construction activities to a less than significant level.

Further, as discussed in Section 4.3.4.1 in the TES, most impacts to soil resources would be temporary, although the actual footprints of the structures and new access roads would result in permanent impacts to the soil resource, for those disturbances left unreclaimed. Cutting of trees and removal of vegetation may occur; however, where practicable, downed vegetation and undisturbed low vegetation would be left in place within the disturbance areas to serve as soil protection and erosion control. Vegetation would only be cleared to the extent necessary, minimizing impacts to soil resources.

Indirect impacts associated with soil removal may include invasive plant colonization, soil erosion, and reduction of soil water retention. Construction activities may also cause disturbance to fragile biological crusts, which could increase wind and water erosion and delay reestablishment of plant communities post construction. Other indirect effects are associated with the sediment redistribution of the soil resource as a result of wind and water erosion, which could cause damages to WOUS, Prime Farmlands, and air quality.

As discussed above, implementation of MM GEO-CEQA-1 would reduce these impacts to a less than significant level through the implementation of APMs, BMPs, and CMAs. Specifically, APM BIO-12 would require development of a Noxious Weed Control Plan, which would address potential invasive plant colonization. Implementation of APM WQ-01 would minimize soil erosion by requiring the applicant to obtain a NPDES Construction General Permit. As part of obtaining a National Pollution Discharge Elimination System (NPDES) Construction General Permit. The applicant would be required to design and implement a SWPPP, as outlined in APM WQ-01. The SWPPP would incorporate management practices for erosion and sedimentation

controls that are designed to prevent soil particles from detaching and being transported off-site. Examples of erosion control measures include use installation of temporary silt fences and other containment features (including gravel bags and fiber rolls) surrounding work areas to prevent the loss of soil during rain events and other disturbances. Sedimentation controls are structural measures intended to complement and enhance the selected erosion control measures and reduce sediment discharges from active construction areas. Examples of sediment control measures include utilization of storm drain inlet protection, including sediment filters and ponding barriers, to retain sediments on site and prevent excess discharge into storm drains.

Additionally, the BLM would require implementation of the following BMPs through MM GEO-CEQA-1, during construction, operation and maintenance, and during decommissioning of the Project: BMP SOIL-01, BMP SOIL-02, BMP SOIL-03, BMP SOIL-04, BMP SOIL-05, BMP SOIL-06, and BMP SOIL-07. Implementation of these BMPs would result in BLM working with the construction crews, reclamation crews, and soils scientists to determine where soil compaction would be appropriate in order to reduce the potential for adverse effects to biological crusts, water holding capacity, and permeability and porosity of the Project area. These BMPs would also include requirements for covering topsoil stockpiles, minimization of desert pavement, biological monitoring prior to construction, avoidance of side-casting of soil during road construction, and the avoidance of disturbance to desert biologically intact soil crusts. Implementation of MM GEO-CEQA-1 would reduce the potential for erosion or loss of topsoil and would effectively minimize construction, operation, maintenance, and decommissioning soil erosion impacts to a less than significant level.

The Project, through implementation of MM GEO-CEQA-1, would also require and be in compliance with CDCA CMAs LUPA-SW-8, LUPA-SW-9, LUPA-SW-10, LUPA-SW-11, LUPA-BIO-9 with the implementation of the above APMs and BMPs. The LUPA CMAs applicable to desert pavement and biological soil crusts overlap in many respects with the BMPs but tend to be more specific and stringent. For example, CMA LUPA-SW-8 and CMA LUPA-SW-10 address the same issue as BMP SOIL-07, i.e., biological soil crusts, but provide additional details on when protective measures should be implemented. Similarly, CMA LUPA-SW-9, BMP SOIL-04, and BMP SOIL-05 all address desert pavement in the same manner by indicating how biological monitors would identify sensitive soils and consult with BLM is such soils exceed 10% of the disturbance area for each phase of construction.

The implementation of MM GEO-CEQA-1 and MM GEO-CEQA-2 along with measures identified in the APMs, BMPs, and compliance with the applicable CMAs during all ground-disturbing activities during from construction and/or operation of the Project would minimize or avoid substantial losses of topsoil and substantial losses of soils, including biological crusts through wind and water erosion to a less than significant level.

Impact GEO 3 -Be located on strata or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction, or collapse?

Less Than Significant – No Mitigation Required

As discussed in Section 4.3.4.5 of the TES (BLM 2019), most cases of land subsidence in Riverside County are caused by excessive groundwater pumping and lower water tables. This

type of subsidence occurs very slowly over decades and affects broad areas; as such, structures sink uniformly with the ground and are not damaged. Because he severity of subsidence increases from the edges to the center like a bowl, certain infrastructure like canals and sewers, which rely on slope, can be damaged or rendered inoperable (AZGS 1993). Transmission lines, however, are not slope-dependent and would not be affected in such a way. In addition, a geotechnical engineering study would be completed prior to final design and construction of the Project to identify site-specific geological conditions and potential geological hazards including subsidence. Since the Project would not contribute to the over-pumping of groundwater basins that underlie the Project and would be designed to avoid areas where localized subsidence is occurring, impacts due to unstable soils would be less than significant.

Soil collapse typically occurs in recent (less than 10,000 years old) soils that were deposited in an arid or semi-arid environment. Collapsible soils are commonly associated with human-made fill, wind-laid sands and silts, and alluvial fan and mudflow sediments deposited during flash floods. They predominantly occur at the base of mountains or in wind deposits. These soils typically contain minute pores and voids and may be partially supported by clay or silt, or chemically cemented with carbonates. When saturated, collapsible soils undergo a rearrangement of their grains, and the water removes the cohesive (or cementing) material, causing rapid settlement (Riverside County 2015a). Expansive, corrosive, or collapsible soil characteristics are identified locally through site-specific geotechnical testing. Associated hazards would be addressed through soil correction during construction or engineering design; therefore, this impact would be less than significant.

Impact GEO 4 - Be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code, creating substantial risks to life or property?

Less Than Significant – No Mitigation Required

Expansive soils are those soils with a significant amount of clay particles that have the ability to take on water (swell) or give up water (shrink). When these soils swell, the change in volume exerts significant pressures on loads (such as buildings) that are placed on them. As discussed in Section 4.3.4.5 of the TES (BLM 2019), the shrink swell potential in the Project area varies from low to high. As discussed above under the discussion of strong ground shaking (item ii), the application of standard industry building codes and standards (inlcuding GO 95 and IEEE standards) means that structures would be designed in a manner that addresses expansive soils by either removing them and replacing them with clean fill, or designing foundations and pole depths to accommodate expansive soils without issue. As outlined in Chapter 2 of the TES, the applicant would conduct a Project-specific geotechnical engineering study to identify site-specific geological conditions and potential geological hazards. The completion of a geotechnical engineering study prior to final design and construction of the Project is standard practice to identify site-specific geological conditions, so that such information can be used to guide sound engineering practices, and so that foundation design is consistent with geological conditions for each tower site. Therefore, impacts resulting from construction on expansive soils would be less than significant.

Impact GEO 5 - Have soils incapable of adequately supporting the use of septic tanks or alternative wastewater disposal systems where sewers are not available for the disposal of wastewater?

No impact

The Project would not require the use of septic tanks or other permanent wastewater disposal facilities, therefore, there would be no impact.

2.7.6 Geology and Soils Mitigation

MM GEO-CEQA-1: Implement Geology and Soils Applicant Proposed Measures, Best Management Practices, and Conservation and Management Actions.

The APMs, BMPs, and CMAs in Sections 2.7.2 and 2.7.3 above provide a suite of measures, practices, and actions that shall be implemented as part of the Project. APMs, BMPs, and CMAs shall be implemented prior to, or during all ground disturbance and construction related activities to avoid or minimize Project related impacts to geology and soils. These APMs, BMPs, and CMAs include; APM WQ-01, BMP SOIL-01, BMP SOIL-02, BMP SOIL-03, BMP SOIL-04, BMP SOIL-05, BMP SOIL-06, BMP SOIL-07, APM BIO-12, CMA LUPA-SW-8, CMA LUPA-BIO-9, CMA LUPA-SW-9, CMA LUPA-SW-10, CMA LUPA-SW-11. If an APM, BMP, or CMA is subjective, such as containing text that states; “where appropriate,” “where applicable,” “where feasible,” or similar language, the BLM and CPUC shall be consulted to determine the applicability of each measure prior to the disturbance of a covered resource. Compliance with APMs, BMPs, and CMAs shall be documented, and a weekly report shall be provided to the BLM and CPUC. The Applicant shall provide a synopsis of the weekly reports to the BLM and CPUC monthly. The report shall include a summary of the construction activities completed, a list of compliance actions and any remedial actions taken to correct any actions, and the status of ongoing mitigation efforts. For those instances (only) where an APM, BMP, and/or CMA conflicts, or does not meet required specificity pursuant to CEQA, the following BMP has been modified to meet CEQA requirements:

- **BMP SOIL-07.** As discussed in this BMP, desert biologically intact soil crusts would be avoided to the extent feasible. Where it is infeasible to avoid these areas, the Applicant would work with the BLM to identify further measures to reduce wind and water erosion in these areas and shall implement MM GEO-CEQA-2 in these areas to prevent long-term erosion.

MM GEO-CEQA-1 Implementation

Responsible Party: The Applicant shall ensure that all APMs, BMPs, and CMAs are implemented during construction. If an APM, BMP, or CMA is subjective, the Applicant shall consult with the BLM and/or the CPUC to determine the applicability of each measure.

Timing: APMs, BMPs, and CMAs shall be implemented throughout construction activities.

Mitigation Monitoring and Reporting Program: The Applicant shall develop a weekly report that shall include all applicable APMs, BMPs, and CMAs and the related actions taken in order to be in compliance with these measures. These weekly reports shall be compiled and submitted to the BLM and CPUC monthly.

Standards for Success: Compliance with all applicable APMs, BMPS, and CMAs is achieved throughout construction of the Project.

MM GEO-CEQA-2: Implement an Erosion Control Plan and Demonstrate Compliance with Water Quality Permits.

The Applicant shall develop and submit an Erosion Control Plan to the CPUC and BLM at least 60-days prior to the start of construction activities. The Erosion Control Plan shall be developed in conjunction with the SWPPP (See APM WQ-01) and shall be kept onsite and readily available upon request. Successful implementation of the Erosion Control Plan will result in a less than significant impact related to erosion during all construction activities.

Soil disturbance at structures and access roads is to be minimized and designed to prevent long-term erosion. The Erosion Control Plan shall include:

- The location of all soil-disturbing activities, including, but not limited to new and/or improved access and spur roads;
- The location of all streams and drainage structures that would be directly affected by soil-disturbing activities (such as crossings or public storm drains by the right-of-way and access roads);
- BMPs to protect drainage structures, such a public storm drains, downstream of soil disturbance activities as well as to prevent loss of topsoils and erosion during construction (See BMP SOIL-01 through -07);
- Design features to be implemented to minimize erosion during construction;
- If soil cement is proposed, the specific locations must be defined in this Plan, and evidence of approval by the appropriate jurisdiction shall be submitted to the CPUC and BLM prior to use;
- If design features include the use of retaining structures and/or walls, the design of the features shall be consistent with MM VIS-06 (under Section 2.1.6 above) to use structure type to match the existing structures in the area and reduce form contrast;
- The location and type of BMPs that would be installed to prevent off-site sedimentation;
- Specification for the implementation and maintenance of erosion control measures and description of the erosion control practices, including appropriate design and installation details;

- Proposed schedule for inspection of erosion control/SWPPP measures and schedule for corrective actions/repairs, if required. Erosion control/SWPPP inspection reports shall be provided to the CPUC.

The locations requiring erosion control/SWPPP corrective actions/repairs shall be tracked by the Applicant, including dates of completion, and documented during inspections. Inspections and monitoring shall be performed in compliance with the Federal California Construction General Permits. The inspection reports shall be maintained and kept in their respective SWPPP, kept on site as required by the Federal and State Construction General Permits, and made available to the RWQCB, CPUC, BLM, counties, local municipalities, and tribal governments, on request. Additionally, an Annual Report shall be filed for each reporting period in compliance with the Federal and California Construction General Permit reporting requirements.

The Applicant shall submit to the CPUC and the BLM any grading plans that define the locations of the specific features listed.

The Applicant shall submit to the CPUC and BLM evidence of possession of applicable required permits for the representative land disturbance prior to engaging in any soil-disturbance or construction activities. Such permits may include, but are not limited to, a CWA Section 402 NPDES California General Permit for Stormwater Discharges Associated with Construction Activities (General Permit) from the applicable RWQCBs, and the Federal General Permit for Storm Water Discharges Associated with Construction Activities on Tribal Land.

Prior to ground disturbance in stream channels or other waters jurisdictional to the State of California or the Federal Government, the Applicant shall obtain a Streambed Alteration Agreement from the CDFW, a Section 404 permit from the ACOE, and a CWA Section 401 certification from the SWRCB.

MM GEO-CEQA-2 Implementation

Responsible Party: The Applicant shall develop the Erosion Control Plan and ensure that it is implemented throughout construction activities. The Applicant shall also be responsible for obtaining all necessary permits related to erosion and water quality control.

Timing: The Erosion Control Plan shall be developed at least 60-days prior to construction and shall be implemented throughout all construction activities. Any permits required for the Project shall be obtained prior to the start of construction.

Mitigation Monitoring and Reporting Program: The Applicant shall develop the Erosion Control Plan in conjunction with the SWPPP required for the Project. The Applicant shall keep on file any corrective actions related to erosion control and the SWPPP and submit these records to the RWQCB, CPUC, BLM, and any applicable counties, local municipalities, or tribal governments upon request. The Annual Report shall be developed and filed by the Applicant for each reporting period. Any permits required shall be developed by the Applicant and submitted to the applicable agency for approval. The Applicant shall maintain a record of all permits and associated approvals to be kept on file.

Standards for Success: The Project will comply with Federal and California Construction General Permit reporting requirements and any stipulations of applicable permits related to erosion control or the SWPPP.

2.8 HAZARDS AND HAZARDOUS MATERIALS

This section describes the potential impacts to human health and the environment from preexisting hazardous materials, hazardous materials used or generated during construction and decommissioning, and hazardous materials generated during operation and maintenance of the Project. Additionally, this section responds to issues raised during the public scoping process, which are presented in Appendix 1 of the EIS.

As disclosed in Section 4.13 of the TES (BLM 2019), the primary impact from hazards and hazardous materials would be the use of hazardous materials during construction, resulting from leaks and spills and potential effects to workers and the public, as well as potential contamination of surrounding soils, the atmosphere, surface waters, and groundwater.

2.8.1 Thresholds and Methodology

Existing conditions described in Section 3.13 of the TES (BLM 2019) have been evaluated with regard to their potential to be affected by Project construction, operation, maintenance, and decommissioning activities. The evaluation of Project impacts is based on Section 4.13 of the TES and the significance criteria established by Appendix G of the CEQA Guidelines.

2.8.2 Applicant Proposed Measures and BLM Best Management Practices

APMs have been identified and would be implemented by the Project applicant. In addition, BLM would require implementation of BMPs, which are intended to further minimize Project impacts. All Project APMs and BMPs are described in EIS Appendix 2A. Of these, the following would apply to the portion of the Project located within California and have therefore been incorporated into the Project for evaluation of significant impact to hazards and hazardous materials under CEQA.

- **APM HAZ-01: Hazardous Substance Control and Emergency Response.** DCRT would implement its hazardous substance control and emergency response procedures as needed in conjunction with a Hazardous Substance Control and Containment Plan and Emergency Response Plan for the Project. The procedures identify methods and techniques to minimize the exposure of the public and site workers to potentially hazardous materials during all phases of Project construction through operation. They address worker training appropriate to the site worker's role in hazardous substance control and emergency response. The procedures also require implementing appropriate control methods and approved containment and spill-control practices for construction and materials stored on site. If it were necessary to store chemicals on site, they would be managed in accordance with all applicable regulations. Material safety data sheets would be maintained and kept available on site, as applicable.

- Project construction would involve soil surface blading/leveling and excavation. In the event that soils suspected of being contaminated (on the basis of visual, olfactory, or other evidence) are removed during site grading activities or excavation activities, the excavated soil would be tested and, if contaminated above hazardous waste levels, would be contained and disposed of at a licensed waste facility. The presence of known or suspected contaminated soil would require testing and investigation procedures to be supervised by a qualified person, as appropriate, to meet state and federal regulations.
- All hazardous materials and hazardous wastes would be handled, stored, and disposed of in accordance with all applicable regulations by personnel qualified to handle hazardous materials. The hazardous substance control and emergency response procedures include, but are not limited to, the following:
- Proper disposal of potentially contaminated soils.
- Establishing site-specific buffers for construction vehicles and equipment near sensitive resources.
- Emergency response and reporting procedures to address hazardous material spills.
  - Stopping work at that location and contacting the County Fire Department Hazardous Materials Unit immediately if visual contamination or chemical odors are detected; work would be resumed at this location after any necessary consultation and approval by the Hazardous Materials Unit.

DCRT would complete its Emergency Action Plan Form as part of Project tailgate meetings. The purpose of the form is to gather emergency contact numbers, first aid location, work site location, and tailgate information.

APM TT-01: Traffic Coordination. Emergency service providers would be notified of the timing, location, and duration of construction activities. Traffic control devices and signs would be used as needed. These measures would be implemented in conjunction with a Traffic and Transportation Management Plan for the Project. This plan would also include measures/protocols for aviation, including helicopter use, coordination with local air traffic control, and a Congested Area Plan, pursuant to FAA regulations.

APM WQ-01: SWPPP Development and Implementation. Following Project approval, DCRT would prepare and implement a SWPPP or an amendment to an existing SWPPP to minimize construction impacts on surface water and groundwater quality. Implementation of the SWPPP would help stabilize graded areas and reduce erosion and sedimentation. The Plan would designate BMPs that would be adhered to during construction activities. Erosion and sediment control measures, such as straw wattles, covers, and silt fences, would be installed prior to ground disturbance, based on the anticipated volume and intensity of precipitation, the nature of stormwater runoff in the Project Area, and the soil types within the Project Area. Suitable stabilization measures would be used to protect exposed areas during construction activities, as necessary and final stabilization would be completed when construction materials, waste, and temporary erosion and sediment control measure have been removed. During construction activities, measures would be implemented to prevent

contaminant discharge from vehicles and equipment, including complying with the Spill Prevention, Control, and Countermeasures requirements in 40 CFR 112.

The Project SWPPP would include erosion control and sediment transport BMPs to be used during construction. BMPs, where applicable, would be designed by using specific criteria from recognized BMP design guidance manuals. Erosion-minimizing efforts may include measures such as the following:

- defining ingress and egress within the Project site
- implementing a dust control program during construction
- properly containing stockpiled soils

Erosion control measures identified would be installed in an area before construction begins and would be properly maintained until construction is complete and final stabilization begins.

Temporary measures such as silt fences or wattles, intended to minimize sediment transport from temporarily disturbed areas, would remain in place until disturbed areas have stabilized.

The Plan would be updated during construction as required by the SWRCB and ADEQ. The Plan would include the following components, in accordance with ADEQ requirements for coverage under the General Permit:

- stormwater team qualifications and contact information
- identification of operators
- nature of construction activities
- sequence and estimated dates of construction activities
- site description
- site map(s)
- receiving waters
- control measures to be used during construction activity
- summary of potential pollutant sources
- use of treatment chemicals pollution prevention procedures, including spill prevention and response and waste management procedures
- **APM HAZ-02: Fire Avoidance and Suppression.** Per the FPP for the Project: DCRT would select a welding site that is void of native combustible material and/or would clear such material for 10 feet around the area where the work is to be performed. DCRT would follow its standard practice for clearing in wildland areas. Project personnel would be directed to drive on areas that have been cleared of vegetation,

park away from dry vegetation, and carry water, shovels, and fire extinguishers in times of high fire hazard. DCRT would also prohibit trash burning. Additionally, fire-suppression materials and equipment would be kept adjacent to all areas of work and in staging areas and would be clearly marked.

- **BMP PH&S-02.** An FPP would be developed for the Project.

- **APM WQ-02: Worker Environmental Awareness Program Development and Implementation.** The Project's worker environmental awareness program would communicate environmental issues and appropriate work practices specific to this Project. This awareness would include spill prevention and response measures and proper BMP implementation. The training would emphasize site-specific physical conditions to improve hazard prevention (such as identification of flow paths to nearest water bodies) and would include a review of all site-specific water quality requirements, including applicable portions of erosion control and sediment transport BMPs and Hazardous Substance Control and Containment and Emergency Response Plan.

- **BMP HAZ-03: Equipment & Material Inventory.** DCRT would provide the BLM with an inventory of equipment and materials to cover each hazardous material used at any time during the life of the Project, updating as additions to equipment and materials are made. Appropriate equipment and materials would follow specific recommendations for individual Haz Mat types in BLM Handbooks, EPA guidelines, and from the California Department of Toxic Substance Control (DTSC).

- **APM WQ-03: Vehicles and Equipment Fueling and Maintenance.** Vehicle and equipment fueling and maintenance operations would be conducted in designated areas only; these areas would be equipped with appropriate spill control materials and containment.

- **BMP HAZ-04.** DCRT would provide the BLM with a Pesticide/Herbicide Use Proposal, outlining the pesticides and herbicides that would be proposed for use on the Project, demonstrating conformance with BLM requirements, and seeking preapproval before use. Only BLM-approved products from the approved California herbicide list would be used in California.

2.8.3 Conservation and Management Actions

The CDCA Plan, as amended, contains CMAs, which include a specific set of avoidance, minimization, and compensation measures. The applicability of those measures to the Project was determined using a CMA checklist (EIS Appendix 2C). The CMAs applicable to the Project and related to hazards and hazardous materials are listed below and Project compliance with CDCA CMAs is addressed in the analysis portion of this section.

- **CMA LUPA-SW-6.** In addition to the applicable required governmental safeguards, third party activities will implement up-to-date standard industry construction practices to prevent toxic substances from leaching into the soil.

- **CMA LUPA-SW-7.** Prepare an emergency response plan, approved by the BLM contaminant remediation specialist, that ensures rapid response in the event of spills of toxic substances over soils.

- **CMA LUPA-BIO-9.** Implement the following general LUPA CMA for water and wetland dependent resources:

  - Implement construction site standard practices to prevent toxic chemicals, hazardous materials, and other fluids from entering vegetation type streams, washes, and tributary networks through water runoff, erosion, and sediment transport by, at a minimum, implementing the following:

    - On project sites, vehicles and other equipment will be maintained in proper working condition and only stored in designated containment areas where runoff is collected or controlled and that are located outside of streams, washes, and distributary networks to minimize accidental fluids and hazardous materials spills.

    - Hazardous material leaks, spills, or releases will be immediately cleaned, and equipment will be repaired upon identification. Removal and disposal of spill and related clean-up materials will occur at an approved off-site landfill.

    - Maintenance and operations vehicles will carry the appropriate equipment and materials to isolate, clean up, and repair any hazardous material leaks, spills, or releases.

  - Activity-specific drainage, erosion, and sedimentation control actions, which meet the approval of BLM and the applicable regulatory agencies, will be carried out during all appropriate phases of the approved project. These actions, as needed, will address measures to ensure the proper protection of water quality, site-specific stormwater and sediment retention, and design of the project to minimize site disturbance, including the following:

    - Identify site-specific surface water runoff patterns and implement measures to prevent excessive and unnatural soil deposition and erosion.

    - Implement measures to maintain natural drainages and to maintain hydrologic function in the event drainages are disturbed.

    - Reduce the amount of area covered by impervious surfaces through use of permeable pavement or other pervious surfaces. Direct runoff from impervious surfaces into retention basins.

    - Stabilize disturbed areas following grading in the manner appropriate to the soil type so that wind or water erosion is minimized.

    - Minimize irrigation runoff by using low or no irrigation native vegetation landscaping for landscaped retention basins.

- Conduct regular inspections and maintenance of long-term erosion control measures to ensure long-term effectiveness.

- **CMA DFA-VPL-BIO-FIRE-1.** Implement the following standard practice for fire prevention/protection:
  - Implement site-specific fire prevention/protection actions particular to the construction and operation of renewable energy and transmission project that include procedures for reducing fires while minimizing the necessary amount of vegetation clearing, fuel modification, and other construction-related activities. At a minimum these actions will include designating site fire coordinators, providing adequate fire suppression equipment (including in vehicles), and establishing emergency response information relevant to the construction site

2.8.4 CEQA Significance Criteria

Appendix G of CEQA Guidelines (14 CCR 15000 et seq.) provides guidance on assessing whether a project would have significant impacts on the environment. Consistent with Appendix G, the Project would have significant hazards and hazardous materials impacts if it would:

a. Create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials.

b. Create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment.

c. Emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within 0.25 mile of an existing or proposed school.

d. Be located on a site that is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would create a significant hazard to the public or the environment.

e. For a project located within an airport land use plan or, where such a plan has not been adopted, within 2 miles of a public airport or public use airport, would the project result in a safety hazard for people residing or working in the project area.

f. For a project within the vicinity of a private airstrip, would the project result in a safety hazard for people residing or working in the project area.

g. Impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan.

h. Expose people or structures to a significant risk of loss, injury or death involving wildland fires, including where wildlands are adjacent to urbanized areas or where residences are intermixed with wildlands?

2.8.5 Hazards and Hazardous Materials Analysis

Impact HAZ 1 - Create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?

Less than Significant with Mitigation

During both construction and operation of the Project components, hazardous materials including oils, lubricants, fuels, and other substances would be transported, used, and disposed as waste. Accidental releases or spills could result in exposure of the public to hazards, thus resulting in a potential impact prior to mitigation. Larger quantities of hazardous materials would exist as fuel stored at staging yards. Fuels and other hazardous materials would be stored in designated areas at staging yards, away from drainage areas and ignition hazards, such as electrical outlets or overhead hazards, to the extent feasible. Fuels would be stored in 55-gallon drums or aboveground storage tanks with capacity up to 10,000 gallons. Fuel would also be stored and transported on mobile refuelers that would travel to individual work sites and staging yards to refuel equipment. Secondary containment would be provided for storage tanks containing 55-gallons or more, such as spill trays, lined basins, double-walled tanks, or other containment devices.

If a release were to occur, it would most likely result from an accidental spill or other unauthorized release during work site grading, pole installation, or during conductor pulling, splicing, and tensioning. A hazardous materials release could also occur during equipment and vehicle servicing and refueling. Although accidental spills would be unlikely, spilled or leaking hazardous materials would create a significant hazard to the public or the environment and could result in a significant impact. As such, as discussed in Sections 4.13.4 and 4.13.5 of the TES (BLM 2019), during both construction and operation activities, hazardous materials and wastes would be handled, stored, recycled, and disposed of according to applicable manufacturer specifications as well as local, state, and federal regulations, and in accordance with the BMPs listed in the SWPPP, Spill Prevention, Control, and Countermeasures Plan (SPCC Plan), and hazardous materials management programs. Therefore, with implementation of standard manufacturer specifications and local, state, and federal regulations impacts from accidental spill release would be less than significant.

As part of Project permitting and in accordance with APM WQ-01 and CMA LUPA-BIO-9, the applicant would be required to prepare and submit for approval a Project-specific SWPPP to the Colorado River Basin RWQCB under the NPDES permits for stormwater. The SWPPP would include provisions to conduct worker training related to storage, use, and handling of hazardous materials, including fueling and maintenance for vehicles, equipment, and helicopters (although helicopter use is not anticipated in California). The Project-specific SPCC Plan would be submitted to the Hazardous Materials Management Division of the Riverside County Department of Environmental Health. The approved SWPPP and SPCC Plans would be submitted to CPUC and BLM prior to the start of construction. However, because there is a still a potential of hazardous materials release into the environment during construction, MM HAZ-CEQA-1 would be required in order to reduce potential impacts related to hazardous materials release. MM HAZ-CEQA-1 requires the implementation of APMs, BMPs, and CMAs in order to reduce the potential for accidental spill releases and provides measures in case an accidental spill were to occur during construction activities. MM HAZ-CEQA-1 includes the implementation of APMs

HAZ-01, Hazardous Substance Control and Emergency Response; WQ-02, Worker Environmental Awareness Program Development and Implementation; and WQ-03, Vehicles and Equipment Fueling and Maintenance to address potential impacts from handling and emergency release of hazardous materials. Collectively, APMs HAZ-01, WQ-02, and WQ-03 which are included in MM HAZ-CEQA-1 ensure that employees understand what to do in the event of an accidental spill or discovery of previously undiscovered contamination, and that the appropriate agencies are consulted and the applicable laws and regulations for protection of worker safety and the environment are complied with, and therefore, impacts would be reduced to a less than significant level.

Additionally, MM HAZ-CEQA-1 requires implementation of BMPs identified by the BLM in order to reduce potential impacts related to accidental spill release to a less than significant level, which would be implemented including HAZ-03, Equipment & Material Inventory and HAZ-04 which includes the development of Pesticide/Herbicide Use Proposal. This Pesticide/Herbicide Use Proposal would demonstrate DCRT's conformance with BLM requirements regarding pesticide and herbicide use for the Project. This Proposal would allow only BLM approved products to be used during construction, including the use of approved herbicides from the California herbicide list. BMP HAZ-03 would require that DCRT provide the BLM with an inventory of equipment and materials to cover each hazardous material used at any time during the lifetime of the Project. The equipment used for the Project would be in conformance with individual hazardous materials types in the BLM Handbooks, U.S. Environmental Protection Agency (USEPA) guidelines, and from the California DTSC. Additionally, through MM HAZ-CEQA-1 the Project would also be in compliance with CDCA CMAs LUPA-SW-6, LUPA-SW-7, and LUPA-BIO-9 with the implementation of the above APMs and BMPs.

Therefore, impacts related to the routine transport, use, or disposal of hazardous materials would be less than significant with mitigation incorporated.

Impact HAZ 2 Create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?

Less than Significant with Mitigation

As described in greater detail above, potential impacts related to hazards and hazardous materials may result from construction, operation, maintenance, and decommissioning of the Project. The Project could include the accidental release of hazardous materials such as fuels, oils, lubricants, and solvents if not managed appropriately. However, as required by the NPDES General Construction Permit, construction activities would be required to adhere to a SWPPP which would include BMPs for the safe handling and storage of hazardous materials during construction. Additionally, as discussed previously in Impact HAZ-1, because there would still be a potential for hazardous materials release during construction, MM HAZ-CEQA-1 would be required in order to reduce potential impacts to a less than significant level. MM HAZ-CEQA-1 includes the implementation of APMs, BMPs, and CMAs during operation and adhere to City, State, and federal regulations which would avoid or minimize the release of hazardous materials into the environment. Specifically, implementation of APM HAZ-01 would avoid or minimize the upset of hazardous materials through the excavation of impacted materials. MM HAZ-CEQA-1 through the implementation of the required APMs, BMPs, and compliance with the

associated CMAs would address potential impacts from release of hazardous materials into the environment and would reduce these potential impacts from the hazardous materials to a less than significant level.

Additionally, there are numerous natural gas pipelines that cross segments in California. Pipeline damage or rupture could occur during construction of the Project by ground-disturbing activities (e.g., grading, trenching, auguring foundation holes, or blasting) which could result in the uncontrolled release of natural gas from a pipeline and/or cause a fire or explosion, thus resulting in a potential impact prior to mitigation. Prior to trenching in city streets, the applicant would coordinate with local jurisdictions to secure excavation and encroachment permits, as required and common industry construction procedures would reduce the likelihood of damaging subsurface utilities, and include notifying other utilities along the proposed alignment via Underground Service Alert prior to ground disturbing activities in the vicinity of a buried utility.

Further, MM HAZ-CEQA-2 would be required which would include requirements for the Project Applicant to uncover or "pothole" existing utility pipelines within 10 feet of Project excavations, including tower structure foundations and underground duct bank or vaults, to ensure that excavation work does not damage the existing utility pipeline. This MM would effectively reduce potential impacts related to hazards that could be encountered during Project construction from existing utility lines in the area. Therefore, implementation of MM HAZ-CEQA-1 and MM HAZ-CEQA-2 would reduce impacts associated with damage or rupture to buried utilities to a less than significant level.

Impact HAZ 3 - Emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school?

No Impact

Project construction equipment emissions would include diesel particulate matter (PM2.5), a TAC. Construction could also involve the use of coatings that contain volatile organic compounds (VOCs), another TAC. The emission of VOCs or PM2.5 at concentrations that exceed air quality standards would be a significant impact with respect to this issue if such exceedances occurred within one-quarter mile of a school. The closest existing or proposed school to the Project route within California is Felix J Appleby Elementary School, which is located more than four miles north of the Project route (segment p-15w). Project construction is not expected to involve handling of acutely hazardous materials but may transport and/or store small quantities of hazardous materials necessary in the course of construction activities (e.g., vehicle and/or generator fuels). However, similar to TACs and VOCs, this activity would not occur within one-quarter mile of an existing school. For this reason, the Project would have no impact with respect to exposure of schools to hazardous emissions or hazardous materials.

Impact HAZ 4 - Be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment?

Less Than Significant – No Mitigation Required

As discussed in Section 3.13.2 of the TES (BLM 2019), an Environmental Data Resources Inc. (EDR) was conducted for the Project area that included over 50 databases including the USEPA

Hazardous Materials Incident Report System, the California "Cortese" Hazardous Waste and Substances Sites List, and the federal listing of Unexploded Ordnance Sites, among numerous others. As discussed in Section 3.13.3.2 (Colorado River and California Zone) and shown in Table 3.13-7 of the TES, no sites that meet the definition of Government Code Section 65962.5 were identified in the government database research within a one-mile wide study area for Segments p15w through p-18 in California. Therefore, impacts would be less than significant.

Operation and maintenance activities would not involve excavation activities near or on an open hazardous site; therefore, it would be very unlikely that a significant hazard to the public or the environment would occur as a result of operation and maintenance activities. Impacts would be less than significant.

Impact HAZ 5 - For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard for people residing or working in the project area?

No Impact

In California, the Project's segment p-16 is located approximately 6 miles south of Blythe Airport, a public airport. No impacts related to safety hazard for people residing or working in the Project area would occur.

While the Project is not located within an existing airport land use plan, some segment alternatives fall within the Blythe Municipal Airport influence areas D and E and is subject to the Riverside County Airport Land Use Compatibility Plan (ALUCP). The ALUCP addresses four types of land use compatibility concerns: noise, safety, airspace protection, and overflight.

For safety planning purposes, the ALUCP uses the safety zones (i.e., zones within which potential hazards may occur) defined in the Air Installations Compatible Use Zones prepared by the U.S. Department of Defense for Blythe Municipal Airport. The Project is not located within any of these zones; therefore, there would be no safety hazard for people residing or working in the Project corridor as a result. There would be no impact.

For airspace protection, the ALUCP requires evaluation of compatibility with airspace protection surfaces. Policies of the ALUCP "relies upon regulations enacted by the Federal Aviation Administration and the State of California. The ALUC policies are intended to help implement the federal and state regulations". The Project is located within an area subject to Federal Aviation Regulation Part 77. To be compatible with the ALUCP and to comply with Part 77, the Project would require notification to the FAA through filing of a Form 7460-1: Notice of Proposed Construction or Alteration. The FAA completes an aeronautical study and issues a determination regarding the impact to air navigation. As identified in the required approvals and permits listed in Appendix 1 in the EIS, the applicant will consult with the FAA and incorporate all FAA recommendations to the Project, particularly regarding the use of helicopters (although not anticipated in the California portions of the Project) and the placement of marker balls and tower lights. There would be no safety hazard for people residing or working in the Project corridor because the applicant would comply with ALUCP and FAA airspace projection requirements.

Impact HAZ 6 - For a project within the vicinity of a private airstrip, would the project result in a safety hazard for people residing or working in the project area?

Less than Significant with Mitigation

In California, the Project's segment p-15w is located approximately 4 miles south of CYR Aviation, a private airstrip. Although not anticipated in the California portions of this Project, helicopter use and transport could be utilized during Project construction. The use of helicopters near these helipads and private airports could potentially create a hazard, resulting in a significant impact prior to mitigation.

MM TRANS-CEQA-2 would be implemented in order to ensure hazards resulting from potential helicopter use in Segment p-15w is reduced to a less than significant level. MM TRANS CEQA-2 includes the development and implementation of a Traffic, Transportation, and Access Management Plan which includes usage restrictions imposed by the FAA and Caltrans. In addition, MM TRANS-CEQA-2 requires the Project Applicant and/or the construction contractor to coordinate with local air traffic control and comply with applicable FAA regulations regarding helicopter use to prevent conflict with air traffic generated by local airports. As required, a Congested Area Plan will be prepared under the Traffic, Transportation, and Access Management Plan, based upon actual helicopter usage, pursuant to FAA regulations. Therefore, with the implementation of MM TRANS-CEQA-2, impacts related to safety hazard for people residing or working in the Project area would be less than significant.

Impact HAZ 7 - Impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?

Less than Significant with Mitigation

Temporary road or lane closures may be necessary during Project construction to ensure safety of the public and workers. Temporary road or lane closures could impair implementation of an emergency response plan or evacuation plan or disrupt emergency vehicle traffic and access. Closure of these facilities for conductor stringing or installation of guard structures would cause a temporary interruption of traffic flow on the local highways. These temporary closures would potentially cause a significant impact on the routes available for emergency vehicles and emergency evacuation routes prior to mitigation

MM TRANS-CEQA-2 would be required in order to ensure that impacts related to emergency access and emergency evacuation routes are maintained at a less than significant level throughout Project construction. MM TRANS-CEQA-2 requires the development and implementation of a Traffic, Transportation, and Access Management Plan which includes specific measures for maintaining access for emergency personnel and vehicles throughout Project construction and includes continued coordination with the appropriate emergency agencies for Project related detours and/or road closures. This measure would ensure that emergency response times are not unintentionally inhibited by Project construction activities. Therefore, with the implementation of MM TRANS-CEQA-2, impacts would be less than significant.

Impact HAZ 8 - Expose people or structures to a significant risk of loss, injury or death involving wildland fires, including where wildlands are adjacent to urbanized areas or where residences are intermixed with wildlands?

Less than Significant with Mitigation

As discussed in Section 3.14.3 of the TES (BLM 2019), the risk of wildfire in the Project area is related to weather, fuels, ignition potential, and fire history (fire environment). In California, the Project is located within “moderate” and “un-zoned” fire hazard severity zones, as classified by CAL FIRE. Section 4.14.4 of the TES indicates that the Project Area has been subject to historical fires, largely caused by humans, and primarily located along the I-10 corridor and around Blythe. As discussed in Section 4.14.4.1 of the TES, Project-related increases in fire risk during construction activities are associated with potential ignitions resulting from certain construction activities (e.g., blasting, welding, refueling, and sparks from construction equipment). As discussed in Section 4.14.5 of the TES, Project-related increases in fire risk during operations are associated with potential equipment failures, operations and maintenance activities that could ignite flammable material (e.g., refueling, welding, blasting), electrical arcing, bird-strikes, or vandalism. Transmission line relays and circuit breakers that rapidly detect faults and cut off power to avoid shock and fire hazards help reduce fire risk during the operations phase. Section 4.14.5 of the TES also identifies increases in fire risk associated with the presence of transmission lines, which can hinder firefighting operations, and notes that fire risk increases during decommissioning activities would be similar to those during Project construction. Finally, Section 4.14.11.1 of the TES states that the Project presents an increased source of potential ignitions for the life of the Project.

Without implementation of fire prevention actions, Project-related impacts associated with wildland fires during construction, operations, and decommissioning would be considered significant. Therefore, MM HAZ-CEQA-1 would be required and would include the development and implementation of a Project FPP (which is further required through APM HAZ-02, BMP PH&S-02, and CMA DFA-VPL-BIO-FIRE-1). This FPP would be developed in consultation with and approved by local fire agencies and would include measures and procedures to prevent fires throughout all construction activities for the Project. APM HAZ-02 specifically, identifies that the Applicant would minimize ignitions through vegetation clearing, prohibition of trash burning, and carrying of fire suppression tools during high fire hazard periods. Therefore, with implementation of MM HAZ-CEQA-1, impacts related to wildland fire hazards due to Project construction, operations, and decommissioning activities would be less than significant.

2.8.6 Hazards and Hazardous Materials Mitigation

See **MM TRANS-CEQA-2** under Section 2.17.6 (Traffic and Transportation).

MM HAZ-CEQA-1: Implement Hazards and Hazardous Materials Applicant Proposed Measures, Best Management Practices, and Conservation and Management Actions.

The APMs, BMPs, and CMAs in Sections 2.8.2 and 2.8.3 above provide a suite of measures, practices, and actions that shall be implemented as part of the Project. APMs, BMPs, and CMAs shall be implemented prior to, or during all ground disturbance, including construction,

operations, maintenance, and decommissioning-related activities to avoid or minimize Project related impacts to hazards and hazardous materials. These APMs, BMPs, and CMAs include; APM HAZ-01, APM TT-01, APM WQ-01, APM HAZ-02, BMP PH&S-02, APM WQ-02, BMP HAZ-03, APM WQ-03, BMP HAZ-04, CMA LUPA-SW-6, CMA LUPA-SW-7, CMA LUPA-BIO-9, CMA DFA-VPL-BIO-FIRE-1.

If an APM, BMP, or CMA is subjective, such as containing text that states; “where appropriate,” “where applicable,” “where feasible,” or similar language, the BLM and CPUC shall be consulted to determine the applicability of each measure prior to the disturbance of a covered resource. Compliance with APMs, BMPs, and CMAs shall be documented, and a weekly report shall be provided to the BLM and CPUC. The Applicant shall provide a synopsis of the weekly reports to the BLM and CPUC monthly. The report shall include a summary of the construction activities completed, a list of compliance actions and any remedial actions taken to correct any actions, and the status of ongoing mitigation efforts.

For those instances (only) where an APM, BMP, and/or CMA conflicts, or does not meet required specificity pursuant to CEQA, the following AMPs and BMPs have been modified to meet CEQA requirements:

- **APM T&T-01: Traffic Coordination.** As discussed in this APM, a Traffic, Transportation, and Access Management Plan would be developed for the Project. The details of this Traffic, Transportation, and Access Management Plan, as well as the correlation with a Congested Area Plan, are further discussed under MM TRANS-CEQA-2.

- **APM HAZ-02: Fire Avoidance and Suppression, BMP PH&S-02, and CMA DFA-VPL-BIO-FIRE-1.** As discussed in APM HAZ-02, BMP PH&S-02, and CMA DFA-VPL-BIO-FIRE-1, an FPP shall be developed and implemented for the Project throughout construction, and operation and maintenance. The Applicant shall develop a Project FPP in consultation with the appropriate local fire agencies at least 30-days prior to the start of construction activities. The Plan shall cover the construction and operations/maintenance phases of the Project. The Applicant shall monitor Project-related activities to ensure implementation and effectiveness of the Plan. The final Plan would be approved by the consulted fire agencies prior to the initiation of construction activities and shall be implemented during all Project-related activities by the Applicant. Information contained in the Plan and location of fire-suppression materials and equipment shall be included as part of the Worker Environmental Awareness Program discussed in APM BIO-01. Successful implementation of this Plan shall result in a less than significant impact to the potential for construction-related fires. At minimum, the Plan shall include the following:

    - Procedures for minimizing potential ignition, including, but not limited to, vegetation clearing, parking requirements/restrictions, idling restrictions, smoking restrictions, proper use of gas-powered equipment, use of spark arrestors, hot work restrictions, and timing of vegetation treatment or maintenance. Where necessary, vegetation management or clearing necessary to mitigate fire risk shall supersede other measures for vegetation protection and avoidance. Applicable

permitting, compensation, and mitigation resulting from such activity shall be the responsibility of the Applicant.

- Proper use of construction, maintenance, and decommissioning equipment.
- Work restrictions during Red Flag Warnings and High to Extreme Fire Danger days.
- Fire coordinator and fire patrol roles and responsibilities.
- Worker training for fire prevention, initial attack firefighting, and fire reporting.
- Emergency fire suppression equipment/tools inventory and maintenance.
- Emergency communication, response, and reporting procedures.
- Coordination with local fire agencies to facilitate emergency access through the Project site.
- Emergency contact information.
- Compliance with applicable wildland fire management plans and policies established by state and local agencies.
- Other information as required by responsible and consulted agencies.

Responsible Party: The Applicant shall develop the FPP and ensure that it is implemented throughout construction activities.

Timing: The Applicant shall develop the FPP at least 30-days prior to the start of construction activities. The FPP shall be implemented throughout all construction activities.

Mitigation Monitoring and Reporting Program: The Applicant shall ensure that the information in the FPP is included in the Worker Environmental Awareness Program. Documentation of any Red Flag Warnings or High to Extreme Fire Danger days shall be kept on file and submitted to the applicable local fire agencies as well as the BLM and CPUC.

Standards for Success: Construction impacts related to fires is reduced to a less than significant level and no fires are started as a result of construction activities.

- **BMP HAZ-04.** The Pesticide Use Proposal would be developed in accordance with MM VEG-CEQA-1 (See Section 2.4.6).

MM HAZ-CEQA-1 Implementation

Responsible Party: The Applicant shall ensure that all APMs, BMPs, and CMAs are implemented during construction. If an APM, BMP, or CMA is subjective, the Applicant shall consult with the BLM and/or the CPUC to determine the applicability of each measure.

Timing: APMs, BMPs, and CMAs shall be implemented throughout construction activities.

Mitigation Monitoring and Reporting Program: The Applicant shall develop a weekly report that shall include all applicable APMs, BMPs, and CMAs and the related actions taken in order to be in compliance with these measures. These weekly reports shall be compiled and submitted to the BLM and CPUC monthly.

Standards for Success: Compliance with all applicable APMs, BMPS, and CMAs is achieved throughout construction, operations, maintenance, and decommissioning of the Project.

MM HAZ-CEQA-2: Identify and Pothole Existing Utility Pipelines.

The Applicant shall be responsible for the implementation and enforcement of this MM by identifying any existing utility pipelines along the Project alignment through database searches, coordination with public utility agencies, and/or reviewing historic documents during the design phase of the Project. If existing utility pipelines are identified during this search, the Applicant shall then uncover or "pothole" any existing utility pipelines within 10 feet of Project excavations, including tower structure foundations and underground duct bank or vaults, prior to the start of any earth moving activities in a particular area to ensure that excavation work does not damage the existing utility pipeline. The Applicant shall monitor Project construction activities to ensure public utilities remain intact and are not disturbed by construction of the Project. If undiscovered or undocumented utilities are encountered during construction, all Project work shall stop in that location and the Applicant shall notify the appropriate utility agency within 24-hours of discovery. Project work may resume once the area is cleared by the Applicant and the public utility agency.

MM HAZ-CEQA-2 Implementation

Responsible Party: The Applicant shall be responsible for identifying any existing utility pipelines along the Project alignment and uncover any of these existing facilities within 10 feet of Project excavations. The Applicant shall be responsible that any existing utility pipelines are not disturbed during construction activities.

Timing: Database searches, coordination with public utility agencies, and review of historic documents in order to identify existing utilities within the Project area shall be completed prior to the start of construction activities. Monitoring of public utilities within the Project area shall occur throughout construction activities.

Mitigation Monitoring and Reporting Program: The Applicant shall document any public utilities discovered during database searches, consultation, and review of historic documentation. The Applicant shall also keep records of all monitoring activities for the utility pipelines, including any necessary actions taken to avoid these utilities or document any previously unknown utilities discovered during construction. If undiscovered or undocumented utilities are encountered during construction, the Applicant shall notify the appropriate utility agency within 24-hours of discovery.

Standards for Success: Any Project work that will occur within the vicinity of a utility pipeline shall remain undisturbed from construction activities.

2.9 ELECTROMAGNETIC FIELDS

This section describes the potential impacts to human health and the environment from electromagnetic fields (EMF) during Project operations. EMF is a term used to describe electric and magnetic fields that are created by electric voltage (electric field) and electric current (magnetic field). Power frequency EMF are a natural consequence of electrical circuits and can be either directly measured using the appropriate measuring instruments or calculated using appropriate information.

CPUC Decision 06-01-042 (January 27, 2006), affirmed the Commission's November 1993 CPUC Decision 93-11-013 that concluded that the potential health effects associated with EMF exposure are too speculative to allow the evaluation of impacts or the preparation of MMs.

Given the uncertainty of EMF effects and the inability of scientific investigations to identify any unsafe level or component of EMF exposure, potential EMF impacts are appropriately addressed as speculative in accordance with the California Environmental Quality Act Guidelines, Section 15145:

> "If after thorough investigation a particular impact is found to be too speculative for evaluation, the conclusion shall be noted, and the discussion terminated."

While CPUC did not identify a significant scientifically verifiable relationship between EMF exposure and negative health consequences, CPUC Decision 06-01-042 directs the CPUC's Energy Division to pursue and review all available studies regarding EMF and to review scientific information and report on new findings. Should such studies indicate negative EMF health impacts, the Commission will reconsider its EMF policies, and open a new rulemaking if necessary.

Pursuant to the PUC's November 1993 decision, affirmed on January 27, 2006, requires the project applicant to implement the following measure:

1) No-cost and low-cost steps to reduce EMF levels: When regulated utilities design new projects or upgrade existing facilities, approximately four percent of the project's budget may be used for reducing EMFs. The PUC did not set specific reduction levels for EMFs. It was inappropriate to set a specific numerical standard until a scientific basis for doing so exists.

To ensure Project compliance with CPUC Decision 93-11-013, DCRT will incorporate “no cost” and “low cost” magnetic field reduction steps in the proposed transmission and substation facilities plans and designs to ensure that approximately four percent of the Project's budget may be used for reducing EMFs.

The following measures may be available to reduce the magnetic field strength levels from the regulated transmission lines and substations of the Project:

- Increase distance from conductors and equipment;
- Reduce conductor spacing;
- Minimize current, and;
- Optimize phase configuration.

In order to be in conformance with the above-mentioned CPUC decision regarding EMF's MM EMF-CEQA-1 would be implemented and would require the preparation of a Field Management Plan (FMP) to show no-cost/low-cost measures and identify any appropriate EMF reduction measures to be implemented into the Project. This MM would reduce any potential impacts related to EMF to a less than significant level.

2.9.1 Electromagnetic Fields Mitigation Measures

MM EMF-CEQA-1: Field Management Plan.

The Applicant will prepare an FMP at least 30-days prior to the start of construction activities to show implementation of the no-cost/low-cost measures. The FMP shall be submitted to the CPUC for review and to be kept on file and shall be implemented throughout all construction phases of the Project.

The FMP will include the following Project information:

- A description of the Project (cost, design, length, location, etc.), and enhanced by updated Project designs and plans;
- A description of the surrounding land uses using EMF reduction priority criteria classifications;
- No-cost options to be implemented;
- Priority areas where low-cost measures are to be applied, and;
- Measures considered for magnetic field reduction, percent reduction and cost.

This FMP will define EMF reduction priority criteria classifications for the Project's alignment and which EMF reduction options were identified. Project EMF reduction design criteria will be presented, including a description of how the Project alignment is proposed to be treated equivalently or why low-cost measures cannot be applied to this Project due to cost, percent reduction, equivalence, secondary environmental impacts, or other reasons. The ultimate cost of the EMF reduction elements incorporated into the Project will be qualified and compared to the CPUC's stated goal of approximately 4 percent of the Project's budget.

MM EMF-CEQA-1 Implementation

Responsible Party: The Applicant shall be responsible for the development and implementation of the FMP.

Timing: The FMP shall be prepared at least 30-days prior to the start of construction. The FMP shall be implemented throughout construction activities.

Mitigation Monitoring and Reporting Program: The Applicant shall develop and submit the FMP to the CPUC and implement any magnetic field reduction measures relative to the CPUC's stated goal of approximately 4 percent of the Projects cost.

Standards for Success: EMF impacts are reduced to a less than significant level.

2.10 HYDROLOGY AND WATER QUALITY

This section describes the impacts to hydrology and water quality associated with the construction, operation, and maintenance of the proposed transmission line, substations, and ancillary facilities in terms of CEQA significance thresholds disclosed below in Section 2.10.4 below. As disclosed in Section 4.19 of the TES (BLM 2019), impacts to water quality have the potential to occur from a release of contaminants to surface waters and/or shallow groundwater during construction. Additionally, this section responds to issues raised during the public scoping process, which are presented in Appendix 1 of the EIS.

2.10.1 Thresholds and Methodology

Existing conditions described in Section 3.19 TES (BLM 2019) have been evaluated with regard to their potential to be affected by Project construction, operation, maintenance, and decommissioning activities. The evaluation of Project impacts is based on Section 4.19 of the TES and the significance criteria established by Appendix G of the CEQA Guidelines.

Impacts to water resources would occur if the following were to occur, as discussed in Section 4.19.2.3 of the TES:

- Predicted violation of federal and/or state water quality standards due to contamination of surface water or groundwater due to erosion, storm water runoff, or spill.
- Predicted impacts to water rights or water usage by humans, aquatic wildlife, or plants, designated or otherwise.
- Physical alterations to channels, existing drainage patterns, floodplains, water conveyances, or wells, or indirect alterations to adjacent properties due to erosion or siltation.
- Impacts that would violate Section 404 of the Clean Water Act or Section 10 of Rivers and Harbors Act.
- Flooding or floodplain impacts from construction activities or structure placement.

2.10.2 Applicant Proposed Measures and BLM Best Management Practices

APMs have been identified and would be implemented by the Project applicant. In addition, BLM would require implementation of BMPs, which are intended to further minimize Project impacts. All Project APMs and BMPs are described in EIS Appendix 2A. Of these, the following

would apply to the portion of the Project located within California and have therefore been incorporated into the Project for evaluation of significant impact to hydrology and water quality under CEQA.

- **APM WQ-01: SWPPP Development and Implementation.** Following Project approval, DCRT would prepare and implement a SWPPP or an amendment to an existing SWPPP to minimize construction impacts on surface water and groundwater quality. Implementation of the SWPPP would help stabilize graded areas and reduce erosion and sedimentation. The Plan would designate BMPs that would be adhered to during construction activities. Erosion and sediment control measures, such as straw wattles, covers, and silt fences, would be installed prior to ground disturbance, based on the anticipated volume and intensity of precipitation, the nature of stormwater runoff in the Project Area, and the soil types within the Project Area. Suitable stabilization measures would be used to protect exposed areas during construction activities, as necessary and final stabilization would be completed when construction materials, waste, and temporary erosion and sediment control measure have been removed. During construction activities, measures would be implemented to prevent contaminant discharge from vehicles and equipment, including complying with the Spill Prevention, Control, and Countermeasures requirements in 40 CFR 112. The Project SWPPP would include erosion control and sediment transport BMPs to be used during construction. BMPs, where applicable, would be designed by using specific criteria from recognized BMP design guidance manuals. Erosion-minimizing efforts may include measures such as the following:

    - defining ingress and egress within the Project site
    - implementing a dust control program during construction
    - properly containing stockpiled soils

  Erosion control measures identified would be installed in an area before construction begins and would be properly maintained until construction is complete and final stabilization begins. Temporary measures such as silt fences or wattles, intended to minimize sediment transport from temporarily disturbed areas, would remain in place until disturbed areas have stabilized. The Plan would be updated during construction as required by the SWRCB and ADEQ. The Plan would include the following components, in accordance with SWRCB and ADEQ requirements for coverage under the General Permit:

    - stormwater team qualifications and contact information
    - identification of operators
    - nature of construction activities
    - sequence and estimated dates of construction activities
    - site description

- site map(s)
- receiving waters
- control measures to be used during construction activity
- summary of potential pollutant sources
- use of treatment chemicals
- pollution prevention procedures, including spill prevention and response and waste management procedures

- **APM WQ-02: Worker Environmental Awareness Program Development and Implementation.** The Project's worker environmental awareness program would communicate environmental issues and appropriate work practices specific to this Project. This awareness would include spill prevention and response measures and proper BMP implementation. The training would emphasize site-specific physical conditions to improve hazard prevention (such as identification of flow paths to nearest water bodies) and would include a review of all site-specific water quality requirements, including applicable portions of erosion control and sediment transport BMPs and Hazardous Substance Control and Containment and Emergency Response Plan.

- **APM WQ-03: Vehicles and Equipment Fueling and Maintenance.** Vehicle and equipment fueling and maintenance operations would be conducted in designated areas only; these areas would be equipped with appropriate spill control materials and containment.

- **BMP WQ-04: Non-petroleum Dust Palliatives**. Palliatives used for dust control would be non-petroleum products in addition to non-toxic, as specified in AQ-01.

- **BMP WQ-05: Water Use**. Water extracted or consumptively used for the construction, operation, maintenance, or remediation of the Project shall be solely for the beneficial use of the Project or its associated mitigation and remediation measures, as specified in approved plans and permits.

- **BMP WQ-06: Avoidance of Hydrologic Alterations**. Consideration shall be given to design alternatives that maintain the existing hydrology of the site or redirect excess flows created by hardscapes and reduced permeability from surface waters to areas where they would dissipate by percolation into the landscape. All hydrologic alterations shall be avoided that could reduce water quality or quantity for all applicable beneficial uses associated with the hydrologic unit in the Project area, or specific MMs shall be implemented that would minimize unavoidable water quality or quantity impacts, as determined by BLM in coordination with USFWS, CDFW, and other agencies, as appropriate.

- **BMP WQ-07: Structures in Floodplains.** No permanent structures would be placed in floodplains that are narrower at the ROW crossing than the typical span width of 1,200 feet (i.e., it is assumed that such floodplains could be spanned and avoided).

2.10.3 Conservation and Management Actions

The CDCA Plan, as amended, contains CMAs, which include a specific set of avoidance, minimization, and compensation measures. The applicability of those measures to the Project was determined using a CMA checklist (EIS Appendix 2C). The CMAs applicable to the Project and related to hydrology and water quality are listed below and Project compliance with CDCA CMAs is addressed in the analysis portion of this section.

- **CMA LUPA-SW-1.** Stipulations or conditions of approval for any activity will be imposed that provide appropriate protective measures to protect the quantity and quality of all water resources (including ephemeral, intermittent, and perennial water bodies) and any associated riparian habitat (see biological CMAs for specific riparian habitat CMAs). The water resources to which this CMA applies will be identified through the activity specific NEPA analysis.

- **CMA LUPA-SW-5**. Exceptions to any of the specific soil and water stipulations contained in this section, as well as those listed below under the subheadings "Soil Resources," "Surface Water," and "Groundwater Resources," may be granted by the authorized officer if the applicant submits a plan, or, for BLM-initiated actions, the BLM provides documentation, that demonstrates:

  - The impacts are minimal (e.g., no predicted aquifer drawdown beyond existing annual variability in basins where cumulative groundwater use is not above perennial yield and water tables are not currently trending downward) or can be adequately mitigated.

- **CMA LUPA-SW-15.** Surface water diversion for beneficial use will not occur absent a state water right.

- **CMA LUPA-SW-18.** Water extracted or consumptively used for the construction, operation, maintenance, or remediation of the project shall be solely for the beneficial use of the project or its associated mitigation and remediation measures, as specified in approved plans and permits.

- **CMA LUPA-SW-20.** After application of applicable avoidance and minimization measures, all remaining unavoidable residual impacts to surface waters from the proposed activity shall be mitigated to ensure no net loss of function and value, as determined by the BLM.

- **CMA LUPA-SW-21**. Consideration shall be given to design alternatives that maintain the existing hydrology of the site or redirect excess flows created by hardscapes and reduced permeability from surface waters to areas where they will dissipate by percolation into the landscape.

2.10.4 CEQA Significance Criteria

Appendix G of CEQA Guidelines (14 CCR 15000 et seq.) provides guidance on assessing whether a project would have significant impacts on the environment. Consistent with Appendix G, the Project would have significant hydrology and water quality impacts if it would:

a. Violate any water quality standards or waste discharge requirements?

b. Substantially deplete groundwater supplies or interfere substantially with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table level (e.g., the production rate of pre-existing nearby wells would drop to a level which would not support existing land uses or planned uses for which permits have been granted)?

c. Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, in a manner which would result in substantial erosion or siltation on- or off-site?

d. Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, or substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or off-site?

e. Create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff?

f. Otherwise substantially degrade water quality?

g. Place housing within a 100-year flood hazard area as mapped on a federal Flood Hazard Boundary or Flood Insurance Rate Map or other flood hazard delineation map?

h. Place within a 100-year flood hazard area structures which would impede or redirect flood flows?

i. Expose people or structures to a significant risk of loss, injury or death involving flooding, including flooding as a result of the failure of a levee or dam?

j. Inundation by seiche, tsunami, or mudflow?

2.10.5 Hydrology and Water Quality Analysis

Impacts to hydrology and water resources would be considered significant if the Project fulfills the CEQA impact statements listed below. Incorporating the APMs described above in Section 2.10.2 of this appendix would ensure compliance with existing water quality regulations, as well as implementation of standard operating procedures that prevent impacts. Potential hydrology impacts are summarized below.

Impact WQ 1 - Violate any water quality standards or waste discharge requirements?

Less than Significant with Mitigation[6]

As discussed in Section 4.19.4.1 of the TES (BLM 2019), the water quality standards applicable to the Project consist of the water quality objectives contained in the Water Quality Control Plan for the Colorado River Basin (Basin Plan), as well as those contained in NPDES permits and waste discharge requirements pertinent to construction activities and stormwater runoff. Impacts related to water quality standards would include construction-related pollutants of concern such as sediment, trash/debris, and fuels/fluids used to maintain and refuel vehicles and equipment. These impacts have the potential to be significant prior to mitigation.

As such, MM WQ-CEQA-1 would be required and would include implementation of APMs, BMPs, and CMAs related to water quality. Specifically, APM WQ-01 would be required under MM WQ-CEQA-1 and would reduce the potential for these pollutants to be present in stormwater runoff by requiring the applicant to obtain a NPDES Construction General Permit. As part of obtaining a NPDES Construction General Permit, the applicant would be required to design and implement a SWPPP, as outlined in APM WQ-01. Additionally, MM GEO-CEQA-2 (included under Section 2.7.6 above), would be required and would include the development and implementation of an Erosion Control Plan in conjunction with the development of the SWPPP required for the Project. The SWPPP and the Erosion Control Plan would incorporate management practices for erosion and sedimentation controls that are designed to prevent soil particles from detaching and being transported off-site. Examples of erosion control measures include use installation of temporary silt fences and other containment features (including gravel bags and fiber rolls) surrounding work areas to prevent the loss of soil during rain events and other disturbances. Sedimentation controls are structural measures intended to complement and enhance the selected erosion control measures and reduce sediment discharges from active construction areas. Examples of sediment control measures include utilization of storm drain inlet protection, including sediment filters and ponding barriers, to retain sediments on site and prevent excess discharge into storm drains. The SWPPP would also include pollution prevention procedures, including spill prevention and response and waste management procedures.

In addition, APMs HAZ-01 (See Section 2.8.2 under Hazards and Hazardous Materials above), WQ-02, and WQ-03 would collectively ensure that employees understand what to do in the event of an accidental spill or discovery of previously undiscovered contamination, and that the appropriate agencies are consulted and the applicable laws and regulations for protection of worker safety and the environment are complied with.

The existing CWA Section 303(d) impairment designation of the Colorado River (for toxicity) would not be affected by any of the Project activities because the impairment listing is for toxicity from an unknown source or sources, and because the APMs and BMPs to be implemented as part of the Project through MM WQ-CEQA-1. For these reasons, impacts related

[6] The DEIS evaluated the whole of the action but erroneously stated no impact. The impact determination has been revised to reflect the correct impact determination commensurate with the impacts discussion and consistent with the analysis in the DEIS.

to discharge of toxic substances including construction-related fuels, would be reduced to a less than significant level.

Therefore, the overall impact to water quality standards would be less than significant with MM WQ-CEQA-1 and MM GEO-CEQA-2 incorporated.

Impact WQ 2 - Substantially deplete groundwater supplies or interfere substantially with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table level (e.g., the production rate of pre-existing nearby wells would drop to a level which would not support existing land uses or planned uses for which permits have been granted)?

Less Than Significant – No Mitigation Required

Project impacts related to groundwater supplies could occur if construction or operation of the Project would require substantial amounts of water, which the local groundwater source could not adequately supply. As evaluated under Impact PUSVC 2 below (See Section 2.15.4 under Public Services and Utilities below), water may be obtained from municipal sources, trucked in by a water supply vendor, or derived from local wells. Even under the conservative assumption that the totality of construction water demand of 56,766,542.6 gallons, equivalent to about 174 acre-feet, would be sourced from groundwater wells in the local area, construction activities would not substantially deplete groundwater supplies or interfere with groundwater recharge. This is because these demands would be distributed across the length of the alignment, and over the 2-year period of construction. Furthermore, the applicant has committed to BMP WQ-04 which would employ non-petroleum-based dust palliatives. Palliatives used for dust control would be non-petroleum products in addition to non-toxic, as well as BMP WQ-05, which would prevent the wasteful use of water. These measures would further ensure that water use for construction remains minimal.

When distributed spatially and temporally, the amount of water required from any one source would be minimal and temporary. Compared to the volume of water stored within the groundwater basins, 174 acre-feet over a two-year period is negligible. The Palo Verde Valley Groundwater Basin (Department of Water Resources [DWR] Basin No. 7-38) and the Palo Verde Mesa Groundwater Basin (DWR Basin No. 7-39) are estimated to have an existing storage capacity of 4,960,000 acre-feet and 6,840,000 acre-feet, respectively. Furthermore, they are both classified by the DWR as having a “low” priority with respect to sustainable groundwater management, based on the low population density, low or negative growth projections, and/or low numbers of private and public supply wells (DWR 2014). In other words, existing demands on groundwater underlying these basins are not causing significant and long-term groundwater overdraft. Any pumping depression caused by withdrawal of groundwater to support construction would be minor, temporary, and recover once pumping ceases and construction begins on the next segment.

Finally, the Project’s impacts on groundwater recharge would be negligible. Impervious surfaces constructed for tower bases and/or substation equipment would be isolated from other impervious surfaces, disconnected from other impervious Project components, and would not prevent the ability for stormwater runoff to percolate into the soils immediately adjacent to structures. CMA LUPA-SW-21 further ensures that impervious structures are designed in a

manner that directs stormwater to areas that allow percolation into the underlying groundwater aquifer.

For these reasons, the impact of the Project on groundwater resources would be less than significant.

Impact WQ 3 - Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, in a manner which would result in substantial erosion or siltation on- or off-site?

Less than Significant with Mitigation

Section 4.19.7 of the TES (BLM 2019) discusses the variations in the number of canal/ditch and ephemeral drainage crossings, and variations in the lengths of non-wetland WOUS and high-risk floodplains among alternative routes (Table 4.19-5 of the TES). Impacts from Project-related alterations to these drainages could result in increased erosion on- or off-site prior to mitigation. As such, MM WQ-CEQA-1 would be required in order to reduce potential impacts to these drainages. MM WQ-CEQA-1 would include implementation of APMs, BMPs, and CMAs, and specifically, BMP WQ-06, BMP WQ-07, and CMA LUPA-SW-1, in order to avoid or substantially reduce the hydrologic alterations necessary for construction and operation of the Project. Where it is feasible to do so, floodplain would be avoided, and in nearly all circumstances, alterations to the course or stream of a river or wash would not occur. The only location where a floodplain would be affected is the Colorado River floodplain. However, the presence of transmission structures with the floodplain of the Colorado River does not affect the probability, depth or extent of flooding. This is because the nature of flooding is shallow and slow-moving (i.e., overbank), and because the transmission structures would occupy an insufficient portion of the cross-sectional area of the floodplain to affect flow (i.e., flood water would go around the towers and/or poles). With regard to ephemeral washes, the typical span width of 1,200 feet is wide enough that permanent impacts to all of the small-scale washes could be avoided.

The ephemeral nature of almost all the streams study area would reduce the likelihood that an inadvertent impact would be sustained or conveyed downstream (i.e., reduced likelihood that flow would be present at the time of any release) and is therefore less than significant.

Therefore, the overall Project impact to alterations to existing drainage patterns of the site or areas that could result in substantial erosion or siltation on- or off-site would be less than significant with MM WQ-CEQA-1 incorporated.

Impact WQ 4 - Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, or substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or off-site?

Less Than Significant – No Mitigation Required

Construction activities should not substantially alter the existing drainage pattern of the site or area, the course of a stream or river, or substantially increase the rate or amount of surface runoff in a manner which would result in flooding on-site or off-site. Levees, dikes, and upstream dams

control floods in developed areas of the Project and along the Colorado River Valley. While undeveloped desert environments are subject to seasonal flooding or ponding over extensive areas, the degree of development associated with transmission line structures and associated access roads would not alter the course of a stream or river. Impervious surfaces at the bases of transmission line structures would incrementally increase runoff, as could the compacted soils in the access roads. Neither of these alterations to ground cover would occur in a concentrated enough pattern to substantially alter the existing drainage pattern of the site or area. The impact is therefore less than significant.

Impact WQ 5 - Create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff?

Less than Significant with Mitigation[7]

Construction-related ground disturbance and the resultant potential for increased erosion and sedimentation via stormwater runoff could impact nearby surface waters, as discussed in Section 4.19.4.1 of the TES (BLM 2019), and thus could result in a potential impact prior to mitigation. As such, MM WQ-CEQA-1 would be required in order to reduce these potential impacts to a less than significant level. MM WQ-CEQA-1 include the implementation of control measures, APMs, and BMPs (Appendix 2A) to minimize the risk of polluted runoff from Project construction. It is assumed that the (SWPPP (APM WQ-01) would appropriately specify locations for these measures and verify proper implementation such that they would stabilize disturbed ground, control erosion from disturbed areas, and prevent sediment from entering surface waters. Additionally, MM GEO-CEQA-2 would also be required and would include the development and implementation of an Erosion Control Plan for the Project that would effectively reduce the risks associated with erosion and movement of sediment in stormwater to a less than significant level. As such, there are no predictions that any violation of federal and/or state water quality standards, or any hindrance to any water users, would occur due to erosion or sedimentation.

Furthermore, the Project does not appreciably increase the volume of runoff and is primarily located in open space and agricultural areas that lack existing or planned stormwater drainage systems, which consist of engineered conveyances such as canals, storm drainpipes, culverts, etc.). Where the Project crosses agricultural areas, which have informal (non-engineered) drains and ditches, such features would be spanned, and pole//tower footings would not be located so as to affect their capacity.

Therefore, the overall impact related to the Project's contribution to runoff water which could exceed stormwater capacity or provide substantial additional sources of polluted runoff would be less than significant with MM WQ-CEQA-1 and MM GEO-CEQA-2 incorporated.

[7] The original analysis acknowledged required APMs and BMPs, which are now implemented through CEQA MMs; thus, the original impact conclusions were not appropriately stated as "no impact". Although the significance conclusion has changed to Less than Significant with Mitigation, the stated impacts are not more severe.

Impact WQ 6 - Otherwise substantially degrade water quality?

Less than Significant with Mitigation[7]

As discussed in Impact WQ-1 above, MM WQ-CEQA-1 would be required to reduce potential impacts related to water quality to a less than significant level. MM WQ-CEQA-1 includes the implementation of water quality APMs, BMPs, and CMAs which includes the development of the SWPPP(s) (APM WQ-01) required for the Project. This MM would ensure that APMs, BMPs, and CMAs are properly implemented such that they would stabilize disturbed ground, control erosion from disturbed areas and prevent sediment from entering surface waters. Implementation of MM WQ-CEQA-1 would effectively minimize risks associated with degradation of water quality, therefore impacts would be less than significant with mitigation incorporated. Aside from the water quality issues addressed under Impact WQ-1, there are no other water quality issues pertinent to the Project.

Impact WQ 7 - Place housing within a 100-year flood hazard area as mapped on a federal Flood Hazard Boundary or Flood Insurance Rate Map or other flood hazard delineation map?

No Impact

Housing is not a component of the Project, and therefore, no impacts would occur.

Impact WQ 8 - Place within a 100-year flood hazard area structures which would impede or redirect flood flows?

Less Than Significant – No Mitigation Required

During construction, equipment would operate in a FEMA designated 100-year flood hazard Area, but it is unlikely that construction activities would impede or redirect flood flows during a major storm event. The average span between transmission line poles would be 1,200 feet. Per APM WQ-07, floodplains would be avoided, and in nearly all circumstances, the impedance or redirection of flood flows due to Project components would not occur. The only location where a FEMA designated 100-year flood hazard area would be affected is the Colorado River floodplain. However, the presence of transmission structures with the floodplain of the Colorado River does not affect the probability, depth or extent of flooding. This is because the nature of flooding is shallow and slow-moving (i.e., overbank), and because the transmission structures would occupy an insufficient portion of the cross-sectional area of the floodplain to affect flow (i.e., flood water would go around the towers and/or poles).

FEMA has not mapped floodplains on the Palo Verde Mesa, and where washes cross the alignment. Nevertheless, with regard to ephemeral washes, the typical span width of 1,200 feet is wide enough that permanent impacts to all of the small-scale washes could be avoided. Construction disturbance and permanent access roads would also likely cross floodplains which could redirect flood flows; however, these roads would not be hard-surfaced and appropriate controls on sediment and stormwater would be implemented during construction. It is assumed that any of these floodplain disturbances would be located in sheetwash areas where any potential flooding would be shallow and water velocities low. As such, Project facilities would not impede flows, collect debris, or cause an increase in flooding area.

For these reasons, the impacts of the Project on the probability, depth or extent of floodplains would be less than significant.

Impact WQ 9 - Expose people or structures to a significant risk of loss, injury or death involving flooding, including flooding as a result of the failure of a levee or dam?

Less Than Significant – No Mitigation Required

During construction, workers could be subjected to potential risks associated with flash flooding in the desert during infrequent major storms. However, due to the very low probability of occurrence, and standard precautions taken to avoid flash floods (i.e. stopping work during heavy rainfall) this potential impact is considered less than significant.

Additionally, operational impacts related to flooding could occur through exposure of transmission line structures to flooding hazards. However, transmission line structures and foundations would be designed to withstand localized inundation. It is unlikely that transmission line structures would be damaged, and therefore, this impact would be less than significant.

Impact WQ 10 - Inundation by seiche, tsunami, or mudflow?

Less Than Significant – No Mitigation Required

The Project area is located along the California-Arizona border, several hundred miles from the Pacific Ocean. Thus, no tsunami hazard is present and there would be no impact associated with inundation from a tsunami. Additionally, the Project area does not contain lakes which could be subject to seiche, and therefore there would be no impact associated with inundation by a seiche. Finally, the proposed alignment within California is not located in steep mountains that could be subject to mudflow. Even in the unlikely scenario of a mudflow originating from off-site, the presence of Project components would not exacerbate the consequences to public safety or the environment that such a mudflow would present. Project facilities are unmanned and located in undeveloped open space, presenting minimal risks of public safety regardless of the presence of pre-existing natural hazards such as mudflow. For these reasons, the impacts would be less than significant.

2.10.6 Hydrology and Water Quality Mitigation

See **MM GEO-CEQA-2** under Section 2.7.6 (Geology and Soils).

MM WQ-CEQA-1: Implement Hydrology and Water Quality Applicant Proposed Measures, Best Management Practices, and Conservation and Management Actions.

The APMs, BMPs, and CMAs in Sections 2.10.2 and 2.10.3 above provide a suite of measures, practices, and actions that shall be implemented as part of the Project. APMs, BMPs, and CMAs shall be implemented prior to, or during all ground disturbance and construction related activities to avoid or minimize Project related impacts to hydrology and water quality. These APMs, BMPs, and CMAs include; APM WQ-01, APM WQ-02, BMP WQ-04, BMP WQ-05, BMP WQ-06, BMP WQ-7, CMA LUPA-SW-1, CMA LUPA-SW-5, CMA LUPA-SW-15, CMA LUPA-SW-18, CMA LUPA-SW-20, and CMA LUPA-SW-21. If an APM, BMP, or CMA is subjective, such as containing text that states; “where appropriate,” “where applicable,” “where

feasible," or similar language, the BLM and CPUC shall be consulted to determine the applicability of each measure prior to the disturbance of a covered resource. Compliance with APMs, BMPs, and CMAs shall be documented, and a weekly report shall be provided to the BLM and CPUC. The Applicant shall provide a synopsis of the weekly reports to the BLM and CPUC monthly. The report shall include a summary of the construction activities completed, a list of compliance actions and any remedial actions taken to correct any actions, and the status of ongoing mitigation efforts. For those instances (only) where an APM, BMP, and/or CMA conflicts, or does not meet required specificity pursuant to CEQA, the following BMPs have been modified to meet CEQA requirements:

- **CMA LUPA-SW-20.** This CMA shall also include a determination based upon the California Rapid Assessment Method (California Wetlands Monitoring Workgroup [CWMW] 2015).

MM WQ-CEQA-1 Implementation

Responsible Party: The Applicant shall ensure that all APMs, BMPs, and CMAs are implemented during construction. If an APM, BMP, or CMA is subjective, the Applicant shall consult with the BLM and/or the CPUC to determine the applicability of each measure.

Timing: APMs, BMPs, and CMAs shall be implemented throughout construction activities.

Mitigation Monitoring and Reporting Program: The Applicant shall develop a weekly report that shall include all applicable APMs, BMPs, and CMAs and the related actions taken in order to be in compliance with these measures. These weekly reports shall be compiled and submitted to the BLM and CPUC monthly.

Standards for Success: Compliance with all applicable APMs, BMPS, and CMAs is achieved throughout construction of the Project.

2.11 LAND USE AND PLANNING

This section describes the impacts to land uses that could potentially occur during construction, operation, maintenance, and decommissioning of the Project in terms of CEQA significance thresholds disclosed below in Section 2.11.4 below. As disclosed in Section 4.8 of the TES (BLM 2019), impacts from construction and operation of the Project would result in incompatible uses or conflict with a land use plan or policy. Additionally, this section responds to issues raised during the public scoping process, which are presented in Appendix 1 of the EIS.

2.11.1 Thresholds and Methodology

The Project's effects are compared to CEQA thresholds of significance to determine whether the Project would be consistent with the designated and allowable uses. The analysis is based on Section 4.8 of the TES (BLM 2019).

Local general plans and community plans, and zoning were reviewed for consistency with designated land uses. Geographic information system (GIS) data was used to determine land uses along the Project alignment. Land uses analyzed in this CEQA analysis are focused on those within 1,000 feet of the Project or its alternatives; those within one mile of the Project or its alternatives and are nationally, regionally, or locally important; and those that would be affected by the Project or its alternatives. Sensitive land uses addressed in this section include:

- Residences
- Educational institutions
- Day care centers
- Religious facilities
- Health care facilities

Sensitive receptors within 2,000 feet of the centerline of the Project segments are listed in Table 4.12-2 and illustrated on Figure 3.12-1a-w of the TES. As identified in Table 4.12-2 of the TES, there are eight sensitive receptors along Segment p-15w consisting of rural residences near Ripley. Ripley is a rural community and sparsely populated.

Within the State of California, the approximately 17-mile segment of the proposed transmission line alignment traverses a variety of land uses. While the majority of lands traversed consist of agricultural fields and open space/desert lands, the proposed alignment also spans or borders levees, roads (paved and dirt), rural residential and commercial/industrial development, and a commercial solar generating operation. The proposed alignment generally follows existing transmission lines from the Colorado River west to the Colorado River Substation, traversing both City of Blythe and Riverside County jurisdiction lands.

2.11.2 Applicant Proposed Measures and BLM Best Management Practices

There are no APMs or BMPs applicable to Land Use and Planning.

2.11.3 Conservation and Management Actions

The CDCA Plan, as amended, contains CMAs, which include a specific set of avoidance, minimization, and compensation measures. The applicability of those measures to the Project was determined using a CMA checklist (EIS Appendix 2C). The CMAs applicable to the Project and related to Land Use and Planning are listed below and Project compliance with CDCA CMAs is addressed in the analysis portion of this section.

- **CMA LUPA-LANDS-4.** Nonfederal lands within the boundaries of BLM LUPA land use allocations are not affected by the LUPA.
- **CMA LUPA-LANDS-5.** The MUCs used to determine land tenure in the CDCA Plan, as amended, will be replaced by areas listed in the CMAs below.

- **CMA LUPA-LANDS-8.** The CDCA Plan, as amended, requirement that new transmission lines of 161kV or above, pipelines with diameters greater than 12 inches, coaxial cables for interstate communications, and major aqueducts or canals for interbasin transfers of water will be located in designated utility corridors or considered through the plan amendment process outside of designated utility corridors, remains unchanged. The only exception is that transmission facilities may be located outside of designated corridors within DFAs without a plan amendment.

2.11.4 CEQA Significance Criteria

Appendix G of CEQA Guidelines (14 CCR 15000 et seq.) provides guidance on assessing whether a project would have significant impacts on the environment. Consistent with Appendix G, the Project would have significant impacts on land use and planning if it would:

a. Physically divide an established community.

b. Conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the project (including, but not limited to, the general plan, specific plan, local coastal program, or zoning ordinance) adopted for the purpose of avoiding or mitigating an environmental effect.

c. Conflict with any applicable habitat conservation plan or natural community conservation plan.

2.11.5 Land Use Impact Analysis

Impact LU 1 - Physically divide an established community?

No Impact

The construction and operation of the Project would not divide an established community because it would be located within existing utility corridors adjacent to existing transmission lines. The ROW would not be expanded, and there would be no development outside of the ROW. Operation and maintenance activities would be performed concurrently with operation and maintenance activities currently being performed on existing utility infrastructure in the area. There would be no impacts from the construction and operation of the transmission line. As discussed in the Section 4.8.4.1 of the TES (BLM 2019), ROW acquisition on BLM lands and other private lands would be negotiated with the landowner. The temporary impacts would be short term and would cease once construction activities are completed at a segment. No new access roads would be developed in the residential areas of the municipalities that occur within the Project area. In addition, as described in Section 3.8.3.3 of the TES, none of the proposed route segments in the Colorado River and California Zone cross a proposed or approved, but not yet constructed, residential subdivision.

In Riverside County, California, the Project would span across farmlands and BLM lands. The transmission lines will be overhead but the associated transmission structures would require a permanent footprint. As mentioned in Chapter 2, Description of the Proposed Action and Alternatives, DCRT would attempt to match these structure locations adjacent to existing transmission line structures to the extent practicable. If unavoidable, the transmission structure

may be located on agricultural lands. However, this would not sever any linkages or access roads between farmlands as the footprint of these structures would be small and placed to ensure that the farmland is not rendered unproductive.

As discussed in Section 4.8.4.5 of the TES, Project segments may cross the existing NextEra Energy Blythe Solar Energy Center and McCoy Solar Energy facility and the approved but not yet constructed Blythe Mesa Solar Project. In addition to the approved projects, First Solar Energy Desert Quartzite Solar Project and the Recurrent Energy Crimson Solar Project are pending applications within the land use study area. For segments that would cross a solar facility, the Project structures would be sited to avoid all solar energy facility components. However, the Project would have the potential to affect the performance of the solar array, due to shading from the Project structures. Micrositing of the poles, as well as pole type selection, would reduce the potential for this effect. Therefore, the Project would not conflict with solar facilities or divide any established communities both in California and Arizona.

Substation work would be performed entirely within existing SCE property and no expansion of facilities would occur. Temporary use areas would be required for material staging, laydown yards, and batch plants during construction. These areas would be temporary disturbance and selected based upon the final alignment chosen for this Project; however, the work areas would not divide an established community because the proposed work areas would be located in an existing utility corridor adjacent to existing transmission lines. The SCE ROW would not be expanded, and there would be no development outside of the ROW. Operation and maintenance activities would be performed concurrently with operation and maintenance activities currently being performed on existing SCE infrastructure in the area. No impacts would occur from the construction and operation of these Project components.

Staging yards are temporary workspaces that would be used only for construction and would not divide existing communities. There would be no potential to divide an established community from the use of the staging yards because they would be located in areas not being used for residential. Staging yards would be restored to their approximate pre-construction condition following Project completion. No impacts would occur.

Therefore, overall, the Project would have no impact related to dividing an established community.

Impact LU 2 - Conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the project (including, but not limited to the general plan, specific plan, local coastal program, or zoning ordinance) adopted for the purpose of avoiding or mitigating an environmental effect?

Less Than Significant – No Mitigation Required

As discussed in Section 4.8.7 of the TES (BLM 2019), none of the Proposed or Alternative Segments in California would be in compliance with CMA LUPA-BIO-PLANT-2, the intent of which is to protect the ecological process of special status plant species in order to sustain viable, healthy populations. This CMA would apply to Harwood's eriastrum which occurs in the biology study area. This CMA would be further amended in the CDCA Plan to authorize construction of the Ten West Link Project within 0.25-mile of occurrences of Harwood's eriastrum, provided

that a Rare Plant Linear ROW Protection Plan for Harwood's eriastrum is developed and approved by the BLM California State Director. The effects of the amendment on Harwood's eriastrum populations is provided in Section 4.5.7 of the TES.

The amendment to the CDCA Plan to bring the Project into compliance with CMA LUPA-BIO-PLANT-2 would not result in any effects on current land uses in the study area. This amendment would not conflict with any other management direction in the CDCA Plan, as amended.

No local land use plans, policies, or regulations requiring discretionary approval would apply to the Project because, pursuant to GO No. 131-D, the CPUC has sole and exclusive jurisdiction over the siting and design of such facilities. Consequently, the Project would not conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the Project area. There would be no impact. The CPUC has consulted with local agencies regarding land use matters potentially affected by the Project.

The Project is located within several federal, state, and local planning areas. Approximately 72 percent of the Project on BLM land would be within designated utility corridors and thus be complying. As discussed in Section 4.8.4 of the TES, the Project would comply with BLM leases for ROW grants for locations outside the utility corridor. For non-BLM lands, ROWs would be obtained as easements or leases, as appropriate. For Project alignments located within utility corridors, no impacts would occur.

As discussed in Section 4.8.5.3 of the TES, where the proposed segments would intersect private lands outside of existing ROWs, easements would be negotiated with the landowners. The issuance of a CPCN would allow DCRT to site the Project within residential areas, consistent with other transmission lines in the region (Devers-Palo Verde 500 kV No. 1 [DPV1] and No.2 [DPV2]). Therefore, the Project would be compatible with the surrounding residential uses.

As discussed in Section 4.8.4.5 of the TES (BLM 2019), the land use analysis area in the Colorado River and California Zone would include the Colorado River special policy area designated under the Palo Verde Valley Area Plan. The land use concept for this plan intends to preserve the agricultural character of the analysis area. Because the Project would be located within existing utility corridors adjacent to existing transmission lines, the Project and more specifically, new poles and conductors, would not result in a significant change in the character of the analysis area. In addition, in Riverside County, the Project would be located on lands zoned as Agriculture and Rural Residential. Both these zoning districts allow for the installation of transmission facilities. As such, impacts would be less than significant.

Table 4.8-2 in the TES outlines the plans that are applicable within the Project area, land use goals and objectives therein, and the consistency with the Project. Within the State of California, the following plans contain relevant objectives and policies related to land use however, as previously stated above, regional and local agencies do not have jurisdiction over the Project:

- Riverside County General Plan (Riverside County 2015a)
- Riverside County Palo Verde Area Plan (Riverside County 2015b)
- City of Blythe General Plan 2025 (City of Blythe 2007)

Table 2.11-1, below, list the relevant objectives and policies of the Riverside County General Plan, Riverside County Palo Verde Area Plan, and City of Blythe General Plan 2025 and demonstrates the Project's consistency with listed objectives and policies:

Table 2.11-1 Land Use Compliance with Relevant Land Use Plans

GOALS/OBJECTIVES/POLICY	COMPLIANCE DETERMINATION
Riverside County General Plan	
Policy LU 4.1: Require that new developments be located and designed to visually enhance, not degrade the character of the surrounding area.	As proposed, the Project would be located within existing utility corridors adjacent to existing transmission lines. New poles and conductors be constructed and would operate where existing poles and towers supporting high voltage transmission lines are currently installed and contribute to the baseline land use setting. By locating the Project within existing utility corridors and adjacent to existing transmission lines, the character of the Project area would not be substantially degraded. Therefore, the Project would be consistent with this policy.
Policy LU 7.1: Require land uses to develop in accordance with the General Plan and area plans to ensure compatibility and minimize impacts.	Please refer to the Policy LU 4.1 Compliance Determination above. Due to its location within existing utility corridors and proximity to existing transmission lines, land use impacts would be minimized, and the Project would be compatible with surrounding land uses. Therefore, the Project would be consistent with this policy.
Policy LU 7.2: Notwithstanding the Public Facilities designation, public facilities shall also be allowed in any other land use designation except for the Open Space-Conservation and Open Space- Conservation Habitat land use designations. For purposes of this policy, a public facility shall include all facilities operated by the federal government, the State of California, the County of Riverside, any special district governed by or operating within the County of Riverside or any city, and all facilities operated by any combination of these agencies.	Within Riverside County, the proposed alignment traverses several land use designations including open space, residential and agricultural (please refer to Figure 3.8-4 of the TES [BLM 2019]). Please refer to the Policy LU 4.1 Compliance Determination above. Because the Project is proposed within existing utility corridors and adjacent to existing transmission lines, the Project is consistent with this policy.
Policy LU 7.4: Retain and enhance the integrity of existing residential, employment, agricultural, and open space areas by protecting them from encroachment of land uses that would result in impacts from noise, noxious fumes, glare, shadowing, and traffic.	Please refer to the Policy LU 4.1 Compliance Determination above. The Project would be consistent with this policy.

GOALS/OBJECTIVES/POLICY	COMPLIANCE DETERMINATION
Policy LU 14.1: Preserve and protect outstanding scenic vistas and visual features for the enjoyment of the traveling public.	Please refer to the Policy LU 4.1 Compliance Determination above. There are no officially designated scenic vistas or overlook in the Project Area (please refer to Section 2.1.5, Aesthetics Analysis, above). In addition, BMPs including BMP AES-08 would be implemented to minimize impacts to aesthetic resources such as scenic vistas. BMP AES-08 entails the avoidance of "skylining" transmission/communication towers such that these features would not be placed on ridgelines, summits, or other location where they would be silhouetted against the sky. With implementation of BMPs including BMP AES-08, aesthetic resources would be maintained to the extent practicable and the Project would be consistent with this policy.
Policy LU 20.2: Protect agricultural uses, including those with industrial characteristics (dairies, poultry, hog farms, etc.) by discouraging inappropriate land division in the immediate proximity and allowing only uses and intensities that are compatible with agricultural uses.	Please refer to the Policy LU 4.1 Compliance Determination above. The Project would be consistent with this policy.
Policy LU 23.2: Require that structures be designed to maintain the environmental character in which they are located.	Please refer to the Policy LU 4.1 Compliance Determination above. The Project would be consistent with this policy.
Policy LU 31.6: Ensure that development and conservation land uses do not infringe upon existing essential public facilities and public utility corridors, which include Riverside County regional landfills, fee owned rights-of-way and permanent easements, whose true land use is that of Public Facilities. This policy will ensure that the public facilities designation governs over what otherwise may be inferred by the large-scale General Plan maps.	Please refer to the Policy LU 4.1 Compliance Determination above. The Project would be compatible with adjacent transmission lines and underlying land uses would not infringe upon the proposed transmission line (the Project would be located within existing transmission corridors). The Project would be consistent with this policy.
Riverside County General Plan Palo Verde Area Plan	
Policy PVVAP 4.1: Protect farmland and agricultural resources in Palo Verde Valley through adherence to the Agriculture sections of the General Plan Multipurpose Open Space and Land Use Elements.	Please refer to the Policy LU 4.1 Compliance Determination above. The Project would be consistent with this policy.
PVVAP 16.1: Protect ridgelines and slopes that provide a significant visual resource for the Palo Verde Valley area through adherence to the Hillside	Please refer to the Policy LU 4.1 and Policy LU 14.1 Compliance Determination above. The Project would be consistent with this policy.

GOALS/OBJECTIVES/POLICY	COMPLIANCE DETERMINATION
Development and Slope section of the General Plan Land Use Element	
City of Blythe General Plan 2025	
Policy 1: Preserve the scale and character of established neighborhoods.	Please refer to the Policy LU 4.1 Compliance Determination above. The Project would be consistent with this policy.

As demonstrated in Table 2.10-1 above, the Project would be consistent with identified policies of the Riverside County General Plan, Riverside County Palo Verde Area Plan and City of Blythe General Plan 2025.

Since the Project would be consistent with applicable land use plans in California, impacts concerning inconsistencies with applicable land use plans, policies, or regulations would be less than significant.

Impact LU 3 - Conflict with any applicable habitat conservation plan or natural communities' conservation plan?

Less Than Significant – No Mitigation Required

Project transmission line temporary staging yards and the Substation work areas would be located either on Southern California Edison (SCE) property, within SCE ROW or within roadway ROW (franchise agreement) within the applicable municipality, or on new sources of ROW. It is acknowledged that the DRECP supersedes any other MCSPs or HCPs for work conducted by the Project and as documented in Section 4.5 of the TES (BLM 2019), a plan amendment to the HCP would be required. Potential conflicts with applicable HCPs or natural community conservation plans are addressed in Section 4.5 of the TES. The proposed route and alternative segments in California do not cross any areas designated under the DRECP (BLM 2016a) or other applicable BLM management plans (BLM 1980, 2002a) as Areas of Critical Environmental Concern or as other areas designated for the conservation or focused management of biological resources or their habitat. All areas on BLM-managed lands in California that are crossed by the proposed route and alternative segments are classified in the DRECP as DFA. The DRECP allows the development of new transmission line infrastructure outside of utility corridors within DFAs. As stated above, the Project does not conflict with any applicable habitat conservation plan or natural communities' conservation plan. Therefore, there would be a less than significant impact to applicable HCPs and natural community conservation plans.

2.11.6 Land Use Mitigation

No MMs are required.

2.12 MINERAL RESOURCES

This section describes the impacts to mineral resources that could potentially occur during construction, operation, and maintenance of the Project. Environmental impacts presented in section 4.3 of the TES (BLM 2019) are discussed in terms of CEQA significance thresholds disclosed in Section 2.12.4. Additionally, this section responds to issues raised during the public scoping process, which are presented in Appendix 1 of the EIS.

2.12.1 Thresholds and Methodology

The Project's effects are compared to CEQA thresholds of significance to determine whether the Project would result in a significant change to mineral resources. The analysis is based on Sections 3.3 and 4.3 of the TES (BLM 2019).

Section 4.3 of the TES discloses adverse environmental effects that may result from construction and operation of the Project. This CEQA analysis uses information and data from available published resources, including journals, maps, and government websites, were collected and reviewed to bolster the environmental impact analysis found in Section 4.3 of the TES within the context of the impact thresholds found in Appendix G of the CEQA Guidelines.

This analysis assumes that the applicant would comply with the following environmental factors and components of the Project Description (Chapter 2 of the TES) when evaluating the effects of the Project on geology and mineral resources:

- A geotechnical engineering study would be completed prior to final design and construction of the Project to identify site-specific geological conditions and potential geological hazards. The data collected from the study would be used to guide sound engineering practices, and foundation design would be consistent with geological conditions for each tower site.

- Existing fault lines, land subsidence areas, earth fissures, mining claims, oil/gas reserves, areas of mineral resources of economic value, and other pertinent geological and mineral-related features have been accurately mapped.

- Operation and maintenance of the Project, as it relates to geological and mineral resources, would primarily be the presence of transmission structures and transmission lines and how they could preclude access to underground resources in the immediate vicinity.

- Transmission lines typically have little impact to mining operations. Span lengths are such that access to minerals can be accomplished between spans. Should open pit mining be planned, structures can be left on 'islands,' or the mining interests can have the transmission line locally re-routed (personal communication, Mark Wieringa, Western, 2013).

2.12.2 Applicant Proposed Measures and BLM Best Management Practices

There are no APMs or BMPs applicable to Mineral Resources.

2.12.3 Conservation and Management Actions

The CDCA Plan, as amended, contains CMAs, which include a specific set of avoidance, minimization, and compensation measures. The applicability of those measures to the Project was determined using a CMA checklist (EIS Appendix 2C). There are no CMAs applicable to Mineral Resources.

2.12.4 CEQA Significance Criteria

Appendix G of CEQA Guidelines (14 CCR 15000 et seq.) provides guidance on assessing whether a project would have significant impacts on the environment. Consistent with Appendix G, the Project would have significant minerals impacts if it would:

a. Result in the loss of availability of a known mineral resource classified Mineral Resource Zone (MRZ) MRZ-2 by the State Geologist that would be of value to the region and the residents of the State?

b. Result in the loss of availability of a locally important mineral resource recovery site delineated on a local general plan, specific plan, or other land use plan?

2.12.5 Mineral Resources Analysis

Impact MRZ 1 - Result in the loss of availability of a known mineral resource classified MRZ-2 by the State Geologist that would be of value to the region and the residents of the State?

Less Than Significant – No Mitigation Required

The Project area west of Colorado River, in California, is within Mineral Resource Zone 4 (MRZ-4; California Department of Conservation 1994), which is defined as area where there is not enough information available to determine the presence or absence of mineral deposits. Regardless of indeterminate information regarding the MRZ within the Project area, the Project is a transmission line that would not involve the loss of availability of any mineral resources within the area. Project construction could temporarily disturb areas near the MRZ-4 area identified above, however, upon Project completion, the area would remain available for mineral extraction in the future. Therefore, given the lack of determinate information for this area, as well as the availability of this area to remain a viable MRZ-4 area, impacts under this criterion would be less than significant.

Impact MRZ 2 - Result in the loss of availability of a locally important mineral resource recovery site delineated on a local general plan, specific plan, or other land use plan?

Less Than Significant – No Mitigation Required

As discussed in Section 4.3 of the TES (BLM 2019), there are mining operations in the Project area. The Project would not affect these mines, prospects, or occurrences unless the presence of the line prevented access to develop the material, since none of the mines, prospects, or occurrences of mineral resources are being actively mined. The Project has the potential to indirectly impact mineral resources by encumbering the resource during the operational phase of

the Project. As concluded in Section 4.3 of the TES, transmission lines typically have little impact to mining operations, as the spacing between transmission structures is large enough to accommodate access to mineral resource deposits. Should open pit mining be planned, though no such development is currently planned within the Project's ROW, structures can be left on 'islands,' or the mining interests can have the transmission line locally re-routed. Therefore, operational impacts related to the interference with locally important mineral recovery sites would be less than significant.

The Project could temporarily disrupt access to mineral resources during the construction phase of the Project, thus potentially causing loss of availability of a locally important mineral resource. However, since no active mining operations, claims, prospects, or occurrences of mineral resources are located within the Project ROW, it is unlikely that the Project would result in the loss of availability of important mineral resources. Therefore, impacts under this criterion would be less than significant.

2.12.6 Mineral Resources Mitigation

No MMs are required.

2.13 NOISE

This section describes the noise and vibration impacts to sensitive receptor associated with the construction, operation, and maintenance of the proposed transmission line, SCS, and ancillary facilities in terms of CEQA significance thresholds disclosed below in Section 2.13.4 below. As disclosed in Section 4.12 of the TES (BLM 2019), construction activities may temporarily result in increased noise levels to visitors. Additionally, this section responds to issues raised during the public scoping process, which are presented in Section Appendix 1 of the EIS. However, impacts have been determined to be less than significant with APMs, BMPs and CMAs.

2.13.1 Thresholds and Methodology

Existing conditions described in Section 3.12 of the TES (BLM 2019) have been evaluated with regard to their potential to be affected by Project construction, operation, maintenance, and decommissioning activities. The potential impacts associated with the Project are evaluated on a qualitative basis by comparing Project effects on sensitive receptors reported in Section 4.12 of the TES with the significance criteria established by Appendix G of the CEQA Guidelines.

Construction of the Project would require a variety of equipment. During construction, noise levels generated by Project construction activities would vary depending on the particular type, number, and duration of use of various pieces of construction equipment. Typical noise levels at 50 feet from the source for some of the heavy pieces of construction equipment that would be required to construct the Project are listed in Table 2.13-1.

Table 2.13-1 Typical Noise Levels from Construction Equipment

CONSTRUCTION EQUIPMENT	NOISE LEVEL (DBA, LEQ AT 50 FEET)
Front Loader	85
Backhoes, excavators	80
Tractors, dozers	85
Graders, scrapers	85
Trucks	88
Concrete pumps, mixers	82
Cranes (mobile)	83
Cranes (derrick)	88
Pumps	76
Generators	81
Compressors	81
Pneumatic tools	85
Jack hammers, rock drills	88 – 98
Pavers	89
Compactors	82

Source: U.S. Department of Transportation (DOT), 2006

As shown in Table 2.13-1, intermittent and continuous use of construction equipment would generate noise levels in excess of 85 dBA at 50 feet. However, noise levels associated with these types of construction equipment typically attenuate, or reduce, over relatively short distances. The noise analysis included in the Final EIR/EIS for the nearby DPV2 assumed aggregated peak noise levels of up to 100 dBA within 50 feet from construction activity (CPUC and BLM 2006):

> *At 100 feet, the distance would attenuate these peak levels to about 94 dBA, and at 200 feet, 88 dBA. These short peaks would attenuate further to about 76 dBA for locations at 800 feet with an unobstructed line of sight. Over a typical day, average noise levels from construction would be lower than the intermittent peaks because most equipment would not be operated steadily or continuously at peak levels. At 50 feet, continuously steady construction noise levels would average approximately 77 dBA. At 100 feet, these average levels would attenuate to 71 dBA, and to 65 dBA at 200 feet. These noise levels would diminish over additional distance and would be reduced further by any intervening structures. At distances over one-quarter mile, steady construction noise would be under 50 dBA, which would begin to fade into quiet backgrounds.*

Table 4.12-1 in the TES (BLM 2019) identifies noise guidelines and requirements applicable to the Project. Those relevant to Riverside County are replicated here in Table 2.13-2.

Table 2.13-2 Project Noise Guidelines and Requirements in Riverside County

LEVEL	SOURCE	CRITERIA	NOTES
Local	Riverside County General Plan (2015a)	Noise attenuation measures required for land use exposed to levels greater than 65 CNEL	Requirement
Local	Riverside County General Plan (2015a)	Stationary source facility-related limits received by sensitive land uses: 45 dBA, 10minute -Leq between 10 p.m. and 7 a.m.	Requirement
Local	Riverside County General Plan (2015a)	Stationary source facility-related limits received by sensitive land uses: 65 dBA, 10minute -Leq between 7 a.m. and 10 p.m.	Requirement
Local	Riverside County General Plan (2015a)	Construction not to occur between 6 p.m.to 6 a.m.	Required June–September
Local	Riverside County General Plan (2015a)	Construction not to occur between 6 p.m. to7 a.m.	Required October–May

Notes: dB = decibels, L_{dn} = day-night sound level, dBA = A-weighted decibel, CNEL = Community Noise Equivalent Level, L_{eq} = equivalent sound level

The Riverside County Noise Ordinance (Riverside County 2007) specifies that exemptions from noise standards include private construction projects located within 0.25 of a mile from an inhabited dwelling, provided that construction does not occur between the hours of 6 p.m. and 6 a.m. during the months of June through September, and construction does not occur between the hours of 6 p.m. and 7 a.m. during the months of October through May.

2.13.2 Applicant Proposed Measures and BLM Best Management Practices

APMs have been identified and would be implemented by the Project applicant. In addition, BLM would require implementation of BMPs, which are intended to further minimize Project impacts. All Project APMs and BMPs are described in EIS Appendix 2A. Of these, the following would apply to the portion of the Project located within California and have therefore been incorporated into the Project for evaluation of significant impact to noise under CEQA.

- **APM NO-01: Noise Minimization with Portable Barriers.** Compressors and other small stationary equipment used during construction would be shielded with portable barriers if located within 200 feet of a residence.

- **APM NO-02: Noise Minimization with Quiet Equipment.** Quiet equipment (for example, equipment that incorporates noise control elements into the design; quiet model air-compressors or generators can be specified) would be used during construction whenever possible.

- **APM NO-03: Noise Minimization through Direction of Exhaust.** Stationary equipment exhaust stacks and vents (i.e., on equipment like generators and lights) would be directed away from buildings where feasible.

- **APM NO-04: Blasting Mitigation.** If blasting is required, the timeframe that blasting activity would occur would be limited, in addition to limiting the number of blasts that occur per hour or per day.

- **BMP NO-05: County, State, and Federal Noise Regulations.** Project would be located far enough from residences or include engineering and/or operational methods such that county, state, and/or federal regulations for noise are not exceeded.

- **BMP NO-06: Hours of Daily Activity**. The hours of daily activities would be limited, and noise barriers would be constructed if needed and practicable. Coordination with nearby residents is recommended.

- **BMP NO-07: Sensitive Wildlife Protection.** To the extent feasible, locate stationary noise sources that exceed background ambient noise levels away from known or likely locations of and BLM sensitive wildlife species and their suitable habitat.

2.13.3 Conservation and Management Actions

The CDCA Plan, as amended, contains CMAs, which include a specific set of avoidance, minimization, and compensation measures. The applicability of those measures to the Project was determined using a CMA checklist (EIS Appendix 2C). The CMAs applicable to the Project and related to noise are listed below and Project compliance with CDCA CMAs is addressed in the analysis portion of this section.

- **CMA LUPA-BIO-12.** For activities that may impact focus or BLM special status species, implement the following LUPA CMA for noise:

  - To the extent feasible and determined necessary by BLM to protect Focus and BLM sensitive wildlife species, locate stationary noise sources that exceed background ambient noise levels away from known or likely locations of and BLM sensitive wildlife species and their suitable habitat.

  - Implement engineering controls on stationary equipment, buildings, and work areas including sound insulation and noise enclosures to reduce the average noise level, if the activity will contribute to noise levels above existing background ambient levels.

  - Use noise controls on standard construction equipment including mufflers to reduce noise

2.13.4 CEQA Significance Criteria

Appendix G of CEQA Guidelines (14 CCR 15000 et seq.) provides guidance on assessing whether a project would have significant impacts on the environment. Consistent with Appendix G, the Project would have significant impacts to noise if it would:

a. Exposure of persons to or generation of noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?

b. Exposure of persons to or generation of excessive ground-borne vibration or ground-borne noise levels?

c. A substantial permanent increase in ambient noise levels in the project vicinity above levels existing without the Project?

d. A substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project?

e. For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport of public use airport, would the project expose people reside or working in the project area to excessive noise levels?

f. For a project within the vicinity of a private airstrip, would the project expose people residing or working in the project area to excessive noise levels?

2.13.5 Noise Analysis

Impact NOI 1 - Exposure of persons to or generation of noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?

Less than Significant with Mitigation

Noise-sensitive receptors (NSR) identified within 2,000 feet of the centerline of the Project segments in California are listed in Table 4.12-2 and illustrated on Figure 3.12-1j-m of the TES (BLM 2019). Noise-sensitive receptors include residences, schools and day care facilities, hospitals, long-term care facilities, places of worship, libraries, and parks and recreational areas. As identified in Table 4.12-2 of the TES (BLM 2019), there are eight sensitive receptors along Segment p-15w consisting of rural residences near Ripley. Ripley is a rural community and sparsely populated. The general land use character is predominantly rural residential areas and farmland.

2.13.5.1 Construction

As discussed in Section 4.12.5 of the TES, and shown in TES Table 3.12-8**,** the existing ambient noise levels in Ripley are 50 dBA. Construction noise levels are expected to generally be below 65 dBA within a few hundred feet of the limits of construction. As discussed in the DPV2 EIS/EIR, construction noise within 200 feet would not attenuate to less than 65 dBA (CPUC and BLM 2006). NSRs within 2,000 feet of the centerline of the Project and construction noise may exceed 65 dBA at NSR properties.

As discussed in the EIS, construction impacts would be of limited duration (short-term) and exemptions from noise standards as included in the Riverside County General Plan (EIS Table 2.13-2), include private construction projects located within 0.25 of a mile from an inhabited dwelling, provided that construction does not occur between the hours of 6 p.m. and 6 a.m. during the months of June through September, and construction does not occur between the hours of 6 p.m. and 7 a.m. during the months of October through May. As such MM NO-CEQA-1 would be implemented and would ensure that Project activities occur within these specified hours, thus reducing potential impacts related to exposure of persons to noise levels in excess of the standards identified within the Riverside County General Plan to a less than significant level. Additionally, MM NO-CEQA-1 also requires the implementation of APMs, BMPs, and CMAs identified for noise reduction for Project activities. Specifically, APM NO-01 through APM NO-03 would be required through MM NO-CEQA-1 to reduce construction-related noise through the use of portable noise barriers, quiet equipment, proper exhaust orientation. BMPs NO-4 through NO-07 would also be required through MM NO-CEQA-1 and would limit blasting and the use of implosive sleeves, if required, seek to locate the Project away from NSRs, limit the hours of daily activity, and consider wildlife protections.

Implementation of MM NO-CEQA-2 would further reduce construction related noise by ensuring equipment is equipped with noise reduction features (e.g., mufflers and engine shrouds) that are no less effective than those originally installed by the manufacturer; construction traffic is routed away from residences and schools, where feasible; unnecessary construction vehicle use and idling time is minimized; and construction staging and material laydown areas are located away from NSRs.

Therefore, after implementation of MM NO-CEQA-1 and MM NO-CEQA-2 impacts related to construction noise would be consistent with the County’s thresholds and would result in a less than significant impact.

2.13.5.2 Operation, Maintenance, Decommissioning

As with the Project segments in Arizona, the proposed segments in California would continue to follow existing utility corridors and would be co-located with the existing DPV1 line. Therefore, expected noise levels near NSR are expected to be similar to existing levels of noise.

As noted in the Section 4.12.5 of the TES (BLM 2019), the Project could result in corona effect (i.e., localized change of electric charge causing a humming noise), that could result in noticeable noise particularly in unfavorable weather conditions. As shown in Table 4.12-4 of the TES, the Project operations were predicted to have audible noise levels below US EPA guideline of 55 dBA during foul weather conditions. These predicted Project noise levels are in line with existing levels of ambient noise at the NSRs, which range from <45 to 65 dBA. During dry periods, the corona noise levels would be lower than during wet conditions, which were the conditions assessed with the modeling exercise. In the Project area, the wettest months are typically July through September in Arizona (the monsoon season), and December through January in California (U.S. Climate Data 2017, Arizona State Climate Office 2017). Therefore, because the noise levels associated with the corona effect caused by operation of the transmission lines would be consistent with ambient noise levels in the area, impacts would be less than significant.

Section 4.12.5 of the TES concludes that maintenance activities associated with substations and transmission lines would generate noise levels similar to construction-related activities, but would be anticipated to occur less frequently, include fewer individual noise point sources such as pieces of heavy equipment and/or OHVs and pickup trucks used along the ROW, and would be of shorter duration. Indeed, these activities are predicted to result in maximum noise levels in the 55 to 58 dBA range at a distance of 0.25 mile from the centerline of the ROW. Thus, the expected maximum noise levels are in the range of ambient levels (i.e., <35 dBA to 65 dBA). This is consistent with conclusions made in the DPV2 EIR/EIS related to potential impacts from construction noise. Therefore, impacts related to the noise caused by maintenance activities associated with substations would be less than significant.

It is expected that noise impacts resulting from the decommissioning process would be similar to the impacts discussed above (Section 2.13.5.1) during construction of the Project. As discussed above, MM NO-CEQA-1 and MM NO-CEQA-2 would be implemented and would reduce potential impacts related to noise to a less than significant level. As such, because the decommissioning process would result in similar impacts as discussed above, the same MMs would apply, and potential impacts related to noise would therefore be less than significant with mitigation incorporated.

Impact NOI 2 - Exposure of persons to or generation of excessive ground-borne vibration or ground-borne noise levels?

Less than Significant with Mitigation[7]

As noted in Section 4.12.4.1 of the TES (BLM 2019), ground-borne vibration impacts near sensitive receptors would only be expected to occur during pile-driving activities, however, at this time, no pile driving is associated with the construction of the Project. MM NO-CEQA-1 would be required and would implement APM NO-04, which includes requirements for limiting blasting where feasible, and proper notification to sensitive receptors within 100 feet of such blasting. With mitigation incorporated, there would be a less than significant impact to exposure of people to excessive ground-borne vibrations.

Impact NOI 3 - A substantial permanent increase in ambient noise levels in the project vicinity above levels existing without the project?

Less Than Significant – No Mitigation Required

As discussed in Section 4.12.5 of the TES, corona noise associated with the Project would result in a 0.1 decibel increase above the existing noise levels in the Project Area. This increase would be inaudible to the human ear and less than significant. As such, the permanent increase in noise levels along the Project would be less than significant.

Impact NOI 4 - A substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project?

Less than Significant with Mitigation

As discussed in Section 4.12.5 of the TES and Impact NOI 1 above, the existing ambient noise level at the Ripley NSRs is 50 dBA as shown in Table 3.12-8. Construction noise levels are

expected to generally be below 65 dBA within a few hundred feet of the limits of construction. Construction impacts would be of limited duration (short-term) at any one single location as the transmission line placement would move along the Project alignment. In addition, expected noise levels near NSR are expected to be similar to existing levels of noise; and construction of the transmission line would primarily be limited to daytime hours so it is unlikely that construction equipment noise levels would cause sleep disruption for residents at the determined NSR. There may be some instances during construction where noise levels may exceed ambient noise levels in the Project vicinity at NSRs, and as such could result in a potential impact prior to mitigation. Therefore, MM NO-CEQA-1 and MM NO-CEQA-2 would be required in order to reduce potential impacts to a less than significant level. MM NO-CEQA-1 would require the implementation of APMs, BMPs, and CMAs related to noise minimization, specifically APMs NO-01 through -04, BMPs NO-05 through -07, and CMA LUPA-BIO-12. MM NO-CEQA-2 would require the implementation of noise reduction measures during construction and proper notification to sensitive receptors within 100 feet of Project construction activities. Therefore, impacts related to substantial temporary or periodic increases in ambient noise levels would be less than significant with mitigation incorporated.

Impact NOI 5 - For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport of public use airport, would the project expose people residing or working in the project area to excessive noise levels?

No Impact

In California, the Project's Segment p-16 is located approximately six miles south of Blythe Airport, the only public airport along the California portion of the Project. No impacts would occur.

Impact NOI 6 - For a project within the vicinity of a private airstrip, would the project expose people residing or working in the project area to excessive noise levels?

No Impact

In California, the Project's Segment p-15w is located approximately four miles south of CYR Aviation, a private airstrip, the only private airstrip within the California portion of the Project. No impacts would occur.

2.13.6 Noise Mitigation

MM NO-CEQA-1: Implement Noise Applicant Proposed Measures, Best Management Practices, and Conservation and Management Actions.

The APMs, BMPs, and CMAs in Sections 2.13.2 and 2.13.3 above provide a suite of measures, practices, and actions that shall be implemented as part of the Project. APMs, BMPs, and CMAs shall be implemented prior to, or during all ground disturbance and construction related activities to avoid or minimize Project related impacts to noise. These APMs, BMPs, and CMAs include; APM NO-01, APM NO-02, APM NO-03, APM NO-04, BMP NO-05, BMP NO-06, BMP NO-07, and CMA LUPA-BIO-12.

If an APM, BMP, or CMA is subjective, such as containing text that states; “where appropriate,” “where applicable,” “where feasible,” or similar language, the BLM and CPUC shall be consulted to determine the applicability of each measure prior to the disturbance of a covered resource. Compliance with APMs, BMPs, and CMAs shall be documented, and a weekly report shall be provided to the BLM and CPUC. The Applicant shall provide a synopsis of the weekly reports to the BLM and CPUC monthly. The report shall include a summary of the construction activities completed, a list of compliance actions and any remedial actions taken to correct any actions, and the status of ongoing mitigation efforts. For those instances (only) where an APM, BMP, and/or CMA conflicts, or does not meet required specificity pursuant to CEQA, the following APMs and BMPs have been modified to meet CEQA requirements:

- **APM NO-03: Noise Minimization through Direction of Exhaust.** Consistent with APM NO-03, stationary equipment exhaust stacks and vents shall be directed away from buildings, where feasible. If infeasible to do so, the Applicant shall work with the affected residents and the County to achieve the necessary reduction in noise through placement of noise barriers or time of day that such construction work will take place.

- **APM NO-04: Blasting Mitigation.** Consistent with APM NO-04, if any blasting activities will occur during construction, the number of blasts that occur per hour or per day would be limited. In addition, the Applicant shall notify any sensitive receptors, consistent with MM NO-CEQA-2 below), who are within 100 feet of such activity. The same shall be applied to any use of implosive sleeves during wire stringing.

- **BMP NO-05: County, State, and Federal Noise Regulations.** As specified in BMP NO-05, the Project, including staging areas would be located far enough from residences to comply with the Riverside County Noise Ordinance, wherever possible. As discussed under Impact NOI 1 above, the Riverside County Noise Ordinance specifies that exemptions from noise standards include private construction projects located within 0.25 of a mile from an inhabited dwelling, provided that construction does not occur between the hours of 6 p.m. and 6 a.m. during the months of June through September, and construction does not occur between the hours of 6 p.m. and 7 a.m. during the months of October through May. Construction work shall comply with these restrictions and will be in compliance with the Riverside County Noise Ordinance.

- **BMP NO-06. Hours of Daily Activity.** Consistent with BMP NO-06, the hours of daily construction activities would be limited. Specifically, these limitations would coincide with the hour specified within the Riverside County Noise Ordinance (See BMP NO-05 above).

- **BMP NO-07: Sensitive Wildlife Protection.** Consistent with BMP NO-07 and CMA LUPA-BIO-12, stationary noise sources would be limited to the extent feasible near wildlife species and their suitable habitat. Where infeasible to do so, the Applicant shall work with the BLM and CDFW to identify the affected species and/or habitat and achieve the appropriate noise reduction necessary or otherwise mitigate the effect to result in a less than significant noise impact to sensitive species and their habitat.

MM NO-CEQA-1 Implementation

Responsible Party: The Applicant shall ensure that all APMs, BMPs, and CMAs are implemented during construction. If an APM, BMP, or CMA is subjective, the Applicant shall consult with the BLM and/or the CPUC to determine the applicability of each measure.

Timing: APMs, BMPs, and CMAs shall be implemented throughout construction activities.

Mitigation Monitoring and Reporting Program: The Applicant shall develop a weekly report that shall include all applicable APMs, BMPs, and CMAs and the related actions taken in order to be in compliance with these measures. These weekly reports shall be compiled and submitted to the BLM and CPUC monthly.

Standards for Success: Compliance with all applicable APMs, BMPS, and CMAs is achieved throughout construction of the Project.

MM NO-CEQA-2: Noise Reduction Measures.

The Applicant shall ensure that noise reduction measures are implemented throughout construction activities in order to avoid or reduce noise impacts on sensitive receptors. The Applicant shall submit a monthly report to the BLM and the County reporting the effectiveness of the following measures using compliance with the Riverside County Noise Ordinance as a level of measurement for such effectiveness. The Applicant shall also notify all residents within one mile of the Project site at least 15 days prior to any ground-disturbing through mail, or by other effective means. The Applicant shall establish a phone number for use by the public to accompany the notification that will allow the public to report any undesirable noise conditions associated with the construction of the Project. If the telephone number provided is not staffed 24 hours a day, the Applicant shall include an automatic answering feature, with date and time stamp recording, to answer calls when the phone is unattended. This phone number shall be posted at the Project sites during construction where it is visible to passerby. If a complaint is filed regarding Project-related noise, the Applicant shall document, investigate, evaluate, and attempt to resolve all Project-related noise complaints. All complaints related to Project-noise shall be included in the monthly noise report. If the BLM and/or the County determines that noise limits are not sufficiently managed then the Applicant shall work with the BLM, County, and affected residents to achieve the necessary reduction or otherwise mitigate the effect beyond the measures that are included below.

The measures below include noise reduction features, limits to construction traffic as it relates to noise, measure to reduce construction vehicle use, and measures to limit construction staging and material laydown areas.

- **Effectiveness of Noise Reduction Features**. Consistent with APM NO-2, the Applicant shall ensure that the chosen construction contractor use equipment that includes noise reduction features (e.g. mufflers and engine shrouds) that are no less effective than those originally installed by the manufacturer. Additionally, the Applicant shall ensure that the chosen contractor maintains all construction equipment in good working order to avoid unnecessary rattling of loose parts. These

noise reduction features shall be utilized throughout construction activities and will reduce unnecessary noise impacts from construction equipment.

- **Construction Traffic**. The Applicant shall ensure that the chosen contractor routes construction traffic away from residences and schools by taking alternate routes. If residences and schools cannot be avoided during construction the Applicant shall inform the residents and/or schools affected no less than five days prior to construction and work with residents and local schools to minimize timing and duration of construction noise. Possible measures for reducing noise from construction traffic near residences and/or schools may include timing of construction routes or adding noise barriers around areas that may be sensitive to construction traffic.

- **Construction Vehicle Use.** The Applicant shall ensure that the chosen contractor limits unnecessary construction vehicle use and idling times throughout construction activities. This shall include turning off vehicles that are not in use, or idling, consistent with APM AQ-02 and limit the number of vehicles in use to the minimum amount required in order for completion of construction activities.

- **Construction Staging and Material Laydown Areas.** The Applicant shall ensure that the construction staging and material laydown areas be located away from noise sensitive receptors to avoid concentrated and prolonged exposure to noise form construction activities. Where construction staging and laydown areas cannot avoid sensitive receptors, the Applicant shall inform the sensitive receptor(s) no less than one week prior to the start of construction activities and work with the sensitive receptor(s) to provide noise reducing methods such as noise barriers.

MM NO-CEQA-2 Implementation

Responsible Party: The Applicant shall be responsible for ensuring that the noise reduction measures are implemented throughout construction activities.

Timing: The noise reduction measures shall be implemented throughout construction activities.

Mitigation Monitoring and Reporting Program: The Applicant shall prepare a monthly noise report that will include any actions taken in order to be in compliance with the Riverside County Noise Ordinance. Additionally, the noise report shall include any noise complaints received and actions taken to resolve the complaint. The noise report shall be kept on file by the applicant and submitted monthly to the CPUC and BLM.

Standards for Success: Construction noise is maintained at a less than significant level throughout construction activities and noise complaints are minimized and addressed accordingly throughout construction activities.

2.14 POPULATION AND HOUSING

This section presents the environmental setting and impact analysis for population and housing resulting from the Project and its alternatives. This section addresses existing population and

housing information for the Project area, applicable regulations, environmental impacts, and MMs to reduce or avoid significant effects. Additionally, this section responds to issues raised during the public scoping process, which are presented in Appendix 1 of the EIS.

2.14.1 Thresholds and Methodology

The following analysis uses baseline conditions established in Section 3.15 of the TES (BLM 2019) and evaluates the potential for impacts associated with the Project. CEQA Guidelines Section 15131(a) states, economic or social effects of a project will not be treated as significant effects on the environment. CEQA analysis may trace a chain of cause and effect from the proposed decision on a project through anticipated economic or social changes resulting from the project to physical changes caused in turn by the economic or social changes. The intermediate economic or social changes need not be analyzed in any detail greater than necessary to trace the chain of cause and effect. The focus of the analysis, therefore, will be on the physical changes triggered by impacts to socioeconomic resources that would be introduced by the Project.

Population estimates and projections were determined using data from the United States Census Bureau and Western Riverside Council of Governments Housing estimates and projections were determined using data from Western Riverside Council of Governments.

This impact analysis considers whether implementation of the Project would result in significant impacts to population and housing. The analysis focuses on reasonably foreseeable effects of the Project as compared with baseline conditions. The analysis uses significance criteria based on the CEQA Appendix G Guidelines. The potential direct and indirect effects of the Project and alternatives are addressed. Effects that would result from operation and maintenance of the Project and alternatives are also addressed. The applicant did not identify any APMs or BMPs to avoid or reduce significant impacts to population and housing.

2.14.2 Applicant Proposed Measures and BLM Best Management Practices

There are no APMs or BMPs applicable to Population and Housing.

2.14.3 Conservation and Management Actions

The CDCA Plan, as amended, contains CMAs, which include a specific set of avoidance, minimization, and compensation measures. The applicability of those measures to the Project was determined using a CMA checklist (EIS Appendix 2C). There are no CMAs applicable to Population and Housing.

2.14.4 CEQA Significance Criteria

Appendix G of CEQA Guidelines (14 CCR 15000 et seq.) provides guidance on assessing whether a project would have significant impacts on the environment. Consistent with Appendix G, the Project would have significant impacts on population and housing if it would:

a. Induce substantial population growth in an area, either directly (e.g., by proposing new homes and businesses) or indirectly (e.g., through extension of roads or other infrastructure)?

b. Displace substantial numbers of existing housing, necessitating the construction of replacement housing elsewhere?

c. Displace substantial numbers of people, necessitating the construction of replacement housing elsewhere?

2.14.5 Population and Housing Analysis

Impact POP 1 - Induce substantial population growth in an area, either directly (for example, by proposing new homes and businesses) or indirectly (for example, through extension of roads or other infrastructure)?

Less Than Significant – No Mitigation Required

Construction of the Project is anticipated to take approximately 2 years and as shown in Table 2.14-1, construction is projected to support approximately 160 direct short-term construction jobs.

Table 2.14-1 Impacts to Jobs and Employment

JOBS	DIRECT	INDIRECT	INDUCED	TOTAL
Transmission Line	120	54.1	85.5	259.6
Substation	40	9.0	14.3	43.3
Total	160	63.1	99.8	302.9

Source: BLM 2019

Construction of the Project is not anticipated to induce substantial population growth or result in impacts on population and housing. Even with the assumption that half of the construction-related positions would be filled by workers moving into the area, 158 housing units would be required. Based on the vacancy rates are shown in Table 2.14-2, the Project's impact on available housing would be low. It is anticipated that the Project would primarily employ workers who are living within the Project area because the Project is located within a rural urban area with easy access from nearby communities. As such, the workforce would be drawn from the regional metropolitan area and the population in the area would not be affected. Therefore, no impact to the population due to construction workers would occur and no mitigation is required.

Table 2.14-2 Project Impacts on Existing Housing Units

AREA	2014 HOUSING UNITS (TABLE 3.15-1)	SCENARIO ONE		SCENARIO TWO	
		HOUSING UNITS INCREASE	HOUSING UNITS INCREASE (%)	HOUSING UNITS INCREASE	HOUSING UNITS INCREASE (%)
La Paz County	16,113	77	0.478%	158	0.981%
Maricopa County	1,657,753	77	0.005%	158	0.010%
Riverside County	810,426	77	0.010%	158	0.019%
Three-County Study Area	2,484,292	77	0.003%	158	0.006%
Block Group Study Area	13,750	77	0.560%	158	1.149%

Source: BLM 2019

Operations and maintenance activities of the Project would be similar to the existing conditions for the existing transmission line facilities. Existing utility companies currently operate and maintain similar transmission facilities along all of the Project transmission alignment except for areas where new ROW is needed for the transmission line. The frequency and intensity of operations and maintenance would only increase by the additional work needed for maintenance of the alignment, which includes maintenance of the new transmission line and supporting facilities. This additional work would occur daily across the entire Project, therefore, be minimal. The Project would result in an increase in operations or maintenance staff; however, as discussed in Section 4.15.4 of the TES (BLM 2019), they would be hired from the regional talent pool and therefore, there would be no impact to population growth from Project operation and maintenance.

A project would indirectly accommodate growth if it would remove an obstacle to additional growth and development. This could occur through removing a constraint or adding an additional public service. The Project is considered growth accommodating not growth inducing since it would remove a barrier to growth through the construction and operation of transmission and electrical services. The Project would not induce growth beyond the levels of growth identified in applicable local general plans and policies and therefore impacts to population growth would be less than significant.

Impact POP 2 & 3 - Displace substantial numbers of existing housing or people, necessitating the construction of replacement housing elsewhere?

No Impact

The Project includes both new and replacement and relocation of existing electric transmission and power line facilities. All proposed and relocated facilities would primarily be located within existing ROW. As demonstrated above in Table 2.14-2, the Project's would have no impact on

available housing during construction and the Project does not include any features that would displace existing housing. Service interruptions to communities served by the transmission lines would be temporary (only during construction) and minimal. The Project would not displace people or housing. Therefore, there would be no impact.

2.14.6 Population and Housing Mitigation

No MMs are required.

2.15 PUBLIC SERVICES AND UTILITIES

This section describes the public services and utilities impacts associated with the construction, operation, and maintenance of the Project in terms of CEQA significance thresholds disclosed below in Section 2.15.4 below. Additionally, this section responds to issues raised during the public scoping process, which are presented in Appendix 1 of the EIS. Impacts have been determined to be less than significant with APMs, BMPs and CMAs.

2.15.1 Thresholds and Methodology

Baseline conditions for the impact analysis were established in Section 3.14 of the TES (BLM 2019). The baseline conditions were evaluated based on their potential to be affected by construction, operation, or maintenance of the Project. No quantitative thresholds apply to the analysis of potential impacts on public services and utilities under CEQA. Qualitative impact criteria set forth in Appendix G of the CEQA Guidelines are used for the analysis presented in this section.

2.15.2 Applicant Proposed Measures and BLM Best Management Practices

APMs have been identified and would be implemented by the Project applicant. In addition, BLM would require implementation of BMPs, which are intended to further minimize Project impacts. All Project APMs and BMPs are described in EIS Appendix 2A. Of these, the following would apply to the portion of the Project located within California and have therefore been incorporated into the Project for evaluation of significant impact to noise under CEQA.

- **APM HAZ-01: Hazardous Substance Control and Emergency Response.** DCRT would implement its hazardous substance control and emergency response procedures as needed in conjunction with a Hazardous Substance Control and Containment Plan and Emergency Response Plan for the Project. The procedures identify methods and techniques to minimize the exposure of the public and site workers to potentially hazardous materials during all phases of Project construction through operation. They address worker training appropriate to the site worker's role in hazardous substance control and emergency response. The procedures also require implementing appropriate control methods and approved containment and spill-control practices for construction and materials stored on site. If it were necessary to store chemicals on site, they would be managed in accordance with all applicable regulations. Material safety data sheets would be maintained and kept available on site, as applicable.

- Project construction would involve soil surface blading/leveling and excavation. In the event that soils suspected of being contaminated (on the basis of visual, olfactory, or other evidence) are removed during site grading activities or excavation activities, the excavated soil would be tested and, if contaminated above hazardous waste levels, would be contained and disposed of at a licensed waste facility. The presence of known or suspected contaminated soil would require testing and investigation procedures to be supervised by a qualified person, as appropriate, to meet state and federal regulations.
- All hazardous materials and hazardous wastes would be handled, stored, and disposed of in accordance with all applicable regulations by personnel qualified to handle hazardous materials. The hazardous substance control and emergency response procedures include, but are not limited to, the following:
- Proper disposal of potentially contaminated soils.
- Establishing site-specific buffers for construction vehicles and equipment near sensitive resources.
- Emergency response and reporting procedures to address hazardous material spills.
- Stopping work at that location and contacting the County Fire Department Hazardous Materials Unit immediately if visual contamination or chemical odors are detected; work would be resumed at this location after any necessary consultation and approval by the Hazardous Materials Unit.

DCRT would complete its Emergency Action Plan Form as part of Project tailgate meetings. The purpose of the form is to gather emergency contact numbers, first aid location, work site location, and tailgate information.

- **BMP PH&S-01.** Portable toilets would be provided at work sites to assure that adequate facilities are available for the duration of the Project and potential exposure to human waste is avoided.
- **APM TT-01: Traffic Coordination.** Emergency service providers would be notified of the timing, location, and duration of construction activities. Traffic control devices and signs would be used as needed. These measures would be implemented in conjunction with a Traffic and Transportation Management Plan for the Project.
- **BMP PH&S-02.** An FPP would be developed for the Project.
- **BMP MISC-02**. All cleared and graded material to be removed from the Project area would be disposed of in compliance with local ordinances.

2.15.3 Conservation and Management Actions

The CDCA Plan, as amended, contains CMAs, which include a specific set of avoidance, minimization, and compensation measures. The applicability of those measures to the Project was determined using a CMA checklist (EIS Appendix 2C). Of these, the following would apply to the portion of the Project located within California and have therefore been incorporated into the Project for evaluation of significant impact to public services and utilities under CEQA.

- **CMA DFA-VPL-BIO-FIRE-1**. Implement the following standard practice for fire prevention/protection:
    - Implement site-specific fire prevention/protection actions particular to the construction and operation of renewable energy and transmission project that include procedures for reducing fires while minimizing the necessary amount of vegetation clearing, fuel modification, and other construction-related activities. At a minimum, these actions will include designating site fire coordinators, providing adequate fire suppression equipment (including in vehicles), and establishing emergency response information relevant to the construction site.

2.15.4 CEQA Significance Criteria

Appendix G of CEQA Guidelines (14 CCR 15000 et seq.) provides guidance on assessing whether a project would have significant impacts on the environment. Consistent with Appendix G, the Project would have significant public services and utilities impacts if it would:

a. The Project would have a significant impact if it would cause substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, or cause a need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times, or other performance objectives for any of these public services:
    1. fire protection,
    2. police protection,
    3. schools,
    4. parks, or
    5. other public facilities

b. Project would temporarily increase water use, and project operation would contribute to increased long-term water consumption and require new entitlements?

c. Project construction and operations would result in increase in wastewater or wastewater treatment?

d. Project construction and operations would result in new storm drainage facilities or expansion of existing facilities?

e. Project construction and operations would result in solid waste generated during construction of the project that exceeds landfill requirements?

2.15.5 Public Services and Utilities Analysis

Impact PUSVC 1 - The Project would have a significant impact if it would cause substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, or cause a need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times, or other performance objectives for any of these public services:

1. **fire protection,**
2. **police protection,**
3. **schools,**
4. **parks, or**
5. **other public facilities**

Less Than Significant with Mitigation

2.15.5.1 Fire Protection

As discussed under Section 3.14.3.1 in the TES (BLM 2019), in California, the City of Blythe Fire Department and the Riverside County Fire Department (RCFD)/California Department of Forestry provide local fire protection and in Arizona, the Project area is within the Southwest Coordination Center (SWCC) that coordinates and mobilizes resources for wildland fires, prescribed fires, and other incidents.

Section 4.14.4.1 of the TES discusses potential impacts associated with construction and operation of the Project and documents the Project-specific fire risks from temperature, humidity, wind, and lightning as well as Project conditions that could trigger fire hazards which could result in a potential impact prior to mitigation. As such, MM PUB-CEQA-1 would be required which would include the implementation of APMs, BMPs, and CMAs related to fire reduction, thus reducing the potential impacts that could result from fires associated with the Project to a less than significant level. As such, substantial adverse physical impacts associated with providing fire protection would be less than significant with mitigation incorporated since the Project would not result in increased service ratios, decreased response times, or impact to other performance objectives of fire protection services.

Additionally, construction, operation, and maintenance of the Project could increase demand for emergency services in the Project area, and thus result in a potential impact prior to mitigation. To limit potential impacts on emergency response services, the applicant would implement MM PUB-CEQA-1 which include the implementation of APMs HAZ-01, TT-01, and BMP PH&S-02 which would reduce the risk of potential hazards and continue to provide access to emergency responders. In addition, an as discussed in detail in Section 2.8, Hazards and Hazardous Materials, of this appendix, MM HAZ-CEQA-1 would be implemented and consists of the development of an FPP in consultation with appropriate local fire agencies. Further discussion of the MM HAZ-CEQA-1 is provided in Section 2.8 of this appendix. Implementation of MM PUB-CEQA-1 and MM HAZ-CEQA-1 would ensure that impacts related to fire protection would be less than significant.

Further, MM TRANS-CEQA-2 would be required and would include the development and implementation of a Traffic, Transportation, and Access Management Plan for the Project which would ensure that fire, police and other first responders are notified of the timing, location, and duration of construction activities. Further discussion of MM TRANS-CEQA-2 and potential impacts on emergency response services is provided in Section 2.17, Traffic and Transportation, of this appendix. The Project would be designed in accordance with various reliability standards promulgated through implementation of NERC policies and procedures. Additionally, DCRT is governed by Western Electricity Coordinating Council (WECC) standards that may be in addition to or more stringent than those put forth by NERC. Therefore, the Project would not result in the need for new or physically altered fire protection facilities in order to maintain acceptable service ratios, response times, or other performance objectives.

Therefore, the overall impacts to fire protection resources would be less than significant with MM PUB-CEQA-1, MM HAZ-CEQA-1, and MM TRANS-CEQA-2 incorporated.

2.15.5.2 Police Protection

In California, the Project area is within the jurisdiction of the Riverside County Sheriff's Department, Colorado River Station located at 260 North Spring Street in Blythe (Riverside County 2016). The sheriff's office nearest to the proposed SCE Colorado River Substation site is in Blythe, approximately 13 miles east of the substation. In Arizona, the Project area is within the jurisdiction of the La Paz County Sheriff's Department. Stations are located at 8500 Riverside Drive in Parker, Arizona and 305 N. Plymouth Avenue in Quartzsite, Arizona.

The Project construction is not anticipated to permanently increase the local population and no new or expanded law enforcement facilities or increased staff levels within the Project regional or local study area would be required. Up to 140 construction personnel would be required however, these additional workers within the area would be temporary in nature and would not significantly alter the existing service levels when considered in the context of the entire population served. The additional volume of traffic associated with workers commuting to the Project sites during construction would be temporary and the California Highway Patrol (CHP) and local police departments would be sufficient to respond to incidents in the Project area. As discussed in Section 2.2.7.2 of the TES (BLM 2019), seven-foot tall security fencing would be installed around the entire perimeter of the SCS to protect equipment and prevent accidental contact with energized electrical equipment by authorized or unauthorized personnel. The incorporation of security measures and the temporary and minimal increase of construction workers supports the determination the Project would not result in the need for new or physically altered police or sheriff protection facilities in order to maintain acceptable service ratios, response times, or other performance objectives. Therefore, impacts would be less than significant, and no mitigation would be required.

2.15.5.3 Schools

The Project area is located within the Palo Verde Unified School District. Palo Verde Unified serves the Project site, Blythe and other remote areas of Riverside County and consists of three elementary schools, two middle schools, one high school, and a continuation high school. In Arizona, there are no school districts within one mile of the Project and the Project is primarily located on BLM lands.

The Project would not increase the demand for housing or induce population growth during construction, operation, or maintenance. As noted in Section 2.2.7.4 of the TES, 112 workers are anticipated during construction of the Project. Demolition activities would require a similar number of workers as the construction phase. Permanent employees needed for operational activities such as vegetation and infrastructure maintenance would be available locally and not result in new population growth. Construction workers would be expected to commute to the area or reside in the area temporarily. Since construction would be limited to approximately two years, it is unlikely that the workers would relocate their families in the Project area. Therefore, the Project would not increase demand for school services or facilities, and there would be a less than significant impact.

2.15.5.4 Parks and Recreation

Park and other recreational facilities are discussed in Sections 3.10 and 4.10 of the TES. Most of the Project resides in BLM land thus, the Project area is a popular area for recreational activities. Recreation activities in the Project area include camping, nature viewing, amateur geology (i.e., rockhounding), team sports, water sports, OHV use, hiking and backpacking, rock climbing, and hunting. OHV use in Johnson Canyon would need to be closed for the duration of Project construction and dispersed recreation activities would be temporarily affected. Appendix 2A of the EIS describes the APMs for temporary signs directing vehicles to alternative park access and parking. Since construction is anticipated to last approximately two years, and the Project area is relatively large, the impacts to recreation would be less than significant.

Overall, impacts to police protection, schools, parks, and recreation during Project construction and operation would be less than significant, while impacts to fire protection services would be less than significant with mitigation incorporated.

Impact PUSVC 2 - Project would temporarily increases water use, and project operation would contribute to increased long-term water consumption and require new entitlements?

Less Than Significant – No Mitigation Required

The proposed Project would not generate permanent change in water demand that could result in a need for new or expanded water entitlements. As further detailed in Section 2.13, Population and Housing above, construction is projected to support approximately 160 direct short-term construction jobs over an anticipated 2-year period. Further, the Project is located within a rural urban area with easy access from nearby communities. Therefore, the Project would primarily employ construction workers who are already living within local area. The non-local workforce would stay at existing hotels in the vicinity of the Project that are served by existing water service from existing entitlements.

As discussed in Section 2.2.7 of the TES (BLM 2019), “Project Construction,” the applicant has estimated that 2,592,543 gallons of water would be needed for the construction phase of the Project. As stated in the TES section, this water usage during construction would be needed for concrete structure foundation and dust control. The Project would use water that may come from a permitted source associated with an existing water right. The Project would not contribute to depleting the water sources associated with the water right. Water trucks, typically with a capacity of approximately 4,000 gallons, would support construction activities and demand. The

applicant would not require or seek expanded entitlements to water for temporary construction-related purposes. Rather, the applicant would purchase such water from the nearest feasible and available source of suitable quality. Construction water may be obtained from local municipal sources, trucked in by a water supply vendor, or derived from local wells. Considering they would occur over a 2-year period, construction water demand would be minimal and periodic/ episodic in nature and would cease following the completion of construction activities. Therefore, construction related impacts to water use would be less than significant.

Operations and maintenance water usage would be minimal. Any water use needed for long term maintenance and operations would be provided by the private wells and/or municipal supplies, as described above. Substantial water use that would necessitate the need for new entitlements would not be required for operation and maintenance of the Project. Therefore, operational impacts related to water use would be less than significant.

The Project's overall water use from construction and long-term operation of the electric system would be less than significant.

Impact PUSVC 3 – Project construction and operations would result in increase in wastewater or wastewater treatment?

Less Than Significant – No Mitigation Required

The Project would build a transmission line and would not generate any additional wastewater or water demand from Project operation. There would be no operational impacts associated with an increase in wastewater or wastewater treatment. However, during construction, limited wastewater would be generated through the use of portable toilets which would be provided at the work site. The capacity of Blythe Regional Wastewater Reclamation Facility in the City of Blythe has a capacity of 2.4 million gallons per day (MGD). This capacity is enough to cover the minimal construction and operation wastewater generated by the Project. The impacts from construction and operations would not result in an increase in wastewater or need for wastewater treatment and therefore would be less than significant.

Impact PUSVC 4 - Project construction and operations would result in new storm drainage facilities or expansion of existing facilities?

Less Than Significant – No Mitigation Required

The Project would not require or result in the construction of new storm water drainage facilities since the introduction of impervious surfaces would be minimal and any site runoff would be localized to each individual structure. Since the Project would not increase storm water runoff or require new drainage facilities or expansion of existing facilities the Project would not have an impact on storm drain facilities. Therefore, potential impacts would be less than significant, and no mitigation would be required.

Impact PUSVC 5 - Project construction and operations would result in solid waste generated during construction of the project that exceeds landfill requirements?

Less Than Significant – No Mitigation Required

Section 2.2.7.2 of the TES (BLM 2019) discusses the solid waste that would be generated from construction. Approximately 10 dumpsters-full per month would be generated at each active staging site. All waste will be cleaned up and brought to local landfills in accordance with local ordinances. La Paz County Regional Landfill located at 26999 Highway 95, Milepost 128 in Parker Arizona has a capacity of 3,269,877 cubic yards (2.5 million cubic meters) and 2.5 million megagrams. The Blythe Sanitary Landfill, located at 100 Midland Road in Blythe, California has a capacity of 6,229,670 cubic yards. These facilities, along with various other privately owned and local landfills would provide the necessary space to accommodate the approximate Project use of 10 dumpsters of solid waste needed per month. Daily clean-up of individual's trash at each Project site would be disposed of properly and would not result in an impact to local landfill capacities or requirements. In addition, BMP MISC-02 would be incorporated into Project design and would require that all cleared and graded material removed from the Project area be disposed of at a licensed facility with available capacity in compliance with local ordinances. Therefore, Project construction impacts related to landfill requirements and capacities would be less than significant.

Operations and maintenance of the Project would generate solid waste such as packaging and replaced parts. The solid waste generated from routine inspections, replacement of parts, and crew waste would be minimal and would not exceed landfill capacity. Therefore, Project operation impacts related to landfill requirements and capacities would be less than significant.

Overall impacts from Project construction and operations regarding solid waste would be less than significant and no mitigation would be required.

2.15.6 Public Services and Utilities Mitigation

See **MM HAZ-CEQA-1** under Section 2.8.6 (Hazards and Hazardous Materials).

See **MM TRANS-CEQA-2** under Section 2.17.6 (Traffic and Transportation).

MM PUB-CEQA-1: Implement Public Services and Utilities Applicant Proposed Measures, Best Management Practices, and Conservation and Management Actions.

The APMs, BMPs, and CMAs in Sections 2.15.2 and 2.15.3 above provide a suite of measures, practices, and actions that shall be implemented as part of the Project. APMs, BMPs, and CMAs shall be implemented prior to, or during all ground disturbance and construction related activities to avoid or minimize Project related impacts to public services and utilities. These APMs, BMPs, and CMAs include; APM HAZ-01, BMP PH&S-01, APM TT-01, BMP PH&S-02, BMP MISC-02, and CMA-DFA-VPL-BIO-FIRE-1. If an APM, BMP, or CMA is subjective, such as containing text that states; "where appropriate," "where applicable," "where feasible," or similar language, the BLM and CPUC shall be consulted to determine the applicability of each measure prior to the disturbance of a covered resource. Compliance with APMs, BMPs, and CMAs shall be documented, and a weekly report shall be provided to the BLM and CPUC. The Applicant shall provide a synopsis of the weekly reports to the BLM and CPUC monthly. The report shall include a summary of the construction activities completed, a list of compliance actions and any remedial actions taken to correct any actions, and the status of ongoing mitigation efforts. For those instances (only) where an APM, BMP, and/or CMA conflicts, or does not meet required

specificity pursuant to CEQA, the following AMPs and BMPs have been modified to meet CEQA requirements:

- **APM TT-01: Traffic Coordination.** See revisions under MM TRANS-CEQA-2 (Section 2.17.6).

- **BMP PH&S-02.** See revisions under MM HAZ-CEQA-1 (Section 2.8.6).

MM PUB-CEQA-1 Implementation

Responsible Party: The Applicant shall ensure that all APMs, BMPs, and CMAs are implemented during construction. If an APM, BMP, or CMA is subjective, the Applicant shall consult with the BLM and/or the CPUC to determine the applicability of each measure.

Timing: APMs, BMPs, and CMAs shall be implemented throughout construction activities.

Mitigation Monitoring and Reporting Program: The Applicant shall develop a weekly report that shall include all applicable APMs, BMPs, and CMAs and the related actions taken in order to be in compliance with these measures. These weekly reports shall be compiled and submitted to the BLM and CPUC monthly.

Standards for Success: Compliance with all applicable APMs, BMPS, and CMAs is achieved throughout construction of the Project.

2.16 RECREATION

This section describes the impacts to recreation resources that could potentially occur during construction, operation, and maintenance of the Project in terms of CEQA significance thresholds disclosed below in Section 2.16.4 below. As disclosed in Section 4.10 of the TES (BLM 2019), impacts from construction and operation of the Project would result in less-than-significant impacts to recreational areas. Additionally, this section responds to issues raised during the public scoping process, which are presented in Appendix 1 of the EIS.

2.16.1 Thresholds and Methodology

Existing conditions and recreational resources described in Section 3.10 of the TES were evaluated regarding their potential to be affected by Project construction, operation, maintenance, and decommissioning activities. The Project's effects were evaluated by CEQA thresholds of significance to determine whether the Project would result in a significant impact to recreational resources. The analysis is based on Sections 3.10 and 4.10 of the TES.

2.16.2 Applicant Proposed Measures and BLM Best Management Practices

APMs have been identified and would be implemented by the Project applicant. In addition, BLM would require implementation of BMPs, which are intended to further minimize Project impacts. All Project APMs and BMPs are described in EIS Appendix 2A. Of these, the following

would apply to the portion of the Project located within California and have therefore been incorporated into the Project for evaluation of significant impact to Recreation under CEQA.

- **BMP REC-01: Alternative Access and Parking Signs.** Signs directing vehicles to alternative existing access and parking would be posted in the event construction temporarily obstructs parking areas near trailheads.

- **BMP REC-02: Recreation Users Signs.** Signs advising recreation users of construction activities and directing them to alternative trails or bikeways would be posted on both sides of all trail intersections or as determined through DCRT coordination, with the respective jurisdictional agencies. A schedule of construction activities would be posted near entrances to recreational areas as well as on the Project website. Signs would be installed near access roads notifying the public of construction activities in the area and the presence of permanent transmission facilities.

- **BMP REC-04: Alternate Route Signage.** Identify alternative routes (on existing roads and trails**)** of equal or greater standard and access to specially designated areas if roads, primitive roads, or trails used for recreation are temporarily closed or otherwise significantly affected. The alternate route(s) would be clearly identified on signage.

2.16.3 Conservation and Management Actions

The CDCA Plan, as amended, contains CMAs, which include a specific set of avoidance, minimization, and compensation measures. The applicability of those measures to the Project was determined using a CMA checklist (EIS Appendix 2C). The CMAs applicable to the Project and related to Recreation are listed below and Project compliance with CDCA CMAs is addressed in the analysis portion of this section.

- **CMA DFA-REC-1.** Retain, to the extent possible, the identified recreation setting characteristics: physical components of remoteness, naturalness and facilities; social components of contact, group size and evidence of use; and operational components of access, visitor services and management controls (see recreation setting characteristics matrix).

- **CMA DFA-REC-2.** Avoid large-scale ground disturbance within one-half mile of Level 3 Recreation facility footprint including route access and staging areas. If avoidance isn’t practicable, the facility must be relocated to the same or higher standard and maintain recreation objectives and setting characteristics.

- **CMA DFA-REC-4**. When considering large-scale development in DFAs, retain to the extent possible existing, approved recreation activities.

- **CMA DFA-REC-5.** For displacement of dispersed recreation opportunities, commensurate compensation in the form of enhanced recreation operations, recreation facilities or opportunities will be required. If recreation displacement results in resource damage due to increased use in other areas, mitigate that damage

through whatever measures are most appropriate as determined by the Authorized Officer.

- **CMA DFA-REC-7.** If designated vehicle routes are directly impacted by activities (includes modification of existing route to accommodate industrial equipment, restricted access or full closure of designated route, pull outs, and staging areas to the public, etc.), mitigation will include the development of alternative routes to allow for continued vehicular access with proper signage, with a similar recreation experience. In addition, mitigation will also include the construction of an "OHV touring route" which circumvents the activity area and allows for interpretive signing materials to be placed at strategic locations along the new touring route, if determined to be appropriate by BLM.

2.16.4 CEQA Significance Criteria

Appendix G of CEQA Guidelines (14 CCR 15000 et seq.) provides guidance on assessing whether a project would have significant impacts on the environment. Consistent with Appendix G, the Project would have significant impacts to recreation if it would:

a. Would the project increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?

b. Does the project include recreational facilities or require the construction or expansion of recreational facilities which might have an adverse physical effect on the environment?

2.16.5 Recreation Analysis

Impact REC 1 - Would the project increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?

Less than Significant with Mitigation

Recreational activities in the Project area west of and including the Colorado River include boating, hiking, bicycling, golf, camping (including Recreational Vehicle facilities), nature and wildlife viewing, and activities associated with playgrounds and school and regional parks (City of Blythe 2007; Riverside County, 2015b). The Project would not result in new population growth that would increase the use of existing recreational facilities. Impacts to existing recreational facilities could, however, occur during the Project's construction phase, during which certain recreational facilities could be inaccessible. Specifically, the Project ROW crosses three existing or planned linear facilities associated with recreational uses: a planned Class I bike path extending south from Blythe along Lovekin Boulevard through Riverside County lands toward the Colorado River; an existing regional trail from Blythe to Ripley; and the Southern Immigrant Trail / Juan Bautista De Anza National Historic Trail. Passage along each of these routes at the point of ROW crossing may be inaccessible for the duration of the construction which could result in a potential impact prior to mitigation. As such, MM REC-CEQA-1 would be required and would implement APMs, BMPs, and CMAs in order to reduce potential impacts

to recreation resources to a less than significant level. These APMs, BMPs, and CMAs would include measures to provide signage for alternative access and parking, advanced notification to recreational users of construction activities, and alternate routes for roads and trails. Additionally, given the availability of alternative routes or temporary detours, any dispersal of recreation activities would not lead to overcrowding in other unaffected recreational areas. Therefore, construction and operational impacts related to restriction of recreational opportunities located west of the Colorado River and along the Project ROW would be less than significant with mitigation incorporated.

Further, as discussed in the Section 4.10.4.1 of the TES (BLM 2019), impacts to various recreational activities in all the zones may include construction noise, visual disturbances, temporary boat usage restrictions, vehicle and equipment travel, route closures/detours, and short-term over-crowding at other recreational areas, all of which could result in potential impacts related to recreational resources prior to mitigation. As such, MM REC-CEQA-1 would be required and would include the implementation of BMPs during construction (including BMPs REC-01, REC-02, and REC-04) which would ensure adequate notification is provided to the users and signage for alternate routes, access, and parking within/to recreation areas is installed. Additionally, these impacts would be temporary and would not permanently preclude the use of or access to any existing recreation opportunities or activities. Construction associated with the crossing of the Colorado River, including stringing of the wire, would temporarily inhibit boating activity, however, boating traffic would be allowed to resume after each wire stringing activity is complete. Further, Jack Marlowe Park, in Ripley, is within one mile of the Project ROW, and Peter McIntyre County Park, along the Colorado River, is within 1.5 miles of the ROW. Project construction would not result in population dispersal affecting either of these parks, and neither would require temporary closure. Therefore, impacts to recreational resources would be less than significant with mitigation incorporated.

Impact REC 2 - Does the project include recreational facilities or require the construction or expansion of recreational facilities which might have an adverse physical effect on the environment?

No Impact

The Project includes construction of transmission lines and related infrastructure and within a ROW. No new recreational facilities or expansion of existing recreational facilities which might have an adverse physical effect on the environment would be included as part of the Project. Therefore, there would be no impact related to construction or expansion of recreational facilities.

2.16.6 Recreation Resources Mitigation

MM REC-CEQA-1: Implement Noise Applicant Proposed Measures, Best Management Practices, and Conservation and Management Actions.

The APMs, BMPs, and CMAs in Sections 2.16.2 and 2.16.3 above provide a suite of measures, practices, and actions that shall be implemented as part of the Project. APMs, BMPs, and CMAs shall be implemented prior to, or during all ground disturbance and construction related activities to avoid or minimize Project related impacts to recreation. These APMs, BMPs, and CMAs

include; BMP REC-01, BMP REC-02, BMP REC-03, BMP REC-04, CMA DFA-REC-1, CMA DFA-REC-2, CMA DFA-REC-4, CMA DFA-REC-5, CMA DFA-REC-7. If an APM, BMP, or CMA is subjective, such as containing text that states; "where appropriate," "where applicable," "where feasible," or similar language, the BLM and CPUC shall be consulted to determine the applicability of each measure prior to the disturbance of a covered resource. Compliance with APMs, BMPs, and CMAs shall be documented, and a weekly report shall be provided to the BLM and CPUC. The Applicant shall provide a synopsis of the weekly reports to the BLM and CPUC monthly. The report shall include a summary of the construction activities completed, a list of compliance actions and any remedial actions taken to correct any actions, and the status of ongoing mitigation efforts.

For those instances (only) where an APM, BMP, and/or CMA conflicts, or does not meet required specificity pursuant to CEQA, the following CMAs have been modified to meet CEQA requirements:

- **CMA DFA-REC-1.** Consistent with CMA DFA-REC-1, recreation setting characteristics would be retained to the extent feasible. If infeasible to do so, the Applicant shall work with the BLM to mitigate the effect (i.e. placement of construction equipment, timing of construction, etc.).

- **CMA DFA-REC-4**. Consistent with CMA DFA-REC-4, large-scale development in DFAs shall retain approved recreation facilities, to the extent feasible. If infeasible to do so, the recreation facility shall be relocated to the same or higher standard and maintain recreation objectives and setting characteristics.

MM REC-CEQA-1 Implementation

Responsible Party: The Applicant shall ensure that all APMs, BMPs, and CMAs are implemented during construction. If an APM, BMP, or CMA is subjective, the Applicant shall consult with the BLM and/or the CPUC to determine the applicability of each measure.

Timing: APMs, BMPs, and CMAs shall be implemented throughout construction activities.

Mitigation Monitoring and Reporting Program: The Applicant shall develop a weekly report that shall include all applicable APMs, BMPs, and CMAs and the related actions taken in order to be in compliance with these measures. These weekly reports shall be compiled and submitted to the BLM and CPUC monthly.

Standards for Success: Compliance with all applicable APMs, BMPS, and CMAs is achieved throughout construction of the Project.

2.17 TRAFFIC AND TRANSPORTATION

This section describes the potential impacts to roadways and aviation facilities related to the construction, operation, maintenance, and decommissioning of the Project. As disclosed in Section 4.17 of the TES (BLM 2019), impacts to roadways were analyzed to be less than

significant with implementation of APMs and BMPs. Additionally, this section responds to issues raised during the public scoping process, which are presented in Appendix 1 of the EIS.

2.17.1 Thresholds and Methodology

Existing conditions described in Section 3.17 of the TES have been evaluated regarding their potential to be affected by Project construction, operation, maintenance, and decommissioning activities. The evaluation of Project impacts is based on Section 4.17 of the TES and the significance criteria established by Appendix G of the CEQA Guidelines.

2.17.2 Applicant Proposed Measures and BLM Best Management Practices

APMs have been identified and would be implemented by the Project applicant. In addition, BLM would require implementation of BMPs, which are intended to further minimize Project impacts. All Project APMs and BMPs are described in EIS Appendix 2A. Of these, the following would apply to the portion of the Project located within California and have therefore been incorporated into the Project for evaluation of significant impact to traffic under CEQA.

- **APM TT-01: Traffic Coordination.** Emergency service providers would be notified of the timing, location, and duration of construction activities. Traffic control devices and signs would be used as needed. These measures would be implemented in conjunction with a Traffic and Transportation Management Plan for the Project. This plan would also include measures/protocols for aviation, including helicopter use, coordination with local air traffic control, and a Congested Area Plan, pursuant to FAA regulations.

- **APM TT-02: Structure Lighting in Military Training Routes (MTR).** Project structures that are located within MTRs would be fitted with night-vision compatible red lighting emitting an infrared energy between 675 and 900 nanometers.

- **BMP TT-03: Public Access, Marking, and Public Information for Closed Access.** The BLM would determine if new access routes would be retained for public access through approval of the Access Plan for the Project. If any routes of travel are not accessible and/or closed, Carsonite posts and signing would note the closures. Where routes are closed, kiosks with information panels would be posted providing public information.

- **BMP TT-04: Access Plan.** An Access Plan would be required to identify all routes where new disturbance and/or cross-country travel is proposed. Existing access would be used to the maximum extent practicable; new access would only be created when there is no other reasonable or practicable means of access.

- **BMP TT-05: Using Open and Designated Routes.** The Access Plan for the Project would maximize use of open and designated access routes to the extent practicable.

- **BMP TT-06: Access Roads in Dune Habitat**. Access Roads would be unpaved and constructed at grade in dune habitat. No berms or application of rock would be allowed on the California public lands portion of the Project in desert tortoise habitat.

Should other adaptive access measures be required (such as temporary compaction or mats to allow access across washes), those measures would be formulated in concert with the BLM and contained in the Access Management Plan (Appendix 2B)

- **BMP TT-07: Routes of Travel**. Routes of travel for the Project on BLM-managed lands outside established roadways would be limited to those routes on the approved Access Plan.

- **BMP TT-08: Prohibit Cross-Country Vehicle Use Outside Designated Work Areas**. Within Project boundaries, prohibit cross- country vehicle and equipment use outside of approved designated work areas to prevent unnecessary ground and vegetation disturbance.

- **BMP TT-09: Repairs to Local Roads.** Local roads would be restored if road damage occurred as a result of Project construction.

2.17.3 Conservation and Management Actions

The CDCA Plan, as amended, contains CMAs, which include a specific set of avoidance, minimization, and compensation measures. The applicability of those measures to the Project was determined using a CMA checklist (EIS Appendix 2C). There are no CMAs applicable to traffic and transportation.

2.17.4 CEQA Significance Criteria

Appendix G of CEQA Guidelines (14 CCR 15000 et seq.) provides guidance on assessing whether a project would have significant impacts on the environment. Consistent with Appendix G, the Project would have significant traffic and transportation impacts if it would:

a. Conflict with an applicable plan, ordinance, or policy establishing measures of effectiveness for the performance of the circulation system, taking into account all modes of transportation including mass transit and non-motorized travel and relevant components of the circulation system, including but not limited to intersections, streets, highways and freeways, pedestrian and bicycle paths, and mass transit?

b. Conflict with an applicable congestion management program, including, but not limited to level of service standards and travel demand measures, or other standards established by the county congestion management agency for designated roads or highways.

c. Result in a change in air traffic patterns, including either an increase in traffic levels or a change in location that results in substantial safety risks?

d. Substantially increase hazards due to a design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment)?

e. Result in inadequate emergency access?

f. Conflict with adopted policies, plans, or programs regarding public transit, bicycle, or pedestrian facilities, or otherwise decrease the performance or safety of such facilities?

2.17.5 Traffic and Transportation Analysis

Impact TRANS 1 - Conflict with an applicable plan, ordinance, or policy establishing measures of effectiveness for the performance of the circulation system, taking into account all modes of transportation including mass transit and non-motorized travel and relevant components of the circulation system, including but not limited to intersections, streets, highways and freeways, pedestrian and bicycle paths, and mass transit?

Less than Significant with Mitigation

As discussed in Section 3.17.1 of the TES (BLM 2019), plans applicable to establishing effectiveness for circulation system that apply to the Project include: the BLM California Desert Conservation Area Plan which limits use of motorized vehicles within the plan area; the Riverside General Plan which establishes a level of service (LOS) category C to all development proposals not within the boundaries of an Area Plan; the Palo Verde Valley Area Plan which applies to Blythe and surrounding area and states general roadway improvements are needed to support future conditions; and the City of Blythe General Plan which establishes LOS B on residential streets and a LOS C on arterials and collectors. As stated in section 3.17.3, there are many two-lane paved farm field roads over private property in the Colorado River and California Zone of the Project Area, including Intake Boulevard, Broadway Boulevard, and Lovekin Boulevard near Blythe and in general the Project crosses mainly uninhabited farmland where public roads. As discussed in Section 4.17.4.5 of the TES, the Project would add new "unclassified roads and trails" which would help alleviate congestion and level of service problems discussed in the relevant planning documents since they would add approximately 18 miles of access roads to areas currently without roads.

As discussed in Section 4.17.4.1 of the TES, construction of the Project would temporarily generate additional traffic congestion adding approximately 160 additional personal vehicles to the roadway network in a worst-case scenario before and after each shift construction shift. The cumulative additional volume would represent a volume increase of one percent or less on various segments of I-10 and US 95,and would not cause a change in the LOS. As noted in Section 3.17.3 of the TES, LOS for both I-10 and US 95 was LOS B or better during the busiest month. Traffic on other local roads, many of which cross through farmlands, is low. As the construction workers would be dispersed throughout the Project area and would not typically be working at the same place at any one time, only minimal traffic increases would occur on the study area roadway network relative to construction workers. Similarly, the construction-related traffic would be dispersed throughout the Project route and throughout the workday. However, as discussed in Chapter 4 of the EIS (see Section 4.2.9), short-term traffic delays during construction could occur at locations where the transmission line crosses roads or where improvements might be needed at local roads, intersections, and bridges to accommodate overweight or oversize delivery vehicles. Therefore, in order to ensure that potential impacts related to traffic and transportation do not result in a potential impact at any point during construction activities, MM TRANS-CEQA-1 and MM TRANS-CEQA-2 would be required. MM TRANS-CEQA-1 would implement APMs (including previously included APM TT 01 concerning traffic coordination and preparation of a traffic management plan) and BMPs related to traffic, transportation, and access for the Project. MM TRANS-CEQA-2 would develop and implement a Traffic, Transportation, and Access Management Plan for the Project that would ensure construction-related traffic impacts are consistently reduced to a less than significant level

throughout construction of the Project. Therefore, the potential for construction traffic to conflict with applicable management plans is less than significant with mitigation incorporated.

Similar to traffic and congestion along roadways, pedestrian routes, trails on BLM lands, OHV routes, and bicycle lanes in Riverside County, governed by the Riverside County General Plan as detailed in Section 3.17.1 of the TES could be affected by construction activities and could result in a potential impact prior to mitigation. As such, MM TRANS-CEQA-2 would also be required for congestion related to pedestrian routes along trails, BLM lands, OHV routes, and bicycle lanes. MM TRANS-CEQA-2 which includes the development and implementation of a Traffic, Transportation, and Access Management Plan which would require specific measures to maintain pedestrian, OHV, and bicycle access within the Project area, or provide alternate routes and appropriate notification and signage informing users of Project related detours necessary during construction activities. Therefore, with the implementation of MM TRANS-CEQA-2, the Project would not conflict with pedestrian, bike, or OHV congestion management plans and impacts would be less than significant.

As discussed in Section 4.17.5 of the TES (BLM 2019), traffic generated by operation and maintenance activities would be intermittent, and require a small number of vehicles, and occasional deliveries. The number of trips generated during operations would be minimal, and less than the number of construction trips. As such, trips generated during operation would not result in a substantial amount of congestion that could conflict with applicable traffic management plans. Operation and maintenance traffic would not increase traffic on primary roads, and, subsequently, would not decrease the level of service for any primary roads. Therefore, the potential for operational traffic to conflict with applicable management plans would be less than significant.

Decommissioning of the Project would result in similar impacts as construction activities and would be less than significant.

The overall Project impact related to conflicting with an applicable plan, ordinance or policy establishing measures of effectiveness for the performance of the circulation system would be less than significant with mitigation incorporated.

Impact TRANS 2 - Conflict with an applicable congestion management program, including, but not limited to level of service standards and travel demand measures, or other standards established by the county congestion management agency for designated roads or highways.

Less Than Significant – No Mitigation Required

As described above, the Project would result in potential temporary construction impacts and no operational impacts. Riverside County is the Congestion Management Agency for the Project segment located in California. As discussed above, the construction and decommissioning activities associated with Project would generate the highest amount of traffic; however, the increase in traffic from these activities would be temporary, occurring intermittently for a period of approximately two years as discussed in Section 2.2.7.4 of the TES (BLM 2019). Project construction and decommissioning traffic would not exceed a LOS standard established by the

county or conflict with an applicable congestion management program on these roadways. Impacts would be less than significant.

Impact TRANS 3 - Result in a change in air traffic patterns, including either an increase in traffic levels or a change in location that results in substantial safety risks?

Less than Significant with Mitigation

As discussed in Section 3.17.3.2 of the TES, a majority of the aviation facilities within the Project Area are used for general aviation and non-primary commercial service airports. The Blythe Airport is the primary airport in the Colorado River and California Zone of the Project area serving Blythe, California. It is open to the public and is owned by Riverside County. The airport's primary use is for general aviation, but it does not receive any commercial air traffic. Although not anticipated in the California portion of the Project, as evaluated in Section 4.17.4.1 of the TES, construction could cause a hazard to aviation if helicopters required during Project construction would be used in the vicinity of aviation facilities. However, this access method would not be necessary in the vicinity of any aviation facilities, and the ground construction equipment used would not be high enough to affect aviation. Therefore, aviation impacts from construction of the Project would be less than significant.

Operation of the Project would result in a change in air traffic patterns if a Project component such as a tower exceed a certain height with an airport influence area or interfere with flight paths. As discussed in Section 4.17.4.5 of the TES (BLM 2019), tower heights will be limited in Project sections where there is potential for collision hazards, including areas within the Blythe Airport influence area. As discussed in Section 4.17.4.5 of the TES, the FAA has determined that the proposed structure heights would "not exceed obstruction standards and would not be a hazard to air navigation" as a result of the FAA airspace analysis that was conducted (Aeronautical Study No. 2017-AWP-3724-OE). No Project segment lies within a military training route or within influence area of any other aviation facility in California. As discussed in TES Section 4.17.5, in the event that the placement of transmission lines would be required within an aviation flight path or military training route, specific lighting requirements, would be required to fit transmission lines with appropriate lighting, thus resulting in a potential impact, prior to mitigation. MM TRANS-CEQA-1 would be required in order to ensure that these appropriate lighting requirements would be incorporated into the Project. MM TRANS-CEQA-1 requires the implementation of APMs and BMPs to reduce traffic and transportation impacts, including previously identified APMs TT-01 that requires project coordination with local air traffic control and TT-02 which requires specific nighttime lighting requirements for structures. Therefore, operational impacts to air traffic patterns would be less than significant with mitigation incorporated.

Overall the potential for the Project to result in a change in air traffic patterns that results in substantial safety risks during construction and operation would be less than significant with mitigation incorporated.

Impact TRANS 4 - Substantially increase hazards due to a design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment)?

Less Than Significant – No Mitigation Required

As discussed in Section 2.2.3.12 of the TES, the Project would use existing access roads for construction and maintenance to the extent feasible, minimizing new disturbance. Existing roads would not be altered unless improvements are needed for the Project (including maintenance) or future use. Section 4.17.4.5 of the TES identifies new Type C and Type D roads that would be needed for the Project. As discussed in Section 2.2.3.12 of the TES, these roads would go directly from structure to structure, except on hillsides, ridgebacks, rock outcrop areas, wash crossings, treed areas, or in areas where sensitive environmental resources can be avoided. In such cases, the road would follow suitable topography from structure to structure and would be built in areas that generally cause the least amount of overall disturbance.

As described in Section 3.17.1 of the TES, access roads sited on BLM lands will be constructed in compliance with BLM Manual 9100. Other access roads not subject Access roads not on BLM lands would utilize existing rural roads and farm roads to the extent feasible and the additional approximately 18 miles of new access roads would be constructed in accordance to local design criteria for rural roads. Additionally, public agencies require an encroachment permit or other such agreement for each location where the Project would interface with a roadway or other transportation facility and would ensure no increase in design feature hazards would occur as part of the encroachment permit process. Complying with local permits and agreements would ensure that hazards and incompatible uses would be avoided or minimized. Therefore, impacts would be less than significant, and no MMs would be required.

Impact TRANS 5 - Result in inadequate emergency access?

Less than Significant with Mitigation

As discussed in Section 4.17.4.1 of the TES (BLM 2019), construction activities could potentially interfere with emergency response due to temporary, short-term traffic delays at locations where transmission lines cross roads or where improvements might be needed at local roads, intersections, and bridges to accommodate overweight or oversize delivery vehicles, thus resulting in a potential impact prior to mitigation. The temporary road and lane closures associated with construction activities could lengthen the response time required for emergency vehicles passing through the construction zone. As such, MM TRANS-CEQA-1 would be required which would implement APMs and BMPs required for emergency access. Additionally, MM TRANS-CEQA-2 would also be required in order to reduce impacts to emergency access to a less than significant level by developing and implementing a Traffic, Transportation, and Access Management Plan for the Project. This Plan would include specific measures for continued access for emergency vehicles throughout construction of the Project including notification to emergency service providers of the timing, location, and duration of construction activities on the roadways, and traffic control devices and signs would be used as needed. Therefore, impacts to emergency access would be less than significant with MM TRANS-CEQA-1 and MM TRANS-CEQA-2 incorporated.

Impact TRANS 6 - Conflict with adopted policies, plans, or programs regarding public transit, bicycle, or pedestrian facilities, or otherwise decrease the performance or safety of such facilities?

Less than Significant with Mitigation

As discussed under Impact TRANS-1 above, operation of the Project would not conflict with any adopted policies for various modes of transportation. Construction of the Project could impact access to pedestrian facilities, bike lanes, bus routes for a short-term, however, with the implementation of MM TRANS-CEQA-2, which includes the development and implementation of a Traffic, Transportation, and Access Management Plan, impacts related to public transit, bicycle, and pedestrian facilities within the Project area would be less than significant. Additionally, in order to ensure that the public is adequately notified of public road closures and/or detours, MM TRANS-CEQA-1 would be required which includes the implementation of BMP TT-03 for notification to the public of any detours and/or closures to public facilities. Further, due to the rural farmland nature of the Project corridor very few bus routes or public transit facilities are encountered, and recreation facilities would only have short-term temporary closures, which is further discussed under Section 2.16.5 above (Recreation Analysis). Therefore, the potential to conflict with adopted policies, plans, or programs or otherwise decrease the performance or safety of such facilities would be less than significant with mitigation incorporated.

2.17.6 Traffic and Transportation Mitigation

MM TRANS-CEQA-1: Implement Applicant Proposed Measures and Best Management Practices.

The APMs and BMPs in Sections 2.17.2 and 2.17.3 above provide a suite of measures, practices, and actions that shall be implemented as part of the Project. APMs and BMPs shall be implemented prior to, or during all ground disturbance and construction related activities to avoid or minimize Project related impacts to recreation. These APMs, BMPs, and CMAs include; APM TT-01, APM TT-02, APM TT-03, APM TT-04, BMP TT-05, BMP TT-06, BMP TT-07, BMP TT-08, BMP TT-09.

If an APM or BMP is subjective, such as containing text that states; “where appropriate,” “where applicable,” “where feasible,” or similar language, the BLM and CPUC shall be consulted to determine the applicability of each measure prior to the disturbance of a covered resource. Compliance with APMs and BMPs shall be documented, and a weekly report shall be provided to the BLM and CPUC. The Applicant shall provide a synopsis of the weekly reports to the BLM and CPUC monthly. The report shall include a summary of the construction activities completed, a list of compliance actions and any remedial actions taken to correct any actions, and the status of ongoing mitigation efforts.

For those instances (only) where an APM and/or BMP conflicts, or does not meet required specificity pursuant to CEQA, the following AMP and BMPs have been modified to meet CEQA requirements:

- **APM TT-01: Traffic Coordination.** See MM TRANS-CEQA-2 below for the Traffic, Transportation, and Access Management Plan.
- **BMP TT-03: Public Access, Marking, and Public Information for Closed Access.** See MM TRANS-CEQA-2 below for the Traffic, Transportation, and Access Management Plan.

- **BMP TT-04: Access Plan.** See MM TRANS-CEQA-2 below for the Traffic, Transportation, and Access Management Plan.
- **BMP TT-05: Using Open and Designated Routes.** See MM TRANS-CEQA-2 below for the Traffic, Transportation, and Access Management Plan.
- **BMP TT-06: Access Roads in Dune Habitat.** See MM TRANS-CEQA-2 below for the Traffic, Transportation, and Access Management Plan.
- **BMP TT-07: Routes of Travel.** See MM TRANS-CEQA-2 below for the Traffic, Transportation, and Access Management Plan.
- **BMP TT-09: Repairs to Local Roads.** Repairs to local roads would occur in compliance with the Traffic, Transportation, and Access Management Plan developed and implemented for the Project (See MM TRANS-CEQA-2 below).

MM TRANS-CEQA-1 Implementation

Responsible Party: The Applicant shall ensure that all APMs, BMPs, and CMAs are implemented during construction. If an APM, BMP, or CMA is subjective, the Applicant shall consult with the BLM and/or the CPUC to determine the applicability of each measure.

Timing: APMs, BMPs, and CMAs shall be implemented throughout construction activities.

Mitigation Monitoring and Reporting Program: The Applicant shall develop a weekly report that shall include all applicable APMs, BMPs, and CMAs and the related actions taken in order to be in compliance with these measures. These weekly reports shall be compiled and submitted to the BLM and CPUC monthly.

Standards for Success: Compliance with all applicable APMs, BMPS, and CMAs is achieved throughout construction of the Project.

MM TRANS-CEQA-2: Traffic, Transportation, and Access Management Plan.

The Applicant shall develop a Traffic, Transportation, and Access Management Plan at least 30-days prior to the start of construction and work with the BLM and Riverside County to prepare and implement the Plan for roadways adjacent to and directly affected by the proposed Project facilities. The Traffic, Transportation, and Access Management Plan shall be submitted to the BLM and the County for approval prior to the start of ground disturbing activities and issuance of a County grading permit. The Traffic, Transportation, and Access Management Plan shall be implemented by the Applicant throughout all construction activities.

The Traffic, Transportation, and Access Management Plan shall include, but not limited to, the following requirements:

- The Traffic, Transportation, and Access Management Plan shall conform to Part 6 (Temporary Traffic Control) of the California Manual on Uniform Traffic Control Devices;

- Identify truck routes designated by Riverside County and local jurisdictions haul routes that minimize truck traffic on local roadways;
- Provide sufficient-sized staging areas for trucks accessing work zones to minimize disruption of access to adjacent public rights-of-way;
- Scheduling truck trips outside the peak morning and evening commute hours;
- Storing all equipment and materials in designated contractor staging areas on or adjacent to the worksite, such that traffic obstruction is minimized;
- Implementing roadside safety protocols including advance "Road Work Ahead" warning and speed control signs which shall be posted to reduce and provide safe traffic flow through the work zone;
- Providing advance notification to administrators of police and fire stations (including fire protection agencies), ambulance service providers, and recreational facility managers of the timing, location, and duration of construction activities and the locations of detours and lane closures. Maintain access for emergency vehicles within, and/or adjacent to roadways affected by construction activities at all times;
- Repairing and restoring adversely affected roadway pavements to their pre-construction condition;
    - Damage will be documented by the Project Applicant and the applicable jurisdiction (i.e. Caltrans, County, or individual) will be notified within 24 hours. The Applicant will work with the jurisdiction affected and will repair the damage within 30 days.
- Coordination of individual traffic plans for the Project and nearby Projects;
- Coordination between the contractor and Riverside County in developing circulation and detour plans that include safety features (e.g. signage and flaggers). The circulation and detour plans shall address:
    - Full and partial roadway closures;
    - Circulation and detour plans to include the use of signage and flagging to guide vehicles through and/or around the construction zone, as well as any temporary traffic control devices;
    - Bicycle detour plans, where applicable;
    - Parking along arterial and local roadways; and
    - Haul routes for construction trucks and staging areas for instances when multiple trucks arrive at the work sites.

- Protocols for updating the Traffic, Transportation, and Access Management Plan to account for delays or changes in the schedules of individual projects.
- Provisions for coordination with the military and/or Federal Aviation Administration (FAA) should towers be proposed for location in flight paths or Military Training Routes (MTRs).

The Traffic, Transportation, and Access Management Plan shall incorporate an access road siting and management plan, Congested Area Plan (pursuant to FAA regulations and APM TT-01), and a transportation plan for the transport and transmission tower components and equipment.

MM TRANS-CEQA-2 Implementation

Responsible Party: The Applicant shall be responsible for ensuring that the Traffic, Transportation, and Access Management Plan is prepared and implemented throughout construction activities.

Timing: The Traffic, Transportation, and Access Management Plan shall be prepared at least 30-days prior to the start of construction and shall be implemented throughout all construction activities.

Mitigation Monitoring and Reporting Program: The Applicant shall monitor construction transportation and access to ensure that the Traffic, Transportation, and Access Management Plan is implemented successfully as documented in inspection logs.

Standards for Success: Traffic flow remains at acceptable levels, emergency access remains possible at all times, the public is reasonably notified of any road closures, delays, or lane restrictions, and the Project area remains in compliance with all applicable transportation goals, policies, and requirements.

3.0 CUMULATIVE RESOURCE ANALYSIS

CEQA defines cumulative impacts as "two or more individual effects which, when considered together are considerable," and suggests that cumulative impacts may "result from individually minor but collectively significant projects taking place over a period of time" (CEQA Guidelines Section 15355). CEQA documents are required to include a discussion of potential cumulative effects when those effects are significant and the CEQA Guidelines suggest two possible methods for assessing potential cumulative effects (CEQA Guidelines Section 15130). The first method is a list-based approach, which considers a list of past, present, and reasonably foreseeable future projects producing related or cumulative impacts. Section 3.12 of the EIS describes the framework for the cumulative impacts analysis and identifies the geographic scope of the cumulative impacts analysis area and the cumulative conditions for each resource section. The analysis of potential environmental effects in Chapter 4 of the TES (BLM 2019) included discussions of potential cumulative effects for each resource area.

NEPA regulations developed by the federal Council on Environmental Quality (CEQ) require that the cumulative impacts of the Project be addressed in an EIS (40 CFR Part 1508.25). Cumulative impacts on the environment are those that result from the incremental impact of the proposed action when added to other past, present, and reasonably foreseeable future actions (40 CFR Part 1508.7). These impacts can result from individually minor impacts of multiple actions over time. Chapter 3 of the TES lists that past, present, and reasonably foreseeable future actions for the Cumulative Effects Study Areas by resource. Cumulative impacts are then addressed by resource in Chapter 4 of the TES.

Since the cumulative impacts analysis conforms to the CEQA regulations, that is, it includes a list of reasonably foreseeable projects whose impacts may exacerbate adverse impacts resulting from the implementation of the Project; this section seeks to summarize the TES' cumulative impacts discussion for each resource section. Of the BLM-authorized and other known projects listed in FEIS Appendix 3 Table 3.12-1 the following remain in stages of development and were therefore considered in the evaluation of potential cumulative effects:

- Blythe Energy Power Plant and Sonoran Energy Project (Blythe Energy Project Phase II)
- Blythe Mesa Solar Project
- Crimson Solar Project
- Desert Quartzite Solar Project

Aside from the identification of cumulative effects to Tribal Resources (Section 4.7 of the TES [BLM 2019]), no major or significant cumulative effects were identified in the TES for the portions of the Project area within the Colorado River and California Zone.

No cumulative effects from the Project were identified for Special Designations (TES Section 4.11).

Negligible effects from the Project were identified for: Air Quality and Climate Change (TES Section 4.2); Geology, Mineral and Soil Resources (TES Section 4.3); Cultural Resources (TES Section 4.6); Land Use (TES Section 4.8); Grazing and Rangeland (TES Section 4.9); Recreation (TES Section 4.10); Hazardous and Hazardous Materials (TES Section 4.13); Environmental Justice (TES Section 4.16); and Water Resources (TES Section 4.19).

Negligible to minor cumulative effects to were identified for topography (discussed in TES Section 4.3 Geology, Mineral and Soil Resources); Paleontological Resources (TES Section 4.4); Traffic and Transportation (TES Section 4.17); Visual Resources (TES Section 4.18).

Negligible to moderate cumulative effects were identified for Socioeconomics (TES Section 4.15).

Minor cumulative effects were identified for Noise (TES Section 4.12) and Public Health and Safety (TES Section 4.14).

Long-term minor cumulative impacts “where the proposed segments would be collocated or near past/present disturbances and/or existing linear facilities with some exceptions” were identified for Biological Resources (TES Section 4.5).

Minor to moderate, short-term noise impacts would result if the Project were built concurrently with other reasonably foreseeable projects (TES Section 4.12).

4.0 ALTERNATIVES

This alternatives analysis compares potential environmental impacts that may result through construction, operation, and decommissioning of portions of the Project located in the state of California with other alternative route segments located in California. The chapter relies on analysis contained in Chapter 2 of the TES (BLM 2019). Chapter 2 of the TES (BLM 2019) provides a detailed description of the Proposed Action (Section 2.2), a summary of the No Action Alternative (Section 2.3), a description of the 55 alternative route segments, and Alternative and Subalternative routes (Section 2.4.4).

The CEQA requires, state and local agencies in California to implement the CEQA before issuing a discretionary permit. Because California agencies do not have jurisdiction over Project-related activities in other states, this alternatives analysis is limited to alternative route segments located in California and does not analyze route segments in Arizona. This analysis bolsters the alternatives analysis conducted in the TES with a CPUC – specific alternative, the non-wires alternative. A non-wires scenario as statutorily required under the CPUC's Certificate of Public Convenience and Necessity (CPCN) regulations (PUC Section1002.3) and is therefore included in this analysis. This chapter also provides the environmentally superior alternative identified by the CPUC, similar to Section 2.9 of the TES.

The EIS considers both "route segments" (Section 2.4.2 of the TES [BLM 2019]) and "alternatives" (full routes from Delany Substation to the Colorado River Substation) which span all four zones identified in the EIS: the East Plains and Kofa Zone, the Quartzsite Zone, the Copper Bottom Zone, and the Colorado River and California Zone. As mentioned above, this analysis focuses on route segments within the California portion of the Colorado River Zone and California Zone, and relies on the EIS illustrate how segments in California would be integrated into a full-route alternative that cross Arizona.

The purpose of an alternatives analysis pursuant to CEQA is to identify feasible options for attaining most of the basic objectives of the Project while reducing its significant effects. Provisions of the CEQA Guidelines (Section 15126.6) that address Project alternatives in an EIR state the following:

- The range of alternatives required in an EIR is governed by a "rule of reason." Therefore, the EIR must evaluate only those alternatives necessary to permit a reasonable choice. The alternatives will be limited to those that would avoid or substantially lessen any of the significant effects of the Project.

- A No Project Alternative will be evaluated, along with its impacts. The purpose of describing and analyzing a No Project Alternative is to allow decision-makers to compare the effects of approving the Project with the effects of not approving the Project.

- An EIR does not need to consider an alternative whose effects cannot reasonably be ascertained and whose implementation is remote and speculative.

This alternatives analysis relies on the alternatives discussion in the TES (Chapter 2) screen feasible alternatives (Section 2.4) and describe a no project scenario (Section 2.3). Since the TES established a process for screening alternatives that and evaluates a no project alternative as required by the CEQA Guidelines, this analysis focuses on comparing adverse environmental effects that are found to be significant under CEQA for the Project with potentially feasible route segments identified in the TES. Specifically, this analysis addresses the CEQA requirement to assess alternatives to the Project that have the potential to avoid or substantially lessen potential impacts or are capable of eliminating or reducing significant environmental effects even though they may "impede to some degree the attainment of project objectives or would be more costly" (Section 15126.6(b)).

4.1 PROPOSED ACTION AND ACTION ALTERNATIVE SEGMENTS IN CALIFORNIA

Section 2.2.1 of the TES (BLM 2019) describes the route segments that comprise the Project. A description of each segment, the underlying jurisdiction, and its total length is presented in Table 2.2-1 of the TES. The segments of the Proposed Action considered in this analysis include Segments p-15w through p-18. Section 2.4.4.4 of the TES describes each of the segments from the Colorado River crossings through the remainder of the Project alignment in California.

Section 2.4.7 of the TES describes the four full Alternative Routes (Alternative Routes 1 through 4) to the Project (Figure 2.4-10), which were developed by selecting proposed and alternative segment combinations within each zone that linked together logically and also met certain objectives of the BLM, cooperating agencies, and stakeholders, and potentially addressed public concerns with the Project. Subalternatives within each zone consisting of one or more segments were also developed that could replace a portion of one of the full Alternative Routes. The Subalternatives provide localized variations to the full Alternative Routes that could be used to reduce impacts or address issues with the full Alternative Routes.

Table 4.1-1 provides determinations that indicate whether the portions of the Alternative segments located in the Colorado River and California Zones would be more or less impactful than the Project with respect to each environmental factor for which a significant and unavoidable impact would occur during construction or operation. Information for potential impacts in Arizona is included to help describe impacts and benefits that are relevant to the determination of an Agency Preferred/Environmentally Superior Alternative, where appropriate. Impacts that would be less than significant without mitigation or for which feasible mitigation exists to reduce the impact to less than significant levels are not the focus of the comparison of alternatives presented. Where the analysis determines that impacts would be similar to the Project, an environmentally superior alternative for that resource area has not been identified. Table 4.1-1 provides a summary of the impact determinations for the Project and Alternatives for the segments in California, based on the analysis provided in Table 2.2-36a, Table 2.2-36b, Table 2.2-36c, and Table 2.2-36d of EIS Appendix 2.

Table 4.1-1 Summary of CEQA Impact Determinations for the Proposed Action and Action Alternatives

RESOURCE	PROPOSED ACTION	ALTERNATIVE 1: I-10 ROUTE	ALTERNATIVE 1: I-10 ROUTE SUB-ALTERNATIVE 1E	ALTERNATIVE 2: BLM UTILITY CORRIDOR ROUTE	ALTERNATIVE 2: BLM UTILITY CORRIDOR ROUTE SUB-ALTERNATIVE 2E	ALTERNATIVE 3: AVOIDANCE ROUTE	ALTERNATIVE 3: AVOIDANCE ROUTE SUB-ALTERNATIVE 3M	ALTERNATIVE 4: PUBLIC LANDS EMPHASIS ROUTE	ALTERNATIVE 4: PUBLIC LANDS EMPHASIS ROUTE SUB-ALTERNATIVE 4K, 4L, 4M, 4N, 4P	NO ACTION ALTERNATIVE

LS – All impacts under this environmental factor are less than significant
LSMM – Impacts under this environmental factor would be reduced to Less than Significant Levels after mitigation is implemented
NI – No Impact would occur under this environmental factor
S – Significant environmental impacts would occur under this environmental factor

4.1.1 Aesthetics

The Alternatives all have slightly greater impacts to aesthetics because unlike the Project, which would follow the existing DPV1 transmission line, under the Alternatives portions of the transmission line would be a new development added to a view that contains very little development; it would be a moderate to major impact on the views of nearby residents because the routes are all located closer to the I-10 corridor. Therefore, the Project is the environmentally superior alternative with respect to aesthetics.

4.1.2 Agriculture

Alternative 1, Subalternative 1E, Alternative 3, Subalternative 3M, Alternative 4, and Alternative 4 Subalternatives all are more impactful than the Project, as they would affect more residential land and NRCS-classified Farmland in California. Alternative 2 would impact the same amount of agricultural land as the Project in California. Therefore, the Project and Alternative 2 would be the environmentally superior alternatives with respect to agriculture.

4.1.3 Air Quality

The Project and the Alternatives would have similar impacts on air quality in California. Therefore, there is no environmentally superior alternative with respect to air quality in California.

4.1.4 Biological Resources

Some of the alternatives, including alternatives that include segments x-19, ca-9, and ca-07, cross known occurrences of Harwood's eriastrum and fringe-toed lizard habitat. The same sand dune vegetation community is found within the proposed Project ROW; however, there are no known occurrences of Harwood's eriastrum on the majority of the proposed Project ROW. Any of the alternatives that include Segment x-19 could have significant direct and indirect impacts on Harwood's eriastrum and fringed-toed lizard habitat and individuals. These potential impacts would be minimized through the same implementation of various APMs and BMPs, including avoidance measures included in the DRECP, that would occur under the Project as proposed. Therefore, there is no environmentally superior alternative with respect to biological resources in California.

4.1.5 Cultural Resources

All of the Alternatives are less impactful than the Project for cultural resources in California prior to the implementation of MMs and BMPs, as the routes would avoid Project Segments p-17 and p-18, which could have significant impacts on cultural resources. A total of 11 sites previously recommended or determined eligible for inclusion in the NRHP have been previously recorded within the 200-foot analysis corridor of Segment p-17. One of these sites contains known human remains and is within an existing access road. One NRHP-listed archaeological district and TCP containing petroglyphs and intaglios (the Mule Mountains Petroglyph and

Intaglio Site) is potentially sensitive to indirect visual impacts and is located within line of sight of Segment p-17. The types of sites located along Segment p-18 are similar to those described for Segment p-17, thus the impact analysis is the same as well. Depending on the viewshed and tower placement, indirect visual impacts to these sites could range between moderate and major. Therefore, the Alternatives would all be less impactful than the Project with respect to cultural resources in California.

4.1.6 Tribal Resources

None of the Alternatives are less impactful than the Project for Tribal resources in California. Therefore, there is no environmentally superior alternative with respect to Tribal resources in California.

4.1.7 Geology and Soils

The Project and the Alternatives would have similar impacts on geology and soils in California. Therefore, there is no environmentally superior alternative with respect to geology and soils in California.

4.1.8 Hazards and Hazardous Materials

There are a number of cleanup site database listings crossed by or within 1-mile of Action Alternative Segments (ca-01, ca-02, ca-04 through ca-07, ca-09, cb-10, i-08s, x-09 through x-13, x-15, x-16, and x-19) that are not present along the Proposed Action Segments (p-15e through p-18). Therefore, the Project is the environmentally superior alternative with respect to hazards and hazardous materials.

4.1.9 Electromagnetic Fields

The Project and the Alternatives would have similar impacts related to electromagnetic fields in California; the CPUC considers potential health effects related to electromagnetic fields to be speculative. Therefore, there is no environmentally superior alternative with respect to electromagnetic fields in California.

4.1.10 Hydrology and Water Quality

The Project and the Alternatives would have similar impacts on hydrology and water quality resources in California. Therefore, there is no environmentally superior alternative with respect to hydrology and water quality in California.

4.1.11 Land Use

The Project and the Alternatives would have similar impacts on land use in California. However, implementation of BMP-BIO-31, which would apply to Harwood eriastrum suitable habitat would be required in order to reduce biological impacts to a less-than-significant level for Alternative 2 and Subalternative 2E. BMP-BIO-31 would result in an amendment to the CDCA Plan. Subalternative 4D would not conform with BLM VRM classes and would include RMP amendments.

4.1.12 Noise

There would be noise impacts to rural residents near Ripley under the Proposed Action, some of which would be greater than ambient noise levels at NSRs; however, with APMs, BMPs, and MMs these impacts would be reduced to less than significant. Therefore, there is no environmentally superior alternative with respect to noise impacts in California.

4.1.13 Public Services

The Project and the Alternatives would have similar impacts on public services resources in California. Therefore, there is no environmentally superior alternative with respect to public services in California.

4.1.14 Recreation

The Project and the Alternatives would have similar impacts on recreation in California. Therefore, there is no environmentally superior alternative with respect to recreation in California.

4.1.15 Traffic and Transportation

The Project and the Alternatives would have similar impacts on traffic and transportation in California. Therefore, there is no environmentally superior alternative with respect to traffic and transportation in California.

4.2 NO PROJECT ALTERNATIVE

Like NEPA, CEQA requires an analysis of a no project alternative (Section 15126.6(e)) that considers the results of not implementing the Proposed Action or any of the action alternatives. Analysis of a no project alternative is intended to allow state and local agencies to compare the impacts and benefits of the Proposed Action and its alternatives to with the impacts and benefits on not implementing the project. Section 2.3 of the TES (BLM 2019) outlines the BLM's analysis of the No Action Alternative and is summarized below.

Under the No Project Alternative, the following actions related to implementing the Proposed Action or its alternatives would not occur:

- The BLM would not issue a ROW, and the CPUC would not consider using this document to grant the Applicant a Certificate of Public Convenience and Necessity.
- The CDCA Plan, as amended, would not be amended to allow Project construction.
- Adverse environmental impacts outlined in this appendix, and Chapter 4 of the TES would not occur.
- The CAISO-identified interconnection between the Delaney and Colorado River Substation would not be built, and the benefits of allowing new renewable energy resources in Arizona contribute to achieving California's Renewable Portfolio Standards would not be realized.
- Enhancements to the reliability and efficacy of the western transmission system would not occur.

4.3 NON-WIRES ALTERNATIVES

Assessment of the feasibility of a non-wires scenario is a statutorily required element of the CPUC's CPCN (PUC Section1002.3). Because CEQA requires the full range of alternatives to be assessed for their environmental impact, it is the CPUC's practice to assess the feasibility of the non-wires alterative as part of the CEQA environmental review.

The non-wires solution under consideration would require the installation of 2800 GWh of lithium ion batteries capable of charging during off-peak hours and discharging during expensive peak hours, thus accruing economic benefits by competing to reduce peak energy costs. These batteries would be installed in two locations where supply of energy is expensive during peak demand due to lack of competition between suppliers, specifically, near Alamitos and Huntington Beach combined cycle gas plants.

Revenue requirements for the Project are estimated at $491 million over the 40-year life of the Project[8]. The minimum estimated revenue requirement for a lithium ion storage alternative would cost $768 million, with a life span of no more than 20 years. Given that the cost of the Project was explicitly capped by the CAISO, in order to deliver the purported economic benefits, and the non-wires alternative is significantly more expensive, it fails to satisfy the primary objective of the Project.

Furthermore, a storage solution would fail to deliver numerous system reliability benefits including the following: 1) current storage is not yet capable of delivering congestion reduction benefits for extended power transmission maintenance outages; 2) there is no additional power transmission capacity for the Arizona California intertie; 3) there is no congestion relief for the Imperial Valley intertie; and 4) storage is inflexible with regard to delivery of energy or capacity to other parts of the CASIO system. In conclusion, the non-wires solution fails to satisfy the

[8] Revenue requirement is the amount of money that a utility/developer must receive to cover its costs, operating expenses, taxes, interest paid on debts owed to investors and, if applicable, a reasonable return (profit).

primary objective of the Project and would be inefficient when compared to the potential reliability benefits derived from the Project.

The EIS did not include a non-wires alternative as part of the alternatives screening process; therefore, the CPUC conducted the following analysis to support the findings outlined in this section. The assessment of the feasibility of a non-wires scenario is a statutorily required element of the CPUC's CPCN (PUC Section1002.3). PUC Section 1002.3 states that the "Commission shall consider cost effective alternatives to transmission facilities" the solution may include "demand-side alternatives such as…energy efficiency, ultra clean distributed generation and other demand reduction resources". It is the CPUC's practice to assess the feasibility of the non-wires alterative as part of the CEQA environmental review, because CEQA requires the full range of alternatives to be assessed for their environmental impact, assessing the non-wires alterative later in the process may lead to an inadequate environmental review.

In developing a non-wires alternative, it was assumed that any alternative that could displace large amounts of energy (like the Project) and satisfy the "ultra–clean" standard would require the deployment of energy storage, or a combination of storage and renewable energy. The operation and delivery of demand side programs (such as demand response and energy efficiency) that could displace large quantities of energy over and above existing LTPP[9] planning assumptions cannot be guaranteed for the 40-year life cycle of the Project; they were therefore not considered for this alternative.

DCRT proposes to deliver the following hierarchy of benefits:

- Provide economic benefit to the CASIO ratepayers;
- Provide reliability benefits to the wider system; and
- Reduce GHG emission.

A non-wires alternative needs to demonstrate broadly similar characteristics, with the economic benefits and costs determining an alternative's ultimate viability. Given that the Project seeks to positively affect CAISO ratepayers in the broadest terms, the CAISO Balancing Authority area was considered the scale at which the non-wires scenario needs to demonstrate positive effects.

Further, the non-wires scenario does not need to exactly mimic the Project but should bring broadly similar benefits to the ratepayers. The most parsimonious solution does not have to offset energy equivalent to the energy displaced by the line at each location identified in Data Request No. 3, but only offset the total equivalent energy. Since the market behavior of a non-wires solution may be very different from the Project, any combination of locations may deliver a viable scenario.

Therefore, the primary driver used to identify a potential non-wires alternative was the ability of an alternative to deliver similar energy benefits to the CASIO system. It was estimated that when

[9] LTPP – Long Term Procurement Plan - the biennial CPUC energy procurement planning proceeding.

in service, the line would displace 853 GWh[10] of energy within California with cheaper Arizona based electricity[11]; any non-wires would need to deliver similar amounts of energy and be capable of displacing the most expensive electricity.

4.3.1 The Scenario

To develop the non-wires alternative the annual generation profiles for the power generation sites that are most likely to be affected by the Project were reviewed[12]. In the 2026 simulation profiles, both Huntington Beach and Alamitos are operating close to full capacity for more than 80% of the year between 18:00 and 21:00 in the evening[13]. This generation profile provides the best opportunity for a storage solution to efficiently compete with existing generation, because it would maximize the likelihood for the use of the storage.

A plausible lithium-ion storage solution that could provide similar capacity (700 megawatts [MW]) and potentially displace a similar amount of energy (up to 975.1 gigawatt hours [GWh]) was identified. The minimum storage scenario would install 2,800 MWh of Li ion storage split equally between the two locations identified as benefiting most from the Project; no smaller solution that satisfied the energy parameters could be identified. For context, 400 MW of storage have been deployed in the United States between 2011 and 2015[14].

4.3.2 Analysis

The development of a non-wires scenario that satisfies energy displacement criteria highlights the contrast between a non-wires scenario and the Project for other crucial performance parameters, such as capital cost, capacity benefits, and operational value (including longevity and lifetime cost), as well as GHG reduction benefits and reliability improvement to the system.

4.3.3 Cost

Revenue requirements for the proposed line are estimated at $494 million over the 40-year life span of the line[15]. Since the Project is a cost capped line, any non-wires solution should demonstrate similar lifetime costs to ensure a like-for-like comparison. Based on assumptions developed in the Lazard 2016 white paper, a lithium ion storage-based alternative would have revenue requirements[16] of between 1.6-3.4 times those for the Project. The minimum estimated revenue requirement for a lithium ion storage-based non-wires alternative, that could deliver the equivalent energy and capacity would cost from $768 million-$1,673 million, with a life span of

[10] DCRT Response to Data Request 3 - List of locations where generation would be displaced.

[13] IBID.
[14] Deployment of Grid-Scale Batteries in the United States – David Hart and Alfred Sarkissian for DOE 2016.
[15] Ten West Link Economic and Public Benefits Cost Analysis, July 31, 2017 Brattle Group
[16] Revenue requirement is the amount of money that a utility/developer must receive to cover its costs, operating expenses, taxes, interest paid on debts owed to investors and, if applicable, a reasonable return (profit).

no more than 20 years[17]. Other available estimates put the cost at 5-6 times greater[18]. Given that the Project was explicitly cost capped by the CAISO[19] in order to deliver the economic benefits, the non-wires solution performs extremely poorly with respect to potential economic benefits.

4.3.4 Reliability

Furthermore, the non-wires alterative would have limited contribution to the overall reliability across the CAISO system. While the non-wires solution may improve reliability in specific locations, it would not deliver system-wide reliability benefits, nor would it provide CAISO with the operational flexibility of the Project. The Project would provide additional capacity during scheduled prolonged outages on the Arizona – California transmission pathway. The non-wires alternative would not provide the following reliability benefits:

- Additional capacity for import/export from/to Central California (Pacific Gas and Electric [PG&E]) and from/to the Pacific Northwest are not realized.
- Lower benefit on congestion relief for Arizona-California and Nevada-California paths.
- Transmission system reinforcement is not provided. Vulnerability for outages is greater, increase probability of load or generation dropping.
- Ten-West Link transmission capacity is 5-6 times greater than the alternative storage capacity. New generation in Arizona and Nevada could not get to market in Southern California.
- New line support of transmission voltages not provided.
- Less contribution to spinning reserve requirements of Southern California.
- No contribution to intertie scheduling constraints.

4.3.5 Greenhouse Gas Emissions

The GHG emissions of the non-wires alternative is determined by the net difference between the energy profile during battery recharge and the energy profile of the displaced energy. Battery discharge would likely compete with peak gas generation usage, which would typically be between 18:00 hours and 21:00 hours, and recharge would occur between 0:00 hours and 16:00 hours[20]. Battery re-charge would use the cheapest available generation during any 24-hour cycle, this could be either excess solar that would otherwise be curtailed during daytime peak generation, or displaced gas generation available during off peak. Given the wide range of potential recharge opportunities it is not possible to determine whether the batteries would shift

[17] Based on assumptions in Lazard's Levelized Cost of Storage—Version 2.0 December 2016.
[18] Battery Cost Research, November 2017, Brattle Group
[19] CAISO 2013-2014 Transmission Plan.
[20] DCRT Response to Data Request 4 – Baseline Annual Generation Profiles.

the time of use or displace gas generation. Consequently, it is not possible to determine whether use of batteries would reduce GHG emissions by simply out competing gas plants.

4.3.6 Analysis

In conclusion, for the above economic and system reliability reasons, a non-wires solution was screened out and not carried forward for analysis.

4.4 ENVIRONMENTALLY SUPERIOR ALTERNATIVE (CEQA)

CEQA Guidelines Section 15126.6(e)(2) requires the identification of an "environmentally superior alternative." As discussed in Section 4.2, selection of the no project alternative would avoid all of the adverse impacts disclosed in Chapter 4 of the TES (BLM 2019), as well as those identified in this appendix. Therefore, the no project alternative is the environmentally superior alternative. Section 4.2 also discloses that if the no project alternative were to be selected, none of the Project's benefits would be realized.

To balance the Project's benefits with its potential adverse effects, the CEQA Guidelines Section 15126.6(e)(2) indicates that "if the environmentally superior alternative is the 'no project' alternative, the EIR shall also identify the environmentally superior alternative among the other alternatives." Based on the environmental analysis, Alternative 2, the BLM Utility Corridor Route, utilizing Subalternative 4D has been identified as the environmentally superior Alternative. This is consistent with the BLM's finding that Alternative 2, utilizing Subalternative 4D, is the Agency Preferred Alternative in the EIS.

A description of Alternative 2, the BLM Utility Corridor Route, utilizing Subalternative 4D, is outlined in the EIS. Subalternative 4D, that would be utilized in conjunction with Alternative 2, is located in Arizona, and is included to reduce adverse impacts on visual and recreation resources and that would occur if the Project or Alternative 2 were selected. Therefore, environmental impacts in California would be the same under Alternative 2 and Alternative 2 with Subalternative 4D included. As stated in the EIS, under the Agency Preferred Alternative/Environmentally Superior Alternative, the BLM would approve a total of 21.8 miles of 200-foot wide ROW within existing designated utility corridors along the following segments in California: p-15 through p-16; x-15 and x-16; ca-07 and ca-09; and x-19.

In California, the Agency Preferred/Environmentally Superior Alternative is comprised of segments selected to:, emphasize the use of BLM utility corridors; consolidate development and disturbance with existing disturbance, such as along portions of the already impacted DPV1 transmission line route; avoid residential and other development east and south of Blythe; consolidate development along the existing DPV1 transmission line route across private lands in California; and avoid the culturally sensitive area in the vicinity of the Mule Mountains southwest of Blythe (Segments p-17 and p-18).

While the use of alternative Segments x-19, ca-9, and ca-07, in lieu of Segments p-17 and p-18, provides the advantages listed above, the alternative segments cross known occurrences of Harwood's eriastrum and fringe-toed lizard habitat that would not be crossed by the Project; however, habitat for these species also exists with the Project ROW. To further reduce and avoid

potential impacts to biological resources resulting from the implementation of the Agency Preferred/Environmentally Superior Alternative, the BLM would amend the CDCA Plan to state:

> The Ten West Link Project is authorized to include construction within 0.25 mile of occurrences of Harwood's eriastrum, provided that a Linear Right-of-Way Rare Plant Protection Plan for Harwood's eriastrum is developed and approved by the California State Director. The Rare Plant Linear ROW Protection Plan would meet the DRECP goal of promotion of the ecological processes in the BLM DA that sustain vegetation types of focus and BLM special status species and their habitat. The Rare Plant Linear ROW Protection Plan would have the objectives of:
>
> 1. Avoidance of take of Harwood's eriastrum individuals to the maximum extent practical[1]; and
>
> 2. Avoidance of impacts to Harwood's eriastrum suitable habitat to the maximum extent practical.

If Alternative 2 is selected, the California State Director will approve the Harwood's eriastrum Rare Plant Linear ROW Protection Plan and Fringe-toed Lizard Linear ROW Protection Plan prior to ground or vegetation disturbing activities commencing on public lands in California. Doing so will avoid impacts to known populations of Harwood's eriastrum located within the proposed ROW for Alternative 2, reducing potential Project-related impacts to less than significant.

While Alternative 2 crosses known occurrences of Harwood's eriastrum and fringed-toed lizard habitat, it would also avoid impacts to sensitive cultural resources located along Segments p-18 and p-17, when compared to the Project. Additionally, Alternative 2 is located within a BLM-designated utility corridor in California and, like the Project, is mostly located adjacent to existing utility lines. Alternative 2 would reduce impacts on cultural resources and visual resources in Arizona (by avoiding the Kofa NWR), while impacts on land use, tribal resources, hazards, noise, and visual resources would be similar, when compared to the Project. Alternative 2, Subalternative 4D would also reduce visual resource impacts (though amendments to the Yuma RMP would be included) and avoid biological, recreation, and land use impacts associated with crossing the Kofa National Wildlife Refuge in Arizona, when compared to the Project. Therefore, Alternative 2, the BLM Utility Corridor Route, utilizing Subalternative 4D would be the environmentally superior alternative under CEQA.

A comparison of Alternative 2 with Subalternative 4D is provided in the EIS, including environmental impacts and associated benefits.

[1] See definition of maximum extent practical in the Glossary of Terms, EIS Appendix 6.

5.0 OTHER CEQA

This section describes other statutorily required topics, including growth-inducing impacts. It also provides a discussion of energy conservation as required by Section 15126.4 of the CEQA Guidelines.

5.1 GROWTH INDUCING IMPACTS

A project could induce growth if it results in additional development, such as an increase in population, employment, and/or housing above and beyond what is already anticipated in local and regional land use plans or in projections made by regional planning authorities, irrespective of the Project. As detailed in the EIS, the Project is responding to CAISO power demands. Under CEQA (Section 15126.2(d)), a project would be growth inducing if it:

- Directly or indirectly fosters economic or population growth or the construction of additional housing;
- Taxes community facilities to the extent that the construction of new facilities would be necessary;
- Removes obstacles to population growth; or
- Encourages or facilitates other activities that cause significant environmental effects.

Typical growth-inducing factors may include the extension of urban services or transportation infrastructure to a previously unserved or under-served area or the removal of major barriers to development. As described in Section 4.15 of the TES (BLM 2019), the Project would not build or induce housing or otherwise result in growth or secondary development. This section evaluates the Project's potential to create such growth inducements. It should "not be assumed that growth in any area is necessarily beneficial, detrimental, or of little significance to the environment" (CEQA Section 15126.2(d)).

The CPUC's CEQA objectives for the Project are as follows:

- Construct and operate an economically and technically feasible 500kV electric transmission line and associated infrastructure with conductor capacity of approximately 3,200 MW between the Colorado River Substation and the Delaney Substation that meets CAISO-specified electrical characteristics.
- Complete construction and achieve commercial operation in accordance with the terms of the Approved Project Sponsor Agreement with CAISO.
- Provide new transmission infrastructure to facilitate development and interconnection to the bulk transmission system for new renewable energy resources in the region.
- Develop, construct, maintain, and operate transmission infrastructure that is consistent with the laws, regulations, orders, guidelines, standards, and criteria of the NERC, WECC, Federal Energy Regulatory Commission (FERC), CAISO, ACC, and CPUC

and that meets the substation interconnection requirements of APS and SCE and in-compliance with Project permits, licenses, and approvals.

- Utilize existing utility corridors, roads, and infrastructure to the extent feasible to meet the other above-listed Project objectives wherever consistent with minimizing impacts.

The Project responds to growth and demand trends identified by CAISO, and state and federal reliability standards require continuous availability of reliable power. It accommodates anticipated growth – including renewable energy facilities in the vicinity of Colorado River Substation – and no significant Project-related growth-inducing impacts are anticipated.

Further, the applicant would hire a local construction workforce, and outside contractors would only be required if local contractors were not available. Due to the temporary nature of the employment, workers are not expected to relocate to the area in numbers that would result in a significant impact (Section 4.15 of the TES [BLM 2019]). In the event that a small number of workers did relocate to the area, the number would be very minor compared to the area's total population, and numerous temporary lodging facilities, such as hotels and motels, would be available. New housing facilities would not be required.

The Project would not indirectly induce growth as any increases in housing associated with additional electric capacity would be subject to local approvals and permits.

5.2 ENERGY CONSERVATION

Public Resources Code Section 21100(b)(3) requires EIRs to describe, where relevant, the wasteful, inefficient, and unnecessary consumption of energy caused by a project. The Project would accommodate nearby renewable energy generation facilities, helping to offset the use of nonrenewable resources and contribute to an overall reduction of nonrenewable resources currently used to generate electricity. APM AQ-02 would implement measures encouraging use of natural gas- or electric-powered vehicles for light-duty trucks where feasible and available.

The USEPA regulates non-road diesel engines. The USEPA has no formal fuel economy standards for non-road (e.g., construction) diesel engines but does regulate diesel emissions, which indirectly affect fuel economy. In 1994, the USEPA adopted the first set of emissions standards (Tier 1) for all new non-road diesel engines greater than 37 kilowatts (50 hp). The Tier 1 standards were phased in for different engine sizes between 1996 and 2000, reducing NOx emissions from these engines by 30 percent. The USEPA has since adopted more stringent emission standards for NOx, hydrocarbons, and particulate matter from new non-road diesel engines. This program includes the first set of standards for non-road diesel engines that are less than 37 kW. It also phases in more stringent Tier 2 emission standards from 2001 to 2006 for all engine sizes and adds yet more stringent Tier 3 standards for engines that are between 37 and 560 kW (50 and 750 hp) from 2006 to 2008. These standards will further reduce non-road diesel engine emissions by 60 percent for NOx and 40 percent for PM from Tier 1 emission levels. In 2004, the USEPA issued the Clean Air Non-road Diesel Rule. This rule, which took effect in 2008 and was fully phased in by 2014, will cut emissions from non-road diesel engines by more than 90 percent. These emission standards are intended to promote advanced clean technologies

for non-road diesel engines that improve fuel combustion, but they also result in slight decreases in fuel economy.

Construction activities associated with the Project would result in the consumption of petroleum-based fuels. There are no unusual Project characteristics that would necessitate the use of construction equipment that would be less energy efficient than at comparable construction sites in other parts of the state.

Construction operations are expected to last 16 months in total. Fuel consumption would occur from off-road vehicles such as backhoes and scrapers, as well as from on-road commuter and delivery traffic. All fuel usage calculations were derived by establishing the liters per machine hour (LPMH). LPMH equals the kilogram of fuel used per brake horsepower/hour (K) x gross horsepower (GHP)_x load factor (LF)/ weight of fuel (KPL) with the exception of the Chinook and MD500 helicopters. Hourly consumption rates were obtained via the Aviation Training Library[21] and multiplied by the number of units, hours per day and total working days.

All equipment was established for each construction element of the Project beginning with geotechnical investigation and ending with substation equipment installation. The LPMH value for each piece of equipment was determined and converted to gallons per hour. Note the K and KPL values were established for both diesel and gasoline (used for pickups) from Table 3.3 of the Cost Control in Forest Harvesting and Road Construction Manual developed by the Food and Agriculture Organization of the United Nations (FAO 1992). The total number of each piece of equipment was tallied along with hours per day of operation and the total number of days for each construction phase.

During the 16-month construction, it is estimated that 28.34 million gallons of off-road diesel fuel and 1.25 million gallons of gasoline would be consumed. Various stages of construction would utilize more equipment than others. Therefore, fuel consumption is not proportional by month and would vary based on intensity of each phase.

On-road fuel usage associated with construction was determined from the Air Quality Baseline Report (HDR 2017b). The report estimated that each commuting worker would travel 100 miles each workday. Based on total number of crew days, the estimated commuter mileage over 16 months was 3.4 million miles. It was also assumed that the ratio for passenger cars to light duty trucks was 1:1 or 50% of each. Delivery truck mileage was determined by equipment transportation estimates. The total daily average fuel consumption estimated is 2,215 gallons and 1.06 million gallons over 16 total months (mostly from delivery vehicles).

It is expected that construction fuel consumption associated with the Project would not be any more inefficient, wasteful, or unnecessary than at other construction sites in the region.

[21] Aviation Training Library – 400 gal/hr for the Chinook and 29 gal/hr for the MD500 https://www.iat.gov/aircraft_library/index.asp

Vehicle fuel efficiency is regulated at the federal level. Pursuant to the Federal Energy Policy and Conservation Act of 1975, the National Highway Traffic and Safety Administration is responsible for establishing additional vehicle standards and for revising existing standards. The fuel economy standard for new passenger cars has been 27.5 miles per gallon since 1990. The fuel economy standard for new light trucks (gross vehicle weight of 8,500 pounds or less) has been 20.7 miles per gallon since 1996. Heavy-duty vehicles (i.e., vehicles and trucks over 8,500 pounds gross vehicle weight) are not currently subject to fuel economy standards. Compliance with federal fuel economy standards is not determined for each individual vehicle model; rather, compliance is determined on the basis of each manufacturer's average fuel economy for the portion of its vehicles produced for sale in the United States.

Operations and maintenance activities would occur at two different time cycles. Typical procedures would occur annually while more extensive operations would result every five years. It is estimated that 85,628 gallons from off-road activities would be consumed annually. Every five years would see an additional 63,745 gallons of fuel consumed.

On-road activities associated with operations and maintenance would also occur annually and once every five years. Commuter travel is estimated to consume 431 gallons of gasoline each year and approximately 3.4 gallons per day. During the five year cycle an additional 371 gallons of gasoline would be consumed; as would 656 gallons of diesel fuel from delivery trucks. As such, it would be expected that vehicular fuel consumption associated with the Project would not be any more inefficient, wasteful, or unnecessary than for any other similar land use in the region.

Once operational, the Project would facilitate development and interconnection to the bulk transmission system for new renewable energy resources in the region and facilitate development of new renewable energy. Interconnection of utility-scale renewable energy projects would offset the Project's construction-related fossil fuel consumption and help California, and other states in the California Independent System Operator balancing authority network, further reduce their reliance on energy sources with higher carbon footprint.

By facilitating the transmission of renewable energy resources, the Project would be consistent with state policies to encourage renewable energy. The state has established goals for the percentage of renewable energy resources that comprise retail electricity sales in California. These goals are described below.

Senate Bill (SB) 1078 established the California Renewables Portfolio Standard (RPS) Program and required that a retail seller of electricity purchase a specified minimum percentage of electricity generated by eligible renewable energy resources as defined in any given year, culminating in a 20% standard by December 31, 2017. These retail sellers include electrical corporations, community choice aggregators, and electric service providers. The bill relatedly required the CEC to certify eligible renewable energy resources, design and implement an accounting system to verify compliance with the RPS by retail sellers, and allocate and award supplemental energy payments to cover above-market costs of renewable energy.

SB 107 (2006) accelerated the RPS established by SB 1078 by requiring that 20% of electricity retail sales be served by renewable energy resources by 2010 (not 2017). Additionally, SB X1-2 (2011) requires all California utilities to generate 33% of their electricity from eligible renewable energy resources by 2020. Specifically, SB X1-2 sets a three-stage compliance period: by December 31, 2013, 20% had to come from renewables; by December 31, 2016, 25% had to come from renewables; and by December 31, 2020, 33% will come from renewables.

SB 350 (2015) expanded the RPS because it requires retail seller and publicly owned utilities to procure 50% of their electricity from eligible renewable energy resources by 2030, with interim goals of 40% by 2024 and 45% by 2027.

SB 100 (2018) accelerated and expanded the standards set forth in SB 350 by establishing that 44% of the total electricity sold to retail customers in California per year by December 31, 2024, 52% by December 31, 2027, and 60% by December 31, 2030 be secured from qualifying renewable energy sources. SB 100 also states that it is the policy of the state that eligible renewable energy resources and zero-carbon resources supply 100% of the retail sales of electricity to California. This bill requires that the achievement of 100% zero-carbon electricity resources does not increase the carbon emissions elsewhere in the western grid and that the achievement not be achieved through resource shuffling.

6.0 MITIGATION MONITORING AND REPORTING PROGRAM

The purpose of this MMRP is to ensure effective implementation of the applicant proposed APMs and MMs required by the CPUC that the applicant has agreed to implement as part of the Project. Appendix 2A of the EIS lists the APMs/BMPs that would be implemented and included as part of the Project. Table 7-1 details the monitoring and reporting requirements for each APMs/BMPs and MMs, including:

- Each potential impact identified in Section 2;
- APMs/BMPs and MMs that the applicant are required to implement as part of the Project;
- Monitoring requirements; and
- Timing for implementation of the APMs/BMPs and MMs.

A BLM or CPUC-designated environmental monitor (or monitors) will monitor construction of the Project to ensure full implementation of each APM and MM. In all instances where non-compliance occurs, the designated environmental monitor will issue a warning to the construction supervisor and the applicant's project manager. Continued non-compliance will be reported to the BLM and CPUC project managers. Any decisions to halt work due to non-compliance will be made by the BLM and CPUC. The designated environmental monitor will keep a record of any incidents of non-compliance with mitigation measures, APMs, or other conditions of project approval. Copies of these documents will be supplied to the applicant. This MMRP is a draft program and would be finalized if the BLM and CPUC approve the Project and issue a ROW/CPCN. At that time, final MMs would be incorporated into the program and the roles and responsibilities for their implementation refined.

The following procedure will be observed for dispute resolution between CPUC staff and the project proponent:

- Disputes and complaints should be directed to the CPUC Project Manager for resolution.
- Should this informal process fail, the CPUC Project Manager may initiate enforcement or compliance action to address deviations from the approved project.

Table 6.1-1 Applicant Proposed Measures, Best Management Practices, Conservation and Management Actions, and Mitigation Measures for the Project

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
Aesthetics				
Impact AES-3	**APM AES-01: Vegetation Removal and Grading.** During Project construction activities, grading and the amount of existing vegetation cleared from the route would be kept to the minimum required for access by Project construction as much as practicably possible. This approach is further described in the BIO-14. Grading would occur as minimally as practicable and would follow the existing land contours as much as possible.	Confirm that grading is minimal.	Construction	The Applicant
Impact AES-3	**APM AES-02: Work Area Reclamation.** On completion of the Project, all construction material and debris from the permanent easement and temporary staging areas would be removed and the areas restored. All work areas, and areas around new transmission structures, would be re-graded to previous land contours and re-vegetated to and restored them to an appearance that would blend into the overall landscape context. This approach is further described in the BIO-15 to as close to preconstruction conditions as feasible.	Verify that the Applicant removes all construction material, re-grade, re-vegetate, and restore all disturbed land.	Post-construction	The Applicant
Impact AES-3	**BMP AES-02: Work Area Reclamation.** Work area reclamation would include pulling and tensioning sites; all disturbed work areas associated with the Project.	Confirm that all disturbed work areas are reclaimed.	Post-construction	The Applicant
Impact AES-3 Impact AES-4	**BMP AES-04: Visual Contrast.** Color treatment of transmission structures would be applied in all areas deemed necessary by the BLM. The BLM would select/approve the color treatment to be applied under AES-04. Color treatment would be applied to Project components, such as the SCS and fencing. All conductor would be non-specular, and all structures, whether color treated or not, would have a dull, non-reflective surface.	Ensure that all transmission structures are color treated in accordance with BLM requirements.	Design Construction	The Applicant
Impact AES-3	**APM AES-05: Location.** Collocate the transmission line as close as possible to	Confirm that transmission	Design	The Applicant

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
	existing transmission lines of similar size and design (while maintaining the required 250-foot setback) to minimize the overall visual impact of the Project on the surrounding areas. Keeping the proposed transmission line within the same general corridor as existing transmission lines would reduce the spread of visual impacts from areas previously not affected. Collocating with existing transmission lines would also reduce the need to construct new access roads and their associated visual impacts. (Captures BLM BMP for Reducing Visual Impacts of REFs 6.2.10 – Collocate Linear Features in Existing ROWs or Corridors.)	line is collocated as close as possible to existing transmission lines.		
Impact AES-3	**APM AES-06: Siting Staging and Laydown Areas.** The Project will avoid siting, staging and laydown areas in visually sensitive areas to the extent practicable. Staging areas would be located close to transportation access points and would be sited to take advantage of previously disturbed areas to the extent practicable. Staging areas would be located close to transportation access points and would be sited to take advantage of previously disturbed areas to the extent practicable.	Confirm staging and laydown areas are not located in visually or biologically sensitive areas and are previously disturbed.	Design	The Applicant
Impact AES-3	**BMP AES-06: Siting Staging and Laydown Areas.** Additionally, AES-06 would apply to all Project work areas. Also, work areas would be located to minimize impacts, including but not limited to biological and visual.	Confirm staging and laydown areas are not located in visually or biologically sensitive areas and are previously disturbed.	Design	The Applicant
Impact AES-3	**BMP AES-07: Avoid Siting Linear Features in the Centers of Valley Bottoms and on Ridgetops.** The eye follows strong natural lines in the landscape, and these lines and associated landforms can “focus” views on particular landscape features. For this reason, linear facilities associated with renewable energy projects, such as transmission line ROWs, should be sited to avoid running across the centers of valley bottoms, and to avoid ridgetop	Confirm linear features are not sited in the centers of valley bottoms or on ridgetops.	Design	The Applicant

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
	bisection (i.e., routing the ROWs perpendicular to and over ridgelines).			
Impact AES-3	**BMP AES-08: Avoid Skylining.** "Skylining" of transmission/communication towers and other structures should be avoided. Transmission/communication towers and other structures should not be placed on ridgelines, summits, or other locations where they would be silhouetted against the sky. Skylining draws visual attention to the Project elements and can greatly increase visual contrast. Siting should take advantage of opportunities to use topography as a backdrop for views of facilities and structures to avoid skylining. Roads may be less visible if located along ridgetops, but if they are located on the ridge face, they can be highly visible because of increased cut, fill, and side cast material.	Confirm "skylining" of transmission/ communication towers and other structures is avoided.	Design	The Applicant
Impact AES-3	**BMP AES-09: Site Linear Facilities along Natural Lines within the Landscape.** Siting of facilities, especially linear facilities (e.g., transmission lines, pipelines, roads), should take advantage of natural lines within the landscape (e.g., natural breaks in the landscape topography, the edges of clearings, or transitions in vegetation). Siting of facilities on steep slopes should be avoided. Siting linear facilities along naturally occurring lines in the landscape can reduce apparent contrast through repetition of the line element or through combination of multiple line elements into a single line element. Facilities sited on steep slopes are often more visible (particularly if either the project or viewer is elevated); they may also be more susceptible to soil erosion, which could also contribute to negative visual impacts.	Confirm that linear facilities are not on sited on steep slopes.	Design	The Applicant
Impact AES-3	**BMP AES-10: Use Monopole, Guyed, and Lattice Electric Transmission Towers Appropriately.** Consideration should be given to the appropriate choice of monopoles versus guyed or lattice towers for a given landscape setting. Lattice or guyed towers are less visually obtrusive on the rural landscape than monopoles, especially when placed half a mile or more from KOPs and against a landscape backdrop. When transmission towers are placed within a half mile or less from KOPs, then monopoles would occupy a smaller	Confirm that monopole, guyed, and lattice electric transmission towers are used appropriately.	Design	The Applicant

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
	field of view than lattice towers. Monopoles are often more appropriate within built or partially built environments, while lattice or guyed towers tend to be more appropriate for less-developed rural landscapes, where the latticework would be more transparent against natural background textures and colors. Where transmission facilities are to be collocated in ROWs or corridors, and the existing ROW or corridor has either lattice towers only, guyed towers only, or monopoles only, the same tower type should be selected for new transmission facilities within the ROW/corridor.			
Impact AES-3	**BMP AES-11: Use Air Transport to Erect Transmission Towers**. In areas of the highest visual sensitivity, air transport capability should be used to mobilize equipment and materials for clearing, grading, and erecting transmission towers. The use of air transport capability preserves the natural landscape conditions between tower locations and may reduce the need for construction roads.	Ensure that air transport is used to erect transmission towers.	Construction	The Applicant
Impact AES-3	**BMP AES-12: Reclamation to Reduce Visual Impacts.** The Reclamation plan for the Project would include measures designed to reduce long-term impacts to visual resources.	Review adequacy of and implementation of Reclamation plan.	Pre-construction	The Applicant
Impact AES-3	**BMP AES-13: Shifts in Alignment to Reduce Visual Impacts.** The specific location of the Project within the study area would be determined based on micro-siting of Project components and new disturbance associated with access and work areas to reduce, minimize, or eliminate visual impacts.	Ensure that the project alignment reduces visual impacts.	Design	The Applicant
Impact AES-3 Impact AES-4	**APM AES-15: Lighting.** Limited lighting would be used during night construction to ensure safe working conditions while limiting the overall lighted area. To the extent practicable, lighting would be directed in a downward position to minimize impacts to night sky.	During night construction ensure that limited lighting is used, and that lighting is directed downward.	Construction	The Applicant
Impact AES-3	**CMA LUPA-VRM-1.** Manage visual resources in accordance with the VRM	Ensure that visual resources are managed in	Design	The Applicant

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
	Classes shown on Figure 9 (See CDCA Plan).	accordance with the VRM classes.		
Impact AES-3	**CMA LUPA-VRM-2.** Ensure that activities within each of the VRM Class polygons meets the VRM objectives described above, as measured through a visual contrast rating process.	Ensure that activities within each of the VRM Class polygons meets the VRM objectives described above.	Design	The Applicant
Impact AES-3	**CMA LUPA-VRM-3.** Ensure that transmission facilities are designed and located to meet the VRM Class objectives for the area in which they are located. New transmission lines routed through designated corridors where they do not meet VRM Class Objectives will require RMP amendments to establish a conforming VRM Objective. All reasonable effort must be made to reduce visual contrast of these facilities in order to meet the VRM Class before pursing RMP amendments. This includes changes in routing, using lattice towers (vs. monopole), color treating facilities using an approved color from the BLM Environmental Color Chart CC-001 (dated June 2008, as updated on April 2014, or the most recent version) (vs. galvanized) on towers and support facilities, and employing other BMPs to reduce contrast. Such efforts will be retained even if an RMP amendment is determined to be needed. Visual Resource BMPs that reduce adverse visual contrast will be applied in VRM Class conforming situations. For a reference of BMPs for reducing visual impacts see the "*Best Management Practices for Reducing Visual Impacts of Renewable Energy Facilities on Bureau of Land Management-Administered Lands"*, or the most recent version of the document or BMPs for VRM, as determined by BLM.	Ensure that transmission facilities are designed and located to meet the VRM Class objectives for the area in which they are located.	Design	The Applicant
Impact AES-3	**CMA DFA-VPL-VRM-1.** Encourage development in a planned fashion within DFAs (e.g., similar to the planned unit development concept used for urban design—i.e., in-fill vs. scattered development, use of common road networks,	Encourage development in a planned fashion within DFAs.	Design	The Applicant

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
	Generator Tie Lines etc., use of similar support facility designs materials and colors etc.) to avoid industrial sprawl.			
Impact AES-3	**CMA DFA-VPL-VRM-2**. Development in DFAs and VPLs are required to incorporate visual design standards and include the best available, most recent BMPs, as determined by BLM (e.g. Solar, Wind, West Wide Energy Corridor, and Geothermal PEISs, the "*Best Management Practices for Reducing Visual Impacts of Renewable Energy Facilities on BLM-Administered Lands*", and other programmatic BMP documents).	Ensure that the Project incorporates visual design standards and include the best available, most recent BMPs, as determined by BLM.	Design	The Applicant
Impact AES-3	**CMA DFA-VPL-VRM-3.** Required visual resource BMPs. All development within the DFAs and VPLs will abide by the BMPs addressed in the most recent version of the document "*Reducing Visual Impacts of Renewable Energy Facilities on BLM-Administered Lands*", or its replacement, including, but not limited to the following: • Transmission: o Color-treat monopoles Shadow Gray per the BLM Environmental Color Chart CC001 unless a more effective color choice is selected by the local Field Office VRM specialist. o Lattice towers and conductors will have non-specular qualities. o Lattice Towers will be located a minimum of 3/4 mile away from KOPs such as roads, scenic overlooks, trails, campgrounds, navigable rivers, and other areas people tend to congregate and located against a landscape backdrop when topography allows.	Ensure that the transmission Visual Resource BMPs are implemented.	Design	The Applicant
Impact AES-3	**CMA DFA-VRM-1**. Manage all DFAs as VRM Class IV to allow for industrial scale development. Employ BMPs to reduce visual contrast of facilities.	Ensure that BMPs to reduce visual contrast are	Design	

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
		implemented.		
Impact AES-3	**CMA DFA-VRM-2.** Regional mitigation for visual impacts is required in DFAs. Mitigation is to be based on the VRI Class and the underlying visual values (scenic quality, sensitivity, and distance zone) for the activity area as it stands at the time the ROD is signed for the DRECP LUPA. Compensatory mitigation may take the form of reclamation of other BLM lands to maintain (neutral) or enhance (beneficial) visual values on VRI Class II and III lands. Other considerations may include acquisition of conservation easements to protect and sustain visual quality within the viewshed of BLM lands. The following mitigation ratios will be applied in DFAs: • VRI Class II 1:1 ratio	Ensure that a 1:1 ratio is applied for visual impact mitigation.	Design	The Applicant
Impact AES-3	**MM VIS-03:** Apply surface treatments (such as Permeon, or an approved equal) to newly exposed rock and gravel to blend with surrounding rock face and minimize visual impact of attention-attracting disturbance. Standards for Success: Long-term land scaring is prevented during construction and the surface treatment shall blend with the exiting natural environment, not detract from the existing visual environment.	The Applicant shall verify that Permeon will be used throughout construction. If Permeon is not available, then the Applicant shall identify a suitable replacement treatment that is approved by the CPUC and BLM prior to any ground disturbing activities.	The use of surface treatments shall be utilized throughout any ground disturbing activities.	The Applicant shall ensure that appropriate surface treatment is utilized throughout ground disturbing activities to prevent long-term land scaring.
Impact AES-3	**MM VIS-04.** Limit height of structures to what is absolutely necessary for safety and operation in order to minimize skylining and reduce the need for beacons to protect dark sky resources and maintain astronomical viewing opportunities. Standards for Success: Prevention of long-term impacts associated with	The Applicant shall submit design plans to the CPUC who shall review the plans and approve heights. If heights are required that will include	Heights of structures shall be determined during the design phase, prior to	The Applicant shall be responsible for implementation of this measure during the design phase, to avoid design

	unnecessary heights for the transmission lines and/or reduction of operational lighting impacts.	the use of night beacons; the Applicant shall incorporate these lighting requirements consistent with APM AES-15.	construction.	conflicts that could result in unnecessary heights of transmission lines.
Impact AES-3	**MM VIS-06:** Use structure type to match existing structures and reduce form contrast. Standards for Success: Prevention of long-term impacts associated with structures standing out in the natural visual environment. Instead, any structures shall blend with the existing visual environment.	The Applicant shall ensure that structures are built to blend with surrounding structures (if any) including buildings, other transmission lines (such as monopole, guyed, or lattice electric transmission lines), and roadways which shall be consistent with BMP AES-10. Colors and finishes of Project structures shall consist of natural colors (i.e. browns and greys).	Structure type and finishes shall be determined during the design phase, prior to construction.	The Applicant shall be responsible for implementation of this measure prior to construction, during the design phase, to avoid design conflicts that could result in Project structures that do not match the existing visual environment.
Impact AES-3 Impact AES-4	MM VIS-CEQA-1: Implement Aesthetics Applicant Proposed Measures, Best Management Practices, and Conservation and Management Actions. The APMs, BLM BMPs, and CMAs in Sections 2.1.2 and 2.1.3 above provide a suite of measures, practices, and actions that shall be implemented as part of the Project. APMs, BMPs, and CMAs shall be implemented prior to, or during all ground disturbance and construction related activities to avoid or minimize Project related impacts to aesthetic and visual resources. These APMs, BMPs,	The Applicant shall develop a weekly report that shall include all applicable APMs, BMPs, and CMAs and the related actions taken in order to be in compliance with these measures. These	APMs, BMPs, and CMAs shall be implemented throughout construction activities.	The Applicant shall ensure that all APMs, BMPs, and CMAs are implemented during construction. If an APM, BMP, or

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
	and CMAs include; APM AES-01, APM AES-02, BMP AES-02, BMP AES-04, APM AES-05, APM AES-06, BMP AES-06, BMP AES-07, BMP AES-08, BMP AES-09, BMP AES-10, BMP AES-11, BMP AES-12, APM AES-15, CMA LUPA-VRM-1, CMA LUPA-VRM-2, CMA LUPA-VRM-3, CMA DFA-VPL-VRM-1, CMA DFA-VPL-VRM-2, CMA DFA-VPL-VRM-3, CMA DFA-VRM-1, CMA DFA-VRM-2. If an APM, BMP, or CMA is subjective, such as containing text that states; "where appropriate," "where applicable," "where feasible," or similar language, the BLM and CPUC shall be consulted to determine the applicability of each measure prior to the disturbance of a covered resource. Compliance with APMs, BMPs, and CMAs shall be documented, and a weekly report shall be provided to the BLM and CPUC. The Applicant shall provide a synopsis of the weekly reports to the BLM and CPUC monthly. The report shall include a summary of the construction activities completed, a list of compliance actions and any remedial actions taken to correct any actions, and the status of ongoing mitigation efforts. Standards for Success: Compliance with all applicable APMs, BMPS, and CMAs is achieved throughout construction of the Project.	weekly reports shall be compiled and submitted to the BLM and CPUC monthly.		CMA is subjective, the Applicant shall consult with the BLM and/or the CPUC to determine the applicability of each measure.
Agriculture				
Impact AG-5	MM AG-CEQA-1: Coordination with the Metropolitan Water District of Southern California. The Applicant shall consult with the MWD of Southern California for any Project work occurring within lands under this jurisdiction of the MWD of Southern California during the development of the Project design phase. If Project work shall occur within lands designated as under the jurisdiction of the MWD of Southern California, the Applicant will work with the MWD of Southern California to locate transmission structures adjacent to existing	The Applicant shall keep a record of consultation with MWD of Southern California, including during design and Project implementation. If any further measures are identified and/or actions are taken for construction	Consultation with MWD of Southern California shall occur during the design phase of the Project and notification of construction shall	The Applicant shall be responsible for consultation and coordination with MWDSC.

	electrical infrastructure to consolidate potential obstructions to the movement of agriculture machinery or other agricultural activities, locate access roads and staging areas away from agricultural lands and operations, and limit the use of pesticides near agricultural lands. Further if dust control measures (see MM AQ-CEQA-1 under Section 2.3.7) or weed control measures (See MM VEG-CEQA-1 under Section 2.4.6) are required for Project work occurring within MWD of Southern California's jurisdiction, these measures will also require review and approval by the MWDSC for work within agricultural lands under their jurisdiction. Specifically, if Project work will occur within MWD of Southern California lands that are used for farming organic crops, chemicals used within these lands shall be prohibited. The Applicant will work with the MWD of Southern California to identify these lands during the Project design phase and avoid use of chemicals through weed control in these lands. The Applicant shall inform the MWD of Southern California 30-days prior to the start of construction activities that may occur within agricultural lands under the jurisdiction of the MWDSC and follow with a report submitted to the MWD of Southern California upon completion of the construction activities within these lands. Successful implementation of this MM shall prevent short and long-term impacts to agricultural lands under the jurisdiction of the MWD of Southern California. Standards for Success: Prevention of short- and long-term impacts associated with agricultural lands under the jurisdiction of the MWD of Southern California.	work within agricultural lands under jurisdiction of MWD of Southern California, these measures and/or actions will be documented and kept on file by the Applicant.	be given to MWD of Southern California 30-days prior to the start of construction activities that will occur within agricultural lands under the jurisdiction of MWD of Southern California.	
Air Quality and Climate Change				
Impact AIR-1 Impact AIR-4	**APM AQ-01: Fugitive Dust (quantitatively included in the emissions estimate).** The following control measures would be implemented, as applicable, to reduce PM10 and PM2.5 emissions during construction, in conjunction with an Erosion, Dust Control, and Air Quality Plan and Fugitive	Review adequacy of and implementation of Erosion, Dust Control, and Air Quality Plan and	Construction	The Applicant

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
	Dust Control Plan for the Project. Basic control measures: The following measures would be implemented at all construction sites: • Water active construction areas sufficiently to minimize fugitive dust. • Water for dust control would include three 2,000-gallon water trucks that would water access roads twice a day, 5 days a week, for 18 months. • Cover trucks hauling soil, sand, and other loose materials and require all trucks to maintain at least 6 inches of freeboard. • Pave, apply water, or apply nontoxic soil stabilizers on all unpaved access roads, parking areas, and staging areas at construction sites to minimize fugitive dust. Enhanced control measures: In addition to the "basic" control measures listed above, the following control measures may be implemented at all construction sites greater than 4 acres: • Water, hydroseed, or apply nontoxic soil stabilizers to inactive construction areas to minimize fugitive dust. • Enclose, cover, water twice daily, or apply nontoxic soil binders to exposed stockpiles. • Limit traffic speeds on unpaved roads. • Install sandbags or other erosion-control measures to prevent silt runoff to public roadways. • Replant vegetation in disturbed areas as quickly as possible, consistent with seasonal survival considerations.	Fugitive Dust Control Plan. Verify that fugitive dust control measures are implemented.		

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
	Optional control measures: Depending on the extent of dust generation, implementation of the following APMs may occur at larger construction sites, near sensitive receptors (residences or other occupied buildings, parks, or trails within 1,000 feet of earthmoving operations that are substantial; for example, more than excavation for tower foundations), or in situations which for any other reason may warrant additional emissions reductions: • Install wheel washers for all existing trucks or wash off the tires or tracks of all trucks and equipment leaving the site. • Suspend excavation and grading activity when winds (instantaneous gusts) exceed 25 miles per hour (mph). • Limit the area subject to excavation, grading, and other construction activity at any one time.			
Impact AIR-1 Impact AIR-4	**BMP AQ-01: Dust Palliatives (quantitatively included in the emissions estimate).** Dust palliatives would be applied, in lieu of water, to inactive construction areas (disturbed lands or soil stockpiles that are unused for 14 consecutive days). Dust palliatives would be chosen by the Dust Control Site Coordinator and or construction contractor. Dust palliatives would be environmentally safe; comply with Federal, State, and local regulations; and would not produce a noxious odor or contaminate surface water or groundwater and, therefore, would not pose runoff concerns during rain events. Application rates for dust palliatives would follow the manufacturer's recommendations. MSDS/SDSs for any palliatives would be available on site and provided to the BLM and MDAQMD 14 days prior to use.	Ensure that approved dust palliatives are applied in lieu of water to inactive construction areas. Ensure that Safety Data Sheets (MSDS/SDS) are completed and submitted to the BLM and MDAQMD 14 days prior to use.	Construction	The Applicant
Impact AIR-1	**APM AQ-02: Exhaust Emissions (qualitatively included in the emissions estimate).** The following measures would be implemented during construction to further minimize greenhouse gas emissions (carbon dioxide, methane, and	Confirm exhaust emissions measures are implemented.	Construction	The Applicant

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
	nitrous oxide) per California AB32 and criteria air pollutants from vehicle and machinery and in conjunction with the Construction Emissions Mitigation Plan for the Project: • Minimize unnecessary construction vehicle idling time. The ability to limit construction vehicle idling time depends on the sequence of construction activities and when and where vehicles are needed or staged. Certain vehicles, such as large diesel-powered vehicles, have extended warm-up times that limit their availability for use following startup. Where such diesel-powered vehicles are required for repetitive construction tasks, these vehicles may require more idling time. The Project would apply a "common sense" approach to vehicle use, such that idling is reduced as far as possible below the maximum of 5 consecutive minutes required under Title 13 of CCR Section 2485 (13 CCR 2485). If a vehicle is not required for use immediately or continuously for construction activities or other safety-related reasons, its engine would be shut off. • Encourage use of natural gas- or electric-powered vehicles for light-duty trucks where feasible and available.			
Impact AIR-1 Impact AIR-4	**APM AQ-03: Minimize Potential Naturally Occurring Asbestos Emissions (qualitatively included in the emissions estimate).** The following measures would be implemented prior to and during construction to minimize the potential for naturally occurring asbestos emissions, in conjunction with an Asbestos Dust Mitigation Plan: • Prior to construction, samples of the construction area would be analyzed for the presence of asbestos, serpentinite, or ultramafic rock. • If asbestos, serpentinite, or ultramafic rock is determined to be present, all applicable provisions of the ATCM for construction, grading,	Confirm that naturally occurring asbestos emissions measures are implemented in conjunction with the Asbestos Dust Mitigation Plan.	Pre-construction Construction	The Applicant

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
	quarrying, and surface mining operations (17 CCR 93105) would be implemented, including the following: • For disturbed areas of 1 acre or less: o Construction vehicle speed at the work site would be limited to 15 mph or less. o Prior to any ground disturbance, sufficient water would be applied to the area to be disturbed to prevent visible emissions from crossing the property line. o Areas to be graded or excavated would be kept adequately wet to prevent visible emissions from crossing the property line. o Storage piles would be kept adequately wetted, treated with a chemical dust suppressant, or covered when material is not being added to or removed from the pile. o Equipment would be washed down before moving from the property onto a paved public road. o Visible track-out on the paved public road would be cleaned using wet sweeping or a high-efficiency particulate air-filter-equipped vacuum device within 24 hours. • For disturbed areas of greater than 1 acre: o Prepare an Asbestos Dust Mitigation Plan and obtain approval prior to construction. o Implement and maintain the provisions of the approved Asbestos Dust Mitigation Plan from the beginning of construction through the duration of the construction activity.			

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
Impact AIR-1 Impact AIR-4	APM AQ-04: Minimize Potential Emissions of Naturally Occurring *Coccidioides immitis* Fungal Spores (qualitatively included in the emissions estimate). In addition to the APM AQ-01 measures to control general fugitive dust emissions, the following measures would be implemented prior to and during construction to create awareness of the risks and inhalation prevention procedures with respect to *Coccidioides immitis* fungal spores, which are naturally present in soils in the desert southwest, and inhalation of which can cause Valley Fever: • Prior to construction, and for each phase of construction, implement an Environmental Awareness Program for workers to ensure they are informed of the risks of contracting Valley Fever and the protective measures needed to minimize personal exposure to fugitive dust, as well as to minimize possible dust exposure of nearby residents and the general public. • Inform workers of the possible symptoms of Valley Fever and encourage them to seek medical treatment if these symptoms manifest.	Verify implementation of Naturally Occurring *Coccidioides immitis* Fungal Spores measures.	Pre-construction Construction	The Applicant
Impact AIR-1 Impact AIR-4	**BMP AQ-05: Air Quality Regulation and Standard Conformance.** All activities would meet the requirements of the CAA (Sections 110, 118, 160, and 176[c]) and the applicable local AQM jurisdiction(s). Fugitive dust cannot exceed local standards and requirements.	Verify implementation of dust control measures.	Construction	The Applicant

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
Impact AIR-1	**CMA LUPA-AIR-1.** All activities must meet the following requirements: • Applicable NAAQS (Section 109); • SIP (Section 110); • PSD, including visibility impacts to mandatory Federal Class I Areas (Section 160 et seq.); • Conformity Analyses and Determinations (Section 176[c]); and • Apply BMPs on a case by case basis.	Ensure that measures are taken to meet the requirements.	Design	The Applicant
Impact AIR-1	**CMA LUPA-AIR-3.** Where impacts to air quality may be significant under NEPA, requiring analysis through an EIS, require documentation for activities to include a detailed discussion and analysis of Ambient Air Quality conditions (baseline or existing), NAAQS, criteria pollutant nonattainment areas, and potential air quality impacts of the Project (including cumulative and indirect impacts and GHGs emissions). This content is necessary to disclose the potential impacts from temporary or cumulative degradation of air quality. The discussion will include a description and estimate of air emissions from potential construction and maintenance activities, and MMs to minimize net PM10 and PM2.5 emissions. The documentation will specify the emission sources by pollutant from mobile sources, stationary sources, and ground disturbance. A Construction Emissions Mitigation Plan will be developed.	Review adequacy of Construction Emissions Mitigation Plan.	Pre-construction	The Applicant
Impact AIR-1	**CMA LUPA-AIR-4**. Because fugitive dust is the number one source of PM10 and PM2.5 emissions in the Mojave and Sonoran Deserts, fugitive dust impacts to air quality must be analyzed for all activities/projects requiring an EIS and EA. The NEPA air quality analysis may include modeling of the sources of PM10 and PM2.5 that occur prior to construction and/or ground disturbance from the activity/project, and show the timing, duration and transport of emissions off	Confirm that fugitive dust impacts are analyzed.	Design	The Applicant

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
	site. When utilized, the modeling will also identify how the generation and movement of PM10 and PM2.5 will change during and after construction and/or ground disturbance of the activity/project under all activity/project specific NEPA alternatives. The BLM air resource specialist and Authorizing Officer will determine if modeling is required as part of the NEPA analysis based on estimated types and amounts of emissions.			
Impact AIR-1	**CMA LUPA-AIR-5.** A Fugitive Dust Control Plan will be developed for all projects where the NEPA analysis shows an impact on air quality from fugitive dust.	Review adequacy of fugitive Dust Control Plan.	Pre-construction	
Impact AIR-1 Impact AIR-4	MM AQ-CEQA-1: Implement Air Quality Applicant Proposed Measures, Best Management Practices, and Conservation and Management Actions. The APMs, BLM BMPs, and CMAs in Sections 2.3.2 and 2.3.3 above provide a suite of measures, practices, and actions that shall be implemented as part of the Project. APMs, BMPs, and CMAs shall be implemented prior to, or during all ground disturbance and construction related activities to avoid or minimize Project related impacts to air quality and greenhouse gasses. These APMs, BMPs, and CMAs include; APM AQ-01, BMP AQ-01, APM AQ-02, APM AQ-03, APM AQ-04, BMP AQ-05, CMA LUPA-AIR-1, CMA LUPA-AIR-3, CMA LUPA-AIR-4, CMA LUPA-AIR-5. If an APM, BMP, or CMA is subjective, such as containing text that states; "where appropriate," "where applicable," "where feasible," or similar language, the BLM and CPUC shall be consulted to determine the applicability of each measure prior to the disturbance of a covered resource. Compliance with APMs, BMPs, and CMAs shall be documented, and a weekly report shall be provided to the BLM and CPUC. The Applicant shall provide a synopsis of the weekly reports to the BLM and CPUC monthly. The report shall include a summary of the construction activities completed, a list of compliance actions and any remedial actions taken to correct any actions, and the status of ongoing	The Applicant shall develop a weekly report that shall include all applicable APMs, BMPs, and CMAs and the related actions taken in order to be in compliance with these measures. These weekly reports shall be compiled and submitted to the BLM and CPUC monthly.	APMs, BMPs, and CMAs shall be implemented throughout construction activities.	The Applicant shall ensure that all APMs, BMPs, and CMAs are implemented during construction. If an APM, BMP, or CMA is subjective, the Applicant shall consult with the BLM and/or the CPUC to determine the applicability of each measure.

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
	mitigation efforts. For those instances (only) where an APM, BMP, and/or CMA conflicts, or does not meet required specificity pursuant to CEQA, the following BMPs have been modified to meet CEQA requirements: **APM AQ-01: Fugitive Dust (quantitatively included in the emissions estimate).** Consistent with APM AQ-01, and MDAQMD Rule 403.2, a Fugitive Dust Control Plan shall be prepared for the Project prior to the start of construction and shall be implemented throughout all construction phases of the Project. This Fugitive Dust Control Plan shall be prepared by the Applicant at least 30 days prior to construction which shall be approved by the CPUC and MDAQMD. The Applicant shall ensure that the Fugitive Dust Control Plan is implemented throughout construction activities and shall keep records of compliance on site and submit monthly reports to CPUC and MDAQMD. This Fugitive Dust Control Plan shall comply with the MDAQMD Guidelines and include all of the control measures listed in APM AQ-01. In addition to these control measures, the Fugitive Dust Control Plan shall also include signage related to fugitive dust that will include the following specifications: A minimum 48 inch high by 96 inch wide sign containing the following shall be located within 50 feet of each Project site entrance, meeting the specified minimum text height, black text on white background, on one inch A/C laminated plywood board, with the lower edge between six and seven feet above grade, with the contact name of a responsible official for the site and a local or toll-free number that is accessible 24 hours per day: [Site Name] {four-inch text] [Project Name/Project Number] {four-inch text} IF YOU SEE DUST COMING FROM {four-inch text}			

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
	THIS PROJECT CALL: {four-inch text} [Contact Name], PHONE NUMBER XXX-XXXX {six-inch text} If you do not receive a response, Please Call {three-inch text} The MDAQMD at 1-800-635-4617 {three-inch text} Additionally, the following control measures shall be included in the Fugitive Dust Control Plan: Traffic speeds on unpaved roads shall not exceed 15 miles per hour; Drop heights from excavators and loaders shall be minimized to distances no more than 5 feet; Appoint a construction relations officer to act as a community liaison concerning on-site construction activity, including resolution of issues related to PM10 and PM2.5 generation from combustion emissions and fugitive dust generation; An on-site supervisor with a current fugitive dust control class certification shall be present who is available within 30 minutes to respond to any fugitive dust control issue at the site during normal business hours; The operation shall keep on-site records of specific dust control actions taken; All perimeter fencing shall be wind fencing or the equivalent of four feet of height or the top of all perimeter fencing (this wind fencing requirement may be superseded by local ordinance, rule, or Project-specific biological mitigation prohibiting wind fencing); and A wheel washing system shall be installed and used to remove bulk material from tires and vehicle undercarriages before vehicles exit the unpaved construction site.			

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
	Responsible Party: The Applicant shall be responsible for ensuring the Fugitive Dust Control Plan is prepared and implemented throughout construction activities. **Timing:** The Fugitive Dust Control Plan shall be prepared at least 30-days prior to the start of construction and implemented throughout all construction activities. **Mitigation Monitoring and Reporting Program:** Monthly reports shall be prepared by the Applicant and submitted to the CPUC and MDAQMD. These monthly reports shall include a summary of any calls received regarding fugitive dust and all compliance actions taken. **Standards for Success:** Fugitive dust will be minimized throughout all construction activities and compliance with MDAQMD Rule 403.2 shall be achieved. **APM AQ-02: Exhaust Emissions (qualitatively included in the emissions estimate).** Consistent with APM AQ-02 a Construction Emissions Mitigation Plan shall be developed by the Applicant for the Project at least 30-days prior to the start of construction activities and shall be implemented by the Applicant throughout all construction activities. The Construction Emissions control Plan shall be approved by the CPUC and MDAQMD and the Applicant shall keep records of compliance with this Plan on site and submit monthly reports to CPUC and MDAQMD. Successful implementation of with measure will result in minimization of exhaust emissions from worker vehicles, construction equipment, and vehicles. The Construction Emissions Mitigation Plan may include the following measures: Use ultra-low sulfur diesel fuel (e.g., <15 ppm);			

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
	Use clean-burning on- and off-road diesel engines. Heavy-duty diesel-powered construction equipment manufactured after 1996 (with Federally mandated "clean" diesel engines) shall be utilized; The Applicant shall develop a program and require construction workers to carpool to construction sites; Restrict construction vehicle idling time to less than 5 minutes; Properly maintain mechanical equipment; Use particle traps and appropriate controls to reduce diesel particulate matter. Other equipment includes devices such as specialized catalytic converters (oxidation catalysts) control approximately 20 percent of diesel particulate matter, 40 percent of carbon monoxide, and 50 percent of hydrocarbon emissions; Provide temporary traffic controls, such as a flag person, during all phases of construction to maintain a smooth traffic flow (See MM TRANS-CEQA-2 under Section 2.17 for more details); During Project construction, all off-road diesel-powered construction equipment greater than 50 horsepower (hp) shall meet the Tier 4 final emissions standards, where available. In addition, all construction equipment shall be outfitted with the BACT devices certified by CARB. Any emissions control device used by the contractor shall achieve emissions reductions that are no less than what could be achieved by a level 4 diesel emissions control strategy for a similarly sized engine as defined by CARB regulations (i.e., if Project construction goes beyond the anticipated schedule); and A copy of each unit's certified tier specification, BACT documentation, and CARB or MDAQMD operating permit shall be provided to the CPUC			

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
	at the time of mobilization for each applicable unit of equipment. **Responsible Party:** The Applicant shall be responsible for ensuring the Construction Emissions Control Plan is prepared and implemented throughout construction activities. **Timing:** The Construction Emissions Control Plan shall be prepared at least 30-days prior to the start of construction and implemented throughout all construction activities. **Mitigation Monitoring and Reporting Program:** Monthly reports shall be prepared by the Applicant and submitted to the CPUC and MDAQMD. These monthly reports shall include a summary of any compliance actions taken and a list of equipment used on site. Any associated vehicle tier specifications, BACT documentation, or CARB or MDAQMD operating permits shall be kept on site and made available upon request **Standards for Success:** Construction emissions will be minimized and would not exceed MDAQMD significance thresholds. Additionally, any State standards regulating construction emissions would be met (i.e. CARB Tier 4 final emission standards and Title 1. California Code of Regulations Section 2485 standards). **APM AQ-03: Minimize Potential Naturally Occurring Asbestos Emissions (qualitatively included in the emissions estimate).** Consistent with APM AQ-03 an Asbestos Dust Mitigation Plan shall be developed for the Project in conjunction with the Fugitive Dust Control Plan that shall also be developed for the Project only if the results of the asbestos, serpentine, or ultramafic rock are positive in the project area. The Asbestos Dust Mitigation Plan will be developed by the Applicant at least 30-days prior to the start of construction activities and shall be submitted and			

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
	approved by the CPUC and MDAQMD. The plan shall be prepared and implemented according to the requirements of Title 17 California Code of Regulations 93105, CARB Asbestos Airborne Toxic Control Measure for Construction, Grading, Quarrying, and Surface Mining Operations. Successful implementation of this APM will result in compliance with the CARB-required Asbestos Toxic Control Measures. **Responsible Party:** The Applicant shall be responsible for ensuring the Asbestos Dust Mitigation Plan is prepared and implemented throughout all construction activities. **Timing:** The Asbestos Dust Mitigation Plan shall be prepared at least 30-days prior to the start of construction and implemented throughout all construction activities. **Mitigation Monitoring and Reporting Program:** Monthly reports shall be prepared by the Applicant and submitted to the CPUC and MDAQMD. These monthly reports shall include a summary any compliance actions taken related to asbestos control. **Standards for Success:** Construction dust will be minimized, and Project activities will comply with the CARB-required Asbestos Toxic Control Measures.			
Biological Resources				
Impact BIO-1 Impact BIO-2 Impact BIO-3	**APM BIO-1: Worker Environmental Awareness Program.** Before starting any work, including mowing, staging, installing stormwater control structures, implementing other BMPs, removing trees, construction, and restoration, all employees and contractors performing activities and new construction would receive training on environmental requirements that apply to their job duties and work. If additional crewmembers arrive later in the job, they would be required	Review adequacy of worker environmental awareness program and implementation of worker environmental awareness	Pre-construction	The Applicant

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
	to complete the training before beginning work. Training would include a discussion of the avoidance and minimization measures being implemented and would include information on the FESA and CESA and the consequences of not complying with these Acts. An educational brochure would be provided to construction crews working on the Project. This brochure would include color photographs of special-status species as well as a discussion of avoidance and minimization measures.	program.		
Impact BIO-1 Impact BIO-2 Impact BIO-3	**BMP BIO-1: Worker Environmental Awareness Program.** The worker education program would provide interpretation for non-English speaking workers.	Confirm the worker environmental awareness program is interpreted for non-English speaking workers.	Pre-construction	The Applicant
Impact BIO-1 Impact BIO-3	**APM BIO-2: Biological Monitoring and Pre-construction Survey.** A qualified biological monitor would be present on the Project site during all work activities within habitat of special-status animal species. The qualified biologist would conduct a pre-construction survey of those areas immediately before work activities begin and would locate and fence off any present individuals of special-status plant species.	Conduct preconstruction surveys for special-status animal species and fence off any present individuals of special-status plant species	Pre-construction Construction	The Applicant
Impact BIO-1	**BMP BIO-02: Biological Monitoring and Pre-construction Survey.** Multiple biological monitors would be provided so any work site within habitat of special-status species is monitored concurrently if needed.	Provide multiple biological monitors for monitoring within habitat of special-status species.	Construction	The Applicant
Impact BIO-1 Impact BIO-2 Impact BIO-3 Impact BIO-4	**APM BIO-3: Approved Work Areas.** To the extent practicable, stockpiling of material would be allowed only within the established work area. Vehicles and equipment would be parked on pavement, existing roads, and previously disturbed areas within identified work areas or access roads.	Ensure materials are stockpiled only within established work area. Ensure vehicles and equipment parked on pavement, existing roads,	Construction	The Applicant

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
		and previously disturbed areas within work areas and access roads.		
Impact BIO-1 Impact BIO-2 Impact BIO-3 Impact BIO-4	**BMP BIO-03: Approved Work Areas.** The BLM would approve areas to be used for stockpiling, vehicle parking, or other construction support activity that would occur outside established work areas.	Ensure areas used for stockpiling, vehicle parking, or other construction support activity outside established work areas are approved by BLM.	Construction	The Applicant
Impact BIO-1 Impact BIO-2 Impact BIO-3 Impact BIO-4	**APM BIO-4: Environmentally Sensitive Areas and Fencing.** Environmentally sensitive areas, such as the riparian areas, xeroriparian washes, and other habitat of special-status species, would be identified in the field. Barrier fences or stakes would be installed at the edge of the easement or around the sensitive area to minimize the possibility of inadvertently encroaching into sensitive habitat.	Identify environmentally sensitive areas and install barrier fences or stakes around the edge of the easement or sensitive area.	Pre-construction	The Applicant
Impact BIO-1 Impact BIO-2	**APM BIO-5: Additional Prohibitions.** Trash dumping, firearms, open fires, and pets would be prohibited at all work locations and access roads. Smoking would be prohibited along the Project alignment.	Ensure that workers are aware that trash dumping, firearms, open fires, and pets are prohibited at all work locations and access roads and that smoking is prohibited along the Project alignment.	Construction	The Applicant
Impact BIO-1 Impact BIO-2	**APM BIO-6: Trash Handling.** All food scraps, wrappers, food containers, cans, bottles, and other trash from the work area would be disposed of in closed trash containers.	Ensure that workers dispose of food scraps, wrappers, food containers, cans, bottles, and other	Construction Post-construction	The Applicant

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
		trash from the work area in closed trash containers.		
Impact BIO-1 Impact BIO-2 Impact BIO-3	**APM BIO-7: Monofilament Plastic.** No monofilament plastic would be used for erosion control (for example, matting, fiber roll, wattles, silt fencing backing). Appropriate materials include burlap, coconut fiber, or other materials as identified in the general and site-specific SWPPP.	Ensure that only appropriate materials (burlap, coconut fiber, or other materials identified in the Project SWPPP) are used for erosion control. Confirm that no monofilament plastic is used for erosion control.	Pre-construction Construction Post-construction	The Applicant
Impact BIO-1 Impact BIO-2 Impact BIO-3	**APM BIO-8: Refueling.** Vehicular and equipment refueling should not occur within 100 feet of a wetland or drainage unless secondary containment is constructed, for example, a berm and lined refueling area. Proper spill prevention and cleanup equipment would be maintained in all refueling areas in accordance with the SPCC for the Project.	Verify implementation of SPCC measures.	Construction	The Applicant
Impact BIO-1 Impact BIO-4	**APM BIO-9: Escape Ramps.** All excavated steep-walled holes or trenches more than 1-foot-deep would be covered at the end of each working day with plywood or similar materials or would be provided with one or more escape ramps constructed of earth fill or wooden planks. Each trench or hole would be inspected for wildlife at the beginning of each workday and before such holes or trenches are filled. Wildlife found trapped in trenches or holes would be relocated to suitable habitat outside the work area. If possible, pipes and culverts greater than 3 inches in diameter would be stored on dunnage to prevent wildlife from taking refuge in them, to the extent feasible.	Verify implementation of measures.	Construction	The Applicant
Impact BIO-1 Impact BIO-2	**APM BIO-10: Erosion and Dust Control.** The BMPs included in the SWPPP would be implemented during construction to minimize impacts associated with erosion. Watering for dust control during construction would also be used as	Ensure that SWPPP BMPs are implemented.	Construction	The Applicant

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
Impact BIO-3 Impact BIO-4	described previously (AQ-01). Watering shall not result in prolonged ponding of surface water that could attract wildlife to the work area. Minimal or no vegetation clearing and/or soil disturbance would be conducted for site access and construction in areas with suitable topography (i.e., overland driving/overland access).			
Impact BIO-1 Impact BIO-2 Impact BIO-3 Impact BIO-4	**APM BIO-11: Vegetation Management Plan.** The Vegetation Management Plan (EIS Appendix 2B) would be approved by the BLM and implemented. That Plan describes the surveys, permitting, fee payments, and plant protection to be conducted in areas where Project design would not eliminate the need for vegetation control for the Project to be in compliance with NERC requirements. Vegetation would be trimmed or otherwise controlled for safe operation of the transmission line and would be designed to minimize impacts on special-status species to the extent practicable. At a minimum, vegetation treatments shall incorporate the measures identified in the 2016 Memorandum of Understanding regarding vegetation management along ROW for electrical transmission and distribution facilities (USDA 2016). The Plan also would describe how vegetation would be salvaged, as needed, in order to comply with the applicable Arizona Native Plant Law and California regulations.	Confirm that the Vegetation Management Plan is approved by BLM and implemented.	Pre-construction Construction	The Applicant
Impact BIO-1 Impact BIO-4	**BMP BIO-11: Vegetation Management Plan.** In addition to the description of the Vegetation Management Plan in the corresponding APM BIO-11, the plan would also: • Meet BLM Guidelines for mapping and surveying of cacti, yuccas, and succulents. • Include a wire zone/border zone/effective border zone approach to vegetation maintenance as described in Ballard et al. 2007. • Identify tall vegetation species by geographic reach and growth rates, from relevant scientific literature (such as Drezner 2003), to be used to	Confirm that the Vegetation Management Plan includes the additional guidelines, zone approach, and identifications.	Pre-construction	The Applicant

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
	determine maximum allowable vegetation heights in the context of wire zone/border zone/effective border zone concepts, to accommodate identified growth periods (e.g., ten years) based on the specific vegetation community. Species examples include, but are not limited to, saguaro cactus, ironwood, palo verde, cottonwood, and Gooding willow.			
Impact BIO-1 Impact BIO-2 Impact BIO-3 Impact BIO-4	**APM BIO-12: Invasive Species Control.** A Noxious Weed Control Plan (EIS Appendix 2B) that addresses specific requirements in CMA LUPA-BIO-11 would be developed, approved by the BLM, and implemented prior to initiation of ground disturbing activities. That Plan would identify noxious and invasive species to be addressed in the Project Area, describe measures to conduct pre-construction weed surveys, reduce the potential introduction or spread of noxious weeds and invasive species during construction, and monitor and control weeds during operation of the transmission line. It would be designed to minimize impacts on special-status species to the extent practicable. Coordination with resource agencies regarding invasive plant species would be conducted before construction. BMPs would include use of weed-free straw, fill, and other materials; requirements for washing vehicles and equipment arriving on site; proper maintenance of vehicle inspection and wash stations; requirements for managing infested soils and materials; requirements and practices for the application of herbicides.	Confirm that the Noxious Weed Control Plan is developed, approved by the BLM, and implemented.	Pre-construction Construction	The Applicant
Impact BIO-1 Impact BIO-2 Impact BIO-3 Impact BIO-4	**APM BIO-13: Riparian Habitat Avoidance.** Riparian areas and xeroriparian drainages that occur within the ROW would be denoted as environmentally sensitive areas and would be avoided during construction to the extent practicable. Existing topography would be restored to pre-Project conditions to the extent possible.	Confirm implementation of riparian habitat avoidance measures.	Pre-construction Construction Post-construction	The Applicant
Impact BIO-1	**APM BIO-14: Minimizing Vegetation Clearing.** In areas with suitable topography, minimal or no vegetation clearing, and soil disturbance would be	Confirm that vegetation	Pre-construction	The Applicant

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
Impact BIO-2 Impact BIO-3	conducted for site access and construction (i.e. overland driving/overland access). Overland driving/overland access would be used in areas that support the necessary construction equipment. Upgrading of existing access roads and construction of new access roads would be implemented as necessary for the safe construction activities.	clearing is minimized.	Construction	
Impact BIO-1 Impact BIO-2 Impact BIO-3 Impact BIO-4	**APM BIO-15: Reclamation and Restoration.** A Habitat Restoration and Monitoring Plan would be developed, approved by BLM, and implemented for construction and operation of the Project. Revegetate all sites disturbed during construction that would not be required for operation of the transmission line, and restore disturbed areas to the extent practicable, given the arid desert environment. The Plan would describe in detail methods for surveying and characterizing vegetation in disturbed areas before construction; topsoil salvage and management, erosion control, post-construction recontouring and site preparation, seeding and planting, and post-construction watering, monitoring, and remediation. It would be designed to reduce impacts on special-status species to the extent practicable.	Review adequacy and implementation of Habitat Restoration and Monitoring Plan. Confirm the Habitat Restoration and Monitoring Plan is approved by BLM.	Pre-construction Construction Post- construction	The Applicant
Impact BIO-1 Impact BIO-2	**BMP BIO-15: Reclamation and Restoration.** As a part of the Habitat Restoration and Monitoring Plan, the soil horizons would be stored separately for the areas where the success of restoration could be crucial for rare plant species.	Identify areas where the success of restoration could be crucial for rare plant species. Ensure that soil horizons are stored separately for those areas.	Pre-construction	The Applicant
Impact BIO-1 Impact BIO-2	**APM BIO-16: Treatment of Saguaro Cactus.** Measures would be implemented to minimize the number of saguaro cacti that must be relocated for the safe construction and operation of the transmission line. In accordance with the Vegetation Management Plan (EIS Appendix 2B), a survey of saguaros within the ROW would be conducted before construction and where possible,	Ensure that measures for treatment of Saguaro Cactus are implemented in accordance with the Vegetation Management	Pre-construction Construction Post-construction	The Applicant

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
	the transmission line would be designed to minimize the number of saguaros affected by adjusting tower locations and conductor height. The Plan would address plant salvaging, storing, and replanting requirements and methods, only those saguaros that are within 50-feet of the outermost conductors and could be tall enough to pose a hazard would be removed if they cannot be avoided through Project design. When possible, saguaro that must be removed would be relocated as directed by the BLM and state agency protocols. Monitoring and management of saguaros during operations would occur as described in the Vegetation Management Plan.	Plan.		
Impact BIO-1 Impact BIO-2 Impact BIO-3 Impact BIO-4	**APM BIO-17: Limit Off-road Vehicle Travel.** Vehicular travel would be limited to established roads to the maximum extent practicable.	Confirm that vehicular travel is limited to established roads.	Construction	The Applicant
Impact BIO-1 Impact BIO-2 Impact BIO-3	**BMP BIO-19: Colorado River.** In the vicinity of the Colorado River, existing structure spacing, and conductor heights would be matched to the greatest extent practical to reduce the potential for bird collisions with the power line. The transmission line would span the Colorado River and the minimum number of structures possible would be located within the undeveloped floodplain. The term, "vicinity of the Colorado River" is defined to mean the river crossing, floodplain, and associated agricultural lands. In these areas, conductor bundles would be in a horizontal, parallel configuration, and match existing structure spacing and conductor heights to the greatest extent practical to reduce the potential for bird collisions with the power line. No guyed structures would be used at these locations.	Ensure that measures in specific to the vicinity of the Colorado River are implemented.	Design	The Applicant
Impact BIO-1 Impact BIO-2	**APM BIO-20: Migratory Bird Protection During Construction.** If construction is scheduled during the nesting bird season (generally February 1 through August 31), the work area would be surveyed for birds protected under	Confirm that migratory bird protection measures are implemented if	Pre-construction Construction	The Applicant

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
Impact BIO-3	the MBTA and CFG Code. Active nests identified during pre-construction surveys would require protective buffers or visual barriers to ensure compliance with those regulations. If the qualified biologist determines that construction activities would cause distress to nearby nesting birds, larger buffers or construction delays might be necessary to allow the birds to successfully fledge from the nest.	construction is scheduled during the nesting bird season.		
Impact BIO-1 Impact BIO-2 Impact BIO-4	**APM BIO-21: Reduction of Avian Collisions and Electrocution.** Current APLIC guidelines and methodologies (APLIC 2006, 2012) would be used in the design of the proposed transmission facilities to minimize the potential for raptors and other birds to collide with the transmission line during operations and be electrocuted. For example, aerial marker balls or other visibility markers would be placed at and near the crossing of the Colorado River to increase the visibility of the transmission line to birds using that movement corridor. Further, placement of lines significantly above existing transmission lines, topographic features, or tree lines would be avoided. These measures would be implemented, where practicable, in conjunction with an APP for the Project. The APP would include requirements for monitoring the effectiveness of anti-collision design.	Confirm that design implements current methodologies for the reduction of avian collisions and electrocution. Review adequacy of the APP.	Design Pre-construction	The Applicant
Impact BIO-1 Impact BIO-2 Impact BIO-4	**BMP BIO-21: Reduction of Avian Collision.** Aerial marker balls or other visibility markers would be placed on overhead ground wires (not conductors) at crossing of the Colorado River and floodplain to increase visibility to birds using that movement corridor and marking any other static wires to improve visibility and reduce collisions. Deterrents would be added to reduce nesting and perching by ravens and other predatory birds. The APP would include requirements for monitoring the effectiveness of anti-electrocution design.	Review adequacy of and implementation of APP. Confirm that measures for reducing avian collision are implemented during design.	Design Pre-construction	The Applicant
Impact BIO-1 Impact BIO-2	**APM BIO-23: Mojave Desert Tortoise Protection (California).** A qualified-biologist would be present during all ground-disturbing and other construction activities in non-cultivated areas in California, in order to survey areas before	Verify monitoring of all ground-disturbing and other construction	Construction	The Applicant

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
	they are disturbed, monitor construction sites for the presence of desert tortoises, and move tortoises from harm's way in accordance with U.S. Fish and Wildlife Service (USFWS protocols). Burrows near construction sites would be clearly delineated. Road, footing, and work area alignments would be modified to the extent possible to avoid adversely affecting any tortoise burrows. Where burrows would be unavoidably destroyed, they would be excavated carefully using hand tools under the supervision of a field biologist with demonstrated prior experience with this species. Other measures, as required by the USFWS in any applicable Biological Opinion (BO), would also be implemented.	activities in non-cultivated areas in California for desert tortoise and verify completion of surveys and implementation of measures.		
Impact BIO-1 Impact BIO-2	**BMP BIO-23: Mojave Desert Tortoise Protection (California).** A designated biologist would inspect construction pipes, culverts, or similar structures: (a) with a diameter greater than 3 inches, (b) stored for one or more nights, (c) less than 8 inches aboveground and (d) within desert tortoise habitat (such as, outside the long-term fenced area), before the materials are moved, buried, or capped. As an alternative, such materials shall be capped before storing outside the fenced area or placing on pipe racks. Pipes stored within the long-term fenced area after completing desert tortoise clearance surveys would not require inspection.	Confirm Mojave Desert tortoise protection measures are implemented.	Construction	The Applicant
Impact BIO-1 Impact BIO-2	**BMP BIO-24: Sensitive Plant Surveys.** On BLM lands and other lands where access is secured by the owner, a survey would be conducted during the appropriate time of year of the selected route to identify special-status plant species and imperiled or sensitive vegetation alliances. Where possible, and as required by the BLM, special-status species and vegetation alliances would be avoided during construction. This survey would be restricted to non-cultivated land.	Verify completion of sensitive plant surveys.	Pre-construction Construction	The Applicant
Impact BIO-1 Impact BIO-2	**BMP BIO-25: Sensitive Animal Surveys.** A survey would be conducted of the selected route prior to construction of all work areas to identify special-status animal species, including Mojave Desert tortoises, burrowing owls, and Mojave	Prior to construction, conduct a survey of the route of all work areas to	Pre-construction Construction	The Applicant

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
Impact BIO-3	fringe-toed lizards. Where possible, and as required by the BLM, special-status species and vegetation alliances would be avoided during construction.	identify special-status animal species. Ensure special-status species and vegetation alliances are avoided during construction.		
Impact BIO-1	**APM BIO-27: Bighorn Sheep Lambing Areas.** Construction activities would be limited from January 1 to March 31 in active bighorn sheep lambing areas identified by BLM and AGFD.	Confirm that construction activities are limited from January 1 to March 31 in active bighorn sheep lambing areas identified by BLM and AGFD.	Construction	The Applicant
Impact BIO-1	**BMP BIO-28: Raven Management Plan.** The Raven Management Plan would be implemented for all activities to address food and water subsidies and roosting and nesting sites specific to the common raven. These include identification of monitoring reporting procedures and requirements; strategies for refuse management; as well as design strategies and passive repellant methods to avoid providing perches, nesting sites, and roosting sites for common ravens. Compensatory mitigation would be provided that contributes to LUPA-wide raven management associated with lands in the DRECP.	Review adequacy and verify implementation of Raven Management Plan.	Pre-construction Construction	The Applicant
Impact BIO-1 Impact BIO-2 Impact BIO-3 Impact BIO-4	**BMP BIO-29: Bird and Bat Conservation Strategy.** The BBCS would provide guidance on conservation measures applicable to bird and bat species present in the Project Area, including a nesting bird management plan and a nest management plan.	Review adequacy and verify implementation of Bird and Bat Conservation Strategy, a Nesting Bird Management Plan, and a Nest Management Plan.	Pre-construction Construction	The Applicant

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
Impact BIO-1 Impact BIO-2	**BMP BIO-30: Burrowing Owl Nesting Management Plan.** The Plan would include management direction consistent with LUPA-BIO-IFS-12, LUPA-BIO-IFS-13, and LUPA-BIO-IFS-14.	Review adequacy and verify implementation of Burrowing Owl Nesting Management Plan.	Pre-construction	The Applicant
Impact BIO-1 Impact BIO-2 Impact BIO-4	**BMP BIO-31: Treatment of Harwood's eriastrum.** 1. Pre-construction surveys would be required for non-agricultural areas in California. 2. Avoid Harwood's eriastrum individuals through micrositing facilities to the maximum extent practical. 3. Within suitable habitat for Harwood's eriastrum, use overland travel (drive and crush) in-lieu of road construction to pad sites to the maximum extent practical. 4. On non-agricultural Public Lands in California, an authorized botanist would be on site for all construction activities involving surface disturbance or overland travel. 5. Within suitable habitat for Harwood's eriastrum, keep equipment to the minimum necessary to accomplish the necessary work. 6. On public lands in California, avoid establishing features that would interfere with the movement of sand to the maximum extent practical. 7. Laydown and temporary use sites would not be located within suitable habitat for Harwood's eriastrum. 8. On public lands in California, use existing roads or routes to the maximum extent practical. 9. Develop and implement an Invasive Species Management Plan (specific to the rare plant habitat) that California State Director would approve	Verify implementation of measures. Review adequacy and verify implementation of Harwood's eriastrum Linear ROW Protection Plan.	Pre-construction Construction	The Applicant

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
	prior to a notice to proceed for work on public lands in California. 10. No surface disturbance or overland travel would occur within occupied habitat for Harwood's eriastrum from 15 February through the 31 July. This stipulation does not apply to verified, unoccupied habitat. 11. No take of Harwood's eriastrum individuals would be allowed without California BLM State Director approval. 12. Prepare a Harwood's eriastrum Linear ROW Protection Plan. 13. Project impacts to suitable habitat combined with current impacts shall be limited (capped) to a maximum of 1 percent of Harwood's eriastrum habitat across all BLM lands included within the DRECP.			
Impact BIO-1 Impact BIO-2 Impact BIO-4	**BMP BIO-33: Construction Lighting.** All long-term nighttime lighting would be directed away from riparian and wetland vegetation, occupied habitat, and suitable habitat areas for sensitive species. Long-term nighttime lighting, if required, would be directed and shielded downward to avoid interference with the navigation of night-migrating birds and to minimize the attraction of insects as well as insectivorous birds and bats to Project infrastructure. Long-term nighttime lighting would avoid the use of constant-burn lighting.	Ensure that long-term nighttime lighting is directed away from riparian and wetland vegetation, occupied habitat, and suitable habitat areas for sensitive species. Ensure that long-term nighttime lighting directed and shielded downward and avoids the use of constant-burn lighting.	Construction	The Applicant
Impact BIO-1 Impact BIO-4	**BMP BIO-34: Prevention of Puddles During Dust Abatement.** The application of water and/or other palliatives for dust abatement in construction areas and during Project operations and maintenance would be done with the	Confirm puddles are prevented during dust abatement.	Construction Post-construction	The Applicant

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
	minimum amount of water necessary to meet safety and air quality standards and in a manner that prevents the formation of puddles, which could attract wildlife and wildlife predators.			
Impact BIO-1 Impact BIO-4	**BMP BIO-35: Presence of Wildlife in Construction Materials or Equipment.** All construction materials and equipment would be visually checked for the presence of wildlife prior to their movement or use. Any wildlife encountered during the course of these inspections would be allowed to leave the construction area unharmed.	Confirm that measures are implemented.	Construction	The Applicant
Impact BIO-1 Impact BIO-4	**BMP BIO-36: Feeding or Harassment of Wildlife.** The intentional feeding or harassment of wildlife on site is prohibited.	Ensure that workers do not feed or harass wildlife.	Construction	The Applicant
Impact BIO-1 Impact BIO-2	**BMP BIO-37: Native Plant Collection.** The collection of native plants on site is prohibited without required permits and tags.	Ensure that native plants will not be collected without required permits and tags.	Construction	The Applicant
Impact BIO-1 Impact BIO-2	**BMP BIO-38: Use of State-of-the-Art and Commercially Available Technology.** Use state-of-the-art, commercially available, construction and installation techniques, as approved by BLM, appropriate for the specific activity/Project and site, that minimize new site disturbance, soil erosion and deposition, soil compaction, disturbance to topography, and removal of vegetation.	Confirm that the applicant will use state-of-the-art, as approved by BLM, construction and installation techniques.	Construction	The Applicant
Impact BIO-1	**BMP BIO-40: Project Activity Siting Near Bat Maternity Roosts.** Activities would not be sited within 500 feet of any occupied maternity roost or presumed occupied maternity roost for BLM Focus and Special Status Bat Species.	Confirm that appropriate buffers are used.	Construction	The Applicant
Impact BIO-1	**BMP BIO-41: Succulent Management.** Management of cactus, yucca, and other succulents would adhere to current up-to-date BLM policy. All activities	Ensure that all activities follow applicable BLM	Construction	The Applicant

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
Impact BIO-2	would follow applicable BLM state and national regulations and policies for salvage and transplant of cactus, yucca, and other succulents. Pre-construction surveys of disturbance zones would include preparation of maps delineating special vegetation features. BLM may consider disposal of succulents through public sale, as per current up-to-date state and national policy.	state and national regulations and policies for salvage and transplant of cactus, yucca, and other succulents.		
Impact BIO-1 Impact BIO-2	**BMP BIO-42: Dead and Downed Wood.** Promote appropriate levels of dead and downed wood on the ground, outside of campground areas, to provide wildlife habitat, seed beds for vegetation establishment, and reduce soil erosion, as determined appropriate on an activity-specific basis.	Ensure that appropriate levels of dead and downed wood on the ground, outside of campground areas.	Construction	The Applicant
Impact BIO-1	**BMP BIO-43: Collection of Plant Material.** Allow for the collection of plant material consistent with the maintenance of natural ecosystem processes.	Ensure that the Vegetation Management Plan addresses collection of plant material.	Pre-construction	The Applicant
Impact BIO-1	BMP BIO-44: Mojave Desert Tortoise Protection. • All culverts for access roads or other barriers would be designed to allow unrestricted access by desert tortoises and would be large enough that desert tortoises are unlikely to use them as shelter sites (e.g., 36 inches in diameter or larger). Desert tortoise exclusion fencing may be utilized to direct tortoise use of culverts and other passages. • Biological monitoring would occur with any geotechnical boring or geotechnical boring vehicle movement to ensure no desert tortoises are killed or burrows are crushed. • A designated biologist would accompany any geotechnical testing equipment to ensure no tortoises are killed and no burrows are crushed. • The ground would be inspected under vehicles for the presence of desert tortoise any time a vehicle or construction equipment is parked in	Verify implementation of Mojave Desert tortoise protection measures.	Construction	The Applicant

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
	desert tortoise habitat. If a desert tortoise is seen, it may move on its own. If it does not move within 15 minutes, a designated biologist may remove and relocate the animal to a safe location. • Vehicular traffic would not exceed 15 miles per hour within the areas not cleared by protocol-level surveys where desert tortoise may be impacted.			
Impact BIO-1 Impact BIO-2	**BMP BIO-45: Protection from Loss and Harassment of Golden Eagles.** Provide protection from loss and harassment of active golden eagle nests through activities identified LUPA-BIO-IFS-24 through -31.	Ensure activities identified in LUPA-BIO-IFS-24 through -31 are implemented.	Construction	The Applicant
Impact BIO-1 Impact BIO-2	**BMP BIO-46: Compensation for Loss of Desert Riparian Woodland.** The loss of desert riparian woodland would be compensated at a ratio of 5:1 Compensation acreage requirements may be fulfilled through non-acquisition (i.e., restoration and enhancement), land acquisition (i.e., preserve), or a combination of these options, depending on the activity specifics and BLM approval/authorization.	Ensure that loss of desert riparian woodland would be compensated at a ratio of 5:1.	Post-construction	The Applicant
Impact BIO-1 Impact BIO-4	**BMP BIO-48: Flight Diverters.** Bird flight diverters would be installed on the Colorado River and associated floodplain crossings and other areas of high bird use as recommended by BLM in consultation with USFWS, AGFD, and CDFW.	Verify flight diverter installation appropriately installed.	Design	The Applicant
Impact BIO-1 Impact BIO-2	**BMP BIO-49: Fringe-toed Lizard Linear ROW Protection Plan.** A Fringe-toed Lizard Linear ROW Protection Plan would be prepared that identifies specific conservation measures to minimize Project-related impacts to sand dunes and sand transport areas, to map suitable habitat within construction zones, and methods to achieve clearance surveys within suitable habitat so animals are not killed by construction activities.	Review adequacy of and implementation of Fringe-toed Lizard Linear ROW Protection Plan.	Pre-construction Construction	The Applicant

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
Impact BIO-1 Impact BIO-2 Impact BIO-3 Impact BIO-4	**BMP BIO-50 Engineering Controls.** Appropriate engineering controls would be used to minimize impacts on dry wash, dry wash woodland, and chenopod scrub, including downstream occurrences, resulting from surface water runoff, erosion, sedimentation, altered hydrology, accidental spills, or fugitive dust deposition to these habitats. Appropriate buffers and engineering controls would be determined through agency consultation.	Ensure appropriate engineering controls are used to minimize impacts.	Design	The Applicant
Impact BIO-1 Impact BIO-2 Impact BIO-3 Impact BIO-4	**BMP BIO-51: Conductor Clearance.** To minimize vegetation trimming, micrositing and design considerations (including tower height) would be applied so the catenary formed by the conductors (the bottom of the sag) avoids saguaros and is not directly over wash vegetation (microphyll woodlands), to the extent practicable.	Ensure conductors avoids saguaros and is not directly over wash vegetation, to the extent practicable.	Design	The Applicant
Impact BIO-1 Impact BIO-2 Impact BIO-3 Impact BIO-4	**BMP BIO-52: California Riparian Habitat and Rare Plant Alliance Avoidance.** In California, as part of micrositing towers, a 200-foot setback from the outer perimeter of Coloradan semi-desert wash woodland/scrub vegetation community (microphyll woodlands) would be applied. Pre-construction surveys of disturbance zones would include preparation of maps delineating special vegetation features. Minor incursions would be allowed to balance minimizing vegetation trimming (see BMP BIO-51) while maintaining an appropriate setback, as determined based on site-specific conditions. No structure would be placed within, and no new access roads would pass through, these washes to the extent practicable.	Verify completion of preconstruction survey of disturbance zones and adequacy of maps.	Pre-construction Construction	The Applicant
Impact BIO-1 Impact BIO-2 Impact BIO-4	**BMP BIO-53: Protection of Dune Vegetation.** Project facilities would be sited to avoid dune vegetation. Unavoidable impacts to dune vegetation would be limited and Project facilities would be sited to minimize unavoidable impacts. Access roads would be designed and constructed to be at grade with the ground surface to avoid inhibiting sand transportation.	Confirm that facilities avoid dunes and dune vegetation.	Design	The Applicant

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
Impact BIO-1	**BMP BIO-54: Protection of Sand Transport.** Within Aeolian corridors that transport sand to dune formations and vegetation types downwind all activities would be designed and operated to facilitate the flow of sand across activity sites and avoid the trapping or diverting of sand from the Aeolian corridor. Structures would take into account the direction of sand flow and, to the extent feasible, build and align structures to allow sand to flow through the site unimpeded. Fences would be designed to allow sand to flow through and not be trapped.	Confirm that structures take into account the direction of sand flow.	Design	The Applicant
Impact BIO-1 Impact BIO-2 Impact BIO-4	**BMP BIO-55: Access within Focus and BLM Special-Status Species Suitable Habitat.** Construction of new roads and/or routes would be avoided to the extent practicable within focus and BLM special-status species suitable habitat within identified linkages for those focus and BLM special-status species, unless the new road and/or route is beneficial to minimize net impacts to natural or ecological resources of concern.	Confirm that roads and/or routes are avoided within Focus and BLM Special Status Species suitable habitat.	Design	The Applicant
Impact BIO-1	**BMP BIO-56: Sonoran Pronghorn.** Measures, as required by the USFWS in any applicable BO, would be implemented.	Ensure that Sonoran Pronghorn measures are implemented.	Pre-construction Construction	The Applicant
Impact BIO-1 Impact BIO-2 Impact BIO-3	**BMP VEG-01: Removal of Vegetation.** Any removal of vegetation resources would be conducted in accordance with BLM IB 2012-097.	Confirm that vegetation resources are removed in accordance with BLM IB 2012-097.	Construction	The Applicant
Impact BIO-1 Impact BIO-2 Impact BIO-3	**BMP VEG-02: Avoid Vegetation Removal.** Minimize natural vegetation removal through implementation of crush and drive or cut or mow vegetation rather than removing entirely.	Confirm minimal vegetation is removed.	Construction	The Applicant
Impact BIO-1	**CMA DFA-BIO-IFS-1.** Conduct surveys as applicable in the DFAs as shown	Confirm that applicable	Pre-construction	The Applicant

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
	in Table 21 of the DRECP.	surveys are conducted.		
Impact BIO-1	**CMA DFA-BIO-IFS-2.** Implement setbacks shown in Table 22 of the DRECP as applicable in the DFAs.	Confirm that applicable surveys are conducted.	Design	The Applicant
Impact BIO-1 Impact BIO-2	**CMA DFA-VPL-BIO-DUNE-1.** Activities in DFAs and VPLs, including transmission substations, will be sited to avoid dune vegetation (i.e., North American Warm Desert Dune and Sand Flats). Unavoidable impacts (see "unavoidable impacts to resources" in the Glossary of Terms, EIS Appendix 6) to dune vegetation will be limited to transmission projects, except transmission substations, and access roads that will be sited to minimize unavoidable impacts. • For unavoidable impacts (see "unavoidable impacts to resources" in the Glossary of Terms, EIS Appendix 6) to dune vegetation, the following will be required: o Access roads will be unpaved. o Access roads will be designed and constructed to be at grade with the ground surface to avoid inhibiting sand transportation.	Confirm requirements regarding unavoidable impacts and access roads are implemented.	Design	The Applicant
Impact BIO-1 Impact BIO-2	**CMA LUPA-BIO-1.** Conduct a habitat assessment (see Glossary of Terms, EIS Appendix 6) of focus and BLM special-status species suitable habitat for all activities and identify and/or delineate the DRECP vegetation types, rare alliances, and special features (e.g., Aeolian sand transport resources, Joshua tree, microphyll woodlands, carbon sequestration characteristics, seeps, climate refugia) present using the most current information, data sources, and tools (e.g., DRECP land cover mapping, aerial photos, DRECP species models, and reconnaissance site visits) to identify suitable habitat (see Glossary of Terms, EIS Appendix 6) for focus and BLM special-status species. If required by the relevant species-specific CMAs, conduct any subsequent protocol or adequate	Confirm habitat assessment adequacy.	Pre-construction Construction	The Applicant

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
	presence/absence surveys to identify species occupancy status and a more detailed mapping of suitable habitat to inform siting and design considerations. If required by relevant species-specific CMAs, conduct analysis of percentage of impacts to suitable habitat and modeled suitable habitat. • BLM will not require protocol surveys in sites determined by the designated biologist to be unviable for occupancy of the species, or if baseline studies inferred absence during the current or previous active season. • Utilize the most recent and applicable assessment protocols and guidance documents for vegetation types and jurisdictional waters and wetlands that have been approved by BLM, and the appropriate responsible regulatory agencies, as applicable.			
Impact BIO-1	**CMA LUPA-BIO-2.** Designated biologist(s) (see Glossary of Terms, EIS Appendix 6), will conduct, and oversee where appropriate, activity-specific required biological monitoring during pre-construction, construction, and decommissioning to ensure that avoidance and minimization measures are appropriately implemented and are effective. The appropriate required monitoring will be determined during the environmental analysis and BLM approval process. The designated biologist(s) will submit monitoring reports directly to BLM.	Ensure that a biological monitor is present when appropriate and submits monitoring reports directly to BLM.	Pre-construction Construction Post-construction Decommissioning	The Applicant
Impact BIO-1 Impact BIO-2	**CMA LUPA-BIO-3.** Resource setbacks (see Glossary of Terms, EIS Appendix 6) have been identified to avoid and minimize the adverse effects to specific biological resources. Setbacks are not considered additive and are measured as specified in the applicable CMA. Allowable minor incursions (see Glossary of Terms, EIS Appendix 6), as per specific CMAs do not affect the following setback measurement descriptions. Generally, setbacks (which range in distances for different biological resources) for the appropriate resources are	Confirm resource setbacks measures are implemented.	Design	The Applicant

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
	measured from: • The edge of each of the DRECP desert vegetation types, including but not limited to those in the riparian or wetland vegetation groups (as defined by alliances within the vegetation type descriptions and mapped based on the vegetation type habitat assessments described in LUPA-BIO-1). • The edge of the vegetation extent for specified focus and BLM sensitive plant species. • The edge of suitable habitat or active nest substrates for the appropriate focus and BLM special-status species.			
Impact BIO-1	**CMA LUPA-BIO-4.** For activities that may impact focus and BLM special-status species, implement required species-specific seasonal restrictions on pre-construction, construction, operations, and decommissioning activities. Species-specific seasonal restriction dates are described in the applicable CMAs. Alternatively, to avoid a seasonal restriction associated with visual disturbance, installation of a visual barrier may be evaluated on a case-by-case basis that will result in the breeding, nesting, lambing, fawning, or roosting species not being affected by visual disturbance from construction activities subject to seasonal restriction. The proposed installation and use of a visual barrier to avoid a species seasonal restriction will be analyzed in the activity/Project specific environmental analysis.	Confirm Focus and BLM Special Status Species measures are implemented.	Pre-construction Construction Post-construction Decommissioning	The Applicant
Impact BIO-1 Impact BIO-2	**CMA LUPA-BIO-5.** All activities, as determined appropriate on an activity-by-activity basis, will implement a worker education program that meets the approval of the BLM. The program will be carried out during all phases of the Project (i.e., site mobilization, ground disturbance, grading, construction, operation, closure/decommissioning or Project abandonment, and restoration/reclamation activities). The worker education program will provide	Confirm adequacy and implementation of the worker education program and approval of BLM.	Pre-construction Construction Post-construction Decommissioning	The Applicant

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
	interpretation for non-English speaking workers and provide the same instruction for new workers prior to their working on site. As appropriate based on the activity, the program will contain information about: • Site-specific biological and non-biological resources. • Information on the legal protection for protected resources and penalties for violation of Federal and State laws and administrative sanctions for failure to comply with LUPA CMA requirements intended to protect site-specific biological and nonbiological resources. • The required LUPA and Project-specific measures for avoiding and minimizing effects during all Project phases, including but not limited to resource setbacks, trash, speed limits, etc. • Reporting requirements and measures to follow if protected resources are encountered, including potential work stoppage and requirements for notification of the designated biologist. • Measures that personnel can take to promote the conservation of biological and non-biological resources.			
Impact BIO-1	**CMA LUPA-BIO-6.** Subsidized predator standards, approved by BLM, in coordination with the USFWS and CDFW, will be implemented during all appropriate phases of activities, including but not limited to renewable energy activities, to manage predator food subsidies, water subsidies, and breeding sites including the following: • Common raven management actions will be implemented for all activities to address food and water subsidies and roosting and nesting sites specific to the common raven. These include identification of monitoring reporting procedures and requirements; strategies for refuse management; as well as design strategies and passive repellant methods to avoid providing perches, nesting sites, and roosting sites	Confirm that subsidized predatory standards are implemented.	Pre-construction Construction Post-construction	The Applicant

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
	for common ravens. • The application of water and/or other palliatives for dust abatement in construction areas and during Project operations and maintenance will be done with the minimum amount of water necessary to meet safety and air quality standards and in a manner that prevents the formation of puddles, which could attract wildlife and wildlife predators. • Following the most recent national policy and guidance, BLM will take actions to not introduce, dispose of, or release any non- native species into areas of native habitat, suitable habitat, and natural or artificial waterways/water bodies containing native species. All activity work areas will be kept free of trash and debris. Particular attention will be paid to "micro-trash" (including such small items as screws, nuts, washers, nails, coins, rags, small electrical components, small pieces of plastic, glass or wire, and any debris or trash that is colorful or shiny) and organic waste that may subsidize predators. All trash will be covered, kept in closed containers, or otherwise removed from the Project site at the end of each day or at regular intervals prior to periods when workers are not present at the site. • In addition to implementing the measures above on activity sites, each activity will provide compensatory mitigation that contributes to LUPA-wide raven management.			
Impact BIO-1 Impact BIO-2	**CMA LUPA-BIO-7.** Where DRECP vegetation types or focus or BLM special-status species habitats may be affected by ground- disturbance and/or vegetation removal during pre-construction, construction, operations, and decommissioning related activities but are not converted by long-term (i.e., more than two years of disturbance, see Glossary of Terms, EIS Appendix 6) ground disturbance, restore these areas following the standards, approved by BLM authorized officer, following the most recent BLM policies and	Confirm restoration standards are implemented.	Pre-construction Construction Post-construction Decommissioning	The Applicant

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
	procedures for the vegetation community or species habitat disturbance/impacts as appropriate, summarized below: • Implement site-specific habitat restoration actions for the areas affected including specifying and using: o The appropriate seed (e.g., certified weed- free, native, and locally and genetically appropriate seed). o Appropriate soils (e.g., topsoil of the same original type on site or that was previously stored by soil type after being salvaged during excavation and construction activities). o Equipment. o Timing (e.g., appropriate season, sufficient rainfall). o Location. o Success criteria. o Monitoring measures. o Contingency measures, relevant for restoration, which includes seeding that follows BLM policy when on BLM-Administered Lands. • Salvage and relocate cactus, nolina, and yucca from the site prior to disturbance using BLM protocols. To the maximum extent practicable for short-term disturbed areas (see Glossary of Terms, EIS Appendix 6), the cactus and yucca will be re-planted back to the original site. • Restore and reclaim short-term (i.e. 2 years or less, see Glossary of Terms, EIS Appendix 6) disturbed areas, including pipelines, transmission projects, staging areas, and short-term construction-related roads immediately or during the most biologically appropriate			

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
	season as determined in the activity/Project specific environmental analysis and decision, following completion of construction activities to reduce the amount of habitat converted at any one time and promote recovery to natural habitats and vegetation as well as climate refugia and ecosystem services such carbon storage.			
Impact BIO-1 Impact BIO-2	**CMA LUPA-BIO-8.** All activities that are required to close and decommission the site (e.g., renewable energy activities) will specify and implement Project-specific closure and decommissioning actions that meet the approval of BLM, and that at a minimum address the following: • Specifying and implementing the methods, timing (e.g., criteria for triggering closure and decommissioning actions), and criteria for success (including quantifiable and measurable criteria). • Recontouring of areas that were substantially altered from their original contour or gradient and installing erosion control measures in disturbed areas where potential for erosion exists. • Restoring vegetation as well as soil profiles and functions that will support and maintain native plant communities, associated carbon sequestration and nutrient cycling processes, and native wildlife species. • Vegetation restoration actions will identify and use native vegetation composition, native seed composition, and the diversity to values commensurate with the natural ecological setting and climate projections.	Confirm that decommissioning activities will address the BLM standards.	Pre-construction Post-construction Decommissioning	The Applicant
Impact BIO-1 Impact BIO-2	**CMA LUPA-BIO-9.** Implement the following general LUPA CMA for water and wetland dependent resources: • Implement construction site standard practices to prevent toxic	Confirm LUPA CMA for water and wetland resources measures are implemented.	Construction	The Applicant

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
Impact BIO-3	chemicals, hazardous materials, and other fluids from entering vegetation type streams, washes, and tributary networks through water runoff, erosion, and sediment transport by, at a minimum, implementing the following: o On Project sites, vehicles and other equipment will be maintained in proper working condition and only stored in designated containment areas where runoff is collected or controlled and that are located outside of streams, washes, and distributary networks to minimize accidental fluids and hazardous materials spills. o Hazardous material leaks, spills, or releases will be immediately cleaned, and equipment will be repaired upon identification. Removal and disposal of spill and related clean-up materials will occur at an approved off-site landfill. o Maintenance and operations vehicles will carry the appropriate equipment and materials to isolate, clean up, and repair any hazardous material leaks, spills, or releases. • Activity-specific drainage, erosion, and sedimentation control actions, which meet the approval of BLM and the applicable regulatory agencies, will be carried out during all appropriate phases of the approved Project. These actions, as needed, will address measures to ensure the proper protection of water quality, site-specific stormwater and sediment retention, and design of the Project to minimize site disturbance, including the following: o Identify site-specific surface water runoff patterns and implement measures to prevent excessive and unnatural soil deposition and erosion.			

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
	o Implement measures to maintain natural drainages and to maintain hydrologic function in the event drainages are disturbed. o Reduce the amount of area covered by impervious surfaces through use of permeable pavement or other pervious surfaces. Direct runoff from impervious surfaces into retention basins. o Stabilize disturbed areas following grading in the manner appropriate to the soil type so that wind or water erosion is minimized. o Minimize irrigation runoff by using low or no irrigation native vegetation landscaping for landscaped retention basins. o Conduct regular inspections and maintenance of long-term erosion control measures to ensure long-term effectiveness.			
Impact BIO-1 Impact BIO-2	**CMA LUPA-BIO-10.** Consistent with BLM state and national policies and guidance, integrated weed management actions will be carried out during all phases of activities, as appropriate, and at a minimum will include the following: • Thoroughly clean the tires and undercarriage of vehicles entering or reentering the Project site to remove potential weeds. • Store Project vehicles on site in designated areas to minimize the need for multiple washings whenever vehicles re-enter the Project site. • Properly maintain vehicle wash and inspection stations to minimize the introduction of invasive weeds or subsidy of invasive weeds. • Closely monitor the types of materials brought onto the site to avoid the	Confirm integrated weed management actions are implemented.	Pre-construction Construction Post-construction Decommissioning	The Applicant

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
	introduction of invasive weeds and non-native species. • Reestablish native vegetation quickly on disturbed sites. • Monitor and quickly implement control measures to ensure early detection and eradication of weed invasions to avoid the spread of invasive weeds and non-native species on site and to adjacent off-site areas. • Use certified weed-free mulch, straw, hay bales, or equivalent fabricated materials for installing sediment barriers.			
Impact BIO-1 Impact BIO-2	**CMA LUPA-BIO-11.** Implement the following CMAs for controlling nuisance animals and invasive species: • No fumigant, treated bait, or other means of poisoning nuisance animals including rodenticides will be used in areas where focus and BLM special-status species are known or suspected to occur. • Manage the use of widely spread herbicides and do not apply herbicides effective against dicotyledonous plants within 1,000 feet from the edge of a 100-year floodplain, stream and wash channels, and riparian vegetation or to soils less than 25 feet from the edge of drains. Exceptions will be made when targeting the base and roots of invasive riparian species such as tamarisk and *Arundo donax* (giant reed). Manage herbicides consistent with the most current national and California BLM policies. • Minimize herbicide, pesticide, and insecticide treatment in areas that have a high risk for groundwater contamination. • Clean and dispose of pesticide containers and equipment following professional standards. Avoid use of pesticides and cleaning containers and equipment in or near surface or subsurface water.	Confirm CMAs for controlling nuisance animals and invasive species are implemented.	Construction Post-construction Decommissioning	The Applicant

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
	• When near surface or subsurface water, restrict pesticide use to those products labeled safe for use in/near water and safe for aquatic species of animals and plants.			
Impact BIO-1	**CMA LUPA-BIO-12.** For activities that may impact focus or BLM special-status species, implement the following LUPA CMA for noise: • To the extent feasible and determined necessary by BLM to protect focus and BLM sensitive wildlife species, locate stationary noise sources that exceed background ambient noise levels away from known or likely locations of and BLM sensitive wildlife species and their suitable habitat. • Implement engineering controls on stationary equipment, buildings, and work areas including sound-insulation and noise enclosures to reduce the average noise level, if the activity will contribute to noise levels above existing background ambient levels. • Use noise controls on standard construction equipment including mufflers to reduce noise.	Confirm LUPA CMA are implemented for activities that may impact Focus or BLM Special Status Species.	Design Construction	The Applicant
Impact BIO-1 Impact BIO-2 Impact BIO-4	**CMA LUPA-BIO-13.** Implement the following CMA for Project siting and design: • To the maximum extent practicable site and design projects to avoid impacts to vegetation types, unique plant assemblages, climate refugia as well as occupied habitat and suitable habitat for focus and BLM special-status species (see “avoid to the maximum extent practicable” in Glossary of Terms, EIS Appendix 6). • The siting of projects along the edges (i.e. general linkage border) of the biological linkages identified in Appendix D of the CDCA Plan, as amended (Figures D-1 and D-2) will be configured (1) to maximize the	Confirm that measures for project siting and design are implemented.	Design	The Applicant

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
	retention of microphyll woodlands and their constituent vegetation type and inclusion of other physical and biological features conducive to focus and BLM special-status species dispersal, and (2) informed by existing available information on modeled focus and BLM Special-Status Species habitat and element occurrence data, mapped delineations of vegetation types, and based on available empirical data, including radio telemetry, wildlife tracking sign, and road-kill information. Additionally, projects will be sited and designed to maintain the function of special-status species connectivity and their associated habitats in the following linkage and connectivity areas: o Within a 5-mile-wide linkage across Interstate 10 centered on Wiley's Well Road to connect the Mule and McCoy mountains (the majority of this linkage is within the Chuckwalla ACEC and Mule-McCoy Linkage ACEC).			
Impact BIO-1	**CMA LUPA-BIO-14.** Delineate the boundaries of areas to be disturbed using temporary construction fencing and flagging prior to construction and confine disturbances, Project vehicles, and equipment to the delineated Project areas to protect vegetation types and focus and BLM special-status species. • Long-term nighttime lighting on Project features will be limited to the minimum necessary for Project security, safety, and compliance with FAA requirements and will avoid the use of constant-burn lighting. • All long-term nighttime lighting will be directed away from riparian and wetland vegetation, occupied habitat, and suitable habitat areas for focus and BLM special-status species. Long- term nighttime lighting will be directed and shielded downward to avoid interference with the navigation of night-migrating birds and to minimize the attraction of insects as well as insectivorous birds and bats to Project infrastructure.	Confirm that boundaries of areas to be disturbed are implemented.	Design Construction	The Applicant

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
	• To the maximum extent practicable (see Glossary of Terms, EIS Appendix 6), restrict construction activity to existing roads, routes, and utility corridors to minimize the number and length/size of new roads, routes, disturbance, laydown, and borrow areas. • To the maximum extent practicable (see Glossary of Terms, EIS Appendix 6), confine vehicular traffic to designated open routes of travel to and from the Project site, and prohibit, within Project boundaries, cross- country vehicle and equipment use outside of approved designated work areas to prevent unnecessary ground and vegetation disturbance. • To the maximum extent practicable (see Glossary of Terms, EIS Appendix 6), construction of new roads and/or routes will be avoided within focus and BLM special-status species suitable habitat within identified linkages for those focus and BLM special-status species, unless the new road and/or route is beneficial to minimize net impacts to natural or ecological resources of concern. These areas will have a goal of "no net gain" of Project roads and/or routes. • Use nontoxic road sealants and soil stabilizing agents.			
Impact BIO-1 Impact BIO-2	**CMA LUPA-BIO-15.** Use state-of-the-art, as approved by BLM, construction and installation techniques, appropriate for the specific activity/Project and site, that minimize new site disturbance, soil erosion and deposition, soil compaction, disturbance to topography, and removal of vegetation.	Confirm state-of-the-art construction techniques are utilized and approved by BLM.	Construction	The Applicant
Impact BIO-1	**CMA LUPA-BIO-16.** For activities that may impact focus and BLM sensitive birds, protected by the FESA and/or MBTA, and bat species, implement appropriate measures as per the most up-to-date BLM state and national policy and guidance, and data on birds and bats, including but not limited to activity specific plans and actions. The goal of the activity -specific bird and bat actions	Confirm Focus and BLM sensitive birds and bats activity-specific measures are implemented.	Design Pre-construction Construction Post-construction	The Applicant

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
	is to avoid and minimize direct mortality of birds and bats from the construction, operation, maintenance, and decommissioning of the specific activities. Activity-specific measures to avoid and minimize impacts may include, but are not limited to: • Siting and designing activities will avoid high bird and bat movement areas that separate birds and bats from their common nesting and roosting sites, feeding areas, or lakes and rivers. • For activities that impact bird and bat focus and BLM special-status species, during Project siting and design, conducting monitoring of bird and bat presence as well as bird and bat use of the Project site using the most current survey methods and best procedures available at the time. • Reusing or co-locating new transmission facilities and other ancillary facilities with existing facilities and disturbed areas to reduce habitat destruction and avoid additional collision risks. • Reducing bird and bat collision hazards by utilizing techniques such as unguyed monopole towers or tubular towers. Where the use of guywires is unavoidable, demarcate guywires using the best available methods to minimize avian species strikes. • When fencing is necessary, use bird and bat compatible design standards. • Using lighting that does not attract birds and bats or their prey to Project sites including using non-steady burning lights (i.e., red, dual red and white strobe, strobe- like flashing lights) to meet FAA requirements, using motion or heat sensors and switches to reduce the time when lights are illuminated, using appropriate shielding to reduce horizontal		Decommissioning	

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
	or skyward illumination, and avoiding the use of high-intensity lights (e.g., sodium vapor, quartz, and halogen). • Implementing a robust monitoring program to regularly check for wildlife carcasses, document the cause of mortality, and promptly remove the carcasses. • Incorporating a bird and bat use and mortality monitoring program during operations using current protocols and best procedures available at time of monitoring.			
Impact BIO-1 Impact BIO-2	**CMA LUPA-BIO-17.** For activities that may result in mortality to focus and BLM special-status bird and bat species, a NBBMP, as a part of the BBCS, will be prepared with the goal of assessing operational impacts to bird and bat species and incorporating methods to reduce documented mortality. The NBBMP actions for impacts to birds and bats during these activities will be determined by the activity-specific bird and bat operational actions. The strategy shall be approved by BLM in coordination with USFWS, and CDFW as appropriate, and may include, but is not limited to: • Incorporating a bird and bat use and mortality monitoring program during operations using current protocols and best procedures available at time of monitoring. • Activity-specific operational avoidance and minimization actions that reduce the level of mortality on the populations of bird and bat species, such as: o Evaluation and installation of the best available bird and bat detection and deterrent technologies available at the time of construction. The following provides the DRECP vegetation type and focus and BLM special-status species biological CMAs to be implemented throughout the	Confirm BBCS is approved by BLM and implemented.	Pre-construction Construction Post-construction	The Applicant

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
	LUPA DA. RIPWET • Riparian Vegetation Types: o Sonoran-Coloradan Semi-Desert Wash Woodland/ Scrub (microphyll woodland) • Riparian and Wetland Bird Focus Species: o Southwestern Willow Flycatcher o Western Yellow-billed Cuckoo o Yuma Ridgway's Rail			
Impact BIO-1	**CMA LUPA-BIO-BAT-1.** Activities, except wind projects, will not be sited within 500 feet of any occupied maternity roost or presumed occupied maternity roost as described below. Refer to CMA DFA-VPL-BIO-BAT-1 for distances within DFAs and VPLs.	Confirm project is not sited within 500 feet of any occupied or presumed occupied maternity roost.	Design	The Applicant
Impact BIO-1 Impact BIO-2	**CMA LUPA-BIO-COMP-1.** Impacts to biological resources, identified and analyzed in the activity specific environmental document, from activities in the LUPA DA will be compensated using the standard biological resources compensation ratio, except for the biological resources and specific geographic locations listed as compensation ratio exceptions, specifics in CMAs LUPA-BIO-COMP-2, and previously listed CMAs. Compensation acreage requirements may be fulfilled through non-acquisition (i.e., restoration and enhancement), land acquisition (i.e., preserve), or a combination of these options, depending on the activity specifics and BLM approval/authorization. Refer to CMA LUPA-COMP-1 and 2 for the timing requirements for initiation or completion of compensation.	Confirm applicant compensates for impacts as described.	Design Post-construction	The Applicant

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
Impact BIO-1	**CMA LUPA-BIO-COMP-2.** Birds and Bats – The compensation for the mortality impacts to bird and bat focus and BLM special-status species from activities will be determined based on monitoring of bird and bat mortality and a fee re-assessed every 5 years to fund compensatory mitigation. The initial compensation fee for bird and bat mortality impacts will be based on pre-Project monitoring of bird use and estimated bird and bat species mortality from the activity. The approach to calculating the operational bird and bat compensation is based on the total replacement cost for a given resource, an REA. This involves measuring the relative loss to a population (debt) resulting from an activity and the productivity gain (credit) to a population from the implementation of compensatory mitigation actions. The measurement of these debts and gains (using the same "bird years" metric as described in Appendix D of the DRECP) is used to estimate the necessary compensation fee. Each activity, as determined appropriate by BLM in coordination with USFWS, and CDFW as applicable, will include a monitoring strategy to provide activity-specific information on mortality effects on birds and bats in order to determine the amount and type of compensation required to offset the effects of the activity, as described above and in detail in Appendix D of the DRECP. Compensation will be satisfied by restoring, protecting, or otherwise improving habitat such that the carrying capacity or productivity is increased to offset the impacts resulting from the activity. Compensation may also be satisfied by non-restoration actions that reduce mortality risks to birds and bats (e.g., increased predator control and protection of roosting sites from human disturbance). Compensation will be consistent with the most up to date DOI mitigation policy.	Confirm applicant compensates for impacts as described.	Design Post-construction	The Applicant
Impact BIO-1 Impact BIO-2	**CMA LUPA-BIO-DUNE-1.** Because DRECP sand dune vegetation types and Aeolian sand transport corridors are, by definition, shifting resources, activities that potentially occur within or bordering the sand dune DRECP vegetation types and/or Aeolian sand transport corridors must conduct studies to verify the	Verify adequacy of sand dune studies.	Pre-construction	The Applicant

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
	location [refer to Appendix D, Figure D-7 of the DRECP] and extent of the sand resource(s) for the activity-specific environmental analysis to determine: • Whether the proposed activity(s) occur within a sand dune or an Aeolian sand transport corridor • If the activity(s) is subject to dune/Aeolian sand transport corridor CMAs • If the activity(s) needs to be reconfigured to satisfy applicable avoidance requirements			
Impact BIO-1 Impact BIO-2	**CMA LUPA-BIO-DUNE-2.** Activities that potentially affect the amount of sand entering or transported within Aeolian sand transport corridors will be designed and operated to: • Maintain the quality and function of Aeolian transport corridors and sand deposition zones, unless related to maintenance of existing (at the time of the DRECP LUPA ROD) facilities/operations/activities. • Avoid a reduction in sand-bearing sediments within the Aeolian system. • Minimize mortality to dune associated focus and BLM special-status species.	Review design for adequacy regarding sand dunes.	Design Pre-construction	The Applicant
Impact BIO-1 Impact BIO-2	**CMA LUPA-BIO-DUNE-3.** Any facilities or activities that alter site hydrology (e.g., sediment barrier) will be designed to maintain continued sediment transport and deposition in the Aeolian corridor in a way that maintains the Aeolian sorting and transport to downwind deposition zones. Site designs for maintaining this transport function must be approved by BLM in coordination with USFWS and CDFW as appropriate.	Review design for adequacy regarding hydrology and sand dunes.	Design	The Applicant
Impact BIO-1	**CMA LUPA-BIO-DUNE-4.** Dune formations and other sand accumulations (i.e., sand ramps, sand sheets) with suitable habitat characteristics for the	Review mapping for adequacy.	Pre-construction	The Applicant

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
Impact BIO-2	Mojave fringe-toed lizard (i.e., unconsolidated blow-sand) will be mapped according to mapping standards established by the BLM NOC. For minor incursions (see "minor incursion" in the Glossary of Terms, EIS Appendix 6) into sand dunes and sand transport areas the activity will be sited in the mapped zone with the least impacts to sand dunes and sand transport and Mojave fringe-toed lizards.			
Impact BIO-1	**CMA LUPA-BIO-DUNE-5.** If suitable habitat characteristics are identified during the habitat assessment, clearance surveys (see Glossary of Terms, EIS Appendix 6) for Mojave fringe-toed lizard will be performed in suitable habitat areas. The following CMAs will be implemented for bat focus and BLM special-status species, including but not limited to those listed below: • California leaf-nosed bat; • Pallid bat; and • Townsend's big-eared bat.	Confirm CMAs for bat Focus and BLM Special Status Species are implemented.	Pre-construction	The Applicant
Impact BIO-1	**CMA LUPA-BIO-IFS-3.** All culverts for access roads or other barriers will be designed to allow unrestricted access by desert tortoises and will be large enough that desert tortoises are unlikely to use them as shelter sites (e.g., 36 inches in diameter or larger). Desert tortoise exclusion fencing may be utilized to direct tortoise use of culverts and other passages.	Confirm adequate design of culverts.	Design Pre-construction	The Applicant
Impact BIO-1	**CMA LUPA-BIO-IFS-5.** Following the clearance surveys (see Glossary of Terms, EIS Appendix 6) within sites that are fenced with long-term desert tortoise exclusion fencing a designated biologist (see Glossary of Terms, EIS Appendix 6) will monitor initial clearing and grading activities to ensure that desert tortoises missed during the initial clearance survey are moved from	Confirm clearance surveys conducted.	Construction	The Applicant

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
	harm's way. • A designated biologist will inspect construction pipes, culverts, or similar structures: (a) with a diameter greater than 3 inches, (b) stored for one or more nights, (c) less than 8 inches aboveground, and (d) within desert tortoise habitat (such as, outside the long-term fenced area), before the materials are moved, buried, or capped. • As an alternative, such materials shall be capped before storing outside the fenced area or placing on pipe racks. Pipes stored within the long-term fenced area after completing desert tortoise clearance surveys will not require inspection.			
	CMA LUPA-BIO-IFS-6. When working in areas where protocol or clearance surveys are required (Appendix D of the DRECP), biological monitoring will occur with any geotechnical boring or geotechnical boring vehicle movement to ensure no desert tortoises are killed or burrows are crushed.	Confirm biological monitoring is conducted.	Construction (geotechnical boring)	The Applicant
	CMA LUPA-BIO-IFS-7. A designated biologist (see Glossary of Terms, EIS Appendix 6) will accompany any geotechnical testing equipment to ensure no tortoises are killed and no burrows are crushed.	Confirm biological monitoring is conducted.	Construction (geotechnical testing)	The Applicant
Impact BIO-1	**CMA LUPA-BIO-IFS-8.** Inspect the ground under the vehicle for the presence of desert tortoise any time a vehicle or construction equipment is parked in desert tortoise habitat outside of areas fenced with desert tortoise exclusion fencing. If a desert tortoise is seen, it may move on its own. If it does not move within 15 minutes, a designated biologist may remove and relocate the animal to a safe location.	Ensure the ground under vehicles are inspected for desert tortoise.	Construction	The Applicant
Impact BIO-1	**CMA LUPA-BIO-IFS-9.** Vehicular traffic will not exceed 15 miles per hour within the areas not cleared by protocol-level surveys where desert tortoise may be impacted.	Ensure vehicle traffic speeds will not exceed 15 miles per hour within the	Pre-construction Construction Post-construction	The Applicant

		areas not cleared by protocol level surveys where desert tortoise may be impacted		
Impact BIO-1	**CMA LUPA-BIO-IFS-11.** If Bendire's thrasher is present, conduct appropriate activity-specific biological monitoring (see Glossary of Terms, EIS Appendix 6) to ensure that Bendire's thrasher individuals are not directly affected by operations (i.e., mortality or injury, direct impacts on nest, eggs, or fledglings).	Confirm monitoring conducted if Bendire's thrasher is present	Construction	The Applicant
Impact BIO-1	**CMA LUPA-BIO-IFS-12.** If burrowing owls are present, a designated biologist (see Glossary of Terms, EIS Appendix 6) will conduct appropriate activity-specific biological monitoring (see Glossary of Terms, EIS Appendix 6) to ensure avoidance of occupied burrows and establishment of the 656 feet (200 meter) setback to sufficiently minimize disturbance during the nesting period on all activity sites, when practical.	Confirm monitoring conducted if burrowing owls are present	Construction	The Applicant
Impact BIO-1	**CMA LUPA-BIO-IFS-13.** If burrows cannot be avoided on-site, passive burrow exclusion by a designated biologist (see Glossary of Terms, EIS Appendix 6) through the use of one-way doors will occur according to the specifications in Appendix D of the DRECP or the most up-to-date agency BLM or CDFW specifications. Before exclusion, there must be verification that burrows are empty as specified in Appendix D of the DRECP or the most up-to-date BLM or CDFW protocols. Confirmation that the burrow is not currently supporting nesting or fledgling activities is required prior to any burrow exclusions or excavations.	Confirm that, if necessary, passive burrow exclusion conducted by a designated biologist.	Construction	The Applicant
Impact BIO-1	**CMA LUPA-BIO-IFS-14.** Activity-specific active translocation of burrowing owls may be considered, in coordination with CDFW.	Confirm translocation of burrowing owls considered in coordination with CDFW.	Construction	The Applicant

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
Impact BIO-1	**CMA LUPA-BIO-IFS-24.** Provide protection from loss and harassment of active golden eagle nests through the following actions: • Activities that may impact nesting golden eagles, will not be sited or constructed within 1-mile of any active or alternative golden eagle nest within an active golden eagle territory, as determined by BLM in coordination with USFWS as appropriate.	Confirm actions to provide golden eagle nest protection are implemented.	Design	The Applicant
Impact BIO-1	**CMA LUPA-BIO-IFS-25.** Cumulative loss of golden eagle foraging habitat within a 1- to 4-mile radius around active or alternative golden eagle nests (as identified or defined in the most recent USFWS guidance and/or policy) will be limited to less than 20 percent. See CONS-BIO-IFS-5 for the requirement in Conservation Lands.	Confirm actions to provide golden eagle nest protection are implemented.	Design	The Applicant
Impact BIO-1	**CMA LUPA-BIO-IFS-26.** For activities that impact golden eagles, applicants will conduct a risk assessment per the applicable USFWS guidance (e.g., the Eagle Conservation Plan Guidance) using best available information as well as the data collected in the pre-Project golden eagle surveys.	Review golden eagle risk assessment for adequacy.	Design	The Applicant
	CMA LUPA-BIO-IFS-27. If a permit for golden eagle take is determined to be necessary, an application will be submitted to the USFWS in order to pursue a take permit.	Verify whether permit for golden eagle take is determined to be necessary.	Prior to construction	The Applicant
Impact BIO-1	**CMA LUPA-BIO-PLANT-1.** Conduct properly timed protocol surveys in accordance with the BLM's most current (at time of activity) survey protocols for plant focus and BLM special-status species.	Confirm protocol surveys conducted during proper times.	Prior to construction	The Applicant
Impact BIO-1	**CMA LUPA-BIO-PLANT-2.** Implement an avoidance setback of 0.25 mile for all focus and BLM special-status species occurrences. Setbacks will be placed strategically adjacent to occurrences to protect ecological processes necessary to support the plant species (Appendix Q, Baseline Biology Report, in the	Confirm avoidance setback implemented.	Design Prior to construction	The Applicant

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
	proposed LUPA and Final EIS [2015], or the most recent data and modeling).			
Impact BIO-1 Impact BIO-2	**CMA LUPA-BIO-PLANT-3.** Impacts to suitable habitat for focus and BLM special-status plant species should be avoided to the extent feasible and are limited [capped] to a maximum of 1 percent of their suitable habitat throughout the entire LUPA DA. The baseline condition for measuring suitable habitat is the DRECP modeled suitable habitat for these species utilized in the EIS analysis (2014 and 2015), or the most recent suitable habitat modeling.	Confirm impacts to suitable habitat for Focus and BLM Special Status plant species are avoided.	Design	The Applicant
Impact BIO-1 Impact BIO-2 Impact BIO-3	**CMA LUPA-BIO-RIPWET-1.** The riparian and wetland DRECP vegetation types and other features listed in Table 17 will be avoided to the maximum extent practicable, except for allowable minor incursions (see Glossary of Terms for "avoidance to the maximum extent practicable" and "minor incursion," EIS Appendix 6) with the specified setbacks. For minor incursion (see "minor incursion" in the Glossary of Terms, EIS Appendix 6) to the DRECP riparian vegetation types, wetland vegetation types, or encroachments on the setbacks listed in Table 17, the hydrologic function of the avoided riparian or wetland communities will be maintained. Minor incursions in the riparian and wetland vegetation types or other features including the setbacks listed in Table 17 will occur outside of the avian nesting season, February 1 through August 31 or otherwise determined by BLM, USFWS and CDFW if the minor incursion(s) is likely to result in impacts to nesting birds.	Confirm impacts to riparian and wetland DRECP vegetation types are avoided.	Pre-construction Construction Post construction	The Applicant
Impact BIO-1 Impact BIO-2 Impact BIO-3	**CMA LUPA-BIO-RIPWET-3.** For activities that occur within 0.25 mile of a riparian or wetland DRECP vegetation type and may impact BLM special-status riparian and wetland bird species, conduct a pre-construction/activity nesting bird survey for BLM Special-Status riparian and wetland birds according to agency-approved protocols. Based on the results of the nesting bird survey above, setback activities that are	Confirm agency-approved protocol level pre-construction nesting bird surveys for BLM Special Status riparian and wetland birds are	Pre-construction Construction Post-construction Decommissioning	The Applicant

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
	likely to impact BLM Special-Status riparian and wetland bird species, including but not limited to pre-construction, construction and decommissioning, 0.25 mile from active nests special-status during the breeding season (February 1 through August 31 or otherwise determined by BLM, USFWS and CDFW). For activities in areas covered by this provision that occur during the breeding season and that last longer than one week, nesting bird surveys may need to be repeated, as determined by BLM, in coordination with USFWS and CDFW, as appropriate. No pre-activity nesting bird surveys are necessary for activities occurring outside of the breeding season.	conducted for activities within 0.25 mile of riparian or wetland during breeding season.		
Impact BIO-1 Impact BIO-2	**CMA LUPA-BIO-SVF-1.** For activity specific NEPA analysis, a map delineating potential sites and habitat assessment of the following special vegetation features is required: yucca clones, creosote rings, Saguaro cacti, Joshua tree woodland, microphyll woodland, crucifixion thorn stands. BLM Guidelines for mapping/surveying cacti, yuccas, and succulents shall be followed.	Review map for adequacy.	Pre-construction	The Applicant
