The Construction Contractor will train all personnel on the measures to take in the event of a fire. The Construction Contractor will also inform each construction crew member of fire dangers, locations of extinguishers and equipment, safe locations, and escape routes should a fire exceed immediate control and individual responsibilities for fire prevention and suppression during regular safety briefings. Smoking and fire rules also will be discussed with the Construction Contractor and all field personnel during the Project's environmental training.

4.1.2 Pioneering Activities

Pioneering activities have the potential to start fires. Sparks can be created as a result of metal blades on bulldozers or excavators hitting rock. Fire prevention practices may be necessary during these situations and proper fire-fighting tools will be on site such as backpack water pumps (five-gallon minimum capacity), shovels, Pulaski, and fire extinguishers, etc.

4.1.3 Warning Devices

Only battery-powered or electric warning devices are approved for use in the Project area. Torches, highway flares, fuses, and any device using an open flame are prohibited.

4.1.4 Burning

No fires or barbeques are allowed on any construction-related area including the transmission ROW, material storage areas, construction laydown areas, access roads, substation areas, or other construction area. This prohibits fires of any type, for any purpose.

4.1.5 Explosives and Flammable Materials

In the event that blasting activities are necessary during the course of construction, the CIC and Construction Contractor's Fire Marshal must receive prior notification. Fire suppression equipment must be available in the blasting contractor's vehicle.

Flammable materials must be kept clear (a minimum of 10 feet away) from areas where sparks or flames may be generated. Flammable materials will be appropriately stored; for example, oxygen cylinders must be separated from fuel gas cylinders or other combustible items a minimum distance of 20 feet. Otherwise, a non-combustible barrier which provides an appropriate fire resistance rating may be provided, and the minimum separation distance can be reduced to five feet. Outdoor storage of flammable liquids in approved containers with no more than 60-gallon capacity are subject to the following restrictions:

- The total capacity of any one group of containers stored together must not exceed 1,100 gallons. Each group of containers must be at least five feet apart, and each group must be at least 20 feet away from any building or other combustibles.

- Each group of containers must be adjacent to an access way at least 12 feet wide to facilitate the use of firefighting equipment.

4.1.6 Welding

Welding and cutting activities are anticipated during construction. The contractor's Construction Manager must approve welding or cutting of transmission line equipment and components.

Grinding, cutting and welding must take place in areas where vegetation and flammable materials have been cleared. Preventive equipment such as spark shields may be used; vegetation in the immediate area may be wetted as a precaution and a spotter should

monitor the area for ignitions for at least one hour after the activity takes place. The spotter should have fire suppression equipment including ABC-rated five-pound extinguishers, backpack water pumps (five-gallon minimum capacity) and a round-blade shovel.

4.1.7 Spark Arrestors

Spark arrestors that meet agency standards must be used on internal combustion engines on roads where vegetation is present. All spark arrestors must be maintained in good working order. Light trucks and cars equipped with factory-installed mufflers (in good condition) are allowed on roads where the vegetation has been cleared from the roadway. Since vehicles equipped with catalytic converters are potential fire hazards, they must be parked in areas cleared of vegetation. Flues used in work areas must also be equipped with working spark arrestors that comply with agency standards.

4.1.8 Power Saws

Approved spark arrestors and mufflers are required on all gasoline-powered saws. This equipment must be maintained in proper working condition and should be inspected periodically. Chain saws must be managed under the following restrictions:

- Spark arrestors/mufflers must include a 0.023-inch mesh, stainless steel screen.
- Operators using power saws must have an approved, portable fire extinguisher and a long-handled, round blade, size 0 shovels in proper working condition.
- Power saws shall be refueled in an area cleared of flammable materials and the operator must not restart the equipment until it has been moved at least 10 feet from the refueling location. Gasoline must be contained in approved metal safety containers.

4.1.9 Refueling

Fuel trucks must carry a 35-pound minimum fire extinguisher intended for use on electrical and fuel fires. Standard operating procedures pertaining to fueling will be in place and will be followed. While helicopters are fueled, the fuel truck must be grounded to the helicopter.

4.1.10 Smoking

Smoke only in approved areas. No smoking will be allowed while operating equipment, near flammable materials, or while walking or working in areas with vegetation. In areas where smoking is allowed, completely extinguish tobacco products and matches, disposing of them in ash trays or other designated locations. Discarded cigarettes would be properly disposed of and would not be littered on the ROW. These items are NEVER to be thrown on the ground. Review and comply with smoking and fire hazard information posted on project bulletin boards, portable restroom facilities, break areas, material storage areas and parking lots.

4.1.11 Communications

The Construction Contractor will be responsible for maintaining contact with fire-control agencies and will be equipped with a radio or cellular telephone to enable immediate contact with local fire-control agencies when the fire is onsite or adjacent to the Project. If cellular telephone coverage is not available, the Construction Contractor will use the radio to contact their base, who will telephone emergency dispatch.

4.1.12 Motorized Vehicles

Vehicles shall be operated on roadways and parked in designated areas or areas with vegetation less than eight inches tall to ensure the hot vehicle undercarriage does not start a fire. No idling of equipment or vehicles would occur on tall vegetative areas. Personnel should check the underside of vehicles and equipment frequently, removing any vegetation that has accumulated.

4.1.13 Construction Work Sites

Crews will stay within the boundaries and confines of disturbance limits; such disturbance limits would have cleared/crushed vegetation or bare mineral soils.

Good housekeeping techniques will be used such as keeping work sites clean, using properly maintained and undamaged tools and equipment, keep passageways free of obstructions, empty trash receptacles before they overflow, etc., as a means of helping to prevent fires.

4.2 Restricted Operations

4.2.1 Fire Danger Ratings

The United States Forest Service Wildland Fire Assessment Program and National Weather Service have developed Fire Danger Ratings and Red Flag Warnings that consider weather conditions, available fuel and moisture content of available fuel to assist land managers with identifying when additional mitigation is warranted and when operations need to be modified, reduced or halted. These systems will be used by the Construction Contractor's Fire Marshal to determine when increased mitigation or modified work practices will be implemented during transmission line construction. The Construction Contractor's Fire Marshal will consult with the CIC to resolve any questions regarding the level of fire danger in the Project area.

DCRT and the Construction Contractor(s) would check the weather forecast and verify applicable fire danger and fire precautions, if any, before initiating activities that represent potential ignition sources or sparks.

TABLE J-2-1 FIRE DANGER RATINGS

Fire Danger Rating and Color Code	Description
Low (L) Dark Green	Fires do not ignite readily from small firebrands although a more intense heat source, such as lightning, may start fires in duff or punky wood. Fires in open cured grasslands may burn freely a few hours after rain, but wood fires spread slowly by creeping or smoldering and burn in irregular fingers. There is little danger of spotting.
Moderate (M) Light Green or Blue	Fires can start from most accidental causes, but with the exception of lightning fires, in some areas, the number of starts is generally low. Fires in open cured grasslands will burn briskly and spread rapidly on windy days. Timber fires spread slowly to moderately fast. The average fire is of moderate intensity, although heavy concentrations of fuel, especially draped fuel, may burn hot. Short-distance spotting may occur, but is not persistent. Fires are not likely to become serious and control is relatively easy.
High (H) Yellow	All fine dead fuels ignite readily and fires start easily from most causes. Unattended brush and campfires are likely to escape. Fires spread rapidly, and short-distance spotting is common. High-intensity burning may develop on slopes or in concentrations of fine fuels. Fires may become serious and their control difficult unless they are attacked successfully while small.
Very High (VH) Orange	Fires start easily from all causes and, immediately after ignition, spread rapidly and increase quickly in intensity. Spot fires are a constant danger. Fires burning in light fuels may quickly develop high intensity characteristics such as long-distance spotting and fire whirlwinds when they burn into heavier fuels.
Extreme (E) Red	Fires start quickly, spread furiously and burn intensely. All fires are potentially serious. Development into high intensity burning will usually be faster and occur from smaller fires than in the very high fire danger class. Direct attack is rarely possible and may be dangerous except immediately after ignition. Fires that develop headway in heavy slash or in conifer stands may be unmanageable while the extreme burning condition lasts. Under these conditions the only effective and safe control action is on the flanks until the weather changes or the fuel supply lessens.

http://www.wfas.net/index.php/fire-danger-rating-fire-potential--danger-32.

4.2.2 Red Flag Warnings

When the National Weather Service has issued a Red Flag Warning for low humidity and high winds, the Fire Precaution Levels in Table J-2 will be adhered to. Red Flag Warning information for Arizona and California can be found at: http://wrh.noaa.gov/firewx/main.php.

4.3 Project Activity Levels

Table J-2-2 establishes work restrictions and precautions the contractor must observe on Red Flag days and they apply to all land jurisdictions. The Construction Contractor's Fire Marshal will track and report Red Flag Warnings as necessary.

TABLE J-2-2 PROJECT ACTIVITY REQUIREMENTS

Level	Project Activity Requirements
A	Minimum required
B	Furnish fire patrol. A fire patrol person is required for mechanical operations from cessation of operations until two hours after operations cease or sunset, whichever occurs first. Tank truck or trailer shall be on or adjacent to landing.

Level	Project Activity Requirements
C	Fire patrol person is required until sunset local time. The following operations are prohibited from 1:00 p.m. until 8:00 p.m. local time: • Operating high-speed rotary head equipment • Blasting
D	All following activities may operate: • Welding or cutting of metal only by special permit • Road maintenance • Culvert installation • Dirt moving • Helicopter yarding A fire patrol person is required to walk all areas treated that day once per hour until sunset local time. This includes metal track skidding, machines with chainsaw cutting heads, and mastication equipment.
E	All following activities may operate: • Equipment at approved sites may be serviced. • Roads: dust abatement or rock aggregate installation (does not include pit development). All other operations may continue until 1:00 p.m. local time when Construction Contractor's Fire Marshal and CIC agree to variance.
Ev	Same as E with the exception that if site-specific conditions warrant a variance permitting operations, the Construction Contractor's Fire Marshal and CIC will provide the specified emergency precautions needed.

All of the precautions listed above apply unless the Authorized Official agrees to a change in writing. Such written agreement, or substitute precautions shall prescribe measures taken by the Construction Contractor to reduce the risk of ignition, and/or spread of fire. A fire hazard analysis form is located in Attachment A.

4.4 Inspections

The Construction Contractor will be responsible for compliance with all provisions of this Plan. Regular inspections of the Project work area and personnel may include ensuring that new workers receive fire training, taking additional measures to lower the chance of fires in newly identified high-risk areas, equipment inspections, and work site procedures. In addition, federal, state, and local fire-control agencies may perform inspections in areas under their jurisdiction at their discretion.

5 Fire Emergency Response Plan

5.1 Fire Suppression Equipment

Fire suppression equipment identified in this section shall be available during the life of Project. All firefighting equipment will be periodically inspected and maintained in operating condition. Defective equipment shall be immediately replaced. (Occupational Safety and Health Act Publication 3080 [USDL 2002] provides information on proper maintenance of hand and power tools.) Fire suppression equipment will allow Project personnel the resources necessary to immediately respond to a fire, with the potential of extinguishing or controlling the fire.

5.1.1 Motorized Vehicles

During the fire season (typically May through September, but generally there is less risk during monsoon season, which is June 15 to September 30) motorized vehicles shall be stocked with a long-handled round blade shovel, an axe or Pulaski fire tool, a five-pound ABC dry chemical fire extinguisher, a five-gallon water backpack (or equivalent container) full of water or a chemical fire suppressant, and personal protective equipment including hardhat, work gloves and eye protection.

Fueling trucks must be equipped with a 35-pound fire extinguisher containing chemicals designed for use on electrical and fuel fires.

5.1.2 Construction Work Sites

The use of power saws in areas away from the contractor's vehicle requires a five-pound ABC dry chemical fire extinguisher and a long-handled round blade shovel. The saw must be equipped with an approved spark arrestor.

For activities more likely to cause a fire such as welding or cutting, the fire response equipment shall be increased to at least two extinguishers and two shovels.

Work sites where higher risk activities are performed shall be equipped with back pumps filled with water: 1) at welding sites; and 2) at both wood cutting sites and structure construction and installation areas.

When Red Flag Warning days are indicated by National Oceanic and Atmospheric Administration, a fire suppression vehicle equipped with at least a 500-gallon water tank, a 20-gallon per minute pump and 250 feet of 0.75-inch rubber hose must be stationed near the Project area.

The fire suppression vehicle in place during times of Red Flag Warning days, must contain a dedicated fire protection tool set that includes two long-handled round blade shovels, two axes or Pulaski fire tools, a chainsaw of at least 3.5 horsepower and a cutting bar at least 20 inches in length.

The construction site must have communication devices, such as radios and cellular or satellite telephones, as appropriate for the Project location to be used to contact emergency responders and project officials.

5.2 Immediate Fire Suppression Activity

In the event of a fire in the Project area that can be managed with the equipment and resources available, construction and project-related personnel should initiate fire suppression activities to either extinguish or control the spread of the fire. Fire suppression activity includes direct treatment to burning fuel such as wetting, smothering, or chemically quenching the fire, or by physically separating the burning from not burned fuel. Training provided to project personnel will address response actions that should be taken by contractors, conditions that warrant evacuating project personnel, evacuation routes and assembly areas, and notification procedures.

If a fire cannot be managed safely and/or the fire is exceptionally hot and/or or has toxic fumes, personnel will evacuate the area and call 911. When calling 911 the following information will be provided.

- Your name
- Call back telephone number
- Project name
- Location
    - Legal description (township, range, section) or GPS location (latitude and longitude)
    - Descriptive location (reference point)
- Fire information
    - Size of fire
    - Rate of spread
    - Wind conditions
- Access
- Hazards to personnel

Immediately following any fire related emergency and a 911 call, the Construction Contractor's Fire Marshal will be notified as indicated in the following section.

5.3 Notifications

After the 911 call is made, the CIC will contact the Prescott Dispatch Center, Federal Interagency Communication Center, and Perris Emergency Coordination Center, and other notifications shall be made (see Table J-2-3), providing information indicated in Section 5.2. All fires, regardless of size, must be reported to the Project personnel included in this table. Fire notification procedures will be applied to all land jurisdictions.

The Construction Contractor's Fire Marshal shall notify both the CIC and DCRT Project Manager, who will coordinate to notify the BLM authorized representative or designee and FMO, in the event of a fire in the Project area during construction. DCRT's Project Manager will be responsible for these notifications during the operations and maintenance phase of the Project. Both the Construction Contractor's Fire Marshal and DCRT or its designee shall make emergency notification numbers available to all personnel in case of a fire (see Table J-2-3). These numbers must be kept up-to-date during the life of the Project.

TABLE J-2-3 FIRE NOTIFICATION CONTACTS AND NUMBERS

Contact Person	Phone Number
911 – Emergency	911
Prescott Dispatch Center	928-777-5700
Federal Interagency Communication Center	Business and after hours: 909-383-5652
Perris Emergency Coordination Center	951-940-6949
BLM Authorized Officer or Designee	TBD
BLM FMO	TBD
CIC	TBD
DCRT Construction Project Manager	TBD
Construction Contractor's Fire Marshal: TBD	TBD

Prior to commencing work, the Construction Contractor will furnish the information in Tables J-2-4 and J-2-5 relating to key personnel, tools, and equipment available for the purpose of fighting wildland fires within and adjacent to the Project area.

TABLE J-2-4 KEY PERSONNEL IN ORDER OF CALL PREFERENCE

Title	Name	Phone Number
Construction Contractor's Fire Marshal	TBD	
Fire Patrolperson	TBD	

TABLE J-2-5 PERSONNEL AND EQUIPMENT

Fire Fighters and Positions	Equipment	Type, Make and Mode
TBD		

6 Post-Fire Rehabilitation

If the cause of a fire is determined to be the result of the Project, the Construction Contractor(s) will implement reclamation measures as required by the BLM (see Appendix L-1 – Reclamation, Vegetation, and Monitoring Plan), and the following post-fire reclamation measures will be implemented:

- Burn areas that are Project-related must be reclaimed as specified by the BLM. Small burn areas are revegetated with native vegetation using seed mixtures identified by BLM near reclamation time to ensure seed availability. Larger areas may require specific restoration plans. Coordination with the BLM is necessary to determine requirements for each particular area, depending on the size and location of a fire, and the location of sensitive resources.

- To prevent the spread of noxious weeds and invasive species during post-fire reclamation, the measures outlined in Appendix F-7 – Vegetation Management Plan will be implemented by the Construction Contractor(s).

7 Operation and Maintenance

During Project operation and maintenance, the Final Fire Protection and Prevention Plan will be implemented, including all measures and stipulations contained therein.

8 Decommissioning

During Project decommissioning activities, the Final Fire Protection and Prevention Plan will be implemented, including all measures and stipulations contained therein.

9 Environmental Protection Measures

This section includes relevant mitigation measures, example ROW grant stipulations, and best management practices specific to protection against fire. These measures and stipulations were pulled from the project-wide environmental mitigation measures within Appendix B of the Plan of Development.

APM-BIO-05 Additional Prohibitions: Trash dumping, firearms, open fires, and pets would be prohibited at all work locations and access roads. Smoking would be prohibited along the Project alignment.

APM-HAZ-02 Fire Avoidance and Suppression: Per the Fire Protection and Prevention Plan for the Project: DCRT would select a welding site that is void of native combustible material and/or would clear such material for 10 feet around the area where the work is to be performed. DCRT would follow its standard practice for clearing in wildland areas. Project personnel would be directed to drive on areas that have been cleared of vegetation, park away from dry vegetation, and carry water, shovels, and fire extinguishers in times of high fire hazard. DCRT would also prohibit trash burning. Additionally, fire-suppression materials and equipment would be kept adjacent to all areas of work and in staging areas and would be clearly marked.

BMP-HAZ-02 Fire Avoidance and Suppression: APM-HAZ-02 would not interfere with APM BIO-14, which encourages overland driving/access. Vehicle and equipment operators would drive on cleared areas and park away from vegetation where possible, would be responsible to monitor for fire ignition by vehicles and equipment; and would be equipped and trained to provide first response to an inadvertent wildland fire ignition associated with the Project.

BMP-PHS-02 A Fire Prevention Plan would be developed for the Project.

CMA-DFA-VPL-BIO-FIRE-1 Implement the following standard practice for fire prevention/protection: Implement site-specific fire prevention/protection actions particular to the construction and operation of renewable energy and transmission project that include procedures for reducing fires while minimizing the necessary amount of vegetation clearing, fuel modification, and other construction related activities. At a minimum these actions will include designating site fire coordinators, providing adequate fire suppression equipment (including in vehicles), and establishing emergency response information relevant to the construction site.

10 California Environmental Quality Act

In compliance with the California Environmental Quality Act (CEQA) the following mitigation measure will be adhered to in California:

MM-HAZ-CEQA-1 – As discussed in APM-HAZ-02, BMP-PHS-02, and CMA-DFA-VPL-BIO-FIRE-1, a Fire Prevention Plan shall be developed and implemented for the Project throughout construction and operation and maintenance. The Applicant shall develop a Project Fire Prevention Plan in consultation with the appropriate local fire agencies at least 30-days prior to the start of construction activities. The Plan shall cover the construction and operations/maintenance phases of the Project. The Applicant shall monitor Project-related activities to ensure implementation and effectiveness of the Plan. The final Plan will be approved by the consulted fire agencies prior to the initiation of construction activities and shall be implemented during all Project-related activities by the Applicant. Information contained in the Plan and location of fire-suppression materials and equipment shall be included as part of the Worker Environmental Awareness Program discussed in APM BIO-01. Successful implementation of this Plan shall result in a less than significant impact to the potential for construction-related fires. At minimum, the Plan shall include the following:

- Procedures for minimizing potential ignition, including, but not limited to, vegetation clearing, parking requirements/restrictions, idling restrictions, smoking restrictions, proper use of gas-powered equipment, use of spark arrestors, hot work restrictions, and timing of vegetation treatment or maintenance. Where necessary, vegetation management or clearing necessary to mitigate fire risk shall supersede other measures for vegetation protection and avoidance. Applicable permitting, compensation, and mitigation resulting from such activity shall be the responsibility of the Applicant.
- Proper use of construction, maintenance, and decommissioning equipment.
- Work restrictions during Red Flag Warnings and High to Extreme Fire Danger days.
- Fire coordinator and fire patrol roles and responsibilities.

- Worker training for fire prevention, initial attack firefighting, and fire reporting.
- Emergency fire suppression equipment/tools inventory and maintenance.
- Emergency communication, response, and reporting procedures.
- Coordination with local fire agencies to facilitate emergency access through the Project site.
- Emergency contact information.
- Compliance with applicable wildland fire management plans and policies established by state and local agencies.
- Other information as required by responsible and consulted agencies.

Responsible Party: The Applicant shall develop the Fire Protection and Prevention Plan and ensure that it is implemented throughout construction activities

Timing: The Proponent shall develop the Fire Prevention Plan at least 30-days prior to the start of construction activities. The Plan shall be implemented throughout all construction activities.

Mitigation Monitoring and Reporting Program: The Applicant shall ensure that the information in the Fire Prevention Plan is included in the Worker Environmental Awareness Program. Documentation of any Red Flag Warnings or High to Extreme Fire Danger days shall be kept on file and submitted to the applicable local fire agencies as well as the BLM and California Public Utilities Commission (CPUC).

Standards for Success: Construction impacts related to fires is reduced to a less than significant level and no fires are started as a result of construction activities.

1 Introduction

Delaney Colorado River Transmission, LLC (DCRT) prepared this Traffic and Transportation Management Plan (Plan) for the Ten West Link Transmission Project (Project) to address traffic and transportation concerns associated with the Project's construction, operation, maintenance, and decommissioning activities. This Plan addresses regulatory compliance, traffic management practices, and types of right-of-way (ROW) access. Additionally, this Plan describes Applicant Proposed Measures (APMs), Bureau of Land Management (BLM)-required Best Management Practices (BMPs), and mitigation measures (MMs) that DCRT will implement to reduce the Project's impacts on traffic volumes and the transportation network in the Project's vicinity.

2 Regulatory Compliance

Many federal, state, and local government agencies oversee the use and improvement of transportation facilities that the Project's activities will use. Such agencies include the BLM; Federal Highway Administration; Federal Aviation Administration (FAA) for helicopter use; Arizona Department of Transportation (ADOT); Arizona Department of Public Safety; California Department of Transportation (Caltrans); California Office of Traffic Safety; and law enforcement agencies and highway departments in La Paz and Maricopa counties in Arizona and in Riverside County, California. Appendix H-1 – Fugitive Dust Control Plan and Construction Emissions Mitigation Plan addresses the California Air Resources Board's fugitive dust and vehicle emissions' regulations and describes methods for reducing the Project's transportation-related emissions.

Prior to commencing construction activities, DCRT will file encroachment permit applications with appropriate highway departments for areas where the Project-related traffic will enter or where the proposed transmission line will cross public roads (e.g., Interstate 10 [I-10], United States [U.S.] Highway 95, California State Route 78-S, Neighbours Boulevard), and numerous named county roads.

Project personnel who are responsible for transportation activities will be familiar with this Plan and relevant sections of the Project's Plan of Development.

Additionally, as described in Appendix K-3 – Helicopter Flight Plan/Flight and Safety Plan, DCRT will coordinate its construction activities with local air traffic control operators and implement a Congested Area Plan, per FAA regulations, if required.

3 Traffic Management Practices

3.1 Ground Travel

During the Project's construction activities, ground travel will be the primary means of transporting construction and maintenance crews and equipment to and from staging areas and structure work areas. All drivers will obey jurisdictional traffic speed regulations and posted speed limits. Speeds along upgraded existing access roads, new centerline access roads, and access spur roads adjacent to and along the Project's ROW will be limited to 15 miles per hour or to posted speed limits to prevent excessive amounts of construction-

related dust (see Appendix H-1 – Fugitive Dust Control Plan and Construction Emissions Mitigation Plan). Before construction, authorized access roads will be clearly marked in the field with signs or flagging. The Construction Contractor(s) will review the location of proposed access roads and will be responsible for ensuring that construction travel is limited to designated areas that clearly identify the limits of disturbance. During construction, gates or other deterrents may be required to limit access along the ROW for public safety and environmental resource protection.

Project field personnel will attend an environmental training program. This program will instruct field personnel to use only approved access roads, drive in the delineated road limits, and obey jurisdictional and posted speed limits to minimize potential impacts to biological, paleontological, and cultural resources. The Construction Contractor(s), Compliance Inspection Contractor, and environmental monitors will maintain a communications network that consists of one or both of the following devices: two-way radios and/or cellular phones. This will allow for safe coordination of equipment traffic along existing access roads to minimize impacting public safety and traffic volumes.

In general, the number of construction vehicles needed for the Project is not expected to substantially increase existing traffic volumes in the Project's vicinity. Similarly, road and lane closures are anticipated to be minimal, and will most likely occur during conductor-stringing activities or during blasting. If road and lane closures are needed (e.g., to pull the transmission line across major roadways), the appropriate regulatory agencies, affected parties, and emergency service providers will be notified in advance of the anticipated closure. Prior to transporting oversize and/or overweight loads on California highways or freeways, DCRT will coordinate with Caltrans to obtain the applicable permits, as needed.

Construction traffic is not expected to disrupt access to residences along the ROW. However, adjacent landowners will be notified of the construction schedule, where appropriate. Where feasible, construction traffic will be routed away from residences and schools. Signs will be posted in the Project area to notify landowners and others, including off-highway vehicle (OHV) users of the construction activity. Construction crews will park only in designated areas and will be shuttled to the appropriate work sites, if necessary. If existing roads and trails on public lands are blocked due to construction activities, signs will be posted to notify the public. Attachment A includes a sample traffic control plan.

To alleviate traffic congestion and decrease the number of vehicles traveling to the Project work areas, the Construction Contractor(s) will encourage personnel to carpool to work each day. Additionally, crews will commute from show-up yards to the work sites in company provided crew vehicles after meeting at the show-up yard locations.

3.1.1 Ground Travel in Arizona

The Construction Contractor(s) will comply with the 2009 *Arizona Supplement to the Manual on Uniform Traffic Control Devices* for public roads that the Project would impact. Along the BLM Preferred Alternative's route in Arizona where the proposed transmission line would cross I-10 twice, the Construction Contractor(s) will comply with ADOT's *Guideline for Accommodating Utilities on Highway Rights-of-Way*. Both locations are outside of interchange areas. In these locations, the Construction Contractor(s) will install the proposed transmission line's support structures outside of the control of access line. Project work performed in highway ROW will conform to recognized standards of utility construction, the *Arizona Department of Transportation Standard Specifications for Road and Bridge Construction*, and the conditions that the encroachment permit and/or utility permit specify.

3.1.2 Ground Travel in California and California Environmental Quality Act Compliance

In Riverside County, California, the Construction Contractor(s) will comply with the 2014 *California Manual on Uniform Traffic Control Devices* for public roads that the Project would impact. More specifically, the Construction Contractor(s) will comply with the manual's *Part 6 – Temporary Traffic Control*, incorporating the elements below:

- Temporary traffic control plans and control zones.
- Pedestrian and worker safety.
- Flagger control.
- Temporary traffic control zone devices.
- Temporary traffic control zone activities.
- Controlling traffic through traffic incident management areas.

The California Public Utilities Commission requires through their California Environmental Quality Act (CEQA) review, that DCRT also implement the following mitigation measures to help control Project-related construction vehicle traffic (and MM Trans-CEQA-2 per development of this Plan):

- Identify truck routes designated by Riverside County and local jurisdictions' haul routes that minimize truck traffic on local roadways.
- Provide sufficient-sized staging areas for trucks accessing work zones to minimize disruption of access to adjacent public ROWs.
- Schedule truck trips outside the peak morning and evening commute hours.
- Store all equipment and materials in designated contractor staging areas on or adjacent to the work site, such that traffic obstruction is minimized.
- Implement roadside safety protocols including advance "Road Wok Ahead" warning and speed control signs, which shall be posted to reduce and provide safe traffic flow through the work zone.
- Provide advance notification to administrators of police and fire stations, including fire protection agencies; ambulance service providers; and recreational facility managers of the timing, location, and duration of construction activities and the locations of detours and lane closures. Maintain access for emergency vehicles within and/or adjacent to roadways affected by construction activities at all times.
- Repair and restore adversely affected roadway pavements to their pre-construction condition per the following direction:
    - Damage will be documented by the Project Applicant and the applicable jurisdiction, that is, Caltrans, Riverside County, or individual will be notified within 24 hours. The Applicant will work with the jurisdiction affected and will repair the damage within 30 days.

- Coordinate individual traffic plans for the Project and nearby projects.
- Coordinate with Riverside County to develop circulation and detour plans that include safety features, for example, signage and flaggers. The circulation and detour plans will address:
    - Full and partial roadway closures.
    - Circulation and detour plans to include the use of signage and flagging to guide vehicles through and/or around the construction zone, as well as any temporary traffic control devices.
    - Bicycle detour plans, where applicable.
    - Parking along arterial and local roadways.
    - Haul routes for construction trucks and staging areas for instances when multiple trucks arrive at a work site.
- Update this Plan to account for delays or changes in the schedules of individual projects.
- Maintain inspection logs that document construction transportation and access problems and solutions.

In compliance with CEQA, the following mitigation measures will be adhered to:

MM-TRANS-CEQA-2 – The California Public Utilities Commission (CPUC)requires the following with regards to the development and implementation of this Plan (e.g., MM Trans-CEQA-2):

Responsible Party: The Applicant shall be responsible for ensuring that the Traffic, Transportation, and Access Management Plan is prepared and implemented throughout construction activities.

Timing: The Traffic, Transportation, and Access Management Plan shall be prepared at least 30 days prior to the start of construction and shall be implemented throughout all construction activities.

Mitigation Monitoring and Reporting Program: The Applicant shall monitor construction transportation and access to ensure that the Traffic, Transportation, and Access Management Plan is implemented successfully as documented in inspection logs.

Standards for Success: Traffic flow remains at acceptable levels, emergency access remains possible at all times, the public is reasonably notified of any road closures, delays, or lane restrictions, and the Project area remains in compliance with all applicable transportation goals, policies, and requirements.

MM-AQ-CEQA-1 – Consistent with APM AQ-01, and Mojave Desert Air Quality Management District (MDAQMD) Rule 403.2, a Fugitive Dust Control Plan shall be prepared for the Project prior to the start of construction and shall be implemented throughout all construction phases of the Project. This Fugitive Dust Control Plan shall be prepared by the

Applicant at least 30 days prior to construction which shall be approved by the CPUC and MDAQMD. The Applicant shall ensure that the Fugitive Dust Control Plan is implemented throughout construction activities and shall keep records of compliance on site and submit monthly reports to CPUC and MDAQMD. This Fugitive Dust Control Plan shall comply with the MDAQMD Guidelines and include all of the control measures listed in APM AQ-01. In addition to these control measures, the Fugitive Dust Control Plan shall also include signage related to fugitive dust that will include the following specifications:

- A minimum 48-inch high by 96-inch wide sign containing the following shall be located within 50 feet of each Project site entrance, meeting the specified minimum text height, black text on white background, on one-inch A/C laminated plywood board, with the lower edge between six and seven feet above grade, with the contact name of a responsible official for the site and a local or toll-free number that is accessible 24 hours per day:
    - [Site Name] {four-inch text}
    - [Project Name/Project Number] {four-inch text}
    - IF YOU SEE DUST COMING FROM {four-inch text}
    - THIS PROJECT CALL: {four-inch text}
    - [Contact Name], PHONE NUMBER XXX-XXXX {six-inch text}
    - If you do not receive a response, Please Call {three-inch text}
    - The MDAQMD at 1-800-635-4617 {three-inch text}

Additionally, the following control measures shall be included in the Fugitive Dust Control Plan:

- Traffic speeds on unpaved roads shall not exceed 15 miles per hour.
- Drop heights from excavators and loaders shall be minimized to distances no more than five feet.
- Appoint a construction relations officer to act as a community liaison concerning on-site construction activity, including resolution of issues related to PM_{10} and $PM_{2.5}$ generation from combustion emissions and fugitive dust generation.
- An on-site supervisor with a current fugitive dust control class certification shall be present who is available within 30 minutes to respond to any fugitive dust control issue at the site during normal business hours.
- The operation shall keep on-site records of specific dust control actions taken.
- All perimeter fencing shall be wind fencing or the equivalent of four feet of height or the top of all perimeter fencing (this wind fencing requirement may be superseded by local ordinance, rule, or Project-specific biological mitigation prohibiting wind fencing).

- A wheel washing system shall be installed and used to remove bulk material from tires and vehicle undercarriages before vehicles exit the unpaved construction site.

Responsible Party: The Applicant shall be responsible for ensuring the Fugitive Dust Control Plan is prepared and implemented throughout construction activities.

Timing: The Fugitive Dust Control Plan shall be prepared at least 30-days prior to the start of construction and implemented throughout all construction activities.

Mitigation Monitoring and Reporting Program: Monthly reports shall be prepared by the Applicant and submitted to the CPUC and MDAQMD. These monthly reports shall include a summary of any calls received regarding fugitive dust and all compliance actions taken.

Standards for Success: Fugitive dust will be minimized throughout all construction activities and compliance with MDAQMD Rule 403.2 shall be achieved.

3.2 Helicopter Use

In addition to minimizing the impacts associated with ground travel, the Construction Contractor(s) will coordinate construction activities with jurisdictional utilities and the FAA, as needed for helicopter activity. During wire-stringing activities over roads, the Construction Contractor(s) will use traffic controls, which will influence local traffic patterns. A helicopter may be used to move personnel and equipment, and/or assist with structure assembly and erection and wire-stringing, if the Construction Contractor(s) determine that standard, ground-based construction methods are not feasible. Refer to Appendix K-3 – Helicopter Flight Plan/Flight and Safety Plan. The Helicopter Flight Plan provides detailed information, including safety measures that will be implemented during helicopter use along the ROW for the Project's construction, operation, and maintenance activities. During these activities, DCRT will use dust palliatives to reduce the amount of fugitive dust that helicopter takeoffs and landings can generate. Appendix H-1 provides more information on dust palliatives.

The task-specific flight plan will be prepared for helicopter-related uses and will be reported to DCRT's Project Manager, Construction Contractor(s) Manager, Compliance Inspection Contractor, and Environmental Compliance Manager at least 48 hours prior to flight. Ground crew needed on the ROW near a task location will be notified of helicopter use and briefed on safety measures outlined in the Helicopter Flight Plan/Flight and Safety Plan.

4 Types of Right-of-Way Access

As described in detail in Section 3 of the Project's Plan of Development, five different types of access will be used for the Project:

- Access Type A – existing maintained public and private roads, which are paved, gravel, or dirt. These roads will be left in their original condition with no additional disturbance necessary to accommodate Project construction vehicles and equipment.

- Access Type B – existing roads that may require some level of improvement to accommodate Project construction vehicles and equipment.

- Access Type C – centerline access roads that DCRT will create, where necessary, to provide access along the length of the Project's ROW. DCRT will blade these roads along the transmission line's outermost conductor phase, but inside the Project's 200-foot-wide ROW.

- Access Type D – access spur roads that DCRT will blade to connect Access Types A, B, or C roads to structure work areas along the Project's ROW.

- Access Type E – helicopter access. In areas of biological, topographical, archaeological, and visual concerns, the use of helicopter-assisted construction may be implemented for construction activities. Light-duty pickup trucks, tracked equipment, and OHVs may be used in combination with a helicopter. If such vehicles are used for construction and road construction is necessary, such road construction would fall into the Type A, B, C or D access.

For the purpose of this Plan, only Access Type A roads are discussed below. Appendix K-1– Access Road Plan discusses Access Types B, C, and D roads. Appendix K-3 describes Access Type E roads and helicopter operations.

The analysis area for traffic and transportation resources analyzed in the BLM's Environmental Impact Statement covers a 10-mile-wide corridor; five miles on either side of the proposed transmission line's route. In this analysis area, Access Type A Roads include the following:

- I-10, U.S. Highways 60 and 95, Arizona State Route 95, California State Route 78, and Business Route 10.

- Roads and streets in the Town of Quartzsite, Arizona and in the City of Blythe, California.

- Dedicated county roads.

- Local roads and dirt trails on BLM-administered land and on private property.

- Trails providing access to utility corridors and recreation areas.

Along these Access Type A roads, the Project's construction activities would be expected to add approximately 160 personal vehicles to the existing traffic volumes. However, as the Project's construction activities would occur in phases along different segments of the proposed transmission line, not all of these additional personal vehicles would travel in the same direction at the same time. Additionally, these 160 personal vehicles represent the maximum number of vehicles expected to travel to and from construction work areas. Furthermore, DCRT would arrange shuttles or carpooling to transport construction workers, thereby reducing impacts on existing traffic volumes and the transportation network in the analysis area.

5 Decommissioning

At the end of the Project's useful life, if the transmission line and associated facilities were no longer required, or if the BLM or other federal land management agencies do not re-issue authorizations at the time the original authorizations expire, the transmission line and

associated facilities will be decommissioned. Subsequently, conductors, insulators, and hardware will be dismantled and removed from the ROW. Tower structures will be removed and foundations broken off below ground surface. If the transmission line and associated ROW are abandoned at some future date, the ROW will be available for the same uses that existed prior to construction of the Project. Following abandonment and removal of the transmission line from the ROW, any areas disturbed to dismantle the line will be restored and rehabilitated as near as possible to their original condition. During the decommissioning process, DCRT will implement the same or similar traffic management practices as described above for the Project's construction activities.

6 APMs, BMPs, and Mitigation Measures

This section includes relevant APMs, BMPs, and MMs specific to this Plan.

6.1 General BMPs

- All construction vehicle movement outside of the Project's ROW will be restricted to predesignated access roads, Construction Contractor-acquired access roads, or public roads. To the extent practicable, construction vehicle movement in the ROW will be limited to predesignated disturbance areas and access routes.
- The width of construction and new temporary access roads will be kept to the absolute minimum needed, avoiding sensitive areas where possible and limiting disturbance to vegetation.
- Where appropriate (e.g., adjacent to sensitive areas or resources), signs will be placed along access roads to discourage OHV users and Project personnel from driving into unauthorized adjacent areas.
- Where roads that service transmission facilities cross fences, a gate will be installed to standard BLM specifications. The gates will be built prior to construction activities and will be kept closed, except during active construction at the fence site.
- Prior to entering a Project work area, Project vehicles and heavy equipment used to complete, maintain, inspect, or monitor ground-disturbing activities will be cleaned of soil and debris capable of transporting weed propagules. Cleaning vehicles will reduce transporting vehicle-borne noxious and invasive weed seeds, roots, or rhizomes.
- Prior to vehicles and equipment entering a Project area, a weed scientist or qualified biologist will identify, flag, and record areas of noxious weed presence. If necessary during construction, mitigation measures such as a weed wash station will be used to control the transport of noxious weeds.

6.2 BLM-Required BMPs

- BMP-Recreation-01: Alternative Access and Parking Signs

  - Signs directing vehicles to alternative park access and parking would be posted in the event construction temporarily obstructs parking areas near trailheads.

- BMP-Recreation-02: Recreation User Signs
  - Signs advising recreation users of construction activities and directing them to alternative trails or bikeways would be posted on both sides of all trail intersections or as determined through DCRT coordination, with the respective jurisdictional agencies. A schedule of construction activities would be posted near entrances to recreational areas as well as on the Project website. Signs would be installed near access roads notifying the public of construction activities in the area and the presence of permanent transmission facilities.

- BMP-Recreation-04: Alternate Route Signage
  - Alternate route(s) of equal or greater standard and access to specially designated areas would be provided, if roads, primitive roads, or trails used for recreation are temporarily closed or otherwise significantly affected. The alternate route(s) would be clearly identified on signage.

- BMP-Traffic and Transportation-02: Structure Lighting in Military Training Routes
  - Project structures that are located within Military Training Routes would be fitted with night-vision-compatible red lighting emitting an infrared energy between 675 and 900 nanometers.

- BMP-Traffic and Transportation-09: Repairs to Local Roads
  - Local roads would be restored if road damage occurred due to Project construction.

6.3 BLM-Required MMs

- MM-Recreation-01: To mitigate effects related to the temporary construction closure of the proposed Arizona Peace Trail and other OHV routes through Johnson Canyon, MM REC-01 would require that construction of the Project occur outside of peak OHV season. Construction in Johnson Canyon would occur between the months of July and September.

- MM-Recreation-03: New access roads will be gated where appropriate, and signage including road status will be posted at all new access road junctions.

- MM-Traffic and Transportation-01: Structures and lines within Segment ca-05 would constitute a moderate to major, long-term effect associated with a collision hazard at the Cyr Aviation Airport. The marking of structures and lines within 0.5 mile of such facilities with spherical markers and lighting would reduce this effect to minor to moderate.

- MM-Traffic and Transportation-02: Structures and lines within Segments in-01 and i-04 where they pass through the Plomosa Mountains and Segments i-06, cb-01, cb-

02, cb-03, and cb-04 in the Dome Rock Mountains would constitute a moderate to major, long-term effect on the safety of Arizona Game and Fish Department aircraft conducting aerial wildlife surveys. The marking of structures and lines in these locations would reduce this effect to minor.

6.4 Applicant Proposed Measures

- APM-Biology-18: Copper Bottom Pass (Arizona Only)
    - Control of construction activities and use of construction-related vehicles in the Copper Bottom Pass area would be maintained to ensure that only planned construction traffic is allowed in the area and that minimal trips are planned to minimize disturbance to bighorn sheep. This mitigation measure does not apply to non-construction-related public use of the Copper Bottom Pass area.
- APM-Traffic and Transportation-01
    - Emergency service providers would be notified of the timing, location, and duration of construction activities. Traffic control devices and signs would be used as needed. These measures would be implemented in conjunction with a Traffic and Transportation Management Plan for the Project. This plan would also include measures/protocols for aviation, including helicopter use, coordination with local air traffic control, and a Congested Area Plan, pursuant to FAA regulations.

1 Introduction

This framework Stormwater Pollution Prevention Plan (SWPPP or Plan) addresses measures to be undertaken by Delaney Colorado River Transmission, LLC (DCRT) and/or its Construction Contractor(s) to prevent stormwater pollution and comply with Section 402 of the Clean Water Act (CWA) administered by the United States Environmental Protection Agency (USEPA) for the Ten West Link Transmission Project (Project or Ten West Link). This Plan also includes mitigation plans for erosion and sediment control, and a plan addressing for avoiding and minimizing impacts to soil and hydrological resources.

1.1 Plan Purpose

The purpose of a SWPPP is to identify potential stormwater pollutants and stormwater pollution prevention measures to reduce the quantity of impacted runoff and to control runoff in a manner that minimizes environmental impacts during construction of the Project. The proper implementation of mitigation measures associated with a SWPPP is imperative during all construction activities. These activities will be conducted in an environmentally sensitive and responsible manner, so no discharge of sediment or contaminants may be conveyed as either direct or indirect discharge to Waters of the United States or state waters.

Final development, implementation and maintenance of the SWPPP will be the responsibility of the Construction Contractor. The SWPPP will fulfill the following:

- Define the characteristics of the site and the types of construction that will occur at each site.
- Describe the practices which will be implemented to control erosion and the release of pollutants in stormwater.
- Outline an implementation schedule to ensure the practices described in the SWPPP are in fact implemented and to evaluate the Plan's effectiveness in reducing erosion, sedimentation and pollutant levels in stormwater discharge from the site.
- Describe the final stabilization design to minimize erosion and prevent stormwater impacts after construction is complete.

2 Regulatory Compliance

Construction, operation, and maintenance of the Project would include ground disturbing activities that could impact soil and water resources. The following regulations and associated permits and authorizations may be required for the Project.

2.1 Federal Regulations

2.1.1 Soil Resources

Soil resources are managed through a broad set of regulations, guidelines, and formal planning processes. These controls and directions are administered through federal, state, or local units of government. At the federal level, the primary land management agency for the Project is the Bureau of Land Management (BLM). Through state and local agency offices, the Natural Resources Conservation Service administers soil conservation programs on private lands. In addition, the Natural Resources Conservation Service inventories Prime and Unique Farmlands, as identified in 7 Code of Federal Regulations (CFR) Part 657. These farmlands are of statewide or local importance to crop production. The Farmland Protection Policy Act states that federal programs that contribute to the unnecessary and irreversible conversion of farmland to non-agricultural uses will be minimized and shall be administered in a manner that, as practicable, are compatible with state and local government and private programs and policies to protect farmland.

On lands administered by the BLM, the agency addresses soil resources primarily through BLM Handbook H-4810-1, “Rangeland Health Standards.” The Rangeland Health Standards are based on 43 CFR Part 4180.1, “Fundamentals of Rangeland Health” (BLM 2001). This regulation calls on the BLM to ensure that “watersheds are in, or are making significant progress toward, properly functioning physical condition, including their upland, riparian-wetland, and aquatic components; soil and plant conditions support infiltration, soil moisture storage, and the release of water that are in balance with climate and landform and maintain or improve water quality, water quantity, and timing and duration of flow.” Individual BLM districts and field offices administer these regulations and guidelines, including soil conservation considerations, through Resource Management Plans and project-level assessments.

2.1.2 Water Resources

The CWA (33 United States Code [U.S.C.] §1251 et seq., formerly the Federal Water Pollution Control Act of 1972) (USEPA 1972) was enacted with the intent of restoring and maintaining the chemical, physical and biological integrity of the Waters of the United States. Specific sections of the CWA that may apply to the Project are described below, followed by a brief description of the associated permits.

2.1.3 Clean Water Act – Section 303(d) List of Impaired Waters

Section 303(d) of the federal CWA requires states to assess the condition of state waters to determine where water quality is impaired (does not fully support uses identified in the stream classification or does not meet all water quality standards) or threatened (is likely to become impaired in the near future). The result of this review is the compilation of a 303(d) list, which states must submit to the USEPA biannually.

The Colorado River is the only water body in the Project area on the 303(d) list of impaired waters. The Colorado River is listed in California for toxicity, but this section of the Colorado River is not on the 303(d) list of impaired waters for Arizona.

2.1.4 Clean Water Act – Section 130.7 Total Maximum Daily Load

Section 130.7 of the CWA required states to establish Total Maximum Daily Load (TMDL) programs, which are approved by the USEPA for streams and lakes that do not meet adopted water quality standards. A TMDL includes a quantitative assessment of water quality problems, contributing sources, and load reductions or control actions needed to restore and protect water bodies. A TMDL budget takes into account loads from point, nonpoint, and natural background sources. National Pollutant Discharge Elimination System (NPDES) permits address point-source pollution to surface waters. Non-point source pollution is addressed by the application of Best Management Practices (BMPs) and environmental mitigation measures.

In compliance with the federal CWA, the Arizona Department of Environmental Quality (ADEQ) and California Environmental Protection Agency have identified Section 303(d) water quality limited streams and lakes for development of TMDL criteria. TMDLs have been established for surface waters in Arizona and California. From the time a water body is listed as impaired, a TMDL for that water body would be developed within one to five years.

The Colorado River is the only water body in the Project area on the 303(d) list and it is listed for toxicity.

2.1.5 Clean Water Act – Section 401 Water Quality Certification

Pursuant to Section 401 of the federal CWA, any permit or license issued by a federal agency for an activity that may result in a discharge into Waters of the United States requires certification from the state in which the discharge originates. This requirement allows each state to have input into federally approved projects that may affect its waters (rivers, streams, lakes, and wetlands) and to ensure the projects will comply with state water quality standards and any other water quality requirements of state law. State certification ensures that the Project will not adversely impact impaired waters (waters that do not meet water quality standards) and that the Project complies with applicable water quality improvement plans (total maximum daily loads). The states must grant, deny, or waive water quality certification for a project before a federal permit or license can be issued. The ADEQ and Regional Water Quality Board in California must provide Section 401 Water Quality Certifications for the federally issued permits, including the 404 permits in both states.

2.1.6 Clean Water Act – Section 402 National Pollutant Discharge Elimination System Permits

To comply with criteria described in the USEPA's CWA, all construction site operators engaged in clearing, grading, and excavating activities that disturb one acre or more, must obtain an NPDES permit for stormwater discharges (40 CFR Parts 122 and 123) (USEPA 1972). NPDES permits (also called Construction General Permits) are issued by the USEPA or similar authorized state entity following submittal of a Notice of Intent (NOI) for construction activities, and preparation of a SWPPP that describes how erosion and sediment transport will be minimized to adjacent water bodies.

The Construction Contractor(s) will be responsible for implementing site-specific SWPPPs and is required to perform routine inspections throughout the duration of construction activities until the Notice of Termination (NOT) is filed.

2.1.7 Clean Water Act – Section 404 Waters of the United States Permits

Waters of the United States, including wetlands, are subject to the United States Army Corps of Engineers (USACE) jurisdiction under Section 404 of the CWA. A Section 404 permit is required for the discharge of dredged or fill material into Waters of the United States. Section 404 of the CWA applies to all jurisdictional Waters of the United States, including wetlands that have significant nexus to interstate commerce. The USACE jurisdiction over non-tidal Waters of the United States extends to the "ordinary high water mark provided the jurisdiction is not extended by the presence of wetlands" (33 CFR Part 328.4 [USEPA 1972]); and under 40 CFR Part 230.3 (s)(1) (USEPA 1972). Jurisdictional waters include surface waters, such as navigable waters and their tributaries, all interstate waters and their tributaries, natural lakes, all wetlands adjacent to other jurisdictional waters and all impoundments of these waters.

The entire Project is within the Los Angeles District of the USACE and would provide regulatory review and permitting services for the entire Project.

Under Section 404, the USACE issues a number of Nationwide Permits (NWP) for different types of activities that result in minimal individual and cumulative adverse effects on the aquatic environment and Individual Permits for larger and more complex impacts.

The USACE NWP Number 12 (NWP 12), Utility Line Activities authorizes the discharges of dredge or fill material into Waters of the United States during construction, maintenance, repair and removal of utility lines, including the associated excavation, backfill, or bedding for the utility lines, provided that the activity at any single waterbody crossing does not result in the permanent loss of greater than a 0.5 acre of non-tidal Waters of the United States. In accordance with NWP 12 a preconstruction notification (PCN) to the USACE district engineer must be submitted prior to commencement of activity if any of the following criteria is met:

1. The activity involves mechanized land clearing in a forested wetland for the utility line right-of-way (ROW).

2. A Section 10 permit (obstruction or alteration of navigable Waters of the United States) is required.

3. The utility line (in waters), excluding overhead lines, exceeds 500 feet.

4. The utility line is placed within a jurisdictional area (waters) and runs parallel to a stream bed that is within that jurisdictional area.

5. The discharges result in the loss of more than 0.1 acre of regulated waters.

6. Permanent access roads are constructed above grade in regulated waters for a distance of more than 500 feet.

7. Permanent access roads are constructed in regulated waters with impervious materials.

Field surveys and analysis of the survey data from all potential Waters of the United States associated with the Project indicates that submittal of a PCN may be required.

Specifically, a PCN may be required for towers sited within the ordinary high water mark of the Colorado River in which a Section 10 permit is to be submitted because utility lines consisting of aerial electric power transmission lines crossing navigable Waters of the United States (which are defined at 33 CFR part 329 [USEPA 1972] and include the Colorado River) must comply with the applicable minimum clearances specified in 33 CFR Part 322.5(i) (USEPA 1972). A PCN is not predicted to be required for foundations within 404 jurisdictional washes since foundation footings will be micro-sited outside of 404 jurisdictional washes where possible and the maximum permanent loss of Waters of the United States at any tower totals much less than 0.5 acre. The maximum permanent impact for each type of foundation pier and the foundation pier permanent footprint is as follows:

- Guyed-V Structure (Tangent): Typical foundation = 9.0 feet in diameter by 24 feet deep (one per structure); additional four grouted anchors for the guys. Guys would be located within the ROW limits and would include a one-foot square footprint, typically. Helical anchors would require a four-square foot footprint = 85 square feet.

- H-Frame Lattice or Steel Pole (Tangent): foundation five feet in diameter by 24 feet deep (two per structure) = 20 square feet.

- Self-supporting Tangent and Dead-end Structures: foundation four to six feet in diameter by 38 feet deep (four per structure) = 28 square feet.

- Drilled Pier (Steel Monopole): foundation four to six feet in diameter by 38 feet deep (one per structure) = 28 square feet.

Type A roads (well-maintained county dirt roads, private roads, and all paved roads) and Type B roads (existing dirt roads – improvements required) will be utilized to the maximum extent feasible to reduce disturbances caused by access road construction. Type A roads require no improvements. Utilization and maintenance of Type B roads will require blading and widening the existing roadway including some areas that cross 404-regulated washes at grade. Other existing roads may have already been established above grade particularly in Segments P10, P11, and 15e. No impervious surfaces or above grade crossings will be added that exceed the NWP 12 threshold for a PCN, and temporarily impacted crossings will be restored to pre-construction contours. Therefore, maintenance of Type B roads is expected to only result in temporary impacts to Waters of the United States.

Where roads do not currently exist (Type C and Type D roads, respectively), they will be widened or constructed at grade to the maximum extent feasible and no impervious surfaces will be added. Where roads cross Waters of the United States, an at-grade crossing, commonly known as an “Arizona Crossing” would typically be maintained or constructed. Such crossings account for the geography when siting roads to cross them, such as avoidance of steep banks or rock outcroppings, and are constructed to leave the bed of the wash intact or at grade if un-grouted rock is added for stabilization. All crossings will be constructed in a manner that does not change the historical flow by +/- one cubic foot nor change the direction of the flow. Additionally, any grading necessary to achieve appropriate grade for heavy equipment clearances would start at the ordinary high water mark and work laterally pulling native material away from the channel. Because surface flows would be maintained across the road, and the channel bed would not be filled or raised, crossings of this type do not result in a loss of Waters of the United

States even if matts or un-grouted rock are added for stabilization. Matts or rock added for stabilization would ultimately be removed at reclamation.

Should any new above-grade crossings or fill be necessary, they would not be expected to exceed 0.5 acre or 500 linear feet of permanent fill and loss of waters at any single crossing or within any single waterbody. Therefore, a PCN for access road maintenance, improvements, and construction are not anticipated.

2.1.8 Rivers and Harbors Appropriation Act of 1899, Section 10

Under Section 10 of the Rivers and Harbors Appropriation Act of 1899 (33 U.S.C. § 403; Chapter 425, March 3, 1899; 30 Stat. 1151), the building of any wharfs, piers, jetties and other structures is prohibited without Congressional approval, and excavation or fill within navigable waters requires the approval of the Chief of Engineers. Authority of the USACE to issue permits for the discharge of refuse matter into or affecting navigable waters under Section 13 of the 1899 Act (33 U.S.C. § 401; 30 Stat. 1152) was modified by Title IV of P.L. (33 U.S.C. §§ 1341-1345; 86 Stat. 877), as amended, which established the NPDES permits.

USACE permits are required under Section 10 for structures and/or work in or affecting navigable Waters of the United States except as otherwise noted by USACE. Certain activities specified in 33 CFR Part 330 are permitted by that regulation (“nationwide general permits”). Other activities may be authorized by district or division engineers on a regional basis (“regional general permits”). If an activity is not exempted by USACE or authorized by a general permit, an individual Section 10 permit will be required for the proposed activity.

The Fish and Wildlife Coordination Act (16 U.S.C. §§ 661-667e; 48 Stat. 401), as amended, provides authority for the United States Fish and Wildlife Service (USFWS) to review and comment on the effects on fish and wildlife of activities proposed to be undertaken or permitted by the USACE.

The Colorado River is the only navigable water in the Project area. A Section 10 permit from the USACE would be required for an overhead transmission line crossing of the Colorado River.

2.1.9 Other Federal Permits and Programs

Executive Order 11988 requires federal agencies to avoid to the extent possible the long- and short-term adverse impacts associated with the occupancy and modification of floodplains and to avoid direct and indirect support of floodplain development wherever there is a practicable alternative. In accomplishing this objective, “each agency shall provide leadership and shall take action to reduce the risk of flood loss, to minimize the impact of floods on human safety, health, and welfare, and to restore and preserve the natural and beneficial values served by flood plains in carrying out its responsibilities.”

Executive Order 11990, Protection of Wetlands (42 Federal Register 26961), directs all federal agencies to minimize the destruction, loss, or degradation of wetlands, and to enhance the natural and beneficial values of wetlands.

2.2 State Regulations

2.2.1 Soil Resources

State conservation laws have been enacted in all the states that would be traversed by the proposed Project. Through state legislation, local resource conservation districts have been formed. These report to state administrative agencies, typically conservation commissions associated with state departments. The latter include the California Department of Conservation and Arizona State Land Department. The resource conservation districts are responsible for local planning, program development, and reporting to administer soil and water conservation programs. They interact with their respective state-level departments as well as the Natural Resources Conservation Service.

2.2.2 Water Resources

Many states regulate waterways and adjacent wetlands, either through specific regulatory programs or via Section 401 of the CWA, also known as 401 Water Quality Certification. State regulatory programs may incorporate permitting procedures to authorize jurisdictional impacts to waterways and wetlands and may require compensatory mitigation for unavoidable impacts. In the absence of a specific regulatory program, states may utilize 401 Water Quality Certification to require measures over and above those required by the USACE Section 404 permit. Section 401 allows a state to review, authorize or deny, and implement requirements additional to those of the USACE 404 permit. If a state chooses to utilize its authority under Section 401, the Section 404 permit does not go into effect until the state issues the 401 Water Quality Certification.

The state agencies, authorizations and guidance that are applicable to wetlands and Waters of the United States permitting and mitigation requirements for the Project are summarized below.

2.2.3 Arizona

Arizona Department of Water Quality (ADWQ) is responsible for the following:

- CWA Section 401 Water Quality Certification. A 401 Certification is required for a project or activity requiring a federal permit or license that will result in a discharge to Waters of the United States. These projects include:
    - A CWA Section 404 Permit from the USACE to allow discharges of dredged or fill materials to Waters of the United States.
    - A Rivers and Harbors Act Section 9 or 10 Permit.
    - Applying for a federal permit for projects involved in the construction of hydroelectric dams, power plants, or other facilities regulated by Federal Energy Regulatory Commission licenses.
    - Other federal permits or licenses that may result in a discharge to Waters of the United States.

- Request for certification submitted to ADWQ by USACE for Section 404 permits.
- Section 401 certification issued by ADWQ prior to federal Section 404 approval.
- In 2017, the ADWQ certified, with conditions, the use of NWP 12 in the state of Arizona.
- CWA Section 402 NPDES permit for construction stormwater discharge.

Arizona SWPPP – The State of Arizona Construction General Permit (CGP) for stormwater discharges associated with construction activities regulates stormwater discharges from all construction activities that disturb one or more acres. Under this permit, an "operator" is required to obtain an Arizona Pollutant Discharge Elimination System permit in order to discharge stormwater. Prior to obtaining this permit, the entity must prepare a SWPPP and submit it along with an NOI application to ADEQ Quality 30 days before beginning construction activities. The SWPPP describes potential pollution sources and the BMPs, which will be used to prevent stormwater contamination. The NOI describes the construction project and route(s) that stormwater may take from the construction site to surface Waters of the State.

ADEQ reviews the NOI to determine if the operator may discharge stormwater under the CGP, or if an individual permit is required.

It is unlikely a Municipal Separate Storm Sewer System permit would be required for Project batch plants as they would be located outside of municipalities.

2.2.4 California

California Department of Fish and Wildlife (CDFW) is responsible for protecting and conserving fish and wildlife resources, and the habitats upon which they depend per the following:

- California Fish and Game Code, Sections 1600-1616, as Amended: The CDFW regulates activities that would divert or obstruct the natural flow or otherwise substantially change the bed, channel, or bank of any river, stream, or lake, or that would deposit or dispose of debris, waste, or other material where it may pass into any river, stream, or lake that supports fish or wildlife. This jurisdiction also applies to riparian habitats associated with watercourses.
    - The Lake and Streambed Alteration Program (Section 1602) reviews projects that would alter any river, stream, or lake and conditions projects to conserve existing fish and wildlife resources. The California Department of Fish and Wildlife must be notified if a project will substantially modify a river, stream, or lake.
- California Fish and Game Code, Sections 5650-5656, as Amended: These codes state that it is unlawful to deposit in, permit to pass into, or place where it can pass into Waters of the State any substance that is deleterious to fish, plant life, mammals, or bird life.

Porter-Cologne Water Quality Control Act, as Amended: This law gives broad authority to the State Water Resources Control Board and California's nine Regional Water Quality

Control Boards to establish water quality standards and discharge prohibitions, issue waste discharge requirements, and implement provisions of the federal CWA, including Section 401 Water Quality Certification. The Project lies within the jurisdiction of the Colorado River Water Quality Control Board, which administers the Water Quality Control Plan for protection of beneficial uses of surface and groundwater for this part of the state.

Executive Order W-59-93: Established state policy guidelines with two primary goals for wetlands conservation: to ensure no overall net loss and to achieve a long-term net gain in the quantity, quality, and permanence of wetland acreage in the state.

In 2014, California Department of Water Resources prioritized groundwater basins through its California Statewide Groundwater Elevation Monitoring Program, which was established in response to the legislation enacted in California's 2009 Comprehensive Water package. The 2014 California Statewide Groundwater Elevation Monitoring Program Basin Prioritization classified basins as high, medium, low, or very low based on the consideration of factors described in the legislation. The Project area is classified as very low to low priority.

California SWPPP – The state of California CGP for stormwater discharges associated with construction activities regulates stormwater discharges from all construction activities that disturb one or more acres. To obtain coverage under this CGP, the appropriate legally responsible person must electronically file the Permit Registration Documents, which include an NOI, SWPPP, and other documents required by this CGP, and mail the appropriate permit fee to the State Water Resources Control Board, prior to commencement of construction activities. The SWPPP describes potential pollution sources and the BMPs, which will be used to prevent stormwater contamination. The NOI describes the construction project and route(s) that stormwater may take from the construction site to surface Waters of the State.

It is expected that as the stormwater program develops, the Colorado River Regional Water Control Board may issue General Permits or Individual Permits that contain more specific permit provisions. When this occurs, the General Permit will no longer regulate those dischargers that obtain coverage under Individual Permits. There is no specified time table for when these provisions may occur.

A copy of the applicable SWPPP shall remain with the Construction Manager on the construction site or at a staging area(s). The SWPPP must be readily available while the Project is under construction, from the start of construction activities until the NOT is filed.

The Construction Contractor(s) must retain a set of construction site maps for the duration of the Project and for three years after the NOT, that delineates the following items:

- Areas of soil disturbance that have been stabilized.
- Areas to be graded along with a time schedule.
- Areas of potential soil erosion where control practices will be implemented.
- Types of control practices and time schedule for implementation.
- Locations of any post-construction projects.
- Topography.

- Existing cover.
- Drainage patterns.
- Buffer areas (environmentally sensitive areas, wetlands, waterways, etc.).
- Surface waters.

To ensure that water quality is being protected, the CGP requires that all SWPPPs be written, amended, and certified by a Qualified SWPPP Developer. A Qualified SWPPP Developer must possess one of the eight certifications and or registrations specified in the CGP and effective two years after the adoption date of the CGP, must have attended a State Water Resources Control Board-sponsored or approved Qualified SWPPP Developer training course.

Each project must complete a risk determination analysis, which determines sampling, monitoring, and reporting requirements. There are two major requirements related to site planning and risk determination in the CGP; the project's overall risk is broken up into two elements: 1) project sediment risk (the relative amount of sediment that can be discharged, given the project and location details); and 2) receiving water risk (the risk sediment discharges pose to the receiving waters).

It is unlikely a Municipal Separate Storm Sewer System permit would be required for activities within Riverside County, California as Project activities are predominately located outside of municipalities.

3 SWPPP Components

3.1 Project Information

Project/Site Name: Ten West Link Transmission Project

Project Description and Location: The Ten West Link Transmission Line Project proposed by DCRT would consist of a single-circuit, series-compensated, 500 kilovolt transmission line between the Arizona Public Service Delaney Substation in Maricopa County, Arizona and the Southern California Edison Colorado River Substation in Riverside County, California. The Project would be designed with a conductor capacity to transmit 3,200 megawatts and provide interconnection capability for new energy projects located in the region.

The land use of the Project area includes mainly rural, sparsely populated lands under federal management as well as some state and private lands. There is relatively little private residential land in the Project area. Residences are typically scattered on large lots and generally increase in density near cities and towns within the Project Area. Towns near the Project include Brenda, Arizona; Quartzsite, Arizona; and Blythe, California.

The only perennial water course in the Project area is the Colorado River. The Colorado River is also the only water body in the Project area on the California 303(d) list. There are numerous ephemeral washes, canals, irrigation ditches, stock ponds, floodplains, groundwater basins, wells, and springs in the Project area. Water resources in the Project area reflect the area's arid land where: channels are generally dry for long periods of time;

streamflow results from high-intensity, short-duration summer thunderstorms and less intense, longer duration winter storms; runoff is typically erratic and sediment-laden; springs are few and limited in extent; and wetlands and shallow groundwater are localized.

The intermittent movement of water from the higher elevations is towards the south and southeast towards the Gila River as well as north, northeast, and east towards the Colorado River. The Colorado River moves water from north to south through the Project area.

3.2 Nature and Sequence of Construction Activities

Construction of the transmission line(s) would include the following sequence of activities:

1. Surveying and staking the transmission centerline, structure locations, environmental cultural resources sensitive areas, other Project features, and work areas.
2. Upgrading or constructing short- and long-term access roads.
3. Clearing and grading the structure sites, and short- and long-term work areas.
4. Excavating and installing foundations.
5. Assembling and erecting structures with short- and long-term work areas.
6. Stringing conductors and shield wires.
7. Installing counterpoise (structure grounds), where needed.
8. Post-construction cleaning up.
9. Constructing the Series Compensation Station (SCS) and associated power connection to the distribution line.
10. Reclamation.

In addition to these activities, other preconstruction and construction components include:

- Preconstruction resource surveys and aerial photography.
- Construction storage yards and concrete batch plants located in previously disturbed areas and areas of lesser ecological impact to the extent practicable.
- Equipment staging areas located in previously disturbed areas and areas of lesser ecological impact to the extent practicable.
- Equipment and fuel staging and storage areas in conformance with the Project Spill Prevention, Control, and Countermeasure Plan.
- Flagging, fencing, and signs in areas of active construction activities or where required for employee and public safety.

- Transportation management for Project access and public safety as in conformance with the Project Traffic and Transportation Management Plan.
- Fire protection as identified in the Project Fire Prevention and Protection Plan (Appendix J-2).
- Blasting in areas of hard rock not removable by heavy excavators; in conformance with the Project Blasting Plan.
- Erosion/dust control and air quality management in conformance with the Project Fugitive Dust Control Plan and Construction Emissions Mitigation Plan (Appendix H-1).
- Hazardous materials management in conformance with the Project Hazardous Materials Management Plan.
- Emergency preparedness and response in conformance with the Project Emergency Preparedness and Response Plan.
- Control of noxious weeds in conformance with the Project Vegetation Management Plan (Appendix F-7).

Further information and details regarding sequencing and the nature of construction are outlined in the Chapters 3 and 4 of the Project Plan of Development (POD).

3.2.1 Access

Access to the ROW would be provided by existing roads and trails, such as those associated with the Devers Palo Verde transmission line and nearby pipelines, to the extent practicable. Access for the Project would be in accordance with the Access Road Plan and Section 3.1.10 of the Project POD. Access is divided into five categories - Types A through E. These have associated disturbance estimated, as described in Table G-2-1, below.

TABLE G-2-1 ACCESS ROAD DISTURBANCE

ACCESS ROAD DISTURBANCE WIDTHS		ROAD TYPE				
		Access Type A (existing maintained public or private roads)	Access Type B (upgraded existing roads[1])	Access Type C (new centerline access[1])	Access Type D (access spur roads[1])	Access Type E (Helicopter Access)
Slope	Flat (0-7.99%)	-	18[2]	22[2]	22[2]	-
	Moderate (8-14.99%)	-	25[2]	30[2]	30[2]	-
	Steep (15% and above)	-	30	50	76	-

[1] Measured in feet.
[2] Does not include wash areas.

3.2.2 Transmission Structures

Proposed support structures would typically be steel structures of various configurations. The primary structures types would be self-supporting, four-legged tangent and dead-end steel lattice structures; guyed-V structures with a single footing and four support guy wires; and two-legged, H-frame (steel lattice) structures. Lattice H-frame or steel monopole structures may be used for areas of active agricultural activity and/or to facilitate entrance into substations. In certain high off-highway vehicle use areas, self-supporting lattice structures or monopoles would replace guyed-V structures to eliminate hazards to those recreationists (Draft Environmental Impact Statement [EIS]), Section 2.4 in Appendix 2). Typical span length for structures would be approximately 1,500 feet. On average, three to eight structures would be placed per mile, depending on the structure type, topography, and angles of the route.

Guyed-V structures are proposed to be used in areas that do not parallel existing self-supporting lattice structures along the route. Guyed-V structures use four guying lines per structure. Guy lines would be located within the ROW, would have to remain at the grade that they were installed, and would have reduced distances extending from the structure foundation for lower height guyed-V structure.

3.2.3 Foundations and Structure Construction

Each structure type requires specific foundation configurations. A temporary disturbance area of approximately 1.1 acres is estimated for each structure site. A long-term work area at the base of each structure would be required for long-term maintenance. These areas would be somewhat larger than the structure foundations and vary based on structure type.

Each support structure would require the installation of foundations, which are typically drilled concrete piers. The foundation for the structures would be long-term disturbance for the life of the Project. The long-term work area at the base of each structure would be required for long-term maintenance. While revegetation would occur in this work area, minimal contouring would be performed.

A typical temporary disturbance area of up to 1.1 acres has been assumed for each structure work area, which would be used for assembly, erection, and crane pads. Short-term disturbance estimates are based on this assumption; however, actual disturbance would be reduced to the minimum size required to the extent practicable, based on site-specific conditions, during field staking prior to construction (see Draft EIS, BMP-MISC-02; Appendix 2A). Actual dimensions of the temporary area of disturbance may vary, depending on factors such as terrain, structure size, and vegetation.

If foundation type requires the use of cast-in-place concrete, standard BMPs for concrete disposal and handling of concrete wash waste water will be used in accordance with all proper federal and state rules.

3.2.4 Conductors

The conductors are the wire cables strung between transmission line structures over which the electric current flows.

In the process of conductor installation, insulators and stringing sheaves would be installed on the structures (short-term disturbance already accounted for at structure sites), pulling the pilot line through the sheaves, which would connect to and pull the conductor; and pulling/tensioning of the conductor. Additional temporary disturbance work areas to support conductor, ground wire, and optical ground wire pulling, and snubbing sites include the use of puller/tensioner sites, snubbing sites, and splicing areas.

Pulling sites would be approximately 600 feet by 200 feet in size. Snubbing sites (where a conductor is temporarily fixed or attached to the ground for conductor-sagging purposes) would be located within the ROW and are locations where conductors are spliced together approximately every 15,000 to 18,000 feet along the transmission line route. Access to both sites would be required for necessary equipment. Snub sites will be 200 feet wide by 600 feet long. In addition, there will be puller and tensioner sites at each angle, in the dimensions of 500 feet by 200 feet. All puller/tensioner sites, where possible, will be deemed drive and crush with the utilization of a soil compactor to reach compaction necessary for heavy equipment to travel sufficiently without risk of roll over, spinning out, or rutting. In instances where drive and crush disturbance cannot reach a level enough plain for the stated heavy equipment necessary, then blading will have to occur in order to keep pullers, tensioners, and wire boats level for efficient and safe wire conducting activities. All blading associated with puller/tensioner sites will be temporary. Temporary blading is also important and necessary on the temporary roads associated with access to the puller/tensioner sites for the Project.

3.2.5 Series Compensation Station

A new SCS system would be located primarily within the 200-foot-wide ROW parallel to an existing SCS associated with the Devers Palo Verde transmission line, approximately 47 miles from the Arizona Public Service Delaney Substation.

The SCS will be integrated into the footprint of the transmission line within a 200-foot by 315-foot (1.5 acre) fenced area. Clearing of all vegetation would be required for the entire SCS area, including a distance of 10 feet outside the fence, for a total long-term disturbance of 1.7 acres. A layer of minimum four-inch deep crushed, 0.75-inch to 1.0-inch grade, washed rock will be used throughout the station area and up to three feet beyond the fence boundary. The new SCS would be connected to an Arizona Public Service 12 kilovolt distribution line located near Brenda, Arizona within a 20-foot-wide ROW. The distribution line would be approximately 3.13 miles long with a 20-foot-wide ROW. A crossing of Interstate 10 would be required for the distribution line.

Access roads for the transmission lines would be utilized for access to the SCS. The entire perimeter of the SCS would be enclosed with security fencing to protect equipment and prevent accidental contact with energized electrical equipment. Stormwater runoff containment ponds may be installed to moderate the discharge of stormwater offsite if determined to be necessary in the course of design.

3.2.6 Substations Upgrades

The equipment required to interconnect the Project to the Delaney and Colorado River substations is expected to be similar in type and size to the existing equipment at each substation. There would be no new disturbance associated with these installations.

3.2.7 Temporary Use Areas

Temporary use areas would be required for material storage, laydown yards, and batch plants during construction. These areas would be selected based upon the final Project alignment and located in previously disturbed areas to the extent practicable. Material storage/laydown yards would be active during construction. Material staging/storage areas, averaging approximately 10 acres each, would be strategically located along the Project transmission line routes, approximately 20 miles apart. Staging areas would be fenced with locked gates and may have security. Temporary staging areas would be powered by local distribution lines if available and necessary, or by a diesel generator; in California, renewable energy sources would be used if feasible and available. Some staging areas would also be used for concrete batch plant operations. If diesel generators or batch plants are implemented in the temporary use areas, any applicable air quality permits or otherwise will be acquired by the Construction Contractor.

3.2.8 Construction Water Requirements

Water would be required for concrete structure foundation construction at the batch plants and dust control during construction. Water for the Project will be obtained from the following potential sources: 1) drawn from Central Arizona Project locations with permits through the Central Arizona Project and water draw agreements; 2) from municipal resources using water use agreements (typically from metered set-up at fire hydrants); or 3) from private wells under water use agreements with landowners. Water use estimates for dust control, restoration and construction are detailed in Table 3-9 and Table 4-1 of the POD (Volume I).

3.2.9 Disposal and Cleanup

Construction would generate non-hazardous solid wastes, including material packaging, concrete, hardware and scrap metal. However, the volume of these wastes is not expected to be substantial. Personal trash would be removed from the ROW on a daily basis. Construction waste (boxes, crates, etc.) would be removed from the transmission ROW shortly after each crew completes their specific task on site. The solid wastes generated during construction would be hauled away for recycling or disposal at approved disposal sites.

3.2.10 Construction Reclamation

Construction reclamation, including cleanup, soil stabilization, and revegetation would occur at the end of the construction process, as described in Appendix L-1 – Reclamation, Vegetation, and Monitoring Plan.

3.2.11 Construction Workforce and Schedule

The Project is expected to be constructed in up to two simultaneous work fronts with over 100 workers on each work front and is expected to take approximately 1.5 years to complete. The SCS construction effort would require approximately 10 workers and is expected to take about 120 days to complete. Crew parking would be located at one of the material storage yards closest to the work area. Upon obtaining all permits and ROW approvals, DCRT would commence construction activities. Additional details on construction workforce is provided in Section 4.4 Volume I of the POD; a representative

schedule (approximate calendar day durations) for major Project activities are also detailed in Section 4.6, Volume I of the POD, and is as follows:

- Construction Mobilization and Recruitment: 15 days
- Access Road Construction: 128 days
- Foundation Installation: 365 days
- Structure Erection and Assembly: 363 days
- Wire Stringing and Installation of Cables and Accessories: 213 days
- Commissioning and Testing: 57 days
- SCS construction: 120 days

3.2.12 Project Construction Closeout

Upon completion of construction and commissioning for the Project, DCRT and the construction contractor(s) would coordinate with the Compliance Inspection Contractor, BLM, and other permitting agencies to conduct final on-the-ground inspections of Project conditions. After BLM's determination of successful construction completion on BLM-administered lands, the Compliance Inspection Contractor would submit a final summary report to the BLM Authorized Officer documenting the construction process. When the BLM Authorized Officer determines that construction (including initial reclamation activities) has been completed in compliance with the ROW grant, Record of Decision (ROD), POD, and any other applicable permits, the Compliance Inspection Contractor, construction contractor(s), and DCRT's construction roles would be considered complete. This determination would initiate the post-construction monitoring phase for reclamation success for which DCRT would remain responsible.

3.2.13 Operation and Maintenance

After construction, Project operation and maintenance would be an ongoing activity including ROW safety requirements, transmission line inspections, preventative and emergency maintenance, vegetation management including trimming and removal of vegetation within the ROW, SCS maintenance, substation maintenance, and long-term access to the ROW through general road maintenance and installation of signs and markers. DCRT will obtain any necessary stormwater permits necessary for these activities.

3.3 Subcontractors

Subcontractors are required to comply with the SWPPP for any work that is performed on-site. Any person or group who violates any condition of the SWPPP may be subject to substantial penalties or loss of contract. Subcontractors will instruct their employees, working on this project, about the requirements of the SWPPP. A copy of the SWPPP will be available for review at the office trailer.

Each subcontractor engaged in activities at the construction site that could impact stormwater must be identified and sign a certification statement, which, under penalty of law, certifies that the person understands the terms and conditions of the CGP and SWPPP that authorizes the stormwater discharges associated with construction activity associated with this Project.

3.4 Responsibilities and Delegation of Authority

3.4.1 Responsible Parties

At a minimum the stormwater team is comprised of individuals who are responsible for overseeing the development, implementation, and maintenance of the SWPPP, any later modifications to it, and for compliance with the requirements in this permit (i.e., installing and maintaining stormwater controls, submitting reports, conducting site inspections, taking corrective actions where required, employee training, and testing for non-stormwater discharges).

Operator(s)

The operator(s) who will be engaged in construction activities at the site:

Company: TBD
Name:
Address:
City, State, Zip Code:
Telephone Number:
Fax/Email:
Area of control (if more than one operator at the site):

Emergency 24-Hour Contact

Company Name: TBD
Name:
Telephone:

Site Supervisor(s)

Company Name: TBD
Name:
Address:
City, State, Zip Code:
Telephone Number:
Fax/Email:
Area of control (if more than one operator at site:

Subcontractor(s)

Company Name: TBD
Name:
Address:

City, State, Zip Code:
Telephone Number:
Fax/Email:
Area of control (if more than one operator at site:

A delegation of authority must be signed by the person designated as the duly authorized representative for the purpose of overseeing compliance with environmental requirements, including the CGP at the Ten West Link construction site. The designee is authorized to sign any reports, SWPPPs, and all other documents required by the permit.

3.5 Stormwater Discharge

Sediment would be the primary source of stormwater discharge from soil-disturbing construction activities. Erosion takes many forms owing to the effects of climate, topography, land use, groundcover, and the erodibility of the soil type. The main agent of erosion in the Project area is rainfall which leads to splash erosion, rill erosion, tunnel erosion, gully erosion, and sheet erosion. Wind is a secondary agent of erosion. Soil characteristics identified for this Project suggest that disturbed areas would experience low to high erosion potential either by water and/or wind. Sediment redistribution of the soil resource as a result of wind and water erosion could cause damages to Waters of the United States, state prime farmlands, and air quality.

Potential risk for erosion could be increased on disturbed areas after soil salvage operations due to removal of the vegetative cover and the loss of surface soil structure. Cutting and removal of vegetation will occur; however, where practicable, downed vegetation and undisturbed low vegetation would be left in place within the disturbance areas to serve as soil protection and erosion control. Vegetation would only be cleared to the extent necessary, minimizing impacts to soil resources (see Appendix F-7, Vegetation Management Plan).

Soil erosion after redistribution on re-graded sites would also be a risk, thus BMPs (listed in Section 4) would include limiting the amount of time this soil is exposed and seeding shortly thereafter if season allows. Windblown dust could result from the disturbance of fine textured soils during construction and reclamation activities, however dust control measures outlined in Appendix H-1 of the POD (Fugitive Dust Control Plan and Construction Emissions Mitigation Plan) will be followed through the completion of the Project.

Potential stormwater pollutants other than sediment may include:

- Construction Yard – Portable toilets, general building materials, solvents, adhesives and trash.
- Designated Fueling Areas (if applicable) – Fueling activities and minor equipment maintenance.
- Construction Activities – Leaks from construction equipment.

3.6 Non-stormwater Discharge

Potential sources of non-stormwater discharges may include:

- Discharges from emergency fire-fighting activities.
- Water used to control dust.
- Water used to rinse or weed wash vehicles and equipment.
- Water used for compacting soil.
- Water used for drilling and coring such as for evaluation of foundation materials.
- Water obtained from dewatering operations/foundations in preparation for and during excavation and construction.

3.7 Waters of the United States and Impaired Waters

The only perennial water course in the Project area is the Colorado River, which is considered jurisdictional due to its' designation as a navigable water by the USACE. The Colorado River is also the only water body in the Project area on the 303(d) list of impaired waters. The Colorado River is on the California 303(d) list and is listed for toxicity. This section of the Colorado River is not on the 303(d) list of impaired waters in Arizona.

Although no wetlands or springs have been identified at this time, field work would be conducted using the USACE *Wetlands Delineation Manual* (Environmental Laboratory 1987) and *Regional Supplement to the Corps of Engineers Wetland Delineation Manual: Arid West Region (Version 2.0)* (USACE 2008a) to confirm.

Some of the numerous ephemeral washes may be considered Waters of the United States. This determination would be made by field work to identify the ordinary high-water mark using the USACE *A Field Guide to the Identification of the Ordinary High Water Mark (OHWM) in the Arid West Region of the Western United States* (USACE 2008b).

There are no outstanding Arizona waters (OAW) within the Project area.

3.8 Best Management Practices

3.8.1 Selection of Best Management Practices

Selection of the most appropriate combination of BMPs for a specific construction site should be based upon a careful review of the areas of the site that affect its potential for erosion and stormwater runoff contamination. These potential problem areas are:

1. Slope protection.
2. Soil mounds and material stockpile.
3. Excavated area (trenches, pits, etc.).
4. Perimeter and access controls.
5. Inlet drain protection.

6. Channels or medians.

7. Equipment storage and maintenance.

8. Debris management, cleanup, and washout.

9. Landscaping and vegetation.

For each of the nine potential problem areas, there is often more than one BMP available to effectively reduce the volume and velocity of stormwater runoff, the amount of the site exposed to erosion, and the potential for stormwater runoff pollution. BMPs are generally categorized into three main groups: erosion control, sediment and pollutant control, and general housekeeping. Erosion control is preventative; controlling erosion at its source. Sediment and pollutant control treats runoff to remove eroded sediment and other associated stormwater pollutants. Good housekeeping measures are less structured and address general operations and maintenance activities. Typical BMP techniques are discussed in the following sections.

Guidance documents for BMP selection include USEPA's "Developing Your Stormwater Pollution Prevention Plan – A Guide for Construction Sites" and the California Department of Transportation's "Construction Site Best Management Practices (BMP) Manual" available at http://www.dot.ca.gov/hq/construc/stormwater/CSBMP-May-2017-Final.pdf.Erosion Control.

3.8.2 Erosion Control

Erosion control refers to methods for reducing the volume or velocity of stormwater runoff, which will come into contact with exposed areas of the Project site. Erosion control methods involve limiting the exposure of graded areas to offsite runoff through modifications of the construction design plan or scheduling, reducing runoff velocities, providing vegetative cover, installing structural controls, and implementing other onsite management options. If a pre-manufactured product is to be implemented on a site for erosion control, the contractor should always follow the manufacturer's installation and maintenance recommendations as the primary reference for implementation. Erosion control BMPs include:

- Erosion Control Mats – Geotextiles, mats, plastic covers, or erosion control blankets designed to stabilize disturbed soil areas and protect soils from erosion by wind or water.

- Mulching – Providing a stabilized surface for seeding and/or prevention of erosion. Mulches include organic materials, straw, wood chips, bark or other wood fibers, decomposed granite, gravels, a variety of netting or mats of organic or non-organic materials, and chemical soil stabilization.

- Protection of Trees and Vegetation in Construction Areas – Preservation of existing vegetation is the identification and protection of desirable vegetation in order to provide erosion and sediment control and protect desirable trees from mechanical damage while the land is being developed.

    - Vegetation Feathering – The edge of the ROW would be cleared in a manner to emulate the natural open spaces of adjacent landscapes.

Mature vegetation will be put in a gradual transition between two habitat types and other specimens will be placed in varying heights ("edge feathering"). The total area to be cleared would be determined by the size, type, and density of adjacent vegetation as well as the natural clearings of the surrounding landscape.

- Pipe Slope Drains – A temporary rigid or flexible pipe that conveys runoff down un-stabilized slopes. The drain is anchored on the upstream end with some form of headwall to limit erosion, secure the pipe, and direct water into the pipe inlets.

- Stabilized Construction Entrance – A stabilized pad of aggregate underlain with filter cloth located at any point where traffic will be entering or exiting a construction site to or from a public ROW, street, alley, sidewalk or parking area. For added effectiveness, a wheel wash or wash rack area can be incorporated into the design to further reduce sediment tracking.

- Construction Road Stabilization – The temporary stabilization of the subgrade, sub-base, and base of access roads, subdivision roads, parking areas, and other onsite vehicle transportation routes for dust and erosion control.

- Dust Control – A comprehensive plan to limit offsite sediment depression by minimizing or controlling airborne fugitive dust. There are three methods of dust control: 1) Geotextiles, mats, plastic covers, and other mechanical methods; 2) dust palliatives (soil binders); and 3) revegetation.

- Temporary Access Waterway Crossing – A temporary access stream crossing is a structure placed across a waterway to provide access for construction purposes for a period of less than one year. There are two main temporary access waterway crossings that are generally constructed:

    - Temporary access culverts - are effective in controlling erosion, easily constructed, and allow for heavy equipment loading.

    - Temporary access fords - offer very little sediment and erosion control and are only effective in ephemeral stream channels. Temporary fords are the least expensive waterway crossing, allow for maximum load limits, and require minimal maintenance.

- Diversion Dikes – A ridge of compacted soil (recommended with a vegetated lining) that is often located at the top or base of a sloping disturbed area and redirects runoff to a less sensitive outfall or area.

- Drainage Swales – A drainage way with a lining of grass, stone, asphalt, concrete, or other material. Permanent channels must be designed and constructed in accordance with appropriate local design standards.

- Outlet Protection, Velocity Dissipation Devices – Structures and devices placed at pipe outlets to prevent scour and reduce the velocity and/or energy of stormwater flows. These structures may include a section of rock, grouted riprap, and concrete rubble placed at the outlet end of culverts, conduits, or channels. Various products can also be installed for velocity reduction including hydrobrakes, vortex valves, and drop shafts.

- Surface Roughening – A temporary erosion control practice often used in conjunction with grading. Soil roughening involves increasing the relief of a bare soil surface with horizontal grooves, stair-stepping (running parallel to the contour of the land), or tracking using construction equipment. Slopes that are not fine graded and that are left in a roughened condition can also reduce erosion.

3.8.3 Sediment and Pollutant Control

Sediment and pollutant control include methods for separating and containing suspended sediment and other construction related pollutants from the stormwater before the water leaves the Project site and enters a storm drain inlet or a receiving natural water body. These methods involve constructing organic, sand, and rock barriers to filter sediment-laden runoff, protecting storm drain inlets, and constructing settling ponds. If a pre-manufactured product is to be implemented on a site for sediment or pollutant control, the contractor should always follow the manufacturer's installation and maintenance recommendations as the primary reference for implementation. Typical sediment and pollutant controls include:

- Organic Filter Barrier – A temporary linear sediment barrier consisting of straw bales, sediment wattles or similar material, designed to intercept and slow sediment-laden sheet flow runoff. Organic filter barriers allow sediment to settle from runoff before water leaves the construction site. Organic filter barriers include straw bales, sediment wattles, and other organic filter berms.

- Sand Bag Barrier – A temporary berm constructed of stacked sandbags, along the perimeter of a site, installed across a channel, or along the ROW in a disturbed area. The sandbags may be filled with pea-sized gravel to enhance filtration.

- Gravel Filter Berms – A temporary berm constructed of open graded rock or bags of gravel installed at the toe of a slope, or the perimeter of a developing or disturbed area.

- Check Dams – Small barriers consisting of rock, sand bag, or earth berms placed across a drainage swale or ditch. Typically, they are used in conjunction with other channel protection techniques such as vegetation lining and turf reinforcement mats.

- Silt Fence – A geotextile fabric stretched between either wooden or metal posts with the lower edge of the fabric securely embedded in the soil. The fence is typically located downstream of disturbed areas to intercept sheet flow runoff.

- Revegetation – Revegetation consists of an area of trees, shrubs, vines, and ground covers that create a buffer or a groundcover between a disturbed construction area and neighboring areas, particularly natural water bodies.

- Storm Drain Inlet Protection – A variety of methods of intercepting sediment at low point inlets through the use of stone, filter fabric, inlet inserts, and other materials. This is normally located at the inlet, providing either detention or filtration to reduce sediment and floatable materials in stormwater.

- Temporary Sediment Basins – A pond area formed by constructing an embankment of compacted soil across a drainageway with a controlled outlet in which sedimentary laden runoff is directed to allow settling of suspended sediment from the runoff.

- Temporary Sediment Traps – A sediment trap is a temporary containment area that allows sediment in collected stormwater to settle out during infiltration or before the runoff is discharged through a stabilized spillway. Sediment traps are formed by excavating or constructing an earthen embankment across a waterway or low drainage area. Sediment traps are smaller and less expensive to install than sediment basins, but generally settle out coarser particles than sediment basins.

- Sediment Dewatering Operations – A filtration bag or sediment bag is a large bag made of geotextile that is used for filtering water pumped as part of dewatering a worksite. The bag is hooked up to a hose and water is pumped through the bag. The water seeps through the geotextile fabric and the sediment is trapped in the bag.

- Waterbars - A small ditch or ridge of material is constructed diagonally across a road or ROW to divert stormwater runoff from the road surface, wheel tracks, or a shallow road ditch.

3.8.4 Good Housekeeping

General housekeeping refers to any management and/or work practices implemented on a construction site to prevent the contamination of stormwater by materials other than sediment. General housekeeping practices involve proper management of chemicals and other potentially hazardous construction materials, equipment, and wastes. Managing potential pollutants offsite (i.e., conducting equipment maintenance back at the maintenance shop rather than at the site) is an effective method of eliminating potential spills and contamination on the construction site. If a pre-manufactured product is to be implemented on a site for general housekeeping, the contractor should always follow the manufacturer's installation and maintenance recommendations as the primary reference for implementation. Good housekeeping BMPs include:

- Chemical Management – Chemical management includes the proper labeling, handling, storage and disposal of chemical. Proper chemical management prevents, or at least minimizes, stormwater runoff from being polluted through spills or other forms of contact. It is not intended to supersede or replace normal site assessment and remediation procedures. Chemical management practices, along with the applicable Occupational Safety and Health Administration, Department of Transportation, and USEPA guidelines, should be incorporated at all construction sites that use or generate potentially hazardous wastes. Target chemicals include:

    - Paints, solvents, and stains.

    - Fuel, lube oils, grease, and cutting oils.

    - Pesticides, herbicides, and fertilizer.

- Solid Waste Management – The routine collection, recycling, and disposal of accumulated solid waste generated at the construction site.

- Equipment Maintenance Procedures – Establish a program of equipment maintenance procedures, which will reduce contamination of onsite soils.

- Designated Washdown Areas – Procedures and practices that are designed to minimize or eliminate the discharge of concrete waste materials to the storm drain systems of watercourses. Standard practices include:

    - Adequate sizing of concrete washouts to accommodate anticipated washout water and potential rainwater.

    - Frequent inspection of concrete wash areas to check for leaks or integrity/degradation.

    - Siting concrete washouts in construction areas close to the concrete pouring activity but not within 50 feet of wetlands or storm drains.

    - Providing proper ingress/egress to concrete washout areas to encourage vehicle traffic.

    - Educate personnel and subcontractor on proper concrete washout procedures.

    - Installation of signage that identifies concrete washout areas.

    - Removal of excess concrete when the system reaches 50 percent of its capacity.

- Spill Containment Plan – An emergency plan to contain spills of dangerous, hazardous, or toxic wastes, which mitigates environmental damage and provides prompt notice to proper authorities.

- Road Sweeping and Road Track-out Cleaning – Road track-out cleaning procedures refer to methods to remove tracked sediment around construction site points of egress.

3.9 Monitoring, Inspections, and Corrective Action

The Construction Contractor(s) shall properly install and maintain all erosion and sediment control treatments and adequately execute erosion and sediment control measures and techniques. Proper operation and maintenance will also include appropriate quality assurance procedures.

As part of the SWPPP, the Construction Contractor(s) will be required to develop an inspection schedule and conduct routine inspections to identify conditions that could lead to discharges of pollutants or contact stormwater with storm drainages or surface waters. Schedules will be established for regular inspections of equipment, and erosion and sediment control measures. Inspections of the construction site shall occur in accordance with each applicable state CGP to identify areas contributing to a stormwater discharge and to evaluate whether industry standards are in place and functioning properly. During

inspections, the Construction Contractor(s) will also determine if the industry standards identified in the SWPPP are adequate and whether additional control measures are needed. All monitoring and inspection records which have been produced in association with the SWPPP will be retained for a period of at least three years.

To monitor the mitigation's effectiveness and to evaluate whether additional mitigation measures are required a monitoring program and reporting system will be established by the Construction Contractor(s) and followed per the applicable state and federal requirements and guidelines.

3.9.1 Monitoring

3.9.1.1 Arizona

Operators of projects that are located within 0.25 mile of impaired OAWs shall prepare and implement a monitoring program that meets the requirements of this Part. The Colorado River is not on the Arizona 303(d) list of impaired waters for this section of the river and there are no OAWs in the Project area.

The operator shall develop a written monitoring program for analytical monitoring of stormwater unless an acceptable rationale demonstrates that stormwater monitoring is not necessary, in accordance with Part 7.1 of the CGP. The monitoring program shall be a part of the SWPPP as either an appendix or separate SWPPP section. The monitoring program shall include:

1. Locations of monitoring sites.

2. The name(s) and title of the person(s) who will perform the monitoring.

3. A map showing the segments or portions of the receiving water that are most likely to be impacted by the discharge of pollutant(s).

4. Water quality parameters/ pollutants to be sampled.

5. The citation and description of the sampling protocols to be used.

6. Identification of the analytical methods and related method detection limits (if applicable) for each parameter required. Method detection limits shall be below applicable surface water quality standards when possible.

7. Additionally, for construction sites within 0.25 mile of an impaired water, the monitoring program shall include:

    a. An identification of the pollutant(s) of concern based on the most recent 305(b) / 303(d) listing or other information available.

    b. A description of potential source(s) of this pollutant(s) from the Project, if any.

3.9.1.2 California

Attachment A of the CGP establishes minimum monitoring and reporting requirements for all linear underground/overhead projects (LUPs). It establishes different monitoring requirements depending on project complexity and risk to water quality. The monitoring requirements for Type 1 LUPs are less than Type 2 and 3 projects because Type 1 projects have a lower potential to impact water quality. Some type of monitoring will be required for this Project.

A discharger shall prepare a monitoring program prior to the start of construction and immediately implement the program at the start of construction for LUPs. The monitoring program must be implemented at the appropriate level to protect water quality at all times throughout the life of the Project.

3.9.2 Inspections

3.9.2.1 Arizona

The Arizona CGP inspection schedule is indicated below:

At a minimum, operator shall conduct a site inspection in accordance with one of the schedules listed below. The operator shall document in the SWPPP, which schedule is being used and, when necessary the location of the rain gauge or weather station used to obtain rainfall information. ADEQ encourages adding inspections before and/ or during predicted storm events and “spot” inspections to ensure control measures will be effective in managing stormwater runoff and associated pollutants.

1. Routine Inspection Schedule. The operator shall ensure inspections are performed at the site as indicated below to ensure control measures are functional and that the SWPPP is being properly implemented. To determine the amount of rainfall from a storm event that occurs on the site (in accordance with options b. or c.), the operator shall obtain rainfall information (in accordance with Part 4.4(3) of the CGP) from either a properly maintained rain gauge on the site, or a weather station that is representative of the site’s location. For any day of rainfall during normal business hours that measures 0.25 inch or greater, the total rainfall measured for that day shall be recorded in accordance with Part 4.4(3) of the CGP.

    a. The site will be inspected a minimum of once every seven calendar days, or

    b. The site will be inspected a minimum of once every 14 calendar days, and also within 24 hours of each storm event of 0.5 inch or greater in 24 hours; or

    c. The site will be inspected a minimum of once per month, but not within 14 calendar days of the previous inspection and within 24 hours of the occurrence of a storm event of 0.25 inch or greater.

2. Reduced Inspection Schedule. The operator may reduce inspection if the entire site has been temporarily stabilized, discharges are unlikely based on seasonal rainfall patterns, or runoff is unlikely due to winter conditions (e.g., site is covered with snow, ice, or frozen ground exists). With a reduced inspection schedule, the site shall be inspected at least once per month (but not within 14 calendar days of the previous inspection) and before an anticipated storm event and within 24 hours of each storm event of 0.5 inch or greater in 24 hours.

3. Inspection Schedule for Sites within 0.25 mile of Impaired Waters or OAWs. If any portion of the construction site is within 0.25 mile of an impaired water or OAW, the operator shall inspect the site at least once every seven calendar days. The operator may reduce inspections to the schedule specified in Part 4.2(2) for those areas of the construction site that have undergone temporary or final stabilization.

4. Inspection Schedule for Inactive and Unstaffed Sites. A site is inactive and unstaffed that will have an anticipated period of no construction activity for at least six consecutive months. Inactive and unstaffed sites within 0.25 mile of an impaired water or OAW are not eligible for this reduced inspection frequency unless they have undergone temporary stabilization. Operator's responsibilities include:

    a. Immediately before becoming inactive and unstaffed, the operator shall perform an inspection in accordance with Part 4.4 of the CGP. All control measures must be in operational condition in accordance with Part 3.1 of the CGP prior to becoming inactive and unstaffed.

    b. During the time the site is inactive and unstaffed, the operator shall perform an inspection at least once every six months and within 24 hours of each storm event of 0.5 inch or greater in 24 hours.

    c. Non-storm event inspections must be at least three months apart.

    d. All control measures must be maintained in operational condition.

    e. The site shall be secured, such as limited access, blocking or fencing.

    f. Maintain a statement in the SWPPP as required in Part 6.4 (11) of the CGP indicating that the construction site is inactive and unstaffed. The statement must be signed and certified in accordance with Appendix B, Subsection 9 of the CGP.

    g. If circumstances change and the site becomes active and/or staffed, this exception no longer applies, and the operator shall immediately resume the routine inspection schedule.

ADEQ retains the authority to revoke this exception from routine inspections where it is determined that the discharge causes, has a reasonable potential to cause, or contribute to an exceedance of an applicable water quality standard, including designated uses.

5. Inspections are only required during the Project's normal working hours. If an inspection day (except those required relative to a rainfall event) falls on a

Saturday or holiday, the inspection may be conducted on the preceding workday. If the inspection day falls on a Sunday, the inspection may be conducted on the following Monday. If rainfall events occur on the weekend or holiday, an inspection relative to that event may be conducted the following workday.

6. Inspections are not required under Adverse Conditions. The operator is not required to inspect areas that, at the time of the inspection, are considered unsafe for inspection personnel. Inspections may be postponed when conditions such as local flooding, high winds, or electrical storms, or situations that otherwise make inspections unsafe. The inspection must resume as soon as conditions are safe.

3.9.2.2 California

The CGP requires visual monitoring at all sites, and effluent water quality at all Risk Level 2 and 3 sites. It requires receiving water monitoring at some Risk Level 3 sites. All sites are required to submit annual reports, which contain various types of information, depending on the site characteristics and events. A summary of the monitoring requirements is found in Table G-2-2.

TABLE G-2-2 REQUIRED MONITORING ELEMENTS FOR RISK LEVELS-CALIFORNIA

Risk Level	Visual	Non-Visible Pollutant	Effluent	Receiving Water
1	Three types required for all risk levels: Non-stormwater Pre-rain Post-rain	As needed for all risk levels	Where applicable	Not required
2			pH, turbidity	Not required
3			pH, turbidity	If receiving water monitoring trigger exceeded: pH, turbidity and suspended sediment concentration. Bioassessment for sites 30 acres or larger.

Type 1 Monitoring Requirements: A discharger must conduct daily visual inspections of Type 1 linear underground/overhead projects during working hours while construction activities are occurring. Inspections are to be conducted by qualified personnel and can be conducted in conjunction with other daily activities. Inspections will be conducted to ensure the BMPs are adequate, maintained, and in place at the end of the construction day. The discharger will revise the SWPPP, as appropriate, based on the results of the daily inspections. Inspections can be discontinued in non-active construction areas where soil disturbing activities have been completed and final stabilization has been achieved (e.g., trench has been paved, substructures have been installed, and successful final vegetative cover or other stabilization criteria have been met).

A discharger shall implement the monitoring program for inspecting Type 1 projects. This program requires temporary and permanent stabilization BMPs after active construction is completed. Inspection activities will continue until adequate permanent stabilization has been established and will continue in areas where re-vegetation is chosen until minimum vegetative coverage has been established. Photographs shall be taken during site inspections and submitted to the State Water Resources Control Board.

Type 2 and 3 Monitoring Requirements: A discharger must conduct daily visual inspections of Type 2 and 3 projects during working hours while construction activities are occurring. Inspections are to be conducted by qualified personnel and can be in conjunction with other daily activities.

All dischargers of Type 2 and 3 projects are required to conduct inspections by qualified personnel of the construction site during normal working hours prior to all anticipated storm events and after actual storm events. During extended storm events, the discharger shall conduct inspections during normal working hours for each 24-hour period. Inspections can be discontinued in non-active construction areas where soil disturbing activities have been completed and final stabilization has been achieved (e.g., trench has been paved, substructures installed, and successful vegetative cover or other stabilization criteria have been met).

The goals of these inspections are: (1) to identify areas contributing to a stormwater discharge; (2) to evaluate whether measures to reduce pollutant loadings identified in the SWPPP are adequate and properly installed and functioning in accordance with the terms of the CGP; and (3) to determine whether additional control practices of corrective maintenance activities are needed. Equipment, materials, and workers must be available for rapid response to failures and emergencies. All corrective maintenance to BMPs shall be performed as soon as possible, depending upon worker safety.

All dischargers shall develop and implement a monitoring program for inspecting Type 2 and 3 projects that require temporary and permanent stabilization BMPs after active construction is completed. Inspections will be conducted to ensure the BMPs are adequate and maintained. Inspection activities will continue until adequate permanent stabilization has been established and will continue in areas where revegetation is chosen until minimum vegetative coverage has been established.

A log of inspections conducted before, during, and after the storm events must be maintained in the SWPPP. The log will provide the date and time of the inspection and who conducted the inspection. Photographs must be taken during site inspections and submitted to the State Water Resources Control Board.

Rain Event Action Plan: A Rain Event Action Plan is a written document, specific for each rain event. This plan should be designed that when implemented it protects all exposed portions of the site within 48 hours of any likely precipitation event forecast of 50 percent or greater probability.

This CGP requires Risk Level 2 and 3 dischargers to develop and implement a plan designed to protect all exposed portions of their sites within 48 hours prior to any likely precipitation event. The plan requirement is designed to ensure that the discharger has adequate materials, staff, and time to implement erosion and sediment control measures that are intended to reduce the amount of sediment and other pollutants generated from the active site. A plan must be developed when there is likely a forecast of 50 percent or greater probability of precipitation in the Project area. The National Oceanic and Atmospheric Administration defines a chance of precipitation as a probability of precipitation of 30 percent to 50 percent chance of producing precipitation in the Project area. NOAA defines the probability of precipitation as the likelihood of occurrence (expressed as a percent) of a measurable amount (0.01 inch or more) of liquid precipitation (or the water equivalent of frozen precipitation) during a specified period of time at any given point in the forecast area.) Forecasts are normally issued for 12-hour time periods. Descriptive terms for uncertainty and aerial coverage are used as follows:

TABLE G-2-3 NATIONAL OCEANIC AND ATMOSPHERIC DEFINITION OF PROBABILITY OF PRECIPITATION

Probability of Precipitation	Expressions of Uncertainty	Aerial Coverage
0 percent	None used	None used
10 percent	None used	Isolated
20 percent	Slight chance	Isolated
30-50 percent	Chance	Scattered
60-70 percent	Likely	Numerous
80-100 percent	None used	None used

The discharger must obtain the precipitation forecast information from the National Weather Service Forecast Office (http://www.srh.noaa.gov/).

3.9.3 Corrective Action

Corrective actions are actions the operator takes in compliance with this Part to modify, or replace any control measure that failed to meet the conditions of the Permit. ADEQ does not consider routine maintenance or repairs as corrective actions. If any of the following conditions at the construction site occur resulting in or from a failure of a control measure, the operator shall implement new or modified control(s):

1. A necessary control measure was never installed, was installed incorrectly, or
2. One of the prohibited discharges as indicated in the Permit has occurred; or
3. The permitting authority determines that modifications to the control measures are necessary.

On the same day a condition requiring corrective action is discovered, the operator shall take all reasonable steps to minimize or prevent the discharge of pollutants until a permanent solution is installed and made operational. However, if the problem is identified when it is too late in the work day to initiate a corrective action, the corrective action shall be initiated on the following work day, unless the condition poses imminent endangerment to human health or the environment, in which case the operator shall take immediate action.

Any control measures or repairs required must be made operational, or completed, by no later than seven calendar days from the time of discovery. If the operator cannot complete the necessary repairs or installation of controls within seven calendar days, the SWPPP shall include the following:

1. The reason it is infeasible to complete the installation or repair within the seven-calendar day timeframe; and
2. The schedule for installing and making the control measure(s) operational as soon as practicable after the seven-day timeframe.

Any corrective actions that result in changes to any of the control measures or procedures shall be documented in the SWPPP within seven calendar days of completing the corrective action work.

3.10 Training

Training of Project employees and subcontractors on environmental topics including stormwater pollution prevention will be provided during general Project orientation. Stormwater training topics will include: stormwater regulations, erosion control BMPs, sediment control BMPs, non-stormwater BMPs, and good housekeeping BMPs. Training records will be maintained by the Construction Contractor and will be made available upon request. Additional training will be tailored and/or supplemented as required for those employees with specific stormwater responsibilities, as described below.

Arizona and California: Properly trained personnel are more capable of preventing spills, responding safely and effectively to accidents and recognizing situations that could lead to stormwater contamination. The Construction Contractor(s) will be responsible for familiarizing personnel with the information contained in the SWPPP. Training meetings will be held for new personnel who join the Project after the initial training has been provided. The purpose of these meetings will be to review the proper installation methods and maintenance of all erosion control measures to be used for the Project. The monitoring/inspection program and all required maintenance and repair will be conducted by trained personnel. The SWPPP must identify the name, title and a description of the qualifications and a copy of any training certificates of team members and Project-specific training must be documented.

The following personnel, at a minimum, must receive training:

- Personnel who are responsible for the design, installation, maintenance, and/or repair of stormwater controls (including pollution prevention measures);
- Personnel responsible for the application and storage of treatment chemicals (if applicable);
- Personnel responsible for conducting inspections as required; and
- Personnel responsible for taking corrective actions as required.

California: To ensure that the preparation, implementation, and oversight of the SWPPP is sufficient for effective pollution prevention, the Qualified SWPPP Developer and Qualified SWPPP Practitioners responsible for creating, revising, overseeing, and implementing the SWPPP must attend a State Water Resources Control Board sponsored or approved Qualified SWPPP Developer and Qualified SWPPP Practitioner training course.

Environmental protection measures associated with training include the following:

Applicant Proposed Measure (APM)-WQ-02: Worker Environmental Awareness Program (WEAP) Development and Implementation – The Project's worker environmental awareness program would communicate environmental issues and appropriate work practices specific to this Project. This awareness would include spill prevention and response measures and proper BMP implementation. The training would emphasize site-

specific physical conditions to improve hazard prevention (such as identification of flow paths to nearest water bodies) and would include a review of all site-specific water quality requirements, including applicable portions of erosion control and sediment transport BMPs, Health and Safety Plan, and Hazardous Substance Control and Emergency Response Plan.

MM-BIO-California Environmental Quality Act (CEQA)-1 Implement a WEAP: Prior to any work activities on the Project site, including surveying, mobilization, fencing, grading, or construction, a WEAP will be prepared; the WEAP will be approved by the California Public Utilities Commission (CPUC) with a final version complete prior to the issuance of construction permits. The WEAP will be implemented throughout the duration of Project related construction activities, including operation and maintenance phases. The WEAP will include, at a minimum, the following items:

- Maps showing the known locations of listed and/or special status wildlife, populations of listed and rare plants and sensitive vegetation communities, riparian habitats, seasonal depressions and known waterbodies, wetland habitat, exclusion areas, and other construction limitations.

- A discussion of measures to be implemented for avoidance of sensitive resources discussed in the EIS (including this appendix) and the identification of an onsite contact in the event of the discovery of sensitive species on the site; this will include a discussion on micro trash.

- Training materials and briefings will include but not be limited to: a discussion of the federal and state Endangered Species Acts, Bald and Golden Eagle Protection Act, and the Migratory Bird Treaty Act; the consequences of non-compliance with these acts; identification and values of plant and wildlife species and significant natural plant community habitats; hazardous substance spill prevention and containment measures; a contact person and phone number in the event of the discovery of dead or injured wildlife; and a review of mitigation requirements.

- Protocols to be followed when road kill is encountered in the work area or along access roads and the identification of an onsite representative to whom the road kill will be reported. Road kill will be reported to the appropriate local animal control agency and CPUC within 24 hours. Road kill of special status species will also be reported to the CDFW and USFWS (for federally-listed species) per MM BIO-CEQA-2. Special status species mortalities should be reported to the CPUC, CDFW, and USFWS within 24 hours or as otherwise required by the project's regulatory permits.

- Literature and photographs or illustrations of potentially occurring special status plant and/or wildlife species will be provided to all Project contractors and heavy equipment operators.

- A special hardhat sticker or wallet size card will be issued to all personnel completing the training, which will be carried with the trained personnel at all times while on the Project site.

- All new personnel will receive this training and may work in the field for no more than 5 days without participating in the WEAP. A log of all personnel who have completed the WEAP training will be kept on site.

- A copy of the WEAP will be kept at an easily accessible location within the Project site (e.g., foreman's vehicle, construction trailer) for the duration of the Project.
- A standalone version of the WEAP will be developed, that covers all previously discussed items above, and that can be used as a reference for maintenance personnel during Project operations.

3.11 Project Modifications

The Construction Contractor(s) is responsible for maintaining a current SWPPP and shall amend the SWPPP whenever there is a change in construction or operations that may affect the discharge of pollutants to surface waters or groundwater. The SWPPP shall also be amended if it is in violation of the CGP or has not achieved the general objective of eliminating pollutants in stormwater discharges. The SWPPP shall be amended and implemented in a timely manner, but in no case more than 14 days after it has been determined that the SWPPP is inadequate. All amendments should be dated and directly attached to the SWPPP per agency regulations.

3.12 Recordkeeping

A copy of this SWPPP and all associated documents will be maintained on site for the duration of construction activities and for a period of at least three years from the date that the site has been finally stabilized and the NOT has been filed. These records may be kept electronically and will be available to agencies upon request. This will include, but is not limited to:

- Records of all data used to complete the NOI.
- SWPPP and all associated appendices.
- Dates of grading, construction activities and stabilization activities.
- A copy of the CGP.
- The signed and certified NOI form or permit application.
- Inspection Records.
- Corrective action logs.
- A copy of the NOT.

3.13 Post-Construction Stormwater Management

Mitigation measures used to reduce pollutants in stormwater discharges after all construction phases are complete, should take into account local post-construction stormwater management requirements, policies and guidelines, as well as site-specific and seasonal conditions. Post-construction mitigation measures will be assessed during future transmission line maintenance. Any areas disturbed by Project construction that are observed to be eroding sediment into drainages will be assessed for the appropriate

permanent mitigation measure to control sediment movement off the disturbed area. Disturbed areas will also be reclaimed per POD Appendix L-1 – Reclamation, Vegetation, and Monitoring Plan.

4 Environmental Protection Measures

Preparation of an Arizona SWPPP and a California SWPPP would meet the following APM. These measures are broken out by Project-wide and California-specific measures:

4.1 Project-Wide Measures

APM-WQ-01: SWPPP Development and Implementation – Following Project approval, DCRT would prepare and implement a SWPPP or an amendment to an existing SWPPP to minimize construction impacts on surface water and groundwater quality. Implementation of the SWPPP would help stabilize graded areas and reduce erosion and sedimentation. The Plan would designate BMPs that would be adhered to during construction activities. Erosion and sediment control measures, such as straw wattles, covers, and silt fences, would be installed prior to ground disturbance, based on the anticipated volume and intensity of precipitation, the nature of stormwater runoff in the Project Area, and the soil types within the Project Area. Suitable stabilization measures would be used to protect exposed areas during construction activities, as necessary and final stabilization would be completed when construction materials, waste, and temporary erosion and sediment control measure have been removed. During construction activities, measures would be implemented to prevent contaminant discharge from vehicles and equipment, including complying with the Spill Prevention, Control, and Countermeasures requirements in Title 40 CFR Part 112. The Project SWPPP would include erosion control and sediment transport BMPs to be used during construction. BMPs, where applicable, would be designed by using specific criteria from recognized BMP design guidance manuals. Erosion-minimizing efforts may include measures such as the following:

- Defining ingress and egress within the Project site.
- Implementing a dust control program during construction.
- Properly containing stockpiled soils.

Erosion control measures identified would be installed in an area before construction begins and would be properly maintained until construction is complete and final stabilization begins. Temporary measures such as silt fences or wattles, intended to minimize sediment transport from temporarily disturbed areas, would remain in place until disturbed areas have stabilized. The Plan would be updated during construction as required by the State Water Resources Control Board and ADEQ. The Plan would include the following components, in accordance with ADEQ requirements for coverage under the CGP:

- Stormwater team qualifications and contact information.
- Identification of operators.
- Nature of construction activities.

- Sequence and estimated dates of construction activities.
- Site description.
- Site map(s).
- Receiving waters.
- Control measures to be used during construction activity.
- Summary of potential pollutant sources.
- Use of treatment chemicals.
- Pollution prevention procedures, including spill prevention and response and waste management procedures.

Other environmental protection measures which may assist with implementation and adherence to the SWPPP include:

APM-WQ-03: Vehicles and Equipment Fueling and Maintenance – Vehicle and equipment fueling and maintenance operations would be conducted in designated areas only; these areas would be equipped with appropriate spill control materials and containment.

BMP-WQ-05: Water Use (Compliance with Conservation Management Action [CMA]/ Land Use Plan Amendment [LUPA]-SW-18) – Water extracted or consumptively used for the construction, operation, maintenance, or remediation of the Project shall be solely for the beneficial use of the Project or its associated mitigation and remediation measures, as specified in approved plans and permits.

BMP-WQ-06 Avoidance of Hydrologic Alterations (Compliance with CMA/LUPA-SW-21 and 22) – Considerations shall be given to design alternatives that maintain the existing hydrology of the site or redirect excess flows created by hardscapes and reduced permeability from surface waters to areas where they would dissipate by percolation into the landscape. All hydrologic alterations shall be avoided that could reduce water quality or quantity for all applicable beneficial uses associated with the hydrologic unit in the Project area, or specific mitigation measures shall be implemented that would minimize unavoidable water quality or quantity impacts, as determined by BLM in coordination with USFWS, CDFW, and other agencies, as appropriate.

BMP-WQ-07: Structures in Floodplains – No permanent structures would be placed in floodplains that are narrower at the ROW crossing than the typical span width of 1,200 feet (i.e., it is assumed that such floodplains could be spanned and avoided).

BMP-AQ-01: Dust Palliatives (Compliance with CMA-LUPA-BIO-6 and 13) – Dust palliatives would be applied, in lieu of water, to inactive construction areas (disturbed lands or soil stockpiles that are unused for 14 consecutive days). Dust palliatives would be chosen by the Dust Control Site Coordinator and or construction contractor. Dust palliatives would be environmentally safe; comply with federal, state, and local regulations; and would not produce a noxious odor or contaminate surface water or groundwater and, therefore, would not pose runoff concerns during rain events. Application rates for dust palliatives would follow the manufacturer's recommendations.

Material Safety Data Sheets for any palliatives would be available on site and provided to the BLM 14 days prior to use.

BMP-SOIL-03 (Compliance with CMA/LUPA-BIO-7): Covers for topsoil stockpiles would be of materials resistant to damage and/or degradation from exposure to ultraviolet light and other elements and would be replaced (as needed) if they deteriorate, become worn, or damaged.

BMP-SOIL-04 (Compliance with CMA/LUPA-SW-9): The disruption of desert pavement and desert varnish shall be minimized to the extent feasible. Grading for new access roads or work areas in areas covered by desert pavement and/or desert varnish shall be avoided if possible.

APM-BIO-07: Monofilament Plastic – No monofilament plastic would be used for erosion control (for example, matting, fiber roll, wattles, silt fencing backing). Appropriate materials include burlap, coconut fiber, or other materials as identified in the general and site-specific SWPPP.

APM-BIO-10: Erosion and Dust Control – The BMPs included in the SWPPP would be implemented during construction to minimize impacts associated with erosion. Watering for dust control during construction would also be used as described previously (AQ-01). Watering shall not result in prolonged ponding of surface water that could attract wildlife to the work area. Minimal or no vegetation clearing and/or soil disturbance would be conducted for site access and construction in areas with suitable topography (i.e., overland driving/overland access).

APM-BIO-14: Minimizing Vegetation Clearing – In areas with suitable topography, minimal or no vegetation clearing, and soil disturbance would be conducted for site access and construction (i.e., overland driving/overland access). Overland driving/overland access would be used in areas that support the necessary construction equipment. Upgrading of existing access roads and construction of new access roads would be implemented as necessary for the safe construction activities.

BMP-BIO-15: Reclamation and Restoration (Compliance with CMA/LUPA-BIO-7 and 8) – As a part of the Habitat Restoration and Monitoring Plan, the soil horizons would be stored separately for the areas where the success of restoration could be crucial for rare plant species.

BMP-BIO-19: Colorado River (Compliance with CMA/LUPA-SW-13 and 16) – In the vicinity of the Colorado River, existing structure spacing and conductor heights would be matched to the greatest extent practical to reduce the potential for bird collisions with the power line. The transmission line would span the Colorado River and the minimum number of structures possible would be located within the undeveloped floodplain. The term “vicinity of the Colorado River” is defined to mean the river crossing, floodplain, and associated agricultural lands. In these areas, conductor bundles would be in a horizontal, parallel configuration, and match existing structure spacing and conductor heights to the greatest extent practical to reduce the potential for bird collisions with the power line. No guyed structures would be used at these locations.

BMP-BIO-38: Use of State of the Art and Commercially-Available Technology (Compliance with CMA - LUPA-BIO-9 and 15) – Use state-of-the-art, commercially-available, construction and installation techniques as approved by BLM, appropriate for

the specific activity/project and site, that minimize new site disturbance, soil erosion and deposition, soil compaction, disturbance to topography, and removal of vegetation.

BMP-BIO-42: Dead and Downed Wood (Compliance with CMA-LUPA-BIO-VEG-2) – Promote appropriate levels of dead and downed wood on the ground, outside of campground areas, to provide wildlife habitat, seed beds for vegetation establishment, and reduce soil erosion, as determined appropriate on an activity-specific basis.

BMP-BIO-47: Riparian Functioning Condition (Compliance with CMA-LUPA-SW-13) – BLM would manage all riparian areas on BLM land to be maintained at, or brought to, proper functioning condition.

BMP-AES-09: Site Linear Facilities along Natural Lines within the Landscape – Siting of facilities, especially linear facilities (e.g., transmission lines, pipelines, roads), should take advantage of natural lines within the landscape (e.g., natural breaks in the landscape topography, the edges of clearings, or transitions in vegetation). Siting of facilities on steep slopes should be avoided. Siting linear facilities along naturally occurring lines in the landscape can reduce apparent contrast through repetition of the line element or through combination of multiple line elements into a single line element. Facilities sited on steep slopes are often more visible (particularly if either the Project or viewer is elevated); they may also be more susceptible to soil erosion, which could also contribute to negative visual impacts.

APM-GEO-01: Erosion and Sedimentation – DCRT would implement a SWPPP for the Project. A monitoring program would be established to ensure that the prescribed BMPs are followed throughout transmission line construction. Examples of these BMPs include the following:

- Preparation, training, and maintenance for clear work-site practices, tracking controls, and materials management to minimize the direct work impacts on soil and erosion.

- Installation of temporary silt fences and other containment features (including gravel bags and fiber rolls) surrounding work areas to prevent the loss of soil during rain events and other disturbances.

- Utilization of storm drain inlet protection, including sediment filters and ponding barriers, to retain sediments on site and prevent excess discharge into storm drains.

- Utilization of storm drain inlet protection, including sediment filters and ponding barriers, to retain sediments on site and prevent excess discharge into storm drains.

- Stockpiling soils at least 100 feet from drainages to the extent possible. If soil stockpiles are within 100 feet from a drainage proper measures would be implemented such as soil tackifiers, straw wattles around the pile, and/or covering the stockpile.

APM-HAZ-01: Hazardous Substance Control and Emergency Response – DCRT would implement its hazardous substance control and emergency response procedures as needed in conjunction with a Hazardous Substance Control and Containment Plan and Emergency Response Plan for the Project. The procedures identify methods and

techniques to minimize the exposure of the public and site workers to potentially hazardous materials during all phases of Project construction through operation. They address worker training appropriate to the site worker's role in hazardous substance control and emergency response. The procedures also require implementing appropriate control methods and approved containment and spill-control practices for construction and materials stored on site. If it were necessary to store chemicals on site, they would be managed in accordance with all applicable regulations. Material safety data sheets would be maintained and kept available on site, as applicable. Project construction would involve soil surface blading/leveling and excavation. In the event that soils suspected of being contaminated (on the basis of visual, olfactory, or other evidence) are removed during site grading activities or excavation activities, the excavated soil would be tested and, if contaminated above hazardous waste levels, would be contained and disposed of at a licensed waste facility. The presence of known or suspected contaminated soil would require testing and investigation procedures to be supervised by a qualified person, as appropriate, to meet state and federal regulations.

All hazardous materials and hazardous wastes would be handled, stored, and disposed of in accordance with all applicable regulations by personnel qualified to handle hazardous materials. The hazardous substance control and emergency response procedures include, but are not limited to, the following:

- Proper disposal of potentially contaminated soils.
- Establishing site-specific buffers for construction vehicles and equipment near sensitive resources.

As part of the Project tailgate meetings, DCRT or their contractor would gather emergency contact numbers, first aid location, and work site location in case of emergency.

4.2 California-Specific Measures

BMP-WQ-04: Non-petroleum Dust Palliatives – Palliatives used for dust control would be non-petroleum products in addition to nontoxic, as specified in AQ-01.

BMP-SOIL-01: During reclamation and revegetation efforts, a BLM soil scientist and/or botanist review plans and approve, as appropriate, to determine type and location of any scarification.

BMP-SOIL-02: During reclamation and revegetation efforts, the BLM would review plans and approve, as appropriate, to determine where soil compaction would be appropriate, to avoid potential adverse conditions created by compaction.

BMP-SOIL-05: (Compliance with CMA/LUPA-SW-9) – Desert pavement and desert varnish in activity areas in California shall be assessed by qualified geological or biological monitors prior to construction. If disturbance from an activity is likely to exceed 10 percent of the desert pavement and/or desert varnish identified within the activity boundary, the BLM would determine whether the erosional and ecologic impacts of exceeding the 10 percent cap by the proposed amount would be insignificant and/or whether the activity should be redesigned to minimize desert pavement and/or desert varnish disturbance.

BMP-SOIL-06: (Compliance with CMA/LUPA-SW-11) – Side-casting of soil during road construction shall be avoided.

BMP-SOIL-07: (Compliance with CMA/LUPA-SW-10) – To the extent possible, avoid disturbance of desert biologically intact soil crusts, and soils highly susceptible to wind and water erosion.

CMA-LUPA-BIO-9: Water and Wetland Dependent Species Resources – Implement the following general LUPA CMA for water and wetland dependent resources:

- Implement construction site standard practices to prevent toxic chemicals, hazardous materials, and other fluids from entering vegetation type streams, washes, and tributary networks through water runoff, erosion, and sediment transport by, at a minimum, implementing the following:
    - On project sites, vehicles and other equipment will be maintained in proper working condition and only stored in designated containment areas where runoff is collected or controlled and that are located outside of streams, washes, and distributary networks to minimize accidental fluids and hazardous materials spills.
    - Hazardous material leaks, spills, or releases will be immediately cleaned and equipment will be repaired upon identification. Removal and disposal of spill and related cleanup materials will occur at an approved off-site landfill.
    - Maintenance and operations vehicles will carry the appropriate equipment and materials to isolate, clean up, and repair any hazardous material leaks, spills, or releases.
- Activity-specific drainage, erosion, and sedimentation control actions, which meet the approval of BLM and the applicable regulatory agencies, will be carried out during all appropriate phases of the approved project. These actions, as needed, will address measures to ensure the proper protection of water quality, site-specific stormwater and sediment retention, and design of the project to minimize site disturbance, including the following:
    - Identify site-specific surface water runoff patterns and implement measures to prevent excessive and unnatural soil deposition and erosion.
    - Implement measures to maintain natural drainages and to maintain hydrologic function in the event drainages are disturbed.
    - Reduce the amount of area covered by impervious surfaces through use of permeable pavement or other pervious surfaces. Direct runoff from impervious surfaces into retention basins.
    - Stabilize disturbed areas following grading in the manner appropriate to the soil type so that wind or water erosion is minimized.
    - Minimize irrigation runoff by using low or no irrigation native vegetation landscaping for landscaped retention basins.

- Conduct regular inspections and maintenance of long-term erosion control measures to ensure long - term effectiveness.

CMA-LUPA-BIO-13: General Siting and Design (portions) – Implement the following CMA for project siting and design:

- Use nontoxic road sealants and soil stabilizing agents.

CMA-LUPA-BIO-15: Use state-of-the-art, as approved by BLM, construction and installation techniques, appropriate for the specific activity/project and site, that minimize new site disturbance, soil erosion and deposition, soil compaction, disturbance to topography, and removal of vegetation.

CMA-LUPA-BIO-VEG-2: Promote appropriate levels of dead and downed wood on the ground, outside of campground areas, to provide wildlife habitat, seed beds for vegetation establishment, and reduce soil erosion, as determined appropriate on an activity-specific basis.

CMA-LUPA-SW-1: Soil and Water General – Stipulations or conditions of approval for any activity will be imposed that provide appropriate protective measures to protect the quantity and quality of all water resources (including ephemeral, intermittent, and perennial water bodies) and any associated riparian habitat (see biological CMAs for specific riparian habitat CMAs). The water resources to which this CMA applies will be identified through the activity-specific National Environmental Policy Act analysis.

CMA-LUPA-SW-2: Soil and Water General – Buffer zones, setbacks, and activity limitations specifically for soil and water (ground and surface) resources will be determined on an activity/site-specific basis through the environmental review process and will be consistent with the soil and water resource goals and objectives to protect these resources. Specific requirements, such as buffer zones and setbacks, may be based, in part, on the results of the Water Supply Assessment defined below. In general, placement of long-term facilities within buffers or protected zones for soil and water resources is discouraged but may be permitted if soil and water resource management objectives can be maintained.

CMA-LUPA-SW-3: Soil and Water General – Where a seeming conflict between CMAs within or between resources arises, the CMA(s) resulting in the most resource protection apply.

CMA-LUPA-SW-4: Soil and Water General – Nothing in the “Exceptions” below applies to or takes precedence over any of the CMAs for biological resources.

CMA-LUPA-SW-5: Groundwater Resources – Exceptions to any of the specific soil and water stipulations contained in this section, as well as those listed below under the subheadings “Soil Resources,” “Surface Water,” and “Groundwater Resources,” may be granted by the authorized officer if the applicant submits a plan, or, for BLM-initiated actions, the BLM provides documentation, that demonstrates:

- The impacts are minimal (e.g., no predicted aquifer drawdown beyond existing annual variability in basins where cumulative groundwater use is not above perennial yield and water tables are not currently trending downward) or can be adequately mitigated.

CMA-LUPA-SW-12: Surface Water – Except in Development Focus Areas, exclude long-term structures in, playas (dry lake beds), and Wild and Scenic River corridors, except as allowed with minor incursions (see definition in the Glossary of Terms).

CMA-LUPA-SW-14: Surface Water – All relevant requirements of Executive Orders 11988 (Floodplain Management) and 11990 (Protection of Wetlands) will be complied with.

CMA-LUPA-SW-15: Surface Water – Surface water diversion for beneficial use will not occur absent a state water right.

CMA-LUPA-SW-21: Consideration shall be given to design alternatives that maintain the existing hydrology of the site or redirect excess flows created by hardscapes and reduced permeability from surface waters to areas where they will dissipate by percolation into the landscape.

CMA-LUPA-SW-22: All hydrologic alterations shall be avoided that could reduce water quality or quantity for all applicable beneficial uses associated with the hydrologic unit in the Project area, or specific mitigation measures shall be implemented that will minimize unavoidable water quality or quantity impacts, as determined by BLM in coordination with USFWS, CDFW, and other agencies, as appropriate. These beneficial uses may include municipal, domestic, or agricultural water supply; groundwater recharge; surface water replenishment; recreation; water quality enhancement; flood peak attenuation or flood water storage; and wildlife habitat.

5 Erosion Control Plan (California Environmental Quality Act Compliance)

Per CEQA the Applicant shall develop and submit an Erosion Control Plan to the CPUC and BLM at least 60-days prior to the start of construction activities. The Erosion Control Plan shall be developed in conjunction with the SWPPP.

5.1 Sustainable Erosion Control

Soil, water, and vegetation must all be considered to achieve successful, self-sufficient erosion control at a project site. The goals of sustainable erosion control are to meet or exceed stormwater quality requirements and minimize life cycle costs by:

- Creating long-term soil health.
- Establishing the most appropriate vegetation.
- Achieving permanent soil stabilization.

The objectives for soils include optimal infiltration, adequate organic matter, sufficient water holding capacity, and favorable soil biology and healthy microbes. The objectives for vegetation include healthy plant communities, diverse species composition, and optimal rooting depth. The objectives for water include surface erosion reduction, runoff reduction, and no-to-low and temporary impacts to water quality.

5.2 Collect Site-Specific Desktop Data

A desktop assessment will be conducted to collect pertinent site information prior to a site visit. The following resources will be assessed based on availability:

- Environmental. Review any previous environmental studies of the area.
- Aerial Map. Review of vegetation and other land cover.
- Topographic Map. Review slope steepness and drainage flow patterns.
- Soils Map. Determine soil types.
- Geology Map. Determine slope stability.
- Local Annual Rainfall. Determine the amount and intensity of local rainfall.
- Erosivity. Obtain R-Values from Natural Resources Conservation Service National Revised Universal Soil Loss Equation (RUSLE2) Database online at: https://fargo.nserl.purdue.edu/rusle2_dataweb/RUSLE2_Index.htm.

5.3 Site Reconnaissance

Depending on the available desktop information, a site reconnaissance visit may be required to obtain additional pertinent information about the Project area. Site reconnaissance activities may include the following:

- Soil. Inspect eroded areas, inspect fills and cuts, locate discharge point(s), identify topsoil location and depth, review potential disturbed soil areas.
- Water. Identify run-on and runoff areas and direction of sheet and concentrated flow. Identify water sources not found in the desktop assessment.
- Vegetation. Inspect existing vegetation, identify litter/duff location and depth.
- Other considerations. Identify potential environmentally sensitive areas.

5.4 Assess Erosion Potential

The RUSLE2 can assist in this assessment process, so the scope of problem can be adequately addressed with appropriate BMP selection. There are several key design considerations to reduce erosion and increase water quality which include:

- Increase infiltration-incorporate organic matter where feasible.
- Provide surface protection from raindrop impact.
- Incorporate slope breaks, surface roughness, fiber rolls, etc., to slow runoff.
- Control runoff to prevent concentrated flows.

- Divert run-on at top of slope.
- Stabilize toe of slope.

RUSLE2 is a quantitative procedure for estimating soil loss in tons per acre per year. It applies to all land uses where mineral soil is exposed to the erosive forces of raindrop impact and runoff. RUSLE2 applies to all land uses including cropland but is not specific to construction sites; by design, RUSLE2 is more applicable to rural sites.

RUSLE2 must be used as a predictive tool only. Basic information can be found online at: http://www.iwr.msu.edu/rusle/.

5.5 Evaluate and Select Best Management Practices

BMPs are structural, non-structural, and management practices that are recognized to be the most effective and practical means of minimizing soil loss and reducing water quality degradation. There are two main classifications of BMPs for construction projects: “Erosion and Sediment Control” and “Non-Stormwater and Waste/Material Management.”

Erosion and Sediment Control BMPs:

- Minimize disturbed areas.
- Stabilize disturbed areas.
- Protect slopes and channels.
- Control site perimeter.
- Retain sediment.

Non-stormwater and Waste/Material Management BMPs:

- Practice good housekeeping.
- Contain and safely dispose materials and waste.
- Follow spill prevention protocol.

5.6 Evaluate and Select Sustainable Vegetation

Selecting appropriate plants is critical to achieving a sustainable erosion control design that stabilizes disturbed soil areas and helps promote succession. Succession seeks to re-establish natural stages of vegetation growth by providing early successional species as initial plant cover and creating conditions that support the establishment of later successional species.

Many disturbed sites are naturally “colonized” by early succession plants such as annual grasses and are then later supported by a more diverse cover of perennials, woody shrubs and trees. Selecting a balance of early and late succession plants in the Project design is appropriate. The Project’s selected control site will help identify climax species

and determine which early and late succession plants will be most successful. Control sites will exhibit the target plant community that is located adjacent to, or near, the Project-affected treatment sites. Control sites will be established within areas that are not disturbed by the Project per Appendix L-1, Reclamation, Vegetation, and Monitoring Plan.

There are many potential site constraints that might inhibit the succession process. These include but are not limited to drought, poor soils, and noxious weed infestations on or near the Project site.

The following methods may be utilized to evaluate potential plant species for the Project:

- Location. Select seed species based on regional and site-specific requirements (e.g., climate, soil).
- Observation. Finalize plant species list based on the vegetation that occurs on the control site.
- Calculation. Determine density by species and frequency of occurrence.
- Documentation. Evaluate photographs and unidentifiable plant specimens.
- Consultation. A qualified or BLM designated biologist/botanist can aid in identifying plants and noxious weeds. Federal land management agencies will approve the appropriate seed mix of species best suited to each reseeding site, including seed mixes, seeding method, amendments, and timing.

5.7 Environmental Protection Measures

In addition to the environmental protection measures described in Section 4, the following measure will ensure compliance with CEQA (i.e., in California) during construction, operation and maintenance of the Project.

MM-GEO-CEQA-2: The Applicant shall develop and submit an Erosion Control Plan to the CPUC and BLM at least 60-days prior to the start of construction activities. The Erosion Control Plan shall be developed in conjunction with the SWPPP (see APM WQ-01) and shall be kept onsite and readily available upon request. Successful implementation of the Erosion Control Plan will result in a less than significant impact related to erosion during all construction activities.

Soil disturbance at structures and access roads is to be minimized and designed to prevent long-term erosion. The Erosion Control Plan shall include:

- The location of all soil-disturbing activities, including, but not limited to new and/or improved access and spur roads.
- The location of all streams and drainage structures that would be directly affected by soil-disturbing activities (such as crossings or public storm drains by the ROW and access roads).
- BMPs to protect drainage structures, such a public storm drains, downstream of soil disturbance activities as well as to prevent loss of top soils and erosion during construction (see BMP SOIL-01 through -07).

- Design features to be implemented to minimize erosion during construction.
- If soil cement is proposed, the specific locations must be defined in this Plan, and evidence of approval by the appropriate jurisdiction shall be submitted to the CPUC and BLM prior to use.
- If design features include the use of retaining structures and/or walls, the design of the features shall be consistent with MM VIS-06 (under Section 2.1.6 above) to use structure type to match the existing structures in the area and reduce form contrast.
- The location and type of BMPs that would be installed to prevent off-site sedimentation.
- Specification for the implementation and maintenance of erosion control measures and description of the erosion control practices, including appropriate design and installation details.
- Proposed schedule for inspection of erosion control/SWPPP measures and schedule for corrective actions/repairs, if required. Erosion control/SWPPP inspection reports shall be provided to the CPUC.

The locations requiring erosion control/SWPPP corrective actions/repairs shall be tracked by the Applicant, including dates of completion, and documented during inspections. Inspections and monitoring shall be performed in compliance with the federal and California Construction General Permits. The inspection reports shall be maintained and kept in their respective SWPPP, kept on site as required by the federal and state Construction General Permits, and made available to the Regional Water Quality Control Board, CPUC, BLM, counties, local municipalities, and tribal governments, on request. Additionally, an Annual Report shall be filed for each reporting period in compliance with the federal and California Construction General Permit reporting requirements.

The Applicant shall submit to the CPUC and the BLM any grading plans that define the locations of the specific features listed.

The Applicant shall submit to the CPUC and BLM evidence of possession of applicable required permits for the representative land disturbance prior to engaging in any soil-disturbance or construction activities. Such permits may include, but are not limited to, a CWA Section 402 NPDES California General Permit for Stormwater Discharges Associated with Construction Activities (General Permit) from the applicable Regional Water Quality Control Boards, and the federal General Permit for Stormwater Discharges Associated with Construction Activities on Tribal Land.

Prior to ground disturbance in stream channels or other waters jurisdictional to the state of California or the federal government, the Applicant shall obtain a Streambed Alteration Agreement from the CDFW, a Section 404 permit from the USACE, and a CWA Section 401 certification from the State Water Resources Control Board.

Responsible Party: The Applicant shall develop the Erosion Control Plan and ensure that it is implemented throughout construction activities. The Applicant shall also be responsible for obtaining all necessary permits related to erosion and water quality control.

Timing: The Erosion Control Plan shall be developed at least 60-days prior to construction and shall be implemented throughout all construction activities. Any permits required for the Project shall be obtained prior to the start of construction.

Mitigation Monitoring and Reporting Program: The Applicant shall develop the Erosion Control Plan in conjunction with the SWPPP required for the Project. The Applicant shall keep on file any corrective actions related to erosion control and the SWPPP and submit these records to the Regional Water Quality Control Board, CPUC, BLM, and any applicable counties, local municipalities, or tribal governments upon request. The Annual Report shall be developed and filed by the Applicant for each reporting period. Any permits required shall be developed by the Applicant and submitted to the applicable agency for approval. The Applicant shall maintain a record of all permits and associated approvals to be kept on file.

Standards for Success: The Project will comply with federal and California Construction General Permit reporting requirements and any stipulations of applicable permits related to erosion control or the SWPPP.

6 Site Plan for Soils and Hydrology

6.1 Introduction

The following Site Plan for Soils and Hydrology describes DCRT's and/or its contractor's approach for avoiding and minimizing impacts to soil and hydrology resources from the proposed Ten West Link. The following information will be used in developing state-specific SWPPPs and the CPUC-required Erosion Control Plan.

6.1.1 Purpose and Objectives

This section represents the commitment on the part of DCRT to protect soil and water resources. The overall objective is to provide measures to protect these resources from potential impacts during construction, operation, and maintenance. This plan incorporates environmental protection measures contained in the Final EIS/ROD for the Project. This Plan is intended for use as a guide to determine the appropriate site-specific measures to be implemented during construction activities. The goals of this plan are to control Project-related erosion and sedimentation of soils that may impact soil resources and hydrological conditions.

6.2 Overview of Resources

6.2.1 Soils

The soils in the study area are associated with a variety of climates, vegetative cover, topography, and geology. Their properties vary depending on environmental conditions, but area soils were typically developed under hot, dry conditions characterized as having thermic or hyperthermic temperature regimes and arid or semi-arid moisture regimes.

The Natural Resource Conservation Service develops and maintains several soil geographic databases. Only the relatively general State Soil Geographic dataset was

used in the Final EIS/ROD and subsequently in this report. State Soil Geographic soil associations within the study area are generally characterized as having moderate to severe water erosion potential and slight to high wind erosion potential.

Sensitive soils in the study area may include desert pavement, biological soil crusts, calcareous soils, and wetland soils. Sand dunes are mapped along the western end of the study area near the Colorado River Substation and are described further under the active windblown sand, dunes, and sand transport corridors subheading below. Wetland soils in the study area are limited to only small areas along the Colorado River and across several low-lying basins associated with agricultural fields near the towns of Tonopah and Blythe. Similarly, alluvial soils can be found in the alluvial bottom lands associated with rivers and ephemeral drainage channels.

Soils with high shrink-swell (expansive) characteristics, corrosive soils, and collapsible soils may all occur within the study area. Expansive, corrosive, or collapsible soil characteristics are identified locally through site-specific geotechnical testing, and associated hazards can be addressed through soil correction during construction or engineering design.

Valley fever is another potential hazard naturally occurring in some soils in the Project Area. Valley fever spores survive in the top two to 12 inches of soil in many parts of Arizona and California.

6.2.1.1 Active Windblown Sand, Dunes, and Sand Transport Corridors

The Chuckwalla Valley of the Mojave Desert, located along Interstate 10 between Blythe and Desert Center, is an example of a sand transport corridor. This valley supports sand dune habitats that depend upon delivery of fine sand from aeolian (wind-driven) and fluvial (river-driven) processes. These sand dunes have an active layer of mobile sand and exist in a state of dynamic equilibrium as they continuously lose sand downwind and gain sand upwind. Dunes move within sand transport corridors, as wind direction and other factors change. Active sand dunes also provide important habitat for species that rely on regular supply of wind-blown sand.

The Desert Renewable Energy Conservation Plan identifies the entire western portion of the Project area on BLM-administered land west of Blythe as dune systems and aeolian sand transport corridors. Sand transport corridors and sand dunes move over time so the figure is approximate. Sand transport corridors and areas of active windblown sand, such as the one just north of the Colorado River Substation, are sensitive to development.

6.2.1.2 Soil Associations

Table G-2-4 presents the soil associations within the Project area.

TABLE G-2-4 SUMMARY OF STATE SOIL GEOGRAPHIC MAPPED SOILS IN THE PROJECT AREA

Soil Association	Draft EIS Segment Location	Description	Wind Erodibility Group	Shrink/ Swell Potential
Rositas-Ripley-Indio-Gilman (s275)	Colorado River and California Zone (ca-01, ca-02, ca-04, ca-05, ca-06, p-15w, p-16, x-09, x-10, x-11, x-12, x13, x-15, x16)	The soil association consists of very deep, well, or moderately well to somewhat excessively drained soils that formed in stratified stream alluvium, alluvium from mixed rock sources or from sandy aeolian material. The soils are on floodplains and alluvial fans, lacustrine basins, floodplains, dunes or sand sheets and have slopes of 0 to 30 percent.	1-6	0
Rositas-Orita-Carrizo-Aco (s1041)	Colorado River and California Zone (ca-02, ca-06, ca-07, ca-09, p-16, p-17, p-18, x15, x-16)	The soil association consists of very deep, well drained to excessively drained soils formed in sandy aeolian material, alluvium from mixed sources, and mixed igneous alluvium. The soils are on dunes and sand sheets, fan remnants and terraces, floodplains, fan piedmonts, and bolson floors. Slope ranges from 0 to 30 percent.	1-3, 5-6	0.14, 1.0
Rillito-Gunsight (s1140)	Colorado River and California Zone (p-17, p-18)	The soil association consists of very deep, somewhat excessively drained soils that formed in mixed alluvium. Gunsight soils are strongly calcareous. The soil association is on fan terraces or stream terraces. Slopes are predominantly 0 to 60 percent.	4L-6	0.5
Rositas-Dune land-Carsitas (s1136)	Colorado River and California Zone (ca-09, p-18, x-19)	The soil association consists of very deep, somewhat excessively drained soils formed in sandy aeolian material or alluvium from granitoid and/or gneissic rocks. The soils are on dunes and sand sheets, alluvial fans, fan aprons, valley fills, dissected remnants of alluvial fans and in drainageways. Slope ranges from 0 to 30 percent.	1, 2, 6	0
Vaiva-Quilotosa-Hyder-Cipriano-Cherioni (s1141)	Colorado River and California Zone (ca-09, p-18, x-19)	The soil association consists of very shallow and shallow, well drained to somewhat excessively drained soils formed in slope alluvium from granite and gneiss, and alluvium from rhyolite and related volcanic rocks. The soils are on hills and mountains, or fan terraces with slopes of 1 to 70 percent.	None available	0.5
Ligurta-Gunsight-Cristobal (s290)	Colorado River and California Zone (cb-10, i-08s, p-15e, x-11) Copper Bottom Zone (cb-03, cb-04, cb-05, cb-06, i-06, i-07, p09, p-11, p13, p-14, x08) East Plains and Kofa Zone (i-04, in-01, p-06) Quartzsite Zone (p-07, p08, qn-01, qn02, qs-01, qs02, i-05, x-05, x-06, x-07)	The soil association series consists of very deep, well drained to somewhat excessively drained, strongly saline soils that formed in fan alluvium weathered from a wide variety of rocks. The soils are on fan terraces or stream terraces with slopes of 0 to 60 percent.	5, 6	1

Soil Association	Draft EIS Segment Location	Description	Wind Erodibility Group	Shrink/ Swell Potential
Schenco-Rock outcrop-Laposa (s295)	Copper Bottom Zone (cb-01, cb-02, cb-03, cb-04, cb-05, cb-06, i-06, p-09, p10, p-11, p12, x-08) East Plains and Kofa Zone (i-04, in-01, p-06) Quartzsite Zone (qn-02, qs-01, qs-02, x-05)	The soil association consists of very shallow and shallow to moderately deep, well drained to somewhat excessively drained soils formed in slope alluvium from schist, granite, gneiss, rhyolite, and aeolian deposits. The soils are on hill slopes, hills and mountains and have slopes of 3 to 75 percent. Average annual precipitation is about 4 to 8 inches and the mean annual temperature is about 72 to 73 degrees Fahrenheit.	8	None available
Hyder-Coolidge-Cipriano-Cherioni (s289)	East Plains and Kofa Zone (d-01, i03, i-04, in01, p-03, p04, p-05, p06, x-01, x02, x-03, x04) Quartzsite Zone (x-05)	The soil association consists of very shallow and shallow to very deep, well drained to somewhat excessively drained soils that formed in fan or stream alluvium from rhyolite and related volcanic rocks. The soils are on fan terraces, stream terraces, mountains, and hills and have slopes of 0 to 70 percent.	None available	1
Momoli-Denure-Carrizo (s281)	East Plains and Kofa Zone (d-01, p01)	The soil association consists of very deep, well drained to excessively drained soils formed in fan alluvium and aeolian deposits and mixed igneous alluvium. The soils are on stream terraces and fan terraces, alluvia fans, relict basin floors, floodplains, fan piedmonts, and boldon floors and have slopes of 0 to 15 percent.	3, 5, 6	None available
Pahaka-Estrella-Antho (s299)	East Plains and Kofa Zone (d-01, i01, i-02, i-03, p-01, p-02, p03, p-04, p05, p-06, x01, x-02, x03, x-04)	The soil association consists of very deep, well drained to somewhat excessively drained soils that formed in mixed and stratified fan alluvium. The soils are on alluvial fans, terraces, and floodplains with slopes ranging from 0 to 5 percent.	3, 5	0.06, 0.08, 0.09
Rillito-Gunsight-Denure-Chuckawalla (s288)	East Plains and Kofa Zone (d-01, i01, i-02, i-03, p-01, p-06, x01, x-02, x04)	The soil association consists of very deep, well drained to somewhat excessively drained soils that formed in mixed alluvium. Gunsight soils are strongly calcareous. The soils are formed in alluvium from mixed sources and are on fan terraces or stream terraces and relict basin floors. Slopes are 0 to 60 percent.	3, 4L, 5, 6, 8	1
Rock outcrop-Quilotosa-Hyder-Gachado (s294)	East Plains and Kofa Zone (d-01, p01)	The soil association consists of very shallow and shallow, well drained to somewhat excessively drained soils that formed from granitic and metamorphic rocks or in alluvium from rhyolite and related volcanic rocks. The soils are on hills and mountains and have slopes of 1 to 70 percent.	None available	None available
Rock outcrop-Quilotosa-Momoli (s293)	East Plains and Kofa Zone (i-03, x04)	The soil association consists of very shallow and shallow to very deep, somewhat excessively-drained to excessively drained soils that formed from granitic and metamorphic rocks or in fan alluvium and aeolian deposits. The soils are on hills and mountains, stream terraces, and fan terraces and have slopes of 0 to 65 percent.	6	None available

Soil Association	Draft EIS Segment Location	Description	Wind Erodibility Group	Shrink/ Swell Potential
Rock outcrop-Lehmans-Gran (s316)	East Plains and Kofa Zone (i-04, p06) Quartzsite Zone (x-05)	The soil association consists of very shallow and shallow, well drained soils formed in slope alluvium-colluvium from volcanic rock. The soils are on pediments, hill slopes, and mountain slopes and have slopes of 1 to 65 percent.	None available	None available
Valencia-Estrella-Cuerda (s300)	East Plains and Kofa Zone (i-03, p04, p-05, p06, x-01, x-02, x-03, x04)	The soil association consists of very deep, well drained soils formed in recent alluvium and stratified mixed alluvium. The soils are on floodplains and alluvial fans and have slopes of 0 to 5 percent.	3, 5	0.06, 0.08, 0.09

6.3 Hydrology

The hydrologic setting of the region is extreme aridity and seasonally varying precipitation. The few perennial streams in the region arise mainly at higher altitudes, where there is more moisture and lower evaporation rates. As these streams descend to the desert plains, evaporative losses and seepage to the groundwater system greatly reduce or eliminate surface flows.

Water resources were considered a non-key resource in the Draft EIS. There is one perennial surface water and numerous ephemeral washes, canals, irrigation ditches, stock ponds, wetlands, floodplains, groundwater basins, wells, springs, and water rights in the Project area. Water resources in the Project area reflect the area's arid land where: channels are generally dry for long periods of time; streamflow results from high-intensity, short duration summer thunderstorms and less intense, longer duration winter storms; runoff is typically erratic and sediment-laden; springs are few and limited in extent; and wetlands and shallow groundwater are localized.

The intermittent movement of water from the higher elevations is towards the south and southeast towards the Gila River as well as north, northeast, and east towards the Colorado River. The Colorado River moves water from north to south through the Project area.

6.4 Management Techniques

6.4.1 Soils

6.4.1.1 Topsoil

Clearing of vegetation and topsoil would be required. These activities could result in newly exposed, disturbed soils that could be subject to topsoil loss and degradation. Indirect impacts associated with topsoil removal may include invasive plant colonization, soil erosion, and reduction of soil water retention. Preservation of topsoil is important for successful reclamation such as re-establishment of native vegetation, minimization of soil erosion, and retained or improved soil water retention. Topsoil that is used to reclaim disturbed areas immediately after construction activities would begin to revert to more natural conditions.

Temporary use areas such as staging/storage and concrete batch plants would be located in areas of lesser ecological impact and previously disturbed areas to the extent practicable. This approach would minimize adverse impacts to topsoil. Some temporary use areas may be necessary in previously undisturbed areas. In these cases, proactive measures would be taken to preserve the local topsoil and return the sites to their pre-disturbance conditions following completion of construction activities. For all temporary use areas, a layer of topsoil would be initially removed from the area, in conformance with the Appendix L-1 – Reclamation, Vegetation, and Monitoring Plan.

In general, the need for soil removal from temporary disturbance areas is anticipated to be minimal and would ultimately depend upon local site conditions at the selected area. Limited soil removal may be required for temporary disturbance areas based on geologic conditions for the following scenarios:

- Areas with unconsolidated soils, which could not support the types of vehicles required to be used, soil types would typically include sandy soils. In this scenario, a temporary rock base may be installed to support vehicle traffic, and one to two inches of sandy soil may be temporarily displaced when the temporary rock base is removed.

- Areas with soils utilized for agricultural activities. In this scenario, topsoil may be removed from sites where temporary construction activities would occur and stored in an area where contamination would be limited. Typically, three to six inches of fertile topsoil may be temporarily displaced during construction activities.

- Areas where uneven soils are present and not able to support construction of transmission structures. In this scenario, grading of 0.5 to three feet of topsoil may be required where terrain would not allow a usable working pad. Soil would be temporarily displaced, then graded and contoured once construction is complete.

- Areas where terrain may cause erosion during construction. In this scenario, topsoil may be disturbed to place erosion control measures in place during construction and through site reclamation.

6.4.1.2 Topsoil Stripping

Topsoil stripping may be necessary where land is to be disturbed due to construction activities. The minimal amount of topsoil will be removed or stripped to accommodate construction activities. Stockpiling of topsoil may be necessary until construction activities are completed and the topsoil can be re-applied. Freshly stripped and placed topsoil retains more viable seed, micro-organisms and nutrients than stockpiled soil. Vegetation establishment is generally improved by the direct return of topsoil and is considered a BMP for topsoil management.

A general procedure for soil handling during topsoil stripping is presented below and includes soil handling measures which optimize the retention of soil characteristics (in terms of nutrients and micro-organisms) and favorable to plant growth for natural regeneration (e.g., seed banks).

- Topsoil will be recovered using appropriate equipment. Depending on compaction and recovery rates, deep ripping may be required to maximize topsoil recovery with care taken not to mix topsoil with subsoil.

- During the stripping process there may be some unexpected changes in the depth and the nature of the soil. Where practical the inclusion of obviously poorer quality material will be avoided such as subsoil clay with mottles, saline material and material dominated with stones.

- Contractors bringing machinery onto the site will be required to present such machinery in a weed-free condition. Noxious weed species management techniques are included in Appendix F-7 – Vegetation Management Plan.

- Disturbance areas will be stripped progressively, as required, in order to reduce erosion and sediment generation, to reduce the extent of topsoil stockpiles and to utilize stripped topsoil as soon as possible for rehabilitation. Rehabilitation of disturbed areas, such as roads and embankments, will be undertaken as soon as practicable after these structures are completed or as areas are no longer required for operational purposes.

Vegetation cover can make the removal of specific topsoil depths difficult. Excessive quantities of vegetative matter in long-term stockpiles may promote chemical and biological degradation of the seed reserves that are a future source of natural regeneration during rehabilitation. Therefore, prior to stripping, vegetation will be removed or reduced by clearing. All cleared vegetative material may be mulched during reclamation activities (see Appendix L-1 Reclamation, Vegetation, and Monitoring Plan), or if suitable, placed as habitat within the proposed areas. In general, the requirement to clear larger vegetation (shrubs and trees) within the disturbance areas is comparatively small due to the relatively sparse vegetation cover in the Project area's arid environment. If feasible, cleared vegetation may be chipped to provide a cost-effective mulch and soil amendment.

6.4.1.3 Topsoil Stockpiling

The following topsoil stockpiling management measures aim to conserve topsoil in a condition as close as possible to its original state. Stockpile locations will be subject to the following management actions.

- Grazing stock, machinery, and vehicles will be excluded.

- Overland water flow onto or across stockpile site will be kept to a practical minimum.

- Where possible, stockpile sites will be selected to maximize protection from the prevailing winds, particularly if the material is friable in nature (e.g., sand or silt). Establishing stockpiles within an area protected from the prevailing winds or in windrows, may be appropriate for these circumstances.

- All long-term topsoil material stockpiles will be located outside the active construction pathways and away from drainage lines.

- Drainage from higher areas will be diverted around stockpile areas to prevent erosion.
- As required, sediment controls will be installed downstream of stockpile areas to collect run-off.
- Topsoil stockpile locations will be strategically located to assist the sequence of future rehabilitation.

Separate stockpiles for topsoil and subsoil will be formed in low mounds of minimum height (10 feet maximum) and maximum flat surface area, consistent with the storage area available. Stockpiling using a greater number of low mounds or windrowing berms rather than stockpiling, is preferable. Topsoil stockpiles will be clearly signposted for easy identification and to avoid any inadvertent losses.

Stockpiling of topsoil should preferably be kept to the shortest possible period. Dispersive clays (Sodosol and Vertosols on sandy alluvial plains) should not be stockpiled over any wet season without erosion or sediment control measures being used.

In general, topsoil stockpiles will be managed so that:

- Storage time is minimized.
- Sodosols will be stockpiled separately (if they are to be used in rehabilitation).
- Locations are accurately surveyed, and data is recorded relating to the soil type and volume.
- Stockpiles are located outside of dry washes and floodplains.
- Stockpiles are located in areas away from drainages or windy areas in order to minimize the risk of soil and wind erosion.
- Appropriate weed control strategies are implemented particularly for any noxious and invasive weeds. Immediate revegetation will provide vegetative competition to assist with the control of undesirable plant species.
- Where practical and applicable, stockpiles will have sediment control measures installed.
- Stockpiles are delineated to avoid vehicle and pedestrian traffic and accidental removal/disturbance.
- Topsoil stockpiles possess a suitable embankment grade to limit the potential for erosion of the outer pile face.

In addition to the above, adherence to the following environmental protection measure would minimize damage to topsoil.

BMP-SOIL-03: (Compliance with CMA-LUPA-BIO-7) - Covers for topsoil stockpiles would be of materials resistant to damage and/or degradation from exposure to ultraviolet light and other elements and would be replaced (as needed) if they deteriorate, become worn, or damaged.

BMP-BIO-15: Reclamation and Restoration (Compliance with CMA-LUPA-BIO-7) – As a part of the Habitat Restoration and Monitoring Plan, the soil horizons would be stored separately for the areas where the success of restoration could be crucial for rare plant species.

6.4.1.4 Topsoil and Subsoil Erosion Control

Erosion takes many forms owing to the effects of climate, topography, land use, groundcover, and the erodibility of the soil type. The main agent of erosion in the Project area is water resulting in rain splash erosion, rill erosion, tunnel erosion, gully erosion, and sheet erosion. Wind is a secondary agent of erosion. Soil characteristics identified in Table G-3-1 suggest that disturbed areas would experience low to high erosion potential either by water and/or wind. Sediment redistribution of the soil resource as a result of wind and water erosion could cause damages to Waters of the United States, prime farmlands, and air quality.

Areas located on steep slopes are inherently susceptible to erosion. The majority of Project reclaimed areas would incorporate a flat to gently sloped surface during regrading and reclamation activities. Potential for erosion would be increased on disturbed areas after soil salvage operations due to removal of the vegetative cover and the loss of surface soil structure. Cutting and removal of vegetation may occur; however, where practicable, downed vegetation and undisturbed low vegetation would be left in place within the disturbance areas to serve as soil protection and erosion control. Vegetation would only be cleared to the extent necessary, minimizing impacts to soil resources.

Soil erosion after redistribution on re-graded sites would also have a greater potential until the soil is stabilized by successful revegetation. Windblown dust would result from the disturbance of fine textured soils during construction and reclamation activities through the completion of the Project.

Progressive rehabilitation will be undertaken to stabilize disturbed areas as quickly as practical and to limit erosion. Erosion and sediment control measures will be employed as part of the SWPPP for this Project.

The design parameters for the construction of erosion control work will be in accordance with established principles for engineering and soil conservation methods. A number of variables must be considered, such as time of concentration, rainfall intensity, erosivity, gradient, scour velocities, and flow estimations. The erosion control options that may be employed are summarized in Table G-2-5.

TABLE G-2-5 POTENTIAL TOPSOIL EROSION CONTROL MEASURES

Area	Control Measure
Erosion control and cleared land	Restrict clearing to areas essential for the work. Windrow vegetation debris along the contour. Minimize length of time soil is exposed. Divert run-off from undisturbed areas away from the work. Direct run-off from cleared areas to sediment control devices.
Exposed subsoils	Minimize length of time subsoil is exposed. Direct run-off from exposed areas to sediment control devices. Use erosion control measures such as those described above and below.

Area	Control Measure
Temporary soil stabilization	Preservation of existing vegetation, hydraulic mulch, hydroseeding, soil binders, straw mulch, geotextiles, erosion control blankets and mats, wood mulching, earth dikes, drainage swales, and ditches, outlet protection/velocity dissipation devices, and slope drains.
Temporary sediment control	Silt fence, desilting basin, sediment trap, check dam, fiber rolls, gravel bag berm, sandbag barrier, straw bale barrier.
Wind erosion control	Water application or other dust palliatives.
Non-stormwater management	Temporary stream crossings, vehicle and equipment cleaning, streambank stabilization, water conservation, and techniques for concrete and other construction activities.

In addition to the above, adherence to the following environmental protection measure would minimize soil erosion.

APM-WQ-01: SWPPP Development and Implementation – Following Project approval, DCRT or their contractor would prepare and implement a SWPPP or an amendment to an existing SWPPP to minimize construction impacts on surface water and groundwater quality. Implementation of the SWPPP would help stabilize graded areas and reduce erosion and sedimentation. The Plan would designate BMPs that would be adhered to during construction activities. Erosion and sediment control measures, such as straw wattles, covers, and silt fences, would be installed prior to ground disturbance, based on the anticipated volume and intensity of precipitation, the nature of stormwater runoff in the Project Area, and the soil types within the Project Area. Suitable stabilization measures would be used to protect exposed areas during construction activities, as necessary and final stabilization would be completed when construction materials, waste, and temporary erosion and sediment control measure have been removed. During construction activities, measures would be implemented to prevent contaminant discharge from vehicles and equipment, including complying with the Spill Prevention, Control, and Countermeasures requirements in 40 CFR Part 112. The Project SWPPP would include erosion control and sediment transport BMPs to be used during construction. BMPs, where applicable, would be designed by using specific criteria from recognized BMP design guidance manuals. Erosion-minimizing efforts may include measures such as the following:

- Defining ingress and egress within the Project site.
- Implementing a dust control program during construction.
- Properly containing stockpiled soils.

Erosion control measures identified would be installed in an area before construction begins and would be properly maintained until construction is complete and final stabilization begins. Temporary measures such as silt fences or wattles, intended to minimize sediment transport from temporarily disturbed areas, would remain in place until disturbed areas have stabilized (see SWPPP, Section 3). The Plan would include the following components, in accordance with ADEQ requirements for coverage under the General Permit:

- Stormwater team qualifications and contact information.
- Identification of operators.

- Nature of construction activities.
- Sequence and estimated dates of construction activities.
- Site description.
- Site map(s).
- Receiving waters.
- Control measures to be used during construction activity.
- Summary of potential pollutant sources.
- Use of treatment chemicals.
- Pollution prevention procedures, including spill prevention and response and waste management procedures.

APM-GEO-01: Erosion and Sedimentation (Compliance with CMA/LUPA-BIO-9 and CMA/LUPA-SW-8) – DCRT would implement a SWPPP for the Project. A monitoring program would be established to ensure that the prescribed BMPs are followed throughout transmission line construction. Examples of these BMPs include:

- Preparation, training, and maintenance for clear work-site practices, tracking controls, and materials management to minimize the direct work impacts on soil and erosion.
- Installation of temporary silt fences and other containment features (including gravel bags and fiber rolls) surrounding work areas to prevent the loss of soil during rain events and other disturbances.
- Utilization of storm drain inlet protection, including sediment filters and ponding barriers, to retain sediments on site and prevent excess discharge into storm drains.
- Implementation of soil erosion controls, including preservation of existing vegetation, temporary soil stabilization through hydroseeding, mulching, and other techniques.
- Stockpiling soils at least 100 feet from drainages to the extent possible. If soil stockpiles are within 100 feet from a drainage proper measures would be implemented such as soil tackifiers, straw wattles around the pile, and/or covering the stockpile.

APM-BIO-14: Minimizing Vegetation Clearing – In areas with suitable topography, minimal or no vegetation clearing and soil disturbance would be conducted for site access and construction (i.e., overland driving/overland access). Overland driving/overland access would be used in areas that support the necessary construction equipment. Upgrading of existing access roads and construction of new access roads would be implemented as necessary for the safe construction activities.

BMP-BIO-42: Dead and Downed Wood (Compliance with CMA/LUPA-BIO-VEG-2) – Promote appropriate levels of dead and downed wood on the ground, outside of campground areas, to provide wildlife habitat, seed beds for vegetation establishment, and reduce soil erosion, as determined appropriate on an activity-specific basis.

Only BLM specified non-toxic substances approved by state and federal regulations shall be used for dust control. The use of any chemical dust control measures on or near any area that may wash into or blow onto Metropolitan Water District of Southern California fee property or agricultural lands participating in the Fallowing Program will be conditioned on the approval of Metropolitan or its designated representative.

6.4.1.5 Topsoil Application

The application procedure is essentially the reverse of the stripping procedure. First, the overburden materials will be profiled to the design slopes, then if suitable, subsoil should be placed in position, followed by the topsoil. All soils will be spread uniformly and evenly across the site to the extent practicable. The following measures may be used to minimize the loss of topsoil material that is re-spread on reclaimed areas and to promote successful vegetation establishment:

- Minimize the length of time that topsoil material is to be stockpiled.
- During removal of soils from the stockpiles, take care to minimize structural degradation of the soils.
- Re-spread topsoil material in even and uniform layers at a thickness appropriate for the landform and land capability of the area to be reclaimed to the extent practicable.
- Contour and leave in a soil roughened state to encourage rainfall infiltration and minimize run-off.
- Soon after re-spreading, seed with appropriate species to establish revegetation cover as early as possible.
- Construct collection drains and sedimentation dams to collect run-off and remove suspended sediment.
- Regularly inspect and maintain reclaimed areas to facilitate sediment and erosion control and revegetation success.
- Reclaimed areas of returned topsoil will be ripped, with care taken not to bring subsurface materials to the surface (e.g., large rocks). Ripping should only be sufficient to allow equipment to work efficiently. Ripping along slopes should be along contour.
- Regularly inspect rehabilitated areas for noxious and invasive weeds and control significant infestations by procedures outlined in the Vegetation Management Plan (Appendix F-7).

6.4.1.6 Biological Crusts

One of the primary impacts of concern for construction is disturbance to soil biological crusts. It is expected that soils within the ROW have the ability to support soil biotic crust; therefore, it is expected that disturbance caused by excavation and compaction during construction may directly affect biological soil crusts. Disturbance to fragile biological crusts could increase wind and water erosion and delay reestablishment of plant communities post construction. Clearing and grading of the ancillary facilities, structure work areas, and access roads could also adversely affect any soil biological crusts in the immediate vicinity. Large portions of the Project have been routed to parallel existing linear infrastructure, thus reducing impacts to previously undisturbed soils.

BMP-SOIL-07: (California only) (Compliance with CMA/LUPA-SW-10) - To the extent possible, avoid disturbance of desert biologically intact soil crusts, and soils highly susceptible to wind and water erosion.

6.4.1.7 Desert Pavement

Desert pavement is a natural mosaic of closely-packed pebbles, cobblestones, and boulders commonly found in a desert where the wind has swept away all smaller particles. The removal of small particles by wind does not continue indefinitely, because once the pavement forms, it acts as a barrier to resist further erosion.

To the extent feasible, construction activities will avoid disturbance of desert pavements. Disturbance areas throughout the Project will be minimized during construction to reduce impacts to desert pavement. All vehicular traffic and foot traffic will be restricted to the designated limits of the project except in the case of physical or safety constraints. Prior to construction, appropriate flagging or fencing will delineate work area boundaries. Damage to desert pavements will be avoided by selecting and using construction equipment that is appropriately sized for each portion of the work. Use of larger and heavier equipment than needed would result in larger areas of damage and greater compaction and shearing disturbance of soils. It would produce greater trauma to plants and other habitat components.

In addition to the above, adherence to the following environmental protection measures would minimize impacts to desert pavement.

BMP-SOIL-05: (California only) (Compliance with CMA/LUPA-SW-9) - Desert pavement and desert varnish in activity areas in California shall be assessed by qualified geological or biological monitors prior to construction. If disturbance from an activity is likely to exceed 10 percent of the desert pavement and/or desert varnish identified within the activity boundary, the BLM would determine whether the erosional and ecologic impacts of exceeding the 10 percent cap by the proposed amount would be insignificant and/or whether the activity should be redesigned to minimize desert pavement and/or desert varnish disturbance.

6.4.1.8 Soil Productivity

Direct impacts to soil resources as a result of construction activities include the loss of soil productivity due to the removal of soils during new surface disturbance. There would be long-term loss of soil productivity on acres not reclaimed during the life of the Project. Other soils disturbed but reclaimed would likely have long-term loss of soil productivity

that would improve over time because of reclamation efforts. Following topsoil management techniques described in Section 6.4.1.1 – Topsoil will retain and/or improve soil productivity. Soils will be reclaimed as described in Appendix L-1 – Reclamation, Vegetation, and Monitoring Plan.

In addition to the above, adherence to the following environmental protection measure would minimize the loss of soil productivity or retain soil productivity.

BMP-SOIL-01: (California only) - During reclamation and revegetation efforts, a BLM soil scientist and/or botanist review plans and approve, as appropriate, to determine type and location of any scarification.

6.4.1.9 Compaction

Direct physical impacts to soil resources include compaction and crushing of the topsoil by equipment during salvage, stockpiling, construction, and reclamation activities. Potential physical effects of soil compaction may include reduced permeability and porosity, damage to microbiotic crusts, increased bulk density, decreased available water holding capacity, and increased erosion potential. With adherence to the APMs and BMPs listed below, physical effects of soil compaction would be reduced.

BMP-BIO-38: Use of State-of-the-Art and Commercially-Available Technology (Compliance with CMA - LUPA-BIO-9 and 15) – Use state-of-the-art, commercially-available construction and installation techniques, as approved by BLM, appropriate for the specific activity/project and site, that minimize new site disturbance, soil erosion and deposition, soil compaction, disturbance to topography, and removal of vegetation.

BMP-SOIL-02: (California only) – During reclamation and revegetation efforts, the BLM would review plans and approve, as appropriate, to determine where soil compaction would be appropriate, to avoid potential adverse conditions created by compaction.

6.4.1.10 Active Sand Dune Habitat

Impacts to areas of wind-blown sand would range from no impacts, if avoided, to long-term negligible to minor impacts to dune habitat because of the intermittent nature of the structure foundations, and the spacing between structures.

6.4.1.11 Soil Hazards

Project-related construction (and, to a far lesser extent, operation) fugitive-dust emissions could include emissions of spores from a soil dwelling fungus (*Coccidioides immitis* and *C. posadasii*), which occurs across arid areas in the southwestern United States and may occur in the Project area. When soil is disturbed by activities such as grading, digging, vehicle operation on dirt roads, or high winds, the fungal spores can become airborne and potentially inhaled, which can result in what is known as “Valley Fever.” There is a risk of Valley Fever and exacerbation of spore emissions. Project construction conducted in a way that minimizes fugitive-dust emissions would minimize emissions of the fungal spores. The following environmental protection measures would minimize the risk of soil hazards.

APM-AQ-01: Fugitive Dust (Compliance with CMA/LUPA-AIR-01, 02, 03, and 05; CMA/LUPA-BIO-13) – The following control measures would be implemented, as

applicable, to reduce PM10 and PM2.5 emissions during construction, in conjunction with an Fugitive Dust Control Plan and Construction Emissions Mitigation Plan for the Project (Appendix H-1).

Basic Control Measures

The following measures would be implemented as applicable at all construction sites:

- Water active construction areas sufficiently to minimize fugitive dust.
- The use of one or more water trucks that would water access roads daily as needed to control dust throughout the construction period.
- Cover trucks hauling soil, sand, and other loose materials and require all trucks to maintain at least six inches of freeboard.
- Pave, apply water, or apply nontoxic soil stabilizers as applicable on for all unpaved access roads, parking areas, and staging areas at construction sites to minimize fugitive dust.

Enhanced Control Measures

In addition to the “basic control measures” listed above, the following control measures may be implemented at all construction sites greater than four acres:

- Water, hydroseed, or apply nontoxic soil stabilizers to inactive construction areas to minimize fugitive dust.
- Enclose, cover, water, or apply nontoxic soil binders to exposed stockpiles.
- Limit traffic speeds on unpaved roads.
- Replant vegetation in disturbed areas as quickly as possible, consistent with seasonal survival considerations.

Optional Control Measures

Depending on the extent of dust generation, implementation of the following optional control measures may occur at larger construction sites, near sensitive receptors (residences or other occupied buildings, parks, or trails within 1,000 feet of earthmoving operations that are substantial; for example, more than excavation for tower foundations), or in situations which for any other reason may warrant additional emissions reductions:

- Install wheel washers for all existing trucks or wash off the tires or tracks of all trucks and equipment leaving the site.
- Suspend excavation and grading activity when winds (instantaneous gusts) exceed 25 miles per hour.

Limit the area subject to excavation, grading, and other construction activity at any one time.

BMP-AQ-01: Dust Palliatives (Compliance with CMA-LUPA-BIO-6 and 13) – Dust palliatives would be applied, in lieu of water, to inactive construction areas (disturbed lands or soil stockpiles that are unused for 14 consecutive days). Dust palliatives would be chosen by the Dust Control Site Coordinator and or construction contractor. Dust palliatives would be environmentally safe; comply with federal, state, and local regulations; and would not produce a noxious odor or contaminate surface water or groundwater and, therefore, would not pose runoff concerns during rain events. Application rates for dust palliatives would follow the manufacturer's recommendations. Material Safety Data Sheets for any palliatives would be available on site and provided to the BLM 14 days prior to use.

APM-AQ-04: Minimize Potential Emission of Naturally Occurring Coccidioides immitis Fungal Spores – In addition to the AQ-01 measures to control general fugitive dust emissions, the following measures would be implemented prior to and during construction to create awareness of the risks and inhalation prevention procedures with respect to Coccidioides immitis fungal spores, which are naturally present in soils in the desert southwest, and inhalation of which can cause valley fever:

- Prior to construction, and for each phase of construction, implement an Environmental Awareness Program for workers to ensure they are informed of the risks of contracting valley fever and the protective measures needed to minimize personal exposure to fugitive dust, as well as to minimize possible dust exposure of nearby residents and the public.

- Inform workers of the possible symptoms of valley fever and encourage them to seek medical treatment if these symptoms manifest.

APM-HAZ-01: Hazardous Substance Control and Emergency Response (Compliance with CMA/LUPA-SW-6 and SW-7) – DCRT would implement its hazardous substance control and emergency response procedures as needed in conjunction with a Hazardous Substance Control and Containment Plan and Emergency Response Plan for the Project. The procedures identify methods and techniques to minimize the exposure of the public and site workers to potentially hazardous materials during all phases of Project construction through operation. They address worker training appropriate to the site worker's role in hazardous substance control and emergency response. The procedures also require implementing appropriate control methods and approved containment and spill-control practices for construction and materials stored on site. If it were necessary to store chemicals on site, they would be managed in accordance with all applicable regulations.

Material safety data sheets would be maintained and kept available on site, as applicable. Project construction would involve soil surface blading/leveling and excavation. In the event that soils suspected of being contaminated (on the basis of visual, olfactory, or other evidence) are removed during site grading activities or excavation activities, the excavated soil would be tested and, if contaminated above hazardous waste levels, would be contained and disposed of at a licensed waste facility. The presence of known or suspected contaminated soil would require testing and investigation procedures to be supervised by a qualified person, as appropriate, to meet state and federal regulations. All hazardous materials and hazardous wastes would be handled, stored, and disposed of in accordance with all applicable regulations by personnel qualified to handle hazardous materials. The hazardous substance control and emergency response procedures include, but are not limited to:

- Proper disposal of potentially contaminated soils.
- Establishing site-specific buffers for construction vehicles and equipment near sensitive resources.
- Emergency response and reporting procedures to address hazardous material spills.
- Stopping work at that location and contacting the County Fire Department Hazardous Materials Unit immediately if visual contamination or chemical odors are detected; work would be resumed at this location after any necessary consultation and approval by the Hazardous Materials Unit.

6.4.2 Hydrology

6.4.2.1 Sediment Loading and Movement

Sediment loading is the movement of organic and inorganic particles by water. In general, the greater the flow, the more sediment that will be conveyed. Water flow can be strong enough to suspend particles in the water column as they move downstream, or simply push them along the bottom of a waterway. Transported sediment may include mineral matter, chemicals and pollutants, and organic material. Soil disturbance activities could increase sediment loading and movement in Project waterways, which could subsequently reduce both floodplain capacity and energy dissipation during a flood event. Soil erosion near waterways may also increase due to soil disturbance activities. Soil erosion is described in Section 6.4.1.4. Adherence to the following environmental protection measures will eliminate and/or reduce sediment loading and movement in Project waterways.

APM-WQ-03: Vehicles and Equipment Fueling and Maintenance – Vehicle and equipment fueling and maintenance operations would be conducted in designated areas only; these areas would be equipped with appropriate spill control materials and containment.

BMP-WQ-04: (California only): Non-petroleum Dust Palliatives – Palliatives used for dust control would be non-petroleum products in addition to nontoxic, as specified in AQ-01.

BMP-WQ-07: Structures in Floodplains – No permanent structures would be placed in floodplains that are narrower at the ROW crossing than the typical span width of 1,200 feet (i.e., it is assumed that such floodplains could be spanned and avoided).

BMP-BIO-19: Colorado River (Compliance with CMA/LUPA-SW-13 and 16) – In the vicinity of the Colorado River, existing structure spacing and conductor heights would be matched to the greatest extent practical to reduce the potential for bird collisions with the power line. The transmission line would span the Colorado River and the minimum number of structures possible would be located within the undeveloped floodplain. The term “vicinity of the Colorado River” is defined to mean the river crossing, floodplain, and associated agricultural lands. In these areas, conductor bundles would be in a horizontal, parallel configuration, and match existing structure spacing and conductor heights to the greatest extent practical to reduce the potential for bird collisions with the power line. No guyed structures would be used at these locations.

CMA-LUPA-SW-1: (California only): Soil and Water General – Stipulations or conditions of approval for any activity will be imposed that provide appropriate protective measures to protect the quantity and quality of all water resources (including ephemeral, intermittent, and perennial water bodies) and any associated riparian habitat (see biological CMAs for specific riparian habitat CMAs). The water resources to which this CMA applies will be identified through the activity-specific National Environmental Policy Act analysis.

CMA-LUPA-SW-2: (California only): Soil and Water General – Buffer zones, setbacks, and activity limitations specifically for soil and water (ground and surface) resources will be determined on an activity/site-specific basis through the environmental review process, and will be consistent with the soil and water resource goals and objectives to protect these resources. Specific requirements, such as buffer zones and setbacks, may be based, in part, on the results of the Water Supply Assessment defined below. In general, placement of long-term facilities within buffers or protected zones for soil and water resources is discouraged, but may be permitted if soil and water resource management objectives can be maintained.

CMA-LUPA-SW-14: (California only): Surface Water – All relevant requirements of Executive Orders 11988 (Floodplain Management) and 11990 (Protection of Wetlands) will be complied with.

6.4.2.2 Alterations

Crossing of ephemeral washes by construction equipment may alter surface or subsurface water movement. Restoring disturbed areas to their pre-construction conditions (contours, hydrology, segregation, and restoration of topsoil), would eliminate or reduce potential negative impacts during revegetation efforts (see Appendix L-1 of the POD – Reclamation, Vegetation, and Monitoring Plan). Jurisdictional (Waters of the United States) washes will be identified by field surveys and Project activities will result in no fill at these locations and channel banks will be retained or returned to pre-construction conditions.

BMP-WQ-06: Avoidance of Hydrologic Alterations (Compliance with CMA/LUPA-SW-21 and 22) – Considerations shall be given to design alternatives that maintain the existing hydrology of the site or redirect excess flows created by hardscapes and reduced permeability from surface waters to areas where they would dissipate by percolation into the landscape. All hydrologic alterations shall be avoided that could reduce water quality or quantity for all applicable beneficial uses associated with the hydrologic unit in the Project area, or specific mitigation measures shall be implemented that would minimize unavoidable water quality or quantity impacts, as determined by BLM in coordination with USFWS and other agencies, as appropriate.

6.5 Other Environmental Protection Measures

Other specific stipulations and methods presented in Appendix L-1 of the POD – Reclamation, Vegetation, and Monitoring Plan, Appendix F-7 – Vegetation Management Plan, I-2 – Spill Prevention, Control, and Countermeasures Plan, and F-2 – Plant and Wildlife Species Conservation Measures Plan contain environmental protection measures that will result in the protection and minimization of impacts to soils and hydrologic resources. The following environmental protection measures will also minimize the potential impacts to soils and hydrology.

APM-WQ-02: WEAP Development and Implementation – The Project's worker environmental awareness program would communicate environmental issues and appropriate work practices specific to this Project. This awareness would include spill prevention and response measures and proper BMP implementation. The training would emphasize site-specific physical conditions to improve hazard prevention (such as identification of flow paths to nearest water bodies) and would include a review of all site-specific water quality requirements, including applicable portions of erosion control and sediment transport BMPs, Health and Safety Plan, and Hazardous Substance Control and Emergency Response Plan.

CMA-LUPA-SW-3: (California only): Soil and Water General – Where a seeming conflict between CMAs within or between resources arises, the CMA(s) resulting in the most resource protection apply.

CMA-LUPA-SW-4: (California only): Soil and Water General – Nothing in the "Exceptions" below applies to or takes precedence over any of the CMAs for biological resources.

CMA-LUPA-SW-12: (California only): Surface Water – Except in Development Focus Areas, exclude long-term structures in, playas (dry lake beds), and Wild and Scenic River corridors, except as allowed with minor incursions (see definition in the Glossary of Terms).

BMP-SOIL-06: (California only) (Compliance with CMA/LUPA-SW-11) - Side-casting of soil during road construction shall be avoided.

APM-BIO-15: Reclamation and Restoration (Compliance with CMA/LUPA-BIO-7 and CMA/LUPA-BIO-8) – A Habitat Restoration and Monitoring Plan would be developed, approved by BLM, and implemented for construction and operation of the Project. Revegetate all sites disturbed during construction that would not be required for operation of the transmission line, and restore disturbed areas to the extent practicable, given the arid desert environment. The Plan would describe in detail methods for surveying and characterizing vegetation in disturbed areas before construction; topsoil salvage and management, erosion control, post-construction recontouring and site preparation, seeding and planting, and post-construction watering, monitoring, and remediation. It would be designed to reduce impacts on special status species to the extent practicable.

BMP-BIO-38: Use of State-of-the-Art and Commercially-Available Technology (Compliance with CMA/LUPA-BIO-15) – Use state-of-the-art, commercially-available construction and installation techniques, as approved by BLM, appropriate for the specific activity/project and site, that minimize new site disturbance, soil erosion and deposition, soil compaction, disturbance to topography, and removal of vegetation.

BMP-AES-09: Site Linear Facilities along Natural Lines within the Landscape – Siting of facilities, especially linear facilities (e.g., transmission lines, pipelines, roads), should take advantage of natural lines within the landscape (e.g., natural breaks in the landscape topography, the edges of clearings, or transitions in vegetation). Siting of facilities on steep slopes should be avoided. Siting linear facilities along naturally occurring lines in the landscape can reduce apparent contrast through repetition of the line element or through combination of multiple line elements into a single line element. Facilities sited on steep slopes are often more visible (particularly if either the Project or viewer is elevated); they may also be more susceptible to soil erosion, which could also contribute to negative visual impacts.

6.6 Monitoring

Monitoring of soil erosion control measures will continue until reclamation efforts are considered complete as outlined in Appendix L-1 – Reclamation, Vegetation and Monitoring Plan, and accelerated erosion has been controlled. The following provides guidance for monitoring and environmental protection measures.

APM-WQ-01: SWPPP Development and Implementation (Portions) – Erosion control measures identified would be installed in an area before construction begins and would be properly maintained until construction is complete and final stabilization begins. Temporary measures such as silt fences or wattles, intended to minimize sediment transport from temporarily disturbed areas, would remain in place until disturbed areas have stabilized.

6.7 Operation and Maintenance

After construction and reclamation, monitoring the soil erosion control measures will continue on an annual basis during the operation and maintenance phase until affected soils and hydrology have been stabilized. Monitoring should continue until reclamation efforts are considered complete.

Table of Contents

This page intentionally left blank.

2C.1 LUPA WIDE CMAS

2C.1.1 Biological Resources

CATEGORY	CMA #	CMA TEXT	RELEVANT EIS SECTIONS	COMPLIANCE SUMMARY
Biological Resources	LUPA-BIO-1	Conduct a habitat assessment (see Glossary of Terms) of Focus and BLM Special Status Species' suitable habitat for all activities and identify and/or delineate the DRECP vegetation types, rare alliances, and special features (e.g., Aeolian sand transport resources, Joshua tree, microphyll woodlands, carbon sequestration characteristics, seeps, climate refugia) present using the most current information, data sources, and tools (e.g., DRECP land cover mapping, aerial photos, DRECP species models, and reconnaissance site visits) to identify suitable habitat (see Glossary of Terms) for Focus and BLM Special Status Species. If required by the relevant species-specific CMAs, conduct any subsequent protocol or adequate presence/ absence surveys to identify species occupancy status and a more detailed mapping of suitable habitat to inform siting and design considerations. If required by relevant species-specific CMAs, conduct analysis of percentage of impacts to suitable habitat and modeled suitable habitat.	Section 3.4 Section 4.4	Compliance with this CMA is achieved through data contained in the Biological Resources Technical Reports (including rare plant studies), which is incorporated into Chapter 3 and Appendix 3 of this EIS, and analysis presented in Chapter 4 and Appendix 4. Additional preconstruction studies along the Selected Alternative route in California would be undertaken for rare plants (APM-BIO-24 and BMP-BIO-31), protected plants (BMP-BIO-11), rare vegetation alliances (APM-BIO-24), riparian and xeroriparian habitat (APM-BIO-13), Mojave fringe-toed lizard (APM-BIO-25 and BMP-BIO-49), desert tortoise (APM/BMP-BIO-23), burrowing owl (APM-BIO-25 and APM-BIO-30), nesting migratory birds (APM-BIO-30), dune vegetation (BMP-BIO-53) and sand transport corridors (BMP-BIO-54).
		• BLM will not require protocol surveys in sites determined by the designated biologist to be unviable for occupancy of the species, or if baseline studies inferred absence during the current or previous active season.		

CATEGORY	CMA #	CMA TEXT	RELEVANT EIS SECTIONS	COMPLIANCE SUMMARY
	Con't	Utilize the most recent and applicable assessment protocols and guidance documents for vegetation types and jurisdictional waters and wetlands that have been approved by BLM, and the appropriate responsible regulatory agencies, as applicable.		
	LUPA-BIO-2	Designated biologist(s) (see Glossary of Terms), will conduct, and oversee where appropriate, activity-specific required biological monitoring during pre-construction, construction, and decommissioning to ensure that avoidance and minimization measures are appropriately implemented and are effective. The appropriate required monitoring will be determined during the environmental analysis and BLM approval process. The designated biologist(s) will submit monitoring reports directly to BLM.	Section 4.4.4 Appendix 2A	Compliance with this CMA is achieved through application of APM-BIO-02 and BMP-BIO-02.
Resource Setback Standards	LUPA-BIO-3	Resource setbacks (see Glossary of Terms) have been identified to avoid and minimize the adverse effects to specific biological resources. Setbacks are not considered additive and are measured as specified in the applicable CMA. Allowable minor incursions (see Glossary of Terms), as per specific CMAs do not affect the following setback measurement descriptions. Generally, setbacks (which range in distances for different biological resources) for the appropriate resources are measured from:	Section 4.4.7 Appendix 2A	The CDCA Plan would be further amended to eliminate this setback for sensitive plants for the Project. Compliance with this CMA is achieved, in part, through application of APM-BIO-04, APM-BIO-11, BMP-BIO-31, BMP-BIO-50, and BMP-BIO-52.
		• The edge of each of the DRECP desert vegetation types, including but not limited to those in the riparian or wetland vegetation groups (as defined by alliances within the vegetation type descriptions and mapped based on the vegetation type habitat assessments described in LUPA-BIO-1).		
		• The edge of the vegetation extent for specified Focus and BLM sensitive plant species.		
		• The edge of suitable habitat or active nest substrates for the appropriate Focus and BLM Special Status Species.		

CATEGORY	CMA #	CMA TEXT	RELEVANT EIS SECTIONS	COMPLIANCE SUMMARY
Seasonal Restrictions	LUPA-BIO-4	For activities that may impact Focus and BLM Special Status Species, implement all required species-specific seasonal restrictions on pre- construction, construction, operations, and decommissioning activities.	Appendix 2A	Compliance with this CMA is achieved through application of APM-BIO-20, BMP-BIO-31, and BMP-BIO-32.
		Species-specific seasonal restriction dates are described in the applicable CMAs.	Appendix 2A	Compliance with this CMA is achieved through application of BMP-BIO-32.
		Alternatively, to avoid a seasonal restriction associated with visual disturbance, installation of a visual barrier may be evaluated on a case-by-case basis that will result in the breeding, nesting, lambing, fawning, or roosting species not being affected by visual disturbance from construction activities subject to seasonal restriction. The proposed installation and use of a visual barrier to avoid a species seasonal restriction will be analyzed in the activity/project specific environmental analysis.	Appendix 2A Appendix 4	The use of visual barriers is allowed for nesting migratory birds when included in the nest management plan (Appendix 2B) in accordance with AMP BIO-20 and BMP-BIO-29.

CATEGORY	CMA #	CMA TEXT	RELEVANT EIS SECTIONS	COMPLIANCE SUMMARY
Worker Education	LUPA-BIO-5	All activities, as determined appropriate on an activity-by-activity basis, will implement a worker education program that meets the approval of the BLM. The program will be carried out during all phases of the project (site mobilization, ground disturbance, grading, construction, operation, closure/decommissioning or project abandonment, and restoration/reclamation activities). The worker education program will provide interpretation for non-English speaking workers and provide the same instruction for new workers prior to their working on site. As appropriate based on the activity, the program will contain information about:	Appendix 2, 2A	Compliance with this CMA is achieved through application of APM/BMP-BIO-01. Required worker training would be Included as a part of the Environmental Health and Safety Plan (Appendix 2B).
		• Site-specific biological and nonbiological resources.	Appendix 2A	Compliance with this CMA is achieved through application of APM-BIO-01.
		• Information on the legal protection for protected resources and penalties for violation of federal and state laws and administrative sanctions for failure to comply with LUPA CMA requirements intended to protect site-specific biological and nonbiological resources.	Appendix 2A	Compliance with this CMA is achieved through application of APM-BIO-01.
		• The required LUPA and project-specific measures for avoiding and minimizing effects during all project phases, including but not limited to resource setbacks, trash, speed limits, etc.	Appendix 2A	Compliance with this CMA is achieved through application of APM-BIO-01.
		• Reporting requirements and measures to follow if protected resources are encountered, including potential work stoppage and requirements for notification of the designated biologist.	Appendix 2A	Compliance with this CMA is achieved through application of APM-BIO-01.
		• Measures that personnel can take to promote the conservation of biological and nonbiological resources.	Appendix 2A	Compliance with this CMA is achieved through application of APM-BIO-01.

CATEGORY	CMA #	CMA TEXT	RELEVANT EIS SECTIONS	COMPLIANCE SUMMARY
Subsidized Predators Standards	LUPA-BIO-6	Subsidized predator standards, approved by BLM, in coordination with the USFWS and CDFW, will be implemented during all appropriate phases of activities, including but not limited to renewable energy activities, to manage predator food subsidies, water subsidies, and breeding sites including the following:	Appendix 2A Appendix 4	
		• Common Raven management actions will be implemented for all activities to address food and water subsidies and roosting and nesting sites specific to the Common Raven. These include identification of monitoring reporting procedures and requirements; strategies for refuse management; as well as design strategies and passive repellant methods to avoid providing perches, nesting sites, and roosting sites for Common Ravens.	Section 4.4.4 Appendix 2A Appendix 4	Compliance with this CMA is achieved through application of AMP BIO-05, AMP BIO-06, and BMP-BIO-28.
		• The application of water and/or other palliatives for dust abatement in construction areas and during project operations and maintenance will be done with the minimum amount of water necessary to meet safety and air quality standards and in a manner that prevents the formation of puddles, which could attract wildlife and wildlife predators.	Appendix 2A Appendix 4	Compliance with this CMA is achieved through application of BMPs AQ-01 and BIO-34.
		• Following the most recent national policy and guidance, BLM will take actions to not introduce, dispose of, or release any non-native species into areas of native habitat, suitable habitat, and natural or artificial waterways/water bodies containing native species.	Section 4.4.4 Appendix 2A	Compliance with this CMA is achieved through application of APM-BIO-12 and BMP-BIO-31.

CATEGORY	CMA #	CMA TEXT	RELEVANT EIS SECTIONS	COMPLIANCE SUMMARY
	Con't	All activity work areas will be kept free of trash and debris. Particular attention will be paid to "micro-trash" (including such small items as screws, nuts, washers, nails, coins, rags, small electrical components, small pieces of plastic, glass or wire, and any debris or trash that is colorful or shiny) and organic waste that may subsidize predators. All trash will be covered, kept in closed containers, or otherwise removed from the project site at the end of each day or at regular intervals prior to periods when workers are not present at the site.	Section 4.4.4 Appendix 2A	Compliance with this CMA is achieved through application of APM-BIO-06.
		• In addition to implementing the measures above on activity sites, each activity will provide compensatory mitigation that contributes to LUPA-wide raven management.	Appendix 2A	Compliance with this CMA is achieved through application of BMP-BIO-28.
Restoration of Areas Disturbed by Construction Activities but Not Converted by Long-Term Disturbance	LUPA-BIO-7	Where DRECP vegetation types or Focus or BLM Special Status Species habitats may be affected by ground- disturbance and/or vegetation removal during pre-construction, construction, operations, and decommissioning related activities but are not converted by long-term (i.e., more than two years of disturbance, see Glossary of Terms) ground disturbance, restore these areas following the standards, approved by BLM authorized officer, following the most recent BLM policies and procedures for the vegetation community or species habitat disturbance/impacts as appropriate, summarized below:	Section 4.4.5 Appendix 2A Appendix 4	Compliance with this CMA is achieved through application of APM-BIO-15.
		• Implement site-specific habitat restoration actions for the areas affected including specifying and using:	Section 4.4.4 Appendix 2A	Compliance with this CMA is achieved through application of APM-BIO-15.
		o The appropriate seed (e.g., certified weed- free, native, and locally and genetically appropriate seed)	Section 4.4.4 Appendix 2A	Compliance with this CMA is achieved through application of APM-BIO-15.

CATEGORY	CMA #	CMA TEXT	RELEVANT EIS SECTIONS	COMPLIANCE SUMMARY
	Con't	o Appropriate soils (e.g., topsoil of the same original type on site or that was previously stored by soil type after being salvaged during excavation and construction activities)	Section 4.3.4 Section 4.4.4 Appendix 2A	Compliance with this CMA is achieved through application of APM/BMP-BIO-15 and BMP-SOIL-3.
		o Equipment	Appendix 2A	Compliance with this CMA is achieved through application of APM-BIO-15.
		o Timing (e.g., appropriate season, sufficient rainfall)	Section 4.4.4 Appendix 2A	Compliance with this CMA is achieved through application of APM-BIO-15.
		o Location	Section 4.4.4 Appendix 2A	Compliance with this CMA is achieved through application of APM-BIO-15.
		o Success criteria	Section 4.4.4 Appendix 2A	Compliance with this CMA is achieved through application of APM-BIO-15.
		o Monitoring measures	Section 4.4.4 Appendix 2A	Compliance with this CMA is achieved through application of APM-BIO-15.
		o Contingency measures, relevant for restoration, which includes seeding that follows BLM policy when on BLM administered lands.	Section 4.4.4 Appendix 2A	Compliance with this CMA is achieved through application of APM-BIO-15.
		• Salvage and relocate cactus, nolina, and yucca from the site prior to disturbance using BLM protocols. To the maximum extent practicable for short-term disturbed areas (see Glossary of Terms), the cactus and yucca will be re-planted back to the original site.	Section 4.4.7 Appendix 2A	Compliance with this CMA is achieved through application of APM/BMP-BIO-11, APM/BMP-BIO-15 and BMP-BIO-41.

CATEGORY	CMA #	CMA TEXT	RELEVANT EIS SECTIONS	COMPLIANCE SUMMARY
	Con't	• Restore and reclaim short-term (i.e. 2 years or less, see Glossary of Terms) disturbed areas, including pipelines, transmission projects, staging areas, and short-term construction-related roads immediately or during the most biologically appropriate season as determined in the activity/project specific environmental analysis and decision, following completion of construction activities to reduce the amount of habitat converted at any one time and promote recovery to natural habitats and vegetation as well as climate refugia and ecosystem services such carbon storage.	Section 4.4.4 Appendix 2A	Compliance with this CMA is achieved through application of APM-BIO-15.
General Closure and Decommissioning Standards	LUPA-BIO-8	All activities that are required to close and decommission the site (e.g., renewable energy activities) will specify and implement project-specific closure and decommissioning actions that meet the approval of BLM, and that at a minimum address the following:	Section 4.4.4 Appendix 2A	Compliance with this CMA is achieved through application of APM-BIO-15.
		• Specifying and implementing the methods, timing (e.g., criteria for triggering closure and decommissioning actions), and criteria for success (including quantifiable and measurable criteria).	Appendix 2A	Compliance with this CMA is achieved through application of APM-BIO-15.
		• Recontouring of areas that were substantially altered from their original contour or gradient and installing erosion control measures in disturbed areas where potential for erosion exists.	Appendix 2A	Compliance with this CMA is achieved through application of APM-BIO-15.
		• Restoring vegetation as well as soil profiles and functions that will support and maintain native plant communities, associated carbon sequestration and nutrient cycling processes, and native wildlife species.	Appendix 2A	Compliance with this CMA is achieved through application of APM/BMP-BIO-11, APM/BMP-BIO-15.

CATEGORY	CMA #	CMA TEXT	RELEVANT EIS SECTIONS	COMPLIANCE SUMMARY
	Con't	• Vegetation restoration actions will identify and use native vegetation composition, native seed composition, and the diversity to values commensurate with the natural ecological setting and climate projections.	Appendix 2A	Compliance with this CMA is achieved through application of APM-BIO-15.
Water and Wetland Dependent Species Resources	LUPA-BIO-9	Implement the following general LUPA CMA for water and wetland dependent resources: • Implement construction site standard practices to prevent toxic chemicals, hazardous materials, and other fluids from entering vegetation type streams, washes, and tributary networks through water runoff, erosion, and sediment transport by, at a minimum, implementing the following:	Appendix 2A	Compliance with this CMA is achieved through application of APM-BIO-08, APM-BIO-07, APM-BIO-10, and APM-HAZ-01.
		o On project sites, vehicles and other equipment will be maintained in proper working condition and only stored in designated containment areas where runoff is collected or controlled and that are located outside of streams, washes, and distributary networks to minimize accidental fluids and hazardous materials spills.	Appendix 2A	Compliance with this CMA is achieved through application of APM-HAZ-01.
		o Hazardous material leaks, spills, or releases will be immediately cleaned and equipment will be repaired upon identification. Removal and disposal of spill and related clean-up materials will occur at an approved off-site landfill.	Appendix 2A	Compliance with this CMA is achieved through application of APM-BIO-08 and APM-HAZ-01.
		o Maintenance and operations vehicles will carry the appropriate equipment and materials to isolate, clean up, and repair any hazardous material leaks, spills, or releases.	Appendix 2A	Compliance with this CMA is achieved through application of APM-BIO-08 and BMP-HAZ-03.

CATEGORY	CMA #	CMA TEXT	RELEVANT EIS SECTIONS	COMPLIANCE SUMMARY
	Con't	• Activity-specific drainage, erosion, and sedimentation control actions, which meet the approval of BLM and the applicable regulatory agencies, will be carried out during all appropriate phases of the approved project. These actions, as needed, will address measures to ensure the proper protection of water quality, site-specific stormwater and sediment retention, and design of the project to minimize site disturbance, including the following:	Appendix 2A	Compliance with this CMA is achieved through application of APM-BIO-10, BMP-BIO-38, and APM-WQ-01.
		o Identify site-specific surface water runoff patterns and implement measures to prevent excessive and unnatural soil deposition and erosion.	Appendix 2A	Compliance with this CMA is achieved through application of APM-WQ-01.
		o Implement measures to maintain natural drainages and to maintain hydrologic function in the event drainages are disturbed.	Appendix 2A	Compliance with this CMA is achieved through application of APM-WQ-01.
		o Reduce the amount of area covered by impervious surfaces through use of permeable pavement or other pervious surfaces. Direct runoff from impervious surfaces into retention basins.	Appendix 2A	Compliance with this CMA is achieved through application of APM-WQ-01.
		o Stabilize disturbed areas following grading in the manner appropriate to the soil type so that wind or water erosion is minimized.	Appendix 2A	Compliance with this CMA is achieved through application of APM-WQ-01. The CA portion of the Project Area is scheduled for soil survey in the near future. Updated soils data would be incorporated in the EIS when available and analysis and BMPs updated as needed.
		o Minimize irrigation runoff by using low or no irrigation native vegetation landscaping for landscaped retention basins.	Appendix 2A	Compliance with this CMA is achieved through application of APM-WQ-01.

CATEGORY	CMA #	CMA TEXT	RELEVANT EIS SECTIONS	COMPLIANCE SUMMARY
	Con't	o Conduct regular inspections and maintenance of long-term erosion control measures to ensure long-term effectiveness.	Appendix 2A	Compliance with this CMA is achieved through application of APM-WQ-01.
Standard Practices for Weed Management	LUPA-BIO-10	Consistent with BLM state and national policies and guidance, integrated weed management actions, will be carried out during all phases of activities, as appropriate, and at a minimum will include the following:	Section 2.2.5 Section 4.4.4 Appendix 2, 2A	Compliance with this CMA is achieved through application of APM-BIO-12 and the Noxious Weed Management Plan (Appendix 2B).
		• Thoroughly clean the tires and undercarriage of vehicles entering or reentering the project site to remove potential weeds.	Appendix 2A	Compliance with this CMA is achieved through application of APM-BIO-12.
		• Store project vehicles on site in designated areas to minimize the need for multiple washings whenever vehicles re-enter the project site.	Appendix 2A	Compliance with this CMA is achieved through application of APM-BIO-12.
		• Properly maintain vehicle wash and inspection stations to minimize the introduction of invasive weeds or subsidy of invasive weeds.	Appendix 2A	Compliance with this CMA is achieved through application of APM-BIO-12.
		• Closely monitor the types of materials brought onto the site to avoid the introduction of invasive weeds and non-native species.	Appendix 2A	Compliance with this CMA is achieved through application of APM-BIO-12.
		• Reestablish native vegetation quickly on disturbed sites.	Appendix 2A	Compliance with this CMA is achieved through application of APM-BIO-12 and APM-BIO-15.
		• Monitor and quickly implement control measures to ensure early detection and eradication of weed invasions to avoid the spread of invasive weeds and non-native species on site and to adjacent off-site areas.	Appendix 2A	Compliance with this CMA is achieved through application of APM-BIO-12.
		• Use certified weed-free mulch, straw, hay bales, or equivalent fabricated materials for installing sediment barriers.	Appendix 2A	Compliance with this CMA is achieved through application of APM-BIO-12.

CATEGORY	CMA #	CMA TEXT	RELEVANT EIS SECTIONS	COMPLIANCE SUMMARY
Nuisance Animals and Invasive Species	LUPA-BIO-11	Implement the following CMAs for controlling nuisance animals and invasive species:	Section 2.2.5 Section 4.4.4 Appendix 2A	Compliance with this CMA is achieved through application of APM-BIO-12 and the Noxious Weed Management Plan (Appendix 2B).
		• No fumigant, treated bait, or other means of poisoning nuisance animals including rodenticides will be used in areas where Focus and BLM Special Status Species are known or suspected to occur.	Appendix 2A	Compliance with this CMA is achieved through application of APM-BIO-12.
		• Manage the use of widely spread herbicides and do not apply herbicides effective against dicotyledonous plants within 1,000 feet from the edge of a 100-year floodplain, stream and wash channels, and riparian vegetation or to soils less than 25 feet from the edge of drains. Exceptions will be made when targeting the base and roots of invasive riparian species such as tamarisk and *Arundo donax* (giant reed). Manage herbicides consistent with the most current national and California BLM policies.	Appendix 2A	Compliance with this CMA is achieved through application of APM-BIO-12. The Noxious Weed Control Plan would include requirements and practices for the application of herbicides, including identification of floodplains and washes to limit application areas.
		• Minimize herbicide, pesticide, and insecticide treatment in areas that have a high risk for groundwater contamination.	Appendix 2A	Compliance with this CMA is achieved through application of APM-BIO-12.
		• Clean and dispose of pesticide containers and equipment following professional standards. Avoid use of pesticides and cleaning containers and equipment in or near surface or subsurface water.	Appendix 2A	Compliance with this CMA is achieved through application of APM-BIO-12.
		• When near surface or subsurface water, restrict pesticide use to those products labeled safe for use in/near water and safe for aquatic species of animals and plants.	Appendix 2A	Compliance with this CMA is achieved through application of APM-BIO-12.

CATEGORY	CMA #	CMA TEXT	RELEVANT EIS SECTIONS	COMPLIANCE SUMMARY
Noise	LUPA-BIO-12	For activities that may impact Focus or BLM Special Status Species, implement the following LUPA CMA for noise:		
		• To the extent feasible, and determined necessary by BLM to protect Focus and BLM sensitive wildlife species, locate stationary noise sources that exceed background ambient noise levels away from known or likely locations of and BLM sensitive wildlife species and their suitable habitat.	Appendix 2A	Compliance with this CMA is achieved through application of BMP-NO-07.
		• Implement engineering controls on stationary equipment, buildings, and work areas including sound-insulation and noise enclosures to reduce the average noise level, if the activity will contribute to noise levels above existing background ambient levels.	Appendix 2A	Compliance with this CMA is achieved through application of APM-NO-01.
		• Use noise controls on standard construction equipment including mufflers to reduce noise	Appendix 2A	Compliance with this CMA is achieved through application of APM-NO-01.
General Siting and Design	LUPA-BIO-13	Implement the following CMA for project siting and design:	Appendix 2A Appendix 4	Compliance with this CMA is partially achieved through application of T&T-05.
		• To the maximum extent practicable site and design projects to avoid impacts to vegetation types, unique plant assemblages, climate refugia as well as occupied habitat and suitable habitat for Focus and BLM Special Status Species (see “avoid to the maximum extent practicable” in Glossary of Terms).	Section 4.4.4 Appendix 2A	Compliance with this CMA is achieved through application of APM/BMP-BIO-11, APM-BIO-13, BMP-BIO-31, and BMP-BIO-52.

CATEGORY	CMA #	CMA TEXT	RELEVANT EIS SECTIONS	COMPLIANCE SUMMARY
	Con't	• The siting of projects along the edges (i.e. general linkage border) of the biological linkages identified in Appendix D (Figures D-1 and D-2) will be configured (1) to maximize the retention of microphyll woodlands and their constituent vegetation type and inclusion of other physical and biological features conducive to Focus and BLM Special Status Species' dispersal, and (2) informed by existing available information on modeled focus and BLM Special Status Species habitat and element occurrence data, mapped delineations of vegetation types, and based on available empirical data, including radio telemetry, wildlife tracking sign, and road-kill information. Additionally, projects will be sited and designed to maintain the function of F Special Status Species connectivity and their associated habitats in the following linkage and connectivity areas:	N/A	Though identified linkages are not within the Project area, implementation of BMP-BIO-52 minimizes impacts to microphyll woodlands wherever it occurs on BLM land in California.
		o Within a 5-mile-wide linkage across Interstate 10 centered on Wiley's Well Road to connect the Mule and McCoy mountains (the majority of this linkage is within the Chuckwalla ACEC and Mule-McCoy Linkage ACEC).	N/A	Though the identified linkage, centered on Wiley's Well Road, is 4.5 miles from the Project and outside the linkage corridor (2.5 miles to each side of Wiley's Well Road), implementation of BMP-BIO-52 minimizes impacts to microphyll woodlands wherever it occurs on BLM land in California.
		• Delineate the boundaries of areas to be disturbed using temporary construction fencing and flagging prior to construction and confine disturbances, project vehicles, and equipment to the delineated project areas to protect vegetation types and focus and BLM Special Status Species.	Section 4.4.4 Appendix 2A	Compliance with this CMA is achieved through application of APM-BIO-04, APM-BIO-22, and APM-BIO-23.

CATEGORY	CMA #	CMA TEXT	RELEVANT EIS SECTIONS	COMPLIANCE SUMMARY
	Con't	• Long-term nighttime lighting on project features will be limited to the minimum necessary for project security, safety, and compliance with Federal Aviation Administration requirements and will avoid the use of constant-burn lighting.	Section 4.4.4 Appendix 2A	Compliance with this CMA is achieved through application of BMP-BIO-33.
		• All long-term nighttime lighting will be directed away from riparian and wetland vegetation, occupied habitat, and suitable habitat areas for Focus and BLM Special Status Species. Long-term nighttime lighting will be directed and shielded downward to avoid interference with the navigation of night-migrating birds and to minimize the attraction of insects as well as insectivorous birds and bats to project infrastructure.	Section 4.4.4 Appendix 2A	Compliance with this CMA is achieved through application of BMP-BIO-33.
		• To the maximum extent practicable (see Glossary of Terms), restrict construction activity to existing roads, routes, and utility corridors to minimize the number and length/size of new roads, routes, disturbance, laydown, and borrow areas.	Section 4.4.4 Appendix 2A	Compliance with this CMA is achieved through application of APM-& BMP-BIO-03, APM-BIO-17, BMP-BIO-31, BMP-BIO-52, BMP-BIO-53, BMP-BIO-55, and BMP-T&T-04.
		• To the maximum extent practicable (see Glossary of Terms), confine vehicular traffic to designated open routes of travel to and from the project site, and prohibit, within project boundaries, cross- country vehicle and equipment use outside of approved designated work areas to prevent unnecessary ground and vegetation disturbance.	Section 4.4.4 Appendix 2A	Compliance with this CMA is achieved through application of APM-BIO-17, BMP-BIO-31, BMP-BIO-52, BMP-BIO-53, BMP-BIO-55, BMP-T&T-07, and BMP-T&T-08.

CATEGORY	CMA #	CMA TEXT	RELEVANT EIS SECTIONS	COMPLIANCE SUMMARY
	Con't	• To the maximum extent practicable (see Glossary of Terms), construction of new roads and/or routes will be avoided within Focus and BLM Special Status Species suitable habitat within identified linkages for those Focus and BLM Special Status Species, unless the new road and/or route is beneficial to minimize net impacts to natural or ecological resources of concern. These areas will have a goal of "no net gain" of project roads and/or routes.	Section 4.4.4 Appendix 2A	Compliance with this CMA is achieved through application of APM-& BMP-BIO-03, APM-BMP-BIO-31, BMP-BIO-50, BMP-BIO-52, BMP-BIO-53, and BMP-BIO-55.
		• Use nontoxic road sealants and soil stabilizing agents.	Appendix 2A	Compliance with this CMA is achieved through application of BMP-WQ-04 and APM/BMP-AQ-01.
Biology: General Standard Practices	LUPA-BIO-14	Implement the following general standard practices to protect Focus and BLM Special Status Species:	Section 4.4.4 Appendix 2A Appendix 4	
		• Feeding of wildlife, leaving of food or trash as an attractive nuisance to wildlife, collection of native plants, or harassing of wildlife on a site is prohibited.	Appendix 2A	Compliance with this CMA is achieved through application of APM-BIO-06, BMP-BIO-36, BMP-BIO-37, and BMP-WQ-04.
		• Any wildlife encountered during the course of an activity, including construction, operation, and decommissioning will be allowed to leave the area unharmed.	Appendix 2A	Compliance with this CMA is achieved through application of BMP-BIO-35 and BMP-BIO-36.
		• Domestic pets are prohibited on sites. This prohibition does not apply to the use of domestic animals (e.g., dogs) that may be used to aid in official and approved monitoring procedures/protocols, or service animals (dogs) under Title II and Title III of the American with Disabilities Act.	Appendix 2A	Compliance with this CMA is achieved through application of BMP-BIO-05.

CATEGORY	CMA #	CMA TEXT	RELEVANT EIS SECTIONS	COMPLIANCE SUMMARY
	Con't	• All construction materials will be visually checked for the presence of wildlife prior to their movement or use. Any wildlife encountered during the course of these inspections will be allowed to leave the construction area unharmed.	Appendix 2A	Compliance with this CMA is achieved through application of BMP-BIO-35.
		• All steep-walled trenches or excavations used during the project will be covered, except when being actively used, to prevent entrapment of wildlife. If trenches cannot be covered, they will be constructed with escape ramps, following up-to-date design standards to facilitate and allow wildlife to exit, or wildlife exclusion fencing will be installed around the trench(s) or excavation(s). Open trenches or other excavations will be inspected by a designated biologist immediately before backfilling, excavation, or other earthwork.	Appendix 2A	Compliance with this CMA is achieved through application of APM-BIO-09.
		• Minimize natural vegetation removal through implementation of crush and drive or cut or mow vegetation rather than removing entirely.	Appendix 2A	Compliance with this CMA is achieved through application of APM-BIO-14 and BMP-VEG-02.
	LUPA-BIO-15	Use state-of-the-art, as approved by BLM, construction and installation techniques, appropriate for the specific activity/project and site, that minimize new site disturbance, soil erosion and deposition, soil compaction, disturbance to topography, and removal of vegetation.	Appendix 2A	Compliance with this CMA is achieved through application of BMP-BIO-38 and BMP-VEG-01.

CATEGORY	CMA #	CMA TEXT	RELEVANT EIS SECTIONS	COMPLIANCE SUMMARY
Activity-Specific Bird and Bat CMAs	LUPA-BIO-16	For activities that may impact Focus and BLM sensitive birds, protected by the ESA and/or Migratory Bird Treaty Act of 1918, and bat species, implement appropriate measures as per the most up-to-date BLM state and national policy and guidance, and data on birds and bats, including but not limited to activity specific plans and actions. The goal of the activity-specific bird and bat actions is to avoid and minimize direct mortality of birds and bats from the construction, operation, maintenance, and decommissioning of the specific activities.	Section 4.4.4 Appendix 2A Appendix 4	Compliance with this CMA is achieved through application of APM/BMP-BIO-19, APM/BMP-BIO-21, BMP-BIO-29, BMP-BIO-30, and BMP-BIO-45.
		Activity-specific measures to avoid and minimize impacts may include, but are not limited to:		
		• Siting and designing activities will avoid high bird and bat movement areas that separate birds and bats from their common nesting and roosting sites, feeding areas, or lakes and rivers.	Appendix 2A	Compliance with this CMA is achieved through application of APM/BMP-BIO-19, APM/BMP-BIO-21, BMP-BIO-29, and BMP-BIO-40.
		• For activities that impact bird and bat Focus and BLM Special Status Species, during project siting and design, conducting monitoring of bird and bat presence as well as bird and bat use of the project site using the most current survey methods and best procedures available at the time.	Appendix 2A	Compliance with this CMA is achieved through application of BMP-BIO-29.
		• Reusing or co-locating new transmission facilities and other ancillary facilities with existing facilities and disturbed areas to reduce habitat destruction and avoid additional collision risks.	Chapter 2 Appendix 2	The Proposed Action follows the existing DPV1 transmission line. Action alternative segments follow other linear utilities with associated access (with exception of a short connector road at the Colorado River Substation), and/or are located within BLM utility corridors.

CATEGORY	CMA #	CMA TEXT	RELEVANT EIS SECTIONS	COMPLIANCE SUMMARY
	Con't	• Reducing bird and bat collision hazards by utilizing techniques such as unguyed monopole towers or tubular towers. Where the use of guywires is unavoidable, demarcate guywires using the best available methods to minimize avian species strikes.	Chapter 2 Appendix 2	Guyed structures are not proposed for the California portion of the Project.
		• When fencing is necessary, use bird and bat compatible design standards.	Appendix 2A	Compliance with this CMA is achieved through application of BMP-BIO-39.
		• Using lighting that does not attract birds and bats or their prey to project sites including using non-steady burning lights (red, dual red and white strobe, strobe- like flashing lights) to meet Federal Aviation Administration requirements, using motion or heat sensors and switches to reduce the time when lights are illuminated, using appropriate shielding to reduce horizontal or skyward illumination, and avoiding the use of high-intensity lights (e.g., sodium vapor, quartz, and halogen).	Section 4.4.4 Appendix 2A	Compliance with the CMA is achieved through application of BMP-BIO-29 and BMP-BIO-33.
		• Implementing a robust monitoring program to regularly check for wildlife carcasses, document the cause of mortality, and promptly remove the carcasses.	Section 4.4.4 Appendix 2A	Compliance with this CMA is achieved through application of BMP-BIO-21 and BMP-BIO-29.
		• Incorporating a bird and bat use and mortality monitoring program during operations using current protocols and best procedures available at time of monitoring	Appendix 2A	Compliance with this CMA is achieved through application of BMP-BIO-21 and BMP-BIO-29.

CATEGORY	CMA #	CMA TEXT	RELEVANT EIS SECTIONS	COMPLIANCE SUMMARY
Activity-Specific Bird and Bat CMAs	LUPA-BIO-17	For activities that may result in mortality to Focus and BLM Special–Status bird and bat species, a Bird and Bat Conservation Strategy (BBCS) will be prepared with the goal of assessing operational impacts to bird and bat species and incorporating methods to reduce documented mortality. The BBCS actions for impacts to birds and bats during these activities will be determined by the activity-specific bird and bat operational actions. The strategy shall be approved by BLM in coordination with USFWS, and CDFW as appropriate, and may include, but is not limited to:	Section 4.4.4 Appendix 2A	Compliance with this CMA is achieved through application of AMP/BMP-BIO-19, BMP-BIO-21, and BMP-BIO-29.
		• Incorporating a bird and bat use and mortality monitoring program during operations using current protocols and best procedures available at time of monitoring.	Appendix 2A	Compliance with this CMA is achieved through application of BMP-BIO-21 and BMP-BIO-29.
		• Activity-specific operational avoidance and minimization actions that reduce the level of mortality on the populations of bird and bat species, such as:	Appendix 2A	Compliance with this CMA is achieved through application of BMP-BIO-21 and BMP-BIO-29.
		o Evaluation and installation of the best available bird and bat detection and deterrent technologies available at the time of construction.	N/A	N/A
		The following provides the DRECP vegetation type and Focus and BLM Special Status Species biological CMAs to be implemented throughout the LUPA Decision Area.		
		Riparian and Wetland Vegetation Types and Associated Species (RIPWET)		
		Riparian Vegetation Types		

CATEGORY	CMA #	CMA TEXT	RELEVANT EIS SECTIONS	COMPLIANCE SUMMARY
	Con't	• Sonoran-Coloradan Semi-Desert Wash Woodland/Scrub	Section 4.4.4 Appendix 2A	Compliance with this CMA is achieved through application of BMP-BIO-46, BMP-BIO-47, BMP-BIO-50, BMP-BIO-51, and BMP-BIO-52.
		Riparian and Wetland Bird Focus Species		
		• Southwestern Willow Flycatcher	Section 3.4.2 Appendix 2A	Though no suitable nesting habitat is present in the Project area, ground disturbance during the nesting season requires surveys for, and protection of all active bird nests, including the southwestern willow flycatcher. If nests are found protective buffers are applied. APM-BIO-20 and BMP-BIO-29 apply.
		• Western Yellow-billed Cuckoo	Section 3.4.2 Appendix 2A	Though no suitable nesting habitat is present in the Project area, ground disturbance during the nesting season requires surveys for, and protection of all active bird nests, including the western yellow-billed cuckoo. If nests are found protective buffers are applied. APM-BIO-20 and BMP-BIO-29 apply.
		• Yuma Clapper Rail	Section 3.4.2 Appendix 2A	Though no suitable nesting habitat is present in the Project area, ground disturbance during the nesting season requires surveys for, and protection of all active bird nests, including the Yuma clapper rail. If nests are found protective buffers are applied. APM-BIO-20 and BMP-BIO-29 apply.

CATEGORY	CMA #	CMA TEXT	RELEVANT EIS SECTIONS	COMPLIANCE SUMMARY
Other Riparian & Wetland Focus Species: Tehachapi Slender Salamander	LUPA-BIO-RIPWET-1	The riparian and wetland DRECP vegetation types and other features listed in Table 17 will be avoided to the maximum extent practicable, except for allowable minor incursions (see Glossary of Terms for "avoidance to the maximum extent practicable" and "minor incursion") with the specified setbacks.	Section 4.4.4 Appendix 2A	Compliance with this CMA is achieved through application of AMP/BMP-BIO-11, AMP/BMP-BIO-19, BMP-BIO-50, BMP-BIO-51, and BMP-BIO-52
		For minor incursion (see "minor incursion" in the Glossary of Terms) to the DRECP riparian vegetation types, wetland vegetation types, or encroachments on the setbacks listed in Table 17, the hydrologic function of the avoided riparian or wetland communities will be maintained.	Appendix 2A	Compliance with this CMA is achieved through application of AMP/BMP-BIO-19 and BMP-BIO-47.
		• Minor incursions in the riparian and wetland vegetation types or other features including the setbacks listed in Table 17 will occur outside of the avian nesting season, February 1 through August 31 or otherwise determined by BLM, USFWS and CDFW if the minor incursion(s) is likely to result in impacts to nesting birds.	Appendix 2A	Compliance with this CMA is achieved through application of APM-BIO-20 and BMP-BIO-29.
BLM Special Status Riparian Bird Species	LUPA-BIO-RIPWET-3	For activities that occur within 0.25 mile of a riparian or wetland DRECP vegetation type and may impact BLM Special Status riparian and wetland bird species, conduct a pre-construction/activity nesting bird survey for BLM Special Status riparian and wetland birds according to agency-approved protocols.	Section 4.4.4 Appendix 2A Appendix 4	Compliance with this CMA is achieved through application of APM-BIO-02, APM-BIO-20, and APM-BIO-25.
		• Based on the results of the nesting bird survey above, setback activities that are likely to impact BLM Special Status riparian and wetland bird species, including but not limited to pre-construction, construction and decommissioning, 0.25 mile from active nests Special Status during the breeding season (February 1 through August 31 or otherwise determined by BLM, USFWS and CDFW). For activities in areas covered by this provision that occur during the breeding season and that last longer than one	Section 4.4.4 Section 4.4.7 Appendix 2A	Compliance with this CMA is achieved through application of APM-BIO-02, APM-BIO-20, and APM-BIO-25.

CATEGORY	CMA #	CMA TEXT	RELEVANT EIS SECTIONS	COMPLIANCE SUMMARY
		week, nesting bird surveys may need to be repeated, as determined by BLM, in coordination with USFWS and CDFW, as appropriate. No pre-activity nesting bird surveys are necessary for activities occurring outside of the breeding season.		
Dune DRECP Vegetation Types, Aeolian Processes and Associated Species (DUNE): Aeolian Processes	LUPA-BIO-DUNE-1	Because DRECP sand dune vegetation types and Aeolian sand transport corridors are, by definition, shifting resources, activities that potentially occur within or bordering the sand dune DRECP vegetation types and/or Aeolian sand transport corridors must conduct studies to verify the location [refer to Appendix D, Figure D-7] and extent of the sand resource(s) for the activity-specific environmental analysis to determine:	Section 3.3.2 Section 3.4.2 Section 4.3.4 Section 4.4.4 Appendix 2A	Compliance with this CMA is partially achieved through data contained in the Biological Resources Technical Reports, which is incorporated into Chapter 3 and Appendix 3 of this EIS, and analysis presented in Chapter 4 and Appendix 4. BMP-BIO-53 and BMP-BIO-54 apply.
		• Whether the proposed activity(s) occur within a sand dune or an Aeolian sand transport corridor	Section 3.3.2 Section 3.4.2 Section 4.3.4 Section 4.4.4 Appendix 2A	Portions of Segments ca-07, ca-09, and x-19 would cross areas of active windblown sand. BMP-BIO-53 and BMP-BIO-54 apply.
		• If the activity(s) is subject to dune/Aeolian sand transport corridor CMAs	Section 3.3.2 Section 3.4.2 Section 4.3.4 Section 4.4.4 Appendix 2A	Because portions of Segments ca-07, ca-09, and x-19 would cross areas of active windblown sand, those segments would be subject to dune/Aeolian sand transport corridor CMAs. BMP-BIO-54 applies.
		• If the activity(s) needs to be reconfigured to satisfy applicable avoidance requirements	Section 3.3.2 Section 3.4.2 Section 4.3.4 Section 4.4.4 Appendix 2A	Compliance with this CMA is achieved through application of BMP-BIO-54.

CATEGORY	CMA #	CMA TEXT	RELEVANT EIS SECTIONS	COMPLIANCE SUMMARY
	LUPA-BIO-DUNE-2	Activities that potentially affect the amount of sand entering or transported within Aeolian sand transport corridors will be designed and operated to:		
		• Maintain the quality and function of Aeolian transport corridors and sand deposition zones, unless related to maintenance of existing [at the time of the DRECP LUPA ROD] facilities/operations/activities	Section 4.3.4 Appendix 2A	Portions of Segments ca-07, ca-09, and x-19 would cross areas of active windblown sand. Compliance with this CMA is achieved through application of BMP-BIO-54.
		• Avoid a reduction in sand-bearing sediments within the Aeolian system	Section 4.3.4 Appendix 2A	Compliance with this CMA is achieved through application of BMP-BIO-54.
		• Minimize mortality to DUNE associated Focus and BLM Special Status Species	Section 4.4.4 Appendix 2A	Compliance with this CMA is achieved through application of BMP-BIO-31, BMP-BIO-49, and BMP-BIO-53.
	LUPA-BIO-DUNE-3	Any facilities or activities that alter site hydrology (e.g., sediment barrier) will be designed to maintain continued sediment transport and deposition in the Aeolian corridor in a way that maintains the Aeolian sorting and transport to downwind deposition zones. Site designs for maintaining this transport function must be approved by BLM in coordination with USFWS and CDFW as appropriate.	Appendix 2A	Compliance with this CMA is achieved through application of BMPs WQ-06 and WQ-07.
Mohave Fringe-Toed Lizard	LUPA-BIO-DUNE-4	Dune formations and other sand accumulations (i.e., sand ramps, sand sheets) with suitable habitat characteristics for the Mojave fringe-toed lizard (i.e., unconsolidated blow-sand) will be mapped according to mapping standards established by the BLM National Operations Center.	Section 4.4.4 Appendix 2A	Compliance with this CMA is achieved through application of APM-BIO-25 and BMP-BIO-49.

CATEGORY	CMA #	CMA TEXT	RELEVANT EIS SECTIONS	COMPLIANCE SUMMARY
Con't		For minor incursions (see "minor incursion" in the Glossary of Terms) into sand dunes and sand transport areas the activity will be sited in the mapped zone with the least impacts to sand dunes and sand transport and Mojave fringe-toed lizards.	Section 4.4.4 Appendix 2A	All access and structures in sand dunes and transport areas would be microsited in consultation with the BLM. Compliance with this CMA is achieved through application of APM-BIO-25, BMP-BIO-49, BMP-BIO-53, BMP-BIO-54, and BMP-BIO-55.
	LUPA-BIO-DUNE-5	If suitable habitat characteristics are identified during the habitat assessment, clearance surveys (see Glossary of Terms) for Mojave fringe-toed lizard will be performed in suitable habitat areas.	Section 4.4.4 Appendix 2A	Compliance with this CMA is achieved through application of BMP-BIO-02, APM-BIO-25, and BMP-BIO-49.
		The following CMAs will be implemented for bat Focus and BLM Special Status Species, including but not limited to those listed below:	Section 4.4.4 Appendix 2A	Compliance with this CMA is achieved through application of BMP-BIO-29, BMP-BIO-33, BMP-BIO-39, and BMP-BIO-40.
		• California Leaf-nosed Bat		
		• Pallid Bat		
		• Townsend's Big-eared Bat		
Bat Species (BAT)	LUPA-BIO-BAT-1	Activities, except wind projects, will not be sited within 500 feet of any occupied maternity roost or presumed occupied maternity roost as described below. Refer to CMA DFA-VPL-BIO-BAT-1 for distances within DFAs and VPLs.	Appendix 2A	Compliance with this CMA is achieved through application of BMP-BIO-40; However, no bat roosts are expected in the portion of the Project area within the CDCA.
Plant Species (PLANT): Plant Focus and BLM Special Status Species CMAs	LUPA-BIO-PLANT-1	Conduct properly timed protocol surveys in accordance with the BLM's most current (at time of activity) survey protocols for plant Focus and BLM Special Status Species.	Section 3.4.2 Section 4.4.4 Appendix 2A	The rare plant surveys previously conducted, in conjunction with planned pre-construction surveys will meet the BLM's survey requirements. APM-BIO-24 applies.

CATEGORY	CMA #	CMA TEXT	RELEVANT EIS SECTIONS	COMPLIANCE SUMMARY
	LUPA-BIO-PLANT-2	Implement an avoidance setback of 0.25 mile for all Focus and BLM Special Status Species occurrences. Setbacks will be placed strategically adjacent to occurrences to protect ecological processes necessary to support the plant Species (see Appendix Q, Baseline Biology Report, in the Proposed LUPA and Final EIS [2015], or the most recent data and modeling).	Section 4.4.4 Section 4.4.7 Appendix 2, 2A	The CDCA Plan would be further amended to eliminate this setback for the Project. Compliance with this CMA is achieved through application of BMP-BIO-31.
	LUPA-BIO-PLANT-3	Impacts to suitable habitat for Focus and BLM Special Status plant species should be avoided to the extent feasible and are limited [capped] to a maximum of 1% of their suitable habitat throughout the entire LUPA Decision Area. The baseline condition for measuring suitable habitat is the DRECP modeled suitable habitat for these species utilized in the EIS analysis (2014 and 2015), or the most recent suitable habitat modeling.	Section 4.4.4 Appendix 2A	Compliance with this CMA is achieved through data contained in the Biological Resources Technical Reports, which is incorporated into Chapter 3 and Appendix 3 of this EIS, and analysis presented in Chapter 4 and Appendix 4. BMP-BIO-31 applies.
Special Vegetation Features (SVF)	LUPA-BIO-SVF-1	For activity-specific NEPA analysis, a map delineating potential sites and habitat assessment of the following special vegetation features is required: Yucca clones, creosote rings, Saguaro cacti, Joshua tree woodland, microphyll woodland, Crucifixion thorn stands. BLM guidelines for mapping/surveying cacti, yuccas, and succulents shall be followed.	Section 4.4.4 Appendix 2A	Compliance with this CMA is achieved through application of APM/BMP-BIO-11, BMP-BIO-16, APM-BIO-24, BMP-BIO-41, BMP-BIO-52, and BMP-VEG-01.
	LUPA-BIO-SVF-6	Microphyll woodland: impacts to microphyll woodland (see Glossary of Terms) will be avoided, except for minor incursions (see Glossary of Terms).	Section 4.4.4 Appendix 2A	Compliance with this CMA is achieved through application of BMP-BIO-50, BMP-BIO-51, and BMP-BIO-52.
General Vegetation Management (VEG)	LUPA-BIO-VEG-1	Management of cactus, yucca, and other succulents will adhere to current up-to-date BLM policy.	Appendix 2A	Compliance with this CMA is achieved through application of BMP-BIO-41.

CATEGORY	CMA #	CMA TEXT	RELEVANT EIS SECTIONS	COMPLIANCE SUMMARY
	LUPA-BIO-VEG-2	Promote appropriate levels of dead and downed wood on the ground, outside of campground areas, to provide wildlife habitat, seed beds for vegetation establishment, and reduce soil erosion, as determined appropriate on an activity-specific basis.	Appendix 2A	Compliance with this CMA is achieved through application of BMP-BIO-42.
	LUPA-BIO-VEG-3	Allow for the collection of plant material consistent with the maintenance of natural ecosystem processes.	Appendix 2A	Compliance with this CMA is achieved through application of BMP-BIO-43.
	LUPA-BIO-VEG-5	All activities will follow applicable BLM state and national regulations and policies for salvage and transplant of cactus, yucca, other succulents, and BLM Sensitive plants.	Appendix 2A	Compliance with this CMA is achieved through application of BMP-BIO-41.
	LUPA-BIO-VEG-6	BLM may consider disposal of succulents through public sale, as per current up-to-date state and national policy.	Appendix 2A	Compliance with this CMA is achieved through application of BMP-BIO-41.
Individual Focus Species (IFS): Desert Tortoise	LUPA-BIO-IFS-3	All culverts for access roads or other barriers will be designed to allow unrestricted access by desert tortoises and will be large enough that desert tortoises are unlikely to use them as shelter sites (e.g., 36 inches in diameter or larger). Desert tortoise exclusion fencing may be utilized to direct tortoise use of culverts and other passages.	Section 4.4.4 Appendix 2A	Compliance with this CMA is achieved through application of BMP-BIO-44.
	LUPA-BIO-IFS-5	Following the clearance surveys (see Glossary of Terms) within sites that are fenced with long-term desert tortoise exclusion fencing a designated biologist (see Glossary of Terms) will monitor initial clearing and grading activities to ensure that desert tortoises missed during the initial clearance survey are moved from harm's way.	Section 4.4.4 Appendix 2A Appendix 4	Compliance with this CMA is achieved through application of APM/BMP-BIO-23 and BMP-BIO-44.

CATEGORY	CMA #	CMA TEXT	RELEVANT EIS SECTIONS	COMPLIANCE SUMMARY
		• A designated biologist will inspect construction pipes, culverts, or similar structures: (a) with a diameter greater than 3 inches, (b) stored for one or more nights, (c) less than 8 inches aboveground and (d) within desert tortoise habitat (such as, outside the long-term fenced area), before the materials are moved, buried, or capped.	Section 4.4.4 Appendix 2A	Compliance with this CMA is achieved through application of BMP-BIO-23 and BMP-BIO-44.
		• As an alternative, such materials shall be capped before storing outside the fenced area or placing on pipe racks. Pipes stored within the long-term fenced area after completing desert tortoise clearance surveys will not require inspection.	Appendix 2A	Compliance with this CMA is achieved through application of BMP-BIO-23 and BMP-BIO-44.
	LUPA-BIO-IFS-6	When working in areas where protocol or clearance surveys are required (see Appendix D), biological monitoring will occur with any geotechnical boring or geotechnical boring vehicle movement to ensure no desert tortoises are killed or burrows are crushed.	Appendix 2A	Compliance with this CMA is achieved through application of APM-BIO-02, APM-BIO-23, APM-BIO-25, and BMP-BIO-44.
	LUPA-BIO-IFS-7	A designated biologist (see Glossary of Terms) will accompany any geotechnical testing equipment to ensure no tortoises are killed and no burrows are crushed.	Appendix 2A	Compliance with this CMA is achieved through application of APM-BIO-02, APM-BIO-23, and BMP-BIO-44.
	LUPA-BIO-IFS-8	Inspect the ground under the vehicle for the presence of desert tortoise any time a vehicle or construction equipment is parked in desert tortoise habitat outside of areas fenced with desert tortoise exclusion fencing. If a desert tortoise is seen, it may move on its own. If it does not move within 15 minutes, a designated biologist may remove and relocate the animal to a safe location.	Appendix 2A	Compliance with this CMA is achieved through application of APM-BIO-23 and BMP-BIO-44.
	LUPA-BIO-IFS-9	Vehicular traffic will not exceed 15 miles per hour within the areas not cleared by protocol level surveys where desert tortoise may be impacted.	Appendix 2A	Compliance with this CMA is achieved through application of BMP-BIO-44.

CATEGORY	CMA #	CMA TEXT	RELEVANT EIS SECTIONS	COMPLIANCE SUMMARY
Bendire's Thrasher	LUPA-BIO-IFS-11	If Bendire's thrasher is present, conduct appropriate activity-specific biological monitoring (see Glossary of Terms) to ensure that Bendire's thrasher individuals are not directly affected by operations (i.e., mortality or injury, direct impacts on nest, eggs, or fledglings).	Appendix 4.4.4	Though Bendire's thrasher is not expected to be present in the Project area, ground disturbance during the nesting season requires surveys for, and protection of all active bird nests, including Bendire's thrasher. If nests are found protective buffers are applied. APM-BIO-20 and BMP-BIO-29 apply.
Burrowing Owl	LUPA-BIO-IFS-12	If burrowing owls are present, a designated biologist (see Glossary of Terms) will conduct appropriate activity-specific biological monitoring (see Glossary of Terms) to ensure avoidance of occupied burrows and establishment of the 656 feet (200 meter) setback to sufficiently minimize disturbance during the nesting period on all activity sites, when practical.	Section 4.4.4 Appendix 2A	Compliance with this CMA is achieved through application of APMs BIO-02, AMPBIO-25, BMP-BIO-29, and BMP-BIO-30.
	LUPA-BIO-IFS-13	If burrows cannot be avoided on-site, passive burrow exclusion by a designated biologist (see Glossary of Terms) through the use of one-way doors will occur according to the specifications in Appendix D or the most up-to-date agency BLM or CDFW specifications. Before exclusion, there must be verification that burrows are empty as specified in Appendix D or the most up-to-date BLM or CDFW protocols. Confirmation that the burrow is not currently supporting nesting or fledgling activities is required prior to any burrow exclusions or excavations.	Appendix 2A	Compliance with this CMA is achieved through application of BMP-BIO-30.
	LUPA-BIO-IFS-14	Activity-specific active translocation of burrowing owls may be considered, in coordination with CDFW.	Appendix 2A	Compliance with this CMA is achieved through application of BMP-BIO-30.

CATEGORY	CMA #	CMA TEXT	RELEVANT EIS SECTIONS	COMPLIANCE SUMMARY
Golden Eagle	LUPA-BIO-IFS-24	Provide protection from loss and harassment of active golden eagle nests through the following actions:		
		• Activities that may impact nesting golden eagles, will not be sited or constructed within 1-mile of any active or alternative golden eagle nest within an active golden eagle territory, as determined by BLM in coordination with USFWS as appropriate.	Section 4.4.4 Appendix 2A	Compliance with this CMA is achieved through application of BMP-BIO-45.
	LUPA-BIO-IFS-25	Cumulative loss of golden eagle foraging habitat within a 1- to 4-mile radius around active or alternative golden eagle nests (as identified or defined in the most recent USFWS guidance and/or policy) will be limited to less than 20%. See CONS-BIO-IFS-5 for the requirement in Conservation Lands.	Section 3.4.2 Appendix 2A	Compliance with this CMA is achieved through application of BMP-BIO-45.
	LUPA-BIO-IFS-26	For activities that impact golden eagles, applicants will conduct a risk assessment per the applicable USFWS guidance (e.g. the Eagle Conservation Plan Guidance) using best available information as well as the data collected in the pre-project golden eagle surveys.	Appendix 2A	Compliance with this CMA is achieved through application of BMP-BIO-45.
	LUPA-BIO-IFS-27	If a permit for golden eagle take is determined to be necessary, an application will be submitted to the USFWS in order to pursue a take permit.	Appendix 2A	Compliance with this CMA is achieved through application of BMP-BIO-45.
	LUPA-BIO-IFS-28	In order to evaluate the potential risk to golden eagles, the following activities are required to conduct 2 years of pre-project golden eagle surveys in accordance with USFWS Eagle Conservation Plan Guidance.	Section 3.4.2 N/A	No reasonably foreseeable expectation for take of golden eagles

CATEGORY	CMA #	CMA TEXT	RELEVANT EIS SECTIONS	COMPLIANCE SUMMARY
Compensation	LUPA-BIO-COMP-1	Impacts to biological resources, identified and analyzed in the activity specific environmental document, from activities in the LUPA Decision Area will be compensated using the standard biological resources compensation ratio, except for the biological resources and specific geographic locations listed as compensation ratio exceptions, specifics in CMAs LUPA-BIO-COMP-2 through -4, and previously listed CMAs. Compensation acreage requirements may be fulfilled through non-acquisition (i.e., restoration and enhancement), land acquisition (i.e., preserve), or a combination of these options, depending on the activity specifics and BLM approval/authorization.	Section 4.4.4 Appendix 2A	Compliance with this CMA is achieved through application of BMP-BIO-46. All compensation requirements would be captured in a Compensation Plan (mitigation measure BIO-1).
		Refer to CMA LUPA-COMP-1 and 2 for the timing requirements for initiation or completion of compensation.	N/A	Acknowledged
	LUPA-BIO-COMP-2	Birds and Bats – The compensation for the mortality impacts to bird and bat Focus and BLM Special Status Species from activities will be determined based on monitoring of bird and bat mortality and a fee re-assessed every 5 years to fund compensatory mitigation. The initial compensation fee for bird and bat mortality impacts will be based on pre-project monitoring of bird use and estimated bird and bat species mortality from the activity. The approach to calculating the operational bird and bat compensation is based on the total replacement cost for a given resource, a Resource Equivalency Analysis. This involves measuring the relative loss to a population (debt) resulting from an activity and the productivity gain (credit) to a population from the implementation of compensatory mitigation actions. The measurement of these debts and gains (using the same “bird years” metric as described in Appendix D) is used to estimate the necessary compensation fee.	Section 4.4.4 Appendix 2A	MM BIO-1 requires the preparation of a Compensation Plan, which would aggregate biological compensatory mitigation requirements. Through APM/BMP-BIO-21 the required monitoring would provide data on bird mortality from which compensation fees would be determined.

CATEGORY	CMA #	CMA TEXT	RELEVANT EIS SECTIONS	COMPLIANCE SUMMARY
		Each activity, as determined appropriate by BLM in coordination with USFWS, and CDFW as applicable, will include a monitoring strategy to provide activity-specific information on mortality effects on birds and bats in order to determine the amount and type of compensation required to offset the effects of the activity, as described above and in detail in Appendix D. Compensation will be satisfied by restoring, protecting, or otherwise improving habitat such that the carrying capacity or productivity is increased to offset the impacts resulting from the activity. Compensation may also be satisfied by non-restoration actions that reduce mortality risks to birds and bats (e.g., increased predator control and protection of roosting sites from human disturbance). Compensation will be consistent with the most up to date DOI mitigation policy.	Section 4.4.4 Appendix 2A	All biological compensatory mitigation requirements would be captured in a Compensation Plan (mitigation measure BIO-1).

2C.1.2 Air Resources

CATEGORY	CMA #	CMA TEXT	RELEVANT EIS SECTIONS	COMPLIANCE SUMMARY
Air Resources	LUPA-AIR-1	All activities must meet the following requirements:		
		• Applicable National Ambient Air Quality Standards (Section 109)	Appendix 2A	Compliance with this CMA is achieved through application of APM-AQ-01, BMP-AQ-05.
		• State Implementation Plans (Section 110)	Appendix 2A	Compliance with this CMA is achieved through application of APM-AQ-01, BMP-AQ-05.
		• Prevention of Significant Deterioration, including visibility impacts to mandatory Federal Class I Areas (Section 160 et seq.)	Appendix 2A	Compliance with this CMA is achieved through application of APM-AQ-01, BMP-AQ-05.
		• Conformity Analyses and Determinations (Section 176[c])	Appendix 2A	Compliance with this CMA is achieved through application of APM-AQ-01, BMP-AQ-05.
		• Apply best management practices on a case by case basis	Appendix 2A	Compliance with this CMA is achieved through application of APM-AQ-01, BMP-AQ-05.
		• Applicable local Air Quality Management Jurisdictions (e.g., 403 SCAQMD)	Appendix 2A	Compliance with this CMA is achieved through application of APM-AQ-01, BMP-AQ-05.

CATEGORY	CMA #	CMA TEXT	RELEVANT EIS SECTIONS	COMPLIANCE SUMMARY
	LUPA-AIR-2	Because project authorizations are a federal undertaking, air quality standards for fugitive dust may not exceed local standards and requirements.	Appendix 2A	Compliance with this CMA is achieved through application of APM-AQ-01, AQ-05.
	LUPA-AIR-3	Where impacts to air quality may be significant under NEPA, requiring analysis through an Environmental Impact Statement, require documentation for activities to include a detailed discussion and analysis of Ambient Air Quality conditions (baseline or existing), National Ambient Air Quality Standards, criteria pollutant nonattainment areas, and potential air quality impacts of the proposed project (including cumulative and indirect impacts and greenhouse gas emissions). This content is necessary to disclose the potential impacts from temporary or cumulative degradation of air quality. The discussion will include a description and estimate of air emissions from potential construction and maintenance activities, and proposed mitigation measures to minimize net PM10 and PM2.5 emissions. The documentation will specify the emission sources by pollutant from mobile sources, stationary sources, and ground disturbance. A Construction Emissions Mitigation Plan will be developed.	Appendix 2A	Compliance with this CMA is achieved through application of APM-AQ-01, AQ-02, and MISC-01.

CATEGORY	CMA #	CMA TEXT	RELEVANT EIS SECTIONS	COMPLIANCE SUMMARY
	LUPA-AIR-4	Because fugitive dust is the number one source of PM10 and PM2.5 emissions in the Mojave and Sonoran Deserts, fugitive dust impacts to air quality must be analyzed for all activities/projects requiring an Environmental Impact Statement and Environmental Assessment.	Section 4.2.1	Air Quality impacts are assessed in the EIS.
		• The NEPA air quality analysis may include modeling of the sources of PM10 and PM2.5 that occur prior to construction and/or ground disturbance from the activity/project, and show the timing, duration and transport of emissions off site. When utilized, the modeling will also identify how the generation and movement of PM10 and PM2.5 will change during and after construction and/or ground disturbance of the activity/project under all activity/project specific NEPA alternatives. The BLM air resource specialist and Authorizing Officer will determine if modeling is required as part of the NEPA analysis based on estimated types and amounts of emissions.	N/A	The NOC, in conjunction with the California BLM determined modeling is not required for this Project.
	LUPA-AIR-5	• A fugitive Dust Control Plan will be developed for all projects where the NEPA analysis shows an impact on air quality from fugitive dust.	Appendix 2A	Compliance with this CMA is achieved through application of APM-AQ-01.

2C.1.3 Cultural Resources and Tribal Interests

CATEGORY	CMA #	CMA TEXT	RELEVANT EIS SECTIONS	COMPLIANCE SUMMARY
Cultural Resources and Tribal Interests	LUPA-CUL-4	Design activities to minimize impacts on cultural resources including places of traditional cultural and religious importance to federally recognized Tribes.	Appendix 2A	Compliance with LUPA-CUL-4 would be satisfied with BMP-CULT-03, which states that the applicant would follow avoidance and stipulations outlined in the PA and appropriate Historic Property Treatment Plans (HPTPs), and APM-CULT-01 and APM-CULT-02, in which the applicant commits to following those stipulations.

2C.1.4 Land Use

CATEGORY	CMA #	CMA TEXT	RELEVANT EIS SECTIONS	COMPLIANCE SUMMARY
Lands and Realty	LUPA-LANDS-4	Nonfederal lands within the boundaries of BLM LUPA land use allocations are not affected by the LUPA.	N/A	Acknowledged
	LUPA-LANDS-5	The MUCs used to determine land tenure in the CDCA Plan will be replaced by areas listed in the CMAs below.	Section 4.7.5	Acknowledged
	LUPA-LANDS-8	The CDCA Plan requirement that new transmission lines of 161kV or above, pipelines with diameters greater than 12 inches, coaxial cables for interstate communications, and major aqueducts or canals for interbasin transfers of water will be located in designated utility corridors, or considered through the plan amendment process outside of designated utility corridors, remains unchanged. The only exception is that transmission facilities may be located outside of designated corridors within DFAs without a plan amendment. This CMA does not apply the Bishop and Bakersfield RMPs.	Section 4.7.5	The Project would comply with this CMA because it would be entirely within a DFA; additionally, some of the Project would also be within designated utility corridors.

2C.1.5 Minerals

CATEGORY	CMA #	CMA TEXT	RELEVANT EIS SECTIONS	COMPLIANCE SUMMARY
Minerals	LUPA-MIN-5	Areas Located Outside Identified Mineral Areas		
		• Areas which could not be characterized due to insufficient data and mineral potential may fluctuate dependent on market economy, extraction technology, and other geologic information-requiring periodic updating. Authorizations are subject to the governing laws and regulations and LUPA requirements.	N/A	Compliance would be achieved at a later date, should the BLM change the characterization of lands within the Project ROW.

2C.1.6 Paleontological Resources

CATEGORY	CMA #	CMA TEXT	RELEVANT EIS SECTIONS	COMPLIANCE SUMMARY
Paleontology	LUPA-PALEO-1	If not previously available, prepare paleontological sensitivity maps consistent with the Potential Fossil Yield Classification for activities prior to NEPA analysis.	Appendix 7, Figure 3.2-1	The Project would comply - specific PFYC maps were created using existing PFYC maps of the area and associated geologic unit tables, in addition to known fossil localities.
	LUPA-PALEO-2	Incorporate all guidance provided by the Paleontological Resources Protection Act.	Appendix 2B	The Project will be in full compliance with the Paleontological Resources Preservation Act (P.L. 111-11, Title VI, Subtitle D). The BLM's management of paleontological resources is further directed through BLM IM 2016-124, IM 2009-011, and IM 2008-009.
	LUPA-PALEO-3	Ensure proper data recovery of significant paleontological resources where adverse impacts cannot be avoided or otherwise mitigated.	Appendix 2A	Compliance with this CMA is achieved through application of APM-PALEO-01.
	LUPA-PALEO-4	Paleontological surveys and construction monitors are required for ground disturbing activities that require an EIS.	Appendix 2A	Compliance with this CMA is achieved through application of BMP-PALEO-02.

2C.1.7 Soil and Water Resources

CATEGORY	CMA #	CMA TEXT	RELEVANT EIS SECTIONS	COMPLIANCE SUMMARY
Soil and Water General	LUPA-SW-1	Stipulations or conditions of approval for any activity will be imposed that provide appropriate protective measures to protect the quantity and quality of all water resources (including ephemeral, intermittent, and perennial water bodies) and any associated riparian habitat (see biological CMAs for specific riparian habitat CMAs). The water resources to which this CMA applies will be identified through the activity-specific NEPA analysis.	Section 3.2.10	Compliance with this CMA is achieved through APMs and BMPs in Biological Resources, Soil Resources, and Water Resources in Appendix 2A. The water resources to which this CMA applies are identified in Section 3.2.10.
	LUPA-SW-2	Buffer zones, setbacks, and activity limitations specifically for soil and water (ground and surface) resources will be determined on an activity/site-specific basis through the environmental review process and will be consistent with the soil and water resource goals and objectives to protect these resources. Specific requirements, such as buffer zones and setbacks, may be based, in part, on the results of the Water Supply Assessment defined below. In general, placement of long-term facilities within buffers or protected zones for soil and water resources is discouraged but may be permitted if soil and water resource management objectives can be maintained.	Sections 4.3 and 4.2.10	Compliance with this CMA is achieved by the environmental review in Sections 4.3 and 4.2.10, and the reasoning in the ROD regarding the selected alternative meeting soil and water resource management objectives.
	LUPA-SW-3	Where a seeming conflict between CMAs within or between resources arises, the CMA(s) resulting in the most resource protection apply.	N/A	Acknowledged. No conflicts between CMAs noted.
	LUPA-SW-4	Nothing in the “Exceptions” below applies to or takes precedence over any of the CMAs for biological resources.		

CATEGORY	CMA #	CMA TEXT	RELEVANT EIS SECTIONS	COMPLIANCE SUMMARY
Groundwater Resources	LUPA-SW-5	Exceptions to any of the specific soil and water stipulations contained in this section, as well as those listed below under the subheadings "Soil Resources," "Surface Water," and "Groundwater Resources," may be granted by the authorized officer if the applicant submits a plan, or, for BLM-initiated actions, the BLM provides documentation, that demonstrates:		
		• The impacts are minimal (e.g., no predicted aquifer drawdown beyond existing annual variability in basins where cumulative groundwater use is not above perennial yield and water tables are not currently trending downward) or can be adequately mitigated.	Section 2.2.5	Water would be acquired from private commercial sources.
Soil Resources	LUPA-SW-6	In addition to the applicable required governmental safeguards, third party activities will implement up-to-date standard industry construction practices to prevent toxic substances from leaching into the soil.	Appendix 2A	Compliance with this CMA is achieved through application of APM-HAZ-01.
	LUPA-SW-7	Prepare an emergency response plan, approved by the BLM contaminant remediation specialist, that ensures rapid response in the event of spills of toxic substances over soils.	Appendix 2A	Compliance with this CMA is achieved through application of APM-HAZ-01.
	LUPA-SW-8	As determined necessary on an activity specific basis, prepare a site plan specific to major soil types present (≥5% of footprint or laydown surfaces) in Wind Erodibility Groups 1 and 2 and in Hydrology Soil Class D as defined by the USDA Natural Resource Conservation Service to minimize water and air erosion from disturbed soils on activity sites.	Appendix 2A	Compliance with this CMA is achieved through application of APM-GEO-01.

CATEGORY	CMA #	CMA TEXT	RELEVANT EIS SECTIONS	COMPLIANCE SUMMARY
	LUPA-SW-9	The extent of desert pavement within the proposed boundary of an activity shall be mapped if it is anticipated that the activity may create erosional or ecologic impacts. Mapping will use the best available data and standards, as determined by BLM. Disturbance of desert pavement within the boundary of an activity shall be limited to the extent possible. If disturbance from an activity is likely to exceed 10% of the desert pavement mapped within the activity boundary, the BLM will determine whether the erosional and ecologic impacts of exceeding the 10% cap by the proposed amount would be insignificant and/or whether the activity should be redesigned to minimize desert pavement disturbance.	Appendix 2A	Compliance with this CMA is achieved through application of BMPs SOIL-04 and SOIL-05.
	LUPA-SW-10	The extent of additional sensitive soil areas (cryptobiotic soil crusts, hydric soils, highly corrosive soils, expansive soils, and soils at severe risk of erosion) shall be mapped if it is anticipated that an activity will impact these resources. To the extent possible, avoid disturbance of desert biologically intact soil crusts, and soils highly susceptible to wind and water erosion.	Appendix 2A	Required mapping of sensitive soil areas is contained in the project record. In addition, Compliance with this CMA is achieved through application of BMP-SOIL-07.
	LUPA-SW-11	Where possible, side casting shall be avoided where road construction requires cut- and-fill procedures.	Appendix 2A	Compliance with this CMA is achieved through application of BMP-SOIL-06.
Surface Water	LUPA-SW-12	Except in DFAs, exclude long-term structures in, playas (dry lake beds), and Wild and Scenic River corridors, except as allowed with minor incursions (see definition in the Glossary of Terms).	N/A	The Project would be within a DFA. Non-Federal surface waters outside the DFA would be spanned.
	LUPA-SW-13	BLM will manage all riparian areas to be maintained at, or brought to, proper functioning condition.	Appendix 2A	Compliance with this CMA is achieved through application of AMP/BMP-BIO-19 and BMP-BIO-47.

CATEGORY	CMA #	CMA TEXT	RELEVANT EIS SECTIONS	COMPLIANCE SUMMARY
	LUPA-SW-14	All relevant requirements of Executive Orders 11988 (Floodplain Management) and 11990 (Protection of Wetlands) will be complied with.	Section 4.2.10	The analysis includes a floodplain assessment and statement of findings that analyzes the potential floodplain impacts associated with the Project. The action alternatives would not be likely to disturb or affect any wetlands (e.g., all should be able to be avoided/spanned), thus a wetlands statement of findings is not included.
	LUPA-SW-15	Surface water diversion for beneficial use will not occur absent a state water right.	N/A	No surface water diversions are planned for the Project
	LUPA-SW-16	The 100-year floodplain boundaries for any surface water feature in the vicinity of the project will be identified. If maps are not available from the Federal Emergency Management Agency (FEMA), these boundaries will be determined via hydrologic modeling and analysis as part of the environmental review process. Construction within, or alteration of, 100-year floodplains will be avoided where possible, and permitted only when all required permits from other agencies are obtained.	Section 4.2.10 Appendix 2A	Compliance with this CMA is also achieved through application of APM-BIO-19.
Groundwater	LUPA-SW-18	Water extracted or consumptively used for the construction, operation, maintenance, or remediation of the project shall be solely for the beneficial use of the project or its associated mitigation and remediation measures, as specified in approved plans and permits.	Appendix 2A	Compliance with this CMA is achieved through application of BMP-WQ-05.
	LUPA-SW-20	After application of applicable avoidance and minimization measures, all remaining unavoidable residual impacts to surface waters from the proposed activity shall be mitigated to ensure no net loss of function and value, as determined by the BLM.	Section 4.2.10	Compliance is demonstrated by the fact that no residual impacts are identified.

CATEGORY	CMA #	CMA TEXT	RELEVANT EIS SECTIONS	COMPLIANCE SUMMARY
	LUPA-SW-21	Consideration shall be given to design alternatives that maintain the existing hydrology of the site or redirect excess flows created by hardscapes and reduced permeability from surface waters to areas where they will dissipate by percolation into the landscape.	Appendix 2A	Compliance with this CMA is achieved through application of BMP-WQ-06.
	LUPA-SW-22	All hydrologic alterations shall be avoided that could reduce water quality or quantity for all applicable beneficial uses associated with the hydrologic unit in the project area, or specific mitigation measures shall be implemented that will minimize unavoidable water quality or quantity impacts, as determined by BLM in coordination with USFWS, CDFW, and other agencies, as appropriate. These beneficial uses may include municipal, domestic, or agricultural water supply; groundwater recharge; surface water replenishment; recreation; water quality enhancement; flood peak attenuation or flood water storage; and wildlife habitat.	Appendix 1, Table 1.7-3 Appendix 2A	Compliance with this CMA is achieved through application of BMP-WQ-06 and the Section 404 permitting process.

2C.1.8 Visual Resource Management

CATEGORY	CMA #	CMA TEXT	RELEVANT EIS SECTIONS	COMPLIANCE SUMMARY
Visual Resources Management	LUPA-VRM-1	Manage Visual Resources in accordance with the VRM classes shown on Figure 9.	Section 4.11	Conformance with VRM classes is demonstrated in the EIS analysis.
	LUPA-VRM-2	Ensure that activities within each of the VRM Class polygons meets the VRM objectives described above, as measured through a visual contrast rating process.	Section 4.11	Conformance with VRM classes is demonstrated in the EIS analysis.
	LUPA-VRM-3	Ensure that transmission facilities are designed and located to meet the VRM Class objectives for the area in which they are located. New transmission lines routed through designated corridors where they do not meet VRM Class Objectives will require RMP amendments to establish a conforming VRM Objective. All reasonable effort must be made to reduce visual contrast of these facilities in order to meet the VRM Class before pursing RMP amendments. This includes changes in routing, using lattice towers (vs. monopole), color treating facilities using an approved color from the BLM Environmental Color Chart CC-001 (dated June 2008, as updated on April 2014, or the most recent version) (vs. galvanized) on towers and support facilities, and employing other BMPs to reduce contrast. Such efforts will be retained even if an RMP amendment is determined to be needed. Visual Resource BMPs that reduce adverse visual contrast will be applied in VRM Class conforming situations. For a reference of BMPs for reducing visual impacts see the “Best Management Practices for Reducing Visual Impacts of Renewable Energy Facilities on BLM-Administered Lands”, available at http://www.blm.gov/style/medialib/blm/wo/MINERALS__REALTY__AND_RESOURCE_PROTECTION_/energy/renewable_references.Par.1568.File.dat/RenewableEnergyVisualImpacts_BMPs.pdf, or the most recent version of the document or BMPs for VRM, as determined by BLM.	Section 4.11	The Project would meet VRM objectives established for BLM-administered public lands within the Project Area in the PSFO.

2C.2 LUPA-WIDE TRANSMISSION CMAS

2C.2.1 Biological Resources

CATEGORY	CMA #	CMA TEXT	RELEVANT EIS SECTION	COMPLIANCE SUMMARY
Biological Resources	LUPA-TRANS-BIO-1	Where feasible and appropriate for resource protection, site transmission activities along roads or other previously disturbed areas to minimize new surface disturbance, reduce perching opportunities for the Common Raven, and minimize collision risks for birds and bats.	Section 4.4.7 Appendix 2A	Compliance with this CMA is achieved through application of APM-AES-06, APM/BMP-BIO-19, BMP-AES-06, BMP-BIO-21, and BMP-BIO-28.
	LUPA-TRANS-BIO-2	Flight diverters will be installed on all transmission activities spanning or within 1,000 feet of stream and wash channels, canals, ponds, and any other natural or artificial body of water. The type of flight diverter selected will be subject to approval by BLM, in coordination with USFWS and CDFW as appropriate, and will be based on the best available scientific and commercial data regarding the prevention of bird collisions with transmission and guy wires.	Section 4.4.4 Appendix 2A	Compliance with this CMA is achieved through application of APM-BIO-21 and BMP-BIO-48.
	LUPA-TRANS-BIO-3	When siting transmission activities, the alignment should avoid, to the maximum extent practicable, being located across canyons or on ridgelines. Site and design sufficient distance between transmission lines to prevent electrocution of condors.	Appendix 2A	Compliance with this CMA is achieved through application of APM/BMP-BIO-21, BMP-AES-07, and BMP-AES-08. However, there are no canyons or ridgelines in the portion of the Project area located within the CDCA Plan area.

CATEGORY	CMA #	CMA TEXT	RELEVANT EIS SECTION	COMPLIANCE SUMMARY
Biological Resources	LUPA-TRANS-BIO-4	Siting of transmission activities will be prioritized within designated utility corridors, where possible, and designed to avoid, where possible, and otherwise minimize and offset impacts to sand transport processes in Aeolian corridors, rare vegetation alliances and Focus and BLM Special Status Species. Transmission substations will be sited to avoid Aeolian corridors, rare vegetation alliances, and sand-dependent Focus and BLM Special Status Species habitats.	Section 3.3.2 Section 3.4.2 Chapter 2 Section 4.3.4 Section 4.4.4 Appendix 2, 2A	Portions of Segments ca-07, ca-09, and x-19 would cross areas of active windblown sand. Compliance with this CMA is achieved through application of APM-AES-05, BMP-BIO-53, and BMP-BIO-54.

2C.2.2 Cultural Resources and Tribal Interests

CATEGORY	CMA #	CMA TEXT	RELEVANT EIS SECTION	COMPLIANCE SUMMARY
Cultural Resources & Tribal Interests	LUPA-TRANS-CUL-1	For transmission (and renewable energy) activities, require the applicant to pay all appropriate costs associated with the following processes, through the appropriate BLM funding mechanism:	Appendix 2D	Compliance with LUPA-TRANS-CUL-1 would be satisfied by APM-CULT-01 and APM-CULT-02, in which the applicant commits to conducting a cultural resources inventory of the direct and indirect APE, preparing HPTPs, and conducting cultural resource monitoring during Project construction, operations, and maintenance (as appropriate) to meet stipulations outlined in the PA Appendix 2D.
		• All appropriate costs associated with the BLM's analysis of the DRECP geodatabase and other sources for cultural resources sensitivity.		

CATEGORY	CMA #	CMA TEXT	RELEVANT EIS SECTION	COMPLIANCE SUMMARY
		• All appropriate costs associated with preliminary sensitivity analysis.		
		• All appropriate costs associated with the Section 106 process including the identification and defining of cultural resources. These costs may also include logistical, travel, and other support costs incurred by tribes in the consultation process.	N/A	Enforcement by BLM.
		• All appropriate costs associated with updating the DRECP cultural resources geodatabase with project specific results.		
	LUPA-TRANS-CUL-2	Consistent and in compliance with the NHPA Programmatic Agreement, signed February 5, 2016, or the most up to date signed version – for transmission (and renewable energy) activities, a compensatory mitigation fee will be required within the LUPA Decision Area to address cumulative and some indirect adverse effects to historic properties. The mitigation fee will be calculated in a manner that is commensurate to the size and regional impacts of the project. Refer to the NHPA Programmatic Agreement for details regarding the mitigation fee.	Appendix 2D	Compensatory mitigation determinations pending within the BLM. Compliance with LUPA-TRANS-CULT-2 would be satisfied by BMP-CULT-05, which outlines the fee structure of the compensatory mitigation fee. The compensatory mitigation fee structure is also outlined in the stipulations contained within the PA.
	LUPA-TRANS-CUL-3	For transmission (and renewable energy) activities, the management fee rate will be determined through the NHPA programmatic Section 106 consultation process that will be completed as part of the DRECP land use plan amendment.	Appendix 2D	Management fee determinations pending within the BLM. Compliance with LUPA-TRANS-CUL-3 would be satisfied by BMP-CULT- 05, which outlines the fee structure of the management fee as part of the compensatory mitigation fee. The management fee and compensatory mitigation fee structure is also outlined in the stipulations contained within the PA.

CATEGORY	CMA #	CMA TEXT	RELEVANT EIS SECTION	COMPLIANCE SUMMARY
	LUPA-TRANS-CUL-4	For transmission (and renewable energy) activities, demonstrate that results of cultural resources sensitivity, based on the DRECP geodatabase, and other sources, are used as part of the initial planning pre-application process and to select of specific footprints for further consideration.		Sensitivity analysis responses pending BLM review. Compliance with LUPA-TRANS-CUL-4 would be satisfied with BMP-CUL-06. The BLM has prepared a sensitivity model (Kline 2017).
	LUPA-TRANS-CUL-5	For transmission (and renewable energy) activities, provide a statistically significant sample survey as part of the pre-application process, unless the BLM determines the DRECP geodatabase and other sources are adequate to assess cultural resources sensitivity of specific footprints.	Section 3.5	Class III inventory results pending BLM review. Compliance with LUPA-TRANS-CUL-5 would be satisfied by BMP-CULT-07, which requires cultural resources Class III survey of segments p-17 and p-18 to be conducted during the NEPA and CEQA analyses to meet the conditions of LUPA-TRANS-CUL-5 and DFA-VPL-CUL-5. The Class III survey of segments p-17 and p-18 has been conducted.
	LUPA-TRANS-CUL-6	For transmission (and renewable energy) activities, provide justification in the application why the project considerations merit moving forward if the specific footprint lies within an area identified or forecast as sensitive for cultural resources by the BLM.		Sensitivity analysis responses pending BLM review. Compliance with LUPA-TRANS-CUL-6 would be satisfied by BMP-CULT-08, which requires such justification from the Project applicant.

2C.3 DFA AND VPL-SPECIFIC CMAS

2C.3.1 Biological Resources

CATEGORY	CMA #	CMA TEXT	RELEVANT EIS SECTIONS	COMPLIANCE SUMMARY
Biological Resources: North American Warm Desert Dune and Sand Flats	DFA-VPL-BIO-DUNE-1	Activities in DFAs and VPLs, including transmission substations, will be sited to avoid dune vegetation (i.e., North American Warm Desert Dune and Sand Flats). Unavoidable impacts (see "unavoidable impacts to resources" in the Glossary of Terms) to dune vegetation will be limited to transmission projects, except transmission substations, and access roads that will be sited to minimize unavoidable impacts.	Section 3.3.2 Section 3.4.2 Section 4.3.4 Section 4.4.4 Appendix 2A	Compliance with this CMA is achieved through application of BMP-BIO-53.
		• For unavoidable impacts (see "unavoidable impacts to resources" in the Glossary of Terms) to dune vegetation, the following will be required:		
		o Access roads will be unpaved.	Appendix 2A	Compliance with this CMA is achieved through application of BMP-BIP-53 and BMP-T&T-06.
		o Access roads will be designed and constructed to be at grade with the ground surface to avoid inhibiting sand transportation.	Appendix 2A	Compliance with this CMA is achieved through application of BMP-BIO-53 and BMP-T&T-06.

CATEGORY	CMA #	CMA TEXT	RELEVANT EIS SECTIONS	COMPLIANCE SUMMARY
	DFA-VPL-BIO-DUNE-2	Within Aeolian corridors that transport sand to dune formations and vegetation types downwind inside and outside of the DFAs, all activities will be designed and operated to facilitate the flow of sand across activity sites, and avoid the trapping or diverting of sand from the Aeolian corridor. Buildings and structures within the site will take into account the direction of sand flow and, to the extent feasible, build and align structures to allow sand to flow through the site unimpeded. Fences will be designed to allow sand to flow through and not be trapped.	Section 4.3.4 Section 4.4.4 Appendix 2A	Compliance with this CMA is achieved through application of BMP-BIO-54. Buildings and fences are not proposed for the portion of the Project in California. Structures are proposed to be self-supported lattice, which would minimize obstruction to sand transport. Tangent lattice structures would allow winds to essentially blow through the structure, minimizing the impact on sand transport.
Individual Focus Species (IFS): Desert Tortoise	DFA-VPL-BIO-IFS-1	To the maximum extent practicable (see Glossary of Terms), activities will be sited in previously disturbed areas, areas of low-quality habitat, and areas with low habitat intactness in desert tortoise linkages and the Ord-Rodman TCA, identified in Appendix D.	Appendix 2A	Compliance with this CMA is achieved through application of BMP-MISC-04.

CATEGORY	CMA #	CMA TEXT	RELEVANT EIS SECTIONS	COMPLIANCE SUMMARY
Fire Prevention/Protection	DFA-VPL-BIO-FIRE-1	Implement the following standard practice for fire prevention/protection:		
		• Implement site-specific fire prevention/protection actions particular to the construction and operation of renewable energy and transmission project that include procedures for reducing fires while minimizing the necessary amount of vegetation clearing, fuel modification, and other construction-related activities. At a minimum these actions will include designating site fire coordinators, providing adequate fire suppression equipment (including in vehicles), and establishing emergency response information relevant to the construction site.	Section 4.4.4 Appendix 2A	Compliance with this CMA is achieved through application of AMP/BMP-BIO-11, BMP-PH&S-02, and BMP-HAZ-02
Biological Compensation	DFA-VPL-BIO-COMP-1	Impacts to biological resources from all activities in DFAs and VPLs will be compensated using the same ratios and strategies as LUPA-BIO-COMP-1 through 4, with the exception identified below in DFA-VPL-BIO-COMP-2.	N/A	See LUPA-BIO-COMP-1 and 2. All biological compensatory mitigation requirements would be captured in a Compensation Plan (mitigation measure BIO-1).

2C.3.2 Cultural Resources and Tribal Interests

The following CMAs are for renewable energy and transmission land use authorizations only, in DFAs and VPLs. All other activities in DFAs and VPs are subject to the NHPA Section 106 process.

CATEGORY	CMA #	CMA TEXT	RELEVANT EIS SECTIONS	COMPLIANCE SUMMARY
	DFA-VPL-CUL-1	For renewable energy activities and transmission, require the applicant to pay all appropriate costs associated with the following processes, through the appropriate BLM funding mechanism:	Appendix 2D	Compliance with DFA-VPL-CUL-1 would be satisfied by APM-CULT-01 and APM-CULT-02, in which the applicant commits to conducting a cultural resources inventory of the direct and indirect APE, preparing HPTPs, and conducting cultural resource monitoring during Project construction, operations, and maintenance (as appropriate) to meet stipulations outlined in the PA.
		• All appropriate costs associated with the BLM's analysis of the DRECP geodatabase and other sources for cultural resources sensitivity.		
		• All appropriate costs associated with preliminary sensitivity analysis.	N/A	Enforcement by BLM.
		• All appropriate costs associated with the Section 106 process including the identification and defining of cultural resources. These costs may also include logistical, travel, and other support costs incurred by tribes in the consultation process.		
		• All appropriate costs associated with updating the DRECP cultural resources geodatabase with project specific results.		

CATEGORY	CMA #	CMA TEXT	RELEVANT EIS SECTIONS	COMPLIANCE SUMMARY
	DFA-VPL-CUL-2	Consistent and in compliance with the NHPA Programmatic Agreement, signed February 5, 2016, or the most up to date signed version -for renewable energy activities and transmission, a compensatory mitigation fee will be required within the LUPA Decision Area to address cumulative and some indirect adverse effects to historic properties. The mitigation fee will be calculated in a manner that is commensurate to the size and regional impacts of the project. Refer to the Programmatic Agreement for details regarding the mitigation fee.	Appendix 2D	Compensatory mitigation determinations and final draft PA language pending within the BLM. Compliance with LUPA-TRANS-CULT-2 and DFA-VPL-CUL-2 would be satisfied by BMP-CULT-05, which outlines the fee structure of the compensatory mitigation fee. The compensatory mitigation fee structure is also outlined in the stipulations contained within the PA.
	DFA-VPL-CUL-3	For renewable energy activities and transmission, the management fee rate will be determined through the NHPA programmatic Section 106 consultation process that will be completed as part of the DRECP land use plan amendment.	Appendix 2D	Management fee and mitigation fee determinations, and final draft PA language pending within the BLM. Compliance with DFA-VPL-CUL-3 would be satisfied by BMP-CULT- 05, which outlines the fee structure of the management fee as part of the compensatory mitigation fee. The management fee and compensatory mitigation fee structure is also outlined in the stipulations contained within the PA.

CATEGORY	CMA #	CMA TEXT	RELEVANT EIS SECTIONS	COMPLIANCE SUMMARY
	DFA-VPL-CUL-4	For renewable energy activities and transmission, demonstrate that results of cultural resources sensitivity, based on the DRECP geodatabase, and other sources, are used as part of the initial planning pre-application process and to select of specific footprints for further consideration.		Sensitivity analysis responses pending BLM review. Compliance with DFA-VPL-CUL-4 would be satisfied with BMP-CUL-06. The BLM has prepared a sensitivity model (Kline 2017).
	DFA-VPL-CUL-5	For renewable energy activities and transmission, provide a statistically significant sample survey as part of the pre-application process, unless the BLM determines the DRECP geodatabase and other sources are adequate to assess cultural resources sensitivity of specific footprints.	Section 3.5.2	Sensitivity analysis responses and Class III draft survey report pending BLM review. Compliance with DFA-VPL-CUL-5 would be satisfied by BMP-CULT-07, which requires cultural resources Class III survey of segments p-17 and p-18 to be conducted during the NEPA and CEQA analyses to meet the conditions of DFA-VPL-CUL-5. The Class III survey of segments p-17 and p-18 has been conducted.
	DFA-VPL-CUL-6	For renewable energy activities and transmission, provide justification in the application why the project considerations merit moving forward if the specific footprint lies within an area identified or forecast as sensitive for cultural resources by the BLM.		Sensitivity analysis responses pending BLM review. Compliance with DFA-VPL-CUL-6 would be satisfied by BMP-CULT-08, which requires such justification from the Project applicant.

CATEGORY	CMA #	CMA TEXT	RELEVANT EIS SECTIONS	COMPLIANCE SUMMARY
	DFA-VPL-CUL-7	For renewable energy activities and transmission, complete the NHPA Section 106 Process as specified in 36 CFR Part 800, or via an alternate procedure, allowed for under 36 CFR Part 800.14 prior to issuing a ROD or ROW grant on any utility-scale renewable energy or transmission project. For utility-scale solar energy developments, the BLM may follow the Solar Programmatic Agreement.	Sections 5.3 and 5.5.1 Appendix 2D	Section 5.5.1 summarizes the process of drafting the Programmatic Agreement. Section 5.3 presents the efforts of Native American consultation with Indian tribes. Appendix 2D is the draft Programmatic Agreement for the Project. The PA would be executed prior to issuing a ROD or ROW grant.

2C.3.3 Visual Resource Management

CATEGORY	CMA #	CMA TEXT	RELEVANT EIS SECTIONS	COMPLIANCE SUMMARY
Visual Resources Management	DFA-VPL-VRM-1	Encourage development in a planned fashion within DFAs (e.g., similar to the planned unit development concept used for urban design—i.e., in-fill vs. scattered development, use of common road networks, Generator Tie Lines etc., use of similar support facility designs materials and colors etc.) to avoid industrial sprawl.	Section 3.7.2	The entire portion of the Project Area on BLM-administered lands in California is within a DFA. Portions of the Proposed Action and many of the Action Alternative segments would either be within or immediately adjacent to designated utility corridors on BLM-administered lands in California.
	DFA-VPL-VRM-2	Development in DFAs and VPLs are required to incorporate visual design standards and include the best available, most recent BMPs, as determined by BLM (e.g. Solar, Wind, West Wide Energy Corridor, and Geothermal PEISs, the "*Best Management Practices for Reducing Visual Impacts of Renewable Energy Facilities on BLM-Administered Lands*", and other programmatic BMP-documents).	Appendix 2A	See APMs and BMPs developed for visual resources, some of which came from the referenced document.

CATEGORY	CMA #	CMA TEXT	RELEVANT EIS SECTIONS	COMPLIANCE SUMMARY
	DFA-VPL-VRM-3	Required Visual Resource BMPs. All development within the DFAs and VPLs will abide by the BMPs addressed in the most recent version of the document "*Reducing Visual Impacts of Renewable Energy Facilities on BLM-Administered Lands"*, or its replacement, including, but not limited to the following:	Appendix 2A	See APMs and BMPs developed for visual resources, some of which came from the referenced document. J. Dalton is seeking additional direction regarding dark night skies from Washington; additions will be made once direction is received.
		• Transmission:		
		o Color-treat monopoles Shadow Gray per the BLM Environmental Color Chart CC001 unless a more effective color choice is selected by the local Field Office VRM specialist.	Appendix 2A	Compliance with this CMA is achieved through application of APM-& BMP-AES-04.
		o Lattice towers and conductors will have non-specular qualities.	Appendix 2A	Compliance with this CMA is achieved through application of BMP-AES-04.
		o Lattice Towers will be located a minimum of 3/4 mile away from Key Observation Points such as roads, scenic overlooks, trails, campgrounds, navigable rivers and other areas people tend to congregate and located against a landscape backdrop when topography allows.	Appendix 7, Figure 3.11-8	The Project would comply with this CMA, as the KOPs for the portion of the Project located on Federal lands in California are a minimum of ¾ mile away from Project infrastructure, and self-supporting lattice structures are proposed.

2C.4 DFA-SPECIFIC CMAS

2C.4.1 Biological Resources

CATEGORY	CMA #	CMA TEXT	RELEVANT EIS SECTIONS	COMPLIANCE SUMMARY
Biological Resources	DFA-BIO-IFS-1	Conduct the following surveys as applicable in the DFAs as shown in Table 21.	Appendix 2A	Compliance with this CMA is achieved through application of APM-BIO-02, APM/BMP-BIO-23, APM-BIO-20, BMP-BIO-30, and BMP-BIO-45.
	DFA-BIO-IFS-2	Implement the following setbacks shown below in Table 22 as applicable in the DFAs.	Appendix 2A	Compliance with this CMA is achieved through application of APM-BIO-02, BMP-BIO-29, BMP-BIO-30, and BMP-BIO-45.

2C.4.2 Recreation

CATEGORY	CMA #	CMA TEXT	RELEVANT EIS SECTIONS	COMPLIANCE SUMMARY
Recreation	DFA-REC-1	Retain, to the extent possible, the identified recreation setting characteristics: physical components of remoteness, naturalness and facilities; social components of contact, group size and evidence of use; and operational components of access, visitor services and management controls (see recreation setting characteristics matrix).	Appendix 2A	Compliance with this CMA is achieved through application of BMP-REC-01.
	DFA-REC-2	Avoid large-scale ground disturbance within one-half mile of Level 3	Appendix 2A	Compliance with this CMA is achieved through application of BMP-REC-01.
		Recreation facility footprint including route access and staging areas. If avoidance isn't practicable, the facility must be relocated to the same or higher standard and maintain recreation objectives and setting characteristics.	Appendix 2A	Compliance with this CMA is achieved through application of BMP-REC-01.
	DFA-REC-4	When considering large-scale development in DFAs, retain to the extent possible existing, approved recreation activities.	Appendix 2A	Compliance with this CMA is achieved through application of BMP-REC-01.
	DFA-REC-5	For displacement of dispersed recreation opportunities, commensurate compensation in the form of enhanced recreation operations, recreation facilities or opportunities will be required. If recreation displacement results in resource damage due to increased use in other areas, mitigate that damage through whatever measures are most appropriate as determined by the Authorized Officer.	Appendix 2A	Compliance with this CMA is achieved through application of BMP-REC-01.

CATEGORY	CMA #	CMA TEXT	RELEVANT EIS SECTIONS	COMPLIANCE SUMMARY
	DFA-REC-7	If designated vehicle routes are directly impacted by activities (includes modification of existing route to accommodate industrial equipment, restricted access or full closure of designated route, pull outs, and staging areas to the public, etc.), mitigation will include the development of alternative routes to allow for continued vehicular access with proper signage, with a similar recreation experience. In addition, mitigation will also include the construction of an "OHV touring route" which circumvents the activity area and allows for interpretive signing materials to be placed at strategic locations along the new touring route, if determined to be appropriate by BLM.	Appendix 2A	Compliance with this CMA is achieved through application of BMP-REC-01.

2C.4.3 Lands and Realty

CATEGORY	CMA #	CMA TEXT	RELEVANT EIS SECTIONS	COMPLIANCE SUMMARY
Lands and Realty	DFA-LANDS-7	Transmission facilities are an allowable use and will not require a plan amendment within DFAs.	Section 4.7.9	The Project would be within the established DFA and therefore no RMPA would be required; thus, the Project complies with this CMA.

2C.4.4 Visual Resource Management

CATEGORY	CMA #	CMA TEXT	RELEVANT EIS SECTIONS	COMPLIANCE SUMMARY
Visual Resources Management	DFA-VRM-1	Manage all DFAs as VRM Class IV to allow for industrial scale development. Employ best management practices to reduce visual contrast of facilities.	Section 4.11	The Project would comply with VRM Class IV objectives.
	DFA-VRM-2	Regional mitigation for visual impacts is required in DFAs. Mitigation is to be based on the VRI class and the underlying visual values (scenic quality, sensitivity, and distance zone) for the activity area as it stands at the time the ROD is signed for the DRECP LUPA. Compensatory mitigation may take the form of reclamation of other BLM lands to maintain (neutral) or enhance (beneficial) visual values on VRI Class II and III lands. Other considerations may include acquisition of conservation easements to protect and sustain visual quality within the viewshed of BLM lands. The following mitigation ratios will be applied in DFAs:	Section 4.11	Analysis of impacts determined that the Project would not result in reduction of VRI Class II areas in California to lower VRI classes. Therefore, no compensatory mitigation would be required for the Project.
		VRI Class II 1:1 ratio		

2C.4.5 Compensation

CATEGORY	CMA #	CMA TEXT	RELEVANT EIS SECTIONS	COMPLIANCE SUMMARY
	LUPA-COMP-1	For third party actions, compensation activities must be initiated or completed within 12 months from the time the resource impact occurs (e.g. ground disturbance, habitat removal, route obliteration, etc. for construction activities; wildlife mortality, visual impacts, etc. due to operations).	N/A	Details of reclamation/restoration demonstrating compliance with the CMA will be contained in various plans referenced in the EIS and will be resolved with the BLM prior to issuance of the NTP. All compensation requirements would be captured in a Compensation Plan (mitigation measure BIO-1).
		• BLM will determine, in the environmental analysis, the activity/project-level timing of the compensation (i.e. initiated, completed or a combination) based on the specific resources being impacted, and scope and content of the activity.		
		• A 6-month extension may be authorized, subject to approval by the authorizing officer, dependent on the resources impacted and compensation due diligence of the project developer.		

This page intentionally left blank.

Appendix 2D Programmatic Agreement

PROGRAMMATIC AGREEMENT
AMONG
THE BUREAU OF LAND MANAGEMENT,
ARIZONA TUCSON FIELD OFFICE,
THE ARIZONA STATE HISTORIC PRESERVATION OFFICER,
THE CALIFORNIA STATE HISTORIC PRESERVATION OFFICER,
THE COLORADO RIVER INDIAN TRIBES,
AND THE ADVISORY COUNCIL ON HISTORIC PRESERVATION
REGARDING THE
TEN WEST LINK TRANSMISSION PROJECT
BETWEEN TONOPAH, LA PAZ COUNTY, ARIZONA
AND BLYTHE, RIVERSIDE COUNTY, CALIFORNIA

1. **WHEREAS,** DCR Transmission, LLC (the Applicant), intends to construct, operate and maintain the Ten West Link Transmission Project (the Undertaking) in Arizona and California according to general parameters contained in the Undertaking's Plan of Development (POD), as summarized in Stipulation II and Attachment 1; and

2. **WHEREAS,** the Undertaking consists of the construction, operation and maintenance of a 500 kV transmission line approximately 114 miles in length, proposed to begin at the Delaney Substation near Tonopah, Arizona and end at the Colorado River Substation west of Blythe, California, crossing lands with the following jurisdictions: the Bureau of Land Management (BLM); Bureau of Reclamation (Reclamation); U.S. Fish and Wildlife Service (FWS); Colorado River Indian Tribes (CRIT); Arizona State Land Department (ASLD); California State Land Commission (SLC); Counties of Maricopa and La Paz, Arizona and Riverside, California; Town of Quartzsite, Arizona; and private lands (Attachment 1); and

3. **WHEREAS,** the Yuma Field Office of the BLM may issue a right-of-way (ROW) grant to the Applicant for the construction, operation, and maintenance of the Undertaking, and if issued, the ROW grant will incorporate this Programmatic Agreement (PA); and

4. **WHEREAS,** the BLM has determined that issuance of the ROW grant and related authorizations is an Undertaking as defined at 36 C.F.R. § 800.16 that triggers the requirements of 54 U.S.C. § 306108, commonly known as Section 106 of the National Historic Preservation Act (NHPA) of 1966 (54 U.S.C. § 300101 et seq., as amended), hereinafter referred to as Section 106, on Federal and non-Federal lands during the planning, construction, operation, and maintenance of the Undertaking; and

5. **WHEREAS,** this PA and the Historic Properties Treatment Plans (HPTPs), one for each State, that will be developed pursuant to this PA will be incorporated into the POD; and

6. **WHEREAS,** the Federal agencies involved have designated the BLM to serve as the lead Federal agency for the Undertaking, and has identified the area of potential effects (APE) as described in Stipulation V (also see Attachment 1); and

7. **WHEREAS,** the BLM in consultation with the other parties to this PA, has determined that the Undertaking will have adverse effects upon historic properties as defined in 36 C.F.R. § 800.16(l)(1); and this PA has been negotiated to resolve the adverse effect; and

8. **WHEREAS,** pursuant to 36 C.F.R. § 800.6 and 800.14, the BLM has consulted with the Arizona State Historic Preservation Officer and the California State Historic Preservation Officer (collectively, the SHPOs), and the CRIT Tribal Council, and they are Signatories to this PA; and

9. **WHEREAS**, the Arizona and California SHPOs and CRIT Tribal Historic Preservation Officer are authorized to enter this agreement in order to fulfill their roles of advising and assisting Federal agencies in carrying out Section 106 responsibilities under the following Federal statutes: Sections 101 and 106 of the NHPA, at § 800.2(c)(l)(i), and § 800.6(b)(1)(i); and

10. **WHEREAS,** the AZ SHPO is authorized to advise and assist the Federal and State agencies in carrying out their historic preservation responsibilities and cooperate with these agencies under A.R.S. § 41-511.04(D)(4); and

11. **WHEREAS,** pursuant to 36 C.F.R. § 800.6(a)(1)(i)(C), the BLM, on February 15, 2017, notified the Advisory Council on Historic Preservation (ACHP) that the Undertaking will have adverse effects on historic properties that will be resolved through the PA, and the ACHP declined on March 9, 2017 to participate as a party to the PA to resolve such adverse effects; and the BLM requested that the ACHP participate as a party to the PA on January 11, 2018; and the ACHP accepted on January 25, 2018 and are a Signatory to this PA; and

12. **WHEREAS,** CRIT has assumed the role of THPO with respect to lands within its reservation boundaries and this Undertaking may cross lands under its jurisdiction; and

13. **WHEREAS,** no provision of this PA will be construed by any of the Signatories, Invited Signatories, or Concurring Parties to the PA as: (a) abridging, debilitating, or in any way affecting any sovereign powers of CRIT; (b) affecting the trustee-beneficiary relationship between the United States Secretary of the Interior and CRIT (or individual Indian landowners); or (c) interfering with the government-to-government relationship between the United States and CRIT; and

14. **WHEREAS,** the Bureau of Indian Affairs Western Regional Office (BIA) is the agency responsible for issuing permits and approving ROWs on tribal and allotted lands of CRIT, and the BLM has consulted with the BIA about the effects of the Undertaking on historic properties and has invited them to be an Invited Signatory to this PA; and

15. **WHEREAS,** the Applicant has participated in Section 106 consultations and the BLM has consulted with the Applicant about the effects of the Undertaking on historic properties and has invited them to be an Invited Signatory to this PA; and

16. **WHEREAS,** no provision of this PA shall be construed by any of the Signatories, Invited Signatories, or Concurring Parties to the PA as: (a) diminishing or reducing the Applicant's property rights or business operation discretion as provided by law, (b) expanding or increasing the authority of any governmental or Tribal entity beyond that explicitly provided by law or regulation or (c) waiving the Applicant's right to contest and/or appeal any governmental action; and

17. **WHEREAS,** the Undertaking crosses lands in California that are subject to the Programmatic Agreement Regarding Renewable Energy Development on a Portion of Public Lands Administered by the Bureau of Land Management – California, dated February 5,

2016 (the Desert Renewable Energy Conservation Plan or DRECP PA); the California portion of the PA tiers from this version of the DRECP PA, pursuant to Stipulation I(B)(2) of the DRECP PA; and certain stipulations of the DRECP PA apply to the portion of the Undertaking in California; and

18. **WHEREAS,** because the Undertaking crosses lands under the jurisdiction of the ASLD, the ASLD may use provisions of the PA to address the applicable requirements of the Arizona State Historic Preservation Act (A.R.S. § 41-861 et seq.) on State Trust lands in Arizona and may issue a ROW for the Undertaking; the BLM has consulted with the ASLD about the effects of the Undertaking on historic properties and has invited the ASLD to be an Invited Signatory to the PA; and

19. **WHEREAS,** the SLC may authorize alternatives of the Undertaking on State land and has certain responsibilities under California State laws and regulations to take into account and mitigate the impacts on properties eligible for or included on the California Register of Historic Places; and the SLC has declined in a Consulting Party Return Form dated March 6, 2017 to participate as a Consulting Party in the negotiation of the PA; and

20. **WHEREAS,** the BLM has consulted with the California Department of Transportation (Caltrans), which may issue ROWs to the Applicant for access to and construction of certain components of the Undertaking, about the effects of the Undertaking on historic properties and Caltrans has declined in a Consulting Party Return Form dated February 24, 2017 to participate as a Consulting Party in the negotiation of the PA; and

21. **WHEREAS,** the BLM has consulted with Arizona Department of Transportation (ADOT), which may issue ROWs to the Applicant for access to and construction of certain components of the Undertaking, about the effects of the Undertaking on historic properties and has invited ADOT to be an Invited Signatory to the PA; and

22. **WHEREAS,** the Lower Colorado Region of Reclamation is considering issuing a license to the Applicant to construct, operate, and maintain the proposed transmission line on any Reclamation lands crossed by the Undertaking; and the BLM has consulted with Reclamation about the effects of the Undertaking on historic properties and has invited Reclamation to be an Invited Signatory to the PA; and

23. **WHEREAS**, the Department of Defense Yuma Proving Ground (YPG) is considering issuing a license to the Applicant to construct, operate, and maintain the proposed transmission line on any YPG lands crossed by the Undertaking; and the BLM has consulted with YPG about the effects of the Undertaking on historic properties and has invited YPG to be an Invited Signatory to the PA; and

24. **WHEREAS,** the California Public Utilities Commission (CPUC) agrees that the California State Historic Preservation Officer (SHPO), per 36 CFR 800(c)(2) reflects the interests of the State of California and its citizens in the preservation of their cultural heritage and therefore the interests of the CPUC, as a State of California lead agency for purposes of compliance with the California Environmental Quality Act (CEQA); and

25. **WHEREAS,** the CPUC is the lead State agency for compliance with the California Environmental Quality Act (CEQA) and has certain responsibilities under California State laws and regulations to take into account and mitigate the impacts on properties eligible for or included on the California Register of Historical Resources; and the BLM has consulted

with the CPUC about the effects of the Undertaking on historic properties and has invited the CPUC to be an Invited Signatory to the PA; and

26. **WHEREAS,** the Undertaking may cross lands under the jurisdiction of La Paz and Maricopa Counties, Arizona and Riverside County, California. The Undertaking may cross lands under the jurisdiction of the Town of Quartzsite, Arizona; and the BLM has invited the above counties and the Town of Quartzsite, Arizona to be Consulting Parties. La Paz County and the Town of Quartzsite have accepted the invitation to be Consulting Parties. The BLM has consulted with them about the effects of the Undertaking on historic properties and has invited each of La Paz County and the Town of Quartzsite to be Invited Signatories to this PA; and

27. **WHEREAS,** the Arizona State Museum (ASM) has been invited to participate in the PA pursuant to 36 C.F.R. § 800.6(c)(2)(iii) as it has mandated authority and responsibilities under the Arizona Antiquities Act (AAA) A.R.S. § 41-841 et seq. that apply to that portion of the Undertaking on State lands as defined in the AAA in Arizona; and the ASM has mandated authority and responsibilities under A.R.S. § 41-865 that apply to that portion of the Undertaking on private lands; and the BLM has consulted with the ASM about the effects of the Undertaking on historic properties and has invited the ASM to be an Invited Signatory to the PA; and

28. **WHEREAS,** the Western Area Power Administration (WAPA) may participate in the Undertaking by providing funding to the Applicant; and the BLM has consulted with WAPA about the effects of the Undertaking on historic properties and has invited WAPA to be an Invited Signatory to the PA: and

29. **WHEREAS,** the BLM is responsible for government-to-government consultation with Indian tribes pursuant to 36 C.F.R. § 800.2(c)(2)(ii), the American Indian Religious Freedom Act (42 U.S.C. § 1996) (AIRFA), Executive Order 13175, and Section 3(c) of the Native American Graves Protection and Repatriation Act (25 U.S.C. § 3001-13) (NAGPRA), and has formally invited the twenty-three (23) Indian tribes listed below to participate in consultations regarding the potential effects of the Undertaking on properties to which they ascribe traditional religious and cultural significance, provided that CRIT and the CRIT THPO take no position on whether consultation has occurred or is consistent with Federal law; and

30. **WHEREAS,** the Agua Caliente Band of Cahuilla Indians, the Ak-Chin Indian Community, the Augustine Band of Cahuilla Indians, the Cabazon Band of Mission Indians, the Chemehuevi Tribe, the Cocopah Tribe, the Fort McDowell Yavapai Nation, the Fort Mojave Indian Tribe, the Quechan Tribe, the Gila River Indian Community, the Salt River Pima-Maricopa Indian Community, the Hopi Tribe, the Moapa Band of Paiute Indians, the Morongo Band of Mission Indians, the San Manuel Band of Mission Indians, the Soboba Band of Luiseno Indians, the Tohono O'odham Nation, the Torres Martinez Desert Cahuilla Indians, the Twenty-Nine Palms Band of Mission Indians, the Yavapai-Apache Nation, the Yavapai-Prescott Indian Tribe, and the Pueblo of Zuni (collectively, the Tribes) have been contacted, invited to engage in consultations and invited to be Concurring Parties to the PA; and

31. **WHEREAS,** the Ak-Chin Indian Community, the Cocopah Tribe, the Fort Mojave Indian Tribe, the Gila River Indian Community, the Hopi Tribe, the Morongo Band of Mission

Indians, the Quechan Tribe, the Salt River Pima-Maricopa Indian Community, the Soboba Band of Luiseno Indians, the Tohono O'odham Nation, the Torres Martinez Desert Cahuilla Indians, the Twenty-Nine Palms Band of Mission Indians, and the Yavapai-Apache Nation, and the Yavapai-Prescott Indian Tribe have participated in consultations for the Undertaking and the development of the PA consistent with 36 C.F.R. § 800.2(c)(2); provided that CRIT and the CRIT THPO take no position on whether consultation has occurred or is consistent with Federal law; and

32. **WHEREAS,** the CPUC is responsible for government-to-government consultation with Indian tribes pursuant to CEQA for non-Federal lands, the CPUC has informed consulting Indian tribes in California that the BLM's consultation process fulfills part of CPUC's consultation obligations; and

33. **WHEREAS,** the BLM has provided the public with opportunities to comment on the Undertaking and participate in the National Environmental Policy Act (NEPA) process through a Notice of Intent to Prepare an Environmental Impact Statement (EIS) published in the Federal Register on March 23, 2016 for the development of the EIS; held three public scoping meetings in April 2016; published the Draft EIS on August 31, 2018 and held three public meetings in Phoenix, AZ on October 9, 2018, Quartzsite, AZ on October 10, 2018, and Blythe, CA on October 11, 2018. Public meeting materials included information about the NHPA and the Section 106 process, and the BLM considered comments received through the NEPA and NHPA processes concerning cultural resources in the development of the PA; and

34. **WHEREAS**, Human Remains, Associated/Unassociated Funerary Objects, Sacred Objects, and Objects of Cultural Patrimony recovered within or on Federal and tribal land will be treated in accordance with NAGPRA pursuant to 25 U.S.C. § 3001–13, ARPA pursuant to U.S.C. 470aa, and in accordance with the AIRFA pursuant to 42 U.S.C. § 1996; and

35. **WHEREAS,** Human Remains and Funerary Objects discovered on State or private land in Arizona will be treated in accordance with A.R.S. § 41-844 and A.R.S. § 41-865, respectively; and in California, in accordance with the Cal. Pub. Res. Code §§ 5097.98, 5097.991 and the Cal. Health & Safety Code § 7050.5(c); and

36. **WHEREAS,** Termination of the agreement by an Invited Signatory shall only apply to lands under their respective jurisdiction. In such case, the BLM shall comply with 36 C.F.R. § 800, subpart B, for all undertakings affecting the terminating Signatory's lands within the scope of the PA. Dispute resolution (Stipulation XV) is strongly encouraged prior to termination

NOW, THEREFORE, the BLM, the Arizona SHPO, the California SHPO, CRIT, and the ACHP (collectively, the Signatories) agree that the Undertaking shall be completed in accordance with the stipulations established in the PA in order to take into account the effects of the Undertaking on historic properties. The BLM shall ensure that the Undertaking is carried out in accordance with the following stipulations in order to take into account the effect of the Undertaking on historic properties:

STIPULATIONS

I. **DEFINITIONS USED IN THIS PA:** Definitions used in this PA are included as Attachment 2.

II. DESCRIPTION OF THE UNDERTAKING

A. The Undertaking encompasses the construction phase of the proposed transmission line project that takes place after the BLM ROW grant is issued and includes the construction of associated project facilities as well as the reclamation of areas used during construction but not necessary for operation and maintenance of the facilities. The Undertaking may include surveys, geotechnical testing, engineering, mitigation planning and design, or other activities initiated prior to construction of the transmission line and project facilities. The potential effects to historic properties will be the most extensive and substantial during the construction phase. The Undertaking also encompasses those activities necessary to operate and maintain the transmission line and project facilities over the life of the project. Operation and maintenance activities are approved in the ROW grant and confined to the areas specified in the ROW grant. This PA stipulates the process necessary to comply with Section 106 obligations for construction and reclamation as well as operation and maintenance of the proposed transmission line and associated facilities. A detailed description and a map of the Undertaking are included as Attachment 1.

B. Changes to approved operations and maintenance activities, including new actions on BLM lands outside of the approved BLM ROW grant, require BLM approval and may necessitate a separate Section 106 review and additional ROWs, subject to Stipulation XI.

C. If decommissioning occurs in the future, it will be considered a separate undertaking. The ROW grant shall stipulate, and the BLM shall ensure, that decommissioning will be considered a new action for Section 106 review, and that historic properties potentially affected by decommissioning will be considered in accordance with the pertinent laws, regulations, and policies extant at the time.

III. TRIBAL CONSULTATION

A. The BLM acknowledges its government-to-government responsibilities to the Tribes for Section 106 review and implementation of the PA and commits to accord tribal officials the appropriate respect and dignity as leaders of sovereign nations. The BLM shall facilitate meaningful consultation with the Tribes during the planning and implementation of the Undertaking.

B. The BLM will continue to engage the Tribes in meetings and discussions regarding the Undertaking. The BLM has invited the Tribes to engage at the earliest stages of the Undertaking to gather ethnographic information, property information, and other resource information to help identify areas which may be of religious and cultural significance to them and which may be eligible for the National Register of Historic Places (NRHP). Engaging in consultation at the earliest stages of project planning has assisted and will continue to assist the BLM in identifying significant issues and resources that may not be identified during conventional cultural resources survey and identification efforts. As part of the consultation process the BLM shall endeavor to provide information and maps that are easily understood by tribal representatives.

C. The BLM will continue to discuss and seek agreement with the Tribes regarding processes of consultation that are clear, open and transparent. If a Tribe would like

government-to-government consultation with the BLM will honor the request on an individual basis at the earliest possible time. If a Tribe would like to establish regular meetings with a BLM Field Office regarding the Undertaking, the Tribe and the BLM Field Manager should consult to develop specific procedures for consultation.

D. The BLM will require the Applicant to hire tribal monitors during archaeological surveys, construction monitoring, reclamation, and archaeological field work activities for the Undertaking, including the monitoring of ground-disturbing activities. The BLM will ensure that tribal participation is in coordination with archaeological surveys by the Applicant's cultural resources consultant. Procedures for participation during the construction and reclamation activities of the Undertaking will be coordinated with all the Tribes with whom the BLM consulted through the development of a Tribal Participation Plan specific to the Undertaking. All the Tribes with whom the BLM consulted will be afforded the opportunity to be hired by the Applicant to monitor and be on site during ground disturbance construction activities for facilities, roads, or other components associated with the Undertaking.

E. The objective of consultation is for BLM to seek agreement with the Tribes regarding matters arising in the Section 106 process. The BLM will identify as early as possible any potential historic properties, properties with cultural or religious significance to Indian tribes (including landscape-level resource concerns), or tribal concerns associated with the Undertaking in order to avoid, minimize or mitigate effects on historic properties.

F. The BLM shall make reasonable attempts to contact the Tribes to confirm that the party has elected not to comment or agrees with the course of action proposed by the BLM. "Reasonable attempts" include two forms of written communication, including a formal letter and/or email to the Tribal Chairperson and designated representative for the Tribe; and two follow-up phone calls to the Tribe's designated representative. Unless otherwise agreed to, the BLM shall respond to any request from a Tribe for information and clarification about any proposed language or element that is part of the implementation of the PA, within thirty (30) calendar days of receipt of the request. Where the time period for review or comment has passed after such reasonable attempts, the BLM may proceed with the course of action proposed.

G. The BLM shall coordinate with the CPUC on tribal consultation efforts for all non-Federal lands in California, including outreach, information sharing, and other activities, to allow the CPUC to fulfill its tribal consultation obligations under CEQA. The CPUC is responsible for tribal consultation under California State law.

H. In all instances where the BLM provides documents for review by the THPO or Tribes, the BLM shall either incorporate requested changes into the document or provide a written explanation of its inability to make such changes. The BLM shall consult with the appropriate reviewer(s) to resolve differences and/or disagreements.

IV. STANDARDS AND QUALIFICATIONS

A. PROFESSIONAL QUALIFICATIONS. The BLM will ensure that all actions prescribed by this PA shall be carried out by or under the direct supervision of a person or persons meeting, at a minimum, the applicable professional qualification standards

set forth in the Office *of* Personnel management professional qualifications for archaeology and historic preservation, or the Secretary of the Interior's Professional Qualification Standards (PQS), as appropriate (48 Fed. Reg. 44739 dated September 29, 2983, and C.F.R. § 61. The PQS are available online at: http://www.nps.gov/history/local-law/arch_stnds_9.htm.

1. Individuals must also meet the regional experience or other requirements of a BLM-issued Cultural Resources Use Permit issued under the authority of the Archaeological Resources Protection Act of 1979 (ARPA) (16 U.S.C. 470aa-mm) and U.S.C. 431-433) and its regulations (43 C.F.R. § 7), the Antiquities Act of 1906 (P. L. 59-209; 34 Stat. 225, 16 U.S.C. 431-433) and its regulations (43 C.F.R. § 3), and/or the Federal Land Policy and Management Act of 1976 (FLPMA) (Public Law 94-570). However, nothing in this Stipulation may be interpreted to preclude any party qualified under the terms of this paragraph from using the services of persons who do not meet the PQS, so long as the work of such persons is directly supervised in the field and laboratory by someone who meets the PQS.

2. On State lands in Arizona, all actions prescribed by this PA shall be carried out by or under the direct supervision of an AAA-permitted consultant.

B. DOCUMENTATION STANDARDS. The BLM will ensure that reporting on and documenting the actions cited in this PA shall conform to every reasonable extent with the *Secretary of the Interior's Standards and Guidelines for Archeology and Historic Preservation* (48 Fed. Reg. 44716-40 dated September 29, 1982) and take into consideration the ACHP's handbook, *Section 106 Archaeology Guidance* (http://www.achp.gov/archguide) as well as *Guidelines for Identifying Cultural Resources* BLM Manual H-8110 and Guidelines for Evaluating and Documenting Traditional Cultural Properties, National Register *Bulletin 38*, 1989. The following guidelines are available during development of this PA. Should the guidelines be updated after the execution of the PA, the latest versions will take precedent. In the event that any guidelines are modified in the future to conflict with this PA, the BLM shall notify all Consulting Parties and will consult to determine how this PA should be revised, if necessary, pursuant to **Stipulation XVI**.

1. Arizona:

a. The BLM will ensure that on State land in Arizona, all activities and documentation shall be consistent with the AAA and its implementing rules. Additionally, rules for implementing the AAA and AZ SHPO guidance on implementing the Arizona State Historic Preservation Act shall conform to specifications and guidelines contained in *Guidelines for State Historic Preservation Act.* Additionally, *AZ SHPO Standards for Documents Submitted for SHPO Review in Compliance with Historic Preservation Laws* (Revised January 2016) shall guide inventory reports for all work done in Arizona.

b. In Arizona, the Applicant shall ensure that its cultural resources contractor obtains the appropriate AAA permit from the ASM prior to conducting archaeological work for the Undertaking.

2. California: The BLM will ensure that on State land in California, all activities and documentation shall be consistent with the standards as outlined in the California Office of Historic Preservation Archaeological Resource Management Reports (ARMR): Recommended Contents and Format (ARMR Guidelines) for the Preparation and Review of Archaeological Reports.

3. CRIT: The Applicant shall ensure that its cultural resources contractor obtains any necessary permits from CRIT prior to working on CRIT lands. Afterwards, the Applicant's cultural resources contractor shall approach the BIA to consult and determine the need to obtain an ARPA permit.

C. CONFIDENTIALITY. Information concerning the nature and location of any historic property, archaeological resource (historic or prehistoric), or other confidential cultural resource will be considered sensitive and protected from release under the provisions of the Freedom of Information Act (FOIA) (5 U.S.C. § 552, as amended by Public Law No. 104-231, 110 Stat. 3048), Section 9 of ARPA (16 U.S.C. § 470hh), Section 304 of the NHPA (54 U.S.C. § 307103), and Executive Order 13007. For the purposes of consultation under this PA, the BLM may release certain information for the benefit of the resource. Consideration may result in the sharing of summary reports that do not contain sensitive location information. Other than the respective SHPOs/THPO and the ACHP, the BLM will only consider the release of complete reports or other information concerning the nature and location of any historic property, archaeological resource, or other confidential cultural resource to a Consulting Party with a demonstrated interest in the information requested and a signed data sharing agreement. The data sharing agreement shall include provisions to ensure protection to tribal sovereign immunity. It shall also permit tribal members to review reports and information without individually signing the agreement, provided that the affiliated THPO or tribe has signed the data sharing agreement. All Consulting Parties will ensure that all sensitive information is protected from release.

D. CURATION STANDARDS.

1. Collections from Federal Lands:

a. All records and materials removed from Federal lands as a result of the actions required by this PA shall be curated in accordance with 36 C.F.R. § 79, and the provisions of the NAGPRA, 43 C.F.R. § 10, as applicable.

b. Materials that are archaeological resources under ARPA, NAGPRA materials, or historic properties under the NHPA are subject to the processes and procedures set forth in the applicable laws and regulations. In accordance with 43 C.F.R. 7.33, the BLM land manager may determine that certain materials are not or are no longer of archaeological interest and therefore not considered archaeological resources. For those materials that are determined to not be archaeological resources under 43 C.F.R 7.33, the BLM land manager may determine appropriate conservation measures, including, but not limited to, avoidance, leaving materials in situ or relocated nearest the discovery locale as practicable, reburial, curation, or any other measure as the BLM land manager deems appropriate under applicable laws, regulations, and BLM policies related to such activity. Any reburial or conservation

decisions will be conducted by or in consultation with the relevant Tribes or their representatives, as provided for in the Tribal Participation Plan.

2. Collections from State Lands:

a. All artifacts recovered from lands owned, controlled or operated by the State of Arizona, including associated records and documentation, shall be curated at the ASM, or an approved and certified repository, in accordance with the standards and guidelines required by the ASM.

b. To the extent permitted under Sections 5097.98 and 5097.991 of the California Public Resources Code and by private property owners, the materials and records results from the actions required by this PA for lands owned, controlled or operated by the State of California and private lands in California, including associated records and documentation, shall be curated in accordance with 36 C.F.R. § 79.

3. Collections from CRIT lands: On lands within the Colorado River Indian Reservation, all records and materials resulting from the actions required by this PA shall be managed in accordance with tribal law, including any CRIT reburial policy.

4. Collections from Private Lands: To the extent a private landowner requests that the materials be removed from the site, the BLM will seek to have the materials donated through a written donation agreement developed in consultation with the Tribes or their representatives. The BLM will seek to have all materials from each State curated together in the same curation facility within the State.

V. IDENTIFICATION, EVALUATION, AND FINDINGS OF EFFECT

A. AREAS OF POTENTIAL EFFECTS (APEs, see map in Attachment 1) are defined as:

1. Direct effects: The APE for direct effects for the Undertaking will include all areas likely to be affected by construction and reclamation activities. This APE will include the 200-foot-wide permitted ROW corridor for one 500 kV transmission line and access roads (within the corridor), plus 100 feet on either side of the corridor (400 feet total width). This width will allow for adjustments in transmission line or access road placement to avoid when possible any modern infrastructure, natural features such as drainages and bedrock outcrops, or cultural resources such as archaeological sites and historic buildings or structures.

a. Proposed new access routes and existing roads requiring improvement outside the transmission line ROW will have a 150-foot wide direct effects APE (75 feet from centerline).

b. The direct effects APE for staging areas, borrow areas, substations and other transmission infrastructure will include the footprint of the facility and a buffer of 250 feet around the footprint of the proposed activity/facility.

c. The direct effects APE for pulling/tensioning sites that fall outside the ROW will be the footprint of the site plus a 250-foot buffer around the footprint of these sites.

d. The BLM has provided the APE definitions above concurrently to the SHPOs/THPO and Consulting Parties for a single thirty (30)-calendar-day review and comment period.

2. Indirect effects: There are two APEs to account for indirect effects, one that addresses effects from the construction of the transmission line components that will be visible after construction, and one that addresses atmospheric effects from new or maintained access routes. The indirect effects APE for visible transmission line components (consisting of the transmission towers and the series compensation station) shall be within 3 miles from the center of the ROW unless consultation identifies a reasonable need to expand this APE in certain locations. The indirect effects APE for new or maintained roads (includes new or maintained roads within the 200-foot ROW) shall be 1/8-mile from the centerline of the access road, or to the nearest existing road, transmission line tower, or other pre-existing built feature on the landscape, as applicable.

a. BLM will use a Geographic Information System (GIS) view shed analysis to identify areas in both of the indirect effects APE from which the Undertaking may be visible.

b. The indirect effects APE may extend beyond the 1/8-mile and 3-mile conventions to encompass properties that have traditional religious and cultural importance, including traditional cultural properties (TCPs) or other geographically extensive historic properties, such as trails, when a Consulting Party requests and the BLM and SHPO/THPO concur that the APE be extended.

3. Cumulative effects: The APE for cumulative effects shall be the same as that for direct and indirect effects combined and shall be reasonably foreseeable.

4. Final APE

a. The final APE is shown on the map included with Attachment 1, the Agency Preferred Alternative in the Draft Environmental Impact Statement published on August 31, 2018.

b. Should the APE require modification as a result of a refinement in the construction POD, the BLM will consult with the Consulting Parties for no more than fifteen (15) calendar days to establish the new APE. The BLM will then prepare a description and map(s) of the modified APE and any additional identification efforts and provide them to the Consulting Parties within thirty (30) calendar days of the day upon which agreement was reached.

B. Identification of Historic Properties and/or Historic Districts: The BLM shall ensure that the Applicant completes a cultural resources inventory to identify historic properties and/or historic districts that could be affected by the Undertaking to include the following reports:

1. Class I Literature Review, Ethnographic Overview, and Research Design and Work Plan

a. A Class I records search and literature review (as defined in Attachment 2) of Federal and State agency files has been completed for a 1.0-mile wide corridor

(.5 miles on either side of centerline) along all alternatives of the proposed Undertaking. The Class I report will inform all subsequent phases and will be used as a reference document to support the Class III surveys (as defined in Attachment 2) conducted for this Undertaking. The BLM will ensure that additional file searches are conducted as needed to address changes in the APE and to be current in advance of any additional Class III inventories.

b. The BLM has consulted and will continue to consult with the Tribes to identify any resources that have cultural or religious significance to the Tribes.

i. The Applicant, through its cultural resources contractor, has completed an ethnographic literature review (Ethnographic Overview) based on the review of existing information about resources with cultural or religious significance to the Tribes.

ii. The BLM requires the development of an Ethnographic Assessment for a specific geographic area within the Undertaking's APE because a Tribe has indicated that they have additional information not included in the Ethnographic Overview that should be considered in the Section 106 identification efforts. All the Tribes with whom the BLM consulted will be afforded the opportunity to participate in the Ethnographic Assessment per a work plan to be developed by the Applicant's cultural resources contractor and to review the resulting draft report.

c. The BLM has submitted the Class I report (Brodbeck and Glenny 2017 – See Attachment 3. References Cited) and Ethnographic Overview (Leard and Brodbeck 2017) to the SHPOs, Tribes, and Federal and State land managing agencies for review and comment and to seek any additional information regarding resources in the APE with cultural or religious significance to the Tribes.

d. Research Design and Work Plan: The information in the Class I report has been used to develop a Research Design and Work Plan for all cultural resources inventory studies for the proposed Undertaking. The BLM has submitted the Research Design and Work Plan (Brodbeck et al. 2017) to the Consulting Parties for a thirty (30) day review and comment period and has concurrently requested SHPOs/THPO review and concurrence on the proposed identification efforts. The Research Design and Work Plan describes the proposed Class III inventory, the geo-archaeological study, the built environment survey, and the identification and assessment of effects to historic properties in the indirect effects APE.

e. The AZ SHPO commented on the above documents, including the geo-archaeological study referenced in **Stipulation V.B.2** below, in a letter to the BLM dated August 23, 2017. The CA SHPO concurred in a letter to the BLM dated November 16, 2017. The CRIT THPO commented on the above documents in a letter to the BLM dated November 9, 2017.

2. Geo-archaeological Study: At the BLM's request, the Applicant, through its cultural resources contractor, has completed a geo-archaeological study of the entire

direct effects APE (Brodbeck et al 2017), which is included in the Research Design and Work Plan (**Stipulation V.B.1.d**). The study considers natural and archaeological site formation processes to determine the likelihood of subsurface archaeological remains within the APE. The purpose of the geo-archaeological study is to assist in the identification of locations where archaeological remains that cannot be seen on the surface are likely to be found, in anticipation of the Class III inventory and construction.

3. Class III Inventory of Geotechnical Testing Locations

a. The Applicant, through their cultural resources contractor, will complete a Class III inventory of geotechnical testing locations required prior to final engineering.

b. The Applicant, through their cultural resources contractor, will submit the Class III Inventory Report of geotechnical testing locations to the BLM Upon approval by the BLM, the report will be submitted to the SHPOs/THPO and the CPUC for a thirty (30)-calendar day review.

4. Pre-Construction Class III Inventory: Any part of the APE for direct effects for the final selected route that has not already been inventoried to current standards, or not considered by the BLM, the SHPOs/THPO, or other land managing agencies to be adequately inventoried, and which can be accessed safely and legally, shall be completely inventoried at a Class III level to the standards of the BLM and SHPO for Arizona and California as detailed in **Stipulation IV.A and B.** Determinations of eligibility, findings of effect, and possible treatment shall be made by the BLM in consultation with the SHPOs/THPO and appropriate Consulting Parties, including Tribes. Identification efforts shall be performed regardless of the ownership (public, private, State, or Tribal) of the lands. The Applicant shall be responsible for gaining access to non-BLM lands. In the event access to non-BLM lands is not obtained, the Applicant will provide documentation to BLM sufficient to demonstrate two (2) unsuccessful efforts to secure access or showing that the landowner has affirmatively denied such access. Where access cannot be obtained, resorting to other means for survey such as aerial imagery may be used to determine likelihood of presence of historic properties. The Class III Inventory will be conducted with sensitivity for locations or other features identified as important through Tribal consultation or ethnographic studies.

All previously recorded cultural resources within the direct effects APE will be re-visited and the associated records updated and revised as appropriate, including NRHP eligibility recommendations and determinations. Previously recorded cultural resources and newly recorded cultural resources whose boundaries lie partially within or straddle the direct effects APE will be fully recorded outside the direct effects APE, to the extent practical and within .25 miles of the direct effects APE, regardless of surface ownership in order to provide context for any necessary treatment within the direct effects APE.

5. Historic Built-Environment Study: The BLM will require the Applicant, through their cultural resources contractor, to complete a separate Historic Built-Environment study for the entire APE to identify built-environment resources

within the direct and indirect APE and assess their eligibility for listing in the NRHP. For the APE for direct effects as defined in **Stipulation V.A**, all historic and in-use linear cultural resources such as canals, roads, trails, and railroads will be identified and recorded where they intersect the APE and will be fully recorded within the APE.

C. Determination of Eligibility and Finding of Effect

1. For each cultural resource within the APE, the BLM shall consult with the SHPOs/THPO and any Native American tribe that attaches religious and cultural significance to any identified resource and other Consulting Parties to determine NRHP eligibility pursuant to 36 C.F.R. § 800.4(c)(1) following guidance in *How to Apply the National Register Criteria for Evaluation.* If the BLM and the SHPOs/THPO cannot reach concurrence on NRHP eligibility, the documentation will be forwarded to the Keeper of the National Register (Keeper) for a formal determination.

2. The Applicant, through their cultural resources contractor, will use existing resources to the extent available to identify historic properties eligible under Criteria A, B and/or C, that fall within the indirect effects APE and that may be affected by the Undertaking. The Applicant will ensure that ethnographic and other information provided by the Consulting Parties will be included in this identification and assessment effort, including comments on the eligibility of and effects on TCPs. Some historic properties eligible under Criterion D may be included at the BLM's discretion, if requested by a Consulting Party. This analysis will include potential impacts to historic properties within the indirect effects APE from increased access occurring as a result of the Undertaking. The methods for assessing indirect effects are described in the Research Design and Work Plan.

The BLM shall make findings of the effects to historic properties identified in the APE in consultation with the SHPOs/THPO after Consulting Party comment. If the BLM and the SHPOs/THPO cannot reach concurrence on findings, the question will be referred to the ACHP, per 36 C.F.R. § 800.5(c)(2).

D. Reporting

1. For each State, the Applicant shall prepare a comprehensive Inventory Report or Reports incorporating findings from the Class III Intensive Field Inventory, the geo-archaeological study, the Historic Built-Environment study, and the study on the effects of the Undertaking on historic properties in the APE for indirect effects. The comprehensive Inventory Report or reports will include a summary of results from the Ethnographic Overview and Ethnographic Assessment; and any additional information provided by the Consulting Parties about places of concern to them, the location of those places in relationship to the Undertaking, and an assessment of the effect of the Undertaking on those places. The reports shall include recommendations on NRHP eligibility and treatment recommendations for historic properties within the APEs for direct, indirect and cumulative effects of the Undertaking as described in **Stipulation V.A**. Any assessment that avoidance during construction is not possible will be supported by documentary evidence from the Applicant.

2. The Applicant shall submit drafts of the Inventory Report for each State to the BLM. The BLM will provide the reports to the SHPOs, THPO, appropriate land managers, the ASM, the CPUC, and the Tribes within each State for review, concurrent with BLM review. These parties will provide written comments to the BLM within sixty (60) calendar days regarding:

a. The adequacy of the identification effort;

b. The NRHP eligibility of the cultural resources identified;

c. The assessment of effects of the Undertaking on the historic properties identified.

d. The presence of TCPs or any properties of traditional religious or cultural importance to the Tribes that were not identified in the inventory but that may be affected by the Undertaking.

3. The BLM shall ensure that comments received within sixty (60) calendar days are considered in development of the revised Inventory Reports. The BLM shall submit a consolidated set of comments on the draft Inventory Report within fifteen (15) calendar days following end of the review period. The applicant shall have forty-five (45) calendar days to address comments and return a revised Inventory Report to the BLM. The BLM will submit the revised Inventory Report to the appropriate SHPO/THPO, Tribes, and Consulting Parties for a sixty (60)-calendar-day concurrent review, and will request SHPO/THPO concurrence on the BLM's determinations of NRHP eligibility and treatment recommendations for each historic property identified. The BLM will notify the Consulting Parties via electronic mail (email) of the submittal and the date that comments are due. If the sixty (60)-calendar-day review time frame cannot be met, the SHPO/THPO, Tribe or Consulting Party will notify the lead BLM Office main point of contact by email requesting a review extension. The lead BLM Office will determine whether to grant an extension, not to exceed an additional thirty (30) calendar days.

4. The Inventory Reports will provide the following (except for unevaluated cultural resources [see definition in Attachment 2] or properties found during possible future variances and discoveries):

a. Characterization of the efforts to identify historic properties

b. Inventory of cultural resources and recommendations of NRHP eligibility

c. Recommendations for treatment measures to be applied to historic properties affected by the Undertaking.

VI. RESOLUTION OF ADVERSE EFFECTS: The BLM, in consultation with the Applicant, the SHPOs/THPO, and Consulting Parties, shall ensure that an HPTP is developed and implemented to avoid, minimize and/or mitigate Project-related adverse effects on historic properties.

A. Avoidance

1. The BLM shall make every reasonable effort to avoid adverse effects to historic properties, including those of traditional religious and cultural significance to Tribes, with input from Consulting Parties and affected Tribes.
2. Avoidance measures for historic properties may include (but are not limited to) realignment of the transmission line, fencing of historic properties with a buffer zone during construction, monitoring of construction near the boundaries of historic properties, or placing towers, maintenance roads and ancillary facilities outside of the boundaries of historic properties.
3. BLM will ensure that the Applicant, through their cultural resources contractor, includes a description of these proposed efforts for each applicable historic property in the Class III Inventory Report and in the applicable State HPTP.

B. Minimization of Adverse Effects

1. When complete avoidance of adverse effects to historic properties is not possible, the BLM shall ensure that the Applicant, in consultation with the Consulting Parties, makes a good faith effort to minimize adverse effects on historic properties by efforts minimizing the visual effects of the Undertaking.
2. The BLM shall ensure that the Applicant, through their cultural resources contractor, includes a description of these proposed efforts for each applicable historic property in the Class III Inventory Report and in the applicable State HPTP.

C. The BLM shall ensure that the Applicant, through its cultural resources contractor, prepares an HPTP for each State that addresses the effects of the proposed Undertaking on historic properties, including properties of traditional religious and cultural importance to Tribes, and TCPs. The HPTP shall address direct, indirect and cumulative effects from construction and reclamation as well as from operation and maintenance of the proposed transmission line and associated facilities. The HPTP will be incorporated into the POD as an appendix.

D. The HPTPs will be consistent with the Secretary of the Interior's Standards for Archeology and Historic Preservation (48 FR 44716) (*Federal Register*, September 29, 1983), hereinafter referred to as Secretary's Standards; the ACHP's Section 106 Archaeology Guidance (2009); and all applicable NPS guidance for evaluating and documenting NRHP properties (e.g., *Guidelines for Evaluating and Documenting Traditional Cultural Properties*, *Guidelines for Evaluating and Documenting Rural Historic Landscapes*); and the Rules Implementing the AAA in Arizona as well as the guidelines in California.

E. The HPTPs will include treatment measures developed through the efforts of all Consulting Parties that address adverse effects on all historic properties that will be adversely affected.

F. The HPTP must include the following information:

1. All identified historic properties within the APE by land ownership and by township. The HPTPs will identify the specific avoidance, minimization, and/or treatment strategies proposed to address the direct, indirect, and cumulative adverse effects of the Undertaking on historic properties. Any finding that avoidance during

construction is not possible will be supported by documentary evidence from the Applicant.

2. Research questions and goals that are applicable to the Undertaking area and can be addressed through data recovery and archival studies, along with an explanation of their relevance and importance. These research questions and goals will incorporate the concept of historic contexts as defined in *National Register Bulletin 16*.

3. A description of fieldwork and analytical methods and strategies applicable to the Undertaking, along with an explanation of their relevance to the research questions. If phased data recovery will be employed, describe the fieldwork and analytical methods and strategies that will be employed during each phase. Treatment methods will be developed for each class of property identified in the Inventory Report and may include, but are not limited to, excavation, archival research, ethnographic studies, and oral history, as appropriate and as agreed upon by the Consulting Parties.

4. The level of effort to be expended on the treatment of each property. For archaeological data recovery, this will include methods of sampling, i.e., sample size, and rationale for specific sample unit selection.

5. Data needs for each research question, i.e., items (for example, ceramics, obsidian, thermal features) that need to be present to be able to address the research question.

6. Results of tribal consultation regarding the incorporation of tribal perspectives into the cultural history, research design, data recovery/treatment methodology, analysis and interpretation.

7. A plan for the use of tribal monitors during archaeological field work.

8. Professional qualifications of staff, including archaeological field personnel, laboratory and analysis personnel, personnel in charge of report writing, and subcontractors.

9. Permits required and obtained.

10. Curation arrangements.

11. Project suspension/termination plan.

12. Monitoring and Discovery plan, as described in **Stipulation VIII** below.

13. Protocol for sensitive treatment of human remains, as described in **Stipulation VIII** below.

14. Historic Properties Management Plan (HPMP), as described in **Stipulation IX** below. The HPMP describes management of historic properties during operation and maintenance.

15. Treatment measures will include but not be limited to those that address public outreach as appropriate, such as journal articles, public site visits, brochures, or web sites focusing on the historic properties impacted by the Undertaking. Any proposed public outreach will be developed in consultation with the Tribes to ensure that sensitive cultural resource material is kept confidential.

16. Treatment measures may include but not be limited to the synthesis of regional data and the study of related collections.

G. The HPTPs will provide a table listing each historic property, including:

1. The site number and name of the historic property or unevaluated property by land ownership and by township, range, and section number. Locational information for historic properties shall be included as an appendix that can be redacted for the version of the HPTP available to the general public;

2. A brief description of the historic property or unevaluated property;

3. The type of disturbance that will affect the historic property or unevaluated property;

4. For unevaluated properties, the testing plan for determining the eligibility of the property; for nature and extent testing; and for establishing required treatment;

a. The BLM will ensure that the Applicant, through their cultural resources contractor, implements the approved testing plan in the HPTP and submits a draft testing report including eligibility and treatment recommendations to the BLM.

b. BLM shall review the testing report and provide comments to the Applicant within fifteen (15) calendar days. The Applicant shall respond to the BLM's comments and submit a revised testing report within fifteen (15) calendar days of receipt of comments. Upon the BLM's approval of the testing report, the BLM will submit the eligibility determinations, the treatment recommendations, and the supporting reports for unevaluated cultural resources via email and regular mail to the respective SHPOs/THPO and land manager as well as to the CPUC in California with a request for concurrence. The SHPOs/THPO and land manager will respond to the BLM within fifteen (15) calendar days. If the SHPOs/THPO or the land manager do not respond to the BLM within fifteen (15) calendar days, the BLM will make a good faith effort to contact the entity via email or telephone, rather than assume concurrence with the determination(s) of NRHP eligibility. A "good faith effort" includes two forms of communication, including an email and a telephone call to the SHPOs/THPO or land manager point of contact for the Undertaking. After no response to a good faith effort, the BLM will proceed.

c. Where resources are identified that are evaluated as not eligible under Criteria A-C, and where their Criterion D values are unknown but will be avoided by project design or by implementing protection measures, the BLM will treat such resources as eligible for the NRHP under Criterion D without formal evaluation, and their significant values will be avoided. In California, the Applicant must submit a formal letter committing to the avoidance of any resources that are unevaluated under Criterion D; this applies to resources identified on Federal and non-Federal lands. Any such resources must be included in the HPMP.

5. The nature or kind of each required treatment measure (avoidance, minimization, mitigation) pertaining to each historic property (e.g., landscape photography, archaeological data recovery, etc.);

6. The identification of treatment measures, if any, which must be completed prior to authorization of ground-disturbing activities (e.g., barricading or fencing, archaeological data recovery, landscape photography) and/or those measures which may be completed after authorization of ground disturbance (e.g., historical research, installation of an interpretive kiosk, public education materials, etc.); and

7. The documentation and reporting procedures for each proposed treatment measure, including data management and dissemination methodologies and a proposed schedule of reports.

H. The HPTP may include but is not limited to the following examples of treatment measures for adverse effects:

1. Treatment measures for tribal values that focus on benefit to tribes through public outreach or other means; completion of NRHP nomination forms; Historic American Building Survey, Historic American Engineering Record, and Historic American Landscape Survey documentation to be submitted to the Library of Congress; documentation of local or regional resources to be submitted to the appropriate SHPO/THPO or State Archives; and partnerships and funding for public archaeology projects; print publication (brochure/book); digital media publication (website/podcast/video).

2. Treatment measures may also include, but not limited to, conservation easements, including easements held by a Tribe, OR purchase of land containing historic properties for transfer to a protective preservation organization or a Tribe, with willing consent of landowner

a. These options should only be considered in rare and special cases because of their difficulty of implementation and preservation in perpetuity.

b. Implementation of either of these options would require a commitment to long term monitoring, a second legally binding agreement document, and a third-party preservation entity to hold the easement or covenant, and the involvement of the SHPO/THPO.

I. Review and Approval of the HPTPs

1. The Applicant shall submit the draft HPTP to the BLM for initial review and comments. BLM shall review the draft HPTP and provide comments to the Applicant within thirty (30) calendar days. The Applicant shall respond to BLM's comments and submit a revised HPTP within thirty (30) calendar days of receipt of comments. Upon approval by the BLM, the BLM shall provide the SHPOs/THPO and other Consulting Parties within each State a copy for review, requesting comments on the adequacy of the proposed treatment measures. These parties will be notified of the review period via email and will have sixty (60) calendar days to review and comment on the plan. If the SHPO/THPO does not respond to the BLM within sixty (60) calendar days, the BLM will contact the SHPO/THPO via email or

telephone rather than assume concurrence with the proposed treatment measures embodied in the respective HPTP. After a good faith effort, the BLM will proceed.

2. The BLM will convene at least one consultation meeting to discuss comments on the HPTP in each State with all interested Consulting Parties after the sixty (60)-calendar-day comment period. Tribes may request individual government-to-government consultation meetings, rather than or in addition to participating in the collective consultation meeting. If the sixty (60)-calendar-day review time frame cannot be met, the SHPO/THPO, Tribe or Consulting Party will notify the lead BLM Office main point of contact by email requesting a review extension. The lead BLM Office will determine whether to grant an extension, not to exceed an additional thirty (30) calendar days.

3. The BLM shall consolidate the comments from Consulting Parties in each State and advise the Applicant of necessary revisions to the draft HPTP. The BLM shall ensure that all comments are taken into consideration in revising the HPTP and will provide the revised HPTP to the SHPO/THPO for a twenty-one (21)-calendar-day review period. Comments from Consulting Parties will be addressed in the final HPTP. The BLM will notify and provide the Applicant and the Consulting Parties with a copy of the final HPTP when approved.

J. During the treatment phase, if deviations to the approved HPTP are warranted, the Applicant will submit proposed deviations from the HPTP to the BLM for review prior to implementation. The BLM shall provide copies of the proposed deviation via email to the appropriate SHPO/THPO, the Tribes, the ASM and land manager(s) within the respective State for a five (5)-calendar-day review. The BLM shall consider comments received within the review period and shall determine the adequacy of the proposed deviation. The BLM will notify the Applicant if and when the deviation has been approved.

VII. MONITORING, POST-REVIEW DISCOVERIES, AND UNANTICIPATED EFFECTS

A. All monitoring shall follow clearly stated objectives and methodologies for achieving those objectives delineated in the Monitoring and Discovery Plan (MDP) or the HPMP, both of which are parts of the HPTP, such as to ensure avoidance or minimization during construction and reclamation; to measure the effectiveness of avoidance, minimization and treatment measures; to assess the effects of operations and maintenance activities; or to help define treatments for historic properties with long-term concerns. The MDP describes the monitoring and discovery protocol during construction and reclamation. The HPMP describes the monitoring and discovery protocol during operations and maintenance.

B. Monitoring During Construction and Reclamation

1. The Applicant, through their cultural resources contractor, shall conduct monitoring during construction activities as described in the MDP, to manage post-review discoveries and unanticipated effects during project construction. Monitoring locations will include all areas identified in the MDPs in the HPTPs, including areas of ground disturbance not associated with historic properties. Monitoring

procedures, the evaluation of NRHP eligibility, tribal consultation, and the treatment of discovered historic properties shall be handled in accordance with the MDPs in the HPTPs.

2. Post-review discoveries: Any cultural resources determined by the BLM to be historic properties that were discovered or adversely affected during construction and not subjected to pre-construction treatment will be addressed in accordance with the MDP.

3. Roles and responsibilities of the Applicant, the Applicant's cultural resources contractor, the BLM, and the Tribes, including those pertaining to the determinations of eligibility, and treatment of discoveries, are described in the MDP.

4. The MDP includes a Tribal Participation Plan to be prepared as an appendix so that it can be used as a stand-alone document. The BLM will require the Applicant to hire tribes' designated representatives (tribal cultural consultants or tribal monitors) to monitor and be on site during Class III cultural resources inventory, as well as all ground disturbing construction activities for facilities, roads or other components associated with the Undertaking, post-construction reclamation activities, and any archaeological field work required by the HPTP or any subsequent plan. The Tribal Participation Plan describes the logistics and protocols for tribal participation.

C. Post-Review Discoveries

1. Cultural Resources: All discoveries made during construction shall be addressed in accordance with the MDP, which is a part of the HPTP. A process for timely Tribal notification of discoveries shall be included in the MDP.

a. In Arizona on State and private land, the BLM shall ensure that the discoveries are treated according to A.R.S. § 41-841, and that the SHPO is notified of the discovery.

b. In California on State and private land, the BLM shall ensure that discoveries follow the process in California Public Resources Code (PRC) Sections § 5020 et seq.; § 21000 et seq.; California Code of Regulations (CCR), Title 14, Chapter 3, Sections § 4850 et seq.; § 15000 et seq.; and that the SHPO is notified of the discovery.

2. Human Remains

a. The BLM and Applicant shall ensure that in the event human remains are discovered during the construction activities, work within 300 feet of the discovery will cease and the area will be secured; the Applicant will immediately contact the BLM authorized officer. The BLM will notify the appropriate County officials as outlined in the MDP.

b. The BLM and the Applicant shall ensure that any human remains, funerary objects, items of cultural patrimony, or sacred objects encountered during any construction activities are treated with the respect due such materials and consistent with the MDP.

c. The BLM shall ensure that any Native American human remains, funerary objects, sacred objects, or objects of cultural patrimony discovered on Federal or tribal lands shall be treated in accordance with the provisions of NAGPRA and its implementing regulations at 43 C.F.R. § 10.

d. In consultation with the Tribes and prior to any ground disturbing work associated with construction and with the HPTP, the BLM shall seek to develop a written NAGPRA plan of action pursuant to 43 C.F.R. § 10.5(e) to manage the inadvertent discovery or intentional excavation of human remains, funerary objects, sacred objects, or objects of cultural patrimony.

e. On lands within the exterior boundaries of the Colorado River Indian Reservation, the CRIT THPO will be contacted and consulted to ensure compliance with NAGPRA and tribal law.

f. In Arizona, the BLM shall ensure that, in consultation with the ASM, human remains and/or funerary objects identified on State and/or private land, will comply with the methods and procedures within A.R.S. § 41-844 and A.R.S. § 41-865 and their implementing rules. The Applicant, through their cultural resources contractor and working through the ASM, shall obtain "burial agreements" with Indian tribes pursuant to Rules Implementing A.R.S. § 41-844 and A.R.S. § 41-865, which govern discoveries of human remains and funerary objects on State, city, county and private lands. The SHPO shall be notified of such discoveries.

g. In California, the BLM shall ensure that the Native American Heritage Commission is notified so that Native American human remains and/or funerary objects discovered on non-Federal lands in California are treated in accordance with the applicable requirements of the Cal. Pub. Res. Code §§ 5097.98, 5097.991 and the Cal. Health & Safety Code § 7050.5(c).

h. When the BLM has verified that the requirements of the NAGPRA and Arizona and/or California State laws and tribal law have been met, the BLM may authorize the Applicant to resume operations in the vicinity of the discovery, as described in the MDP.

VIII. HISTORIC PROPERTIES MANAGEMENT

A. The BLM shall ensure that an HPMP will be developed as part of the HPTP (but as a stand-alone document) to establish the protocol for the long-term management of historic properties during operations and maintenance. The HPMP will be developed in consultation with the SHPOs/THPO and the Consulting Parties. The HPMP will identify how historic properties will be managed throughout the operations and maintenance of the Undertaking. The BLM will ensure that the Applicant implements the terms of the HPMP, with BLM oversight.

B. The HPMP will prescribe the monitoring of or other protective measures for historic properties (such as fencing, barricades, limiting access, or other protective measures) that may be affected by operations and maintenance within the area of the ROW grant or by increased access to historic properties through the access road network associated with the Undertaking and the related risk of vandalism to those properties.

C. The HPMP shall lay out a protocol for monitoring and protective measures that includes:

1. The specific historic properties to be monitored or subjected to protective measures; the reason for monitoring of each historic property (e.g., proximity to Undertaking components with the potential for damage from operation and maintenance, a property identified as being of particular importance to a Tribe, a property especially susceptible to vandalism, etc.); and schedule for monitoring of each historic property;

2. How these historic properties will be avoided during operations and maintenance and how impacts would be minimized or mitigated if they could no longer be avoided during operations and maintenance;

3. The professional qualifications of archaeologists doing the monitoring;

4. A protocol for involving the Tribes in monitoring;

5. A protocol for the schedule, production and distribution of monitoring reports; and the review of monitoring reports;

6. The objectives that long-term monitoring would achieve as part of the effort to avoid, minimize and/or mitigate adverse effects to those properties.

IX. REPORTING

A. Preliminary/End of Fieldwork Report

1. Upon completion of fieldwork at each historic property or group of historic properties, the Applicant, through their cultural resources contractor, shall provide the BLM with a Preliminary/End of Fieldwork Report of treatment completed at that site. The Preliminary/End of Fieldwork Report will include a brief characterization of the site assemblage/contents, the types of analyses yet to be completed, and a brief description of how the provisions of the HPTP were implemented. The Preliminary/End of Fieldwork Report shall include a description of any deviations from the HPTP that were implemented and the reasons for such deviations.

2. BLM shall review the Preliminary/End of Fieldwork Report and provide comments to the Applicant within seven (7) calendar days. The Applicant shall respond to BLM's comments and submit a revised report within seven (7) calendar days of receipt of comments. After the BLM's approval, the BLM shall provide a copy of the Preliminary/End of Fieldwork Report for each site via email and regular mail to the appropriate SHPO/THPO and other Consulting Parties for review. For previously unevaluated sites subjected to eligibility testing (discussed in **Stipulation VI.G.4**), the review period will be fifteen (15) calendar days for comments and concurrence with eligibility determinations and findings of effect as well as review of the proposed treatment. For sites at which data recovery was conducted as per the HPTP, the review period for the adequacy of treatment measures will be fifteen (15) calendar days. The BLM shall consider comments submitted during the review period and shall consult with the appropriate reviewer(s) and SHPOs/THPO to resolve differences and/or disagreements. If the

SHPO/THPO does not respond to the BLM within fifteen (15) calendar days, the BLM will contact the SHPO/THPO via email or telephone rather than assume concurrence with the contents of the Report. After a good faith effort, the BLM will proceed.

B. Final Treatment Reports

1. The BLM shall ensure that the Applicant, through their cultural resource contractor, prepares a draft Final Treatment Report for each State that incorporates the results of all the site-specific Preliminary/End of Fieldwork Reports along with post-fieldwork data analysis and synthesis into a comprehensive regional overview for each State. The Final Treatment Reports will also include updated site forms that reflect treatment.

2. The BLM shall review the draft Treatment Reports and provide a copy to the appropriate SHPO/THPO and Consulting Parties for a sixty (60)-calendar-day review, and comment period. The BLM will notify these parties of the submittal and review periods via electronic mail. The BLM shall consider comments received during the review period and shall consult with the appropriate reviewer(s) to resolve differences and/or disagreements. If the SHPO/THPO does not respond to the BLM within sixty (60) calendar days, the BLM will contact the SHPO/THPO via email or telephone rather than assume concurrence with the contents of the Report. After a good faith effort, the BLM will proceed. If the sixty (60) calendar-day review time frame cannot be met, the SHPO/THPO, Tribe or Consulting Party will notify the lead BLM Office main point of contact by e-mail requesting a review extension. The lead BLM Office will determine whether to grant an extension, not to exceed an additional thirty (30) calendar days.

3. The BLM shall ensure that the Applicant prepares a revised Treatment Report that considers comments received on the draft Treatment Report. The BLM shall provide copies to the appropriate SHPO/THPO and other Consulting Parties for a concurrent thirty (30)-calendar-day review period. The BLM will notify these parties of the submittal and review periods via electronic mail. The BLM shall consider comments submitted during the review period and shall consult with the appropriate reviewer(s) to resolve differences and/or disagreements. If the SHPO/THPO does not respond to the BLM within thirty (30) calendar days, the BLM will contact the SHPO/THPO via email or telephone rather than assume concurrence with the Report contents. After a good faith effort, the BLM will proceed. The BLM shall notify the Applicant when the final Treatment Report has been accepted and will distribute the final version to the Consulting Parties.

4. All Final Treatment Reports will be completed within three years of the termination of fieldwork. The BLM may grant an extension in the event of extenuating circumstances.

X. INITIATION OF CONSTRUCTION ACTIVITIES

A. Land managing agencies may issue a Notice to Proceed (NTP) for any and all segments of the Undertaking only if such authorizations will not restrict subsequent measures to

avoid, minimize or mitigate the adverse effects to historic properties through rerouting of the corridor or placement of ancillary facilities.

B. For each segment of the Undertaking, upon the BLM's acceptance of the final Inventory Report for each State, as described in **Stipulation V**, the BLM, at its discretion and pending compliance with all other applicable laws and regulations, may issue an NTP on lands under any ownership or jurisdiction, subject to the appropriate jurisdiction's right-of-entry and ROW requirements, where there are no historic properties present.

C. For each segment of the Undertaking, upon the BLM's acceptance of the final HPTP for each State, the BLM, at its discretion and pending compliance with all other applicable laws and regulations, may issue an NTP on lands under any ownership or jurisdiction, subject to the appropriate jurisdiction's right-of-entry and ROW requirements, if historic properties are present but will not be adversely affected, and all stipulations in the HPTP are in place to ensure no adverse effect. Such measures may include a buffer for avoidance clearly marked in the field and provision for any monitoring, if required (as described in the approved HPTP/MDP/HPMP).

D. For each segment of the Undertaking, if historic properties are present and such historic properties may be adversely affected by the Undertaking, then the BLM may issue an NTP for that segment only if the BLM has accepted a final Preliminary/End of Fieldwork Report of treatment that has occurred at each site described in the HPTP for that segment, and in consultation with all Consulting Parties.

E. Contingent upon **Stipulation XI.D**, the BLM, at its discretion, and pending compliance with all other applicable laws and regulations, may issue an NPT on lands under any ownership or jurisdiction, subject to the appropriate jurisdiction's right-of-entry and ROW requirements for segments where provisions of the HPTP have been successfully implemented.

XI. CHANGES IN CONSTRUCTION ACTIVITIES

A. General requirements for variances: The BLM will require that a Class III inventory be conducted for any variances or amendments to the ROW grant or any other changes to the Undertaking that are outside the APE surveyed for the Undertaking. Where the BLM determines that additional inventory is needed, the BLM will issue an NTP only after the Section 106 process is completed. The BLM will determine where construction may continue while the additional work is being completed.

1. The APEs of all variance areas and the identification and evaluation of historic properties within variance areas will be consistent with those defined in **Stipulation V.**

2. A Record Search and Literature Review (Class I Inventory) and a Class III Intensive

3. Field Inventory will be performed on all variance areas, where not previously inventoried for cultural resources or where SHPO/THPO guidance indicates that new Class III inventory of previously inventoried areas is warranted.

4. The Applicant will assemble all variance reports into a second Class III inventory volume for the Undertaking.

B. Reporting and Review of Class III Inventory Results for Variances - Eligibility, Effects and Treatment: The BLM, SHPOs/THPO, and Consulting Parties will make every effort to expedite review of any changes to construction plans after initiation of construction. Results of the Inventory Report will be handled as follows:

1. If the inventory results in **no cultural resources or potential properties of traditional cultural or religious importance to Tribes identified**, the Applicant, through their cultural resources contractor, will submit copies of reports on SHPO Survey Report Summary Form (SRSF) (for Arizona) or in the ARMR format or as an addendum to an existing ARMR technical report (for California) to the lead BLM Office for distribution to the appropriate Federal and State agencies and Tribes. The BLM will provide an expedited review of the variance request, not to exceed two (2) working days following receipt, and will provide the Applicant, through their cultural resources contractor, with written approval/disapproval of the report via email. The report data will also be included in any final report for the Undertaking.

2. If the inventory and eligibility evaluation results in **no historic properties** identified (i.e., the cultural resources identified are not eligible), the Applicant, through their cultural resources contractor, will submit the draft Inventory Report to the lead BLM Office for distribution to the appropriate SHPO/THPO, Tribes and land manager for concurrent review. Reviewers will provide any comments to the lead BLM Office within fifteen (15) calendar days of receipt of the document. The Applicant, through their cultural resources contractor, will revise the Report as necessary, and resubmit it to the BLM within fifteen (15) calendar days. If the SHPO/THPO does not respond to the BLM within fifteen (15) calendar days, the BLM will contact the SHPO/THPO via email or telephone rather than assume concurrence with the contents of the report. After a good faith effort, the BLM will proceed. The BLM may issue the NTP or other applicable authorization to proceed at this point pursuant to **Stipulation XI**.

3. If the inventory results in **historic properties identified**, the Applicant, through their cultural resources contractor, will submit copies of the draft Inventory Report, including the recommendations of eligibility for and assessment of effect on any historic properties, to the lead BLM Office to distribute to the appropriate SHPO/THPO, Tribes and land managers for concurrent review. Reviewers will provide any comments to the lead BLM Office within thirty (30) calendar days. The Applicant, through their cultural resources contractor, will revise the Report as necessary, and resubmit it to the BLM within ten (10) calendar days. If the SHPO/THPO does not respond to the BLM within thirty (30) calendar days, the BLM will contact the SHPO/THPO via email or telephone rather than assume concurrence with the contents of the report. After no response to a good faith effort, the BLM will proceed.

a. No historic properties will be affected: If the variance is modified to avoid or minimize the effects of the Undertaking on the historic property (or properties),

the BLM may issue the NTP or other applicable authorization to proceed pursuant to **Stipulation XI.B**.

b. Historic properties will be adversely affected:

i. A Supplemental Treatment Plan for those properties will be developed and reviewed consistent with **Stipulation VI** of this PA.

ii. The Supplemental Treatment Plan shall be appended to the HPTP, and after the completion of these treatment measures, a Preliminary/End of Fieldwork Report will be prepared and distributed in accordance with **Stipulation IX.A**.

iii. The BLM shall ensure that the results of such treatment efforts are reported in the final Treatment Report for the Undertaking.

iv. Once the BLM determines that the approved treatment has been completed, the BLM may issue the NTP or other application for authorization to proceed pursuant to **Stipulation X.C**.

XII. CONSERVATION MANAGEMENT ACTIONS

A. BLM Internal Third-Party Review Process

1. The Applicant will hire a third-party cultural resources consultant to provide cultural resources technical support to the BLM. This support will include, but not be limited to, assisting the BLM as needed throughout the processes identified in **Stipulations V through XI**. The BLM must review and approve the scope of work for the third-party cultural resources consultant's services. Third-party cultural resources consultants must meet the same permitting requirements as the cultural resources consultant, consistent with **Stipulation IV.A,** and report directly to the BLM lead archaeologist for the project. The purpose of the third-party peer review is to ensure information accuracy and consistency with all BLM requirements and to assist the BLM in meeting its Section 106 compliance requirements.

2. Third-party peer reviews will include, but are not limited to the following activities:

a. Review of Class III Inventory Reports, treatment plans, and other documents required by this PA developed for the Undertaking.

b. Review of all fieldwork conducted by the cultural resources consultants, including on-site check-ins during fieldwork and post-fieldwork field verification assessments.

c. The third-party consultant may also complete other tasks to assist the BLM with meeting its Section 106 compliance requirements including, but not limited to drafting letters, meeting coordination, and Consulting Party coordination.

d. While the third-party consultant may assist the BLM with Section 106 compliance, the third-party consultant cannot conduct government-to-government consultation with the Tribes.

3. The results of the field verification under subsection 2.b and review of the information presented in the technical reports will be documented in a summary

report to be submitted to the BLM within sixty (60) calendar days of completion of the peer review of those components. The BLM will review the final third-party peer review report within sixty (60) calendar days of receipt. After acceptance by the BLM, the final third-party peer review report will be made available to Consulting Parties.

4. The BLM will consider the information presented in the third-party peer review when making determinations and findings for the portion of the project consistent with **Stipulation V.**

C. Compensatory Mitigation Fee for Cumulative Effects: Only for the portion of the Undertaking in California, the BLM will impose a compensatory mitigation fee that applies only to the portion of the Undertaking located within the DRECP Land Use Planning Amendment Area to address cumulative and some indirect adverse effects to historic properties.

1. The mitigation fee will be calculated in a manner that is commensurate to the size and regional impacts of the Undertaking, as determined by Appendix G of the DRECP PA.

2. If Appendix G of the DRECP PA has not been completed at the time the PA is executed, the BLM will develop resolution strategies to address cumulative and indirect adverse effects in a manner that is commensurate to the size and regional impacts of the Undertaking, in consultation with the Consulting Parties. The BLM will have final approval of these treatment measures and the BLM will ensure that these treatment measures are described in the HPTP. All types of project-specific treatment may be considered to mitigate the specific cumulative and indirect adverse effects of the Undertaking, as identified in **Stipulation V.B**.

D. Cultural Resources Sensitivity Orientation

1. Prior to conducting environmental orientation, the Applicant will provide their cultural resource orientation materials to BLM for a thirty (30)-calendar-day review. During that review period, BLM shall provide a fifteen (15)-calendar-day review by the Consulting Parties within five (5) calendar days of receipt of the orientation materials.

2. Before any company is authorized to work within the APE, the Applicant shall provide orientation to all personnel (including contractors, inspectors and monitors) involved in construction, operation and maintenance of the Undertaking on site avoidance and protection measures and statutes protecting all cultural resources. Orientation will include sensitivity orientation regarding properties of traditional religious and cultural significance to the Tribes and Tribal issues in general. The BLM shall ensure that information regarding properties of traditional religious and cultural significance to the Tribes presented during orientation is treated with respect and kept confidential. At a minimum, all personnel shall receive in-person orientation that discusses the importance of cultural resources, including linear resources such as trails; laws and regulations protecting them; penalties for violation; and requirements to avoid damage to historic properties and to report discoveries of cultural resources in accordance with the MDP. The Tribes will be

provided opportunities to participate in or provide materials to supplement the orientation program. This orientation program will also apply to personnel hired after the project has started. The Applicant shall maintain records demonstrating that the above described personnel orientation has been carried out and that all on-site workers have received the orientation.

3. If construction occurs outside of the approved ROW, the BLM will determine whether to issue a stop-work order and conduct damage assessment under ARPA, if appropriate, while the Applicant provides additional orientation (and documentation of that orientation) for personnel in the area.

XIII. APPLICANT'S RESPONSIBILITIES

A. The Applicant will post a financial security (such as a surety bond, letter of credit, etc.) with the BLM in an amount sufficient to cover all costs associated with implementing the HPTP, as negotiated by the Applicant where they contract for services in support of this PA. Such costs should cover all aspects of the HPTP implementation and may include, but are not limited to, inventory; treatment; post-field analyses; research and report preparation; interim and summary reports preparation; the curation of Project documentation, samples, and artifact collections in a BLM-approved curation facility; and the repatriation and reburial of any human remains, sacred objects, or objects of cultural patrimony. The Applicant will post a financial security prior to commencing any work to implement the HPTP.

B. The security posted is subject to forfeiture if the Applicant does not complete tasks within the time period established by the treatment selected; provided, however, that the BLM and the Applicant may agree to extend any such time periods. The BLM will notify the Applicant that the security is subject to forfeiture and will allow the Applicant thirty (30) calendar days to respond before action is taken to forfeit the security.

C. The BLM will release the financial security, in whole or in part, as specific tasks are completed and accepted by the BLM.

D. Project Suspension/Termination Plan

1. If the Undertaking is suspended or terminated for any reason, the Applicant shall provide a plan outlining the steps they will take in order to complete any data recovery or other treatment measures that are in progress at the time of project termination.

2. As part of this plan, the Applicant will also outline how they will complete the analysis, interpretation, reporting, and curation of artifacts obtained during the treatment measures at all historic properties up to the time of suspension or termination.

E. The BLM shall actively oversee activities pursuant to this PA. Should the Applicant or its cultural resources contractor fail to comply with any provision of this PA, the BLM may, at its discretion, counsel the Applicant and/or its cultural resources contractor regarding performance requirements or suspend the permits under which this PA is executed. Such suspension could, at the BLM's discretion, result in the issuance of a

"stop work" order for the entire Undertaking if the BLM determines that the severity of the failure to comply warrants it. The provisions of the PA are mandatory and can be enforced through any administrative or legal remedies available by law.

F. The BLM will remain responsible to inspect for compliance with the terms and conditions of the BLM ROW grant pertaining to historic properties for the life of the grant, including enforcing provisions of this PA and the required HPMP related to operations and maintenance. The BLM will ensure that the appropriate BLM cultural resources specialist participates in these compliance reviews.

XIV. PA ANNUAL REPORT AND REVIEW: The Consulting Parties shall evaluate the implementation and operation of the PA on an annual basis. There shall be an annual meeting among the Consulting Parties on or near the anniversary date of the execution of this Agreement to review the progress and effectiveness of the PA. The BLM will set up this meeting, in coordination with all the Consulting Parties.

A. Prior to each annual meeting, the BLM will provide Consulting Parties with an annual letter report (Annual Report) to review the progress under the PA and under each approved HPTP. The Annual Report will include an update on project schedule, status, and any ongoing cultural resources monitoring or treatment activities, discovery situations, proposed future actions, or outstanding tasks to be completed under the PA or the HPTP. Consulting Parties will have thirty (30) calendar days to review the Annual Report and provide comments to the BLM, who will then use the comments when developing the agenda for the annual meeting.

B. The Annual Report shall address issues and describe actions and accomplishments over the past year, as well as plans for the coming year, as appropriate, and shall minimally include the following components:

1. Historic property surveys and results;
2. Status of treatment activities;
3. Ongoing and completed public education activities;
4. Any issues that are affecting or may affect the ability of the BLM to continue to meet the terms of the PA;
5. Any disputes and objections received, and how they were resolved;
6. Any additional parties who have become Signatories or Concurring Parties to the PA in the past year; and
7. Proposed plans for next year's activities, per each State's HPTP.

C. Within fourteen (14) calendar days after each annual meeting, the BLM will summarize the meeting, including proposed action items identified during the annual meeting and how they are to be addressed, in a letter to Consulting Parties. Proposed action items must be directly linked with the implementation of the PA and the HPTP. Consulting Parties will have twenty (20) calendar days to review and comment on the meeting notes and, if necessary, provide the BLM with any changes that need to be considered in revising the meeting notes. If changes are needed, the BLM will produce revised meeting notes within thirty (30) calendar days of receipt of comments and will provide the final notes to the Consulting Parties. The BLM, in consultation with the Consulting Parties, must approve of the proposed action items before they are fully implemented.

D. Evaluation of the implementation of the PA may also include in-person meetings or conference calls among Consulting Parties, and suggestions for possible modifications or amendments to the PA. All Consulting Parties should be included in these consultations.

XV. DISPUTE RESOLUTION

A. Should any Consulting Party to this PA object at any time to any actions proposed or the manner in which the terms of this PA are implemented, that party shall notify the BLM in writing expressing its concern and including a proposed resolution. The BLM shall notify the Signatories of any objection and invite them to participate in resolution of the dispute. The BLM and the Signatories shall consult with such party to resolve the objection. If the BLM determines that such objection cannot be resolved, the BLM will notify all Consulting Parties of the dispute and will:

1. Forward all documentation relevant to the dispute, including the BLM's proposed resolution, to the ACHP, asking that office to provide the BLM with its advice on the resolution of the objection within thirty (30) days of receiving adequate documentation. Prior to reaching a final decision on the dispute, the BLM shall prepare a written response that takes into account any timely advice or comments regarding the dispute from the ACHP and Consulting Parties and provide everyone with a copy of this written response. The BLM will then proceed according to its final decision.

2. If the ACHP does not provide its advice regarding the dispute within the thirty-(30) day period, the BLM may make a final decision on the dispute and proceed accordingly. Prior to reaching such a final decision, the BLM shall prepare a written response that takes into account any timely comments regarding the dispute from the Consulting Parties and provide them and the ACHP with a copy of such written response.

3. The BLM will be responsible for carrying out all other actions subject to the terms of this PA that are not the subject of the dispute.

XVI. AMENDMENT: Any Signatory or Invited Signatory to this PA may request that it be amended by informing the BLM in writing of the reason for the request and the proposed amendment language, whereupon the BLM shall inform the other Signatories and request their views concerning the proposed amendment. If there is agreement among all Signatories, the document shall be amended accordingly and the amendment will be effective on the date a copy signed by all of the Signatories is executed by the ACHP. The BLM shall provide all Consulting Parties with a copy of the final amendment.

XVII. TERMINATION

A. Pursuant to 36 C.F.R. § 800.6(c) (8), if any Signatory or Invited Signatory to this PA determines that the terms of the PA cannot be or are not being carried out, then such party must provide written notice to the BLM and the other Signatories and Invited Signatories stating the reasons for the determination and requesting consultation to resolve the stated concerns through amendment of the PA. The Signatories and Invited

Signatories shall consult regarding potential amendments to the PA to resolve the stated concerns within thirty (30) calendar days of the written request. If the Signatories and Invited Signatories are unable to amend the PA or agree on other actions to resolve the concerns, the objecting party may terminate the PA by providing written notice to the Signatories and Invited Signatories.

B. Termination of the agreement by an Invited Signatory shall only apply to lands under their respective jurisdiction. In such case, the BLM shall comply with 36 C.F.R. § 800, subpart B, for all undertakings affecting the terminating Signatory's lands within the scope of the PA.

C. In the event that this PA is terminated, the BLM shall have six months after termination, or a longer time period if agreed to in writing by all Signatories, to either (a) have another PA executed by all Signatories, or (b) request, take into account, and respond to ACHP comments in accordance with 36 C.F.R. § 800.7. The BLM shall take reasonable steps to avoid adverse effects to historic properties until either option is carried out. The BLM will notify all parties to this PA as to the course of action it will pursue.

D. If neither option has been carried out within six months after termination (or a longer time period agreed to in writing by all Signatories), BLM shall, within fourteen (14) days thereafter, request ACHP formal comments and, within forty-five (45) days after the ACHP issues them, take into account and respond to them in accordance with 36 C.F.R. § 800.7. The BLM shall continue to take reasonable steps to avoid adverse effects to historic properties until this process is concluded.

XVIII. DURATION OF THE PA

A. This PA will expire if the Undertaking: a) has not been initiated, b) the BLM ROW grant expires or is withdrawn, or c) the stipulations of this PA have not been initiated within 10 years from the date of the execution of the PA. At such time, and prior to work continuing on the Undertaking, the BLM must either execute a memorandum of agreement pursuant to 36 C.F.R. § 800.6; execute a PA pursuant to 36 C.F.R. § 800.14(b); or request, take into account, and respond to the comments of the ACHP under 36 CFR § 800.7.

B. At least six months prior to the Sunset date, the Signatories and Invited Signatories shall consult to determine whether this PA remains satisfactory. If there is agreement, the agency will amend (revise and update) the PA in accordance with Stipulation XVI, as needed, in consultation with the Consulting Parties. The amended agreement must be signed and executed by all Signatories prior to the expiration date.

C. Unless the PA is terminated, expired, or amended, this PA will remain in full force and effect for 10 years. If, prior to the termination date, the BLM, in consultation with the other Signatories and Invited Signatories, determines that all terms of this PA have been fulfilled in a satisfactory manner, the BLM may notify consulting parties in writing of the BLM's determination to terminate the PA. The PA will terminate on the day that BLM so notifies the Consulting Parties.

D. The BLM will retain responsibility for administering the terms and conditions of the ROW grant pertaining to historic properties for the life of the grant, including enforcing provisions of this PA and the required HPMP related to operations and maintenance.

XIX. NON-ENDORSEMENT CLAUSE: Nothing in this PA should be interpreted to imply that any party endorses the Ten West Link Transmission Project.

XX. COUNTERPART SIGNATURES AND EXECUTION STATEMENT

A. This PA may be executed in counterparts, each separately and together constituting one and the same document. Execution and delivery of this PA by facsimile or email shall be sufficient for all purposes and shall be binding on any party to this PA.

B. Execution of this PA by the BLM, the SHPOs/THPO, and the ACHP and implementation of its terms evidence that the BLM has satisfied its Section 106 responsibilities with regard to the construction, operation and maintenance of the Ten West Link Transmission Project and has afforded the ACHP an opportunity to comment.

ATTACHMENT 1: PROJECT DESCRIPTION AND MAP

Project Description

The Applicant filed a ROW application (SF-299) with the BLM on September 14, 2015 to construct, operate, maintain, and decommission an electric transmission line project in western Arizona and eastern California. **(This Undertaking does not consider decommissioning. As per Stipulation II.B, decommissioning will be a separate undertaking.)** The proposed Ten West Link Transmission Line Project (the Project) would consist of a series-compensated, single circuit, 500 kilovolt (kV) transmission line traversing approximately 114 miles.
The Project would be designed with a conductor capacity to transmit 3200 megawatts (MW) and provide interconnection capability for new energy projects located in the region.

The Project would begin at the existing Arizona Public Service Company (APS) Delaney Substation near Tonopah, Arizona, and terminate at the existing Southern California Edison (SCE) Colorado River Substation near Blythe, California. The Project would be located in Maricopa and La Paz counties in Arizona, and Riverside County in California.
The Applicant's proposed Project would be constructed using a combination of guyed V, self-supporting lattice, lattice H-frame and/or monopole structures. The Project would be primarily located within designated utility corridors largely following the existing Devers to Palo Verde (DPV) transmission line and other linear facilities including natural gas pipelines. The Project is designed to be located within a 200-foot wide ROW for the transmission line. In areas of colocation, the Project would maintain a 250-foot separation from the existing DPV 500-kV transmission line in accordance with requirements set forth by the California Independent System Operator (CAISO). To the extent possible, the Applicant proposes to use existing DPV access roads and other existing access roads. Approximately 97 miles of the Project would be in Arizona, and approximately 17 miles would be in California. The Project would cross approximately 83 miles of Federal land, including lands managed by the BLM and Reclamation. The Project would also cross lands administered by the ASLD, the SLC, and private lands. The Project would take approximately two years to construct. Once constructed, the Project would be in operation year-round.

The BLM has identified Alternative 2: BLM Utility Corridor Route (with the inclusion of subalternative 4d) as the Agency Preferred Alternative. This route was developed to emphasize the use of BLM utility corridors along Interstate 10 and parallel to the existing Palo Verde to Devers transmission line; avoid the Kofa National Wildlife Refuge; avoid Johnson Canyon and other high use recreation areas; minimize impacts to the Colorado River Indian Tribes Reservation; avoid residential and other developed areas; and avoid areas of dense cultural resources near the Mule Mountains south of Blythe, California.

MAP OF UNDERTAKING

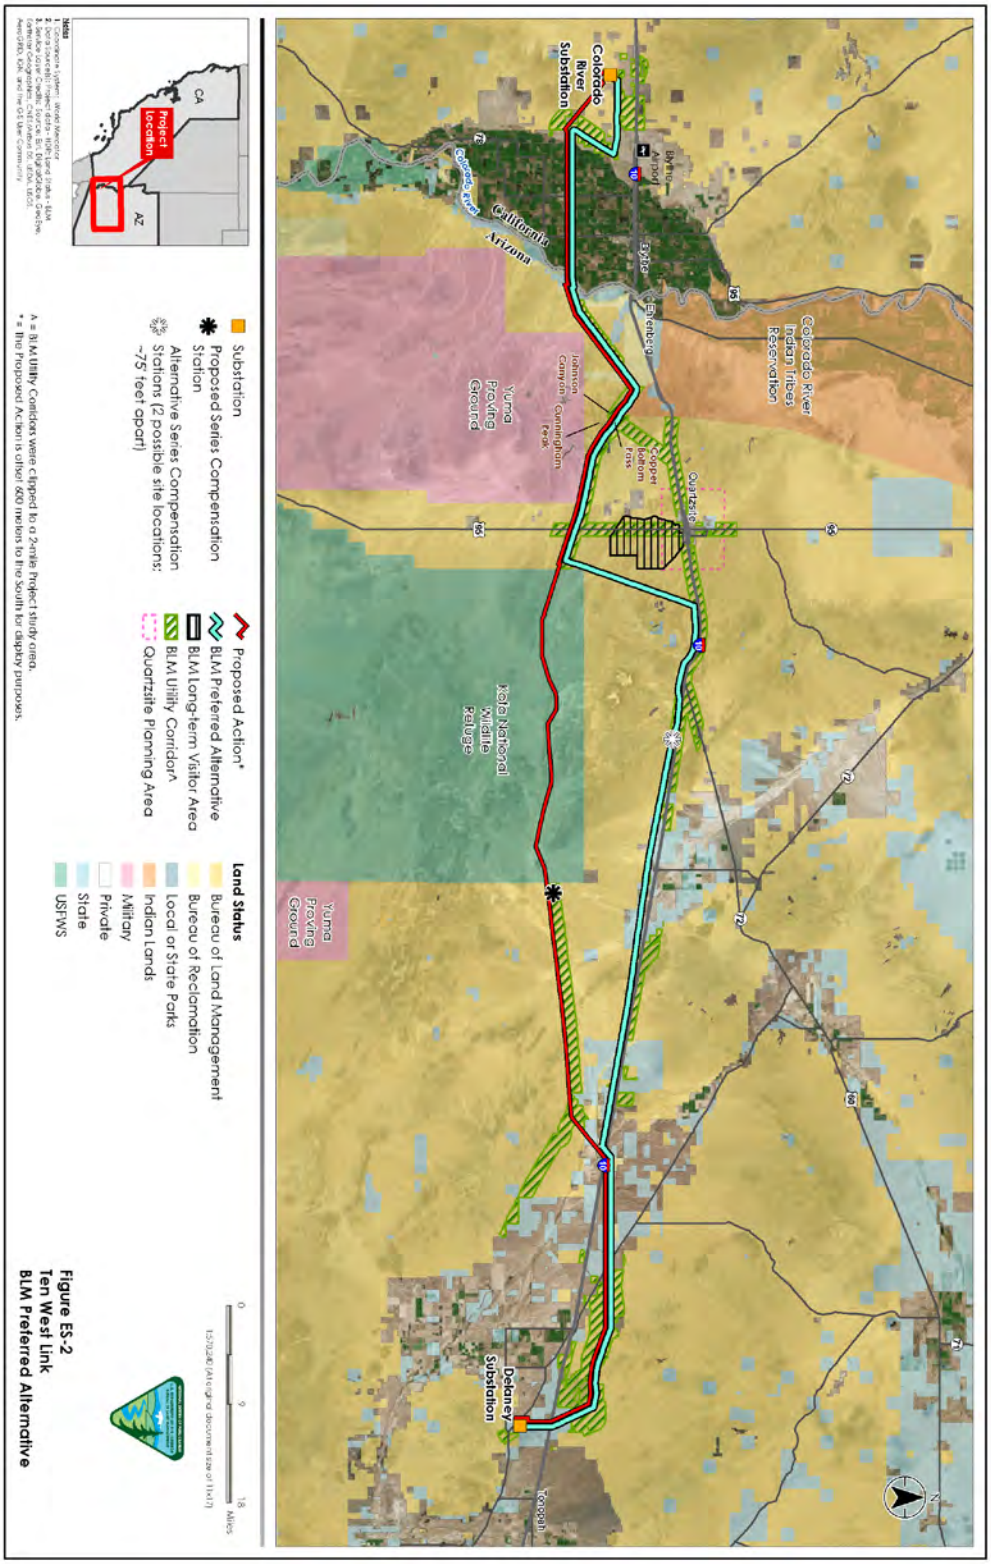

Figure ES-2
Ten West Link
BLM Preferred Alternative

ATTACHMENT 2: DEFINITIONS FOR TERMS USED IN THIS PA

Adverse Effect – Alteration of the characteristics of a historic property qualifying it for inclusion in or eligibility for the National Register of Historic Places (NRHP).

Area of Potential Effects (APE) – The geographic area or areas within which an undertaking may directly, indirectly or cumulatively cause alterations in the character or use of historic properties, if any such properties exist. The APE is influenced by the scale and nature of an undertaking and may be different for different kinds of effects caused by the undertaking [36 C.F.R. §800.16(d)].

Authorized Officer – The Authorized Officer for this Undertaking is the BLM Yuma Field Office Manager and/or his or her delegated representative.

Consultation – The process of seeking, discussing, and considering the views of other participants, and, where feasible, seeking agreement with them regarding matters that arise during the Section 106 process. The Secretary of Interior's "Standards and Guidelines for Federal Agency Preservation Programs pursuant to the National Historic Preservation Act" provide further guidance on consultation.

Consulting Party – Any party (including Tribes) that has participated in the development of this PA and has indicated intent to participate in consultations during its implementation either by signing in concurrence or by written notification to the Agency Official. The refusal of any party invited to sign the PA, other than the Signatories, does not invalidate the PA. Consulting Parties include:

Signatories – Parties who have legal responsibilities for completion of the stipulations in the PA. The Signatories have sole authority to execute the PA, and together with the Invited Signatories, to amend or terminate the PA.

Invited Signatories – The authorized official may invite additional parties to sign the PA and upon signing, they have the same rights with regard to amendments and termination as the Signatories. These parties have legal or financial responsibility in terms of the Undertaking, such as the issuance of a permit, license or ROW, and they have a compliance responsibility under the NHPA or a state cultural resource statute.

Concurring Parties – A party who signs this PA but is not legally or financially responsible for completion of stipulations set forth in the PA.

Construction and Reclamation– The construction phase begins when the BLM has issued a ROW grant to the Applicant for the Undertaking. It includes all activities related to construction of the Undertaking, including activities required to be completed in advance of construction, as well as all activities completed in order to reclaim lands disturbed during construction for two years after construction is completed or until cost recovery agreements related to construction expire.

Cultural Resource – Any location of human activity, occupation, or use identifiable through field inventory, historical documentation, or oral evidence. The term includes archaeological, historic, or architectural sites, landscapes, buildings, structures, objects, and places that possess historic and/or cultural significance as well as places with important public and scientific uses and may include definite locations (sites or places) of traditional cultural or religious importance to specified social and/or cultural groups. Cultural resources may be but are not necessarily eligible for the NRHP.

Cultural Resource Consultant/Contractor (CRC) – A qualified and permitted professional consultant in cultural resources (archaeologist, historian, ethnographer, historic architect, architectural historian, or anthropologist) who is responsible for implementing cultural resource inventories and who prepares cultural resource documents, reports, analysis, records, and professional literature. CRCs must meet the Secretary of the Interior's Professional Qualification Standards and hold appropriate permits from land managing agencies and/or the Arizona State Museum for lands in Arizona.

Cultural Resource Inventory (from H-8100-1) –

Class I – Existing data inventory: Large-scale review of known cultural resource data

Class II – Sampling field inventory: Sample oriented field inventory

Class III – Intensive field survey: A complete surface inventory of a specific area involving a systematic field examination of an area to gather information regarding the number, location, condition, distribution, and significance of cultural resources present, typically requiring a systematic pedestrian review of an area with transect intervals that shall not exceed 15 meters.

Day – Refers to calendar day unless otherwise stated.

Decommissioning – The action in which the transmission line and/or related facilities such as substations are taken out of commission (cease to operate) and are physically dismantled.

Effects – Alterations to the characteristics of a historic property qualifying it for inclusion in or eligibility for the NRHP:

Direct effects are caused by the Undertaking and occur at the same time and place as the undertaking.

Indirect effects are also caused by the Undertaking and are effects that may be visual, atmospheric, or audible that could diminish the integrity of the historic properties. Indirect effects may include increased vandalism and looting resulting from increased access.

Cumulative effects are the impacts on cultural resources which result from the incremental impact of the Undertaking when added to other past, present and reasonably foreseeable future actions regardless of what agency (Federal or non-Federal) or person undertakes such other actions (per 40.C.F.R. § 1508.7). Cumulative effects may be direct or indirect and result from incremental effects related to the Undertaking over time (e.g., increased access because

of new roads, future transmission lines along the same corridor, new projects feeding into the Undertaking, etc.). Additional roads and visitors to the area (construction personnel, recreationists, etc.) also increase opportunities for impacts from pot hunting, vandalism of historic properties, and disruption of spiritually important sites.

Eligible (for Inclusion in the NRHP) – Includes both properties formally determined as such in accordance with regulations of the Secretary of the Interior and all other properties not formally determined or listed, but that meet the NRHP criteria as determined by the Federal Agency in consultation with the SHPO/THPO, Tribes, and other parties.

Historic Property – Any prehistoric or historic district, site, building, structure, or object included in, or eligible for inclusion in, the NRHP maintained by the Secretary of the Interior. This term includes artifacts, records, and remains that are related to and located within such properties. The term includes properties of traditional religious and cultural importance to an Indian tribe or Native Hawaiian organization and that meet the NRHP criteria (36 C.F.R. § 800.16[l][1]).

Historic Properties Management Plan (HPMP) – A document that details the procedures and protocols to ensure the long-term protection and preservation of historic properties within the ROW for the duration of the ROW grant.

Historic Properties Treatment Plan (HPTP) – A document that details the procedures and techniques for resolving adverse effects to historic properties within the APE through avoidance, minimization, and/or mitigation (treatment) caused by construction.

Indian Tribe – An Indian tribe, band, nation, or other organized group or community, including a native village, regional corporation, or village corporation, as those terms are defined in Section 3 of the Alaska Native Claims Settlement Act (43 U.S.C. § 1602), which is recognized as eligible for the special programs and services provided by the United States to Indians because of their status as Indians (36 C.F.R. § 800.16[m]).

Integrity – Refers to location, design, setting, materials, workmanship, feeling and association as defined in 36 C.F.R. § 60.

Interested tribal members – Tribal members who have identified themselves either as individuals or a group, through consultations with the BLM, the THPO, or the tribal member designated to participate in consultations concerning this Undertaking, as being interested in attending field inspection visits with the BLM and/or the CRC.

Inventory Report – The (Class III – see above description) Inventory Report documents the results of the cultural resources inventory detailing the areas surveyed; the survey methodologies used; the cultural framework of the project area and its relationship to the evaluation of significance; and the cultural resources discovered and documented. It provides recommendations to the lead Federal agency on NRHP-eligibility of the cultural resources identified within the inventoried area. It includes assessments of direct, indirect, and cumulative effects for historic properties within the APE of the Undertaking.

Monitoring and Discovery Plan – The Monitoring and Discovery Plan (1) provides a detailed plan to monitor compliance with stipulations of the HPTP to avoid, minimize, or mitigate adverse effects of the Undertaking; (2) may include specific plans where monitoring is necessary to help resolve adverse effects to historic properties; (3) establishes procedures to follow in the event that previously undiscovered cultural resources are encountered during the Undertaking; and (4) may include a Native American Graves Protection and Repatriation Act (NAGPRA) Plan of Action developed specifically to address the handling of human remains pursuant to 43 C.F.R. § 10; and (5) describes how the Undertaking will comply with A.R.S. § 41-844 (with respect to State, county, and city lands) and A.R.S. § 41-865 (with respect to private lands) in Arizona; and in California, with the Cal. Pub. Res. Code §§ 5097.98, 5097.991 and the Cal. Health & Safety Code § 7050.5(c). All monitoring plans shall explicitly state the objectives of the monitoring and provide a methodology for attaining these objectives. The Tribal Participation Plan is a component of the MDP.

Monitoring Report – A document that summarizes the results of monitoring activities performed as outlined within the MDP of the HPTP for each state.

NAGPRA Plan of Action (POA) – A written document that establishes procedures for ensuring the proper treatment of Native American remains and related grave goods encountered on Federal lands pursuant to 43 C.F.R. § 10.

National Register of Historic Places (NRHP) – The official list of the Nation's historic places worthy of preservation. Authorized under the National Historic Preservation Act of 1966, it is part of a national program to coordinate and support public and private efforts to identify, evaluate, and protect our historic and archeological resources. The National Register is administered by the National Park Service under the Secretary of the Interior. Properties listed in the National Register include districts, sites, buildings, structures, and objects that are significant in American history, architecture, archeology, engineering, and culture.

NRHP Criteria – The criteria of significance established by the Secretary of the Interior for use in evaluating the eligibility of properties for inclusion in the NRHP (36 C.F.R. § 60).

Operation and Maintenance – Activities associated with operation and maintenance of the approved ROW over the life of the ROW grant. This includes all activities related to the functioning of the Undertaking after construction and reclamation are completed and prior to any activities related to decommissioning of the Undertaking. Activities during this time are generally infrequent, predictable, and routine. Any actions not specifically approved in the ROW grant, such as changes in equipment used or actions outside the ROW grant area require approval of the BLM.

Plan of Development (POD) – The Final POD is a BLM approved document that will be an enforceable term and condition as part of the BLM approved ROW grant. Contributors in the development of the Final POD prior to construction will include the Arizona State Land Department (ASLD) and the California Land Commission (SLC). The ASLD and the SLC will be responsible for developing and enforcing their respective stipulations, as they deem necessary, to mitigate natural and cultural resource impacts on state administered lands. Should the ASLD

and/or the SLC choose to adopt the terms, conditions, and special stipulations as outlined in the Final POD on their respective state authorized ROWs, responsibility to enforce these Final POD terms, conditions, and stipulations is strictly their sole responsibility. Enforcement will be between the state agency and the applicant.

Post Review Discovery -- A previously unknown cultural resource identified in the APE during construction and after the review of the Class III Inventory Report.

Preliminary/End of Fieldwork Report – A document that summarizes results of the treatment activities undertaken on an individual historic property for the purposes of informing the BLM and Consulting Parties and gaining approval for the Undertaking to proceed prior to the acceptance of the final Treatment Report.

Programmatic Agreement (PA)– A document that records the terms and conditions agreed upon to resolve the potential adverse effects of a Federal agency program, complex Project, or other situations in accordance with 36 C.F.R. § 800.14(b).

Reclamation – The activities necessary to restore lands disturbed by construction to as close to a pre-construction condition as possible. This may include ripping, re-seeding and contouring lands disturbed during construction, such as temporary access roads and staging areas.

Research Design and Work Plan – A document that describes the proposed Area of Potential Effect and the reports that the BLM proposes to fulfill identification efforts for the Project per 36 C.F.R. § 800.4.

Right-of-Way (ROW) – The public lands the BLM authorizes for use or occupation under a ROW grant. The POD is an essential component of the ROW grant, and the PA and the HPTP are appended to the POD.

Section 106 – Section 106 of the National Historic Preservation Act of 1966 (NHPA) requires Federal agencies to take into account the effects of their undertakings on historic properties and afford the Advisory Council on Historic Preservation (ACHP) a reasonable opportunity to comment. The historic preservation review process mandated by Section 106 is outlined in regulations issued by the ACHP ("Protection of Historic Properties," 36 C.F.R. § 800, incorporating amendments effective August 5, 2004).

State Historic Preservation Officer (SHPO) – The official appointed or designated pursuant to Section 101(b)(1) of the NHPA to administer the State Historic Preservation Program or a representative designated to act for the State Historic Preservation Officer.

Traditional Cultural Property (TCP) - A property that is eligible for inclusion in the NRHP because of its association with cultural practices or beliefs of a living community that (a) are rooted in that community's history, and (b) are important in maintaining the continuing cultural identity of the community (*National Register Bulletin 38*).

Tribal Participation Plan - As used in this PA, a plan that outlines details and protocols for affording tribally designated representatives (tribal cultural consultants) the opportunity to monitor and be on site during all ground disturbing construction activities for facilities, roads or other components associated with the Undertaking. The Tribal Participation Plan is a component of the MDP.

Treatment Report – As used in this PA, a document that presents the complete results of treatment activities performed on all historic properties, addresses the research questions developed in the HPTP, and synthesizes the results into regional context.

Tribal Historic Preservation Officer (THPO) – The tribal official appointed by the Tribe's chief governing authority or designated by a tribal ordinance who has assumed the responsibilities of the SHPO for purposes of Section 106 compliance on tribal lands in accordance with 54 U.S.C. 302702.

Undertaking – A project, activity, or program funded in whole or in part under the direct or indirect jurisdiction of a Federal agency, including those carried out by or on behalf of a Federal agency; those carried out with Federal financial assistance; and those requiring a Federal permit, license, or approval (36 C.F.R. § 800.16[y]). The Undertaking may include surveys, geotechnical testing, engineering, mitigation planning and design, or other activities initiated prior to construction of project facilities.

Unevaluated cultural resources -- As used in this PA, unevaluated cultural resources are those that require additional test excavations, archival or ethnographic research in order for a determination of National Register eligibility to be made.

Variance – A relatively minor change in construction activities (for example, a modification in the route of an access road) requiring the approval of the BLM, including compliance with Section 106 of the NHPA, prior to the issuance of a Notice to Proceed with construction.

3.3 SOIL RESOURCES

Table 3.3-1 Summary of STATSGO Mapped Soils within the Study Area

GENERAL MAP UNIT (STATSGO SOIL ASSOCIATION)	SEGMENT LOCATION	DESCRIPTION[a]	WIND ERODIBILITY GROUP[b,c]	SHRINK/ SWELL POTENTIAL[d]	CORROSION RISK[e]	
					CONCRETE	UNCOATED STEEL
Rositas-Ripley-Indio-Gilman (s275)	Colorado River and California Zone (ca-01, ca-02, ca-04, ca-05, ca-06, p-15w, p-16, x-09, x-10, x-11, x-12, x-13, x-15, x-16)	The soil association consists of very deep, well, or moderately well to somewhat excessively drained soils that formed in stratified stream alluvium, alluvium from mixed rock sources or from sandy aeolian material. The soils are on floodplains and alluvial fans, lacustrine basins, floodplains, dunes or sand sheets and have slopes of 0 to 30 percent.	1–6	0	Low–Moderate	Moderate–High
Rositas-Orita-Carrizo-Aco (s1041)	Colorado River and California Zone (ca-02, ca-06, ca-07, ca-09, p-16, p-17, p-18, x-15, x-16)	The soil association consists of very deep, well drained to excessively drained soils formed in sandy aeolian material, alluvium from mixed sources, and mixed igneous alluvium. The soils are on dunes and sand sheets, fan remnants and terraces, floodplains, fan piedmonts, and bolson floors. Slope ranges from 0 to 30 percent.	1–3, 5–6	0.14, 1.00	Low–Moderate	Moderate

GENERAL MAP UNIT (STATSGO SOIL ASSOCIATION)	SEGMENT LOCATION	DESCRIPTION[a]	WIND ERODI-BILITY GROUP[b,c]	SHRINK/ SWELL POTEN-TIAL[d]	CORROSION RISK[e]	
					CON-CRETE	UNCOAT-ED STEEL
Rillito-Gunsight (s1140)	Colorado River and California Zone (p-17, p-18)	The soil association consists of very deep, somewhat excessively drained soils that formed in mixed alluvium. Gunsight soils are strongly calcareous. The soil association is on fan terraces or stream terraces. Slopes are predominantly 0 to 60 percent.	4L–6	0.5	Moderate	Moderate–High
Rositas-Dune land-Carsitas (s1136)	Colorado River and California Zone (ca-09, p-18, x-19)	The soil association consists of very deep, somewhat excessively drained soils formed in sandy aeolian material or alluvium from granitoid and/or gneissic rocks. The soils are on dunes and sand sheets, alluvial fans, fan aprons, valley fills, dissected remnants of alluvial fans and in drainageways. Slope ranges from 0 to 30 percent.	1, 2, 6	0	Moderate	Moderate
Vaiva-Quilotosa-Hyder-Cipriano-Cherioni (s1141)	Colorado River and California Zone (ca-09, p-18, x-19)	The soil association consists of very shallow and shallow, well drained to somewhat excessively drained soils formed in slope alluvium from granite and gneiss, and alluvium from rhyolite and related volcanic rocks. The soils are on hills and mountains, or fan terraces with slopes of 1 to 70 percent.	None available	0.5	Low–Moderate	Moderate

The soils are on floodplains and alluvial fans and have slopes of 0 to 5 percent.	3, 5	0.06, 0.08, 0.09	Low–Moderate	Moderate

[a] Soil Survey Staff, NRCS. Official Soil Series Descriptions. https://www.nrcs.usda.gov/wps.portal/nrcs/detail/soils/home/. November 9, 2016. Descriptions are a compilation of the descriptions for each individual soil map unit.

[b] Soil Survey Staff, NRCS. Web Soil Survey. http://websoilsurvey.nrcs.usda.gov/. November 9, 2016. Soil characteristics are a compilation of the data for each individual soil map unit.

[c] A wind erodibility group consists of soils that have similar properties affecting their susceptibility to wind erosion in cultivated areas. The soils assigned to group 1 are the most susceptible to wind erosion, and those assigned to group 8 are the least susceptible.

[d] Numerical ratings indicate the severity of individual limitations. The ratings are shown as decimal fractions ranging from 0.01 to 1.00. They indicate gradations between the point at which a soil feature has the greatest negative impact on the use (1.00) and the point at which the soil feature is not a limitation (0.00).

[e] Tecopa map unit description was used; no other soil map unit descriptions were available.

Table 3.4-2 Arizona Protected and BLM Sensitive Plant Species and Potential Presence in the Project Area in Arizona

COMMON NAME	SCIENTIFIC NAME[A]	STATUS[B]	POTENTIAL PRESENCE IN PROJECT AREA
Ajo lily	*Hesperocallis undulate*	ANPL-SR	Likely
Barrel cactus	*Ferocactus wislizeni*	ANPL-SR	Likely
Beavertail cactus	*Opuntia basilaris var. basilaris*	ANPL-SR	Likely
Beehive cactus	*Echinomastus johnsonii*	ANPL-SR	Likely
Bigelow's nolina	*Nolina bigelovii*	ANPL-SR, HR	Likely
Blue paloverde	*Parkinsonia florida*	ANPL-SA	Likely
Blue sand lily	*Triteliopsis palmeri*	ANPL-SR BLM Sensitive	Not expected
Buckhorn cholla	*Cylindropuntia acanthocarpa var. acanthocarpa*	ANPL-SR	Likely
Crucifixion thorn	*Castella emoryi*	ANPL-SR	Likely
Desert agave	*Agave deserti spp. simplex*	ANPL-SR	Likely
Desert holly	*Atriplex hymenelytra*	ANPL-SR	Likely
Desert willow	*Chilopsis linearis*	ANPL-SA	Likely
Devil's cholla	*Cylindropuntia kunzei*	ANPL-SR	Likely
Diamond cholla	*Cylindropuntia ramosissima*	ANPL-SR	Likely
Dudleya	*Dudleya arizonica*	ANPL-SR	Likely
Elephant tree, torote	*Bursera microphylla*	ANPL-SR	Likely
Foothill paloverde	*Parkinsonia microphylla*	ANPL-SA	Likely
Hedgehog cactus	*Echinocereus engelmanii var. chrysocentrus*	ANPL-SR	Likely

COMMON NAME	SCIENTIFIC NAME[A]	STATUS[B]	POTENTIAL PRESENCE IN PROJECT AREA
Ironwood	*Olneya tesota*	ANPL-SA, HR	Likely
Kearney sumac	*Rhus kearneyi spp. kearneyi*	ANPL-SR BLM Sensitive	Not expected
Kofa mountain barberry	*Berberis harrisoniana*	BLM sensitive	Unlikely
Parish wild onion	*Allium parishii*	BLM sensitive	Unlikely
Pincushion cactus	*Mammillaria tetrancistra*	ANPL-SR	Likely
Mesquite	*Prosopis spp.*	ANPL-SA, HR	Likely
Night blooming cereus	*Peniocereus greggii*	ANPL-SR	Likely
Ocotillo	*Fouquieria splendens*	ANPL-SR	Likely
Parish wild onion	*Allium parishii*	ANPL-SR	Likely
Pencil cholla	*Cylindropuntia leptocaulis*	ANPL-SR	Likely
Queen-of-the-night	*Peniocereus greggii var. transmontanus*	ANPL-SR	Likely
Saguaro cactus	*Carnegiea gigantea*	ANPL-SR	Likely
Saguaro cactus ‘crested’	*Carnegia gigantea*	ANPL-HS	Likely
Sand food	*Pholisma sonorae*	ANPL-HS BLM Sensitive	Not expected
Scaly sandplant	*Pholisma arenarium*	ANPL-HS BLM Sensitive	Not expected
Schott wire lettuce	*Stephanomeria schottii*	BLM sensitive	Not expected
Silver cholla	*Cylindropuntia echinocarpa*	ANPL-SR	Likely
Smoke tree	*Psorothamnus spinosus*	ANPL-SA	Likely
Teddy-bear cholla	*Cylindropuntia bigelovii*	ANPL-SR	Likely

[A] Additional cacti and yucca protected under the Arizona Native Plant Law could be present in the biological study area.

[B] Arizona Native Plant Law (ANPL) status: HS = Highly Safeguarded, SR = Salvage Restricted, SA = Salvage Assessed, HR = Harvest Restricted

Table 3.4-4 Special Status Plant Species That Could Occur Within or Near the Biological Study Area in California

SPECIES		STATUS (CALIFORNIA/BLM)	HABITAT	POTENTIAL PRESENCE IN PROJECT AREA
Euphorbia abramsiana	Abrams' spurge	CRPR: 2B.2	Sandy soils in Mojave desertscrub and Sonoran desertscrub from 5 to 915 meters (15 to 3,000 feet) above mean sea level (MSL). Annual herb. Blooms September to November. Has been found north of Interstate 10 near McCoy Mountains (BLM 2012b) and could occur within or near biological study area in creosote bush association with sandy soil.	Moderate potential to occur
Hymenoxys odorata	Bitter hymenoxys	CRPR: 2B.1	Occurs in sandy soils in riparian scrub and Sonoran desertscrub from 45 to 150 meters (147 to 492 feet) above MSL. Annual herb. Blooms February to November. Low potential to occur along Colorado River and in woodland washes within study area.	Low potential to occur

SPECIES		STATUS (CALIFORNIA/BLM)	HABITAT	POTENTIAL PRESENCE IN PROJECT AREA
Ditaxis serrata var. californica	California ditaxis	CRPR: 3.2	Occurs in Sonoran desertscrub from 30 to 1,000 meters (98 to 3,280 feet) above MSL. Perennial herb. Blooms March to December. Has been found north of Interstate 10 near McCoy Mountains (BLM 2012b) and likely is uncommon or absent on sandy soil in study area.	Low potential to occur
Proboscidea althaeifolia	Desert unicorn-plant	CRPR: 4.3	Occurs primarily in sandy soils of Sonoran desertscrub from 85 to 1,000 meters (278 to 3,280 feet) above MSL. Perennial herb. Blooms May to October. Has been found within study area (BLM 2012b; BLM and Riverside County Planning Department 2015).	Present
Teucrium cubense ssp. depressum	Dwarf germander	CRPR: 2B.2	Occurs in Desert dunes, playa margins and Sonoran desertscrub from 45 to 400 meters (147 to 1,312 feet) above MSL. Annual herb. Blooms March to November. Has not been found in or near study area but could occur on sandy soils there and in surrounding region.	Moderate potential to occur
Euphorbia platysperma	Flat-seeded spurge	CRPR: 1B.2 BLM: Sensitive	Sonoran desertscrub habitats with sandy soils and dunes below 200 meters (660 feet) above MSL. Could occur on sandy soils within or near study area but has not been found there.	Moderate potential to occur
Ditaxis claryana	Glandular ditaxis	CRPR: 2B.2	Perennial herb that prefers low-elevation sandy soils in Mojave and Sonoran desert creosote scrub habitats in southern California below 100 meters (328 feet) above MSL. Could occur within or near study area but has not been found there.	Moderate potential to occur
Astragalus sabulonum	Gravel milkvetch	CRPR: 2B.2	Occurs in desert dunes and Mojave/Sonoran desertscrub from –53 to 910 meters (–173 to 2,985 feet) above MSL. Annual herb. Blooms February to July. Could occur within or near study area but has not been found there.	Moderate potential to occur

SPECIES		STATUS (CALIFORNIA/BLM)	HABITAT	POTENTIAL PRESENCE IN PROJECT AREA
Eriastrum harwoodii	Harwood's eriastrum	CRPR: 1B.2 BLM: Sensitive	Occurs in Desert dunes from 125 to 915 meters (410 to 3,001 feet) above MSL. Annual herb. Blooms March to June. This species has been found on stabilized dunes and other sandy soils in the biological study area (BLM 2012b; BLM and Riverside County Planning Department 2015; Transcon Environmental 2017).	Present
Astragalus insularis var. harwoodii	Harwood's milkvetch	CRPR: 2B.2	Occurs in sandy or gravelly soils along desert dunes and Mojave desertscrub below 710 meters (2,329 feet) above MSL. Annual herb. Blooms January to May. This species has been found in the biological study area (BLM and Riverside County Planning Department 2015; Transcon Environmental 2017).	Present
Colubrina californica	Las Animas colubrina	CRPR: 2B.3	Perennial deciduous shrub found in Mojave and Sonoran desertscrub and Joshua Tree woodland. Preferred habitat includes sandy, gravelly soils and dry canyons from 10 to 1,000 meters (32 to 3,280 feet) above MSL. Blooms April to June. Has been found north of Interstate 10 near McCoy Mountains but not within study area (BLM 2012b; BLM 2014b). Unlikely to occur in sandy soil within study area.	Low potential to occur
Calliandra eriophylla	Pink fairy-duster	CRPR: 2B.3	Perennial deciduous shrub associated with dry wash woodlands in the Sonoran desert from 120 to 1,500 meters (393 to 4,921 feet) above MSL. Blooms January to March. Low potential to occur in desert woodlands within study area.	Low potential to occur
Cryptantha costata	Ribbed cryptantha	CRPR: 4.3	Occurs in sandy soils in desert dunes and Mojave/Sonoran desertscrub from –60 to 500 meters (–196 to 1,640 feet) above MSL. Annual herb. Blooms February to May. This species has been found in the biological study area (BLM 2012b, 2014b; BLM and Riverside County Planning Department 2015).	Present

SPECIES		STATUS (CALIFORNIA/BLM)	HABITAT	POTENTIAL PRESENCE IN PROJECT AREA
Carnegiea gigantea	Saguaro	CRPR: 2B.2	Large perennial succulent and signature species of Sonoran desertscrub. Known to prefer gravelly slopes and rocky soils on mountains or bajadas. Blooms May to June. Could occur in desert woodlands and upper slopes surrounding study area.	Moderate potential to occur
Funastrum utahense	Utah vine milkweed	CRPR: 4.2	Occurs in sandy or gravelly soil in Mojave/Sonoran desertscrub from 100 to 1,435 meters (328 to 4,708 feet) above MSL. Perennial herb. Blooms March to October. Has been found north of Interstate 10 near McCoy Mountains but not within study area (BLM 2012b).	Moderate potential to occur
Cryptantha holoptera	Winged cryptantha	CRPR: 4.3	Annual herb that occurs in Mojave desert/Sonoran desertscrub from 100 to 1,690 meters (328 to 5,544 feet) above MSL. Blooms March to April. This species has been observed in the study area (BLM 2014b).	Present

Notes: CRPR = California Rare Plant Ranking
MSL = mean sea level
List 1A = Plants presumed extirpated in California and either rare or extinct elsewhere
List 1B = Plants rare, threatened, or endangered in California and elsewhere
List 2A = Plants presumed extirpated in California, but common elsewhere
List 2B = Plants rare, threatened, or endangered in California, but more common elsewhere
List 3 = Plants about which more information is needed – a review list
List 4 = Plants of limited distribution – a watch list
0.1 Seriously endangered in California
0.2 Fairly endangered in California
0.3 Not very endangered in California

Table 3.4-5 Federal and State-regulated Noxious Weeds Found in or Near the Biological Study Area

SCIENTIFIC NAME	COMMON NAME	FEDERAL DESIGNATION	CALIFORNIA DESIGNATION	ARIZONA DESIGNATION
Acroptilon repens	Russian knapweed	-	Noxious	Prohibited; Restricted
Alhagi maurorum	Camelthorn	-	Noxious	Prohibited; Restricted
Arundo donax	Giant-reed	-	Noxious	-
Carduus nutan	Musk thistle	-	Noxious	-
Centaurea diffusa	Diffuse knapweed	-	Noxious	Prohibited; Restricted
Centaurea solstitialis	Yellow star thistle	-	Noxious	Prohibited; Restricted
Cuscuta spp.	Dodder	-	Noxious	Prohibited; Restricted
Eichhornia crassipes	Water hyacinth	-	-	Prohibited; Restricted
Halogeton glomeratus	Halogeton	-	Noxious	Prohibited; Restricted
Hydrilla verticaillata	Hydrilla	-	Noxious	Prohibited
Onopordum acanthium	Scotch thistle	-	Noxious	Prohibited; Restricted
Salvinia molesta	Giant salvinia	Noxious	-	Prohibited
Salsola tragus	Prickly Russian thistle	-	Noxious	-
Tamarix spp.	Saltcedar	-	Noxious	-
Tribulus terrestris	Puncturevine	-	Noxious	Prohibited; Regulated

3.4.2 Wildlife, Including Special Status Wildlife and Migratory Birds

Table 3.4-8 Federal ESA-Listed Threatened, Endangered, and Proposed Species in or near the Biological Study Area

SPECIES		STATUS[A,B]	HABITAT	POTENTIAL PRESENCE IN PROJECT AREA
Mammals				
Antilocapra americana sonoriensis	Sonoran pronghorn	ESA: E, NSE AZ: SGCN CA: N/A	Sonoran desertscrub in open valleys	Introduced in 2011 into Kofa NWR south of the Proposed Action. Has been documented along or near the route segments in and near the Refuge. Not expected to occur in California portion.
Birds				
Coccyzus americanus occidentalis	Western yellow-billed cuckoo	ESA: T AZ: SGCN CA: E BLM: Sensitive BLM: Focus Species	Nests in dense, wide riparian woodlands with well-developed understories	Present along the Colorado River in suitable habitat. Habitat at proposed river crossings is not suitable for nesting, although this species is likely to use the habitat during migration. The route segments cross proposed critical habitat along the Colorado River. Not expected to occur in California portion.
Empidonax traillii extimus	Southwestern willow flycatcher	ESA: E AZ: SGCN CA: E BLM: Sensitive BLM: Focus species	Nests in early successional riparian willow-dominated riparian habitats	Present along the Colorado River in suitable habitat. Habitat at proposed river crossings is not suitable for nesting, although this species could use the habitat during migration. Low potential to occur in California portion.
Rallus obsoletus yumanensis (Rallus longirostris yumanensis)	Yuma Ridgway's rail (Yuma clapper rail)	ESA: E AZ: SGCN CA: T, Fully Protected BLM: Sensitive BLM: Focus species	Freshwater marshes with stands of bulrushes and cattails	Known to be present in canals and drains adjacent to agricultural fields in California. No proposed crossing of the Colorado River has suitable marsh habitat, but there is potential habitat in nearby backwater channels. Moderate potential to occur in California portion.

SPECIES		STATUS[A,B]	HABITAT	POTENTIAL PRESENCE IN PROJECT AREA
Reptiles				
Gopherus agassizii	Mojave desert tortoise	ESA: T AZ: SGCN CA: T BLM: Sensitive BLM: Focus species	Desertscrub	Known to be present on the Palo Verde Mesa around the Colorado River Substation. Designated critical habitat 3 miles west of the substation. High potential to occur in California portion.
Fish				
Xyrauchen texanus	Razorback sucker	ESA: E AZ: SGCN CA: E BLM: Sensitive	*Spring* – deep runs, eddies, backwater, and flooded off-channels *Summer* – runs and pools in shallow water with sandbars; *Winter* – low-velocity runs, pools, and eddies	Known to be present in mainstream Colorado River and nearby backwaters in and near the Project Area. The transmission line would span critical habitat. Moderate potential to occur in California portion.
Gila elegans	Bonytail chub	ESA: E AZ: SGCN CA: E BLM: Sensitive	Mainstream rivers, possibly preferring rocky areas and areas with faster flow. Also use eddies and pools 1-3 m deep.	Hatchery reared fish are released into backwater channels near the TWL crossing of the Colorado River. Moderate potential to occur in California portion.

Source: USFWS (2019)

[A] E = Endangered; T = Threatened; NSE = Nonessential experimental population;

[B] BLM Focus species as designated under the DRECP LUPA

N/A = not applicable (species is not present in the state); SGCN = Species of Greatest Conservation Need

Table 3.4-9 Special Status Wildlife Species (not including Federal ESA-listed species) that Could Occur within or near the Biological Study Area in Arizona

SPECIES		STATUS DESIGNATION (ARIZONA/BLM)[1]	HABITAT
Amphibians			
Incillius alvarius	Sonoran desert toad	Arizona: SGCN	Central and southern Arizona within several miles of permanent or temporary water sources.
Reptiles			
Lichanura trivirgata	Rosy boa	Arizona: SGCN	Rocky areas or boulder fields in mountains, bajadas, and hillsides in Sonoran desertscrub.
Heloderma suspectum	Gila monster	Arizona: SGCN	Prefers rocky areas in desertscrub and semi-desert grassland. Found in lower mountain slopes, rocky bajadas, canyon bottoms, and arroyos.
Gopherus morafkai	Sonoran desert tortoise	Arizona: SGCN BLM: Sensitive	Rocky terrain in Sonoran desertscrub.
Kinosternon sonoriense sonoriense	Sonora mud turtle	BLM: Sensitive	Usually found in rocky streams, creeks, and rivers. It also inhabits ponds, cattle tanks, and ditches. Within Project Area, rare along lower Colorado River.
Micruroides euryxanthus	Sonoran coralsnake	Arizona: SGCN	Sonoran, Mohave, and Chihuahuan desertscrubs, through Semi-desert Grassland, and into the lower reaches of the woodlands. Usually encountered in or near rocky or gravelly drainages, mesquite-lined washes, and canyons.
Uma scoparia	Mojave fringe-toed lizard	Arizona: SGCN BLM: Sensitive	Sparsely-vegetated arid areas with fine wind-blown sand, including dunes, flats with sandy hummocks formed around the bases of vegetation, washes, and the banks of rivers. Needs fine, loose sand for burrowing.
Fish - None (see Table 3.4-8 for federally listed fish)			
Birds (see Table 3.4.-8 for federally listed birds)			
Melozone aberti	Abert's towhee	Arizona: SGCN	Low-elevation desert riparian and desert wash habitats. Habitat includes dense vegetation, including thickets of willow, cottonwood, mesquite, and saltcedar. Likely restricted to within and near xeroriparian washes with dense shrubs and agricultural areas within Project Area.

SPECIES		STATUS DESIGNATION (ARIZONA/BLM)[1]	HABITAT
Botaurus lentiginosus	American bittern	Arizona: SGCN	Marshlands and very wet meadows. Rarely seen away from dense reeds, rushes, cordgrass, cattails and other emergent vegetation. Within Project Area, restricted to Colorado River.
Vireo bellii arizonae	Arizona Bell's vireo	Arizona: SGCN	Desert riparian woodlands, primarily with dense willow or mesquite. Uncommon along lower Colorado River.
Haliaeetus leucocephalus	Bald eagle	Arizona: SGCN BLM: Sensitive	Coasts, rivers, and large lakes. Open country and mountains during migration. Migrant and winter resident along lower Colorado River.
Laterallus jamaicensis coturniculus	California black rail	BLM: Sensitive	Salt and brackish water marshes. Occurs in the lower Colorado River in areas of pickle weed thickets.
Progne subis hesperia	Desert purple martin	Arizona: SGCN BLM: Sensitive	Open, flat areas and farms. Inhabits saguaros in southern Arizona. Much more common in southcentral Arizona than within and near Project Area.
Buteo regalis	Ferruginous hawk	Arizona: SGCN BLM: Sensitive	Plains and prairies throughout western North America. In southwestern Arizona, migrant and winter resident primarily near cultivated fields.
Melanerpes uropygialis	Gila woodpecker	Arizona: SGCN	Upper Sonoran desert in areas with stands of saguaro, riparian woodlands, and suburban areas.
Colaptes chrysoides	Gilded flicker	Arizona: SGCN BLM: Sensitive	Upper Sonoran desert in areas with stands of saguaro, riparian woodlands, and suburban areas.
Aquila chrysaetos	Golden eagle	Arizona: SGCN BLM: Sensitive	Open areas, plains, and mountains throughout North America. Nests in mountains of western Arizona.
Toxostoma lecontei	Le Conte's thrasher	Arizona: SGCN BLM: Sensitive	Flat desert areas with sparse vegetation, especially saltbush flats.
Melospiza lincolnii	Lincoln's sparrow	Arizona: SGCN	Winters in the southern United States in brushes and weedy habitats. Within Project Area, restricted to Colorado River and possibly along large xeroriparian washes.
Charadrius montanus	Mountain plover	Arizona: SGCN	Winters in semiarid plains and flats in the southwestern United States. Uncommon or rare along lower Colorado River.
Falco peregrinus anatum	Peregrine falcon	BLM: Sensitive	Open country and cliffs. Sometimes inhabits urban areas. Uncommon resident in southwestern Arizona.

SPECIES		STATUS DESIGNATION (ARIZONA/BLM)[1]	HABITAT
Tyrannus crassirostris	Thick-billed kingbird	Arizona: SGCN	Breeds in southeastern Arizona in riparian gallery forests. Rare in winter along Colorado River.
Athene cunicularia hypugaea	Western burrowing owl	Arizona: SGCN BLM: Sensitive	Utilizes burrows made by mammals in arid regions and deserts. Within Project Area, likely to be common only near agricultural areas and along and near Colorado River.
Aix sponsa	Wood duck	Arizona: SGCN	Wooded areas of rivers and ponds. Uncommon in winter along the lower Colorado River.
Mammals (see Table 3.4-8 for federally listed mammals)			
Idionycteris phyllotis	Allen's (Mexican) big-eared bat	BLM: Sensitive	Forested areas above 3,000 feet.
Castor canadensis	American beaver	Arizona: SGCN	Rivers, streams, and lakes. Could occur along Colorado River.
Myotis occultus	Arizona myotis	Arizona: SGCN BLM: Sensitive	In southwestern Arizona, they are found along the lower Colorado River.
Perognathus amplus	Arizona pocket mouse	Arizona: SGCN	Valley bottoms with shrub cover and stable soil. Likely to occur in Harquahala and Ranegras plains.
Macrotus californicus	California leaf-nosed bat	Arizona: SGCN BLM: Sensitive	Mostly found in the Sonoran desertscrub; summer and winter range the same; primarily roost in mines, caves, and rock shelters.
Myotis velifer	Cave myotis	Arizona: SGCN BLM: Sensitive	Desertscrub of creosote, brittlebush, palo verde, and cacti. Roost in caves, tunnels, and mineshafts, and under bridges, and sometimes in buildings within a few miles of water.
Sigmodon arizonae plenus	Colorado River cotton rat	Arizona: SGCN	Riparian thickets, dense grass cover, drier grassy areas. Restricted to Colorado River floodplain and surrounding area.
Ovis canadensis mexicana	Desert bighorn sheep	Arizona: SGCN	Desert crags, rocky outcrops, and valleys in southern Arizona. Occurs in all mountain ranges throughout Project Area.
Invertebrates – None

[A] Sonoran desert tortoise habitat in the Kofa NWR is not mapped. Good-quality habitat is along parts of this route in the New Water Mountains and Livingston Hills.

Table 3.4-14 Special Status Wildlife Species (not including Federal ESA-listed species) that Could Occur within or near the Biological Study Area in California

SPECIES		STATUS DESIGNATION (CALIFORNIA/ BLM)	HABITAT	POTENTIAL PRESENCE IN PROJECT AREA
Amphibians				
Scaphiopus couchii	Couch's spadefoot	California: SSC BLM: Sensitive	Desert, arid, and semi-arid shrublands/chaparral, shortgrass plains, cropland/hedgerow, savanna. High potential to occur in and near ephemeral pools and agricultural areas in eastern portion of Project Area in California.	Moderate potential to occur
Incillius alvarius	Sonoran desert toad	California: SSC	Occurs in a variety of habitats including creosote bush desertscrub, grasslands, along major river corridors, and the edges of agriculture. Generally, within several miles of permanent or temporary water sources.	Not expected to occur
Reptiles (see Table 3.4-8 for federally listed reptiles)				
Uma scoparia	Mojave fringe-toed lizard	California: SSC BLM: Sensitive	Sparsely vegetated dunes, flats, riverbanks and washes with fine, loose sand. This species is common on sandy soils within the biological study area.	Present
Kinosternon sonoriense	Sonoran mud turtle	California: SSC	Usually found in rocky streams, creeks, and rivers. It also inhabits ponds, cattle tanks, and ditches. Within study area, rare along lower Colorado River.	Low potential to occur
Fish – None (see Table 3.4-8 for federally listed fish)				
Mammals				
Taxidea taxus	American badger	California: SSC	Agricultural land, grassland, and other open areas and brush lands with sparse groundcover. This species has been detected near the study area.	Present
Myotis occultus	Arizona myotis	California: SSC	Ponderosa pine and oak-pine woodland near water and wooded riparian areas in desert areas.	Low potential to occur
Macrotus californicus	California leaf-nosed bat	California: SSC BLM: Sensitive	Lowland desertscrub roosting in caves, abandoned mine tunnels and rock shelters in canyon walls.	Low potential to occur
Myotis velifer	Cave myotis	California: SSC BLM: Sensitive	Evergreen or pine-oak forest and pine forest at mid-high elevations and riparian habitats near desertscrub at lower elevations.	Low potential to occur

SPECIES		STATUS DESIGNATION (CALIFORNIA/ BLM)	HABITAT	POTENTIAL PRESENCE IN PROJECT AREA
Sigmodon arizonae plenus	Colorado River cotton rat	California: SSC	Riparian thickets, dense grass cover, drier grassy areas. Likely rare or absent along Colorado River in study area.	Low potential to occur
Felis concolor brownii	Yuma mountain lion	California: SSC	From mountains to valley bottoms where prey is abundant. Absent or very rare in study area.	Low potential to occur
Ovis canadensis nelsoni	Desert bighorn sheep	California: FP BLM: Sensitive BLM: Focus Species	Canyons, hills, and mountains in rough terrain throughout the southwestern US. There is no habitat for this species within the study area.	Not expected to occur
Antrozous pallidus	Pallid bat	California: SSC BLM: Sensitive	Deserts and grasslands, mostly near rocky outcrops and water. Roosts in rock crevices.	Low potential to occur
Nyctinomops femorosaccus	Pocketed free-tailed bat	California: SSC	Rocky canyons with outcroppings and high cliffs. Roosts in rock crevices and caves. Observed near shrubland, mixed tropical deciduous forest, and floodplains with sycamore and mesquite with nearby high cliffs.	Low potential to occur
Corynorhinus townsendii	Townsend's big-eared bat	California: SSC BLM: Sensitive	Near the entrance of caves, mine tunnels, and other well-ventilated areas. Night roosts can include caves as well as buildings and tree cavities. Potential foraging habitat exists along the Colorado River and in adjacent agricultural fields, and it is likely that this species is present in the area at least occasionally.	Moderate potential to occur
Lasiurus xanthinus	Western yellow bat	California: SSC	Roosts in trees, including woodland and riparian habitat.	Moderate potential to occur
Myotis yumanensis	Yuma myotis	BLM: Sensitive	Riparian, desertscrub, moist woodlands, and forests, typically near open water.	Moderate potential to occur
Birds (see Table 3.4-8 for federally listed birds)				
Vireo bellii arizonae	Arizona bell's vireo	California: Endangered BLM: Sensitive	Dense shrub vegetation in riparian areas, fields, woodlands, scrub oak, chaparral near water in arid regions. Could occur uncommonly within or near study area.	Not expected to occur

SPECIES		STATUS DESIGNATION (CALIFORNIA/ BLM)	HABITAT	POTENTIAL PRESENCE IN PROJECT AREA
Toxostoma bendirei	Bendire's thrasher	California: SSC BLM: Sensitive BLM: Focus Species	Rare or uncommon during summer, dry and semi-arid washes and other areas containing shrubs, trees, and especially yucca. Unlikely to occur in study area.	Low potential to occur
Athene cunicularia	Burrowing owl	California: SSC BLM: Sensitive BLM: Focus Species	Open grasslands, savannas and plains. Occasionally in vacant lots. This species has been detected within the study area.	Present
Laterallus jamaicensis coturniculus	California black rail	California: Threatened, Fully Protected BLM: Focus Species	Marshlands and very wet meadows. Rarely seen away from dense reeds, rushes, cordgrass, cattails and other emergent vegetation. Within Project Area, restricted to Colorado River.	Moderate potential to occur
Toxostoma crissale	Crissal thrasher	California: SSC	Microphyll woodland and riparian washes, mesquite woodlands, other dense scrub vegetation. Uncommon year-round resident in region.	Low potential to occur
Micrathene whitneyi	Elf owl	California: Endangered BLM: Sensitive	Riparian forests, desert, woodlands. No suitable habitat along California route segments but could be present uncommonly in the surrounding area.	Low potential to occur
Melanerpes uropygialis	Gila woodpecker	California: Endangered BLM: Sensitive BLM: Focus Species	Arid lowland scrub, second-growth and montane scrub, deciduous forests, riparian woodlands. There is very little or no habitat for this species in the study area.	Low potential to occur
Colaptes chrysoides	Gilded flicker	California: Endangered BLM: Sensitive	Saguaro cactus or Joshua tree stands, riparian areas lined with cottonwood and willows in desert lowlands and foothills. There is very little or no habitat for this species in the study area.	Low potential to occur
Aquila chrysaetos	Golden eagle	California: Fully Protected Eagle Protection Act BLM: Sensitive BLM: Focus Species	Open areas, plains, and mountains throughout North America. This species is not known to nest or forage in the vicinity of the study area in California, and the Palo Verde Mesa offers low prey availability.	Low potential to occur

SPECIES		STATUS DESIGNATION (CALIFORNIA/ BLM)	HABITAT	POTENTIAL PRESENCE IN PROJECT AREA
Grus canadensis tabida	Greater sandhill crane	California: Threatened, Fully Protected BLM: Sensitive	Overwinters in agricultural fields and irrigated pastures and nearby shallow-water wetlands for roosting. Sandhill cranes, including possibly this subspecies, have been observed uncommonly in agricultural fields near Blythe.	Moderate potential to occur
Toxostoma lecontei	Le Conte's thrasher	California: SSC	Vegetated washes and desertscrub with saltbush, shadscale, cholla cacti, or other species suitable for nesting. This species has been detected within or near the study area.	Present
Asio otus	Long-eared owl	California: SSC	Uncommon to rare year-round resident in riparian and desert woodlands throughout deserts of southern California. There are no stands or riparian trees or large desert woodlands within the study area that would be suitable habitat for this species.	Not expected to occur
Lanius ludovicianus	Loggerhead shrike	California: SSC	Year-round resident in open habitats with scattered shrubs, trees, posts, fences, utility lines, or other perches. This species has been detected in or near the study area.	Present
Charadrius montanus	Mountain plover	California: SSC BLM Sensitive	Winters in and near cultivated fields along lower Colorado River. Could occur uncommonly within and near cultivated fields.	Moderate potential to occur
Circus cyaneus	Northern harrier	California: SSC	Grasslands, flat areas, and hills with open habitat. This species has been detected within or near the study area.	Present
Asio flammeus	Short-eared owl	California: SSC	Rare in open areas, fields, and wetlands. Unlikely to occur in study area.	Not expected to occur
Setophaga petechia sonorana	Sonora yellow warbler	California: SSC	Cottonwood, willow, and salt cedar riparian woodlands. Limited habitat within the study area.	Low potential to occur
Piranga rubra	Summer tanager	California: SSC	Summer resident in mature cottonwood riparian woodlands along Colorado River. Limited or no habitat within and near study area.	Low potential to occur
Buteo swainsoni	Swainson's hawk	California: Threatened BLM: Sensitive BLM: Focus Species	Plains and hills with open vegetation. This species is not expected to nest within or near the study area.	Low potential to occur

SPECIES		STATUS DESIGNATION (CALIFORNIA/ BLM)	HABITAT	POTENTIAL PRESENCE IN PROJECT AREA
Pyrocephalus rubinus	Vermilion flycatcher	California: SSC	Cropland, cultivated lands, desert, shrubland, riparian woodlands near water. Could occur uncommonly near cultivated fields.	Moderate potential to occur
Icteria virens	Yellow-breasted chat	California: SSC	Summer resident in dense, early successional riparian woodlands and thickets with willows, salt cedar, vine tangles, and dense brush with well-developed understories and some overstory for perches.	Low potential to occur
Xanthocephalus xanthocephalus	Yellow-headed blackbird	California: SSC	Freshwater wetlands with open water and dense, emergent vegetation. Foraging in fields and open cultivated areas. Could occur uncommonly along Colorado river and among agricultural fields.	Moderate potential to occur
Invertebrates – None				

Notes: FP = Fully Protected; SSC = Species of Special Concern
BLM Focus species as designated under the DRECP LUPA

Sources: Arizona: Compiled from Annual Reports (Arizona Department of Revenue 2016). California: Research and statistics page (California Board of Equalization 2016).
Notes: The reports are for fiscal year and aligned to calendar year (2006 represents FY2005–2006). The municipal distributions are a subset of the total for each county, collected by the state on behalf of the municipality and distributed on a weekly basis. No other municipalities in the block group study area received municipal distributions.

x-04	C	Moderate and Low	Foreground-middleground	IV	III

Segment d-01 falls within the Yuma planning area and the Lower Sonoran planning area. Values for VRI and VRM classes are presented as follows: "Yuma class / Lower Sonoran class." Scenic quality and visual sensitivity values were only available for the Yuma planning area.

Scenic Quality categories: A = High, B = Medium, C = Low

VRI classes: I = areas where the current management situation requires maintaining a natural environment essentially unaltered by man, II/III/IV = based on combinations of scenic quality, sensitivity levels, and distance zones.

VRM classes: I = Objective is to preserve the existing character of the landscape. Provides for natural ecological changes; but does not preclude very limited management activity. The level of change to the characteristic landscape should be very low and must not attract attention.

II = Objective is to retain the existing character of the landscape. Level of change to the characteristic landscape should be low. Management activities may be seen, but should not attract attention of the casual observer. Changes must repeat the basic elements found in the predominant natural features of the characteristic landscape.
III = Objective is to partially retain existing character of the landscape. Level of change to the characteristic landscape should be moderate. Management activities may attract attention, but should not dominate the view of the casual observer. Changes should repeat the basic elements found in the predominant natural features of the characteristic landscape.
IV = Objective is to provide for management activities which require major modification of the existing character of the landscape. The level of change to the characteristic landscape can be high. Management activities may dominate the view and be the major focus of viewer attention. Any action necessary to prevent unnecessary and undue degradation to the land is to be taken, such as, but not limited to, careful location, minimal disturbance, and repeating the basic elements.
Notes: If more than one value applies to a segment, both values are provided showing the value with the highest proportion of the segment first
N/A indicates that the segment does not lie on BLM land or that a value was not applied to that segment by the BLM.

12 CB zone	Ehrenberg Wash Pit Expansion	La Paz	active	mine	Facility Owner/Developer: Mineral Aggregate Recycling Services, Inc. Acreage and Land Ownership: expansion of the existing BLM owned 40-acre open pit by 20 acres Technology Type: competitive sale of rock product from open pit mine General Overview: wash plant is currently operational. (C. Scott, Mineral Aggregate Recycling Services, Inc., personal communication August 31, 2016); the project can produce up to 30,000 tons of rock product per year for the duration of ten years; approximately five to ten 25-ton truck loads of rock product can be shipped per day, and up to 30 deliveries per day during peak demand.	X	X	X
13 CR&CA zone	Venable Solar 1	Riverside	active	solar facility	Facility Owner/Developer: Venable Solar LLC Technology Type: 1.5 MW solar photovoltaic facility General Overview: solar photovoltaic project near Blythe, south of I-10 near US 95; Commercial Operations Date: 4/13/2015.	X	X	X

16 CR&CA zone	North Baja Pipeline	Riverside	active	interstate natural gas pipeline	Facility Owner/Developer: TransCanada - North Baja Pipelines LLC Acreage and Land Ownership: 86 miles in US Technology Type: 500-600 million cubic feet per day natural gas pipeline General Overview: The North Baja Pipeline system consists of 86 miles of pipeline receiving natural gas from an interconnection with the El Paso Natural Gas Pipeline at Ehrenberg, Arizona, that sources natural gas primarily from the West Texas and Southern Rocky Mountain supply regions. North Baja has a design capacity of 500 million cubic feet per day for southbound transportation and 600 million cubic feet per day for northbound transportation. Given the bidirectional capability modifications completed in 2008, North Baja is also able to transport natural gas northbound at Ogilby, California, and receive natural gas sourced from the Energia Costa Azul liquefied natural gas terminal in Mexico.	X	X	X

20 CR&CA	Blythe Solar Power Project	Riverside	active	solar facility	Facility Owner/Developer: NextEra Energy Resources, LLC - NextEra Blythe Solar Acreage and Land Ownership: 4,138 BLM acres (BLM Right-of-Way Grant No. CACA–048811) Technology Type: 4 unit 485 MW solar photovoltaic facility Expansion Construction Schedule and/or Permitting Milestones: The construction of Units 3 and 4 is currently on hold General Overview: A Next Era Energy Resources, LLC, 485 MW solar project on 4,138 acres 2 miles north of I-10 and 8 miles west of Blythe in unincorporated Riverside County, California. The modified Blythe Solar Power Project was approved on August 1, 2014. NextEra Blythe Solar Energy Center, LLC (the current Project applicant), has proposed conversion of the previously approved project from thermal solar to photovoltaic solar technology. A 230kV generation tie-line will connect the solar energy generating facility with the Colorado River Substation, located 5 miles to the southwest. Units 1 and 2 are now operational (CEC 2017).		X	X
21 CR&CA zone	Blythe Solar Generating Facility	Riverside	active	solar facility	Facility Owner/Developer: NRG Energy, Inc. Technology Type: 21 MW solar photovoltaic facility General Overview: NRG Energy, Inc., through NRG Renew started commercial operation in December 2009 for the Blythe Solar Generating Facility, a 21 MW solar photovoltaic solar facility in Blythe, California. Project completed in 2009.	X	X	X

25 CR&CA zone	Genesis Solar Energy Project	Riverside	active	solar facility	Facility Owner/Developer: NextEra Energy Resources, LLC - Genesis Solar, LLC Acreage and Land Ownership: unknown acreage of BLM-administered land Technology Type: 2-unit concentrated solar electric generating facility General Overview: The Genesis Solar Energy Project is operated by Genesis Solar, LLC, a subsidiary of NextEra Energy Resources, LLC. The project is a concentrated solar electric generating facility located in Riverside County, California. The project consists of two independent solar electric generating facilities with a nominal net electrical output of 125 MW each, for a total net electrical output of 250 MW. The project is located approximately 25 miles west of Blythe, California, on lands managed by the BLM. Construction was completed in April 2014. The facility is in full operation. (BLM Palm Springs-South Coast Field Office 2016).		X	X
ASLD Various Parcels EP&K, QTZ, and CB zones	Grazing Leases	Mariposa and La Paz	current	Grazing Leases	Facility Owner/Developer: ASLD Acreage and Land Ownership: 43 leases of various acreage; parcels on state trust lands General Overview: 43 grazing leases along the project route on lands administered by the ASLD.	X	X	X

Yuma Proving Grounds CB zone	YPG	Yuma and La Paz	active	military installation	Facility Owner/Developer: US DOD - US Army Acreage and Land Ownership: 1,307.8 square miles of DOD land Technology Type: military testing site General Overview: The primary mission of the YPG is to ensure that the weapon systems and equipment issued to soldiers function safely and as intended. However, the land is not entirely restricted to these uses. In coordination with the AGFD, the YPG administers hunting in certain parts of the installation.	X	X	X
continuous along the Colorado River CR&CA zone	Colorado River Bankline Repairs	La Paz and Riverside	as needed basis	maintenance activity	Facility Owner/Developer: Reclamation Acreage and Land Ownership: unknown; continuous along the Colorado River Technology Type: n/a; maintenance activity General Overview: Under the Colorado River Front Work and Levee System Act of 1946 (as amended) Reclamation has responsibility along the lower Colorado River for flood control. The Act authorizes Reclamation to improve, stabilize, and maintain the river channel so that it can handle flows resulting from flood control operations and floods of local origin. In the Palo Verde Division (Blythe CA area), the following activities are continuous along the river: reinforcing bankline and levees by placing riprap material, removing (sediment) wash fans, maintaining river access roads, and conducting excavation activities to remove excess sediment along the river in critical areas in order to protect Reclamation facilities.	X	X	X

continuous along the Colorado River CR&CA zone	Palo Verde Backwaters Maintenance Activities	La Paz and Riverside	as needed basis	maintenance activity	Facility Owner/Developer: Reclamation Acreage and Land Ownership: unknown; continuous along the Colorado River Technology Type: n/a; maintenance activity General Overview: Reclamation monitors various backwaters along the lower Colorado River (Blythe CA area) located south of I-10, to address concerns related to the management of the backwaters and maintenance requirements. All work is conducted with previously impacted areas (i.e. replacing culverts and cleaning out the inlets and outlets of the backwaters).	X	X	X
27 EP&K	Catchment #726 Replacement	La Paz	active	Wildlife improvement	Facility Owner/Developer: AGFD Acreage and Land Ownership: BLM, Yuma FO General Overview: AGFD Region IV proposes to replace the #726 wildlife water above ground system with a new water system at the same location within the Eagletail Mountain Wilderness. This water is a grandfathered structure that predates the Eagletail Mountain Wilderness designation that occurred on November 29, 1990. It is also an important source of water for desert bighorn sheep in the Eagletail Mountains (Game Management Unit 41), as well as other game and nongame species. Currently, this water development is a rain apron and steel storage tank system. It uses slick rock as an apron to capture water.		X	X

4.5 CULTURAL RESOURCES

The following tables present known cultural resources data from the 200-foot direct effects analysis corridor. The extent of previous cultural resources survey, counts of known historic properties, counts of cultural resources for which NRHP eligibility is unknown, and projections of total numbers of historic properties and sites of undetermined eligibility is presented by zone, and further subdivided by segments within specific alternatives and subalternatives.

For the purposes of this discussion, total site density (regardless of NRHP eligibility status) for each individual segment within specific alternatives and subalternatives per 100 acres is presented. The formula for this calculation is as follows:

$$Site\ density\ per\ 100\ acres = \frac{\#\ \text{of known sites}}{\text{acres surveyed}} \times 100$$

For example, 16.6 acres of the 200-foot corridor of Segment cb-03 has been previously surveyed. A total of two sites (regardless of NRHP eligibility status) were recorded within those 16.6 acres. The calculated site density per 100 acres for the 200-foot corridor of Segment cb-03 is as follows:

$$12.0 = \frac{2}{16.6} \times 100$$

Additionally, projected numbers of sites per NRHP eligibility status category are calculated for each individual segment within specific alternatives and subalternatives. The formula for this calculation is as follows:

$$Projected\ \#\ of\ sites = \frac{\text{segment acres}}{100} \times \text{site (per NRHP eligibilty status) density per 100 acres}$$

For example, two sites were recorded within the 106.0 acres of the 200-foot corridor of Segment cb-03, however, only one is NRHP-eligible. To project the site density of NRHP eligible sites within Segment cb-03, the number 6 (representing the value of a single site, in this example) is used in the calculation below. The calculated projected number of NRHP-eligible sites for the 200-foot corridor of Segment cb-03 is as follows:

$$6 = \frac{106.0}{100} \times 6.0$$

These same calculations are used to assess site density and projected site counts for the proposed action, alternative, and subalternative routes. These calculations use combined acres and combined surveyed acres from which to calculate percentage surveyed, site density, and projected sites.

For instance, in the example table below, we show that the segments of Subalternative 1A, combined, includes 241.5 acres. 7.5 percent of those 241.5 acres have been surveyed. The density of known sites per 100 acres of the entire 241.5-acre subalternative is 16.6 (because we have more acreage, but still only the known sites from segment p-02). The known sites are the combined known sites from each segment, and the resulting density and projected site count are based on the total site count and the combined acres or acres surveyed, using the formula above.

In another example below, we show that the segments of Subalternative 4P, combined, includes 250.2 acres. 60.4 percent of those 250.2 acres have been surveyed. The density of known sites per 100 acres of the entire 250.2 -acre subalternative is 31.1.

These two examples reveal how differently site count can be projected if the resulting projections from each segment are added together, rather than calculated based upon the combined acres and acres surveyed. Using the same calculation for individual segments as for complete routes allows for an apple-to-apple comparison or perspective.

For analysis purposes, minimum survey coverage of 25 percent or more is considered to be adequate to estimate the projected number of cultural resources by eligibility category for each Project segment. In cases where survey coverage of at least 25 percent can be demonstrated with negative findings, the projected sensitivity for cultural resources is considered to be low. However, this does not take into account potential environmental variations that may affect the distribution of cultural resources on the landscape per segment.

Example Table for Site Density Calculations:

SEGMENT NO. 4.6 CONCERNS OF INDIAN TRIBES

See Chapter 4.

4.7 LAND USE

Table 4.7-1 Land Use Compliance with Relevant Land Use Plans

PLAN	GOALS/OBJECTIVES/POLICY	COMPLIANCE DETERMINATION
BLM Yuma RMP	The Yuma Field Office has identified eight utility corridors in its planning area. New major ROWs and utility facilities should be located in designated ROW corridors, unless an evaluation of the project demonstrates location outside of a designated corridor is the only practicable alternative. The BLM has stated that the Project ROW must be in designated corridors or would be out of compliance with the RMP.	Several segments would be out of compliance with the ROW requirements of the Yuma RMP and would require an RMP Amendment (Section 4.7.4.2). Several segments would not conform with designated VRM classes (Section 4.11) and would require an RMP Amendment.
BLM Bradshaw-Harquahala RMP	The Hassayampa Field Office has identified utility corridors as a specific land use allocation and has listed the types of projects for which utility corridors may be designated. To minimize impacts on BLM-administered land, new infrastructure should be within these designated corridors. The BLM has the authority to designate new utility corridors for facilities that fall within one of three categories (including electric transmission); however, other land uses, such as avoiding sensitive or special resources, must be taken into consideration.	The Project would be consistent with the Bradshaw-Harquahala RMP.
BLM Lower Sonoran RMP	The Lower Sonoran Field Office has identified utility corridors as a specific land use allocation in which all compatible major linear utilities will be allowed. The RMP states that linear facilities may be authorized outside of the utility corridor if they are due and necessary and connecting a generating facility to the closest designated utility corridor.	The Project would be consistent with the Lower Sonoran RMP.

PLAN	GOALS/OBJECTIVES/POLICY	COMPLIANCE DETERMINATION
BLM Lake Havasu RMP	The Lake Havasu Field Office has identified utility corridors as a land use authorization pursuant to Title 5 of the FLPMA. Uses authorized by a ROW issued under Title 5 may include power lines. The Lake Havasu Field Office has identified 12 utility corridors in its planning area that are either existing corridors or additional/revised corridors tying together existing corridors. To minimize impacts and the proliferation of separate ROWs on BLM-administered land, new infrastructure should be within these identified corridors.	One Alternative Segment would not conform with designated VRM classes (Section 4.11) and would require an RMP Amendment (Section 4.7.4.2).
Kofa National Wildlife Refuge and Wilderness…Interagency Management Plan	Within the Interagency Management Plan, shared land uses are described, which include designated utility corridors. To grant use of a ROW, the USFWS would need to find the use appropriate for the refuge based on the conditions in chapter 603 FW 1 of the USFWS Fish and Wildlife Service Manual and would also need to conduct a compatibility determination if the use is found appropriate.	The Project was found to not be an appropriate use on the Kofa NWR (USFWS 2017).
CDCA Plan of 1980, as amended	The Project would fall within a DFA identified in the CDCA Plan. In addition to being pre-screened and allowed for development, projects in DFAs benefit from consistent and predictable mitigation requirements identified in the DRECP and can take advantage of the database of resource data collected as part of the DRECP. New projects must comply with applicable CMAs in the CDCA Plan.	The Project would be consistent with this plan and all CMAs that would apply to the Project, except for LUPA-BIO-PLANT-2 (Appendix 2C). An amendment to the CDCA Plan would be required for all California segments to be in compliance (Section 4.7.4.2).
Maricopa County Comprehensive Plan	The plan does not specifically discuss regulations or policies for transmission lines or other utilities; however, the plan includes a Land Use Policy that states, “Maricopa County supports land use buffers and compatible land use strategies near existing and future high voltage electric utility line corridors.” This Land Use Policy points toward the use of corridors for transmission lines.	The Project would be consistent with this plan.

PLAN	GOALS/OBJECTIVES/POLICY	COMPLIANCE DETERMINATION
Tonopah/Arlington Area Plan	This area plan does not designate specific corridors for utility infrastructure or provide detail on how transmission line infrastructure should occur.	The Project would be consistent with this plan.
La Paz County Zoning Plan	Although the plan does not expressly identify utility corridors for transmission infrastructure, it states that "[a]ny new industrial development should be located along a major arterial corridor, rail connection, [or] state highway, or in close proximity to the Interstate corridor."	The Proposed Action and Alternative Segments, where they occur along the DPV1 or I-10, would be consistent with this plan. Alternative segments outside of these areas would not be consistent with this plan.
Riverside County General Plan	The plan objectives include ensuring that development and conservation land uses do not infringe on existing essential public facilities and public utility corridors, taking into consideration utility easements and linear ROWs in land development and conservation proposal reviews, and avoiding crossing ridge tops to avoid bird collisions.	The Project would be consistent with this Plan.
Riverside County Palo Verde Area Plan	This area plan does not define land specifically for the use of utility infrastructure; however, it is intended to be consistent with the Riverside County General Plan, the City of Blythe General Plan, and the City of Blythe Colorado River Corridor Plan.	The Project would be consistent with this Plan.
Town of Quartzsite General Plan	One of the goals of this plan is to promote an efficient land use development pattern where utility infrastructure is available. Although the plan does not identify particular corridors for utilities, the strategy supporting this goal is to coordinate infrastructure improvement with existing and projected development activity and, therefore, place utilities in areas that are beneficial to the community and complement the plan.	The Alternative Segments that cross existing development, e.g., the La Posa LTVA, Dome Rock 14-Day Camping Area, or a Tier III growth area, would not be consistent with this plan. This plan does not apply to the Proposed Action segments because they are outside its planning boundary.
City of Blythe General Plan 2025	Although specific corridors are not identified for utility infrastructure in this plan, the guiding policies indicate the city's intent to protect existing uses (e.g., agriculture, recreation, sensitive habitats) and minimize conflicts between urban and open-space uses by requiring buffers and greenbelts.	The Project would be consistent with this Plan.

PLAN	GOALS/OBJECTIVES/POLICY	COMPLIANCE DETERMINATION
City of Blythe Colorado River Corridor Plan	Although this plan does not discuss transmission line corridors or utility ROWs, it is intended to be consistent with the City of Blythe General Plan, and the city would assess placement of these ROWs in the same manner.	The Project would be consistent with this Plan.

Table 4.7-2 Segments Requiring Yuma RMP Amendment Prior to ROW Grant

SEGMENT	ZONE	LENGTH BLM	ACRES BLM

See Chapter 4.

4.9 SOCIOECONOMICS

4.9.1 Socioeconomic Methods for Analysis

4.9.1.1 Analysis Area

As noted in Section 3.9, some economic data are reliably available only at the county level while others are available at the census block group geographic level. Due to the dominance of Phoenix and Los Angeles at the county level for Maricopa County and Riverside County, respectively, in socioeconomic data areas, the Block Group study area will be the analysis area where possible. Otherwise the three-county Analysis Area will be used. The Block Group study area is comprised of the block groups that contain the area within 0.5-mile of the Proposed Action and Action Alternative segments. The block group study area is the area that would be most affected by the Project. The block groups do not coincide with the geographic zones used for analysis of most of the other resources in this EIS. Consequently, the zones will not be used in this section.

Economic effects from the Project were estimated using the RIMS II regional economic model, developed by the US Department of Commerce Bureau of Economic Analysis. RIMS II is an input/output modeling system that is widely used by both private-sector and public-sector economists throughout the United States to assess the potential economic impacts of proposed projects within a broad range of sizes and industries. The model is based on “interindustry relationships within regions” (BEA 1997) and uses multipliers determined through recent economic activity to estimate indirect and induced effects of any given project on the modeled area. One example of a potential indirect effect would include any “multiplier” effects on the economy resulting from the recirculation of money spent by construction workers or the

purchase of construction goods and services within the analysis area. RIMS II multipliers used for this analysis are based on 2007 national benchmark input-output data and 2015 regional data.

4.9.1.2 Assumptions

The construction phase of the Project would have a greater impact on jobs, income, population, housing, and the economy, than the operations and maintenance phase. The decommissioning phase would be similar to the construction phase relative to anticipated socioeconomic impacts. Such impacts, however, would occur so much later in time that conducting a thorough analysis for decommissioning now would necessarily rely on unsupported assumptions. Construction of the Project would produce multiple types of revenue streams that would stimulate the local economy—procurement of locally sourced goods and services, wages paid to local construction workers, and the local expenditures of non-local construction workers during the period they reside in the analysis area. Each of these revenue streams was incorporated in the RIMS II analysis. Operation and maintenance of the transmission line would generate tax revenues for as long as the line is in use, as well as potential right-of-way lease fees.

Even though the majority of the construction workforce would be temporary workers who would not permanently reside in the analysis area, they would still contribute to the overall economic impacts of the Project. Given that the non-local labor force would reside in the local community for the duration of the Project, they would inevitably spend a portion of their income in the local economy. These local expenditures would likely primarily include housing, food, and entertainment. DCRT estimates that approximately 45 percent of Project construction workers would be hired from the local labor pool, which is typically defined as workers who reside within a 50-mile radius of the Project (DCRT 2017b).

Given the short-term and migratory nature of this Project during construction activities, very few of these employees are expected to be accompanied by their families. Experience on similar projects has shown that the proportion of non-local construction workers accompanied by their families ranges from none to roughly 10 percent of the non-local work force (BLM 2013a; 2013b). To ensure this analysis does not inadvertently understate potential population-related impacts, the analysis assumes that 10 percent of the non-local construction workforce would be accompanied by a spouse and a school-aged child.

The local economic opportunities that result from construction-related payroll and construction expenditures for local goods and services could also lead to additional migration to the analysis area. The RIMS II model provides estimates of the number of indirect and induced jobs that would be created due to these expenditures. “Indirect effects,” as the term is used in economics, includes additional employment and wages resulting from spending by the construction companies, while “induced effects” are increased employment and wages resulting from the economic growth associated with increased spending by workers in the area. The extent to which indirect and induced jobs would be filled by existing residents in the analysis area, versus people drawn to the area by these new employment opportunities, is unknown. For purposes of estimating potential impacts on population, this analysis provides a range of potential population effects from the alternatives. At the low end, the indirect and induced jobs are assumed to be

filled entirely by local residents and estimates of population effects include only the direct Project construction workers and families from outside the Project Area (55 percent). At the high end, half the indirect and induced jobs are assumed to be filled by workers who migrate to the analysis area. The composition of these workers' households is assumed to mirror the current average of 2.19 persons per household within La Paz County, which is considered most representative of the Project Area (US Census Bureau 2017).

Non-local workers, direct or indirect, would require housing in the analysis area. For purposes of considering potential effects on housing conditions, the number of projected non-local workers is compared to the estimated availability of rental housing, motel/hotel rooms, and RV sites within the analysis area.

During the operations and maintenance phase of the Project, which is expected to last approximately 50 years, DCRT estimates a workforce of three, full-time equivalent local jobs at a cost of $195,000 per year (in 2020 dollars) (DCRT 2017b).

Table 4.9-1 Impacts to Jobs and Employment

JOBS	DIRECT	INDIRECT	INDUCED	TOTAL
Transmission Line	120	54.1	85.5	259.6

4.11 VISUAL RESOURCES

4.11.1 Introduction

See Chapter 4.

4.11.2 Methods for Analysis

4.11.2.6 Analysis of KOPs/Segments not Simulated

When viewers are proximal to the large structures (such as driving the road through Copper Bottom Pass, where existing structures are a few hundred feet away, adjacent to the road) and overall infrastructure of a transmission line is similar to the Project, the infrastructure has "presence" for the viewer. Viewers see and sense the largeness of the structures and other infrastructure in comparison to themselves, their vehicle, and the surrounding landscape. Apart of visibility, viewers can experience noise created by wind moving around the conductors or crackling. When the Project would have "presence" for the viewer it would be a major modification to and dominate the visual environment. Distance between the viewer and the Project was found to be the primary indicator of "presence," level of modification, and dominance.

The following examples of transmission structure visibility in the Project Area provide a gradient of viewer proximity and demonstrate how these factors affect the visual impact that the Project would have, and how the factors can be applied to non-simulated KOPs/segments to make conformance determinations.

From KOP 1 viewers would be approximately 2 miles from the closest point of the Project along Segment d-01. At 2 miles distant where the Project infrastructure would be viewed against a background of somewhat scenic topography, the Project (and the existing monopole structures connecting the Delaney Substation to the Harquahala Power Plant) would essentially not be visible, understanding that time of day, atmospheric, and lighting conditions could somewhat affect visibility.

From KOP 7 viewers would be approximately 1 mile from the closest point of the DPV1 transmission line along Segment p-01. The self-supporting lattice structures would be visible and barely noticeable where skylined, but difficult to discern against the mountainous backdrop. Where visible, the structures form would be unclear and the conductors would not be visible.

From KOP 19, (simulated, Figure 4.11-21, Appendix 7) viewers would be approximately 1.25 miles from the closest point of the Project along Segment in-01. Similar to KOP 7, due to distance, the structures would appear very small in the landscape; due to intervening topography, only the tops would be visible and form would be indistinguishable. Due to intervening vertical vegetation (primarily saguaro cactus), the structures would be barely distinguishable and not noticeable, and the conductors would not be visible. Segment in-01 would be located within a BLM utility corridor and would meet VRM Class III objectives, as viewed from KOP 19.

From KOP 20, (simulated, Figure 4.11-10a, Appendix 7) viewers would be approximately 0.5-mile away from the Project along Segment in-01. Where skylined, structures would be visible and somewhat noticeable, but would not be detectible against a backdrop of rugged mountains. Structure form would be distinguishable, but conductors would not be visible. Segment in-01 would be located within a BLM utility corridor and would meet VRM Class III objectives, as viewed from KOP 20.

From KOP 20, (simulated, Figure 4.11-10b, Appendix 7) viewers would be approximately 0.2-mile away from the Project along Segment i-04. In this view, because of proximity to the structures, they would begin to appear larger than some of the surrounding landforms. Where skylined, structures, conductors, and guy wires would be clearly visible and attract attention. With a backdrop of low rugged hills, structures would be visible but not noticeable, and conductors and guy wires would not be visible. Structure form would be distinctive. While Segment i-04 would be located within a BLM utility corridor and would meet VRM Class III objectives, as viewed from KOP 20, this area is used for OHV recreation, and viewers would be expected to be traveling in closer proximity to the Project. In this case, the Project would dominate the surrounding landscape and would not conform to VRM Class III objectives.

From KOP 17, viewers would be approximately 0.3-mile away from the Project along Segment i-03. Structures would be partially skylined and partially visible against a backdrop of distant mountains with hazy atmospheric conditions. The structures and their form would be noticeable. The portion of Segment i-03 located within a BLM utility corridor would meet VRM Class III objectives, as viewed from KOP 17.

From KOP 37, (simulated, Figure 4.11-6, Appendix 7) viewers would be less than 0.2-mile away from the Project along Segment p-13. Because of the proximity of the viewer to the structures and the distance between the structures and the backdrop of rugged mountains, the structures would be much larger than the surrounding scenery, the conductors and guy wires would be clearly visible, and the contrast between the form of the guyed V structures and the self-supporting lattice structures of the DPV1 transmission line would be evident. As structures recede in the distance, the conductors and guy wires quickly would become invisible and the form contrast would transition to less noticeable and then undetectable with greater distance. However, this area is heavily used for OHV recreation, with routes essentially paralleling and winding around the existing DPV1 structures. Therefore, a portion of the structures would appear to recreationists as the closest structures. The Project, in conjunction with the DPV1 transmission line would be a major modification and would dominate the surrounding landscape and therefore would not conform to VRM Class III objectives.

Further, as previously described, the BLM has determined that in heavily recreated areas, guy wires could pose an unacceptable risk to OHV recreationists. Therefore, in situations such as the one simulated in KOP 37, the structures would be replaced with self-supporting lattice structures to eliminate guy wires, which would also repeat the form and lines of the existing DPV1 infrastructure (Figure 4.11-6, Appendix 7). However, despite the replacement of structure type and application of other MMs, such as dulling or coloring of structure surfaces, the Project would continue to not meet VRM class objectives, and an RMP amendment would be included.

Generally speaking, in the Project Area environment, when the viewer is less than 0.3-mile away from the Project, the structures would begin to appear larger than the surrounding landforms; the conductors and guy wires would be clearly visible; and the infrastructure would become a major modification and dominate views, and would not conform to VRM Class III objectives.

Table 4.11-1 Visual Impact Analysis and Mitigation Summary for the East Plains and Kofa Zone

KOP	KOP NAME	SEGMENTS VIEWED	SCENIC QUALITY	SENSITIVITY	VRI	VRM	CONFORM?	MITIGATION[1]	RMPA?[2]

Table 4.11-3 Visual Impact Analysis and Mitigation Summary for the Copper Bottom Zone

KOP	KOP NAME	SEGMENTS VIEWED	SCENIC QUALITY	SENSI-TIVITY	VRI	VRM	COMPLY?	MITIGATION[1]	RMPA?[2]
30	Copper Bottom Pass Road #1	p-09, p-10	C & B	High	II, III	III	No	Analysis of impacts to recreation found that guyed V structures pose an unacceptable human health and safety risk to OHV recreationists in heavily used recreation areas. Self supporting lattice structures with matching color and span lengths to match the existing DPV1 structures would be used to reduce contrast between the structure types, sense of visual clutter, and eliminate guy wires (MM-REC-02, MM-VIS-06).	Yes
31	Not Assigned								
32	Copper Canyon	p-10	B	High	II	III	No	The surface of the structures should be dulled to match or be better than surface conditions of the DPV1 structures. Surface disturbance should be minimized; therefore, structure sites should be accessed via helicopter. Newly disturbed rock areas should be surface treated to match surrounding rock to minimize color contrast (MM-VIS-03).	Yes

KOP	KOP NAME	SEGMENTS VIEWED	SCENIC QUALITY	SENSI-TIVITY	VRI	VRM	COMPLY?	MITIGATION[1]	RMPA?[2]
33	Johnson Canyon	cb-02	B	High	II, III	II, III	No	Recommend no access routes be constructed to structure sites, and thus structure sites be accessed by foot or helicopter (MM-VIS-02). Recommend that disturbance at structure bases be minimized (MM-VIS-01). Consider applying surface treatments to newly exposed rock and gravel to blend with surrounding rock face and minimize visual impact of attention-attracting disturbance (MM-VIS-03). Recommend height of structures be limited to that absolutely necessary for safety and operation in order to minimize skylining (MM-VIS-04). Consider shortening span lengths and designing the route to follow the canyon route to minimize elements (conductors in particular) that would be overhead of viewers and skylined (MM-VIS-05). At a minimum, the surface of the structures should be dulled to eliminate potential for reflection, if not treated to color blend with the canyon, which could help reduce color contrast.	Yes

KOP	KOP NAME	SEGMENTS VIEWED	SCENIC QUALITY	SENSI-TIVITY	VRI	VRM	COMPLY?	MITIGATION[1]	RMPA?[2]
34	Copper Bottom Alternatives Intersection	cb-01/cb-04	B	High	II, III, IV	II & III	No	At a minimum, the surface of the structures should be dulled to eliminate potential for reflection, if not treated to color blend with the mountainous backdrop, which could help reduce contrast. Disturbance at the bases of structures and along access routes should be minimized (MM-VIS-01). Limit height of structures to that absolutely necessary for safety and operation in order to minimize skylining (MM-VIS-04). Shorten span lengths and design the route to follow canyon routes to minimize elements (conductors in particular) that would be overhead of viewers and skylined (MM-VIS-05).	Yes
		cb-02/cb-04	B	High and Moderate	II, III	II, III	No	At a minimum, the surface of the structures should be dulled to eliminate potential for reflection, if not treated to color blend with the mountainous backdrop, which could help reduce contrast. Disturbance at the bases of structures and along access routes should be minimized (MM-VIS-01). Limit height of structures to that absolutely necessary for safety and operation in order to minimize skylining (MM-VIS-04). Table 4.11-5 Summary of Visual Resource-related RMP Amendments to the Yuma RMP

SEGMENT	LENGTH	STATE AND COUNTY	PROJECT AREA ZONE	VRM CLASS	WITHIN UTILITY CORRIDOR?	RMPA INCLUDED?	RMPA ANALYSIS DRIVERS	VISUAL RMPA SUMMARY
PROPOSED ACTION SEGMENTS								
p-06	35.7	Arizona, La Paz	East Plains and Kofa	III	Yes - BLM Portion	Yes (only west of Kofa NWR)	VRM class for p-06, p-07, and p-08 (KOP 29) should match for effective management of visual resources of lands west of the Kofa NWR. Travelers along the DPV1 access road would be experiencing the Project in conjunction with the. DPV1 transmission line within 0.1- to 0.25-mile, resulting in major modification and dominance	Change to VRM Class IV west of the Kofa NWR
p-07	2.1	Arizona, La Paz	Quartzsite	III	Yes	Yes		Change to VRM Class IV
p-08	0.6	Arizona, La Paz	Quartzsite	III	Yes	Yes		Change to VRM Class IV
p-09	6.9	Arizona, La Paz	Copper Bottom	III	Yes	Yes	Travelers along Copper Bottom Pass Road would be experiencing the Project in conjunction with the DPV1 transmission line within 0.1- to 0.25-mile (KOPs 30, 32, 35, 37, and 38), resulting in major modification and dominance.	Change to VRM Class IV
p-10	1.1	Arizona, La Paz	Copper Bottom	III	Yes	Yes		Change to VRM Class IV
p-11	4.1	Arizona, La Paz	Copper Bottom	III	Yes	Yes		Change to VRM Class IV
p-12	2.5	Arizona, La Paz	Copper Bottom	III	Yes	Yes		Change to VRM Class IV
p-13	3.5	Arizona, La Paz	Copper Bottom	III	Yes	Yes		Change to VRM Class IV
ALTERNATIVE SEGMENTS								
cb-01	3.2	Arizona, La Paz	Copper Bottom	II & III	Yes - Partial	Yes	Implementation of recommended MMs would not reduce contrast to the point that the segment would conform to VRM Class II and III standards (KOP 34).	Change to VRM Class III for conformance outside utility corridor within 0.3-mile either side of the centerline of segments, or in an area bounded by the viewshed where the segment would be within canyons.
cb-02	2.2	Arizona, La Paz	Copper Bottom	II & III	Yes - Partial	Yes	Implementation of recommended MMs would not reduce contrast to the point that the segment would conform to VRM Class II and III standards (KOP 33).	Change to VRM Class IV in conjunction with ROW within 0.3-mile either side of the centerline of segments, or in an area bounded by the viewshed where the segment would be within canyons, for conformance outside utility corridor; or expand existing utility corridor to contain this segment, and in conjunction with other corridor changes, change VRM to Class IV.
cb-03	4.3	Arizona, La Paz	Copper Bottom	III	Yes - Partial	Yes	Implementation of recommended MMs would not reduce contrast to the point that the segment would conform to VRM Class III standards (KOP 35).	Located partially on CRIT Reservation Change to VRM Class IV on portion on BLM-administered land within the utility corridor within the viewshed of the canyon.

SEGMENT	LENGTH	STATE AND COUNTY	PROJECT AREA ZONE	VRM CLASS	WITHIN UTILITY CORRIDOR?	RMPA INCLUDED?	RMPA ANALYSIS DRIVERS	VISUAL RMPA SUMMARY
cb-04	1.9	Arizona, La Paz	Copper Bottom	II & III	No	Yes	Implementation of recommended MMs would not reduce contrast to the point that the segment would conform to VRM Class III standards (KOP 34).	Change to VRM Class IV for the area within 0.3-mile either side of the centerline of the segment, or in an area bounded by the viewshed where the segment would be within canyons.
cb-05	4.4	Arizona, La Paz	Copper Bottom	II & III	Yes - Partial	Yes	Implementation of recommended MMs would not reduce contrast to the point that the segment would conform to VRM Class III standards (KOP 36).	Change to VRM Class IV for the area within 0.3-mile either side of the centerline of the segment.
cb-06	1.9	Arizona, La Paz	Copper Bottom	III	Yes - Partial	Yes	Implementation of recommended MMs would not reduce contrast to the point that the segment would conform to VRM Class II and III standards (KOP 36).	Change to VRM Class IV for the area within 0.3-mile either side of the centerline of the segment.
i-03	19.9	Arizona, La Paz	East Plains and Kofa	III	Yes - partial	Optional for ROW	Viewers at the KOP would be 0.4-mile from the closest point along the segment (KOPs 17 & 60). Viewers in closer proximity to the segment would be few if any, as access near/along the segment is extremely limited. An RMPA would be necessary if the existing corridor is not widened to include the portion of i-03 not in the corridor.	None
i-04	10.5	Arizona, La Paz	East Plains and Kofa	III	Yes	Yes	VRM Class III objectives would not be met because viewers would only be 0.1-mile away from the Project in certain areas (KOP 20), MMs would not reduce impacts to allow for conformance, resulting in major modification and dominance.	Change the VRM to Class IV within the BLM utility corridor.
i-05	2.8	Arizona, La Paz	East Plains and Kofa	III	Yes	Yes	Viewers along I-10 would be 0.3-mile from the closest point along the segment. Viewers in closer proximity to the segment would be few, as access near/along the segment is limited. However, Segment i-05 would be changed to Class IV to conform.	Change the VRM to Class IV within the BLM utility corridor.
i-06	7.2	Arizona, La Paz	Copper Bottom	III	Yes	Yes	Viewers along I-10 would be 0.2-mile from the closest point along the segment (KOP 61).	Change the VRM to Class IV within the BLM utility corridor.
qn-02	10.8	Arizona, La Paz	Quartzsite	III & IV	Yes - partial	ROW	Viewers at KOP 27 would be 0.3-mile from the closest point of BLM-administered land along the segment. Viewers in closer proximity to the segment would be few if any, as access near/along the segment is limited.	Change to VRM Class IV 0.3-mile either side of centerline within a single-use ROW
qs-01	3.1	Arizona, La Paz	Quartzsite	III	Yes - partial	Yes	Viewers at KOP 24 would be approximately 0.2-mile from the closest point of the segment, with structures expected out outsize nearby landforms and dominate the view.	Change to VRM Class IV 0.3-mile either side of centerline within a ROW

SEGMENT	LENGTH	STATE AND COUNTY	PROJECT AREA ZONE	VRM CLASS	WITHIN UTILITY CORRIDOR?	RMPA INCLUDED?	RMPA ANALYSIS DRIVERS	VISUAL RMPA SUMMARY
qs-02	4.8	Arizona, La Paz	Quartzsite	III & IV	Yes - partial	Yes	Viewers of Segment qs-02 would be viewing the Project in the context of other development and vertical elements that the Project would blend with.	Change to VRM Class IV within the BLM utility corridor.
x-06	9.2	Arizona, La Paz	Quartzsite	III, IV, II	Yes - partial	Yes	Viewers from KOP 22 would be about 700 feet from the segment, where the Project would be viewed as a major modification and dominating; MMs would not allow conformance and VRM Class III objectives would not be met.	Change to VRM Class IV 0.3-mile either side of segment centerline. Class II portions not visible from KOP 22 or 28.
x-07	7.7	Arizona, La Paz	Quartzsite	III	Yes	Yes	Implementation of MMs would not reduce contrast to the point that the segment would conform to VRM Class III standards.	Change to VRM Class IV within the BLM utility corridor.

N/A – Not Applicable; not located on BLM-administered land.

*Structure changes would be required as mitigation for unacceptable impacts for other resources, with ramifications for visual resources impacts analysis.

**Segment not located on BLM-administered land, therefore structure type to be determined by DCRT in conjunction with landowner; BLM recommendations only

3/29/17	Ak-Chin Indian Community	Letter indicating that the tribe does not know of any cultural resources in the Project area. Please contact if any are found.

DATE	TRIBE	DESCRIPTION
3/29/17	Morongo Band of Mission Indians	PSFO Management and George Kline participated in a Project update meeting with Raymond Huaute.
4/10/17	Ak-Chin Indian Community	Letter deferring to the Tohono O'odham Nation for Project consultation.
4/14/17	Colorado River Indian Tribes	Letter from tribe requesting additional information on becoming a Cooperating Agency.
4/18/17	Colorado River Indian Tribes Fort Yuma Quechan Tribe Twenty-Nine Palms Band of Mission Indians	Sixteen members of the CRIT, three members of the Quechan tribe, and two Twenty-Nine Palms tribal members attended the first day of the field tour.
4/19/17	Colorado River Indian Tribes Fort Yuma Quechan Tribe	Eleven CRIT members and three members of the Fort Yuma Quechan Tribe attended the second day of the field tour.
5/12/17	Twenty-Nine Palms Band of Mission Indians	Letter response to BLM Class I and Ethnographic reports stating areas of sensitive cultural resources should be avoided.
5/23/17	Colorado River Indian Tribes	Letter declining participation as a Cooperating Agency for the Project. Letter also expresses tribal concerns about Class III information for Segments p-17 and p-18. The tribe provided proposed guidance for government-to-government consultation under Section 106.
6/9/17	Colorado River Indian Tribes	Letter from tribe indicating a tribal preference for in-person meetings rather than conference calls and formal letters rather than emails. The letter also requests further clarification on the BLM's decision to move forward with a PA vs. MOA.
6/15/17	Ak-Chin Indian Community Cocopah Indian Tribe Colorado River Indian Tribes Fort McDowell Yavapai Nation Fort Mojave Tribe Gila River Indian Community Morongo Band of Mission Indians Fort Yuma Quechan Tribe Salt River Pima-Maricopa Indian Community Soboba Band of Luiseno Indians Tohono O'odham Nation Torres Martinez Desert Cahuilla Indians Twenty-Nine Palms Band of Mission Indians Yavapai-Apache Nation Yavapai-Prescott Indian Tribe	Letter to tribes requesting written tribal input on the Ten West Link Project alternatives.

DATE	TRIBE	DESCRIPTION
7/11/17	Colorado River Indian Tribes	Email to tribe requesting a meeting with the tribal council in order to gain feedback on the Project alternatives.
7/13/17	Colorado River Indian Tribes	Letter to tribe in response to CRIT's 5/23/17 letter.
7/13/17	Colorado River Indian Tribes	Letter to tribe in response to CRIT's 6/9/17 letter.
7/14/17	Colorado River Indian Tribes	Letter from tribe inviting the PSFO manager to meet with the tribal council on 8/10/17.
7/18/17	Colorado River Indian Tribes	Letter to tribe accepting CRIT's 7/14/17 invitation to meet with the tribal council on 8/10/17.
7/19/17	Colorado River Indian Tribes Fort Yuma Quechan Tribe Twenty-Nine Palms Band of Mission Indians	Email to tribes inviting them to attend an 8/15/17 meeting on the viewshed analysis for the Project.
7/26/17	Colorado River Indian Tribes	Email to tribe updating acting THPO on the status of the Project and reiterating the contents of the 6/15/17 letter to the tribe requesting input on the Project alternatives.
7/27/17	Fort Yuma Quechan Tribe	Letter from tribe expressing agreement on potential indirect effects to cultural sites and the need for a Class III survey.
8/1/17	Ak-Chin Indian Community Cocopah Indian Tribe Colorado River Indian Tribes Fort McDowell Yavapai Nation Fort Mojave Tribe Gila River Indian Community Morongo Band of Mission Indians Fort Yuma Quechan Tribe Salt River Pima-Maricopa Indian Community Soboba Band of Luiseno Indians Tohono O'odham Nation Torres Martinez Desert Cahuilla Indians Twenty-Nine Palms Band of Mission Indians Yavapai-Apache Nation Yavapai-Prescott Indian Tribe	Letter to tribes providing an overview of the Project APE and identification efforts for cultural resources and historic properties that the applicant will be required to complete.
8/10/17	Colorado River Indian Tribes	Meeting with the CRIT Tribal Council and PSFO Manager to discuss Project alternatives.
8/15/17	Colorado River Indian Tribes	Letter from tribe containing summary of the 8/10/17 meeting. Letter also requested an opportunity to review the PDEIS.
8/15/17	Colorado River Indian Tribes	Letter from tribe providing CRIT's comments on the 7/19/17 draft of the PA.

DATE	TRIBE	DESCRIPTION
8/15/17	Colorado River Indian Tribes	PA writing group meeting to review comments on draft PA.
8/23/17	Colorado River Indian Tribes Fort Yuma Quechan Tribe Twenty-Nine Palms	Letter to tribes transmitting portions of the PDEIS for tribal review. Sections include Cultural Resources, Concerns of Indian Tribes, and Socioeconomics.
8/23/17	Ak-Chin Indian Community	Letter to BLM re; APE and Historic Property Identification.
8/30/17	Colorado River Indian Tribes	Letter from tribe providing additional comments on the PA to those in the 8/15/17 letter.
8/31/17	Colorado River Indian Tribes	PA writing group meeting to review comments on draft PA.
9/1/17	Ak-Chin Indian Community Cocopah Indian Tribe Fort McDowell Yavapai Nation Fort Mojave Tribe Gila River Indian Community Morongo Band of Mission Indians Salt River Pima-Maricopa Indian Community Soboba Band of Luiseno Indians Tohono O'odham Nation Torres Martinez Desert Cahuilla Indians Yavapai-Apache Nation Yavapai-Prescott Indian Tribe	Letter to tribes transmitting portions of the PDEIS for tribal review. Sections include Cultural Resources, Concerns of Indian Tribes, and Socioeconomics.
9/1/17	Twenty-Nine Palms Band of Mission Indians	Letter from tribe in response to 8/1/17 letter regarding the Project APE. Letter also notes areas of concern for potential indirect effects.
9/6/17	Twenty-Nine Palms Band of Mission Indians	In-person meeting of PSFO manager with Tribal Council to discuss Project and alternatives.
9/18/17	Colorado River Indian Tribes	Letter from tribe expressing concern about sections of the PDEIS and requesting in-person meeting on 10/23/17 to discuss.
9/22/17	Twenty-Nine Palms Band of Mission Indians	Email to tribe acknowledging receipt of 9/1/17 letter.
9/26/17	Ak-Chin Indian Community	Letter from tribe acknowledging receipt of PDEIS sections for review. Tribe will await the DEIS to submit any comments. Letter reiterates that the Ak-Chin will defer to the Tohono O'odham.
10/5/17	Colorado River Indian Tribes	Letter to tribe acknowledging receipt of the tribe's 8/15/17 and 8/29/17 letters regarding the PA. A comment matrix with the BLM's responses is included for reference.

DATE	TRIBE	DESCRIPTION
10/6/17	Fort Yuma Quechan Tribe	In-person meeting with tribal cultural committee to give a general update on the Project.
10/10/17	Ak-Chin Indian Community Cocopah Indian Tribe Colorado River Indian Tribes Fort McDowell Yavapai Nation Fort Mojave Tribe Gila River Indian Community Morongo Band of Mission Indians Fort Yuma Quechan Tribe Salt River Pima-Maricopa Indian Community Soboba Band of Luiseno Indians Tohono O'odham Nation Torres Martinez Desert Cahuilla Indians Twenty-Nine Palms Band of Mission Indians Yavapai-Apache Nation Yavapai-Prescott Indian Tribe	Letter to tribes transmitting the Research Design and Work Plan for review.
10/12/17	Colorado River Indian Tribes	Letter from tribe providing comments on the 9/12/17 draft of the PA. The letter also requests that an ethnographic assessment be completed for the Project.
10/23/17	Colorado River Indian Tribes	In person meeting to discuss maps included in the PDEIS.
10/24/17	Colorado River Indian Tribes Quechan Tribe	PA writing group meeting to discuss edits to 9/12/17 version of PA.
11/1/17	Colorado River Indian Tribes	Letter responding to tribe's comments on the PA.
11/1/17	Colorado River Indian Tribes	Letter responding to tribe's comments on the PA.
11/7/17	Colorado River Indian Tribes	In person meeting to discuss documentation of the ethnographic background information.
11/9/17	Colorado River Indian Tribes	Letter containing tribe's comments on the PDEIS sections related to Cultural Resources and Native American Concerns.
11/15/17	Ak-Chin Indian Community Cocopah Indian Tribe Colorado River Indian Tribes Fort McDowell Yavapai Nation Fort Mojave Tribe Gila River Indian Community Morongo Band of Mission Indians Fort Yuma Quechan Tribe Salt River Pima-Maricopa Indian Community	Letter containing the 11/13/17 draft of the Project PA for review by all consulting parties and tribes.

DATE	TRIBE	DESCRIPTION
	Soboba Band of Luiseno Indians Tohono O'odham Nation Torres Martinez Desert Cahuilla Indians Twenty-Nine Palms Band of Mission Indians Yavapai-Apache Nation Yavapai-Prescott Indian Tribe	
11/27/17	Yavapai-Prescott Indian Tribe	Email request from tribe for a copy of the Draft Research Design and Work Plan.
12/1/17	Yavapai Apache Nation	Email stating tribe has no comments on the draft PA.
12/19/17	Colorado River Indian Tribes Quechan Tribe Twenty-Nine Palms Band of Mission Indians	PA writing group consulting parties meeting to review comments on the draft PA.
1/8/18	Colorado River Indian Tribes	Letter acknowledging receipt of CRIT's Government-to-Government Consultation Policy.
2/5/18	Colorado River Indian Tribes	Letter responding to tribe's 12/15/17 comments on the draft PA.
2/09/18	Colorado River Indian Tribes, Tribal Council Meeting	Meeting with Yuma Field Manager to discuss the Project, Section 106 consultation, and other related topics.
2/12/18	Quechan Tribal Council Meeting	Meeting with Yuma Field Manager to discuss the Project, Section 106 consultation, and other related topics.

n.d.	no date
NAAQS	National Ambient Air Quality Standards
NAGPRA	Native American Graves Protection and Repatriation Act
NCL	National Conservation Area
NEPA	National Environmental Policy Act
NERC	North American Electric Reliability Corporation
NESC	National Electrical Safety Code
NFPA	National Fire Protection Association
NGO	non-governmental organization
NHPA	National Historic Preservation Act
NOA	Notice of Availability
NO_x	nitrogen dioxide

Acronym/Abbreviation	Definition
NPDES	National Pollutant Discharge Elimination System
NPS	National Park Service
NRCS	Natural Resources Conservation Service
NRHP	National Register of Historic Places
NSE	Nonessential experimental population
NSR	Noise Sensitive Receptor
NTP	Notice to Proceed
NWP	Nationwide Permit
NWR	National Wildlife Refuge
OHV	off-highway vehicle
OPGW	optical ground wire
PA	Programmatic Agreement
PEIS	Programmatic Environmental Impact Statement
PFYC	Potential Fossil Yield Classification
PILT	Payments in Lieu of Taxes
PL	Public law
PM_{10}	particulate matter smaller than 10 microns in aerodynamic diameter
$PM_{2.5}$	particulate matter smaller than 2.5 microns in aerodynamic diameter
POD	Plan of Development
PPA	Power purchase agreement
PRPA	Paleontological Resources Preservation Act
PTO	Permit to Operate
PUP	pesticide use proposal
PWA	Philip Williams & Associates
Reclamation	U.S. Bureau of Reclamation
RECS	rolled erosion control systems
RETI	Renewable Energy Transmission Initiative
RMP	Resource Management Plan
ROD	Record of Decision
ROS	Recreation Opportunity Spectrum

Acronym/Abbreviation	Definition
ROW	right-of-way
RV	recreational vehicle
RWQCB	Regional Water Quality Control Board
SA	Salvage assessed
SBR	Sequencing batch reactor
SCADA	supervisory control and data acquisition
SCE	Southern California Edison Company
SCS	series compensation station
SF_6	sulfur hexafluoride
SGCN	Species of Greatest Conservation Need
SHPA	State Historic Preservation Act (Arizona)
SHPO	State Historic Preservation Office
SLC	State Lands Commission
SO_2	sulfur dioxide
SQRU	Scenic Quality Rating Unit
SR	State Route #
SRMA	Special Recreation Management Area
SRP	Special Recreation Permit
SCS	Series Compensation Station
SSURGO	Soil Survey Geographic Data Base
STATSGO	State Soil Geographic Data Base
SWPPP	Stormwater Pollution Prevention Plan
SWRCB	State Water Resources Control Board
T	Threatened
TES	Technical Environmental Study
TCP	Traditional Cultural Property
THPO	Tribal Historic Preservation Officer
US	United States
USACE	U.S. Army Corps of Engineers
U.S.C.	United States Code
USFS	U.S. Forest Service

WAPA	Western Area Power Administration
WECC	Western Electricity Coordinating Council
WEG	Wind erodibility group
WHA	Wildlife Habitat Area
WHB	wild horse and burro
WHMA	Wildlife Habitat Management Area
WWEC	West-wide Energy Corridor
YFO	Yuma Field Office
YPG	Yuma Proving Ground
yr	year

6.3 GLOSSARY

Activity Footprint. The area of long- and short-term ground disturbance associated with the pre-construction, construction, operation, implementation, maintenance, and decommissioning of an activity, including associated linear and non-linear components, such as staging areas, access routes and roads, gen-ties, other utility lines, borrow pits, disposal areas, etc. May also be considered synonymous with activity site, activity area, or activity boundary.

Administrative Route. A designated road, primitive road, or trail on BLM-managed public lands that is limited to BLM-authorized official use. Official use is defined in 43 CFR 8340 as, "Use by an employee, agent, or designated representative of the Federal Government or one of its contractors, in the course of his employment, agency, or representation."

Adverse visual impact. Any modification of landforms, water bodies, or vegetation, or any introduction of structures, which negatively interrupts the visual character of the landscape and disrupts the harmony of the basic elements (that is, form, line, color, and texture).

Aeolian. Pertaining to material or processes associated with transportation or deposition of soil by action of the wind.

Air Quality. A measure of the health-related and visual characteristics of the air, often derived from quantitative measurements of the concentrations of specific injurious or contaminating substances.

Alluvial. Pertaining to material or processes associated with transportation or deposition of soil and rock by flowing water (e.g., streams and rivers).

Alluvium. Soil and rock deposited by flowing water (e.g., streams and rivers); consists of unconsolidated deposits of sediment, such as silt, sand, and gravel.

Alternative. Any one of a number of options for a project.

Ambient. Surrounding, existing, background conditions.

Animal unit month (AUM). The amount of forage necessary to sustain one cow and one calf (e.g., a 1,000-pound cow and calf) for a period of one month.

Annual (ecology). A plant that completes its development in one year or one season and then dies.

Anthropogenic (climate change/global warming). Resulting from or produced by human beings.

Aquatic. Growing or living in or near the water.

Aquifer. A water-bearing rock unit (unconsolidated or bedrock) that will yield water in a usable quantity to a well or spring.

Archaeological site. A discrete location that provides physical evidence of past human use.

Archaeology. The scientific study of the life and culture of past, especially ancient, peoples, as by excavation of ancient cities, relics, artifacts, etc.

Area of Critical Environmental Concern (ACEC). A BLM designation pertaining to areas where specific management attention is needed to protect and prevent irreparable damage to important historical, cultural, and scenic values, fish or wildlife resources, or other natural systems or processes, or to protect human life and safety from natural hazards.

Arroyo. A dry gully, or a stream in a dry region.

Artifact. Any object showing human workmanship or modification, especially from a prehistoric or historic culture.

Avoid to the Maximum Extent Practicable. A standard identified in the DRECP LUPA CMAs and applied to implementation of activities. Under this standard, impacts to identified resources are not allowed unless there is no reasonable or practicable means of avoidance that is consistent with the basic objectives of the activity. Compensation for unavoidable impacts would be required as specified in the CMAs. The term "maximum extent practicable" as used here in the DRECP LUPA is applicable only to its use in the CMAs; it does not apply to the term as it is used in the Endangered Species Act of 1973.

Backfill. The excavated material (soil and/or rock) used to refill a hole/trench created during construction activities (i.e., drilling foundation holes). The excavated material used to fill a hole/trench in the groundbed (i.e., structure foundations). The composition of the backfill varies based on the soil type at the excavation site and the component being covered.

Background (visual). That portion of the visual landscape lying from the outer limit of the middleground to infinity. Color and texture are subdued in this area, and visual sensitivity analysis here is primarily concerned with the two-dimensional shape of landforms against the sky.

Background distance zone. The visible area of a landscape that lies beyond the foreground-middleground. Visibility from 5 miles to a maximum distance of approximately 15 miles from a travel route, use area, or another observer platform. Atmospheric conditions in some areas may limit the maximum distance to approximately 8 miles or less.

Basic Elements (visual). The four major elements (form, line, color, and texture) that determine how the character of a landscape is perceived.

Baseline. The existing conditions against which impacts of the proposed action and its alternatives can be compared.

Basin. A depressed area having no surface outlet (topographic basin); a physiographic feature or subsurface structure that is capable of collecting, storing, or discharging water by reason of its shape and the characteristics of its confining material (water); a depression in the earth's surface, the lowest part often filled by a lake or pond (lake basin); a part of a river or canal widened (drainage, river, stream basin).

Best Management Practices (BMPs). Vegetative and structural methods to control erosion and sedimentation.

Big Game. Large species of wildlife that are hunted (such as elk, mule deer, and pronghorn antelope).

Biological monitoring. Visual survey of an area conducted by a designated biologist to determine if a biological resource is present. Biological monitoring is commonly conducted on the sites of proposed projects. Biological monitoring conducted during the implementation of activities is used to implement DRECP BLM LUPA CMAs that require construction setbacks or that require the designated biologist to move a biological resource out of harm's way.

Butte. A steep hill standing alone in a plain.

California Ambient Air Quality Standards (CAAQS). The allowable concentrations of air pollutants in the air specified by the State of California and established by the California Clean Air Act. The standards include the same pollutants regulated under the NAAQS and some additional pollutants, including hydrogen sulfide, sulfates, and vinyl chloride. Air quality standard setting in California commences with a critical review of all relevant peer reviewed scientific literature. The Office of Environmental Health Hazard Assessment (OEHHA) uses the review of health literature to develop a recommendation for the standard. The recommendation can be for no change or can recommend a new standard. The review, including the OEHHA recommendation, is summarized in a document called the draft Initial Statement of Reasons (ISOR), which is released for comment by the public, and also for public peer review by the Air Quality Advisory Committee (AQAC). AQAC members are appointed by the President of the University of California for their expertise in the range of subjects covered in the ISOR, including health, exposure, air quality monitoring, atmospheric chemistry and physics, and effects on plants, trees, materials, and ecosystems.

Candidate Species. A plant or animal species not yet officially listed as threatened or endangered under the Endangered Species Act, but which is undergoing status review by the U.S. Fish and Wildlife Service.

C**haracteristic landscape.** The established landscape in an area being viewed. This does not necessarily mean a naturalistic character. It could refer to an agricultural setting, an urban landscape, a primarily natural environment, or a combination of these types.

Clean Air Act of 1990. Federal legislation governing air pollution. The Clean Air Act established National Ambient Air Quality Standards for carbon monoxide, nitrogen oxide, ozone, particulate matter, sulfur dioxide, and lead. Prevention of Significant Deterioration classifications define the allowable increased levels of air quality deterioration above legally established levels and include the following:

Class I – minimal additional deterioration in air quality (certain national parks and wilderness areas)

Class II – moderate additional deterioration in air quality (most lands)

Class III – greater deterioration for planned maximum growth (industrial areas)

Clean Water Act of 1987. National environmental law enforced by the U.S. Environmental Protection Agency that regulates water pollution.

Clearance Survey. Survey for Focus and BLM Special-Status Species conducted immediately prior to vegetation and/or ground disturbance from activities, as per the CMAs. Clearance surveys must be conducted throughout the DRECP BLM LUPA Decision Area and in accordance with applicable species-specific CMAs and protocols, as approved by BLM and the applicable Wildlife Agencies, to detect and clear (i.e., remove, translocate) out of harm's way individuals of a species prior to disturbance.

Contrast (visual). Opposition or unlikeness of different forms, lines, colors, or textures in a landscape.

Contrast rating. A method of analyzing the potential visual impacts of proposed management activities.

Consulting Party under NPHA Section 106. A consulting party under Section 106 of NHPA assists the federal agency in identifying historic properties potentially affected by an undertaking, assessment of the undertaking's effects, and identifying ways to avoid, minimize, or mitigate any adverse effects to historic properties. Consultation is the process of seeking, discussing, and considering the views of other participants, and, where feasible, seeking agreement with them regarding matters arising in the Section 106 process. The following parties are entitled to participate as consulting parties during Section 106 review: Advisory Council on Historic Preservation; State Historic Preservation Officers; Federally recognized Indian tribes/THPOs; Native Hawaiian organizations; local governments; and applicants for Federal assistance, permits, licenses, and other approvals.

Cooperating Agency. Assists the lead Federal agency in developing an environmental assessment or environmental impact statement. The Council on Environmental Quality regulations implementing NEPA define a cooperating agency as any agency that has jurisdiction by law or special expertise for proposals covered by NEPA (40 CFR 1501.6). Any Federal, state, or local government jurisdiction with such qualification may become a cooperating agency by agreement with the lead agency.

Council on Environmental Quality (CEQ). An advisory council to the President established by the National Environmental Policy Act of 1969. It reviews Federal programs for their effort on environmental studies and advises the President on environmental matters.

Creosote Bush Rings. Rings of creosote bush (*Larrea tridentata*) that form over long periods of time. As a single creosote bush produces new branches at the periphery of its crown, the branches in the center of the crown begin to die. Eventually a sterile area of bare ground occupies the center of the original shrub, and as the ring becomes larger the original shrub segments into several shrubs (satellites), forming a ring around the point where the original shrub originated. As more time goes by these rings become elliptical rather than circular. The satellite shrubs in a ring are the same genetically, attesting to the fact that they form a single clone originating from one original shrub. Vasek (1980) showed that some of these clones are several thousand years old. The largest known creosote ring is 20.5 feet in diameter and may be 11,700 years old.

Cubic feet per second (CFS). Unit of discharge, or volume rate of flow, equal to 0.0283 cubic meters per second. As a rate of streamflow, a cubic foot of water passing a referenced section in one second. A measure of a moving volume of water.

Cultural Resources. Remains of human activity, occupation, or endeavor as reflected in districts, sites, buildings, objects, artifacts, ruins, works of art, architecture, and natural features important in human events.

Cumulative effect (or impact). As defined in the CEQ Regulations at §1508.7, the cumulative impact is the impact on the environment that results from the incremental impact of the action when added to other past, present, and reasonably foreseeable future actions regardless of what agency (Federal or non-Federal) or person undertakes such other actions. These impacts may result from individually minor but collectively significant actions taking place over a period of time.

dBA. The sound pressure levels in decibels measured with a frequency weighing network corresponding to the A-scale on a standard sound level meter. The A-scale tends to suppress lower frequencies (e.g., below 1,000 Hz).

Decibel (dB). One-tenth of a Bel is a measure on a logarithmic scale that indicates the ratio between two sound powers. A ratio of 2 in power corresponds to a difference of 3 decibels between two sounds. The decibel is the basic unit of sound measure.

Designated Biologist. A biologist who is approved as qualified by BLM, and U.S. Fish and Wildlife Service (USFWS) and CDFW, as appropriate. A designated biologist is the person responsible for overseeing compliance with specific applicable DRECP BLM LUPA biological CMAs.

Developed land. For purposes of this analysis, the term “developed land” is defined to mean property that has been developed for residential, commercial, recreation, or other uses and contains the required infrastructures for those uses. This definition also includes all the required infrastructure needed for lots to be home sites and are marketed as such, including things such as roads and utilities.

Direct effect. See effect.

Discharge. Outflow of surface water in a stream or canal (water). Discharge from an industrial facility that may contain pollutants harmful to fish or animals if it is released into nearby water bodies usually requires a permit issued by the U.S. Environmental Protection Agency and is monitored.

Displacement. When one or more wildlife individual abandons a habitat because the habitat is no longer suitable, and must seek out alternative habitat, which may or may not be adjacent. If the abandonment of habitat is caused by a disturbance, wildlife individuals may or may not return to the habitat after the disturbance is no longer present.

Distance zones. A subdivision of the landscape as viewed from an observer position. The subdivision (zones) includes foreground, middleground, and background, and is seldom seen.

Drainage. The natural or artificial removal of surface water and groundwater from a given area. Many agricultural soils need drainage to improve production or to manage water supplies.

Easement. A right afforded to a person, agency, or organization to make limited use of another's real property for access or other purposes.

Effect (impact). A modification of the existing environment as it presently exists, caused by an action (such as construction or operation of facilities). An effect may be direct, indirect, or cumulative. The terms effect and impact are synonymous under the NEPA.

A direct effect is caused by an action and occurs at the same time and same place (40 CFR 1508.8(a)).

An indirect effect is caused by the action later in time or farther removed in distance but is still reasonably foreseeable (40 CFR 1508.8(b)). Indirect effects may include growth-inducing effects and other effects related to induced changes in the pattern of land use, population density or growth rate, and related effects on air and water or other natural systems including ecosystems.

Electromagnetic field (EMF). Also called electric and magnetic fields. An electric field is the region around a conductor where a force will be experienced by an electric current or charge. A magnetic field is the region around a current where a moving charge will experience a force. Extremely low frequency EMF is the type associated with transmission lines.

Emission. Effluent discharged into the atmosphere, usually specified by mass per unit time, and considered when analyzing air quality.

Endangered Species. Species in danger of extinction throughout all or a significant portion of its range. Endangered species are rarely identified by the Secretary of the Interior in accordance with the Endangered Species Act of 1973.

Endangered Species Act (ESA) of 1973. Provides a means whereby the ecosystems upon which threatened and endangered species depend may be conserved and to provide a program for the conservation of such threatened and endangered species. The ESA requires all Federal agencies to seek to conserve threatened and endangered species, use applicable authorities in furtherance of the purposes of the ESA, and avoid jeopardizing the continued existence of any species that is listed or proposed for listing as threatened and endangered or destroying or adversely modifying its designated or proposed critical habitat. The U.S. Fish and Wildlife Service is responsible for administration of this act.

Environmental Impact Statement (EIS). A document prepared to analyze the impacts on the environment of a proposed action and released to the public for review and comment. An EIS must meet the requirements of NEPA, CEQ, and the directives of the agency responsible for the proposed action.

Environmental Justice. The fair treatment and meaningful involvement of all people regardless of race, color, national origin, or income with respect to the development, implementation, and enforcement of environmental laws, regulations, and policies. Fair treatment means that no group of people including racial, ethnic, or socioeconomic group should bear a disproportionate share of the negative environmental consequences resulting from industrial, municipal, and commercial operations or the execution of Federal, state, local, and tribal programs and policies (see Executive Order 12898).

Ephemeral stream (wash, creek, waterbody). A stream or portion of a stream which flows briefly in direct response to precipitation in the immediate vicinity, and whose channel is at all times above the water table.

Erosion. The wearing away of the land surface by running water, wind, ice, or other geological agents and by such processes as “gravitation creep.”

Extremely low frequency (ELF). Invisible lines of force that you cannot feel that surround electrical equipment, power cords, wires that carry electricity, and outdoor power lines.

Federal Land Policy and Management Act of 1976 (FLPMA). Public Law 94-579 signed by the President on October 21, 1976. Established public land policy for management of lands administered by the Bureau of Land Management (BLM). FLPMA specifies several key directions for the BLM, notably: (1) management on the basis of multiple use and sustained yield; (2) land use plans prepared to guide management actions; (3) public lands for the protection, development, and enhancement of resources; (4) public lands retained in Federal ownership; and (5) public participation used in reaching management decisions.

Federal Register. Published by the Office of the Federal Register, National Archives, and Records Administration, the *Federal Register* is the official daily publication for rules, proposed rules, and notices of Federal agencies and organizations, as well as executive orders and other presidential documents.

Floodplain. The low and relatively flat areas adjacent to rivers and streams. A 100-year floodplain is that area subject to a 1 percent or greater chance of flooding in any given year.

Forage. Vegetation used for food by wildlife, particularly big game wildlife and domestic livestock.

Foreground (visual). The visible area from a viewpoint or use area out to a distance of 0.5 mile. The ability to perceive detail in a landscape is greatest in this zone.

Foreground-middleground distance zone. The area visible from a travel route, use area, or other observation platform to a minimum distance of 0 to 5 miles. The outer boundary of this zone is defined as the point where the texture and form of individual plants are no longer apparent in the landscape. Vegetation is apparent only in patterns or outline.

Forbs. Any herbaceous plant other than a grass.

Form. The mass or shape of an object or objects that appears unified, such as a vegetative opening in a forest, a cliff or mountain formation, a water tank, or a highway overpass.

Fossil. Any remains, trace, or imprint of a plant or animal that has been preserved by natural process in the earth's crust since some past geologic time.

Game Species. Animals commonly hunted for food or sport.

Gauss (G). A unit used for measuring magnetic flux density fields. Since gauss is a large measure, milligauss (mG) is more commonly used for environmental measurements. One gauss equals 1,000 milligauss, 10,000 gauss equal 1 tesla.

Geographic Information System (GIS). A system of computer hardware, software, data, people, and applications that capture, store, edit, analyze, and graphically display a potentially wide array of geospatial information.

Geology. The science that relates to the earth, the rocks of which it is composed, and the changes that the earth has undergone or is undergoing.

Geothermal Resource. Heat found in rocks and fluids at various depths within the earth's crust that can be extracted by drilling or pumping for use as an energy source. This heat may be residual heat, friction heat, or a result of radioactive decay.

Global Warming. An increase in the average temperature of the earth's atmosphere and oceans. The term is also used to describe the theory that increasing temperatures are the result of a strengthening greenhouse effect caused primarily by manmade increases in carbon dioxide and other greenhouse gases.

Greenhouse Gases (GHGs). The warming of the earth and its atmosphere through the trapping of heat from the sun by gases, known as greenhouse gases, in the earth's atmosphere.

Groundwater. Subsurface water that fills available openings in rock or soil materials to the extent that they are considered water saturated.

Habitat. A specific set of physical conditions in a geographic area(s) that surrounds a single species, group of species, or large community. In wildlife management, the major components of habitat are food, water, cover, and living space.

Habitat assessment. As required in LUPA-BIO CMAs. Use of the DRECP land cover mapping and/or species model(s), as well as reconnaissance-level site visits and available aerial photography for confirmation of site conditions and mapping of vegetation types and species' suitable habitat. For all activities, a habitat assessment will be required to assess site-specific vegetation types and Focus and BLM Special-Status Species.

Historic Property. Any prehistoric or historic district, site, building, structure, or object included in, or eligible for inclusion in, the National Register of Historic Places maintained by the Secretary of the Interior. This term includes artifacts, records, and remains that are related to and located within such properties. The term includes properties of traditional religious and cultural importance to an Indian tribe or Native Hawaiian organization and that meet the National Register criteria.

Hydrology. The study of the movement, distribution, and quality of water throughout the earth, addresses both the hydrologic cycle and water resources.

Hydrographic basin (area, region, unit). A geographic area drained by a single major stream or an area consisting of a drainage system comprised of streams and often natural or man-made lakes. See also basin.

Impact. See effect.

Indian Tribe. An Indian tribe, band, nation, or other organized group or community, including a native village, regional corporation, or village corporation, as those terms are defined in section 3 of the Alaska Native Claims Settlement Act (43 U.S.C. 1602), which is recognized as eligible for the special programs and services provided by the United States to Indians because of their status as Indians.

Indirect effect. See effect.

Infrastructure. The facilities, services, and equipment needed for a community or facility to function, such as and including roads, sewers, water lines, and electric lines.

Intermittent. A river or stream that flows for a period of time, usually seasonally during rainy periods, and stops during dry periods. In arid regions, dry periods may be interrupted by occasional flash floods from brief but intense rainstorms.

Invasive Species. Describes a large number of non-native plant species whose introduction causes or is likely to cause economic or environmental harm or harm to human health.

Joshua Tree Woodlands. Evenly distributed with Joshua trees at ≥1% and *Juniperus* and/or *Pinus* spp <1% absolute cover in the tree canopy (Thomas et al. 2004).

Key Observation Point (KOP). One or a series of points on a travel route or at a use area or potential use area, where the view of a management activity would be most revealing.

Kilovolt (kV). A unit of power equivalent to 1,000 volts. A volt is a measure of electrical potential difference that would cause a current of 1 ampere to flow through a conductor whose resistance is 1 ohm.

Labor Force. All persons 16 years of age or over who are either employed or unemployed and actively looking for a job.

Landform. A term used to describe the many land surfaces that exist as a result of geologic activity and weathering (e.g., plateaus, mountains, plains, and valleys).

Land Use Plan. The organized direction or management of the use of lands and their resources to best meet human needs over time, according to the land's capabilities.

Laydown Area. An area where construction material and equipment are staged during a construction operation.

Lease. An authorization or contract by which one party (lessor) conveys the use of property to another (lessee) in return for rental payments. In cases of resource production, lessees pay royalties to the lessor in addition to rental payments.

Long-term Impacts. Ground and/or vegetation disturbance that results in impacts lasting greater than 2 years.

Long-term visitor area (LTVA). LTVAs are specially designated areas on BLM lands in California and Arizona. LTVAs provide places for visitors to stay for up to 180 days between September and April.

Megawatt (MW). A unit for measuring power equal to one million watts. The productive capacity of electrical generators is measured in megawatts.

Mesa. An isolated, nearly level land mass, formed on nearly horizontal rocks, standing above the surrounding country, and bounded with steep sides.

Microphyll Woodlands. Consist of drought-deciduous, small-leaved (*microphyllus*), mostly leguminous trees. Occurs in bajadas and washes where water availability is somewhat higher than the plains occupied by creosote bush and has been called the "riparian phase" of desertscrub (Webster and Bahre 2001). Composed of the following alliances: desert willow, mesquite, smoke tree, and the blue palo verde-ironwood.

Minor Incursion. Small-scale allowable impacts to sensitive resources, as per specific CMAs, that do not individually or cumulatively compromise the conservation objectives of that resource or rise to a level of significance that warrants development and application of more rigorous CMAs or a LUPA amendment. Minor incursions may be allowed to prevent or minimize greater resource impacts from an alternative approach to the activity. Not all minor incursions are considered unavoidable impacts.

Mitigation. Actions to avoid, minimize, reduce, eliminate, replace, or rectify the impact of a management practice.

National Ambient Air Quality Standards (NAAQS). The allowable concentrations of air pollutants in the air specified by the Federal government and established by the Clean Air Act. The air quality standards are divided into primary standards (based on the air quality criteria and allowing an adequate margin of safety and requisite to protect the public health) and secondary standards (based on the air quality criteria and allowing an adequate margin of safety and requisite to protect the public welfare) from any unknown or expected adverse effects of air pollutants.

National Environmental Policy Act (NEPA) of 1969. Our nation's basic charter for protection of the environment. It establishes policy, sets goals, and provides means for carrying out the policy. In accordance with NEPA, all Federal agencies must prepare a written statement on the environmental impacts of a proposed action. The provisions to ensure that Federal agencies act according to the letter and spirit of NEPA are the CEQ regulations for implementing NEPA 943 CFR 1500-1508).

National Register of Historic Places. A listing, maintained by the Secretary of the Interior, of districts, sites, buildings, structures, and objects worthy of preservation. To be eligible a property must normally be at least 50 years old, unless it has exceptional significance, and have national, state, or local significance in American history, architecture, archaeology, engineering, or culture; and possess integrity of location, design, setting, material, workmanship, feeling, and association; and (a) be associated with events that have made a significant contribution to the broad pattern of history, (b) be associated with the lives of persons significant to our past, (c) embody the distinctive characteristics of a type, period, or method of construction; represent the work of a master; possess high artistic values; or represent a significant and distinguishable entity whose components may lack individual distinction; or (d) have yielded, or may be likely to yield, information important to prehistory or history.

National Wildlife Refuge (NWR). NWR is a designation for certain protected areas managed by the U.S. Fish and Wildlife Service. NWRs are public.

Native Infrastructure. Elements of the landscape, either cultural or natural, important to Indian tribes. Elements of Native infrastructure on the landscape may include, but are not limited to, prehistoric trail networks and cultural resources sites, natural landmarks, and areas used for resource procurement.

Negligible (impact). Unless otherwise specified, "negligible" indicates impacts of such a small scale such as to be non-measurable.

Non-attainment Area. An air quality control region (or portion thereof) in which the U.S. Environmental Protection Agency has determined that ambient air concentrations exceed national ambient air quality standards for one or more criteria pollutants.

Noxious Weed. Nonnative plant species that negatively impact crops, native plant communities, and/or management of natural or agricultural systems. Noxious weeds are officially designated by a number of states and Federal agencies.

Off-highway vehicle. A vehicle specifically designed for off-highway use.

Perennial (vegetation). A plant whose root remains alive more than two years.

Perennial Stream. A stream that flows throughout the year and from source to mouth.

Physiographic province. An extensive portion of the landscape normally encompassing many hundreds of square miles, which portrays similar qualities of soil, rock, slope, and vegetation of the same geomorphic origin such as the Basin and Range province where this Project is situated.

$PM_{2.5}$. Particulate matter less than 2.5 microns in aerodynamic diameter.

PM_{10}. Particulate matter less than 10 microns in aerodynamic diameter.

Prime Farmland. A special category of highly productive cropland that is recognized and described by the U.S. Department of Agriculture's Soil Conservation Service and receives special protection under the Surface Mining Law of 1977.

Programmatic Agreement. A document that records the terms and conditions agreed upon to resolve the potential adverse effects of a Federal agency program, complex undertaking, or other situations in accordance with § 800.14(b) of the NHPA.

Project Area. The area of land which the project would encompass.

Protocol survey. Species-specific surveys that are conducted under a protocol that has been adopted by the Wildlife Agency(ies) or is otherwise scientifically accepted for determining the occupancy or presence and absence of Covered Species. These surveys would be required as specified in the species-specific CMAs in the DRECP BLM LUPA.

Public Land. Land or interest in land owned by the United States and administered through agencies such as the BLM and USBR without regard to how the United States acquired ownership, except lands on the Outer Continental Shelf, and land held in trust for the benefit of American Indians, Aleuts, and Eskimos.

Radio frequency. Electromagnetic energy in the approximate frequency range of 3,000 Hz (3 kHz) to 1 billion Hz (l gHz).

Range. A large, open area of land over which livestock can wander and graze.

Raptor. A bird of prey (e.g., eagles, hawks, falcons, and owls).

Reclamation. Restoration of land disturbed by natural or human activity (e.g., mining, pipeline construction) to original contour, use, or condition. Also describes the return of land to alternative uses that may, under certain circumstance, be different from those prior to disturbance.

Recontouring. Return a land surface to or near to its original form through earth-moving equipment such as front-end loaders, backhoes, hand rakes, hoes, shovels, etc.

Record of Decision. A document separate from but associated with an EIS that publicly and officially discloses the responsible official's decision on a proposed action.

Revegetation. The reestablishment and development of self-sustaining plant cover. On disturbed sites, this normally requires human assistance such as reseeding.

Right-of-way. Land authorized to be used or occupied for the construction, operation, maintenance, and termination of a project, such as a road or utility.

Riparian. Situated on or pertaining to the bank of a river, stream, or other body of water. Riparian is normally used to refer to plants of all types that grow along streams, rivers, or at spring and seep sites.

Resource Management Plan. Document that establishes direction for the use of resources to best meet the needs of humans over time, according to the resource potential or capability.

Resource setback. A minimal horizontal distance required for construction activities from a particular biological resource.

Scoping. Procedures by which agencies determine the extent of analysis necessary for a proposed action (i.e., the range of actions, alternatives, and impacts to be addressed; identification of significant issues related to a proposed action; and the depth of environmental analysis, data, and task assignments needed).

Sediment. Solid fragmental material, either mineral or organic, that is transported or deposited by air, water, gravity, or ice.

Sedimentation. The result when soil or mineral is transported by moving water, wind, gravity, or glaciers and deposited in streams or other bodies of water, or on land. Also, letting solids settle out of wastewater by gravity during treatment.

Sensitive Species. Those plant or animal species that are susceptible or vulnerable to activity impacts or habitat alterations.

Setback. A defined distance, usually expressed in feet or miles, from a resource feature (such as the edge of a vegetation type or an occupied nest) within which an activity would not occur; otherwise often referred to as a buffer. The purpose of the setback is to maintain the function and value of the biological resource features identified in the DRECP BLM LUPA CMAs. See Section II.3.4.2.1 for a summary of setbacks incorporated in the CMAs.

Scenic quality. Scenic quality is a measure of the visual appeal of a tract of land. In the visual resource inventory process, public lands are given an A, B, or C rating based on the apparent scenic quality that is determined using seven key factors: landform, vegetation, water, color, adjacent scenery, scarcity, and cultural modifications.

Sensitivity level. Sensitivity levels are a measure of public concern for scenic quality. Public lands are assigned high, medium, or low sensitivity levels by analyzing the various indicators of public concern including type of use, amount of use, public interest, adjacent land uses, special areas, and other factors.

Short-term Impacts. Ground and/or vegetation impacts that result in effects lasting 2 years or less.

Significant Impact Level (SIL). The SIL is a de minimis threshold applied to individual facilities that apply for a permit to emit a regulated pollutant in an area that meets the NAAQS. The state and EPA must determine if emissions from that facility will cause the air quality to worsen. The SIL is a measure of whether a source may cause or contribute to a violation of PSD increment or the NAAQS, i.e. a significant deterioration of air quality.

Simulation. A realistic visual portrayal that demonstrates the perceivable changes in landscape features caused by a proposed management activity. This is done using photography, artwork, computer graphics, and other such techniques.

Special Recreation Management Area (SRMA). SRMAs are areas officially designated by statute or Secretarial order, including components of the National Trails System, the National Wild and Scenic Rivers System, the National Wilderness System, National Conservation Areas, National Monuments or National Recreation Areas, an area covered by joint agreement between the BLM and a state government, or any area where the authorized officer determines that the resources require special management and control measures for their protection, and where a permit system for individual use would achieve management objectives.

Special Status Species. Wildlife and plant species either Federally listed or proposed for listing as endangered or threatened; state-listed; or priority species of concern to Federal agencies or tribes.

Substation. A facility where electrical voltage is either increased or decreased through the use of transformers; electric lines are interconnected at one or more voltage; and electric power is metered and regulated to provide safe and stable voltage for end-use customers.

Suitable habitat. In general, Focus and BLM Special-Status Species habitat consisting of land within a species range that has—in the case of wildlife, breeding and foraging habitat characteristics required by the species, or in the case of plants, vegetation and microhabitat characteristics—consistent with known or likely occurrences, as determined by the habitat assessment. In the California Desert Conservation Framework modeled habitat as determined by species distribution models and confirmed or refined (i.e., expanded or reduced) by activity- level habitat assessment and that require site-specific protocol or presence/absence surveys as specified in the species-specific DRECP BLM LUPA CMAs.

Texture. The visual manifestations of the interplay of light and shadow created by the variations in the surface of an object or landscape.

Threatened Species. Any species of plant or animal which is likely to become endangered within the foreseeable future throughout all or a significant portion of its range.

Traditional Cultural Property. A Traditional Cultural Property (TCP), as defined in the NHPA, is a property that is eligible for inclusion on the NRHP because of its association with cultural practices or beliefs of a living community that (a) are rooted in that community's history, and (b) are important in maintaining the continuing cultural identity of the community. Stated another way, a significant TCP is defined as a property with significance derived from the role the property plays in a community's historically rooted beliefs, customs, and practices.

Transportation Corridor. A BLM- designated corridor that would reduce resource impacts while allowing for linear ROWs for development of new transportation routes or expansion of existing roads within the designated corridor. However, corridor designation does not automatically result in authorization of requested ROWs within the corridor. Each requested ROW would require environmental analysis and evaluation of compatibility of the proposed ROW with any existing ROWs within the corridor.

Tribal Land. All lands within the exterior boundaries of any Indian reservation and all dependent Indian communities.

Unavoidable impacts to resources. Small-scale impacts to sensitive resources, as allowed per specific CMAs, that may occur even after such impacts have been avoided to the maximum extent practicable (see definition). Unavoidable impacts are limited to minor incursions (see definition), such as a necessary road or pipeline extension across a sensitive resource required to serve an activity.

Undertaking. A project, activity, or program funded in whole or in part under the direct or indirect jurisdiction of a Federal agency, including those carried out by or on behalf of a Federal agency; those carried out with Federal financial assistance; those requiring a Federal permit, license, or approval; and those subject to state or local regulation administered pursuant to a delegation or approval of a Federal agency.

Undeveloped Land. For purposes of this analysis, the term "undeveloped land" is defined to mean land that does not have existing residential or commercial buildings, facilities, or uses. Undeveloped land may be private lands that are part of a master planned community that is not yet fully developed to include residential or commercial facilities or uses, and may be in varying stages of planning or preparation for development.

Utility Corridor. Designated through land use planning to promote compatible, systematic, and predictable development on Federal lands to expedite permitting and reduce impacts to natural, economic and cultural resources from linear ROWs. However, corridor designation does not automatically result in authorization of requested ROWs within the corridor. Each requested ROW would require environmental analysis and evaluation of compatibility of the proposed ROW with any existing ROWs within the corridor.

Vegetation communities. Species of plants that commonly live together in the same region or ecotone.

Viewing platform. A point such as a scenic overlook, or route such as a highway or trail where observers would be viewing the surrounding landscape.

Viewshed. Visible portion of the specific landscape seen from a specific viewpoint, normally limited by landform, vegetation, distance, and existing cultural modifications.

Visibility. The distance to which an observer can distinguish objects from their background. The determinants of visibility include the characteristics of the target object (shape, size, color, pattern), the angle and intensity of sunlight, the observer's eyesight, and any screening present between the viewer and the object (i.e., vegetation, landform, even pollution such as regional haze).

Visual quality. The relative worth of a landscape from a visual perception point of view.

Visual resource. The visible physical features on a landscape (for example, land, water, vegetation, animals, structures, and other features).

Visual resource inventory. A BLM inventory tool that portrays the relative value of the existing visual resources of an area.

Visual resource management classes. Four management categories assigned to public lands based on scenic quality, sensitivity level, and distance zones. Each class has an objective that prescribes the amount of change allowed in the characteristic landscape.

VRM Class I Objective - The objective of this class is to preserve the existing character of the landscape. This class provides for natural ecological changes; however, it does not preclude very limited management activity. The level of change to the characteristic landscape should be very low and must not attract attention.

VRM Class II Objective - The objective to this class is to retain the existing character of the landscape. The level of change to the characteristic landscape should be low. Management activities may be seen but should not attract the attention of the casual observer. Any changes must repeat the basic elements of form, line, color, and texture found in the predominant natural features of the characteristic landscape.

VRM Class III Objective - The objective of this class is to partially retain the existing character of the landscape. The level of change to the characteristic landscape should be moderate. Management activities may attract attention but should not dominate the view of the casual observer. Changes should repeat the basic elements found in the predominant natural features of the characteristic landscape.

VRM Class IV Objective - The objective of this class is to provide for management activities that require major modification of the existing character of the landscape. The level of change to the characteristic landscape can be high. These management activities may dominate the view and be the major focus of viewer attention. However, every attempt should be made to minimize the impact of these activities through careful location, minimal disturbance, and repeating the basic elements.

Waters of the United States (WOUS). All waters that are currently used, were used in the past, or may be susceptible to use in interstate or foreign commerce including adjacent wetlands and tributaries to water of the United States; and all waters by which the use, degradation, or destruction of which would affect or could affect interstate or foreign commerce.

Watershed. Drainage basin for which surface water flows to a single point.

Wetlands. Areas inundated by surface water or groundwater with a frequency sufficient to support vegetation or aquatic life that requires saturated or seasonally saturated soil conditions for growth and reproduction.

Wilderness. An area formally designated by Congress as part of the National Wilderness Preservation System.

Wilderness Area (WA). WAs are designated under the Wilderness Act. They generally do not allow motorized equipment, motor vehicles, mechanical transport, temporary roads, or permanent structures or installations (with exceptions in Alaska). WAs are to be primarily affected by the forces of nature, although the Act does acknowledge the need to provide for human health and safety, protect private property, control insect infestations, and fight fires in the area.

6.4 INDEX

Appendix 8 Public Comments and Responses on the DEIS

Table of Contents

List of Tables

This page intentionally left blank.

8.0 DEIS COMMENTS AND RESPONSES

8.1 INTRODUCTION

This chapter provides public comments received by the BLM in response to publication of the DEIS, and the BLM's responses to those comments. The information contained in this chapter did not exist in the DEIS.

The comment period for the DEIS commenced with the publication of the NOA in the *Federal Register* on August 28, 2018 and ended on November 28, 2018.

A total of 50 comment letters and emails were received. All comments on the DEIS that were received, were read, and given careful consideration, with necessary changes incorporated into this FEIS.

8.2 RESPONSE TO COMMENTS

In responding to comments, every effort was made to address all questions, concerns, and other points presented by the commenter. Table 8.1-1 presents all of the specific comments that were received on the DEIS. It includes the comment letter number, commenter name, the comment type, the specific comment, and the BLM's response to the comment. Information contained in comment letters that had no specific relevance to the analysis in the DEIS is not included in Table 8.1-1. Copies of the comment letters in their entirety are included in the Project administrative record.

Not all comments in Table 8.1-1 resulted in text changes that appear in the FEIS. The "Response" provided by BLM, in many cases, refers to information already contained in the DEIS, or provides an explanation and/or clarification as to why a text change to the document was not required.

The following is a list of comment type codes that were used to indicate each comment's associated resource or concern.

AQ	Air Quality Concern
AG	Agricultural Concern
AIRP	Airport Concern
AR	Access Routes Concern
CE	Cumulative Effects Concern
CEQA	CEQA Concern
CLIM	Climate Change Concern
CONST	Construction Concern
CUL	Cultural Resources Concern
DATA	Data Concern
EJ	Environmental Justice Concern

GEN	General Concern
GEO	Geology & Minerals Concern
GHG/CC	Greenhouse Gas/Climate Change Concern
I10	Supports route along I10 without indicating which side (north or south)
INFO	Information Request
KOFA	Kofa NWR Concern
LAW	Legal Concern
LU	Land Use Concern
LWC	Lands with Wilderness Characteristics Concern
M&M	Mitigation and Monitoring Concern
MTR	Military Training Route Concern
NA	Native American Consultation
NEPA	NEPA Concern
NOISE	Noise Concern

Table 8.1-1 Public Comment Response Matrix

Response ID No.	Number of Signatures	Name	Comment ID No.	Comment Type	Comment	Response
1	1	Jean Public	1.1	LU	This is national land. This plan is to expropriate land owned by 328 million Americans and put up this horrific transmission line primarily for the use of all the Hispanics unlawful sneaks who flood to this Maricopa area…	Federal lands would be part of the route. See Sections 1.2.2 and 1.3 for the Applicant's project objectives and BLM's purpose and need, respectively.
1	1	Jean Public	1.2	UC	We believe joe Arpaio that there is high infestation of such non americans flooding this area and that this line is only necessary because of this high infestation of people who unlawfully are in the usa. They don't belong here. We should not be using national land so that these foreigners can get electricity. They should be in their own country.	Comment unrelated to Project.
1	1	Jean Public	1.3	OPP FL	Let the transmission company find private land to buy to use. We don't want our national land used for this purpose.	Comment unrelated to Project.
1	1	Jean Public	1.4	UC	We want an America that has a lawful immigration policy, not one flooded by illegal criminal and other foreign sneaks. You should not be able to sneak unlawfully into a country that has laws set out for how to enter this country. We need a lawful country and letting in those who don't obey the law is wrong, totally wrong. This comment is for the public record. No transmission line should be approved. It will not be for americans. It will be for an area that is used as illegal immigration territory. I don't see our national land being used for the purposes this comment is for the public record. Please receipt.	Comment unrelated to Project.
2	1	Alan J. De Salvio, Deputy Director, Mojave Desert Operations, **MDAQMD**	2.1	AQ	The District has reviewed the DEIS/EIR and concurs with the findings and actions stated in Applicant Proposed Measures (APMs) AIR-01 through AIR-05.	Comment noted. For clarification, this document is not a joint EIS/EIR.
2	1	Alan J. De Salvio, Deputy Director, Mojave Desert Operations, **MDAQMD**	2.2	AQ	The District also recommends the project require that that the following dust mitigation measures be required for the construction of the expansion (enforceable by the District AND by the land use agency): Prepare and submit to the MDAQMD, prior to commencing earth-moving activity, a dust control plan that describes all applicable dust control measures that will be implemented at the project. The most current Dust Control Plan Requirements and Dust Control Plan Submission Form are available at http://mdimrnd.ca.gov/permitting/cornpliance-fonns.;	The dust control plan will be submitted for review and approval to the MDAQMD. The fugitive dust control plan is in Appendix 2B.
2	1	Alan J. De Salvio, Deputy Director, Mojave Desert Operations, **MDAQMD**	2.3	AQ	The following signage shall be erected not later than the commencement of construction: A minimum 48 inch high by 96 inch wide sign containing the following shall be located within 50 feet of each project site entrance, meeting the specified minimum text height, black text on white background, on one inch A/C laminated plywood board, with the lower edge between six and seven feet above grade, with the contact name of a responsible official for the site and a local or toll-free number that is accessible 24 hours per day: "[Site Name] {four inch text} [Project Name/Project Number] {four inch text} IF YOU SEE DUST COMING FROM {four inch text} THIS PROJECT CALL: {four inch text} [Contact Name], PHONE NUMBER XXX-XXXX {six inch text} If you do not receive a response, Please Call {three inch text} The MDAQMD at 1-800-635-4617 {three inch text}"	The language has been added to the EIS and CEQA Appendix and is included in the Fugitive Dust Control Plan (Appendix 2B) for the part of the Project Area that is in Riverside County, California.

Response ID No.	Number of Signatures	Name	Comment ID No.	Comment Type	Comment	Response
2	1	Alan J. De Salvio, Deputy Director, Mojave Desert Operations, **MDAQMD**	2.4	AQ	Use a water truck to maintain moist disturbed surfaces and actively spread water during visible dusting episodes to minimize visible fugitive dust emissions. For projects with exposed sand or fines deposits (and for projects that expose such soils through earthmoving), chemical stabilization or covering with a stabilizing layer of gravel will be required to eliminate visible dust/sand from sand/fines deposits.	Appendix 2A, AQ-01 includes these dust control measures. The language has been added to the EIS and CEQA Appendix and is included in the Fugitive Dust Control Plan (Appendix 2B).
2	1	Alan J. De Salvio, Deputy Director, Mojave Desert Operations, **MDAQMD**	2.5	AQ	All perimeter fencing shall be wind fencing or the equivalent, to a minimum of four feet of height or the top of all perimeter fencing. The owner/operator shall maintain the wind fencing as needed to keep it intact and remove windblown dropout. This wind fencing requirement may be superseded by local ordinance, rule or project-specific biological mitigation prohibiting wind fencing.	The language has been added to the EIS and CEQA Appendix and is included in the Fugitive Dust Control Plan (Appendix 2B).
2	1	Alan J. De Salvio, Deputy Director, Mojave Desert Operations, **MDAQMD**	2.6	AQ	All maintenance and access vehicular roads and parking areas shall be stabilized with chemical, gravel or asphaltic pavement sufficient to eliminate visible fugitive dust from vehicular travel and wind erosion. Take actions to prevent project-related trackout onto paved surfaces, and clean any project-related trackout within 24 hours. All other earthen surfaces within the project area shall be stabilized by natural or irrigated vegetation, compaction, chemical or other means sufficient to prohibit visible fugitive dust from wind erosion.	Appendix 2A, AQ-01 includes these dust control measures. The language has been added to the EIS and CEQA Appendix and is included in the Fugitive Dust Control Plan (Appendix 2B).
3	1	Mary-Ellen Walsh, Cultural Resources Compliance Manager, **Arizona State Historic Preservation Office**	3.1	CUL	1. SHPO Guidance Point # 5 says new survey is recommended if the survey is 10 years or older if: a) field methods do not meet current professional standards; or b) there may be structures or buildings that are now historical in age; or c) changes in landform due to pedogenic processes would result in the visibility of previously buried cultural resources.	Comment noted. The BLM conducted a Class I inventory of all routes included in the DEIS, with a 1-mile buffer analysis area. The Class I inventory, as part of their methodological approach, evaluated all previous studies and surveys in accordance with SHPO Guidance Point # 5.
3	1	Mary-Ellen Walsh, Cultural Resources Compliance Manager, **Arizona State Historic Preservation Office**	3.2	CUL	2. We also recommend that, in areas where no new survey is necessary, previously recorded sites should be revisited (depending on pedogenic processes) to assess condition and reevaluate Register eligibility.	This is also a stipulation in BLM Cultural Resource Use Permits.
4	1	Don Rerick, Manager, Planning and Project Management Division, **Flood Control District of Maricopa County**	4.1	WTR	Thank you for the project maps. I have reviewed them and have found that the proposed alignment west of Tonopah, AZ may have the potential for impacting one of our Flood Control structures, the Harquahala FRS (Flood Retarding Structure) a.k.a. a dam. I have attached one of your maps showing this area along with a Maricopa County map that shows the same area. To provide you with some geographic reference for the two maps: On your attached map; 1. As the alignment moves north and then west from the Delaney Substation, the alignment travels along the CAP Canal alignment. 2. To the north of the alignment you will see the Big Horn Mountains Wilderness area, and to the west the Salome Hwy alignment. On the attached county map; 1. You will see the same geographic references; the wilderness and the highway. 2. You will notice between these two features the CAP Canal alignment, and adjacent and	Comment noted. The selected Project Alternative would be required to span the Harquahala FRS, or any other such feature. BMP MISC-07 (Appendix 2A) states that “project structures would be located to avoid sensitive infrastructure.

Response ID No.	Number of Signatures	Name	Comment ID No.	Comment Type	Comment	Response
					parallel to the canal you will see the alignment for the Harquahala FRS structure, an earthen dam. It is this flood control dam that you should be aware of as you develop any alignments for the transmission corridor.	
5	1	Alex Daue, Assistant Director, Energy & Climate, **The Wilderness Society**	5.1	LWC	I've been reviewing the DEIS and am having trouble making sense of the descriptions of potential impacts to lands with wilderness characteristics as well as the map in Figure 3.2-3 in Appendix 7. After comparing with LWC maps from the underlying RMPs, I think there is something off with some of the symbology and legend in Figure 3.2-3.	The wrong figure was included in the DEIS as Figure 3.2-3. A correct Figure 3.2-3 has been included in the FEIS and represents the mapping and data used as a part of the DEIS analysis. The text in Section 4.2.5.3 has been clarified.
6	1	Alex Daue, Assistant Director, Energy & Climate, **The Wilderness Society**	6.1	LWC	Did BLM do new LWC inventory as part of this EIS?	Yes. The study team conducted a stepwise evaluation of the Project study area using GIS software to determine which lands potentially meet LWC criteria, and to specify a subset of these lands for field examination. The primary information sources used for this screening evaluation included BLM route GIS data, BLM GIS data for prior inventory of LWC, citizen-provided GIS data (The Wilderness Society), U.S. Census road inventory data, and 2014 aerial imagery.
6	1	Alex Daue, Assistant Director, Energy & Climate, **The Wilderness Society**	6.2	LWC	Are the LWC polygons shown in purple crosshatching on the new Figure3.2-3 the units that BLM found to have LWC as part of that new inventory?	The FEIS Figure 3.2-3 that will replace the DEIS Figure 3.2-3 identifies six LWC polygons in purple cross-hatch; these are the updated BLM LWC polygons (see response to Comment 6.1).
6	1	Alex Daue, Assistant Director, Energy & Climate, **The Wilderness Society**	6.3	LWC	Can you share the inventory reports, both for units found to have LWC and units not found to have LWC?	The inventory reports were provided per this request on 11/7/18.
6	1	Alex Daue, Assistant Director, Energy & Climate, **The Wilderness Society**	6.4	LWC	Based on the new Figure 3.2-3, it appears that BLM's preferred alternative would not intersect LWC, is that correct?	The Preferred Alternative includes Segment p-09, which would intersect LWC Polygon 23. However, the intersection of Segment p-09 would only reduce the polygon by approximately 9 acres, and would not result in reducing Polygon 23 below the 5,000-acre requirement to qualify as LWC. Therefore, Segment p-09 would have negligible direct impacts on LWC Polygon 23. See Response to Comment 6.6 for further information about impacts to LWC.
6	1	Alex Daue, Assistant Director, Energy & Climate, **The Wilderness Society**	6.5	LWC	It looks like segment i-04 runs along the edge of LWC unit 14, but doesn't intersect it? It looks like segment x-05 runs along the edge of LWC unit 13, but doesn't intersect it?	Correct for both – according to Table 3.11-3 of the TES, the study area for Segment i-04 includes a portion of LWC polygons 14 and 34, but neither polygon is bisected by Segment i-04. According to Table 3.11-4 (Appendix 3), the study area for Segment x-05 includes a portion of LWC polygon 13, but the polygon is not bisected by Segment x-05.
6	1	Alex Daue, Assistant Director, Energy & Climate, **The Wilderness Society**	6.6	LWC	As described in the DEIS on p. 4-6, the only route segment that would intersect an LWC unit is qn-02 (intersecting LWC unit 35_SW), but that route segment is not part of the BLM-preferred alternative. Correct?	DEIS page 4-6 is not fully correct, but also note that page 4-6 does not specifically identify Segment qn-02. The following segments would intersect (bisect) an LWC polygon: in-01 (polygon 34), qn-02 (polygon 35_SW), p-09 (polygon 23 [this one may be within GIS margin of error, but it is being evaluated as correct]), cb-01 (polygon 23), cb-02 (polygon 23), and cb-04 (polygon 23). Of these, cb-01, cb-02, and cb-04 would result in polygon 23 being reduced to below the 5,000-acre LWC criteria, and thus making the polygon ineligible for LWC designation. None of these three segments (cb-01, -02, or -04) are part of the BLM Preferred Alternative. Section 4.2.5.3 of

Response ID No.	Number of Signatures	Name	Comment ID No.	Comment Type	Comment	Response
						the FEIS has been revised to clarify and correct the information.
6	1	Alex Daue, Assistant Director, Energy & Climate, **The Wilderness Society**	6.7	LWC	Less important, but in the old Figure 3.2-3, do you know what the polygons with green hashing angling down to the left (the majority of the polygons shown on the map) are?	In the old Figure 3.2-3 the green-hashed polygons are the citizen-provided data from The Wilderness Society.
7	1	Mark Cunningham, **IBEW Local 769**	7.1	SUP PRO	I am very much in support of this project.	Comment noted.
7	1	Mark Cunningham, **IBEW Local 769**	7.2	Socio	I represent workers who do the construction of these type [of] transmission line. We would employ approximately 160 IBEW workers from AZ on this project.	Comment noted. The Socioeconomics section discloses potential employment effects.
7	1	Mark Cunningham, **IBEW Local 769**	7.3	Socio	The line would also help improve the current electrical grid. Power would be able to travel to and from AZ to CA CA to AZ when the peak demand was needed.	Comment noted.
8	1	Julie Kroepel	8.1	WTR	Has the flood plain issue been address[ed] with the construction of Ten West particularly in the Harquahala Valley area west of Tonopah south of I-10? Having land in this area I was made aware of the floodplain there and I know that there are other flood plain areas between Tonopah and California border. Won't this impact the running of lines or cables?	Floodplains were analyzed in detail in the TES (Section 4.19). The average span between transmission line poles would be 1,200 feet. For the various alternative routes, floodplains would likely be able to be spanned and thus avoided. Final design would emphasize avoidance of floodplains for structure locations. Whether avoided or not, compliance with Section 404 of the Clean Water Act and Section 10 of the Rivers and Harbors Act would ensure that any physical alterations of floodplains would be mitigated to ensure their continuing functioning.
9	1	Travis Odle	9.1	SUP PRO	I'm for the Project brings jobs and needed energy resource.	Comment noted.
10	1	Ron Riffe	10.1	SUP PRF	Please use the Preferred	Comment noted.
10	1	Ron Riffe	10.2	REC	[the preferred alternative] will not [impact] the Arizona Peace Trail.	As noted in Tables 2-10 and 2-13, the Agency Preferred Alternative would have similar negligible to moderate impacts as the Proposed Action to the Arizona Peace Trail.
11	1	[Carol] Lynn Stimson	11.1	SUP PRF	I'm agreed with your preferred alternative.	Comment noted.
12	1	Bruce Fenske, Arizona Department of Transportation	12.1	LU	As a reminder (because I have made this comment before), Ten West will require an encroachment permit from ADOT for each location where it wishes to cross I-10 and US 95 in Arizona. Ten West should be aware of this due to previous comments at public/agency meetings and in a meeting held at our office in Yuma.	Comment noted. Table 1.5-2 lists the permits that would be required.
13	1	Jim Schwarz	13.1	Socio, LU	How will any of these proposed routes affect our real property?	Impacts to property values are discussed in Section 4.9 of the DEIS, and in Section 4.15 Socioeconomics, 4.16 Environmental Justice, and 4.8 Land Use in the TES. Short-term negligible impacts to property values under all alignments are anticipated.
14	1	Alex Daue, Assistant Director, Energy & Climate, **The Wilderness Society**	14.1	LWC	Does the TWL preferred alternative crosses any lands with wilderness characteristics identified in the inventory we performed for Ten West.	See response to comment 6.5.

Response ID No.	Number of Signatures	Name	Comment ID No.	Comment Type	Comment	Response
14	1	Alex Daue, Assistant Director, Energy & Climate, **The Wilderness Society**	14.2	LWC	Requested shapefiles for all project alternatives.	Shapefiles were provided.
14	1	Alex Daue, Assistant Director, Energy & Climate, **The Wilderness Society**	14.3	LWC	Requested a copy of the actual wilderness inventory completed by HDR.	Most recent version of the LWC inventory report was provided.
15	6	Mike Quigley (AZ State Director, **The Wilderness Society**), Rob Peters (Senior Southwest Representative, **Defenders of Wildlife**), Helen O'Shea (Director, Western Renewable Energy Project, **NRDC**), Garry George (Renewable Energy Director, **National Audubon Society**), John Shepard (Senior Director of Programs, **Sonoran Institute**), Sandy Bahr (Chapter Director, **Sierra Club** – Grand Canyon Chapter)	15.1	KOFA	Avoiding the Kofa National Wildlife Refuge (NWR): BLM should not approve a route for Ten West Link through the Kofa NWR because of the sensitive and valuable wildlife habitat and other resources there. The Kofa NWR provides habitat for nearly 200 species of birds, 49 species of mammals, 41 species of reptiles and amphibians, and many species of plants. The habitat types of the Kofa NWR are fragile and unique in the country; consequently, Kofa continues to be an essential landscape for desert bighorn sheep and other species of interest, including desert tortoise, Gila monster, Colorado Desert Fringe toed Lizard, Golden Eagle, LeConte's Thrasher, Gray Vireo, California leaf-nosed bat, peregrine falcon, and Kofa Mountain barberry.	Comment noted.
15	6	Mike Quigley (AZ State Director, **The Wilderness Society**), Rob Peters (Senior Southwest Representative, **Defenders of Wildlife**), Helen O'Shea (Director, Western Renewable Energy Project, **NRDC**), Garry George (Renewable Energy Director, **National Audubon Society**), John Shepard (Senior Director of Programs, **Sonoran Institute**), Sandy Bahr (Chapter Director, **Sierra Club** – Grand Canyon Chapter)	15.2	SUP PRF	We appreciate that BLM's preferred alternative route, described in the DEIS as modified Alternative 2, avoids the Kofa NWR. If BLM approves Ten West Link, we support BLM selecting modified Alternative 2 or another alternative that avoids the Kofa NWR in the Final EIS and Record of Decision (ROD).	Comment noted.
15	6	Mike Quigley (AZ State Director, **The Wilderness Society**), Rob Peters (Senior Southwest Representative, **Defenders of Wildlife**),	15.3	KOFA	U.S. Fish and Wildlife Service (USFWS) determination: As stated in the DEIS, "The USFWS determined that the Project would not be an appropriate use within the Kofa NWR on January 26, 2017, and therefore the USFWS cannot authorize a ROW for the Project across the Kofa NWR (USFWS 2017) (Appendix 1A)." DEIS p. 1-5. Beyond making it clear that the USFWS will not authorize a ROW for Ten West Link through the Kofa NWR, this determination	The route through the Kofa NWR was part of the Proponent's Proposed Action. The BLM must analyze the impacts of the route as proposed by the Proponent; therefore, this route is considered in the EIS.

Response ID No.	Number of Signatures	Name	Comment ID No.	Comment Type	Comment	Response
		Helen O'Shea (Director, Western Renewable Energy Project, **NRDC**), Garry George (Renewable Energy Director, **National Audubon Society**), John Shepard (Senior Director of Programs, **Sonoran Institute**), Sandy Bahr (Chapter Director, **Sierra Club** – Grand Canyon Chapter)			underscores the fact that BLM and the project developer should abandon consideration of any routes that intersect with the Kofa NWR. We further note that the DEIS identifies significant and unacceptable impacts to the Kofa NWR and its mission associated with the originally proposed alternative, including: "[the Kofa route] segment is almost 36 miles long and follows the existing DPV1 line and corridor with approximately 25 miles crossing the Kofa NWR. Construction along this segment has the potential to alter habitats of various special status species including Gila monster, elf owl, gilded flicker, LeConte's thrasher, and Lucy's warbler. The portion of this segment near and through the Kofa NWR has the potential to disrupt desert bighorn sheep movement and habitat use, as well as impact good quality habitat for the Sonoran desert tortoise, and disturb golden eagles... The route crosses between the Livingston Hills and New Water Mountains, an identified desert bighorn sheep dispersal corridor, temporarily disrupting movement for forage. This segment... [is] within the designated experimental nonessential population area for the Sonoran pronghorn.... Sonoran pronghorn may avoid the area during construction, thereby disrupting natural movement patterns, and forage habitat would be lost in the short term until construction areas are revegetated. Construction activities associated with Segment p-06 would not be in compliance with the National Wildlife Refuge System Administration Act of 1966, as amended by the National Wildlife Refuge System Improvement Act of 1997 and could have significant direct and indirect impacts on the continued management of the Kofa NWR for the conservation and development of natural wildlife. These impacts would be major, with both short- and long-term effects, and cannot be mitigated. The USFWS states (USFWS 2017) that the construction of a new transmission line across the Kofa NWR should not be considered as a viable alternative." [DEIS p. 4-30] Clearly, the Kofa NWR is an unsuitable location for infrastructure development such as the proposed electrical transmission line.	
15	6	Mike Quigley (AZ State Director, **The Wilderness Society**), Rob Peters (Senior Southwest Representative, **Defenders of Wildlife**), Helen O'Shea (Director, Western Renewable Energy Project, **NRDC**), Garry George (Renewable Energy Director, **National Audubon Society**), John Shepard (Senior Director of Programs, **Sonoran Institute**), Sandy Bahr (Chapter Director, **Sierra Club** – Grand Canyon Chapter)	15.4	WLF	Sonoran pronghorn: As we noted in our prior comments, a very significant change of circumstance has occurred since the DPV1 line was constructed: the presence of Sonoran pronghorn in the project area. As noted by the USFWS: "In 2011, the refuge began work to re-establish a population of the endangered Sonoran pronghorn on Kofa NWR which lies within the historic range of the species. This was undertaken to support recovery and down-listing of the species. The wild population has reached about 70 animals through reproduction and supplemental releases. Sonoran pronghorn are nomadic and require large expenses of land to survive as localized droughts are frequent and summer rains are sporadic. These animals must be able to move to areas with sufficient food and water throughout the year. Sonoran pronghorn have repeatedly been documented within the area of the proposed ROW and may be negatively impacted by general human disturbance, construction and maintenance activities, and associated habitat loss and fragmentation." [DEIS, Appendix 1A p. 5] The presence of Sonoran pronghorn in the project area is the result of successful re-establishment efforts by federal and state agencies and other stakeholders involving years of planning and resources. This includes significant investment from the Department of the Interior. We encourage BLM to give these efforts and resource expenditures exceptional consideration and, consequently, support the recovery of Sonoran pronghorn by avoiding any	Comment noted. The BLM's preferred alternative does avoid the Kofa NWR.

Response ID No.	Number of Signatures	Name	Comment ID No.	Comment Type	Comment	Response
					routing or activity on the Kofa NWR. If BLM approves Ten West Link, we support BLM selecting modified Alternative 2 or another alternative that avoids the Kofa NWR in the Final EIS and ROD.	
15	6	Mike Quigley (AZ State Director, **The Wilderness Society**), Rob Peters (Senior Southwest Representative, **Defenders of Wildlife**), Helen O'Shea (Director, Western Renewable Energy Project, **NRDC**), Garry George (Renewable Energy Director, **National Audubon Society**), John Shepard (Senior Director of Programs, **Sonoran Institute**), Sandy Bahr (Chapter Director, **Sierra Club** – Grand Canyon Chapter)	15.5	WLF	Desert bighorn sheep: In prior comments we noted that the Kofa NWR was originally designated as a game range for desert bighorn sheep. Indeed, the USFWS comments echo this: "Kofa NWR was established for the recovery of desert bighorn sheep populations." [DEIS, Appendix 1A p. 4]. Further, the USFWS explains the negative effects on desert bighorn sheep of a routing through the Kofa NWR: "While the sheep have largely done well on the refuge, a recent population decline of nearly half the historic population of 800 sheep prompted investigations into possible causes of the decline and management actions targeted specifically toward recovery. Increased habitat fragmentation and construction activities that would occur as a result of a ROW for a transmission line, may slow population recovery and restrict sheep movements between mountain ranges. North-south movement between mountain ranges is important for sheep to maintain genetic diversity and since habitat conditions may vary dramatically between different locations based on sporadic and localized rainfall. It is important for the long-term survival of desert bighorn sheep to be able to move to areas with sufficient food and water, particularly during dry seasons or dry years and prolonged droughts." [DEIS, Appendix 1A p. 4] Similar to that for Sonoran pronghorn, the effort to recover desert bighorn sheep on the Kofa NWR represents a considerable investment by federal and state agencies and non-governmental organizations. Similarly, we encourage BLM to give these efforts and resource expenditures by sister agencies exceptional consideration and, consequently, support the recovery of desert bighorn sheep by avoiding any routing or activity on the Kofa NWR. We support BLM selecting modified Alternative 2 or another alternative that avoids the Kofa NWR in the Final EIS and ROD.	Comment noted. The BLM's preferred alternative does avoid the Kofa NWR.
15	6	Mike Quigley (AZ State Director, **The Wilderness Society**), Rob Peters (Senior Southwest Representative, **Defenders of Wildlife**), Helen O'Shea (Director, Western Renewable Energy Project, **NRDC**), Garry George (Renewable Energy Director, **National Audubon Society**), John Shepard (Senior Director of Programs, **Sonoran Institute**), Sandy Bahr (Chapter Director, **Sierra Club** – Grand Canyon Chapter)	15.6	PI	Response to stakeholder input: BLM's press release announcing publication of the DEIS noted that the agency's preferred alternative route, "…is responsive to stakeholder input by avoiding popular recreation areas, the Kofa National Wildlife Refuge, and Tribal lands." A broad suite of stakeholders submitted comments to BLM opposing routing the project through the Kofa NWR and recommending BLM instead consider use of the West-wide Energy Corridor (WWEC) along Interstate Highway 10 (I-10). We appreciate BLM's responsiveness to stakeholder input in the agency's selection of its preferred alternative.	Comment noted.

Response ID No.	Number of Signatures	Name	Comment ID No.	Comment Type	Comment	Response
15	6	Mike Quigley (AZ State Director, **The Wilderness Society**), Rob Peters (Senior Southwest Representative, **Defenders of Wildlife**), Helen O'Shea (Director, Western Renewable Energy Project, **NRDC**), Garry George (Renewable Energy Director, **National Audubon Society**), John Shepard (Senior Director of Programs, **Sonoran Institute**), Sandy Bahr (Chapter Director, **Sierra Club** – Grand Canyon Chapter)	15.7	I10	Using portions of the West-wide Energy Corridor 30-52 along I-10: As noted in the DEIS, portions of the BLM-preferred alternative for Ten West Link would be within WWEC 30-52. DEIS p. 1-7. WWEC 30-52 is the result of a multi-stakeholder and multidiscipline analysis to determine more appropriate corridors for infrastructure development on federal lands. WWEC 30-52 avoids many of the negative environmental impacts associated with the original proposed route through the Kofa NWR. BLM has done the right thing in taking advantage of this work and choosing the WWEC in this case. This route along I-10 demonstrates the promise and value of the WWEC to facilitate consolidated, lower-conflict infrastructure development by steering it to places with fewer impacts. If BLM approves Ten West Link, we support BLM selecting modified Alternative 2 or another alternative that avoids the Kofa NWR and uses WWEC 30-52 in the Final EIS and ROD.	Comment noted.
15	6	Mike Quigley (AZ State Director, **The Wilderness Society**), Rob Peters (Senior Southwest Representative, **Defenders of Wildlife**), Helen O'Shea (Director, Western Renewable Energy Project, **NRDC**), Garry George (Renewable Energy Director, **National Audubon Society**), John Shepard (Senior Director of Programs, **Sonoran Institute**), Sandy Bahr (Chapter Director, **Sierra Club** – Grand Canyon Chapter)	15.8	REC	Avoiding Johnson Canyon: This area is very important to local residents for its scenic views and opportunities for solitude, convenient recreational opportunities, and inclusion in the Arizona Peace Trail. We appreciate that the BLM-preferred alternative avoids Johnson Canyon and traverses Copper Bottom Pass instead. Our staff have visited the area with local residents and agree that the BLM-preferred alternative is the best solution for that portion of the route. As BLM notes in the DEIS, "The effects to OHV routes and the proposed Arizona Peace Trail under the Preferred Alternative would be the similar to those under the Proposed Action. [DEIS 4-125]" which is to say "Because the Proposed Action would follow the existing DPV1, the Project would have negligible changes on the recreation experience of OHV users on OHV routes and the proposed Arizona Peace Trail." [DEIS 4-123] We applaud BLM's decision to avoid new infrastructure in Johnson Canyon or detrimental impacts to the proposed Arizona Peace Trail. If BLM approves Ten West Link, we support BLM selecting modified Alternative 2 or another route that avoids Johnson Canyon and the Arizona Peace Trail in the Final EIS and ROD. We do not oppose the creation of limited spur roads to support construction of the project in Copper Bottom Pass; doing so may help limit safety risks that helicopter installation would create because of the proximity of the existing DPV1 line and the lack of escape routes.	Comment noted.
15	6	Mike Quigley (AZ State Director, **The Wilderness Society**), Rob Peters (Senior Southwest Representative, **Defenders of Wildlife**), Helen O'Shea (Director, Western Renewable Energy Project, **NRDC**), Garry George (Renewable Energy Director, **National Audubon**	15.9	VEG	We are pleased that the analysis of the BLM-preferred alternative in the DEIS follows the Desert Renewable Energy Conservation Plan (Land Use Plan Amendment adopted 2016) scientific data and Conservation Management Actions in determining impacts and mitigation ratios for microphyll woodlands, as is appropriate. We recommend that any indirect impacts such as grading or removing vegetation for construction or removing vegetation under the lines be considered direct and not indirect impacts to this plant assemblage. We also recommend that any mitigation needed for microphyll woodlands expand the size of a protected area of BLM lands with a high amount of existing microphyll woodlands, such as the Chuckwalla Area of Critical Environmental Concern.	Comment noted. Ground disturbance, including grading and removing vegetation, for project construction is considered a direct impact. BMP BIO-46 (Appendix 2A, Section 2A.4) compensates for loss of desert riparian woodland at a ratio of 5:1 in California.

		Society), John Shepard (Senior Director of Programs, **Sonoran Institute**), Sandy Bahr (Chapter Director, **Sierra Club** – Grand Canyon Chapter)				
15	6	Mike Quigley (AZ State Director, **The Wilderness Society**), Rob Peters (Senior Southwest Representative, **Defenders of Wildlife**), Helen O'Shea (Director, Western Renewable Energy Project, **NRDC**), Garry George (Renewable Energy Director, **National Audubon Society**), John Shepard (Senior Director of Programs, **Sonoran Institute**), Sandy Bahr (Chapter Director, **Sierra Club** – Grand Canyon Chapter)	15.10	WLF	The alternatives analysis in the Draft EIS also rightly acknowledges that migratory birds are at higher risk where the BLM-preferred alternative crosses the agriculture fields. Audubon has identified the Lower Colorado River Valley as an Important Bird Area (IBA) in an international program to identify areas of high conservation value for birds led by BirdLife International. The IBA designation states: Because the river is emerging as one of the most important corridors in the state for northbound migrants in spring, the agricultural fields to the west of Blythe (esp. along Lovekin Blvd.) support exceptionally high numbers of migrant shorebirds when flooded (e.g. up to 10,000 Whimbrel in spring, RM). Long-billed Curlew is also found in migration and winter in large flocks. The fields in this area host one of just two large aggregations of Mountain Plover left in southern California (several hundred birds), the other being in similar habitat in the Imperial Valley. (Cooper, Important Bird Areas of California, 2008) We are also pleased that the BLM-preferred alternative aligns with the existing SCE Devers Palo Verde 1 line (DPV1) rather than crossing these fields in another area, because this routing will reduce the risk of bird collisions. We recommend that the DEIS include a specific mitigation measure from Avian Power Line Interaction Committee guidance on collision that was included in DPV1 line Mitigated Negative Declaration in siting parallel distribution lines: Avian Protection – The Avian Power Line Interaction Committee (APLIC) guidelines will be followed to the greatest extent feasible (APLIC 2006, 2012). SCE shall install transmission lines utilizing APLIC standards for collision-reducing techniques, which avoids placement of lines significantly above existing transmission lines, topographic features, or tree lines. Use of bird flight diverters or other visual markers to reduce avian collisions with lines shall mimic existing and adjacent transmission line features.	Comment noted. Avian Protection measures following APLIC guidelines are included in the Applicant Proposed Measures as APM BIO-21 (Appendix 2A, Section 2A.4). Additional examples of these were added to the APM description. Additionally, text has been added to Impact BIO 2 in Appendix 1 C to more closely address potential impacts within riparian habitat, including the Colorado River corridor.
15	6	Mike Quigley (AZ State Director, **The Wilderness Society**), Rob Peters (Senior Southwest Representative, **Defenders of Wildlife**), Helen O'Shea (Director, Western Renewable Energy Project, **NRDC**), Garry George (Renewable Energy Director, **National Audubon Society**), John Shepard (Senior Director of Programs, **Sonoran Institute**), Sandy Bahr (Chapter Director, **Sierra Club,** Grand Cyn Ch)	15.11	WLF	We are also pleased that the BLM-preferred alternative crosses the Colorado River at an area where the banks of the river have been channelized, because doing so will reduce the risk of bird collisions. Nevertheless, it is well documented that migratory birds fly along the Colorado River during migration periods, some of which may be Endangered or Threatened under Endangered Species Act, such as Yellow-billed Cuckoo and Southwest Willow Flycatcher. While following the Avian Power Line Interaction Committee guidance for reducing the risk of collision and electrocution of birds with transmission lines is key, many birds that migrate at night will not be able to see the lines. The Final EIS and ROD should include guidance on lighting in order not to attract nocturnal migrants to the infrastructure or the lines.	Avian Protection measures following APLIC guidelines are included in the Applicant Proposed Measures as APM BIO-21 (Appendix 2A, Section 2A.4). These include using visual markers, avoiding placing lines significantly above existing transmission lines, topographic features, or tree lines, and lighting specifications in order not to attract nocturnal migrants to the infrastructure or lines.

15	6	Mike Quigley (AZ State Director, **The Wilderness Society**), Rob Peters (Senior Southwest Representative, **Defenders of Wildlife**), Helen O'Shea (Director, Western Renewable Energy Project, **NRDC**), Garry George (Renewable Energy Director, **National Audubon Society**), John Shepard (Senior Director of Programs, **Sonoran Institute**), Sandy Bahr (Chapter Director, **Sierra Club** – Grand Canyon Chapter)	15.12	WLF	Consistent with industry best practices the developer should develop an Avian Protection Plan covering the entire project footprint. BLM should include requirements for the preparation and implementation of an Avian Protection Plan, including measures for nocturnal migrants, in the Final EIS and ROD. The Avian Protection Plan should put particular emphasis on the Colorado River crossing and the crossing of agricultural fields.	The Avian Protection Plan is in Appendix 2B of the FEIS.
15	6	Mike Quigley (AZ State Director, **The Wilderness Society**), Rob Peters (Senior Southwest Representative, **Defenders of Wildlife**), Helen O'Shea (Director, Western Renewable Energy Project, **NRDC**), Garry George (Renewable Energy Director, **National Audubon Society**), John Shepard (Senior Director of Programs, **Sonoran Institute**), Sandy Bahr (Chapter Director, **Sierra Club** – Grand Canyon Chapter)	15.13	VIS	We understand that BLM is recommending that the project developer site the towers close to the existing DPV1 towers to reduce visual impacts. While reduction of visual impacts is important, we understand that strict requirements for close placement of the towers would limit opportunities to adjust tower placement to avoid impacts to microphyll woodlands and cultural resources. In general, we recommend that BLM prioritize flexibility for tower placement to avoid microphyll woodlands and cultural resources over reduction of visual impacts.	It is unclear whether this situation will occur until micrositing has been designed. As part of the micrositing process the BLM will consider impacts to microphyll woodlands and cultural resources and work with DCRT to balance tower placement requirements while minimizing impacts to resources. Impacts to microphyll woodland vegetation communities were evaluated in FEIS Section 4 and Appendix 1C; Table 2.4-1 from Appendix 1C assumed under a worst-case scenario that 7.5 acres of Blue palo verde - ironwood woodland (*Parkinsonia florida - Olneya tesota*) may be impacted by the Project; however, the actual impact is expected to be considerably less after micrositing and application of resource setbacks and applicable APMs, BMPs, and MMs. All unavoidable impacts to microphyll woodlands would be offset through required compensatory mitigation.
15	6	Mike Quigley (AZ State Director, **The Wilderness Society**), Rob Peters (Senior Southwest Representative, **Defenders of Wildlife**), Helen O'Shea (Director, Western Renewable Energy Project, **NRDC**), Garry George (Renewable Energy Director, **National Audubon Society**), John Shepard (Senior Director of Programs,	15.14	LWC	Lands with wilderness characteristics (LWC) inventory: We appreciate that BLM completed an LWC inventory update for the DEIS and analyzed impacts to LWC in the DEIS, as required by the Federal Land and Policy Management Act (FLPMA) and BLM guidance (Manual 6310). It is our understanding that the BLM-preferred alternative avoids LWC, which we also appreciate. We are trying to confirm with BLM whether this is the case. If the BLM-preferred alternative does intersect LWC, BLM should pursue adjustments to the route to avoid LWC, while taking into consideration potential impacts that adjusting the route could cause to other important resources and values. Unfortunately, the map showing LWC inventory BLM included in the DEIS did not include the right information. BLM has since shared the correct map with some stakeholders; BLM should post the correct map on its ePlanning page and notify stakeholders of its availability as soon as possible.	Corrected figures shared with the Wilderness Society on 11/7/18. Corrected figures and discussion on LWC is included in Section 4.2.5.3 of the FEIS.

Response ID No.	Number of Signatures	Name	Comment ID No.	Comment Type	Comment	Response
		Sonoran Institute), Sandy Bahr (Chapter Director, **Sierra Club** – Grand Canyon Chapter)			Instruction Memorandum 2013-106 instructs that BLM field offices should make finalized and signed wilderness characteristics inventory findings available to the public as soon as practicable after their completion and before the inventory data is used to inform decisions. BLM should make these detailed inventory findings available to the public as soon as possible to facilitate informed comments on the DEIS.	
15	6	Mike Quigley (AZ State Director, **The Wilderness Society**), Rob Peters (Senior Southwest Representative, **Defenders of Wildlife**), Helen O'Shea (Director, Western Renewable Energy Project, **NRDC**), Garry George (Renewable Energy Director, **National Audubon Society**), John Shepard (Senior Director of Programs, **Sonoran Institute**), Sandy Bahr (Chapter Director, **Sierra Club** – Grand Canyon Chapter)	15.15	M&M	Compensatory mitigation: BLM is subject to a broad range of authorities supporting mitigation measures to avoid, minimize and offset unavoidable impacts. While the BLM preferred alternative avoids some of the worst potential impacts by avoiding the Kofa NWR, construction, operation and maintenance of Ten West Link in the BLM-preferred alternative would still cause significant impacts which must be addressed through the mitigation hierarchy. FLPMA requires BLM to manage for multiple use and sustained yield, and to avoid unnecessary or undue degradation of resources and values. The National Environmental Policy Act (NEPA) and associated Council on Environmental Quality (CEQ) regulations require BLM to analyze potential impacts and consider ways to avoid, minimize and mitigate impacts – in accordance with the mitigation hierarchy. The DEIS currently includes inappropriate and inadequate requirements for compensatory mitigation. The BLM must address this by including appropriate requirements for compensatory mitigation in the Final EIS and ROD. The project developer should also make voluntary commitments to appropriate compensatory mitigation, in coordination with BLM, cooperating agencies and stakeholders.	IM 2019-018 (dated December 6, 2018) supersedes IM 2018-093 (and all previous policies regarding compensatory mitigation) and states that BLM must not require compensatory mitigation from public land users under FLPMA. This policy does not preclude compensatory mitigation required under other federal law, state law, or voluntary actions of the proponent. Compensatory mitigation identified in the DRECP will be required for permitting under CEQA in California. Several of the mitigation measures identified in Appendix 1-C have a compensatory mitigation component. Should the CPUC, or any other California agency, use the EIS in lieu of an EIR, the compensatory mitigation requirements would become part of the Mitigation Monitoring and Reporting Program (MMRP), which is attached to Appendix 1C. All measures in the MMRP would be enforced by the CEQA Lead Agency. Therefore, the Applicant may need to compensate for direct impacts regardless of the BLM's stance on compensatory mitigation.
15	6	Mike Quigley (AZ State Director, **The Wilderness Society**), Rob Peters (Senior Southwest Representative, **Defenders of Wildlife**), Helen O'Shea (Director, Western Renewable Energy Project, **NRDC**), Garry George (Renewable Energy Director, **National Audubon Society**), John Shepard (Senior Director of Programs, **Sonoran Institute**), Sandy Bahr (Chapter Director, **Sierra Club** – Grand Canyon Chapter)	15.16	LAW	Instruction Memorandum (IM) 2018-093: Despite recent guidance from BLM in IM 2018-093 instructing agency staff not to require compensatory mitigation to offset impacts from development on public lands, there is a strong legal framework supporting the authority of BLM to require mitigation and in some cases compelling it to do so. FLPMA provides for the administration of the public lands by the Secretary of the Interior through the BLM. BLM has broad authority and obligations under FLPMA to require mitigation when exercising its authority to engage in land use planning, approve site-specific projects, or engage in other management activities. In accordance with FLPMA, the Administrative Procedure Act, other laws and case-law. BLM's decisions regarding mitigation must not be arbitrary or capricious. Because of this, we believe that the BLM must consider and as appropriate require compensatory mitigation in the FEIS and ROD, consistent with FLPMA.	See response to comment 15.15.
15	6	Mike Quigley (AZ State Director, **The Wilderness Society**), Rob Peters (Senior Southwest Representative, **Defenders of Wildlife**), Helen O'Shea (Director, Western Renewable Energy	15.17	M&M	Inadequate and unclear compensatory mitigation requirements: While we appreciate that the DEIS includes some compensatory mitigation requirements, they are inadequate and unclear in many cases. For example, when addressing compensatory mitigation for impacts to birds and bats in California, the DEIS states that "Compensation will be consistent with the most up to date DOI mitigation policy." DEIS Appendix 2C-32. As described above, the current DOI and BLM mitigation policy is inconsistent with the agency's requirements under FLPMA and other laws and regulations. BLM must include specific and appropriate requirements for	See response to comment 15.15.

		Project, **NRDC**), Garry George (Renewable Energy Director, **National Audubon Society**), John Shepard (Senior Director of Programs, **Sonoran Institute**), Sandy Bahr (Chapter Director, **Sierra Club** – Grand Canyon Chapter)			compensatory mitigation in the Final EIS and ROD. The project developer should also make voluntary commitments to appropriate compensatory mitigation, in coordination with BLM, cooperating agencies and stakeholders.	
15	6	Mike Quigley (AZ State Director, **The Wilderness Society**), Rob Peters (Senior Southwest Representative, **Defenders of Wildlife**), Helen O'Shea (Director, Western Renewable Energy Project, **NRDC**), Garry George (Renewable Energy Director, **National Audubon Society**), John Shepard (Senior Director of Programs, **Sonoran Institute**), Sandy Bahr (Chapter Director, **Sierra Club** – Grand Canyon Chapter)	15.18	M&M	Compensatory mitigation for impacts to lands with wilderness characteristics: As stated above, we appreciate that the BLM-preferred alternative avoids LWC. If the final Ten West Link route impacts any LWC, BLM must include appropriate compensatory mitigation requirements in the FEIS and ROD, and the project developer should make voluntary commitments. Our scoping comments (incorporated by reference) include details on appropriate compensatory mitigation for LWC impacts and examples from other energy infrastructure projects on BLM lands.	Impacts to LWC would be impacted are presented in FEIS Section 4.2.5.3. Currently there are no proposed structures that would be sited on LWC and only a small portion of the conductors would cross over LWC. BLM has no authority or direction in relevant RMPs to require compensatory mitigation to impacts to LWC. Also see response to comment 15.15.
15	6	Mike Quigley (AZ State Director, **The Wilderness Society**), Rob Peters (Senior Southwest Representative, **Defenders of Wildlife**), Helen O'Shea (Director, Western Renewable Energy Project, **NRDC**), Garry George (Renewable Energy Director, **National Audubon Society**), John Shepard (Senior Director of Programs, **Sonoran Institute**), Sandy Bahr (Chapter Director, **Sierra Club** – Grand Canyon Chapter)	15.19	GEN	In conclusion, we reiterate our appreciation of the fact that the BLM-preferred alternative avoids the Kofa NWR, uses portions of WWEC 30-52, avoids Johnson Canyon, appears to avoid LWC, and reduces risks of bird collisions in California by crossing the Colorado River where it is channelized and following DPV1 across agricultural lands. If BLM approves Ten West Link, the agency should select this BLM-preferred alternative in the Final EIS and ROD, or another route that addresses these sensitive resources and potential impacts in the same way. The Final EIS and ROD should also appropriately address compensatory mitigation. We appreciate the opportunity to comment.	Comment noted.
16	1	Lowell Sorenson, AZ Sunriders & AZ Peace Trail	16.1	SUP PA	It is my belief that the new power line should be built in the same corridor as the old one. Common sense tells us that, but I am told that not possible because of certain government entities that think there ideas are more important than anybody's.	Comment noted.

Response ID No.	Number of Signatures	Name	Comment ID No.	Comment Type	Comment	Response
16	1	Lowell Sorenson, AZ Sunriders & AZ Peace Trail	16.2	SUP PREF	So next best thing is the BLM proposal. I will approve that proposal.	Comment noted.
17	1	Bruce Fuller, President **Arizona Sunriders**	17.1	SUP PREF	The Arizona Sunriders support the BLM Preferred route that bypasses Quartzsite and Johnson Canyon.	Comment noted.
18	1	Eric Angle	18.1	LU	I own a 20 acre parcel of land near Ave 22 in Blythe. When the project was announced I was contacted by a representative regarding access and testing on my property. I granted access but have not received any follow up information as to findings or resolutions that would impact the project or my property specifically. What will be the long term impacts to the viability of surrounding properties and their use for other non project related functions? Will zoning be changed or will there be limit as to what and who can access the surrounding properties based on security concerns?	DCRT will negotiate easements with private landowners that contain specific stipulations on allowable uses. Impacts to residential land use are provided in the TES, Section 4.8.4.1 and 4.8.5.4. Zoning changes are out of the jurisdiction of the BLM. Access for construction and maintenance is described in the EIS Appendix 2.
18	1	Eric Angle	18.2	SOCIO	Whether or not the equipment being deployed will cause medical conditions is arguable but out of caution the perception would be to keep a distance which means surrounding properties will see a negative impact on values and use. I am not opposed to progress, especially as a benefit for the entire community as long as there is mitigation for those directly and negatively impacted by progress.	Public health and safety is discussed in Section 4.2.8 of the EIS. EMF levels were modeled (Appendix 4, Tables 4.2-4 and 4.2-5) and would be at levels comparable to typical magnetic fields associated with common household appliances with EMF levels decreasing rapidly at increasing distance from the Project. As noted in Section 4.9.5.6 of the DEIS, any potential long-term decreases in property values are difficult to determine. The majority of studies have focused on urban residential properties whereas this Project is largely rural. Property owners allowing the use of a portion of their property for the transmission line ROW would be compensated by DCRT, as negotiated, for the encumbrance the line creates upon their land and potential reductions in their property values.
19	1	Victor Lujan, Palo Verde Irrigation District	19.1	WTR	Palo Verde Irrigation District would like to submit the following comments. Under Chapter 4 Section 2.10 named Water Resources; the DEIS indicates flexibility with structure placement would eliminate or reduce impact to water resources. Palo Verde Irrigation District would suggest any structure being placed in Palo Verde Irrigation District boundary from the Ten West Project have a hundred-foot minimum distance from any existing Palo Verde Irrigation District right of way. Palo Verde Irrigation District's concerns are from the possibility of Ten West structure failure due to possible unforeseen soil wash outs due to normal system use in our canals and drains system.	DCRT will be required to work with PVID and agricultural operators to design the Project to minimize impact. Palo Verde Irrigation District is included in Table 1.5-2 that lists state and local permits required by the Project.
20	1	Kathleen Martyn Goforth, Manager, Environmental Review Section, **EPA**	20.1	GEN	As a cooperating agency for the proposed Project, EPA recognizes the BLM for its early and sustained coordination throughout the NEPA process. The BLM convened a diverse group of federal, state, and local stakeholders and conducted months of cooperating agency calls and in-person meetings to identify potential impacts resulting from the Project. As a result of that well managed process, the BLM Preferred Alternative proposed in the DEIS responds to major issues of concern by avoiding the Kofa National Wildlife Refuge, minimizing impacts to the Yuma Proving Ground, and avoiding the area of abundant cultural resources in the Mule Mountains, among other measures.	Comment noted.
20	1	Kathleen Martyn Goforth, Manager, Environmental Review Section, **EPA**	20.2	WOUS	While EPA has no outstanding concerns, we suggest that the BLM provide additional information in the Final EIS regarding the potential impacts from project activities on sensitive water resources such as waters of the United States (WUS). The BLM states, in the Technical Environmental Study (TES) prepared for the Project, that existing wetlands and	The preliminary stand-in delineation of linear feet was a compromise with USACE for the EIS. Through consultation with USACE, it was decided that a PJD report and need for PJD-level (detailed) mapping for all EIS alternatives was a major undertaking and not necessary for the EIS but rather would be

Response ID No.	Number of Signatures	Name	Comment ID No.	Comment Type	Comment	Response
					WUS mapping from the National Wetlands Inventory was reviewed for the water resources study area, and that the U.S. Fish and Wildlife Service has mapped potentially jurisdictional waters, mostly ephemeral washes, throughout the study area at each mapped drainage crossing (p. 3-495). The TES provides a table (Table 3.19-4) with estimates of the ephemeral wash crossings and the WTJS crossing length (in feet) but does not include an estimate of the number of acres of jurisdictional waters that could be subject to Section 404 of the Clean Water Act (CWA). The BLM notes in the DEIS that Nationwide Permit (NWP) 12 for Utility Line Activities would be the likely applicable Section 404 permit for most Project features requiring compliance. The EPA suggests that the Final EIS include an estimate of the acres of jurisdictional waters that could be subject to Section 404 permit requirements, as well as a description of how the BLM would coordinate with the U.S. Army Corps of Engineers to ensure that the proposed Project complies with such requirements and how the extent of jurisdictional waters would be verified.	carried forward in the 404 permitting process. DCRT would need to coordinate with the USACE to apply for and obtain the necessary Section 404 permit(s) for the project.
20	1	Kathleen Martyn Goforth, Manager, Environmental Review Section, **EPA**	20.3	GEN	Effective October 22, 2018, EPA no longer includes ratings in our comment letters. Information about this change and EPA's continued roles and responsibilities in the review of federal actions can be found on our website at: https://www.epa.gov/nepalepa-review-process-under-section-3 09-clean-air-act.	Comment noted.
21	3	D.L. Wilson (District 1), Duce Minor (District 2), and Holly Irwin (District 3) **La Paz County Board of Supervisors**	21.1	GEN	Like the proponents, we too desire the construction and operation of a feasible transmission line with associated infrastructure that provides economic security in the future, while avoiding destructive impacts to existing land uses. So far, it appears that is what is underway.	Comment noted.
21	3	D.L. Wilson (District 1), Duce Minor (District 2), and Holly Irwin (District 3) **La Paz County Board of Supervisors**	21.2	SUP PREF	The preferred alternative follows the existing BLM designated energy corridor. Negative impacts to locations and uses long established by tourists and La Paz residents will be avoided. Critically, the transfer and sale of Federal public lands to La Paz County for economic development, a process now well underway in the US Congress, will not be threatened.	Comment noted.
21	3	D.L. Wilson (District 1), Duce Minor (District 2), and Holly Irwin (District 3) **La Paz County Board of Supervisors**	21.3	ROUTE	We would like to know as soon as possible where the proposed route for the Link will meet the California state border.	The Agency Preferred Alternative identified in the DEIS would cross the Arizona-California border at the same Colorado River crossing essentially as the existing DPV1 line transmission line, on the north side of it.
22	1	Mark Roberts, ACIP, Office Chief, IGR/Community & Regional Planning, **California Department of Transportation**, District 8	22.1	ROUTE	The Executive Summary of the DEIS and DRMPA has identified Alternative 2 as BLM's preference. This alternative might traverse State Route 78 (SR-78). As the owner and operator of the State Highway System (SHS) we respectively offer the following comments…	Correct, Alternative 2 would cross SR-78. As SR 78 traverses north-south through Blythe, all routes would cross it.
22	1	Mark Roberts, ACIP, Office Chief, IGR/Community & Regional Planning, **California Department of Transportation**, District 8	22.2	PERM	This project will require a Caltrans Encroachment Permit if the transmission lines traverse any portion of the SHS for any work performed within the State right-of-way. Please refer to the Caltrans Encroachment Permit Manual, Chapter 600-Utilities Permits website for further information: http://www.dot.ca.gov/trafficops/ep/manual.html In addition, all work undertaken shall be in compliance to all current design standards,	Comment noted. DCRT would be required to obtain this permit, as applicable.

Response ID No.	Number of Signatures	Name	Comment ID No.	Comment Type	Comment	Response
					applicable policies, and construction practices.	
23	1	Angela Horn, Senior Planner, Maricopa County Department of Transportation	23.1	TRANS	In comparing the proposed transmission line route and alternatives, with the Major Streets and Routes Plan (MSRP) and Maricopa County Zoning requirements, we found many instances where the proposed transmission line is in close proximity to, adjacent to, or in line with existing or future roadways. Specifically these include Salome Highway, Indian School Road, Eagle Eye Road, and several section and mid-section line roadways within the study area. All of these roadways will require 130 feet of right-of-way to accommodate future travel, with the exception of mid-section lines which will require 80 feet.	Comment noted. DCRT would be required to obtain a road/highway encroachment permit from Maricopa County (Appendix 1, Table 1.5-2). As part of the final siting (micrositing) of the Project, DCRT would be required to coordinate design of the Project and micrositing of Project infrastructure with Maricopa County to allow for future ROW needs for Maricopa County roads.
23	1	Angela Horn, Senior Planner, Maricopa County Department of Transportation	23.2	TRANS	MCDOT has previously expressed concerns regarding impact to future roadway widening due to utility conflicts and repeats that concern with this project. MCDOT respectfully requests the Bureau of Land Management (BLM) carefully consider the potential impact of this line with roadways. We encourage any approval to require equal cooperation in sharing right-of-way (roadway and utilities) thereby limiting impact to the environment by decreasing overall right-of-way requirements.	Comment noted. See comment 23.1.
24	1	Nils Stannik, Utilities Engineer, **Public Advocates Office**, California Public Utilities Commission	24.1	P&N	The Public Advocates Office recognizes that the BLM's DEIS does not assess project need, non-wire alternatives, or policy goals. As such, claims by the project proponent, DCR Transmission LLC (DCRT) about economic benefits, renewable energy development, and reliability/operational flexibility were not examined in the BLM's analysis and should not, at this time, be presumed correct or considered as justifications for the project. The Public Advocates Office proposes that further analysis and policy recommendations are required to determine if the project is needed, if any alternatives are feasible or desirable, and what costs are appropriate for the project. The Public Advocates Office looks forward to examining and discussing these issues in the Certificate for Public Convenience and Necessity (CPCN) Application before the California Public Utilities Commission (Application 16-10-012).	The EIS addresses purpose and need as required by NEPA and BLM guidance (Section 1.3). The non-wires alternative can be found in Section 4.3 of Appendix 1C.
24	1	Nils Stannik, Utilities Engineer, **Public Advocates Office**, California Public Utilities Commission	24.2	P&N	The BLM's environmental analysis and route alignment recommendations are an important first step in the analysis of the Proposed Project and will assist with compliance with the California Environmental Quality Act (CEQA), but do not obviate or reduce the need for thorough, transparent and updated analysis to confirm project need, cost/benefit evaluation, potential alternatives, and consistency with statewide policy goals.	BLM invited the CPUC to cooperate in preparation of the EIS to ensure the EIS also meets the requirements of the CEQA. Appendix 1c of the EIS contains the CEQA analysis. Further, the California Independent System Operator (CAISO) is responsible for operating and managing California's energy grid. The Ten West Link line is being developed through the CAISO's competitive transmission solicitation process to connect APS's Delaney 500 kV Substation to the SCE Colorado River 500 kV Substation. Therefore, the need for the project was established by CAISO during their transmission planning process.
24	1	Nils Stannik, Utilities Engineer, **Public Advocates Office**, California Public Utilities Commission	24.3		The Public Advocates Office notes that the BLM's Preferred Project Alternative (124.9 miles long) and many of the other considered alternatives (ranging from 111.5 miles to 126.1 miles) are longer than the DCR Transmission's Proposed Project (114 miles). Should the BLM's Preferred Project Alternative be approved by the CPUC, a longer project route will almost certainly result in higher project costs and therefore greater ratepayer impact. DCR Transmission estimates its Proposed Project's total cost as $279,560,483 in 2020 dollars. Although a per-mile extrapolation is an imperfect measure, an increase in project length of nearly 10% would correlate to a cost increase of nearly $27 million in 2020 dollars.	NEPA requires the development and analysis of project alternatives. These were developed with consideration of resource impacts, as well as existing infrastructure, with the goal of minimization of environmental impacts. The EIS analyzes a range of alternatives that meet the requirements of NEPA which also are consistent with the DCRT's interests and objectives.

Response ID No.	Number of Signatures	Name	Comment ID No.	Comment Type	Comment	Response
24	1	Nils Stannik, Utilities Engineer, **Public Advocates Office**, California Public Utilities Commission	24.4		At this time, the Public Advocates Office neither supports nor opposes the BLM's Preferred Project Alternative. However, the Public Advocates Office's future support of or opposition to this project is contingent on demonstrable project need, costs, and potential alternatives that will be evaluated during the CPCN process.	Comment noted.
25	1	Ileene Anderson, Senior Scientist/ Public Lands Desert Director, **Center for Biological Diversity**	25.1	KOFA	The Center is encouraged that many of the alternatives, including BLM's preferred alternative, avoid impacts to the Kofa National Wildlife Refuge. The Final EIS should not select any alternative or subalternative that includes constructing any part of this proposed project in the Kofa National Wildlife Refuge because the proponents' preferred route through the Kofa National Wildlife Refuge would cause excessive environmental harm compared to other routes. This route would not be compatible with the purpose of the refuge which was established in 1939 "for the protection of desert bighorn sheep and other native wildlife"	Comment noted.
25	1	Ileene Anderson, Senior Scientist/ Public Lands Desert Director, **Center for Biological Diversity**	25.2	P&N	While the DEIS includes sections on the Purpose and Need for the project proponent and various agencies, we had requested in joint scoping comments that the DEIS independently evaluate the following: • whether the project significantly contributes to meeting energy needs in Arizona and/or California; • whether the line would help generators meet California's deliverability requirements for out-of-state renewable energy resources; • whether the energy shipped on the line would be cost-competitive and the project would be economically viable; • whether the line would reduce current congestion and increase reliability; • the degree to which distributed generation, energy efficiency, demand-side management, or proposed line enhancements and additions may modify or shape congestion and reduce the need for the line; • an analysis of the ultimate energy mix;	Evaluating these issues are outside the scope of NEPA analysis for the ROW application.
25	1	Ileene Anderson, Senior Scientist/ Public Lands Desert Director, **Center for Biological Diversity**	25.3	P&N	Instead of providing an analysis on these basic issues, the DEIS relies on the 2014 CAISO report that is not provided as part of the DEIS. This independent analysis still needs to be included in a revised or supplemental DEIS.	The report is part of the Administrative Record for the Project. Including it as an appendix was not warranted. It is available on the CAISO website at: http://www.caiso.com/Pages/documentsbygroup.aspx?GroupID=36222BAE-8DB0-4BCE-B88C-75267214120F.
25	1	Ileene Anderson, Senior Scientist/ Public Lands Desert Director, **Center for Biological Diversity**	25.4	RENE	While grid reliability may be a driving factor for this new proposed line, the planet desperately needs humans to transition to a clean energy economy including a transition to renewable energy generation (with storage). The proposed project has the opportunity to commit to moving only clean renewable energy and rejecting climate-harming energy from fossil fuels. The DEIS identifies one of the developer's purpose and need for the project is to "Facilitate development of new renewable energy", a true commitment to this goal would be to reject moving energy generated from polluting fossil fuels on this line.	Sources of energy that would be transmitted along the Project line would be beyond the scope of the project and authority of the BLM.
25	1	Ileene Anderson, Senior Scientist/ Public Lands Desert Director, **Center for Biological Diversity**	25.5	WLF	While the DEIS contemplates a Section 7 consultation with the U.S. Fish and Wildlife Service, which we agree is necessary, the consultation appears limited to the federally threatened Mojave desert tortoise population and the federally endangered Sonoran pronghorn. Because the proposed project in all alternatives will be crossing the Colorado River, a known thread of the Pacific flyway and habitat for non-migratory federally protected avian species, the BLM needs to consult on additional federally and California State protected species including the federally endangered southwestern willow flycatcher ((*Empidonax*	The scope of and requirements for Section 7 consultation will be determined by the USFWS.

Response ID No.	Number of Signatures	Name	Comment ID No.	Comment Type	Comment	Response
					traillii extimus) and California endangered willow flycatchers (*Empidonax traillii*), the federally threatened and California endangered western yellow billed cuckoo (Coccyzus americanus occidentalis), the federally and California endangered least Bell's vireo (*Vireo bellii pusillus*), federally endangered and California threatened Yuma Ridgway's rail (*Rallus obsoletus yumanensis*)(formerly Yuma clapper rail (*Rallus longirostris yumanensis*)) and potentially others. Consultation must cover construction, operation and maintenance (O&M) and decommissioning.	
25	1	Ileene Anderson, Senior Scientist/ Public Lands Desert Director, **Center for Biological Diversity**	25.6	WLF	We remain particularly concerned about Yuma Ridgway's rail in part because the USFWS' Draft Yuma (Ridgway's) Clapper Rail Recovery Plan, First Revision, states that the Yuma clapper rail has a "high degree of threat and low recovery potential from loss of habitat due to lack of natural river processes that create and maintain marshes, and lack of security relative to the protection of existing habitats in the U.S. and Mexico". The USFWS identifies the population along the Colorado River as non-migratory, however one key action identified in the 2010 Draft Recovery Plan is "Identify migration pathways between the three core populations to assess metapopulation status and contribute to determinations on minimum population size and habitat necessary to support that population." While the definition of "migratory" and "non-migratory" are not clearly defined in the Draft Recovery Plan, the rails (and other birds) do move along the Colorado River flyway. The proposed project site traverses the Lower Colorado River core population. Ridgway's rails have been found at PV projects. One of this proposed project's purposes is to facilitate additional renewable energy projects. Impacts to this very rare and apparently non-migratory wading bird not only from this proposed transmission project, but also from its purpose to facilitate additional renewable energy projects, need to be considered in a revised EIS. Because of already low and now declining population numbers, additional impacts and mortalities will drive the Yuma clapper rail closer to the brink of extinction.	The BLM is consulting with USFWS for ESA-listed species. The basis of Section 7 consultation under ESA is to ensure that actions a federal agency may authorize, fund, or carry out are not likely to jeopardize the continued existence of any listed species or result in the destruction or adverse modification of designated critical habitat. Cumulative effects in regard to the BA analysis include those effects of future state, private, or tribal actions that are reasonably certain to occur in the action area.
25	1	Ileene Anderson, Senior Scientist/ Public Lands Desert Director, **Center for Biological Diversity**	25.7	VEG	The DEIS defers a proper look at proposed mitigation by referencing but then failing to provide key plans that are proposed to minimize and mitigate impacts. For example, missing plans include: • Vegetation Management Plan (Appendix 2A-17) which would "describe[] the surveys, permitting, fee payments, and plant protection to be conducted in areas where Project design would not eliminate the need for vegetation control for the project to be in compliance with NERC requirements. Vegetation would be trimmed or otherwise controlled for safe operation of the transmission line and would be designed to minimize impacts on special status species to the extent practicable. The Plan also would describe how vegetation would be salvaged, as needed, in order to comply with the applicable Arizona Native Plant Law and California regulations." (IBID) While we support such a plan in concept, it remains unclear exactly how vegetation treatments would occur. A plan alone does not ensure minimization and mitigation for impacts to vegetation.	Additional mitigation is outlined in Appendix 1C, Section 4.1.2. The FEIS Plan of Development provided by DCRT includes this plan in Appendix L1.

Response ID No.	Number of Signatures	Name	Comment ID No.	Comment Type	Comment	Response
25	1	Ileene Anderson, Senior Scientist/ Public Lands Desert Director, **Center for Biological Diversity**	25.8	VEG	Noxious Weed Control Plan (Appendix 2A-19) – It is unclear if herbicides would be used and how native species would be protected from the harmful impacts associated with herbicide use, which potentially affect both plants and animals.	The Noxious Weed Control Plan is part of the overall Vegetation Management Plan in Appendix 2B. MM BIO-CEQA-4: suggested role up all into one plan: A vegetation management plan that covers specifications for restoration, revegetation, mitigation, and monitoring and noxious weed control and abatement.
25	1	Ileene Anderson, Senior Scientist/ Public Lands Desert Director, **Center for Biological Diversity**	25.9	VEG	Habitat Restoration and Monitoring Plan (Appendix 2A-21) – It is unclear what plant palettes would be used which is particularly concerning based on the linear scope of the proposed project, where it will transect numerous vegetation alliances. Clearly a simple plant restoration palette would be insufficient. No success criteria are provided upon which to base such a plan. It is unclear what types of monitoring (remedial, success, etc.) would be required and how the monitoring types would be implemented.	The Vegetation Monitoring Plan identifies a proposed plant palette (Appendix 2B). This plan would require approval from the CPUC and resource agencies. This palette will be comprised of native species known to occur in the area.
25	1	Ileene Anderson, Senior Scientist/ Public Lands Desert Director, **Center for Biological Diversity**	25.10	WLF	Raven Management Plan (Appendix 2A-30) – While we support the implementation of such a plan, California has a regional plan and funding mechanism to address this issue, but it is unclear if that strategy would be adopted here.	The Raven Management Plan has been added to Appendix 1C as MM WIL-CEQA-2. This new mitigation measure includes payment requirements to the USFWS Regional Raven Management Program. The Raven Management Plan is in Appendix 2B.
25	1	Ileene Anderson, Senior Scientist/ Public Lands Desert Director, **Center for Biological Diversity**	25.11	WLF	Bird and Bat Conservation Strategy (Appendix 2A-30). As noted above, the proposed project crosses the Colorado River, which is a heavily used thread of the Pacific flyway and an Audubon Important Bird Area - Lower Colorado River Valley. It is unclear what strategies would be included in the Bird and Bat Conservation Strategy, particularly to offset the impacts to migratory and resident birds from transmission towers.	New MM WIL-CEQA-1 includes compliance with the APLIC guidelines. The Avian Protection Plan is in Appendix 2B.
25	1	Ileene Anderson, Senior Scientist/ Public Lands Desert Director, **Center for Biological Diversity**	25.12	WLF	Burrowing Owl Nesting Management Plan (Appendix 2A-31) – It is unclear if the Nesting Management Plan would propose using passive relocation of owls despite the fact that there is no scientific evidence that passive burrow exclusion (or passive relocation) of burrowing owls is a successful strategy for long-term survival of burrowing owls. “Passively relocated” owls need to be monitored to determine the effectiveness of that action. Therefore, the BLM and agencies need to work with the state and federal wildlife agencies to set up a statistically useful monitoring program to assess the outcome of passively relocated owls.	New MM WIL-CEQA-3 cover relocation of burrowing owls, including continued monitoring efforts. The Burrowing Owl Nesting Management Plan is in Appendix 2B.
25	1	Ileene Anderson, Senior Scientist/ Public Lands Desert Director, **Center for Biological Diversity**	25.13	WLF	If burrowing owl habitat is permanently converted, appropriate acres of burrowing owl habitat will need to be acquired to off-set impacts from the construction and operation of the solar project and transmission line. Mean burrowing owl foraging territories are 242 hectares in size, although foraging territories for owls in heavily cultivated areas are only 35 hectares. The DEIS fails to identify the actual number of territories that occur on the proposed project site and how they would be affected. Absent the actual plan for the nesting burrowing owls, it is unclear how this declining raptor would be affected.	In California, compensation for damaged or collapsed burrows is included at a 2:1 ratio in MM WIL-CEQA-3. A burrowing owl nesting management plan has been developed as part of the Avian Protection Plan and is available for review in Appendix 2B.
25	1	Ileene Anderson, Senior Scientist/ Public Lands Desert Director, **Center for Biological Diversity**	25.14	WLF	Fringe-toed Lizard Linear ROW Protection Plan (Appendix 2A-38) – This is a particularly important plan based on the uniqueness of the fringe-toed lizard population on the proposed project ROW and the documented impacts to the species from previous attempts to avoid impacts, which were not successful despite the best of intentions. The sand dune and partially stabilized sand dune habitat is crucial for the Mojave fringe-toed lizard, which is the most southerly population of the Mojave fringe-toed lizard and likely the population most adapted to the increasing temperatures due to climate change. There is no analysis of impacts (either direct or indirect) to the sand migration zones by the project. The adjacent Desert Quartzite	BMP BIO-54 (Appendix 2A, Section 2A.4) requires that the Project be constructed such that the flow of sand is allowed across Project activity sites and to avoid the trapping or diverting of sand from the Aeolian corridor. The FEIS contains this plan in Appendix 2B. Sand transport was analyzed in Sections 4.3.4.2 and 4.4.4.2 of the DEIS, as well as Sections 4.3.4.5, 4.3.10.2, 4.3.11, 4.5.4.5, and 4.20 of the TES.

Response ID No.	Number of Signatures	Name	Comment ID No.	Comment Type	Comment	Response
					solar project did an analysis that shows impacts will occur from their gen-tie line to the Colorado River Substation which appears in a very similar location to the proposed project.	
25	1	Ileene Anderson, Senior Scientist/ Public Lands Desert Director, **Center for Biological Diversity**	25.15	WLF	Other projects proposed to impact Mojave fringe-toed lizard habitat have identified mitigation ratios of 5:1 and 3:1 for direct impacts to all occupied Mojave fringe-toed lizard habitat and lesser ratios for indirect impacts. For example, Desert Sunlight project was required to mitigate any unavoidable impacts to the Mojave fringe-toed lizard habitat up to 5:1 for direct impacts to all occupied Mojave fringe-toed lizard habitat and lesser ratios for indirect impacts (Desert Sunlight FEIS at 4.4-40). As Barrows et al. (2006) found, edge effects are significant for fringe-toed lizards and, in addition, the increase in predators associated with developed edges may also have a significant adverse effect on fringe-toed lizards and other species, therefore additional mitigation is warranted.	The CEQA analysis took into account ratios for similar projects and determined that a 3:1 ratio for permanent impacts would mitigate impacts to less than significant. There is a 3:1 mitigation ratio (acquisition or rehabilitation) in NECO (p. 2-57) and the CEC Palen Project (p. 4.2-92, p. 4.2-129) for disturbance to sand dune habitat. See Sections 2.4.5.2 and 2.4.6 of Appendix 1C. Regulatory permits required for the Project may impose additional mitigation depending on each agency involved. The edge effects from a transmission line are much different than compared to a solar project and are not expected to pose a significant impact.
25	1	Ileene Anderson, Senior Scientist/ Public Lands Desert Director, **Center for Biological Diversity**	25.16	WLF	One significant concern is the ability of the impact to Mojave fringe-toed lizards to be mitigated. The Desert Quartzite DEIS/R states: “It is uncertain whether sufficient private lands meeting the habitat criteria may be available for purchase.” (at pg. 4.4-7). Furthermore, on that same page, it states: “Therefore, compensation required under Mitigation Measure WIL-10 may be accomplished through acquisition and management of off-site habitat or, if suitable compensation habitat is not available, through offsite habitat enhancement and restoration (e.g., by controlling weeds or off-highway vehicle access). However, it is also uncertain whether off-site enhancement and restoration can feasibly and effectively restore natural sand transport function and aeolian sand habitat values. Therefore, with implementation of Mitigation Measure WIL-10 to the extent it is feasible, the Proposed Action’s direct effects on sand transport may remain only partially mitigated.” Clearly the lack of adequate mitigation land and the infeasibility of restoration of habitat elsewhere is a key reason in California to consider alternatives that will avoid impacts to both the sand movement zones or select the No Project alternative.	Mitigation will be implemented consistent with the CDCA Plan. BMP BIO-49 and MM BIO CEQA-3 are sufficient. Lattice towers, which have small footprints, and dirt access roads built at grade without berms would have a less than significant effect on sand transport. The impacts of transmission lines on sand dunes fits the DRECP definition of a “minor incursion”. The impacts on fringe-toed lizards from direct habitat loss and potential roadkill would be greater than the impacts to the sand transport. Direct habitat loss would be the area of the access road plus the tower pads. This acreage would be fairly small especially when compared to the total amount of available habitat in the Palen-Ford dune system. There is a 3:1 mitigation ratio (acquisition or rehabilitation) in NECO (p. 2-57) for disturbance to sand dune habitat. BLM needs to do an analysis of how much land is available for acquisition and how much BLM land is available for rehabilitation. Restricting vehicle access to closed dunes is a viable option for mitigating impacts to fringe-toed lizards. On-site mitigation would be maximizing the use of existing access roads to reduce habitat disturbance and roadkill. Because the access road would be dirt (low vehicle speeds) and in a location with light usage, we would expect a low level of lizard mortality and negligible population impacts.
25	1	Ileene Anderson, Senior Scientist/ Public Lands Desert Director, **Center for Biological Diversity**	25.17	WLF	Lastly, during construction of the Colorado River substation, despite escorted construction and a speed limit on the access road, significant Mojave fringe-toed lizard mortality occurred that required additional minimization and mitigation.	Comment noted. Protection for Mojave fringe-toed lizards is included specifically as BMP BIO-25, BMP BIO-49 (CA only), and in many other APM/BMPs that specify wildlife protection (Appendix 2A). There is a fringe-toed lizard plan (Appendix 2B) for the Project which outlines measures to minimize impacts on the lizard including a lizard clearance survey protocol.
25	1	Ileene Anderson, Senior Scientist/ Public Lands Desert Director, **Center for Biological Diversity**	25.18	M&M	Several of the proposed mitigation measures are vague and unclear. Below, we identify the clarifications needed or improvements to the mitigation measure: BIO-32: Seasonal Restriction Dates - Species-specific seasonal restriction dates would be observed. (Appendix 2A-33) – It is unclear which species and which activities are protected by this mitigation measure. Much greater detail is needed (specific species, actual restriction dates and reasons for restriction dates) and which activities would be restricted.	Seasonal restriction dates due to nesting and blooming are important. Additional information has been included in the document where applicable to identify these dates/periods. Seasonal wildlife restrictions are subject to change and are generally dictated by the AGFD or CDFW. The seasonal restrictions would be dictated by the AGFD, CDFW, and/or applicable RMPs. This was added to BIO-32.

Response ID No.	Number of Signatures	Name	Comment ID No.	Comment Type	Comment	Response
						Reference to the seasonal wildlife restrictions was also added to the TES Section 4.5.4.1. Seasonal restrictions for listed species will be established though the ongoing Section 7 consultation with the USFWS.
25	1	Ileene Anderson, Senior Scientist/ Public Lands Desert Director, **Center for Biological Diversity**	25.19	M&M	BIO-33: Construction Lighting. (Appendix 2A-33) – The measure indicates that it pertains to not just construction but to O&M and decommissioning. Based on the O&M, the Mitigation Measure needs to adopt the APLIC standards, not just rely on "avoid the use of constant-burn lighting". Constant burning lights can attract birds and bats and put them in harm's way, resulting in an impact that can be avoided by proper lighting.	Avian Protection measures following APLIC guidelines are included in the Applicant Proposed Measures as APM BIO-21. These include lighting guidelines to deter attracting nocturnal migrants to the infrastructure or lines. Additionally, compliance with the APLIC guidance is included in MM WIL-CEQA-1.
25	1	Ileene Anderson, Senior Scientist/ Public Lands Desert Director, **Center for Biological Diversity**	25.20	WLF	The DEIS needs at a minimum to adopt all of the APLIC standards for this project as they pertain to transmission lines and substations.	The Avian Protection Plan (Appendix 2B) incorporates APLIC standards, as well as the APMs and BMPs as appropriate.
25	1	Ileene Anderson, Senior Scientist/ Public Lands Desert Director, **Center for Biological Diversity**	25.21	M&M	BIO-46: Compensation for Loss of Desert Riparian Woodland (Appendix 2A-37). As proposed this mitigation measure would only be applied in California, yet Desert Riparian Woodlands in Arizona hold the same critical value for wildlife as the California woodlands. In striving for consistency in mitigation across the project for sensitive plant communities, this mitigation measure should be adopted for the proposed project in Arizona.	BLM will follow mitigation requirements in the Arizona RMPs for riparian woodlands; riparian woodlands would be avoided to the greatest extent practicable in both California and Arizona through Project design.
25	1	Ileene Anderson, Senior Scientist/ Public Lands Desert Director, **Center for Biological Diversity**	25.22	M&M	HAZ-02: Fire Avoidance and Suppression (Appendix 2A-50) – applies to all phases from construction through O&M and decommissioning. It requires a Fire Protection Plan, but as stated above, no plan is provided for review. In light of the increasingly destructive fires in California from powerlines as ignition sources, coupled with the fact that natural desert lands are significantly and sometimes permanently impacted by fire, the DEIS must include a much more robust analysis of the impacts from powerline ignitions particularly in the remote areas as well as the areas developed for human habitation that the DEIS is considering.	MM HAZ-CEQA-1 is included in the CEQA Appendix and covers the preparation and implementation of a Fire Prevention Plan for the Project. The Fire Plan is included in the FEIS Appendix 2B. Power line ignition is not anticipated to be a significant impact based on lack of fuel load.
25	1	Ileene Anderson, Senior Scientist/ Public Lands Desert Director, **Center for Biological Diversity**	25.23	GEN	We look forward to BLM responding affirmatively to these comments and incorporating them into a revised DEIS which should then be released for an additional public comment period. We urge the BLM to do so, before making any decision regarding the proposed plan amendments and right-of-way application. In the event BLM chooses not to revise the DEIS and provide adequate analysis, the BLM should reject the right-of-way application and the plan amendments. Please feel free to contact us if you have any questions about these comments or the documents provided.	As noted in the applicable responses to comments, revisions to the EIS will be made, as deemed necessary and will be documented in the FEIS which will be released to the public. A revised DEIS was deemed unnecessary and will not be prepared and released for additional public comment period.
26	1	Ross C. Poppenberger, Colonel, US Army, Commanding, **Yuma Proving Ground (YPG)**	26.1	YPG	The previously agreed to alternatives of issue (Segments cb-07, cb-08, and cb-09) remain removed and are documented on page Appendix 2-73 and 2-74. One segment, p-09, which is part of the BLM preferred alternative clips the northeast corner of Yuma Proving Ground (YPG). Previous memorandums from the Department of Defense and YPG requested this route not cross over YPG land space in North Cibola and that YPG had no objection as long as it did not deviate from the established corridor. Our position on this remains unacceptable to encroach on YPG property.	Comment noted. See comment response 26.2.
26	1	Ross C. Poppenberger, Colonel, US Army, Commanding, **YPG**	26.2	YPG	According to the recommended BLM preferred alternative, p-09 would cross the extreme northeastern corner of YPG. We are currently discussing the requirement with DCRT. Our position on this remains unacceptable to encroach on YPG property which is consistent with previous input to BLM. 05 Feb 2016 memorandum from DoD to BLM requested that the	Comment noted. Per approval by YPG (letter dated 1/9/19), the Segment p-09 alignment was shifted as far north as possible while maintaining the 250-ft reliability separation to the existing DPV transmission line. The TWL conductors would cross the very furthest corner of YPG while the structures

Response ID No.	Number of Signatures	Name	Comment ID No.	Comment Type	Comment	Response
					route not cross over YPG land space in North Cibola, YPG. 14 Oct 2016 memorandum from YPG to BLM stated no objection to segment p-09 as long as it did not deviate from the established corridor. The current deviation is estimated at 175 meters below the current corridor on YPG land space.	themselves would be on BLM lands. Only an aerial easement over YPG would be needed and no construction ground activities would be conducted on YPG property.
26	1	Ross C. Poppenberger, Colonel, US Army, Commanding, **YPG**	26.3	PLAN	YPG has updated the Integrated Natural Resources Management Plan. Citation should be updated to state "YPG 2017."	This has been updated throughout the EIS.
26	1	Ross C. Poppenberger, Colonel, US Army, Commanding, **YPG**	26.4	OPP ALT 2	There is not an existing BLM utility corridor on DOD land. Table 2-5 indicates that 0.4 miles of transmission line would encroach on YPG which is contrary to the 14 October 2016 memorandum from YPG to BLM prepared which states "We have no objection to the Proposed Action as depicted in the enclosure as long as segment p-09 does not deviate from established corridor." DEIS indicates deviation and intrusion onto DOD lands. Note: Enclosure was the 16 Aug 2016 Draft Preliminary Alternatives Report.	See comment response 26.2.
26	1	Ross C. Poppenberger, Colonel, US Army, Commanding, **YPG**	26.5	OPP ALT 3	There is not an existing BLM utility corridor on DOD land. Table 2-6 indicates that 0.4 miles of transmission line would en+E12croach on YPG which is contrary to the 14 October 2016 memorandum from YPG to BLM which states "We have no objection to the Proposed Action as depicted in the enclosure as long as segment p-09 does not deviate from established corridor." DEIS indicates deviation and intrusion onto DOD lands. Note: Enclosure was the 16 Aug 2016 Draft Preliminary Alternatives Report.	See comment response 26.2.
26	1	Ross C. Poppenberger, Colonel, US Army, Commanding, **YPG**	26.6	OPP ALT 4	There is not an existing BLM utility corridor on DOD land. Table 2-7 indicates that 0.4 miles of transmission line would encroach on YPG which is contrary to the 14 October 2016 memorandum from YPG to BLM which states "We have no objection to the Proposed Action as depicted in the enclosure as long as segment p-09 does not deviate from established corridor." DEIS indicates deviation and intrusion onto DOD lands. Note: Enclosure was the 16 Aug 2016 Draft Preliminary Alternatives Report.	See comment response 26.2.
26	1	Ross C. Poppenberger, Colonel, US Army, Commanding, **YPG**	26.7	WLF	There should be a brief discussion of consultation for the T&E species mentioned in 3.4-8. Reference the consultation procedures in 5.5.1. YPG must also be covered in the BA and BO	Consultation requirements are discussed in the EIS. The BA states: The BLM must also consult and conference as appropriate with the U.S. Fish and Wildlife Service (USFWS). Other federal agencies, including Reclamation, Western Area Power Authority, and Department of Defense also might issue land use authorizations or take other federal actions related to the Project; this BA is intended to meet the ESA requirements of those agencies as well. Per 50 CFR § 402.07, the BLM has been designated as the lead agency for ESA consultation and conference responsibilities for the Project.
26	1	Ross C. Poppenberger, Colonel, US Army, Commanding, **YPG**	26.8	LU	The military land use study area overlaps the U.S. Army Yuma Proving Ground (YPG), which is the only military installation in the military land use study area. YPG is a center for testing military equipment including vehicles, unmanned aerial systems, air delivery, electronic warfare, artillery, rockets and other weapon systems. Testing on YPG consists of both developmental testing for new equipment and operational testing to prepare equipment for fielding by military units. The Army's Free Fall School is also located on YPG. Land use within the YPG is not entirely restricted to military equipment and artillery testing., General Motors operates a test track on YPG under an Enhanced Use Lease. different regions within the YPG are used for different purposes (YPG 2016). Where compatible with the military mission, For example, in coordination with the AGFD, the YPG administers public access for	This description has been added to the baseline data for land use in Chapter 3 of the FEIS.

Response ID No.	Number of Signatures	Name	Comment ID No.	Comment Type	Comment	Response
					hunting in certain parts of the installation by permit.	
26	1	Ross C. Poppenberger, Colonel, US Army, Commanding, **YPG**	26.9	GEN	The previously agreed to alternatives of issue (Segments cb-07, cb-08, and cb-09) remain removed and are documented on page Appendix 2-73 and 2-74.	Comment noted.
27	1	Kelly Sarber, President/CEO, **Strategic Management Group**	27.1	SUP PREF	This letter is intended to demonstrate my support for the preferred route in the Draft EIS and to convey my gratitude to the BLM, Ten West Link and stakeholders who were engaged since the beginning on the siting issues, economic development options and ultimate vetting of the proposed preferred route.	Comment noted.
27	1	Kelly Sarber, President/CEO, **Strategic Management Group**	27.2	PI	Based on the Board of Supervisor's request, I undertook substantial efforts to work closely with the numerous stakeholders to create a transmission project that would gain support from a variety of different entities, many with competing agendas, including US Fish and Wildlife, CRIT, State Lands, AZ Fish and Game, The Wilderness Society, The Peace Trail volunteers, the Cities of Quartzsite, Ehrenberg and Blythe as well as the numerous members of the public who were engaged in the process. During the BLM's formal process, I feel that everyone was heard, and their comments were considered important and relevant with the end result being the preferred route selected in the Draft EIS.	Comment noted.
27	1	Kelly Sarber, President/CEO, **Strategic Management Group**	27.3	P&N	… The addition of this transmission capacity could represent a boon in development for the region in the form of new opportunities to build renewable energy projects to electrify the line and I recognized that this new, desperately needed transmission capacity for the western region could help the State of Arizona in becoming more sustainable while increasing economic development options in Maricopa and La Paz Counties. I knew that our local stakeholders could support the route if they were engaged early in the process and understood the benefits of grid resiliency, economic development opportunities and local support for a shift to renewable energy. Unlike the Devers Two process, it was clear to everyone that the State of Arizona would benefit economically and environmentally from the addition of this new transmission capacity.	Comment noted.
27	1	Kelly Sarber, President/CEO, **Strategic Management Group**	27.4	KOFA	…I worked informally on issues of concerns, including with The US Fish and Wildlife's interest in avoiding the KOFA reserve which led to La Paz County's and other stakeholder support for the line's placement parallel to Interstate 10. Both the Ten West Link staff members and BLM worked constantly with La Paz County staff and political representatives to make sure that the stakeholders could find ways to support the preferred route without jeopardizing other important political relationships that are integral to the fabric of a cohesive, and supportive government.	Comment noted.
27	1	Kelly Sarber, President/CEO, **Strategic Management Group**	27.5	SUP PREF	…I applaud you for your professionalism and tenacity and fully support both the integrity of the process and the resulting Draft EIS and its' preferred route that I support fully.	Comment noted.
27	1	Kelly Sarber, President/CEO, **Strategic Management Group**	27.6	RENE	… I believe that the State of Arizona will benefit tremendously for this new capacity which will lay the groundwork for building additional new renewable energy projects (and their resulting jobs) due to SRP and APS both intending to add thousands of megawatts of new solar and battery storage projects during the next eight years.	Comment noted.

Response ID No.	Number of Signatures	Name	Comment ID No.	Comment Type	Comment	Response
27	1	Kelly Sarber, President/CEO, **Strategic Management Group**	27.7	GEN	I believe that the BLM's process has resulted in a route for a transmission line that has the least probably impacts with the best possible result --- grid resiliency, reliability and new opportunities for renewable energy in our great nation.	Comment noted.
28	1	Norman Simpson, Mayor, **Town of Quartzsite**, Arizona	28.1	SOCIO	The Town of Quartzsite, Arizona is reliant on its Winter Visitor Tourist industry for the overwhelming majority of its mostly sales tax based General Fund Revenue. The Winter Visitor Tourist season is focused during a four month time period of December thru March. During these four months local businesses such as restaurants, grocery stores, fuel stations and R.V parks are already operating at their maximum capacity. Any additional demand for services during the four month season would not be positive for these businesses, nor the Town.	As discussed in the TES, Section 4.15.4.1, the population of La Paz County (data for the Town of Quartzsite was not analyzed) would increase by a minimum of 92 people (0.45 percent increase) and a maximum of 190 people (0.93 percent increase) during the Project construction period, which would be a negligible effect on the county population. This change would cause a negligible to minor, short-term effect on the demand for public services (TES Section 4.15.4.1); it could be inferred that the effect on local businesses would be similar (negligible to minor).
28	1	Norman Simpson, Mayor, **Town of Quartzsite**, Arizona	28.2	SOCIO	Proposed Action: Appears to have the least impact on QUARTZSITE considering both construction and business impact. Alternative 1: 1-10 Route: Appears to have great impact to the Northerly portions of the town. It is unclear on what portion(s) would be of new construction. Alternative 2: BLM Utility Corridor: Appears to have the greatest impact to both the Northerly and Easterly portions of the town. It is also unclear on what portion(s) would be of new construction. Alternative 3: Avoidance Route: Appears to have the second least impact to the town. Alternative 4: Public Lands Emphasis Route: Appears to have great impact to the Easterly and Southerly portions of the town. It is unclear on what portion(s) would be of new construction.	Comment noted. Commenter does not provide input on the Preferred Alternative that was developed with input from La Paz County and Quartzite to avoid the Town of Quartzsite.
28	1	Norman Simpson, Mayor, **Town of Quartzsite**, Arizona	28.3	SUP PA	Given the choices available it is my belief that the Proposed Action route would be the obvious choice for Quartzsite, Arizona showing the furthest proximity to the town.	Comment noted.
28	1	Norman Simpson, Mayor, **Town of Quartzsite**, Arizona	28.4	M&M	Regardless of the route chosen, negative impact to the town would be mitigated by scheduling construction in areas close to the town to occur during the April thru November time period. Construction during this time period could in-fact become a boost to the local economy.	Comment noted.
29	1	Christa Weise, Refuge Manager, **Kofa NWR**	29.1	OPP PRO	Thank you for the opportunity to comment on the Draft Environmental Impact Statement for Ten West Link 500kv Transmission Line Project. We do not support the Proposed Action Route, which is proposed to cross Kofa NWR, as we have discussed with involved parties.	Comment noted
29	1	Christa Weise, Refuge Manager, **Kofa NWR**	29.2	SUP PREF	We are supportive of the Agency Preferred Alternative as it does not cross Kofa National Wildlife Refuge (NWR) but suggest one adjustment to the route be considered as described in the following paragraph.	Comment noted
29	1	Christa Weise, Refuge Manager, **Kofa NWR**	29.3	RNA	Section x-05 is extremely close to the refuge boundary at the Northwestern corner of Kofa NWR and as a result may impact Sonoran pronghorn, which are threatened on the Refuge. The route could be improved by moving section x-05 further from the refuge (for instance by cutting west to route x-06 instead using the southern half of x-05, or by moving the trajectory of section x-05 to the west) and thus keeping the transmission line from running extremely close to the refuge boundary. This would reduce potential for interaction between the Agency Preferred Alternative for the proposed transmission line and Sonoran pronghorn on the refuge and disturbance to refuge habitat and other wildlife on the refuge. Interactions/impacts could include for example route proliferation and increased fire danger, dust, noise and visual	The Preferred Alternative was developed in conjunction with multiple stakeholders, to include avoidance of multiple resources on public lands. Per input from USFWS, the BLM Preferred Alternative avoids the Kofa NWR. BLM feels that the Preferred Alternative would not result in measurable impacts in terms of interactions/impacts to Sonoran pronghorn, especially with Applicant Protection Measures that would be implemented. Section 7 consultation on the Project is ongoing between BLM and USFWS Ecological Services.

Response ID No.	Number of Signatures	Name	Comment ID No.	Comment Type	Comment	Response
					disturbance. Such a change, depending on exact routing, may reduce or eliminate the need to conduct a section 7 consultation for Sonoran pronghorn.	
29	1	Christa Weise, Refuge Manager, **Kofa NWR**	29.4	WLF	Section 2.5 IDENTIFICATION OF THE BLM'S PREFERRED ALTERNATIVE Page 2-39 Table 2-13 Special Status Animal Species: Comment: Impacts to Sonoran pronghorn are not listed in this table. Due to the vicinity of the preferred route to Kofa NWR where Sonoran Pronghorn are threatened, impacts to Sonoran pronghorn are possible (dust, noise, visual impacts, increased fire danger, etc.) and should appear in this table.	The Preferred Alternative has been added to the overall comparison of alternatives table that is now Table 2-12. Sonoran pronghorn is listed for all alternatives.
29	1	Christa Weise, Refuge Manager, **Kofa NWR**	29.5	WLF	4.4.4.1 Direct and Indirect Effects Common to All Action Alternatives Page 4-27 Special Status Wildlife Species Sonoran Pronghorn Original Text: Project construction activities could frighten Sonoran pronghorn if they are in the area. Though the population would likely not substantially expand during the Project timeframe for construction, individual animals or small groups could wander to areas where construction would occur. Suggested addition: Construction activities may keep Sonoran pronghorn from water sources, or may cause them to avoid the areas entirely. Sonoran pronghorn need to move widely across the landscape as habitat conditions may vary dramatically between different locations based on sporadic and localized rainfall.	Addition made.
29	1	Christa Weise, Refuge Manager, **Kofa NWR**	29.6	WLF	4.4.4.2 Direct and Indirect Segment-and Species-Specific Impacts Page 4-30 Segment p-06 Last part of first paragraph Original Text with unclear language in grey: This segment, along with most alternative segments to Segment p-06 are within the designated experimental nonessential population area for the Sonoran pronghorn; except within the Kofa NWR the Sonoran pronghorn is protected under the same standards as for a threatened species. Sonoran pronghorn may avoid the area during construction, thereby disrupting natural movement patterns, and forage habitat would be lost in the short term until construction areas are revegetated. Suggested text: This segment, along with most alternative segments to Segment p-06 are within the designated experimental nonessential population area for the Sonoran pronghorn; except within the Kofa NWR where the Sonoran pronghorn is protected as a threatened species. Sonoran pronghorn may avoid the area during construction, thereby disrupting natural movement patterns, and forage habitat and access to water sources would be lost in the short term until construction areas are revegetated.	Revision made.

Response ID No.	Number of Signatures	Name	Comment ID No.	Comment Type	Comment	Response
29	1	Christa Weise, Refuge Manager, **Kofa NWR**	29.7	WLF	Page 4-31 Segment x-05 Comment: There is no mention of the extreme vicinity to Kofa NWR, potential impacts to refuge wildlife and habitat including threatened Sonoran pronghorn. Please include this information.	Added Kofa NWR.
29	1	Christa Weise, Refuge Manager, **Kofa NWR**	29.8	WLF	4.4.7.1 Proposed Action Page 4-40 Wildlife, 2nd paragraph Original text: Segment p-06 crosses about 25 miles of good quality habitat for the Sonoran desert tortoise and is within an extended use area of a reintroduced population of the endangered Sonoran pronghorn, which is afforded special management consideration on a NWR. Suggested text: Segment p-06 crosses about 25 miles of good quality habitat for the Sonoran desert tortoise and is within an area used by a reintroduced population of the endangered Sonoran pronghorn. Comment: Original phrasing not appropriate because multiple animals including females have been documented repeatedly in the vicinity of p-06.	Revision made.
29	1	Christa Weise, Refuge Manager, **Kofa NWR**	29.9	WLF	4.4.7.4 Alternative 3: Avoidance Route Pages 4-45/46 Comment: The extreme vicinity to Kofa NWR of section x-05 and potential impacts are not addressed. Impacts to Sonoran pronghorn are not addressed at all for this alternative. Please include this information.	Text was added regarding impacts to Sonoran pronghorn under Alternative 3 and the following information was excerpted from the Biological Assessment prepared for the Project. Following the May 2011 publication of a Final Rule establishing a nonessential experimental population (76 FR 25593), a pen for captive breeding of Sonoran pronghorn and five permanent water sources were established in King Valley on Kofa NWR. That pen is about 30 miles south of the portion of the TWL transmission line route along I-10, and about 26 miles south-southeast of the southernmost point of the route in La Posa Plain. Pronghorn from that pen and from the Cabeza Prieta population were released into King Valley starting in 2012–2013, and by 2016, 45 individuals had been released. As of January 2017, there were about 70 animals in this nonessential experimental population on and near Kofa NWR (USFWS 2017). In January 2019 pronghorn were released into the east arm of the Yuma Proving Grounds. At its closest point, the transmission line would be less than 0.5 mile west of the northwest corner of Kofa NWR. Some of the released pronghorn were radio-collared, and the movements of those individuals have been 16 monitored periodically by the Arizona Game and Fish Department. Most individuals in that population have remained in and near King Valley on Kofa NWR and the Yuma Proving Grounds, generally 20 to 40 miles south of the southernmost point of the TWL transmission line route in the La Posa Plain, and farther from the route along I-10. In addition, individuals have been documented in the northern portion of Kofa NWR and adjacent BLM land, including along both the eastern and western ends of the pipeline road and 500 kV transmission line that bisect the

Response ID No.	Number of Signatures	Name	Comment ID No.	Comment Type	Comment	Response
						northern part of the refuge (Erin Fernandez, USFWS, personnel 24 communication, February 11, 2019). Some individuals have moved relatively long distances from King Valley. For example, a male pronghorn spent about seven months west of Highway 95 near Stone Cabin, 26 about 18–20 miles south of the transmission line route in southern La Posa Plain, and others have moved outside of the Refuge and into or through the Palomas Plain, the southern Ranegras Plain, and north of and near the Little Horn and Eagletail mountains (AGFD 2014, 2015, 2016; Daniel Stewart, Yuma Proving 29 Grounds, Personal Communication, October 25, 2018). O'Brien et al. (2005) developed models of potential Sonoran pronghorn habitat within the boundaries of the nonessential experimental population, including along much of the TWL transmission line route in Arizona. Those models identified much of the area along and near I-10 in the Ranegras and Harquahala plains that will be crossed by the transmission line as non-habitat or as having a low probability of use by pronghorn. The models identified the area to be crossed in the La Posa Plain as a large contiguous block of potential habitat. In that area, the transmission line will traverse south-southeast along the western edge of the Plomosa Mountains for 18 miles. The transmission line route then parallels the Devers-Palo Verde 500-kV transmission line to the east-northeast into the Dome Rock Mountains and across Copper Bottom Pass. That La Posa Plain in this region is bisected to the north-south by US93 and by the Devers-Palo Verde line to the east west, and there are numerous roads and trails in that area that are used for recreation, especially during the winter.
29	1	Christa Weise, Refuge Manager, **Kofa NWR**	29.10	WLF	4.4.7.5 Alternative 4: Public Lands Emphasis Route Pages 4-47/48 Comment: Impacts to Sonoran pronghorn are not addressed at all for this alternative. Please include this information.	Impacts to Sonoran pronghorn would include the general impacts described for all alternatives in Section 4.4.4.1. Sonoran pronghorn were added to the impacts summary for Alternatives 3 and 4 (and subalternatives, as appropriate).
29	1	Christa Weise, Refuge Manager, **Kofa NWR**	29.11	KOFA	4.4.7.6 BLM Preferred Alternative Wildlife 3rd paragraph Original text: In comparison to the Proposed Action, the Preferred Alternative would have no direct impact on the Kofa NWR because the route avoids the refuge and is adjacent to I-10; would have reduced impacts to the Sonoran pronghorn; Comment: The original text seems incomplete. The extreme vicinity to Kofa NWR of section x-05 in the Northwestern corner is not mentioned and it is not clear that there may be effects to the threatened Sonoran pronghorn on Kofa. We hope that our suggested minor change to the BLM Preferred Alternative will be considered in the final EIS, in which case the above text would not need to be edited.	See response to comment 29.3.

30	1	David Vigil, Senior Environmental Scientist, **California Department of Fish and Wildlife**, Inland Deserts Region	30.1	NEPA	CDFW is California's Trustee Agency for fish and wildlife resources, and holds those resources in trust by statute for all the people of the state. (Fish & G. Code, §§ 711.7, subd. (a) & 1802; Pub. Resources Code,§ 21070; CEQA Guidelines§ 15386, subd. (a).) CDFW, in its trustee capacity, has jurisdiction over the conservation, protection, and management of fish, wildlife, native plants, and habitat necessary for biologically sustainable populations of those species. (Id.,§ 1802.) Similarly for purposes of CEQA, CDFW is charged by law to provide, as available, biological expertise during public agency environmental review efforts, focusing specifically on projects and related activities that have the potential to adversely affect fish and wildlife resources.	Comment noted. The BLM acknowledges that the CDFW may become a CEQA lead agency if and when the Applicant files a discretionary permit. Presently, there is no CEQA document or CEQA Lead Agency, so CDFW is not yet a trustee Agency, as defined by CEQA. The EIS anticipates the Applicant will obtain all required permits and issuance of Notice to Proceed may be withheld until the Applicant secures such permits.
30	1	David Vigil, Senior Environmental Scientist, **California Department of Fish and Wildlife**, Inland Deserts Region	30.2	VEG	COMMENT 1: Appendix 1C, Section 2.4 Page 418 Issue: The preconstruction survey requirements for Harwood's eriastrum and other CNPS Rank 1 and 2 plants are unspecific and may allow surveys that do not adequately quantify occurrences of rare plants in impact areas. Why impact would occur: If preconstruction surveys are inadequate and rare plants in the impact areas are not properly quantified, then there is the potential of significant impacts to rare plants species from project activities. Evidence impact would be significant: Many rare plants are annuals and do not occur in the same location from year to year. Due to this nomadic nature, it is recommended that floristic surveys be performed multiple times within the blooming season for rare plants. There are protocols for performing rare plant surveys available on the CDFW website at: https://www. wildlife.ca. gov/Conservation/SurveyProtocols# 377281 280-plants. Recommended Potentially Feasible Mitigation Measure(s) (Regarding Mitigation Measure or Alternative and Related Impact Shortcoming) Mitigation Measure 1: To reduce impacts to less than significant: Outline specific methods to conduct preconstruction surveys for rare plants that include multiple floristic surveys within the blooming season.	Appendix 1C has been updated to include a new/updated Mitigation Measures to address impacts on sensitive plants and/or vegetation communities. This includes floristic surveys consisting of three distinct survey events to capture the blooming periods for all special-status plants known to occur in the Project area. Survey and protection requirements for Harwood's eriastrum are further developed in the Rare Plant Linear ROW Protection Plan for Harwood's Eriastrum.
30	1	David Vigil, Senior Environmental Scientist, **California Department of Fish and Wildlife**, Inland Deserts Region	30.3	VEG	COMMENT 2: Appendix 1 C, Section 2.4.5.1, Page 437 Issue: Measures to address unavoidable impacts are inadequate. Why impact would occur: CDFW generally does not support the use of relocation, salvage, and /or transplantation as mitigation for impacts to rare, threatened, or endangered species. Department studies have shown that these efforts are experimental in nature and largely unsuccessful. Recommended Potentially Feasible Mitigation Measure(s) (Regarding Mitigation Measure or Alternative and Related Impact Shortcoming) Mitigation Measure 1: To reduce impacts to less than significant: Consider including the following measures to further reduce unavoidable impacts: 1 . Seed Collection for Restoration: Seed from individuals to be impacted would be collected prior to ground-disturbing activities. The seed would be collected following the protocols set forth by the Center for Plant Conservation and, if long-term storage is necessary, placed in a secure seed bank facility such as the Agricultural Research Service National Center for	Section has been updated to address comment. Specifications have been incorporated into MM VEG-CEQA-1 (Appendix 1C, Section 2.4.6).

Response ID No.	Number of Signatures	Name	Comment ID No.	Comment Type	Comment	Response
					Genetic Resources Preservation in Fort Collins, Colorado. Collected seed would be applied to restoration areas within the Project Area. Restoration plans developed for the proposed Project would be revised to include success criteria for restoration of the special-status plant species to ensure successful re-establishment of the impacted species. Success criteria for impacted special-status plants would be developed through coordination with CDFW. 2. Enhancement of Known Populations: Known populations of the species to be impacted would be enhanced by undertaking actions to increase the size of the known population. Such actions may include improving the quality of occupied habitat (e.g., invasive species removal) and/or seeding to facilitate population expansion. Enhancement of known populations may occur at off-site populations that are currently conserved or within the occupied portions of the Project Area that can be conserved. 3. Preservation of Occupied Habitat: Habitat occupied by the species to be impacted would be permanently protected by establishing a conservation easement. DTRC would coordinate with CPUCU, SLM and CDFW to determine the conditions of the conservation easement, including the required acreage of occupied habitat to be conserved and requirement monitoring and management of the conserved population.	
30	1	David Vigil, Senior Environmental Scientist, **California Department of Fish and Wildlife**, Inland Deserts Region	30.4	VEG	COMMENT 3: Appendix 1 C, Section 2.4.5.1 Page 438 Issue: In the final sentence of this section, the document states "compensation for permanent impacts to potential special status plant species habitat will include off-site creation, enhancement, and/or preservation or participation in an established mitigation bank program at a minimum 3:1 replacement ratio". Why impact would occur: Different mitigation strategies offer different values to the environment. As an example, preservation through acquisition of land with an attached conservation easement or credits from an approved mitigation bank would offer the highest value and a compensation ratio of 2:1 would be appropriate. For on-site restoration, a ratio of 3:1 is appropriate. Finally, for enhancement, which offers the lowest ecological value, a higher ratio should be employed, such as 5:1. Recommended Potentially Feasible Mitigation Measure(s) (Regarding Mitigation Measure or Alternative and Related Impact Shortcoming) Mitigation Measure 1: To reduce impacts to less than significant: Specify different compensation ratios depending on the mitigation strategy utilized.	Section has been updated to address comment. Specifications were incorporated into MM VEG-CEQA-1. A 3:1 replacement ratio is contained within this MM as well as a statement that mitigation can be achieved through different strategies, or a combination thereof.
30	1	David Vigil, Senior Environmental Scientist, **California Department of Fish and Wildlife**, Inland Deserts Region	30.5	WLF	COMMENT 4: Appendix 1 C, Section 2.4.5.2 Page 439 Issue: As in the comment above, there are many sub-sections that use a blanket 3:1 compensation ratio for varying mitigation strategies. Why impact would occur: Different mitigation strategies offer different values to the environment. As an example, preservation through acquisition of land with an attached conservation easement or credits from an approved mitigation bank would offer the highest value and a compensation ratio of 2:1 would be appropriate. For on-site restoration a ratio of 3:1 is appropriate. Finally, for enhancement, which offers the lowest ecological value, a	The document provides a variety of compensation ratios ranging from 1:1 to 3:1 and 5:1. These are dependent on type of impact. The ratios vary by species and take into account the type of proposed compensation.

Response ID No.	Number of Signatures	Name	Comment ID No.	Comment Type	Comment	Response
					higher ratio should be employed, such as 5:1. Recommended Potentially Feasible Mitigation Measure(s) (Regarding Mitigation Measure or Alternative and Related Impact Shortcoming) Mitigation Measure 1: To reduce impacts to less than significant: Specify different compensation ratios depending on the mitigation strategy utilized.	
30	1	David Vigil, Senior Environmental Scientist, **California Department of Fish and Wildlife**, Inland Deserts Region	30.6	M&M	COMMENT 5: Appendix 1C, Section 2.4.2 Page 418 BMP 810-30 states that a Burrowing Owl Nesting Management Plan will be drafted. Please include CDFW as a reviewer for the plan.	MM BIO-CEQA-3 has been updated to list CDFW as a reviewer of the Burrowing Owl Nesting Management Plan.
30	1	David Vigil, Senior Environmental Scientist, **California Department of Fish and Wildlife**, Inland Deserts Region	30.7	M&M	COMMENT 6: General Issue: Throughout the document it is stated that mitigation for temporary impacts "will include on-site habitat restoration at a 1 : 1 ratio". CDFW considers a 1: 1 ratio to be inadequate for both permanent and temporary impacts to desert ecosystems. Why impact would occur: Mitigation for both temporary and permanent impacts is crucial for desert ecosystems due to the sensitive nature of these systems. It is well documented that the time required for a desert system to reestablish itself after a disturbance is considerably longer than other systems. All temporary impacts should be mitigated to account for temporal losses of ecosystem services. A 1 :1 ratio does not account for the time that the habitat is affected and no longer able to provide vital ecosystem services. Recommended Potentially Feasible Mitigation Measure(s) Mitigation Measure 1: To reduce impacts to less than significant: CDFW recommends utilizing a 1.5:1 ratio for temporary impacts.	A review of compensation ratios for similar projects was used in determining the 1:1 ratio for temporary impacts. Restoration of conditions of the impacted areas within the Project footprint shall be at 1:1; and creation, restoration, or enhancement of similar vegetation communities offsite shall be 0.5:1, as approved by CDFW and CPUC. Alternatively, payments would be made into an appropriate mitigation program or other mitigation funding mechanism. As the Project would be occurring over a large linear distance, prolonged temporary impacts are not expected to occur as areas subject to temporary impacts would constantly be relocated based on Project progress.
30	1	David Vigil, Senior Environmental Scientist, **California Department of Fish and Wildlife**, Inland Deserts Region	30.8	VEG/ WLF	COMMENT 7: General Issue: Project activities may result in take of plant or animals listed under the California Endangered Species Act (CESA). If take of species of plants or animals listed under the California Endangered Species Act (CESA) cannot be avoided during Project activities, please be advised that an Incidental Take Permit (ITP) would be warranted. CESA Permits are issued to conserve, protect, enhance, and restore State-listed threatened or endangered species and their habitats.	See response to comment 30.1. The EIS anticipates the Applicant will obtain all required permits and may withhold issuance of Notice to Proceed until the Applicant secures such permits; this includes CESA Permits from CDFW.
30	1	David Vigil, Senior Environmental Scientist, **California Department of Fish and Wildlife**, Inland Deserts Region	30.9	WTR/ WOUS	COMMENT 8: General Issue: Project activities describe project activities within CDFW jurisdictional waters. CDFW opposes the elimination of watercourses and/or their channelization or conversion to subsurface drains. All wetlands and watercourses, whether intermittent or perennial, must be retained and provided with substantial setbacks which preserve the riparian and aquatic values and maintain their value to on-site and off-site wildlife populations. In order for the Department to process a LSAA agreement, the CEQA-certified documents must include an analysis of the impacts of the proposed project on the lake or streambed, an	The document notes that jurisdictional features/habitats shall be avoided where possible and requires that a delineation of such features/habitats is conducted prior to Project activities. It is also stated that the Application must obtain all required regulatory permits prior to the start of Project activities.

Response ID No.	Number of Signatures	Name	Comment ID No.	Comment Type	Comment	Response
					analysis of the biological resources present on the site, copies of biological studies conducted on the site, biological survey methodology, and a discussion of any alternative, avoidance, or mitigation measures which will reduce the impacts of the proposed development to a level of insignificance. In addition, a discussion of potential adverse impacts from any increased runoff, sedimentation, soil erosion, and/or pollutants on streams and watercourses on or near the project site, with mitigation measures proposed to alleviate such impacts must be included in the CEQA certified documents.	
30	1	David Vigil, Senior Environmental Scientist, **California Department of Fish and Wildlife**, Inland Deserts Region	30.10	GEN	ENVIRONMENTAL DATA CEQA requires that information developed in environmental impact reports and negative declarations be incorporated into a data base which may be used to make subsequent or supplemental environmental determinations. (Pub. Resources Code, § 21003, subd. (e).) Accordingly, please report any special status species and natural communities detected during Project surveys to the California Natural Diversity Database (CNDDB). The CNNDB field survey form can be found at the following link: http://www.dfg. ca.gov/biogeodata/cnddb/pdfs/CNDDB FieldSurveyForm.pdf. The completed form can be mailed electronically to CNDDB at the following email address: CNDDB@wildlife.ca.gov. The types of information reported to CNDDB can be found at the following link: http://www.dfg.ca. gov/biogeodata/cnddb/plants and animals.asp.	MM BIO-CEQA-3 has been updated to require the Applicant submit all applicable environmental data to the CNDDB.
30	1	David Vigil, Senior Environmental Scientist, **California Department of Fish and Wildlife**, Inland Deserts Region	30.11	GEN	FILING FEES The Project, as proposed, would have an impact on fish and/or wildlife, and assessment of filing fees is necessary. Fees are payable upon filing of the Notice of Determination by the Lead Agency and serve to help defray the cost of environmental review by CDFW. Payment of the fee is required in order for the underlying project approval to be operative, vested, and final. (Cal. Code Regs, tit. 14, § 753.5; Fish & G. Code, § 711.4; Pub. Resources Code,§ 21089.)	The Applicant will pay all required filing fees if and when the CPUC, or other CEQA Lead Agency, files a NOD with the State Clearinghouse.
31	2	Rob Peters, Ph.D., Senior Southwest Representative; Rupak Thapaliya, Renewable Energy and Wildlife Policy Analyst, **Defenders of Wildlife**	31.1	RENE	Transforming the nation's electricity sources from polluting fossil fuels to clean renewable energy is an essential part of reducing greenhouse gas emissions and limiting the threats posed by global climate change. Defenders supports environmentally responsible development of renewable energy projects, including transmission lines, on public and private lands as a means to transforming to clean renewable energy. We recognize that new transmission lines will be needed in some cases to carry renewable energy to population centers and create improved transmission capacity and reliability. We are committed to guiding our nation's transition to clean energy in a way that protects wildlife and habitats by ensuring renewable energy and transmission projects are built "smart from the start" so as to avoid, minimize and effectively mitigate for negative impacts to our environment, wildlife habitat and other sensitive resources.	Comment noted.

Response ID No.	Number of Signatures	Name	Comment ID No.	Comment Type	Comment	Response
31	2	Rob Peters, Ph.D., Senior Southwest Representative; Rupak Thapaliya, Renewable Energy and Wildlife Policy Analyst, **Defenders of Wildlife**	31.2	P&N	We understand that the proposed Project is meant to increase grid capacity by connecting the Delaney and Colorado River stations and would facilitate interconnection of any new renewable energy resources in Arizona or California. The proposed Project would also afford the transmission system operators, including the California Independent System Operator (CAISO) the operational flexibility to redirect the power flows under normal and emergency conditions, improving system reliability and deferring transmission upgrades and strengthen regional grid reliability. We appreciate the purpose of the Project and provide the following general comments on the Draft EIS for the Project.	Comment noted.
31	2	Rob Peters, Ph.D., Senior Southwest Representative; Rupak Thapaliya, Renewable Energy and Wildlife Policy Analyst, **Defenders of Wildlife**	31.3	KOFA	In our scoping comments dated May 9, 2016, we had noted that routing the Project through the Kofa NWR is contrary to the mission and management standards established in the National Wildlife Refuge System Improvement Act of 1997. Furthermore, we noted that routing the line through Kofa NWR would not only be incompatible with the purpose of the refuge but that such an action would cause harm to hundreds of bird, mammal, reptile, and amphibian species, including the endangered Sonoran Pronghorn and other priority management species such as desert bighorn sheep, desert mule deer, mountain lion, California leaf-nosed bat, southern yellow bat, Sonoran desert tortoise, Tarahumara frog, Costa's hummingbird, LeConte's thrasher, willow flycatcher, ferruginous hawk, peregrine falcon, and gilded flicker.	Comment noted.
31	2	Rob Peters, Ph.D., Senior Southwest Representative; Rupak Thapaliya, Renewable Energy and Wildlife Policy Analyst, **Defenders of Wildlife**	31.4	KOFA	Indeed, the Fish and Wildlife Service determined in 2017 that "the proposed project does not meet the criteria for an appropriate use and would interfere with and detract from fulfilling the NWRS mission and purpose of Kofa NWR." The USFWS further concluded that "the proposed project cannot be authorized and a right of way permit will not be granted for this project on Kofa NWR." This determination underscores the fact that the BLM and the project developer should abandon consideration of any routes that go through the Kofa NWR.	Comment noted. This is presented in Section 4.7 of the EIS.
31	2	Rob Peters, Ph.D., Senior Southwest Representative; Rupak Thapaliya, Renewable Energy and Wildlife Policy Analyst, **Defenders of Wildlife**	31.5	KOFA	We further note that the Draft EIS identifies significant and unacceptable impacts to the Kofa NWR and its mission associated with the originally proposed alternative as noted below: "[the Kofa route] segment is almost 36 miles long and follows the existing DPV1 line and corridor with approximately 25 miles crossing the Kofa NWR. Construction along this segment has the potential to alter habitats of various special status species including Gila monster, elf owl, gilded flicker, LeConte's thrasher, and Lucy's warbler. The portion of this segment near and through the Kofa NWR has the potential to disrupt desert bighorn sheep movement and habitat use, as well as impact good quality habitat for the Sonoran Desert tortoise, and disturb golden eagles... The route crosses between the Livingston Hills and New Water Mountains, an identified desert bighorn sheep dispersal corridor, temporarily disrupting movement for forage. This segment... [is] within the designated experimental nonessential population area for the Sonoran pronghorn.... Sonoran pronghorn may avoid the area during construction, thereby disrupting natural movement patterns, and forage habitat would be lost in the short term until construction areas are revegetated. Construction activities associated with Segment p-06 would not be in compliance with the National Wildlife Refuge System Administration Act of 1966, as amended by the National Wildlife Refuge System Improvement Act of 1997 and could have significant direct and indirect impacts on the continued management of the Kofa NWR for the conservation and development of natural wildlife. These impacts would be major, with both short- and long-	Comment noted.

Response ID No.	Number of Signatures	Name	Comment ID No.	Comment Type	Comment	Response
					term effects, and cannot be mitigated. The USFWS states (USFWS 2017) that the construction of a new transmission line across the Kofa NWR should not be considered as a viable alternative."	
31	2	Rob Peters, Ph.D., Senior Southwest Representative; Rupak Thapaliya, Renewable Energy and Wildlife Policy Analyst, **Defenders of Wildlife**	31.6	SUP PREF	We appreciate that the BLM's preferred alternative- the modified Alternative 2- does not route the proposed project through the Kofa NWR. We support the BLM preferred alternative that avoids the Kofa and therefore any impacts to the Kofa NWR. We encourage the BLM to select the preferred alternative in the Final EIS and Record of Decision (ROD).	Comment noted.
31	2	Rob Peters, Ph.D., Senior Southwest Representative; Rupak Thapaliya, Renewable Energy and Wildlife Policy Analyst, **Defenders of Wildlife**	31.7	M&M	Compensatory Mitigation We appreciate that the BLM's preferred alternative- the modified Alternative 2- avoids the Kofa NWR thereby avoiding significant impacts to wildlife and habitat in the Kofa. However, construction, operation and maintenance of the Project through the BLM-preferred alternative would still cause significant impacts which must be addressed through the mitigation hierarchy. We understand that a recent guidance from BLM in IM 2019-0935 instructs agency staff not to require compensatory mitigation to offset impacts from development on public lands. However, we believe that BLM not only has statutory authority to recognize and require mitigation under the Federal Land and Policy Management Act (FLPMA) but is in fact required to do so. FLPMA requires BLM to manage for multiple use and sustained yield, and to avoid unnecessary or undue degradation of resources and values. BLM's obligation under FLPMA to "take any action to prevent unnecessary or undue degradation of the lands" is an independent source of authority for requiring mitigation, in addition to BLM's broad authority to manage the public lands under FLPMA's multiple use and sustained yield principles. Furthermore, the National Environmental Policy Act (NEPA) and associated Council on Environmental Quality (CEQ) regulations require BLM to analyze potential impacts and consider ways to avoid, minimize and mitigate impacts – in accordance with the mitigation hierarchy.	IM 2019-018 (dated December 6, 2018) supersedes IM 2018-093 (and all previous policies regarding compensatory mitigation) and states that BLM must not require compensatory mitigation from public land users under FLPMA. This does not preclude compensatory mitigation required under other federal law, state law, or voluntary actions of the proponent. Compensatory mitigation identified in the DRECP will be required for permitting under CEQA.
31	2	Rob Peters, Ph.D., Senior Southwest Representative; Rupak Thapaliya, Renewable Energy and Wildlife Policy Analyst, **Defenders of Wildlife**	31.8	M&M	Although the Draft EIS contains limited requirements for compensatory mitigation, we believe those requirements are inadequate. For example, when addressing compensatory mitigation for impacts to birds and bats in California, the DEIS states that "Compensation will be consistent with the most up to date DOI mitigation policy." As described above, the current BLM mitigation policy is inconsistent with the agency's requirements under FLPMA and other laws and regulations. BLM must include specific and appropriate requirements for compensatory mitigation in the Final EIS and ROD.	See response to comment 31.7.
31	2	Rob Peters, Ph.D., Senior Southwest Representative; Rupak Thapaliya, Renewable Energy and Wildlife Policy Analyst, **Defenders of Wildlife**	31.9	M&M	At the same time, the project developer should make voluntary commitments to appropriate compensatory mitigation, in coordination with BLM, agencies and other stakeholders.	Under IM 2019-018, voluntary compensatory mitigation can be considered by BLM.

Response ID No.	Number of Signatures	Name	Comment ID No.	Comment Type	Comment	Response
31	2	Rob Peters, Ph.D., Senior Southwest Representative; Rupak Thapaliya, Renewable Energy and Wildlife Policy Analyst, **Defenders of Wildlife**	31.10	LWC	Wilderness Values We appreciate that BLM completed a Lands with Wilderness Characteristics (LWC) inventory update for the DEIS as we requested in our May 2016 letter and analyzed impacts to LWC in the Draft EIS, as required by the Federal Land and Policy Management Act (FLPMA) and BLM guidance (Manual 6310). However, we note that the map included in the DEIS in Appendix 7, Part I (Figure 3.2-3) is not the accurate map. We request the BLM to provide an accurate map in the Final EIS. In addition, we request that the BLM make public the final LWC inventory as soon as possible.	The wrong figure was included in the DEIS as Figure 3.2-3. The figure in the DEIS was originally provided as a part of the baseline information, but it apparently has inherent problems (for example, some of the symbology is not identified in the legend), beyond being the wrong referenced figure. The correct Figure 3.2-3 represents the mapping and data used as a part of the DEIS analysis, so no changes to the FEIS are needed aside from replacement of this figure.
31	2	Rob Peters, Ph.D., Senior Southwest Representative; Rupak Thapaliya, Renewable Energy and Wildlife Policy Analyst, **Defenders of Wildlife**	31.11	KOFA	In addition, we note that more than 80 percent of Kofa NWR is designated wilderness, another important reason to avoid any route that traverses the refuge. We welcome the BLM's effort to avoid the Kofa NWR and hence the wilderness by routing the Project around the Kofa NWR with its preferred alternative.	Comment noted.
31	2	Rob Peters, Ph.D., Senior Southwest Representative; Rupak Thapaliya, Renewable Energy and Wildlife Policy Analyst, **Defenders of Wildlife**	31.12	SUP DUC	Using portion of WWEC 30-52 for the Project The Draft EIS notes that portions of the BLM preferred alternative for the Project would fall within West Wide Energy Corridor (WWEC) 30-52, which is not a WWEC corridor of concern. Choosing a route through WWEC 30-52 avoids many of the negative impacts to wildlife associated with the proposed route through Kofa NWR. The principle purpose of WWECs is to cluster transmission development in areas where it would do minimal environmental harm. Were the BLM not to use the 30-52 corridor it would undercut the large investment by the BLM and other participants in the WWEC process. For these reasons, we support the BLM in routing the Project through WWEC 30-52 instead of Kofa NWR in its preferred alternative.	Comment noted.
31	2	Rob Peters, Ph.D., Senior Southwest Representative; Rupak Thapaliya, Renewable Energy and Wildlife Policy Analyst, **Defenders of Wildlife**	31.13	WLF	Sonoran Pronghorn The Sonoran Pronghorn is an endangered species under the Endangered Species Act as well as a Species of Great Conservation Need (SGCN) in Arizona. This species was reintroduced into the Kofa NWR in 2013 where the herd now numbers more than 100 individuals with plans to increase that to more than 150. The Draft EIS notes that segment p-06 of the proposed line, which is 36 miles long and follows the existing Devers Palo Verde 1 transmission line contains experimental nonessential population area for the Sonoran pronghorn. The proposed action would result in "major long-term impacts to …Sonoran pronghorn on the refuge." However, under the preferred alternative which avoids the Kofa NWR, the Draft EIS notes that there will be reduced impacts to Sonoran pronghorn. The Draft EIS notes that measures under the Biological Opinion for Sonoran Pronghorn would be implemented during pre-construction, construction, operation and maintenance, and decommissioning. Since the Biological Opinion is not available yet, we cannot now comment on the measures to be implemented, but we support the BLM-preferred alternative 2, which has reduced impacts to Sonoran pronghorn.	Comment noted.
31	2	Rob Peters, Ph.D., Senior Southwest Representative; Rupak Thapaliya, Renewable	31.14	WLF	Desert Bighorn Sheep As noted by the USFWS in its January 2017 letter, the Kofa NWR was originally established for conservation of natural wildlife resources with an emphasis on conservation of desert	Comment noted. The Preferred Alternative avoids the Kofa NWR.

Response ID No.	Number of Signatures	Name	Comment ID No.	Comment Type	Comment	Response
		Energy and Wildlife Policy Analyst, **Defenders of Wildlife**			bighorn sheep. The Kofa population has played an important part in recovery of the species in Arizona, as its relatively robust population has been the source for sheep reintroduced in other areas. However, the population crashed from approximately 800 sheep to roughly 400 between 2000 and 2006, for reasons that include human disturbance. Although the number of sheep has since stabilized, the population has not yet regained pre-2006 levels. This large decline indicates the population is vulnerable, and it is important for the refuge to be kept intact in order to continue recovery.	
31	2	Rob Peters, Ph.D., Senior Southwest Representative; Rupak Thapaliya, Renewable Energy and Wildlife Policy Analyst, **Defenders of Wildlife**	31.15	WLF	We understand and acknowledge that the preferred alternative route would still have impacts to desert bighorn sheep in the Copper Bottom Pass below Cunningham Peak. However, we believe that the measure to minimize disturbance to bighorn sheep through limiting the construction activities from January 1 to March 31 in active lambing areas and control of construction activities during pre-construction, construction, operation and decommissioning is appropriate and is a much-preferred option.	Comment noted. APM-BIO-18 limits construction related access and APM-BIO-27 restricts the timing of construction in Copper Bottom Pass during lambing season. These APMs are further described in Appendix 2A.
31	2	Rob Peters, Ph.D., Senior Southwest Representative; Rupak Thapaliya, Renewable Energy and Wildlife Policy Analyst, **Defenders of Wildlife**	31.16	WLF	Mojave Desert Tortoise and Sonoran Desert Tortoise The Draft EIS correctly notes that these species "…are susceptible to being killed during vegetation removal, crushed in burrows, and run over by construction equipment and vehicles" and that "Any loss of a tortoise, especially a female, has serious ramifications to tortoise populations." Other threats related to project construction and maintenance such as invasion of non-native plant species, especially brome grasses, predation of juvenile desert tortoise from ravens perching on transmission structures, and the potential for increased recreational vehicles also pose significant risk to desert tortoise. We support the BLM preferred alternative that avoids desert tortoise habitat near Mule mountains and only has minor impacts to Sonoran Desert Tortoise in Plomosa and Dome Rock Mountains. This is a better route than the applicant proposed route which would have crossed 25 miles of good quality Sonoran Desert tortoise habitat. We believe the avoidance of good quality habitat combined with applicant proposed measures and best management practices will minimize the impacts to Desert Tortoise.	Comment noted.
31	2	Rob Peters, Ph.D., Senior Southwest Representative; Rupak Thapaliya, Renewable Energy and Wildlife Policy Analyst, **Defenders of Wildlife**	31.17	WLF	Burrowing owls Burrowing owls are continuing to decline in California. The Draft EIS states that burrowing owl is present or could occur within the California portion of the Project. The Draft EIS, under Mitigation Measure MM BIO-CEQA-8 requires that the Project applicant conduct pre-construction burrowing owl surveys using a qualified biologist knowledgeable of the species. We support the requirement of the survey and subsequent avoidance measures to avoid any existing burrows. Furthermore, we support the requirement to avoid active burrows, and coordination with California Department of Fish and Wildlife in any efforts to translocate burrowing owls if avoidance is not possible.	Your support for the analysis is noted. Additionally, MM BIO-CEQA-3 has been updated to list CDFW as a reviewer of the Burrowing Owl Nesting Management Plan. This plan is available in Appendix 2B, as a component of the Avian Protection Plan/Bird and Bat Conservation Strategy Plan.
31	2	Rob Peters, Ph.D., Senior Southwest Representative; Rupak Thapaliya, Renewable Energy and Wildlife Policy Analyst, **Defenders of Wildlife**	31.18	WLF	Mojave Fringe-toed Lizard The Mojave fringe-toed lizard is a BLM sensitive species as well as a California state Species of Special Concern. We note that significant mortality of these species were documented during construction and operation of Colorado Rivers substation despite the implementation of avoidance measures including enforced speed limits, vehicle escorts and other avoidance measures. The Draft EIS notes that BLM's preferred alternative- the Alternative 2 would "potentially disturb 48.2 acres of DRECP modeled Mojave fringe-toed lizard habitat, more	Comment noted.

Response ID No.	Number of Signatures	Name	Comment ID No.	Comment Type	Comment	Response
					than any other Action Alternative…" However, the number of acres impacted- 48.2 acres- is only 0.037% of all modeled Mojave fringe-toed lizard habitat across the Chuckwalla Valley. We support the BLM required Best Management Practice (BMP) to require Fringe-toed Lizard Linear ROW Protection Plan that identifies specific conservation measures to minimize project-related impacts and maps suitable habitat within construction zones. We also support the requirement for clearance surveys if suitable habitat characteristics are identified during the habitat assessment.	
31	2	Rob Peters, Ph.D., Senior Southwest Representative; Rupak Thapaliya, Renewable Energy and Wildlife Policy Analyst, **Defenders of Wildlife**	31.19	WLF	The Draft EIS mentions that "Compensation for temporary impacts to desert tortoise and special status terrestrial herpetofauna (including Couch's spadefoot toad and Mojave fringe-toed lizard) potential/modeled habitat will include on-site habitat restoration at a minimum 1:1 ratio." However, it is not clear what sort of on-site mitigation would be required. We encourage the BLM to specify appropriate on-site habitat mitigation measures in the Final EIS.	See MM WIL-CEQA-9 for compensation to desert tortoise and MM-WIL-CEQA-11 for terrestrial herpetofauna (Appendix 1C). On site habitat restoration would follow guidelines in the DRECP (e.g., LUPA-BIO-7, etc.) and NECO (Appendix E, Desert Restoration) and would be detailed in the Project's required Habitat Restoration Plan.
31	2	Rob Peters, Ph.D., Senior Southwest Representative; Rupak Thapaliya, Renewable Energy and Wildlife Policy Analyst, **Defenders of Wildlife**	31.20	WLF	Avian Protection A 2014 meta-analysis of studies of bird strikes on power lines concluded that between 12 and 64 million birds are killed each year at U.S. power lines and that "bird mortality at U.S. power lines constitutes a major source of anthropogenic mortality. We are also pleased that the BLM-preferred alternative crosses the Colorado River at an area where the banks of the river have been channelized, because doing so will reduce the risk of bird collisions.	Comment noted.
31	2	Rob Peters, Ph.D., Senior Southwest Representative; Rupak Thapaliya, Renewable Energy and Wildlife Policy Analyst, **Defenders of Wildlife**	31.21	WLF	Nevertheless, it is well documented that migratory birds fly along the Colorado River during migration periods, some of which may be Endangered or Threatened under Endangered Species Act, such as Yellow-billed Cuckoo and Southwest Willow Flycatcher. While following the Avian Power Line Interaction Committee (APLIC) guidelines and methodologies to minimize the potential for avian collision and electrocution, as stated in the Draft EIS, is important, many birds that migrate at night will not be able to see the lines. The Final EIS and ROD should include guidance on lighting in order not to attract nocturnal migrants to the infrastructure or the lines.	No lighting is proposed for the Colorado River area. As presented in Appendix 2A, BMP BIO-33 pertains to project lighting and APM BIO-21 includes APLIC guidelines. Additionally, MM WIL-CEQA-1 includes compliance with the APLIC guidelines.
31	2	Rob Peters, Ph.D., Senior Southwest Representative; Rupak Thapaliya, Renewable Energy and Wildlife Policy Analyst, **Defenders of Wildlife**	31.22	WLF	Consistent with industry best practices the developer should develop an Avian Protection Plan covering the entire project footprint. BLM should include requirements for the preparation and implementation of an Avian Protection Plan, including measures for nocturnal migrants, in the Final EIS and ROD. The Avian Protection Plan should put emphasis on the Colorado River crossing and the crossing of agricultural fields in the California segment of the Project. We support the requirement that bird diverters such as aerial marker balls or other visibility markers be placed on overhead wires at the Colorado River crossing and the vicinity, including the floodplain. We also support the use of deterrents to reduce nesting and perching by ravens and other predatory birds and the requirement to monitor the effectiveness of anti-electrocution design. These measures will help reduce predation of juvenile desert tortoise by ravens.	An Avian Protection Plan will be required, inclusive of these measures as it will incorporate APLIC (2006, 2012) guidelines. This plan is available in Appendix 2B. Additionally, a Raven Management Plan has been included in Appendix 1C (MM WIL-CEQA-2) which includes minimization of the attraction of ravens to the Project site. The Raven Management Plan is available in Appendix 2B.
31	2	Rob Peters, Ph.D., Senior Southwest Representative; Rupak Thapaliya, Renewable Energy and Wildlife Policy	31.23	SUP ALT2	In conclusion, we support Alternative 2- the BLM Corridor Utility Route- because this alternative: • Avoids the Kofa NWR, thereby eliminating impacts on the Kofa NWR, its wildlife and	Comment noted.

Response ID No.	Number of Signatures	Name	Comment ID No.	Comment Type	Comment	Response
		Analyst, **Defenders of Wildlife**			the habitat, • Is partially located within a segment of the WWEC 30-52, • Reduces impacts to desert bighorn sheep and limits the impacts to the Copper Bottom Pass area, • Reduces impacts to the Sonoran Pronghorn, • Limits impacts to Sonoran Desert Tortoise to Plomosa and Dome Rock Mountains, and • Avoids Mojave Desert Tortoise habitat in Mule mountains.	
32	1	Micah Horowitz, AICP, Project Manager, Planning and Engineering Section, **Arizona State Land Department**	32.1	SUP PRO	ASLD understands the Ten West Link project vision of planning and constructing a 500-kV transmission line which would enhance the State of Arizona's transmission system efficiency, facilitate new energy development, and promote economic development. The Department has reviewed the proposed alternatives, including the BLM Preferred Alternative and does not object to the proposed route at this time, but will continue to analyze impacts to ASLD interests as well as potential economic development opportunities associated with this project and alignment.	Comment noted.
32	1	Micah Horowitz, AICP, Project Manager, Planning and Engineering Section, **Arizona State Land Department**	32.2	ROW	As mentioned in ASLD's May 9, 2016 Scoping comment, the Department considers a number of factors when evaluating transmission line proposals which may cross State Trust land including minimizing the fragmentation of State Trust land. Figure 4.11-25 in Appendix 7 (reference attachment A) depicts a viewshed rendering structures offset from the 1-10 Right of Way. The Department understands these are preliminary depictions, and requests the Bureau of Land Management directly coordinate any detailed planning adjacent to State Trust land to ensure the 200-foot Right of Way described in the EIS approaches State Trust land at an acceptable location to minimize impacts to the Trust.	Comment noted. We'll continue to coordinate with ASLD directly and as a cooperating agency. The Project proponent is responsible for acquisition of ROW across state lands.
33	1	Faye Streier, NEPA Coordinator, **Bureau of Reclamation**, Lower Colorado Region	33.1	RNA	Move Segment i-01, near its connection with Segment p-01, north by approximately 0.13 miles.	Project proponent is in discussion with Reclamation on spanning this area.
33	1	Faye Streier, NEPA Coordinator, **Bureau of Reclamation**, Lower Colorado Region	33.2	RNA	Move Segment i-03 that crosses the CAP canal west of the Little Harquahala Pumping Plant south by approximately 0.6 miles.	Project proponent is in discussion with Reclamation on spanning this area.
34	1	Jennifer Harriger, Team Manager, Environmental Planning Section, **Metropolitan Water District of Southern California**	34.1	LU	Metropolitan remains concerned about the how the proposed project will affect Metropolitan-owned land in the Palo Verde Valley in Riverside County, California, specifically we are concerned that the installation of the proposed transmission will affect field operations, irrigation, aerial spraying, wind breaks, as well as current and future land uses. These effects could alter the potential for Metropolitan to lease these lands in accordance with its management objectives or realize the anticipated water savings on both the Metropolitan fee property and other private property currently enrolled in the Program.	Project proponent is responsible for identifying tower locations and acquisition of ROW from private landowner. The TES was updated to clarify that a portion of the private agricultural lands in CA are in fee-ownership by a local water district or are in local water district agricultural programs. The concerns of the Metropolitan Water District are addressed in the discussion of noxious weed, land use, or agricultural impacts in TES Sections 4.5.4.1, 4.5.5.1, 4.8.4.1, 4.8.5.3, and 4.8.5.5.
34	1	Jennifer Harriger, Team Manager, Environmental	34.2	LU	Based on our review, the Project's proposed alignment traverses a portion of the property that Metropolitan purchased in 2015, as well as other privately owned lands which are enrolled in	See response to comment 34.1.

Response ID No.	Number of Signatures	Name	Comment ID No.	Comment Type	Comment	Response
		Planning Section, **Metropolitan Water District of Southern California**			the Fallowing Program, in Riverside County, California. The alignment and its impacts on Metropolitan's fee-owned and Fallowing Program enrolled lands does not appear to have changed since the release of the NOI and as such, our concern with Land Use Issues remain.	
34	1	Jennifer Harriger, Team Manager, Environmental Planning Section, **Metropolitan Water District of Southern California**	34.3	LU	The Project's proposed route alignment should avoid Metropolitan's fee property and other private lands currently enrolled in the Fallowing Program. We are concerned that the installation of the proposed transmission lines will affect field operations, irrigation, aerial spraying, wind breaks, and have other impacts on current and future land uses. These effects could alter the potential for Metropolitan to lease these lands in accordance with its management objectives and to realize the anticipated water savings on both the Metropolitan fee property and other private property currently enrolled in the Fallowing Program.	See response to comment 34.1. The TES previously summarized potential impacts to agriculture from Project operations, mentioning crop production that involves mechanical irrigation, automated farming methods, or farming equipment. This discussion was expanded in Appendix 1C to address the specific concerns raised by MWD. A new CEQA mitigation measure has been added (MM AG-CEQA-1) to Appendix 1C to address this comment and further discussion added to Impact AG-5 has also been added.
34	1	Jennifer Harriger, Team Manager, Environmental Planning Section, **Metropolitan Water District of Southern California**	34.4	LU	The placement of transmission structures can cause the following agricultural impacts: • Create problems for turning field machinery and maintaining efficient fieldwork patterns, thus impacting the ability to conduct cropping on the land; • Increase soil erosion by requiring the removal of windbreaks that were planted along field edges or between fields; • Create opportunities for weed and other pest encroachment; increasing costs both to manage lands that are fallowed and to manage lands in agricultural use; • Compact soils and damage drain tiles; • Result in safety hazards due to pole and guy wire placement; • Hinder or prevent aerial spraying or seeding activities by planes or helicopters; • Interfere with moving irrigation equipment; • Hinder future consolidation of farm fields or subdividing land; • Restrict the type of crops the tenant-farmer may cultivate; and • Restrict the Palo Verde Irrigation District's operations and maintenance of surrounding canals and drains.	See response to comment 34.1. A new CEQA mitigation measure has been added (MM AG-CEQA-1) Appendix 1C to address this comment and further discussion added to Impact AG-5 has also been added.
34	1	Jennifer Harriger, Team Manager, Environmental Planning Section, **Metropolitan Water District of Southern California**	34.5	AG	Metropolitan requires the lands enrolled in the Fallowing Program to be rotated in and out of production, so that no parcels are permanently fallowed as part of the Fallowing Program. By locating power lines and associated facilities on a Fallowing Program enrolled parcel, there is the potential that all or a portion of the parcel will become permanently non-producing, placing a greater burden on remaining lands and affecting the current land management and goals of the Fallowing Program, which include promoting a thriving agricultural community in the Palo Verde Valley.	See response to comment 34.1. The TES previously summarized potential impacts to agriculture from Project operations, mentioning crop production that involves mechanical irrigation, automated farming methods, or farming equipment. This discussion was expanded in Appendix 1C to address the specific concerns raised by MWD. A new CEQA mitigation measure has been added (MM AG-CEQA-1) to Appendix 1C to address this comment and further discussion added to Impact AG-5 has also been added.
34	1	Jennifer Harriger, Team Manager, Environmental Planning Section, **Metropolitan Water District of Southern California**	34.6	SOCIO	Additionally, new transmission facilities would require easements, which may bifurcate land holdings and adversely affect market rents and impact property values. The specific location of the transmission lines would impair access to the property and impact future placement of utilities and roads to service Metropolitan's assets and infrastructure.	See response to comment 34.1.

Response ID No.	Number of Signatures	Name	Comment ID No.	Comment Type	Comment	Response
34	1	Jennifer Harriger, Team Manager, Environmental Planning Section, **Metropolitan Water District of Southern California**	34.7	WTR	Metropolitan is developing new leases provisions for its fee owned properties, to encourage greater water efficient crop production, and innovative irrigation technology. The operation of irrigation systems such as pivot sprinklers will be severely impacted by the locations of the transmission facilities. The proposed location of the transmission line Project could thus prevent Metropolitan from promoting greater efficiency in the area and, in the process, impact water supplies for the 19 million people that Metropolitan serves.	See response to comment 34.1.
34	1	Jennifer Harriger, Team Manager, Environmental Planning Section, **Metropolitan Water District of Southern California**	34.8	LU	Development associated with the Project must not restrict any of Metropolitan fee property management objectives of revenue generation, augmentation to Metropolitan's Colorado River supply by reducing consumptive water use on the land, and maintaining local agricultural production. Metropolitan has been managing its lands to reduce consumptive water use, and Metropolitan is currently engaged in an effort to negotiate new leases on its properties to generate greater water savings and promote efficient and innovative technologies throughout the Palo Verde Valley. By impacting these objectives, the proposed Project may impact the ability to advance land management throughout the area, and will also impact the water supplies of southern California.	See response to comment 34.1.
34	1	Jennifer Harriger, Team Manager, Environmental Planning Section, **Metropolitan Water District of Southern California**	34.9	PI	In order to avoid potential conflicts with Metropolitan's facilities, Metropolitan requires that any design plans for any activity in the area of Metropolitan fee property be submitted for our review and written approval. Approval of the Project where it could impact Metropolitan fee property should be conditioned on Metropolitan's approval of design plans for that portion of the Project.	See response to comment 34.1.
34	1	Jennifer Harriger, Team Manager, Environmental Planning Section, **Metropolitan Water District of Southern California**	34.10	LU	All submitted Project designs or plans must clearly identify Metropolitan fee property and other private lands currently enrolled in the Fallowing Program. While impacts to these areas should be avoided by modifying the proposed Project, if the Project continues to impact these areas, these impacts must be clearly delineated.	See response to comment 34.1.
34	1	Jennifer Harriger, Team Manager, Environmental Planning Section, **Metropolitan Water District of Southern California**	34.11	AG	Appendix 2C Applicable CMAS and Compliance Summary outlines various strategies for pest control, weed control or dust control measures. The use of any chemical pest, weed, or dust control measures used on or near any area that may wash into or blow onto Metropolitan fee property or agricultural lands participating in the Fallowing Program should be conditioned on the approval of Metropolitan or its designated representative. While Metropolitan appreciates that BLM specifies that only non-toxic substances approved by state and federal regulations will be used, some lands may be used for farming organic products and chemical use would be inconsistent with current land use.	This comment will be referred to DCRT. A new CEQA mitigation measure has been added (MM AG-CEQA-1) to Appendix 1C to address this comment and further discussion added to Impact AG-5 has also been added.
34	1	Jennifer Harriger, Team Manager, Environmental Planning Section, **Metropolitan Water District of Southern California**	34.12	LAW	Executive Summary ES-2 states: "WAPA needs to consider DCRT's application for funding under §301 of the Hoover Power Plant Act of 1984 and the Transmission Infrastructure Program. Additionally, WAPA is considering whether to take an ownership interest in fiber optic communication links over the Project's fiber optic overhead ground wire." Metropolitan requests clarification on the DCRT's application for funding under §301 of the Hoover Power Plant Act of 1984 (HPAA 1984). There does not appear to be a §301 in either version of the HPAA. Copies of both are attached to this letter. Metropolitan suggests referencing the latest amended version of the HPAA dated 2011.	The law cited is incorrect. It should be the American Recovery and Reinvestment Act of 2009, Title III, Section 301 (“Western Area Power Administration Borrowing Authority). This was revised, as was the description of the authorization, which was also incorrect.

Response ID No.	Number of Signatures	Name	Comment ID No.	Comment Type	Comment	Response
35	1	Anthony Madrigal, Jr., Director of the THPO, **Twenty-Nine Palms Band of Mission Indians**	35.1	SUP ALT 1	Depending on which action goes through (Proposed Action or Alternatives 1 - 4) the number of types of resource that may be affected can change. Once an action has been decided, the Tribe requests to be notified. As stated in our letters sent July 6, 2017, and September 11, 2017, the Tribe preferred the route following Interstate 10 (Alternative 1). The reasoning behind this preference was the avoidance of known resources and areas with increased sensitivity to contain native intact sediments.	The Preferred Alternative considers numerous resources in addition to cultural resources; however, cultural resource sites would be avoided whenever possible.
35	1	Anthony Madrigal, Jr., Director of the THPO, **Twenty-Nine Palms Band of Mission Indians**	35.2	NA	The Tribe and THPO request any draft and final copies of the Monitoring and Discovery Plan. Any draft documents should be provided to the Tribe, and adequate time to allow for a comprehensive review of the document. Additionally, while a Tribal Participation Plan is being developed as a stand-alone document it is recommended that it is mentioned in the Monitoring and Discovery Plan to ensure that it if followed.	Comment noted. BLM will continue to consult with the Tribe and provide requested documents for your review and input.
35	1	Anthony Madrigal, Jr., Director of the THPO, **Twenty-Nine Palms Band of Mission Indians**	35.3	M&M	As stated in previous correspondence, the Tribe requests the presence of monitors from the Twenty-Nine Palms Band of Mission Indians during ground disturbance.	As presented in part III section D of the Programmatic Agreement (Appendix 2D), the BLM encourages the Proponent to provide all of the Tribes that were consulted the opportunity to monitor and be on site during ground disturbing activities.
35	1	Anthony Madrigal, Jr., Director of the THPO, **Twenty-Nine Palms Band of Mission Indians**	35.4	M&M	For all construction projects, the Tribe recommends and prefers avoidance. When avoidance cannot be used, the Tribe recommends Tribal Monitors. The Tribe requests the presence of monitors from the Twenty-Nine Palms Band of Mission Indians during construction, especially in areas with known cultural resources and areas with increased potential to contain intact prehistoric sediments.	Avoidance of cultural resources is preferred and will be implemented during final project design. See response to comment 35.3 regarding tribal monitors.
35	1	Anthony Madrigal, Jr., Director of the THPO, **Twenty-Nine Palms Band of Mission Indians**	35.5	M&M	The Tribe requests that a list of all personnel who have attended the Worker Cultural Resources Awareness Program is provided to Tribes that request this documentation. Additionally, the THPO requests to be provided the slides/presentation material prior to distribution or training.	As presented in part XII section C of the Programmatic Agreement (Appendix 2D), the consulting parties will have the opportunity to review the cultural resource training materials and the Proponent will maintain records of all personnel that receives the training.
35	1	Anthony Madrigal, Jr., Director of the THPO, **Twenty-Nine Palms Band of Mission Indians**	35.6	M&M	The THPO has previously commented on Compensatory Mitigation in regards to the Desert Renewable Energy and Conservation Plan (DRECP). During consultation the Tribe recommended that the formula should include input from all consulting tribes and the benefits of the collected fees should be evenly distributed. Additionally, the developer should have an understanding that any inadvertent discoveries would not be included in these compensatory fees, but that it would have to be paid for by the developer as a separate expense. This mitigation fee does not replace consultation on specific resources that may be affected by an individual project. For the distribution of fees, the Tribe recommended that the Lead Agency approach a non-profit tribal organization (e.g., the Mica Group/Tides Foundation) to administer programs that are funded by the mitigation fees. The non-profit would also be responsible for the accounting of all fees for each project and subject to an annual audit. The annual report would be distributed to the BLM and consulting party tribes. The non-profit tribal organization's administration fee would be added to the overall direct fee that is collected from each developer.	Cultural resource mitigation fees will be required per the CDCA Plan and state requirements.
35	1	Anthony Madrigal, Jr., Director of the THPO, **Twenty-Nine Palms Band of Mission Indians**	35.7	NA	The Tribe requests access to the results of the sensitivity model once it is completed. Additionally, the THPO requests to review the results and to provide additional comment if necessary on the Sensitivity Model.	This was provided as requested.

Response ID No.	Number of Signatures	Name	Comment ID No.	Comment Type	Comment	Response
35	1	Anthony Madrigal, Jr., Director of the THPO, **Twenty-Nine Palms Band of Mission Indians**	35.8	NA	There are additional mitigation measures in concern to Conservation and Management Actions. As stated in the letters sent May 2, 2017, and April 20, 2018, the project area is within the Chemehuevi Traditional Use Area and contains landscapes and culturally sensitive areas that concern the Tribe.	Comment noted.
35	1	Anthony Madrigal, Jr., Director of the THPO, **Twenty-Nine Palms Band of Mission Indians**	35.9	M&M	While the compensatory fee should not assign a monetary value to cultural resources, Tribal perspectives and values should be evaluated and considered in the calculations.	The compensatory mitigation fee for cumulative effects applies to lands administered by BLM-California, as prescribed in the Desert Renewable Energy Conservation Plan (DRECP) Programmatic Agreement (PA) that was executed February 5, 2016. The BLM will follow the process described in the DRECP PA for the Ten West Link project for those portions of the project that are on lands administered by BLM-California.
35	1	Anthony Madrigal, Jr., Director of the THPO, **Twenty-Nine Palms Band of Mission Indians**	35.10	NA	As stated in previous correspondence, the Tribe prefers the route that will provide the least disturbance and avoids cultural resources.	Comment noted.
35	1	Anthony Madrigal, Jr., Director of the THPO, **Twenty-Nine Palms Band of Mission Indians**	35.11	M&M	The Tribe requests to be notified of the Draft Historic Resources Mitigation and Management Plan and time to input comments on this document. For mitigation of specific resources, the Tribe recommends a varied approach allowing for the proper treatment of each resource. The final disposition of the resource should come about with consultation from the applicant, representatives from the lead agency, and interested tribes. Re-burial, curation, or other dispositions should be analyzed based on the specific resource.	As presented in part VI section I of the Programmatic Agreement (Appendix 2D), consulting parties will have the opportunity to review and comment on the HPTPs.
35	1	Anthony Madrigal, Jr., Director of the THPO, **Twenty-Nine Palms Band of Mission Indians**	35.12	NA	The Tribe recommends avoidance of cultural resources. Currently the Tribe will defer comments until after the Consulting Parties Meeting.	Comment noted.
35	1	Anthony Madrigal, Jr., Director of the THPO, **Twenty-Nine Palms Band of Mission Indians**	35.13	NA	While this letter addresses the Draft Environmental Impact Report and the finalization of mitigation measures, the Tribe requests government-to-government consultation throughout the life of the project. The Tribe requests to be notified of any updated reports. The Tribe and THPO look forward to continuing working with the Bureau of Land Management on this project.	Comment noted. Consultation with the Twenty-Nine Palms Band of Mission Indians will be ongoing.
36	1	Stewart B. Koyiyumptewa, Interim Manager, **Hopi Cultural Preservation Office**	36.1	CUL	We have now reviewed the enclosed Draft Environmental Impact Statement and Draft Resource Management Plan Amendments and understand in the BLM Preferred Alternative 32.5% of the project area has been surveyed for cultural resources, 38 National Register eligible and unevaluated sties have been identified and 120 sites requiring evaluation are projected. Key resources projected to occur include trails and intaglio. Therefore we have determined that prehistoric sites in Arizona are and will be identified that will be adversely affected by project activities. Therefore, we look forward to continuing consultation on the Programmatic Agreement and Class I and III cultural resource surveys of the area of potential effect and any proposed treatment plans for review and comment.	Comment noted. Consultation with the Hopi will be ongoing.
37	1	Dennis Patch, Chairman, Colorado River Indian Tribes	37.1	SUP PREF / CUL	While CRIT supports the Bureau of Land Management's (BLM) decision to select a … Preferred Alternative" that moves the Line away from the Mule Mountains, the Tribes are still troubled by the Project's potential to irreparably damage sensitive resources and cultural landscapes and BLM's failure to thoroughly study these issues in the DEIS. As a result, CRIT	A Class I cultural inventory was completed on all potential routes with a 1-mile analysis buffer. There was sufficient existing information within this 1-mile buffer to understand the nature, density, and distribution of cultural resources within the analysis area. The BLM used this information to develop

Response ID No.	Number of Signatures	Name	Comment ID No.	Comment Type	Comment	Response
					requests that BLM delay release of any final EIS or Record of Decision until after adequate surveys have been completed and revised analyses have been prepared and made available for public comment.	the range of alternatives analyzed in the DEIS. A Class III inventory was completed where the Proposed Action came closest to the Mule Mountains (P-17 and P-18). The BLM adjusted the Preferred Alternative based on information provided to BLM by the Tribes. In addition, pursuant to the regulations that implement Section 106, the final selected alternative will be fully inventoried, which will inform the ultimate design and construction of transmission line infrastructure.
37	1	Dennis Patch, Chairman, Colorado River Indian Tribes	37.2	NA	As a preliminary matter, the Colorado River Indian Tribes are a federally recognized Indian tribe comprised of over 4,440 members belonging to the Mohave, Chemehuevi, Hopi and Navajo Tribes. The almost 300,000-acre Colorado River Indian Reservation sits astride the Colorado River between Blythe, California and Parker, Arizona. The ancestral homelands of the Tribes' members, however, extend far beyond the Reservation boundaries. Significant portions of public and private lands in California, Arizona, and Nevada were occupied by the ancestors of the Tribes' Mohave and Chemehuevi members since time immemorial. These landscapes remain imbued with substantial cultural, spiritual, and religious significance for the Tribes' current members and future generations. For this reason, the Tribes urge BLM to press pause on moving forward with the proposed Project, which has the potential to transform a significant cultural landscape to an industrial one. In the event the Project does move forward, however, BLM must take steps to revise the DEIS to adequately consider and mitigate for impacts to cultural and other resources.	Existing corridors were used to the fullest extent, except where avoidance was needed for a wildlife refuge, towns, recreation areas, Indian and military reservations, historic properties, and known sacred sites. See comment response 37.1.
37	1	Dennis Patch, Chairman, Colorado River Indian Tribes	37.3	NEPA	The purpose of NEPA is to inform the public and agency decisionmakers of a project's potential environmental impact before those decisionmakers act. By requiring an EIS to provide a complete picture in advance, the drafters of NEPA expected that decisionmakers would make better decisions. Robertson v. Methow Valley Citizens Council, 490 U.S. 332,349 (1989) (NEPA "ensures that the agency, in reaching its decision, will have available, and will carefully consider, detailed information concerning significant environmental impacts "). BLM has an obligation pursuant to NEPA to conduct its analysis "objectively and in good faith, not as an exercise in form over substance, [] not as a subterfuge designed to rationalize a decision already made ... [and] not just to file detailed impact studies which will fill governmental archives." Metcalf v. Daley, 214 F.3d 1135, 1142 (9th Cir. 2000); see also Earth Island Institute v. U.S. Forest Service, 351 F.3d 1291, 1300 (9th Cir. 2003) (NEPA requires that federal agencies "consider every significant aspect of the environmental impact of a proposed action ... [and] inform the public that [they have] indeed considered environmental concerns in [their] decision-making process[es].") (citations omitted). Beyond merely disclosing potential environmental impacts, NEPA require agencies to develop tactics to address them. Specifically, the EIS must "[i]nclude appropriate mitigation measures " and discuss the "[m]eans to mitigate adverse environmental impacts." 40 C. F.R. §§ 1502.14(f), 1502.16(h). The statute "require[s] that an EIS discuss mitigation measures, with 'sufficient detail to ensure that environmental consequences have been fairly evaluated.' An essential component of a reasonably complete mitigation discussion is an assessment of whether the proposed mitigation measures can be effective." South Fork Band Council of W. Shoshone of Nevada v. U.S. Dep't of Interior, 588 F.3d 718, 727 (9th Cir. 2009) (quoting Robertson v. Methow Valley Citizens Council, 490 U.S. 332, 352 (1989)). Where, as here, the environmental review document fails to fully and accurately inform	The DEIS carefully considered all available information to ascertain impacts to resources. Consequently, numerous alternative routes to the Proposed Action were considered and analyzed, due to the known and possible resources in the study area. Mitigation measures were devised to address impacts. This information was studied and analyzed and made available to the public and decision-makers in the DEIS, with substantive comments being acted upon to develop the FEIS and ROD.

Response ID No.	Number of Signatures	Name	Comment ID No.	Comment Type	Comment	Response
					decisionmakers and the public of the environmental consequences of proposed actions, or identify ways to mitigate or avoid those impacts, it does not satisfy the basic goals of NEPA. See 40 C.F.R. § 1500.l(b) ("NEPA procedures must insure that environmental information is available to public officials and citizens before decisions are made and before actions are taken. "). As a result of the DEIS's numerous and serious inadequacies, there can be no meaningful review of the Project by either the public or BLM' s decisionmakers.	
37	1	Dennis Patch, Chairman, Colorado River Indian Tribes	37.4	SUP PREF	The Tribes continue to have grave concerns about the potential of this Project to impact sensitive resources and cultural landscapes and BLM's failure to adequately discuss these issues in an EIR. However, to the extent that BLM decides to move forward with this Project, CRIT supports BLM's selection of a route that is located further from Mule Mountains.	See comment response 37.3. The CPUC and BLM decided to use this EIS, in place of an EIR, to satisfy the needs of CEQA, and consequently worked closely together over the past two years towards this effort. However, the CPUC has yet to formally adopt the EIS.
37	1	Dennis Patch, Chairman, Colorado River Indian Tribes	37.5	NA	As documented in the· DEIS, the Mule Mountains contain "an archaeological district" that is listed in the NRHP and is culturally significant for the Indian tribes along the Colorado River. The district includes a natural water catchment and was and is an important junction of indigenous travel routes and a focal point of human activity. Numerous trails extend away from this district and are related to the intaglios and petroglyphs." DEIS at 3-31. In addition, the area is important for spiritual access for CRIT Tribal Members. DEIS at 3-33. The CRIT THPO Office has shared additional information about the importance of this area with BLM Staff. For these and other reasons, the Tribes support BLM's efforts to move the new Line further away from this sensitive area.	The general significance and some of the specific details are known about the Mule Mountains area (FEIS Section 3.5.2.2, subsections Cultural Resources of Concern to Indian Tribes and Cultural Resources Sensitive to Indirect Effects). As indicated, the BLM and others accompanied the CRIT and Quechan Tribes into the field to examine the resources of this area. Consequently, the Preferred Alternative was moved further north away from this sensitive area.
37	1	Dennis Patch, Chairman, Colorado River Indian Tribes	37.6	ROUTE	While CRIT supports the selection of an Alternative that is further from Mule Mountains, the Tribes are troubled by the Preferred Alternative's increased length and correspondingly increased capacity to disturb the landscape. Specifically, CRIT is concerned about the development of the Line along segments x-15 and x-16, which appear to be located on relatively undisturbed desert land. This concerned is heighted by the fact that neither segment has been adequately surveyed. In particular, only 12.3 percent of Segment x-16 has been surveyed.	The relatively minor increase in length of the Preferred Alternative route was developed in order to avoid communities and resources, as discussed in comment responses 37.1, 37.2, and 37.5. As noted in Section 4.5.1 of the FEIS, once a route is selected, a Class III cultural resource inventory will be conducted. As noted in Section 4.5.7.1, potential adverse effects to historic properties would be resolved in accordance with the provisions of the PA and the development of specific HPTPs. Avoidance of cultural resources by final design and construction would be the preferred adverse effect resolution measure.
37	1	Dennis Patch, Chairman, Colorado River Indian Tribes	37.7	RNA	To ensure the Project avoids both the sensitive Mule Mountain area and the increased disturbance of segments x-15 and x-16, CRIT requests analysis of an Alternative that follows x-19, ca-09, and ca-07, and then continues straight across on ca-06 before turning south. It appears that this alternative would meet the project's purpose and need and avoid increased impacts associated with disturbing the desert landscape. This alternative should be included in a revised EIS and circulated for additional public comment. See 42 U.S.C. § 4332(E) (directing federal agencies to "study, develop, and describe appropriate alternatives").	These segments (ca-06, ca-07, ca-09, and x-19) have been analyzed as part of full-route Alternatives 1, 3, and 4. All Alternatives were studied and analyzed using available data. See comment response 37.11.
37	1	Dennis Patch, Chairman, Colorado River Indian Tribes	37.8	PI	As BLM and DCRT are both aware, CRIT has submitted extensive comment letters on prior versions of this EIS and the Project's Programmatic Agreement. CRIT appreciates that BLM has made some modifications, especially to the Programmatic Agreement, that are responsive to the Tribe's stated concerns. However, many of the Tribes' most pressing comments have not been addressed. CRIT incorporates these prior comments by reference and briefly reiterates some of the most concerning issues here.	Numerous meetings and coordination occurred between the BLM and the CRIT THPO representatives and other tribes over the past two years to understand tribal concerns and issues. The input received from the meetings was used in identification of project alternatives including the Preferred Alternative in the EIS. BLM tribal relations policy considers tribal consultation to be on-going, and the BLM will continue to consult with tribes and make a continued effort to address the tribes' comments to the extent

Response ID No.	Number of Signatures	Name	Comment ID No.	Comment Type	Comment	Response
						feasible.
37	1	Dennis Patch, Chairman, Colorado River Indian Tribes	37.9	CUL	CRIT continues to object to BLM's decision to allow the Applicant to conduct Class III surveys after the route has been selected. This deferral of analysis renders the DEIS wholly inadequate. For instance, the DEIS admits that "[s]pecific impacts to historic properties are unknown until Class III identification studies and indirect effect analyses of the selected route are completed and additional information regarding engineering design is available. As a result, the evidence is currently insufficient to state specific direct or indirect impacts to particular historic properties or to discuss specific measure to resolve potential effects to those properties." DEIS at 4-59. CRIT also objects to BLM's decision to defer analysis of impacts to known historic properties until that time. For instance, BLM offers no explanation for why it cannot do the work now to determine if eligible sites can be avoided by Project design or why it cannot determine if sites such as those listed in the DEIS at 4-65 have the requisite degree of integrity to be impacted by the Project. It also fails to explain why it has not yet determined if certain areas qualify as Traditional Cultural Properties. E.g., DEIS at 3-34. Without a discussion of proposed mitigation measures or treatment plans, CRIT cannot tell if the BLM has adequately considered measures to alleviate harm. Additional information about these known resources is both available and important to BLM's decision making; as a result, it must be provided in the EIS. See 40 C.F.R. § 1502.22(a) ("If the incomplete information relevant to reasonably foreseeable significant adverse impacts is essential to a reasoned choice among alternatives and the overall costs of obtaining it are not exorbitant, the agency shall include the information in the environmental impact statement.") (emphasis added).	BLM's identification efforts are being conducted in accordance with 36 CFR 800 regulations and a PA that governs the 106 process for the Project. NEPA requires that all Alternatives be treated equally for comparative analysis. With the numerous alternative routes and sub-alternatives throughout the study area comprising hundreds of miles, it is impractical to conduct a Class III survey on all routes in the study area. A Class I inventory was completed on all Alternatives and sub-Alternatives within the study area, with a 1-mile buffer analysis area. The Class I inventory documented sufficient existing information to understand the nature, density, and distribution of cultural resources to the extent it was possible to develop the range of alternatives analyzed in the DEIS and Project impacts to cultural resources.
37	1	Dennis Patch, Chairman, Colorado River Indian Tribes	37.10	NA	CRIT likewise objects to the release of the DEIS prior to completion of the ethnographic assessment. This document is intended to guide BLM's decision making process. It cannot do so if it is completed after the route is already selected.	The ethnographic assessment is currently being prepared as part of the Section 106 process, which per law and guidance from the CEQ and the ACHP, can run concurrently with the NEPA process. This study will be complete prior to the ROD.
37	1	Dennis Patch, Chairman, Colorado River Indian Tribes	37.11	CUL	BLM's deferral decision is particularly problematic because so little of the Project area has been subject to prior surveys. While BLM asserts that "[m]any of the segments that comprise the Proposed Action and Action Alternatives have been intensively surveyed for cultural resources by other projects in the past" (DEIS at 3-28), the data presented illustrates a different picture. Of the 64 total segments, only 15 have been surveyed above 50 percent. Moreover, while BLM claims that "minimum survey coverage of 25 percent or more is considered to be adequate to estimate the projected number of cultural resources" (DEIS at 4-60), it provides no justification for this number. And fewer than half of the segments have been surveyed above 25 percent. This scarcity of data calls into question whether BLM can adequately select a route that adequately avoids cultural resources.	Avoidance of cultural resources, as well as minimizing the project footprint, is BLM policy regarding the treatment of cultural resources. BLM believes this can be accomplished through Class III pedestrian survey of the final selected alternative and design and engineering decisions on the placement of transmission line infrastructure. In the event that a select few resources cannot be avoided, the BLM will resolve and mitigate any adverse effects pursuant to Section 106 and its implementing regulations found at 36 CFR 800.6.
37	1	Dennis Patch, Chairman, Colorado River Indian Tribes	37.12	LAW	As BLM is aware, CRIT continues to object to BLM's insistence that federal law require curation of cultural resources. E.g., DEIS at 2D-9 to -10. BLM has yet to provide an adequate explanation of its position. Moreover, CRIT is extremely concerned that BLM has attempted to impose its erroneous and harmful position on non-federal land and to non-eligible artifacts. For instance, the Programmatic Agreement requires curation for artifacts found on California state lands (DEIS at Appendix 2D-10), even though California law prioritizes preservation in place (CEQA Guidelines § 15126.S(A); Madera Oversight Coalition v. County of Madera, 199 Cal.App.4th 48 (2011)). It also states that BLM will attempt to force private land owners	Comment noted. Relevant cultural resources law including the Antiquities Act and ARPA all require curation of artifacts or objects removed from federal lands. BLM has continued to work with CRIT and others to address treatment of non-eligible artifacts, and otherwise deal with these concerns to the extent possible under current law and policy.

Response ID No.	Number of Signatures	Name	Comment ID No.	Comment Type	Comment	Response
					to curate artifacts found on their lands. Id. These statements are wholly unacceptable to CRIT and must be revised.	
37	1	Dennis Patch, Chairman, Colorado River Indian Tribes	37.13	CUL	CRIT likewise objects to the use of testing to further study unevaluated resources. DEIS at 2D-17. Rather than subject prehistoric resources to these invasive tests, CRIT urges BLM to simply assume their eligibility and to devise mechanisms to avoid or protect these sites.	Section 106 of NHPA requires BLM to identify and evaluate cultural resources for significance rather than just assuming eligibility.
37	1	Dennis Patch, Chairman, Colorado River Indian Tribes	37.14	LAW	Pursuant to the NHPA, the Programmatic Agreement must be signed by the CRIT Tribal Historic Preservation Officer, if BLM ultimately selects a route that crosses the Colorado River Indian Reservation. The Programmatic Agreement should be revised to reflect that the THPO is the potential signatory. E.g., DEIS at Appendix 2D-2.	BLM has already identified the CRIT as a signatory of the document. The BLM acknowledges the THPO as the CRIT's signatory.
37	1	Dennis Patch, Chairman, Colorado River Indian Tribes	37.15	NEPA	CRIT continues to object that BLM has bifurcated the Project's construction, operation, and maintenance from decommissioning. DEIS at Appendix 2D-6.	BLM has determined that decommissioning is a separate undertaking requiring Section 106 compliance. This determination is primarily based on the 50-year life span of the Project. It is not prudent to attempt to take into account the effects of an undertaking that is 50 years out because conditions will have changed that are at present, unpredictable. It is better for the resources to consider decommissioning a separate undertaking and conduct separate Section 106 compliance and analysis at that time. However, decommissioning is included in the NEPA analysis within the FEIS.
37	1	Dennis Patch, Chairman, Colorado River Indian Tribes	37.16	M&M	CRIT continues to object to BLM's position that it cannot "require" tribal monitoring during Class III surveys or ground disturbing construction activities. DEIS at Appendix 2D-7. While CRIT appreciates that DCRT has promised to include tribes in these activities, CRIT is concerned that DCRT will sell the Project approval to a different company, and the approval documents will allow the new company to back out of this promised monitoring.	BLM agrees that BLM can require tribal monitors for archaeological survey and ground disturbing construction activities and plans to do so. This requirement is authorized under BLM tribal relations policy (MS-1780 & H-1780-1) and language requiring monitors is included in the Programmatic Agreement for this Project.
37	1	Dennis Patch, Chairman, Colorado River Indian Tribes	37.17	NEPA	CRIT also objects to the preparation of a Tribal Participation Plan and Monitoring and Discovery Plan after Project approval. DEIS at Appendix 2D-7, -17. As these documents are crucial to understanding whether the Project has been adequately analyzed and mitigated, it must be prepared prior to Project approval.	These are required by the PA as part of Section 106 process which can run concurrently with the NEPA process.
37	1	Dennis Patch, Chairman, Colorado River Indian Tribes	37.18	PROG	CRIT continues to object that the Programmatic Agreement allows the Applicant to avoid conducting any additional surveys in the Indirect APE. Instead, the Programmatic Agreement states that the Applicant may rely solely on "existing resources to the extent available." DEIS at Appendix 2D-13. CRIT urges BLM to require the Applicant to at least survey the areas in the Indirect APE where increased access routes may result in vandalism or other harms.	BLM will require surveys to the extent required by Section 106 of the NHPA.
37	1	Dennis Patch, Chairman, Colorado River Indian Tribes	37.19	PROG	CRIT continues to object to the Programmatic Agreement's inclusion of short response times for Tribes. CRIT is particularly concerned about the five-calendar day review for deviations to the HPTP- this review period must be lengthened to at least five business days. DEIS at Appendix 2D-19.	This change will be made in the PA.
37	1	Dennis Patch, Chairman, Colorado River Indian Tribes	37.20	PROG	CRIT continues to object to the Programmatic Agreement's inclusion of the following language: "Execution of this PA by the BLM, the SHPOs/THPO and the ACHP and implementation of its terms evidence that the BLM has satisfied its Section 106 responsibilities ..." DEIS at 2D-32. As described in this letter, CRIT does not believe that the PA has satisfied the NHP A.	According to the ACHP this standard language that appears in all Section 106 agreement documents.

Response ID No.	Number of Signatures	Name	Comment ID No.	Comment Type	Comment	Response
37	1	Dennis Patch, Chairman, Colorado River Indian Tribes	37.21	NA	The proposed Project crossed directly south of the Colorado River Indian Reservation. CRIT is traditionally and culturally affiliated with much of the Project area as the ancestors of CRIT's Mohave and Chemehuevi members have lived and traveled in the Project area since time immemorial. The Tribes remain troubled by the Project's potential to remove, damage, or destroy cultural resources and artifacts. These resources are sacred and finite, and together make up the cultural footprint of the Tribes' ancestors. According to the belief system of CRIT's Mohave members, the disturbance of any cultural resources affiliated with their ancestors is taboo, and thus considered a severe cultural harm. Adequate analysis of cultural resource impacts is therefore essential.	Comment noted. BLM acknowledges tribal use of the area. Information presented here is the type that will be captured in the ethnographic study. This study will be complete prior to the ROD.
37	1	Dennis Patch, Chairman, Colorado River Indian Tribes	37.22	CUL	The DEIS fails to acknowledge that cultural resources can include cultural landscapes. DEIS at 3-26. See also National Register Bulletin, "Guidelines for Evaluating and Documenting Traditional Cultural Properties" ("A culturally significant natural landscape may be classified as a site" eligible for the National Register). Indeed, evaluation and protection of such landscapes is necessary to ensure adequate protection of both individual resources and their historic context. Recently, the California Office of Historic Preservation recognized the need for cultural resource professionals working on renewable energy projects to shift focus from a site level to the landscape level of assessment. The same reasoning applies to a massive transmission project like this one. As a result of this definitional failure, the analysis omits adequate discussion of both the existence of cultural landscapes and the Project's potential to disturb them. Likewise, while the DEIS initially acknowledges that traditional cultural properties are a type of cultural resource (DEIS at 3-26), the analysis section provides no information identifying any traditional cultural properties or analyzing how the Project may affect them.	Comment noted. Language has been added to the FEIS discussing cultural landscapes and TCPs.
37	1	Dennis Patch, Chairman, Colorado River Indian Tribes	37.23	NEPA	The DEIS relies on a different Area of Potential Effect for cultural resources than the Programmatic Agreement. DEIS at 3-26. CRIT does not object to this difference out of hand; however, the DEIS must provide adequate justification based in differences between NEPA and the NHPA. The document currently does not contain such justification.	EIS language has been adjusted to reflect this difference and APE has been changed to “analysis area” in the EIS.
37	1	Dennis Patch, Chairman, Colorado River Indian Tribes	37.24	CUL	The DEIS explains that BLM has conducted a "cultural resources sensitivity analysis" in alleged compliance with the DRECP's requirements. However, the DEIS does an inadequate job of explaining the purpose and methodology of this sensitivity analysis and why the analysis is limited to the p-16, p-17, p-18, x-16, ca-02, x-15, ca-07, ca-09, and x-19 segments. These are not the only segments located in California. Moreover, it appears as though the sensitivity analysis has been limited to the Applicant's Proposed Action (DEIS at 3-28), even though BLM has selected a different Preferred Alternative. BLM offers no explanation for why the sensitivity analysis was not completed for all possible alternatives, given its potential to help guide the route selection process.	The sensitivity analysis was done in compliance with the California Desert Conservation Area plan and the DRECP. The segments selected for inclusion in the sensitivity analysis represent the segments on BLM land in California.
37	1	Dennis Patch, Chairman, Colorado River Indian Tribes	37.25	CUL	The DEIS compiles a list of issues of concern to Indian Tribes. DEIS at 4-86 to -87. While this list helpfully includes some of the major impacts that will result from this Project, the DEIS fails to adequately analyze how the Project will impact these areas. For instance, it is clear from the list that area tribes are broadly concerned about impacts to resources that may not be traditionally considered eligible for the National Register of Historic Places. E.g., DEIS at 4-86 to -87 (describing removal of ancestral footprint and importance of Colorado River). However, the "analysis" portion of the DEIS claims that these issues will be resolved	The PA requires a Tribal Participation Plan which will provide an avenue for tribal monitors to give input on resources of concern during archaeological surveys. The Tribal Participation Plan will outline the process for how to document and make management recommendations for cultural resources that do not qualify for the NRHP.

Response ID No.	Number of Signatures	Name	Comment ID No.	Comment Type	Comment	Response
					in the Programmatic Agreement. DEIS at 4-89. This claim is incorrect. The Programmatic Agreement is intended to implement the requirements of the NHPA, which is concerned only with impacts to NRHP-eligible resources. As a result, it does little to address impacts to non-eligible resources of importance to area tribes. Moreover, as described above, the Programmatic Agreement itself is insufficient to address these issues, in that it continues to require curation. These sections must be revised to focus on the impacts of the Project on the areas of concern raised by area tribes.	
37	1	Dennis Patch, Chairman, Colorado River Indian Tribes	37.26	NA	The DEIS provides a chart purporting to evaluate each segment for its potential to impact areas of concern to tribes. DEIS at 4-91 to -93. However, the DEIS provides no information on how this chart was developed. As a result, it is difficult to assess its accuracy. Moreover, the chart states that issues related to "access restrictions" would be studied in an access analysis required by the PA. DEIS at 4-93. As a result, this information is deferred until after Project approval. Moreover, it does not appear that the proposed study is actually part of the PA; while that document requires further study of the ways in which new access can lead to additional indirect effects, it contains no requirements about the ways in which the project may impede access to culturally important sites and resources. As a result, the DEIS presents a wholly inadequate study about the ways in which different segments may result in different impacts to area tribes.	This table summarizes information that is itemized in the cultural resources assessments of each route segment (DEIS Section 4.5) and from known tribal concerns (DEIS Section 3.6). Added this statement to Section 4.6.4.2 of the FEIS, as well as that additional areas of concern to the tribes may be identified in the future through additional coordination and consultation. Restricted access is analyzed in Sections 4.6.5 and 4.6.8 of the FEIS.
37	1	Dennis Patch, Chairman, Colorado River Indian Tribes	37.27	NA	The DEIS claims that concerns related to "new disturbance," "access considerations" and "intrusion on pristine environments" will be negated or minimized if the Line is located adjacent to existing transmission infrastructure. DEIS at 4-95. This statement is not adequately supported. As the new Line will require additional ground disturbance, new roads, and fencing, it appears obvious that it will lead to new disturbances, indirect affects resulting from new access, and additional restrictions on access. Likewise, it appears that BLM has made a determination for itself about whether a landscape qualifies as "pristine," rather than consulting with affected tribes. This section must be revised to adequately discuss these issues.	Comment noted. The general statement in Section 4.6.7.1 of the FEIS has been revised. The section already describes potential impacts along specific segments of concern.
37	1	Dennis Patch, Chairman, Colorado River Indian Tribes	37.28	CE	The DEIS offers scant information about the severe cumulative impacts to cultural resources caused by the influx of renewable energy projects and associated transmission infrastructure in Riverside County. See DIES at 3-73 to -74. Cultural resources represent a direct linkage between present-day tribal members and their ancestors. Removal of these resources from the landscape is removal of the Tribes' footprint. Once such resources are gone, it will be difficult, if not impossible, for the Tribes to prove that these lands are part of their ancestral homeland, and that their ancestors lived and worked on these lands since time immemorial. This is a significant impact that must be adequately addressed.	Comment noted. Information during BLM coordination with tribes indicates the area is a cultural landscape with TCPs present. Additional information was inserted in the EIS.
37	1	Dennis Patch, Chairman, Colorado River Indian Tribes	37.29	CE	The DEIS claims that for cumulative impacts on federal lands, "the impact to historic properties would be resolved through data recovery and other methods." DEIS at 4-83. Therefore, the DEIS claims that there will be no cumulative cultural resource impact from this and other projects. This is patently incorrect. As CRIT has repeatedly described to BLM, the removal of cultural resources from the landscape is a distinct and severe harm. Likewise, BLM claims that within California, cumulative impacts have already been addressed through the development of the DRECP PA. DEIS at 4-83. Again, this document does little to remedy the significant harms. It continues to require removal and curation of cultural resources and purports to address cumulative impacts through payment of a compensatory fee. Neither of	Comment noted. BLM plans to minimize the cumulative effects of this project through avoidance of sites (Section 4.6.4), as well as minimization of the project footprint, before even considering mitigation of sites and data recovery. The PA ensures the priority of avoidance of historic properties during construction phases, and ensures the process of identifying, evaluating, and avoiding or mitigating is followed and will continue even after the NEPA process is complete.

Response ID No.	Number of Signatures	Name	Comment ID No.	Comment Type	Comment	Response
					these "mitigation measures" are adequate. This section must be revised to acknowledge the significant impact caused by the continued industrialization of the Mojave Desert.	
37	1	Dennis Patch, Chairman, Colorado River Indian Tribes	37.30	CE	Likewise, the cumulative impact analysis offers no discussion of the potential cumulative impacts caused by locating the applicant's Proposed Project, the Desert Quartzite Project, and the Crimson Solar Project at the base of the Mule Mountains. DEIS at 4-106. This is a significant cultural resource concern that must be adequately discussed in revised document.	Comment noted. BLM has expanded the cumulative effects discussion of the EIS (Section 4.6.11).
37	1	Dennis Patch, Chairman, Colorado River Indian Tribes	37.31	PROG	CRIT is unclear why Section VI.A. I of the Programmatic Agreement is limited to "minimizing the visual effects of the Undertaking." DEIS at Appendix 2D-15. This section should be broadly drafted to include efforts to minimize all effects.	Comment noted. BLM will review that language of the PA.
37	1	Dennis Patch, Chairman, Colorado River Indian Tribes	37.32	PROG	The Programmatic Agreement should specify that the development of treatment measures for tribal values must be developed in consultation with affected tribes. DEIS at Appendix 2D-18.	Comment noted.
37	1	Dennis Patch, Chairman, Colorado River Indian Tribes	37.33	PROG	The Programmatic Agreement must be revised to ensure that tribes are afforded the opportunity to consult on any future determination that there are no cultural resources or potential properties of traditional cultural or religious importance within a variance area. DEIS at Appendix 2D-25.	Comment noted. Any variance area would still be within the 200-foot right of way, and well within the 400-foot buffer area that will be subject to a Class III survey. As required by law, and reiterated in the PA, the BLM will have already consulted with the CRIT on this Class III inventory.
37	1	Dennis Patch, Chairman, Colorado River Indian Tribes	37.34	M&M	Pursuant to the DRECP, BLM must comply with LUPA-CUL-4, which requires BLM to "design activities to minimize impacts on cultural resources including places of traditional cultural and religious importance to federally recognized Tribes." DEIS at Appendix 2C-36. As described in this letter, CRIT does not believe that BLM has met this standard. Specifically, without tribal monitoring, reburial of cultural resources, and survey work in advance of BLM's decision, such impacts cannot be minimized.	Comment noted. BLM plans to adhere to the requirements of the DRECP for the California portion of the project and further discuss these issues with the CRIT.
37	1	Dennis Patch, Chairman, Colorado River Indian Tribes	37.35	CUL	Pursuant to the DRECP, BLM was required to complete cultural resource sensitivity analysis and a sample survey in the pre-application process (pursuant to LUPA-TRANSCUL-4 and -5). These analyses are intended to inform the selection of the Project footprint, pursuant to LUPA-TRANS-6. However, BLM has improperly delayed these activities, as noted in the compliance table. E.g., DEIS at Appendix 2C-49. As a result, BLM cannot be certain that the specific footprint is justified.	BLM completed a sensitivity analysis for the project based on information obtained from the Class I inventory. The Class I inventory documented sufficient existing information to understand the nature, density, and distribution of cultural resources to the extent it was possible to develop the range of alternatives analyzed in the DEIS. In addition, during this process the BLM requested and incorporated tribal input on alternatives and conducted surveys of project alternatives in California to inform the EIS analysis.
37	1	Dennis Patch, Chairman, Colorado River Indian Tribes	37.36	EJ	Under NEPA, BLM must consider, to the extent practicable, whether there is or will be an impact on the natural or physical environment that significantly and adversely affects Native American tribes. Specifically, BLM must consider whether significant environmental effects may have an adverse impact on Native American tribes that appreciably exceeds those on the general population. See, e.g., EPA's 1998 Environmental Justice Guidance; Executive Order 12898. These analyses are required for an adequate consideration of environmental justice impacts.	CRIT was identified as an EJ Population in Section 3.10.2.4 of the DEIS. CRIT lands are identified on both Figures 3.10-1 and 3.10-2.
37	1	Dennis Patch, Chairman, Colorado River Indian Tribes	37.37	EJ	However, the DEIS takes a familiar path with respect to environmental justice. It first severely limits the geographic consideration of this issue, looking for environmental justice communities only within one mile of the Line. DEIS at 4-136. Likewise, it narrowly defines the potential impacts that are considered "environmental justice" impacts, such as visual and air quality effects. DEIS at 4-138. The analysis fails to recognize that the proposed Project will result in adverse impacts on CRIT that appreciably exceed those of the general	Although the study area was defined as a one-mile corridor, it included the entirety of the block groups that extended beyond the corridor. As noted in Section 3.10.1, the analysis area includes the study area and all census block groups crossed by the Proposed Action and Action Alternative segments. This ensures the inclusion of adjacent and nearby communities that may be

Response ID No.	Number of Signatures	Name	Comment ID No.	Comment Type	Comment	Response
					population.	affected.
37	1	Dennis Patch, Chairman, Colorado River Indian Tribes	37.38	EJ	This gross omission renders the analysis inadequate under federal law. Unlike most members of the public, tribal members maintain long-standing ancestral and traditional practices that connect their identities to specific environments. Tribal members cannot easily shift their use and enjoyment of public lands to other, non-industrialized areas, as may be the case for many members of the public. Once these ancestral ties are severed, either by the removal of cultural resources or the fencing and development of the entire site, they cannot be regained. Consequently, the DEIS must be revised to recognize the significant environmental justice impacts of the proposed Project on CRIT and other affected tribes.	Additional language has been added to the EIS.
37	1	Dennis Patch, Chairman, Colorado River Indian Tribes	37.39	EJ	One of the most substantial environmental costs of the proposed Project is the destruction of tangible cultural resources and the wholesale transformation of the ancestral homelands of Indian tribes, including CRIT. This cost is borne exclusively by tribal members. The power produced at the proposed Project, however, is unlikely to serve residents of the Colorado River Indian Reservation, and the climate change benefits will be spread across the globe. The massive profits, moreover, will benefit a small number of private companies. This imbalanced allocation of costs and benefits, which disproportionately disadvantages a minority population while providing them little or no benefit from the program, satisfies any recognized definition of environmental justice.	Comment noted. The CRIT were identified as an EJ population in Section 3.10.2.4 of the DEIS. Additional discussion has been added to the EIS.
37	1	Dennis Patch, Chairman, Colorado River Indian Tribes	37.40	M&M	To begin to right this imbalance, CRIT urges BLM to adopt a mitigation measure to give employment preferences to Indians, as well as access to any necessary job training programs to ensure performance and experience requirements can be met. BLM should also adopt mitigation measures that ensure that the project developer sources construction materials from tribal enterprises. CRIT has serious questions as to whether the proposed Project will bring much needed construction and permanent jobs to an area close to the Reservation. At a minimum, please provide additional information about the nature of the jobs related to the Project to ensure that Tribal members may be available for hire. Tribal members must have access to these jobs to ensure that at least some of the benefits of the proposed Project flow back to the disadvantaged minority community on the Reservation.	See response to comment 37.16. BLM will require tribal monitors for archaeological survey and ground disturbing construction activities.
37	1	Dennis Patch, Chairman, Colorado River Indian Tribes	37.41	LAW	Much of the traditional value of cultural resources in the Project area comes from maintaining the connectivity between cultural resource sites stretching from Spirit Mountain in Nevada to the area south of Blythe. As the DEIS recognizes, the Mule Mountains play a key role in maintaining this connectivity within Tribal members' ancestral landscape. DEIS at 3-33. To the extent that the proposed Project prevent access to the Mule Mountains for traditional practitioners or destroy the landscape connectivity necessary to traditional cultural practices, and thereby present a substantial burden on their religious free exercise, BLM violates the Religious Freedom Restoration Act. See Burwell v. Hobby Lobby Stores, Inc., 573 U.S. _ (2014). This issue must be addressed prior to any Project approval.	Comment noted. BLM acknowledges that the tribes have a deep connection to the landscape and its resources, and prefers avoidance of cultural resources, as well as minimizing the project footprint. Restricted access is analyzed in Sections 4.6.4, 4.6.5, and 4.6.8 of the FEIS. Access restrictions in this location would be temporary during construction.
37	1	Dennis Patch, Chairman, Colorado River Indian Tribes	37.42	WTR	According to the DEIS, the Project will require over 2.5 million gallons of water for construction. DEIS at Appendix 2-55. An additional 2.2 million gallons of water would be required for dust control. Id at Appendix 2-25. According to the document, the Applicant will obtain water either from "private wells and/or municipal supplies with permitted and allocated water rights." DEIS at 2-25.	Design and engineering of the Project was refined between the DEIS and the FEIS; therefore, water required for construction was adjusted to reflect this in the FEIS. Water sources would be widely distributed along the 114-mile Project alignment, over a 2-year construction period. Such a wide distribution of sources, including private wells and/or municipal supplies, and over a long

Response ID No.	Number of Signatures	Name	Comment ID No.	Comment Type	Comment	Response
					CRIT is concerned that this use has not be adequately studied in the EIR. Many wells and municipal supplies in the area are hydrologically connected to the Colorado River. The DEIS must be revised to specifically identify the proposed water source and to study any potential impacts of water use on the Colorado River.	period of time, would minimize the potential for overdraft of any individual water supply. The two underlying basins are not in overdraft and the storage capacities of the two basins are 4.9 million-acre feet and 6.8 million acre feet, respectively (Appendix 1C). These large storage capacities put into perspective the Project water demand of 174 acre feet. BLM is satisfied with the applicant's commitment to procure water from existing sources.
37	1	Dennis Patch, Chairman, Colorado River Indian Tribes	37.43	NA	The DEIS states that BLM has consulted with CRIT. DEIS at 5-2. However, CRIT continues to object to BLM's failure to acknowledge the Government-to-Government Consultation Policy of the Colorado River Indian Tribes.	BLM acknowledges receiving and reviewing the CRIT government to government consultation policy.
37	1	Dennis Patch, Chairman, Colorado River Indian Tribes	37.44	NA	CRIT prepared this Policy to establish a framework by which CRIT and federal agencies could work together to facilitate better consultation processes and outcomes. The Policy is a product of tribal law and is intended to govern the activities of the CRIT Tribal Council. As a result, CRIT has requested that the federal agencies with which it interacts both acknowledge the Policy and attempt to comply with its requirements.	BLM will continue to follow established DOI and BLM policy regarding tribal consultation.
37	1	Dennis Patch, Chairman, Colorado River Indian Tribes	37.45	PROG	In addition, CRIT objects to the statement in the Programmatic Agreement that "BLM's consultation process fulfills part of CPUC' s consultation obligations." DEIS at Appendix 2D-5. Nothing in the California Environmental Quality Act or state law permits the CPUC to pass along its responsibilities to federal agency. Nor does this deferral serve one of the fundamental purposes of consultation, which is to ensure that tribal sovereign nations have the opportunity to present their concerns directly to government decisionmakers. CRIT request that the CPUC engage in consultation activities before beginning consideration of the Project.	CRIT was notified by BLM in 2017 that the BLM's consultation efforts also doubled for CPUC's consultation efforts, including for the purposes of gathering information pertinent to AB52 and the identification of Tribal Cultural Resources. CEQA Guidelines Section 15221 specifically authorizes this process. It is the BLM's and CPUC's understanding that there were no objections by CRIT or other consulting tribes to the BLM's and CPUC's combined consultation efforts. However, CPUC also sent letters to consulting tribes, including CRIT, for the purposes of AB52 consultation, clearly identifying the CPUC's standalone obligations for tribal consultation under AB52. These letters were sent for the sole purpose of identifying TCRs under AB52 in order to support CEQA's analysis of impacts to TCRs. No information was provided by consulting tribes, including CRIT, based on the AB52 outreach letters. If CRIT has additional information to provide regarding possible TCRs that could be impacted by the proposed undertaking, CPUC needs that information to complete the CEQA analysis and work with consulting tribes to determine appropriateness of mitigation, if avoidance is not feasible. Finally, the PA memorializes the consultation process between BLM, CPUC, and consulting tribes, including early outreach efforts between BLM and CRIT. AB52 requires a separate California CEQA process that CPUC is engaged in, which is also specifically identified in the PA as an ongoing CEQA obligation. CPUC has not yet made a decision to accept the EIS as a CEQA-equivalent document.
38		Doug McEntee, Sr. Project Manager, **Southern California Edison**	38.1	ROW	SCE's rights-of-way and fee-owned properties are used by SCE to operate and maintain its present and future facilities. SCE reviews any proposed use within its right-of-way on a case-by case basis. Approvals or denials are provided in writing and based upon review of maps provided by the developer and compatibility with SCE right-of-way constraints, rights, and standards. SCE is concerned that the proposed project may impact SCE's existing transmission line facilities. SCE has requested the developer to submit detailed plans reflecting all crossings	Table 1.5-2 was updated to reflect that DCRT must obtain approval from SCE for crossings of SCE facilities.

Response ID No.	Number of Signatures	Name	Comment ID No.	Comment Type	Comment	Response
					and impacts on SCE right-of-way to complete its review for this project. The proposed project cannot unreasonably interfere with SCE's ability to access, maintain, and operate its current and future facilities. SCE's approval of any proposed crossings of SCE's transmission line facilities will be in accordance with Part 3, Section 7.2 of SCE's Interconnection Handbook.	
38		Doug McEntee, Sr. Project Manager, **Southern California Edison**	38.2	NEPA	SCE's construction, modification, and relocation of transmission lines, or electrical facilities that are designed to operate at or above 50 kV may be subject to the California Public Utilities Commission's (CPUC) General Order 131-D2. The construction, modification, or relocation of transmission lines to be performed by SCE for this project should be identified and analyzed in the Final EIS. If not, SCE may be required to pursue a separate, mandatory CEQA review through the CPUC, which could delay approval of the SCE transmission line portion of the project for two years or longer.	As outlined in the final POD and EIS, the Project would interconnect to SCE's Colorado River substation. No additional modifications / relocation is proposed. The Applicant will be coordinating with SCE and trustree/responsible agencies in support of Interconnection approval and encroachment/ crossing permits.
39		Craig Weaver, Tonopah Area Coalition and Friends of Saddle Mountain	39.1	P&N	The Tonopah Area Coalition and Friends of Saddle Mountain have serious concerns regarding this 500kV power line being proposed. This transmission line is to sell electricity made in AZ to folks in California which is not necessary.	Comment noted. Please see Section 1.2.2 for the Applicant's project objectives and Section 1.3 for the purpose and need.
39		Craig Weaver, Tonopah Area Coalition and Friends of Saddle Mountain	39.2	PH&S	This addition will not increase safety for power transmission system.	Please see Section 1.2.2 for the Applicant's project objectives, which states the Project would strengthen the regional transmission system in Arizona and California by adding additional capacity and alleviating grid congestion, as well as improving transmission line reliability. These contribute to the safety of the power transmission system. Safety is addressed in Section 4.2.8 of the FEIS.
39		Craig Weaver, Tonopah Area Coalition and Friends of Saddle Mountain	39.3	UC	This substation (incorrectly listed as Tonopah) was made for an APS solar project in Harquahala Valley which was never built. A Canadian firm also proposed a solar project for connection to Phoenix via Delaney but they never built that project either.	Comment noted.
39		Craig Weaver, Tonopah Area Coalition and Friends of Saddle Mountain	39.4	WLF	The wildlife linkage (64) for desert bighorn sheep was discovered decades ago (radio collared DBS in 1990 but Arizona Game and Fish). The desert bighorn sheep linkage will be negatively affected by these additional power lines. Stand below a 500kV and you'll notice the static effect on your skin... the shocking feel of those power lines is likely to be disturbing for [desert bighorn sheep] also. This narrow 'hall way' for [desert bighorn sheep] is limited and another 500kV will result in additional lack of interaction of [desert bighorn sheep] north of Interstate 10 and those below I-10.	Desert bighorn sheep impacts are disclosed in Section 4.4 of the EIS.
39		Craig Weaver, Tonopah Area Coalition and Friends of Saddle Mountain	39.5	WLF	This restriction further reduces sustainability for wildlife.	Impacts to wildlife are disclosed in Section 4.4 of the EIS.

Response ID No.	Number of Signatures	Name	Comment ID No.	Comment Type	Comment	Response
40		Linda Ogo, Director, Culture Research Department, **Yavapai Tribe**	40.1	NA	We have reviewed the Ten West Link Draft EIS provided along with your correspondence received by certified mail. This letter is to advise you that the Yavapai-Prescott Indian tribe wishes to be a Consulting Party to the Programmatic Agreement regarding the Ten West Link Transmission Project between Tonopah, La Paz County, Arizona and Blythe, Riverside County, California. The proposed project will impact lands in the traditional aboriginal territory of the Yavapai.	The BLM sent a letter to the Yavapai in December 2018 confirming that the Yavapai-Prescott Tribe is a consulting party to the PA. BLM will continue to keep the Tribe informed and involved in the EIS and PA process.
40		Linda Ogo, Director, Culture Research Department, **Yavapai Tribe**	40.2	CUL	The research Design and Work Plan for Cultural Resources Inventory documents that the Class I investigation identified five intaglios (geoglyphs) as well as seven petroglyph sites that might be affected in the Arizona areas. Be advised that these are cultural resources that have traditional cultural significance to the Yavapai-Prescott Indian Tribe. In addition, cairns, rock alignments, cleared circles and trails are important elements of the ceremonial landscape which are identified in Yavapai oral history.	Comment noted. Consultation with the Yavapai Tribe will be ongoing throughout the Project.
40		Linda Ogo, Director, Culture Research Department, **Yavapai Tribe**	40.3	NA	We would like to have more information on the BLM Tribal Participation Plan (pg.7), the data sharing agreement (pg.9), and request hard copy communication in addition to email (pg.18). It is noted in your correspondence that arrangements can be made for a presentation to the Yavapai-Prescott Indian Tribe and we would like to have the opportunity for this to occur.	Those documents have not been drafted yet. When these have been drafted, BLM will provide them to the Tribe.
41		Lowell Rogers, **DCRT** Project Manager, Ten West Link Transmission Project	41.1		The DEIS mischaracterizes DCRT's request as being for a 30-year ROW rather than the 50 years actually requested (DEIS, p. 2-1). We note that the language at DEIS, page ES-1, analyzes a 50-year project life that corresponds to DCRT's requested ROW grant. DCRT's Approved Project Sponsor Agreement states that the Ten West Link project will have a service life of 50 years, which is in line with the project life analyzed in the DEIS. DCRT requests that the FEIS and ROD reflect at 50-year ROW being granted by the BLM.	Comment noted. Action is being taken to address this. The EIS was revised to reflect a 50-year ROW.
42	2	Doug & Dinice Ross, Local Liason, **Arizona Sunriders OHV Club**	42.1	SOCIO	Off-road vehicle activities in the Quartzsite, Arizona area provide an important quality-of-life opportunity for residents. It also contributes significantly to the local economy and tourism industry.	These topics are discussed in Sections 3.8, 3.9, 4.8, and 4.9 of the EIS.
42	2	Doug & Dinice Ross, Local Liason, **Arizona Sunriders OHV Club**	42.2	REC/ SUP PREF	We appreciate BLM's efforts to acknowledge the importance of established off-road trails, such as the Arizona Peace Trail. We support the BLM Preferred Alternative that the BLM identified in the DEIS. It avoids the Johnson Canyon area and interference with the Arizona Peace Trail, which was a priority for our members.	Comment noted.
42	2	Doug & Dinice Ross, Local Liason, **Arizona Sunriders OHV Club**	42.3	VIS	Our members feel that this is a good approach to locate the new transmission line along the same route as the existing transmission line within the Copper Bottom Pass as identified by the BLM Preferred Alternative. With the all the existing construction in this area, we do not feel that the new transmission line, including new access roads, will create a visual impact in the Copper Bottom Pass (KOPs 32 and 35) and feel that mitigation measure MM-VIS-02 is unnecessary.	BLM policy is to reduce and mitigate for visual impacts.

Response ID No.	Number of Signatures	Name	Comment ID No.	Comment Type	Comment	Response
43	1	Sheryl H. Christenson, Chair, Laguna Natural Resource Conservation District	43.1	SUP PRO	like all of the agencies that are involved in this project, we are acutely aware of the environmental impact that this new project will bring. After attending one of the meetings held this past October, we learned that BLM prefers the most southern route crossing AZ and ending in CA. We agree with this preference. We also agree that the transmission line should stay as far away as possible from the towns of Quartzite and Blythe which, again, the southernmost route proposal accomplishes.	As presented in the DEIS, the BLM's Preferred Alternative does include the southern route in the western portion of the project area, to avoid Quartzsite and Blythe.
43	1	Sheryl H. Christenson, Chair, Laguna Natural Resource Conservation District	43.2	LU	With specific regards to Blythe and crossing the farmland south of town, we understand there are three proposals. In our view, the only one that makes sense is the most southern route. The reasons are: 1. There is already a corridor established at that proposed route and it doesn't make sense to divide farmland any more than necessary. 2. We believe that it is important to stay as far away from the town of Blythe as possible, therefore, the two other proposals should be avoided. 3. We understand that the line entering the Colorado River Substation needs to be entered from the south end. Using either of the two most northern farmland crossing proposals would add both distance and cost to the overall project and would create a larger footprint which is not desirable.	Comment noted.
44	1	Terrance J. Fulp, Ph.D, Regional Director, **Bureau of Reclamation**, Lower Colorado Regional Office	44.1	SUP PREF	Reclamation has reviewed the DEIS and supports the Bureau of Land Management Preferred Alternative (Alternative 2) with several small adjustments to the proposed Project Route Segments (Segments). Details about these requested adjustments are given below.	Comment noted.
44	1	Terrance J. Fulp, Ph.D, Regional Director, **Bureau of Reclamation**, Lower Colorado Regional Office	44.2	LU	Segments i-03, i-01, and p-01, as proposed in Alternative 2, cross what is known as the 'Green Up Area' of the CAP canal. In accordance with the 1993 CAP Right-of-Way Land Use Policy (Policy), the 'Green-Up Area' consists of lands administered by Reclamation on the upslope of the CAP canal that mitigates for the loss of wildlife habitat from construction of the canal. It currently contains dense xeroriparian habitat that Reclamation is committed to protect. As identified in the Policy, any land disturbing activities within the 'Green-Up Area' must be fully replaced or existing habitat values enhanced.	As coordinated with Reclamation, structure locations along these segments have been placed to avoid these sensitive areas.
44	1	Terrance J. Fulp, Ph.D, Regional Director, **Bureau of Reclamation**, Lower Colorado Regional Office	44.3	RNA	To avoid having to mitigate for impacts to habitat within the 'Green-Up Area, Reclamation recommends avoiding these areas by adjusting: Segment i-01, near its connection with Segment p-01, north by approximately 0.13 miles (Attachment A, Figure 1) and, Segment i-03 that crosses the CAP canal and the 'Green-Up Area' west of the Little Harquahala Pumping Plant, south by approximately 0.6 miles (Attachment A, Figure 2)	See response to comment 44.2.
44	1	Terrance J. Fulp, Ph.D, Regional Director, **Bureau of Reclamation**, Lower Colorado Regional Office	44.4	WLF	Reclamation notes there are proposed locations for the transmission line in Alternative 2 that while outside the 'Green-Up Area' and CAP Right-of-Way, support patches of xeroriparian habitat and desert washes that are important wildlife and habitat areas. It is recommended that disturbances to those areas also be avoided to the greatest extent possible to minimize impacts.	These areas would be avoided.
44	1	Terrance J. Fulp, Ph.D, Regional Director, **Bureau of Reclamation**, Lower Colorado Regional Office	44.5	CONST	Reclamation also requests further coordination as some of the proposed locations are on a combination of Reclamation withdrawn land, fee land, and rights-of-way. Use of these lands will require further authorization from Reclamation. Reclamation and the Central Arizona Water Conservation District (CAWCD) have design standards for facilities that encroach on CAP lands. These design standards protect the CAP facilities and the ability to perform	Comment noted. During the Reclamation land use authorization process and the CAP crossing permit process, the Proponent will coordinate with Reclamation. CAWCD is included in Table 1.5-2 that lists state and local permits required by the Project.

Response ID No.	Number of Signatures	Name	Comment ID No.	Comment Type	Comment	Response
					Operation and Maintenance of project facilities. As the Project reaches the design phase, please coordinate with CAWCD and Reclamation on the applicable design standards.	
44	1	Terrance J. Fulp, Ph.D, Regional Director, **Bureau of Reclamation**, Lower Colorado Regional Office	44.6	INFO	In addition, Reclamation also requests review of the detailed Project design drawings of the Colorado River crossing and the Plan of Development to ensure the transmission line and any new structures placed adjacent to the Colorado River do not impact Reclamation levees/banklines and other flood control facilities.	Comment noted. During the Reclamation land use authorization process and the CAP crossing permit process, the Proponent will coordinate with Reclamation. CAWCD is included in Table 1.5-2 that lists state and local permits required by the Project.
45	1	Eric Gillies, Assistant Chief, Division of Environmental Planning and Management, **California State Lands Commission**	45.1	WTR	The Commission has jurisdiction and management authority over all ungranted tidelands, submerged lands, and the beds of navigable lakes and waterways. The Commission also has certain residual and review authority for tidelands and submerged lands legislatively granted in trust to local jurisdictions (Pub. Resources Code, §§ 6009, subd. (c); 6009.1; 6301; 6306). All tidelands and submerged lands, granted or ungranted, as well as navigable lakes and waterways, are subject to the protections of the common law Public Trust.	Comment noted. California State Lands Commission is identified in Table 1.5-2 of the EIS as a state agency requiring a permit (e.g., ROW easement, public trust land use lease, right-of-entry, as applicable).
45	1	Eric Gillies, Assistant Chief, Division of Environmental Planning and Management, **California State Lands Commission**	45.2	DATA	Project Description: A thorough and complete Project Description should be included in the EIS in order to facilitate meaningful environmental review of potential impacts, mitigation measures, and alternatives. With the Colorado River being one of the most sensitive environments in the Project area, Commission staff recommends more description of work activities within the channel and floodplain of the river. Specifically, the river crossing should be a specific segment for environmental impact analysis, rather than as part of a larger segment.	This information is contained in the TES. DCRT would be required to submit a *standard application for lease of state lands for commercial and industrial use applicants* and obtain a ROW from the California State Lands Commission (Appendix 1, Table 1.5-2). As part of the final siting (micrositing) of the Project, DCRT would be required to coordinate design of the Project and micrositing of Project infrastructure with the California State Lands Commission.
45	1	Eric Gillies, Assistant Chief, Division of Environmental Planning and Management, **California State Lands Commission**	45.3	WTR	Please update the Project Description to include the following information: Describe and illustrate all proposed work and siting of structures below the OHWM and OLWM of the Colorado River and within the floodplain, inclusive of support structures, transmission lines, construction access and staging areas.	Based on our understanding, all work would be above the OHWM.
45	1	Eric Gillies, Assistant Chief, Division of Environmental Planning and Management, **California State Lands Commission**	45.4	WTR	For segment p-15e, provide greater description of whether support structures would be sited within the floodplain of the Colorado River and describe proximity of structures to the OHWM and OLWM. To the extent possible, provide description and illustration of construction techniques for how the support tower foundations will be installed.	Final design would emphasize avoidance of floodplains for structure locations. Whether avoided or not, compliance with Section 404 of the Clean Water Act and Section 10 of the Rivers and Harbors Act would ensure that any physical alterations of floodplains would be mitigated to ensure their continuing functioning. Section 404 compliance would likely occur through coverage under NWP 12 - Utility Line Activities, unless the coverage requirements (e.g., acreage loss) of that general permit could not be met, in which case an Individual Permit would be pursued. Information regarding floodplains is located in Section 4.19.4.1 of the TES, The Floodplain Statement of Findings is presented in Section 4.19.10.1 of the TES. The Plan of Development states: Specifically, a preconstruction notification (PCN) may be required for towers sited within the OHWM of the Colorado River in which a Section 10 permit is to be submitted because utility lines consisting of aerial electric power transmission lines crossing navigable waters of the United States (which are defined at 33 CFR part 329 and include the Colorado River) must comply with the applicable minimum clearances specified in 33 CFR 322.5(i). A PCN is not predicted to be required for foundations within Section 404 jurisdictional washes because

Response ID No.	Number of Signatures	Name	Comment ID No.	Comment Type	Comment	Response
						foundation footings will be micro-sited outside of 404 jurisdictional washes where possible and the maximum permanent loss of waters of the U.S. at any tower totals much less than 0.5 acre.
45	1	Eric Gillies, Assistant Chief, Division of Environmental Planning and Management, **California State Lands Commission**	45.5	WTR	Describe any long-term maintenance needs and potential work that may affect public use and natural resources of the Colorado River.	Impacts to public use of the river during operations would be negligible. This information is contained in the TES.
45	1	Eric Gillies, Assistant Chief, Division of Environmental Planning and Management, **California State Lands Commission**	45.6	CLIM	As stated in Safeguarding California Plan: 2018 Update (California Natural Resources Agency 2018), climate change is projected to increase the frequency and severity of natural disasters related to flooding, drought, and storms. In rivers, more frequent and powerful storms can result in increased flooding conditions and damage from storm created debris. Conversely, prolonged droughts could dramatically reduce river flow and water levels, leading to loss of public access and navigability. Climate change will further influence riverine areas by changing erosion and sedimentation rates, and flooding and storm flow. Runoff will likely increase scour, decreasing bank stability at a faster rate. As explained above, it is unclear if the support towers for segment p-15e of the proposed action will be sited in the floodplain of the Colorado River. If these structures are sited within the floodplain of the river, then they could be subject to the types of climate change impacts explained above. For the alternatives with segments ca-04 and ca-10, although the electrical towers are located above and laterally outside of the floodplain, the towers would support electrical lines that extend above and across the river. Although the towers and utility lines will not be subject to climate change related riverine processes, they could be subject to storm events of increased intensity and frequency. Please note that when considering the lease application for the Project, Commission staff may require information concerning the future effects of climate change on the Project, and if applicable, adaptation strategies during the life of the Project.	See response to comment 45.4. Also, one of the objectives of the Project is to allow for additional renewable energy sources to be connected to the CAISO and APS bulk transmission systems. Therefore, the project has an indirect benefit on GHG emissions.
45	1	Eric Gillies, Assistant Chief, Division of Environmental Planning and Management, **California State Lands Commission**	45.7	REC	Public Access Restrictions: For all construction phases of the Project affecting the Colorado River, the EIS should provide a detailed description of any temporary restrictions on river access, and for navigation within the Colorado River. Potential mitigation measures could include public notices and posting of signs at the Project area to inform the public of temporary access restrictions. For long-term operations affecting the Colorado River, describe any changes in land use that could affect public access to the river and navigation within the river.	Text has been added to the EIS regarding access restrictions during wire pulling. To protect the public, all boat traffic would be restricted from entering the wire pulling area while stringing operations are occurring. Boat traffic may be restricted using a combination of patrol boats and warning buoys on either side of the wire pulling corridor. These restrictions would be temporary in nature. See Section 2.2.4.4 of FEIS Appendix 2. Impact REC-1 of the CEQA Appendix has been updated to address river access.
45	1	Eric Gillies, Assistant Chief, Division of Environmental Planning and Management, **California State Lands Commission**	45.8	PERM	Thank you for the opportunity to comment on the Draft EIS for the Project. As a trustee and responsible agency, Commission staff will need to rely on the Final EIS, including Appendix 1 C for CEQA compliance, for the issuance of a lease as specified above. Therefore, we request that you consider our comments prior to certification of the EIS.	The BLM acknowledges that the California State Lands Commission may become a CEQA lead agency if and when the Applicant files a discretionary permit. Presently, there is no CEQA document or CEQA Lead Agency, so CSLC is not yet a trustee Agency, as defined by CEQA. The EIS anticipates the Applicant will obtain all required permits and issuance of Notice to Proceed may be withheld until the Applicant secures such permits.
46	1	Marilyn McFate	46.1	OPP	I can’t imagine destroying more of our area.	Comment noted.

Response ID No.	Number of Signatures	Name	Comment ID No.	Comment Type	Comment	Response
46	1	Marilyn McFate	46.2	CUL	My husband and I were site stewards for the State until John passed. We worked with Boma Johnson of BLM on surveys and studying the archeological aspect of this area peoples lived here 4000 yrs. ago and theres many areas where they camped also miners at dripping springs with their arastra -	Comment noted.
46	1	Marilyn McFate	46.3	WLF	also that wash [Dripping Springs] is a hummingbird nesting area -	Comment noted. Project avoids the Dripping Springs ACEC.
46	1	Marilyn McFate	46.4	PH&S	I'm most concerned working with the Police dept. sometimes there was interference on radios and had to use Guadalupe Relay or Cunningham Peak this area didn't have TV until 1975 when the Relay was put up on Guadalupe – any electro magnetic – interference from transmission lines are bound to foul up mobil telephones – TV's and the Proving Ground told us our microwaves etc -	Interference and EMF are discussed in Section 4.2.8 of the DEIS. Additional information is provided in the TES.
46	1	Marilyn McFate	46.5	SUP PRO	I feel your best way is the already lines right away -	Comment noted.
46	1	Marilyn McFate	46.6	WLF	Also lines will create a problem with transfer of Desert Sheep and it the line just is not needed here.	Desert bighorn sheep impacts are disclosed in Section 4.4 of the EIS.
46	1	Marilyn McFate	46.7	PH&S	It took 9 yrs to get lines moved around parts of town – it created much havoc with wind shear & storms – lines down -	BLM's Preferred Alternative would avoid both Quartzsite and Blythe.
47	1	Jim de Vos, Assistant Director, Wildlife Management Division, **Arizona Game and Fish Department**	47.1	GEN	Under Title 17 of the Arizona Revised Statutes, the Department, by and through the Arizona Game and Fish Commission (Commission), has jurisdictional authority and public trust responsibilities for management of the state's fish and wildlife resources. It is the Mission of the Department to conserve Arizona's diverse fish and wildlife resources and manage for safe, compatible outdoor recreation opportunities for current and future generations.	Comment noted. AGFD is listed as an authorizing agency in Table 1.5-2 (Appendix 1) and is a cooperating agency.
47	1	Jim de Vos, Assistant Director, Wildlife Management Division, **Arizona Game and Fish Department**	47.2	GEN	The Department has provided comments and data on the proposed alternatives in previous comments. We will restrict our comments in this letter to the BLM Preferred Alternative.	Comment noted.
47	1	Jim de Vos, Assistant Director, Wildlife Management Division, **Arizona Game and Fish Department**	47.3	SUP PREF	The Department supports the BLM Preferred Alternative. It will have the least impacts to wildlife since it will parallel 1-10 on the south side. The south side of the interstate through Plomosa Mountains is more developed and has more recreational activity than the north side. Co-locating the line with the existing line through Copper Bottom Pass will have fewer impacts than alternatives through areas without transmission lines or roads. Additionally, the Department notes that proposed Best Management Practices, Applicant Proposed Measures and Monitoring, and Mitigation Proposals will further reduce impacts to wildlife.	Comment noted.
47	1	Jim de Vos, Assistant Director, Wildlife Management Division, **Arizona Game and Fish Department**	47.4	DATA	Page 2 - 37, Table 2-12. It states that the Series Compensation Station has a long term disturbance of less than 0.1 acres. Is this accurate?	No, this is incorrect. It should be 1.7 acres as it is under all other action alternatives. Typo and totals have been corrected.
47	1	Jim de Vos, Assistant Director, Wildlife	47.5	WLF	Page 3 - 22 Special Status Wildlife Species. Sonoran pronghorn have been found along U.S. 95 south of Quartzsite from roughly milepost 77 to 82. This species is highly mobile and can	Identified mileposts are outside the study area and no impacts in this area are anticipated. However, Sonoran pronghorn will be part of the worker

		Management Division, **Arizona Game and Fish Department**			move long distances searching for areas of green vegetation. During construction workers should be aware of the possibility of pronghorn moving into the area.	environmental education program so that construction workers are aware of this species in the project area.
47	1	Jim de Vos, Assistant Director, Wildlife Management Division, **Arizona Game and Fish Department**	47.6	WLF	Additionally razorback suckers and bonytail chub are found in Colorado River backwater A - 7. Razorback suckers are also found in backwater A - 10. Both backwaters are found in the vicinity of the river crossing.	Comment noted. The river crossings avoid the backwater areas of the Colorado River.
47	1	Jim de Vos, Assistant Director, Wildlife Management Division, **Arizona Game and Fish Department**	47.7	TRANS	Page 4 - 10 Section 4.2.9, Second Paragraph collision hazard for pilots. The Department flies helicopter and fixed wing wildlife surveys in the Plomosa and Dome Rock mountains. Please add these surveys to the discussion of collision hazards for pilots.	The AGFD aerial surveys were added to the EIS. BMP TT-10 was developed to address the issue of helicopter construction in Copper Bottom Pass causing an aerial hazard to AGFD aircraft. The BMP requires DCRT to coordinate helicopter construction with AGFD. A MM was added (MM-TT-02) to mark the lines and structures on segments in the Plomosa and Dome Rock Mountains.
47	1	Jim de Vos, Assistant Director, Wildlife Management Division, **Arizona Game and Fish Department**	47.8	M&M	The Department requests that marker balls be added to the lines in the Dome Rock and Plomosa Mountains and that upon completion of the project, the Department be given maps with the location of the lines.	A MM was added (MM-TT-02 in Section 4.2.9) to mark the lines and structures on segments in the Plomosa and Dome Rock Mountains.
47	1	Jim de Vos, Assistant Director, Wildlife Management Division, **Arizona Game and Fish Department**	47.9	M&M	Page 2B -1 Appendix 2B-1. The Department would appreciate the opportunity to participate in the development of the Avian Protection Plan, Raven Management Plan, and Plant and Wildlife Species Conservation Plan.	Comment noted.
48	1	Bruce Easterday	48.1	OPP PREF	My wife and I attended the Blythe meeting regards to this project. We have Ag land that the northern most possible crossing would be built on. It is approx. 1.5 miles south of Blythe's town. We believe: 1. There is already an established corridor 3 miles south of our property/proposed corridor. It doesn't make sense to disturb more Agricultural land than there is presently.	The Preferred Alternative utilizes designated utility corridors and considers numerous resources in addition to agricultural lands. DCRT will be required to obtain an easement for crossing any private lands.
48	1	Bruce Easterday	48.2	ROUTE	2. The end of the project ends west of the town of Blythe & has to be entered from the south side. It appears that the route would most likely cross the river lining up with the southern most option & established corridor. Why would any project be built from the south heading north toward Blythe then dissecting more Ag land heading west and then turning south again so the lines then head north again to end up on the south site of the "terminal."	The Preferred Alternative considers numerous resources in addition to agricultural lands.
48	1	Bruce Easterday	48.3	OPP UR	3. We feel like the people of Quartzsite, we don't want the lines close to town.	Comment noted.
48	1	Bruce Easterday	48.4	WTR	4. Lastly, there is a severe water shortage on the Colorado. Blythe has one of the highest water priorities on the Colorado River. As other cities are hurt, Blythe stands to prosper from these problems. Having served for many years as a farmer & board member of a water district here in Yuma, I am acutely aware of lower priority water users & our problems associated with lower priorities that we have in Yuma. [last line of letter cut off]	Water resources are discussed in Sections 3.2.10 and 4.2.10 of the FEIS. Water sources would be widely distributed over the Project alignment and over a 2-year construction period. See comment response 37.42.

49	1	Richard Drury, Laborers International Union of North America, Local Union 1184	49.1	GEN	After reviewing the DEIS, we conclude that the DEIS fails as an informational document and fails to impose all feasible mitigation measures to reduce the Project's impacts. Commenters request that the Bureau of Land Management ("BLM') address these shortcomings in a revised draft environmental impact statement ("RDEIS") and recirculate the RDEIS prior to considering approvals for the Project. We reserve the right to supplement these comments during review of the Final EIS for the Project and at public hearings concerning the Project. Galante Vineyards v. Monterey Peninsula Water Management Dist., 60 Cal. App. 4th 1109, 1121 (1997).	Comment does not specifically identify or address any specific errors or omissions in the Draft EIS. The BLM prepared the EIS with the assistance of multiple cooperators with permitting jurisdiction and expertise. The BLM believes the EIS complies with NEPA and BLM policies and is fully adequate.
50	9	Wendy Worthey, Adam Poll, Ryan Henry, M. Howard, Perry Russel, M. Greene, Joshua Saunders, B. Grattidge, **Dudek** on behalf of California Public Utilities Commission (CPUC),	50.1	CEQA	In order to determine CEQA compliance, CPUC/Dudek will need to review the completed Mitigation Measure Compliance and Reporting Plan (MMCRP) document, prior to its approval. The MMCRP should include all APMs, BMPs, and MMs applicable to the California portion of the Project, and present at a minimum: how the measures and BMPs will be implemented, under what conditions, timing, and responsible parties.	A MMCRP has been prepared pursuant to CEQA requirements.
50	9	Wendy Worthey, Adam Poll, Ryan Henry, M. Howard, Perry Russel, M. Greene, Joshua Saunders, B. Grattidge, **Dudek** on behalf of CPUC	50.2	AQ	The chapter claims that major impacts to air quality were disclosed in Section 4.2. However, Section 4.2.1 does not disclose any major impacts and concludes that no ambient air quality standards were exceeded. The Appendix and Section 4.2.1 should be consistent.	The air quality section has been revised to address this comment.
50	9	Wendy Worthey, Adam Poll, Ryan Henry, M. Howard, Perry Russel, M. Greene, Joshua Saunders, B. Grattidge, **Dudek** on behalf of CPUC	50.3	AQ	The document claims that SF6 emissions from gas-insulated circuit breakers in the switchyards could result in significant impacts to conformity *de minimus* thresholds or exceed a National Ambient Air Quality Standard (NAAQS). This statement is not correct. SF6 emissions are a GHG only emissions which is not considered with respect to conformity or NAAQS.	The air quality section has been revised to address this comment.
50	9	Wendy Worthey, Adam Poll, Ryan Henry, M. Howard, Perry Russel, M. Greene, Joshua Saunders, B. Grattidge, **Dudek** on behalf of CPUC	50.4	AQ	In Section 2.3.1, the document does not address that the California portion of the project is within Riverside County. As such, the Riverside County Climate Action Plan and its GHG threshold of 3,000 $MTCO_2e$ per year would apply.	This section has been revised to address this comment and now includes a discussion of Riverside County's CAP and the screening threshold of 3,000 MTCO2e.
50	9	Wendy Worthey, Adam Poll, Ryan Henry, M. Howard, Perry Russel, M. Greene, Joshua Saunders, B. Grattidge, **Dudek** on behalf of CPUC	50.5	GEN	Table reference is incorrect. It should read 2.3-1, not 2.1.	The Table reference has been corrected.
50	9	Wendy Worthey, Adam Poll, Ryan Henry, M. Howard, Perry Russel, M. Greene, Joshua Saunders, B. Grattidge, **Dudek** on behalf of CPUC	50.6	GEN	Table reference is incorrect. It should read 2.3-1, not 2.1-1.	The Table reference has been corrected.

50	9	Wendy Worthey, Adam Poll, Ryan Henry, M. Howard, Perry Russel, M. Greene, Joshua Saunders, B. Grattidge, **Dudek** on behalf of CPUC	50.7	CE	There is no discussion as to what other projects would be occurring in the area at the same time and what impact those projects along with this project would have.	This section has been revised to address this comment.
50	9	Wendy Worthey, Adam Poll, Ryan Henry, M. Howard, Perry Russel, M. Greene, Joshua Saunders, B. Grattidge, **Dudek** on behalf of CPUC	50.8	AQ	Add the following text to Section 2.3.5.1 and add “CO” to the 2.3.5.1 heading title: “The project is not anticipated to create a CO impact or hotspot during construction as emissions of CO would not be concentrated in any one area or intersection. There would be no CO emissions during operation as there is little to no activity generating CO emissions during operation.”	Revisions made as requested.
50	9	Wendy Worthey, Adam Poll, Ryan Henry, M. Howard, Perry Russel, M. Greene, Joshua Saunders, B. Grattidge, **Dudek** on behalf of CPUC	50.9	AQ	Section 2.3.5.2 needs to identify the closest sensitive receptor to the project. This section also needs to address TAC emissions during operation.	Added information about where receptors are disclosed in the TES in Table 4.14-1 and provided the distance to the nearest receptor. Added brief discussion on TAC emissions during operations. The project is not a source of TACs during operation.
50	9	Wendy Worthey, Adam Poll, Ryan Henry, M. Howard, Perry Russel, M. Greene, Joshua Saunders, B. Grattidge, **Dudek** on behalf of CPUC	50.10	AQ	Impact AIR 5 does not address the odor impacts during operation of the project.	Added sentence about not being a land use associated with odors.
50	9	Wendy Worthey, Adam Poll, Ryan Henry, M. Howard, Perry Russel, M. Greene, Joshua Saunders, B. Grattidge, **Dudek** on behalf of CPUC	50.11	AQ	Section 2.3.6 does not address the Riverside County GHG threshold of 3,000 $MTCO_2e$ per year.	Confirmed. Moved to sentence after MDAQMD.
50	9	Wendy Worthey, Adam Poll, Ryan Henry, M. Howard, Perry Russel, M. Greene, Joshua Saunders, B. Grattidge, **Dudek** on behalf of CPUC	50.12	AQ	Section 2.3.6.1 does not address the projects consistency with the goals or measures within the Riverside County Climate Action Plan. Therefore, the conclusion that the project is consistent with the CAP is unfounded.	Added information that a consistency analysis is not required because the project is less than 3,000 MTCO2e, further the measures in the CAP are not applicable to the project.
50	9	Wendy Worthey, Adam Poll, Ryan Henry, M. Howard, Perry Russel, M. Greene, Joshua Saunders, B. Grattidge, **Dudek** on behalf of CPUC	50.13	VEG	Need to reference updated analysis from CEQA Appendix in PEIS. Under “Other Special Status Plant Species – California” refer to Appendix 1C, Chapter 2.4 for analysis of other special status plant species in California.	Comment addressed.

50	9	Wendy Worthey, Adam Poll, Ryan Henry, M. Howard, Perry Russel, M. Greene, Joshua Saunders, B. Grattidge, **Dudek** on behalf of CPUC	50.31	Veg	The biological resources environmental consequences section of the DEIS and the supporting tables in Appendix 4 provide some impact quantification in terms of disturbance acreages or linear miles; however quantification is not provided for all relevant biological resources. In some cases impacts are reported differently between the DEIS Chapter 4.4 and the CPUC supplement for the California segment (Appendix 1C). For example, Table 4.4-4 in Appendix 4 of the DEIS shows a total disturbance to blue palo verde-ironwood on the Palo Verde Mesa as totaling approximately 2.5 acres; however, Table 2.4-1 in Appendix 1C (pg. 1C-76) shows 7.56 acres of impacts to this resource using a worst case assumption. The impact analyses and quantification of impacts should be consistent between the PEIS and the CPUC CEQA Appendix, and for at least the California segment, the quantification provided should be	Comment addressed. Calculations between the EIS and Appendix 1C were reviewed and revised for consistency.

Response ID No.	Number of Signatures	Name	Comment ID No.	Comment Type	Comment	Response
					sufficient to evaluate the significance of the impact and adequacy of the mitigation.	
50	9	Wendy Worthey, Adam Poll, Ryan Henry, M. Howard, Perry Russel, M. Greene, Joshua Saunders, B. Grattidge, **Dudek** on behalf of CPUC	50.32	CEQA	According to this section, "AMPs have been identified and would be implemented by the project applicant. In addition, BLM would require implementation of Best Management Practices (BMPs). A CEQA mitigation measure is needed to ensure that the AMPs and BMPs are implemented in California, on public and non-public lands as applicable, and sufficient for compliance with CEQA. See comments on MM-BIO-CEQA-3.	Comment addressed. Mitigation measures have been developed (incorporating AMPs, CMAs, and BMPs) on public and non-public lands as applicable, to meet CEQA requirements.
50	9	Wendy Worthey, Adam Poll, Ryan Henry, M. Howard, Perry Russel, M. Greene, Joshua Saunders, B. Grattidge, **Dudek** on behalf of CPUC	50.33	CEQA	Many of the BLM BMPs use "would" be implemented or "would" be installed, etc. Many of these measures also specify "on public lands in California". If these need to apply to non-public lands in California, a CEQA measure with "shall" is needed to fill in the gaps; See comments on MM-BIO-CEQA-3.	Comment addressed.
50	9	Wendy Worthey, Adam Poll, Ryan Henry, M. Howard, Perry Russel, M. Greene, Joshua Saunders, B. Grattidge, **Dudek** on behalf of CPUC	50.34	CEQA	Many of the Applicant Proposed Measures use "to the extent practicable", a CEQA mitigation measure or other conditions are needed to clarify when these APMs shall be implemented. See comments on MM-BIO-CEQA-3.	Comment addressed.
50	9	Wendy Worthey, Adam Poll, Ryan Henry, M. Howard, Perry Russel, M. Greene, Joshua Saunders, B. Grattidge, **Dudek** on behalf of CPUC	50.35	WLF	Please specify the species and the seasonal restriction dates or an overall period that this measure applies to and describe what "would be observed" means.	Comment addressed in Section 2.4.2 of Appendix 1C.
50	9	Wendy Worthey, Adam Poll, Ryan Henry, M. Howard, Perry Russel, M. Greene, Joshua Saunders, B. Grattidge, **Dudek** on behalf of CPUC	50.36	WLF	Please specify or provide examples of what a bird or bat compatible design standard is.	Comment addressed in Section 2.4.2 of Appendix 1C.
50	9	Wendy Worthey, Adam Poll, Ryan Henry, M. Howard, Perry Russel, M. Greene, Joshua Saunders, B. Grattidge, **Dudek** on behalf of CPUC	50.37	VEG	This BMP does not require avoidance of desert riparian woodlands, which conflicts with the BLM DRECP CMAs for this resource in California. This BMP should reference to BMP BIO-52, which addresses avoidance and setbacks that is more consistent with the CMAs.	Revised and added to MM BIO-CEQA-3 in Section 2.4.2 of Appendix 1C.
50	9	Wendy Worthey, Adam Poll, Ryan Henry, M. Howard, Perry Russel, M. Greene, Joshua Saunders, B. Grattidge, **Dudek** on behalf of CPUC	50.38	RIP	This BMP appears to be a measure BLM is requiring of itself to management riparian areas? What is the intent of this measure and what does "all riparian areas" refer to.	Comment addressed in Section 2.4.2 of Appendix 1C.
50	9	Wendy Worthey, Adam Poll, Ryan Henry, M. Howard, Perry Russel, M. Greene, Joshua Saunders, B. Grattidge,	50.39	WLF	Based on a review of the surface water mapping along the project alignment, it would appear that all or a majority of the project would be within 1,000 feet of a wash or other surface water feature. Implementation of this measure as written would result in flight diverters along the entire length of the project. Is the intent really to place diverters every 1,000 feet along the	Measure modified in Section 2.4.2 of Appendix 1C to give CPUC/BLM authority to select final type and spacing of diverters.

		Dudek on behalf of CPUC			entire alignment? Please clarify in the discussion.	
50	9	Wendy Worthey, Adam Poll, Ryan Henry, M. Howard, Perry Russel, M. Greene, Joshua Saunders, B. Grattidge, **Dudek** on behalf of CPUC	50.40	VEG	BMP says that project facilities would be sited to avoid "dune vegetation". Based on the land cover map for California (Figure 3.5-2 and 3.5-3), land cover types and vegetation alliances do not use the term "dune vegetation". On separate geology figures (Figure 3.3-8) Sand and Dune System mapping is shown as well as areas of active windblown deposits. Does this measure apply to any vegetation on areas mapped as sand dunes or are there vegetation types that would considered "dune vegetation" that would be avoided? Please clarify in the BMP.	MCV definition of "Dune vegetation" added to MM BIO-CEQA-3 in Appendix 1C.
50	9	Wendy Worthey, Adam Poll, Ryan Henry, M. Howard, Perry Russel, M. Greene, Joshua Saunders, B. Grattidge, **Dudek** on behalf of CPUC	50.41	DATA	These CMAs refer to DFAs. None of the Figures in Appendix 1 or Appendix 7 depict the DRECP LUPA DFAs; this should be added to applicable Figures.	The DFA boundaries have been added to Figure 3.2-2c of the FEIS and Figure 3.11-1c of the TES.
50	9	Wendy Worthey, Adam Poll, Ryan Henry, M. Howard, Perry Russel, M. Greene, Joshua Saunders, B. Grattidge, **Dudek** on behalf of CPUC	50.42	WLF	Text refers to CMAs related to Bats but does not list the applicable DRECP LUPA CMAs, which would be LUPA-BIO-BAT-1 and LUPA-BIO-BAT-2. Please revise if applicable.	CMAs are listed verbatim, suggest leavings as is. MM WIL-CEQA-4 (Appendix 1C) covers bats.
50	9	Wendy Worthey, Adam Poll, Ryan Henry, M. Howard, Perry Russel, M. Greene, Joshua Saunders, B. Grattidge, **Dudek** on behalf of CPUC	50.43	DATA	See comment above on impact quantification consistency with the DEIS. Is there additional impact detail, like tabular resource-specific impact information, that can be provided for the California segment? If yes, then add it. If no, then please explain further.	Impact quantification will occur after focused surveys are conducted as outlined in various MMs.
50	9	Wendy Worthey, Adam Poll, Ryan Henry, M. Howard, Perry Russel, M. Greene, Joshua Saunders, B. Grattidge, **Dudek** on behalf of CPUC	50.44	CEQA	This section evaluates compliance with the CDCA CMAs. Compliance with the CMAs in many cases relies on implementation of BLM BMPs and the APMs. The BLM BMPs are written with different language (would vs shall), and the APMs are written with flexible/subjective language with no enforcement mechanism to require that they are implemented unless conditioned into the state and federal project approvals or unless required separated through CEQA mitigation measures. See comments on MM-BIO-CEQA-3.	MM BIO-CEQA-3 (Appendix 1C) has been updated to add teeth to these measures and give BLM and CPUC the authority to determine where and when certain measures are applicable. See MM BIO-CEQA-1. In addition, a sentence has been added to all MMs that specify what APMs, BMPs, and CMAs apply to that measure.
50	9	Wendy Worthey, Adam Poll, Ryan Henry, M. Howard, Perry Russel, M. Greene, Joshua Saunders, B. Grattidge, **Dudek** on behalf of CPUC	50.45	WLF	Text refers to Figure D-1 from Appendix D of the BLM DRECP LUPA. That DRECP LUPA figure depicts many potential wildlife movement corridors including corridors through the proposed project area. Revise the narrative to reflect this.	Text revised.
50	9	Wendy Worthey, Adam Poll, Ryan Henry, M. Howard, Perry Russel, M. Greene, Joshua Saunders, B. Grattidge, **Dudek** on behalf of CPUC	50.46	CEQA	The discussion states that APM BIO-13 "requires" that….be avoided. The APMs do not "require" anything unless there are conditions, compliance requirements, and/or mitigation measures in CEQA that require the APMs be implemented. Revise language or referring to MM-BIO-CEQA-3. See comments also on MM-BIO-CEQA-3.	Additional text added to both the impact analysis and MM BIO CEQA-3 (Appendix 1C) to clarify the applicability of APMs, BMPs, and CMAs.

Response ID No.	Number of Signatures	Name	Comment ID No.	Comment Type	Comment	Response
50	9	Wendy Worthey, Adam Poll, Ryan Henry, M. Howard, Perry Russel, M. Greene, Joshua Saunders, B. Grattidge, **Dudek** on behalf of CPUC	50.47	CEQA	The introduction to the mitigation measures NEEDS to specify that the measures apply only to the California segment of the Project. Also, it is unclear in some of the measures whether the mitigation action (e.g., restoration) would be allowable on BLM land or whether it would be required to occur on non-public lands in California. Please clarify.	Text added to the introduction of Appendix 1C to clarify the geographic extent of the CEQA impact analysis and resulting MMs.
50	9	Wendy Worthey, Adam Poll, Ryan Henry, M. Howard, Perry Russel, M. Greene, Joshua Saunders, B. Grattidge, **Dudek** on behalf of CPUC	50.48	M&M	Revise measure name to read “Implement Biological Resources Applicant Proposed Measures and Best Management Practices”. This measures also reads “The APMS, BLM BMPS, and CMAs in Section 2.4.2 and 2.4.3 above provide a suite of BMPs to be implemented for the Project”; however, Section 2.4.3 does not say that the CMAs will be implemented. Section 2.4.3 describes how the CMAs are being complied with using the APMs and BMPs. This MM appears to say that all the CMAs in Section 2.4.3 will be required to be implemented; however, I am not certain that is true. BLM is not requiring the CMAs, as written, to be implemented on their lands. Also this measure should specify that the BLM BMPs would be implemented on both the public and non-public lands in California, if that is indeed the case.	Added to measure name. Additional text added to measure in response to the spirit of your comments.
50	9	Wendy Worthey, Adam Poll, Ryan Henry, M. Howard, Perry Russel, M. Greene, Joshua Saunders, B. Grattidge, **Dudek** on behalf of CPUC	50.49	VEG	Measure states that “Applicant will provide creation and/or restoration of habitat at the following ratios….”, however, it later says “land identified for preservation would….”. Does this measure allow for preservation of habitat to compensate for this permanent impacts If so, text revisions are necessary. Also, must discuss the feasibility of creating/restoring ironwood woodland or mesquite thickets; as written, it is not reasonable to believe that the creation/restoration of these communities is a feasible and achievable measure. Impact acreages listed here are vastly different from the impact numbers listed in DEIS Table 4.4-4 (page App 4-8).	Text updated in MM BIO-CEQA-12 (Appendix 1C) as requested.
50	9	Wendy Worthey, Adam Poll, Ryan Henry, M. Howard, Perry Russel, M. Greene, Joshua Saunders, B. Grattidge, **Dudek** on behalf of CPUC	50.50	DATA	Figure must show the BLM NCLs designation in California, based on the DRECP LUPA. And the document must be revised to address the NCLs designation in California, similar to the way ACECs are addressed.	Added NCLs to the special designations figure (Figure 3.5-10), and text to the EIS and TES to describe NCLs. Note, there are no NCLs within the analysis area for special designations.
50	9	Wendy Worthey, Adam Poll, Ryan Henry, M. Howard, Perry Russel, M. Greene, Joshua Saunders, B. Grattidge, **Dudek** on behalf of CPUC	50.51	DATA	Figure must show the BLM SRMAs in California, based on the DRECP LUPA.	The Mule Mountains SRMA was added to Figure 3.10-1. This SRMA was already described in the text.
50	9	Wendy Worthey, Adam Poll, Ryan Henry, M. Howard, Perry Russel, M. Greene, Joshua Saunders, B. Grattidge, **Dudek** on behalf of CPUC	50.52	DATA	Figure must show the BLM SRMAs in California, based on the DRECP LUPA.	The Mule Mountains SRMA was added to Figure 3.10-6. This SRMA was already described in the text.

Response ID No.	Number of Signatures	Name	Comment ID No.	Comment Type	Comment	Response
50	9	Wendy Worthey, Adam Poll, Ryan Henry, M. Howard, Perry Russel, M. Greene, Joshua Saunders, B. Grattidge, **Dudek** on behalf of CPUC	50.53	DATA	Figure must be revised to show the current ACECs in California, based on the DRECP LUPA. Figure must also show the BLM SRMAs in California, based on the DRECP LUPA. Figure must also show the BLM National Conservation Lands (NCLs) designations and the Development Focus Areas (DFAs) designations in California, based on the DRECP LUPA.	The Mule Mountains ACEC was added to Figure 3.11-1c for the recreation section; however, this ACEC does not fall within the analysis area for special designations. ACECs, SRMAs, NCL, and DFA was added to the recreation and special designation figures, as appropriate, and the text was revised to ensure these designations are described for CA.
50	9	Wendy Worthey, Adam Poll, Ryan Henry, M. Howard, Perry Russel, M. Greene, Joshua Saunders, B. Grattidge, **Dudek** on behalf of CPUC	50.54	GEN	PDF file on BLM website would not open or download after multiple attempts.	Comment noted.
50	9	Wendy Worthey, Adam Poll, Ryan Henry, M. Howard, Perry Russel, M. Greene, Joshua Saunders, B. Grattidge, **Dudek** on behalf of CPUC	50.55	DATA	ACECs shown in California are outdated and do not reflect the current ACECs based on the DRECP. Must be updated with current information. This map and the document also do not address the BLM National Conservation Lands (NCLs) designations. This map must also show the DFAs if you intend to reflect all relevant designations.	The Mule Mountains ACEC was added to Figure 3.2-2c for the recreation section; however, this ACEC does not fall within the analysis area for special designations. ACECs, SRMAs, NCL, and DFA were added to the recreation and special designation figures, as appropriate, and the text was revised to ensure these designations are described for CA.
50	9	Wendy Worthey, Adam Poll, Ryan Henry, M. Howard, Perry Russel, M. Greene, Joshua Saunders, B. Grattidge, **Dudek** on behalf of CPUC	50.56	DATA	Figure must show the BLM NCLs designation in California, based on the DRECP LUPA.	NCLs were added to Figure 3.4-5.
50	9	Wendy Worthey, Adam Poll, Ryan Henry, M. Howard, Perry Russel, M. Greene, Joshua Saunders, B. Grattidge, **Dudek** on behalf of CPUC	50.57	DATA	Figure must show the BLM SRMAs in California, based on the DRECP LUPA.	SRMAs in CA were added to Figure 3.8-1.
50	9	Wendy Worthey, Adam Poll, Ryan Henry, M. Howard, Perry Russel, M. Greene, Joshua Saunders, B. Grattidge, **Dudek** on behalf of CPUC	50.58	DATA	ACECs shown in California are outdated and do not reflect the current ACECs based on the DRECP. Must be updated with current information.	Current ACECs were added to Figure 3.8-6.
50	9	Wendy Worthey, Adam Poll, Ryan Henry, M. Howard, Perry Russel, M. Greene, Joshua Saunders, B. Grattidge, **Dudek** on behalf of CPUC	50.59	SOIL	Although tabular soils data is provided in Appendix 3, there does not appear to be an Appendix 3A containing soils maps. Please include.	Figures including soils maps are contained in Appendix 7.
50	9	Wendy Worthey, Adam Poll, Ryan Henry, M. Howard, Perry Russel, M. Greene,	50.60	GEN	In the first sentence of the section, Section 3.3 should be changed to Section 3.2.	Section numbers were incorrect in Appendix 3; Section 3.3 will be correct for the FEIS.

Response ID No.	Number of Signatures	Name	Comment ID No.	Comment Type	Comment	Response
		Joshua Saunders, B. Grattidge, **Dudek** on behalf of CPUC				
50	9	Wendy Worthey, Adam Poll, Ryan Henry, M. Howard, Perry Russel, M. Greene, Joshua Saunders, B. Grattidge, **Dudek** on behalf of CPUC	50.61	NOISE	There seems to be an inconsistency between the findings of significance (significant and unavoidable) in Section 2.12.4.1, Construction, and the subsequent discussions regarding decommissioning noise ("It is expected that impacts resulting from the decommissioning process would be like the impacts during construction of the Project. As discussed above, with implementation of APMs, compliance with County of Riverside, and City of Blythe (as necessary) local ordinances, noise impacts from construction, operation, and maintenance of the Project would be less than significant."	Noise analysis modified to make LTS/M consistent throughout noise section.
50	9	Wendy Worthey, Adam Poll, Ryan Henry, M. Howard, Perry Russel, M. Greene, Joshua Saunders, B. Grattidge, **Dudek** on behalf of CPUC	50.62	GEN	Apparent spelling error: "were" should be "where".	Corrected in Section 2.12 of Appendix 1C.
50	9	Wendy Worthey, Adam Poll, Ryan Henry, M. Howard, Perry Russel, M. Greene, Joshua Saunders, B. Grattidge, **Dudek** on behalf of CPUC	50.63	NOISE	Impact NOI-3 lacks a discussion of typical groundborne vibration levels from construction equipment, the reduction of vibration with distance, etc.	Please see Impact NOI-2 in Section 2.13.5 of Appendix 1C which discusses ground-borne vibrations.
50	9	Wendy Worthey, Adam Poll, Ryan Henry, M. Howard, Perry Russel, M. Greene, Joshua Saunders, B. Grattidge, **Dudek** on behalf of CPUC	50.64	VIS	Information to adequately address this comment is included in the Project record but should be clearly presented in the CEQA Appendix to meet CEQA requirements. The analysis states that the Project would appear in views from Interstate 10 and "other locations in the vicinity of Blythe" but does not specifically state whether scenic vistas are available from Interstate 10 and what other locations may provide opportunities for scenic vistas. Please clarify what "other locations" were considered. This comment can be addressed by inserting a discussion/overview of the Project study area located west of the Colorado River as described in Section 3.11.2.2, Visual Resources Study Area Overview, of the EIS. In particular, incorporation of the language on Page 3-53 disclosing where the Proposed Action would be visible from and language on 3-56 beginning with "The western end of the study area…" and ending with "the area offers broken views of distant rugged mountains in all directions." In addition, the analysis for scenic vista impacts from Interstate 10 should be bolstered by incorporation of visual contrast rating form observations/"comments" that were prepared for KOPs 55 and 56 and are included in the Project record (see TES Appendix 3C page 289 of 322 and in particular, comments pertaining to operations (for KOP 55) and page 297 of 322 and in particular, comments pertaining to scenic quality). In addition, KOP 52 (and visual contrast rating from observations; TES Appendix 3C or the KOP 52 analysis for the Colorado River and California Zone included in the TES (Chapter 4.18, Section 4.18.4.5) can be a surrogate for Interstate 10 due to proximity.	Revised in Section 2.1 of Appendix 1C.
50	9	Wendy Worthey, Adam Poll, Ryan Henry, M. Howard,	50.65	VIS	Information to adequately address this comment is included in the Project record but should be clearly presented in the CEQA Appendix to meet CEQA requirements.	Clarified in Section 2.1 of Appendix 1C. The important point to make here is that, where visible, the Project / alternatives would be intermittent or distant.

Response ID No.	Number of Signatures	Name	Comment ID No.	Comment Type	Comment	Response
		Perry Russel, M. Greene, Joshua Saunders, B. Grattidge, **Dudek** on behalf of CPUC			The analysis should clarify whether the Project is a) visible from segments of Interstate 10 and State Route 95 within the Palo Verde Valley and b) whether project construction would result in substantial damage to existing scenic resources including trees, rock outcroppings, and historic buildings. Incorporate visual contrast rating form observations/"comments" for operations that were prepared for KOP 55 (I-10) and KOP 41 (I-10 at Colorado River crossing) which approximates views from US 95 near Blythe. The bulk of the analysis provides proximities of the interstate and state route to Project components, but potential effects to scenic resources present in their viewshed are not specifically addressed and should be clarified to meet CEQA requirements. Also, as an alternative to referring to the Impact AES-3 analysis, incorporate relevant effects discussions pertaining to views from Interstate 10 and State Route 52 (if the Project would be visible from State Route 52). Utilize before and after observations documented in the visual contrast rating forms (TES Appendix 3C) or the KOP analysis for the Colorado River and California Zone included in the TES (Chapter 4.18, Section 4.18.4.5).	No scenic resources as described would be damaged within the highway corridors, or their viewsheds. Clarification also added indicating that ground disturbance described in the TES and Visual Contrast Rating Forms would constitute scaring impacts.
50	9	Wendy Worthey, Adam Poll, Ryan Henry, M. Howard, Perry Russel, M. Greene, Joshua Saunders, B. Grattidge, **Dudek** on behalf of CPUC	50.66	VIS	Information to adequately address this comment is included in the Project record but should be clearly presented in the CEQA Appendix to meet CEQA requirements. Add support for the existing character analysis by incorporating a discussion of typical effects anticipated at appropriate KOPs located west of the Colorado River in California. The selected KOPs should reflect the viewer groups in California (i.e., motorists, recreationists, urban and ag receptors) and the before and after effects can be sourced from visual character rating forms. KOP 45 (McIntyre County Park – recreationists), 55 (I-10), 51 (22nd Avenue at Lovekin Boulevard – ag receptors), and 47 (Appleby Elementary – urban receptors) are examples of KOPs that encompass the range of receptors previously identified in the study area located west of the Colorado River.	In Section 2.1 of Appendix 1C, added specification of limited effects to views w/in Blythe, west of Colorado River.
50	9	Wendy Worthey, Adam Poll, Ryan Henry, M. Howard, Perry Russel, M. Greene, Joshua Saunders, B. Grattidge, **Dudek** on behalf of CPUC	50.67	M&M	Please ensure that the MMRP includes specificity regarding the implementation of this mitigation measure. For example, the MMRP should identify where construction will expose gravel and rock and should identify whom will determine whether impacts would be considered an "attention-attracting disturbance".	Noted; FEIS addresses this.
50	9	Wendy Worthey, Adam Poll, Ryan Henry, M. Howard, Perry Russel, M. Greene, Joshua Saunders, B. Grattidge, **Dudek** on behalf of CPUC	50.68	M&M	Information to adequately address this comment is included in the Project record but should be clearly presented (and clarified) in the CEQA Appendix to meet CEQA requirements. The analysis discloses that the new transmission line would be "similar in scale, if not completely in structure type to an adjacent, existing transmission line." The analysis also states that towers and conductors would repeat the vertical and undulating horizontal elements in existing views and concludes that impacts would be less than significant. If this is the case (and if no FAA or other lighting will be required for transmission line towers) please clarify why MM VIS-04 and MM VIS-06 are necessary. The measures seem to be redundant to the design characteristics of the Project, as proposed.	These are the programmatic mitigation measures that would apply to the entire Project. Appendix 1C lists all MMs from the DEIS that would apply to segments within CA. Other MMs apply to specific segments outside of CA.
50	9	Wendy Worthey, Adam Poll, Ryan Henry, M. Howard, Perry Russel, M. Greene, Joshua Saunders, B. Grattidge,	50.69	VIS	Information to adequately address the comments below are included in the Project record but should be clearly presented (and clarified) to specifically address effects thresholds. Please revise the headings to Sections 4.11.5.1, 4.11.5.2, and 4.11.5.3 (or add introductory statements) to clarify which environmental effects indicators are focused on in the sections.	Clarification was added within the text in Section 4.11 of EIS. Additional information is provided in the VCRFs in Appendix 3C of the TES.

Response ID No.	Number of Signatures	Name	Comment ID No.	Comment Type	Comment	Response
		Dudek on behalf of CPUC			Instead of “Residents and Local Viewers” for Section 4.11.5.3, it may make sense to relabel as “Visual Change and Effects to Views” as the analysis in the section is primarily supported by a before/after KOP analysis. Recommend also expanding the discussion in this section to provide a greater volume of before/after KOP analyses to present a more familiar analysis and provide support for adverse determinations and mitigation measures.	
50	9	Wendy Worthey, Adam Poll, Ryan Henry, M. Howard, Perry Russel, M. Greene, Joshua Saunders, B. Grattidge, **Dudek** on behalf of CPUC	50.70	GEN	In first paragraph of analysis – insert TES after “Section 3.17.1 of the”. Typo	Corrected in Section 2.16 of Appendix 1C.
50	9	Wendy Worthey, Adam Poll, Ryan Henry, M. Howard, Perry Russel, M. Greene, Joshua Saunders, B. Grattidge, **Dudek** on behalf of CPUC	50.71	GEN	Information to adequately address this comment is included in the Project record but should be clearly presented (and clarified) in the CEQA Appendix to meet CEQA requirements. In second paragraph of analysis, please include a reference to the table in the TES that supports the claim that cumulative additional volume would represent a volume increase of one percent or less on various segments of I-10 and US-95.	The references to the TES will be checked after all comments are resolved and no further edits are needed.
50	9	Wendy Worthey, Adam Poll, Ryan Henry, M. Howard, Perry Russel, M. Greene, Joshua Saunders, B. Grattidge, **Dudek** on behalf of CPUC	50.72	LWC	Clarification is required to adequately address the comment below. Please clarify whether Project effects to LWC Polygon 35_SW (located west of the town of Quartzite) would be adverse. The DEIS discloses that the Project would effectively eliminate LWC Polygon 35_SW, that effects would be long-term and “minor to major” however, a clear determination is not provided.	In the TES Section 4.11.10, Unavoidable Adverse Effects, already states: Unavoidable adverse effects to special designations would occur from reducing LWC Polygon 35_SW to less than 5,000 acres, which would affect its designation as LWC, and moderate to major effects on the WA criteria required of LWC. Whether effects are adverse or beneficial are not qualified in the TES or FEIS.
50	9	Wendy Worthey, Adam Poll, Ryan Henry, M. Howard, Perry Russel, M. Greene, Joshua Saunders, B. Grattidge, **Dudek** on behalf of CPUC	50.73	SOC	No comments. Socioeconomics is not normally an environmental effect under CEQA unless related to population/housing/growth or urban decay. No such impacts are identified.	Comment noted.
50	9	Wendy Worthey, Adam Poll, Ryan Henry, M. Howard, Perry Russel, M. Greene, Joshua Saunders, B. Grattidge, **Dudek** on behalf of CPUC	50.74	EJ	“Income data for the city of Blythe CDP, the CCD area of Blythe, Ripley CDP, and Mesa Verde CDP were presented in Section 3.10.2.3. These local areas along the Proposed Action and Action Alternatives have low-income percentages that are greater than the EJ.” What does “greater than the EJ” mean? Should that read greater than the County average?	The sentence was incomplete (Section 4.10.4.3 of DEIS); it should have read “the EJ comparison area.” The EJ study or comparison area is a 1-mile corridor encompassing the Proposed Action and Action Alternative segments. The analysis area includes the study area and all census block groups crossed by the Proposed Action and Action Alternative segments. This ensures the inclusion of adjacent and nearby communities that may be affected.
50	9	Wendy Worthey, Adam Poll, Ryan Henry, M. Howard, Perry Russel, M. Greene, Joshua Saunders, B. Grattidge, **Dudek** on behalf of CPUC	50.75	CEQA	This section does not clearly identify what category of impact would be considered cumulatively considerable (significant) under CEQA. “Aside from the identification of cumulative effects to Tribal Resources (Section 4.7 of the TES [BLM 2018]), no major or significant cumulative effects were identified in the TES for the portions of the Project area within the Colorado River and California Zone.” From this can we determine that there is a	As noted in Section 4.7.11 of the TES, an increase in visual degradation along segments p-17 and p-18 may result in a moderate to major cumulative impact on the Mule Tank Discontiguous Rock Art District. The BLM Preferred Alternative does not utilize segments p-17 or p-18. Minimization of cumulative effects of this Project would be addressed through avoidance of

Response ID No.	Number of Signatures	Name	Comment ID No.	Comment Type	Comment	Response
					cumulative impact for Tribal Resources within California? Are negligible, minor, and moderate cumulative impacts considered to be less than significant?	sites and minimization of the Project footprint, before any consideration of mitigation of sites and data recovery. As noted in Section 2.6.5 of Appendix 1C, impacts to tribal resources would be potentially significant – less than significant with mitigation.
50	9	Wendy Worthey, Adam Poll, Ryan Henry, M. Howard, Perry Russel, M. Greene, Joshua Saunders, B. Grattidge, **Dudek** on behalf of CPUC	50.76	GEN	Section states that "[W]here the analysis determines that impacts would be similar to the Project, the Project is selected as environmentally superior for that resource area." It would be more accurate to say that for that resource, an environmentally superior alternative has not been identified. If this statement were taken on its face value, then the selection of Alternative 2 Sub 4D as the environmentally superior alternative (in Section 4.4) is incorrect.	Revised sentence in Section 4.1 of Appendix 1C to read "Where the analysis determines that impacts would be similar to the Project, an environmentally superior alternative for that resource area has not been identified."
50	9	Wendy Worthey, Adam Poll, Ryan Henry, M. Howard, Perry Russel, M. Greene, Joshua Saunders, B. Grattidge, **Dudek** on behalf of CPUC	50.77	VIS	Aesthetics should be called out separately, as project alternatives would result in a potentially significant impact even though the proposed project would be less than significant. (This is consistent with other resources called out in this section, such as Agriculture).	Revised (Section 4.1, Appendix 1C).
50	9	Wendy Worthey, Adam Poll, Ryan Henry, M. Howard, Perry Russel, M. Greene, Joshua Saunders, B. Grattidge, **Dudek** on behalf of CPUC	50.78	VIS	For consistency, Aesthetics should be given its own subheading. "Other Resources" that are less than significant for the project and all project alternatives include air quality, GHG, minerals, population/housing, public services, transportation, geology, and hydrology/water quality.	Moved Aesthetics to its own subsection, now Section 4.1.1 in Appendix 1C. Added sentence as to what other resources (Section 4.1.16 in Appendix 1C) includes.
50	9	Wendy Worthey, Adam Poll, Ryan Henry, M. Howard, Perry Russel, M. Greene, Joshua Saunders, B. Grattidge, **Dudek** on behalf of CPUC	50.79	GEN	"…near Alamitos and Huntington Beach combined cycle as plants." Delete "as"?	This was a typo; "as" should have been "gas". Corrected in Section 4.3 of Appendix 1C.
50	9	Wendy Worthey, Adam Poll, Ryan Henry, M. Howard, Perry Russel, M. Greene, Joshua Saunders, B. Grattidge, **Dudek** on behalf of CPUC	50.80	GEN	Make "2" superscript to indicate footnote.	Corrected in Section 4.3 of Appendix 1C.
50	9	Wendy Worthey, Adam Poll, Ryan Henry, M. Howard, Perry Russel, M. Greene, Joshua Saunders, B. Grattidge, **Dudek** on behalf of CPUC	50.81	GEN	See comment on page 190. Alt 2 Sub 4D is only the environmentally superior alternative if the project is not considered automatically superior when alternative impacts are similar.	Revisions made in Section 4.4 of Appendix 1C based upon the comment provided on page 190.
50	9	Wendy Worthey, Adam Poll, Ryan Henry, M. Howard, Perry Russel, M. Greene, Joshua Saunders, B. Grattidge, **Dudek** on behalf of CPUC	50.82	GEN	The impact conclusions text in the various impacts sections should be compared to the impact conclusions in Table 4.1.1. There are some discrepancies that need to be changed or at least clarified.	Discrepancies in Appendix 1C have been fixed. Section 4.1, including table 4.1-1 and the alternatives discussion related to each resource has been revised to accurately reflect conclusions (impact determinations and mitigation measures) in current CEQA Appendix.

Response ID No.	Number of Signatures	Name	Comment ID No.	Comment Type	Comment	Response
50	9	Wendy Worthey, Adam Poll, Ryan Henry, M. Howard, Perry Russel, M. Greene, Joshua Saunders, B. Grattidge, **Dudek** on behalf of CPUC	50.83	CEQA	The DEIS and Appendix 1C (Supplemental California Public Utilities Commission Information) partially rely on APMs, BMPs, and CMAs to mitigate environmental impacts, most notably potential impacts to biological resources impacts. However, some of these measures are either project design features, are inconsistent with each other, or do not adequately provide enough information to ensure that implementation would occur, be trackable, and/or be enforceable as is required pursuant to CEQA. In addition, phrases such as "where possible", "where practicable", "as required by BLM", "on public lands in California", etc. do not provide solid assurances that these proposed measures would be implemented along the entire project alignment and substation locations in California. Furthermore, because survey data was not available when the DEIS and Appendix 1C were prepared and will not be available before the FEIS, concluding that avoidance of all resources based on APMs, BMPs, and CMAs is not possible. As such, and discussed previously with BLM, a worst-case scenario should be assumed in California and addressed with appropriate mitigation. Relevant to any of the instances described above, and to ensure CEQA compliance, a MM must be proposed in the Appendix 1C and the MMCRP that provides at a minimum, the following information to address each potential impact where it has not yet been included: • What potential impact is being mitigated with implementation of the MM? In other words, why is the MM necessary? How will implementation of the MM be achieved to ensure that the end result is a less than significant impact? • Where will the MM be implemented? On both public and non-public lands? Specific to compensatory mitigation, where will this be implemented? • When will the MM be implemented? Prior to, during, or after construction? If during construction, include the anticipated phases and anticipated duration. Will specific seasonal restrictions apply to various areas of the project based on the presence of resources determined through surveys prior to construction? • Who will be responsible for implementation of each MM? • Who will be responsible for mitigation implementation oversight and enforceability? Note that if the CPUC uses the EIS pursuant to CEQA Guidelines Section 15221 rather than preparing their own EIR, the CPUC will be responsible for enforcement of mitigation implementation in the California portion of the project. • Use terminology in the MM and MMCRP such as "shall" and "must." Specific and appropriate mitigation requirements, including compensatory mitigation must be included in Appendix 1 C (and in the FEIS when Appendix 1C is relying on the NEPA document). Furthermore, for consistency and accuracy, any text in the analysis of impacts that requires mitigation to bring potentially significant impacts to less than significant levels must be revised accordingly. Also, ensure that as all mitigation is being developed and/or refined in the FEIS and Appendix 1C, that both permanent and temporary impacts during construction and operations are being considered and addressed. Please refer to all previous comments for specific examples where this issue with mitigation has been raised, and review all other text in Appendix 1C to ensure that this approach regarding including mitigation pursuant to CEQA has been adequately incorporated for all	MMs revised throughout Appendix 1C.

Response ID No.	Number of Signatures	Name	Comment ID No.	Comment Type	Comment	Response
					resources as needed.	
50	9	Wendy Worthey, Adam Poll, Ryan Henry, M. Howard, Perry Russel, M. Greene, Joshua Saunders, B. Grattidge, **Dudek** on behalf of CPUC	50.84	GEN	The impact conclusions text in the various impacts sections should be compared to the impact conclusions in Table 4.1.1. There are some discrepancies that need to be changed and/or clarified. Based on all the comments above, and what should result in a detailed check of all current and necessary additional mitigation measures and significance conclusions, this could also result in a few changes (for accuracy and consistency) to the Alternatives discussion.	Section 4.1, including Table 4.1-1 and the alternatives discussion related to each resource has been revised to accurately reflect conclusions (impact determinations and mitigation measures) in current CEQA Appendix.
50	9	Wendy Worthey, Adam Poll, Ryan Henry, M. Howard, Perry Russel, M. Greene, Joshua Saunders, B. Grattidge, **Dudek** on behalf of CPUC	50.85	NOISE	Construction noise was conservatively determined to be significant and unavoidable. Some of the typical construction measures are incorporated as APMs and BMPs, for example: BMP NO-05: County, State, and Federal Noise Regulations. Project would be located far enough from residences, or include engineering and/or operational methods such that county, state, and/or federal regulations for noise are not exceeded. It is not particularly clear how this BMP would lower the exposure to construction noise at any particular location. The BMP also lacks a commitment that construction shall be limited to the timeframes allowable by local noise ordinances. As such, a MM should be proposed to include this commitment. If not already clear in the analysis, the MM should also include additional detail such as defining the hours of construction and assumptions regarding noise generated by various construction equipment/activities. Furthermore, and specific to the conclusion of significant and unavoidable, feasible MMs that could minimize significant adverse impacts should be included. It's also possible that the conclusion could be revised to "less than significant with mitigation." If the conclusion is still significant and unavoidable even after mitigation, this would be acceptable provided there is adequate information included to support that even after all feasible mitigation has been considered and implemented, the significance conclusion would remain the same.	Noise analysis has been revised in Appendix 1C Section 2.13 and new mitigation has been added to make impacts Less Than Significant with Mitigation.
50	9	Wendy Worthey, Adam Poll, Ryan Henry, M. Howard, Perry Russel, M. Greene, Joshua Saunders, B. Grattidge, **Dudek** on behalf of CPUC	50.86	TRAN	Referring to BMP T&T-09: Repairs to Local Roads. Local roads would be restored if road damage occurred as a result of Project construction. Include a MM that provides additional detail, including at a minimum, identifying who will determine the damage and its extent, when these road inspection(s) would occur, and who would repair the damage and when (i.e., within a specified timeframe of the damage would the repairs occur).	New mitigation added to Section 2.17 (Traffic and Transportation) to address this comment. Specifically, who will repair the damage, verified by applicable jurisdiction, and when damage will be repaired added to new mitigation measure.

ALJ/DAP/mph **Date of Issuance 11/5/2021**

Decision 21-11-003 November 4, 2021

BEFORE THE PUBLIC UTILITIES COMMISSION OF THE STATE OF CALIFORNIA

In the Matter of the Application of DCR TRANSMISSION, LLC for a Certificate of Public Convenience and Necessity for the Ten West Link Project.	Application 16-10-012

DECISION GRANTING DCR TRANSMISSION, LLC A CERTIFICATE OF PUBLIC CONVENIENCE AND NECESSITY FOR THE TEN WEST LINK PROJECT

TABLE OF CONTENTS

Title **Page**

DECISION GRANTING DCR TRANSMISSION, LLC A CERTIFICATE OF PUBLIC CONVENIENCE AND NECESSITY FOR THE TEN WEST LINK PROJECT

Summary

This decision grants DCR Transmission, LLC (DCRT) a certificate of public convenience and necessity (CPCN) for the Ten West Link Transmission Line Project, to construct a 125-mile, series-compensated 500 kilovolt transmission line with a conductor capacity of approximately 3200 megawatts between the Colorado River 500 kilovolt substation, owned by Southern California Edison Company, and Delaney 500 kilovolt substation, owned by Arizona Public Services Company.

This CPCN is conditioned upon DCRT's compliance with (a) the Mitigation Monitoring and Reporting Plan attached to this decision; (b) the Electric and Magnetic Fields Field Management Plan, filed as updated pursuant to the Final Environmental Impact Statement based on environmentally superior alternative route and configuration; (c) the Applicant's Proposed Measures for Safety and the Bureau of Land Management's Required Best Management Practices, attached as Appendix 2A of the FEIS; and (d) all other necessary state and local permitting processes and approvals.

This decision also certifies that the FEIS satisfies the requirements under National Environmental Policy Act and California Environmental Quality Act and concludes the maximum reasonable and prudent cost for the Ten West Link Transmission Line Project is $389,045,968 in 2021 dollars, including contingency, subject to the Commission's authority to review actual costs incurred for reasonableness and prudency and to challenge them as appropriate at the Federal Energy Regulatory Commission.

Lastly, this decision:

(a) authorizes DCRT to file the FERC Forms 1 and 3-Q as proxies to meet the requirements of General Orders (GOs) 65-A and 104-A;

(b) denies DCRT's requested exemption from the reporting requirements under GO 77-M; and

(c) grants DCRT limited exemption from the sections V.C., V.E. and V.G. of the Affiliate Transaction Rules.

This proceeding is closed.

1. Background

1.1. Proposed Project Description

Ten West Link Transmission Line Project is a proposed 125-mile 500 kilovolt (kV) single-circuit, series-compensated, transmission line project (Proposed Project). The California Independent System Operator (CAISO) Board, in the 2013-2014 Transmission Planning Process (TPP), approved the Proposed Project to provide economic benefits for California ratepayers.[1] The Proposed Project will span between the Delaney Substation (located just north of the Palo Verde generating plant in Tonopah, Maricopa County, Arizona) and the Colorado River Substation (located west of the Arizona-California border in Riverside County, California).

The Delaney Substation is owned and operated by Arizona Public Service (APS) and connected to the Palo Verde-Hassayampa Common Bus. The Colorado River Substation is owned and operated by Southern California Edison (SCE) and connected at the 500 kV bus.

[1] *Opening Brief of the California Independent System Operator Corporation*, filed February 12, 2021 (CAISO Opening Brief), at 1. *See also*, *Application of DCR TRANSMISSION, LLC for a Certificate of Public Convenience and Necessity for the Ten West Link Project* (Application), Appendix M.

Spanning approximately 103.5 miles in Arizona and 21.5 miles in California, the proposed route of the Proposed Project largely follows the existing Devers-Palo Verde (DPV) 500 kV transmission line and utilizes the established utility corridor, crossing Federal land, including lands managed by the Bureau of Land Management (BLM), Bureau of Reclamation (Reclamation), and the United States Army, Yuma Proving Ground (YPG).[2]

The Proposed Project will have a conductor capacity to transmit 3,200 megawatt (MW) and provide interconnection capability for new energy projects located in the region.[3] Once the Proposed Project is constructed and energized, DCRT intends to establish a second contiguous 500 kV transmission connection from the Palo Verde trading hub in Arizona to the Devers substation in Southern California.

The Proposed Project construction includes:

1. Installation of a single 500 kV transmission circuit supported by a combination of self-supporting and guyed galvanized steel lattice towers, and
2. Construction of a new series compensation substation (SCS), to be located within the 200-foot-wide right of way (ROW) parallel to the existing SCS associated with the DPV transmission line, approximately 47 miles from the APS Delaney Substation.[4]

The proposed transmission structures will comprise of steel lattices of various configurations[5] and between 72 and 195 feet in height, depending on the span length required and topography, with most being shorter than 142 feet.

[2] Record of Decision (ROD), November 22, 2019, at 2.

[3] Final Environmental Impact Statement (FEIS), Executive Summary, at ES-1.

[4] A detailed description of Project facilities is found in Application under Appendix A.

[5] FEIS, Executive Summary, at ES-5-ES-6.

Span lengths between structures would vary from 400 to 2,300 feet, depending upon terrain conditions, current land use, structure type, and site-specific mitigation objectives. Since the new SCS will be in Arizona, this decision focuses on the proposed transmission lines located within California, in the context of the overall Proposed Project.

The CAISO's 2013-2014 economic evaluation projected the benefit-to-cost ratio (BCR) for the Proposed Project to range from 0.87 to 1.17, with a discount rate ranging between five to seven percent.[6] The CAISO concluded that adding the Proposed Project provides Southern California with more direct access to efficient generation at Palo Verde Trading Hub and APS system.[7] Based on 8,760 hourly production simulations for the study years 2018 and 2023, the CAISO calculated annual ratepayer benefits to be $26 million in 2018 and $17 million in 2023, respectively. In July 2015, the CAISO selected DCRT, as the approved project sponsor for the Proposed Project, to develop, permit, design, finance, build, own, operate and maintain the Proposed Project in accordance with the CAISO tariff. DCRT and CAISO entered into the Approved Project Sponsor Agreement (APSA) on December 1, 2015.[8]

DCRT is a limited liability company organized under the laws of Delaware and a joint venture between Starwood Energy Group Global, Inc. (Starwood Energy) and Atlantica Yield PLC (Atlantica).[9] Starwood Energy, through its

[66] Application, Appendix M, *2013-2014 Transmission Plan*, dated July 16, 2014 (2013-2014 TPP) at 266.

[7] *Id*., at 255.

[8] Application, Appendix N.

[9] Exhibit DCRT-1, Chapter I, *Prepared Direct Testimony of DCR Transmission, L.L.C. in Support of Its Application for a Certificate of Public Convenience and Necessity for the Ten West Link Project, Prepared Direct Testimony of Ali Amirali in Support of DCRT* (Amirali Opening Testimony), at I-3.

affiliates, is the managing member of DCRT with an 87.5% majority ownership interest. Atlantica holds a 12.5% minority ownership interest.[10]

Starwood Energy, an affiliate of private real estate investment firm Starwood Capital Group, specializes in energy infrastructure investments, with a focus on the transmission, renewable power generation, and natural gas sectors.[11] Through its general opportunity funds and other affiliated investment vehicles, Starwood Energy manages more than $2 billion in total equity commitments with transactions totaling more than $4 billion in enterprise value. Starwood Energy developed, constructed, and owned two major transmission projects: 1) the Neptune Regional Transmission System, a 65-mile, 660 MW undersea transmission power cable connecting Long Island to New Jersey, and 2) Hudson Transmission Partners, an 8-mile, 660 MW undersea transmission power cable connecting New Jersey to New York City.[12] Both lines were completed under budget and ahead of schedule.[13]

Starwood Energy also owns minority interest in certain transmission lines in California, Arizona, and Nevada, and developed wind generation in Texas, gas generation in California, and solar generation in Ontario, Canada.[14] Starwood Energy's total investments include 65 MW biomass, 940 MW of wind generation, and 1.8 gigawatt (GW) of gas generation, including current

[12] *Id.,* at 18.

[13] *Ibid*.

[14] *Ibid.*

ownership of two 50 MW gas projects in California, as well as investments in energy storage platforms.[15]

In 2019, the CAISO updated its economic analysis for the Proposed Project based on the study assumptions, base cases, and Commission-developed renewable generation portfolios prepared for the 2019-2020 TPP studies, due to significant changes in both state policy and electricity market conditions since the CAISO Board approval.[16] The CAISO assessed both the production cost and capacity benefits associated with the Proposed Project[17] with reliability and public policy benefits in meeting overall resource adequacy (RA) and energy needs, including additional transmission capacity to the southwest and improving interregional opportunities for diversity benefits of sharing resources.[18]

The CAISO's updated economic evaluation projected an increase in the BCR for the Proposed Project, since the 2013-2014 TPP, to range from 1.16 to 1.54 in the baseline analysis using the avoided cost of battery storage to quantify capacity benefits.[19] In the higher gas price sensitivity, the range of BCR increased from 1.48 to 1.89 using the same avoided cost of battery storage to quantify capacity benefits.[20] Using the locational renewable cost savings to calculate

[20] *Id*. at 11, Table 5.

capacity benefits, the CAISO projected the BCR to range from 1.00 to 1.56.[21] Overall, the CAISO concluded in each of the differing scenarios that the Proposed Project would consistently produce positive BCR, even after heavily discounting the potential capacity benefits.

All parties anticipate economic, reliability, and policy benefits to California ratepayers from the Proposed Project, although at differing levels.[22] The CAISO's updated analysis currently projects the BCR to range from 1.05 to 1.66, depending on the sensitivities and accounting for the uncertainties, discussed in detail in Sections 5.1.1 through 5.1.4. DCRT anticipates the BCR to range from 1.78 to 2.66, depending on one of the three production cost model (PCM) scenarios, discussed in detail in Section 5.2.1, below.[23] Cal Advocates anticipates a lower BCR range between 0.55 and 0.73, based on differing assumptions.[24]

1.2. Procedural Background

On October 12, 2016, DCRT filed an application for a certificate of public convenience and necessity (CPCN) to build the Proposed Project pursuant to the Rule 3.1 of Commission Rules of Practice and Procedure (Rules), and General Order (GO) 131-D (Application). Concurrent with the Application, DCRT moved to file the redacted portions of Appendixes D, J and N under seal pursuant to GO 66-D, Public Utilities (Pub. Util.) Code § 583, and Rules 11.1 and 11.4.

---

[21] *Id*. at 12-13, Tables 6 and 7.

[22] Application, at 2, *citing to* Memorandum from Keith Casey, Vice President, *Market & Infrastructure Development to ISO Board of Governors* (July 8, 2014).

[24] Exh. CA PA-3, *Chapter 2: Ten West Link Benefit Analysis (Witness - Pushkar Wagle, Ph.D.)* (Wagle Opening Testimony), at 2-53. *See also*, Wagle Opening Testimony at 2-52 and Cal Advocates Reply Brief, at 6.

The Center for Biological Diversity, Yuma Audubon Society, Maricopa Audubon Society (collectively referred to as Conservation Groups) jointly filed a protest on November 21, 2016. Office of Ratepayer Advocates, now Public Advocates Office (Cal Advocates) filed its protest on November 28, 2016.

A prehearing conference (PHC) was initially set for April 27, 2017. This PHC was reset to May 15, 2017, and, later, to June 2, 2017. In advance of the initial PHC, the Applicant, Cal Advocates, and Conservation Groups each filed PHC statements. On June 2, 2017, the initial PHC in this proceeding was held.

On June 20, 2017, Conservation Groups and Colorado River Indian Tribes (CRIT) moved for party status, which was granted by ruling of the assigned Administrative Law Judge (ALJ) on July 27, 2017.

On June 30, 2017, Conservation Groups and The Utility Reform Network (TURN) filed Notices of Intent to Claim Intervenor Compensation. TURN did not actively participate in this proceeding, thereafter.

The assigned Commissioner and ALJ issued a Scoping Memo and Ruling (First Scoping Memo) on August 4, 2017. The First Scoping Memo identified, amongst other things, the issues within the scope of the proceeding and set the procedural schedule. The assigned Commissioner also determined that evidentiary hearings would be more effective and efficient after the environmental review was completed.

A second PHC was held on November 4, 2019, primarily to revisit the procedural schedule in view of the issuance of the Record of Decision (ROD) to the Final Environmental Impact Statement (FEIS).

On December 16, 2019, DCRT and the CAISO served its Opening Testimony.

On December 17, 2019, the assigned Commissioner issued an Amended Scoping Memorandum and Ruling (Amended Scoping Memo) to add an additional issue to the scope of the proceeding, after the CAISO updated its economic evaluation for the Proposed Project, and to update the procedural schedule for the proceeding.

On March 31, 2020, Arizona Corporation Commission (ACC), the Arizona regulatory body that ensures safe, reliable, and affordable utility services and railroad and pipeline systems, granted a Certificate of Environmental Compatibility and authorized construction of the Arizona portion of the Proposed Project.[25]

On April 20, 2020, the assigned Commissioner issued the Second Amended Scoping Memorandum and Ruling (Second Amended Scoping Memo) to extend the procedural schedule for six weeks to allow completion of the modeling and review of the data derived from the modeling runs, as requested by Cal Advocates.

On May 13, 2020, Cal Advocates, Conservation Group, and CRIT served their Opening Testimony. On June 18, 2020, all parties served the Reply Testimony.

On July 23, 2020, the assigned ALJ held a status conference to notify the parties of the continuance of evidentiary hearings, due to the Commission's

[25] *The Decision of the Arizona Corporation Commission in the Matter of the Application of DCR Transmission, L.L.C. or its Assignees, in Conformance with the Requirements of A.R.S. § 40-360 et seq., for a Certificate of Environmental Compatibility Authorizing the 500 KV Transmission Line, Which Includes the Construction of a New 125 Mile 500 kV Transmission Line Between Arizona Public Service Company's Delaney Substation Until Southern California Edison's Colorado River Substation, to be Referred to as the Ten West Link Project,* filed March 31, 2020 (ACC 2020 Decision).

limited ability to conduct remote hearings and the Shelter-in-Place Order issued by the Governor of the State of California.

On October 27, 2020, the proceeding was reassigned to ALJ Daphne Lee. On November 20, 2020, the assigned ALJ issued a ruling setting a third PHC to be held on December 8, 2020, and ordering the parties to meet, confer, and submit a Joint PHC Statement prior to that PHC. The parties timely filed a Joint PHC Statement.

On December 2, 2020, the CRIT moved to withdraw their party status after reaching a settlement with Applicant, DCRT, outside of this proceeding.

On December 8, 2020, during the third PHC, the ALJ granted CRIT's motion to withdraw, and DCRT, CAISO and Cal Advocates advised that they were engaged in a negotiation to develop a set of stipulated facts and exhibits and anticipated conclusion of said negotiation around December 15, 2020. They advised that they expected to complete their negotiation and thereafter file a stipulation of facts and exhibits to expedite the resolution of the proceeding. The assigned ALJ ordered the parties to provide all parties on the service list a status update on the negotiation soon thereafter.

On December 17, 2020, DCRT advised the ALJ and the service list that additional time was needed to complete negotiation of stipulated facts. DCRT and Conservation Group anticipated completion by January 8, 2021.

On January 6, 2021, all parties jointly served and filed on the service list, the Parties' Stipulation of Facts and Admission of Exhibits.

On January 11, 2021, the parties moved Prepared Testimony and Exhibits into evidence. DCRT further moved to file under seal the stipulated Exhibits DCRT-2, DCRT-3, DCRT-5, DCRT-9, DCRT-11, DCRT-12, DCRT-16, and DCRT-18.

On January 21, 2021, this proceeding was reassigned to President Marybel Batjer as the assigned Commissioner. Upon the parties' request, the assigned ALJ set an interim proceeding schedule on January 25, 2021 (January 25, 2021 Ruling).

On January 29, 2021, Cal Advocates moved for oral argument pursuant to Rule 13.13. On February 2, 2021, this proceeding was reassigned to Commissioner Genevieve Shiroma.

On February 12, 2021, the parties timely filed their opening briefs. DCRT and Cal Advocates moved for oral argument within their respective opening briefs.[26] On the same day, the ALJ granted the parties' Joint Motion for Leave to Admit Exhibits into Evidence, filed on January 11, 2021 (January 11, 2021 Joint Motion) and marked, identified, and received stipulated testimony and exhibits uploaded to the Commission's e-file system, consistent with the parties' January 11, 2021 Joint Motion.

On February 16, 2021, Commissioner Shiroma issued the Third Amended Scoping Memorandum and Ruling (Third Amended Scoping Memo), clarifying the scoped issues, confirming the proceeding schedule set forth in the January 25, 2021 Ruling, and extending the statutory deadline to November 30, 2021. Concurrently, in response to a motion by Cal Advocates, the assigned ALJ marked, identified, and received additional stipulated testimony and exhibits, which were mistakenly excluded in the January 11, 2021 Joint Motion.

On March 12, 2021, the parties filed their reply briefs, and the record was closed.

[26] DCRT Opening Brief, at 53.

On March 24, 2021, the ALJ reopened the record to receive additional evidence necessary to rule on DCRT's October 12, 2016 and January 11, 2021 motions to file documents under seal. DCRT filed its compliance filing on April 5, 2021. After the ALJ issued further ruling directing DCRT to provide additional evidence, DCRT filed its Compliance Filing in Response to the ALJ Ruling on June 4, 2021.

On May 25, 2021, the ALJ granted Conservation Groups' motion, filed May 7, 2021, to withdraw their party status and opening and reply briefs.

On July 1, 2021, Cal Advocates moved to admit two additional exhibits into evidence, 1) Exhibit (Exh.) Cal PA-26, the CAISO Active Generational Interconnection Queue as of June 22, 2021 (Interconnection Queue); and 2) Exh. Cal PA-27, the CAISO Preliminary Cluster 14 Project List as of May 20, 2021 (Project List). This motion was unopposed. The ALJ granted Cal Advocates' motion, directed Cal Advocates to upload the additional evidence to the Commission e-file system and allowed parties to brief the additional evidence.

On July 20, 2021, Cal Advocates filed the additional exhibits.

On July 23, 2021, DCRT, CAISO and Cal Advocates filed additional briefs.

On July 28, 2021, the ALJ issued a ruling granting, in part, the motions of DCRT to file the documents under seal for Appendix J and Portions of Appendix N of the Application and Exhs. DCRT-2, DCRT-3, DCRT-9, DCRT-11, DCRT-12, DCRT-16, and DCRT-18 of the evidentiary record and denying the motions for Appendix D, a portion of Appendix N and DCRT-5. This ruling also directed DCRT to file unredacted Appendix D, a portion of Appendix N and DCRT-5. On August 20, 2021, DCRT, in response to the ALJ ruling, filed the unredacted Appendix D, a portion of Appendix N and DCRT-5.

On August 24, 2021, the ALJ resolved outstanding evidentiary issues by identifying, marking and admitting CAL PA-26 and CAL PA-27 and determined that no further information or evidence was needed to adequately inform and evaluate the issues in this proceeding. Consequently, the ALJ closed the record, and the matter was submitted.

2. Issues Before the Commission

Pursuant to the assigned Commissioner's Third Amended Scoping Memo, the issues to be determined are:

1. Whether the Application meets the requirements of GO 131-D, Section IX(A)(1) and Rule 3.1 to obtain a CPCN;
2. Whether the Proposed Project serves a present or future convenience and need and meets the requirements of Pub. Util. Code §1001 *et seq.*;
3. What are the economic and other benefits of the Proposed Project?
4. Is there substantial evidence that the Proposed Project will have any significant impact on the environment? If there is substantial evidence of significant impact(s):
    a. What are the significant environmental impacts of the Proposed Project within the Commission's jurisdiction?
    b. Are there mitigation measures that will eliminate or lessen such impacts?
    c. Are the mitigation measures and/or alternatives infeasible for economic, social, legal, technological, or other considerations, including community values?
    d. What is the environmentally superior project alternative?
    e. To the extent that the Proposed Project or project alternatives result in significant and unavoidable

impacts, are there overriding considerations that warrant Commission approval?

5. Whether the Proposed Project is necessary for compliance or to facilitate compliance with the Renewables Portfolio Standard (RPS)?
6. What is the maximum prudent and reasonable cost for the Proposed Project and environmentally superior alternative, if approved?
7. Whether the Commission should grant DCRT exemptions from certain affiliate transaction rules and reporting requirements?
8. Whether the FEIS complies with California Environmental Quality Act (CEQA); did the Commission review and consider it; and does it reflect the Commission's independent judgment and analysis?
9. Whether DCRT should provide a guarantee of payments for intervenors' consultants and the costs of intervenor compensation?
10. Whether the application raises any safety concerns or considerations?
11. Is the Proposed Project and/or environmentally superior project alternative designed in compliance with the Commission's policies governing the mitigation of electromagnetic field (EMF) effects using low-cost and no-cost measures?

3. General Order 131-D, Section IX(A)(1) And Rule 3.1.

Applications for the construction of a 500 kV transmission line must meet the filing requirements of Rule 3.1 as well as GO 131-D.

Here, the record reflects that the Applicant filed, as part of the Application, the filings as required under Rule 3.1 and GO 131-D. The Application and subsequent filings comply with the requirements under Rule 3.1 and GO 131-D as summarized below:

CRITERIA	DCRT SUBMISSION
GO 131-D(IX)(1)(a) and Rule 3.1(a)	Appendix A of the Application provides a detailed description of the proposed transmission facilities and equipment for the Proposed Project, and Appendix B to the Application provides a preliminary schedule.
GO 131-D(IX)(1)(b) and Rule 3.1(c)	Appendix C of the Application provides a scaled map of the original Submitted Route, showing parks, recreation areas and scenic areas, and existing transmission lines existing within a mile of the proposed route. Exh. DCRT-65 provides an updated map showing the Proposed Route as adopted from the Preferred Alternative of the FEIS.[27]
GO 131-D(IX)(1)(c) and Rule 3.1(e)	Proposed Project was selected by the CAISO as a primarily economically-efficient project that also provides significant reliability and policy benefit, thereby supporting a finding that public convenience and necessity require the construction and operation of the proposed transmission facilities.[28]
GO 131-D(IX)(1)(d) and Rule 3.1(f)	Appendix D and page 45 of Appendix N of the Application and Exh. DCRT-5 provide the Project Cost Estimate.
GO 131-D(IX)(1)(e)	DCRT initially selected the route described in the Application because it utilized the BLM designated utility corridors and largely followed the existing DPV transmission line to minimize the Proposed Project's environmental and visual impacts. Appendix E of the Application showed alternatives that were under consideration at the time the Application was submitted with a table summarizing the advantages and disadvantages of each alternative. DCRT's current Proposed Route for the Proposed Project is the BLM's Preferred Alternative as identified in the FEIS and BLM's ROD.
GO 131-D(IX)(1)(f)	Appendix B of the Application provides the preliminary construction schedule and the ROW acquisition activities. Exh. DCRT-4 and the Testimony of Lowell Rogers provide updated ROW acquisition activities.

[27] Exh. DCRT-65 at 22.

[28] Application, at 2.

GO 131-D(IX)(1)(g)	Appendix L of the Application provides the list of governmental agencies consulted and the results of those consultations.
GO 131-D(IX)(1)(h)	FEIS with collaboration with the Commission was issued on September 12, 2019.
Rule 3.1(b)	The Proposed Project will be operated as part of the CAISO-controlled transmission system and will not compete with any other utilities, corporations, person, or entities. While a portion of the Proposed Project will be located geographically within SCE's service area, neither SCE nor any other utility, corporation, or person will compete with the Proposed Project. The Proposed Project will not provide service within specific city or county, except as part of the CAISO-controlled transmission system.
Rule 3.1(d)	Appendix H of the Application identifies the permits the Proposed Project may require from federal, state, and local agencies for construction and operation of the Proposed Project.
Rule 3.1 (g)	DCRT relies on the financial resources of its controlling member, Starwood Energy, which manages total equity commitments in excess of $2 billion. Starwood Energy has executed transactions totaling more than $4 billion in enterprise value. Exhs. DCRT-1, DCRT-2 (Financial Ability and Financing Structure), and DCRT-3 (Financial Statement) detail financial information, ability, and structure of DCRT.
Rule 3.1(h)	DCRT did not prepare a rate schedule because cost recovery plus a reasonable rate of return will occur through the CAISO Transmission Access Charge (TAC), subject to Federal Energy Regulatory Commission (FERC) review and approval.

Rule 3.1(i) required DCRT to submit a statement corresponding to the statement required by Section 2 of GO 104-A. As discussed in detail under Sections 8.2 and 8.3 of this decision, the Commission allowed DCRT to file the FERC Forms 1 and 3-Q as proxies in compliance with GO 104-A and Rule 3.1(i). Since the Proposed Project is not currently in operation, DCRT has not filed a

FERC Form 1 or Form 3-Q. Hence, the Commission will excuse the requirement under Rule 3.1(i).[29]

4. General Background on the Commission's Integrated Resource Planning (IRP) Process and the CAISO's Transmission Planning Process

To determine whether the Proposed Project is necessary, we must first understand the assumptions used in the parties' PCM scenarios. For the Proposed Project, the crux of the parties' dispute are the portfolios from the 2017 integrated resource planning (IRP) process and the 2019 IRP process and the sources of the assumptions used in the PCM scenarios.

In 2015, the California Legislature, through Senate Bill (SB) 350, set the goal to reduce greenhouse gas (GHG) emissions by 40% of 1990 levels by 2030 and directed the Commission to develop an IRP process to ensure that California's electric sector meets its GHG reduction goals, while maintaining reliability at the lowest possible costs. In 2018, the California Legislature passed SB 100, which required 60 percent of electric retail sales be served by renewable resources by the year 2030 and zero-carbon resources to supply 100 percent of electric retail sales to end-use customers by 2045.

The Commission's ongoing IRP process provides guidance to Load Serving Entities (LSEs), developers of generating resources and other entities on the optimal path for the state to achieve these state goals, at the least cost to California retail ratepayers, while maintaining reliability. The IRP process provides the analytical foundation for Commission orders for LSEs to procure renewable and other diverse electricity resources. The IRP process also produces

[29] FERC Form 1 and Form 3-Q are required forms for reporting to FERC once the Proposed Project is constructed and operational.

portfolios of future generation which the CAISO analyzes within its annual TPP to determine the implications for the transmission system.

To achieve the goals of SB 350 and SB 100, the Commission, the CAISO, and the California Energy Commission (CEC) established coordinated processes to ensure that there is a common understanding of expectations regarding the development of renewable generation portfolios feeding into the annual TPP cycle. This includes using the assumptions in the load forecast which is included and regularly updated within the CEC's Integrated Energy Policy Report (IEPR).

The recurring modeling analysis conducted throughout each IRP cycle produces a Reference System Plan (RSP) and a Preferred System Plan (PSP) that reflect the optimal set of future resource needs to meet the GHG target for the electricity sector. These plans also provide the foundation for the portfolios that the Commission transmits to the CAISO's annual TPP.

The IRP process is designed to be regularly updated to reflect changes in GHG reduction target, reliability requirements, expected resource costs, expected levels of imported electricity and other key constraints that are incorporated into the modeling.

During the 15-month TPP cycle, the CAISO identifies and assesses the transmission implications from the types and amounts of renewable generation that will be needed to meet state policy goals and future needs of the CAISO-controlled transmission grid.[30] Each TPP also assesses the economic costs and benefits of nominated transmission projects. For each TPP cycle, the CAISO's analysis assumes that transmission projects that have been approved in

[30] Millar Opening Testimony, at 2.

previous TPPs will be developed, thus signaling to generation developers the areas where potential transmission access will be available.

The Commission adopted the PSP for the 2017-2018 IRP process on May 1, 2019.[31] On April 6, 2020, the Commission adopted 2019-2020 RSP to be used by all LSEs required to file individual integrated resource plans in 2020.[32] On February 11, 2021, in Decision (D.) 21-02-008, the Commission approved a set of portfolios for analysis in the 2021-2022 TPP. This aligns with the 2019-2020 RSP and the direction given to the LSEs for planning in D.20-03-028. On August 17, 2021, the Commission, in the IRP proceeding, sought comment on the proposed 2019-2020 PSP.[33]

5. Project Need

The Commission is charged with ensuring that public utilities furnish and maintain such adequate, efficient, just, and reasonable service, instrumentalities, equipment, and facilities as are necessary to promote the safety, health, comfort, and convenience of its patrons, employees, and the public.[34] Pursuant to Pub. Util. Code § 1001, a utility intending to construct or extend transmission line facilities, designed for immediate or eventual operation at 200 kV or more, must first obtain a CPCN from the Commission.[35] The CPCN is issued upon the

[31] D.19-04-040.

[33] ALJ's Ruling Seeking Comments on Proposed Preferred System Plan filed August 17, 2021, in R.20-05-003.

[34] *Utility Consumers' Action Network v. Public Utilities Com.* (2010) 187 Cal.App.4th 688, 689 *citing to* Pub. Util. Code § 451.

[35] Pub. Util. Code, § 1001. *See also* General Order (GO) 131-D at 1.

Commission finding that "the present or future public convenience and necessity require or will require such construction."[36]

At issue in this proceeding is a determination by the CAISO on the cost-effectiveness and need for the Proposed Project, a transmission project. In Decision (D.) 06-11-018, the Commission examined "what deference should be given to determinations by the CAISO regarding the cost-effectiveness and need for a transmission project that is proposed for its economic benefits."[37]

D.06-11-018 sets forth general principles, minimum requirements, and other guidance for economic evaluations of proposed transmission projects subject to CPCN proceedings. Specifically, D.06-11-018 established a rebuttable presumption in favor of a CAISO Board-approved economic evaluation, provided the economic evaluation meets certain safeguards to protect the public interest and meets the Commission's statutory mandates. These safeguards require 1) the CAISO process has met the public participation requirements outlined in D.06-11-018; 2) the evaluation must be submitted to the Commission within sufficient time to be included in the scope of the proceeding; 3) to the extent that material facts relied upon in the CAISO Board-approved economic evaluation become outdated, the applicant shall submit additional information and shall provide an explanation of the additional information's impact on the assumptions and conclusions contained in the evaluation; and 4) the CAISO shall be a party to any proceeding in which a rebuttable presumption is to be granted to a CAISO Board-approved economic evaluation.[38]

---

[36] Pub. Util. Code, § 1001.

[37] D.06-11-018, at 2.

[38] *Id.*, at 23-25.

To meet the requirements under the first safeguard, the CAISO must sponsor at least two meetings open to the public with opportunity for public comment both at the meeting and following the meeting, including: (1) an initial meeting, which occurs sufficiently early in the CAISO's assessment process to provide an opportunity to discuss the scope of the proposed economic assessment, including identification of the base case and other relevant assumptions, as well as resource alternatives and (2) a second meeting to take public comment on the draft economic evaluation prior to its submission to the CAISO Board.[39] The CAISO process must provide interested parties with sufficient time and opportunity, including sufficient access to information, to adequately review and comment on the draft economic evaluation, and the final economic evaluation must address all public comments, either through incorporation in full, modification, or rejection, and the reasons therefore.[40]

The CAISO's economic evaluation further must meet the additional safeguards by ensuring that: (1) the CAISO Board has made certain explicit findings regarding the economic value of the Proposed Project; (2) the CAISO Board-approved evaluation is consistent with the principles and minimum requirements set forth in D.06-11-018; and (3) the CAISO Board-approved evaluation is submitted to the Commission within sufficient time to be included within the scope of the proceeding.[41]

To overcome this presumption, the party opposing the Proposed Project bears the burden of demonstrating either (1) that the CAISO Board-approved

[39] *Id.*, at 23.

[40] *Id.*, at 24.

[41] *Id.*, at 3 and 23-25.

economic evaluation does not comply with the principles and minimum requirements of D.06-11-018 or (2) that the project is not cost-effective.[42]

The principles and minimum requirements for the CAISO's economic evaluations shall evaluate the following:

1. The CAISO's standardized benefit-cost methodology, used to measure the economic benefits of proposed transmission projects;[43]
2. The CAISO's framework for the computation of potential energy benefits;[44]
3. Other economic effects of a transmission project, including economic effects that may not be quantifiable;
4. Uncertainty about future system and market conditions, affecting the likelihood that a transmission project's forecasted benefits will be realized;
5. Baseline resource plans and assumptions about the system outside the applicant's service territory that are consistent with resource plans and system assumptions used in procurement or other recent Commission proceedings, updated as appropriate; and
6. Feasible resource alternatives to the proposed transmission project.[45]

---

[42] *Ibid*.

[43] The perspective of CAISO ratepayers is of primary importance in a CPCN proceeding, although there is value in reviewing benefit-cost results from other perspectives as well. *See*. D.06-11-018, at 4.

[44] Parties shall assess energy benefits using established, credible, and commercially available production cost modeling tools. The applicant may decide whether to include market power mitigation benefits as part of its demonstration of need for a proposed transmission project. *Ibid.*

[45] *Ibid.*

5.1. Public Participation in the 2013-2014 TPP

The 2013-2014 TPP is a result of an extensive collaboration by the Commission and many other interested stakeholders.[46] During Phase 1 of the TPP, the CAISO posted the unified planning assumptions and study plan in draft form for stakeholder review and comment, during which stakeholders may request specific economic planning studies to assess the potential economic benefits (e.g., congestion relief) in specific areas of the grid.[47] A list of high priority studies among these requests (*i.e.*, those which the engineers expect may provide the greatest benefits) are identified and included in the study plan, when the CAISO published the final unified planning assumptions and study plan at the end of phase 1. The list of high priority studies may be modified later based on new information such as revised generation development assumptions and preliminary production cost simulation results.[48]

The conceptual statewide plan takes a whole-state perspective to identify potential upgrades or additions needed to meet state and federal policy requirements or directives such as renewable energy targets. Whenever possible, the CAISO coordinated with regional planning groups and neighboring balancing authorities.[49] To focus on developing compliance filings addressing FERC Order 1000 requirements, the CAISO updated the previous TPP using

[46] 2013-2014 TPP, at 3.

[47] *Id.,* at 18.

[48] *Ibid.*

[49] *Ibid*.

updated and publicly available information from our neighboring planning entities.[50]

In phase 2 of the TPP, a 12-month process, the CAISO performs all necessary technical studies, conducts a series of stakeholder meetings and develops an annual comprehensive transmission plan for the CAISO controlled grid.[51] The proposed resource portfolios, developed with by Commission with input from the CEC and the CAISO, were also reviewed with stakeholders to seek their comments, which are then considered for incorporation into the final portfolios. Stakeholder meetings and public comment opportunities occurred at key points during Phase 2 of the 2013-2014 TPP.[52]

5.2. The CAISO's Economic Evaluation of the Proposed Project

Separate from the coordinated interaction with the Commission during the TPP cycle, the CAISO assesses economic benefits of proposed transmission projects by simulating production costs.[53] When determining whether a particular solution is needed, the CAISO must consider comparative costs and

[50] The previous TPP involved California planning authorities and load serving transmission providers under the structure of the California Transmission Planning Group. *Ibid*.

[51] *Id*., at 19.

[52] *Id*., at 20. *See also* CAISO Tariff §24.3.3, requiring the CAISO to conduct a stakeholder meeting to discuss its Unified Planning Assumptions and Study Plan; CAISO Tariff §24.4.9(a), requiring the CAISO to hold a stakeholder meeting after posting technical study results; CAISO Tariff §24.4.9(b), requiring the CAISO to schedule at least one (1) other public meeting before the draft comprehensive Transmission Plan is posted to provide information about any policy-driven transmission solution evaluations or economic planning studies; CAISO Tariff §24.4.9(c), requiring the CAISO to conduct a public conference regarding the draft transmission plan.

[53] Spending over 8,760 hours in a study year, the CAISO considers unit commitment, generator dispatch, locational marginal prices, and transmission line flows.

benefits[54] of viable alternatives to the particular transmission solution including: 1) other potential transmission solutions, including those being considered or proposed during the TPP; 2) acceleration or expansion of any transmission solution already approved by the CAISO Governing Board or included in any TPP, and 3) non-transmission solutions, including demand-side management.[55]

The CAISO originally determined the Proposed Project's economic benefits based on (1) capacity benefits from the increased amount of out-of-state resources in the Southwest to count for RA and (2) production cost benefits from the Proposed Project's ability to reduce the CAISO net ratepayer payments.[56] The Proposed Project's economic benefit is intertwined with reliability benefits to achieve state policy needs. When evaluating the Proposed Project, the CAISO concluded that the quantified economic and reliability benefits exceeded

[54] The CAISO assesses the benefits of a proposed transmission project using five categories, production, capacity, public-policy, renewable integration and avoided cost of other projects. Production benefits are benefits to ratepayers resulting from changes in the net ratepayer payment based on production cost simulation from the proposed transmission project. Capacity benefits are benefits to ratepayers resulting from increased importing capability into the CAISO's Balancing Authority Area (BAA) or into a local capacity requirement (LCR) area. Capacity benefits analysis also includes benefits resulting from decreased transmission losses and increased generator deliverability. Public-policy benefit is the benefit to ratepayers through reduction of the cost of reaching renewable energy targets by facilitating the integration of lower cost renewable resources located in remote areas, or by avoiding overbuild. Renewable integration benefit is the interregional transmission upgrades, allowing sharing energy and ancillary services among multiple BAAs, which help mitigate integration challenges, such as over-supply and curtailment. Avoided cost of other projects is the avoidance of a reliability or policy project because of the economic project under study. The avoided cost contributes to the benefit of the economic project. *See* Exhibit Ca PA-2, *Public Advocates Office Opening Testimony of Jerry Melcher, Transmission Planning Process, and the Application of the Transmission Economic Assessment Methodology* (Melcher Opening Testimony), at 2.

[55] Exhibit CAISO-6, Millar Rebuttal Testimony, at 2, *citing to* CAISO tariff, Section 24.4.6.7 Economic Studies and Mitigation Solutions.

[56] Yimer Corrected Rebuttal Testimony, at 4-5.

estimated costs.[57] The 2013-2014 TPP analyzed sensitivities, with varying load, hydrological conditions, and natural gas costs.[58] These results showed economic benefits under various assumptions and uncertainties. The CAISO also found the following additional potential benefits:

1. Mitigation of the impacts of higher contingency flows on neighboring systems;[59]
2. Opportunities for CAISO-connected renewable generation to develop in the Delaney area;
3. Increase in deliverability from the Imperial Valley zone; and
4. Increase competition in the California generation market.[60]

By comparing the 2018 and 2023 the production cost benefit for the Proposed Project, the CAISO found three benefits to CAISO ratepayer: 1) consumer energy cost decreases; 2) increased LSE-owned generation revenues; and 3) increased transmission congestion revenues.[61] Based on these findings, the CAISO Board approved the Proposed Project in its 2013-2014 TPP.

[59] Los Angeles Department of Water and Power's Marketplace, Adelanto 500 kV line in particular, caused higher contingency flows on neighboring systems as a result of the development of renewable generation in southeastern California and the retirement of gas generation in southwestern California

[60] *Ibid.*

[61] 2013-2014 TPP, at 253-268.

5.2.1. In 2019, the CAISO found a continuing necessity for the Proposed Project after updating its economic evaluation, based on study assumptions, base cases, and the Commission-developed renewable generation portfolios prepared for the 2019-2020 TPP studies.[62] The CAISO's Framework for the Computation of Potential Energy Benefits

Based on the CAISO's Transmission Economic Analysis Methodology (TEAM), the CAISO ran two different PCM scenarios in 2019: 1) Baseline Scenario and 2) Sensitivity Scenario with updated natural gas and carbon prices.[63] The baseline scenario shows a total of $33.6 million in production cost benefits annually.[64] The sensitivity analysis, using higher natural gas prices in California compared to decreased natural gas prices in other states, increased production cost benefits to $46.6 million annually.[65]

Taking the production cost benefit and capacity benefits from the avoided capacity costs for battery storage and the locational renewable capacity cost savings, the CAISO calculated the BCR to range from 1.16 to 1.54.[66]

The CAISO approached the updated economic assessment in three steps: 1) resource portfolios are developed based on Commission's RESOLVE;[67] 2) the resource portfolios are then used to conduct production cost simulation and

[66] *Id*., at 8-10.

[67] Yimer Opening Testimony, *supra*, at 3. The RESOLVE model is the final model developed in the Commission's 2017-2018 IRP process, which was used to inform the CAISO's 2019-2020 TPP.

production benefit analysis, while the 2019-2020 Transmission Plan economic planning PCM with the Updated Resource Portfolio is used to conduct the production cost simulation;[68] and 3) using the results of the first two steps, the BCR for the Proposed Project was calculated based on the estimated 2021 in-service date of the Proposed Project.[69]

The CAISO's updated analysis considered the following specific major changes in circumstances that have occurred since the CAISO initially approved the Proposed Project:

1. Continued growth of the grid-connected solar in excess of the level anticipated in the 2013 timeframe;
2. Rapid deployment of distributed energy resources far exceeding industry expectations, *e.g.,* rooftop solar PV;
3. Decreasing battery storage costs;
4. Actual and forecast reductions in the out-of-state thermal fleet, including out-of-state coal resources;
5. LSE requirements under SB 100 to acquire 60% of their energy from renewable resources by 2030 and 100% of energy from non-GHG-emitting generation by 2045;
6. Broader acceptance that natural gas resources will be critical to ensure reliability well into the future—with those resources providing a key source of dispatchable capacity but far less overall energy production; and
7. Advancement of generation and transmission planning and development processes.[70]

[68] The key assumptions of the 2019-2020 economic planning PCM are described in Appendix I to the Zhang Opening Testimony.

[69] Zhang Opening Testimony, at 3.

[70] Over the last five years, there were significant generation development activity in the western Arizona area and generation projects seeking direct connection to the CAISO-controlled grid through points of interconnection located in Arizona. Millar Opening Testimony, at 15-16.

5.2.2. The CAISO's Analysis of Arizona Solar and Battery Capacity Savings

Part of the CAISO's determination of the Proposed Project's capacity benefits is based upon the solar generation from Arizona using assumptions derived from the 2017-2018 PSP.[71] The public-policy benefits of the Proposed Project arose from the increase of the amount of lower cost, out-of-state resources in the Southwest, including the CAISO grid-connected solar and solar-storage hybrid resources in western Arizona (Arizona Solar), that counts towards meeting RA goals.[72]

Using the latest version of RESOLVE, the CAISO determined the amount of solar from Arizona inside the CAISO Balancing Authority Area (BAA), that can be economically selected to achieve emissions and RA targets and removed the transmission cost adder for delivery to the California boarder associated with the Arizona Solar resource.[73] After enabling Arizona Solar as a candidate resource in RESOLVE, the CAISO calculated that 3262 MW of Arizona Solar from the Proposed Project can be economically selected to meet the RA target.[74]

By modeling the resource shift from enabling Arizona Solar as a candidate resource in RESOLVE and using the deliverability power flow model developed

[71] CAISO compared the data from the 2017 IRP portfolio and 2019 IRP portfolio with the data from the 2018 National Renewable Energy Labs (NREL) Annual Technology Baseline (ATB) and the 2020 Energy Information Administration (EIA) reports and concluded that the 2019 IRP reported capital cost and levelized costs of energy for PV between California and Arizona did not align with findings from the NREL ATB or the EIA report. As such, the 2017 IRP portfolio assumption more closely aligned with those reports. Yimer Corrected Rebuttal Testimony, at 7-11.

[72] *Ibid*., at 10-11.

[73] The Commission made the same corrections to the RESOLVE model used in the 2019-2020 IRP. *See,* Yimer Corrected Rebuttal Testimony, at 3.

[74] Yimer Opening Testimony, at 15-16.

for its 2019-2020 TPP to perform a deliverability assessment, the CAISO estimated the incremental amount of economically-selected Arizona Solar capacity that can count for RA.[75] Because the objective of the deliverability assessment is to determine the amount of Arizona Solar capacity that can count for RA, all of the Arizona Solar resources were modeled as seeking full capacity deliverability status (FCDS).[76]

In the deliverability power flow case with the Proposed Project, Arizona Solar was distributed among Delaney (60%), Hassayampa (20%) and Hoodoo Wash (20%) substations approximately in the same proportion as resources in the CAISO Generation Interconnection Queue.

The CAISO compared the generation at the substations when the economically-selected Arizona Solar was allocated to Delaney, Hassayampa, and Hoodoo Wash substations against generation at only Hassayampa and Hoodoo Wash substations, with the Delaney substation's share of Arizona Solar allocated to Hassayampa and Hoodoo Wash substations.[77] The constraint limits the amount of economically-selected Arizona Solar that can count for RA to about 2,149 MW with the Proposed Project. Without the Proposed Project, same constraint limits Arizona Solar deliverability to 1,180 MW.[78]

---

[75] *Id.*, at 11.

[76] *Ibid*.

[77] Delaney substation will be outside the CAISO BAA without the Proposed Project. *Ibid.*

[78] Without the Proposed Project, the most limiting contingency is an outage of the Ocotillo–Suncrest 500 kV line, which overloads the Eco-Miguel 500 kV line.

Applying the effective load carrying capability (ELCC) methodology, adopted by the Commission, to determine the RA value for solar resources,[79] the Proposed Project provides an increase of 969 MW in deliverable Arizona Solar capacity, which is equivalent to a net qualifying capacity (NQC) of 136 MW,[80] to count towards RA capacity that would otherwise need to be procured from other resources.[81] Based on the same assumptions, the equivalent of 969 MW in deliverable solar capacity, or 29.7 percent of the economically-selected Arizona Solar capacity, will have to come from renewables located in less economic locations subject to deliverability constraints, if the Proposed Project is not built. This resource shift will result in resource cost saving of $977 million in present value of revenue requirements or $58 million in terms of annual levelized cost, both in 2016 dollars.[82]

In evaluating the battery capacity savings, the CAISO interpolated cost projections for a lithium-ion battery energy storage system (BESS) for year 2022 and calculated the levelized cost of 136 MW of BESS $36.3 million per year for the capacity benefit based on the avoided cost of energy storage.[83] The CAISO

[79] Yimer Opening Testimony at 13. This means that for every MW of installed and deliverable solar capacity, the Commission applies a discount to determine the solar resource's actual contribution to meeting load requirements.

[80] The CAISO calculated the NQC based on the ELCC values for solar adopted in 2019. *Id.* at 13-14, *citing to* D.19-06-026.

[81] *Id.*, at 11-13.

[82] For the purposes of modeling in RESOLVE, resources located in Southern Nevada are assumed to interconnect directly to the existing CAISO transmission system. This assumption has been updated from the Commission's solar resources in southern California and southern Nevada in the same year and wind resources in the Southwest in 2030. Yimer Opening Testimony, at 6-9.

[83] *Id.,* at 14.

calculated the capacity benefit to be $290.3 million in terms of present value or $17.3 million in terms of levelized annual benefits.[84]

5.2.3. The CAISO's Natural Gas Price Analysis

The CAISO used the 2018 IEPR natural gas price forecast for its baseline PCM scenario and the 2019 preliminary IEPR natural gas price forecast for its a sensitivity PCM scenario. The CAISO's baseline PCM monthly natural gas price differential between Arizona South and Southern California is between $0.581 to 0.597, similar to the lower end of the price differential referenced by Cal Advocates.[85] The sensitivity PCM scenario applied a relatively large natural gas price differential between Arizona and Southern California, consistent with the 2019 IEPR natural gas forecast, to represent the upper bound for natural gas price differentials between Southern California and Arizona. Together, the CAISO's baseline and sensitivity PCM scenarios covered a wide and reasonable range of natural gas price differentials between Arizona and Southern California.

5.2.4. The CAISO's Consideration of Uncertainties

The CAISO considered multiple uncertainties in its economic evaluation. Recognizing that the capacity value of solar resources will likely continue to decline in the future as more solar resources are added and post-sunset energy needs become more predominant, the CAISO calculated reduction of capacity for Arizona Solar and natural gas benefits based on one-third, one-half, and two-thirds of the capacity benefit values to account for this uncertainty.[86]

The CAISO also considered the uncertainty in the costs of utility-scale battery cost and found the estimated cost of a 4-hour lithium-ion utility-scale

---

[84] *Id.,* at 14-15.

[85] Arizona South Hub represents the Arizona Phoenix natural gas hub.

[86] Yimer Opening Testimony, at 15.

battery system cost varies significantly from about a low of $1,100/kW to a high of $2,250/kW in 2018 dollars, based on the review of a study by the Western Electric Coordinating Council (WECC).[87]

The CAISO used $1661/kW in its analysis to represent approximately the midpoint of the range.[88] Similarly, the CAISO considered the significant uncertainty regarding the future rate of decline in battery storage costs with one report finding that year-over-year cost declines were less pronounced, particularly for wholesale systems.[89]

Due to the uncertainties associated with the actual cost of battery storage, the CAISO assessed the Proposed Project's BCR with the battery storage costs based upon the 2019 IRP portfolios as an additional data point by establishing a baseline calculation on the avoided cost of battery storage with the storage cost assumption from the 2019 IRP portfolios. The evaluation resulted in a BCR between 1.05 to 1.31, with capacity benefits discounted by two-thirds, one-half, and one-third to adjust for the solar resource uncertainty. When the 2019 IEPR Preliminary Forecast is included in the baseline model, the BCR increased and was between 1.38 to 1.66.[90]

[90] Exh. CAISO-4, Zhang Rebuttal Testimony, at 7-9. The CEC prepares the IEPR, which provides a cohesive approach to identifying and solving the state's pressing energy needs and issues.

5.2.5. Rebuttable Presumption Exists in Favor of CAISO Board-Approved Economic Evaluation

The Commission reviews each application for a CPCN on a case-by-case basis due to the unique character of each proceeding. Here, we find that the CAISO Board-approved economic evaluation meets the safeguards set forth in D.06-11-018 to protect the public interest and meets the Commission's statutory mandates.

First, to meet the public participation requirement, the CAISO engaged the public and other stakeholders throughout the TPP process. In Phase 1, the CAISO posted the unified planning assumptions and study plan in draft form for stakeholder review and comment and an opportunity for stakeholders to request specific economic planning studies to assess the potential economic benefits in specific areas of the grid. In Phase 2, the CAISO held a series of meetings to engage the stakeholders and public in comments on the TPP and the solutions, including the Proposed Project. The stakeholders and public also participated in the development of the proposed resource portfolios along with the Commission, CEC and the CAISO. The final TPP addressed the public comments and concerns.

Upon careful examination of the record, including the parties' comments, the Commission finds the safeguards under D.06-11-018 were met here. First, sufficient opportunities for public participation were afforded such that the economic evaluation of the Proposed Project met the requirements of the first safeguard. Second, the economic evaluation was submitted as part of the Application, in Appendix M and within sufficient time to be included in the scope of this proceeding. Third, DCRT and the CAISO submitted additional economic and public policy analysis and provided an explanation of the

additional information's impact on the assumptions and conclusions contained in the economic evaluation in the 2013-2014 TPP. Finally, the CAISO is a party to this proceeding.

Further, we find that consistent with D.06-11-018: (1) the CAISO Board has made explicit findings regarding the economic value of the Proposed Project; (2) the CAISO Board-approved evaluation is consistent with the principles and minimum requirements set forth in D.06-11-018; and (3) the CAISO Board-approved evaluation has been submitted to the Commission within sufficient time for its inclusion within the scope of the proceeding.

First, the CAISO Board found explicit findings of quantifiable capacity and production cost benefits with reliability benefits from the Proposed Project in the baseline and sensitivity scenarios to conclude that the Proposed Project provides economic and public policy benefits. In the CAISO's updated economic evaluation, the CAISO further found benefits derived from Arizona Solar and potential battery capacity in expanding the CAISO BAA in this Proposed Project and calculated the production cost savings of $33.6 million.

Second, the CAISO Board-approved evaluation is consistent with the principles and minimum requirements set forth in D.06-11-018. The CAISO's economic evaluation for the Proposed Project applied CAISO's standardized benefit-cost methodology, TEAM, to measure the economic benefits of the Proposed Project. The framework of this economic evaluation computed the potential energy benefits and other economic effects of Proposed Project. Using the PSP derived from the Commission's 2017 IRP process, the CAISO applied this baseline resource plans and assumptions about the system outside the DCRT's service territory that are consistent with resource plans and system assumptions used in procurement and the TPP cycles for 2019-2020 and the

2020-2021.[91] Moreover, the CAISO considered the uncertainties of future systems in solar generation, in natural gas pricing and the utility-size battery costs, along with market conditions affecting the likelihood that a transmission project's forecasted benefits to be realized. Finally, the CAISO considered alternative interconnection projects and the Palo Verde intertie when determining the economic benefits of the Proposed Project.

Third, the CAISO Board-approved evaluation presented to the Commission as part of the evidence for this proceeding.

Upon review of the foregoing, the Commission finds that the CAISO's original and updated economic evaluation comply with the principles and minimum requirements under D.06-11-018 and should be presumed reliable in determining the necessity of the Proposed Project. Thus, a rebuttable presumption in favor of the CAISO Board-approved economic evaluation exists here.

5.3. DCRT's Economic Evaluation

In addition to the rebuttable presumption in favor of the CAISO Board-approved economic evaluation which supports the need for the Proposed Project, DCRT additionally argues that the Proposed Project is needed to reduce overall costs to the CAISO ratepayers and increase system reliability while providing some renewable source of energy to meet the State's policy goals.[92] DCRT concluded that the economic benefits includes: 1) reduced production costs and CAISO customer net payments; 2) reduced energy losses; 3) increased competition at the Palo Verde trading hub; 4) increased transmission transfer

[91] *See* D.20-03-028 and D.21-02-008.

[92] Millar Opening Testimony, at 2.

capability between CAISO and APS in the Western Energy Imbalance Market (EIM); and 5) reduced RA costs.[93]

DCRT estimates the Proposed Project will reduce ratepayer costs by $1-1.6 billion over a 50-year economic life with the present value of the revenue requirement of $607 million with an after-tax weighted average cost of capital of 6.8%; Federal income tax of 21%; California income tax 8.84%; a tax depreciated based on a 15 year Modified Accelerated Cost Recovery System (MACRS) schedule; and a straight-line book depreciation over 40 years.[94]

DCRT and the ACC concluded that the Proposed Project presented no negative impact to the reliability or safety to the Arizona transmission infrastructure or to the delivery of power to Arizona ratepayers.[95] In granting authorization to construct the Proposed Project, ACC reviewed DCRT's economic evaluation and found that the Proposed Project would result in stronger transmission infrastructure while reducing congestion in Arizona.[96]

5.3.1. DCRT's Analysis of the Economic Benefit of the Proposed Project

If the CAISO did not complete an economic evaluation, D.06-11-018 required the applicant in a CPCN proceeding to use baseline resource plan and assumptions about the system outside its service territory that are consistent with its resource plan and system assumptions used in procurement or other recent Commission proceedings.[97] In its showing, the applicant should identify

[93] Exh. DCRT-1, Chapter IV, Chang Opening Testimony, at IV-2-IV-3.

[94] *Id.*, at IV-37. The assumptions do not include economic, policy, and reliability benefits to CAISO customers.

[95] ACC Decision, at 4.

[96] Exh. Cal PA-24, Little Testimony, at 13-14.

[97] D.06-11-018, at 69.

clearly and explain any changes to its baseline resource plan or to prior assumptions about transmission and generation resources in other parts of the study area.[98] The applicant should also specify the criteria it used to determine the inclusion, exclusion, and retirements of generation, transmission, and other resources, and also the sources and justification for its assumptions about the system outside its service area.[99]

Based on a combination of information from the Brattle Ten West Link Technical Report (Brattle Report)[100] and three different PCM scenarios, DCRT projected 1) annual savings between $7 million to $36 million; 2) reduction in curtailment of renewable generation by increasing operational flexibility of the CAISO system; 3) more options to integrate and access to renewable energy resources to achieve the goals to reduce GHG;[101] and 4) increased reliability of the California and Arizona transmission network by increasing reliable power transfers in the region.[102]

DCRT's PCM scenarios did not analyze the impact on renewable generation interconnection but accounted for transmission congestion due to

[98] *Id.,* at 70.

[99] *Ibid*.

[100] *See* Exh. DCRT-13, *Appendix L- Brattle Ten West Link Technical Report*.

[101] 4150 MW of solar and storage capacity projects are in the CAISO interconnection queue to connect the Proposed Project and 900 MW of solar and storage capacity projects are in the APS interconnection queue to connect to Delaney Substation. Chang Opening Testimony at IV-31. As of June 2021, the CAISO Interconnection Queue Report reflects 9400 MW of renewable resources seeking to interconnect to the Proposed Project. *Amended Brief of DCR Transmission L.L.C. Addressing Exhibits Cal PA-26 and Cal PA-27*, filed July 30, 2021 (DCRT Additional Brief), at 2.

[102] Chang Opening Testimony, at IV-3-IV-4.

intertie scheduling limits on the CAISO's neighboring markets and additional congestion due to the Palo Verde intertie during peak and overnight hours.[103]

DCRT modeled three scenarios, Scenarios A, B and C, with varying assumptions. In Scenario A, DCRT applied the resource portfolios used in the 2018-2019 TPP and progressively added layers of assumptions in Scenarios B and C to model potential costs and savings associated with the Proposed Project. In Scenario B, DCRT added updated generation resource mix and calculated an increase in all base categories, with notable increases for battery capacity (143%), geothermal capacity (56%), solar (12%), wind (7%) and less than 1 percent of other generation.[104] In Scenario C, DCRT added to Scenario B the natural gas price forecasts, summarized by the CEC as a 12.8% decrease by 2028.[105]

DCRT's assumptions were taken from the most up-to-date information available from the Commission, CEC and the CARB at the time of calculation. DCRT found savings for California ratepayers were $7 million per year under Scenario A, $19 million per year under Scenario B, and $36 million per year under Scenario C.

Based on the Brattle Report and the three PCM scenarios, DCRT concluded that the Proposed Project will provide an estimated range of savings of $62-93 million per year and broken down into 1) CAISO production cost savings of $41-70 million per year; 2) reduction in transmission energy losses of $3-4 million per year; 3) reduction in renewable curtailments of $0.3-0.9 million

[103] *Id.*, at IV-14.

[104] Arguments can be made that the increases in certain sectors are too large or small, but costs continue to decrease. No party has made claims that increases in certain sectors are not projected.

[105] Scenario A began with the 2018-2019 TPP, Scenario B then added 2028 generation resource mix information, and Scenario C then added 2028 projected gas prices based on the 2018 IEPR.

per year; and 4) increase in renewable procurement of $18 million per year.[106] DCRT calculated the BCR range from 1.78 to 2.66.[107]

5.3.2. DCRT's Analysis on the Public Policy Benefits

DCRT anticipates several public policy benefits from the construction and operation of the Proposed Project. The Proposed Project will 1) increase the transfer capability across the congested portion of the CAISO system between Palo Verde and Southern California, also known as the Palo Verde intertie, and, thereby, reducing congestion and customer costs in California;[108] 2) unload energy across highly utilized transmission lines to reduce energy loss, while encouraging further development of RA to connect to the Palo Verde hub to increase competition and meet RA goals for California;[109] and 3) expand the BAA for CAISO and APS so that both can benefit from the EIM, in addition the estimated production cost benefits.[110]

DCRT calculated that the Proposed Project will 1) increase transfer capability by 690 MW between California and Arizona when all lines are operational; 2) allow an additional 781 MW generation to the Delaney Substation and output to southern California; and 3) transfer an additional 219 to 257 MW between Arizona and California under transmission outage conditions.[111]

DCRT expects the Proposed Project will provide additional public policy benefits, including the increase ability to achieve California's de-carbonization

---

[106] Exh. DCRT-1, Chapter III, Mackin Opening Testimony, at III-4.

[107] Chang Opening Testimony, at IV-37.

[108] *Id.,* at IV-2.

[109] *Id.*, at IV-3.

[110] *Ibid*.

[111] Mackin Opening Testimony, at III-4.

goals at a lower cost and reliability on the CAISO system in Southern California, while reducing renewable procurement costs and curtailment of renewable generation.[112]

Based on Scenarios A, B, and C, DCRT found that the reduction in renewable curtailment and cost savings from building solar resources in Arizona to be between $18.2 to $18.7 million in 2028 dollars.[113]

5.4. Cal Advocates' Rebuttal to the Presumption in Favor of the CAISO-Board Approved Economic Evaluation

To overcome the presumption in favor of a CAISO Board-approved economic evaluation, Cal Advocates presented the following arguments: 1) the CAISO's updated economic evaluation did not meet the requirements of the rebuttable presumption because it was not approved by the CAISO Board; 2) the BCR from the CAISO and DCRT models are inflated and based on outdated assumptions; and 3) the Proposed Project is unnecessary to achieve California's RPS goals set forth in SB 350 and SB 100.[114] As discussed below, we are not persuaded by these arguments.

Cal Advocates erroneously cited to D.08-12-058 as the basis for the Commission to deny the finding of a rebuttal presumption in favor of the economic evaluation.[115] We find D.08-12-058 inapposite here and distinguishable, as discussed below.

---

[112] Chang Opening Testimony, at IV-3-IV-4.

[113] *Id.*, at IV-32.

[114] Wagle Opening Testimony, at 2-6.

[115] *Opening Comments of the Public Advocates Office to the Proposed Decision Granting DCR Transmission, LLC a Certificate of Public Convenience and Necessity for the Ten West Link Project,* filed October 21, 2021 (Cal Advocates' Opening Comments) at 3.

The Commission, in D.08-12-058, did not apply a presumption to the CAISO's economic evaluation for these three reasons particular to that proceeding:

1. The CAISO's economic evaluation, developed during the course of that proceeding, did not reflect a significant amount of public review and input presented at the beginning of that proceeding and rendered the economic evaluation used for CAISO-Board approval irrelevant;

2. The CAISO's economic evaluation neither complied with CAISO's TEAM analysis for economic evaluations, nor the principles and minimum requirements; and

3. Applying a rebuttable presumption would be fundamentally unfair to the other parties, because the parties already developed their showing with the understanding that the rebuttable presumption did not apply.[116]

Here, unlike D.08-12-058, the CAISO in this proceeding completed an economic evaluation in the 2013-2014 TPP and further updated the assumptions and calculations for the baseline and sensitivity evaluation using the TEAM analysis, as required under the safeguards and minimum requirements.

Moreover, pursuant to D.06-11-018, the Commission correctly declined to grant the rebuttable presumption in D.08-12-058, because the underlying CPCN application had commenced before the effective date of D.06-11-018. As stated in D.06-11-018:

> [T]o prevent delays and/or confusion with regard to pending CPCN proceedings, the rebuttable presumption granted in this decision will not apply to CPCN applications filed with the Commission prior to the effective date of this decision unless the economic

[116] D.08-12-058, at 20-23.

> analysis complies with the safeguards and requirements of this decision and the assigned commissioner of a pending transmission proceeding issues a ruling that explicitly elects to apply it to that application.[117]

Here, the instant application was filed and this proceeding commenced after the effective date of D.06-11-012. Therefore, a ruling that explicitly elect to apply the rebuttal presumption is unnecessary.[118] Based on the foregoing, the Commission finds Cal Advocates' argument to be unconvincing.

5.4.1. CAISO's Updated Economic Evaluation Do Not Need Further CAISO Board Approval

The Proposed Project had already received CAISO Board approval in 2014, citing to economic, reliability and public policy benefits.[119] The CAISO explains that the CAISO Board, since 2014, did not have any reason to revisit project need, since its updated economic analysis showed continuing net economic benefits to CAISO ratepayers. The CAISO tariff also did not require the CAISO Board to revisit a project once the Proposed Project was approved.[120]

As the CAISO Board approved the Proposed Project after evaluating economic benefits in 2014 and the updated economic evaluation found continuing economic benefits, the Commission finds that further CAISO Board approval of the updated economic evaluation for the Proposed Project is unnecessary to meet the minimum requirements under D.06-11-018 in this proceeding.

---

[117] D.06-11-018, at 26.

[118] Cal Advocates Opening Brief extensively argued against a rebuttable presumption under D.06-11-018. *See*, Cal Advocates Opening Brief, at 5-6.

[119] Millar Rebuttal Testimony, at 2.

[120] *Rebuttal Brief of the California Independent System Operator* filed March 12, 2021 (CAISO Rebuttal Brief), at 4.

5.4.2. CAISO's Application of the IRP Portfolios are Reasonable and Proper

Cal Advocates argues that the economic benefits are based on outdated assumptions and inflated benefits. Specifically, Cal Advocates believes that the CAISO erroneously applied 16% differential for the capital cost of solar between Arizona and California, based on the portfolios from the 2017 IRP process, rather than the 3.6% differential, based on the portfolios from the 2019 IRP process.[121] Cal Advocates further believes the CAISO allocated solar resources improperly and did not conduct sufficient range of uncertainty analysis.[122]

Cal Advocates also argues that the 2019 IEPR forecast for earlier years has a larger differential in natural gas prices between Arizona and Southern California Gas hubs than the forecast for later years. Cal Advocates compared the projected natural gas prices of Arizona Phoenix hub and Southern California hub. The projected natural gas price differential between Arizona Phoenix hub and Southern California in 2028 is $1.13/MMBtu, which would drop to $0.58/MMBtu in 2055.[123] Because of that, Cal Advocates claims that using the 2019 IEPR natural gas price forecast from earlier years overstated the value of the Proposed Project.

In addition, Cal Advocates asserts that anticipated growth in battery storage will lead to change in future need of transmission projects and criticizes the limitation of the CAISO's estimate for storage growth.

---

[121] Wagle Opening Testimony, at 2-25 and Chang Opening Testimony, at IV-29.

[122] When Cal Advocates referred to the 2017 IRP and 2019 IRP, the Commission inferred that Cal Advocates intended to reference the portfolios from the 2017 IRP process and 2019 IRP process. Cal Advocates Opening Brief at 15-16. *See also, Reply Brief of Public Advocates Office*, filed March 12, 2021 (Cal Advocates Reply Brief), at 10.

[123] *Ibid*., at 2-29.

At the time the CAISO completed the updated economic evaluation, the 2017-2018 PSP and the 2019-2020 RSP were the most updated IRP portfolios adopted by the Commission. The CAISO reviewed other industry reports on the capital costs of solar generation in Arizona, which aligned more with the portfolios from the 2017 IRP process, rather than 2019 IRP process, as argued by Cal Advocates.[124]

As consistent with the 2019-2020 and the 2020-2021 TPP cycles, the CAISO properly applied the PSP adopted by the 2017 IRP cycle as the base case and the RSP adopted by the 2019 IRP cycle as the policy-driven sensitivity in the economic evaluation of the Proposed Project to align with the transmission planning coordinated between the Commission, CAISO and CEC.[125]

Moreover, Cal Advocates offers no new modeling approaches and merely asserts flaws in the modeling and cost assumptions relied upon by the CAISO in its updated economic analysis of the Proposed Project. Cal Advocates substituted different cost assumptions from the Commission's *Inputs and Assumptions: 2019-2020 Integrated Resource Planning* (2019-2020 IRP assumptions), which was not available to the CAISO when the updated economic analysis for solar resources was completed. With the 2019-2020 IRP assumptions, Cal Advocates calculated a BCR between 0.55 to 0.73 and showed that the Proposed Project will result in benefits to the California ratepayers, even if it is less than anticipated by CAISO and DCRT.[126]

---

[124] Yimer Corrected Rebuttal Testimony, at 8.

[125] D.20-03-028 at 4. *See also*, D.21-02-008.

[126] *Opening Brief of Public Advocates Office*, filed February 12, 2021 (Cal Advocates Opening Brief), at 16. *See also*, Wagle Opening Testimony at 2-52 and Cal Advocates Reply Brief, at 6.

It is also important to note that the IRP process continually updates information resulting in refreshed assumptions which would suggest different economic benefits for meeting the state's future resource needs. The holistic and ongoing IRP process, in coordination with the comprehensive TPP cycle, develops conclusions that are relied upon by developers and should be assumed to be consistent with the state's overall needs and direction.

Cal Advocates finally contend that the reliability benefits should be disregarded because the Proposed Project was not formulated to solve a reliability concern but provided no evidence to support its argument. We find this argument unpersuasive.

Upon review of the evidence and the Commission's IRP process, the Commission finds that the CAISO's use of the Commission-recommended portfolios from the IRP process is reasonable and appropriate.

5.4.3. CAISO Interconnection Queue and Project List Do Not Rebut the Presumption Afforded to CAISO's Economic Evaluation

Citing to the Interconnection Queue and the Project List, Cal Advocates believes the Proposed Project is unnecessary because the Interconnection Queue and the Project List reflect an approximately 68,000 MW of solar photovoltaic (PV) and approximately 131,000 MW of battery storage generation seeking connection to the CAISO grid which are not dependent on the Proposed Project.[127]

[127] *Brief of the Public Advocates Office on Additional Exhibits*, filed July 23, 2021 (Cal Advocates Additional Brief), at 2-3. The CAISO's Resource Interconnection Management System tracks and manages data from Interconnection Requests in the CAISO generator interconnection queue. The current version of the Interconnection Queue includes all the requests through Cluster 13. Due to the interconnection queue's large size in terms of both the number of requests and capacity, the CAISO has chosen to separately report the Cluster 14 projects. Together, the

The Interconnection Queue consists of interconnection requests from developers, which are regularly updated as developers complete, withdraw, or downsize their projects. The Project List identifies all the current generator requests seeking interconnection to the CAISO system. Cal Advocates essentially believes that the Proposed Project is unnecessary to meet the Commission's RPS goals.

DCRT responds that meeting the Commission's RPS goals was not the primary benefit of the Proposed Project. Rather, the Proposed Project's economic benefits alone should be the basis to grant the CPCN.

The Interconnection Queue and Project List present dynamic information about pending projects and uncertainty as to which projects will come to fruition. Given the uncertainty and the dynamic nature of the information, the Commission finds little value in the Interconnection Queue and the Project List towards the Commission's assessment of the need for the Proposed Project.

5.4.4. Cost-Effectiveness of the Proposed Project

To rebut the presumption afforded to the CAISO's economic evaluation, Cal Advocates may also show that the Proposed Project is not cost-effective. D.06-11-018 does not define the term "cost-effective." Here, Cal Advocates argued that the Proposed Project would produce less benefit than calculated by the CAISO and DCRT. We find, however, that Cal Advocates failed to adequately demonstrate that the Proposed Project is not cost effective.

Cost-benefit analysis is not synonymous with cost-effective analysis. The cost-effective analysis expands the cost-benefit analysis and focuses on whether the cost of the Proposed Project will meet the needs of the California ratepayer,

---

Interconnection Queue and the Project List identify all the current generator requests seeking interconnection to the CAISO system that are and are not dependent on the Proposed Project.

beyond the quantifiable benefits discussed above. Hence, the Proposed Project can be cost-effective with reduced economic benefit by effectuating the increase in production efficiency and reduction of ratepayer costs.[128] Moreover, as discussed below, we find that in the grand scheme this Proposed Project is cost-effective.

Pub. Util. Code § 1002.3 provides:

> In considering an application for a certificate for an electric transmission facility pursuant to Section 1001, the commission shall consider cost-effective alternatives to transmission facilities that meet the need for an efficient, reliable, and affordable supply of electricity, including, but not limited to, demand-side alternatives such as targeted energy efficiency, ultraclean distributed generation, as defined in Section 353.2, and other demand reduction resources.

As the Commission seeks to avoid developing transmission in areas where electric resources are unlikely to develop, causing stranding of expensive transmission investments and to ensure that reality follows planning, the Commission must weigh these broad economic and public policy benefits against the monetary costs to construct the Proposed Project. Despite the disputed BCRs and assumptions in this proceeding, the Commission must consider the larger picture to meet the future needs of California ratepayers.

Furthermore, all parties agree that increasing resources of renewable energy and battery capacity are necessary to meet the increasing electric demands of California ratepayers but merely dispute how that goal would be attained. The increase of the renewable energy and battery storage projects will have little benefit to California ratepayers without sufficient capacity and deliverability.

[128] 2013-2014 TPP, at 209.

Here, aside from the calculated costs and benefits, the Proposed Project will expand the CAISO BAA and would improve opportunities for interstate commerce.[129] In consideration of the foregoing broader considerations and impacts of the Proposed Project, the Commission concludes that the Proposed Project is cost-effective.

5.4.5. Cal Advocates Failed to Overcome the Rebuttable Presumption in Favor of CAISO Board-Approved Economic Evaluation

In addition to the prior arguments, Cal Advocates quoted Member Haenichen from the proceeding before the Arizona Power Plant and Transmission Line Siting Committee to dispute the cost-effectiveness of the Proposed Project.[130] That quote was taken out of context. Member Haenichen expressed concern regarding the cost-effectiveness of battery storage interconnection projects which may result in an increase in "fossil-fired equipment" in Arizona if the anticipated interconnection battery storage projects did not come to fruition.[131] Member Haenichen concluded the Proposed Project was another "east-to-west flowing transmission line" that will be "overwhelmingly beneficial to California, with a relatively small benefit accruing to Arizona ratepayers and other entities in the state of Arizona" and voted against the Proposed Project.[132]

---

[129] Exh. Cal PA-5, *Chapter 4: Arizona Transmission Policy and Planning Implications for Ten West Link (Witness: Danielle Dooley) citing to the Biennial Transmission Assessment Report* (Dooley Opening Testimony), at 4-2.

[130] Cal Advocates' Opening Comments, at 6-7.

[131] Exh. Cal PA-25, *Reporter's Partial Transcript of Proceedings Before the Arizona Power Plant and Transmission Line Siting Committee, Pages 1104 to 1109 and 1226 to 1231*, filed July 31, 2020 (APPTL Partial Transcript), at 1226-1231.

[132] *Id.*, at 1228-1229.

As discussed above, we are not persuaded by any of the Cal Advocates' rebuttal arguments and find that Cal Advocates therefore failed to overcome the rebuttable presumption in favor of the CAISO Board-approved economic evaluation.

5.5. Conclusion

In sum, the Commission finds that the CAISO's original and updated economic evaluations are reliable in determining the necessity and cost-effectiveness of the Proposed Project, since Cal Advocates failed to overcome the rebuttable presumption here. The Commission further finds that the Proposed Project is needed and meets the requirements under Pub. Util. §1001 *et seq.*

6. Environmental Considerations

The Commission is the lead agency under CEQA, and the BLM is the lead agency under National Environmental Policy Act (NEPA) for the purposes of identifying environmental impacts of the Proposed Project. We address all environmental considerations associated with this Application and the Proposed Project in the following section of this decision.

6.1. Compliance with NEPA

BLM filed Notice of Intent (NOI) to prepare an Environmental Impact Study (EIS) for the Proposed Project under NEPA, on March 23, 2016. On April 11, 2016, the Commission entered into a Memorandum of Understanding (MOU) with the lead agency under NEPA, Federal Department of the Interior, BLM, to act as a cooperating state agency responsible for ensuring the EIS complied with the CEQA.[133]

The Commission, with the assistance of its consultant, worked very closely with BLM to provide relevant CEQA guidance, detailed review of, and

[133] Exh. DCRT-66, *Final Environmental Impact Statement,* Appendix 1B, (FEIS Appendix 1B).

recommended revisions to, the Draft Environmental Impact Statement (DEIS) and Final EIS (FEIS), as well as detailed review and recommended revisions for all supporting technical studies and appendices, including the Appendix 1C Supplemental California Public Utilities Commission Information attached to the FEIS (CEQA Appendix).[134]

On August 31, 2018, BLM published the DEIS. The FEIS was provided to the Commission on September 12, 2019, and, thereafter, made available to the public for additional comment on October 15, 2019. The ROD was issued on November 22, 2019.[135]

6.2. Compliance with CEQA

Under CEQA, the lead agency is either the public agency that carries out the project or has the greatest responsibility for supervising or approving the project. For the Proposed Project, the Commission is the lead agency under CEQA. As the lead agency, the Commission must review and consider the environmental impacts identified in the FEIS as it relates to the Proposed Project and the CEQA requirements. [136]

The Commission further has the authority to mitigate or avoid only the direct and indirect environmental effects of the Proposed Project and must approve any mitigation measures within the Commission's jurisdiction that

---

[134] *See* FEIS, Appendix 1C, *Supplement California Public Utilities Commission Information*.

[135] The ROD summarizes the environmental review process FRA conducted in accordance with NEPA, and BLM's Procedures for Considering Environmental Impacts. The ROD identifies the alternatives considered by BLM, addresses comments received during the NEPA process, and identifies the Selected Alternative. The ROD also includes a list of all measures to avoid and minimize environmental harm, including a monitoring and enforcement program to ensure adherence to these measures. Finally, the ROD presents the BLM decision, determinations, and findings regarding the Project, and identifies the factors that BLM considered in making its decision. 40 CFR §1505; 64 Fed. Reg. 28545, May 26, 1999.

[136] 14 Cal. Code Regs. §15090(a).

avoid or mitigate the environmental effects due to the parts of the Proposed Project the Commission approves, unless the changes or alterations are infeasible for specific economic, legal, social, technical and other considerations.[137] The Commission must balance any unavoidable impacts against specific economic, legal, social, technical or other benefits.

Under CEQA, unlike NEPA, we must consider "significant" environmental impacts of the proposed project when we perform the environmental review. The CEQA Guidelines provides that a "significant effect on the environment' means a substantial, or potentially substantial, adverse change in any of the physical conditions within the area affected by the project."[138] The significance criteria used for this analysis of environmental impacts are based on Appendix G of the CEQA Guidelines, as well and input from Cooperating Agencies, such as the Commission.[139] These criteria serve as a benchmark for determining if the Proposed Project would result in significant impacts when evaluated against the baseline conditions established in the EIS and Technical Environmental Study (TES).

The function of Mitigation Measures (MMs) under CEQA differs from the function of MMs in the EIS under NEPA. For instance, in the EIS, mitigation can be applied to any potentially adverse effect, where feasible, regardless of the severity or duration of the effect. Under CEQA, MMs are applied to reduce potential environmental impacts to less than significant levels.[140] Under CEQA,

---

[137] 14 Cal. Code Regs. §§ 15091(a)(2) and 15096(g).

[138] Public Resources (Pub. Res.) Code §15382.

[139] FEIS, Appendix 1C, *Supplemental California Public Utilities Commission Information* (Appendix IC), at Appendix 1C-2.

[140] Pub. Res. Code §15126.4(a)(1).

a MM must be a specific, enforceable, feasible action that can be shown to reduce significant impacts.[141] The effectiveness of the measure should be demonstrable and capable of being monitored with specific performance standards. Unlike NEPA, MMs under CEQA are only applied to avoid or reduce impacts that would otherwise be significant.[142]

The FEIS for the Proposed Project considered the potential environmental impacts and found that the majority of the significant environmental impacts associated with the construction and operation of the Proposed Project could be mitigated and minimized to less than significant level to comply with CEQA. A copy of the MMs is included with this decision as Appendix A. No significant and unavoidable impacts were found.

On September 20, 2021, pursuant to CEQA Guidelines 15225(a), the Commission's Energy Division noticed the ALJ and the service list of this proceeding that the Commission intends to use the FEIS, including the CEQA Appendix, in lieu of preparing a separate CEQA document, environmental impact report (EIR) (September 20, 2021 Notice).

Energy Division informed the ALJ that, after reviewing the protests submitted to the BLM and in this proceeding, it continues to believe that the FEIS, including its CEQA Appendix, meets the requirements of CEQA. Accordingly, the September 20, 2021 Notice, attached to Appendix B of this decision, is hereby marked as Exh. A and is received into the evidentiary record.

[141] Pub. Res. Code §15126.4(a)(2).

[142] Pub. Res. Code §15126.4(a)(3).

6.2.1. Environmentally Superior Alternative

CEQA Guidelines requires the identification of an "environmentally superior alternative."[143] Selection of the no project alternative would avoid all of the adverse impacts and would be the environmentally superior alternative, but none of the Proposed Project's benefits will be realized. To balance the Proposed Project's benefits with its potential adverse effects, the environmentally superior alternative among the other alternatives is Alternative 2, the BLM Utility Corridor Route, utilizing Subalternative 4D (Alternative 2-4D), which is the BLM's Preferred Alternative identified in the FEIS.[144]

Alternative 2-4D reduces adverse impacts on visual and recreational resources. Under this Alternative, the BLM would approve a total of 21.8 miles of 200-foot-wide ROW within existing designated utility corridors in California and comprised of segments selected to:

1) emphasize the use of BLM utility corridors;
2) consolidate development and disturbance with existing disturbance, such as along portions of the already impacted DPV transmission line route;
3) avoid residential and other development east and south of Blythe;
4) consolidate development along the existing DPV1 transmission line route across private lands in California; and
5) avoid the culturally sensitive area in the vicinity of the Mule Mountains southwest of Blythe.

Alternative 2-4D also avoids impacts to sensitive cultural resources and reduce impact to visual resources in Arizona, by avoiding the King of Arizona

[143] Pub. Res. Code §15126.6(e)(2).

[144] Appendix IC at Appendix 1C-292.

(KofA) National Wildlife Refuge (NWR), while also avoid biological, recreation, and land use impacts associated with crossing the KofA NWR in Arizona.[145] Therefore, Alternative 2-4D would be the environmentally superior alternative under CEQA.

6.2.2. Certification of EIS

Where, as here, the project requires compliance with both CEQA and NEPA, CEQA encourages the state agency to use the NEPA document, EIS, if 1) the EIS is prepared before the state agency would otherwise prepare its own EIR, 2) the EIS complies with the provisions of the CEQA Guidelines, and 3) the EIS is supplemented to include certain CEQA requirements that are not required pursuant to NEPA.[146] Here, the FEIS was prepared before the Commission would otherwise prepare its own EIR and supplemented by the CEQA Appendix to comply with the CEQA Guidelines.

The FEIS and the CEQA Appendix was completed after notice and opportunity for public comment on the scope of the environmental review and the DEIS, as required by CEQA. The FEIS documents all written and oral comments made on the DEIS, and responds to them, as required by CEQA. The FEIS identifies MMs in the CEQA Appendix that 1) avoid or substantially lessen the environment impacts and 2) identify no significant and unavoidable environmental impacts.

As required by CEQA, the CEQA Appendix of the FEIS identifies Alternative 2-4D as the environmentally superior alternative pursuant to CEQA and details of the Energy Division's consideration and comparison of the

[145] *Ibid.*

[146] CEQA Guidelines § 15221; Pub. Resources Code § 21083.7.

combinations of Four Action Alternatives, including the environmentally superior alternative, described above, along with associated subalternatives, considered in full detail in the body of the FEIS. Action alternatives consist of individual segments that have been compiled into full Alternative Routes and Subalternatives.[147] Additionally, the CEQA Appendix of the FEIS considered the No-Project and No-Wire Alternatives. As required by CEQA (but not NEPA), the FEIS discusses growth-inducing effects in Section 5.1 of the CEQA Appendix.[148]

The Commission reviewed and considered the information contained in the FEIS and believes it meets the requirements of CEQA. The Commission certifies that the FEIS has been completed in compliance with CEQA after the Commission received, reviewed, and considered the information contained in the FEIS with the CEQA Appendix. The Commission further finds that the FEIS with the CEQA Appendix reflects our independent judgment and analysis. Accordingly, the Commission concludes that the FEIS with the CEQA Appendix sufficiently meets the CEQA requirements and is adequate for our decision-making purposes in this proceeding.

6.3. Pub. Util. Code §1002(a)

In granting a CPCN, Pub. Util. Code §1002(a) requires that the Commission must also consider the following factors: 1) community values; 2) recreational and park areas; 3) historical and aesthetic values; and 4) influence on environment.[149]

---

[147] FEIS, Chapter 2, at 2-3.

[148] 14 California Code of Regulations (CCR) §15221.

[149] Pub. Util. Code §1002(a) requires the Commission to consider, as a basis for granting a certificate of public convenience and necessity, community values, recreational and park areas, historical and aesthetic values, and influence on the environment. (See CEQA Guideline, Public Resources (Pub. Res.) Code § 15091(a), "No public agency shall approve or carry out a project

Pursuant to Pub. Util. Code § 1002(a)(1), we have considered the community values factor. There is no opposition from any party in this regard. FEIS demonstrates that the Proposed Project uses the existing transmission line corridor, and therefore results in only minimal impact upon any nearby communities.

Specifically, the FEIS showed that the local communities rely upon the cumulative effect area (CEA) to draw visitors to support the local economy. The FEIS also showed that, in the long run, the main unavoidable adverse effect would be the increased development in natural areas heavily used for recreation;[150] however, in the reasonably foreseeable future, actions on the undeveloped natural areas would likely have only minor cumulative effect on the recreation experience, the availability of primitive or unconfined recreational settings, and the solitude in the CEAs.[151]

Moreover, the Proposed Project also will neither displace existing housing or persons from housing nor necessitate the construction of replacement housing elsewhere.[152] Specifically, the FEIS anticipates 1) no impact from construction workers requiring housing that exceeds the supply of local housing or temporary

---

for which an EIR has been certified which identifies one or more significant environmental effects of the project unless the public agency makes one or more written findings for each of those significant effects […]. The possible findings are: […] (c) Specific legal, social, technological, or other considerations, including provision of employment opportunities for highly trained workers, make infeasible the mitigation measures or project alternatives identified in the EIR.")

[150] FEIS, Chapter 4, *Environmental Consequences* (FEIS Chapter 4), at 4-126.

[151] FEIS, Chapter 3, *Past, Present, And Reasonably Foreseeable Future Projects* (CEA Projects), at 3-67.

[152] FEIS Chapter 4, at 4-135.

housing facilities and 2) minimal potential changes in the demand for labor or in local employment.[153]

Finally, as growth has been accounted for in various local and regional plans and projections, cumulative impacts from construction workers on the local housing market are negligible to moderate during project construction.[154] The Proposed Project, in conjunction with reasonably foreseeable energy, utility, and other infrastructure projects, could support population increases in the area in the foreseeable future.[155]

Pursuant to Pub. Util. Code § 1002(a)(2), we have also considered the issue of preservation of recreational and park areas. There is no opposition from any party in this regard. FEIS provides a detailed analysis of potential impacts to these recreational and park areas.

Specifically, FEIS also showed that the impacts to recreation and recreation areas, related to noise, dust, visual disturbance and restricted access during construction, would likely be localized and short-term.[156] FEIS projected that the reduction in recreation users coming to the area will be minor, as most users will likely move to other nearby locations not impacted by construction activities.[157] Ongoing operations and maintenance will have little or no long-term effect on the tourism- and recreation-related economy.[158]

[153] *Ibid*.

[154] *Ibid.*

[155] *Ibid.*

[156] *Ibid.*

[157] *Ibid*.

[158] FEIS Chapter 4, at 4-133.

Pursuant to Pub. Util. Code § 1002(a)(3), we have also considered the historic and aesthetic values. There is no opposition from any party in this regard. The Proposed Project's impacts on historical and aesthetic values and the environment were further discussed in Sections 6.2 and 6.2.1, above.

Pursuant to Pub. Util. Code § 1002(a)(4), we have considered the Proposed Project's influence on its environment in our independent review of the FEIS.

6.4. Alignment with the Commission's Environmental and Social Justice Action Plan

In February 2019, the Commission adopted the Environmental and Social Justice (ESJ) Action Plan to serve as a roadmap for implementing the Commission's vision to advance equity in its programs and policies for ESJ or disadvantaged communities.

Here, the FEIS reviewed the Proposed Project's environmental and economic impacts to ESJ communities. ESJ communities is defined in the FEIS as minority or low-income populations.[159] In California, the ESJ communities impacted are located within Riverside County, with a minority population of 61.7 percent, which is 1.5 percent greater than the state percentage.[160] The city of Blythe and surrounding area have a minority population of 70 percent with about 24 percent being low-income. Ripley, which is south of Blythe, has a 95 percent minority population with highest low-income population at 33.7 percent.[161] In Riverside County, the land within half mile of the Proposed Project is used for commerce, recreation, residence, and agriculture.

[159] FEIS Chapter 4, at 4-136

[160] FEIS, Chapter 3, *Cultural Resources* (Cultural Resources), at 3-50.

[161] *Id.,* at 3-50-3-51.

The Proposed Project will impact a disproportionate number of the ESJ communities on a localized basis from construction, operation, and maintenance of the Proposed Project, due to the high percentage of minority population in Riverside County. These impacts would include construction noise and other disruptions and impacts to visual resources and property values during operations.[162] However, FEIS found that any impact would likely be negligible to minor due to the predominantly low population density in this rural setting and the presence of existing transmission and utility lines nearby.[163]

The Proposed Project route is adjacent or nearly adjacent to existing transmission lines, interstate highways, or other utility corridors as a means of minimizing new disturbance to either the natural or human environment.[164] Overall, the FEIS found that no short- or long-term displacement of low-income or minority businesses or residents will occur under the Proposed Project to contribute to potential cumulative effects on minority populations.[165]

Yet, ESJ communities may benefit from the short-term economic stimulus from construction activities and expenditures, short-term and longer-term increases in tax revenues, and added capacity and reduced congestion for electricity transmission.[166]

The Proposed Project further meets the Commission's ESJ Action Plan goals to 1) to increase climate resiliency; and 2) promote economic and workforce development opportunities in the affected ESJ communities. We note the

[162] FEIS, *Executive Summary* (Executive Summary), at ES-12.

[163] *Ibid.*

[164] *Id.,* at ES-12-ES-13.

[165] *Ibid.*

[166] *Ibid*.

identified negative impacts are not directly attributable to the construction of the Proposed Project in California but related to the overall project.

Upon review of the FEIS, we find that although there may be some potential and gradual negative economic and environmental impacts from the Proposed Project, the MMs, will reduce the impact to the ESJ communities to less than significant levels. The Proposed Project is also consistent with the goals set forth in the Commission's ESJ Action Plan. The Proposed Project will not result in a long-term disproportionate environmental impact upon the affected ESJ communities. Based on the foregoing, we find that the construction of the Proposed Project aligns with the Commission's ESJ Action Plan

6.5. The Commission's Third Amended Scoping Memo Did Not Materially Change the Issues Surrounding Environmental Review

Cal Advocates believes the Commission's Third Amended Scoping Memo changed the issues in scope to warrant a need to further "develop a record to assess whether the Commission reviewed and considered the FEIS and whether the FEIS reflects the Commission's independent judgment and analysis" and did not address the sufficiency of the FEIS.[167] Specifically, Cal Advocates incorrectly asserts, in its Opening and Reply Brief, an inability to address Issue 8 in the First Scoping Memo (Issue 8) and Issue H in the Third Amended Scoping Memo (Issue H) because it lacked information about the Commission review and consideration of the FEIS or whether the FEIS reflects the Commission's independent judgment and analysis. Cal Advocates' Reply Brief was filed on March 12, 2021, over three weeks after the Third Amended Scoping Memo was issued, and claimed "the Parties cannot take a position in the reply briefs without

[167] Cal Advocates Reply Brief, at 38

the Commission providing some indication as to whether it has reviewed and considered the FEIS and intends to adopt it in lieu of preparing an EIR under CEQA."[168]

Issue H did not materially change the scoped Issue 8. Both Issues 8 and H addressed the sufficiency of the EIS to meet CEQA requirements. Issue H clarifies the Commission's scope in evaluating the sufficiency of the FEIS.

The Commission's role in the EIS process is clearly stated in the Appendix 1B of the FEIS, made available to the public on October 15, 2019, which states,

> CPUC Will: (1) As the cooperating State agency, be responsible to ensure that the EIS is in compliance with all requirements of CEQA and will be responsible for the scope and content of the EIS that relates to all necessary aspects of CEQA. . .[169]

The Introduction of the 509-page CEQA Appendix to the FEIS, entitled "Supplemental California Public Utilities Commission Information" states, in relevant part:

> This appendix incorporates the environmental analysis conducted in the EIS by reference, *while providing supplemental analysis needed to address issues that may be unique to CEQA* [emphasis added]. This includes describing those environmental effects resulting from Project implementation identified in Chapter 4, Environmental Impact Analysis that may be considered significant and that cannot be mitigated to a less than significant level under CEQA. The analysis also identifies cumulative impacts, the potential to foster economic or population growth either directly or indirectly in the Project study area and surrounding environment, and an environmentally superior alternative.

[168] *Id.,* at 39.

[169] FEIS, Appendix 1B, at 5.

> Should the CPUC decide to issue a CPCN based on environmental analysis presented in the EIS, pursuant to Section 15221 of the CEQA Guidelines, the MOU provides for the CPUC's continued involvement during the Project's construction and operation phases. This involvement includes, but is not limited to, enforcement of Mitigation Measures (MMs) presented in the Mitigation Monitoring and Reporting Program (MMRP; Section 6.0).

The Introduction of the CEQA Appendix and the Appendix 1B provided the factual information necessary to analyze whether the FEIS complies with CEQA; the Commission properly reviewed and considered it; and it reflects the Commission's independent judgment and analysis as identified in Issues 8 and H.

Therefore, the Commission finds that Issue H did not materially change the scope of Issue 8 and Cal Advocates was not prejudiced by the scoped issues in the Third Amended Scoping Memo.

7. Maximum Reasonable and Prudent Cost

Pub. Util. Code §1005.5 requires the Commission, in granting a CPCN, to specify a maximum reasonable and prudent cost for the facility. The reasonable and prudent maximum cost (cost cap) for the Proposed Project was determined using the estimated anticipated construction cost, taking into consideration the design of the Proposed Project, the expected duration of construction, an estimate of the effects of economic inflation, and any known engineering difficulties associated with the Proposed Project.

CAISO originally awarded the project to DCRT subject to a cost cap of $241,805,391.[170] Since then, due to route change and a delay in in-service date,

[170] Unless otherwise noted, all cost figures are expressed in 2028 dollars ($).

DCRT estimates the maximum reasonable cost for the Proposed Project to be $389,045,968[171] in 2021 dollars which breaks down as follows:

- Development $39,061,346
- Financing $45,024,237
- SPV – Management $26,866,199
- EPC Construction $225,664,267
- Interconnection Costs $ 52,429,919[172]

DCRT estimates an additional annual Operation and Maintenance cost of $9,700,000, including estimated property taxes.

Cal Advocates challenges the reasonableness of the cost based on its assertion that Arizona ratepayers will benefit by $2-7 million in cost savings per year from the Proposed Project and the costs of the Proposed Project should be borne by both states. Cal Advocates urged the Commission therefore to condition the approval of the CPCN for the Proposed Project upon DCRT submitting the Proposed Project for review of cost allocation under FERC Order 1000. The Commission rejects this argument because the issue of allocation of the Proposed Project costs is outside the scope of this proceeding and outside the Commission's jurisdiction pursuant to Pub. Util. Code § 9600(a)(2)(A).

We note, Cal Advocates proposes, for the first time in its opening comments to the proposed decision, that the cost cap should be reduced by 6.5 to 23 percent to reflect the benefits that Arizona ratepayers may receive from the Proposed Project and proposes that a 5 percent contingency to be included in the cost cap. Both of these untimely propositions are unsupported by the evidence in the record.

[171] DCRT Opening Brief, at 6.

[172] Exh. DCRT-1, at. 16 and Exh. DCRT-5.

Furthermore, Cal Advocates failed to account for the impacts to the Arizona environment and ESJ communities from the approximately 103.5 miles of transmission line in Arizona and associated risks of the uncertainties of the proposed interconnection projects. Member Haenichen spoke at length during the proceeding before the Arizona Power Plant and Transmission Line Siting Committee and voted against Arizona's approval of the Proposed Project arguing, inter alia, that "east-to-west flowing transmission line" would be "overwhelmingly beneficial to California, with a relatively small benefit accruing to Arizona ratepayers and other entities in the state of Arizona" and that "[Arizona ratepayers] might wind up with just a bunch of combustion turbines . . . fired by natural gas."[173]

Based on the evidence, we believe DCRT's updated estimates are reasonable and find that the reasonable and prudent maximum cost for the Proposed Project, including contingency, is $389,045,968 in 2021 dollars. This cost cap shall not be exceeded absent significant changes to the Proposed Project which cannot be anticipated at this time. The Commission finds the figures are reasonable and within expectations as the Proposed Project was initially submitted in 2016 with an expected in-service date in 2021. However, as further detailed in Section 8.1 below, to safeguard the California retail ratepayers, the Commission is committed and intends to exercise its authority to review actual costs incurred to ensure reasonableness and prudency and to challenge them as appropriate at the FERC proceedings.

[173] APPTL Partial Transcript, at 1230.

8. DCRT's Request for Exemption from GOs 65-A, 77-M, 104-A is Granted in Part and Denied in Part.

DCRT requests exemptions from all annual reporting requirements under GOs 65-A, 77-M, and 104-A, due to the lack of retail customers in California as DCRT will operate as part of the CAISO system and subject to FERC review and approval. GOs 65-A, 77-M, and 104-A each concern some element of financial disclosure that utilities must regularly report to the Commission.

8.1. GO 65-A

GO 65-A, in pertinent part, requires each utility with more than $200,000 in annual gross operating revenue to file with the Commission a copy of each financial statement it prepares in the normal course of business that presents its operating results and financial condition, as well as a copy of its annual report and all other financial statements issued to its stockholders.[174]

DCRT argues that the objectives served by GO 65-A are inapplicable to DCRT "[a]s the Commission is not performing a ratemaking function with regard to DCRT" in this proceeding and should be waived.[175]

However, Cal Advocates correctly pointed out that the Commission is involved in the FERC Transmission Owner (TO) rate cases and granting exemptions from the reporting requirements may impede its ability to obtain relevant and accurate information to ensure that customer interests are protected, since roughly 90% of the costs of CAISO transmission is paid indirectly through the energy rates of California retail customers.[176] Cal

[174] GO 65-A.

[175] Application, at 32.

[176] *Protest of the Office of Rate Payers Advocates*, at 8.

Advocates further argued that the exemption will prevent access to "critical information" to both Commission staff and Cal Advocates without litigation.

Although the Commission is not engaging in ratemaking in this proceeding, the Commission is a party to the ratemaking of DCRT in the FERC TO rate cases, once DCRT is fully operational. Accordingly, DCRT's request for exemption from annual reporting requirements under GO 65-A is not in the public interest to California ratepayers and is denied.

8.2. GO 104-A

GO 104-A, in pertinent part, requires each utility with more than $50,000 in annual gross operating revenue to annually file with the Commission a report identifying all persons holding a financial interest in the utility, either based upon contracts they hold with the utility or for services provided to the utility or based upon their control of ten percent or more of the voting power in the utility.[177]

DCRT believes that adhering to these reporting requirements is unnecessary, duplicative and burdensome for a transmission-only utility that is subject to (i) rate regulation by FERC, and (ii) restrictions on the costs that may be recovered in its TAC and should be waived.[178] DCRT further asserts that the form supplied by the Commission's Energy Division for GO 104-A annual report requires "information that complements the regulation of cost-based rates by the Commission, such as information on income statements, sales to residential

[177] GO 104-A.

[178] Application at 32. DCRT will financial information and reports to FERC, which will be publicly available through FERC's processes.

customers, and related issues" which is inapplicable to DCRT, since DCRT has no retail customers and will be subject to FERC rate authority.[179]

Considering DCRT will be a transmission-only utility under the operational control of CAISO with its rates and terms and conditions of service set by FERC, DCRT is still subject to the Commission's oversight. The Commission is unconvinced that the information required under GO 104-A should be exempted. Accordingly, DCRT's request for exemption from annual reporting requirements under GO 104-A is denied.

8.3. FERC Forms 1 and 3-Q as Proxy for GOs 65-A, 104-A.

FERC Form 1, in pertinent part, requires FERC-regulated utilities to file with FERC an annual financial statement including any statement to stockholders, a balance sheet, and statements of income, retained earnings, cash flows, and related information. Among the Form 1 individual components is the duty to identify the name, title, and salary of every executive officer, but not of all other such employees making $50,000 or more annually.[180] FERC Form 3-Q, filed quarterly, is very similar to FERC Form 1 but is intended to supplement information to be provided in Form 1.[181]

DCRT, once constructed and in operation, must file FERC Forms 1 and 3-Q with FERC. FERC Forms 1 and 3-Q are, to a meaningful degree, duplicative of the information that is captured by GOs 65-A and 104-A. The Commission also does not foresee any change in the availability of information that would alter the Commission's ability to gauge and exercise its safety oversight authority of

[179] Application, at 32.

[180] FERC Form 1 can be found at the FERC website.

[181] FERC Form 3-Q can be found at the FERC website.

DCRT; raise new, additional, or different safety implications; or result in any change to the reliability of DCRT's electrical service.

The filing of FERC Forms 1 and 3-Q is also an efficient use of resources for the Commission and DCRT. First, less Commission resources may be required to track, review, and synthesize the information in the FERC forms for the Commission's purposes as a party to the FERC TO rates proceedings and as watchdog over DCRT's requested rate recovery. Second, DCRT would require less work to prepare only those forms (as opposed to also preparing GO 65-A and 104-A filings) and, therefore, avoid potentially duplicative effort.

Considering (1) DCRT is a wholesale-only utility that does not have its rates set by the Commission and is operationally controlled by CAISO, (2) the Commission's oversight of DCRT regarding safety issues will be unaffected, and (3) there will be reduction of the Commission's regulatory work burden and additional work by DCRT to prepare and file GO 65-A and 104-A information, the Commission authorizes DCRT to file its FERC Forms 1 and 3-Q filings to suffice as proxies for the financial information that would otherwise be received pursuant to GOs 65-A and 104-A filings.

8.4. FERC Form 1 and GO 77-M Requirements

GO 77-M, in pertinent part, requires each utility with more than $500,000 in annual gross operating revenue to annually file with the Commission a statement identifying the titles and duties and compensation of its executive officers and of all employees earning more than $85,000 annually.[182] GO 77-M

[182] GO 77-M.

requires submission of data on the compensation of officers and employees, dues and donations, and legal fees.[183]

While the Commission agrees with DCRT that the "primary" purpose of GO 77-M is to assist the Commission in setting utilities' rates, the Commission has never said this is the sole purpose of GO 77-M and that, indeed, its purposes go beyond that of cost-of-service or rate-of-return ratemaking at the Commission.[184] The Commission may use all information it gleans from GO 77-M, as well as GOs 65-A and GO 104-A, in carrying out its responsible role as a party in the applicable FERC proceedings.[185]

DCRT argues that GO 77-M's disclosure requirements was unnecessary and unduly burdensome because the Commission lack jurisdiction over a DCRT's rates.[186] However, the Commission has required utilities to submit the annual reports required by General Order 77-M when FERC Form 1 is not a proxy that suffices to convey the information that would have been found in a properly completed and filed GO 77-M.[187] As explained previously, the Commission has a continuing duty to ensure that rates remain reasonable and affordable, and GO 77-M remains one tool to assist the Commission in fulfilling this duty in its responsible role before FERC.

Additionally, FERC Form 1 contains a duty to identify the name, title, and salary of every executive officer making $50,000 or more annually. Given the operational size of DCRT and its parent companies, Starwood Energy and

[183] Application, at 32.

[184] D.19-07-002, at 7-9.

[185] *Ibid*.

[186] Application, at 32.

[187] D.19-07-002, at 9.

Atlantica, it is presumed that employees, who may otherwise not be disclosed in the FERC Form 1, would only have been identified and their titles, duties and their compensation described, if DCRT met the GO 77-M requirements. Based upon this observation, FERC Form 1 is clearly not a proxy that suffices to convey the information that would have been found in a properly completed and filed GO 77-M.

Although the Commission's oversight regarding DCRT is not the same as it would be for a typical utility under the Commission's full regulatory scheme, an exemption from complete compliance with GO 77-M filing requirements would pose a meaningful harm to the Commission's continued responsible roles concerning DCRT. This is because DCRT's presentation of FERC Form 1 as a proxy for compliance with GO 77-M would be inadequate, given the differences in their respective sets of information. Because the information found in FERC Form 1 does not suffice as a proxy for the information found in GO 77-M for the Commission's needs, DCRT's request for exemption from annual reporting requirements under GO 77-M is denied. DCRT must file complete information in full conformance with GO 77-M requirements.

8.5. Authorities Cited by DCRT in Support of Its Requested Reporting Exemptions are Inapposite

DCRT cites to D.00-12-030 and D.18-09-030 to support its request for full waiver of annual reporting requirements under GOs 65-A, 77-M, and 104-A. Neither decision fully exempts the reporting requirements for those applicants.

In D.00-12-013, the applicant requested exemption only from those requirements that are not applicable to a utility offering market-based rates.[188] The Commission relieved the applicant of certain reporting requirements

[188] D.00-12-030 (Wild Goose Decision), at 3.

deemed inapplicable to the applicant's operations but did not waive all annual reporting requirements.[189]

In D.18-09-030, the Commission granted a limited exemption from the annual reporting requirements under GOs 65-A, 77-M and 104-A by requiring the applicant to provide a copy of the applicant's FERC Form 1 to "facilitate providing the Commission with the vast majority of the relevant reporting information," when requested.[190]

Here, the Commission finds that D.19-07-002 is more applicable in this proceeding. In D.19-07-002, the applicant, Trans Bay Cable LLC (TBC), requested to be relieved of reporting requirements under GOs 65-A, 77-M, and 104-A.[191] TBC is a transmission-only utility with solely wholesale customers and without retail customers.

Like DCRT, TBC is under the operational control of CAISO and regulated solely by FERC for purposes of its rates and terms and conditions of service.[192] TBC owns and operates a single high voltage direct current transmission line service of approximately 400 MWs, spanning 53 miles from the town of Pittsburgh to the city of San Francisco.[193] In D.19-07-002, the Commission ordered TBC to file FERC Forms 1 and 3-Q as proxies for filings under GOs 65-A and 104-A and denied request for waiver of filing under GO 77-M.[194]

Likewise, in the instant proceeding, the Commission:

---

[193] *Ibid.*

[194] *Id.,* at 14.

1) denies the requested exemption from the reporting requirements under GOs 65-A, 104-A and 77-M; and

2) authorizes DCRT to file the FERC Form 1 and Form 3-Q in lieu of the reporting requirements under GOs 65-A and 104-A.

9. DCRT's Request for Limited Exemption to the Affiliate Transactions Rules

The Affiliate Transaction Rules (ATRs), as initially adopted in D.94-12-088 and as set forth in D.06-12-029, were intended to establish standards of conduct for relationships between Commission-regulated gas and electric utilities and their corporate affiliates. The adopted rules create standards for non-discrimination, disclosure and information, and separation aimed at fostering competition and protecting consumers' interests.

On October 12, 2016, DCRT, in its Application, requested certain exemptions from the ATRs in order to utilize the resources available from its parent company, Starwood Energy, Atlantica and its affiliates. DCRT intends to utilize resources, personnel, and facilities of its affiliates Starwood Energy to facilitate the cost-effective financing, development, construction, ownership, operation, and maintenance of the Proposed Project.[195]

Specifically, DCRT intends to utilize resources and support of Starwood Energy and Atlantica for financing, development, and planning, environmental, engineering, and construction services. DCRT also intends to rely on Starwood Energy affiliate to support necessary corporate support services, such as "payroll, taxes, shareholder services, insurance, financial reporting, financial planning and analysis, corporate accounting, corporate security, human

[195] Application, at 28.

resources (compensation, benefits, employment policies), employee records, regulatory affairs, lobbying, legal, [and] pension management."[196]

In addition, DCRT also intends to rely on its affiliates for information technology, compliance, business management and planning, treasury, integrated supply chain procurement, project management, and corporate oversight and management.

9.1. Sharing of Officers and Directors

DCRT requests limited exemptions from Sections V.C., V.E. and V.G. of the ATRs, asserting that DCRT will need "from time to time to utilize certain engineering, transmission operations, employee recruiting, and marketing services from its Starwood Energy affiliates..."[197]

Section V.C. of the ATRs provides, in pertinent part:

> A utility shall not share office space, office equipment, services, and systems with its affiliates, nor shall a utility access the computer or information systems of its affiliates or allow its affiliates to access its computer or information systems, except to the extent appropriate to perform shared corporate support functions permitted under Section V E of these Rules. Physical separation required by this rule shall be accomplished preferably by having office space in a separate building, or, in the alternative, through the use of separate elevator banks and/or security-controlled access. This provision does not preclude a utility from offering a joint service provided this service is authorized by the Commission and is available to all non-affiliated service providers on the

[196] An energy utility and its affiliates may share these corporate support services in accordance with the affiliate transaction rules. *Affiliate Transactions Rules*, Appendix A, Rule V.E., D. 98-08-035.

[197] Application, at 29.

same terms and conditions (*e.g.*, joint billing services pursuant to D.97-05-039).[198]

Section V.E. of the ATRs provides, in pertinent part:

As a general principle, a utility, its parent holding company, or a separate affiliate created solely to perform corporate services may share with its affiliates joint corporate oversight, governance, support systems and personnel. […] As a general principle, such joint utilization shall not allow or provide a means for the transfer of confidential information from the utility to the affiliate, create the opportunity for preferential treatment or unfair competitive advantage, lead to customer confusion, or create significant opportunities for cross-subsidization of affiliates.[199]

[…]

Examples of services that may not be shared include: employee recruiting, engineering, hedging and financial derivatives and arbitrage services, gas, and electrical purchasing for resale, purchasing of gas transportation and storage capacity, purchasing of electric transmission, system operations, and marketing.[200]

Section V.G. of the ATRs provides, in pertinent part:

Except as permitted in Section V.E. (corporate support), a utility and its affiliates shall not jointly employ the same employees. This Rule prohibiting joint employees also applies to Board Directors and corporate officers, except for the following circumstances: In instances when this Rule is applicable to holding companies, any board member or corporate officer may serve on the holding company and with either the utility or the affiliate (but not both).[201]

---

[198] D.98-08-035, Appendix B (Appendix B), Section V.C.

[199] *Ibid*., at Section V.E.

[200] *Ibid*.

[201] *Id*., at Section V.G.

DCRT believes that the limited exemptions from Sections V.C. and V.E. are necessary to "utilize the expertise and resources of DCRT's affiliates, including: (i) development support from Starwood Energy and Atlantica; (ii) development, planning, engineering, and construction support from Starwood Energy, Atlantica, and its affiliates; (iii) certain corporate support services from various Starwood Energy and Atlantica affiliates, whose services might not otherwise be expressly permitted under Section V.E. of the affiliate transaction rules, such as information technology, compliance, business management and planning, treasury, integrated supply chain procurement, and corporate real estate; and (iv) oversight by shared corporate officers."[202]

In D.97-12-088, the Commission cited certain objectives for adopting the ATRs, including preventing cross-subsidization between a utility's customers and the affiliate's operations, protecting the use of customer-specific information, preventing consumer confusion between the affiliate and the regulated utility, and mitigating the use of market power.[203]

DCRT has the burden to demonstrate that circumstances warrant an exemption from the ATRs. DCRT asserts that granting the limited exemptions will not lead to the risks that the ATRs were designed to protect against.

First, the costs of the Proposed Project will be recovered solely through transmission rates as part of the CAISO TAC, following approval by the FERC, which has jurisdiction over rates for interstate transmission service and will not create a cross-subsidization risk that could impair competition. Since DCRT's ability to recover costs is subject to FERC approval through the ratemaking

[202] Application, at 29.

[203] D.97-12-088, at 11-13.

process, DCRT must implement its TO Tariff in a non-discriminatory manner and thus cannot exercise market power.[204]

Second, DCRT argues that its lack of retail customers or retail service prevents access to customer information or accounts and eliminates any "meaningful risk of consumer confusion" between DCRT and its affiliates. Since DCRT does not have any retail customers in California, there is no apparent risk of customer confusion or privacy violations.

In considering the Application and supplemental response, the Commission finds that DCRT has met its burden of showing that circumstances warrant a limited exemption from Sections V.C., V.E. and V.G. With oversight by FERC for approval of DCRT's transmission rates, there is no apparent risk of cross-subsidization that could impair competition. Because DCRT is subject to open access terms in the CAISO Tariff, we do not find evidence of the potential to exercise market power. Accordingly, the Commission grants DCRT limited exemptions from Sections V.C., V.E. and V.G. of the ATRs.

10. Electric and Magnetic Field

The Commission has examined EMF impacts in several previous proceedings, concluding that the scientific evidence presented in those proceedings was uncertain as to the possible health effects of EMFs.[205] Therefore, the Commission has not found it appropriate to adopt any related numerical standards. Because there is no agreement among scientists that exposure to EMF creates any potential health risk, and because CEQA does not define or adopt any standards to address the potential health risk impacts of possible exposure to

[204] DCRT Opening Brief, at 47.

[205] *See* D.06-01-042 and D.93-11-013.

EMFs, the Commission does not consider magnetic fields in the context of CEQA and the determination of environmental impacts.

However, recognizing that public concern remains, we do require, pursuant to GO 131-D, Section X.A, that all requests for a CPCN include a description of the measures taken or proposed by the utility to reduce the potential for exposure to EMFs generated by the proposed project.

We developed an interim policy that requires utilities, among other things, to identify the no-cost measures undertaken, and the low-cost measures implemented, to reduce the potential EMF impacts.

Here, DCRT filed a Field Management Plan as Appendix F to this Application, which details the EMF measures for the Proposed Project, including the (1) utilization of a typical horizontal 500 kV tower height of 165 feet;[206] (2) installation of 500 kV transposition towers near the locations of existing transposition towers for the SCE Colorado River-Palo Verde (CRPV), formally the Devers-Palo Verde No 1 (DPV1) 500 kV transmission line;[207] and (3) use of existing utility corridors. DCRT updated the Field Management Plan in accordance with Alternative 2-4D route and configuration, identified in the FEIS and incorporated the same as part of the MMs in the CEQA Appendix. On August 6, 2020, DCRT updated the Field Management Plan and identified the no cost EMF reduction measures to include (1) the utilization of typical conductor to ground clearance heights that exceed GO 95, Section III, Rule 37; and (2)

[206] Magnetic field models are based on both a 155-foot tower height and a 165-foot tower height. The 165-foot structures help to lower the magnetic field strength. *See* Application, *Field Management Plan for Ten West Link Transmission Project* (EMF Plan), Appendix F, at 118-120.

[207] Transposition towers are used to re-arrange the phase conductors on a transmission line; transposition structures enable magnetic field reduction as well as phase impedance equalization across the line route. EMF Plan, at 13.

optimization of phasing and transposing the Proposed Project with respect to the DPV transmission line, which will parallel the Proposed Project for most of its length.[208]

The record contains no other evidence or argument regarding EMF concerns. We adopt DCRT's proposed EMF reduction measures as stated in its Field Management Plan and require DCRT to comply with it.

11. Miscellaneous Issues

Intervenor compensation and safety considerations were two issues scoped in the First Scoping Memo. During the course of the proceeding, Conservation Group and CRIT have withdrawn from this proceeding, and TURN did not actively participate in this proceeding. Only Conservation Group and TURN filed Notices of Intent to Claim Intervenor Compensation. Therefore, the issue of guarantee of payments for intervenors' consultants and the costs of intervenor compensation is now moot.

No specific safety concern or consideration were raised. DCRT intends to operate in compliance with applicable rules, regulations, and standards governing safety, reliability, and competition.[209] The FEIS addressed public health and safety considerations, including fire, EMF, radio interference with military operations, and dust-related illness.[210] Appendix 2A of the FEIS sets

---

[208] The Field Management Plan included as Appendix F to the Application filed in 2016 was superseded by the Detailed Field Management Plan, Revision B, dated August 6, 2020, which was based on the Preferred Alternative route and project configuration identified in the FEIS. The CEQA Appendix identifies development of the Field Management Plan as mitigation measure "MM EMF-CEQA-1" and requires that a Field Management Plan be submitted "at least 30 days prior to the start of construction." *Comments of DCR Transmission on the Proposed Decision Granting DCR Transmission, LLC a Certificate of Public Convenience and Necessity for the Ten West Link Project*, filed October 21, 2021 (DCRT Opening Comments) at 2.

[209] DCRT Opening Brief at 53.

[210] FEIS at 3-6, 4-9,

forth in the APM and BMP for construction and maintenance of the Proposed Project to address safety concerns and considerations.

In granting the CPCN, the Commission adopts the APM and BMP requirements and compels DCRT to implement the APM and BMP requirements set forth in Appendix 2A of the FEIS for construction and maintenance of the Proposed Project.

12. Comments on Proposed Decision

The proposed decision of ALJ Daphne Lee in this matter was mailed to the parties in accordance with Pub. Util. Code §311 and comments were allowed under Rule 14.3 of the Commission's Rules of Practice and Procedure. Comments were filed by DCRT, the CAISO and Cal Advocates on October 21, 2021, and reply comments were filed on October 26, 2021, by the same parties. Those comments were carefully evaluated. We were not persuaded by the comments to alter the outcome recommended in the proposed decision. Where appropriate, clarifying revisions responsive to the comments to the proposed decision have been made throughout the decision.

13. Assignment of Proceeding

Genevieve Shiroma is the assigned Commissioner and Daphne Lee is the assigned Administrative Law Judge in this proceeding.

Findings of Fact

1. The Proposed Project is a 125-mile 500 kV single-circuit, series-compensated, transmission line spanning between the Delaney Substation (located just north of the Palo Verde generating plant in Tonopah, Maricopa County, Arizona) and the Colorado River Substation (located west of the Arizona-California border in Riverside County, California).

2. Spanning approximately 103.5 miles in Arizona and 21.5 miles in California, the proposed route of the Proposed Project largely follows the existing DPV 500 kV transmission line and utilizes the established utility corridor, crossing Federal land, including lands managed by the BLM, Reclamation, and the YPG.

3. The Proposed Project will have a conductor capacity to transmit 3,200 MW and provide interconnection capability for new energy projects located in the region.

4. The CAISO Board, in the 2013-2014 TPP, approved the Proposed Project to provide economic benefits for California ratepayers.

5. In its updated analysis prepared for this proceeding, based on the TEAM approach, the CAISO ran two different PCM scenarios: 1) Baseline Scenario and 2) Sensitivity Scenario with updated natural gas and carbon prices.

6. CAISO's TEAM approach provided an estimated range of annual savings of $62-93 million and broken down into 1) CAISO production cost annual savings of $41-70 million; 2) Reduction in annual transmission energy losses of $3-4 million; 3) Reduction in annual renewable curtailments of $0.3-0.9 million; and 4) Increase in annual renewable procurement of $18 million per year.

7. The production cost benefit for the Proposed Project includes three benefits to CAISO ratepayer: consumer energy cost decreases; increased LSE-owned generation revenues; and increased transmission congestion revenues. Based on these findings, the CAISO Board approved the Proposed Project in its 2013-2014 TPP, and the CAISO presented additional evidence of continuing economic benefits from the Proposed Project.

8. The CAISO's updated economic evaluation projected the BCR for the Proposed Project to range from 1.16 to 1.54 in the baseline analysis using the

avoided cost of battery storage to quantify capacity benefits. In the higher gas price sensitivity, the range of BCR increased from 1.48 to 1.89 using the same avoided cost of battery storage to quantify capacity benefits. Using the locational renewable cost savings to calculate capacity benefits, the CAISO projected the BCR to range from 1.00 to 1.56.

9. In July 2015, the CAISO selected DCRT, as the approved project sponsor for the Proposed Project, to develop, permit, design, finance, build, own, operate and maintain the Proposed Project in accordance with the CAISO tariff.

10. The Commission recommends portfolios from the ongoing IRP process for the CAISO's annual TPP cycle.

11. In evaluating the economic benefits of the Proposed Project, the CAISO applied portfolios adopted and recommended by the Commission for the TPP of the current year.

12. When evaluating the Proposed Project, the CAISO concluded that the quantified economic and reliability benefits exceeded estimated costs. The CAISO also found additional potential benefits to include: (1) Mitigating the impacts of higher contingency flows on neighboring systems; (2) Providing opportunities for CAISO-connected renewable generation to develop in the Delaney area; (3) Providing an increase in deliverability from the Imperial Valley zone; and (4) Increasing competition in the California generation market.

13. In 2019, the CAISO updated the economic assessment in three steps: (1) resource portfolios are developed based on the portfolios from the Commission's RESOLVE models; (2) the resource portfolios are then used to conduct production cost simulation and production benefit analysis, while using the 2019-2020 TPP with the resource portfolio is used to conduct the production cost simulation; and (3) using the results of the first two steps, the BCR for the

Proposed Project was calculated based on the estimated 2021 in-service date of the Proposed Project.

14. The CAISO's updated economic evaluation considered the following specific major changes in circumstances that have occurred since the CAISO initially approved the Proposed Project: (1) Continued growth of grid-connected solar generation, in excess of the level anticipated in the 2013 timeframe; (2) Rapid deployment of distributed energy resources, *e.g.*, rooftop solar PV, far exceeding industry expectations; (3) Decreasing battery storage costs; (4) Reducing out-of-state thermal fleet, including out-of-state coal resources; (5) Meeting LSE requirements under SB 100; (5) Accepting natural gas resources as a key resource with dispatchable capacity and critical to ensure reliability into the future, despite far less overall energy production; and (6) Advancing generation and transmission planning and development processes.

15. The CAISO believes 3262 MW of Arizona Solar can be economically selected to meet the renewable policy target and provide ratepayer production cost benefits.

16. The CAISO calculated $290.3 million in terms of present value or $17.3 million in terms of levelized annual benefits in the battery capacity benefit.

17. If the Proposed Project is not built, the CAISO calculated that the equivalent of 969 MW, or 29.7 percent of the economically-selected Arizona Solar capacity, will have to come from renewables located in less economic locations.

18. The CAISO, through the updated economic evaluation, projected the total production cost benefits to be $33.6 million annually.

19. The CAISO expects the Proposed Project will increase the amount of cost-effective, out-of-state resources in the Southwest, towards RA, from the

CAISO grid-connected solar and solar-storage hybrid resources in western Arizona.

20. The CAISO's baseline scenario applied monthly natural gas price differential between Arizona South and Southern California between $0.581 to 0.597, similar to the lower end of the price differential referenced by Cal Advocates.

21. The CAISO considered the uncertainty of future systems in solar generation, in natural gas pricing and the utility-size battery costs, along with market conditions affecting the likelihood that the Proposed Project's benefits will be realized.

22. The CAISO considered alternative interconnection projects and the Palo Verde intertie when determining the economic benefits of the Proposed Project.

23. The CAISO Board made explicit findings regarding the economic value of the Proposed Project; specifically, the CAISO found quantifiable capacity and production cost benefits with reliability benefits from the Proposed Project in the baseline and sensitivity scenarios to concluded that the Proposed Project provided economic and public policy benefits.

24. The CAISO Board-approved evaluation was presented to the Commission as part of the evidence for this proceeding.

25. Based on a combination of information from the Brattle Report and three different PCM scenarios, DCRT anticipates: 1) Projected annual savings between $7 million to $36 million; 2) Reduction in curtailment of renewable generation by increasing operational flexibility of the CAISO system; 3) Increased options to integrate and access renewable energy resources to achieve the goals to reduce GHG; and 4) Increased reliability of the California and Arizona transmission network by increasing reliable power transfers in the region.

26. Although DCRT's scenarios did not analyze the impact on renewable generation interconnection, DCRT accounted for transmission congestion due to intertie scheduling limits on the CAISO's neighboring markets and additional congestion on the Palo Verde intertie during peak and overnight hours.

27. DCRT concluded that the Proposed Project will 1) increase transfer capability by 690 MW between California and Arizona, when all lines are operational; 2) allow an additional 781 MW generation to the Delaney Substation and output to southern California; and 3), transfer an additional 219 to 257 MW between Arizona and California under transmission outage conditions.

28. DCRT concluded the following economic benefits from the Proposed Project: 1) Reduced production costs and CAISO customer net payments; 2) Reduced energy losses; 3) Increased competition at the Palo Verde trading hub; 4) Increased transmission transfer capability between CAISO and APS in the EIM; and 5) Reduced RA costs.

29. DCRT anticipates the following public-policy benefits: 1) Increase the transfer capability across the Palo Verde intertie and reduce congestion and customer costs in California; 2) Unload energy across highly utilized transmission lines to reduce energy loss, while encouraging further development of RA to connect to the Palo Verde hub to increase competition and meet RA goals for California; and 3) Expand the BAA for CAISO and APS so that both can benefit from the EIM, in addition the estimated production cost benefits.

30. Cal Advocates provided no new modeling and adjusted assumptions on solar PV development, natural gas pricing and battery capacity costs based on the Commission's portfolio from the 2019 IRP process and, thus, was not provided to the CAISO when updated economic evaluation was performed.

31. With the 2019-2020 IRP assumptions, Cal Advocates calculated a BCR between 0.55 to 0.73 and concluded that the Proposed Project, even under Cal Advocates' calculation, will result in benefits to California ratepayers, even if it is less than anticipated by CAISO and DCRT.

32. The CAISO posted the unified planning assumptions and study plan in draft form for stakeholder review and comment and provided an opportunity to stakeholders to request specific economic planning studies to assess the potential economic benefits (e.g., congestion relief) in specific areas of the grid.

33. The economic evaluation by the CAISO was submitted as part of the Application, in Appendix M and within sufficient time to be included in the scope of this proceeding.

34. DCRT submitted additional economic and public policy analysis and provided an explanation of the additional information's impact on the assumptions and conclusions contained in the economic evaluation from both DCRT and the CAISO.

35. The CAISO Board-approved evaluation is consistent with the safeguards, principles and minimum requirements set forth in D.06-11-018.

36. The CAISO Board approval of the updated economic evaluation is unnecessary to meet the minimum requirements under D.06-11-018.

37. The CAISO's use of the portfolios from the 2017 IRP process for the economic evaluation aligns with the transmission planning coordinated between the Commission, CAISO, and CEC.

38. The Interconnection Queue consists of interconnection requests from developers, which are regularly updated as developers complete, withdraw, or downsize their projects. The Project List identifies all the current generator requests seeking interconnection to the CAISO system.

39. Given the uncertainties and the dynamic nature of the information, the Commission finds little value in the Interconnection Queue and the Project List towards the Commission's assessment of the need for the Proposed Project.

40. The Commission weighed the economic and public policy benefits against the cost of the Proposed Project to determine the cost effectiveness of the Proposed Project.

41. BLM, as the lead agency under NEPA, prepared the FEIS in September 2019, and issued a ROD for the Proposed Project on November 22, 2019.

42. The Commission, through its consultant, prepared the CEQA Appendix, attached to the FEIS, to supplement the environmental review required under CEQA.

43. The FEIS, including its CEQA Appendix, concluded that Alternative 2-4D was the environmentally superior alternative and minimized impacts on the environment and ESJ communities.

44. The Commission received, reviewed, and considered the information contained in the FEIS with the CEQA Appendix.

45. The Proposed Project will not have any significant or unavoidable impacts that cannot be mitigated to a less-than-significant level with the MMs identified in the CEQA Appendix of the FEIS.

46. In California, the ESJ communities impacted are located within Riverside County, with a minority population of 61.7 percent, which is 1.5 percent greater than the state percentage. The city of Blythe and surrounding area have a minority population of 70 percent with about 24 percent being low-income. Ripley, which is south of Blythe, has a 95 percent minority population with the highest low-income population at 33.7 percent.

47. In Riverside County, the land within half a mile of the Proposed Project is used for commerce, recreation, residence, and agriculture.

48. The Proposed Project will impact a disproportionate number of the ESJ communities on a localized basis from construction, operation, and maintenance of the Proposed Project, due to the high percentage of minority population in Riverside County. These impacts would include construction noise and other disruptions and impacts to visual resources and property values during operations. However, any impact would likely be negligible to minor due to the predominantly low-density rural setting and the presence of existing transmission and utility lines nearby.

49. The MMs for the Proposed Project will reduce the impacts to the ESJ communities to less than significant level.

50. The construction of the Proposed Project is expected to have some positive economic impacts to the affected ESJ communities.

51. Pursuant to CEQA Guidelines 15225(a), the Commission's Energy Division noticed the ALJ and the official service list of this proceeding, that the Commission will use the FEIS, including the CEQA Appendix, in the place of an EIR.

52. The FEIS discusses community values and recreation and park areas along with the CEA. Local communities rely upon the CEA to draw visitors to support the local economy. In the long term, the main unavoidable adverse effect is increased development in natural areas heavily used for recreation. The reasonably foreseeable future actions on the undeveloped areas will have a minor cumulative effect on the recreation experience, the availability of primitive or unconfined recreational settings, and the solitude in the CEAs.

53. The impacts to recreation and recreation areas, related to noise, dust, visual disturbance and restricted access during construction, will be localized and short-term.

54. The reduction in recreation users coming to the area should be minor, as most users will likely move to other nearby locations not impacted by construction activities.

55. Ongoing operations and maintenance will have little or no long-term effect on the tourism- and recreation-related economy.

56. The Proposed Project will neither cause existing housing or persons to be displaced nor necessitate the construction of replacement housing elsewhere.

57. As growth has been accounted for in various local and regional plans and projections, cumulative impacts from construction workers on the local housing market are negligible to moderate during Project construction. The Proposed Project, in conjunction with reasonably foreseeable energy, utility, and other infrastructure projects, could support population increases in the area in the foreseeable future.

58. The Commissioner's Third Amended Scoping Memo did not materially change Issue 8 of the First Scoping Memo; and Issue H of the Third Amended Scoping Memo clarified Issue 8 of the First Scoping Memo.

59. DCRT will be a transmission-only utility with no retail customers, owning and operating a single high voltage direct current transmission line service.

60. DCRT will be under the operational control of CAISO with rates and terms and conditions of service set by the FERC.

61. GO 65-A requires utilities with more than $200,000 in annual gross operating revenue to file with the Commission a copy of each financial statement prepared in the normal course of business which shows its operating results and

financial condition, and also a copy of its annual report and other financial statements issued to its stockholders.

62. GO 77-M requires utilities with more than $500,000 in annual gross operating revenue to annually file with the Commission a statement identifying titles and duties and all compensation of executive officers and all employees who earn more than $85,000 annually.

63. GO 104-A requires utilities with more than $50,000 in annual gross operating revenue to annually file with the Commission a report identifying persons with financial interest in the utility based upon contracting with the utility or services provided to the utility or ten percent or more of voting power in the utility.

64. FERC Form 1 requires FERC-regulated utilities to file with FERC an annual financial statement including any statement to stockholders, a balance sheet, and statements of income, retained earnings, cash flows, and related information. Among its individual components is the duty to identify the name, title, and salary of every executive officer making $50,000 or more annually.

65. FERC Form 3-Q is very similar to FERC Form 1 but is intended to supplement information to be provided in Form 1 and is filed quarterly.

66. FERC Forms 1 and 3-Q provide financial and other information similar to the information necessarily provided through GOs 65-A and 104-A.

67. GO 77-M would provide the Commission with information not contained in FERC Forms 1 and 3-Q, and, therefore, FERC Forms 1 and 3-Q would not suffice as proxies to convey the information that would have been found in a properly completed GO 77-M filing.

68. DCRT's filing with the Commission of completed and accurate FERC Forms 1 and 3-Q instead of the filing required under GOs 65-A and 104-A would

not interfere with, alter, or negatively impact the Commission's regulatory authority over DCRT, and may enhance the Commission's interests.

69. DCRT's filing with the Commission of completed and accurate FERC Forms 1 and Form 3-Q in lieu of reports required under GOs 65-A and 104-A would not reduce DCRT's safety or electrical service reliability.

70. DCRT intends to utilize resources and support of Starwood Energy and Atlantica 1) for financing, development and planning, environmental, engineering, and construction services; 2) to support necessary corporate support services, such as payroll, taxes, shareholder services, insurance, financial reporting, financial planning and analysis, corporate accounting, corporate security, human resources (compensation, benefits, employment policies), employee records, regulatory affairs, lobbying, legal, and pension management; and 3) for information technology, compliance, business management and planning, treasury, integrated supply chain procurement, project management, and corporate oversight and management.

71. Since DCRT's ability to recover costs is subject to FERC approval through the ratemaking process, the limited exemption from sections V.C., V.E. and V.G. of the ATRs will not create a cross-subsidization risk that could impair competition because DCRT must implement its TO Tariff in a non-discriminatory manner and thus cannot exercise market power.

72. Since DCRT does not have any retail customers in California, there is no apparent risk of customer confusion or privacy violations.

73. DCRT submitted a Field Management Plan as Appendix F to the Application, which details the EMF reduction measures for the Proposed Project, including the (1) utilization of a typical horizontal 500 kV tower height of 165 feet; (2) installation of 500 kV transposition towers near the locations of

existing transposition towers for the SCE Colorado River-Palo Verde (CRPV), formally the DPV 500 kV transmission line; and (3) use of existing utility corridors.

74. DCRT updated the Field Management Plan in accordance with Alternative 2-4D route and configuration as identified in the FEIS and incorporated as part of the MMs in the CEQA Appendix.

75. On August 6, 2020, DCRT updated the Field Management Plan and identified the no cost EMF reduction measures to include (1) the utilization of typical conductor to ground clearance heights that exceed GO 95, Section III, Rule 37; and (2) optimization of phasing and transposing the Proposed Project with respect to the DPV transmission line, which will parallel the Proposed Project for most of its length.

76. All intervenors who filed a Notice of Intent to Claim Intervenor Compensation either withdrew from the proceeding or did not actively participate in this proceeding.

77. No specific safety concerns or considerations were raised. The FEIS addressed public health and safety considerations, including fire, EMF, radio interference with military operations, and dust-related illness. Appendix 2A of the FEIS sets forth in the APM and BMP for construction and maintenance of the Proposed Project to address safety concerns and consideration.

Conclusions of Law

1. DCRT should be granted a certificate of public convenience and necessity for the Proposed Project, to construct 125-mile, series-compensated 500 kV transmission line with a conductor capacity of approximately 3200 MW between the Colorado River 500 kV substation, owned by SCE, and Delaney 500 kV substation, owned by APS; and this CPCN should be conditioned upon DCRT's

compliance with (a) the Mitigation Monitoring and Reporting Plan attached to this decision; (b) the EMF Field Management Plan filed as updated pursuant to the FEIS and based on the Alternative 2-4D route and configuration; (c) the APM and the BPM attached as Appendix 2A of the FEIS; and (d) all other necessary state and local permitting processes and approvals.

2. The Application and subsequent filings by the Applicant in support of the Application comply with Rule 3.1 and GO 131-D.

3. DCRT should be excused from compliance with Rule 3.1(i).

4. The CAISO Board-approved evaluation engaged in public participation with at least two meetings with sufficient time for stakeholders and the public to review the unified planning assumptions and study plan in draft form and an opportunity for stakeholders to request specific economic planning studies to assess the potential economic benefits in specific areas of the grid.

5. The CAISO Board-approved evaluation met the four safeguards set forth in D.06-11-018 by 1) posting the draft unified planning assumptions and study plan with opportunities to request additional information and engaging in a series of stakeholder and public meetings for comments, prior to Board approval, to meet the public participation requirements; 2) filing the Application with Appendix M, the 2013-2014 TPP, filed on July 16, 2014, DCRT, which addressed the comments from the stakeholders; 3) DCRT submitted its own economic evaluation and explained the impacts that the evaluation had on the assumptions and conclusions; and 4) the CAISO was a party to the proceeding.

6. The CAISO Board-approved evaluation had explicit findings which are consistent with the principles and minimum requirements set forth in D.06-11-018 and was filed to the Commission within sufficient time to be included within the scope of this proceeding.

7. The CAISO's original and updated economic evaluation comply with the principles and minimum requirements under D.06-11-018 and should be presumed reliable as determination of the necessity and cost-effectiveness of the Proposed Project.

8. The Proposed Project is needed and meets the requirements under Pub. Util. §1001 et seq.

9. The Proposed Project promotes present or future safety, health, comfort, and convenience of the public to necessitate such construction.

10. The Proposed Project is cost effective.

11. Cal Advocates failed to meet its burden to rebut the presumption afforded to CAISO's economic evaluation.

12. The FEIS and its CEQA Appendix for the Proposed Project, including associated impacts and mitigations, were reviewed and are sufficient for our decision-making purposes concerning the associated environmental impacts.

13. The FEIS did not find any significant and unavoidable environmental impacts.

14. DCRT should adopt the environmentally superior alternative identified as Alternative 2-4D for the route of the Proposed Project to minimize impacts on the environment and the ESJ communities.

15. The Proposed Project, with implementation of the MMs, will have less than significant impact on the community values, recreational and park areas, historical and aesthetic values and the environment, pursuant to Pub. Util. Code §1002.

16. The FEIS is completed in compliance with CEQA requirements and reflects the Commission's independent judgment and analysis on all material matters and is adequate for Commission decision-making purposes.

17. The Commission should adopt all mitigation measures detailed in the FEIS and the CEQA Appendix.

18. The Commission should certify that the FEIS with the CEQA Appendix as adequate environmental document meeting the requirements under CEQA.

19. The Proposed Project aligns with the Commission's ESJ Action Plans goals.

20. For the Proposed Project, configured as Alternative 2-4D, the reasonable and prudent maximum cost cap is $389,045,968, including contingency.

21. DCRT should be authorized to submit properly completed FERC Forms 1 and Forms 3-Q as approximate proxies for the information it would otherwise submit to the Commission under GOs 65-A and 104-A filings.

22. DCRT should not be excused from its reporting duties under GO 77-M and should not be authorized to submit properly completed FERC Forms 1 and Forms 3-Q in lieu of GO-77 filing, because the information that would be directly conveyed to the Commission through those forms is not equivalent to all the information conveyed through a properly completed and filed GO 77-M filing.

23. DCRT should be granted limited exemptions from Sections V.C., V.E. and V.G. of the ATRs for the purpose of utilizing resources and support of Starwood Energy and Atlantica for financing, development and planning, environmental, engineering, and construction services and to support necessary corporate support services, such as payroll, taxes, shareholder services, insurance, financial reporting, financial planning and analysis, corporate accounting, corporate security, human resources (compensation, benefits, employment policies), employee records, regulatory affairs, lobbying, legal, and pension management.

24. DCRT's Field Mitigation Plan and the proposed EMF reduction measures identified therein are reasonable.

25. DCRT's proposed EMF reduction measures as stated in its Field Management Plan should be adopted.

26. DCRT should be ordered to comply with its Field Mitigation Plan and implement its proposed no-cost and low-cost measures, as updated pursuant to the FEIS and based upon Alternative 2-4D route and configuration.

27. The issue of guarantee of payments for intervenors' consultants and costs of intervenor compensation is now moot and need not be decided.

28. The APM and BMP requirements should be adopted, and DCRT should implement the APM and BMP requirements set forth in Appendix 2A of the FEIS for construction and maintenance of the Proposed Project.

29. Motions made in this proceeding that have not been expressly ruled upon should be deemed denied.

30. This proceeding should be closed.

O R D E R

IT IS ORDERED that:

1. DCR Transmission, LLC (DCRT) is granted a certificate of public convenience and necessity to construct the Ten West Link Transmission Line Project, configured with Alternative 2-4D and conditioned upon DCRT's compliance with (a) the Mitigation Monitoring and Reporting Plan attached to this decision; (b) the Electric and Magnetic Fields Field Management Plan filed as updated pursuant to the Final Environmental Impact Statement and based on the Alternative 2-4D route and configuration; (c) the DCRT's Proposed Measures for Safety and the BLM's Required Best Management Practices attached as Appendix 2A of the FEIS; and (d) all other necessary state and local permitting processes and approvals.

2. The Commission's Energy Division may approve requests by DCR Transmission, LLC (DCRT) for minor project refinements that may be necessary due to final engineering of the environmentally superior project, so long as such minor project refinements are located within the geographic boundary of the study area of the Final Environmental Impact Statement (FEIS) and do not, without mitigation, result in a new significant impact or a substantial increase in the severity of a previously identified significant impact based on the criteria used in the FEIS; conflict with any mitigation measure or applicable law or policy; or trigger an additional permit requirement. DCRT shall seek any other project refinements by a petition to modify today's decision.

3. DCR Transmission, LLC shall work with the Commission's Energy Division to create detailed maps for use in construction and mitigation monitoring.

4. The Final Environmental Impact Statement for Ten West Link Transmission Line Transmission Line Project is certified.

5. The maximum cost cap for the Ten West Link Transmission Line Project, configured with Alternative 2-4D is $389,045,968, including contingency.

6. Pursuant to Public Utilities Code Section 1005.5(b), at any point during the Ten West Link Transmission Line Project construction and prior to any expenditures in excess of the maximum reasonable and prudent cost determined in this decision, DCR Transmission, LLC must file a formal Petition for Modification with the Commission for consideration of a revised determination of the reasonable and prudent maximum cost of the Project.

7. DCR Transmission, LLC (DCRT) shall make quarterly information-only submittals to the Commission's Energy Division's CEQA and Federal Energy Regulatory Commission (FERC) Electric Costs teams providing status updates on

the Ten West Link Transmission Project. These status updates shall include, at minimum:

a. Comprehensive project development schedule (with data organized by month), including estimated project in-service date;
b. Any changes in project scope and schedule, including the reasons for such changes;
c. Any engineering difficulties encountered in constructing the project;
d. Total estimated project costs;
e. Actual spending to date;
f. Any and all filings submitted to FERC for ultimate cost recovery through transmission rates; and
g. Any additional information DCRT believes relevant and necessary to accurately convey the status of the project.

8. Upon satisfactory completion of the Ten West Link Transmission Line Project, DCR Transmission, LLC shall file a notice of completion with the Executive Director by the Energy Division.

9. In lieu of filing reports in compliance with General Order 65-A, DCR Transmission, LLC is authorized instead to file copies of its Federal Energy Regulatory Commission Form 1 with the Commission.

10. In lieu of filing reports in compliance with General Order 104-A, DCR Transmission, LLC is authorized instead to file copies of its Federal Energy Regulatory Commission Form 3-Q with the Commission.

11. DCR Transmission, LLC must file with the Commission reports in compliance with General Order 77-M.

12. The Commission may rescind the authorization granted in paragraphs 9 and 10 above upon 60-day notice to DCR Transmission, LLC.

13. Except as otherwise ordered here, DCR Transmission, LLC must be fully compliant with every and all applicable Commission regulations and requirements.

14. DCR Transmission, LLC is granted limited exemptions from Sections V.C., V.E. and V.G. of the Affiliate Transaction Rules for the purpose of DCR Transmission, LLC using the expertise of Starwood Energy Group Global, Inc., and its affiliates.

15. All pending motions that have not been expressly ruled upon are deemed denied.

16. Application 16-10-012 is closed.

This order is effective today.

Dated November 4, 2021, at San Francisco, California.

Real Property & Asset Management Committee

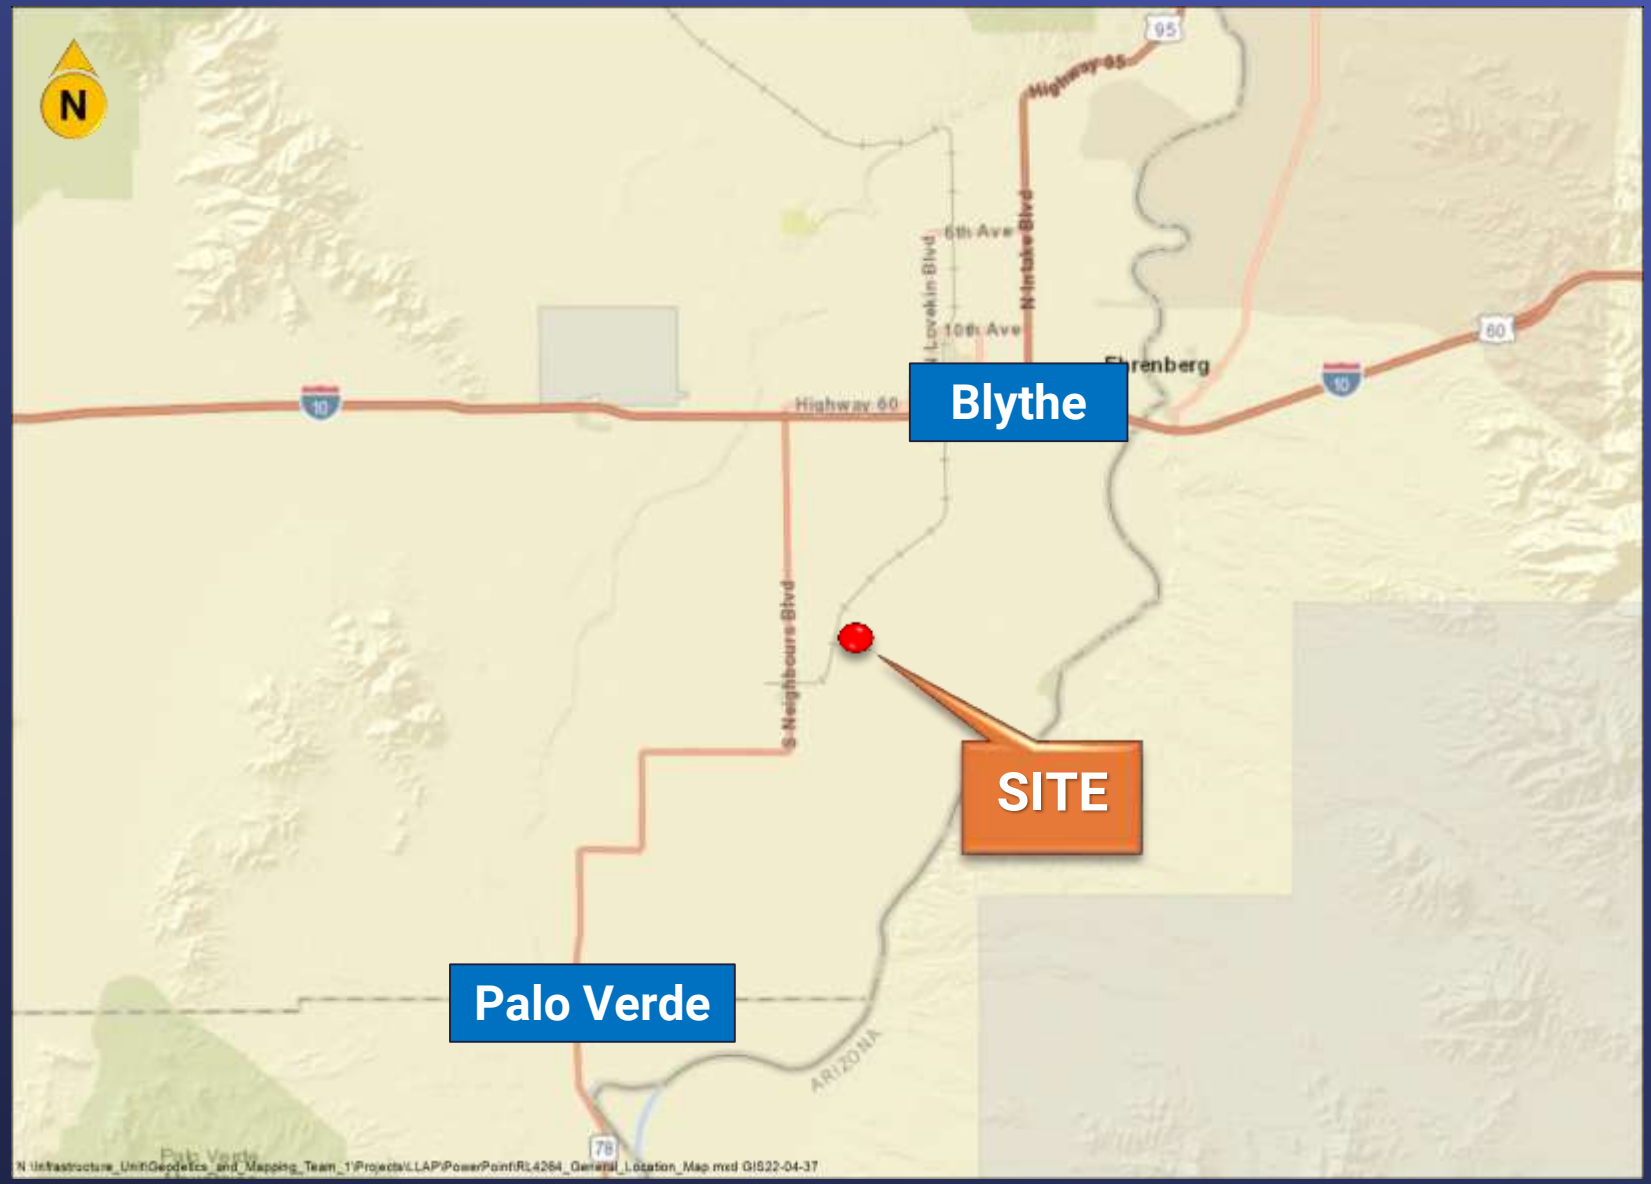
Authorize a Permanent Easement to DCR Transmission, LLC

Item 7-11

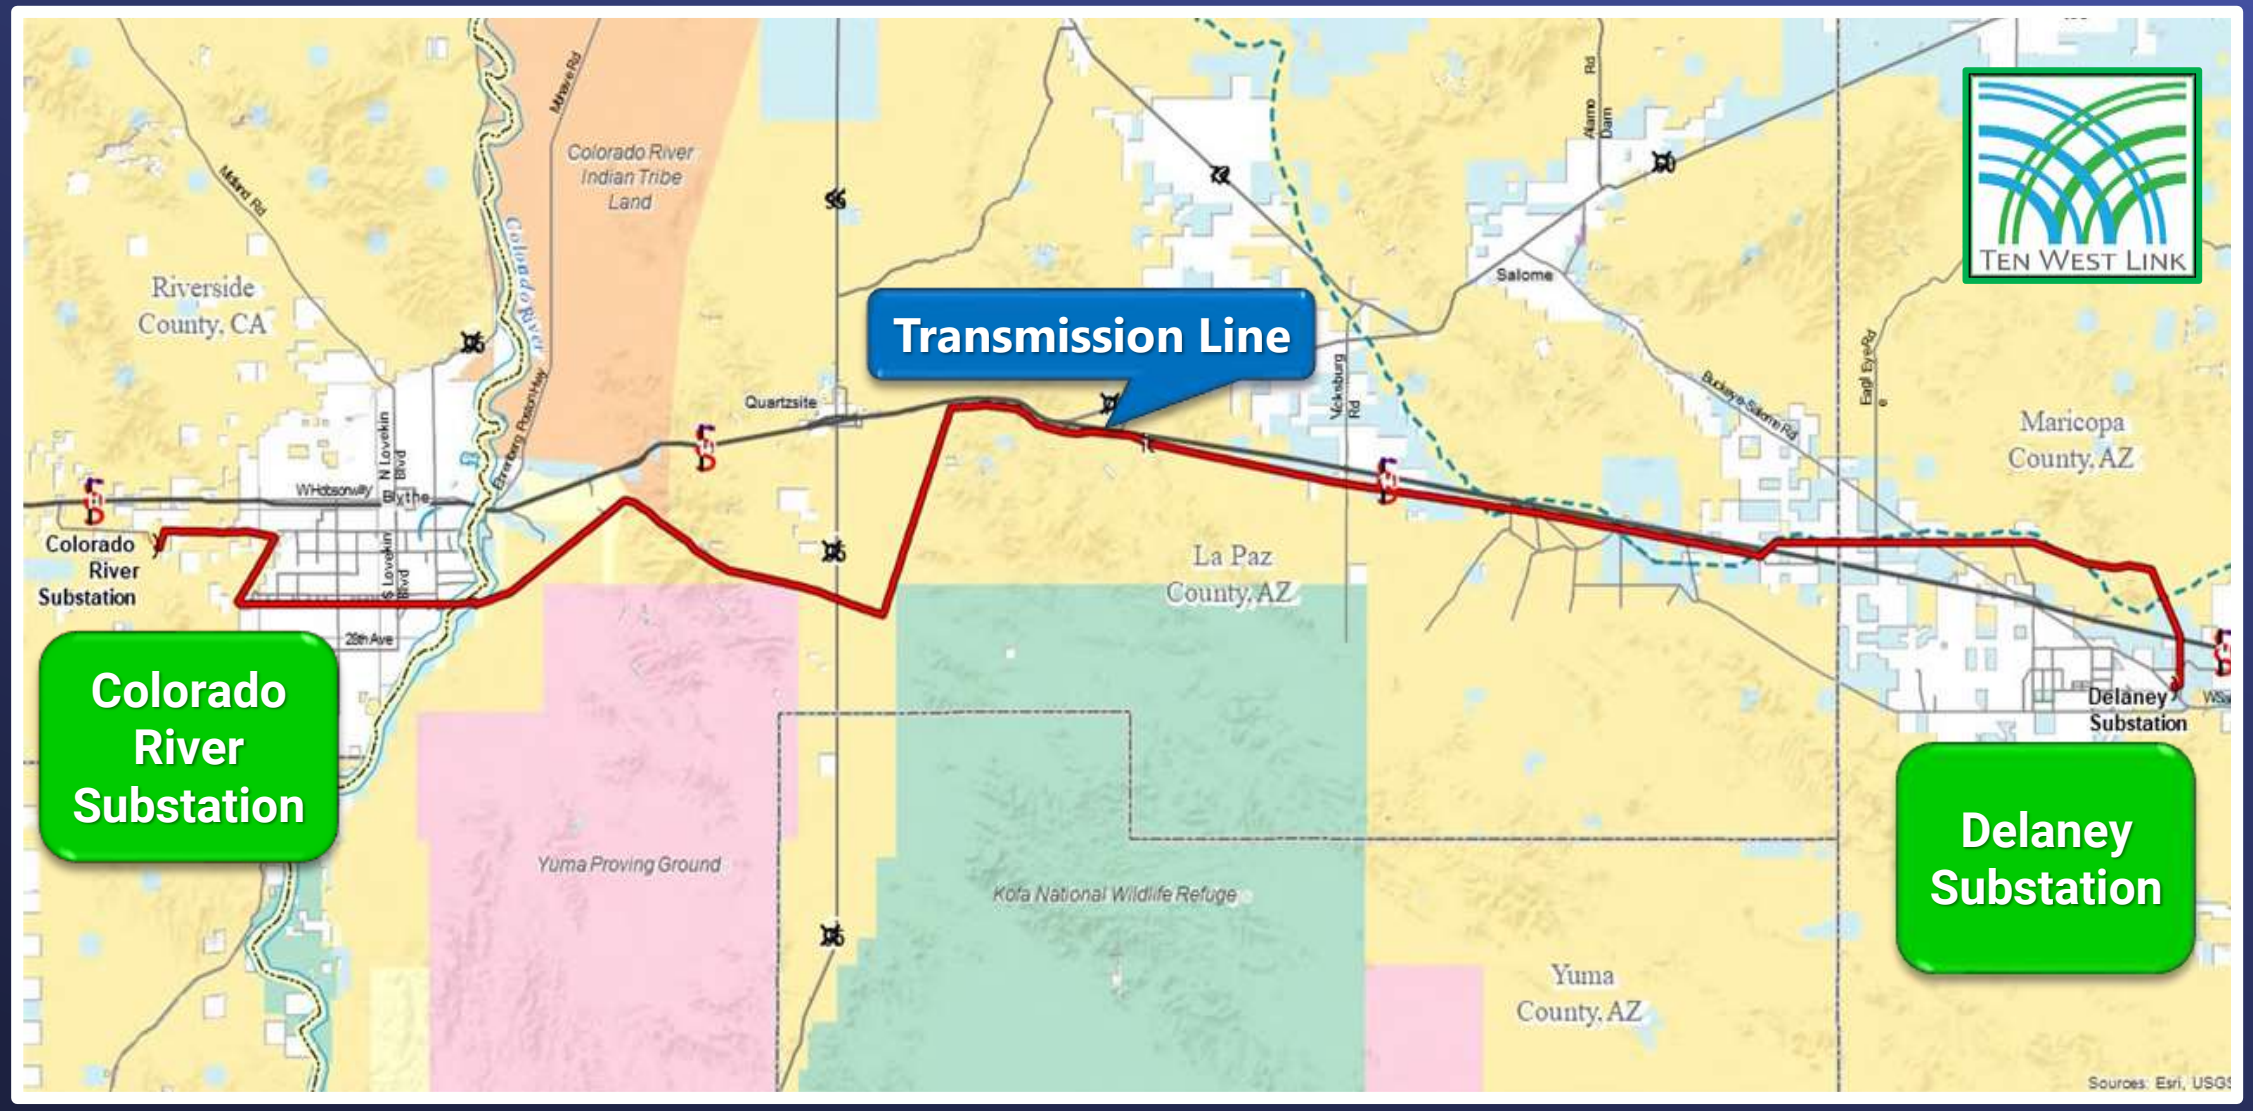
June 13, 2022

Service Area and CRA

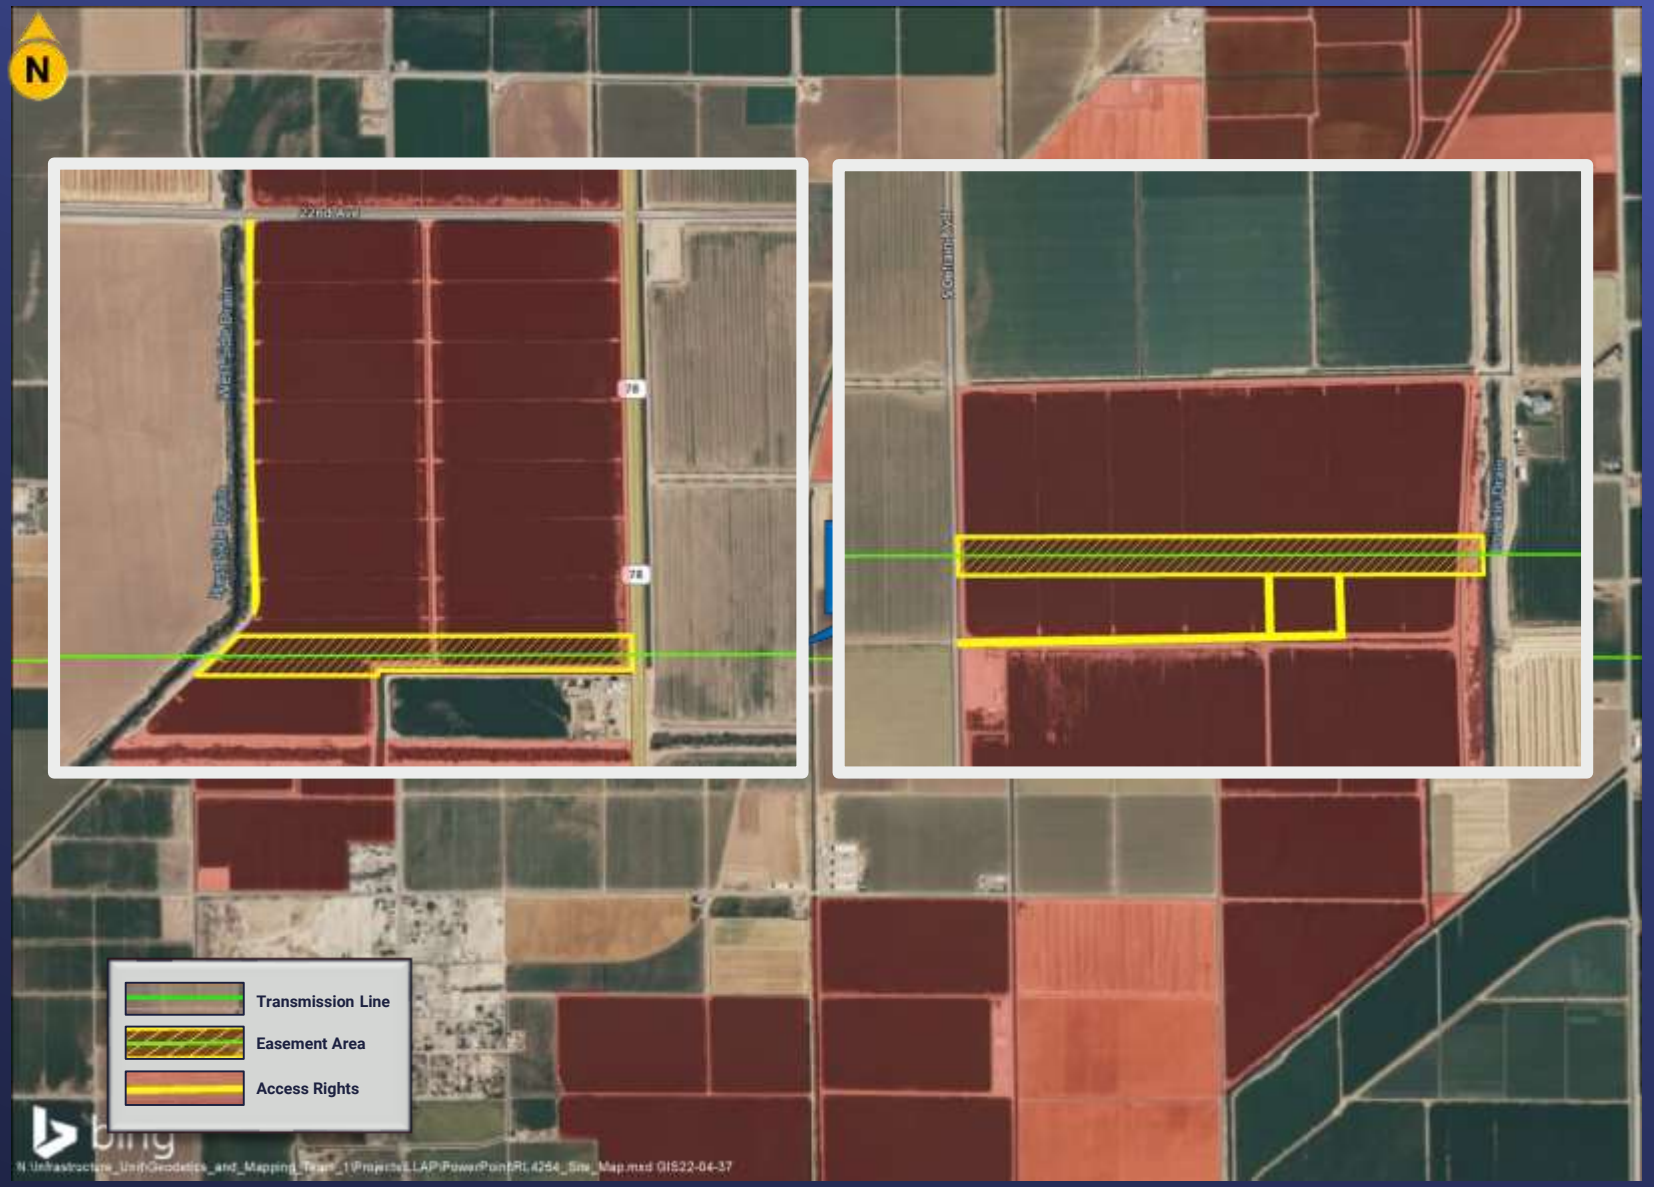
General Location Map



DCR Transmission, LLC



Site Map



Key Provisions

- Construction, operation and maintenance of a 500kV transmission line
- Paramount rights for water related purposes
- DCRT shall have the right to sell, assign, and convey
- DCRT shall compensate farmer for any crop losses
- Total easement value and fees: $324,500

Board Options

Option No. 1

Review and consider the Bureau of Land Management's Final Environmental Impact Statement certified to satisfy CEQA and take related CEQA actions; and authorize the General Manager to grant a permanent transmission line easement to Delaney Colorado River Transmission, LLC

Option No. 2

Do not authorize the permanent easement

  Real Property and Asset Management Committee

6/14/2022 Board Meeting

7-12

Subject

Review and consider the Lead Agency's adopted Mitigated Negative Declaration and take related CEQA actions, and adopt a resolution for Calleguas Municipal Water District Annexation No. 104 to Calleguas and Metropolitan

Executive Summary

This action grants approval for an annexation requested by Calleguas Municipal Water District (Calleguas) and authorizes collecting Metropolitan's water standby charge and ad valorem tax. This request is compliant with current policy and requirements. This annexation request consists of approximately 10.72 acres with 0.24 acres of public roads, leaving a net area of 10.48 acres as the basis for the annexation charge **(Attachment 1)**. The new water demand from Metropolitan ranges from 20.20 to 24.24 acre-feet per year (AFY). Calleguas meets the demand management measures in the agency's Water Use Efficiency Statement of Compliance **(Attachment 2)**. The charge for this annexation, if completed in 2022, is $74,220.40, which includes a $5,000 processing fee.

Details

Background

On February 2, 2022, Calleguas' board of directors adopted Resolution No. 2038, requesting formal terms and conditions for annexation and collection of water standby charge for the proposed Calleguas Annexation No. 104. The proposed annexation will extend the service area of Metropolitan and Calleguas. The parcel is a 10.72-acre property identified as APN: 145-0-232-010, located at 2714 East Vineyard Avenue in the city of Oxnard. The area will be developed with a two-story office building and parking with 167 condominiums and widening of Vineyard Avenue.

The proposed area after annexation will be served by the city of Oxnard and will be eligible for imported water through Calleguas and Metropolitan. The charge for this annexation is $74,220.40, which includes the $5,000 processing fee collected at the time of the initial annexation request; the balance is payable prior to completion. The annexation charge is calculated based on the 2022 per-acre fee of $6,605. If the annexation is not completed in the calendar year 2022, the fee would be based on the then-current annexation rate pursuant to Section 3300 of Metropolitan's Administrative Code. Pursuant to Section 3107 of Metropolitan's Administrative Code, approved November 6, 2018, Calleguas has submitted an acceptable Water Use Efficiency Statement of Compliance for this annexation project **(Attachment 2)**. The projected water demand from Metropolitan is estimated to be between 20.20 and 24.24 AFY. Completion of this annexation would be subject to such terms and conditions as may be fixed by Metropolitan's Board in granting final consent to such annexation, including the Local Agency Formation Commission conditioning approval of the proposed annexation upon a requirement that all previously established and collected taxes, benefit assessments, or property-related fees or charges be established and collected on parcels being annexed to Metropolitan. This action adopts a resolution consenting to Calleguas' request for annexation with water standby charge as set forth in **(Attachment 3)**. Upon completion of the annexation, the lands within Calleguas Annexation No. 104 will be subject to Metropolitan's ad valorem property tax in the current amount of 0.0035 percent of the assessed valuation of each parcel and Metropolitan's water standby charge collected on behalf of Calleguas in the current amount of $9.58 per acre, or per a parcel of less than one acre.

Policy

Metropolitan Water District Administrative Act Section 350: Annexation of Corporate Area of Agency

Metropolitan Administrative Code Section 3100: Request for Annexation

California Environmental Quality Act (CEQA)

CEQA determination for Option #1:

Pursuant to the provisions of CEQA and the State CEQA Guidelines, the city of Oxnard, acting as the Lead Agency and subagency to Calleguas, adopted the Rio Urbana Project (also known as Calleguas Annexation No. 104) Mitigated Negative Declaration (MND) on March 4, 2020, for the annexation process. Metropolitan, as a Responsible Agency under CEQA, is required to certify that it has reviewed and considered the information in the 2019 MND and adopt the Lead Agency's findings prior to approval of the formal terms and conditions for the annexation. The environmental documentation is in **Attachment 4**.

CEQA determination for Option #2:

None required

Board Options

Option #1

Review and consider the Lead Agency's adopted 2019 Mitigated Negative Declaration and take related CEQA actions, and adopt a resolution for the Calleguas Annexation No. 104 concurrently to Calleguas Municipal Water District and Metropolitan

Fiscal Impact: Receipt of annexation fee of $74,220.40 for the annexation area and water sales revenue from the newly annexed territory.

Business Analysis: This annexation will provide the ability for water service and associated benefits to the property owner. The initial fixed and variable costs will be borne by the local water supplier and property owners, including processing, infrastructure, and the cost of raw and treated water. This annexation helps to meet Metropolitan's member agency request.

Option #2

Decline the request for the proposed Calleguas Annexation No. 104.

Fiscal Impact: Unrealized annexation fee and water sales revenue from non-annexed areas.

Business Analysis: The subject area will not receive the direct benefits of water supplied through Calleguas and Metropolitan.

EXHIBIT A

CALLEGUAS MUNICIPAL WATER DISTRICT ANNEXATION No. 104

LEGAL DESCRIPTION

That portion of Lot 90 of the Rancho Santa Clara Del Norte, in the County of Ventura, State of California, as shown on the map recorded in the Office of the County Recorder of said Ventura County, in Book 3, Page 26 of Miscellaneous Records (Maps), described as follows:

Beginning at the northwesterly terminus of the 2nd course of Parcel A of Annexation No. 69-19 (Cohn) to the City of Oxnard, as filed with the Secretary of State of said State, on August 11, 1969, said northwesterly terminus also being in the 11th course of Annexation No. 68-2 (Andrews) to the City of Oxnard, as filed with said Secretary of State, on August 5, 1968, said Point of Beginning also being the northwesterly terminus of the 2nd course of Parcel 10-A of Annexation No. 7 (Oxnard Second Fringe Area) to the Calleguas Municipal Water District, as recorded in the Office of said County Recorder in Book 3579, Page 129 of Official Records, last said terminus also being the 11th course of Parcel 31 of said Annexation No. 7; thence along said 11th course of Annexation No. 68-2, and along said 11th course of Parcel 31, and continuing along the boundaries of said city and said district the following three courses:

1st- North 32°47'56" East 574.78 feet; thence,

2nd- South 49°42'28" East 35.30 feet; thence,

3rd- North 32°47'56" East 30.00 feet to the intersection with the northeasterly line of said Lot 90; thence, leaving said city and said district boundaries, along said northeasterly line of Lot 90,

4th- South 49°42'28" East 857.66 feet to the intersection with the northwesterly line of the Cloverdale Subdivision, as shown on the map recorded in the Office of aid County Recorder, in Book 8, Page 38 of Miscellaneous Records (Maps); thence along said northwesterly line,

5th- South 40°18'10" West 492.55 feet to said city and said district boundaries, being the southeasterly terminus of said 2nd course of Parcel A and the southeasterly terminus of said 2nd course of Parcel 10-A; thence, along the boundaries of said city and said district,

6th- North 57°12'04" West 821.00 feet to the Point of Beginning.

As shown on Exhibit B attached hereto and made a part hereof.

The Metropolitan Water District of Southern California (MWD)

Water Use Efficiency Compliance Statement

Calleguas Municipal Water District Annexation 104 – Rio Urbana

A. General Information

Description of Annexing Area	Member Agency: Calleguas Municipal Water District Annexation Name: Annexation 104 – Rio Urbana Water Use: CMWD CY 2021 (Imported Demands – Sales to Other Agencies): 92,923 AF Annexing Water Demand: 40.40 AFY Imported Water Demand: 20.20 to 24.24 AFY Percent MWD Supplied: 50-60% Development Plans: Commercial General (City of Oxnard) Zoning: C-2 General Commercial Planned Development Zone [C-2-PD] (City of Oxnard) Address: 2714 East Vineyard Avenue, Oxnard, 93036 (APN: 145-0-232-010) Additional Water Agencies Involved in Annexation: 1. City of Oxnard

B. Member Agency Water Use and Efficiency Plans

(1) Annual Water Use.

1. Does your agency minimize annual water demand and peak demands by incorporating water conservation measures throughout the service area? Please describe such conservation measures in the service area. **MWD Administrative Code § 3107 (a)(1)(i)**	Member Agency Response: **Yes** Description: ▪ CMWD contributes cash incentives beyond MWD rebates in the amount of $25 per device for high efficiency clothes washers, premium high efficiency toilets, weather-based irrigation controllers and soil moisture sensor systems. Effective September 1, 2021, Calleguas also adds a $1 supplement per square foot to MWD's turf rebate, for a total of $3/square foot for Calleguas customers. It does this in conjunction with participation by member purveyors. ▪ Calleguas' staff includes a Principal Resource Specialist who actively promotes and coordinates Metropolitan and Calleguas conservation programs. Activities include direct contact with builders, dissemination of literature, and presentations to public and industry groups. ▪ Calleguas relies on its Member Purveyors to enforce compliance with mandated conservation measures at the local level as part of the project approval process. ▪ Newly annexing territory is conditioned to be compliant with: Metropolitan Water District of Southern California Administrative Code 3107 (as amended over time), California Water Code Sections 13550-13557, Calleguas Resolution No. 903 and Calleguas Ordinance No. 17. Reporting on compliance is required by the Member Purveyor and the property owner through provisions of Exhibit 'C' attached to Calleguas annexation resolutions. Supporting Documentation: Please refer to: 1) CMWD 2020 Urban Water Management Plan Pages 9-1 through 9-4. 2) CMWD Resolution 1964 - Attachment C (pg. 50-51)

2. Does your service area maximize use of groundwater, local surface water, and recycled waste water supplies to minimize annual water demand on MWD? Please describe such maximizing uses in the service area. **MWD Administrative Code § 3107 (a)(1)(ii)**	Member Agency Response: **Yes** Description: CMWD member agencies produce and distribute approximately 40,000 to 50,000 AF of water from local sources annually. Sources include imported surface water supplied to the City of Oxnard by United Water Conservation District, groundwater, and recycled water. The Regional Salinity Management Program involves construction of a pipeline to dispose of brine concentrates and thereby facilitate the use of high-salinity groundwater and recycled wastewater in the Calleguas watershed. 16.7 miles of the pipeline and the ocean outfall are complete. Ultimately it will extend from the outfall 32 miles inland to Simi Valley. When complete and fully utilized by CMWD member agencies, the pipeline will substantially increase local water supplies. Working with its member purveyors, CMWD has identified several other potential projects for recovering low quality groundwater and recycling. The program has the potential of providing 40,000 AF of potable water annually directly offsetting demand on MWD. Supporting documentation: Please visit smp.calleguas.com
3. Does your service area construct and operate local storage and groundwater production facilities as required by California Water Code Sections 10700-10710 (Groundwater Resources)? Please describe such construction and operations in the service area. **MWD Administrative Code § 3107 (a)(1)(iii)**	Member Agency Response: **Yes** Description: Member purveyors with groundwater pump more heavily in summer months. In addition, the District operates ten reservoirs with a combined capacity of 63 million gallons to reduce daily peaking. CMWD Ordinance No. 12 penalizes member purveyors for extremes of high and low flow and imposes the Capacity Reservation Charge on member purveyors as an incentive to reduce peaking. Calleguas itself also maintains groundwater facilities in the Las Posas Basin. Groundwater supplies in the Las Posas Valley Groundwater Basin may be utilized in the event of an emergency. Supporting Documentation: Please see: 1) Calleguas Urban Water Management Plan 2020, Chapter 6; 2) Calleguas 2017 Potable Water Master Plan Executive Summary Pages 9-14 and 25-27; 3) Calleguas Ordinance No. 12, Page 2
4. Does your agency condition all new territory to be consistent with all applicable city, county, and state laws? **MWD Administrative Code § 3107 (a)(1)(iv)**	Member Agency Response: **Yes** Description: ▪ Newly annexing territory is conditioned to be compliant with: Metropolitan Water District of Southern California Administrative Code 3107 (as amended over time), California Water Code Sections 13550-13557, Calleguas Resolution No. 903 and Calleguas Ordinance No. 17. Reporting on compliance is required by the Member Purveyor and the property owner through provisions of Exhibit 'C' attached to Calleguas annexation resolutions. ▪ Further, 'Exhibit C' of CMWD Resolution 1964 captures compliance with the Model Water Efficient Landscape Ordinance, known as 'MWELO', by conditioning newly annexed territory to be compliant with the City of Oxnard Municipal Code (Chapter 22), which contains MWELO provisions as specified in Article XIII. Landscape Water Conservation Standards. ▪ Calleguas relies on its Member Purveyors to enforce compliance with mandated conservation measures at the local level as part of the project approval process.

	Supporting Documentation: Please refer to: 1) CMWD Resolution 1964 - Attachment C (pg. 50-51)

(2) Recycled Water.

5. Does your service area use recycled water in accordance with California Water Code Sections 13550-13557 (Water Reuse)? Please describe such recycled water use in the service area. **MWD Administrative Code § 3107 (a)(2)**	Member Agency Response: **Yes** Description: ▪ Calleguas supports the use of recycled water in accordance with Water Code Sections 13550-13557 wherever it is feasible to do so within its service area. ▪ In recent years, the City of Oxnard delivered highly treated wastewater through the CMWD Salinity Management Pipeline for delivery to CII users. However, this operation will be not be feasible when the City of Camarillo's North Pleasant Valley Desalter begins its discharge to the SMP (estimated in 2022). ▪ The City of Oxnard continues to study maximizing production from its Advanced Water Purification Facility (AWPF). The City of Oxnard is currently planning for an Indirect Potable Reuse (IPR) project that began pilot testing in 2020. ▪ Calleguas built three pipelines to facilitate distribution of recycled water by its member purveyors. In 2017 these pipelines delivered 1,655 Acre-feet of recycled water. In May of 2017 two of the recycled pipelines were sold to Triunfo Water & Sanitation District, which continues to operate them. Today, Calleguas owns a small pipeline that provides recycled water to the City of Simi Valley (VCWWD No. 8). In the future, it is expected that the City of Simi Valley will take ownership, operation, and maintenance of this delivery facility. Additional AF of recycled water are distributed for M and I use by CMWD purveyors. Most of these deliveries are used for landscape irrigation and directly offset potable demand. Supporting Documentation: Please see: 1) Calleguas 2020 Urban Water Management Plan Page 4-4, Pages 6-8 to 6-10; 2) Calleguas 2017 Potable Water Master Plan Executive Summary Pages 11. 3) Regional Salinity Management Program Brochure 4) City of Oxnard Recycled Water Webpage. 5) Oxnard IPR Program

(3) Local Resources.

6. Has your agency established measures to sustain a seven-to 21-day interruption in service, as required by MWD Administrative Code Section 4503(b)? **MWD Administrative Code § 3107 (a)(3)**	Member Agency Response: **Yes** Description: ▪ Calleguas can call on multiple sources of water to sustain service through a 7-day interruption of supplies from Metropolitan. Lake Bard has usable storage capacity of 7,500 AF as a potable supply. The Lake Bard Water Filtration Plant can produce 90 cubic feet per second (CFS). Additionally, Calleguas presently holds the right to roughly 95,000 AF of groundwater. During a shutdown, Calleguas can produce 55 CFS from its Las Posas ASR Project. Other Calleguas groundwater supplies can by agreement be extracted by its member purveyors. These supplies are sufficient to meet demand in the Calleguas service area in winter and spring months. In addition, interconnections with the City of Ventura and Las Virgenes MWD are currently in the planning phase and construction phase, respectively. ▪ Calleguas' staff includes an Emergency Response Coordinator. This position leads the District's disaster management programs. ▪ Calleguas' member purveyors can augment these supplies during such short-term interruptions with increased groundwater pumping and other regional resources so that summer demand can be largely satisfied with minimal delivery curtailment.

	▪ The District would heavily emphasize water conservation and a message of "NO OUTDOOR IRRIGATION" should Calleguas face a prolonged interruption in service from MWD. ▪ Calleguas is in the process of finalizing a Water Supply Alternatives Study (WSAS) that examines more than 90 projects that could increase the District's reliability (& redundancy) at least cost. This is a long-range planning document. Supporting Documentation: Please refer to: 1) Calleguas 2020 Urban Water Management Plan Chapter 8 (Water Shortage Contingency Planning) and Appendix K (Water Shortage Continency Plan); and 2) Imported Water Outage Planning

C. Reporting to the District

7. Has your agency incorporated conservation measures in the new territory? Please describe such measures. **MWD Administrative Code § 3107(b)(1)**	Member Agency Response: **Yes** Description: ▪ Newly annexing territory is conditioned to be compliant with: Metropolitan Water District of Southern California Administrative Code 3107 (as amended over time), California Water Code Sections 13550-13557, Calleguas Resolution No. 903 and Calleguas Ordinance No. 17. Reporting on compliance is required by the Member Purveyor and the property owner through provisions of Exhibit 'C' attached to Calleguas annexation resolutions. ▪ Calleguas relies on its Member Purveyors to enforce compliance with mandated conservation measures at the local level as part of the project approval process. Supporting Documentation: Please refer to: 1) CMWD Resolution 1964 - Attachment C (pg. 50-51)
8. What is your agency's total annual production of local water supplies including, but not limited to, recycled water, groundwater, and local surface water use? **MWD Administrative Code § 3107(b)(2)**	Member Agency Response: ▪ Per CY 2020 reconciliation (Local Production All Sources): 43,327.7 AF ▪ Per CY 2020 reconciliation (CMWD Imported Sales): 89,631.5 AF ▪ CY 2021 reconciliation will occur when prompted by MWD WRM staff.
9. Has your agency established resources to sustain a seven-to 21-day interruption in service, as required by MWD Administrative Code Section 4503(b)? Please describe such resources, as applicable to your agency's facilities, as specified in MWD Administrative Code §§ 3107(b)(3). **MWD Administrative Code § 3107(b)(3)**	Member Agency Response: **Yes** Description: ▪ Calleguas can call on multiple sources of water to sustain service through a 7-day interruption of supplies from Metropolitan. Lake Bard has usable storage capacity of 7,500 AF as a potable supply. The Lake Bard Water Filtration Plant can produce 90 cubic feet per second (CFS). Additionally, Calleguas presently holds the right to roughly 95,000 AF of groundwater. During a shutdown, Calleguas can produce 55 CFS from its Las Posas ASR Project. Other Calleguas groundwater supplies can by agreement be extracted by its member purveyors. These supplies are sufficient to meet demand in the Calleguas service area in winter and spring months. In addition, interconnections with the City of Ventura and Las Virgenes MWD are currently in the planning phase and construction phase, respectively. ▪ Calleguas' staff includes an Emergency Response Coordinator. This position leads the District's disaster management programs. ▪ Calleguas' member purveyors can augment these supplies during such short-term

	interruptions with increased groundwater pumping and other regional resources so that summer demand can be largely satisfied with minimal delivery curtailment. ▪ Finally, the District would heavily emphasize water conservation and a message of "NO OUTDOOR IRRIGATION" should CMWD face a prolonged interruption in service from MWD.
10. Has your agency submitted a current Urban Water Management Plan (UWMP) to the reporting agency? **MWD Administrative Code § 3107(b)(4)(i)**	Member Agency Response: **Yes** Description: ▪ Calleguas' 2020 UWMP is available on its website: https://www.calleguas.com/cmwdfinal2020uwmp.pdf ▪ The City of Oxnard's 2020 UWMP: https://www.oxnard.org/city-department/public-works/water/uwmp/
11. Does your agency's most current UWMP include a narrative description addressing the nature and extent of each water demand management measure implemented over the past 5 years, as required by California Water Code Section 10631(f)? **MWD Administrative Code § 3107(b)(4)(ii)**	Member Agency Response: **Yes** Description: ▪ Calleguas' 2020 UWMP is available on its website: https://www.calleguas.com/cmwdfinal2020uwmp.pdf, see Chapter 9, Demand Management Measures ▪ The City of Oxnard's 2020 UWMP: https://www.oxnard.org/city-department/public-works/water/uwmp/, see Chapter 9, Demand Management Measures
12. Does your agency's most current UWMP adequately address California Water Code requirements? **MWD Administrative Code § 3107(b)(4)(iii)**	Member Agency Response: **Yes** Description: ▪ Calleguas' 2020 UWMP is available on its website: https://www.calleguas.com/cmwdfinal2020uwmp.pdf ▪ The City of Oxnard's 2020 UWMP: https://www.oxnard.org/city-department/public-works/water/uwmp/ ▪ The Department of Water Resources (DWR) is currently reviewing the Calleguas MWD 2020 UWMP and the City of Oxnard 2020 UWMP. Documentation regarding DWR's determination of each agency's 2020 UWMP compliance with California Water Code (CWC) requirements can be provided upon receipt.
13. What is the status of implementing the water plans, projects, and programs described in the UWMP to implement California Water Code Section 10620 et seq.? **MWD Administrative Code § 3107(b)(5)**	Member Agency Response: In progress Description: ▪ Calleguas relies in part on the MWD Water Surplus & Drought Management Plan, including the periodic updates to MWD's Water Supply Allocation Plan (WSAP). ▪ As required for the 2020 CMWD UWMP update, the District developed its own Water Shortage Contingency Plan (WSCP). See Calleguas 2020 Urban Water Management Plan Appendix K ▪ The Calleguas MWD Final 2020 UWMP and WSCP were adopted by the Calleguas Board of Directors on June 2, 2021 (Resolution No. 2018).

Member Agency Representative Name: Dan Drugan, Manager of Resources

Notes: N/A

RESOLUTION XXXX

RESOLUTION OF THE BOARD OF DIRECTORS
OF THE METROPOLITAN WATER DISTRICT OF
SOUTHERN CALIFORNIA
CONSENTING TO CALLEGUAS MUNICIPAL WATER DISTRICT'S
CALLEGUAS ANNEXATION NO. 104
AND FIXING THE TERMS AND CONDITIONS
TO
THE METROPOLITAN WATER DISTRICT OF SOUTHERN CALIFORNIA

WHEREAS, the Board of Directors of the Calleguas Municipal Water District ("Calleguas"), a county water authority situated in the county of Ventura, state of California, pursuant to Resolution No. 2038, in accordance with the provisions of the Metropolitan Water District Act (MWD Act), has applied to the Board of Directors of The Metropolitan Water District of Southern California (Metropolitan) for consent to annex thereto certain uninhabited territory situated in the county of Ventura referred to as Calleguas Annexation No. 104, more particularly described in an application to the Ventura County Local Agency Formation Commission (LAFCO), concurrently with Calleguas Annexation No. 104 thereof to Calleguas, such annexation to Metropolitan to be upon such terms and conditions as may be fixed by the Board of Directors of Metropolitan;

WHEREAS, the owner of Ventura County Assessor Parcel Number 145-0-232-010 (Property) has applied for annexation into the Calleguas and Metropolitan service areas;

WHEREAS, completion of said Annexation No. 104 shall be contingent upon approval by the LAFCO; conditioning its approval of the Calleguas Annexation No. 104 upon a requirement that Metropolitan's existing and established taxes, benefit assessments, or property-related fees or charges in place in the service area are levied or fixed and collected on the parcels being annexed to the agency; these taxes, benefit assessments, or property-related fees or charges are identified below;

WHEREAS, Metropolitan has levied and collected ad valorem taxes on parcels within the territory of Calleguas. Such charges for fiscal year 2022/23 are described in Resolution 9301, adopted by Metropolitan's Board on April 12, 2022;

WHEREAS, since fiscal year 1992-93, Metropolitan has levied and collected water standby charges pursuant to Section 134.5 of the MWD Act on parcels within the territory of Calleguas. Such charges for fiscal year 2022/23 are described in Resolution 9307, adopted by Metropolitan's Board on May 10, 2022;

WHEREAS, upon Annexation No. 104, the parcel will be within Metropolitan's service area, Metropolitan water will be available to such parcels and such parcels will receive the benefit of the projects provided in part with proceeds of Metropolitan's water standby charges. Upon completion of the annexation, the lands within the Calleguas Annexation No. 104 will be subject to Metropolitan's water standby charge in the current amount of $9.58 per acre, or per a parcel of less than one acre. Approval of Metropolitan's standby charge levied elsewhere within Calleguas' territory is a condition to complete this annexation;

WHEREAS, pursuant to the provisions of the California Environmental Quality Act (CEQA), The City of Oxnard, acting as Lead Agency and subagency to Calleguas, adopted the Rio Urbana Project (also known as Calleguas Annexation No. 104) Mitigated Negative Declaration on March 4, 2020, and approved the Project for the development of the proposed annexation parcels. Metropolitan, as Responsible Agency under CEQA, reviewed and considered the information contained in the 2019 MND prior to approval of the formal terms and conditions for the Calleguas Annexation No. 104; and

WHEREAS, it appears to this Board of Directors that such application should be granted, subject to the terms and conditions hereinafter set forth.

NOW, THEREFORE, BE IT RESOLVED, that the Board of Directors of Metropolitan, acting as Responsible Agency, reviewed and considered the information in the 2019 MND prior to approval of the final terms and conditions for Calleguas Annexation No. 104; and subject to the following terms and conditions, does hereby grant the application of the governing body of Calleguas Municipal Water District for consent to annex Calleguas Annexation No. 104, to Metropolitan and does hereby fix the terms and conditions of such annexation.

BE IT FURTHER RESOLVED that the Board of Directors of Metropolitan, subject to the following terms and conditions, does hereby grant the application of the governing body of Calleguas for consent to Calleguas Annexation No. 104 to Metropolitan and does hereby fix the terms and conditions of such annexation:

Section 1. Annexation of said area to Calleguas shall be made concurrently with annexation thereof to Metropolitan, and all necessary certificates, statements, maps, and other documents required to be filed by or on behalf of Calleguas to effectuate Annexation No. 104 shall be filed on or before December 31, 2023.

Section 2. Prior to filing a request for a Certificate of Completion of Annexation No. 104 proceedings with LAFCO, Calleguas shall submit a certified copy of LAFCO's resolution approving Annexation No. 104 to Calleguas and shall pay to Metropolitan $74,220.40 for its annexation fee, if annexation is completed by December 31, 2022. If the annexation is completed during the 2023 calendar year, the annexation charge will be calculated based on the then-current rate, in accordance with Metropolitan's Administrative Code Section 3300.

Section 3. a. Metropolitan shall be under no obligation to provide, construct, operate, or maintain feeder pipelines, structures, connections, and other facilities required for the delivery of water to said area from works owned and operated by Metropolitan.

b. Calleguas shall not be entitled to demand that Metropolitan deliver water to Calleguas for use, directly or indirectly, within said area, except for domestic or municipal use therein.

c. The delivery of all water by Metropolitan, regardless of the nature and time of use of such water shall be subject to the water service regulations, including rates and charges promulgated from time to time by Metropolitan.

d. The delivery of all water by Metropolitan, regardless of the nature and time of use of such water shall be subject to the water service regulations, including rates and charges promulgated from time to time by Metropolitan.

Section 4. LAFCO has conditioned approval of Calleguas Annexation No. 104 upon a requirement that Metropolitan levy or fix and collect all previously established and collected taxes, benefit assessments, or property-related fees or charges on parcels being annexed to the agency.

Section 5. Such charges, which are subject to change over time, include but are not limited to:

a. Metropolitan's ad valorem tax on properties located within the territory of Calleguas in the amount of 0.0035 percent of the assessed value of each parcel. Metropolitan shall levy the ad valorem tax in the amount, at the same time and in the same manner as ad valorem tax on other properties located within the territory of Calleguas. Such charges for fiscal year 2022/21 are described in Resolution 9301, adopted by Metropolitan's Board on April 12, 2022.

b. Metropolitan's water standby charge on properties located within the territory of Calleguas in the amount, at the same time and in the same manner as the ad valorem tax on other properties located within the territory of Calleguas. Such charges for fiscal year 2022/23 are described in Resolution 9307, adopted by Metropolitan's Board on May 10, 2022

Section 6. That the General Manager is hereby authorized and directed to take all necessary action to secure the collection of the ad valorem taxes and water standby charges by the appropriate county officials, including payment of the reasonable cost of collection.

Section 7. That the Board of Directors of Metropolitan, acting as Responsible Agency, reviewed and considered the information in the 2019 MND prior to approval of the final terms and conditions for the Annexation No. 104; and subject to the following terms and conditions, does hereby grant the application of the governing body of Calleguas for consent to annex the Calleguas Annexation No. 104 to Metropolitan and does hereby fix the terms and conditions of such annexation.

Section 8. That the General Manager and General Counsel are hereby authorized to do all things necessary and desirable to accomplish the purposes of this resolution, including, without limitation, the commencement of defense of litigation.

Section 9. That if any provision of this resolution or the application to any member agency, property or person whatsoever is held invalid, that invalidity shall not affect the other provisions or applications of this resolution which can be given effect without the invalid portion or application, and to that end the provisions of this resolution are severable.

BE IT FURTHER RESOLVED that the Board Executive Secretary is directed to transmit forthwith to the governing body of Calleguas a certified copy of this resolution.

I HEREBY CERTIFY that the foregoing is a full, true and correct copy of a resolution adopted by the Board of Directors of The Metropolitan Water District of Southern California, at its meeting held on June 14, 2022.

Mitigation Monitoring and Reporting Plan (MMRP)

Environmental Impact	Significance Before Mitigation	Recommended Mitigation Measure	Significance After Mitigation	Responsible Party
Biological Resources	Potentially Significant	**BIO-1** Nesting Bird and Raptor Survey and Avoidance. In the event that the proposed action is planned to occur within the general bird nesting season, a pre-construction nesting bird survey shall be conducted by a qualified biologist. The nesting season is generally considered February 1 through August 31, with a peak from March to June; however, these dates vary by year depending on prey availability, weather, and other factors. In the event an active bird is observed in the habitats to be removed or in other habitats within 100 feet for songbirds and 500 feet for raptors of the construction work areas, all construction work in the suitable habitat or within 100 feet/500 feet of the suitable habitat must be delayed until after September 1st, or surveys must be continued in order to locate any nests. If an active nest is found, clearing and construction within 100 feet/500 feet of the nest shall be postponed until the nest is vacated and juveniles have fledged, and until there is no evidence of a second attempt at nesting. Limits of construction to avoid a nest site shall be established in the field with flagging and stakes or construction fencing. Construction personnel shall be instructed on the ecological sensitivity of the area.	Less Than Significant	Community Development
Cultural and Tribal Cultural Resources	Potentially Significant	**CUL-2** A qualified archaeologist shall monitor all project-related ground-disturbing activities. In the unlikely event that potentially significant archaeological materials are encountered during construction, the applicant must comply with State regulations and City's standard condition of approval for handling such resources.	Less Than Significant	Community Development
Noise	Potentially Significant	**N-1(a)** Building Material Guidelines. The living areas for all residences in the project, including those adjacent to Vineyard Avenue, shall be constructed to include sufficient noise attenuation to reduce interior noise levels to a CNEL of 45 dBA, as required by California building standards. For the estimated exterior CNEL values of 65 dBA, this performance standard requires an exterior-to interior noise reduction of approximately 20 dBA. This noise reduction is	Less Than Significant	Community Development

Environmental Impact	Significance Before Mitigation	Recommended Mitigation Measure	Significance After Mitigation	Responsible Party
		routinely achieved in residential construction that is consistent with current California energy conservation standards, and involves measures such as exterior stucco walls with a Sound Transmission Class (STC) rating of 45, double-paned windows with an STC of 37, solid core exterior doors. Building permit applications shall include documentation that the interior standard of 45 dBA CNEL will be achieved through a combination of these or other measures. **N-1(b)** Building Design. The living areas shall contain forced air ventilation. All duct work for ventilation shall include noise louvers at the exterior outlet and/or duct outlets shall be directed either opposite to or perpendicular to Vineyard Avenue. Upper level patio/deck areas shall not be positioned facing the Vineyard Avenue for residences along the western site boundary <u>without additional mitigation or verification that exterior CNEL values would meet the City noise standard of 65 dBA as shown in a Noise Study reviewed and approved by the Planning Manager or designee.</u>		
Noise	Potentially Significant	**N-2** Construction Noise Levels. For all construction-related activities, noise-attenuation techniques shall be employed as needed to ensure that noise remains as low as possible during construction, specifically at REC-1 through REC-3. The following noise-attenuation techniques shall be incorporated into contract specifications to reduce the impact of construction noise: • Ensure that construction equipment is properly muffled according to industry standards and in good working condition. • Place noise-generating construction equipment and locate construction-staging areas away from sensitive uses, where feasible. • Schedule high noise-producing activities between the hours of 7:00 AM and 5:00 PM to minimize disruption on sensitive uses. • Implement noise attenuation measures to the extent feasible, which may include but are not limited to temporary noise barriers or noise blankets around stationary construction noise sources.	Less Than Significant	Community Development

Environmental Impact	Significance Before Mitigation	Recommended Mitigation Measure	Significance After Mitigation	Responsible Party
		• Use electric air compressors and similar power tools rather than diesel equipment, where feasible. • All stationary construction equipment (e.g., air compressors, generators, impact wrenches, etc.) shall be operated as far away from residential uses as possible and shall be shielded with temporary sound barriers, sound aprons, or sound skins. • Construction-related equipment, including heavy-duty equipment, motor vehicles, and portable equipment, shall be turned off when not in use for more than 30 minutes. • Clearly post construction hours, allowable workdays, and the phone number of the job superintendent at all construction entrances to allow for surrounding owners to contact the job superintendent. If the City or the job superintendent receives a complaint, the superintendent shall investigate, take appropriate corrective action, and report the action taken to the reporting party.		
Utilities and Energy	Potentially Significant	**W-1** The applicant shall provide for the allocation of groundwater pumping rights sufficient to serve the development (40.399 acre feet per year) from the Fox Canyon Groundwater Management Agency to the City of Oxnard, consistent with the ordinances and requirements of the two agencies, prior to recording the final map for the project.	Less Than Significant	Water Division

CITY OF OXNARD CEQA INITIAL STUDY CHECKLIST

This FINAL Initial Study-Mitigated Negative Declaration includes clarifications that were made in response to questions from the Planning Commission on October 3, 2019. The DRAFT MND, Responses to Comments, and Technical Appendices are available at the City of Oxnard Planning Division CEQA documents webpage: https://www.oxnard.org/city-department/community-development/planning/environmental-documents/

Project Title: Rio Urbana Project (Tentative Subdivision Map for Tract No. 5998)

Lead Agency Name and Address:

City of Oxnard
Community Development Department
Planning Division
214 S. C Street
Oxnard, California 93030

City of Oxnard Contact Person and Phone Number:

Chris Williamson, AICP, Contract Planner
(805) 385-8156

Project Location:

2714 East Vineyard Avenue and Rio School Lane
Assessor's Parcel Number (APN) 145-0-232-01

Co-Applicants:

El Rio School District
2500 East Vineyard Avenue
Oxnard, California 93036

The Pacific Companies
430 East State Street, Suite #100
Eagle, Idaho 83616

Project Contacts:

Tony Talamante, P.E.
Caleb Roope

Oxnard General Plan Designation: SCH – School

Oxnard Zoning: N/A – Unincorporated (County of Ventura)

Project Description: The proposed project includes demolition of the existing school buildings onsite (formerly El Rio Elementary School) and subdivision of the approximately 10.5 acre parcel into two parcels. The project would develop 167 condominium units in eight, three-story buildings that include a fitness center and 17 low income and 3 moderate income deed-restricted units on the 9.12-acre parcel,

as well as a two-story, 15,100 square foot office building on the 1.12-acre parcel. This office development may be used to relocate the Rio School District administrative offices. The project would also include widening of Vineyard Avenue, associated parking, open space, landscaping, and amenities for on-site residents. The residential units would be made up of one- to three-bedroom attached units. The residential and office structures would have a maximum height of 38 feet. The residential portion of the project would include 431 parking spaces consisting of 169 resident garages, 163 parking spaces, and 99 guest parking spaces. The office portion of the project would include 60 standard parking spaces. Resident amenities include a 1,068 square foot recreation pavilion, four refuse structures, six play areas and a tot lot, and a dog run.

Rio School Lane would be vacated by the County of Ventura with current access and parking for adjoining properties, maintained. This roadway will be included as a private street within the annexation to the City of Oxnard, and will include a 7-foot wide sidewalk to connect existing access points from the adjacent residential area to Vineyard Avenue and its sidewalk. The project site would be accessed by three driveways from Vineyard Avenue. Internal circulation would accommodate fire and emergency access, and solid waste collection vehicles.

The project would require the following entitlements:

1. Annexation to the City of Oxnard (PZ 17-610-01)
2. Oxnard General Plan Amendment (PZ 17-620-01) to change the land use designation from School to Commercial General
3. Pre-Zoning to C-2-PD (PZ 17-560-01)
4. Tentative Subdivision Map that creates two parcels (Parcel 1 on 1.12 acres and Parcel 2 on 9.12 acres; PZ 17-300-03) and 167 condominium parcels and a common area parcel.
5. Special Use Permit (PZ 17-500-05) for development of an office building on Parcel 1
6. Special Use Permit (PZ 17-500-13) for three-story (38 feet high(residential use on Parcel 2
7. Issuance of a Density Bonus (PZ 17-535-02) for provision of three additional units (a 2% density bonus, out of the 20% that is allowable) and reduction in interior yard space from 30 percent to 24 percent

Surrounding Land Uses and Setting: The project site is location within the El Rio community in unincorporated County of Ventura north of the City of Oxnard. The site is bordered by the following land uses:

- North – CG- Commercial General, RL-Low Residential
- East – RL-Low Residential; eight-acre greenhouse and agriculture use which is designated in the Ventura County 2014-2021 Housing Element for affordable housing at 20 units per acre
- South – CG- Commercial General
- West – CG-Commercial General, RL-Low Residential

The project site is a 10.49 acre parcel developed with Rio School Lane and vacant buildings (cafeteria, administration, classrooms, and two portable buildings) that were formerly the El Rio Elementary School campus, closed since 2008. Portions of the site are currently utilized as parking and dispatch for school buses and storage.

The project site is shown in the context of the City's planning area boundaries on Figure 1. Figure 2 shows the project site boundary as well as the City's 2030 General Plan land use designations for the site

and surrounding properties. Figure 3 shows the project site boundary as well as the existing County of Ventura zoning designations. Figure 4 shows the proposed site plan for the project.

Other Public Agencies Whose Approval is Required:

- *Ventura Local Agency Formation Commission* – Annexation to the City of Oxnard and Annexation to the Calleguas Municipal Water District;~~,~~ Detachment from the Ventura County Resource Conservation District, Ventura County Fire Protection District, and Ventura County Service Area No. 32.
- *California Department of Transportation* – Approval of Vineyard Avenue (State Route 232) improvements.
- *County of Ventura* – Vacation of Rio School Lane, Detachment from County of Ventura service areas and districts.
- *Calleguas Municipal Water District and Metropolitan Water District of Southern California*– Annexation.
- *Fox Canyon Groundwater Management Agency* – Transfer of allocations for groundwater use.
- *Ventura County Watershed Protection District* – Stormwater runoff compliance and permitting

Have California Native American tribes traditionally and culturally affiliated with the project area requested consultation pursuant to Public Resources Code 21080.3.1?

[Note: Conducting consultation early in the CEQA process allows tribal governments, lead agencies, and project proponents to discuss the level of environmental review, identify and address potential adverse impacts to tribal cultural resources, and reduce the potential for delay and conflict in the environmental review process. (See Public Resources Code section 21083.3.2.) Information may also be available from the California Native American Heritage Commission's Sacred Lands File per Public Resources Code section 5097.96 and the California Historical Resources Information System administered by the California Office of Historic Preservation. Please also note that Public Resources Code section 21082.3(c) contains provisions specific to confidentiality.]

ENVIRONMENTAL FACTORS POTENTIALLY AFFECTED

☐ Aesthetics and Urban Design	☐ Climate Change and Greenhouse Gas Emissions	■ Hydrology and Water Quality	☐ Population, Education, and Housing
☐ Agricultural Resources	■ Cultural Resources and Tribal Cultural Resources	☐ Land Use and Planning	☐ Public Services and Recreation
☐ Air Quality	☐ Geology and Soils	☐ Mineral Resources	☐ Transportation and Circulation
■ Biological Resources	☐ Hazards and Hazardous Materials	■ Noise	■ Utilities and Energy

DETERMINATION:

On the basis of this initial evaluation:

☐ I find that the proposed project COULD NOT have a significant effect on the environment, and a NEGATIVE DECLARATION will be prepared.

■ I find that although the proposed project could have a significant effect on the environment, there will not be a significant effect in this case because revisions in the project have been made by or agreed to by the project proponent. A MITIGATED NEGATIVE DECLARATION will be prepared.

☐ I find that the proposed project MAY have a significant effect on the environment, and an ENVIRONMENTAL IMPACT REPORT is required.

☐ I find that the proposed project MAY have a "potentially significant impact" or "potentially significant unless mitigated" impact on the environment, but at least one effect 1) has been adequately analyzed in an earlier document pursuant to applicable legal standards, and 2) has been addressed by mitigation measures based on the earlier analysis as described on attached sheets. An ENVIRONMENTAL IMPACT REPORT is required, but it must analyze only the effects that remain to be addressed.

☐ I find that although the proposed project could have a significant effect on the environment, because all potentially significant effects (a) have been analyzed adequately in an earlier EIR or NEGATIVE DECLARATION pursuant to applicable standards, and (b) have been avoided or mitigated pursuant to that earlier EIR or NEGATIVE DECLARATION, including revisions or mitigation measures that are imposed upon the proposed project, nothing further is required.

EVALUATION OF ENVIRONMENTAL IMPACTS

1. When the answer to a checklist question is “yes”, either the “Potentially Significant Impact” or “Less than Significant Impact with Mitigation Incorporated” box will typically be checked. When the answer to a checklist question is “no,” either the “Less than Significant Impact” or “No Impact” box will typically be checked.

2. A brief explanation is required for all answers except "No Impact" answers that are adequately supported by the information sources a lead agency cites in the parentheses following each question. A "No Impact" answer is adequately supported if the referenced information sources show that the impact simply does not apply to projects like the one involved (e.g., the project falls outside a fault rupture zone). A "No Impact" answer should be explained where it is based on project-specific factors as well as general standards (e.g., the project will not expose sensitive receptors to pollutants, based on a project-specific screening analysis).

3. All answers must take account of the whole action involved, including off-site as well as on-site, cumulative as well as project-level, indirect as well as direct, and construction as well as operational impacts.

4. Once the lead agency has determined that a particular physical impact may occur, then the checklist answers must indicate whether the impact is potentially significant, less than significant with mitigation, or less than significant. "Potentially Significant Impact" is appropriate if there is substantial evidence that an effect may be significant. If there are one or more "Potentially Significant Impact" entries when the determination is made, an EIR is typically required.

5. "Negative Declaration: Less Than Significant With Mitigation Incorporated" applies where the incorporation of mitigation measures has reduced an effect from "Potentially Significant Impact" to a "Less Than Significant Impact." The lead agency must describe the mitigation measures, and briefly explain how they reduce the effect to a less than significant level (mitigation measures from "Earlier Analyses," as described in (5) below, may be cross-referenced).

6. Earlier analyses may be used where, pursuant to the tiering, program EIR, or other California Environmental Quality Act (CEQA) process, an effect has been adequately analyzed in an earlier EIR or negative declaration. Section 15063(c)(3)(D). In this case, a brief discussion should identify the following:

    a. Earlier Analysis Used. Identify and state where they are available for review.

    b. Impacts Adequately Addressed. Identify which effects from the above checklist were within the scope of and adequately analyzed in an earlier document pursuant to applicable legal standards, and state whether such effects were addressed by mitigation measures based on the earlier analysis.

c. Mitigation Measures. For effects that are "Less than Significant with Mitigation Measures Incorporated," describe the mitigation measures which were incorporated or refined from the earlier document and the extent to which they address site-specific conditions for the project.

7. Lead agencies are encouraged to incorporate into the checklist references to information sources for potential impacts (e.g., general plans, zoning ordinances). Reference to a previously prepared or outside document should, where appropriate, include a reference to the page or pages where the statement is substantiated.

8. Supporting Information Sources: A source list should be attached, and other sources used or individuals contacted should be cited in the discussion.

9. The explanation of each issue should identify:

   a. The significance criteria or threshold, if any, used to evaluate each question; and

   b. The mitigation measure identified, if any, to reduce the impact to less than significance

ISSUE TOPICS

I. AESTHETICS AND URBAN DESIGN	Potentially Significant Impact	Less Than Significant Impact with Mitigation Incorporated	Less Than Significant Impact	No Impact
1. Would the project have a substantial adverse effect on a scenic vista such as an ocean or mountain view from an important view corridor or location as identified in the 2030 General Plan or other City planning documents?	☐	☐	■	☐
2. Would the project substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway, or route identified as scenic by the County of Ventura or City of Oxnard?	☐	☐	■	☐
3. Would the project substantially degrade the existing visual character or quality of the site or its surroundings such as by creating new development or other physical changes that are visually incompatible with surrounding areas or that conflict with visual resource policies contained in the 2030 General Plan or other City planning documents?	☐	☐	■	☐
4. Would the project add to or compound an existing negative visual character associated with the project site?	☐	☐	■	☐
5. Would the project create a source of substantial light or glare that would adversely affect day or nighttime views in the area?	☐	☐	■	☐

1. The project site is currently developed with Rio School Lane and vacant buildings that were formerly the El Rio Elementary School campus. The existing school development does not constitute the type of urban landscape considered an important aesthetic resource in the City's 2030 General Plan. Therefore, changes to the appearance of the site from surrounding viewpoints due to the project would not result in an adverse effect on a scenic vista. No ocean, mountain, or other identified scenic views are provided from or through the site due to the existing development on the site. Therefore, redevelopment of the project site resulting in greater development density and intensity

than the existing condition would not have a substantial adverse effect on any identified scenic vistas. This impact would be less than significant.

2. According to the California Department of Transportation (Caltrans) Designated Scenic Highway Route Map for Ventura County, the nearest Eligible State Scenic Highway to the project site is United States Highway 101 (U.S. 101). However, U.S. 101 is not officially designated as a State Scenic Highway and does not provide views of the project site due to intervening development and vegetation. According to Section 5.3.2 of the Background Report for the 2030 General Plan, Vineyard Avenue between Los Angeles Avenue and Patterson Road, from which the project site is visible, is included in the City's designated Scenic Highway/Roadway System. According to 2030 General Plan Goal CD-9.4, View Corridor Preservations, a landscaped buffer corridor of at least 30 feet deep is required along designated scenic corridors and other major transportation corridors. Views of the site from Vineyard Avenue are dominated by the existing development of the former El Rio Elementary School campus and current utilization for school bus parking and storage. No scenic resources are prominently visible onsite from Vineyard Avenue. Additionally, in compliance with 2030 General Plan Goal CD-9.4, the project has been designed with a 30-foot landscaped setback from the public right-of-way on Vineyard Avenue. With this design provision, the project would not result in substantial damage to scenic resources within a state or local scenic route. This impact would be less than significant.

3,4. The project site currently possesses a generally urban character due to the existing one- and two-story buildings comprising the former El Rio Elementary School campus onsite. The site is located in a developed portion of the County of Ventura's unincorporated El Rio community along East Vineyard Avenue and adjacent to the City of Oxnard, with surrounding uses consisting of various residential and general commercial uses that are similar in character. The proposed condominium residential units and amenities would be a maximum of three stories or 38 feet in height and would provide front, rear, and side setbacks, consistent with the proposed City of Oxnard C-2 zoning designation and R-3 development standards for residential development in the C-2 zone. The office building would be two stories and 35 feet in height. The proposed buildings would be designed to complement the urban character of surrounding uses. The proposed development would also include open space and landscaping features around new buildings to enhance the visual character, pursuant to 2030 General Plan Goal CD-9.4, and is subject to the City's design review process to ensure consistency with the City's goals, policies, and design guidelines. Therefore, as proposed, the project would be visually compatible with the character and quality of the surrounding urban development and consistent with City visual resource policies. This impact would be less than significant.

5. The project site currently contains facilities of a former elementary school that provide lighting and potential sources of glare on the site. Nighttime lighting sources also exist along East Vineyard Avenue in the vicinity of the site. New sources of lighting associated with the project would include security and street lighting typical of the surrounding residential and commercial development and would comply with Section 16-320 of the Oxnard Municipal Code, which specifies on-site lighting requirements that are applicable in all zones of the City. Exterior building materials would consist of non-reflective, textured surfaces and non-reflective, glazed glass on the building. The project would not include any sources of high-intensity lighting. As a standard condition of approval, all proposed

lighting would be subject to the City's review and approval process, which would include the preparation of a photometric plan for the project. Due to the existing ambient light conditions in the surrounding area as well on the project site, the proposed use of non-reflective building materials, and compliance with the City's lighting requirements and review processes, the project would not create a source of substantial light or glare that would adversely affect day or nighttime views in the area. This impact would be less than significant.

Cumulative Impact Analysis: The project would establish new residential and office uses on a previously developed site in an urban area resulting in no direct or indirect adverse project-level impacts, or contribution to cumulative impacts to aesthetic and visual resources. With incorporation of standard conditions of approval for compliance with City lighting requirements, impacts of the project with respect to glare and lighting would not be cumulatively considerable.

This page intentionally left blank.

II. AGRICULTURAL RESOURCES	Potentially Significant Impact	Less Than Significant Impact with Mitigation Incorporated	Less Than Significant Impact	No Impact
1. Would the project convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance to non-agricultural use?	☐	☐	☐	■
2. Would the project conflict with existing zoning for agricultural use or an existing Williamson Act contract?	☐	☐	☐	■
3. Would the project involve other changes in the existing environment that, due to their location or nature, could result in conversion of off-site farmland to non-agricultural use?	☐	☐	☐	■

1,2. According to the California Department of Conservation (DOC) Ventura County Important Farmland 2016 and Ventura County Williamson Act FY 2015-2016 maps, the project site and surrounding properties consist entirely of Urban and Built-up Land. The project would not covert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance to non-agricultural use or conflict with land placed under an existing Williamson Act contract. There would be no impacts associated with conversion of Prime Farmland, Unique Farmland, or Farmland of Statewide Importance to non-agricultural use, or conflicts with existing zoning for agricultural use or an existing Williamson Act contract.

3. The project would result in new urban development on an infill site that is already developed with urban uses. The site and surrounding properties do not contain any farmland or other agricultural uses. The project would not involve changes that could result in the conversion of off-site farmland to non-agricultural use. There would be no impact.

Cumulative Impact Analysis: In 1998, the Save Open Space and Agricultural Resources (SOAR) initiative was adopted establishing the City Urban Restriction Boundary (CURB), which defines the urban development boundary for the City of Oxnard until December 31, 2020, and re-designating all land designated "Agricultural Planning Reserve (AG/PR)" as "Agriculture (AG)". The SOAR initiative also established a City Buffer Boundary (CBB) which lies outside of the CURB line and is coterminous with the Oxnard Area of Interest. Change to the CURB line or an agricultural land use designation within the CBB generally requires majority approval of Oxnard voters, with some exceptions (City of Oxnard 2011). In compliance with 2030 General Plan Policy CD-6.2, which supports the preservation of the SOAR requirements, the project would preserve agricultural land and uses within the City's Planning Area by providing for housing on a previously developed site and relieving development pressure beyond the CURB line or on Agriculture-designated lands. As such, the project would not contribute to cumulative impacts to agricultural resources.

This page intentionally left blank.

III. AIR QUALITY	Potentially Significant Impact	Less Than Significant Impact with Mitigation Incorporated	Less Than Significant Impact	No Impact
1. Would the project conflict with or obstruct implementation of the Ventura County AQMP?	☐	☐	■	☐
2. Would the project violate any federal or state air quality standard or contribute substantially to an existing or projected air quality standard violation?	☐	☐	■	☐
3. Would the project result in a cumulatively considerable net increase of any criteria in excess of quantitative thresholds recommended by the VCAPCD)?	☐	☐	■	☐
4. Would the project expose sensitive receptors to pollutant concentrations exceeding state or federal standards or in excess of applicable health risk criteria for toxic air contaminants?	☐	☐	■	☐
5. Would the project create objectionable odors affecting a substantial number of people?	☐	☐	■	☐

Setting

An Air Quality Study was completed for the project by Meridian Consultants, LLC in August 2017 and is included as Appendix A. The Air Quality Study assesses and discusses the potential air quality impacts that may occur with the implementation of the project. The analysis estimates future emission levels resulting from construction and operation of the project, and identifies the potential for significant impacts based on adopted thresholds. An evaluation of the project's contribution to potential cumulative air quality impacts is also provided in the study. A Health Risk Assessment (HRA) of Diesel Emissions was also completed by Meridian Consultants, LLC in July 2017 and is included as Appendix B. The HRA assesses potential health risk impacts on future residents at the project site from exposure to diesel emissions generated by vehicles on U.S. 101. The AERMOD dispersion model was used to determine concentrations of diesel particulate matter (DPM) on the project site generated on U.S. 101 located approximately 1,000 feet to the south of the project site. The following discussion of air quality setting and impacts is based on the assessment and findings included in the Air Quality Study and HRA.

Federal and State standards have been established for ozone, carbon monoxide (CO), nitrogen dioxide (NO_2), sulfur dioxide (SO_2), lead, and particulates less than 10 microns in diameter (PM_{10}) and less than 2.5 microns in diameter ($PM_{2.5}$). California has also set standards for sulfates, hydrogen sulfide, vinyl

chloride, and visibility reducing particles. Local air pollution control districts are required to monitor air pollutant levels to ensure that air quality standards are met and, if they are not met, to develop strategies to meet the standards.

The project site is located in the County of Ventura, adjacent to the City of Oxnard, in the South Central Coast Air Basin (SCCAB). The South Central Coast Air Basin comprises Ventura County, Santa Barbara County, and San Luis Obispo County. The project site is also located in the Ventura County Air Pollution Control District (VCAPCD) boundaries. Air basins in which air pollutant standards are exceeded are referred to as "non-attainment areas." Ventura County is a non-attainment area for federal eight-hour ozone standard. The County is as also a non-attainment area for the State one-hour and eight-hour ozone standards (Final 2016 Ventura County Air Quality Management Plan [2016 AQMP], 2017).

Ventura County Air Pollution Control District is responsible for comprehensive air pollution control in the SCCAB including reducing emissions from stationary, area, and mobile sources. The Ventura County Air Pollution Control Board adopted the 2016 AQMP on February 14, 2017. The 2016 AQMP presents the County's strategy to attain the 2008 federal eight-hour ozone standard by 2020, as required by the federal Clean Air Act Amendments of 1990 and applicable U.S. EPA clean air regulations. Table 1 includes the current federal and State air quality standards and the attainment status of pollutants.

Table 1 Federal and State Ambient Air Quality Standards

Pollutant	Averaging Time	Federal Primary Standards	Federal Attainment (Y/N)	California Standard	State Attainment (Y/N)
Ozone	8-Hour	0.070 ppm	N	0.070 ppm	N
	1-Hour	-	-	0.09 ppm	N
Carbon Monoxide	8-Hour	9.0 ppm	Y	9.0 ppm	Y
	1-Hour	35.0 ppm	Y	20.0 ppm	Y
Nitrogen Dioxide	Annual	0.053 ppm	Y	0.030 ppm	Y
	1-Hour	0.100 ppm	Y	0.18 ppm	Y
Sulfur Dioxide	Annual	–	–	–	–
	24-Hour	–	–	0.04 ppm	Y
	1-Hour	0.075 ppm	Y	0.25 ppm	Y
PM_{10}	Annual	–	–	20 $\mu g/m^3$	N
	24-Hour	150 $\mu g/m^3$	Y	50 $\mu g/m^3$	N
$PM_{2.5}$	Annual	12 $\mu g/m^3$	Y	12 $\mu g/m^3$	Y
	24-Hour	35 $\mu g/m^3$	Y	–	–
Lead	30-Day Average	–	–	1.5 $\mu g/m^3$	Y
	3-Month Average	0.15 $\mu g/m^3$	Y	–	–

Notes: Y = yes, N = no, ppm = parts per million, $\mu g/m^3$ = micrograms per cubic meter
Source: CARB 2017a and VCAPCD 2017

Ambient Air Quality

To identify ambient concentrations of criteria pollutants, VCAPCD operates eight air quality monitoring stations throughout the County. The monitoring station located closest to the project site and most representative of air quality within the City of Oxnard is the El Rio monitoring station, which is located on the campus of Rio Mesa High School at 545 Central Avenue, approximately 1.75 miles to the north of

the project site. Table 2 summarizes the annual air quality data over the past three years of available data for the local airshed (data from 2018 is not yet available).

Table 2 Ambient Air Quality Data at the El Rio Monitoring Station

Pollutant	2015	2016	2017
Ozone, 8-Hour, ppm			
Number of days of State exceedances (> 0.09 ppm)	0	1	1
Number of days of Federal exceedances (> 0.075 ppm)	0	1	1
Nitrogen Dioxide, ppm – Worst Hour			
Number of days of State exceedances (> 0.18 ppm)	0	0	0
Particulate Matter, < 10 microns, µg/m^3			
Number of samples of State exceedances (> 50 µg/m^3)	6	14	29
Number of samples of federal exceedances (> 150 µg/m^3)	0	0	1
Particulate Matter, < 2.5 microns, µg/m^3			
Number of samples of federal exceedances (> 35 µg/m^3)	0	0	4

Notes: ppm = parts per million, µg/m^3 = micrograms per cubic meter
Source: CARB 2017b

1. According to the Ventura County Air Quality Assessment Guidelines (VCAPCD 2003), a project must conform to the local general plan and must not result in or contribute to an exceedance of the County's projected population growth forecast in order to be consistent with the AQMP. According to the California Department of Finance (DOF) population and housing estimates, the City had a total population of 209,879 people and an average household size of 3.97 persons in January 2019. Using the average household size, the 167 proposed condominiums included in the project would accommodate approximately 663 people. This would result in a total population of 210,542 people in the City upon project implementation. VCAPCD's AQMP considers regional population forecasts developed by the Southern California Association of Governments (SCAG). SCAG's 2016–2040 Regional Transportation Plan/Sustainable Communities Strategy growth forecast projects a population of 237,300 people in the City in the year 2040. The total population in the City with implementation of the project is within SCAG's most recent growth projections for the City. As such, the growth forecast is also within the population growth parameters considered in the AQMP, which is updated by the VCAPCD to manage air emissions in the County of Ventura in accordance with local, State, and federal standards. Therefore, development of the project would not obstruct implementation of the AQMP or attainment of State or federal air quality standards resulting in a less than significant impact.

2. Construction emissions would be temporary in nature and would occur within the project area. The primary source of reactive organic gases (ROG), nitrogen oxides (NO_X), CO, and sulfur oxides (SOX) emissions is from internal combustion of construction equipment exhaust and on-road haul-truck trips, while the majority of particulate matter emissions would occur as a result of fugitive dust emissions generated during grading and excavation activities. Primary sources of PM_{10} and $PM_{2.5}$ emissions would be clearing activities, excavation and grading operations, construction vehicle traffic on unpaved ground, and wind blowing over exposed earth surfaces. As detailed in the Air Quality Study for the project, VCAPCD's Air Quality Assessment Guidelines recommend significance

thresholds for projects proposed in Ventura County. Under these guidelines, projects that generate more than 25 pounds per day (lb/day) of ROG or NO_X are considered to individually and cumulatively jeopardize attainment of the federal ozone standard and thus have a significant adverse impact on air quality. However, VCAPCD's 25 lb/day threshold for ROG and NO_X do not apply to construction emissions because construction emissions are not permanent. Nevertheless, for construction impacts, the VCAPCD recommends imposition of mitigation if emissions of either pollutant exceed 25 lb/day. The VCAPCD requires minimizing fugitive dust through various dust control measures as documented in Rule 55.

As detailed in the Air Quality Study, project construction would generate up to 80.2 lb/day of ROG and 130.2 lb/day of NO_X. The Air Quality Study assumed development of 182 dwelling units, 15,100 square feet of office space, and 463 parking spaces on the project site. The updated project, as proposed, would result in 15 fewer dwelling units and 32 fewer parking spaces than anticipated in the Air Quality Study. Therefore, the emissions estimates therein are considered a conservative estimate for the project as proposed. The project would be required to implement all applicable standard VCAPCD emissions control measures including dust control measures, such as watering graded areas, covering trucks hauling excavated soil, soil stabilization methods, and street sweeping; and construction equipment controls, such as minimizing idle time, maintaining equipment engines, using alternatively fueled equipment, and minimizing the number of pieces of equipment operated simultaneously. Additionally, all construction activities would be required to adhere to the VCAPCD Rule 50 for Opacity, Rule 51 for Nuisance, and Rule 55 for Fugitive Dust. Compliance with these measures would result in less than significant impacts to air quality associated with project construction emissions.

As detailed in the Air Quality Study, operational emissions associated with the project would be generated by both stationary and mobile sources as a result of normal day-to-day use of the proposed residential units and office facilities. Stationary emissions would be generated by the consumption of natural gas for space and water heating equipment. Mobile emissions would be generated by vehicles traveling to and from the project site. Project-generated operational emissions were estimated based on the proposed land use assumptions and vehicle emissions factors using the California Emissions Estimator Model (CalEEMod). According to the CalEEMod data output for the project (included in Appendix A of the Air Quality Study), project operations would generate up to 12.4 lb/day of ROG and 6.8 lb/day of NO_X. As discussed above, these emissions estimates are conservative as the project would result in development of fewer dwelling units and parking spaces than development assumed in the Air Quality Study for the project. Furthermore, these emissions would not exceed the VCAPCD significance thresholds of 25 lb/day. Therefore, impacts to air quality associated with new stationary sources of emissions and increased vehicle trips in the area as a result of the project would be less than significant.

3. The SCCAB is currently a nonattainment area for both the federal and State standards for ozone and the State standard for PM_{10}. With regard to determining the significance of the project's contribution to air quality violations, the VCAPCD neither recommends quantified analyses of cumulative operational emissions nor provides methodologies or threshold of significance to be used to assess cumulative construction or operational impacts. Instead, the VCAPCD recommends

that a project's contribution to cumulative impacts should be assessed utilizing the same significance criteria as those for project specific impacts. Therefore, if implementation of the project would generate operational emissions that exceed the VCAPCD-recommended daily thresholds for project-specific impacts, then the project would also cause a cumulatively considerable increase in emissions for those pollutants for which SCCAB is in nonattainment. As previously discussed, operational daily emissions associated with the project would not exceed VCAPCD significance thresholds. Therefore, cumulative impacts to air quality would be less than significant.

4. Neither the State of California nor the VCAPCD has developed a quantitative threshold for the purposes of evaluating the health impacts on residential developments from exposure to Toxic Air Contaminants (TAC) emissions associated with a nearby freeway or high-volume roadway. However, in absence of a threshold specific to assessing health impacts from a freeway, the State's significant risk for exposures to carcinogens thresholds of 10 per one million for cancer risk and 1 for hazard index (HI) were determined to be the most appropriate thresholds for use in this HRA analysis for the project. The analysis in the HRA found that the maximum cancer risk at the project site from DPM emissions generated by diesel-vehicle travel along U.S. 101 is 1.06 per 100,000 or 10.6 per one million, exceeding the State significance criteria. Additionally, the maximum non-cancer HI for the project's residents would be 0.18, which would not exceed the State significance criteria.

   Project construction would result in short-term emissions of diesel particulate matter (DPM), which consists of exhaust $PM_{2.5}$ and PM_{10} and is a TAC. The project would be required to comply with the CARB Airborne Toxic Control Measures' anti-idling measure, which limits idling to no more than five minutes at any location for diesel-fueled commercial vehicles, as well as the required and applicable Best Available Control Technology and the In-Use Off-Road Diesel Vehicle Regulation to avoid and/or reduce emissions of DPM associated with project construction to the maximum extent possible.

   During long-term project operations, TACs could be emitted as part of periodic maintenance operations, cleaning, and painting, and from periodic delivery trucks and service vehicles onsite. However, these uses are expected to be occasional and result in minimal exposure to on- and off-site sensitive receptors. Given that the project consists of residential and office uses, the project would not include sources of substantive TAC emissions identified by the VCAPCD- or CARB-siting recommendations.

   Therefore, with implementation of the required CARB DPM control measures and minimal sources of TAC emissions associated with project operations, the project would not expose sensitive receptors to pollutant concentrations exceeding state or federal standards or in excess of applicable health risk criteria for TACs and would not exacerbate existing environmental conditions associated with DPM emissions at the site from U.S. 101. Impacts would be less than significant.

5. Land uses likely to produce objectionable odors include agriculture, chemical plants, composting operations, dairies, fiberglass molding, landfills, refineries, rendering plants, rail yards, and wastewater treatment plants. The project would not involve development or operation of any of these types of uses. Potential activities that may emit odors during project construction activities include the use of architectural coatings and solvents and the combustion of diesel fuel in on- and

off-road equipment. VCAPCD Rule 74.2 would limit the amount of ROGs in architectural coatings and solvents. In addition, project construction activities would be required comply with the applicable provisions of the CARB Air Toxics Control Measure regarding idling limitations for diesel trucks. Through mandatory compliance with VCAPCD rules and CARB idling limitation, construction activities would not create objectionable odors affecting a substantial number of people. This impact would be less than significant.

Cumulative Impact Analysis: The project's contribution to cumulative impacts to air quality is evaluated under issue 3. As previously discussed, air pollutant emissions would be generated by the consumption of natural gas for space and water heating equipment and by vehicles traveling to and from the project site. These emissions would not exceed the VCAPCD significance thresholds of 25 lb/day at the project level and, therefore, were determined to result in a less than significant cumulative impact to air quality.

IV. BIOLOGICAL RESOURCES	Potentially Significant Impact	Less Than Significant Impact with Mitigation Incorporated	Less Than Significant Impact	No Impact
1. Would the project have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special-status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Wildlife or U.S. Fish and Wildlife Service?	☐	■	☐	☐
2. Would the project have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, or regulations adopted by the California Department of Wildlife and Wildlife or U.S. Fish and Wildlife Service?	☐	☐	☐	■
3. Would the project have a substantial adverse effect on federally protected waters of the U.S. as defined by Section 404 of the federal Clean Water Act or protected waters of the state as defined by Section 1600 et seq. of the California Fish and Game Code (including, but not limited to, marshes, vernal pools, and coastal wetlands) through direct removal, filling, hydrological interruption, or other means?	☐	☐	☐	■
4. Would the project interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?	☐	☐	■	☐
5. Would the project conflict with any local policies or ordinances protecting biological resources?	☐	■	☐	☐

6. Would the project conflict with an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan?	☐	☐	☐	■

The project site is located in a commercial and urban area dominated by ornamental and ruderal vegetation communities. There are no areas with strictly native vegetation and no drainages or waterways are present on the site. The elevation of the site is approximately 90 feet above mean sea level. The entire property had been previously graded and the terrain is flat.

A Biological Assessment Report (BA) was prepared for the project by BioResource Consultants, Inc. in July 2017 and is included as Appendix C. The BA document describes the existing conditions of biological resources on the project site and provides an analysis of biological resources, including the potential occurrence of special-status species and their habitats, on the site.

1. A large portion of the project site is paved and built out with buildings from the former El Rio Elementary School campus. Vegetation on the site consists mainly of ruderal fields. Ornamental shrubs border most fence lines, buildings, and parking lots on the developed portion of the site. The remainder of the site is also bordered by ornamental trees and shrubs. There are three Heritage trees, as defined by the Ventura County Tree Protection Ordinance, in the more central areas of the site. Heritage trees can be a tree of any species that is 90 inches in circumference for a single trunk. Heritage trees on the project area include a single coast live oak (*Quercus agrifolia*) and two velvet ash (*Fraxinus velutina*). All three of these trees are native and provide nesting habitat for birds. During a site visit for the BA, northern mockingbird (*Mimus polyglottos*) fledglings as well as many other adult birds were observed foraging in two of the Heritage trees. Throughout the area of the site with existing school buildings, house sparrows (*Passer domesticus*) were observed nesting. These birds are not protected by the Migratory Bird Act and commonly harass native birds and take over their active nests. Additionally, an inactive American crow (*Corvus brachyrhynchos*) nest was observed in the larger Heritage velvet ash tree. Courting behavior was observed in the field by Anna's hummingbirds (*Calypte anna*) and Cassin's kingbirds (*Tyrannus vociferans*). Although nesting habitat occurs where tall, dense vegetation occurs on the property, high disturbance in this urban area and disconnect of this property from any wildlife corridors results in low likelihood that a special-status bird would be nesting in marginal habitat on site. Nesting raptors could occur adjacent to the property in eucalyptus trees along Rio School Lane on the northeast border.

   The Federal Migratory Bird Treaty Act (MBTA) and the California Fish and Game Code (FGC; §§ 3503, 3503.5, 3511, 3513, and 3800) protect most native birds. In addition, the federal and state endangered species acts protect some bird species listed as threatened or endangered. FGC § 3513 relies on the MBTA by prohibiting any take or possession of birds that are designated by the MBTA as migratory nongame birds, except as allowed by federal rules and regulations promulgated pursuant to the MBTA. In addition, FGC (§§ 3503, 3503.5, 3511, and 3800) further protects nesting birds, including passerine birds, raptors, and state "fully protected" birds. These regulations generally apply during the breeding season, because unlike adult birds, eggs and chicks are unable

to escape impacts. FGC § 3503.5 protects birds of prey, and their nests and eggs against take, possession, or destruction.

According to the BA, the project site is not located within any United States Fish and Wildlife Service (USFWS)-designated critical habitat. A review of the California Natural Diversity Database (CNDDB) and other existing records within the vicinity of the site showed 116 species having previously been reported in the area. Of these 116 species, two species, Davidson's saltscale (*Atriplex serenana var. davidsonii*) and Monarch butterflies (*Danaus plexippus* pop. 1), have marginal habitat on the project site. However, due to the high level of disturbance and existing development, these species are unlikely to occur onsite. Therefore, the project would not have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Wildlife or USFWS, because no listed species are expected to occur at the project site. Additionally, Heritage trees onsite would be required to be protected in compliance with 2030 General Plan Policy ER-10.2, which is intended to protect certain significant trees on private and public property through replacement or transplantation, as well as the City's Landscape Standards general requirements for the preservation of existing trees. Nevertheless, construction of the project could result in potential impacts to raptors and protected nesting birds located in Heritage trees on the site and in trees near the northeaster boundary of the site. Compliance with mitigation measure BIO-1 would ensure impacts are less than significant.

Mitigation Measure

The following mitigation measures would reduce impacts to a less than significant level.

BIO-1 Nesting Bird and Raptor Survey and Avoidance. In the event that the proposed action is planned to occur within the general bird nesting season, a pre-construction nesting bird survey shall be conducted by a qualified biologist. The nesting season is generally considered February 1 through August 31, with a peak from March to June; however, these dates vary by year depending on prey availability, weather, and other factors. In the event an active bird is observed in the habitats to be removed or in other habitats within 100 feet for songbirds and 500 feet for raptors of the construction work areas, all construction work in the suitable habitat or within 100 feet/500 feet of the suitable habitat must be delayed until after September 1st, or surveys must be continued in order to locate any nests. If an active nest is found, clearing and construction within 100 feet/500 feet of the nest shall be postponed until the nest is vacated and juveniles have fledged, and until there is no evidence of a second attempt at nesting. Limits of construction to avoid a nest site shall be established in the field with flagging and stakes or construction fencing. Construction personnel shall be instructed on the ecological sensitivity of the area.

2. A large portion of the project site is paved and built out with buildings from the former El Rio Elementary School campus, and the entire property had been previously graded and the terrain is flat. Riparian vegetation or other sensitive natural community types do not occur on the project site or within the project vicinity. There are no sensitive natural communities identified in plans,

regulations, or by regulatory agencies within the project site. The proposed project would have no impact to riparian habitat or other sensitive natural communities.

3. According to the USFWS National Wetlands Inventory Wetlands Mapper database, no wetlands or other surface waters exist on the project site. Therefore, the project would not result in any impacts to State or federally protected waters.

4. The project site would not be expected to support wildlife movement due to the disturbed nature of the project site, adjacent urban development, and disconnect from any wildlife corridors. Additionally, the project would be required to comply with the provisions of the MBTA to avoid potential impacts to migratory birds. Therefore, the project would result in less than significant impacts associated with wildlife migration and use of nursery sites.

5. As previously discussed, the project would be required to ensure that on-site Heritage tree protection occurs in compliance with the requirements of the 2030 General Plan Policy ER-10.2 and the City's Landscape Standards. Therefore, with implementation of the requirements of the Tree Protection Ordinance, the project would result in a less than significant impact associated with conflicts with local policies or ordinances protecting biological resources.

6. According to the Environmental Impact Report for the City of Oxnard 2030 General Plan (2009), no established or planned Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan exists in the City Planning Area, which includes the project site. Therefore, the project would not result in any impact associated with conflict with the provisions of such plan.

Cumulative Impact Analysis: Impacts to biological resources in the Planning Area were analyzed by the 2030 General Plan EIR at a programmatic level, including all development facilitated by the 2030 General Plan, and found to be less than significant with implementation of uniformly applied development policies and regulations. The proposed project would have less than significant impacts with respect to biological resources and would be subject to the City's uniformly applied development policies and regulations. Therefore, the project would not contribute to or result in significant cumulative impacts to biological resources.

V. Climate Change and Greenhouse Gas Emissions	Potentially Significant Impact	Less Than Significant Impact with Mitigation Incorporated	Less Than Significant Impact	No Impact
1. Would the project generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?	☐	☐	■	☐
2. Would the project conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases or otherwise conflict with the state goal or reducing greenhouse gas emissions in California?	☐	☐	■	☐
3. Would the project contribute or be subject to potential secondary effects of climate change (e.g., sea level rise, increase fire hazard)?	☐	☐	■	☐

A Climate Change and Greenhouse Gas (GHG) Study was prepared for the project by Meridian Consultants, LLC. in August 2017 and is included as Appendix D. The GHG Study assesses and discusses the potential GHG impacts that may occur with implementation of the project. The analysis in the GHG Study estimates future emission levels at surrounding land uses resulting from construction and operation of the project, and identifies the potential impacts. The findings of the GHG Study are summarized in this section.

Setting

The accumulation of GHGs in the atmosphere regulates the earth's temperature. Without the natural heat trapping effect of GHGs, Earth's surface would be about 34 degrees Celsius (°C) cooler (CalEPA 2006). However, emissions from human activities, particularly the consumption of fossil fuels for electricity production and transportation, have elevated the concentration of these gases in the atmosphere beyond the level of naturally occurring concentrations. Carbon dioxide (CO_2), methane (CH_4), and nitrous oxide (N_2O) are the GHGs that are emitted in the greatest quantities from human activities. Emissions of CO_2 are largely by-products of fossil fuel combustion. CH_4 results from fossil fuel combustion as well as off-gassing associated with agricultural practices and landfills. N_2O is produced by microbial processes in soil and water, including those reactions that occur in fertilizers that contain nitrogen, fossil fuel combustion, and other chemical processes.

Scientific modeling predicts that continued GHG emissions at or above current rates would induce more extreme climate changes during the 21st century than were observed during the 20th century. According to the CalEPA 2010 Climate Action Team Biennial Report, potential impacts of climate change

in California may include loss in snow pack, sea level rise, more extreme heat days per year, more high ozone days, more large forest fires, and more drought years (CalEPA 2010). While these potential impacts identify the possible effects of climate change at a global and potentially statewide level, current scientific modeling tools are generally unable to predict what impacts would occur locally with a similar degree of accuracy.

In response to an increase in man-made GHG concentrations over the past 150 years, California has implemented Assembly Bill (AB) 32, the "California Global Warming Solutions Act of 2006." AB 32 codifies the statewide goal of reducing GHG emissions to 1990 levels by 2020 (essentially a 15 percent reduction below 2005 emission levels), and requires CARB to prepare a Scoping Plan that outlines the main State strategies for reducing GHGs to meet the 2020 deadline. In addition, AB 32 requires CARB to adopt regulations to require reporting and verification of statewide GHG emissions.

After completing a comprehensive review and update process, CARB approved a 1990 statewide GHG level and 2020 limit of 427 million metric tons of CO_2 equivalents (MMT CO_2e). The Scoping Plan was approved by CARB on December 11, 2008, and includes GHG emission reduction strategies related to energy efficiency, water use, and recycling and solid waste, among other measures. The Scoping Plan includes a range of GHG reduction actions that may include direct regulations, alternative compliance mechanisms, monetary and non-monetary incentives, voluntary actions, and market-based mechanisms.

In May 2014, CARB approved the 2013 Scoping Plan, the first update to the AB 32 Scoping Plan. The 2013 Scoping Plan defines CARB's climate change priorities for the next five years and sets the groundwork to reach post-2020 goals set forth in Executive Order (EO) S-3-05. The update highlights California's progress toward meeting the "near-term" 2020 GHG emission reduction goals defined in the original Scoping Plan. It also illustrates how to align the State's longer-term GHG reduction strategies with other State policy priorities, such as for water, waste, natural resources, clean energy and transportation, and land use (CARB 2014).

Senate Bill (SB) 97, signed in August 2007, acknowledges that climate change is an environmental issue that requires analysis in CEQA documents. In March 2010, the California Resources Agency (Resources Agency) adopted amendments to the CEQA Guidelines for the feasible mitigation of GHG emissions or the effects of GHG emissions. The adopted guidelines give lead agencies the discretion to set quantitative or qualitative thresholds for the assessment and mitigation of GHGs and climate change impacts.

On September 8, 2016, the governor signed SB 32 into law, extending AB 32 by requiring the State to further reduce GHGs to 40 percent below 1990 levels by 2030 (the other provisions of AB 32 remain unchanged). On December 14, 2017, CARB adopted the 2017 Scoping Plan, which provides a framework for achieving the 2030 target. As with the 2013 Scoping Plan, the 2017 Scoping Plan does not provide project-level thresholds for land use development. Instead, it recommends that local governments adopt policies and locally-appropriate quantitative thresholds consistent with a statewide per capita goal of six metric tons (MT) CO_2e by 2030 and two MT CO_2e by 2050 (CARB 2017c).

For more information on the Senate and Assembly Bills, Executive Orders, and reports discussed above, and to view reports and research referenced above, please refer to the following websites: www.climatechange.ca.gov and www.arb.ca.gov/cc/cc.htm.

1. According to the GHG Study for the project, CARB, VCAPCD, and the City of Oxnard have not adopted a numerical GHG significance threshold for land use development projects (e.g., residential/commercial projects). Ventura County is adjacent to the South Coast Air Quality Management District (SCAQMD) jurisdiction and is part of the Southern California Association of Governments (SCAG) region. Given the lack of an adopted VCAPCD numerical significance threshold applicable to this project, the significance of the project is evaluated based on the proposed screening level of 3,000 MT CO_2e per year established by the adjacent SCAQMD. The GHG Study for the project found that the total project construction emissions would be approximately 713.5 MT CO_2e per year and construction emissions amortized over 30 years would be approximately 23.8 MT CO_2e per year. The GHG Study also found that the GHG emissions associated with the project operations would result in 2,184.7 MT CO_2e per year. The GHG Study assumed development of 182 dwelling units, 15,100 square feet of office space, and 463 parking spaces on the project site. The updated project, as proposed, would result in 15 fewer dwelling units and 32 fewer parking spaces than anticipated in the GHG Study. Therefore, the emissions estimates therein are considered a conservative estimate for the proposed project. GHG emissions associated with project construction and operations would not exceed the screening threshold of 3,000 MT CO_2e per year and impacts would be less than significant.

2,3. The California Air Pollution Control Officers Association (CAPCOA) suggests making significance determinations on a case-by-case basis when no significance threshold have been formally adopted by a lead agency. This includes evaluating a project's sources of GHG emissions and considering project consistency with applicable emission reduction strategies and goals. As detailed in the GHG Study, the project would be consistent with the policies identified in the City's 2030 General Plan for addressing energy issues of climate change mitigation and adaptation, sea level rise, and energy conservation and generation by incorporating solar panels and implementing features consistent with the latest requirements of the 2016 California Green Building Code. Additionally, as detailed in Table 7 of the GHG Study, the project would be consistent with recommendations presented in the California Climate Action Team Report and the project's post-2020 GHG emissions trajectory is expected to follow a declining trend, consistent with the State's 2030 and 2050 targets. Furthermore, the GHG Study determines that the project would be consistent with the goals of AB 32. The Project would incorporate energy reduction and water conservation measures, identified in the City's 2030 General Plan, that reduce GHG emissions compared to a conventional project of similar size and scope. Additionally, GHG emissions reductions would be achieved through energy-efficient lighting, installation of low-flow appliances, and water conservation.

   In summary, the project would not conflict with any applicable plan, policy or regulation adopted for the purpose of reducing the emissions of GHGs or otherwise conflict with the state goal or reducing GHGs in California. The GHG reduction strategies incorporated into the project would ensure that the project would not contribute to or be subject to potential secondary effects of climate change. Impacts would be less than significant.

Cumulative Impact Analysis: Development facilitated by the 2030 General Plan would increase overall GHG emissions generated within the City. Analyses of GHG emissions and climate change are cumulative in nature, as they affect the accumulation of GHGs in the atmosphere. Projects that exceed the

thresholds discussed above would have a significant impact on GHG emissions and climate change, both individually and cumulatively. As indicated in issue 1, GHG emissions associated with the project would be less than significant. As a result, the project's contribution to cumulative levels of GHGs would not be cumulatively considerable and cumulative impacts to climate change would be less than significant.

VI. CULTURAL AND TRIBAL CULTURAL RESOURCES	Potentially Significant Impact	Less Than Significant Impact with Mitigation Incorporated	Less Than Significant Impact	No Impact
1. Would the project cause a substantial adverse change in the significance of an historical resource as defined in CEQA Guidelines Section 15064.5?	☐	☐	■	☐
2. Would the project cause a substantial adverse change in the significance of a unique archaeological resource pursuant to State CEQA Guidelines Section 15064.5?	☐	■	☐	☐
3. Would the project directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?	☐	☐	■	☐
4. Would the project disturb any human remains, including those interred outside of formal cemeteries?	☐	■	☐	☐

A Phase I Cultural Resource Assessment (Phase I) report was prepared by Applied Earthworks, Inc. in August 2017 and is included in Appendix E. The assessment consisted of records searches, Native American coordination, a Phase I survey, and documentation and evaluation of the project site, formerly the El Rio Elementary School campus, to identify any cultural resources present. A Paleontological Resource Assessment technical memorandum (memo) was also prepared by Applied Earthworks, Inc. in August 2017 for the site and is also included in Appendix E. The assessment consisted of a museum records search, a literature and geologic map review, and preparation of the memo, to identify any paleontological resources present on the project site.

1. Generally, a cultural resource is considered historically significant if it is 45 years old or older, meets the requirements for listing on the California Register of Historic Resources (CRHR) under any one of the criteria defined in 14 CCR Section 15064.5, and possesses integrity of location, design, setting, materials, workmanship, feeling, and association. According to the Phase I for the project, one potentially historical cultural resource, the former El Rio Elementary School campus, was identified and documented on the project site. However, based on an evaluation of the school site in the Phase I, the El Rio Elementary School campus meets none of the CRHR significance criteria and is not considered a historical resource under CEQA. Therefore, the project would result in less than significant impacts to historical resources because no historic resources are present on the project site.

2, 4. The intensive pedestrian survey conducted for the Phase I failed to identify any prehistoric or historic archaeological resources on the project site. The records search for the Phase I indicated that an isolated, partial prehistoric Native American burial was uncovered while excavating for a storm drain adjacent to Vineyard Avenue less than a quarter mile from the project site. Therefore, there is potential to encounter subsurface cultural deposits during project construction activities and grading and impacts to such resources would be potentially significant. In the event of discovery or recognition of any human remains in any location other than a dedicated cemetery, there shall be no further excavation or disturbance of the site or any nearby area reasonable suspected to overlie adjacent remains until the Ventura County Coroner has determined whether or not the remains are subject to the Coroner's authority, pursuant to Section 7050.5 of the California Health and Safety Code. If the human remains are of Native American origin, the Coroner must notify the NAHC within 24 hours of identification. The NAHC will identify a Native American Most Likely Descendant (MLD) to inspect the site and provide recommendations for the proper treatment of the remains and associated grave goods. Under certain circumstances, as stipulated by CEQA Guidelines Section 15064.5, the lead agency or applicant must develop an agreement with the Native Americans for the treatment and disposition of the remains. Additionally, compliance with mitigation measure CUL-2 would be required to ensure impacts are less than significant.

Mitigation Measure

The following mitigation measure would reduce impacts to a less than significant level.

CUL-2 A qualified archaeologist shall monitor all project-related ground-disturbing activities. In the unlikely event that potentially significant archaeological materials are encountered during construction, the applicant must comply with State regulations and City's standard condition of approval for handling such resources.

3. Based on the literature review and museum records search results for the Paleontological Resource Assessment for the project, the paleontological sensitivity of the site was determined in accordance with the Society of Vertebrate Paleontology (SVP; 2010) sensitivity scale. The Quaternary alluvium mapped at the surface of the project site was determined to have a low paleontological resource potential because the deposits are likely too young to contain fossilized material. Project-related ground disturbing activities would primarily disturb surface deposits and, therefore, would not result in impacts to paleontological resources. This impact would be less than significant.

Cumulative Impact Analysis: Impacts to cultural resources in the Planning Area were analyzed by the 2030 General Plan EIR at a programmatic level, including all development facilitated by the 2030 General Plan, and found to be less than significant with implementation of the City's resource protection policies and regulations. With implementation of mitigation measure CUL-2, the project would have less than significant impacts with respect to cultural resources and tribal cultural resources and would be subject to the City's uniformly applied resource protection policies and regulations. Therefore, the project would not contribute to or result in significant cumulative impacts to cultural resources or tribal cultural resources.

VII. GEOLOGY AND SOILS	Potentially Significant Impact	Less Than Significant Impact with Mitigation Incorporated	Less Than Significant Impact	No Impact
1. Would the project expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving:				
a. Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist or based on other substantial evidence of a known fault?	☐	☐	☐	■
b. Strong seismic groundshaking that cannot be addressed through compliance with standard Code requirements?	☐	☐	■	☐
2. Would the project be located on a geologic unit or soil that is unstable or that would become unstable as a result of the project and potentially result in an on-site or off-site landslide, lateral spreading, subsidence, liquefaction, or collapse that cannot be addressed through compliance with standard Code requirements?	☐	☐	■	☐
3. Would the project be located on expansive soil, creating substantial risks to life or property that cannot be addressed through compliance with standard Code requirements?	☐	☐	■	☐
4. Would the project expose people or structures to inundation by seiche or tsunami?	☐	☐	☐	■
5. Would the project rely on dredging or other maintenance activity by another agency that is not guaranteed to continue?	☐	☐	☐	■

1a. The Alquist-Priolo Earthquake Fault Zoning Act (1972) requires the delineation of zones along active faults in California in order to regulate development on or near active fault traces to reduce the hazards associated with fault rupture and to prohibit the location of most structures for human occupancy across these traces. According to the City of Oxnard General Plan Background Report (2006), the General Plan Area, including the project site, is not located within an Alquist-Priolo zone. Therefore, the project would not expose people or structures to potential substantial adverse effects involving the rupture of a known Alquist-Priolo earthquake fault. There would be no impact.

1b.-3. The project site is located in a highly active earthquake region of Southern California and thus is subject to various seismic and geologic hazards, including ground shaking, landslide, lateral spreading, subsidence, liquefaction, or collapse. Seismically induced hazards cover a wide area and are greatly influenced by the distance of a site to the seismic source, soil conditions, and depth to groundwater. As with any location in Southern California, in the event of a strong earthquake (magnitude 6.0 to 7.5) originating near the site or a major earthquake (8.0 magnitude) along the San Andreas Fault, damage to onsite structures associated with these hazards could be severe and loss of life could occur.

According to the City of Oxnard General Plan Background Report (2006), there are no known earthquake faults in the City area. However, active and/or potentially active faults are present in the surrounding region, and some of these may extend into the subsurface beneath the General Plan Planning Area that generally extends from Point Mugu to Wells Road.

As part of the Community Development standard permitting procedure and uniformly applied development conditions, the project applicant and/or their contractors shall submit a site-specific soils investigation prepared by a licensed geotechnical engineer. At a minimum, the study shall include liquefaction and compressible soils characteristics on-site and shall identify any necessary construction techniques or other mitigation measures to prevent significant liquefaction/compressible soils impacts on the proposed project. All recommendations of the report shall be incorporated into the project as conditions of approval. The report shall be submitted concurrently with plans submitted for review by the Building Official. Additionally, the project would be required to comply with local policies and state regulations regarding building standards, hazard mitigation and seismic safety that would minimize risk and exposure to adverse effects of seismic events. Therefore, with compliance with local and State standards and the application of uniformly applied development conditions and standards, the project would have a less than significant impact associated with hazards of existing geological and soil conditions.

3. Expansive soils are generally clayey causing them to swell when wetted and shrink when dried. Wetting can occur naturally in a number of ways (e.g., absorption from the air, rainfall, groundwater fluctuations, lawn watering, and broken water or sewer lines). In hillside areas, as expansive soils expand and contract, gradual downslope creep may occur, eventually causing landslides. Clay soils also retain water and may act as lubricated slippage planes between other soil/rock strata, also producing landslides, often during earthquakes or when caused by unusually moist conditions.

Expansive soils are also often prone to erosion. Foundations of structures placed on expansive soils may rise during the wet season and fall during the succeeding dry season. Expansive soils can act as

a lubricant when between differing soil/rock strata, which can facilitate movement triggered during heavy rains or earthquakes. According to the County of Ventura Expansive Soils Map, the project site is located in a low expansive soil potential area of Oxnard (Ventura County Resource Management Agency 2010). According to Figure 5-12 of the City of Oxnard General Plan Background Report (2006), the project site is located in an area of low susceptibility to erosion. Therefore, the project would not create substantial risks to life or property due to expansive soils that cannot be addressed through compliance with standard Code requirements and this impact would be less than significant.

4. Seiches are seismically induced waves that occur in large bodies of water, such as lakes and reservoirs. According to the City of Oxnard General Plan Background Report (2006), the City's Channel Islands Harbor and Mandalay Bay could be potentially impacted by seiches. The project site is not in proximity to either of these areas and, therefore, new development and residents on the site would not be at risk of exposure to inundation by seiche. There would be no impact.

   A tsunami is a tidal wave produced by off-shore seismic activity. The project site is not located in a tsunami inundation area as shown on the Tsunami Inundation Map of the Oxnard Quadrangle. Therefore, new development and residents on the site would not be at risk of exposure to inundation by tsunami. There would be no impact.

5. As a typical office and residential development on previously developed, flat site, the project would not require dredging or other maintenance activity that is not guaranteed to continue. There would be no impact.

Cumulative Impact Analysis: Impacts associated with geology and soils in the City Planning Area were analyzed by the 2030 General Plan EIR and found to be less than significant after implementation of uniformly applied development policies and regulations. The project would result in less than significant impacts with regards to geology and soils on and in the vicinity of the project site and would be required to comply with the City's uniformly applied development policies and regulations. Therefore, the project would not result in or contribute to cumulative impacts associated with geology and soils.

This page intentionally left blank.

VIII. HAZARDS AND HAZARDOUS MATERIALS	Potentially Significant Impact	Less Than Significant Impact with Mitigation Incorporated	Less Than Significant Impact	No Impact
1. Would the project create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?	☐	☐	■	☐
2. Would the project create a significant hazard to the public or the environment through reasonably foreseeable upset or accident conditions involving the release of hazardous materials into the environment?	☐	☐	■	☐
3. Would the project emit hazardous substances or involve handling hazardous or acutely hazardous substances, or waste within one-quarter mile of an existing or proposed school in quantities or a manner that would create a substantial hazard?	☐	☐	☐	■
4. Would the project be located on a site that is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a substantial hazard to the public or environment?	☐	☐	■	☐
5. Would the project impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?	☐	☐	■	☐

1,2. The project would use normal and nominal amounts of hazardous materials during construction of the project as well as using household cleaners in during operation of the development with use of normal amounts of hazardous materials for maintenance of machinery used onsite, such as forklifts and trucks. No routine disposal of hazardous materials is proposed. Therefore, the project would not create a significant hazard to the public or the environment through a foreseeable upset or accident, or the routine transport, use, or disposal of hazardous materials and impacts would be less than significant.

3. The project site currently contains facilities of the former El Rio Elementary School. However, the school has not been in operation for a number of years and these facilities would be demolished as part of the project. The nearest operational school to the project site is Rio del Mar Elementary School, located at 3150 Thames River Drive, approximately one-half mile north of the project site. Therefore, the project would not emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste in one-quarter mile of an existing or proposed school, and there would be no impact.

4. In order to evaluate hazardous materials records located on the project site or adjacent to the project site, the State Water Resources Control Board GeoTracker database, and the Department of Toxic Substances Control EnviroStor database and Cortese List were reviewed in May 2018. Review of these resources indicates that the project site is not located in a site that is considered to contain hazardous materials pursuant to Government Code Section 65962.5. Two leaking underground storage tank (LUST) cleanup sites (T.W. Brown Oil Co [T0611100270] and Rio School Dist-Maintenance Yd [T0611101240]) are identified on East Vineyard Avenue, adjacent to the western boundary of the project site. However, the T.W. Brown Oil Co site has a Completed- Case Closed as of 8/29/1989 status and the Rio School Dist-Maintenance Yd site has a Completed- Case Closed as of 1/16/2001 status. Therefore, these sites would not present a substantial hazard to the public or environment and this impact would be less than significant.

5. The project would not involve the development of structures that could potentially impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan. The design of new access points would be reviewed and approved by the City of Oxnard Fire Department to ensure that emergency access meets City standards. Therefore, impacts would be less than significant.

Cumulative Impact Analysis: Impacts associated with hazards and hazardous materials in the City Planning Area were analyzed by the 2030 General Plan EIR and found to be less than significant after implementation of uniformly applied development policies and regulations. The project would result in less than significant impacts with regards to hazards and hazardous materials and would be required to comply with the City's uniformly applied development policies and regulations. Therefore, the project would not result in or contribute to cumulative impacts associated with hazards and hazardous materials.

IX. HYDROLOGY AND WATER QUALITY	Potentially Significant Impact	Less Than Significant Impact with Mitigation Incorporated	Less Than Significant Impact	No Impact
1. Would the project cause a violation of any adopted water quality standards or waste discharge requirements?	☐	☐	■	☐
2. Would the project substantially deplete groundwater supplies or interfere substantially with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table level (e.g., the production rate of pre-existing nearby wells would drop to a level that would not support existing land uses or planned uses for which permits have been granted)?	☐	■	☐	☐
3. Would the project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, in a manner that would result in on- or off-site flooding or exceed the capacity of existing or planned stormwater drainage systems?	☐	☐	■	☐
4. Would the project place new structures within a 100-year flood hazard area as mapped on a federal Flood Hazard Boundary or Flood Insurance Rate Map or other flood hazard delineation map?	☐	☐	■	☐
5. Would the project impede or redirect flood flows such that it would increase on- or off-site flood potential?	☐	☐	■	☐
6. Would the project expose people or structures to a significant risk of loss, injury or death involving flooding, including flooding as a result of the failure of a levee or dam?	☐	☐	■	☐
7. Would the project be exposed to a substantial risk related to inundation by seiche, tsunami, or mudflow?	☐	☐	☐	■

1. The Ventura County Watershed Protection District, County of Ventura, and the cities of Camarillo, Fillmore, Moorpark, Ojai, Oxnard, Port Hueneme, San Buenaventura, Santa Paula, Simi Valley, and Thousand Oaks have joined together to form the Ventura Countywide Stormwater Quality Management Program and are named as co-permittees under a revised countywide municipal NPDES permit for stormwater discharges issued by the Regional Water Quality Control Board in 2010 (Order R4-2010-0108). Under Order R4-2010-0108, the co-permittees are required to administer, implement, and enforce a Stormwater Quality Management Program to reduce pollutants in urban runoff to the maximum extent practicable. Accordingly, the project would be required by uniformly applied regulations and conditions of approval to comply with Clean Water Act National Pollutant Discharge Elimination System (NPDES) requirements. Compliance with the Oxnard building permit would require the development and implementation of a Stormwater Pollution Prevention Plan (SWPPP) and associated Best Management Practices (BMP). The BMPs would include measures that would be implemented to prevent discharge of eroded soils from the construction site and sedimentation of surface waters offsite. The BMPs would also include measures to quickly contain and clean up any minor spills or leaks of fluids from construction equipment. Given the relatively flat topography of the site, distance from surface waters, the minimal grading and excavation required for construction, and implementation of the required SWPPP, construction of the project would not violate any water quality standards or waste discharge requirements. This impact would be less than significant.

2. As with the existing school district facilities on the site, the proposed development would include a connection to the municipal water supply system to provide potable water to the residential and office uses within the project. The following paragraphs provide a brief summary of groundwater resources and their regulation in the area. More detail regarding the planning and regulation of water service, is provided below in Section XVI Utilities and Energy.

   Groundwater within the Oxnard Plain and throughout the region is under the management of the Fox Canyon Groundwater Management Agency (FCGWMA). The FCGWMA was created in 1982 by the California Legislature via the Fox Canyon Groundwater Management Agency Act [AB-2995] for the express purposes of regulating, conserving, managing, and controlling the use and extraction of groundwater to help preserve resources, and to counter seawater intrusion beneath the Oxnard Plain. The regulations of FCGWMA, which restrict groundwater withdrawals, apply to all groundwater users within its jurisdiction. These users include agricultural activities, industrial users, and municipal governments such as the City of Oxnard. The City will provide water to the proposed Rio Urbana development, and approval of the project will be subject to the provisions of the City of Oxnard Municipal Code Chapter 22: Water, as well as to the FCGWMA and other requirements. The City has a “net-zero” policy with respect to new development, which requires a proposed development to provide and transfer any necessary groundwater allocation to the City (subject to FCGMA approval) or contribute to City programs designed to offset potable water use. This policy was confirmed in a report to the City Council on October 19, 2009, and is incorporated into the City’s Urban Water Management Plan (UWMP; Oxnard 2016:Section 8.4.1), and other plans. Section XVI Utilities and Energy provides more detail regarding the provision of water service; and the key conclusion from that discussion is that the identified mitigation measures, which would implement

these existing requirements, would serve to mitigate the potential effects of the project on regional groundwater supplies.

With respect to potential localized effects on groundwater, Section 22-100 of the Oxnard Municipal Code requires that any existing water rights; groundwater pumping allocations from FCGWMA; and all wells, mains, easements and water production equipment or facilities, be assigned and transferred to the City of Oxnard. In addition, provisions of Article VII of the Municipal Code (starting at Section 22-110) regulate all well operations and require the destruction of any abandoned wells (Section 22-123). Because of these requirements, any wells that exist on the property and which may have been used in the past to serve the school facilities could not be used to serve the proposed development directly. For this reason, the project would not have any localized effects on groundwater withdrawals and would not adversely affect any other wells in the vicinity.

3. During operations of the project, surface water discharge would include minimal amounts of stormwater runoff generated during precipitation events. However, according to a letter prepared by Jensen Design & Survey, Inc. in January 2017 assessing required Ventura County Municipal Separate Storm Sewer Systems (MS4) permit compliance and on-site drainage, the project would increase stormwater flows on the project site. The MS4 compliance and drainage letter was revised on March 25, 2019, and is included in Appendix F of this Initial Study.

   Given the nearly flat topography of the site, and landscaped and open space areas incorporated into the project design, precipitation would be expected to infiltrate or evaporate onsite more so than sheet flow over land and discharge offsite at substantial rates or volumes. The project would continue to use the existing stormwater system that is connected to the city's storm sewer system and consistent with applicable development standards and permits. The project would be subject to the requirements of a Ventura County MS4 permit. Site-specific BMPs would be designed by the contractor in compliance with all applicable regulations and conditions of the MS4 permit. More specifically, stormwater runoff would be directed to multiple inlets throughout the project site that connect to the onsite drainage system. The two proposed parcels (residential and office) would have individual drainage systems, a pollutant trap and separation unit, and an infiltration basin. Low flows entering the inlets would be routed through the separation unit before entering an infiltration basin. High flows that exceed the required volume of infiltration would be routed through the infiltration basin and released to the 54-inch City storm drain located in Vineyard Avenue. According to the MS4 compliance and drainage letter prepared for the project, this drain currently possesses excess capacity that would be sufficient to accommodate increased stormwater flows as a result of the project. The project would not include any unique components that would impact stormwater runoff quality. The project would also be required to comply with all standards for a watercourse permit for potential project drainage effects on flows in the El Rio Drain, as implemented by the Ventura County Watershed Protection District, County of Ventura, and the City.

   The County standard would require that the project not increase peak flows from 10-year, 25-year, and 100-year storms in the El Rio Drain. Section 202 of County Ordinance WP-2 requires County review and permit approval for any alteration in the characteristics of flow in channels under the County jurisdiction. Evidence of County review and issuance of written permission in compliance

with County Ordinance WP-2 will be required by the City prior to final approval of the project. Appendix F contains the updated drainage memo for the project prepared by Jensen Design & Survey, Inc., dated March 25, 2019. This study describes the combination of separation structures and infiltration systems that will keep peak flows from the developed project within current values and within the capacity of downstream drainage structures, consistent with requirements of both the City and the County of Ventura. Operation of the project would not be expected to violate any water quality standards or waste discharge requirements. The project would have less than significant impacts on water quality standards and discharge requirements.

4,5. The project site is located in an area mapped by the Federal Emergency Management Agency (FEMA) as Zone X, Area of Minimal Flood Hazard. The project site is not located in a 100-year flood hazard area. Additionally, the project site is an already developed site with existing structures. Redevelopment of the site for the project would not introduce any features or components that would impede or redirect flood flows such that it would increase on- or off-site flood potential. Impacts would be less than significant.

6. According to the Safety and Hazards chapter of the City of Oxnard General Plan Background Report (2006):

   "Several dams are located at least 35 miles to the east and northeast of the city of Oxnard within Ventura and Los Angeles Counties. These include the Santa Felicia Dam at Lake Piru, the Castaic Lake Dam and the Pyramid Lake Dam. The major threat to Oxnard is upstream along the Santa Clara River corridor. Although the potential for a dam failure is considered low, should one or more of these dams fail, the entire city is located within the Dam Inundation Zone, also called Dam Failure Hazard Area. Damage to the city could be in the form of a wall of fast-moving water, mud, and debris."

   While potential failure of any of these dams could cause inundation of the City, including the project site, the Ventura County Hazard Mitigation Plan (2010) states that the probability of dam failure inundation is unknown, but would be the result of certain types of extreme storm events. The project would not exacerbate the potential for levee or dam failure and project-related impacts in relation to levee or dam failure would be less than significant.

7. Seiches are seismically induced waves that occur in large bodies of water, such as lakes and reservoirs. According to the City of Oxnard General Plan Background Report, the City's Channel Islands Harbor and Mandalay Bay could be potentially impacted by seiches. The project site is not in proximity to a large body of water. Therefore, seiches are a not a risk to the project site. No impacts would occur.

   A tsunami is a tidal wave produced by off-shore seismic activity. The project site is not located in a tsunami inundation area as shown on the Ventura County Multi-Jurisdictional Hazard Mitigation Plan Update, and would not be subject to inundation by tsunami (County of Ventura 2010). No impacts would occur.

   The project site is not located in an earthquake-induced landslide zone (California Geological Survey 2002). Landslides and mud flows are most likely to occur on or near a slope or hillside area, rather

than in generally level areas, such as the project site. Mud flows would not be a risk to the project. No impacts would occur.

Cumulative Impact Analysis: Impacts to hydrology and water quality as a result of development in the City Planning Area facilitated by the 2030 General Plan were analyzed by the 2030 General Plan EIR and found to be less than significant after implementation of uniformly applied development policies and regulations. The project would result in less than significant impacts with regards to hydrology and water quality and would be required to comply with the City's uniformly applied development policies and regulations. Therefore, the project would not result in or contribute to cumulative impacts associated with hydrology and water quality.

X. LAND USE AND PLANNING	Potentially Significant Impact	Less Than Significant Impact with Mitigation Incorporated	Less Than Significant Impact	No Impact
1. Would the project conflict with an applicable land use plan, policy or regulation of the City or other agency with jurisdiction over the project adopted for the purpose of avoiding or mitigating a significant environmental effect?	☐	☐	■	☐
2. Would the project involve land uses that are not allowed under any applicable airport land use compatibility plan?	☐	☐	☐	■
3. Would the project conflict with an applicable habitat conservation plan or natural community conservation plan?	☐	☐	☐	■
4. Would the project physically divide an established community?	☐	☐	■	☐

1. The project would involve demolition of the existing campus for the former El Rio Elementary School and the construction of 167 condominium residential units and a 15,100-square-foot office building. The project site lies within the County of Ventura's unincorporated community of El Rio, which is in the City of Oxnard's Sphere of Influence (SOI). The City currently designates the project site its former for school use. The entitlements requested by the project applicants include:

    1. Annexation to the City of Oxnard (PZ 17-610-01)
    2. Oxnard General Plan Amendment (PZ 17-620-01) to change the land use designation from School to Commercial General
    3. Pre-Zoning to C-2-PD (PZ 17-560-01)
    4. Tentative Subdivision Map that creates two parcels (Parcel 1 on 1.12 acres and Parcel 2 on 9.12 acres; PZ 17-300-03) and 167 condominium parcels
    5. Special Use Permit (PZ 17-500-13) for development of an office building on Parcel 1;
    6. Special Use Permit (PZ 17-500-05) for residential use on Parcel 2
    7. Issuance of a Density Bonus for provision of three additional units and reduction in interior yard space from 30 percent to 24 percent

    The City's Commercial General land use designation allows retail centers and free-standing commercial uses along arterials, and residential uses up to 18 dwelling units per acre and office use not to exceed a floor area ratio (FAR) of 0.35 to 1. The C-2 General Commercial zoning allows for professional and business offices, with the Planned Development (PD) designation permitting the development of multifamily residential uses in conformance with the City's 2030 General Plan. Based on the area of the parcel for the residential uses (approximately 9.12 acres), the Commercial

General land use designation would permit up to 164 dwelling units. With the approval of Density Bonus for providing 17 (10 percent of units) low and 3 moderate income deed-restricted households, the project would be permitted to construct up an additional 20% or 30 units. Only 3 additional units are requested, however, for a total of 167 residential units. One additional concession, allowed by state and local codes would reduce the interior yard space from 30 percent to 24 percent on the project site. Construction of 167 residential units and a 15,100-square-foot office building as proposed by the project both would be consistent with the City's land use designation for the site if changes from SCH to Commercial General as proposed.

The project would be designed in accordance with the City's Zoning Code development standards to ensure massing and scale compatibility with surrounding uses. The office building would be two stories and consistent with the maximum building height of 35 feet, as well as with the minimum front, rear, and side setbacks permitted by the C-2 zoning designation. The residential buildings would be three stories (38 feet) in height, with review and approval of the requested Special Use Permit. The project incorporates a 30-foot landscaped setback along East Vineyard Avenue, in accordance with 2030 General Plan Policy CD-9.4, to provide a landscaped buffer along this City-designated scenic corridor. As such, implementation of the project would not conflict with the City's 2030 General Plan or zoning code. The project would introduce multifamily residential and commercial office uses that have been designed for visual compatibility and consistency with the surrounding land uses. Impacts would be less than significant.

2. The nearest airport to the project site is the Oxnard Airport, located approximately three miles southwest of the site. The Oxnard Airport Sphere of Influence (SOI) is a designated area for the coordination and review of land use proposals which may affect or be affected by the operations of the Oxnard Airport. The project site is outside of the Airport SOI. Therefore, the project would not result in any impact associated with land uses that are not allowed under an applicable airport land use compatibility plan.

3. According to the City's 2030 General Plan (2009), there is no established or planned Habitat Conservation Plan or Natural Communities Conservation Plan in or near the City's Planning Area, which includes the project site. Therefore, the project would have no impact associated with conflict with such a plan.

4. The proposed residential and office development would occur on a site developed with a former school and surrounded by residential and commercial uses. Therefore, the project would serve to extend similar surrounding uses and would not divide an established community. This impact would be less than significant.

Cumulative Impact Analysis: Impacts associated with land use and planning in the City Planning Area were analyzed by the 2030 General Plan EIR and found to be less than significant with implementation of uniformly applied development policies and regulations. The project would result in less than significant impacts with regard to land use and planning and would be required to comply with the City's uniformly applied development policies and regulations. Therefore, the project would not result in or contribute to cumulative impacts associated with land use and planning.

XI. MINERAL RESOURCES	Potentially Significant Impact	Less Than Significant Impact with Mitigation Incorporated	Less Than Significant Impact	No Impact
1. Would the project result in the loss of availability of a known mineral resource of value to the region or state?	☐	☐	■	☐
2. Would the project result in the loss of availability of a locally important mineral resource recovery site delineated in the 2030 General Plan, specific plan or other land use plan?	☐	☐	■	☐

1,2. According to the Background Report for the 2030 General Plan, important mineral/sand/gravel deposits are primarily located along the Santa Clara River channel, along the U.S. 101 corridor, and along the eastern edge of the City. The project site is located in the City's Non-designated Mineral Resource Zone-2 (MRZ-2), indicating that mineral deposits may be present in the area. However, policies in the Ventura County Mineral Resource Management Plan establishing land use controls that allow for flexibility for mineral extraction do not apply because the site is not in an officially designated MRZ-2 area. Therefore, the project would not result in the loss of availability of a known mineral resource that is of known value to the region or the State, or loss of a designated locally important mineral resource recovery site. Impacts would be less than significant.

Cumulative Impact Analysis: Impacts to mineral resources in the City Planning Area were analyzed by the 2030 General Plan EIR and found to be less than significant with implementation of uniformly applied development policies and regulations. The project would result in less than significant impacts to mineral resources and would be required to comply with the City's uniformly applied development policies and regulations. Therefore, the project would not result in or contribute to cumulative impacts to mineral resources.

This page intentionally left blank.

XII. NOISE	Potentially Significant Impact	Less Than Significant Impact with Mitigation Incorporated	Less Than Significant Impact	No Impact
1. Would the project generate or expose persons to noise levels in excess of standards established in the Oxnard 2030 General Plan or Noise Ordinance, or applicable standards of other agencies?	☐	■	☐	☐
2. Would the project generate or expose persons to excessive groundborne vibration or groundborne noise levels?	☐	☐	■	☐
3. Would the project generate a substantial temporary or periodic increase in ambient noise in the project vicinity above levels existing without the project?	☐	■	☐	☐
4. Would the project generate a substantial permanent increase in ambient noise in the project vicinity above levels existing without the project?	☐	☐	■	☐
5. For a project located within the airport land use plan for Oxnard Airport or within two miles of Naval Base, Ventura County at Point Mugu, would the project expose people residing or working in the project area to excessive noise levels?	☐	☐	☐	■
6. Would the project expose non-human species to excessive noise?	☐	☐	■	☐

1. The Noise Study for the Rio Urbana Project (Noise Study), prepared by Meridian Consultants in May 2018, is included as Appendix G of this Initial Study. This study provides background information on noise and how it is measured and described. The Noise Study also provides quantitative estimates of potential noise effects of the proposed project based on criteria in use by the City of Oxnard. Material from the Noise Study, as well as additional information from other City documents is summarized in the following paragraphs.

   The proposed multi-family residences within the project and existing detached single family homes and mobile homes to the northeast in the Rio neighborhood are noise-sensitive land uses. The Oxnard 2030 General Plan Goals & Policies (Oxnard December 2016:Goals SH-5 and SH-6) include

the City's noise goals and policies for maintaining appropriate noise levels in residential and other land uses within the City. Two different specific standards or criteria are described in the City of Oxnard CEQA Guidelines related to acceptable noise levels in various land use types (Oxnard May 2017:Section 12.3). These noise criteria are found (1) in the Oxnard General Plan Draft Background Report and (2) in the City's noise ordinance, Section 7-185 Exterior Noise Standards.

From the General Plan Draft Background Report, the maximum Community Noise Equivalent Level (CNEL) considered "normally acceptable" for single family and mobile home land uses is 60 decibels (dBA), and for multi-family land uses the CNEL limit is 65 dBA (Oxnard April 2006:Table 6-4). CNEL is a 24-hour average noise level, and is often used interchangeably with the Day-Night Average Noise Level (Ldn). The City's use of the CNEL standards in this manner is consistent with many other agencies and local governments (see Figure 6 in the Noise Study for the Rio Urbana Project.) These limits or criteria are intended to be applied to the evaluation of noise from all sources and how it affects the various land uses. Thus, these criteria are commonly used in evaluating noise from roadways, airports and aircraft overflights, rail operations, and similar sources.

In assessing the significance of noise level increases caused by a project – such as long-term increases in noise due to project-generated traffic, the Oxnard CEQA Guidelines reference criteria used by the Federal Transit Administration. For typical urban areas where existing noise levels range from 55 to 65 dBA (measured either as Ldn or Leq), a project-generated increase of from 2-3 dBA would be considered allowable. If existing noise levels are already excessive, then a more stringent increase of 1 dBA is applied up to 74 dBA. And if existing noise levels already exceed 75 dBA, then any increase is considered a significant impact (Oxnard May 2017:Table 5).

The City's noise ordinance uses a different approach to setting noise standards for various land uses. The ordinance is part of the City's process for regulating nuisances, and applies to the generation of noise from specific activities. For residential uses, the maximum allowable exterior sound level during daytime hours (7:00 a.m. to 10:00 p.m.) is 55 dBA, and for nighttime hours (10:00 p.m. to 7:00 a.m.), the limit is 50 dBA. In this context, the stated noise levels are One-hour Equivalent Noise Levels (Leq), not 24-hour averages. The noise ordinance itself has more details, including various adjustments for the presence of impulse sound and for various short-term exceedances. The ordinance also includes several exemptions, one of which applies to construction activities as long as specific days and hours are followed. For this reason, the City of Oxnard CEQA Guidelines suggests, "…construction related noise be considered 'substantial' only in unusual circumstances…" (Oxnard May 2017:page 57).

The Noise Study also reviews California State building code requirements applicable to multi-family residential dwellings, which require that interior living spaces meet a standard of 45 dBA CNEL or less. The Noise Study for the Rio Urbana Project describes the project, addressing both construction related noise and increases in traffic noise levels after the project is completed. Construction related effects are addressed in issues 2 and 3 below.

Traffic noise levels are computed in Table 5 (existing) and Table 9 (existing plus project) of the Noise Study for the Rio Urbana Project, which is Appendix G of this Initial Study. Aspects of the presentation in Tables 5 and 9 of the Noise Study may be confusing because it lists CNEL values for "AM" and "PM" time periods. As noted above, CNEL is a 24-hour noise descriptor so it does not

apply to morning or afternoon periods – it represents the average for an entire day. The "AM" and PM" periods are identified in Table 9 because the morning and afternoon peak hour traffic volumes were used, in turn, to estimate the Average Daily Traffic (ADT) volumes for the noise model work. Thus, slightly different results of CNEL were obtained reflecting the use of either morning or afternoon peak hour volumes to estimate the ADT values used in the model work. Additionally, the noise estimates in the Noise Study are based on traffic generated by development of 182 dwelling units and 15,100 square feet of office space. The updated project, as proposed, would result in 15 fewer dwelling units, and thus fewer vehicle trips, than anticipated in the traffic and noise analyses for the project. Therefore, noise estimates herein are considered conservative estimates for the project as proposed. Excerpts from Table 9 in the Noise Study for the Rio Urbana Project are summarized here in Table 3. All of the noise levels shown in Table 3 are CNEL values computed for a distance of 75 feet from the center of the identified roadway.

Table 3 Summary of Existing Plus Project Traffic Noise Levels

Street	Intersection No. – Location of segment	Existing Noise Level	Existing Plus Project Noise Level	Change
Vineyard Ave.	1 North of E. Stroube St.	65.3 dBA	65.4 dBA	0.1 dBA
Vineyard Ave.	1 South of E. Stroube St.	65.2 dBA	65.3 dBA	0.1 dBA
Vineyard Ave	2 North of Rio School Lane	65.6 dBA	65.6 dBA	0.0 dBA
Vineyard Ave.	3 South of Rio School Lane	65.6 dBA	65.7 dBA	0.1 dBA
Stroube St.	1 East of Vineyard Ave.	49.6 dBA	49.8 dBA	0.2 dBA
Stroube St.	1 West of Vineyard Ave.	47.0 dBA	47.0 dBA	0.0 dBA
Rio School Lane	2 East of Vineyard Ave	39.9 dBA	44.4 dBA	4.5 dBA

Source: Meridian Consultants, Inc. Noise Study for the Rio Urbana Project, Table 9, May 2018. Noise levels recorded on July 6, 2017
Note from Meridian Consultants, Inc. Noise Study: Roadway noise levels are modeled 75 feet from the center of the roadway.

Most of the intersections and roadway segments analyzed in the Noise Study for the Rio Urbana Project are located at some distance from the project site itself and are not representative of the residential neighborhood generally between Rio School Lane and Stroube Street. Table 3 above includes only those intersections potentially impacted by project traffic that are located generally near existing residential neighborhoods.

For the intersections where the existing CNEL value exceeds 65 dBA, the increase due to project traffic would be much less than 1 dBA. The only substantial increase in roadway noise levels caused by the project would be along what is now Rio School Lane that would serve as the primary access to the proposed development. Although the increase in traffic noise here would be about 4.5 dBA at 75 feet, the resulting CNEL values would still be relatively low (less than 45 dBA) in areas removed from Vineyard Avenue. The actual distance from the centerline of Rio School Lane and the nearest existing house is about 30 feet. At this distance the CNEL would be about 50.4 dBA, still well below the impact threshold of 65 dBA. The existing residences on the north side of Rio School Lane closest to Vineyard Avenue are about 200 feet from the center of Vineyard Avenue. At this distance, the "Existing Plus Project" CNEL value would be reduced from 65.6 dBA to approximately 60 dBA. Areas closer to Vineyard Avenue would experience higher noise levels, but the added effect of project traffic would be much less in these areas. The primary concern in this respect would be the residences proposed within the project itself, specifically those in residential Building 2 (south of Rio

School Lane) that would be about 86 feet from the center of Vineyard Avenue. At this distance, the existing CNEL from Vineyard Avenue would be about 64.7 dBA, and the existing plus project CNEL would be 64.8 dBA. This result is right at the limit considered acceptable for multi-family residential uses, and exterior living areas would exceed 65 dBA. Although the increases in noise would be relatively minor, the proposed development would lead to small increases in traffic related noise levels in areas where existing noise levels already exceed and mitigation would be required to reduce potential impacts to nearby sensitive receptors to a less than significant level.

Mitigation Measure

The following mitigation measures would reduce potential impacts related to the exposure of people to excessive noise levels to a less than significant level. Equivalent design measures may be substituted as long as the identified performance standard is met.

N-1(a) **Building Material Guidelines.** The living areas for all residences in the project, including those adjacent to Vineyard Avenue, shall be constructed to include sufficient noise attenuation to reduce interior noise levels to a CNEL of 45 dBA, as required by California building standards. For the estimated exterior CNEL values of 65 dBA, ~~t~~This performance standard requires an exterior-to interior noise reduction of approximately 20 dBA~~ or more~~. This noise reduction is routinely achieved in residential construction that is consistent with current California energy conservation standards, and involves measures such as exterior stucco walls with a Sound Transmission Class (STC) rating of 45, double-paned windows with an STC of 37, solid core exterior doors. Building permit applications shall include documentation that the interior standard of 45 dBA CNEL will be achieved through a combination of these or other measures.

N-1(b) **Building Design.** The living areas shall contain forced air ventilation. All duct work for ventilation shall include noise louvers at the exterior outlet and/or duct outlets shall be directed either opposite to or perpendicular to Vineyard Avenue. Upper level patio/deck areas shall not be positioned facing the Vineyard Avenue for residences along the western site boundary without additional mitigation or verification that exterior CNEL values would meet the City noise standard of 65 dBA as shown in a Noise Study reviewed and approved by the Planning Manager or designee.

2. Ground vibration is discussed in the *Noise Study for the Rio Urbana Project*. The study focused on three existing residences near the project site that are representative of residences in the vicinity. Due to the relatively short distances separating these residences from the project site, construction noise levels from the proposed development would cause increases ranging from about 9 dBA to 21 dBA over short periods of time. As described above, the City of Oxnard Noise Ordinance includes an exemption for construction activities during normal working hours. Even with this exemption, the construction noise from the proposed development is considered a potential significant impact that warrants mitigation. Specific mitigation measures to reduce construction noise levels are listed below.

   No mitigation measures are necessary related to ground vibration, since the Noise Study for the Rio Urbana Project concludes that ground vibration from construction activities would remain well

below the criteria used. Specifically, the construction activities are estimated to cause peak particle velocities (PPV) of 0.021 inches per second at the nearest residences, which is well below the criterion of 0.5 inches per second for PPV.

Mitigation Measure

To reduce the effects of construction activity noise to a less than significant level, the following mitigation measure would be required:

N-2 Construction Noise Levels. For all construction-related activities, noise-attenuation techniques shall be employed as needed to ensure that noise remains as low as possible during construction, specifically at REC-1 through REC-3. The following noise-attenuation techniques shall be incorporated into contract specifications to reduce the impact of construction noise:

- Ensure that construction equipment is properly muffled according to industry standards and in good working condition.
- Place noise-generating construction equipment and locate construction-staging areas away from sensitive uses, where feasible.
- Schedule high noise-producing activities between the hours of 7:00 AM and 5:00 PM to minimize disruption on sensitive uses.
- Implement noise attenuation measures to the extent feasible, which may include but are not limited to temporary noise barriers or noise blankets around stationary construction noise sources.
- Use electric air compressors and similar power tools rather than diesel equipment, where feasible.
- All stationary construction equipment (e.g., air compressors, generators, impact wrenches, etc.) shall be operated as far away from residential uses as possible and shall be shielded with temporary sound barriers, sound aprons, or sound skins.
- Construction-related equipment, including heavy-duty equipment, motor vehicles, and portable equipment, shall be turned off when not in use for more than 30 minutes.
- Clearly post construction hours, allowable workdays, and the phone number of the job superintendent at all construction entrances to allow for surrounding owners to contact the job superintendent. If the City or the job superintendent receives a complaint, the superintendent shall investigate, take appropriate corrective action, and report the action taken to the reporting party.

3. Temporary increases in noise levels caused by the project would occur due to construction activities. This potential impact is discussed above in issue 2.

4. The project is not expected to cause any significant permanent increases in noise levels. Increases in traffic noise levels due to the project are discussed in issue 1 above, and are considered to be a less than significant impact.

5. As discussed in the Land Use and Planning section, the project site is located outside of the Oxnard Airport Sphere of Influence. The project site is located approximately two miles from the nearest points of the 60 dBA CNEL contours associated with the Oxnard Airport (to the southwest) and about three miles from the nearest extent of the 60 dBA CNEL contour from the Camarillo Airport

(to the east-southeast) (Ventura County Department of Airports August 2004:Exhibit D-4, and Ventura County Airports Land Use Commission July 2007:Exhibit E-3). This project site is also located more than five miles from Naval Base, Ventura County at Point Mugu. Therefore, the project would not result in exposure of people residing or working in the project area to excessive noise levels associated with nearby airports. There would be no impact.

6. There are no listed endangered or threatened species within the project site, and the proposed development would not subject any sensitive biological species to noise levels beyond those common in urban neighborhoods. Additionally, the project would be required to implement mitigation measure BIO-1 to reduce and/or avoid potential impacts to nesting birds and raptors. For this reason, potential effects related to this issue would be less than significant.

Cumulative Impact Analysis: Impacts associated with noise generated by all development facilitated by the 2030 General Plan were analyzed by the 2030 General Plan EIR and found to be significant for which an overriding consideration was adopted. The project would have less than significant impacts with respect to noise with implementation of mitigation measure N-2, and would be subject to the City's uniformly applied resource protection policies and regulations. Therefore, the project would not contribute to or result in significant cumulative impacts to noise.

XIII. POPULATION, EDUCATION, AND HOUSING	Potentially Significant Impact	Less Than Significant Impact with Mitigation Incorporated	Less Than Significant Impact	No Impact
1. Would the project involve a General Plan amendment that could result in an increase in population over that projected in the 2030 General Plan that may result in one or more significant physical environmental effects?	☐	☐	■	☐
2. Would the project induce substantial growth on the project site or surrounding area, resulting in one or more significant physical environmental effects?	☐	☐	■	☐
3. Would the project result in a substantial (15 single-family or 25 multi-family dwelling units – about one-half block) net loss of housing units through demolition, conversion, or other means that may necessitate the development of replacement housing?	☐	☐	☐	■
4. Would the project result in a net loss of existing housing units affordable to very low- or low-income households (as defined by federal and/or City standards), through demolition, conversion, or other means that may necessitate the development of replacement housing?	☐	☐	☐	■
5. Would the project cause an increase in enrollment at local public schools that would exceed capacity and necessitate the construction of new or expanded facilities?	☐	☐	■	☐
6. Would the project directly or indirect interfere with the operation of an existing or planned school?	☐	☐	■	☐

1,2. The project consists of the development of 167 condominium residential units and a 15,100-square-foot office building on an approximately 10.5-acre site containing the former El Rio Elementary School campus. In January 2019, the City had a total population of 209,879 people and an average household size of 3.97 persons (DOF 2019). Based on the 2019 population and household size, the

project would result in an increase of approximately 663 residents in the City, representing an increase of 0.32 percent from the January 2019 population. The proposed office uses are not likely to generate an additional population within the City because the majority of these new employees would be relocated from existing Rio School District facilities located nearby at 2500 East Vineyard Avenue.

The 2030 General Plan projects a City population within a range of 238,000 to 286,000 people, with the Southern California Association of Governments (SCAG) projecting a population of 237,300 people by 2040. The population growth facilitated by the project would represent less than one percent of these growth forecasts and would be within the predicted growth projections previously evaluated by the City's 2030 General Plan and SCAG. While the project applicant is requesting an amendment to the 2030 General Plan to annex the project site into the City limits and to change the land use designation from School to Commercial General, the project site is in a developed area of the County surrounded by various low density residential and general commercial uses. Therefore, the proposed residential and office uses would be compatible with the uses designated by the City's General Plan for the project area. Impacts would be less than significant.

3,4. The project site does not contain any existing dwelling units. Therefore, the project would not result in any loss of housing units, including affordable to very low- or low-income households, through demolition, conversion, or other means that may necessitate the development of replacement housing. There would be no impacts.

5,6. According to the DOF population and housing estimates, the City had a total population of 209,879 people and an average household size of 3.97 persons in January 2019. Using the average household size, the 167 proposed condominiums included in the project would result in an increase in the City's population of 663 people. A portion of this new population would likely be school-age and would attend local public schools including those operated by Rio School District, and Oxnard Union High School District.

At the elementary school level (grades k-5), the Rio Elementary School District is over capacity. At the time the *Facilities Master Plan* was prepared in 2014, it was predicted that only one elementary school would be under capacity by 2016 and that two schools would be over 100% utilization (Rio School District September 2014:page 5). By 2018, in the *Developer Fee Justification Study & School Facilities Needs Analysis*, the District determined that for the elementary grades K-5 it was 207 students over capacity, but for the middle school grades 6-8 is was 201 students under capacity (Rio School District October 2018:Table 2).

The projections of future development and student generation in the 2018 study included the assumption that the Rio Urbana development project would be completed (along with other projects in the City). Based on generation rates used in the 2018 study, the Rio Urbana project would generate about 29 K-5 students and 10 grade 6-8 students, or about 10% of the projected growth at the time (Rio School District 2018:Tables 4 and 5).

Oxnard Union High School District has seven existing high schools, plus an independent study school and a continuation school. Nearest to the project site are: Oxnard High School, Pacifica High School,

and Rio Mesa High School. All three of these high schools have student enrollment in excess of their original facility capacity and all three use portable classrooms to accommodate part of their current enrollment. The Oxnard Union High School District has acquired land and is planning a new eighth high school southeast of N. Rose Avenue and Caesar Chavez Drive, with construction to start in 2020 (Oxnard Union High School District, October 2017 and January 2019.

To offset a project's potential impact on schools, Government Code 65995(b) establishes the base amount of allowable developer fees a school district can collect from development projects located within its boundaries. The fees obtained by the local districts are used to maintain the desired school capacity and the maintenance and/or development of new school facilities. The project proponents would be required to pay the State-mandated school impact fees. Pursuant to Section 65995(3)(h) of the California Government Code (SB 50, chaptered August 27, 1998), the payment of statutory fees "...is deemed to be full and complete mitigation of the impacts of any legislative or adjudicative act, or both, involving, but not limited to, the planning, use, or development of real property, or any change in governmental organization or reorganization." Additionally, the project would provide new administrative office space for the Rio School District, assisting in the operation of the schools in this district. Therefore, impacts to local public schools as a result of the project would be less than significant.

Cumulative Impact Analysis: Population and housing were analyzed by the 2030 General Plan EIR and found to be less than significant after implementation of uniformly applied development policies and regulations. The project would result in less than significant impacts to population, education, and housing and would be required to implement the City's uniformly applied development policies and regulations. Therefore, the project would not contribute to or result in cumulative impacts to population, housing, and education.

This page intentionally left blank.

XIV. PUBLIC SERVICES AND RECREATION	Potentially Significant Impact	Less Than Significant Impact with Mitigation Incorporated	Less Than Significant Impact	No Impact
1. Would the project increase demand for fire protection service such that new or expanded facilities would be needed to maintain acceptable service levels, the construction of which may have significant environmental effects?	☐	☐	■	☐
2. Would the project increase demand for law enforcement service such that new or expanded facilities would be needed to maintain acceptable service levels, the construction of which may have significant environmental effects?	☐	☐	■	☐
3. Would the project increase the use of existing park facilities such that substantial physical deterioration of the facilities would occur or be accelerated or that new or expanded park facilities would be needed to maintain acceptable service levels?	☐	☐	■	☐
4. Would the project increase the need for or use of existing library or other community facilities such that substantial physical deterioration of the facilities would occur or be accelerated?	☐	☐	■	☐

1. Upon annexation to the City of Oxnard, the project site and proposed development would be under the jurisdiction of the Oxnard Fire Department (OFD). The OFD fire station nearest to the project site is Station 7, located approximately 0.6 mile northeast of the site at 3300 Turnout Park Circle. The project would increase development density on the project site and result in new population in the City of Oxnard resulting in a potential increase in demand for OFD services. However, the population growth facilitated by the project would not substantially affect provision of fire protection given the location of the project in an urbanized area adjacent to the City and in close proximity to existing fire stations. Additional information related to police and fire service is provided in Response 3.3 contained in Attachment 1, Responses to Comments. For clarification, that information is repeated here in the following paragraphs

In the 2018 Municipal Services Review for the City of Oxnard, LAFCO indicated that the City employed 0.67 firefighters for every 1,000 residents (up from a ratio of 0.48 in 2000). The Police Department employed one officer for each 831 residents (LAFCO 2018:pages 11-12).

With respect to fire service, the project site is less than one mile from the City of Oxnard Fire Station No. 7, located at 3300 Turnout Park Circle. The City Fire Department sets a goal of a 240 second (4 minute) travel time. Station No. 7 achieves this goal about 42% of the time. Station No. 7 is located approximately 0.7 miles to the northeast, just off of E. Vineyard Avenue. This proximity would allow a travel time well within the goal of 4 minutes. This City Fire Station No. 7 is located adjacent to the Ventura County Fire Station No. 51, located at 3302 Turnout Park Circle, which currently serves the unincorporated El Rio community (including the project site).

The City provides police services directly, including community patrol, criminal investigation, emergency communications, animal safety, and support services. The project site is located within Police Beat 14, Riverpark District. According to the LAFCO Municipal Services Review, the City of Oxnard 2017-2018 budget allowed for increased spending both for new vehicles and staffing to help maintain the police staffing ratio (Ventura LAFCO 2018:12).

The proposed development would be required to meet all fire and building code provisions to the satisfaction of the City and OFD. As such, the increase in demand for OFD services would not result in the need for new or expanded facilities to maintain acceptable service levels, the construction of which may have significant environmental effects. This impact would be less than significant.

2. Upon annexation to the City of Oxnard, the project site and proposed development would be under the jurisdiction of the Oxnard Police Department (OPD) for law enforcement protection services. OPD operates from its police station located at 251 South C Street, approximately 2.5 miles south of the project site. OPD also operates a police substation located within the Collection RiverPark center at 2751 Park View Court, less than one mile west of the project site. The City is divided into four police districts, each of which is further divided into smaller response beats. The project site is located in Beat 12, which is part of the North District. The project would increase development density on the project site and result in new population in the City of Oxnard resulting in a potential increase in demand for OPD services. However, the population growth facilitated by the project would not substantially affect provision of police protection given the location of the project in an urbanized area adjacent to the City and in close proximity to existing police stations. Additionally, construction of the project would incorporate various security features, such as fencing, surveillance cameras, and security lighting, to minimize trespassing, vandalism, and other uses that could place an additional demand on OPD. As such, the increase in demand for OPD services would not result in the need for new or expanded facilities to maintain acceptable service levels, the construction of which may have significant environmental effects. This impact would be less than significant.

3. Under the Quimby Act (California Government Code Section 66477), cities and counties in California may require that developers set aside land, donate conservation easements, or pay fees for park improvements in order to achieve a minimum of three acres per 1,000 residents. The goal of the Quimby Act is to require developers to assist in the mitigation of impacts associated with property improvements and development. According to Section 4.5.1 of the Background Report for the 2030

General Plan, the City of Oxnard operates 50 existing park facilities located in the City Planning Area. In total, the City Planning Area contains approximately 828 acres of parkland, including a 362-acre public golf course. Based on the City's January 2019 population of 209,879, the City currently possesses 3.9 acres of parkland per 1,000 residents. The project would generate approximately 663 new residents in the City of Oxnard, increasing demand on City park and recreational facilities. However, the project would provide various on-site recreational amenities, including a recreation center and activity room, tot lot, and small dog park, as well as open space areas. Therefore, the new residents generated by the project would likely use these areas for recreation before going elsewhere in the City alleviating some of the potential demand of the project on existing City park or recreational facilities. Additionally, the increase in City residents as a result of the project would not decrease the parkland to resident ratio below the requirement of three acres per 1,000 residents of the Quimby Act. The employees associated with the proposed office uses are likely to be relocated from existing Rio School District facilities and, therefore, would not result in a substantial increase in demand on existing park or recreational facilities. In accordance with the City's 2030 General Plan, the project applicant would meet any additional demand on parks and recreational facilities through payment of applicable developer fees to finance public facilities. These developer fees would be assessed and determined by the City's Community Development Department through the plan check and permitting process prior to the issuance of building permits. This impact would be less than significant.

4. The nearest library to the project site is the Albert H. Soliz Library. This library is owned and operated by the County of Ventura, but located in the City of Oxnard at 2820 Jourdan Street, approximately 350 feet north of the project site. Due to the close proximity to the project site, future residents on the site are likely to use this facility for their library needs. However, with other accessible library facilities throughout the City and County, the project would not create a substantial increase in demand for library services such that new facilities are needed. In accordance with the City's 2030 General Plan, the project applicant would meet any additional demand on library facilities through payment of applicable developer fees to finance public facilities. These developer fees would be assessed and determined by the Community Development Department through the plan check and permitting process prior to the issuance of building permits. This impact would be less than significant.

Cumulative Impact Analysis: Impacts to public services were analyzed in the 2030 General Plan EIR and found to be less than significant with implementation of uniformly applied development policies and regulations. The project would result in less than significant impacts to public services and recreation and would be required to implement the City's uniformly applied development policies and regulations. Therefore, the project would not result in or contribute to cumulative impacts to public services and recreation.

This page intentionally left blank.

XV. TRANSPORTATION AND CIRCULATION	Potentially Significant Impact	Less Than Significant Impact with Mitigation Incorporated	Less Than Significant Impact	No Impact
1. Would the project cause an increase in traffic that is substantial in relation to the existing traffic load and capacity of the street system (i.e., result in a substantial increase in either the number of vehicle trips, the volume to capacity ratio on roads, or congestion at intersections) based on adopted City of Oxnard level of service (LOS) standards?	☐	☐	■	☐
2. Would the project exceed, either individually or cumulatively, and LOS standard established by the Ventura County Congestion Management Program (CMP) for designated roads or highways?	☐	☐	■	☐
3. Would the project result in a change in air traffic patterns, including either an increase in traffic levels or a change in location that results in substantial safety risks?	☐	☐	■	☐
4. Would the project substantially increase hazards due to a design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment)?	☐	☐	■	☐
5. Would the project result in inadequate emergency access?	☐	☐	■	☐
6. Would the project conflict with adopted policies, plans, or programs supporting alternative transportation (e.g., bus turnouts, bicycle racks)?	☐	☐	■	☐

1. **CONSTRUCTION**

Equipment and materials associated with project demolition and construction activities would be imported and exported from the project site and stored onsite for the duration of construction, where possible. Construction delivery and demolished materials export trips would be infrequent and short-term. The project demolition and construction workforce would likely commute to the project site in personal vehicles. The additional daily vehicle trips generated from the demolition and construction workforce would have localized impacts on Vineyard Avenue, Oxnard Boulevard, and Channel Islands Boulevard. However, the number of daily trips would be minimal in comparison

of the average daily vehicle trips on these arterial roadways of the city. All additional trips generated from the demolition and construction workforce would be temporary and short term.

OPERATION

A Revised Traffic and Circulation Study (Traffic Study) was completed for the project by Associated Transportation Engineers (ATE) on April 27, 2018 (refer to Appendix H). The Traffic Study describes the existing conditions, project trip generation rates, and the impact of the project on existing conditions. The Traffic Study also includes an analysis of the proposed and developing projects in the vicinity and the project's related impacts to traffic and circulation in a future setting.

The project site is served by a circulation system comprising arterial and collector streets. Traffic flow on urban arterials is most constrained at intersections. Therefore, a detailed analysis of traffic flows must examine the operating conditions of critical intersections during peak travel periods. Levels of Service (LOS) A through F are used to rate intersection operations, with LOS A indicating free flow operations and LOS F indicating congested operations. In the City of Oxnard LOS C is the acceptable operating standard for intersections.

Existing Conditions

The existing a.m. and p.m. peak hour traffic volumes at the study area intersections were collected by ATE in March of 2016, and March and June of 2017. Existing LOS for the study area intersections were calculated using the Intersection Capacity Utilization (ICU) methodology as required by the City of Oxnard. Table 4 below lists the existing LOS for study area intersections during the a.m. and p.m. peak hour periods.

Table 4 Existing Peak Hour Levels of Service

Intersection	Control Type	A.M. Peak Hour		P.M. Peak Hour	
		ICU	LOS	ICU	LOS
Vineyard Avenue/Stroube Street	Signal	0.56	A	0.55	A
Vineyard Avenue/Rio School Lane	STOP-Sign	1.0 sec.	A	1.0 sec.	A
Vineyard Avenue/Sycamore Street	STOP-Sign	1.0 sec.	A	1.0 sec.	A
Vineyard Avenue/Riverpark Boulevard	Signal	0.55	A	0.56	A
U.S. Highway 101 NB ramps/Vineyard Avenue	Signal	0.50	A	0.52	A
U.S. Highway 101 SB ramps/Vineyard Avenue	Signal	0.53	A	0.55	A
Vineyard Avenue/Esplanade Drive	Signal	0.56	A	0.63	B
Rose Avenue/Stroube Street	STOP-Sign	15.3 sec.	C	12.3 sec.	B
Rose Avenue/Auto Center Drive	Signal	0.55	A	0.77	C
U.S. Highway 101 NB ramps/Rose Avenue	Signal	0.42	A	0.47	A
U.S. Highway 101 SB ramps/Rose Avenue	Signal	0.61	B	0.69	B

Source: ATE Revised Traffic and Circulation Study, Table 1, April 2018.

As shown in Table 4, the study area intersections currently operate at LOS C or better during the a.m. and p.m. peak hour periods, which meets the City's LOS C standard.

Project Trip Generation

Trip generation estimates were calculated for the project based on Residential Condominiums (Land-Use Code #230) and Single Tenant Office Buildings (Land Use Code #715) rates presented in the Institute of Transportation Engineers (ITE) Trip Generation, 9th Edition. The trip generation estimates in the Traffic Study are based on development of 182 dwelling units and 15,000 square feet of office space. The updated project, as proposed, would result in 15 fewer dwelling units, and thus fewer trips, than anticipated in the Traffic Study. Therefore, trip generation estimates herein are considered conservative estimates for the project as proposed. Table 5 summarizes the average daily, a.m., and p.m. peak hour trip generation estimates for the project.

Table 5 Project Trip Generation

Intersection	Size	ADT		A.M. Peak Hour		P.M. Peak Hour	
		Rate	Trips	Rate	Trips	Rate	Trips
Condominium	182 units	5.81	1,057	0.44	80 (14/66)	0.52	95 (64/31)
Office	15,000 sq.ft.	11.65	175	1.80	27 (24/3)	1.74	26 (4/22)
	Total Project Trip Generation:		**1,232**		**107 (38/69)**		**121 (68/53)**

Source: ATE Revised Traffic and Circulation Study, Table 2, April 2018.

The data presented in Table 5 show that the project would generate a total of 1,232 average daily trips (ADT), 107 a.m. peak hour trips, and 121 p.m. peak hour trips.

Project Trip Distribution and Assignment

The project-generated a.m. and p.m. peak hour traffic volumes were distributed and assigned to the study area intersection based on travel data derived from the existing traffic volumes as well as general knowledge of the population, employment, and commercial centers in the Oxnard/Ventura area.

Project-Specific Impacts

LOS were calculated for the study area intersection assuming the Existing + Project traffic volumes. Table 6 shows the results of the calculations and identifies the project's impacts based on City of Oxnard thresholds.

Table 6 Existing plus Project Peak Hour Levels of Service

Intersection	Existing		Existing plus Project		Change	Impact?
	ICU/Delay	LOS	ICU/Delay	LOS		
A.M. Peak Hour						
Vineyard Avenue/Stroube Street	0.56	A	0.57	A	0.01	No

U.S. Highway 101 SB ramps/Rose Avenue	0.69	B	0.69	B	0.00	No

Source: ATE Revised Traffic and Circulation Study, Tables 3 and 4, April 2018.

As shown in Table 6, the project would not generate traffic level impacts of a significant level to the study area intersections, based on the City of Oxnard's traffic impact thresholds during the a.m. or p.m. peak hour periods.

Cumulative (Existing + Approved/Pending Project) Conditions

The City of Oxnard requires that intersection operations be analyzed with the addition of traffic generated by projects that have been approved or are pending in the project study area. Trip generation estimates were used for the developments that are approved or pending near the project study area using the rates presented in the ITE, Trip Generation, 9th Edition. Table 7 summarizes the average daily, a.m., and p.m. peak hour trip generation estimates for the approved and pending projects, buildout of Riverpark Specific Plan, and third tower at Esplanade.

Table 7 Approved and Pending Projects (Cumulative Development) Trip Generation

Source: ATE Revised Traffic and Circulation Study, Table 5, April 2018.

The data presented in Table 7 indicate that the approved and pending projects would generate a total of 21,965 average daily trips, 1,427 a.m. peak hour trips and 2,066 p.m. peak hour trips. The traffic generated by the approved and pending projects was distributed and assigned to the study area intersections based on the location of each project, recent traffic studies, existing traffic patterns observed in the study area as well as a general knowledge of the population, employment and commercial centers in Oxnard and surrounding Ventura County area. The Cumulative LOS for the study area intersections are shown in Table 8.

Table 8 Cumulative Peak Hour Levels of Service

Source: ATE Revised Traffic and Circulation Study, Table 6, April 2018.

The date presented in Table 8 indicate that the Rose Avenue/Auto Center Drive intersection would operate at LOS D during the p.m. peak hour period with the addition of Cumulative traffic volumes, which does not meet the City's LOS C standard. The Rose Avenue/Auto Center Drive intersection would operate at LOS B during the a.m. peak hour period and all other study intersections would operation at LOS C or better during the a.m. and p.m. peak hour periods with the addition of cumulative traffic volumes, meeting the City's LOS C standard.

Cumulative Plus Project Impacts

LOS was calculated for the study area intersections, assuming the Cumulative plus Project volumes. Table 9 shows the results of the calculations and identifies the impacts of the project, based on City of Oxnard thresholds.

Table 9 Cumulative plus Project Peak Hour Levels of Service

Source: ATE Revised Traffic and Circulation Study, Tables 7 and 8, April 2018.

The data presented in Table 9 indicate that the project contribution to traffic would not result in significant cumulative impacts to the study area intersections based on the City's traffic impact thresholds during the a.m. or the p.m. peak hour periods. Additionally, the project applicant would be required to pay the City's standard traffic mitigation fees to off-set any project contribution to cumulative traffic increases in the City.

2. According the County's Congestion Management Program (CMP; 2009), the minimum acceptable standard for traffic operations is LOS E. However, to avoid unfair penalization to local jurisdictions for existing congestion, CMP locations that currently operate in the LOS F range are considered acceptable.

The study area intersections along Vineyard Avenue and Rose Avenue are included in the County's CMP. These intersections would operate at LOS D or better with the addition of Cumulative plus Project peak hour volumes and, thus, would not exceed the CMP LOS E standard.

3. The project would not result in a change in air traffic patterns including either an increase in traffic levels or a change in location that results in a substantial safety risk. The project represents an infill project on a parcel that has been utilized for public school uses for a number of decades. Also, as discussed in the Land Use and Planning section, the project site is located outside of the Oxnard Airport SOI. Therefore, development on the project site would not result in substantial safety risks associated with the airport. This impact would be less than significant.

4,5. Rio School Lane would be vacated by the County of Ventura for the project, with current access and parking for adjoining properties, maintained. Access to the project site would be provided by three driveways from Vineyard Avenue. The project would also be designed to incorporate fire/emergency access and circulation throughout the proposed development. Turning radius within the proposed development would accommodate maneuverability on the site of large trucks and vehicles, including fire and solid waste collection trucks. The entrances and internal circulation routes would be designed and constructed to City of Oxnard design standards and include driveway aprons.

   Construction of the project would involve typical construction equipment and project materials that would be delivered via trucks. Large flatbed trucks, dump trucks, and water trucks would travel on Vineyard Avenue, Rio Lane, and other roads in the area while delivering supplies and equipment. Streets used to access the project site are public streets designed for use by large trucks. Therefore, the project would not substantially increase hazards due to a design feature or incompatible uses. This impact would be less than significant.

6. According to the City's Bicycle and Pedestrian Master Plan (2011) and the Ventura County Regional Bikeway Wayfinding Plan (Ventura County Transportation Commission 2017), there are no existing bicycle routes adjacent to the project site. However, according to both plans, Class II Bicycle Lanes are proposed along Vineyard Avenue adjacent to the project site. Gold Coast Transit District provides bus and paratransit services in the City of Oxnard, with Route 15 transit stops along Vineyard Avenue in close proximity to the project site. Route 15 includes eastbound stops at Vineyard Avenue/Ventura Boulevard, approximately 600 feet south of the site, and Vineyard Avenue/Collins Street, approximately 1,000 feet north of the site, and a westbound stop at Vineyard Avenue/Olive Street, approximately 230 south of the site. The project would not preclude future implementation of the City's planned bicycle facilities along Vineyard Avenue or use of existing transit services. Additionally, the project would preserve the existing public sidewalk along Vineyard Avenue and would include various new pedestrian connectivity routes throughout the project site. Therefore, the project would not conflict with adopted policies, plans, or programs supporting alternative transportation. This impact would be less than significant.

Cumulative Impact Analysis: The project's contribution to cumulative impacts to transportation and circulation is evaluated under issue 1 and would be less than significant.

XVI. UTILITIES AND ENERGY	Potentially Significant Impact	Less Than Significant Impact with Mitigation Incorporated	Less Than Significant Impact	No Impact
With respect to Utilities:				
1. Would the project need new or expanded water supply entitlements that are not anticipated in the current Urban Water Management Plan?	☐	■	☐	☐
2. Would additional wastewater conveyance or treatment capacity be required to serve project demand and existing commitments?	☐	☐	■	☐
3. Would the project generate solid waste that would exceed the permitted capacity of a landfill serving the City?	☐	☐	■	☐
4. Would the project conflict with federal, state, or local statutes or regulations related to solid waste?	☐	☐	■	☐
With respect to Energy:				
5. Would the project involve wasteful, inefficient, or unnecessary consumption of energy during project construction, operation, maintenance, and/or removal?	☐	☐	■	☐
6. Would the project require additional energy facilities, the provision of which may have a significant effect on the environment?	☐	☐	■	☐
7. Would the project be inconsistent with existing energy standards?	☐	☐	■	☐
8. Would the project preempt future energy development or future energy conservation, or inhibit the future use of renewable energy or energy storage?	☐	☐	■	☐

A Wet Utility Preliminary Investigation was prepared by Jensen Design & Survey, Inc. in August 2017 and revised through August 6, 2018 to assess existing and proposed water usage and sewer loading associated with the project. A Domestic Water Supply and Demand memorandum was also prepared by Jensen Design & Survey, Inc. in April 2019 to provide an updated analysis of projected water demand for the project, and the proposed transfer of pumping rights to the City of Oxnard from active Rio School District groundwater wells. These reports are included in Appendix I of this Initial Study. The Wet Utility Preliminary Investigation determined that operation of the former El Rio Elementary School on the project site resulted in a historical sewer loading of 12,470 gallons per day (GPD). Past water consumption for the former El Rio Elementary School is documented by allocations by the Fox Canyon Groundwater Management Agency (FCGWMA) to three separate wells that were operated by the Rio School District. This allocation was assigned to the well onsite (Well No. 02N22W22Q05S). According to the Wet Utility Preliminary Investigation, the FCGWMA existing allocation for this well is 42.676 acre-feet per year (AFY). This allocation is based on the historic allocation dating back to 1990, as adjusted by subsequent restrictions imposed by the FCGWMA – reviewed and explained in Section 3.0 of the Wet Utility Preliminary Investigation. According to the Domestic Water Supply and Demand memorandum, FCGWMA is in process of conducting hearings to adopt an Ordinance which will require well owners to reduce groundwater pumping and reduce transferable allocation and pumping rights. Based on well pumping information provided by Rio School District and review by FCGWMA, pumping a maximum of 52.074 AFY will be allowed for development on the project site once the Ordinance is adopted. Currently, the well on Rio Urbana project site would have an allocation of 10.483 AFY per the proposed future Ordinance with the remaining amount of 41.591 AFY allocated to the other two wells to be held by the Rio School District.

The Wet Utility Preliminary Investigation determined that the proposed development would result in sewer loading of 45,717 GPD. The Domestic Water Supply and Demand memorandum determined that the proposed development would result in water demand of 40.399 AFY. This equates to a net difference, or increase of 33,247 GPD of sewer loading demand and decrease of 2.277 AFY in water demand, from existing to proposed conditions.

1. Impacts to water supply

a. Water System and Sources

The discussion below provides a brief summary of the current sources of water used in the City of Oxnard and the various government agencies and regulatory systems that control those sources. Much of the information in this discussion is based on the City of Oxnard UWMP (prepared in July 2016 and updated January 19, 2018). Documents or codes and ordinance adopted by other agencies are cited as necessary. With respect to the water demands of the proposed project itself, a Wet Utility Preliminary Investigation was prepared by Jensen Design & Survey, Inc. in August 2017, and then updated in August 6, 2018, to assess existing and proposed water usage and sewer loading associated with the project. The updated version of the report is included in Appendix I of this document. That investigation identifies the existing allocation of groundwater to the Rio School site, as well as a projection of the water demand of the proposed development and the potential for reclaimed water use in the development. The earlier version of the report also provided estimates

of actual past water use on the property. The Wet Utility Preliminary Investigation also discusses sewer service, which is the topic in Issue 2 below.

The City of Oxnard provides potable water service to the existing El Rio School District facilities on the project site, even though the land is within the unincorporated area of Ventura County, outside of the existing City limits. This water service is limited to the existing storage and maintenance uses at the school district facilities, and the property will have to be annexed to the City in order for the City to provide water for the proposed development. The following paragraphs describe the water supply of the City of Oxnard.

As of 2015, the total volume of potable water distributed by the City of Oxnard to its service area was approximately 25,806 acre-feet per year (AFY).The City uses three sources of water to make up it system supply, as described in the Oxnard UWMP (Oxnard January 19, 2018:Sections 4 and 6) and summarized as follows:

- **Imported water purchased from the Calleguas Municipal Water District (CMWD)**. Surface water imported from CMWD constitutes about 36 percent of the City water supply or 8,059 AFY in 2016. CMWD obtains the vast majority of its water (about 90,000 AFY) from the Metropolitan Water District of Southern California (MWD or Metropolitan). CMWD also participates in aquifer storage and recovery projects and other projects to recover and reclaim water, but these comprise less than 5,000 AFY (CMWD UWMP June 2016:Sections 4 and 6). The larger MWD system and the CMWD system on the regional level provide a reliable water source and an administrative structure for the management of surface water. There are, however, several constraints to this system (CMWD UWMP June 2016:Section 7.1). These include:
    - Increasing demands throughout California
    - Potential for damage to SWP system and interruption of supply due to earthquake
    - Increased demands for water to support environmental resources in San Joaquin Delta
    - Drought
    - Climate Change leading to increased variability in supply
    - Need to offset historic overdraft of groundwater

  For these reasons, an increase in water supply directly from CMWD is not likely in the future without an increase in water resources available from the larger State Water Project, through MWD.

- **Groundwater purchased from the United Water Conservation District (UWCD)**, The UWCD provides about 32 percent of the City supply (7,329 AFY in 2016). UWCD obtains water from the Santa Clara River, and diverts it to spreading basins to help replenish groundwater within the Oxnard Plain. UWCD is within, and subject to the regulations of, FCGWMA, introduced in Section IX above, Hydrology and Groundwater.

- **Groundwater pumped from a system of City-owned wells** The City of Oxnard owns 10 groundwater wells throughout the Oxnard Plain, and operates six blending stations within the City. Groundwater from City-owned wells is blended at six of these stations. These City-owned wells supply about 32 percent of the potable water distributed by the City (7,186 AFY in 2016).

As with the UWCD and all other groundwater users, the City of Oxnard is subject to the monitoring and allocation requirements of the FCGWMA to help achieve and maintain sustainable use of the groundwater resources in the region.

Other programs within the City provide additional, although smaller, volumes of water. These include the Advanced Water Purification Facility (AWPF), which is part of the City's wastewater treatment system and uses Reverse Osmosis technology to produce treated wastewater that can be recycled for irrigation and other uses to offset the demand for potable water. The Calleguas Municipal Water District (discussed above) participates in this program by conveying treated wastewater from the City of Oxnard AWPF to agricultural customers for irrigation in lieu of groundwater pumping (CMWD UWMP, June 2016:Section 6.5). As of 2015 the AWPF has the capability to produce about 7,000 AFY. This effort is part of the City's Groundwater Recovery Enhancement and Treatment (GREAT) program. In coordination with other service providers in the region (including Pleasant Valley County Water District, Port Hueneme Water Agency, and UWCD, the GREAT program is a regional effort that will assist in aquifer restoration and in achieving the groundwater allocation restrictions imposed by the FCGWMA.

Another component of the City's GREAT program is its desalinization plant, or Desalter #1. This plant treats brackish groundwater, and works in conjunction with the AWPF described above and the City's groundwater injection well as part of the larger aquifer or groundwater management system. At the present time, expansion of the desalinization program to treat seawater is not considered financially feasible.

b. Applicable Regulations and Policies

The complex water supply and delivery network summarized above is regulated through a hierarchy of codes, ordinances, plans, and agreements adopted at the state, regional, and local level. The following paragraphs summarize the applicable requirements and procedures that apply to the proposed development.

California Requirements. The California Sustainable Groundwater Management Act in 2014 resulted in the designation of the Oxnard Plain as a "high priority" groundwater basin, within which local governments and agencies are required to prepare Groundwater Sustainability Plans. Any General Plan amendments or similar actions must consider compliance with applicable Groundwater Sustainability Plan (Government Code Section 65350.5). In this region, the FCGWMA was designated as the Groundwater Management Agency.

FCGWMA Requirements. Since 1982, FCGWMA has overseen monitoring and allocation of groundwater resources in the region as part of its original responsibility and authority. These actions include the development of strict groundwater monitoring requirements, preparation of a *Groundwater Management Plan* updated in 2007 (FCGWMA May 2007), several ordinances that were consolidated and updated into a single Ordinance Code in January 2015, various annual reports, and Emergency Ordinance E. The latter ordinance was in response to the state declaration of drought in 2014, and established a Temporary Extraction Allowance for Municipal and Industrial users, such as the City of Oxnard, limited to 80 percent of their annual average use between 2003

and 2012. Ordinance E also imposes additional efficiency requirements for agricultural users. Since its designation as the Groundwater Management Agency, FCGWMA has released a draft *Sustainable Groundwater Plan for the Oxnard Plain* (FCGWMA November 2017). This draft plan describes the coordinated plans and programs in the City of Oxnard (FCGWMA November 2017:Section 1.2.6.2, pages 1-28 and 1-29)—including the City's "net-zero" policy regarding water use by new development--and would further reduce groundwater allocations to 50 percent compared to the historical averages. The goals of the plan are to restore the groundwater resources in the region, and specifically to maintain groundwater elevations near the coast for the management of seawater intrusion (page 1-30).

CMWD Requirements. The Calleguas Municipal Water District also operates under an UWMP, and also has a district Code that defines its service area and annexation requirements. All groundwater use and any reclamation and recharge programs within CMWD also occur under the umbrella of the FCGWMA plans and requirements described above. The project site is not within the CMWD but would join the CMWD through annexation to the City of Oxnard. For this reason, CMWD is listed in among other agencies that must review and approve annexation (page iv of this IS-MND). The following paragraphs, provided by CMWD, describe the district and their requirements.

> Land on which the proposed projects will be built is not presently within the boundaries of Calleguas Municipal Water District or Metropolitan Water District of Southern California. The Administrative Codes of both agencies state that water delivered by their systems may be used only within their respective service area boundaries. Calleguas purchases all of its potable water from Metropolitan. Metropolitan supplies water from the Colorado River and the State Water Project for municipal, industrial and agricultural uses within its service area. Annexation to Calleguas and Metropolitan of the land under consideration is necessary to allow annexation to and water service by the City of Oxnard.
>
> Annexation procedures for Metropolitan are defined in Section 3500 of the Metropolitan Water District Act, which are also observed by Calleguas. In addition, annexations to Calleguas are subject to Part 8 of Calleguas' Administrative Code. Annexation is also subject to approval by the Ventura Local Agency Formation Commission and any terms and conditions the Commission may apply. Pursuant to Section 56017 of Part 1, Chapter 2, of the Cortese/Knox/Hertzberg Local Government Reorganization Act of 2000, annexation means the annexation, inclusion, attachment, or addition of territory to a city or district. This action will require amendment of the Spheres of Influence of Calleguas and Metropolitan.
>
> Calleguas and Metropolitan have in place Water Standby Charges. In the course of annexation, such charges will be fixed for the subject property. Water Standby Charges are assessed to pay for the benefits that properties receive from the projects and facilities provided by Calleguas and Metropolitan, whether or not they receive water from Calleguas and Metropolitan.
>
> This administrative change in water service areas will have a less than significant impact.

City of Oxnard Requirements. The City of Oxnard Municipal Code Chapter 22 addresses water resources in all respects. As a general summary, all applicants are responsible for making

arrangements for any allocation adjustments or transfers of water rights to the City, as set forth in Article VI, Section 22-100 Water Rights and Groundwater Pumping Allocations:

> …the land owner …shall transfer or assign to the city any water rights, water wells, mains, easements, and water production equipment or facilities which may be appurtenant to such property or which may be used exclusively thereon as follows:
>
> …Any and all applicable groundwater pumping allocations and/or credits attributable to the property to be served by the city and available from the Fox Canyon Groundwater Management Agency, shall be transferred to the city by the property owner. The property owner shall be responsible for all fees and charges necessary to obtain the approval of the transfer of pumping allocations and/or credits from the Fox Canyon Groundwater Management Agency to the city;

The Rio Urbana development would be subject to other municipal code provisions that identify and prohibit wasteful use of water (Article VIII, beginning at Section 22-135)) and require conformance with water conservation measures that exist or may be declared by the City in the Future (Article IX, beginning at Section 22-150). These measures would reduce water consumption internally, but would not eliminate or necessarily guarantee a complete offset any new water use caused by the project. Therefore, additional measures would be necessary to mitigate the impact of increased water use by the project. These are discussed below under mitigation. Specifically, Mitigation W-1 addresses the provision of groundwater allocation to the City within the FCGWMA to provide for the project.

c. Project Effects and Mitigation

The Domestic Water Supply and Demand memorandum determined that the water demand for all proposed uses in the Rio Urbana project would amount to 40.399 acre-feet per year (AFY). As noted above, this memorandum also estimated that the maximum pumping allowed for the three active Rio School District wells under the current FCGWMA requirements is 52.074AFY. Therefore, without any offsets, or other mitigation measures, this estimated demand would be consistent with the City of Oxnard "net-zero" policy for water use by new development and would not be considered a significant impact.

In order to provide the necessary water supply to the City for the project, the Rio School District must arrange for an allocation and transfer of sufficient water rights to the City, consistent with the requirements and procedures of the FCGWMA.

Mitigation W-1. The applicant shall provide for the allocation of groundwater pumping rights sufficient to serve the development (40.399 acre feet per year) from the Fox Canyon Groundwater Management Agency to the City of Oxnard, consistent with the ordinances and requirements of the two agencies, prior to recording the final map for the project.

Implementation of this mitigation will ensure that the project complies with the "net-zero" water service policy in the City. Thus the potential impact on water service would be less than significant.

2. The project site is located in County Service Area (CSA) No. 34, in an area informally referred to as the El Rio community. On August 12, 1999, the Regional Water Quality Control Board (RWQCB) amended the Water Quality Control Basin Plan for the Los Angeles Region and prohibited the use of septic systems in the Oxnard Forebay, including the El Rio area. CSA No. 34 was formed in December 2005 to provide administration, operations, and maintenance of a new sewer system in the area to bring the area in compliance with the State septic system prohibition. CSA No. 34 planned and constructed a sewer collection system in phases as funding was secured. All phases of the project were completed in April 2011. Phases 1 and 5D of the Sewer System Project established sewer lines adjacent to the project sites southern, western, and northern boundaries. Waste water discharged into these lines is sent to the City's Wastewater Treatment Plant for treatment and disposal. The project site is also included in the boundary area of the City of Oxnard's Wastewater Master Plan Update (September 2008). Land use projections used for creating the Wastewater Master Plan were based on the City's adopted 2020 General Plan in which the project site was identified as a Redevelopment Area.

   Existing development on the project site currently disposes of wastewater into the existing sewer line in Rio School Lane via pump and force main. This sewer line in Rio School Lane enters the 10-inch trunk sewer line in Vineyard Avenue at a manhole near the intersection of the two roadways. There was inconclusive data in the City's Wastewater Master Plan (2008) and the City's Integrated Waste Master Plan (2015) to determine the sewer capacity of the 10-inch trunk sewer line in Vineyard Avenue at the time of project submittal. Response 3.9 in Attachment 1 provides updated information regarding sewer capacity in this line. Based on updated information in the revised 2018 Wet Utility Memo prepared for the project, the City determined that the sewer transmission capacity in this line was adequate to serve the project. The proposed development on the site would connect to the existing sewer system line in Rio School Lane. Although the project would increase the load on the sewer system, the applicant would be required to pay the City-required and CSA No. 34-required Sewer Connection Fees (SCF) and service charges that finance the operation and maintenance of the sewer system for all properties in the El Rio area. With payment of these fees, the project would not result in a significant adverse effect on the system and this impact would be less than significant.

3, 4. According to the City's 2017 CEQA Guidelines, the City's Environmental Resources Division oversees solid waste programs in the City, including residential waste collection and recycling programs. Commercial facilities in the City contract with private waste haulers. The City operates the Del Norte Regional Recycling and Transfer Station (also referred to as the Materials Recovery Facility [MRF]), which serves as the hub of the City's solid waste management system and serves as a resource for rest of the County. Solid waste that is incapable of being recycled is hauled to other landfill sites in Ventura County, primarily the Toland Road Landfill. As of 2017, the City meets or exceeds state mandated rates for diversion of solid waste from landfills via waste reduction, reuse, and recycling.

   Solid waste generated from project demolition and construction activities would be segregated for recycling, where possible. Non-recyclable wastes would be placed in covered dumpsters and removed on a regular basis by a certified waste-handling contractor for disposal at the Toland Road

Landfill. According to the CalEEMod output generated for the Air Quality Study for the project (Appendix A), the project would generate approximately 49.1 metric tons of solid waste per year, or 0.13 tons of waste per day. In January 2016, the total remaining capacity of the Toland Road Landfill was approximately 10.6 million cubic yards and the facility is permitted to accept up to 1,500 tons of solid waste per day (CalRecycle 2018). Using a conservative assumption that all project waste would be diverted to the landfill rather than recycled, the project would contribute less than 0.01 percent of the daily permitted capacity to the landfill. With the recycling programs in place in the City and required compliance with all federal, state, and local regulations regarding solid waste disposal, the projects contribution to the landfill would be even less. Therefore, solid waste generated by the project would have a less than significant impact on the permitted remaining capacity of the landfill.

5-8. The City's standard conditions of approval and application of uniformly applied development standards require compliance with the California Green Building Code which includes energy efficiency standards. The project would involve typical to low consumption of energy during project construction, operation, and maintenance. As descried in the GHG Study (Appendix D) for the project, the project would incorporate solar panels on the proposed office building and would implement various features consistent with the latest requirements of the 2016 California Green Building Code including, energy-efficient lighting, installation of low-flow appliances, and water conservation. Therefore, the project would not require additional energy facilities, would be consistent with existing energy standards, and would not inhibit the future use of renewable energy or energy storage. Impacts would be less than significant.

Cumulative Impact Analysis: Utilities and services were analyzed by the 2030 General Plan EIR and found to be less than significant with implementation of uniformly applied development policies and regulations.

XVII. CUMULATIVE IMPACTS	Potentially Significant Impact	Less Than Significant Impact with Mitigation Incorporated	Less Than Significant Impact	No Impact
1. Would cumulative impact of the project in combination with the impacts of past, present, and reasonably foreseeable future projects exceed a City significance threshold?	☐	■	☐	☐
2. If so, would the project's contribution to the significant cumulative impact be cumulatively considerable?	☐	■	☐	☐

1, 2. The proposed project would result in less than significant impacts with implementation of mitigation measures BIO-1, CUL-2, N-1(a), N-1(b), and N-2 provided herein. The proposed project is an urban infill project in an area planned for development under the 2030 General Plan. Most of the surrounding properties are currently developed, and it is therefore expected that project implementation would result in less than significant cumulative impacts. Cumulative citywide significant impacts were documented in the 2030 General Plan Program EIR and overriding considerations were adopted in 2011.

PLANNING DIVISION
214 SOUTH C STREET
OXNARD, CALIFORNIA 93030

CITY OF OXNARD CALIFORNIA

NOTICE OF INTENT
TO ADOPT MITIGATED NEGATIVE DECLARATION NO. 2017-04

The City of Oxnard Planning Division has reviewed an application on the following proposal:

PLANNING AND ZONING (PZ) PERMIT NOS. 17-610-01 (Annexation); 17-620-01 (General Plan Amendment), 17-560-01 (Pre-Zoning), 17-300-03 (Tentative Subdivision Map for Tract No. 5998), 17-500-05 (Special Use Permit – Office), 17-500-13 (Special Use Permit - Residential), and 17-535-02 (Density Bonus): Request to annex the 10.5 acre former school parcel located at 2714 E. Vineyard Avenue (APN 145-0-232-010) to the City of Oxnard with 2030 General Plan land use and zoning designations of General Commercial, and demolish five structures, paving, vegetation, and a water well in order to subdivide and develop 1.12 acres (Parcel 1) with a two-story 15,000 square foot (sf) office building with 61 parking spaces and develop 9.1 acres (Parcel 2) with 167 one to three-bedroom attached apartment condominiums (17 low income affordable units) in eight, three-story (38 feet), structures; fitness center; recreation pavilion; four refuse structures; 169 resident garages; 163 resident parking spaces; 99 guest parking spaces; storm water retention and treatment facilities; on-site utilities and off-site connections; landscaping; seven play areas with a tot lot; and a dog run. The project includes widening of Vineyard Avenue by 23 ft.; relocating four SCE 66kV transmission poles; and maintaining parking and access to abutting properties. A Density Bonus is required for three additional units and reduction in qualifying interior yard space from 30% to 24% of the parcel area. Filed by Rio School District, 2500 E. Vineyard Ave., Oxnard, CA and The Pacific Companies, 430 E. State Street #100, Eagle, Idaho.

In accordance with Section 15070 of the California Code of Regulations, the Planning Division of the City of Oxnard has determined that with the proposed mitigations, there is no substantial evidence that the proposed project would have a significant effect on the environment, and that a mitigated negative declaration may be adopted.

The draft environmental document may be reviewed at the following City webpage: https://www.oxnard.org/city-department/community-development/planning/environmental-documents/.

The draft environmental document is also available for review at the Oxnard Planning Division office (214 South "C" Street, 8:00 a.m. to 6:00 p.m., Monday through Thursday and 9:00 a.m. to 5:00 p.m. on alternative Fridays), Oxnard Main Library, 251 South "A" Street (9:00 a.m. to 8:00 p.m., Monday through Thursday, and 9:00 a.m. to 5:30 p.m. on Saturday), and at the Albert H. Soliz Library, 2820 Jourdan Street, El Rio (call for hours of operation, 805-485-4515).

The 30-day public review period begins on July 19, 2019 and ends on August 19, 2019.

All comments should be provided in writing and received before 5:00 p.m. on Monday, August 19, 2019. Inquiries should be directed to Chris Williamson, Consultant Planner, at (805) 385-8156, or by e-mail to Chris.Williamson@oxnard.org. Written comments may be faxed to (805) 385-7417 or mailed to "City of Oxnard, Planning Division, 214 South C Street, Oxnard, CA 93030 - Attn: Chris Williamson."

Mitigation Monitoring and Reporting Plan (MMRP)

Environmental Impact	Significance Before Mitigation	Recommended Mitigation Measure	Significance After Mitigation	Responsible Party
Biological Resources	Potentially Significant	**BIO-1** Nesting Bird and Raptor Survey and Avoidance. In the event that the proposed action is planned to occur within the general bird nesting season, a pre-construction nesting bird survey shall be conducted by a qualified biologist. The nesting season is generally considered February 1 through August 31, with a peak from March to June; however, these dates vary by year depending on prey availability, weather, and other factors. In the event an active bird is observed in the habitats to be removed or in other habitats within 100 feet for songbirds and 500 feet for raptors of the construction work areas, all construction work in the suitable habitat or within 100 feet/500 feet of the suitable habitat must be delayed until after September 1st, or surveys must be continued in order to locate any nests. If an active nest is found, clearing and construction within 100 feet/500 feet of the nest shall be postponed until the nest is vacated and juveniles have fledged, and until there is no evidence of a second attempt at nesting. Limits of construction to avoid a nest site shall be established in the field with flagging and stakes or construction fencing. Construction personnel shall be instructed on the ecological sensitivity of the area.	Less Than Significant	Community Development
Cultural and Tribal Cultural Resources	Potentially Significant	**CUL-2** A qualified archaeologist shall monitor all project-related ground-disturbing activities. In the unlikely event that potentially significant archaeological materials are encountered during construction, the applicant must comply with State regulations and City's standard condition of approval for handling such resources.	Less Than Significant	Community Development
Noise	Potentially Significant	**N-1(a)** Building Material Guidelines. The living areas for all residences in the project, including those adjacent to Vineyard Avenue, shall be constructed to include sufficient noise attenuation to reduce interior noise levels to a CNEL of 45 dBA, as required by California building standards. For the estimated exterior CNEL values of 65 dBA, this performance standard requires an exterior-to interior noise reduction of approximately 20 dBA. This noise reduction is	Less Than Significant	Community Development

Environmental Impact	Significance Before Mitigation	Recommended Mitigation Measure	Significance After Mitigation	Responsible Party
		routinely achieved in residential construction that is consistent with current California energy conservation standards, and involves measures such as exterior stucco walls with a Sound Transmission Class (STC) rating of 45, double-paned windows with an STC of 37, solid core exterior doors. Building permit applications shall include documentation that the interior standard of 45 dBA CNEL will be achieved through a combination of these or other measures. **N-1(b)** Building Design. The living areas shall contain forced air ventilation. All duct work for ventilation shall include noise louvers at the exterior outlet and/or duct outlets shall be directed either opposite to or perpendicular to Vineyard Avenue. Upper level patio/deck areas shall not be positioned facing the Vineyard Avenue for residences along the western site boundary <u>without additional mitigation or verification that exterior CNEL values would meet the City noise standard of 65 dBA as shown in a Noise Study reviewed and approved by the Planning Manager or designee.</u>		
Noise	Potentially Significant	**N-2** Construction Noise Levels. For all construction-related activities, noise-attenuation techniques shall be employed as needed to ensure that noise remains as low as possible during construction, specifically at REC-1 through REC-3. The following noise-attenuation techniques shall be incorporated into contract specifications to reduce the impact of construction noise: • Ensure that construction equipment is properly muffled according to industry standards and in good working condition. • Place noise-generating construction equipment and locate construction-staging areas away from sensitive uses, where feasible. • Schedule high noise-producing activities between the hours of 7:00 AM and 5:00 PM to minimize disruption on sensitive uses. • Implement noise attenuation measures to the extent feasible, which may include but are not limited to temporary noise barriers or noise blankets around stationary construction noise sources.	Less Than Significant	Community Development

Environmental Impact	Significance Before Mitigation	Recommended Mitigation Measure	Significance After Mitigation	Responsible Party
		• Use electric air compressors and similar power tools rather than diesel equipment, where feasible. • All stationary construction equipment (e.g., air compressors, generators, impact wrenches, etc.) shall be operated as far away from residential uses as possible and shall be shielded with temporary sound barriers, sound aprons, or sound skins. • Construction-related equipment, including heavy-duty equipment, motor vehicles, and portable equipment, shall be turned off when not in use for more than 30 minutes. • Clearly post construction hours, allowable workdays, and the phone number of the job superintendent at all construction entrances to allow for surrounding owners to contact the job superintendent. If the City or the job superintendent receives a complaint, the superintendent shall investigate, take appropriate corrective action, and report the action taken to the reporting party.		
Utilities and Energy	Potentially Significant	**W-1** The applicant shall provide for the allocation of groundwater pumping rights sufficient to serve the development (40.399 acre feet per year) from the Fox Canyon Groundwater Management Agency to the City of Oxnard, consistent with the ordinances and requirements of the two agencies, prior to recording the final map for the project.	Less Than Significant	Water Division

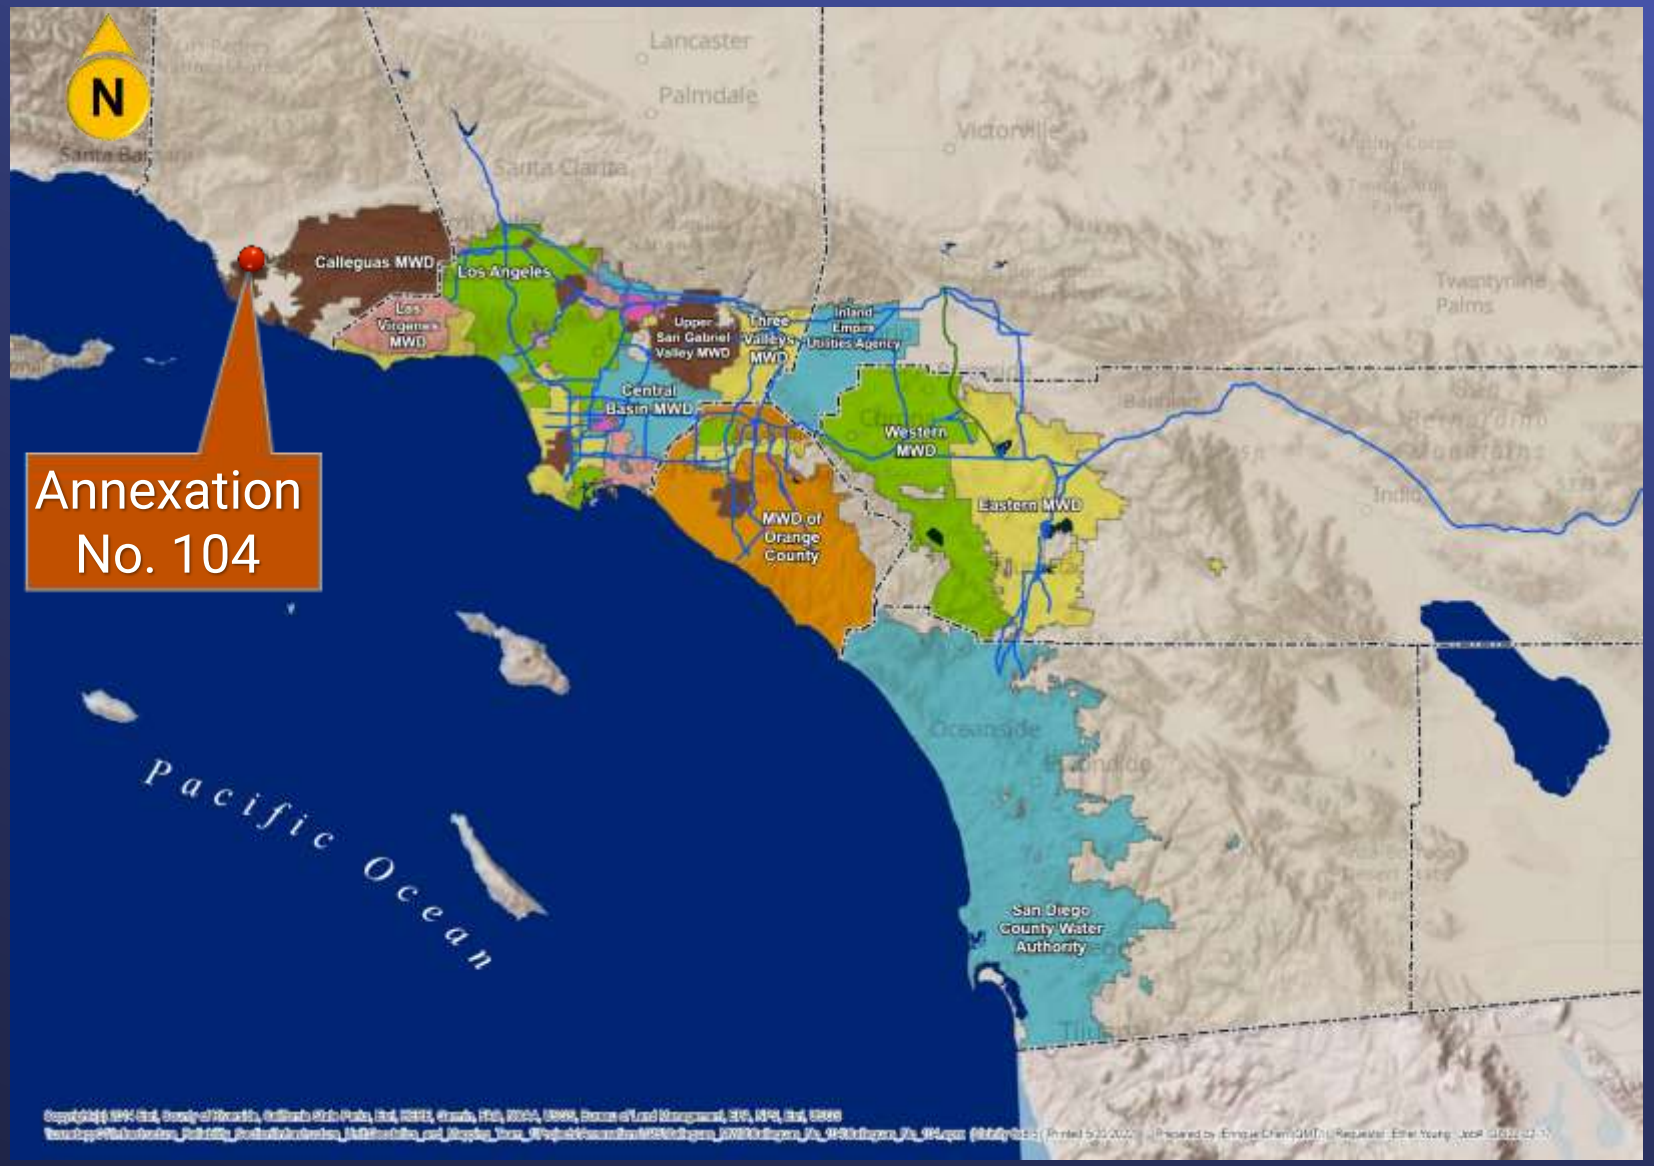
Real Property and Asset Management Committee

Adopt Resolution for Calleguas Annexation No. 104

Item 7-12

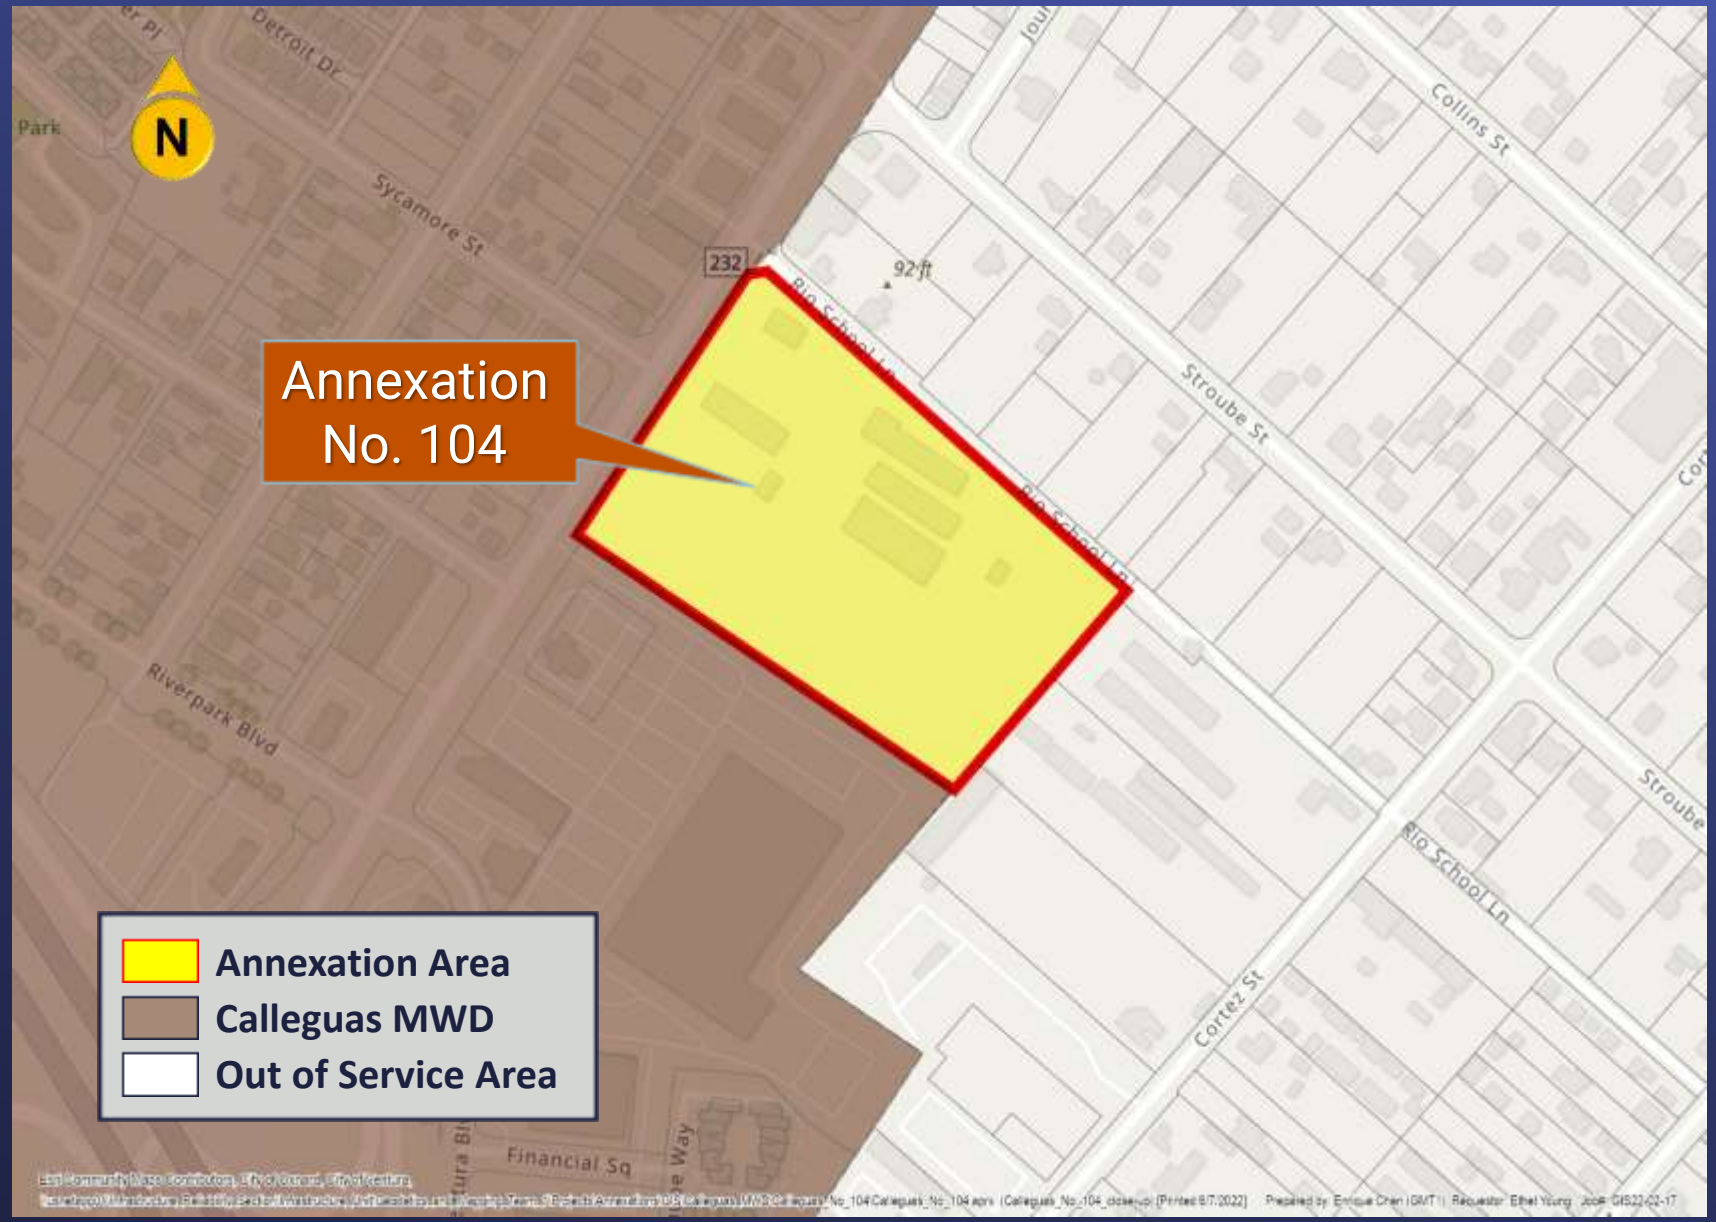
June 13, 2022

Service Area Map



Annexation Site Map

Total Area = 10.72 Acres
Public Road= 0.24 Acres
Net Area = 10.48 Acres



Key Provisions

- Annexation Area is 10.72 acres
- Total fees are $ 74,220.40
- Water use estimate is 20.20 – 24.24 AF/Y
- Annexation request is compliant with current policy and requirements

Board Options

Option 1:

- Review and Consider the Lead Agency's adopted CEQA determination and actions, and
- Adopt annexation resolution for Annexation No. 104 to Calleguas and Metropolitan

Option 2:

- Decline the Request

Board Options

Staff Recommendations

- Option 1

THE METROPOLITAN WATER DISTRICT OF
SOUTHERN CALIFORNIA

THE METROPOLITAN WATER DISTRICT OF SOUTHERN CALIFORNIA

BOARD ACTION

- **Board of Directors**
  Real Property and Asset Management Committee

6/14/2022 Board Meeting

7-13

Subject

Adopt resolution for Calleguas Annexation No. 106 to Calleguas Municipal Water District and Metropolitan; the General Manager has determined that the proposed action is exempt or otherwise not subject to CEQA

Executive Summary

This action grants approval for an annexation requested by Calleguas Municipal Water District (Calleguas) and authorizes collecting Metropolitan's water standby charge and ad valorem tax. This request is compliant with current policy and requirements. This annexation request consists of approximately 6.30 acres with no public roads, leaving a net area of 6.30 acres as the basis for the annexation charge (**Attachment 1**). The new water demand from Metropolitan ranges from 21.69 to 26.01 acre-feet per year (AFY). Calleguas meets the demand management measures in the agency's Water Use Efficiency Statement of Compliance (**Attachment 2**). The charge for this annexation, if completed in 2022, is $46,618.11, which includes a $5,000 processing fee.

Details

Background

On January 19, 2022, Calleguas' board of directors adopted Resolution No. 2037, requesting formal terms and conditions for annexation and collection of a water standby charge for the proposed Calleguas Annexation No. 106. The proposed annexation would help to close a window in the service area by extending Metropolitan's and Calleguas' service area into two areas, Parcel A, a low-income housing development, and Parcel B, a neighborhood park. Parcel A is a 5.281-acre property identified as APNs: 223-0-041-020 and 223-0-090-015 located at 5536 and 5482 Cypress Road in the city of Oxnard. The affordable housing development consists of 150 residential units, with onsite amenities including a community building, learning center, centralized laundry room, community kitchen, and outdoor recreational areas for children, teens, and adults. Parcel B is an acre of land identified as APN: 223-0-090-095, located on the southernmost portion of Garden City Acres Park and is directly north of Parcel A. While a majority of the park was previously annexed, this small portion remained outside the service area.

The proposed area after annexation will be served by the city of Oxnard and will be eligible for imported water through Calleguas and Metropolitan. The charge for this annexation is $46,618.11, which includes the $5,000 processing fee collected at the time of the initial annexation request; the balance is payable prior to completion. The annexation charge is calculated based on the 2022 per-acre fee of $6,605. If the annexation is not completed in calendar year 2022, the fee would be based on the then-current annexation rate pursuant to Section 3300 of Metropolitan's Administrative Code. Pursuant to Section 3107 of Metropolitan's Administrative Code, approved November 6, 2018, Calleguas has submitted an acceptable Water Use Efficiency Statement of Compliance for this annexation project (**Attachment 2**). The projected water demand from Metropolitan is estimated to be between 21.69 and 26.01 AFY. Completion of this annexation would be subject to such terms and conditions as may be fixed by Metropolitan's Board in granting final consent to such annexation, including the Local Agency Formation Commission conditioning approval of the proposed annexation upon a requirement that all previously established and collected taxes, benefit assessments, or property-related fees or charges be established and collected on parcels being annexed to Metropolitan. This action adopts a resolution consenting to Calleguas' request for annexation with water standby charge as set forth in (**Attachment 3**). Upon completion of the annexation, the lands within Calleguas Annexation No. 106 will be subject to Metropolitan's ad valorem property

tax in the current amount of 0.0035 percent of the assessed valuation of each parcel and Metropolitan's water standby charge collected on behalf of Calleguas in the current amount of $9.58 per acre, or per a parcel of less than one acre.

Policy

Metropolitan Water District Administrative Act Section 350: Annexation of Corporate Area of Agency

Metropolitan Administrative Code Section 3100: Request for Annexation

California Environmental Quality Act (CEQA)

CEQA determination for Option #1:

Pursuant to the provisions of CEQA and the State CEQA Guidelines, Calleguas, acting as the Lead Agency, prepared and processed a Notice of Exemption (NOE) for the infill development (affordable housing on 5.281 acres), finding this portion of the project categorically exempt. The NOE was filed on February 8, 2022. The environmental documentation is included as **Attachment 4**.

Metropolitan, acting as the Responsible Agency, has independently determined that the proposed action is categorically exempt under the provisions of CEQA and the State CEQA Guidelines. The proposed action involves the annexation process on the property known as the 5536 and 5482 Cypress Road (i.e., Cypress Place at Garden City) and 5302 Cypress Road (i.e., Garden City Acres Park) property into Metropolitan and Calleguas' service areas. Metropolitan finds that this land is an infill development and is consistent with the applicable general plan designation and policies, as well as with applicable zoning designation and regulations, and involves annexation of individual small parcels of the minimum size. Additionally, the proposed action qualifies as 100 percent affordable housing development and meets the requirements of Senate Bill 35 and Government Code Section 65913.4 as a Streamlined Infill Project. Accordingly, the proposed action is categorically exempt and qualifies under Class 19 and Class 32 Categorical Exemptions (Sections 15319 and 15332 of the State CEQA Guidelines).

CEQA determination for Option #2:

None required

Board Options

Option #1

Adopt resolution for Calleguas Annexation No. 106 concurrently to Calleguas and Metropolitan

Fiscal Impact: Receipt of annexation fee of $46,618.11 for the annexation area and water sales revenue from the newly annexed territory.

Business Analysis: This annexation will provide the ability for water service and associated benefits to the property owners. The initial fixed and variable costs will be borne by the local water supplier and property owners, including processing, infrastructure, and the cost of raw and treated water. This annexation helps to meet Metropolitan's member agency request.

Option #2

Decline the request for the proposed Calleguas Annexation No. 106.

Fiscal Impact: Unrealized annexation fee and water sales revenue from non-annexed areas.

Business Analysis: The subject area will not receive the direct benefits of water supplied through Calleguas and Metropolitan.

EXHIBIT A

CALLEGUAS MUNICIPAL WATER DISTRICT ANNEXATION (CALLEGUAS ANNEXATION NO. 106)

Portions of Lots 12 and 13, and Ventura County Ditch, in the City of Oxnard, County of Ventura, State of California, as shown on the map of Garden City Acres Tract, filed in Book 11, Page 105 of Miscellaneous Records (Maps), described as follows:

PARCEL A

BEGINNING at a point in the westerly line of said Lot 12, said point being the southerly terminus of the 11th course of Parcel No. 3 of Annexation No. 7 (Oxnard Second Fringe Area) to the Calleguas Municipal Water District, as described in Certificate of Filing recorded on November 13, 1969 in the Office of said County Recorder in Book 3579, Page 129 of Official Records of said County; thence, along the west line of said Lots 12 and 13, said west line also being the existing Calleguas Municipal Water District boundary,

1st - North 0°02'00" West 300.13 feet to the Point of Beginning of Parcel A described in Instrument No. 20201015-00170280-0 of Official Records of said County; thence leaving said existing district boundary and along the 1st, 2nd, and a portion of the 3rd course of said Parcel A, the following three courses,

2nd - North 89°53'00" East 51.00 feet; thence,

3rd - North 0°01'00" West 51.00 feet to a point in the north line of said Lot 12; thence,

4th - North 89°53'00" East 78.99 feet to the southwesterly corner of Parcel B described in said Instrument No. 20201015-00170280-0 of Official Records; thence, leaving said 3rd course of Parcel A and along the northwesterly line of said Parcel B the following four courses,

5th - North 0°02'00" West 89.31 feet; thence,

6th - North 89°53'00" East 170.00 feet; thence,

7th - North 0°02'00" West 50.00 feet; thence,

8th - North 89°53'00" East 324.91 feet to the northeasterly corner of said Parcel B; thence, continuing along the easterly prolongation of the previously described course,

9th - North 89°53'00" East 10.00 feet to the east line of said Ventura County Ditch, 10.00 feet wide, said east line being also the westerly line of Parcel No. 57 of said Annexation No. 7 (Oxnard Second Fringe Area) to the Calleguas Municipal Water District, and also being the existing boundary of said Calleguas Municipal Water District; thence, along said east line and the existing boundary of said Calleguas Municipal Water District,

10th - South 0°01'00" East 192.65 feet to the northwesterly line of Parcel No. 5 of said Annexation No. 7 (Oxnard Second Fringe Area) to the Calleguas Municipal Water

EXHIBIT A

District; thence, continuing along the existing boundary of said Calleguas Municipal Water District and said northwesterly line, the following two courses,

11th - South 49°32'00" West 434.59 feet to the beginning of a tangent curve concave southeasterly, having a radius of 2939.40 feet; thence,

12th - Southwesterly along said tangent curve through a central angle of 0°29'30", an arc length of 25.22 feet to the easterly terminus of the 12th course of said Parcel No. 3 of Annexation 7 (Oxnard Second Fringe Area) to the Calleguas Municipal Water District; thence leaving said northwesterly line and along said 12th course and the existing boundary of said Calleguas Municipal Water District,

13th - South 89°53'00" West 284.93 feet, more or less, to the **POINT OF BEGINNING**.

Parcel A containing 5.281 acres, more or less.

PARCEL B

COMMENCING at a point in the westerly line of said Lot 12 of said Garden City Acres Tract, said point being the southerly terminus of the 11th course of Parcel No. 3 of Annexation No. 7 (Oxnard Second Fringe Area) to the Calleguas Municipal Water District, as described in Certificate of Filing recorded on November 13, 1969 in the Office of said County Recorder in Book 3579, Page 129 of Official Records of said County; thence, along the west line of said Lots 12 and 13, said west line also being the existing Calleguas Municipal Water District boundary, thence, North 0°02'00" West 300.13 feet to the Point of Beginning of Parcel A described in Instrument No. 20201015-00170280-0 of Official Records of said County; thence leaving said existing district boundary and along the 1st, 2nd, and a portion of the 3rd course of said Parcel A, the following three courses, thence, North 89°53'00" East 51.00 feet; thence, North 0°01'00" West 51.00 feet to a point in the north line of said Lot 12; thence, North 89°53'00" East 78.99 feet to the southwesterly corner of Parcel B described in said Instrument No. 20201015-00170280-0 of Official Records; thence, leaving said 3rd course of Parcel A and along the northwesterly line of said Parcel B the following four courses, North 0°02'00" West 89.31 feet; thence, North 89°53'00" East 170.00 feet; thence, North 0°02'00" West 50.00 feet, to the **POINT OF BEGINNING**, thence,

1st - North 89°53'00" East 324.91 feet to the northeasterly corner of said Parcel B; thence, continuing along the easterly prolongation of the previously described course,

2nd - North 89°53'00" East 10.00 feet to the east line of said Ventura County Ditch, 10.00 feet wide, said east line being also the westerly line of Parcel No. 57 of said Annexation No. 7 (Oxnard Second Fringe Area) to the Calleguas Municipal Water District, and also being the existing boundary of said Calleguas Municipal Water District; thence, along said east line and the existing boundary of said Calleguas Municipal Water District,

3rd - North 0°01'00" West 70.00 feet to the easterly terminus of the 6th course of Parcel A of Annexation No. 85 (Cypress No. 1) to the Calleguas Municipal Water District, as described in Certificate of Completion recorded on January 3, 2006 in the Office of

EXHIBIT A

said County Recorder as Instrument No. 20060103-0000853 of Official Records of said County; thence, continuing along the existing boundary of said Calleguas Municipal Water District, said 6th course of Parcel A, and the 7th course of said Parcel A, the following three (3) courses,

4th - South 89°53'00" West 10.00 feet to the westerly line of said Ventura County Ditch, 10.00 feet wide, thence,

5th - South 89°53'00" West 624.93 feet, to the easterly line of Cypress Road, 50.00 feet wide, thence along said easterly line,

6th - South 00°02'00" East 70.00 feet to the easterly prolongation of the north line of said Parcel B, thence leaving said easterly line, along said prolongation,

7th - North 89°53'00" East 300.00 feet, more or less, to the **POINT OF BEGINNING**.

Parcel B containing 1.020 acres, more or less.

All as shown on EXHIBIT B attached hereto and made a part hereof.

Documentation for Annexation of Territory to
The Metropolitan Water District of Southern California (MWD)

Water Use Efficiency Compliance Statement

Calleguas Municipal Water District Annexation 106 – Cypress Place at Garden City/Garden City Acres Park

A. General Information

Description of Annexing Area	Member Agency: Calleguas Municipal Water District Annexation Name: Annexation 106 – Cypress Place at Garden City/Garden City Acres Park Water Use: CMWD CY 2021 (Imported Demands – Sales to Other Agencies): 92,923 AF Annexing Water Demand (Parcel A: Cypress Place at Garden City): 37.79 AFY Imported Water Demand (Parcel A: Cypress Place at Garden City): 18.90-22.67 AFY Annexing Water Demand (Parcel B: Garden City Acres Park)*: 5.57 AFY Imported Water Demand (Parcel B: Garden City Acres Park)*: 2.79-3.34 AFY TOTAL Annexing Water Demand: 43.36 AFY TOTAL Imported Water Demand: 21.68-26.02 AFY Percent MWD Supplied: 50-60% *Amount used to irrigate the entire Garden City Acres Park, the majority of which is already within the service area; the annexing parcel is a subset of this total Parcel A Development Plans: Residential Low-Medium (City of Oxnard) Parcel A Zoning: Multiple-Family AAHOP [R2-AH] (City of Oxnard) Parcel B Development Plans: Park (City of Oxnard) Parcel B Zoning: Community Reserve [CR] (City of Oxnard) Address: Cypress Place at Garden City: 5536 and 5482 Cypress Road, Oxnard, 93033 (APN: 223-0-041-020 and APN: 223-0-090-015 Garden City Acres Park: 5302 Cypress Road, Oxnard, 93033 (APN: 223-0-090-095) Additional Water Agencies Involved in Annexation: 1. City of Oxnard

B. Member Agency Water Use and Efficiency Plans

(1) Annual Water Use.

1. Does your agency minimize annual water demand and peak demands by incorporating water conservation measures throughout the service area? Please describe such conservation measures in the service area. **MWD Administrative Code § 3107 (a)(1)(i)**	Member Agency Response: **Yes** Description: ▪ CMWD contributes cash incentives beyond MWD rebates in the amount of $25 per device for high efficiency clothes washers, premium high efficiency toilets, weather-based irrigation controllers and soil moisture sensor systems. Effective September 1, 2021, Calleguas also adds a $1 supplement per square foot to MWD's turf rebate, for a total of $3/square foot for Calleguas customers. It does this in conjunction with participation by member purveyors. ▪ Calleguas' staff includes a Principal Resource Specialist who actively promotes and coordinates Metropolitan and Calleguas conservation programs. Activities include direct contact with builders, dissemination of literature, and presentations to public and industry groups.

	▪ Calleguas relies on its Member Purveyors to enforce compliance with mandated conservation measures at the local level as part of the project approval process. ▪ Newly annexing territory is conditioned to be compliant with: Metropolitan Water District of Southern California Administrative Code 3107 (as amended over time), California Water Code Sections 13550-13557, Calleguas Resolution No. 903 and Calleguas Ordinance No. 17. Reporting on compliance is required by the Member Purveyor and the property owner through provisions of Exhibit 'C' attached to Calleguas annexation resolutions. Supporting Documentation: Please refer to: 1) CMWD 2020 Urban Water Management Plan Pages 9-1 through 9-4. 2) CMWD Resolution 1964 - Attachment C (pg. 50-51)
2. Does your service area maximize use of groundwater, local surface water, and recycled waste water supplies to minimize annual water demand on MWD? Please describe such maximizing uses in the service area. **MWD Administrative Code § 3107 (a)(1)(ii)**	Member Agency Response: **Yes** Description: CMWD member agencies produce and distribute approximately 40,000 to 50,000 AF of water from local sources annually. Sources include imported surface water supplied to the City of Oxnard by United Water Conservation District, groundwater, and recycled water. The Regional Salinity Management Program involves construction of a pipeline to dispose of brine concentrates and thereby facilitate the use of high-salinity groundwater and recycled wastewater in the Calleguas watershed. 16.7 miles of the pipeline and the ocean outfall are complete. Ultimately it will extend from the outfall 32 miles inland to Simi Valley. When complete and fully utilized by CMWD member agencies, the pipeline will substantially increase local water supplies. Working with its member purveyors, CMWD has identified several other potential projects for recovering low quality groundwater and recycling. The program has the potential of providing 40,000 AF of potable water annually directly offsetting demand on MWD. Supporting documentation: Please visit smp.calleguas.com
3. Does your service area construct and operate local storage and groundwater production facilities as required by California Water Code Sections 10700-10710 (Groundwater Resources)? Please describe such construction and operations in the service area. **MWD Administrative Code § 3107 (a)(1)(iii)**	Member Agency Response: **Yes** Description: Member purveyors with groundwater pump more heavily in summer months. In addition, the District operates ten reservoirs with a combined capacity of 63 million gallons to reduce daily peaking. CMWD Ordinance No. 12 penalizes member purveyors for extremes of high and low flow and imposes the Capacity Reservation Charge on member purveyors as an incentive to reduce peaking. Calleguas itself also maintains groundwater facilities in the Las Posas Basin. Groundwater supplies in the Las Posas Valley Groundwater Basin may be utilized in the event of an emergency. Supporting Documentation: Please see: 1) Calleguas Urban Water Management Plan 2020, Chapter 6; 2) Calleguas 2017 Potable Water Master Plan Executive Summary Pages 9-14 and 25-27; 3) Calleguas Ordinance No. 12, Page 2
4. Does your agency condition all new territory to be consistent with all applicable city, county, and state laws? **MWD Administrative Code § 3107 (a)(1)(iv)**	Member Agency Response: **Yes** Description: ▪ Newly annexing territory is conditioned to be compliant with: Metropolitan Water District of Southern California Administrative Code 3107 (as amended

	over time), California Water Code Sections 13550-13557, Calleguas Resolution No. 903 and Calleguas Ordinance No. 17. Reporting on compliance is required by the Member Purveyor and the property owner through provisions of Exhibit 'C' attached to Calleguas annexation resolutions. ▪ Further, 'Exhibit C' of CMWD Resolution 1964 captures compliance with the Model Water Efficient Landscape Ordinance, known as 'MWELO', by conditioning newly annexed territory to be compliant with the City of Oxnard Municipal Code (Chapter 22), which contains MWELO provisions as specified in Article XIII. Landscape Water Conservation Standards. ▪ Calleguas relies on its Member Purveyors to enforce compliance with mandated conservation measures at the local level as part of the project approval process. Supporting Documentation: Please refer to: 1) CMWD Resolution 1964 - Attachment C (pg. 50-51)

(2) Recycled Water.

5. Does your service area use recycled water in accordance with California Water Code Sections 13550-13557 (Water Reuse)? Please describe such recycled water use in the service area. **MWD Administrative Code § 3107 (a)(2)**	Member Agency Response: **Yes** Description: ▪ Calleguas supports the use of recycled water in accordance with Water Code Sections 13550-13557 wherever it is feasible to do so within its service area. ▪ In recent years, the City of Oxnard delivered highly treated wastewater through the CMWD Salinity Management Pipeline for delivery to CII users. However, this operation will be not be feasible when the City of Camarillo's North Pleasant Valley Desalter begins its discharge to the SMP (estimated in 2022). ▪ The City of Oxnard continues to study maximizing production from its Advanced Water Purification Facility (AWPF). The City of Oxnard is currently planning for an Indirect Potable Reuse (IPR) project that began pilot testing in 2020. ▪ Calleguas built three pipelines to facilitate distribution of recycled water by its member purveyors. In 2017 these pipelines delivered 1,655 Acre-feet of recycled water. In May of 2017 two of the recycled pipelines were sold to Triunfo Water & Sanitation District, which continues to operate them. Today, Calleguas owns a small pipeline that provides recycled water to the City of Simi Valley (VCWWD No. 8). In the future, it is expected that the City of Simi Valley will take ownership, operation, and maintenance of this delivery facility. Additional AF of recycled water are distributed for M and I use by CMWD purveyors. Most of these deliveries are used for landscape irrigation and directly offset potable demand. Supporting Documentation: Please see: 1) Calleguas 2020 Urban Water Management Plan Page 4-4, Pages 6-8 to 6-10; 2) Calleguas 2017 Potable Water Master Plan Executive Summary Pages 11. 3) Regional Salinity Management Program Brochure 4) City of Oxnard Recycled Water Webpage. 5) Oxnard IPR Program

(3) Local Resources.

6. Has your agency established measures to sustain a seven-to 21-day interruption in service, as required by MWD Administrative Code Section 4503(b)?	Member Agency Response: **Yes** Description: ▪ Calleguas can call on multiple sources of water to sustain service through a 7-day interruption of supplies from Metropolitan. Lake Bard has usable storage capacity of 7,500 AF as a potable supply. The Lake Bard Water Filtration Plant can produce 90 cubic feet per second (CFS). Additionally, Calleguas presently holds the right to roughly 95,000 AF of groundwater.

MWD Administrative Code § 3107 (a)(3)	During a shutdown, Calleguas can produce 55 CFS from its Las Posas ASR Project. Other Calleguas groundwater supplies can by agreement be extracted by its member purveyors. These supplies are sufficient to meet demand in the Calleguas service area in winter and spring months. In addition, interconnections with the City of Ventura and Las Virgenes MWD are currently in the planning phase and construction phase, respectively. ▪ Calleguas' staff includes an Emergency Response Coordinator. This position leads the District's disaster management programs. ▪ Calleguas' member purveyors can augment these supplies during such short-term interruptions with increased groundwater pumping and other regional resources so that summer demand can be largely satisfied with minimal delivery curtailment. ▪ The District would heavily emphasize water conservation and a message of "NO OUTDOOR IRRIGATION" should Calleguas face a prolonged interruption in service from MWD. ▪ Calleguas is in the process of finalizing a Water Supply Alternatives Study (WSAS) that examines more than 90 projects that could increase the District's reliability (& redundancy) at least cost. This is a long-range planning document. Supporting Documentation: Please refer to: 1) Calleguas 2020 Urban Water Management Plan Chapter 8 (Water Shortage Contingency Planning) and Appendix K (Water Shortage Continency Plan); and 2) Imported Water Outage Planning

C. Reporting to the District

7. Has your agency incorporated conservation measures in the new territory? Please describe such measures. **MWD Administrative Code § 3107(b)(1)**	Member Agency Response: **Yes** Description: ▪ Newly annexing territory is conditioned to be compliant with: Metropolitan Water District of Southern California Administrative Code 3107 (as amended over time), California Water Code Sections 13550-13557, Calleguas Resolution No. 903 and Calleguas Ordinance No. 17. Reporting on compliance is required by the Member Purveyor and the property owner through provisions of Exhibit 'C' attached to Calleguas annexation resolutions. ▪ Calleguas relies on its Member Purveyors to enforce compliance with mandated conservation measures at the local level as part of the project approval process. Supporting Documentation: Please refer to: 1) CMWD Resolution 1964 - Attachment C (pg. 50-51)
8. What is your agency's total annual production of local water supplies including, but not limited to, recycled water, groundwater, and local surface water use? **MWD Administrative Code § 3107(b)(2)**	Member Agency Response: ▪ Per CY 2020 reconciliation (Local Production All Sources): 43,327.7 AF ▪ Per CY 2020 reconciliation (CMWD Imported Sales): 89,631.5 AF ▪ CY 2021 reconciliation will occur when prompted by MWD WRM staff.
9. Has your agency established resources to sustain a seven-to 21-day interruption in service, as required by MWD Administrative	Member Agency Response: **Yes** Description: ▪ Calleguas can call on multiple sources of water to sustain service through a 7-day

Code Section 4503(b)? Please describe such resources, as applicable to your agency's facilities, as specified in MWD Administrative Code §§ 3107(b)(3). **MWD Administrative Code § 3107(b)(3)**	interruption of supplies from Metropolitan. Lake Bard has usable storage capacity of 7,500 AF as a potable supply. The Lake Bard Water Filtration Plant can produce 90 cubic feet per second (CFS). Additionally, Calleguas presently holds the right to roughly 95,000 AF of groundwater. During a shutdown, Calleguas can produce 55 CFS from its Las Posas ASR Project. Other Calleguas groundwater supplies can by agreement be extracted by its member purveyors. These supplies are sufficient to meet demand in the Calleguas service area in winter and spring months. In addition, interconnections with the City of Ventura and Las Virgenes MWD are currently in the planning phase and construction phase, respectively. ▪ Calleguas' staff includes an Emergency Response Coordinator. This position leads the District's disaster management programs. ▪ Calleguas' member purveyors can augment these supplies during such short-term interruptions with increased groundwater pumping and other regional resources so that summer demand can be largely satisfied with minimal delivery curtailment. ▪ Finally, the District would heavily emphasize water conservation and a message of "NO OUTDOOR IRRIGATION" should CMWD face a prolonged interruption in service from MWD.
10. Has your agency submitted a current Urban Water Management Plan (UWMP) to the reporting agency? **MWD Administrative Code § 3107(b)(4)(i)**	Member Agency Response: **Yes** Description: ▪ Calleguas' 2020 UWMP is available on its website: https://www.calleguas.com/cmwdfinal2020uwmp.pdf ▪ The City of Oxnard's 2020 UWMP: https://www.oxnard.org/city-department/public-works/water/uwmp/
11. Does your agency's most current UWMP include a narrative description addressing the nature and extent of each water demand management measure implemented over the past 5 years, as required by California Water Code Section 10631(f)? **MWD Administrative Code § 3107(b)(4)(ii)**	Member Agency Response: **Yes** Description: ▪ Calleguas' 2020 UWMP is available on its website: https://www.calleguas.com/cmwdfinal2020uwmp.pdf, see Chapter 9, Demand Management Measures ▪ The City of Oxnard's 2020 UWMP: https://www.oxnard.org/city-department/public-works/water/uwmp/, see Chapter 9, Demand Management Measures
12. Does your agency's most current UWMP adequately address California Water Code requirements? **MWD Administrative Code § 3107(b)(4)(iii)**	Member Agency Response: **Yes** Description: ▪ Calleguas' 2020 UWMP is available on its website: https://www.calleguas.com/cmwdfinal2020uwmp.pdf ▪ The City of Oxnard's 2020 UWMP: https://www.oxnard.org/city-department/public-works/water/uwmp/ ▪ The Department of Water Resources (DWR) is currently reviewing the Calleguas MWD 2020 UWMP and the City of Oxnard 2020 UWMP. Documentation regarding DWR's determination of each agency's 2020 UWMP compliance with California Water Code (CWC) requirements can be provided upon receipt.
13. What is the status of implementing the water plans, projects, and programs described in the UWMP to implement California Water Code Section 10620 et seq.?	Member Agency Response: In progress Description: ▪ Calleguas relies in part on the MWD Water Surplus & Drought Management Plan, including the periodic updates to MWD's Water Supply Allocation Plan (WSAP).

MWD Administrative Code § 3107(b)(5)	▪ As required for the 2020 CMWD UWMP update, the District developed its own Water Shortage Contingency Plan (WSCP). See Calleguas 2020 Urban Water Management Plan Appendix K ▪ The Calleguas MWD Final 2020 UWMP and WSCP were adopted by the Calleguas Board of Directors on June 2, 2021 (Resolution No. 2018).

Notes: N/A

RESOLUTION XXXX

RESOLUTION OF THE BOARD OF DIRECTORS
OF THE METROPOLITAN WATER DISTRICT
OF SOUTHERN CALIFORNIA
CONSENTING TO CALLEGUAS MUNICIPAL WATER DISTRICT'S
CALLEGUAS ANNEXATION NO. 106
AND FIXING THE TERMS AND CONDITIONS
TO
THE METROPOLITAN WATER DISTRICT OF SOUTHERN CALIFORNIA

WHEREAS, the Board of Directors of the Calleguas Municipal Water District ("Calleguas"), a county water authority situated in the county of Ventura, state of California, pursuant to Resolution No. 2037, in accordance with the provisions of the Metropolitan Water District Act (MWD Act), has applied to the Board of Directors of The Metropolitan Water District of Southern California (Metropolitan) for consent to annex thereto certain uninhabited territory situated in the county of Ventura referred to as Calleguas Annexation No. 106, more particularly described in an application to the Ventura County Local Agency Formation Commission (LAFCO), concurrently with Calleguas Annexation No. 106 thereof to Calleguas, such annexation to Metropolitan to be upon such terms and conditions as may be fixed by the Board of Directors of Metropolitan;

WHEREAS, the owner of Ventura County Assessor Parcel Number 223-0-041-020, 223-0-090-015, and 223-3-090-095 (Property) has applied for annexation into the Calleguas and Metropolitan service areas;

WHEREAS, completion of said Annexation No. 106 shall be contingent upon approval by the LAFCO; conditioning its approval of the Calleguas Annexation No. 106 upon a requirement that Metropolitan's existing and established taxes, benefit assessments, or property-related fees or charges in place in the service area are levied or fixed and collected on the parcels being annexed to the agency; these taxes, benefit assessments, or property-related fees or charges are identified below;

WHEREAS, Metropolitan has levied and collected ad valorem taxes on parcels within the territory of Calleguas. Such charges for fiscal year 2022/23 are described in Resolution 9301, adopted by Metropolitan's Board on April 12, 2022;

WHEREAS, since fiscal year 1992-93, Metropolitan has levied and collected water standby charges pursuant to Section 134.5 of the MWD Act on parcels within the territory of Calleguas. Such charges for fiscal year 2022/23 are described in Resolution 9307, adopted by Metropolitan's Board on May 10, 2022;

WHEREAS, upon Annexation No. 106, the parcel will be within Metropolitan's service area, Metropolitan water will be available to such parcels and such parcels will receive the benefit of the projects provided in part with proceeds of Metropolitan's water standby charges. Upon completion of the annexation, the lands within the Calleguas Annexation No. 106 will be subject to Metropolitan's water standby charge in the current amount of $9.58 per an acre, or per a parcel of less than one acre. Approval of Metropolitan's standby charge levied elsewhere within Calleguas' territory is a condition to complete this annexation;

WHEREAS, pursuant to the provisions of the California Environmental Quality Act (CEQA), Calleguas Municipal Water District, acting as Lead Agency, prepared a Notice of Exemption (NOE) for the Calleguas Annexation No. 106 Project, and approved the Project on January 24, 2022, to annex the affordable housing infill development, and Metropolitan, as Responsible Agency, independently determined that the proposed action is categorically exempt as an infill development and annexation of individual small parcels of a minimum size, and qualifies as 100% affordable housing development per Senate Bill 35 and Government Code Section 65913.4 as a streamlined infill project; and

WHEREAS, it appears to this Board of Directors that such application should be granted, subject to the terms and conditions hereinafter set forth.

NOW, THEREFORE, BE IT RESOLVED, that the Board of Directors of Metropolitan, acting as Responsible Agency, reviewed and considered the information in the NOE prior to approval of the final terms and conditions for Calleguas Annexation No. 106; and subject to the following terms and conditions, does hereby grant the application of the governing body of Calleguas Municipal Water District for consent to annex Calleguas Annexation No. 106, to Metropolitan and does hereby fix the terms and conditions of such annexation.

BE IT FURTHER RESOLVED that the Board of Directors of Metropolitan, subject to the following terms and conditions, does hereby grant the application of the governing body of Calleguas for consent to Calleguas Annexation No. 106 to Metropolitan and does hereby fix the terms and conditions of such annexation:

Section 1. Annexation of said area to Calleguas shall be made concurrently with annexation thereof to Metropolitan, and all necessary certificates, statements, maps, and other documents required to be filed by or on behalf of Calleguas to effectuate Annexation No. 106 shall be filed on or before December 31, 2023.

Section 2. Prior to filing a request for a Certificate of Completion of Annexation No. 106 proceedings with LAFCO, Calleguas shall submit a certified copy of LAFCO's resolution approving Annexation No. 106 to Calleguas and shall pay to Metropolitan $46,618.11 for its annexation fee, if annexation is completed by December 31, 2022. If the annexation is completed during the 2023 calendar year, the annexation charge will be calculated based on the then-current rate, in accordance with Metropolitan's Administrative Code Section 3300.

Section 3. a. Metropolitan shall be under no obligation to provide, construct, operate, or maintain feeder pipelines, structures, connections, and other facilities required for the delivery of water to said area from works owned and operated by Metropolitan Calleguas shall not be entitled to demand that Metropolitan deliver water to Calleguas for use, directly or indirectly, within said area, except for domestic or municipal use therein.

b. The delivery of all water by Metropolitan, regardless of the nature and time of use of such water shall be subject to the water service regulations, including rates and charges promulgated from time to time by Metropolitan.

c. The delivery of all water by Metropolitan, regardless of the nature and time of use of such water shall be subject to the water service regulations, including rates and charges promulgated from time to time by Metropolitan.

d. Except upon the terms and conditions specifically approved by the Board of Directors of Metropolitan, water sold and delivered by Metropolitan shall not be used in any manner which intentionally or avoidably results in the direct or indirect benefit of areas outside Metropolitan, including use of such water outside Metropolitan or use thereof within Metropolitan in substitution for other water outside Metropolitan.

Section 4. LAFCO has conditioned approval of Calleguas Annexation No. 106 upon a requirement that Metropolitan levy or fix and collect all previously established and collected taxes, benefit assessments, or property-related fees or charges on parcels being annexed to the agency.

Section 5. Such charges, which are subject to change over time, include but are not limited to:

a. Metropolitan's ad valorem tax on properties located within the territory of Calleguas in the amount of 0.0035 percent of the assessed value of each parcel. Metropolitan shall levy the ad valorem tax in the amount, at the same time and in the same manner as ad valorem tax on other properties located within the territory of Calleguas. Such charges for fiscal year 2022/23 are described in Resolution 9301, adopted by Metropolitan's Board on April 12, 2022.

b. Metropolitan's water standby charge on properties located within the territory of Calleguas in the amount, at the same time and in the same manner as the ad valorem tax on other properties located within the territory of Calleguas. Such charges for fiscal year 2022/23 are described in Resolution 9307, adopted by Metropolitan's Board on May 10, 2022.

Section 6. That the General Manager is hereby authorized and directed to take all necessary action to secure the collection of the ad valorem taxes and water standby charges by the appropriate county officials, including payment of the reasonable cost of collection.

Section 7. That the Board of Directors of Metropolitan, acting as Responsible Agency, reviewed and considered the information in the NOE prior to approval of the final terms and conditions for the Annexation No. 106; and subject to the following terms and conditions, does hereby grant the application of the governing body of Calleguas for consent to annex the Calleguas Annexation No. 106 to Metropolitan and does hereby fix the terms and conditions of such annexation.

Section 8. That the General Manager and General Counsel are hereby authorized to do all things necessary and desirable to accomplish the purposes of this resolution, including, without limitation, the commencement of defense of litigation.

Section 9. That if any provision of this resolution or the application to any member agency, property or person whatsoever is held invalid, that invalidity shall not affect the other provisions or applications of this resolution which can be given effect without the invalid portion or application, and to that end the provisions of this resolution are severable.

BE IT FURTHER RESOLVED that the Board Executive Secretary is directed to transmit forthwith to the governing body of Calleguas a certified copy of this resolution.

I HEREBY CERTIFY that the foregoing is a full, true and correct copy of a resolution adopted by the Board of Directors of The Metropolitan Water District of Southern California, at its meeting held on June 14, 2022.

_____

Secretary of the Board of Directors
of The Metropolitan Water District
of Southern California

Notice of Exemption

Appendix E

To: Office of Planning and Research
P.O. Box 3044, Room 113
Sacramento, CA 95812-3044

County Clerk
County of: Ventura

From: (Public Agency) Calleguas Municipal Water District
2100 Olsen Road
Thousand Oaks, CA 91360
(Address)

Project Title: exation 106 - Cypress Place at Garden City/Garden City Acres Park

Project Applicant: Calleguas MWD Ann Calleguas Municipal Water District

Project Location - Specific:

5536 and 5482 Cypress Road (Cypress Place at Garden City) and 5302 Cypress Road (Garden City Acres Park)

Project Location - City: Oxnard Project Location - County: Ventura

Description of Nature, Purpose and Beneficiaries of Project:

Annexation to Calleguas Municipal Water District and Metropolitan Water District of Southern California to allow municipal water service to the proposed Cypress Place at Garden City by the City of Oxnard and to legalize existing water service at the Garden City Acres Park.

Name of Public Agency Approving Project: Calleguas Municipal Water District

Name of Person or Agency Carrying Out Project: Calleguas Municipal Water District

Exempt Status: **(check one):**

- ☐ Ministerial (Sec. 21080(b)(1); 15268);
- ☐ Declared Emergency (Sec. 21080(b)(3); 15269(a));
- ☐ Emergency Project (Sec. 21080(b)(4); 15269(b)(c));
- ☒ Categorical Exemption. State type and section number: Class 1 (Existing Facilities) and Class 19 (Annexations of Existing Facilities)
- ☒ Statutory Exemptions. State code number: Senate Bill 35 and Government Code Section 65913.4

Reasons why project is exempt:

Cypress Place at Garden City is a proposed 100% affordable housing development. The City of Oxnard found the proposed project meets the requirements of Senate Bill 35 and Government Code Section 65913 4 as a Streamlined Infill Project, and is therefore statutorily exempt from CEQA.

Garden City Acres Park is an existing facility and annexation would not result in any new or expanded use. Applicable CEQA Guidelines are Sections 15301 (Existing Facilities) and 15319 (Annexations of Existing Facilities).
