	best available scientific and commercial data regarding the prevention of bird collisions with transmission and guy wires.			
Impact BIO-1	**CMA LUPA-TRANS-BIO-3.** When siting transmission activities, the alignment should avoid, to the maximum extent practicable, being located across canyons or on ridgelines. Site and design sufficient distance between transmission lines to prevent electrocution of condors.	Confirm alignment meets standards.	Design	The Applicant
Impact BIO-1 Impact BIO-2	**CMA LUPA-TRANS-BIO-4.** Siting of transmission activities will be prioritized within designated utility corridors, where possible, and designed to avoid, where possible, and otherwise minimize and offset impacts to sand transport processes in Aeolian corridors, rare vegetation alliances and focus and BLM Special-Status species. Transmission substations will be sited to avoid Aeolian corridors, rare vegetation alliances, and sand-dependent focus and BLM special-status species habitats.	Confirm siting meets standards.	Design	The Applicant
Impact BIO-1	**CMA DFS-VPL-BIO-FIRE-1.** Implement the following standard practice for fire prevention/protection: • Implement site-specific fire prevention/protection actions particular to the construction and operation of renewable energy and transmission Project that include procedures for reducing fires while minimizing the necessary amount of vegetation clearing, fuel modification, and other construction-related activities. At a minimum these actions will include designating site fire coordinators, providing adequate fire suppression equipment (including in vehicles), and establishing emergency response information relevant to the construction site.	Confirm implementation of fire prevention standards.	Pre-Construction Construction	The Applicant
Impact BIO-1 Impact BIO-2	MM BIO-CEQA-1 Implement Biological Resources Applicant Proposed Measures, Best Management Practices, and Conservation and Management Actions.	The Applicant shall develop a weekly report that shall include all applicable APMs, BMPs,	APMs, BMPs, and CMAs shall be implemented throughout	The Applicant shall ensure that all APMs, BMPs, and CMAs are

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
	The APMs, BMPs and CMAs in Sections 2.4.2 and 2.4.3 above provide a suite of measures, practices, and actions that shall be implemented as part of the Project. APMs, BMPs, and CMAs shall be implemented prior to, during, and after Project activities to avoid or minimize Project related impacts on biological resources. If an APM, BMP, or CMA is subjective, such as containing text that states; "where appropriate," "where applicable," "where feasible," or similar language, the BLM and CPUC shall be consulted to determine the applicability of each measure prior to the disturbance of a covered resource. Compliance with APMs, BMPs, and CMAs shall be documented, and a weekly report shall be provided to the BLM and CPUC. The Applicant shall provide a synopsis of the Weekly Compliance Report to the BLM and CPUC Monthly Compliance Report. Each report shall include a summary of the construction activities completed, a review of the sensitive plants and wildlife encountered, a list of compliance actions and any remedial actions taken to correct the actions, and the status of on-going mitigation efforts. Standards for Success: Compliance with all applicable APMs, BMPS, and CMAs is achieved throughout construction of the Project.	and CMAs and the related actions taken in order to be in compliance with these measures. These weekly reports shall be compiled and submitted to the BLM and CPUC monthly.	construction activities.	implemented during construction. If an APM, BMP, or CMA is subjective, the Applicant shall consult with the BLM and/or the CPUC to determine the applicability of each measure.
Impact BIO-1 Impact BIO-2 Impact BIO-4	MM BIO-CEQA-2: Implement a Worker Environmental Awareness Program (WEAP). BMP-BIO 1 and CMA LUPA-BIO-5 shall be incorporated within this MM BIO-CEQA-2. Prior to any work activities on the Project site, including surveying, mobilization, fencing, grading, or construction, a WEAP shall be prepared and implemented by the Applicant. Prior to implementation the WEAP will be approved by the CPUC with a final version completed prior to the issuance of construction permits. The WEAP shall be implemented throughout the duration of Project, including O&M phases. Successful implementation of the WEAP will result in all on-site Project personnel	The WEAP shall be developed by a qualified biologist designated by the Applicant and approved by the CPUC. A copy of the WEAP shall be kept at an easily accessible location within the Project site for the duration of the Project. A log of all personnel who have completed the	Prior to construction, and during construction for all new on-site Project personnel.	The Applicant shall ensure that a qualified biologist (approved by the CPUC) prepares the WEAP and that it is implemented for all on-site Project personnel.

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
	being properly informed and educated on the pertinent environmental concerns related to the Project. One of the main goals of the WEAP, is that it shall reduce unintentional impacts to biological resources within the Project area and ensure that all workers are trained in accordance with this MM. The WEAP shall include, at a minimum, the following items: Maps showing the known locations of listed and/or special-status wildlife, populations of listed and special-status plants and sensitive vegetation communities, riparian habitats, seasonal depressions and known waterbodies, wetland habitat, exclusion areas, and other construction limitations. A discussion of measures to be implemented for avoidance of sensitive resources discussed in the EIS (including this appendix) and the identification of an onsite contact in the event of the discovery of sensitive species on the Project site; this shall include a discussion on micro trash. Training materials and briefings shall include, but not be limited to: a discussion of the FESA and CESA; the BGEPA; the MBTA; the APLIC guidelines; the consequences of non-compliance with these regulations; identification and values of plant and wildlife species and significant natural plant community habitats; hazardous substance spill prevention and containment measures; a contact person and phone number in the event of the discovery of dead or injured wildlife; and a review of mitigation requirements. Protocols to be followed when roadkill is encountered in the work area, or along access roads, and the identification of an onsite representative to whom the roadkill shall be reported. Roadkill shall be reported to the appropriate local animal control agency, the CPUC within 24 hours. Roadkill of special-status species shall also be reported to the CDFW and/or USFWS within 24 hours or otherwise specified in Project-specific	WEAP training shall be kept on site.		

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
	permits. Literature and photographs or illustrations of potentially occurring special-status plant and/or wildlife species shall be provided to all Project contractors and heavy equipment operators. A special hardhat sticker or wallet size card shall be issued to all personnel completing the training, which shall be carried with the trained personnel at all times while on the Project site. All new personnel shall receive this training and may work in the field for no more than 5 days without participating in the WEAP. A log of all personnel who have completed the WEAP training shall be kept on site. A copy of the WEAP shall be kept at an easily accessible location within the Project site (i.e., foreman's vehicle, construction trailer, etc.) for the duration of the Project. A standalone version of the WEAP shall be developed, that covers all previously discussed items above, and that can be used as a reference for maintenance personnel during Project operations. The Applicant shall ensure that interpretation of the WEAP is available for all non-English speaking workers. Standards for Success: All construction/Project related personnel are trained in the key characteristics for identifying and avoiding impacts to special status species and sensitive habitats.			
Impact BIO-1 Impact BIO-2	MM BIO-CEQA-3: Implement Biological Construction Monitoring. APM BIO-2, BMP BIO-02, and CMA LUPA BIO-2 shall be incorporated within this MM BIO-CEQA-3.	Copies of daily monitoring reports shall be compiled and submitted to the CPUC,	During all Project phases if biological resources are	The Applicant is responsible for designating qualified biologists

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
	No more than 30 days prior to the start of site mobilization or ground disturbing activities, the Applicant shall designate a qualified biologist(s) to monitor construction of the Project. Multiple qualified biologists shall be designated by the Applicant, as needed. Designated qualified biologists must be approved by the CPUC, BLM, and CDFW prior to conducting construction monitoring. The biologist(s) must be knowledgeable with the life history and habitat requirements of Federal and State listed and special-status plants, mammals, reptiles, amphibians, and birds. The qualified biologist(s) shall conduct clearance surveys for listed and special-status species prior to the start of construction activities each workday during initial site disturbance; clearance surveys can be conducted on a weekly basis thereafter. Any handling of special-status species must be approved by the appropriate Federal and State agencies and be done in accordance with species-specific handling protocols. During initial site disturbance, and for the duration of construction, the qualified biologist(s) shall remain on-site at all times when activities shall occur immediately adjacent to, or within, habitat that supports populations of listed and/or special-status species. The designated biologist(s) shall relocate terrestrial special-status species that would be impacted by the Project. An exception to this would be for Fully Protected species, which would require avoidance. Additionally, Federal and state-listed species would require FESA and CESA authorization to handle or relocate. All locations of listed and/or special-status plants shall be flagged for avoidance or salvage, relocation, or transplanting as described in MM VEG-CEQA-4. Similarly, locations of listed and/or special-status wildlife shall be flagged for avoidance and appropriate avoidance buffers established as described in MM WIL-CEQA-1 through MM WIL-CEQA-11. If dead or injured special-status wildlife species and/or impacted special-status plant are detected on the construction site, the qualified biological monitor shall, immediately upon finding the remains or injured animal, coordinate with the onsite construction foreman to discuss the events that caused the mortality or injury, if known, and implement measures to	BLM, and CDFW on a weekly basis. Separate incident reports shall be compiled and submitted to the appropriate Federal and State agencies if observations of dead, injured or impacted special-status species are observed during monitoring within five calendar days.	pertinent or monitoring is required by the appropriate Federal or State regulatory agency.	to monitor Project construction activities that are within and/or adjacent sensitive habitats, and/or have the potential to impact special-status species.

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
	prevent future incidents. Details of these measures shall be included within monitoring separate incident report. Species remains shall be collected and frozen as soon as possible, and CDFW and USFWS, as well as all other appropriate Federal and State regulatory agencies, shall be contacted regarding ultimate disposal of the remains. The incident report shall be sent to the CPUC, CDFW and/or USFWS (as appropriate), as well as any other appropriate Federal and State agencies, within five calendar days. The construction biological monitoring report shall at a minimum include: the date, time of the finding or incident (if known), and location of the carcass, injured animal or other impacted species, and the circumstances of its death or injury (if known). Injured animals shall be taken immediately to the nearest appropriate veterinary or wildlife rehabilitation facility. Standards for Success: Sensitive biological resources are avoided and/or impacts are reduced to a less than significant level throughout all construction activities.			
Impact BIO-1 Impact BIO-2	MM BIO-CEQA-4: Avoidance Measures and Compensation for Impacts to Jurisdictional Waters/Wetlands and/or Sensitive Natural Communities. The following APMs, BMPs, and CMAs shall be incorporated within this MM BIO-CEQA-4: APM BIO-2; BMP BIO-2; APM BIO-4; APM BIO-11; BMP BIO-11; APM BIO-13; APM BIO-14; APM BIO-15; BMP BIO-15; APM BIO-16; BMP BIO-24; BMP BIO-25; BMP BIO-52; BMP BIO-53; BMP BIO-55; BMP VEG-01; BMP VEG-02; CMA DFA-BIO-IFS-1; CMA DFA-BIO-IFS-2; CMA DFA-VPL-BIO-DUNE-1; CMA LUPA-BIO-1; CMA LUPA-BIO-2; CMA LUPA-BIO-3; CMA LUPA-BIO-4; CMA LUPA-BIO-7; CMA LUPA-BIO-9; CMA LUPA-BIO-13; CMA LUPA-BIO-14; CMA LUPA-BIO-DUNE-1; CMA LUPA-BIO-DUNE-3; CMA LUPA-BIO-DUNE-5; CMA LUPA-BIO-PLANT-1; CMA LUPA-BIO-PLANT-2; CMA LUPA-BIO-RIPWET-1; CMA LUPA-BIO-RIPWET-3; CMA LUPA-BIO-SVF-1; CMA LUPA-BIO-SVF-6;	A Preliminary Jurisdictional Wetlands/Waters Delineation Report shall be prepared and approved by the ACOE and CDFW prior to Project commencement; all required regulatory permits must be obtained prior to the start of Project activities. All jurisdictional waters/wetlands and	Pre-construction surveys to delineate jurisdictional aquatic resource features and/or map sensitive vegetation communities shall be completed prior to Project commencement and all required permits have been	The Applicant shall ensure that a designated qualified biologist (approved by the CPUC, BLM, and CDFW) conducts pre-construction surveys (i.e., delineation and mapping) for jurisdictional waters/wetlands and sensitive

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
	CMA LUPA-SW-13; and CMA LUPA-SW-16. To avoid, minimize disturbance, and restore impacts to jurisdictional waters/wetlands and sensitive natural communities the following shall be implemented: Prior to conducting any Project activities, a formal jurisdictional delineation and mapping of sensitive natural communities shall be conducted following current protocols, guidance, and standards, as defined by the ACOE, RWQCB, and CDFW. The Applicant shall ensure that a formal delineation is conducted, and all required regulatory permits are obtained prior to the start of Project construction activities. Implement APMs and BMPs to prevent prohibited materials from entering jurisdictional waters/wetlands and/or causing disturbance to sensitive natural communities. Construction activities shall be done in such a manner as to avoid and minimize the removal and impacts to jurisdictional waters/wetlands and sensitive natural communities to the extent feasible. If jurisdictional waters/wetlands and/or sensitive natural communities are present within the Project area, then they shall be identified as environmentally sensitive areas and flagged by an Applicant designated qualified biologist prior to construction activities. If jurisdictional waters/wetlands and/or sensitive natural communities are present within the Project area, then the Applicant shall ensure that the designated qualified biologist is on-site at all times during active work in these areas; including but not limited to within the floodplain, adjacent to and/or in jurisdictional waters/wetlands, and/or in sensitive natural communities. All on-site personnel shall be instructed on the importance of avoiding and minimizing disturbance in these areas if present within the	sensitive natural communities shall be identified (including measures for avoidance and mitigation), mapped, and included in the Vegetation Management Plan (MM VEG-CEQA-1). Specific mitigation and monitoring requisites for temporarily and/or permanently impacts jurisdictional waters/wetlands and/or sensitive natural communities shall also be documented in the Special-Status Plant and Sensitive Vegetation Community Mitigation and Monitoring Plan (MM-VEG-CEQA-4). Subsequent follow-up reporting measures are as defined in the Vegetation Management Plan (MM VEG-CEQA-1) and Special-Status Plant and Sensitive Vegetation Community Mitigation	obtained. Environmentally sensitive area exclusion fencing (at appropriate buffer distances) shall be implemented in the appropriate locations prior to Project activities. All temporary and permanent mitigation shall be approved by the appropriate Federal and/or State regulatory agencies prior to Project commencement.	natural communities. The Applicant is responsible for the implementation of environmentally sensitive area exclusion fencing and mitigation from potential impacts of these features.

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
	Project area. If impacts to jurisdictional waters/wetlands or sensitive natural communities cannot be avoided, the Applicant shall coordinate with the appropriate Federal and State regulatory agencies to obtain authorization from the ACOE through a CWA Section 404 ACOE Nationwide Permit (NWP) or Individual Permit (IP); the RWQCB through a CWA Section 401 WQC; and the CDFW through a California FGC Section 1602 LSA Notification. The Applicant shall restore all temporary impacts at a ratio of 1.5:1 as described in the Vegetation Management Plan (MM-VEG-CEQA-1). Restoration of conditions of the impacted areas within the Project footprint shall be at 1:1; and creation, restoration, or enhancement of similar vegetation communities offsite shall be 0.5:1, as approved by CDFW and CPUC. Alternatively, payments would be made into an appropriate mitigation program or other mitigation funding mechanism. To compensate for permanent impacts to jurisdictional waters/wetlands, the impacted areas shall be replaced at a minimum ratio of 2:1 but will vary depending on the mitigation strategy used. Permanent impacts to riparian desert woodland habitats (e.g., blue Palo Verde-ironwood woodland, mesquite thickets, bush seepweed) that are jurisdictional shall be mitigated at a ratio of 5:1 (e.g., desert riparian woodland). Additional mitigation may be proposed by each Federal and/or State agency during the regulatory permitting process. The mitigation strategy to compensate for the loss of jurisdictional habitats may be achieved by (a) on-site habitat creation or enhancement with similar species compositions to those present prior to construction; (b) off-site creation, enhancement, and/or preservation; and/or (c) participation in an established mitigation bank program. If offsite lands are used as part of the mitigation strategy, then they shall be permanently protected by establishing a conservation easement. The Applicant shall	and Monitoring Plan (MM-VEG-CEQA-4).		

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
	coordinate with CPUC, BLM, and CDFW to determine the conditions of the conservation easement, including the required acreage to be conserved and the required monitoring and management of the conserved lands, as appropriate. All mitigation for temporary and/or permanent impacts to jurisdictional waters/wetlands and/or sensitive natural communities shall be approved by the appropriate Federal and State regulatory agencies prior to Project activities. All created or restored habitats shall be monitored per the requirements in the Vegetation Management Plan (MM-VEG-CEQA-1), and the Special-Status Plant and Sensitive Vegetation Community Mitigation and Monitoring Plan (MM-VEG-CEQA-4). All lands identified for preservation would require the recordation of a conservation easement. The easement could be held by CDFW or an approved land management entity. All lands identified for preservation shall require approval from the appropriate Federal and/or State regulatory agency. Standards for Success: No net loss of jurisdictional waters/wetlands and/or sensitive natural communities. Disturbance to all jurisdictional waters/wetlands and/or sensitive natural communities shall be minimized and avoided to the extent feasible. Temporary impacts shall be restored at a 1.5:1 ratio. Restoration of conditions of the impacted areas within the Project footprint shall be at 1:1; and creation, restoration, or enhancement of similar vegetation communities offsite shall be 0.5:1, as approved by CDFW and CPUC. Alternatively, payments would be made into an appropriate mitigation program or other mitigation funding mechanism. Permanent impacts to jurisdictional waters/wetlands shall be mitigated at a ratio that varies from 2:1 to 5:1 depending on the resource impacted and mitigation strategy used. All temporary and/or permanent impacts to jurisdictional waters/wetlands and/or sensitive natural communities shall be mitigated and approved by the appropriate Federal and State regulatory agencies.			

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
Impact BIO-1	MM VEG-CEQA-1: Develop and Implement a Vegetation Management Plan. The following APMs, BMPs, and CMAs shall be incorporated within this MM VEG-CEQA-1: APM BIO-4; APM BIO-10; APM BIO-11; BMP BIO-11; APM BIO-12; APM BIO-13; APM BIO-14; APM BIO-15; BMP BIO-15; APM BIO-16; BMP BIO-32; BMP BIO-37; BMP BIO-41; BMP BIO-41; BMP BIO-43; BMP BIO-51; BMP BIO-52; BMP BIO-53, BMP BIO-54; BMP BIO-55; BMP VEG-01; BMP VEG-02; CMA DFA-BIO-IFS-1; CMA DFA-BIO-IFS-2; CMA LUPA-BIO-1; CMA LUPA-BIO-3; CMA LUPA-BIO-4; CMA LUPA-BIO-7; CMA LUPA BIO-8; CMA LUPA-BIO-10; CMA LUPA-BIO-11; CMA LUPA-BIO-14; CMA LUPA-BIO-15; CMA LUPA-BIO-COMP-1; CMA LUPA-BIO-PLANT-1; CMA LUPA-BIO-PLANT-2; CMA LUPA-BIO-PLANT-3; CMA LUPA BIO-SVF-1; CMA LUP-BIO-VEG-1; CMA LUP-BIO-VEG-2; CMA LUP-BIO-VEG-3; CMA LUP-BIO-VEG-5; CMA LUP-BIO-VEG-6; CMA LUPA-SW-13; CMA LUPA-TRANS-BIO-4; and CMA DFS-VPL-BIO-FIRE-1. Prior to the start of ground disturbance, the Applicant shall develop and implement a Vegetation Management Plan for the Project. The Vegetation Management Plan shall be approved by the BLM, CPUC, and CDFW prior to the start of any Project activities (i.e., mobilization). The purpose of the Vegetation Management Plan is to provide guidance and outline a Project-specific protocol to ensure that the Applicant restores all temporarily disturbed areas to pre-construction conditions, or better, and provide for habitat preservation, creation, and/or restoration resulting from permanent impacts to special-status species habitat, sensitive vegetation communities, and/or jurisdictional waters/wetlands. The Vegetation Management Plan shall detail procedures to manage, monitor, mitigate, and restore native vegetation and habitat, as well as provide controls for noxious and invasive weed species. The Vegetation Management Plan shall incorporate the APMs, BMPs, and CMAs, by including the specifications detailed in the Habitat Restoration and Monitoring Plan, the Noxious Weed	Prior to Project commencement, pre-construction vegetation surveys shall be conducted by an Applicant designated qualified biologist. A Vegetation Management Plan shall be prepared by the Applicant and approved by the appropriate Federal and State regulatory agencies prior to Project commencement. Following Project completion, the Applicant shall ensure post-construction vegetation management surveys are completed quarterly and annually. Post-Construction Vegetation Management Quarterly Monitoring Reports, and Post-Construction Vegetation Management Annual Monitoring Reports shall be prepared by the Applicant and	Vegetation management shall be conducted, as needed, within the Project area prior to construction, during construction, and following the completion of Project activities; special attention will be paid to avoid nesting/breeding seasons for special-status wildlife and blooming periods for status plants where practicable.	The Applicant shall ensure that a qualified biologist (approved by the CPUC, BLM, and CDFW) familiar with special-status species, sensitive vegetation communities, noxious and invasive vegetation species, and jurisdictional waters/wetlands present in the Project region, is appointed to oversee vegetation management activities.

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
	Management Plan/Invasive Species Management/Control Plan, and all other applicable vegetation management mitigation and monitoring plans associated with the Project. The Vegetation Management Plan shall also reference and integrate protocols and requirements detailed in the most up-to-date State and Federal laws, policies and guidance regarding vegetation management including, but not limited to: • *Integrated Vegetation Management Handbook* (BLM 2008); Integrated Weed Management Plan (BLM 2015b); Memorandum of Understanding on Vegetation Management for Powerline Rights-of-Way (USDA 2016); New Diagrams and Applications for the Wire Zone-border Zone Approach to Vegetation Management on Electric Transmission Line ROWs (Ballard et al. 2007); Saguaro (Carnegiea gigantea, Cactaceae) Age-Height Relationships and Growth: The Development of a General Growth Curve (Drezner 2003); The Step-Pointe Method of Sampling- A Practical Tool in Range Research (Evans et al. 1957); and Transmission Vegetation Management, NERC Standard FAC-003-2 Technical Reference (NERC 2009-2011). The Vegetation Management Plan shall include, at a minimum, an overview of the following technical items: **Vegetation Management Goals and Objectives.** The goals of Project vegetation management shall be defined in the Project Vegetation	submitted to the appropriate Federal and State regulatory agencies.		

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
	Management Plan. At a minimum, Project vegetation management shall be consistent with the following objectives: Vegetation management measures and BMPs pertaining to sensitive vegetation species and habitats, seeding, soils, restoration and revegetation, noxious and invasive weeds, equipment, schedule and implementation timing, success criteria, monitoring and reporting will be specifically outlined and be consistent with the aforementioned protocols and methodologies set forth by the appropriate State and Federal regulatory agencies; Vegetation will be trimmed, cleared, or otherwise controlled, to minimize and reduce impacts to the extent practicable; Avoidance and minimization shall be employed to ensure the reduction, introduction, and spread of noxious and invasive weed species; The Project will restore, and revegetate affected areas; Habitat enhancement and preservation shall be applied to the extent practical (e.g., promote appropriate levels of dead and downed woody debris to provide habitat and sees bed establishment); and Mitigation and contingency measures will be employed on an as needed basis. **Plan Submittal and Approval Process.** A process for proposing Vegetation Management Plan modifications to the appropriate Federal and State regulatory agencies for review and approval shall be outlined**.** **Avoidance, Minimization, Restoration, and Mitigation Criteria.** Documentation shall include the avoidance, minimization, restoration, and mitigation criteria terms, stipulations, and general conditions required by the appropriate Federal and State regulatory agencies. All disturbed Project			

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
	areas shall be restored and revegetated to the extent practicable, given the arid desert environment. **Pre-Construction Project Site Conditions.** Provide a description of the pre-Project conditions. Describe other site characteristics relevant to the management of vegetation (e.g., composition of plants, topography and drainage patterns, soil types, geomorphic and hydrologic processes important to the site or species, pre-construction anthropogenic factors, etc.). This shall also include ecological characteristics and factors **(**e.g., total population, reproduction, distribution, pollinators, etc.). **Methods**. Describe the methods that will be used (e.g., invasive exotics control, site protection, seedling protection, propagation techniques, crush and drive-cut-mow removal techniques, etc.) and the long-term maintenance required. **Discussion.** The Vegetation Management Plan will include a discussion section that, at a minimum, considers specifications for habitat preservation and enhancement, adaptive management, use of conservation easements (e.g., Desert Wildlife Management Area, Wildlife Habitat Management Area), and other land use protections and restrictions applicable to the management of vegetation within the Project area. **Schedule.** A proposed schedule for all vegetation management, including vegetation pre- and post- construction surveys, monitoring, mitigation, restoration, and Project construction activities. The following is recommended as part of the Vegetation Management Plan schedule: Species-specific seasonal restriction dates will be outlined in the Vegetation Management Plan and observed during implementation. At a minimum, this shall incorporate timeframes for breeding and nesting birds, lambing, fawning, or roosting of species, bloom periods for special-status species, and periods of highest precipitation and rainfall (i.e., to maximize irrigation			

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
	requisites and implement erosion controls). The Project area should be broken up into sections based on the required construction activities; When applicable, restoration or habitat enhancement activities shall be implemented once construction activities are complete within a specific area; and Restoration and/or creation of habitat should occur within an appropriate window for each specific community and species makeup (i.e., impacts to habitat during the summer months may not be initiated until the fall to promote native seed germination). **Pre-Construction Survey.** Pre-construction vegetation surveys will consist of up to three survey events, to capture the annual species only present at specific times of the year, to document the presence of special-status species, to identify and map the locations and extent of sensitive vegetation communities, and a general vegetation inventory survey for all vegetation species, including invasive and noxious weeds. Measures for conducting and completing floristic surveys to support the Vegetation Management Plan are specified in MM VEG-CEQA-2—Conduct Pre-Construction Floristic Surveys. **Post-Construction Surveys, Monitoring, and Reporting.** The Applicant shall appoint a qualified biologist to complete post-construction surveys. Monitoring surveys shall be conducted within following vegetation management activities within the Project area (e.g., restoration, re-contouring, etc.). Areas subject to vegetation management shall be monitored to assess progress and to make recommendations for successful revegetation, habitat enhancement, etc. Monitoring surveys shall be performed by a qualified biologist knowledgeable in the area of vegetation management and restoration specific to the Project vegetation communities			

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
	and jurisdictional waters/wetlands. Monitoring o Qualitative Monitoring: Qualitative monitoring surveys shall be performed monthly in all vegetation management areas for the one year following the completion of Project activities and subsequent vegetation management implementation. Qualitative monitoring shall be on a quarterly schedule thereafter, until final completion and approval by the appropriate Federal and State regulatory agencies. Qualitative monitoring shall assess native plant species performance, including growth and survivorship, germination success, reproduction, plant fitness and health, and pest or invasive plant problems. Monitoring at this stage shall indicate need for remediation or maintenance work well in advance of final success/failure determination. Post-Construction Vegetation Management Quarterly Monitoring Progress Reports shall be prepared for the first year of monitoring and are further described below. o Quantitative Monitoring: Quantitative monitoring shall occur annually for year one through five, or for additional years until the success criteria are met. Within each vegetation management area, the qualified biologist shall collect data in a series of 1 m^2 quadrats to estimate absolute and relative cover and density of each plant species. In year 2 or 3, depending on the growth within the vegetation management, the qualitative monitoring methods may deviate from the quadrat methodology to toe-point transects (Evans et al. 1957). Data shall be used to measure native species growth performance, to estimate native and non-native species coverage, seed mix germination, native species recruitment and			

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
	reproduction, and species diversity. Based on these results, the designated biologist shall make recommendations for maintenance, adaptive management, or remedial work efforts that may be needed to meet success criteria for the Project area vegetation management requisites. Reporting Quarterly Reporting: For the first year, a Post-Construction Vegetation Management Quarterly Monitoring Progress Report shall be compiled by the Applicant detailing the post-construction results for areas where vegetation management has occurred within the Project area. The Post-Construction Vegetation Management Quarterly Monitoring Progress Reports shall include results for monthly qualitative monitoring; specifically, summarizing site status and recommended remedial measures. Each Post-Construction Vegetation Management Quarterly Monitoring Progress Report shall list estimated species coverage and diversity, species health and overall vigor, the establishment of volunteer native species, topographical/soils conditions, problem weed species, the use of the site by wildlife, significant drought stress, and any recommended remedial and/or adaptive management measures deemed necessary to ensure compliance with specified vegetation management success criteria. Annual Reporting: Every year, for years one through five, the results of annual quantitative monitoring shall be compiled into an Annual Post-Construction Vegetation Management Report by the Applicant. Each annual report shall list plant species coverage and diversity measured during yearly quantitative surveys, compliance/non-compliance with required vegetation management success criteria, species health and overall vigor, the establishment of volunteer native species, hydrological and topographical conditions, use of the site by wildlife, and the presence of invasive weed species. In the event of where the required vegetation			

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
	management success criteria are not fulfilled, the Annual Post-Construction Vegetation Management Report shall include remedial and/or adaptive management measures to ensure future success (CPUC 2016). These annual reports shall be forwarded by the qualified biologist to the appropriate State and Federal regulatory agencies (e.g., CPUC, BLM, and CDFW) at the end of each year following implementation of the Vegetation Management Plan, until the established success criteria have been met. Each Post-Construction Vegetation Management Annual Report shall include, at the minimum: – The name, title, and company of all persons involved in restoration monitoring and report preparation; – Maps or aerials showing vegetation management (i.e., restoration and invasive weed management areas), transect locations, and photos documentation with locations; – An explanation of the methods used to perform vegetation management, including, but not limited to, the number of acres for restoration and/or areas treated for removal of non-native plants; and – An assessment of the treatment success. **Planting Methodology and Palette**. Revegetation plantings shall be implemented in all areas impacted by Project activities. A description of the preferred methods for seeding shall be provided within the Vegetation Management Plan (e.g., hydroseeding, drill seeding, broadcast seeding, etc.). Additionally, a discussion on proposed timing of seeding, type and duration of irrigation system proposed (if needed), and erosion controls for revegetation activities, shall be included.			

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
	Several different plant palettes shall be developed depending on the vegetation communities proposed to be restored. The plant palettes shall include an appropriate native seed mix representative of the current species composition in the Project area. Seed should be sourced from genetic stock appropriate to the Project vicinity. In additional, all plant materials used in Project revegetation shall be consistent with the maintenance of natural ecosystem processes. Supply of seed material and container plants will be purchased by the Contractor. If commercial seed mixes are purchased, they shall be native and free of noxious weeds. If seed from genetic stock appropriate to the Project vicinity is not available, seeds can be collected within the Project vicinity with the appropriate permits and tags for native plant collection. The source of available seed must be approved by the BLM and CPUC prior to use in any species palates. Seeding and revegetation shall begin after construction has and will occur within 30 days post-construction. Supply of seed material and container plants will be purchased by the Contractor(s). **Noxious Weed and Invasive Species Management.** The Vegetation Management Plan will identify noxious and invasive weed species to be addressed in the Project area, describe measures to conduct pre-construction weed surveys, reduce the potential introduction or spread of noxious weeds and invasive species during construction, and monitor and control weeds during operation of the transmission line. Specifically, an inventory of invasive and noxious weeds shall be compiled following pre-construction floristic surveys and disposed of at an appropriate off-site location (MM VEG-CEQA-2). If weeds are detected in the Project area following removal, then remedial actions shall be employed to eradicate noxious or invasive weed species and to prevent their subsequent spread. All equipment, tools, and tires shall be properly cleaned and decontaminated of noxious weeds before entering the Project region. Prior			

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
	to construction activities (i.e., including clearing, grubbing, etc.), a Weed Decontamination Form will be submitted to the Project Designated Biologist. The Weed Decontamination Form shall verify that construction related equipment used by the contractor(s), has been cleaned and deemed weed free, before entering the Project region. Vehicle and equipment wash, and inspection stations will be utilized minimize the introduction of invasive weeds or subsidy of invasive weeds. Weed removal activities such as noxious/ invasive weed removal, and other varied management practices, are recommended before (e.g., topsoil weed removal) and after construction. When installing sediment barriers, the use of certified weed-free mulch, straw, hay bales, or equivalent fabricated materials shall be prescribed. The use of pesticides and/or herbicides is restricted in areas associated with waterways, wetlands, or areas that could impact water quality. Weed removal in jurisdictional areas adjacent to streams or wetlands shall be done using hands tools. Application of pesticides and/ or herbicides must be approved by the Project Designated Biologist, the appropriate local, State, and Federal regulatory agencies. **Soils and Contouring.** Native soils will be salvaged to the extent feasible. Specifically, soil horizons will be separated for the spoils, stored during construction, and returned to their native sites to ensure revegetation and restoration success. Restoring and preserving vegetation, as well as soil, will support and maintain native vegetation communities, associated carbon sequestration and nutrient cycling processes, and habitat for wildlife species. Erosion control measures will be implemented during all Project ground disturbance, including vegetation management activities. Recontouring of areas that were altered from their original contour or gradient is required.			

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
	Treatment of Succulents. Measures would be implemented to minimize the number of succulents (e.g., saguaro cacti) that must be relocated for the safe construction and operation of the transmission line. The Vegetation Management Plan shall detail requirements and methods for the salvage, storage, and replanting of succulent species. Saguaro cacti that are within 50-feet of the outermost conductors and could be tall enough to pose a hazard would be removed if they cannot be avoided through Project design. When possible, succulent species that must be removed would be relocated as directed by the appropriate State and Federal agencies (i.e., the BLM). Monitoring and management would be detailed in the Vegetation Management Plan. **Success Criteria.** A description of the success criteria and methods for achieving success of vegetation management, specifically restoration/revegetation efforts, and supplemental activities to be conducted. Success criteria in the Vegetation Management Plan shall address include the following components: Compliance Success: evaluates compliance with Project scope, permits, contracts, etc. Functional Success: evaluates habitat integrity and determines if restoration of the designated ecosystem(s) has been successful. Landscape Success: measures functional success and how restoration, management, maintenance, and monitoring of Project vegetation has contributed to the ecological integrity of overall landscape and has further maintained and/or enhanced biodiversity. Success will be based on the establishment of seeded and planted species and the exclusion of exotic and ruderal species as compared to reference or neighboring sites. **Figures.** The Vegetation Management Plan shall include detailed figures indicating the locations and vegetation types of areas proposed for			

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
	management (i.e., areas of temporary or permanent disturbance, mitigation areas, etc.). The location of special-status plant species shall be consistent with the floristic inventory conducted as part of MM VEG-CEQA-2. Specifically, these figures shall meet the specific BLM Guidelines for mapping of succulent species (e.g., cacti, yuccas, etc.); Mapped habitats for other species shall be consistent with the survey requirements; Avoidance setbacks for sensitive vegetation species and habitats shall be delineated on the Vegetation Management Plan figures. Setbacks shall be consistent with appropriate distances outlined in the APM, BMP, and CMA measures, as well as those defined by State and Federal requisites for the Project; and Vegetation Management Plan figures shall be updated, as necessary, to reflect current site conditions should they change. **Supplemental References.** In addition to the incorporation of the most-up-to-date State and Federal protocols, policies and guidance pertaining to vegetation management, the following Project-specific plans shall be referenced and/or included as supplemental attachments to the Vegetation Management Plan. ECP/ Erosion, Dust Control, and Air Quality Plan; Fire Prevention Plan; Project grading plans; SPCC; and SWPPP			

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
	Standards for Success: Restore temporarily disturbed areas to pre-construction conditions, or better, and provide for habitat preservation/creation/restoration resulting from permanent impacts to sensitive vegetation species, sensitive vegetation communities, and jurisdictional waters/wetlands. Reduce the spread and introduction of noxious and invasive vegetation species. Ensure all Project vegetation management success criteria are met. Remedial and/or adaptive management measures shall be implemented to meet vegetation management success criteria for the Project, as needed.			
Impact BIO-1	MM VEG-CEQA-2 Conduct Pre-Construction Floristic Surveys. The following APMs, BMPs, and CMAs shall be incorporated within this MM BIO-VEG-CEQA-2: APM BIO-2; BMP BIO-02; APM BIO-4; APM BIO-11; BMP BIO-11; BMP BIO-24; BMP BIO-41; BMP BIO-52; BMP BIO-53; CMA DFA-BIO-IFS-1; and CMA LUPA-BIO-1. Prior to the start of ground disturbance, including fencing, grading, or construction, the Applicant shall designate a qualified biologist/botanist (approved by the CPUC, BLM, and CDFW) to conduct pre-construction floristic surveys for the Project. The purpose of the pre-construction floristic surveys is to identify if and/where special-status plant species occur within the Project area. The pre-construction floristic surveys shall also adhere to the following protocols and requisites detailed by the BLM, and the most up-to-date State and Federal protocols, policies, and guidance: CNPS Botanical Survey Guidelines (CNPS 2001); General Rare Plant Survey Guidelines (Cypher 2002); Guidelines for Conducting and Reporting Botanical Inventories for Federally Listed, Proposed and Candidate Plant (USFWS 1996); Protocols for Surveying and Evaluating Impacts to Special-Status Native Plant Populations and Sensitive Natural Communities (CDFW 2018a);	Surveys and monitoring of special-status plants, if identified, shall be conducted by a designated qualified biologist/botanist. The Applicant shall produce a Pre-Construction Floristic Survey Report documenting the results of the floristic survey(s) and submit to the BLM and CPUC, as well as all other appropriate State and Federal agencies. If special-status plants are determined present in the Project area during pre-construction and impacts are unavoidable, then consultation with	A series of three floristic surveys, to capture different blooming periods, will be conducted prior to the start of construction activities; surveys will be conducted in February, May, and September.	Supervision, guidance, and verification of the implementation of these measures shall be achieved by the Applicant and the designated qualified biologist/botanist.

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
	Survey Protocols Required for NEPA/ESA Compliance for BLM Special-Status Plant Species (BLM 2009). Reconnaissance-level surveys, floristic in nature, will be conducted to inventory plants occurring within the Project area. The surveys shall be completed prior to Project commencement. It is recommended that the surveys be conducted concurrently with blooming periods for all special-status species known to occur in the Project and surrounding area as detailed below. The purpose of the surveys is to identify and record all observable plant species (at a minimum to the genus level); identify and map areas where special-status plant species occur and to support pre-construction requisites detailed in the Vegetation Management Plan (MM VEG-CEQA-1) (e.g., avoidance areas, occurrences of invasive and noxious weeds, etc.). A complete inventory of observed plant species will be compiled and included as an appendix in the Vegetation Management Plan (MM VEG-CEQA-1). In addition, ACOE national wetland indicator status, and the native/non-native status of each species observed shall be included. For invasive and noxious plant species, their State and Federal ranks shall be listed using up-to-date information provided by the U.S. Department of Agriculture (USDA) and the Cal-IPC. a) Surveys for Sensitive Plant Species: To avoid and/or minimize impacts to endangered, threatened, rare, and/or special-status plant species within the Project area, the designated qualified biologist/botanist will conduct pre-construction floristic surveys for sensitive plant species. The pre-construction floristic surveys shall be at a reconnaissance-level and timed to cover the appropriate bloom period(s) for the sensitive plant species that have known occurrences and/or have a moderate potential to occur in the Project area. Specifically, for the Project, three pre-construction bloom-period floristic surveys are recommended to be conducted to maximize the	appropriate Federal and State agencies will be completed and Special-Status Plant and Sensitive Vegetation Community Mitigation and Monitoring Plan will be developed and implemented.		

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
	potential for observations during the appropriate bloom-period for special-status species that have known occurrences or the potential to occur in the Project area, which include reference populations for each special-status species shall be checked to ensure surveys are conducted during appropriate blooming periods. If special-status plants are determined to have no presence within the Project area, then no further action or mitigation is required. b) If special-status plant species are determined present within the Project area during pre-construction floristic surveys, Project activities shall be reduced and minimized to avoid impacts to the extent feasible. In addition, mapping the population and placing flagging and/or exclusion fencing to protect the special-status plant species within the Project area during construction shall be implemented. Installation of environmentally sensitive area fencing and appropriate signage at an appropriate setback or buffer distance, starting from the edge of the individual and/or population. Signage should indicate the area is environmentally sensitive and not to be disturbed. Specifically, if any Federal or State listed threatened or endangered plant species are detected in the Project area that may be impacted, a buffer zone shall be implemented of sufficient size to prevent direct or indirect disturbance to the special-status plants from construction activities, erosion, inundation, or dust. The size of the buffer will depend upon the proposed use of the immediately adjacent lands and the plant's ecological requirements to be specified by the designated qualified biologist/botanist. At a minimum, the buffer for trees or shrubs species shall be equal to twice the drip line (i.e., two times the distance from the trunk to the canopy edge) to protect and preserve the root systems. The buffer for herbaceous species shall be a minimum of 50 feet from the perimeter of the occupied habitat or the individual. If a smaller buffer is necessary due to other Project constraints, then the Applicant shall develop			

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
	and implement site-specific monitoring and put other measures in place to avoid species impacts. If special-status plants are determined present in the Project area during pre-construction floristic surveys and direct and/or unavoidable impacts to special-status plant species shall result from Project activities, then consultation with appropriate Federal and State agencies will be required to develop acceptable mitigation (e.g., agency recommended mitigation may include translocation of individual plants, rectification of impact by seed collecting and stockpiling for replanting/replacement, mitigation fees, and/or permitting). Once mitigation has been determined by the appropriate State and Federal agencies, then a Special-Status Plant and Sensitive Vegetation Community Mitigation and Monitoring Plan shall be developed and implemented upon approval of the agencies. Specifications for the Special-Status Plant and Sensitive Vegetation Community Mitigation and Monitoring Plan are detailed in MM VEG-CEQA-4 below. Additional reporting and protocol-level survey requirements will be detailed in the Vegetation Management Plan criteria (MM VEG-CEQA-1) and in the Special-Status Plant and Sensitive Vegetation Community Mitigation and Monitoring Plan. In addition, as part of the Special-Status Plant and Sensitive Vegetation Community Mitigation and Monitoring Plan, if special-status species individuals and/or populations are identified within the Project area, then the designated qualified biologist/botanist will collect specific ancillary data using the *General Instruction for Filling Out CNDDB Field Forms* (CDFW 2018b). The Applicant is responsible for ensuring submittal of all special-status plant species observations to CDFW CNDDB. **Standards for Success:** No net loss of special-status plant species and/or habitat.			

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
Impact BIO-1	MM VEG-CEQA-3 Conduct Focused Surveys for Harwood's Eriastrum. MM VEG-CEQA-3 will incorporate the following BMPs and CMAs: BMP BIO-24; BMP BIO-31; BMP BIO-49; BMP BIO-53; BMP BIO-54; LUPA-BIO-DUNE-2; CMA LUPA-BIO-PLANT-2; and CMA LUPA-BIO-PLANT-3. Harwood's eriastrum is an annual herb that is native to California. It is ranked as: CRPR 1B.2 (e.g., fairly endangered in California), a California State Rank of S2 (e.g., imperiled), and is ranked 'sensitive' by the BLM (CNPS 2019). The Applicant shall designate a qualified botanist (approved by the CPUC, BLM, and CDFW) to conduct pre-construction floristic surveys prior to the commencement of any activities that may modify vegetation (e.g., clearing, mowing, or ground-breaking activities). Pre-construction floristic surveys shall be conducted in a manner which maximizes the likelihood of locating Harwood's eriastrum that may be present. As such, floristic surveys should be conducted in the Project area during the appropriate bloom-period (i.e., March to June) and may be conducted in conjunction with the floristic surveys required in MM VEG-CEQA-2. Pre-construction floristic surveys should be 'floristic in nature', meaning that every plant taxon that occurs on site is identified to the taxonomic level necessary to determine species and listing status. The pre-construction floristic surveys shall also adhere to the following protocols and requisites detailed by most up-to-date State and Federal protocols, policies, and guidance: Guidelines for Conducting and Reporting Botanical Inventories for Federally Listed, Proposed and Candidate Plant (USFWS 1996); Protocols for Surveying and Evaluating Impacts to Special-Status Native Plant Populations and Sensitive Natural Communities (CDFW 2018a); and Survey Protocols Required for NEPA/ESA Compliance for BLM Special-Status Plant Species (BLM 2009).	The Applicant shall produce a Pre-Construction Harwood's Eriastrum Floristic Survey Report, documenting the results of the floristic survey and submit to the appropriate Federal and State agencies. Floristic survey results for Harwood's eriastrum will also be documented in both the Vegetation Management Plan and the Special-Status Plant and Sensitive Vegetation Community Mitigation and Monitoring Plan. In addition, measures to reduce impacts, protection species individuals and populations, mitigate, and restore for Harwood's eriastrum will be documented in the aforementioned report and plans, if necessary.	One pre-construction floristic survey shall be conducted during the appropriate bloom-period for Harwood's eriastrum (i.e., March to June).	Supervision, guidance, and verification of this measure shall be achieved the Applicant. Surveys and monitoring for Harwood's eriastrum shall be conducted by the designated qualified botanist (approved by the CPUC, BLM, and CDFW).

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
	If individuals and/or populations of Harwood's eriastrum are determined present within the Project area during pre-construction floristic surveys, Project activities shall be reduced and minimized to avoid impacts to the extent feasible. At a minimum, the following avoidance and minimization BMPs shall be implemented: Avoid Harwood's eriastrum individuals through micrositing facilities to the maximum extent feasible; Within suitable habitat for Harwood's eriastrum, keep equipment to the minimum necessary to accomplish the necessary work; On BLM lands, use existing roads or routes. Avoid establishing feature that shall interfere with Harwood's eriastrum habitat or with the movement of sand; On non-agricultural public lands, the Applicant designated qualified botanist shall be on-site for all construction activities involving surface disturbance or overland travel; Staging and temporary-use sites shall not be located within suitable habitat for Harwood's eriastrum; Specification for the avoidance, minimization, and protection of Harwood's eriastrum shall be detailed in in the Project specific Vegetation Management Plan (MM VEG-CEQA-1) and the Special-Status Plant and Sensitive Vegetation Community Mitigation and Monitoring Plan (MM-VEG-CEQA-4). Mapping the population and placing flagging and/or exclusion fencing to protect Harwood's eriastrum within the Project area during construction shall be implemented. Installation of environmentally sensitive area fencing and appropriate signage, starting from the edge of the individual and/or population, shall be implemented. Signage should indicate the area is environmentally			

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
	sensitive and not to be disturbed. At a minimum, a buffer zone shall be developed for the Harwood's eriastrum of sufficient size to prevent direct or indirect disturbance to the species from construction activities, erosion, inundation, or dust. The size of the buffer will depend upon the proposed use of the immediately adjacent lands and the plant's ecological requirements to be specified by the designated qualified biologist/botanist. The buffer for the Harwood's eriastrum shall be a minimum of 50 feet from the perimeter of the occupied habitat or the individual. If a smaller buffer is necessary due to other Project constraints, then the Applicant shall develop and implement site-specific monitoring and put other measures in place to avoid species impacts. If Harwood's eriastrum are determined present in the Project area during pre-construction floristic surveys and direct and/or unavoidable impacts will result from Project activities, then occupied lands will be replaced at a minimum 3:1 ratio and consultation with appropriate Federal and State agencies will be required to develop acceptable mitigation (e.g., agency recommended mitigation may include translocation of individual plants, rectification of impact by seed collecting and stockpiling for replanting/replacement, mitigation fees, and/or permitting). Once mitigation has been determined by the appropriate State and Federal agencies, then specifications for Harwood's eriastrum, including reporting specifications and additional surveying and monitoring, shall be incorporated into the Special-Status Plant and Sensitive Vegetation Community Mitigation and Monitoring Plan (MM VEG-CEQA-4), and the Vegetation Management Plan criteria (MM VEG-CEQA-1). In addition, as part of the Special-Status Plant and Sensitive Vegetation Community Mitigation and Monitoring Plan, if new occurrences of Harwood's eriastrum are identified within the Project area during construction, then a designated qualified botanist will collect specific ancillary data using the *General Instruction for Filling Out CNDDB Field Forms* (CDFW 2018b). The Applicant is responsible for ensuring submittal of all special-status plant species			

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
	observations to CDFW CNDDB. **Standards for Success:** No net loss of Harwood's eriastrum. If Harwood's eriastrum is determined present in the Project area during pre-construction floristic surveys, and impacts are unavoidable, then consultation with appropriate the Federal and State agencies will be completed.			
Impact BIO-1 Impact BIO-2	MM-VEG-CEQA-4: Compensation for Impacts to Special-Status Plant Species and Sensitive Communities. The following APMs, BMPs, and CMAs shall be incorporated within this MM VEG-CEQA-4: APM BIO-2; BMP BIO-2; APM BIO-4; APM BIO-11; BMP BIO-11; APM BIO-13; APM BIO-14; APM BIO-15; BMP BIO-15; APM BIO-16; BMP BIO-24; BMP BIO-25; BMP BIO-31; BMP BIO-37; BMP BIO-41; BMP BIO-43; BMP BIO-52; BMP BIO-53; BMP BIO-55; BMP VEG-01; BMP VEG-02; CMA DFA-BIO-IFS-1; CMA DFA-BIO-IFS-2; CMA DFA-VPL-BIO-DUNE-1; CMA LUPA-BIO-1; CMA LUPA-BIO-2; CMA LUPA-BIO-3; CMA LUPA-BIO-4; CMA LUPA-BIO-7; CMA LUPA-BIO-9; CMA LUPA-BIO-13; CMA LUPA-BIO-14; CMA LUPA-BIO-DUNE-1; CMA LUPA-BIO-DUNE-3; CMA LUPA-BIO-DUNE-5; CMA LUPA-BIO-PLANT-2A; CMA LUPA-BIO-8; CMA LUPA-BIO-COMP-1; CMA LUPA-BIO-PLANT-1; CMA LUPA-BIO-PLANT-2; CMA LUPA-BIO-PLANT-3; CMA LUPA-BIO-RIPWET-1; CMA LUPA RIPWET-3; CMA LUPA-BIO-SVF-1; CMA LUPA-BIO-SVF-6; CMA LUPA-SW-13; and CMA LUPA-SW-16. If special-status plant species are identified during pre-construction floristic surveys (MM VEG-CEQA-2 and MM VEG-CEQA-3), and there is the potential for impacts, then the Applicant shall implement the measures listed below. Mitigation shall be accordance with Federal and State agencies requisites, as well as with the *Policy on Mitigation Guidelines Regarding Impacts to Rare, Threatened, and Endangered Plants* (CNPS 1998), and developed and approved by the appropriate Federal and State regulatory agencies. Mitigation for impacts to	The Applicant shall develop and implement a Special-Status Plant and Sensitive Vegetation Community Mitigation and Monitoring Plan.	Prior to construction, if special-status plant species or sensitive vegetation communities will be impacted by the Project, then the Applicant shall develop and implement mitigation, with the approval by the appropriate Federal and State regulatory agencies.	Supervision, guidance, and verification of compensation for impacts to special-status plants and sensitive vegetation communities, as outlined in this measure, shall be achieved by the Applicant.

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
	special-status plant species shall consider and overlap with compensation for special-status wildlife, sensitive vegetation communities, and jurisdictional waters and wetlands. **Documentation:** The Applicant shall develop and implement a Special-Status Plant and Sensitive Vegetation Community Mitigation and Monitoring Plan. The Special-Status Plant and Sensitive Vegetation Community Mitigation and Monitoring Plan shall summarize the results of the pre-construction floristic surveys and describe any conditions that may have prevented target species from being located or identified, even if they are present as dormant seed or below-ground rootstock (e.g., poor rainfall, recent grazing, or wildfire). The plan will include management considerations for Harwood's eriastrum and serve as the Harwood's Eriastrum Linear ROW Protection Plan, as described by BMP BIO-31 and referenced by MM BIO-CEQA-1. The Special-Status Plant and Sensitive Vegetation Community Mitigation and Monitoring Plan shall at a minimum include: Species and locations (i.e., figures) of plants identified for salvage; Criteria for determining whether an individual plant is appropriate for salvage; The appropriate season for salvage; Equipment and methods for collection, transport, and re-planting plants or seed banks, to retain intact soil conditions and maximize success; Planting methodology for off-site introduction mitigation methods; For shrubs, cacti, and yucca, a requirement to mark each plant to identify the north-facing side prior to transport, and replant it in the same orientation;			

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
	Details regarding storage of plants or seed banks for each species; Location of the proposed recipient site, and detailed site preparation and plant introduction techniques for topsoil storage, as applicable; A description of the irrigation, weed control, and other maintenance activities; Success criteria, including specific timeframe for survivorship and reproduction of each species; A schedule for all mitigation activities; and A detailed monitoring program, commensurate with the goals detailed in the Vegetation Management Plan (MM VEG-CEQA-1). **Onsite Avoidance and Minimization**: Minimizing impacts by limiting the degree or magnitude of the action, and avoidance of special-status plant species is the preferred strategy, wherever feasible. Specifically, Project work areas shall be located to avoid or minimize impacts to special-status plants. Effective avoidance through Project design shall include a buffer area surrounding each avoided occurrence, where no Project activities will take place. The buffer area will be clearly staked, flagged, and signed for environmentally sensitive area avoidance prior to the beginning of ground-disturbing activities, and maintained throughout the active construction phase(s). The buffer zone shall be of sufficient size to prevent direct or indirect disturbance to the plants from construction activities, erosion, inundation, or dust. The size of the buffer will depend upon the proposed use of the immediately adjacent lands and the plant's ecological requirements to be specified by the designated qualified biologist/botanist. At a minimum, the buffer for trees or shrubs species shall be equal to twice the drip line (i.e., two times the distance from the trunk to the canopy edge) to protect and preserve the root systems. The			

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
	buffer for herbaceous species shall be a minimum of 50 feet from the perimeter of the occupied habitat or the individual. If a smaller buffer is necessary due to other Project constraints, then the Applicant shall develop and implement site-specific monitoring and put other measures in place to avoid species impacts. • **Onsite Compensation:** Compensation for unavoidable temporary impacts to special-status plant species shall include on-site habitat restoration with similar species compositions to those present prior to construction at a ratio of 1.5:1. Restoration of conditions of the impacted areas within the Project footprint shall be at 1:1; and creation, restoration, or enhancement of similar vegetation communities offsite shall be 0.5:1, as approved by CDFW and CPUC. Alternatively, payments would be made into an appropriate mitigation program or other mitigation funding mechanism. Restoration measures shall be documented in the Vegetation Management Plan (MM-VEG-CEQA-1), as well as the Special-Status Plant and Sensitive Vegetation Community Mitigation and Monitoring Plan. **Off-Site Compensation.** It was assumed that Project-related impacts would result in the loss of more than 10 percent of the on-site population of any special-status plant species with a CRPR of 1 or 2. Compensation for permanent impacts to special-status plant species based on the results of the floristic surveys shall include off-site creation, enhancement, and/or preservation or participation in an established mitigation bank program at a minimum 3:1 replacement ratio. The Applicant shall coordinate with CPUC, BLM, and CDFW to determine the appropriate mitigation strategy and final replacement ratios and acreages. All mitigation shall be approved by the appropriate Federal and State regulatory agencies prior to Project activities. The Applicant shall restore all temporary impacts to sensitive vegetation communities (e.g., blue Palo Verde-ironwood woodland, mesquite thickets,			

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
	bush seepweed scrub, etc.) and special-status species habitat at a minimum ratio of 1.5:1, as detailed in the Vegetation Management Plan (MM-VEG-CEQA-1) and the Special-Status Plant and Sensitive Vegetation Community Mitigation and Monitoring Plan (MM-VEG-CEQA4). Restoration of conditions of the impacted areas within the Project footprint shall be at 1:1; and creation, restoration, or enhancement of similar vegetation communities offsite shall be 0.5:1, as approved by CDFW and CPUC. Alternatively, payments would be made into an appropriate mitigation program or other mitigation funding mechanism. To compensate for permanent impacts to sensitive vegetation communities and special-status species habitat, the Applicant shall provide the creation and/or restoration of habitat at the following ratios: Permanent impacts to sensitive vegetation communities, (e.g., riparian desert woodland habitats, blue Palo Verde-ironwood woodland, mesquite thickets, etc.) shall be mitigated at a ratio of 5:1; Permanent impacts to other sensitive vegetation communities shall also be mitigated at a ratio of 5:1; and Permanent impacts to jurisdictional waters/wetlands shall be mitigated at a minimum ratio of 2:1, or as otherwise specified by the appropriate Federal and State regulatory agencies. Off-site compensation lands and/or established mitigation bank program will be identified, if available, in coordination with the appropriate Federal and State regulatory agencies. Off-site compensation lands will consist of habitat occupied by the impacted special-status plants at the appropriate ratio of acreage and the number of plants for any occupied habitat affected by the Project. Occupied habitat will be calculated on the Project site and on the compensation lands as including each special-status plant occurrence. Off-site compensation shall be documented in the Project-			

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
	specific Special-Status Plant and Sensitive Vegetation Community Mitigation and Monitoring Plan and approved in consultation with the appropriated Federal and State regulatory agencies. The Applicant shall provide for open space/conservation easements on all acquired lands or provide the required funds for the acquisition of easements to a "qualified easement holder"; the CDFW is a qualified easement holder. To qualify as a "qualified easement holder" a private land trust must have substantial experience managing open space/conservation easements that are created to meet mitigation requirements for impacts to special-status species, have adopted the Land Trust Alliance's Standards and Practices, and have a stewardship endowment fund to pay for its perpetual stewardship obligations. The Applicant shall also provide the "qualified easement holder" with adequate funds to cover administrative costs incurred during the creation of the easement, funds in the form of a non-wasting endowment to cover the cost of monitoring and enforcing the terms of the easement in perpetuity. For special-status plant restoration or enhancement activities, several techniques can be applied including: **Salvage.** The Applicant shall consult with the designated qualified biologist/botanist, as well as the appropriate Federal and State regulatory agencies, regarding the feasibility and likely success of salvage efforts for each special-status plant species. If salvage is deemed to be feasible, then Applicant shall incorporate salvage measures into the Project-specific Special-Status Plant and Sensitive Vegetation Community Mitigation and Monitoring Plan, which shall be approved by the appropriate Federal and State regulatory agencies prior to implementation. **Propagation and Off-Site Introduction.** If salvage and relocation is not believed to be feasible for special-status plants, then Applicant shall consult			

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
	with appropriate Federal and State agencies, as well as other qualified entities if needed, to develop an appropriate experimental propagation and relocation strategy, based on the life history of the species affected. The strategy will include at minimum: (a) a planting methodology including strategies for species specific collection and salvage measures for plant materials (e.g., cuttings), seed, or seed banks, to maximize success likelihood; (b) details regarding storage of plant, plant materials, or seed banks; (c) location of the proposed propagation facility, and proposed methods; (d); time of year that the salvage and other planting or transplantation practices will occur; (e) irrigation; (f) erosion controls; (g) success criteria; and (h) a detailed monitoring program. All propagation and off-site introductions strategies shall be documented in the Special-Status Plant and Sensitive Vegetation Community Mitigation and Monitoring Plan for the Project. **Restoration:** Restoration can be used to mitigate impacts and depending upon the degree of impact, habitat restoration may be as simple as removing debris and controlling public access. In more complex situations, however, partial or total restoration of degraded habitat may require extensive revegetation, and soil protection and stabilization programs. The strategy will include at a minimum: (a) BLM approved genetically and ecologically appropriate native plant materials suitable for the site; (b) a description of any required topsoil salvage, plant salvage, seeding techniques, and methods to stabilize and shape soil surface to reduce soil erosivity; (c) monitoring and reporting protocols; and (d) success criteria. Restoration must be tailored to the specific project site based on the habitat and species involved (CNPS 1998). **Monitoring and Maintenance:** All mitigation for special-status plant species shall be monitored to assess progress and to make recommendations for successful establishment. Monitoring shall be			

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
	performed by qualified biologist/botanist that the Applicant has designated. At a minimum, Monitoring shall include qualitative and quantitative methods as described in MM VEG-CEQA-1 for the Vegetation Management Plan and MM VEG-CEQA-4 Special-Status Plant and Sensitive Vegetation Community Mitigation and Monitoring Plan. Monitoring shall identify the need for remediation or maintenance work well in advance of final success/failure determination. Monitoring and maintenance progress toward achieving success criteria, conditions, and all observations pertinent to eventual success shall be documented in the Post-Construction Vegetation Management Quarterly Monitoring Progress Reports, and the Annual Post-Construction Vegetation Management Report, as described in the Vegetation Management Plan measure (MM-VEG-CEQA-1). In addition to the Vegetation Management Plan annual and quarterly reporting specifications, reporting for mitigation monitoring and maintenances shall also include Progress reports shall include: (a) estimated species survival; (b) species health and overall vigor; (c) the establishment of volunteer native species; (d) topographical/soils conditions; (e) problem weed species; (f) the use of the site by wildlife; (g) significant drought stress; and (h) recommended remedial measures deemed necessary to ensure compliance with specified success criteria. If Federally and/or State listed plant species are identified within Project disturbance areas, then consultation with the appropriate resource agencies will be required to develop acceptable mitigation prior to construction, which may include additional measures. Conservation measures to protect or restore listed special-status plant species, or their habitat, may be required by the appropriate Federal and State regulatory agencies before impacts are authorized. **Standards for Success:** No net loss of special-status plant species, and/or habitat, or sensitive vegetation communities. If special-status plant species or sensitive vegetation communities are determined present in the Project area			

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
	during pre-construction floristic surveys and impacts are unavoidable, then establishment of a new viable occurrence, equal or greater in extent and numbers, to the affected occurrence shall be met. Additionally, consultation with the appropriate Federal and State agencies will be completed.			
Impact BIO-1 Impact BIO-2	MM WIL-CEQA-1: Develop and Implement an APP and BBCS. The following APMs, BMPs, and CMAs shall be incorporated within this MM WIL CEQA-1: BMP BIO-19, APM BIO-20, APM BIO-21, BMP BIO-21, BMP BIO-29, BMP BIO-30, BMP BIO-33, BMP BIO-40, BMP BIO-45, BMP BIO-48, CMA LUPA-BIO-14, CMA LUPA-BIO-16, CMA LUPA-BIO-17, CMA LUPA-BIO-COMP-2, CMA LUPA-BIO-IFS-11, CMA-LUPA-BIO-IFS-12, CMA LUPA-BIO-BAT-1, CMA LUPA-BIO-COM-2, CMA LUPA-BIO-DUNE-5, CMA LUPA-BIO-IFS-13, CMA LUPA-BIO-IFS-14, CMA LUPA-BIO-IFS-24, CMA LUPA-BIO-IFS-25, CMA LUPA-BIO-IFS-26, CMA LUPA-BIO-IFS-27, CMA LUPA-TRANS-BIO-1, CMA LUPA-TRANS-BIO-2, and CMA LUPA-TRANS-BIO-3. The Project Applicant shall prepare an APP and BBCS, which will also include a component for a NBNMP, as identified in the BBCS in BMP BIO-29, in coordination with and approval by the applicable permitting/resource agencies (i.e., BLM, CDFW, USFWS, CPUC) prior to the start of construction. Additionally, the components of the Burrowing Owl Avoidance, Minimization, and Mitigation Plan (MM WIL-CEQA-3) and the Bat Management and Protection Plan (MM WIL-CEQA-4) will also be included under the overarching APP/BBCS Plan. The specifics of the APP and BBCS will include the following: • APP: The APP will follow the APLIC/USFWS 2005 APP Guidelines which specifies program design for transmission projects in order to reduce operational avian risks that result from interactions with transmission lines. This goal of this guidance is to reduce avian mortality from electrocution	The Applicant shall retain a qualified avian biologist (approved by the CPUC) to perform monitoring surveys within 500-feet of the Project area. The qualified avian biologist shall report any inadvertent contact or effects to birds or nests within the Project area to the BLM, CDFW, USFWS, and CPUC. The Applicant shall develop a monthly report documenting compliance with this measure and any actions taken regarding the NBBMP. This report shall be made available to the BLM, CDFW, USFWS, and the CPUC. The monitoring requirements for the APP shall conform to the	The APP/BBCS shall be prepared/approved prior to the start of construction activities and shall be implemented throughout the duration of construction. The APP specifically shall be implemented throughout the life of the Project while the BBCS shall focus on the construction and maintenance of the Project.	The APP/BBCS shall be developed and implemented by the Applicant and approved by the BLM, CDFW, USFWS, CPUC.

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
	and collision with the transmission lines. The APP Guidelines state that although each APP developed for a specific project may be different, the overall goal of reducing avian mortality is the same across all developed APPs. The APP developed for the Project shall include, at a minimum, the following consideration and evaluation of principals identified in the APP Guidance: 1. **Corporate policy:** Confirming the company's commitment to work cooperatively towards the protection of migratory birds; 2. **Training:** All appropriate utility personnel, including managers, supervisors, line crews, engineers, etc. shall be properly trained in avian issues (which shall be enforced through MM BIO-CEQA-2, Implement a Worker Environmental Awareness Program); 3. **Permit Compliance:** Identify the process in which the Applicant will obtain and comply with all necessary permits related to avian issues; 4. **Construction Design Standards**: Avian interactions shall be considered in the design and installation of the transmission line as well as during operations and maintenance of the facility. Construction configurations from the *Suggested Practices for Raptor on Power Lines; The State of the Art in 1996* and *Mitigating Bird Collisions with power Lines: The State of the Art in 1994*, or the most current editions of these documents shall be consulted during the design phase of the Project to ensure new construction is avian-safe; 5. **Nest Management:** Procedures for net management on the transmission lines shall be explained to employees during training	APLIC Guidance including identifying and responding promptly to any avian mortality and including adaptive management for avian issues related to the Project.		

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
	to ensure uniform treatment of avian nest issues among personnel; 6. **Avian Reporting System:** Development of a reporting system which shall include reporting of any avian mortalities, as required by any federal or State permits. The reporting system can also help pinpoint areas of concerns by tracking both the specific locations where mortalities may be occurring, as well as the extent of such mortalities; 7. **Risk Assessment Methodology:** A focus on the areas with the highest risk to migratory birds shall be the focus of the APP and therefore, a method for evaluating the risks posed to migratory birds in a manner that identified areas and issues of particular concern shall be developed; 8. **Mortality Reduction Measures:** After completing the risk assessment, the efforts for avian protection shall be focused on areas of concern. A mortality reduction plan may need to be implemented depending on the results of the risk assessment. This approach could be implemented through direction of where monitoring should occur, where retrofits should be focused, and where new construction warrants special attention to raptor and other bird issues. 9. **Avian Enhancement Options:** In addition to taking steps to reduce mortality risk to avian species, the developed APP also may include opportunities to enhance avian populations or habitat, including developing nest platforms, managing habitats to benefit migratory birds, or working cooperatively with agencies or organizations in such efforts;			

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
	10. **Quality Control:** The developed APP may also include a mechanism to review existing practices, ensuring quality control; 11. **Public Awareness:** The developed APP shall include a method to educate the public about the avian electrocution issues, the developed APP, as well as its success in avian protection. 12. **Key Resources:** The developed APP shall identify key resources to address avian protection issues including, for example, a list of experts who may be called upon to aid in resolving avian issues. • BBCS: The purpose of the BBCS is to outline measures/methods to minimize potential Project effects to nesting birds and avoid unauthorized take as defined by both the MBTA and the CDFC, the latter which covers incidental take. The NBBMP (developed as a part of the BBCS) shall be approved by the above noted agencies prior to the site disturbance or pre-construction activities and be implemented by the Applicant throughout construction activities. Additionally, the current APLIC guidelines shall be incorporated into the NBBMP, which includes protections for nocturnal migrants (i.e., lighting controls) and species along the Colorado River and near agricultural fields (APLIC 2006, 2012) (See BMP BIO-33). Specifically, these guidelines will be used to minimize the potential for attracting birds and bats to the proposed infrastructure (transmission lines and facilities). Any nighttime lighting associated with construction will be temporary and shielded in order to provide safe working conditions while limiting light spillover outside of the construction area. Implementation of APM AES-15 will also ensure that lighting, will be directed in a downward position. Pre-construction surveys shall be completed in accordance with MM WIL-CEQA-6 below and if breeding birds with active nests are found prior to or during construction, a qualified avian biologist shall establish a			

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
	minimum 300-foot buffer (500 foot for raptors) around the nest and no activities shall be allowed within the buffer(s) until the young have fledged from the nest or the nest fails (CPUC 2016). The prescribed buffers may be adjusted by a qualified avian biologist based on existing conditions around the nest, planned construction activities, tolerance of the species, and other pertinent factors. Buffer reductions for listed or special-status species may require coordination with the USFWS and/or CDFW. The qualified avian biologist shall conduct regular monitoring of the nest to determine success/failure and to ensure that Project activities are not conducted within the buffer(s) until the nesting cycle is complete or the nest fails. An avian biologist shall be responsible for documenting the results of the surveys (MM WIL-CEQA-6 below), nest buffers implemented, and the results of ongoing monitoring and shall provide a copy of the monitoring reports for impact areas to the appropriate resource agencies (i.e., USFWS and CDFW) (CPUC 2016). If trees with nests are to be removed as part of Project construction activities, they shall be done so outside of the nesting season to avoid additional impacts to nesting raptors. If removal during the nesting season cannot be avoided all trees shall be inspected for active nests by the avian biologist. If nests are found within these trees, and contain eggs or young, no activities within a 300-foot buffer for nesting birds and/or a 500-foot buffer for raptors shall occur until the young have fledged the nest (CPUC 2016). At a minimum, the NBBMP (as a part of the BBCS) shall include the following: Definitions of standard nest buffers for each species or group of species, depending on characteristics and conservation status for each species. A notification procedure for buffer distance reductions should they become necessary under special circumstances.			

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
	A monitoring protocol including qualifications of monitors, monitoring schedule, and field methods, to ensure that any Project-related effects to nesting birds shall be minimized. A protocol for documenting and reporting any inadvertent contact or effects to birds or nests. A summary of applicable State and Federal laws and regulations, including definition of what constitutes a nest or active nest under State and Federal law. A list of bird species potentially nesting on or near the Project area, indicating approximate nesting seasons, nesting habitat, typical nest locations (e.g., ground, vegetation, structures, etc.), tolerance to disturbance (if known) and any conservation status for each species. A discussion of how construction of the Project has been scheduled, to avoid or minimize Project impacts to nesting birds. Activities that may adversely affect breeding birds shall be scheduled outside the nesting season, as feasible. Discussion on nest buffer modification or reduction guidelines, including reporting procedures to the appropriate agencies (i.e., CDFW, USFWS, and CPUC). Discussion on use of nest deterrents and communication protocols for on-site monitors. Monitoring and reporting requirements. Detailed noise monitoring guidelines for active breeding territories and/or nests for special-status species that may occur within 500-feet of the Project area. Procedures for the calculation of a fee, to be reassessed every five years, to			

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
	fund compensatory mitigation for bird and bat mortality impacts; this shall be based on requirements described in CMA LUPA-BIO-COMP-2. **Standards for Success:** Adverse effects to birds shall be avoided or minimized to less than significant levels as determined by the qualified avian biologist in consultation with the BLM, CDFW, USFWS, and CPUC.			
Impact BIO-1	MM WIL-CEQA-2: Develop and Implement a Raven Management Plan. The following BMPs, and CMAs shall be incorporated within this MM WIL-CEQA-2: BMP BIO-28, CMA LUPA-BIO-6, and CMA-LUPA-TRANS-BIO-1. A Raven Management Plan shall be submitted to the BLM, CDFW, and County for approval prior to the start of ground disturbance and issuance of a County grading permit. The Raven Management Plan shall address Project characteristics and activities that may attract or subsidize common ravens. The Raven Management Plan shall include measures designed to: 1) minimize attracting and subsidizing ravens, 2) provide education to Project personnel (MM-BIO-CEQA-2) 3) remove raven nests and offending ravens, and 4) implement adaptive management. The Applicant shall also provide funding for implementation of the USFWS Regional Raven Management Program, as described below. The Raven Management Plan shall: Identify conditions associated with the Project that might provide raven subsidies or attractants; Describe management practices to avoid or minimize conditions that might increase raven numbers and predatory activities; Describe control practices for ravens; Establish thresholds that would trigger implementation of control practices;	The Applicant shall develop a monthly report documenting compliance with this measure and any actions taken regarding the implementation of the Raven Management Plan or the USFWS Regional Raven Management Plan. This report shall be made available to the BLM and the County.	The Raven Management Plan shall be prepared prior to the start of construction activities and shall be implemented throughout the duration of construction.	The Raven Management Plan shall be developed and implemented by the Applicant and approved by the CPUC, BLM, and CDFW.

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
	and Address monitoring and nest removal during construction and for the life of the Project. The Applicant shall submit payment into an account established for the Project held by the NFWF to support the USFWS Regional Raven Management Program. The one-time fee shall be as described in the cost allocation methodology or more current guidance as provided by USFWS. The contribution to the regional raven management plan will be $105 per acre impacted. **Standards for Success:** The Raven Management Plan is implemented, and ravens are, to the extent possible, deterred from nesting/foraging within the Project area.			
Impact BIO-1	MM WIL-CEQA-3: Develop and Implement Burrowing Owl Avoidance, Minimization, and Mitigation Plan. The following BMPs and CMAs shall be incorporated within this MM WIL-CEQA-3 and MM WIL-CEQA-7: BMP BIO-30, CMA-LUPA-BIO-IFS-12, CMA LUPA-BIO-IFS-13, and CMA LUPA-BIO-IFS-14. The BOAMMP would include management direction consistent with LUPA-BIO-IFS-12, LUPA-BIO-IFS-13, and LUPA-BIO-IFS-14 and will be developed in concurrence with the NBBMP (MM WIL-CEQA-1). The Applicant shall submit a BOAMMP to BLM and CPUC for approval prior to any ground disturbing activities in California. The BLM and CPUC will include CDFW in the review process and incorporate their comments as appropriate. The BOAMMP will include direction for burrowing owls which shall include a combination of active and passive relocation efforts consistent with LUPA BIO-IFS-12, LUPA BIO-IFS-13, and LUPA-BIO-IFS-14. Any relocation shall include follow up monitoring procedures.	The Applicant shall develop a monthly report documenting compliance with this measure and any actions taken regarding the BOAMMP. This report shall be made available to the BLM, CPUC, and CDFW.	The BOAMMP shall be prepared prior to the start of construction activities and shall be implemented throughout the duration of construction.	The BOAMMP shall be developed and implemented by the Applicant and approved by the BLM, CPUC, and CDFW.

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
	If burrowing owls, or burrowing owl habitat is found within the Project area during pre-construction surveys as described in MM WIL-CEQA-7, the following measures shall be implemented and enforced by the BLM and CPUC throughout construction of the Project. If pre-construction focused burrowing owl surveys determine that burrowing owls occupy the Project area, a tiered approach referred to as an Avoidance and Relocation Strategy shall be implemented to avoid burrowing owls, relocate burrowing owls, and prevent recolonization of areas (where needed, such as construction and/or substation areas) by burrowing owls, as outlined below. These methods generally adhere to the recommendations contained in the *Staff Report on Burrowing Owl Mitigation* currently used by CDFW to guide burrowing owl mitigation measures. The four avoidance and relocation strategy tiers are: • Tier 1 – Avoidance Buffers • Tier 2 – Passive Relocation • Tier 3 – Prevention of Recolonization • Tier 4 – Active Relocation (Optional) Methods to avoid impacts to burrowing owls shall take precedence over passive or active relocation. If pre-construction focused burrowing owl surveys determine that burrowing owls occupy the Project area, including within the 150-meter buffer, the qualified Project biologist will evaluate each occupied burrow to determine whether the Project is likely to directly impact or substantially indirectly impact the burrow such that injury or death of a burrowing owl could occur. Avoidance buffers can be implemented to avoid direct and substantial indirect impacts to owl burrows and individuals. A substantial indirect impact would be a situation where even though the burrow			

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
	is not directly impacted during construction, the construction activities could potentially cause injury or mortality of owls, including from collisions with nearby construction equipment, vehicles, fences, or walls. The Project biologist will have discretion in determining whether an indirect impact is substantial. If occupied burrowing owl burrows are found within the Project disturbance footprint or survey buffer during pre-construction surveys, or if burrowing owls arrive on site after construction activities commence, a qualified biologist shall assess the risk of construction activities to the burrowing owl. This risk assessment shall consider several factors, including, but not limited to, the following: • Location of the burrow (e.g., inside the disturbance footprint, within 5 meters (16.4 feet) of the disturbance footprint, more than 40 meters (131.2 feet) from the disturbance footprint); • Type of burrow use (i.e., occupied nest burrow or non-nesting roost burrow that may include wintering or satellite burrows, referred to herein simply as "roost burrow"); • Type of construction activity and level of potential disturbance (e.g., high disturbance, such as mass grading and excavation versus low disturbance, such as painting and landscaping); and • Timing of burrow use (e.g., occupation of a burrow after construction has been started versus prior to construction). Avoidance buffers shall be strictly required for occupied nest burrows so that nesting activities are not disturbed and nesting pairs have the opportunity to rear and successfully fledge young. Per the guidelines outlined by the *Staff Report on Burrowing Owl Mitigation*, a standard minimum avoidance buffer ranging			

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
	between 200 meters (656 feet) and 500 meters (1,640 feet) depending on the level of disturbance will be initially applied to occupied nest sites between April 1 and October 15, and 50 meters (164 feet) to 500 meters (1,640 feet) between October 16 and March 31. Burrows will be monitored by a qualified biologist to determine if a smaller buffer would be adequate to protect the active nest site. A smaller buffer may be implemented, but only after consultation with and approval from CDFW. Establishing avoidance buffers from occupied roost burrows during October 16 through March 31 or from burrows that have been determined to not support nesting (through the non-invasive methods cited above) during the breeding season will initially be based on the buffers described in the *Staff Report on Burrowing Owl Mitigation*. Burrows will be monitored by a qualified biologist to determine if a smaller buffer would be adequate to protect the active nest site. A smaller buffer may be implemented, but only after consultation with and approval from CDFW. Roost burrows detected during pre-construction surveys fall into three categories: (1) burrows within the proposed project disturbance footprint, (2) burrows in close proximity to the disturbance footprint, and (3) burrows farther from the disturbance footprint, but still potentially within the impact area for burrowing owl. The Applicant shall report any special-status species and natural communities detected during Project surveys to the CNDDB. Standards for Success: Any significant impacts to nesting or burrowing owls shall be avoided or minimized to less than significant levels.			
Impact BIO-1	MM WIL-CEQA-4: Develop and Implement a Bat Management and Protection Plan. The following BMPs and CMAs shall be incorporated within this MM WIL CEQA-4: BMP BIO-29, BMP BIO-33, BMP BIO-40, CMA LUPA-BIO-14,	The Applicant shall develop a monthly report documenting compliance with this measure and any actions taken regarding	The Bat Management and Protection Plan shall be prepared prior to the start	The Bat Management and Protection Plan shall be developed and implemented

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
	CMA LUPA-BIO-16, CMA LUPA-BIO-17, CMA LUPA-BIO-BAT-1, CMA LUPA-BIO-COMP-2, CMA LUPA-BIO-DUNE-5, and CMA LUPA-TRANS-BIO-1. The Bat Management and Protection Plan will be developed as part of the BBCS (MM WIL-CEQA-1). The Bat Management and Protection Plan shall be submitted to the BLM, CPUC, and CDFW for approval prior to any ground disturbing activities. The Bat Management and Protection Plan will include direction for roosting bats and shall include, at a minimum, the following: If non-breeding bat hibernacula are found in trees scheduled to be removed or in crevices in rock outcrops within the grading footprint, the bats shall be safely evicted, under the direction of a qualified bat biologist, by opening the roosting area to allow airflow through the cavity or other means determined appropriate by the bat biologist. Roosts that need to be removed shall first be disturbed by various means at the direction of the bat biologist at dusk to allow bats to escape during the darker hours, and the roost tree shall be removed or the grading shall occur the next day (i.e., there shall be no less or more than one night between initial disturbance and the grading or tree removal). If active maternity roosts or hibernacula are found, the rock outcrop or tree occupied by the roost shall be avoided (i.e., not removed) by the Project. If avoidance of the maternity roost is not feasible, the bat biologist shall survey (through the use of radio telemetry or other CDFW approved methods) for nearby alternative maternity colony sites. If the bat biologist determines in consultation with and with the approval of the CDFW, BLM, and CPUC that there are alternative roost sites used by the maternity colony and young are not present, then no further action is required, and it will not be necessary to provide alternate roosting habitat. However, if there are no alternative roosts sites used by the maternity colony, substitute bat roosting habitat shall be provided, as detailed below. If an active maternity roost is	the Bat Management and Protection Plan. This report shall be made available to the BLM, CPUC, and CDFW.	of construction activities and shall be implemented throughout the duration of construction.	by the Applicant and approved by the BLM, CPUC, and CDFW.

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
	located in an area to be impacted by the Project, and alternative roosting habitat is available, the demolition of the roost site must commence before maternity colonies form (i.e., prior to 1 March) or after young are flying (i.e., after 31 July) using the exclusion techniques described above. If a maternity roost will be impacted by the Project, and no alternative maternity roosts are in use near the site, substitute roosting habitat for the maternity colony shall be provided on, or in close proximity to, the Project site no less than three months prior to the eviction of the colony. Alternative roost sites will be constructed in accordance with the specific bat's requirements in coordination with CDFW. By making the roosting habitat available prior to eviction, the colony will have a better chance of finding and using the roost. Large concrete walls (e.g., on bridges) on south or southwestern slopes that are retrofitted with slots and cavities are an example of structures that may provide alternative roosting habitat appropriate for maternity colonies. Alternative roost sites must be of comparable size and proximal in location to the impacted colony. The CDFW shall also be notified of any hibernacula or active nurseries within the construction zone. If special-status bat species occur at these roosting/nursery sites, then construction activities shall avoid these sites and a surrounding buffer distance of 500 feet. If construction activities cannot avoid these sites, construction at these sites shall be delayed until the breeding cycles for the special-status bats are completed. The Applicant shall consult with a bat specialist in order to determine when the breeding cycle for the special-status bats is completed. The Applicant shall consult with CDFW regarding eviction of non-breeding special-status bats. If roosting bats occur within bridges on existing dirt or paved roadways within 500 feet of construction activities, construction may be allowed, provided that the construction activities occur only from 9:00 a.m. to 4:00			

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
	p.m. to avoid disturbance to nocturnal feedings. Standards for Success: Any significant impacts from construction activities to bat species shall be avoided or minimized to result in less than significant levels.			
Impact BIO-1	**MM WIL-CEQA-5: Conduct Pre-Construction Surveys for Maternity Colonies or Hibernaculum for Roosting Bats.** The following BMPs and CMA shall be incorporated within this MM WIL-CEQA-5: APM BIO-2, BMP BIO-02, BMP BIO-25, CMA DFA-BIO-IFS-1, CMA LUPA-BIO-1, CMA LUPA-BIO-16, and CMA LUPA-BIO-DUNE-5. The Applicant shall conduct surveys for roosting bats within 500 feet of Project activities, within 14 days prior to any grading of rocky outcrops or removal of trees with loose bark or other cavities. Surveys shall be conducted during the breeding season (1 March to 31 July) and the non-breeding season. Surveys shall be performed by a qualified bat biologist (i.e., a biologist holding a CDFW collection permit and a Memorandum of Understanding with CDFW allowing the biologist to handle bats). The resume of the biologist shall be provided to the CPUC and BLM for concurrence in consultation with CDFW and USFWS prior to the biologist beginning field duties on the Project. Surveys shall include a minimum of one day and one evening. The Bat Management and Protection Plan (MM WIL-CEQA-4) shall be implemented throughout construction for any active bat roosts within the area. The Applicant shall submit documentation providing pre-construction survey results and any avoidance of roosting and nursery sites to the CPUC, BLM, and CDFW for review and approval. Standards for Success: Surveys for bat roosting and nursery sites are completed within the Project area and required buffer distances.	The Applicant shall submit documentation in the form of a report or technical memorandum that provides the pre-construction survey results and any avoidance of roosting and nursery sites to the CPUC, BLM, and CDFW for review and approval.	The surveys shall be completed within 14 days prior to any grading activities or removal of trees within 500 feet of the Project.	The surveys for maternity colonies or hibernaculum for roosting bats shall be completed by a qualified biologist (i.e. a biologist holding CDFW collection permit and a Memorandum of Understanding with CDFW allowing the biologist to handle bats).

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
Impact BIO-1 Impact BIO-2	MM WIL-CEQA-6: Conduct Pre-construction Surveys for Nesting and Breeding. The following APMs, BMPs, and CMAs shall be incorporated within this MM WIL-CEQA-6: APM BIO-2, BMP BIO-02, APM BIO-20, BMP BIO-25, CMA DFA-BIO-IFS-1, CMA LUPA-BIO-1, CMA LUPA-BIO-16, CMA LUPA-BIO-IFS-26, and CMA LUPA-BIO-RIPWET-3. The Applicant shall retain a qualified avian biologist(s) (approved by the CPUC, BLM, and CDFW) to conduct pre-construction nesting bird surveys, within the recognized breeding season (generally 15 Feb – 15 Sep [1 Jan – 15 Aug for raptors]), for all areas within 500 feet of construction activities; construction activities include mobilization, staging, grading, and/or construction. These survey dates may only be modified with the approval of CDFW and USFWS (where applicable). Measures intended to exclude nesting birds shall only be implemented with the prior approval by the CDFW and/or USFWS. If breeding birds with active nests are found prior to or during construction, the qualified avian biologist shall establish a minimum 300-foot buffer (500 foot for raptors) around the nest and no activities shall be allowed within the buffer(s) until the young have fledged from the nest or the nest fails. The prescribed buffers may be adjusted by the qualified avian biologist based on existing conditions around the nest, planned construction activities, tolerance of the species, and other pertinent factors. Buffer reductions for listed or special-status species may require coordination with the USFWS and/or CDFW. The qualified avian biologist shall conduct regular monitoring of the nest to determine success/failure and to ensure that Project activities are not conducted within the buffer(s) until the nesting cycle is complete or the nest fails. The avian biologist shall be responsible for documenting the results of the surveys, implementing nest buffers, and documenting the results of ongoing monitoring by providing a copy of the monitoring reports for impact areas to the appropriate resource agencies (i.e., USFWS and CDFW). If trees with nests are to be removed as part of Project	The Applicant shall submit documentation in the form of a report or technical memorandum that provides the pre-construction survey results and any avoidance of nesting recommended to the CPUC, BLM, and CDFW for review and approval.	The surveys shall be completed within the recognized breeding season prior to construction activities for all areas within 500 feet of construction.	The surveys for nesting and breeding avian species shall be completed by a qualified avian biologist (approved by the CPUC, BLM, and CDFW).

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
	construction activities, they shall be done so outside of the nesting season to avoid additional impacts to nesting raptors. If removal during the nesting season cannot be avoided, all trees shall be inspected for active nests by the avian biologist. If nests are found within these trees, and contain eggs or young, no activities within a 300-foot buffer for nesting birds and/or a 500-foot buffer for raptors shall occur until the young have fledged the nest. Standards for Success: Nesting and breeding bird surveys are conducted within the Project site and required buffer distances prior to ground disturbing activities.			
Impact BIO-1 Impact BIO-2	MM WIL-CEQA-7: Conduct Focused Pre-Construction Burrowing Owl Surveys. To meet CEQA requirements, the following APMs, BMPs, and CMAs are incorporated within this MM BIO-CEQA-7: APM BIO-2, BMP BIO-02, BMP BIO-25, CMA DFA-BIO-IFS-1, CMA LUPA-BIO-1, CMA LUPA-BIO-12, and CMA LUPA-BIO-16. Prior to initial ground disturbance (no more than 14 days prior) the Project Applicant shall conduct focused surveys for burrowing owls within suitable burrowing owl habitat. Surveys will be completed by a qualified biologist(s) with proven burrowing owl experience. Focused burrowing owl surveys shall be conducted in accordance with the *Staff Report on Burrowing Owl Mitigation* (2012 Staff Report; CDFG 2012), with the exception of the survey buffers, which follows the California Burrowing Owl Consortium (1993). Surveys shall be conducted by walking 20-meter transects. Pre-construction surveys shall be conducted not only within construction area, but also within a reasonable buffer around the area, generally 150 meters (492 feet). If burrowing owls, including any active burrowing owl burrows, are not found during the pre-construction survey, no further action is required. If burrowing owls or active burrows are found, then the appropriate avoidance setbacks depending on the and level of disturbance shall be implemented as	The Applicant shall submit documentation in the form of a report of technical memorandum that provides the pre-construction survey results and any avoidance or relocation recommendations to the CPUC, BLM, and CDFW for review and approval.	The focused pre-construction burrowing owl surveys shall be completed no more than 14 days prior to the start of construction activities.	The focused pre-construction surveys for burrowing owls shall be conducted by a qualified biologist (approved by the CPUC, BLM, and CDFW).

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
	defined in the Burrowing Owl Avoidance, Minimization, and Mitigation Plan (MM WIL-CEQA-3). The only exception to the above requirements would be if any given construction area has become inactive for more than 14 days. Because burrowing owls can recolonize a site after a few days, if time lapses between Project activities for 14 days or more, this shall trigger subsequent pre-construction avoidance surveys, including, but not limited to an additional survey within 24 hours of ground-disturbing activities. Standards for Success: Burrowing owl surveys are completed within all suitable habitats in the Project area and required buffer distances.			
Impact BIO-1 Impact BIO-2	MM WIL-CEQA-8: Conduct Pre-Construction Protocol Surveys for Arizona Bell's Vireo, Southwestern Willow Flycatcher, and Willow Flycatcher; Avoid Occupied Habitat; Compensate Impacts. The following APMs, BMPs, and CMAs shall be incorporated within this MM WIL-CEQA-8: APM BIO-20; APM BIO-21; BMP BIO-21; BMP BIO-29; BMP BIO-32; BMP BIO-35; BMP BIO-36; BMP BIO-40; BMP BIO-48; BMP BIO-55; CMA LUPA-BIO-1; CMA LUPA-BIO-2; CMA LUPA-BIO-3; CMA LUPA-BIO-4; CMA LUPA-BIO-12; CMA LUPA-BIO-16; CMA LUPA-BIO-17; CMA LUPA-BIO-COMP-2; CMA LUPA-TRANS-BIO-1; and CMA LUPA-TRANS-BIO-2. If Project related activities are scheduled to occur during the breeding season (generally 15 Feb – 15 Sep) the Applicant shall have a qualified avian biologist, approved by the CPUC, BLM, and CDFW, conduct protocol surveys prior to the start of construction for Arizona Bell's vireo, southwestern willow flycatcher, and willow flycatcher in suitable habitat within the Project area and 500 feet of disturbance areas. The surveys shall follow all current agency protocols (i.e., CDFW, USFWS). Prior to construction, documentation shall be	The Applicant shall submit documentation in the form of a report of technical memorandum that provides the survey results and any avoidance or relocation recommendations to the CPUC, BLM, and CDFW for review and approval. Responsible parties include USFWS and CDFW.	The focused surveys shall be conducted during the required protocol windows should construction activities occur between 15 Feb and 15 Sep.	The focused protocol surveys for Arizona Bell's vireo, southwestern willow flycatcher, and willow flycatcher shall be conducted by a qualified biologist(s).

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
	submitted providing the results of the pre-construction focused surveys for Arizona Bell's vireo, southwestern willow flycatcher, and willow flycatcher to the CPUC for review and approval in consultation with USFWS and CDFW. Protocol or focused nest location surveys, as appropriate, shall be conducted within one year prior to the start of construction and shall continue annually until completion of construction and restoration activities. If an active breeding territory or nest is confirmed, the CPUC, USFWS, and CDFW shall be notified immediately. All active nests shall be monitored on a weekly basis until the nestlings fledge or the nest becomes inactive. The Applicant shall provide monitoring reports to the CPUC for review on a weekly basis. In coordination with the USFWS and CDFW, a minimum 300-foot disturbance-free ground buffer shall be established around the active nest and demarcated by fencing or flagging. No construction or vehicle traffic shall occur within nest buffers. The qualified biologist shall have the authority to halt construction activities and shall devise methods to reduce the noise and/or disturbance in the vicinity. This may include methods such as, but not limited to, turning off vehicle engines and other equipment whenever possible to reduce noise, installing a protective noise barrier between the nest site and the construction activities, and working in other areas until the young have fledged. All active nests shall be monitored on a weekly basis until the nestlings fledge. Impacts and mitigation for Federal- and State-listed species shall be addressed through either the Section 7 or Section 10(a)(1)(B) process under the FESA with the USFWS, and either the Section 2081 or Section 2080.1 process under the CESA with the CDFW. Additionally, direct impacts to Federally listed species' critical habitat that cannot be avoided shall also be addressed through either the FESA Section 7 or Section 10(a)(1)(B) process. Formal FESA consultation for Federally listed species that have at least a moderate potential to occur and may be impacted by the Project include the Mojave Desert tortoise, razorback sucker, southwestern willow flycatcher, western yellow-billed			

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
	cuckoo, and Yuma Ridgway's rail. CESA consultation for State-listed species that have at least a moderate potential to occur and may be impacted by the Project include California black rail, greater sandhill crane, Mojave Desert tortoise, razorback sucker, southwestern willow flycatcher, western yellow-billed cuckoo, Swainson's hawk, and Yuma Ridgway's rail. Additional mitigation may be required by each agency during the regulatory permitting process. Mitigation for impacts to listed species habitat shall consider and overlap with compensation for special-status plants, sensitive vegetation communities, and jurisdictional waters and wetlands. Standards for Success: Protocol Arizona Bell's vireo, southwestern willow flycatcher, and willow flycatcher surveys are completed within all suitable habitats in the Project area and required buffer distances.			
Impact BIO-1	MM WIL-CEQA-9: Compensation for Impacts to Mojave Fringe-Toed Lizard. To meet CEQA requirements, the following APMs, BMPs, and CMAs are incorporated within this MM WIL-CEQA-9: APM BIO-3; BMP BIO-03; APM BIO-9; APM BIO-10; APM BIO-17; BMP BIO-25; BMP BIO-35; BMP BIO-36; BMP BIO-49; BMP BIO-53; BMP BIO-54; BMP BIO-55; CMA DFA-BIO-IFS-1; CMA DFA-VP; CMA LUPA-BIO-11L-BIO-DUNE-1; CMA LUPA-BIO-1; CMA LUPA-BIO-15 CMA LUPA-BIO-3 CMA LUPA-BIO-4; CMA LUPA-BIO-13; CMA LUPA-BIO-14; CMA LUPA-BIO-COMP-1; CMA LUPA-BIO-DUNE-1; CMA LUPA-BIO-DUNE-2; CMA LUPA-BIO-DUNE-3; CMA LUPA-BIO-DUNE-4; and CMA LUPA-BIO-DUNE-5. Specifically, the following shall be implemented by the Applicant to protect and compensate for impacts to Mojave fringe-toed lizard. **Field Surveys:** Prior to construction, field surveys shall be conducted by an Applicant designated qualified biologist, approved by the CPUC, BLM, and CDFW, to assess for Mojave fringe-toed lizard habitat (e.g., dune	The Applicant shall prepare a Fringe-Toed Lizard Linear ROW Protection Plan.	Field surveys shall be conducted prior to construction. All potential indirect and direct impacts shall be evaluated, and avoidance, minimization, compensation, and mitigation shall be approved by the appropriate Federal and State regulatory agencies prior to project	Supervision, guidance, and verification of mitigation as outlined in this measure shall be achieved the Applicant.

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
	systems, Aeolian sand, scattered vegetation). **Avoidance and Minimization:** If Mojave fringe-toed lizard habitat is present within the Project site and/or adjacent areas, at a minimum, the following avoidance and minimization measures shall be employed to reduce potential species impacts: An Applicant designated qualified biologist shall conduct pre-construction clearance surveys for Mojave fringe-toed lizard in the Project area; Mojave fringe-toed lizard suitable habitat, if present, shall be mapped using the BLM NOC habitat mapping standards; If potential habitat is identified in or adjacent to the Project site, then a biological monitor shall be on-site during all Project activities, as necessary; ESA signage and exclusion fencing shall be installed at the appropriate buffer distance (i.e., resource setback), if suitable habitat is within or encroaches into the Project site; Project-specific, construction-related BMPs shall be implemented to reduce the amount of Aeolian sand transport within work areas; New roads/routes shall avoid Mojave fringe-toed lizard suitable habitat within identified linkages, unless the new road and/or route is beneficial to minimize net impacts to natural or ecological resources of concern; and Project-specific CMAs shall be implemented to ensure the control of invasive and nuisance animal species that could indirectly impact Mojave fringe-toed lizard species. **Compensation for Permanent Impacts:** Permanent habitat loss and direct impacts to Mojave fringe-toed lizards shall be subject to compensatory mitigation at a minimum ratio of 3:1 and overlap with the mitigation for		commencement.	

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
	impacts to special-status plant species, and particularly Harwood's eriastrum, as part of MM VEG-CEQA-4. Compensation for permanent impacts to suitable habitat for the Mojave fringe-toed lizard shall include (a) preservation through acquisition of offsite lands with an attached conservation easement or purchase of credits from an approved bank, or (b) onsite or offsite enhancement of lands that support known populations of Mojave fringe-toed lizard. Off-site compensation lands and/or established mitigation bank program shall be identified, if available, in coordination with the appropriate Federal and State regulatory agencies. The Applicant shall provide for open space/conservation easements on all acquired lands or provide the required funds for the acquisition of easements to a "qualified easement holder"; the CDFW is a qualified easement holder. To qualify as a "qualified easement holder" a private land trust must have substantial experience managing open space/conservation easements that are created to meet mitigation requirements, have adopted the Land Trust Alliance's Standards and Practices, and have a stewardship endowment fund to pay for its perpetual stewardship obligations. The Applicant shall also provide the "qualified easement holder" with adequate funds to cover administrative costs incurred during the creation of the easement, funds in the form of a non-wasting endowment to cover the cost of monitoring and enforcing the terms of the easement in perpetuity. The Applicant shall coordinate with CPUC, BLM, and CDFW to determine the appropriate mitigation strategy and final replacement ratios and acreages. All mitigation shall be approved by the appropriate Federal and State regulatory agencies prior to Project activities. At a minimum, the compensation lands selected for acquisition shall meet the following criteria: Be deposits of Aeolian or fine windblown sands typically associated with dunes, washes, hillsides, and margins of dry lakes, with potential to			

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
	contribute to Mojave fringe-toed lizard habitat connectivity and build linkages between known populations of Mojave fringe-toed lizards and preserve lands with suitable habitat; To the extent feasible, be connected to lands currently occupied by Mojave fringe-toed lizard; To the extent feasible, be near larger blocks of lands that are either already protected or planned for protection, or which could feasibly be protected long-term by a public resource agency or a non-governmental organization dedicated to habitat preservation; Provide quality habitat for Mojave fringe-toed lizard, that has the capacity to regenerate naturally when disturbances are removed; Not have a history of intensive recreational use or other disturbance that might make habitat recovery and restoration infeasible; Not be characterized by high densities of invasive species, either on or immediately adjacent to the parcels under consideration, that might jeopardize habitat recovery and restoration; Not contain hazardous wastes that cannot be removed to the extent the site is suitable for habitat; Not be subject to property constraints (i.e. mineral leases, cultural resources); and Be on land for which long-term management is feasible (BLM 2018a). **Documentation:** The Applicant shall prepare a Fringe-Toed Lizard Linear ROW Protection Plan, as detailed by BMP BIO-49 and referenced in MM BIO-CEQA-1. This plan shall be in accordance with Federal and State regulatory agencies policies, guidance, and protocols. In addition, this plan shall be approved by the appropriate regulatory agencies prior to Project			

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
	commencement, and implemented, as necessary, during all Project phases. The Fringe-Toed Linear ROW Protection Plan, shall at a minimum, discuss potential for Mojave fringe-toed lizard to occur in the Project area (e.g., known occurrences, locations for potential suitable habitat, etc.); provide an overview related to the potential for indirect and/or direct permanent impacts; outline methods and measures for avoidance, minimization, translocation, compensation, and mitigation. **Standards for Success:** Compensation implemented for Mojave fringe-toed lizard that results in a no net loss of suitable habitat.			
Impact BIO-1	MM WIL-CEQA-10: Compensation for Impacts to Mojave Desert Tortoise. To meet CEQA requirements, the following APMs, BMPs, and CMAs are incorporated within this MM WIL-CEQA-10: APM BIO-2; BMP BIO-02; APM BIO-3; BMP BIO-03; APM BIO-4; APM BIO-17; APM BIO-23; BMP BIO-23; BMP BIO-35; BMP BIO-36; BMP BIO-44; BMP BIO-55; CMA DFA-BIO-IFS-1; CMA DFA-VPL-BIO-DUNE-1; CMA LUPA-BIO-1; CMA LUPA-BIO-2; CMA LUPA-BIO-3; CMA LUPA-BIO-4; CMA LUPA-; CMA LUPA-BIO-IFS-3BIO-7; CMA LUPA-BIO-12; CMA LUPA-BIO-13; CMA LUPA-BIO-14; CMA LUPA-BIO-IFS-5; CMA LUPA-BIO-IFS-6; CMA LUPA-BIO-IFS-7; CMA LUPA-BIO-IFS-8; and CMA LUPA-BIO-IFS-9. Specifically, the following shall be implemented by the Applicant to protect and compensate for impacts to Mojave Desert tortoise: **Compensation for Impacts:** To fully mitigate for habitat loss and potential take of Mojave Desert tortoise, the Applicant shall provide compensatory mitigation at a minimum ratio of 2:1. For the purposes of this measure, the Project site (i.e., footprint) means all lands directly disturbed in the construction and operation of the Project, including all linear features, as well as undeveloped areas inside the Project's boundaries that will no	The Applicant shall prepare a Mojave Desert Tortoise Protection and Compensation Plan. In addition, the Applicant shall also prepare a Mojave Desert Tortoise Quarterly Compliance Report.	Prior to construction, field surveys shall be conducted by the Applicant (refer to MM WIL-CEQA-11 below) designated qualified biologist to assess for Mojave Desert tortoise habitat. Additionally, the Applicant designated qualified biologist shall conduct pre-construction clearance surveys for Mojave Desert	Supervision, guidance, and verification of mitigation as outlined in this measure shall be achieved the Applicant.

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
	longer provide viable long- term habitat for the Mojave Desert tortoise. To satisfy this measure, the Applicant shall acquire, protect and transfer one acre of Mojave Desert tortoise habitat for every acre of habitat within the final Project footprint, and provide associated funding for the acquired lands, as specified below (BLM 2018). The Applicant shall coordinate with CPUC, BLM, and CDFW to determine the appropriate mitigation strategy and final replacement ratios and acreages. All mitigation shall be approved by the appropriate Federal and State regulatory agencies prior to Project activities. The Applicant has another option for satisfying some or all of the requirements in this measure, in lieu of acquiring lands itself. The Applicant may satisfy the requirements of this measure by depositing funds into an account established with the NFWF. Applicant shall acquire the land, in fee or in easement, within 12 months from the time the resource impact occurs, unless a 6-month extension is approved by the Authorizing Officer. If compensation lands are acquired in fee title or in easement, the requirements for acquisition, initial improvement and long-term management of compensation lands include all of the following: Be within the appropriate Habitat Unit or, if sufficient land is unavailable, in other locations within approved by the appropriate Federal and State regulatory agencies; Provide habitat for Mojave Desert tortoise with capacity to regenerate naturally when disturbances are removed; Be prioritized near larger blocks of lands that are either already protected or planned for protection, or which could feasibly be protected long-term by a public resource agency or a non-governmental organization dedicated to		tortoise in the Project area during the period when they are most active (i.e., March through May, or September through mid-November).	

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
	habitat preservation; Be connected to lands with Mojave Desert tortoise habitat equal to or better quality than the Project site, ideally with populations that are stable, recovering, or likely to recover; Not have a history of intensive recreational use or other disturbance that does not have the capacity to regenerate naturally when disturbances are removed or might make habitat recovery and restoration infeasible; Not be characterized by high densities of invasive species, either on or immediately adjacent to the parcels under consideration, that might jeopardize habitat recovery and restoration; Not contain hazardous wastes that cannot be removed to the extent that the site could not provide suitable habitat; and Have water and mineral rights included as part of the acquisition, unless consultation with the appropriate Federal and State agencies occurs and there is an agreement in writing to the acceptability of land. **Documentation:** The Applicant shall prepare a Mojave Desert Tortoise Protection and Compensation Plan. This plan shall be in accordance with Federal and State regulatory agencies policies, guidance, and protocols. In addition, this plan shall be approved by the appropriate regulatory agencies prior to Project commencement, and implemented, as necessary, during all Project phases. The Plan, shall at a minimum, discuss the potential for Mojave Desert tortoise to occur in the Project area (e.g., known occurrences, locations for potential suitable habitat, locations of burrows, fencing locations, etc.); provide an overview related to the potential for indirect and/or direct permanent impacts; outline methods and measures for avoidance, minimization, translocation, compensation, mitigation, and requirements for maintenance and monitoring.			

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
	In addition, the Applicant shall also prepare a Mojave Desert Tortoise Quarterly Compliance Report. The first Mojave Desert Tortoise Quarterly Compliance Report shall be complete prior to Project commencement and include a narrative describing species-specific pre-construction compliance measures completed. After the initial Mojave Desert Tortoise Quarterly Compliance Report is submitted prior to construction, subsequent reports shall be prepared and submitted quarterly until the completion of Project activities. If during construction, Mojave Desert tortoise are encountered, and/or relocated, then the following details shall be included in the Mojave Desert Tortoise Quarterly Compliance Report, as necessary. The locations (i.e., maps) and dates of observation; The location moved from and location moved to (i.e., exact coordinates); Ambient temperature when handled and released; Digital photograph(s) of each handled Mojave Desert tortoise; General condition and health, including injuries, state of healing and whether Mojave Desert tortoise voided their bladders; and Gender, carapace length, and diagnostic markings (i.e., identification numbers or marked lateral scutes). **Standards for Success:** Compensation implemented for desert tortoise that results in a no net loss of suitable habitat.			
Impact BIO-1	MM WIL-CEQA-11 Conduct Pre-construction Surveys for Listed and Special-Status Terrestrial Herpetofauna and Compensation for Impacts. The following APMs, BMPs, and CMAs shall be incorporated within this MM WIL-CEQA-11: APM BIO-2; BMP BIO-02; APM BIO-3; BMP BIO-03; APM BIO-4; APM BIO-9; APM BIO-10; APM BIO-17; APM BIO-23; BMP BIO-23; BMP BIO-25; BMP BIO-35; BMP BIO-36; BMP BIO-44; BMP BIO-49;	The Applicant shall prepare a technical report detailing the results of all terrestrial herpetofauna and desert tortoise surveys.	General surveys shall be conducted year-round with desert tortoise surveys focused on the periods of	Supervision, guidance, and verification of mitigation as outlined in this measure shall be

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
	BMP BIO-53; BMP BIO-54; BMP BIO-55; CMA DFA-BIO-IFS-1; CMA DFA-VP; CMA LUPA-BIO-11L-BIO-DUNE-1; CMA LUPA-BIO-1; CMA LUPA-BIO-2; CMA LUPA-BIO-3 CMA LUPA-BIO-4; CMA LUPA-BIO-IFS-7; CMA LUPA-BIO-12; CMA LUPA-BIO-13; CMA LUPA-BIO-14; CMA LUPA-BIO-15; CMA LUPA-BIO-COMP-1; CMA LUPA-BIO-DUNE-1; CMA LUPA-BIO-DUNE-2; CMA LUPA-BIO-DUNE-3; CMA LUPA-BIO-DUNE-4; and CMA LUPA-BIO-DUNE-5; CMA LUPA-BIO-IFS-3; CMA LUPA-BIO-IFS-5; CMA LUPA-BIO-IFS-6; CMA LUPA-BIO-IFS-7; CMA LUPA-BIO-IFS-8; and CMA LUPA-BIO-IFS-9. Conduct Pre-Construction Surveys for Listed and Special Status Terrestrial Herpetofauna and Compensate Impacts Prior to ground disturbance or vegetation clearing within the Project site, the Applicant shall retain an approved/qualified biologist to conduct surveys for special-status terrestrial herpetofauna (i.e., lizards, snakes, tortoise, etc.) where suitable habitat is present and directly impacted by construction vehicle access, or maintenance. Focused surveys shall consist of a minimum of three daytime surveys and one nighttime survey within one week of vegetation clearing. The qualified biologist shall be present during all activities immediately adjacent to or within habitat that supports special-status terrestrial herpetofauna. Clearance surveys for special-status terrestrial herpetofauna shall be conducted by the qualified biologist prior to the initiation of construction each day in suitable habitat. Special-status terrestrial herpetofauna found within the area of disturbance or potentially affected by the Project shall be relocated to the nearest suitable habitat that shall not be affected by the Project. Desert Tortoise Specific Surveys **Field Surveys:** Prior to construction, field surveys shall be conducted by the Applicant designated qualified biologist to assess for Mojave Desert tortoise habitat (e.g., desert scrub vegetation communities dominated, cover		expected activity. Prior to construction, field surveys shall be conducted by an Applicant designated qualified biologist to assess for Mojave Desert tortoise habitat. Additionally, the Applicant designated qualified biologist shall conduct pre-construction clearance surveys for Mojave Desert tortoise in the Project area during the period when they are most active (i.e., March through May, or September through mid-November).	achieved the Applicant.

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
	sites- soil burrows, pallets, caliche caves, etc.). Additionally, the Applicant designated qualified biologist, approved by the CPUC, BLM, and CDFW, shall conduct pre-construction clearance surveys for Mojave Desert tortoise in the Project area during the period when they are most active (i.e., March through May, or September through mid-November). During pre-construction clearance survey, the qualified biologist shall inspect construction pipes, culverts or similar structures with (a) with a diameter greater than 3 inches, (b) stored for one or more nights, (c) less than 8 inches aboveground, and (d) within Mojave Desert tortoise habitat, before the materials are moved, buried, or capped. As an alternative, such materials shall be capped before storing outside the fenced area or placing on pipe racks. Pipes stored within the long-term fenced area after completing desert tortoise clearance surveys would not require inspection. Pre-construction habitat surveys and clearance surveys for Mojave Desert tortoise shall be conducted using techniques outlined in the *Desert Tortoise (Mojave Population) Field Manual (Gopherus agassizii)* (USFWS 2009). **Avoidance and Minimization:** If Mojave Desert tortoise habitat is present within the Project site and/or adjacent areas, at a minimum, the following avoidance and minimization measures shall be employed to reduce potential species impacts: Mojave Desert tortoise habitat and burrows, if present, shall be mapped using the BLM NOC habitat mapping standards; If potential habitat is identified in or adjacent to the Project site, then a qualified biological monitor shall be on-site during all Project activities, as necessary. The qualified biological monitor shall directly monitor site clearing and shall be onsite during grading activities to find and move Mojave Desert tortoises missed during the initial pre-construction tortoise			

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
	clearance survey. Should a tortoise be discovered, it shall be relocated or translocated as described in the Mojave Desert Tortoise Protection and Compensation Plan; ESA signage and exclusion fencing shall be installed at the appropriate buffer distance (i.e., resource setback), if suitable habitat is within or encroaches into the Project site (see further details under "fencing" below); During Project activities, including on specific linear features (e.g., fencing, transmission lines, and access roads, etc.) and during O&M, all live Mojave Desert tortoises and active burrows shall be avoided to the extent possible. The Applicant shall ensure that the qualified biologist and biological monitor monitors any Project activities in unfenced areas for presence of Mojave Desert tortoises. If an active burrow cannot be avoided by construction activities, the burrow shall be excavated using protocols in *Desert Tortoise (Mojave Population) Field Manual (Gopherus agassizii)* (USFWS 2009). If a tortoise wanders into an unfenced, active Project work area, does not leave the area on its own accord (i.e., within 15 minutes), and cannot be avoided by Project activities, the Applicant shall ensure that that the qualified biologist captures the Mojave Desert tortoise, implements a health assessment of the tortoise, relocates it to previously identified appropriate Project-adjacent habitat away from any active, unfenced Project work areas, and monitor the individual via telemetry, in accordance with the aforementioned Protocol. The qualified biologist and biological monitor shall have a copy of all measures, Federal and State permits, when monitoring Project activities. The qualified biologist and biologist monitor shall have the authority to halt all non-emergency activities that are in violation of the measures. Work shall proceed only after hazards to Mojave Desert tortoise are removed, the species is no longer at risk, or the individual has been moved from harm's way by the qualified biologist. A Mojave Desert Tortoise Quarterly Compliance Report will be submitted			

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
	quarterly to the appropriate Federal and State regulatory agencies (BLM 2018); and o Vehicular traffic would not exceed 15 miles per hour within the areas not cleared by protocol-level surveys where desert tortoise may be impacted. **Fencing:** The Applicant shall ensure that temporary and/or permanent tortoise exclusionary fencing is installed around active portions of the Project area following the pre-construction tortoise survey. The exclusionary fencing, whether temporary or permanent in nature, and shall be installed according to specifications in the *Desert Tortoise (Mojave Population) Field Manual (Gopherus agassizii)* (USFWS 2009). Specifications requires fencing to be buried 12 inches below the ground surface and extend to 22 to 24 inches above the ground surface. If a phased approach is implemented during the construction phase, the exclusionary fencing may be installed in phases, with pre-construction surveys conducted prior-to and clearance surveys conducted immediately after installation of the exclusionary fence. The Applicant shall also ensure that tortoise exclusionary fencing is maintained during the decommissioning phase to keep tortoises from accessing active work areas. Throughout the construction and decommissioning phases, the tortoise exclusionary fence shall be checked regularly to ensure its integrity (BLM 2018). Security Gates- For security fencing, the Applicant shall ensure that the Project's perimeter security fence includes exclusionary fencing that prevents Mojave Desert tortoises, and other burrowing animals, from accessing the Project site. The exclusionary fencing shall be installed at the base of the security in accordance with the protocols listed above, and cattle guards shall be installed at entrances to the Project. Specifically, security gates shall be designed with minimal ground clearance to deter ingress by			

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
	tortoises. Tortoise guards shall be installed at gate locations. (BLM 2018) Fence Flagging- All fencing installation corridors shall be flagged to assist the qualified biologist in studying the fence route and surveying within 24 hours prior to the initiation of fence construction. Prior to the surveys the Applicant shall provide all appropriate Federal and State regulatory agencies map figures clearly depicting the limits of construction disturbance for the proposed fence installation (BLM 2018). Fence Installation- The exclusion fencing shall be installed prior to the onset of site clearing and grubbing. The fence installation shall be supervised by the qualified biologist and monitored to ensure the safety of any tortoise present (BLM 2018). Fence Inspections- Following installation of the Mojave Desert tortoise exclusion fencing, the fencing shall be regularly inspected during construction, operations, and decommissioning. If Mojave Desert tortoise were moved out of harm's way during fence construction, fencing shall be inspected daily for the first 7 days to ensure a recently moved Mojave Desert tortoise has not been trapped within the fence. Thereafter, fencing shall be inspected quarterly and during and within 24 hours following major rainfall events. A major rainfall event is defined as one for which flow is detectable within the fenced drainage. Any damage to the fencing shall be temporarily repaired immediately to keep Mojave Desert tortoises out of the site, and permanently repaired within 48 hours of observing damage. Inspections of site fencing shall occur for the life of the Project. Temporary fencing shall be inspected weekly and, where drainages intersect the fencing, during and within 24 hours following major rainfall events. All temporary fencing shall be repaired immediately upon discovery and, if the fence may have permitted Mojave Desert tortoise entry while damaged, the qualified biologist shall inspect the area for			

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
	Mojave Desert tortoise (BLM 2018). Tortoise Encounters- If a tortoise is encountered along the inside or outside of the fence, the qualified biologist shall capture and relocate in accordance with the protocols listed above (i.e., USFWS 2009, Chapter 7), perform a health assessment, attach a radio transmitter to the tortoise in accordance, and release the Mojave Desert tortoise in a previously identified Project-adjacent relocation areas supporting Mojave Desert tortoise habitat in accordance with USFWS and all other appropriate Federal and State regulatory agencies (BLM 2018). Fence Removal- Temporary exclusionary fencing shall be removed following completion of the construction and decommissioning phases. With the exception of desert tortoise, compensation for temporary impacts to special-status terrestrial herpetofauna (including Couch's spadefoot toad and Mojave fringe-toed lizard) potential/modeled habitat shall include on-site habitat restoration at a minimum 1.5:1 ratio. Restoration of conditions of the impacted areas within the Project footprint shall be at 1:1; and creation, restoration, or enhancement of similar vegetation communities offsite shall be 0.5:1, as approved by CDFW and CPUC. Alternatively, payments would be made into an appropriate mitigation program or other mitigation funding mechanism. Compensation for permanent impacts to desert tortoise and special-status wildlife on-site surveyed habitat shall include a) off-site creation, enhancement, and/or preservation, and/or b) participation in an established mitigation bank program at a minimum 3:1 ratio. Compensation for temporary and permanent impacts for all other special-status wildlife habitat shall include a combination of a) on-site habitat creation or enhancement with similar species compositions to those present prior to construction, b) off-site creation, enhancement, and/or preservation, and/or c) participation in an established mitigation bank program at a 2:1 minimum ratio. The Applicant shall coordinate with CPUC, BLM, and CDFW to determine the appropriate mitigation strategy			

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
	and final replacement ratios and acreages. All mitigation shall be approved by the appropriate Federal and State regulatory agencies prior to Project activities. Compensation for impacts to desert tortoise are detailed above in MM WIL-CEQA-10. Impacts and mitigation for the Mojave Desert tortoise shall be addressed through either the Section 7 or Section 10(a)(1)(B) process under the FESA with the USFWS, and either the Section 2081 or Section 2080.1 process under the CESA with the CDFW. Mitigation for impacts to all listed and special-status species habitat shall consider and overlap with compensation for special-status plants, sensitive vegetation communities, and jurisdictional waters and wetlands. Standards for Success**:** Compensation implemented for all listed/special-status terrestrial herpetofauna, including desert tortoise, that results in a no net loss of suitable habitat.			
Cultural Resources				
Impact CUL-1 Impact CUL-2 Impact CUL-4	**APM CULT-01: Cultural Resources Inventory.** A cultural inventory would be conducted that would document cultural resources within the area of potential effects for the Project. Based on results of this inventory, an HPTP would be developed to specifically address direct and indirect impacts that may result from Project construction.	Review adequacy of and implementation of HPTP.	Pre-construction	The Applicant
Impact CUL-1 Impact CUL-2 Impact CUL-4	**APM CULT-02: Monitoring and Discovery Plan.** DCRT's contractor would prepare an MDP that would describe procedures to be followed in the event of the discovery of cultural resources or human remains during implementation of the Project. The Draft MDP would be reviewed by BLM and consulting state and Federal agencies, the California and Arizona SHPOs, and local tribes. Upon approval of the MDP, DCRT would follow the procedures set forth in that plan	Review adequacy of and implementation of MDP.	Pre-construction Construction	The Applicant

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
	during implementation of the Project.			
Impact CUL-1 Impact CUL-2 Impact CUL-4	**BMP CULT-03: Cultural Resources Avoidance and Stipulations.** DCRT would follow the avoidance procedures and other stipulations outlined in the PA and in the appropriate State HPTP for each historic property identified in the HPTP.	Review adequacy of and implementation of State HPTP.	Construction	The Applicant
Impact CUL-1 Impact CUL-2	**BMP CULT-04: Worker Cultural Resources Awareness Program**. Before starting any work, including mowing, staging, sediment and erosion control installation, tree removal, construction, and restoration, all employees and contractors performing activities and construction would receive training on the NHPA, the Archaeological Resources Protection Act, and the Native American Graves Protection and Repatriation Act and the consequences of noncompliance with these acts. Training would also include cultural sensitivity to Native American concerns, since tribal monitors would be present during construction.	Review adequacy and implementation of worker cultural resources awareness program.	Pre-construction	The Applicant
Impact CUL-1 Impact CUL-2	**BMP CULT-05: Compensatory Mitigation Fee.** DCRT would pay a compensatory mitigation fee for cumulative and indirect effects to historic properties as a result of construction. The fee structure of the compensatory mitigation fee would be calculated in a manner that is commensurate to the size and regional impacts of the project and would include a management fee. This fee structure would be determined by BLM and contained in the project-specific PA.	Verify compensatory mitigation fee paid.	Post-construction	The Applicant
Impact CUL-1 Impact CUL-2	**BMP CULT-06: Sensitivity Model.** BLM would develop a sensitivity model for cultural resources using the DRECP geodatabase for the purpose of selecting Project footprints to minimize impacts to recorded historic properties and areas that are culturally sensitive to Tribes.	Verify use of sensitivity model.	Design Pre-construction	The Applicant
Impact CUL-1 Impact CUL-2	**BMP CULT-07: Sample Survey.** The BLM shall ensure that a statistically significant cultural resources sample survey is conducted for consideration in	Verify sample survey is adequate.	Design	The Applicant

Impact CUL-2	application process, unless the BLM determines the DRECP geodatabase and other sources are adequate to assess cultural resources sensitivity of specific footprints.			
Impact CUL-1 Impact CUL-2 Impact CUL-4	**CMA LUPA-TRANS-CUL-6.** For transmission (and renewable energy) activities, provide justification in the application why the project considerations merit moving forward if the specific footprint lies within an area identified or forecast as sensitive for cultural resources by the BLM.	Confirm justification is provided.	Pre-construction	The Applicant
Impact CUL-1 Impact CUL-2	**CMA DFA-VPL-CUL-1.** For renewable energy activities and transmission, require the applicant to pay all appropriate costs associated with the following processes, through the appropriate BLM funding mechanism: • All appropriate costs associated with the BLM's analysis of the DRECP geodatabase and other sources for cultural resources sensitivity. • All appropriate costs associated with preliminary sensitivity analysis. • All appropriate costs associated with the Section 106 process including the identification and defining of cultural resources. These costs may also include logistical, travel, and other support costs incurred by tribes in the consultation process. • All appropriate costs associated with updating the DRECP cultural resources geodatabase with project specific results.	Confirm appropriate costs are paid for Section 106 compliance.	Pre-construction	The Applicant
Impact CUL-1 Impact CUL-2	**CMA DFA-VPL-CUL-2.** Consistent and in compliance with the NHPA PA, signed February 5, 2016, or the most up to date signed version -for renewable energy activities and transmission, a compensatory mitigation fee will be required within the LUPA DA to address cumulative and some indirect adverse effects to historic properties. The mitigation fee will be calculated in a manner that is commensurate to the size and regional impacts of the project. Refer to the PA for details regarding the mitigation fee.	Confirm compensatory mitigation fee is paid as required.	Pre-construction	The Applicant

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
Impact CUL-1 Impact CUL-2	**CMA DFA-VPL-CUL-3**. For renewable energy activities and transmission, the management fee rate will be determined through the NHPA programmatic Section 106 consultation process that will be completed as part of the DRECP land use plan amendment.	Confirm appropriate costs are paid as necessary.	Pre-construction	The Applicant
Impact CUL-1 Impact CUL-2	**CMA DFA-VPL-CUL-4.** For renewable energy activities and transmission, demonstrate that results of cultural resources sensitivity, based on the DRECP geodatabase, and other sources, are used as part of the initial planning pre-application process and to select of specific footprints for further consideration.	Confirm cultural resources sensitivity is included in initial planning.	Pre-construction	The Applicant
Impact CUL-1 Impact CUL-2	**CMA DFA-VPL-CUL-5.** For renewable energy activities and transmission, provide a statistically significant sample survey as part of the pre-application process, unless the BLM determines the DRECP geodatabase and other sources are adequate to assess cultural resources sensitivity of specific footprints.	Confirm sample survey is provided.	Pre-construction	The Applicant
Impact CUL-1 Impact CUL-2	**CMA DFA-VPL-CUL-6.** For renewable energy activities and transmission, provide justification in the application why the project considerations merit moving forward if the specific footprint lies within an area identified or forecast as sensitive for cultural resources by the BLM.	Confirm justification is provided in application	Pre-construction	The Applicant
Impact CUL-1 Impact CUL-2	**CMA DFA-VPL-CUL-7.** For renewable energy activities and transmission, complete the NHPA Section 106 Process as specified in 36 CFR Part 800, or via an alternate procedure, allowed for under 36 CFR Part 800.14 prior to issuing a ROD or ROW grant on any utility-scale renewable energy or transmission project. For utility-scale solar energy developments, the BLM may follow the Solar PA.	Confirm NHPA Section 106 Process or alternate procedure is completed as necessary.	Pre-construction	The Applicant
Impact CUL-1 Impact CUL-2 Impact CUL-3	MM CUL-CEQA-1 Implement Cultural Resources Applicant Proposed Measures, Best Management Practices, and Conservation and Management Actions. The APMs, BLM BMPs, and CMAs in Sections 2.5.2 and 2.5.3 above provide a	The Applicant shall develop a weekly report that shall include all applicable APMs, BMPs,	APMs, BMPs, and CMAs shall be implemented throughout	The Applicant shall ensure that all APMs, BMPs, and CMAs are

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
Impact CUL-4	suite of measures, practices, and actions that shall be implemented as part of the Project. APMs, BMPs, and CMAs shall be implemented prior to, or during all ground disturbance and construction related activities to avoid or minimize Project related impacts to cultural resources. These APMs, BMPs, and CMAs include; APM CULT-01, APM CULT-02, BMP CULT-03, BMP CULT-04, BMP CULT-05, BMP CULT-06, BMP CULT-07, BMP CULT-08, APM PALEO-01, BMP PALEO-02, CMA LUPA-CUL-4, CMA LUPA-TRANS-CUL-1, CMA LUPA-TRANS-CUL-2, CMA LUPA-TRANS-CUL-3, CMA LUPA-TRANS-CUL-4, CMA LUPA-TRANS-CUL-5, CMA LUPA-TRANS-CUL-6, CMA DFA-VPL-CUL-1, CMA DFA-VPL-CUL-2, CMA DFA-VPL-CUL-3, CMA DFA-VPL-CUL-4, CMA DFA-VPL-CUL-5, CMA DFA-VPL-CUL-6, CMA DFA-VPL-CUL-7. If an APM, BMP, or CMA is subjective, such as containing text that states; "where appropriate," "where applicable," "where feasible," or similar language, the BLM and CPUC shall be consulted to determine the applicability of each measure prior to the disturbance of a covered resource. Compliance with APMs, BMPs, and CMAs shall be documented, and a weekly report shall be provided to the BLM and CPUC. The Applicant shall provide a synopsis of the weekly reports to the BLM and CPUC monthly. The report shall include a summary of the construction activities completed, a list of compliance actions and any remedial actions taken to correct any actions, and the status of ongoing mitigation efforts. For those instances (only) where an APM, BMP, and/or CMA conflicts, or does not meet required specificity pursuant to CEQA, the following BMPs have been modified to meet CEQA requirements: **APM CULT-01: Cultural Resources Inventory.** See MM CUL-CEQA-2 below for more details on the cultural resources inventory. **APM CUL-02: Monitoring Discovery Plan.** See MM CUL-CEQA-2	and CMAs and the related actions taken in order to be in compliance with these measures. These weekly reports shall be compiled and submitted to the BLM and CPUC monthly.	construction activities.	implemented. during construction. If an APM, BMP, or CMA is subjective, the Applicant shall consult with the BLM and/or the CPUC to determine the applicability of each measure.

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
	below for more details on the Monitoring Discovery Plan. **BMP CULT-03: Cultural Resources Avoidance and Stipulations.** See MM CUL-CEQA-3 below for more details on cultural resources avoidance stipulations. **BMP CULT-04: Worker Cultural Resources Awareness Program.** See MM CUL-CEQA-2 below for more details on the worker cultural resources awareness program. **APM PAELO-01: Paleontological Resources Treatment Plan.** See MM CUL-CEQA-4 below for more details on the Paleontological Resources Treatment Plan required for the Project. Standards for Success: Compliance with all applicable APMs, BMPS, and CMAs is achieved throughout construction of the Project.			
Impact CUL-1 Impact CUL-2	MM CUL-CEQA-2 Cultural Resources Inventory. The Applicant shall preform a cultural resources inventory prior to the start of construction activities. The cultural inventory (which is further required by APM-CULT-01) shall include archival and pedestrian surveys to identify cultural resources, as well as an evaluation of the significance of those resources that cannot be avoided, in order to determine eligibility for listing in the CRHR, or that meet the qualifications to be considered unique archaeological resources under CEQA. A technical memorandum or report shall be completed, documenting the cultural resources within the Project area, and the associated eligibility listing. Avoidance of cultural resources within the Project area (as required through MM CUL-CEQA-2 below) shall be the preferred option when handling cultural resources that may be impacted by construction. If avoidance is not possible, then a HPTP and MDP will be prepared and implemented by the Applicant throughout construction activities to ensure proper treatment of the significant or unique resources, as specified in the PA. This HPTP and MDP	Known cultural resources shall be documented and mapped prior to the start of construction. Monthly reports shall be prepared by the Applicant and submitted to the CPUC. These monthly reports shall include a summary of compliance measures taken regarding the HPTP/MDP and a list of any cultural resources encountered during construction.	The Cultural Resources Inventory shall be completed prior to the start of construction activities and the HPTP/MDP shall be implemented throughout all construction activities.	The Applicant shall be responsible for ensuring the Cultural Resources Inventory and HPTP/MDP is prepared and implemented prior to and during construction activities.

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
	will, at a minimum, include the following: • Training of workers to recognize cultural resources (as specified in BMP CULT-04); • A brief description of all known cultural resources within the Project area; • A description of all avoidance measures such as flagging or fencing, and specific timeframes during which these MMs would be required to protect cultural resources; • Preparation and implementation of an MDP (as specified in APM CULT-02). This MDP shall include the following specifications: o The MDP shall map all cultural resources within the Project APE; o The MDP shall detail how resource are determined eligible or resources that are unevaluated but are avoided by Project design and would be marked and protected as Environmentally Sensitive Areas during construction; o Th MDP shall also map additional areas that are considered to be of high sensitivity for discovery of buried significant cultural resources including burials, cremations, or sacred features; and o The MDP shall detail procedures for halting construction, making appropriate notifications to agencies, officials, and Native American tribes, and assessing NRHP and CRHR eligibility in the event of unknown archaeological resources are discovered during construction; • Recording procedures and documentation for all cultural resources			

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
	identified within the Project area; and • Policies for any collection, retention, and/or disposal of cultural resources uncovered during construction. Standards for Success: Known cultural resources will be avoided in accordance with this measure. Impacts to unknown cultural resources will be minimized to a less than significant level and treated appropriately throughout all construction activities.			
Impact CUL-1 Impact CUL-2	MM CUL-CEQA-3 Cultural Resources Avoidance and Stipulations. The Applicant shall first consider avoidance of impacts for all known cultural resources identified in the Project APE, through the cultural resources inventory. If the resource cannot be avoided, then the Applicant shall evaluate the resources for significance and eligibility for listing in the CRHR, to determine whether the resource qualifies as a unique archaeological resource under CEQA. As stated in BMP CULT-03, the Applicant would follow the avoidance procedures and other stipulations outlined in the PA and in the appropriate State HPTP. It shall do so for each cultural resource identified in the Project APE. If cultural resources cannot be avoided, then the Applicant shall implement MM CUL-CEQA-2 and any resources shall be evaluated for significance and eligibility for listing in the CRHR. Potential impacts on sites that qualify as historical resources or unique archaeological resources shall be mitigated in accordance with the provisions of the HPTP. **Standards for Success:** Impacts to know or unknown cultural resources will be minimized to a less than significant level throughout all construction activities.	Monthly reports shall be prepared by the Applicant and submitted to the CPUC. These monthly reports shall include a summary of compliance measures taken regarding the cultural resources avoidance stipulations and a list of any known or unknown cultural resources encountered during construction.	Cultural resources avoidance shall be implemented throughout all construction activities or treated with the provisions of the HPTP (MM CUL-CEQA-2) if avoidance is not possible.	The Applicant shall be responsible for ensuring that all known cultural resources are avoided in conformance with this mitigation measure.
Impact CUL-3	MM CUL-CEQA-4 Protect Paleontological Resources. The mitigation actions required by APM PALEO-01 and BMP PALEO-02 shall be accomplished by following the guidance within BLM IM 2009-11, which the	Monthly reports shall be prepared by the Applicant and submitted to the CPUC. These monthly	The Paleontological Resources Management Plan	The Applicant shall be responsible for ensuring the Paleontological

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
	CPUC has accepted as appropriate for CEQA (DRECP EIS/EIR). The Applicant shall develop a Paleontological Resources Management Plan prior to the start of construction activities, which shall be implemented throughout all construction activities associated with the Project. The Paleontological Resources Management Plan shall include the following steps: Project developers shall document in a paleontological resources assessment report whether paleontological resources exist in a Project area on the basis of the following: the geologic context of the region and site and its potential to contain paleontological resources (including the PFYCs on site), a records search of institutions holding paleontological collections from California desert regions, a review of published and unpublished literature for past paleontological finds in the area, and coordination with paleontological researchers working locally in potentially affected geographic areas (or studying similar geologic strata). If the PFYC of the geologic units to be encountered during Project construction has not been determined, the Project developer shall use the best available data and field surveys, as applicable, to develop a site-specific map of the PFYC ratings. The PFYC map shall be at a scale equal to or more detailed than 1:100,000. Depending on the extent of existing information available and the sensitivity of the site, development of the resource assessment and PFYC map could require the completion of a paleontological survey. If paleontological resources are present at the site or if the geologic units to be encountered by the Project (at the surface or the subsurface) have a PFYC Class of 3, 4, or 5, a Paleontological Resources Management Plan shall be developed. The elements of the plan shall be consistent with BLM IM 2009-11 and shall be prepared and implemented by a professional paleontologist as defined under the Society of Vertebrate Paleontology	reports shall include a summary of compliance measures taken regarding the Paleontological Resources Management Plan and a list of any paleontological resources encountered, if any.	shall be developed prior to the start of construction activities and be implemented throughout all construction activities.	Resources Management Plan is prepared and implemented throughout construction activities.

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
	standards. The plan shall include the following: The qualifications of the principal investigator and monitoring personnel; Construction crew awareness training content, procedures, and requirements; Any measures to prevent potential looting, vandalism, or erosion impacts; The location, frequency, and schedule for on-site monitoring activities; Criteria for identifying and evaluating potential fossil specimens or localities; A plan for the use of protective barriers and signs, or implementation of other physical or administrative protection measures; Collection and salvage procedures; Identification of an institution or museum willing and able to accept any fossils discovered; and Compliance monitoring and reporting procedures. The Paleontological Resources Management Plan shall also identify if all geologic units that would be affected by the Project have been determined to be within an area with a PFYC Class of 1 or 2, the lead agency shall include paleontological resources as an element in construction worker awareness training and shall include measures to be followed in the event of unanticipated discoveries, including suspension of construction activities in the vicinity. The measure shall stipulate that the site be protected from further earth moving or damage until a qualified paleontologist can assess the significance and importance of the find and until the fossil specimen or locality can be recorded and salvaged, if necessary. The Paleontological Resources Management Plan shall evaluate all of the			

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
	construction methodologies proposed on a site, including destructive excavation techniques. Where applicable, the principal investigator shall include in the plan an evaluation of the potential for such techniques to disturb or destroy paleontological resources, an evaluation of whether loss of such fossils would represent a significant impact, and discussion of mitigation or compensatory measures (such as recordation/recovery of similar resources elsewhere on the site) that are necessary to avoid or substantially reduce the impact. Successful implementation of this MM will result in a less than significant impact to paleontological resources. Standards for Success: Impacts to known or unknown paleontological resources will be minimized to a less than significant level throughout all construction activities.			
Tribal Resources				
Impact TCR-1	**APM CULT-01: Cultural Resources Inventory.** A cultural inventory would be conducted that would document cultural resources within the area of potential effects for the Project. Based on results of this inventory, a HPTP would be developed to specifically address direct and indirect impacts that may result from Project construction.	Review adequacy of and implementation of HPTP.	Pre-construction	The Applicant
Impact TCR-1	**APM CULT-02: Monitoring and Discovery Plan.** DCRT's contractor would prepare an MDP that would describe procedures to be followed in the event of the discovery of cultural resources or human remains during implementation of the Project. The Draft MDP would be reviewed by BLM and consulting state and Federal agencies, the California and Arizona SHPOs, and local tribes. Upon approval of the MDP, DCRT would follow the procedures set forth in that plan during implementation of the Project.	Review adequacy of and implementation of MDP. Impact TCR-1	**CMA DFA-VPL-CUL-1.** For renewable energy activities and transmission, require the applicant to pay all appropriate costs associated with the following processes, through the appropriate BLM funding mechanism: • All appropriate costs associated with the BLM's analysis of the DRECP geodatabase and other sources for cultural resources sensitivity. • All appropriate costs associated with preliminary sensitivity analysis. • All appropriate costs associated with the Section 106 process including the identification and defining of cultural resources. These costs may also include logistical, travel, and other support costs incurred by tribes in the consultation process. • All appropriate costs associated with updating the DRECP cultural resources geodatabase with project specific results.	Confirm appropriate costs are paid for Section 106 compliance.	Pre-construction	The Applicant
Impact TCR-1	**CMA DFA-VPL-CUL-4.** For renewable energy activities and transmission, demonstrate that results of cultural resources sensitivity, based on the DRECP geodatabase, and other sources, are used as part of the initial planning pre-application process and to select of specific footprints for further consideration.	Confirm cultural resources sensitivity is included in initial planning.	Pre-construction	The Applicant
Impact TCR-1	**CMA DFA-VPL-CUL-5.** For renewable energy activities and transmission, provide a statistically significant sample survey as part of the pre-application process, unless the BLM determines the DRECP geodatabase and other sources are adequate to assess cultural resources sensitivity of specific footprints.	Confirm sample survey is provided.	Pre-construction	The Applicant
Impact TCR-1	**CMA DFA-VPL-CUL-6.** For renewable energy activities and transmission, provide justification in the application why the project considerations merit moving forward if the specific footprint lies within an area identified or forecast as sensitive for cultural resources by the BLM.	Confirm justification is provided in application	Pre-construction	The Applicant
Impact TCR-1	**CMA DFA-VPL-CUL-7.** For renewable energy activities and transmission,	Confirm NHPA Section	Pre-construction	The Applicant

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
	complete the NHPA Section 106 Process as specified in 36 CFR Part 800, or via an alternate procedure, allowed for under 36 CFR Part 800.14 prior to issuing a ROD or ROW grant on any utility-scale renewable energy or transmission project. For utility-scale solar energy developments, the BLM may follow the Solar PA.	106 Process or alternate procedure is completed as necessary.		
Impact TCR-1	MM TCR-CEQA-1 Implement Tribal Cultural Resources Applicant Proposed Measures, Best Management Practices, Conservation and Management Actions. The APMs, BLM BMPs, and CMAs in Sections 2.6.2 and 2.6.3 above provide a suite of measures, practices, and actions that shall be implemented as part of the Project. APMs, BMPs, and CMAs shall be implemented prior to, or during all ground disturbance and construction related activities to avoid or minimize Project related impacts to tribal cultural resources. These APMs, BMPs, and CMAs include; APM CULT-01, APM CULT-02, BMP CULT-03, BMP CULT-04, BMP CULT-06, BMP CULT-07, BMP CULT-08, CMA LUPA-CUL-4, CMA LUPA-TRANS-CUL-1, CMA LUPA-TRANS-CUL-4, CMA LUPA-TRANS-CUL-5, CMA LUPA-TRANS-CUL-6, CMA DFA-VPL-CUL-1, CMA DFA-VPL-CUL-4, CMA DFA-VPL-CUL-5, CMA DFA-VPL-CUL-6, CMA DFA-VPL-CUL-7. If an APM, BMP, or CMA is subjective, such as containing text that states; “where appropriate,” “where applicable,” “where feasible,” or similar language, the BLM and CPUC shall be consulted to determine the applicability of each measure prior to the disturbance of a covered resource. Compliance with APMs, BMPs, and CMAs shall be documented, and a weekly report shall be provided to the BLM and CPUC. The Applicant shall provide a synopsis of the weekly reports to the BLM and CPUC monthly. The report shall include a summary of the construction activities completed, a list of compliance actions and any remedial actions taken to correct any actions, and the status of ongoing mitigation efforts.	The Applicant shall develop a weekly report that shall include all applicable APMs, BMPs, and CMAs and the related actions taken in order to be in compliance with these measures. These weekly reports shall be compiled and submitted to the BLM and CPUC monthly.	APMs, BMPs, and CMAs shall be implemented throughout construction activities.	The Applicant shall ensure that all APMs, BMPs, and CMAs are implemented during construction. If an APM, BMP, or CMA is subjective, the Applicant shall consult with the BLM and/or the CPUC to determine the applicability of each measure.

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
	For those instances (only) where an APM, BMP, and/or CMA conflicts, or does not meet required specificity pursuant to CEQA, the following BMPs have been modified to meet CEQA requirements: **APM CULT-01: Cultural Resources Inventory.** See MM CUL-CEQA-2 (Section 2.5.6) for more details on the cultural resources inventory. **APM CUL-02: Monitoring Discovery Plan.** See MM CUL-CEQA-2 (Section 2.5.6) for more details on the Monitoring Discovery Plan. **BMP CULT-03: Cultural Resources Avoidance and Stipulations.** See MM CUL-CEQA-3 (Section 2.5.6) for more details on cultural resources avoidance stipulations. **BMP CULT-04: Worker Cultural Resources Awareness Program.** See MM CUL-CEQA-2 (Section 2.5.6) for more details on the worker cultural resources awareness program. Standards for Success: Compliance with all applicable APMs, BMPS, and CMAs is achieved throughout construction of the Project.			
Geology and Soils				
Impact GEO-2	**APM WQ-01: SWPPP Development and Implementation.** Following Project approval, DCRT would prepare and implement a SWPPP or an amendment to an existing SWPPP to minimize construction impacts on surface water and groundwater quality. Implementation of the SWPPP would help stabilize graded areas and reduce erosion and sedimentation. The Plan would designate BMPs that would be adhered to during construction activities. Erosion and sediment control measures, such as straw wattles, covers, and silt fences, would be installed prior to ground disturbance, based on the anticipated volume and intensity of precipitation, the nature of stormwater runoff in the Project Area, and the soil types within the Project Area. Suitable stabilization measures would	Review adequacy of and implementation of SWPPP.	Pre-construction Construction Post-construction	The Applicant

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
	be used to protect exposed areas during construction activities, as necessary and final stabilization would be completed when construction materials, waste, and temporary erosion and sediment control measure have been removed. During construction activities, measures would be implemented to prevent contaminant discharge from vehicles and equipment, including complying with the Spill Prevention, Control, and Countermeasures requirements in 40 CFR 112. The Project SWPPP would include erosion control and sediment transport BMPs to be used during construction. BMPs, where applicable, would be designed by using specific criteria from recognized BMP design guidance manuals. Erosion-minimizing efforts may include measures such as the following: defining ingress and egress within the Project site implementing a dust control program during construction properly containing stockpiled soils Erosion control measures identified would be installed in an area before construction begins and would be properly maintained until construction is complete and final stabilization begins. Temporary measures such as silt fences or wattles, intended to minimize sediment transport from temporarily disturbed areas, would remain in place until disturbed areas have stabilized. The Plan would be updated during construction as required by the SWRCB and the ADEQ. The Plan would include the following components, in accordance with ADEQ requirements for coverage under the General Permit: stormwater team qualifications and contact information identification of operators			

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
	nature of construction activities sequence and estimated dates of construction activities site description site map(s) receiving waters control measures to be used during construction activity summary of potential pollutant sources use of treatment chemicals pollution prevention procedures, including spill prevention and response and waste management procedures			
Impact GEO-2	**BMP SOIL-01.** During reclamation and revegetation efforts, a BLM soil scientist and/or botanist would assist reclamation crews with determining type and location of any scarification.	Confirm a BLM soil scientist and/or botanist assists with reclamation and revegetation efforts.	Post-construction	The Applicant
Impact GEO-2	**BMP SOIL-02.** During reclamation and revegetation efforts, the BLM would work with reclamation crews to determine where soil compaction would be appropriate, to avoid potential adverse conditions created by compaction.	Confirm BLM works with reclamation crews.	Post-construction	The Applicant
Impact GEO-2	**BMP SOIL-03.** Covers for topsoil stockpiles would be of materials resistant to damage and/or degradation from exposure to ultraviolet light and other elements and would be replaced (as needed) if they deteriorate, become worn, or damaged.	Ensure correct materials are used for topsoil stockpile covers.	Construction	The Applicant
Impact GEO-2	**BMP SOIL-04.** The disruption of desert pavement shall be minimized to the extent feasible. Grading for new access roads or work areas in areas covered by desert pavement shall be avoided if possible. If avoidance of these areas is not	Confirm disruption of desert pavement is minimized.	Construction	The Applicant

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
	possible, the desert pavement surface shall be protected from damage or disturbance from construction vehicles by use of temporary mats on the surface, or by other suitable means.			
Impact GEO-2	**BMP SOIL-05.** Desert pavement in activity areas in California shall be assessed by biological monitors prior to construction. If disturbance from an activity is likely to exceed 10% of the desert pavement identified within the activity boundary, the BLM would determine whether the erosional and ecologic impacts of exceeding the 10% cap by the proposed amount would be insignificant and/or whether the activity should be redesigned to minimize desert pavement disturbance.	Confirm biological monitors assess desert pavement disturbance.	Pre-construction	The Applicant
Impact GEO-2	**BMP SOIL-06.** Side-casting of soil during road construction shall be avoided.	Confirm avoidance.	Construction	The Applicant
Impact GEO-2	**BMP SOIL-07.** To the extent possible, avoid disturbance of desert biologically intact soil crusts, and soils highly susceptible to wind and water erosion.	Confirm avoidance.	Construction	The Applicant
	APM BIO-12. Noxious and Invasive Species Control. A Noxious Weed Control Plan that addresses specific requirements in CMA LUPA-BIO-11 would be developed, approved by the BLM, and implemented prior to initiation of ground disturbing activities. That Plan would identify noxious and invasive species to be addressed in the Project Area, describe measures to conduct pre-construction weed surveys, reduce the potential introduction or spread of noxious weeds and invasive species during construction, and monitor and control weeds during operation of the transmission line. It would be designed to minimize impacts on special status species to the extent practicable. Coordination with resource agencies regarding invasive plant species would be conducted before construction. BMPs would include use of weed-free straw, fill, and other materials; requirements for washing vehicles and equipment arriving on site; proper maintenance of vehicle inspection and wash stations; requirements for managing infested soils and materials; requirements and	Confirm development and implementation of a Noxious Weed Control Plan.	Pre-Construction Construction	The Applicant

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
	practices for the application of herbicides; and other requirements in applicable BLM Weed Management Plans.			
Impact GEO-2	**CMA LUPA-SW-8.** As determined necessary on an activity specific basis, prepare a site plan specific to major soil types present (≥5% of footprint or laydown surfaces) in Wind Erodibility Groups 1 and 2 and in Hydrology Soil Class D as defined by the USDA NRCS to minimize water and air erosion from disturbed soils on activity sites.	Review adequacy of and implementation of site plan specific to soil types.	Pre-construction	The Applicant
Impact GEO-2	**CMA LUPA-BIO-9.** Implement the following general LUPA CMA for water and wetland dependent resources: ▪ Implement construction site standard practices to prevent toxic chemicals, hazardous materials, and other fluids from entering vegetation type streams, washes, and tributary networks through water runoff, erosion, and sediment transport by, at a minimum, implementing the following: o On project sites, vehicles and other equipment will be maintained in proper working condition and only stored in designated containment areas where runoff is collected or controlled and that are located outside of streams, washes, and distributary networks to minimize accidental fluids and hazardous materials spills. o Hazardous material leaks, spills, or releases will be immediately cleaned, and equipment will be repaired upon identification. Removal and disposal of spill and related clean-up materials will occur at an approved off-site landfill. o Maintenance and operations vehicles will carry the appropriate equipment and materials to isolate, clean up, and repair any	Confirm implementation of standard best practices to prevent impacts to wetland and water dependent resources. Confirm disturbance minimization.	Construction	The Applicant

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
	hazardous material leaks, spills, or releases. ▪ Activity-specific drainage, erosion, and sedimentation control actions, which meet the approval of BLM and the applicable regulatory agencies, will be carried out during all appropriate phases of the approved project. These actions, as needed, will address measures to ensure the proper protection of water quality, site-specific stormwater and sediment retention, and design of the project to minimize site disturbance, including the following: o Identify site-specific surface water runoff patterns and implement measures to prevent excessive and unnatural soil deposition and erosion. o Implement measures to maintain natural drainages and to maintain hydrologic function in the event drainages are disturbed. o Reduce the amount of area covered by impervious surfaces through use of permeable pavement or other pervious surfaces. Direct runoff from impervious surfaces into retention basins. o Stabilize disturbed areas following grading in the manner appropriate to the soil type so that wind or water erosion is minimized. o Minimize irrigation runoff by using low or no irrigation native vegetation landscaping for landscaped retention basins. o Conduct regular inspections and maintenance of long-term erosion control measures to ensure long-term effectiveness.			
Impact GEO-2	**CMA LUPA-SW-9.** The extent of desert pavement within the proposed	Confirm mapping of	Pre-construction	The Applicant and

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
	boundary of an activity shall be mapped if it is anticipated that the activity may create erosional or ecologic impacts. Mapping will use the best available data and standards, as determined by BLM. Disturbance of desert pavement within the boundary of an activity shall be limited to the extent possible. If disturbance from an activity is likely to exceed 10% of the desert pavement mapped within the activity boundary, the BLM will determine whether the erosional and ecologic impacts of exceeding the 10% cap by the proposed amount would be insignificant and/or whether the activity should be redesigned to minimize desert pavement disturbance.	desert pavement.	Construction	BLM
Impact GEO-2	**CMA LUPA-SW-10.** The extent of additional sensitive soil areas (cryptobiotic soil crusts, hydric soils, highly corrosive soils, expansive soils, and soils at severe risk of erosion) shall be mapped if it is anticipated that an activity will impact these resources. To the extent possible, avoid disturbance of desert biologically intact soil crusts, and soils highly susceptible to wind and water erosion.	Confirm mapping of additional sensitive soil areas.	Pre-construction Construction	The Applicant
Impact GEO-2	**CMA LUPA-SW-11.** Where possible, side casting shall be avoided where road construction requires cut- and-fill procedures.	Confirm avoidance.	Pre-construction Construction	The Applicant
Impact GEO-2	MM GEO-CEQA-1 Implement Geology and Soils Applicant Proposed Measures, Best Management Practices, and Conservation and Management Actions. The APMs, BLM BMPs, and CMAs in Sections 2.7.2 and 2.7.3 above provide a suite of measures, practices, and actions that shall be implemented as part of the Project. APMs, BMPs, and CMAs shall be implemented prior to, or during all ground disturbance and construction related activities to avoid or minimize Project related impacts to geology and soils. These APMs, BMPs, and CMAs include; APM WQ-01, BMP SOIL-01, BMP SOIL-02, BMP SOIL-03, BMP SOIL-04, BMP SOIL-05, BMP SOIL-06, BMP SOIL-07, APM BIO-12, CMA	The Applicant shall develop a weekly report that shall include all applicable APMs, BMPs, and CMAs and the related actions taken in order to be in compliance with these measures. These weekly reports shall be compiled and submitted to the BLM and CPUC	APMs, BMPs, and CMAs shall be implemented throughout construction activities.	The Applicant shall ensure that all APMs, BMPs, and CMAs are implemented during construction. If an APM, BMP, or CMA is subjective, the Applicant shall consult with the

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
	LUPA-SW-8, CMA LUPA-BIO-9, CMA LUPA-SW-9, CMA LUPA-SW-10, CMA LUPA-SW-11. If an APM, BMP, or CMA is subjective, such as containing text that states; "where appropriate," "where applicable," "where feasible," or similar language, the BLM and CPUC shall be consulted to determine the applicability of each measure prior to the disturbance of a covered resource. Compliance with APMs, BMPs, and CMAs shall be documented, and a weekly report shall be provided to the BLM and CPUC. The Applicant shall provide a synopsis of the weekly reports to the BLM and CPUC monthly. The report shall include a summary of the construction activities completed, a list of compliance actions and any remedial actions taken to correct any actions, and the status of ongoing mitigation efforts. For those instances (only) where an APM, BMP, and/or CMA conflicts, or does not meet required specificity pursuant to CEQA, the following BMPs have been modified to meet CEQA requirements: ▪ **BMP SOIL-07.** As discussed in this BMP, desert biologically intact soil crusts will be avoided to the extent feasible. Where it is infeasible to avoid these areas, the Applicant will work with the BLM to identify further measures to reduce wind and water erosion in these areas and shall implement MM GEO-CEQA-2 in these areas to prevent long-term erosion. Standards for Success: Compliance with all applicable APMs, BMPS, and CMAs is achieved throughout construction of the Project.	monthly.		BLM and/or the CPUC to determine the applicability of each measure.
Impact GEO-2	MM GEO-CEQA-2 Implement an Erosion Control Plan and Demonstrate Compliance with Water Quality Permits. The Applicant shall develop and submit an Erosion Control Plan to the CPUC and BLM at least 60-days prior to the start of construction activities. The	The Applicant shall develop the Erosion Control Plan in conjunction with the	The Erosion Control Plan shall be developed at least 60-days prior	The Applicant shall develop the Erosion Control Plan and ensure

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
	Erosion Control Plan shall be developed in conjunction with the SWPPP (See APM WQ-01) and shall be kept onsite and readily available upon request. Successful implementation of the Erosion Control Plan will result in a less than significant impact related to erosion during all construction activities. Soil disturbance at structures and access roads is to be minimized and designed to prevent long-term erosion. The Erosion Control Plan shall include: The location of all soil-disturbing activities, including, but not limited to new and/or improved access and spur roads; The location of all streams and drainage structures that would be directly affected by soil-disturbing activities (such as crossings or public storm drains by the right-of-way and access roads); BMPs to protect drainage structures, such a public storm drains, downstream of soil disturbance activities as well as to prevent loss of topsoils and erosion during construction (See BMP SOIL-01 through -07); Design features to be implemented to minimize erosion during construction; If soil cement is proposed, the specific locations must be defined in this Plan, and evidence of approval by the appropriate jurisdiction shall be submitted to the CPUC and BLM prior to use; If design features include the use of retaining structures and/or walls, the design of the features shall be consistent with MM VIS-06 (under Section 2.1.6 above) to use structure type to match the existing structures in the area and reduce form contrast; The location and type of BMPs that would be installed to prevent off-site sedimentation; Specification for the implementation and maintenance of erosion control	SWPPP required for the Project. The Applicant shall keep on file any corrective actions related to erosion control and the SWPPP and submit these records to the RWQCB, CPUC, BLM, and any applicable counties, local municipalities, or tribal governments upon request. The Annual Report shall be developed and filed by the Applicant for each reporting period. Any permits required shall be developed by the Applicant and submitted to the applicable agency for approval. The Applicant shall maintain a record of all permits and associated approvals to be kept on file.	to construction and shall be implemented throughout all construction activities. Any permits required for the Project shall be obtained prior to the start of construction.	that it is implemented throughout construction activities. The Applicant shall also be responsible for obtaining all necessary permits related to erosion and water quality control.

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
	measures and description of the erosion control practices, including appropriate design and installation details; Proposed schedule for inspection of erosion control/SWPPP measures and schedule for corrective actions/repairs, if required. Erosion control/SWPPP inspection reports shall be provided to the CPUC. The locations requiring erosion control/SWPPP corrective actions/repairs shall be tracked by the Applicant, including dates of completion, and documented during inspections. Inspections and monitoring shall be performed in compliance with the Federal California Construction General Permits. The inspection reports shall be maintained and kept in their respective SWPPP, kept on site as required by the Federal and State Construction General Permits, and made available to the RWQCB, CPUC, BLM, counties, local municipalities, and tribal governments, on request. Additionally, an Annual Report shall be filed for each reporting period in compliance with the Federal and California Construction General Permit reporting requirements. The Applicant shall submit to the CPUC and the BLM any grading plans that define the locations of the specific features listed. The Applicant shall submit to the CPUC and BLM evidence of possession of applicable required permits for the representative land disturbance prior to engaging in any soil-disturbance or construction activities. Such permits may include, but are not limited to, a CWA Section 402 NPDES California General Permit for Stormwater Discharges Associated with Construction Activities (General Permit) from the applicable RWQCBs, and the Federal General Permit for Storm Water Discharges Associated with Construction Activities on Tribal Land. Prior to ground disturbance in stream channels or other waters jurisdictional to the State of California or the Federal Government, the Applicant shall obtain a Streambed Alteration Agreement from the CDFW, a Section 404 permit from			

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
	the ACOE, and a CWA Section 401 certification from the SWRCB. Standards for Success: The Project will comply with Federal and California Construction General Permit reporting requirements and any stipulations of applicable permits related to erosion control or the SWPPP.			
Hazards and Hazardous Materials				
Impact HAZ-1 Impact HAZ-2	**APM HAZ-01: Hazardous Substance Control and Emergency Response.** DCRT would implement its hazardous substance control and emergency response procedures as needed in conjunction with a Hazardous Substance Control and Containment Plan and Emergency Response Plan for the Project. The procedures identify methods and techniques to minimize the exposure of the public and site workers to potentially hazardous materials during all phases of Project construction through operation. They address worker training appropriate to the site worker's role in hazardous substance control and emergency response. The procedures also require implementing appropriate control methods and approved containment and spill-control practices for construction and materials stored on site. If it were necessary to store chemicals on site, they would be managed in accordance with all applicable regulations. Material safety data sheets would be maintained and kept available on site, as applicable. • Project construction would involve soil surface blading/leveling and excavation. In the event that soils suspected of being contaminated (on the basis of visual, olfactory, or other evidence) are removed during site grading activities or excavation activities, the excavated soil would be tested and, if contaminated above hazardous waste levels, would be contained and disposed of at a licensed waste facility. The presence of known or suspected contaminated soil would require testing and investigation procedures to be supervised by a qualified person, as	Review adequacy of and implementation of hazardous substance control and emergency response procedures as needed in conjunction with a Hazardous Substance Control and Containment Plan and Emergency Response Plan for the Project.	Pre-construction Construction	The Applicant

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
	appropriate, to meet state and federal regulations. • All hazardous materials and hazardous wastes would be handled, stored, and disposed of in accordance with all applicable regulations by personnel qualified to handle hazardous materials. The hazardous substance control and emergency response procedures include, but are not limited to, the following: • Proper disposal of potentially contaminated soils. • Establishing site-specific buffers for construction vehicles and equipment near sensitive resources. • Emergency response and reporting procedures to address hazardous material spills. • Stopping work at that location and contacting the County Fire Department Hazardous Materials Unit immediately if visual contamination or chemical odors are detected; work would be resumed at this location after any necessary consultation and approval by the Hazardous Materials Unit. DCRT would complete its Emergency Action Plan Form as part of Project tailgate meetings. The purpose of the form is to gather emergency contact numbers, first aid location, work site location, and tailgate information.			
Impact HAZ-6	**APM TT-01: Traffic Coordination.** Emergency service providers would be notified of the timing, location, and duration of construction activities. Traffic control devices and signs would be used as needed. These measures would be implemented in conjunction with a Traffic and Transportation Management Plan for the Project. This plan would also include measures/protocols for aviation, including helicopter use, coordination with local air traffic control, and	Review adequacy of and implementation of Transportation Management Plan.	Construction	The Applicant

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
	a Congested Area Plan, pursuant to FAA regulations.			
Impact HAZ-1	**APM WQ-01: SWPPP Development and Implementation.** Following Project approval, DCRT would prepare and implement a SWPPP or an amendment to an existing SWPPP to minimize construction impacts on surface water and groundwater quality. Implementation of the SWPPP would help stabilize graded areas and reduce erosion and sedimentation. The Plan would designate BMPs that would be adhered to during construction activities. Erosion and sediment control measures, such as straw wattles, covers, and silt fences, would be installed prior to ground disturbance, based on the anticipated volume and intensity of precipitation, the nature of stormwater runoff in the Project Area, and the soil types within the Project Area. Suitable stabilization measures would be used to protect exposed areas during construction activities, as necessary and final stabilization would be completed when construction materials, waste, and temporary erosion and sediment control measure have been removed. During construction activities, measures would be implemented to prevent contaminant discharge from vehicles and equipment, including complying with the Spill Prevention, Control, and Countermeasures requirements in 40 CFR 112. The Project SWPPP would include erosion control and sediment transport BMPs to be used during construction. BMPs, where applicable, would be designed by using specific criteria from recognized BMP design guidance manuals. Erosion-minimizing efforts may include measures such as the following: defining ingress and egress within the Project site implementing a dust control program during construction properly containing stockpiled soils Erosion control measures identified would be installed in an area before construction begins and would be properly maintained until construction is	Review adequacy of and implementation of SWPPP.	Pre-construction Construction Post-construction	The Applicant

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
	complete and final stabilization begins. Temporary measures such as silt fences or wattles, intended to minimize sediment transport from temporarily disturbed areas, would remain in place until disturbed areas have stabilized. The Plan would be updated during construction as required by the SWRCB and the ADEQ. The Plan would include the following components, in accordance with ADEQ requirements for coverage under the General Permit: stormwater team qualifications and contact information identification of operators nature of construction activities sequence and estimated dates of construction activities site description site map(s) receiving waters control measures to be used during construction activity summary of potential pollutant sources use of treatment chemicals pollution prevention procedures, including spill prevention and response and waste management procedures			
Impact HAZ-8	**APM HAZ-02: Fire Avoidance and Suppression.** Per the Fire Prevention Plan for the Project: DCRT would select a welding site that is void of native combustible material and/or would clear such material for 10 feet around the area where the work is to be performed. DCRT would follow its standard	Confirm implementation of Fire Prevention Plan.	Pre-construction Construction	The Applicant

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
	practice for clearing in wildland areas. Project personnel would be directed to drive on areas that have been cleared of vegetation, park away from dry vegetation, and carry water, shovels, and fire extinguishers in times of high fire hazard. DCRT would also prohibit trash burning. Additionally, fire-suppression materials and equipment would be kept adjacent to all areas of work and in staging areas and would be clearly marked.			
Impact HAZ-8	**BMP PH&S-02.** A Fire Prevention Plan would be developed for the Project.	Review adequacy of and implementation of Fire Prevention Plan.	Pre-construction	The Applicant
Impact HAZ-1	**APM WQ-02: Worker Environmental Awareness Program Development and Implementation.** The Project's worker environmental awareness program would communicate environmental issues and appropriate work practices specific to this Project. This awareness would include spill prevention and response measures and proper BMP implementation. The training would emphasize site-specific physical conditions to improve hazard prevention (such as identification of flow paths to nearest water bodies) and would include a review of all site-specific water quality requirements, including applicable portions of erosion control and sediment transport BMPs and Hazardous Substance Control and Containment and Emergency Response Plan.	Confirm worker environmental awareness training is implemented for all new personnel preforming ground-disturbing activities.	Pre-construction Construction	The Applicant
Impact HAZ-1	**BMP HAZ-03: Equipment & Material Inventory.** DCRT would provide the BLM with an inventory of equipment and materials to cover each hazardous material used at any time during the life of the Project, updating as additions to equipment and materials are made. Appropriate equipment and materials would follow specific recommendations for individual Haz Mat types in BLM Handbooks, EPA guidelines, and from the California DTSC.	Verify inventory of equipment and materials and utilization.	Pre-construction Construction	The Applicant
Impact HAZ-1	**APM WQ-03: Vehicles and Equipment Fueling and Maintenance.** Vehicle and equipment fueling and maintenance operations would be conducted in	Ensure vehicle and equipment fueling and	Construction	The Applicant

	designated areas only; these areas would be equipped with appropriate spill control materials and containment.	maintenance operations conducted in designated areas.		
Impact HAZ-1	**BMP HAZ-04.** DCRT would provide the BLM with a Pesticide/Herbicide Use Proposal, outlining the pesticides and herbicides that would be proposed for use on the project, demonstrating conformance with BLM requirements, and seeking preapproval before use. Only BLM-approved products from the approved California herbicide list would be used in California.	Review and implement Pesticide/Herbicide Use Proposal.	Pre-construction	The Applicant
Impact HAZ-1	**CMA LUPA-SW-6**. In addition to the applicable required governmental safeguards, third party activities will implement up-to-date standard industry construction practices to prevent toxic substances from leaching into the soil.	Confirm up-to-date standard industry construction practices implemented.	Construction	The Applicant
Impact HAZ-1	**CMA LUPA-SW-7.** Prepare an emergency response plan, approved by the BLM contaminant remediation specialist, that ensures rapid response in the event of spills of toxic substances over soils.	Review adequacy of emergency response plan.	Pre-construction	The Applicant
Impact HAZ-1	**CMA LUPA-BIO-9.** Implement the following general LUPA CMA for water and wetland dependent resources: ▪ Implement construction site standard practices to prevent toxic chemicals, hazardous materials, and other fluids from entering vegetation type streams, washes, and tributary networks through water runoff, erosion, and sediment transport by, at a minimum, implementing the following: o On project sites, vehicles and other equipment will be maintained in proper working condition and only stored in designated containment areas where runoff is collected or controlled and that are located outside of streams, washes, and distributary networks to minimize accidental fluids and	Confirm implementation of standard best practices to prevent impacts to wetland and water dependent resources. Confirm disturbance minimization.	Construction	The Applicant

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
	hazardous materials spills. o Hazardous material leaks, spills, or releases will be immediately cleaned, and equipment will be repaired upon identification. Removal and disposal of spill and related clean-up materials will occur at an approved off-site landfill. o Maintenance and operations vehicles will carry the appropriate equipment and materials to isolate, clean up, and repair any hazardous material leaks, spills, or releases. ▪ Activity-specific drainage, erosion, and sedimentation control actions, which meet the approval of BLM and the applicable regulatory agencies, will be carried out during all appropriate phases of the approved project. These actions, as needed, will address measures to ensure the proper protection of water quality, site-specific stormwater and sediment retention, and design of the project to minimize site disturbance, including the following: o Identify site-specific surface water runoff patterns and implement measures to prevent excessive and unnatural soil deposition and erosion. o Implement measures to maintain natural drainages and to maintain hydrologic function in the event drainages are disturbed. o Reduce the amount of area covered by impervious surfaces through use of permeable pavement or other pervious surfaces. Direct runoff from impervious surfaces into retention basins. o Stabilize disturbed areas following grading in the manner appropriate to the soil type so that wind or water erosion is			

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
	minimized. o Minimize irrigation runoff by using low or no irrigation native vegetation landscaping for landscaped retention basins. Conduct regular inspections and maintenance of long-term erosion control measures to ensure long-term effectiveness.			
Impact HAZ-8	**CMA DFA-VPL-BIO-FIRE-1.** Implement the following standard practice for fire prevention/protection: • Implement site-specific fire prevention/protection actions particular to the construction and operation of renewable energy and transmission project that include procedures for reducing fires while minimizing the necessary amount of vegetation clearing, fuel modification, and other construction-related activities. At a minimum these actions will include designating site fire coordinators, providing adequate fire suppression equipment (including in vehicles), and establishing emergency response information relevant to the construction site	Confirm fire prevention and protection on-site, including emergency response information.	Construction	The Applicant

Impact HAZ-6 Impact HAZ-7	MM TRANS CEQA-2 Traffic, Transportation, and Access Management Plan. The Applicant shall develop a Traffic, Transportation, and Access Management Plan at least 30-days prior to the start of construction and work with the BLM and Riverside County to prepare and implement the Plan for roadways adjacent to and directly affected by the proposed Project facilities. The Traffic, Transportation, and Access Management Plan shall be submitted to the BLM and the County for approval prior to the start of ground disturbing activities and issuance of a County grading permit. The Traffic, Transportation, and Access Management Plan shall be implemented by the Applicant throughout all construction activities. The Traffic, Transportation, and Access Management Plan shall include, but not limited to, the following requirements: The Traffic, Transportation, and Access Management Plan shall conform to Part 6 (Temporary Traffic Control) of the California Manual on Uniform Traffic Control Devices; Identify truck routes designated by Riverside County and local jurisdictions haul routes that minimize truck traffic on local roadways; Provide sufficient-sized staging areas for trucks accessing work zones to minimize disruption of access to adjacent public right-of-was Scheduling truck trips outside the peak morning and evening commute hours; Storing all equipment and materials in designated contractor staging areas on or adjacent to the worksite, such that traffic obstruction is minimized; Implementing roadside safety protocols including advance “Road Wok Ahead” warning and speed control signs which shall be posted to reduce and provide safe traffic flow through the work zone;	The Applicant shall monitor construction transportation and access to ensure that the Traffic, Transportation, and Access Management Plan is implemented successfully as documented in inspection logs.	The Traffic, Transportation, and Access Management Plan shall be prepared at least 30-days prior to the start of construction and shall be implemented throughout all construction activities.	The Applicant shall be responsible for ensuring that the Traffic, Transportation, and Access Management Plan is prepared and implemented throughout construction activities.

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
	Providing advance notification to administrators of police and fire stations (including fire protection agencies), ambulance service providers, and recreational facility managers of the timing, location, and duration of construction activities and the locations of detours and lane closures. Maintain access for emergency vehicles within, and/or adjacent to roadways affected by construction activities at all times; Repairing and restoring adversely affected roadway pavements to their pre-construction condition; Damage will be documented by the Project Applicant and the applicable jurisdiction (i.e. Caltrans, County, or individual) will be notified within 24 hours. The Applicant will work with the jurisdiction affected and will repair the damage within 30 days. Coordination of individual traffic plans for the Project and nearby Projects; Coordination between the contractor and Riverside County in developing circulation and detour plans that include safety features (e.g. signage and flaggers). The circulation and detour plans shall address: Full and partial roadway closures; Circulation and detour plans to include the use of signage and flagging to guide vehicles through and/or around the construction zone, as well as any temporary traffic control devices; Bicycle detour plans, where applicable; Parking along arterial and local roadways; and Haul routes for construction trucks and staging areas for instances when multiple trucks arrive at the work sites. Protocols for updating the Traffic, Transportation, and Access Management			

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
	Plan to account for delays or changes in the schedules of individual projects The Traffic, Transportation, and Access Management Plan shall incorporate an access road siting and management plan, Congested Area Plan (pursuant to FAA regulations and APM TT-01), and a transportation plan for the transport and transmission tower components and equipment. Standards for Success: Traffic flow remains at acceptable levels, emergency access remains possible at all times, the public is reasonably notified of any road closures, delays, or lane restrictions, and the Project area remains in compliance with all applicable transportation goals, policies, and requirements.			
Impact HAZ-1 Impact HAZ-2 Impact HAZ-8	MM HAZ-CEQA-1 Implement Hazards and Hazardous Materials Applicant Proposed Measures, Best Management Practices, and Conservation and Management Actions. The APMs, BLM BMPs, and CMAs in Sections 2.8.2 and 2.8.3 above provide a suite of measures, practices, and actions that shall be implemented as part of the Project. APMs, BMPs, and CMAs shall be implemented prior to, or during all ground disturbance and construction related activities to avoid or minimize Project related impacts to hazards and hazardous materials. These APMs, BMPs, and CMAs include; APM HAZ-01, APM TT-01, APM WQ-01, APM HAZ-02, BMP PH&S-02, APM WQ-02, BMP HAZ-03, APM WQ-03, BMP HAZ-04, CMA LUPA-SW-6, CMA LUPA-SW-7, CMA LUPA-BIO-9, CMA DFA-VPL-BIO-FIRE-1. If an APM, BMP, or CMA is subjective, such as containing text that states; “where appropriate,” “where applicable,” “where feasible,” or similar language, the BLM and CPUC shall be consulted to determine the applicability of each	The Applicant shall develop a weekly report that shall include all applicable APMs, BMPs, and CMAs and the related actions taken in order to be in compliance with these measures. These weekly reports shall be compiled and submitted to the BLM and CPUC monthly.	APMs, BMPs, and CMAs shall be implemented throughout construction activities.	The Applicant shall ensure that all APMs, BMPs, and CMAs are implemented during construction. If an APM, BMP, or CMA is subjective, the Applicant shall consult with the BLM and/or the CPUC to determine the applicability of each measure.

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
	measure prior to the disturbance of a covered resource. Compliance with APMs, BMPs, and CMAs shall be documented, and a weekly report shall be provided to the BLM and CPUC. The Applicant shall provide a synopsis of the weekly reports to the BLM and CPUC monthly. The report shall include a summary of the construction activities completed, a list of compliance actions and any remedial actions taken to correct any actions, and the status of ongoing mitigation efforts. For those instances (only) where an APM, BMP, and/or CMA conflicts, or does not meet required specificity pursuant to CEQA, the following BMPs have been modified to meet CEQA requirements: **APM TT-01: Traffic Coordination.** As discussed in this APM, a Traffic, Transportation, and Access Management Plan would be developed for the Project. The details of this Traffic, Transportation, and Access Management Plan, as well as the correlation with a Congested Area Plan, are further discussed under MM TRANS-CEQA-2. **APM HAZ-02: Fire Avoidance and Suppression, BMP PH&S-02, and CMA DFA-VPL-BIO-FIRE-1.** As discussed in APM HAZ-02, BMP PH&S-02, and CMA DFA-VPL-BIO-FIRE-1, a Fire Prevention Plan shall be developed and implemented for the Project throughout construction and operation and maintenance. The Applicant shall develop a Project Fire Prevention Plan in consultation with the appropriate local fire agencies at least 30-days prior to the start of construction activities. The Plan shall cover the construction and operations/maintenance phases of the Project. The Applicant shall monitor Project-related activities to ensure implementation and effectiveness of the Plan. The final Plan will be approved by the consulted fire agencies prior to the initiation of construction activities and shall be implemented during all Project-related activities by the Applicant. Information contained in the Plan and location of fire-suppression materials and equipment shall be included as part of the			

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
	Worker Environmental Awareness Program discussed in APM BIO-01. Successful implementation of this Plan shall result in a less than significant impact to the potential for construction-related fires. At minimum, the Plan shall include the following: Procedures for minimizing potential ignition, including, but not limited to, vegetation clearing, parking requirements/restrictions, idling restrictions, smoking restrictions, proper use of gas-powered equipment, use of spark arrestors, hot work restrictions, and timing of vegetation treatment or maintenance. Where necessary, vegetation management or clearing necessary to mitigate fire risk shall supersede other measures for vegetation protection and avoidance. Applicable permitting, compensation, and mitigation resulting from such activity shall be the responsibility of the Applicant. Proper use of construction, maintenance, and decommissioning equipment. Work restrictions during Red Flag Warnings and High to Extreme Fire Danger days. Fire coordinator and fire patrol roles and responsibilities. Worker training for fire prevention, initial attack firefighting, and fire reporting. Emergency fire suppression equipment/tools inventory and maintenance. Emergency communication, response, and reporting procedures. Coordination with local fire agencies to facilitate emergency access through the Project site. Emergency contact information. Compliance with applicable wildland fire management plans and policies			

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
	established by state and local agencies. Other information as required by responsible and consulted agencies. **Responsible Party:** The Applicant shall develop the Fire Prevention Plan and ensure that it is implemented throughout construction activities. **Timing:** The Applicant shall develop the Fire Prevention Plan at least 30-days prior to the start of construction activities. The Fire Prevention Plan shall be implemented throughout all construction activities. **Mitigation Monitoring and Reporting Program:** The Applicant shall ensure that the information in the Fire Prevention Plan is included in the Worker Environmental Awareness Program. Documentation of any Red Flag Warnings or High to Extreme Fire Danger days shall be kept on file and submitted to the applicable local fire agencies as well as the BLM and CPUC. **Standards for Success:** Construction impacts related to fires is reduced to a less than significant level and no fires are started as a result of construction activities. **BMP HAZ-04.** The Pesticide Use Proposal will be developed in accordance with MM VEG-CEQA-1 (See Section 2.4.6 above). Standards for Success: Compliance with all applicable APMs, BMPS, and CMAs is achieved throughout construction of the Project.			
Impact HAZ-2	MM HAZ-CEQA-2 Identify and Pothole Existing Utility Pipelines. The Applicant shall be responsible for the implementation and enforcement of this MM by identifying any existing utility pipelines along the Project	The Applicant shall document any public utilities discovered during database searches,	Database searches, coordination with public utility	The Applicant shall be responsible for identifying any existing utility

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
	alignment through database searches, coordination with public utility agencies, and/or reviewing historic documents during the design phase of the Project. If existing utility pipelines are identified during this search, the Applicant shall then uncover or "pothole" any existing utility pipelines within 10 feet of Project excavations, including tower structure foundations and underground duct bank or vaults, prior to the start of any earth moving activities in a particular area to ensure that excavation work does not damage the existing utility pipeline. The Applicant shall monitor Project construction activities to ensure public utilities remain intact and are not disturbed by construction of the Project. If undiscovered or undocumented utilities are encountered during construction, all Project work shall stop in that location and the Applicant shall notify the appropriate utility agency within 24-hours of discovery. Project work may resume once the area is cleared by the Applicant and the public utility agency. Standards for Success: Any Project work that will occur within the vicinity of a utility pipeline shall remain undisturbed from construction activities.	consultation, and review of historic documentation. The Applicant shall also keep records of all monitoring activities for the utility pipelines, including any necessary actions taken to avoid these utilities or document any previously unknown utilities discovered during construction. If undiscovered or undocumented utilities are encountered during construction, the Applicant shall notify the appropriate utility agency within 24-hours of discovery.	agencies, and review of historic documents in order to identify existing utilities within the Project area shall be completed prior to the start of construction activities. Monitoring of public utilities within the Project area shall occur throughout construction activities.	pipelines along the Project alignment and uncover any of these existing facilities within 10 feet of Project excavations. The Applicant shall be responsible that any existing utility pipelines are not disturbed during construction activities.
Electromagnetic Fields				
-	MM EMF-CEQA-1 Field Management Plan. The Applicant will prepare an FMP at least 30-days prior to the start of construction activities to show implementation of the no-cost/low-cost measures. The FMP shall be submitted to the CPUC for review and to be kept on file and shall be implemented throughout all construction phases of the Project.	The Applicant shall develop and submit the FMP to the CPUC and implement any magnetic field reduction measures relative to the CPUC's stated goal of approximately 4 percent	The FMP shall be prepared at least 30-days prior to the start of construction. The FMP shall be implemented throughout	The Applicant shall be responsible for the development and implementation of the FMP.

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
	The FMP will include the following Project information: A description of the Project (cost, design, length, location, etc.), and enhanced by updated Project designs and plans; A description of the surrounding land uses using EMF reduction priority criteria classifications; No-cost options to be implemented; Priority areas where low-cost measures are to be applied, and; Measures considered for magnetic field reduction, percent reduction and cost. This FMP will define EMF reduction priority criteria classifications for the Project's alignment and which EMF reduction options were identified. Project EMF reduction design criteria will be presented, including a description of how the Project alignment is proposed to be treated equivalently or why low-cost measures cannot be applied to this Project due to cost, percent reduction, equivalence, secondary environmental impacts, or other reasons. The ultimate cost of the EMF reduction elements incorporated into the Project will be qualified and compared to the CPUC's stated goal of approximately 4 percent of the Project's budget. Standards for Success: EMF impacts are reduced to a less than significant level.	of the Projects cost.	construction activities.	
Hydrology and Water Quality				
Impact WQ-1 Impact WQ-3 Impact WQ-5 Impact WQ-6	**APM WQ-01: SWPPP Development and Implementation.** Following Project approval, DCRT would prepare and implement a SWPPP or an amendment to an existing SWPPP to minimize construction impacts on surface water and groundwater quality. Implementation of the SWPPP would help stabilize graded areas and reduce erosion and sedimentation. The Plan would designate BMPs	Review adequacy of and implementation of SWPPP.	Pre-construction Construction Post-construction	The Applicant

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
	that would be adhered to during construction activities. Erosion and sediment control measures, such as straw wattles, covers, and silt fences, would be installed prior to ground disturbance, based on the anticipated volume and intensity of precipitation, the nature of stormwater runoff in the Project Area, and the soil types within the Project Area. Suitable stabilization measures would be used to protect exposed areas during construction activities, as necessary and final stabilization would be completed when construction materials, waste, and temporary erosion and sediment control measure have been removed. During construction activities, measures would be implemented to prevent contaminant discharge from vehicles and equipment, including complying with the Spill Prevention, Control, and Countermeasures requirements in 40 CFR 112. The Project SWPPP would include erosion control and sediment transport BMPs to be used during construction. BMPs, where applicable, would be designed by using specific criteria from recognized BMP design guidance manuals. Erosion-minimizing efforts may include measures such as the following: defining ingress and egress within the Project site implementing a dust control program during construction properly containing stockpiled soils Erosion control measures identified would be installed in an area before construction begins and would be properly maintained until construction is complete and final stabilization begins. Temporary measures such as silt fences or wattles, intended to minimize sediment transport from temporarily disturbed areas, would remain in place until disturbed areas have stabilized. The Plan would be updated during construction as required by the State Water Resources Control Board (SWRCB) and the Arizona Department of			

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
	Environmental Quality (ADEQ). The Plan would include the following components, in accordance with ADEQ requirements for coverage under the General Permit: stormwater team qualifications and contact information identification of operators nature of construction activities sequence and estimated dates of construction activities site description site map(s) receiving waters control measures to be used during construction activity summary of potential pollutant sources use of treatment chemicals pollution prevention procedures, including spill prevention and response and waste management procedures			
Impact WQ-1 Impact WQ-3 Impact WQ-5 Impact WQ-6	**APM WQ-02: Worker Environmental Awareness Program Development and Implementation.** The Project's worker environmental awareness program would communicate environmental issues and appropriate work practices specific to this Project. This awareness would include spill prevention and response measures and proper BMP implementation. The training would emphasize site-specific physical conditions to improve hazard prevention (such as identification of flow paths to nearest water bodies) and would include a review of all site-specific water quality requirements, including applicable portions of erosion control and sediment transport BMPs, Health and Safety	Confirm worker environmental awareness training is implemented for all new personnel preforming ground-disturbing activities.	Pre-construction Construction	The Applicant

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
	Plan, and Hazardous Substance Control and Emergency Response Plan.			
Impact WQ-1 Impact WQ-3 Impact WQ-5 Impact WQ-6	**APM WQ-03: Vehicles and Equipment Fueling and Maintenance**. Vehicle and equipment fueling and maintenance operations would be conducted in designated areas only; these areas would be equipped with appropriate spill control materials and containment.	Verify vehicle equipment fueling in designated areas with appropriate spill control.	Construction	The Applicant
Impact WQ-1 Impact WQ-3 Impact WQ-5 Impact WQ-6	**BMP WQ-04: Non-petroleum Dust Palliatives.** Palliatives used for dust control would be non-petroleum products in addition to non-toxic, as specified in AQ-01.	Confirm palliatives used for dust control are non-petroleum products and non-toxic.	Pre-construction Construction	The Applicant
Impact WQ-1 Impact WQ-3 Impact WQ-5 Impact WQ-6	**BMP WQ-05: Water Use.** Water extracted or consumptively used for the construction, operation, maintenance, or remediation of the project shall be solely for the beneficial use of the Project or its associated mitigation and remediation measures, as specified in approved plans and permits.	Confirm water use.	Pre-construction Construction Post-construction Operation	The Applicant
Impact WQ-1 Impact WQ-3 Impact WQ-5 Impact WQ-6	**BMP WQ-06: Avoidance of Hydrologic Alterations.** Consideration shall be given to design alternatives that maintain the existing hydrology of the site or redirect excess flows created by hardscapes and reduced permeability from surface waters to areas where they would dissipate by percolation into the landscape. All hydrologic alterations shall be avoided that could reduce water quality or quantity for all applicable beneficial uses associated with the hydrologic unit in the project area, or specific MMs shall be implemented that would minimize unavoidable water quality or quantity impacts, as determined by BLM in coordination with USFWS, CDFW, and other agencies, as appropriate.	Confirm water quality or quantity impacts are avoided or mitigated appropriately.	Design Pre-construction Construction	The Applicant

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
Impact WQ-1 Impact WQ-3 Impact WQ-5 Impact WQ-6	**BMP WQ-07: Structures in Floodplains.** No permanent structures would be placed in floodplains that are narrower at the ROW crossing than the typical span width of 1,200 feet (i.e., it is assumed that such floodplains could be spanned and avoided).	Confirm permanent structures span or avoid floodplains.	Design	The Applicant
Impact WQ-1 Impact WQ-3 Impact WQ-5 Impact WQ-6	**CMA LUPA-SW-1.** Stipulations or conditions of approval for any activity will be imposed that provide appropriate protective measures to protect the quantity and quality of all water resources (including ephemeral, intermittent, and perennial water bodies) and any associated riparian habitat (see biological CMAs for specific riparian habitat CMAs). The water resources to which this CMA applies will be identified through the activity specific NEPA analysis.	Confirm appropriate water resource protective measures are implemented.	Pre-construction	The Applicant
Impact WQ-1 Impact WQ-3 Impact WQ-5 Impact WQ-6	**CMA LUPA-SW-5.** Exceptions to any of the specific soil and water stipulations contained in this section, as well as those listed below under the subheadings "Soil Resources," "Surface Water," and "Groundwater Resources," may be granted by the authorized officer if the applicant submits a plan, or, for BLM-initiated actions, the BLM provides documentation, that demonstrates: • The impacts are minimal (e.g., no predicted aquifer drawdown beyond existing annual variability in basins where cumulative groundwater use is not above perennial yield and water tables are not currently trending downward) or can be adequately mitigated.	Verify need for documentation.	Pre-construction	The Applicant
Impact WQ-1 Impact WQ-3 Impact WQ-5 Impact WQ-6	**CMA LUPA-SW-15.** Surface water diversion for beneficial use will not occur absent a state water right.	Verify state water right and use.	Pre-construction Construction Post-construction Operation	The Applicant

Land Use and Planning				
Impact LU 2	**CMA LUPA-LANDS-4.** Nonfederal lands within the boundaries of BLM LUPA land use allocations are not affected by the LUPA.	NA	Design	The Applicant
Impact LU 2	**CMA LUPA-LANDS-5.** The MUCs used to determine land tenure in the CDCA Plan will be replaced by areas listed in the CMAs.	NA	Design	The Applicant
Impact LU 2	**CMA LUPA-LANDS-8.** The CDCA Plan requirement that new transmission lines of 161kV or above, pipelines with diameters greater than 12 inches, coaxial cables for interstate communications, and major aqueducts or canals for interbasin transfers of water will be located in designated utility corridors, or considered through the plan amendment process outside of designated utility corridors, remains unchanged. The only exception is that transmission facilities may be located outside of designated corridors within DFAs without a plan amendment.	Verify whether Project is located in designated utility corridor and complies with CDCA Plan.	Design	The Applicant
Noise				
Impact NOI-1 Impact NOI-2 Impact NOI-4	**APM NO-01: Noise Minimization with Portable Barriers.** Compressors and other small stationary equipment used during construction would be shielded with portable barriers if located within 200 feet of a residence.	Confirm use of portable barriers.	Construction	The Applicant
Impact NOI-1 Impact NOI-2 Impact NOI-4	**APM NO-02: Noise Minimization with Quiet Equipment.** Quiet equipment (for example, equipment that incorporates noise control elements into the design; quiet model air-compressors or generators can be specified) would be used during construction whenever possible.	Confirm use of quiet equipment.	Construction	The Applicant
Impact NOI-1	**APM NO-03: Noise Minimization through Direction of Exhaust.** Stationary	Confirm direction of	Construction	The Applicant

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
Impact NOI-2 Impact NOI-4	equipment exhaust stacks and vents (i.e., on equipment like generators and lights) would be directed away from buildings where feasible.	exhaust is away from buildings.		
Impact NOI-1 Impact NOI-2 Impact NOI-4	**APM NO-04: Blasting Mitigation.** If blasting is required, the timeframe that blasting activity would occur would be limited, in addition to limiting the number of blasts that occur per hour or per day.	Confirm blasting timing limited.	Construction	The Applicant
Impact NOI-1 Impact NOI-2 Impact NOI-4	**BMP NO-05: County, State, and Federal Noise Regulations.** Project would be located far enough from residences or include engineering and/or operational methods such that county, state, and/or federal regulations for noise are not exceeded.	Confirm noise levels are not exceeded.	Design	The Applicant
Impact NOI-1 Impact NOI-2 Impact NOI-4	**BMP NO-06: Hours of Daily Activity.** The hours of daily activities would be limited, and noise barriers would be constructed if needed and practicable. Coordination with nearby residents is recommended.	Confirm time limits on activity.	Construction	The Applicant
Impact NOI-1 Impact NOI-2 Impact NOI-4	**BMP NO-07: Sensitive Wildlife Protection.** To the extent feasible, locate stationary noise sources that exceed background ambient noise levels away from known or likely locations of and BLM sensitive wildlife species and their suitable habitat.	Confirm stationary noise located away from sensitive wildlife.	Construction	The Applicant
Impact NOI-1 Impact NOI-2 Impact NOI-4	**CMA LUPA-BIO-12.** For activities that may impact Focus or BLM Special Status Species, implement the following LUPA CMA for noise: To the extent feasible and determined necessary by BLM to protect Focus and BLM sensitive wildlife species, locate stationary noise sources that exceed background ambient noise levels away from known or likely locations of and BLM sensitive wildlife species and their suitable habitat. Implement engineering controls on stationary equipment, buildings, and work	Verify mufflers are used on construction equipment.	Construction	The Applicant

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
	areas including sound insulation and noise enclosures to reduce the average noise level, if the activity will contribute to noise levels above existing background ambient levels. Use noise controls on standard construction equipment including mufflers to reduce noise			
Impact NOI-1 Impact NOI-2 Impact NOI-4	MM NO-CEQA-1 Implement Noise Applicant Proposed Measures, Best Management Practices, and Conservation and Management Actions. The APMs, BLM BMPs, and CMAs in Sections 2.13.2 and 2.13.3 above provide a suite of measures, practices, and actions that shall be implemented as part of the Project. APMs, BMPs, and CMAs shall be implemented prior to, or during all ground disturbance and construction related activities to avoid or minimize Project related impacts to noise. These APMs, BMPs, and CMAs include; APM NO-01, APM NO-02, APM NO-03, APM NO-04, BMP NO-05, BMP NO-06, BMP NO-07, and CMA LUPA-BIO-12. If an APM, BMP, or CMA is subjective, such as containing text that states; "where appropriate," "where applicable," "where feasible," or similar language, the BLM and CPUC shall be consulted to determine the applicability of each measure prior to the disturbance of a covered resource. Compliance with APMs, BMPs, and CMAs shall be documented, and a weekly report shall be provided to the BLM and CPUC. The Applicant shall provide a synopsis of the weekly reports to the BLM and CPUC monthly. The report shall include a summary of the construction activities completed, a list of compliance actions and any remedial actions taken to correct any actions, and the status of ongoing mitigation efforts. For those instances (only) where an APM, BMP, and/or CMA conflicts, or does not meet required specificity pursuant to CEQA, the following BMPs have been modified to meet CEQA requirements:	The Applicant shall develop a weekly report that shall include all applicable APMs, BMPs, and CMAs and the related actions taken in order to be in compliance with these measures. These weekly reports shall be compiled and submitted to the BLM and CPUC monthly.	APMs, BMPs, and CMAs shall be implemented throughout construction activities.	The Applicant shall ensure that all APMs, BMPs, and CMAs are implemented during construction. If an APM, BMP, or CMA is subjective, the Applicant shall consult with the BLM and/or the CPUC to determine the applicability of each measure.

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
	APM NO-03: Noise Minimization through Direction of Exhaust. Consistent with APM NO-03, stationary equipment exhaust stacks and vents shall be directed away from buildings, where feasible. If infeasible to do so, the Applicant shall work with the affected residents and the County to achieve the necessary reduction in noise through placement of noise barriers or time of day that such construction work will take place. **APM NO-04: Blasting Mitigation.** Consistent with APM NO-04, if any blasting activities will occur during construction, the number of blasts per hour or per day would be limited. In addition, the Applicant shall notify any sensitive receptors, consistent with MM NO-CEQA-2 below), who are within 100 feet of such activity. **BMP NO-05: County, State, and Federal Noise Regulations.** As specified in BMP NO-05, the Project, including staging areas would be located far enough from residences to comply with the Riverside County Noise Ordinance, wherever possible. As discussed under Impact NOI 1 above, the Riverside County Noise Ordinance specifies that exemptions from noise standards include private construction projects located within 0.25 of a mile from an inhabited dwelling, provided that construction does not occur between the hours of 6 p.m. and 6 a.m. during the months of June through September, and construction does not occur between the hours of 6 p.m. and 7 a.m. during the months of October through May. Construction work shall comply with these restrictions and will be in compliance with the Riverside County Noise Ordinance. **BMP NO-06. Hours of Daily Activity.** Consistent with BMP NO-06, the hours of daily construction activities would be limited. Specifically, these limitations would coincide with the hour specified within the Riverside County Noise Ordinance (See BMP NO-05 above). **BMP NO-07: Sensitive Wildlife Protection.** Consistent with BMP NO-07			

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
	and CMA LUPA-BIO-12, stationary noise sources would be limited to the extent feasible near wildlife species and their suitable habitat. Where infeasible to do so, the Applicant shall work with the BLM and CDFW to identify the affected species and/or habitat and achieve the appropriate noise reduction necessary or otherwise mitigate the effect to result in a less than significant noise impact to sensitive species and their habitat. Standards for Success: Compliance with all applicable APMs, BMPS, and CMAs is achieved throughout construction of the Project.			
Impact NOI-1 Impact NOI-4	MM NO-CEQA-2 Noise Reduction Measures. The Applicant shall ensure that noise reduction measures are implemented throughout construction activities in order to avoid or reduce noise impacts on sensitive receptors. The Applicant shall submit a monthly report to the BLM and the County reporting the effectiveness of the following measures using compliance with the Riverside County Noise Ordinance as a level of measurement for such effectiveness. The Applicant shall also notify all residents within one mile of the Project site at least 15 days prior to any ground-disturbing through mail, or by other effective means. The Applicant shall establish a phone number for use by the public to accompany the notification that will allow the public to report any undesirable noise conditions associated with the construction of the Project. If the telephone number provided is not staffed 24 hours a day, the Applicant shall include an automatic answering feature, with date and time stamp recording, to answer calls when the phone is unattended. This phone number shall be posted at the Project sites during construction where it is visible to passerby. If a complaint is filed regarding Project-related noise, the Applicant shall document, investigate, evaluate, and attempt to resolve all Project-related noise complaints. All complaints related to Project-noise shall be included in the monthly noise report. If the BLM and/or the County determines that noise limits are not sufficiently managed then the	The Applicant shall prepare a monthly noise report that will include any actions taken in order to be in compliance with the Riverside County Noise Ordinance. Additionally, the noise report shall include any noise complaints received and actions taken to resolve the complaint. The noise report shall be kept on file by the applicant and submitted monthly to the CPUC and BLM.	The noise reduction measures shall be implemented throughout construction activities.	The Applicant shall be responsible for ensuring that the noise reduction measures are implemented throughout construction activities.

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
	Applicant shall work with the BLM, County, and affected residents to achieve the necessary reduction or otherwise mitigate the effect beyond the measures that are included below. The measures below include noise reduction features, limits to construction traffic as it relates to noise, measure to reduce construction vehicle use, and measures to limit construction staging and material laydown areas. **Effectiveness of Noise Reduction Features**. Consistent with APM NO-2, the Applicant shall ensure that the chosen construction contractor use equipment that includes noise reduction features (e.g. mufflers and engine shrouds) that are no less effective than those originally installed by the manufacturer. Additionally, the Applicant shall ensure that the chosen contractor maintains all construction equipment in good working order to avoid unnecessary rattling of loose parts. These noise reduction features shall be utilized throughout construction activities and will reduce unnecessary noise impacts from construction equipment. **Construction Traffic**. The Applicant shall ensure that the chosen contractor routes construction traffic away from residences and schools by taking alternate routes. If residences and schools cannot be avoided during construction the Applicant shall inform the residents and/or schools affected no less than five days prior to construction and work with residents and local schools to minimize timing and duration of construction noise. Possible measures for reducing noise from construction traffic near residences and/or schools may include timing of construction routes or adding noise barriers around areas that may be sensitive to construction traffic. **Construction Vehicle Use.** The Applicant shall ensure that the chosen contractor limits unnecessary construction vehicle use and idling times throughout construction activities. This shall include turning off vehicles			

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
	that are not in use, or idling, consistent with APM AQ-02 and limit the number of vehicles in use to the minimum amount required in order for completion of construction activities. **Construction Staging and Material Laydown Areas.** The Applicant shall ensure that the construction staging and material laydown areas be located away from noise sensitive receptors to avoid concentrated and prolonged exposure to noise form construction activities. Where construction staging and laydown areas cannot avoid sensitive receptors, the Applicant shall inform the sensitive receptor(s) no less than one week prior to the start of construction activities and work with the sensitive receptor(s) to provide noise reducing methods such as noise barriers. Standards for Success: Construction noise is maintained at a less than significant level throughout construction activities and noise complaints are minimized and addressed accordingly throughout construction activities.			
Public Services and Utilities				
Impact PUSVC-1	**APM HAZ-01: Hazardous Substance Control and Emergency Response.** DCRT would implement its hazardous substance control and emergency response procedures as needed in conjunction with a Hazardous Substance Control and Containment Plan and Emergency Response Plan for the Project. The procedures identify methods and techniques to minimize the exposure of the public and site workers to potentially hazardous materials during all phases of Project construction through operation. They address worker training appropriate to the site worker's role in hazardous substance control and emergency response. The procedures also require implementing appropriate control methods and approved containment and spill-control practices for construction and materials stored on site. If it were necessary to store chemicals on site, they would be managed in accordance with all applicable regulations. Material safety data sheets would be maintained and kept available on site, as	Review adequacy of and implementation of hazardous substance control and emergency response procedures as needed in conjunction with a Hazardous Substance Control and Containment Plan and Emergency Response Plan for the Project.	Pre-construction Construction	The Applicant

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
	applicable. • Project construction would involve soil surface blading/leveling and excavation. In the event that soils suspected of being contaminated (on the basis of visual, olfactory, or other evidence) are removed during site grading activities or excavation activities, the excavated soil would be tested and, if contaminated above hazardous waste levels, would be contained and disposed of at a licensed waste facility. The presence of known or suspected contaminated soil would require testing and investigation procedures to be supervised by a qualified person, as appropriate, to meet state and federal regulations. • All hazardous materials and hazardous wastes would be handled, stored, and disposed of in accordance with all applicable regulations by personnel qualified to handle hazardous materials. The hazardous substance control and emergency response procedures include, but are not limited to, the following: • Proper disposal of potentially contaminated soils. • Establishing site-specific buffers for construction vehicles and equipment near sensitive resources. • Emergency response and reporting procedures to address hazardous material spills. • Stopping work at that location and contacting the County Fire Department Hazardous Materials Unit immediately if visual contamination or chemical odors are detected; work would be resumed at this location after any necessary consultation and approval by the Hazardous Materials Unit. DCRT would complete its Emergency Action Plan Form as part of Project tailgate meetings. The purpose of the form is to gather emergency contact			

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
	numbers, first aid location, work site location, and tailgate information.			
Impact PUSVC-1	**BMP PH&S-01.** Portable toilets would be provided at work sites to assure that adequate facilities are available for the duration of the Project and potential exposure to human waste is avoided.	Confirm portable toilets are provided on construction sites.	Construction	The Applicant
Impact PUSVC-1	**APM TT-01: Traffic Coordination**. Emergency service providers would be notified of the timing, location, and duration of construction activities. Traffic control devices and signs would be used as needed. These measures would be implemented in conjunction with a Traffic and Transportation Management Plan for the Project.	Confirm Traffic and Transportation Management Plan is implemented.	Pre-construction Construction	The Applicant
Impact PUSVC-1	**BMP PH&S-02.** A Fire Prevention Plan would be developed for the Project.	Conform implementation of a Fire Prevention Plan	Pre-construction Construction	The Applicant
Impact PUSVC-1 Impact PUSVC-5	**BMP MISC-02.** All cleared and graded material to be removed from the Project area would be disposed of in compliance with local ordinances.	Verify construction materials are removed in compliance with local ordinances.	Construction	The Applicant
Impact PUSVC-1	**CMA DFA-VPL-BIO-FIRE-1**. Implement the following standard practice for fire prevention/protection: Implement site-specific fire prevention/protection actions particular to the construction and operation of renewable energy and transmission project that include procedures for reducing fires while minimizing the necessary amount of vegetation clearing, fuel modification, and other construction-related activities. At a minimum, these actions will include designating site fire coordinators, providing adequate fire suppression equipment (including in vehicles), and establishing emergency response information relevant to the construction site.	Verify site specific fire prevention/protection actions are implemented.	Construction	The Applicant

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
Impact PUSVC-1	MM HAZ-CEQA-1 Implement Hazards and Hazardous Materials Applicant Proposed Measures, Best Management Practices, and Conservation and Management Actions. The APMs, BLM BMPs, and CMAs in Sections 2.8.2 and 2.8.3 above provide a suite of measures, practices, and actions that shall be implemented as part of the Project. APMs, BMPs, and CMAs shall be implemented prior to, or during all ground disturbance and construction related activities to avoid or minimize Project related impacts to hazards and hazardous materials. These APMs, BMPs, and CMAs include; APM HAZ-01, APM TT-01, APM WQ-01, APM HAZ-02, BMP PH&S-02, APM WQ-02, BMP HAZ-03, APM WQ-03, BMP HAZ-04, CMA LUPA-SW-6, CMA LUPA-SW-7, CMA LUPA-BIO-9, CMA DFA-VPL-BIO-FIRE-1. If an APM, BMP, or CMA is subjective, such as containing text that states; "where appropriate," "where applicable," "where feasible," or similar language, the BLM and CPUC shall be consulted to determine the applicability of each measure prior to the disturbance of a covered resource. Compliance with APMs, BMPs, and CMAs shall be documented, and a weekly report shall be provided to the BLM and CPUC. The Applicant shall provide a synopsis of the weekly reports to the BLM and CPUC monthly. The report shall include a summary of the construction activities completed, a list of compliance actions and any remedial actions taken to correct any actions, and the status of ongoing mitigation efforts. For those instances (only) where an APM, BMP, and/or CMA conflicts, or does not meet required specificity pursuant to CEQA, the following BMPs have been modified to meet CEQA requirements: **APM TT-01: Traffic Coordination.** As discussed in this APM, a Traffic, Transportation, and Access Management Plan would be developed for the Project. The details of this Traffic, Transportation, and Access	The Applicant shall develop a weekly report that shall include all applicable APMs, BMPs, and CMAs and the related actions taken in order to be in compliance with these measures. These weekly reports shall be compiled and submitted to the BLM and CPUC monthly.	APMs, BMPs, and CMAs shall be implemented throughout construction activities.	The Applicant shall ensure that all APMs, BMPs, and CMAs are implemented during construction. If an APM, BMP, or CMA is subjective, the Applicant shall consult with the BLM and/or the CPUC to determine the applicability of each measure.

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
	Management Plan, as well as the correlation with a Congested Area Plan, are further discussed under MM TRANS-CEQA-2. **APM HAZ-02: Fire Avoidance and Suppression, BMP PH&S-02, and CMA DFA-VPL-BIO-FIRE-1.** As discussed in APM HAZ-02, BMP PH&S-02, and CMA DFA-VPL-BIO-FIRE-1, a Fire Prevention Plan shall be developed and implemented for the Project throughout construction and operation and maintenance. The Applicant shall develop a Project Fire Prevention Plan in consultation with the appropriate local fire agencies at least 30-days prior to the start of construction activities. The Plan shall cover the construction and operations/maintenance phases of the Project. The Applicant shall monitor Project-related activities to ensure implementation and effectiveness of the Plan. The final Plan will be approved by the consulted fire agencies prior to the initiation of construction activities and shall be implemented during all Project-related activities by the Applicant. Information contained in the Plan and location of fire-suppression materials and equipment shall be included as part of the Worker Environmental Awareness Program discussed in APM BIO-01. Successful implementation of this Plan shall result in a less than significant impact to the potential for construction-related fires. At minimum, the Plan shall include the following: Procedures for minimizing potential ignition, including, but not limited to, vegetation clearing, parking requirements/restrictions, idling restrictions, smoking restrictions, proper use of gas-powered equipment, use of spark arrestors, hot work restrictions, and timing of vegetation treatment or maintenance. Where necessary, vegetation management or clearing necessary to mitigate fire risk shall supersede other measures for vegetation protection and avoidance. Applicable permitting, compensation, and mitigation resulting from such activity shall be the responsibility of the Applicant.			

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
	Proper use of construction, maintenance, and decommissioning equipment. Work restrictions during Red Flag Warnings and High to Extreme Fire Danger days. Fire coordinator and fire patrol roles and responsibilities. Worker training for fire prevention, initial attack firefighting, and fire reporting. Emergency fire suppression equipment/tools inventory and maintenance. Emergency communication, response, and reporting procedures. Coordination with local fire agencies to facilitate emergency access through the Project site. Emergency contact information. Compliance with applicable wildland fire management plans and policies established by state and local agencies. Other information as required by responsible and consulted agencies. **Responsible Party:** The Applicant shall develop the Fire Prevention Plan and ensure that it is implemented throughout construction activities. **Timing:** The Applicant shall develop the Fire Prevention Plan at least 30-days prior to the start of construction activities. The Fire Prevention Plan shall be implemented throughout all construction activities. **Mitigation Monitoring and Reporting Program:** The Applicant shall ensure that the information in the Fire Prevention Plan is included in the Worker Environmental Awareness Program. Documentation of any Red Flag Warnings or High to Extreme Fire Danger days shall be			

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
	kept on file and submitted to the applicable local fire agencies as well as the BLM and CPUC. **Standards for Success:** Construction impacts related to fires is reduced to a less than significant level and no fires are started as a result of construction activities. **BMP HAZ-04.** The Pesticide Use Proposal will be developed in accordance with MM VEG-CEQA-1 (See Section 2.4.6 above). Standards for Success: Compliance with all applicable APMs, BMPS, and CMAs is achieved throughout construction of the Project.			
Impact PUSVC-1	MM TRANS CEQA-2 Traffic, Transportation, and Access Management Plan. The Applicant shall develop a Traffic, Transportation, and Access Management Plan at least 30-days prior to the start of construction and work with the BLM and Riverside County to prepare and implement the Plan for roadways adjacent to and directly affected by the proposed Project facilities. The Traffic, Transportation, and Access Management Plan shall be submitted to the BLM and the County for approval prior to the start of ground disturbing activities and issuance of a County grading permit. The Traffic, Transportation, and Access Management Plan shall be implemented by the Applicant throughout all construction activities. The Traffic, Transportation, and Access Management Plan shall include, but not limited to, the following requirements: The Traffic, Transportation, and Access Management Plan shall conform to Part 6 (Temporary Traffic Control) of the California Manual on Uniform Traffic Control Devices; Identify truck routes designated by Riverside County and local jurisdictions	The Applicant shall monitor construction transportation and access to ensure that the Traffic, Transportation, and Access Management Plan is implemented successfully as documented in inspection logs.	The Traffic, Transportation, and Access Management Plan shall be prepared at least 30-days prior to the start of construction and shall be implemented throughout all construction activities.	The Applicant shall be responsible for ensuring that the Traffic, Transportation, and Access Management Plan is prepared and implemented throughout construction activities.

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
	haul routes that minimize truck traffic on local roadways; Provide sufficient-sized staging areas for trucks accessing work zones to minimize disruption of access to adjacent public right-of-was Scheduling truck trips outside the peak morning and evening commute hours; Storing all equipment and materials in designated contractor staging areas on or adjacent to the worksite, such that traffic obstruction is minimized; Implementing roadside safety protocols including advance “Road Wok Ahead” warning and speed control signs which shall be posted to reduce and provide safe traffic flow through the work zone; Providing advance notification to administrators of police and fire stations (including fire protection agencies), ambulance service providers, and recreational facility managers of the timing, location, and duration of construction activities and the locations of detours and lane closures. Maintain access for emergency vehicles within, and/or adjacent to roadways affected by construction activities at all times; Repairing and restoring adversely affected roadway pavements to their pre-construction condition; Damage will be documented by the Project Applicant and the applicable jurisdiction (i.e. Caltrans, County, or individual) will be notified within 24 hours. The Applicant will work with the jurisdiction affected and will repair the damage within 30 days. Coordination of individual traffic plans for the Project and nearby Projects; Coordination between the contractor and Riverside County in developing circulation and detour plans that include safety features (e.g. signage and			

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
	flaggers). The circulation and detour plans shall address: Full and partial roadway closures; Circulation and detour plans to include the use of signage and flagging to guide vehicles through and/or around the construction zone, as well as any temporary traffic control devices; Bicycle detour plans, where applicable; Parking along arterial and local roadways; and Haul routes for construction trucks and staging areas for instances when multiple trucks arrive at the work sites. Protocols for updating the Traffic, Transportation, and Access Management Plan to account for delays or changes in the schedules of individual projects The Traffic, Transportation, and Access Management Plan shall incorporate an access road siting and management plan, Congested Area Plan (pursuant to FAA regulations and APM TT-01), and a transportation plan for the transport and transmission tower components and equipment. Standards for Success: Traffic flow remains at acceptable levels, emergency access remains possible at all times, the public is reasonably notified of any road closures, delays, or lane restrictions, and the Project area remains in compliance with all applicable transportation goals, policies, and requirements.			
Impact PUSVC-1	MM PUB-CEQA-1 Implement Public Services and Utilities Applicant Proposed Measures, Best Management Practices, and Conservation and Management Actions: The APMs, BLM BMPs, and CMAs in Sections 2.15.2 and 2.15.3 above provide a suite of measures, practices, and actions that shall be implemented as part of the Project. APMs, BMPs, and CMAs shall be implemented prior to, or	The Applicant shall develop a weekly report that shall include all applicable APMs, BMPs, and CMAs and the related actions taken in order to be in compliance with	APMs, BMPs, and CMAs shall be implemented throughout construction activities.	The Applicant shall ensure that all APMs, BMPs, and CMAs are implemented during construction. If an

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
	during all ground disturbance and construction related activities to avoid or minimize Project related impacts to public services and utilities. These APMs, BMPs, and CMAs include; APM HAZ-01, BMP PH&S-01, APM TT-01, BMP PH&S-02, BMP MISC-02, and CMA-DFA-VPL-BIO-FIRE-1. If an APM, BMP, or CMA is subjective, such as containing text that states; "where appropriate," "where applicable," "where feasible," or similar language, the BLM and CPUC shall be consulted to determine the applicability of each measure prior to the disturbance of a covered resource. Compliance with APMs, BMPs, and CMAs shall be documented, and a weekly report shall be provided to the BLM and CPUC. The Applicant shall provide a synopsis of the weekly reports to the BLM and CPUC monthly. The report shall include a summary of the construction activities completed, a list of compliance actions and any remedial actions taken to correct any actions, and the status of ongoing mitigation efforts. For those instances (only) where an APM, BMP, and/or CMA conflicts, or does not meet required specificity pursuant to CEQA, the following BMPs have been modified to meet CEQA requirements: **APM TT-01: Traffic Coordination.** See revisions under MM TRANS-CEQA-2 (Section 2.17.6). **BMP PH&S-02.** See revisions under MM HAZ-CEQA-1 (Section 2.8.6). **Standards for Success:** Compliance with all applicable APMs, BMPS, and CMAs is achieved throughout construction of the Project.	these measures. These weekly reports shall be compiled and submitted to the BLM and CPUC monthly.		APM, BMP, or CMA is subjective, the Applicant shall consult with the BLM and/or the CPUC to determine the applicability of each measure.
Recreation				
Impact REC-1	**BMP REC-01: Alternative Access and Parking Signs.** Signs directing vehicles to alternative park access and parking would be posted in the event construction temporarily obstructs parking areas near trailheads.	Confirm appropriate signs are posted.	Pre-construction Construction	The Applicant

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
Impact REC-1	**BMP REC-02: Recreation Users Signs.** Signs advising recreation users of construction activities and directing them to alternative trails or bikeways would be posted on both sides of all trail intersections or as determined through DCRT coordination, with the respective jurisdictional agencies. A schedule of construction activities would be posted near entrances to recreational areas as well as on the Project website. Signs would be installed near access roads notifying the public of construction activities in the area and the presence of permanent transmission facilities.	Confirm appropriate signs are posted.	Pre-construction Construction	The Applicant
Impact REC-1	**BMP REC-04: Alternate Route Signage.** Identify alternative routes (on existing roads and trails) of equal or greater standard and access to specially designated areas if roads, primitive roads, or trails used for recreation are temporarily closed or otherwise significantly affected. The alternate route(s) would be clearly identified on signage.	Confirm alternate route signage posted.	Pre-construction	The Applicant
Impact REC-1	**CMA DFA-REC-1.** Retain, to the extent possible, the identified recreation setting characteristics: physical components of remoteness, naturalness and facilities; social components of contact, group size and evidence of use; and operational components of access, visitor services and management controls (see recreation setting characteristics matrix).	Confirm recreation setting characteristics are retained.	Design	The Applicant
Impact REC-1	**CMA DFA-REC-2.** Avoid large-scale ground disturbance within one-half mile of Level 3 Recreation facility footprint including route access and staging areas. If avoidance isn't practicable, the facility must be relocated to the same or higher standard and maintain recreation objectives and setting characteristics.	Confirm large-scale ground disturbance within one-half mile of Level 3 Recreation facility footprint.	Design	The Applicant
Impact REC-1	**CMA DFA-REC-4.** When considering large-scale development in DFAs, retain to the extent possible existing, approved recreation activities.	Confirm recreation activities retained.	Design	The Applicant
Impact REC-1	**CMA DFA-REC-5.** For displacement of dispersed recreation opportunities,	Confirm recreation	Design	The Applicant

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
	commensurate compensation in the form of enhanced recreation operations, recreation facilities or opportunities will be required. If recreation displacement results in resource damage due to increased use in other areas, mitigate that damage through whatever measures are most appropriate as determined by the Authorized Officer.	compensation or mitigation determined by the Authorized Officer.	Post-construction	
Impact REC-1	**CMA DFA-REC-7.** If designated vehicle routes are directly impacted by activities (includes modification of existing route to accommodate industrial equipment, restricted access or full closure of designated route, pull outs, and staging areas to the public, etc.), mitigation will include the development of alternative routes to allow for continued vehicular access with proper signage, with a similar recreation experience. In addition, mitigation will also include the construction of an "OHV touring route" which circumvents the activity area and allows for interpretive signing materials to be placed at strategic locations along the new touring route, if determined to be appropriate by BLM.	Confirm implementation of alternative routes.	Pre-construction Construction	The Applicant
Impact REC-1	MM REC-CEQA-1 Implement Noise Applicant Proposed Measures, Best Management Practices, and Conservation and Management Actions. The APMs, BLM BMPs, and CMAs in Sections 2.16.2 and 2.16.3 above provide a suite of measures, practices, and actions that shall be implemented as part of the Project. APMs, BMPs, and CMAs shall be implemented prior to, or during all ground disturbance and construction related activities to avoid or minimize Project related impacts to recreation. These APMs, BMPs, and CMAs include; BMP REC-01, BMP REC-02, BMP REC-03, BMP REC-04, CMA DFA-REC-1, CMA DFA-REC-2, CMA DFA-REC-4, CMA DFA-REC-5, CMA DFA-REC-7. If an APM, BMP, or CMA is subjective, such as containing text that states; "where appropriate," "where applicable," "where feasible," or similar language, the BLM and CPUC shall be consulted to determine the applicability of each measure prior to the disturbance of a covered resource. Compliance with APMs,	The Applicant shall develop a weekly report that shall include all applicable APMs, BMPs, and CMAs and the related actions taken in order to be in compliance with these measures. These weekly reports shall be compiled and submitted to the BLM and CPUC monthly.	APMs, BMPs, and CMAs shall be implemented throughout construction activities.	The Applicant shall ensure that all APMs, BMPs, and CMAs are implemented during construction. If an APM, BMP, or CMA is subjective, the Applicant shall consult with the BLM and/or the CPUC to determine the applicability of

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
	BMPs, and CMAs shall be documented, and a weekly report shall be provided to the BLM and CPUC. The Applicant shall provide a synopsis of the weekly reports to the BLM and CPUC monthly. The report shall include a summary of the construction activities completed, a list of compliance actions and any remedial actions taken to correct any actions, and the status of ongoing mitigation efforts. For those instances (only) where an APM, BMP, and/or CMA conflicts, or does not meet required specificity pursuant to CEQA, the following BMPs have been modified to meet CEQA requirements: **CMA DFA-REC-1.** Consistent with CMA DFA-REC-1, recreation setting characteristics would be retained to the extent feasible. If infeasible to do so, the Applicant shall work with the BLM and affected recreation users to mitigate the effect (i.e. placement of construction equipment, timing of construction, etc.). **CMA DFA-REC-4**. Consistent with CMA DFA-REC-4, large-scale development in DFAs shall retain approved recreation facilities, to the extent feasible. If infeasible to do so, the recreation facility shall be relocated to the same or higher standard and maintain recreation objectives and setting characteristics. **Standards for Success:** Compliance with all applicable APMs, BMPS, and CMAs is achieved throughout construction of the Project.			each measure.
Traffic and Transportation				
Impact TRANS-1 Impact TRANS-3 Impact TRANS-5	**APM TT-01: Traffic Coordination.** Emergency service providers would be notified of the timing, location, and duration of construction activities. Traffic control devices and signs would be used as needed. These measures would be implemented in conjunction with a Traffic and Transportation Management Plan for the Project. This plan would also include measures/protocols for	Verify emergency service providers are notified of construction activities. Verify implementation of a Traffic and	Pre-construction Construction	The Applicant

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
Impact TRANS-6	aviation, including helicopter use, coordination with local air traffic control, and a Congested Area Plan, pursuant to FAA regulations.	Transportation Management Plan.		
Impact TRANS-1 Impact TRANS-3 Impact TRANS-5 Impact TRANS-6	**BMP TT-03: Public Access, Marking, and Public Information for Closed Access.** The BLM would determine if new access routes would be retained for public access through approval of the Access Plan for the Project. If any routes of travel are not accessible and/or closed, Carsonite posts and signing would note the closures. Where routes are closed, kiosks with information panels would be posted providing public information.	Review adequacy of and implementation of Access Plan.	Pre-construction Construction	The Applicant
Impact TRANS-1 Impact TRANS-3 Impact TRANS-5 Impact TRANS-6	**BMP TT-04: Access Plan.** An Access Plan would be required to identify all routes where new disturbance and/or cross-country travel is proposed. Existing access would be used to the maximum extent practicable; new access would only be created when there is no other reasonable or practicable means of access.	Review adequacy of and implementation of Access Plan.	Pre-construction	The Applicant
Impact TRANS-1 Impact TRANS-3 Impact TRANS-5 Impact TRANS-6	**BMP TT-05: Using Open and Designated Routes.** The Access Plan for the Project would maximize use of open and designated access routes to the extent practicable.	Review adequacy of Access Plan.	Pre-construction	The Applicant
Impact TRANS-1 Impact TRANS-3 Impact TRANS-5 Impact TRANS-6	**BMP TT-06: Access Roads in Dune Habitat.** Access Roads would be unpaved and constructed at grade in dune habitat. No berms or application of rock would be allowed on the California public lands portion of the Project. Should adaptive access measures be required, those measures would be formulated in concert with the BLM and contained in the Access Management Plan (Appendix 2B)	Confirm access roads in dune habitat are addressed in Access Management Plan.	Pre-construction Construction	The Applicant
Impact TRANS-1	**BMP TT-07: Routes of Travel.** Routes of travel for the Project on BLM-managed lands outside established roadways would be limited to those routes	Confirm implementation	Pre-construction	The Applicant

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
Impact TRANS-3 Impact TRANS-5 Impact TRANS-6	on the approved Access Plan.	of Access Plan.	Construction	
Impact TRANS-1 Impact TRANS-3 Impact TRANS-5 Impact TRANS-6	**BMP TT-08: Prohibit Cross-Country Vehicle Use Outside Designated Work Areas.** Within Project boundaries, prohibit cross- country vehicle and equipment use outside of approved designated work areas to prevent unnecessary ground and vegetation disturbance.	Ensure cross-country vehicle use outside of the wok area is prohibited.	Construction	The Applicant
Impact TRANS-1 Impact TRANS-3 Impact TRANS-5 Impact TRANS-6	**BMP TT-09: Repairs to Local Roads.** Local roads would be restored if road damage occurred as a result of Project construction.	Confirm local roads restored.	Post-construction	The Applicant
Impact TRANS-1 Impact TRANS-3 Impact TRANS-5 Impact TRANS-6	MM TRANS-CEQA-1 Implement Noise Applicant Proposed Measures and Best Management Practices. The APMs and BLM BMPs in Sections 2.17.2 and 2.17.3 above provide a suite of measures, practices, and actions that shall be implemented as part of the Project. APMs and BMPs shall be implemented prior to, or during all ground disturbance and construction related activities to avoid or minimize Project related impacts to recreation. These APMs, BMPs, and CMAs include; APM TT-01, APM TT-02, APM TT-03, APM TT-04, BMP TT-05, BMP TT-06, BMP TT-07, BMP TT-08, BMP TT-09. If an APM or BMP is subjective, such as containing text that states; “where appropriate,” “where applicable,” “where feasible,” or similar language, the BLM and CPUC shall be consulted to determine the applicability of each	The Applicant shall develop a weekly report that shall include all applicable APMs, BMPs, and CMAs and the related actions taken in order to be in compliance with these measures. These weekly reports shall be compiled and submitted to the BLM and CPUC monthly.	APMs, BMPs, and CMAs shall be implemented throughout construction activities.	The Applicant shall ensure that all APMs, BMPs, and CMAs are implemented during construction. If an APM, BMP, or CMA is subjective, the Applicant shall consult with the BLM and/or the CPUC to determine

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
	measure prior to the disturbance of a covered resource. Compliance with APMs and BMPs shall be documented, and a weekly report shall be provided to the BLM and CPUC. The Applicant shall provide a synopsis of the weekly reports to the BLM and CPUC monthly. The report shall include a summary of the construction activities completed, a list of compliance actions and any remedial actions taken to correct any actions, and the status of ongoing mitigation efforts. For those instances (only) where an APM and/or BMP conflicts, or does not meet required specificity pursuant to CEQA, the following BMPs have been modified to meet CEQA requirements: **APM TT-01: Traffic Coordination.** See MM TRANS-CEQA-2 below for the Traffic, Transportation, and Access Management Plan. **BMP TT-03: Public Access, Marking, and Public Information for Closed Access.** See MM TRANS-CEQA-2 below for the Traffic, Transportation, and Access Management Plan. **BMP TT-04: Access Plan.** See MM TRANS-CEQA-2 below for the Traffic, Transportation, and Access Management Plan. **BMP TT-05: Using Open and Designated Routes.** See MM TRANS-CEQA-2 below for the Traffic, Transportation, and Access Management Plan. **BMP TT-06: Access Roads in Dune Habitat.** See MM TRANS-CEQA-2 below for the Traffic, Transportation, and Access Management Plan. **BMP TT-07: Routes of Travel.** See MM TRANS-CEQA-2 below for the Traffic, Transportation, and Access Management Plan. **BMP TT-09: Repairs to Local Roads.** Repairs to local roads would occur in compliance with the Traffic, Transportation, and Access Management Plan developed and implemented for the Project (See MM TRANS-CEQA-			the applicability of each measure.

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
	2 below). Standards for Success: Compliance with all applicable APMs, BMPS, and CMAs is achieved throughout construction of the Project.			
Impact TRANS-1 Impact TRANS-5 Impact TRANS-6	MM TRANS CEQA-2 Traffic, Transportation, and Access Management Plan. The Applicant shall develop a Traffic, Transportation, and Access Management Plan at least 30-days prior to the start of construction and work with the BLM and Riverside County to prepare and implement the Plan for roadways adjacent to and directly affected by the proposed Project facilities. The Traffic, Transportation, and Access Management Plan shall be submitted to the BLM and the County for approval prior to the start of ground disturbing activities and issuance of a County grading permit. The Traffic, Transportation, and Access Management Plan shall be implemented by the Applicant throughout all construction activities. The Traffic, Transportation, and Access Management Plan shall include, but not limited to, the following requirements: The Traffic, Transportation, and Access Management Plan shall conform to Part 6 (Temporary Traffic Control) of the California Manual on Uniform Traffic Control Devices; Identify truck routes designated by Riverside County and local jurisdictions haul routes that minimize truck traffic on local roadways; Provide sufficient-sized staging areas for trucks accessing work zones to minimize disruption of access to adjacent public right-of-was Scheduling truck trips outside the peak morning and evening commute hours; Storing all equipment and materials in designated contractor staging areas	The Applicant shall monitor construction transportation and access to ensure that the Traffic, Transportation, and Access Management Plan is implemented successfully as documented in inspection logs.	The Traffic, Transportation, and Access Management Plan shall be prepared at least 30-days prior to the start of construction and shall be implemented throughout all construction activities.	The Applicant shall be responsible for ensuring that the Traffic, Transportation, and Access Management Plan is prepared and implemented throughout construction activities.

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
	on or adjacent to the worksite, such that traffic obstruction is minimized; Implementing roadside safety protocols including advance "Road Wok Ahead" warning and speed control signs which shall be posted to reduce and provide safe traffic flow through the work zone; Providing advance notification to administrators of police and fire stations (including fire protection agencies), ambulance service providers, and recreational facility managers of the timing, location, and duration of construction activities and the locations of detours and lane closures. Maintain access for emergency vehicles within, and/or adjacent to roadways affected by construction activities at all times; Repairing and restoring adversely affected roadway pavements to their pre-construction condition; Damage will be documented by the Project Applicant and the applicable jurisdiction (i.e. Caltrans, County, or individual) will be notified within 24 hours. The Applicant will work with the jurisdiction affected and will repair the damage within 30 days. Coordination of individual traffic plans for the Project and nearby Projects; Coordination between the contractor and Riverside County in developing circulation and detour plans that include safety features (e.g. signage and flaggers). The circulation and detour plans shall address: Full and partial roadway closures; Circulation and detour plans to include the use of signage and flagging to guide vehicles through and/or around the construction zone, as well as any temporary traffic control devices; Bicycle detour plans, where applicable;			

IMPACT	APPLICANT PROPOSED MEASURE (APM), BEST MANAGEMENT PRACTICE (BMP), CONSERVATION AND MANAGEMENT ACTION (CMA), OR MITIGATION MEASURE (MM)	MONITORING REQUIREMENTS	TIMING	RESPONSIBLE AGENCY
	Parking along arterial and local roadways; and Haul routes for construction trucks and staging areas for instances when multiple trucks arrive at the work sites. • Protocols for updating the Traffic, Transportation, and Access Management Plan to account for delays or changes in the schedules of individual projects The Traffic, Transportation, and Access Management Plan shall incorporate an access road siting and management plan, Congested Area Plan (pursuant to FAA regulations and APM TT-01), and a transportation plan for the transport and transmission tower components and equipment. Standards for Success: Traffic flow remains at acceptable levels, emergency access remains possible at all times, the public is reasonably notified of any road closures, delays, or lane restrictions, and the Project area remains in compliance with all applicable transportation goals, policies, and requirements.

2.1 INTRODUCTION

See Chapter 2.

2.2 PROPOSED ACTION AND ALTERNATIVES

2.2.1 ROW Actions

See Chapter 2.

2.2.2 Proposed Action

Table 2.2-1 provides descriptions of the individual Proposed Action segments.

Table 2.2-1 Proposed Action Segment Descriptions

SEGMENT NAME	DESCRIPTION	JURISDICTION MILES	TOTAL LENGTH
p-01	Begins at the Delaney Substation, heads north across I-10 and the Central Arizona Project (CAP), then heads generally west, crossing the CAP again and then paralleling the CAP, turning southwest, and crossing I-10 again. Crosses BLM-administered land, ASLD-managed land (Arizona state trust), and privately-owned land. Located within a utility corridor on BLM-administered land, skirts southern end of the Big Horn Mountains Wilderness Area.	BLM - 12.6 Private – 9.4 AZ State Trust – 4.7	26.7
p-02	From Segment p-01, heads southwest, across privately owned and Arizona state trust land.	Private – 0.5 AZ State Trust - 0.5	1.0
p-03	From Segment p-02, segment heads southwest across Arizona state trust and BLM-administered land within a utility corridor.	AZ State Trust – 1.1 BLM – 1.0	2.1
p-04	From Segment p-03, heads generally west through Arizona state trust and BLM-administered land, just north of Eagletail Mountains Wilderness Area.	BLM - 5.0 AZ State Trust – 0.5	5.5
p-05	From Segment p-04, segment continues generally west through BLM-administered land within a utility corridor.	BLM – 2.0	2.0
p-06	From Segment p-05, this segment continues generally west through BLM-administered land and then through the Kofa NWR. The segment is within a utility corridor on BLM-administered land that borders the Plomosa and New Water Mountains to the north and the Kofa Mountains to the south. It crosses through the northern portion of the Kofa National Wildlife Refuge (NWR).	BLM – 10.8 USFWS – 24.9	35.7

SEGMENT NAME	DESCRIPTION	JURISDICTION MILES	TOTAL LENGTH
p-07	From Segment p-06, this segment crosses BLM-administered land within a utility corridor, west of the Kofa NWR, heads west-northwest towards SR 95.	BLM – 2.2	2.2
p-08	From Segment p-07, heads west-northwest to and across SR 95 on BLM-administered land south of the BLM's La Posa Long Term Visitor Area (LTVA).	BLM – 0.6	0.6
p-09	From Segment p-08, heads west-northwest across SR 95 and through BLM-administered land within a utility corridor south of the BLM's LTVA; then aerially crosses the northeast corner and passes to the north of the Yuma Proving Ground (YPG).	BLM – 6.7 DOD – 0.2	6.9
p-10	From Segment p-09, traverses through BLM-administered land southeast of Copper Bottom Pass, which is narrow and contains steep rocky terrain.	BLM – 1.1	1.1
p-11	From Segment p-10, follows Copper Bottom Pass, southwest and upslope from the existing Devers to Palo Verde 500kV No. 1 (DPV1) line crossing BLM- and Reclamation-managed lands and within a utility corridor on BLM-administered land	BLM – 4.0 Reclamation – 0.1	4.1
p-12	From Segment p-11, heads southwest from Copper Bottom Pass through BLM- and Reclamation-managed lands.	Reclamation – 1.4 BLM – 1.1	2.5
p-13	From Segment p-12, heads southwest through BLM-administered land.	BLM – 3.5	3.5
p-14	From Segment p-13, heads southwest crossing BLM-administered land.	BLM – 0.9	0.9
p-15e	From Segment p-14, heads west-southwest through BLM-administered land and Arizona state trust land, then ends at the Colorado River.	BLM – 1.5 AZ State Trust – 1.3	2.8
p-15w	From Segment p-15e and the Colorado River, heads west. California State Lands Commission administers land submerged by the Colorado River; Colorado River itself is controlled by the State Water Resources Control Board (SWRCB) with Federal oversight.	Private – 6.6	6.6
p-16	From Segment p-15w, heads west across private agricultural land, up the bluff at the edge of the Colorado River floodplain, then onto BLM-administered land, turning northwest for a short distance.	Private – 4.2 BLM – 0.4	4.6

SEGMENT NAME	DESCRIPTION	JURISDICTION MILES	TOTAL LENGTH
p-17	From Segment p-16, heads northwest across a combination of BLM-administered land and private land along the southwest boundary of the Desert Quartzite Project. Would parallel the southwestern boundary of the proposed Desert Quartzite LLC solar facility.	Private – 0.8 BLM – 2.3	3.1
p-18	From Segment p-17, heads generally northwest toward the SCE Colorado River Substation southwest of Blythe, where it terminates. Crosses a combination of BLM-administered land and undeveloped private land. Would cross the proposed Bright Source Energy Sonoran West and Crimson Solar Facility.	Private – 1.6 BLM – 0.8	2.4

AZ = Arizona; CA = California

2.2.2.1 Amendment of the Yuma RMP

See Chapter 2.

2.2.2.2 Amendment of the CDCA Plan

See Chapter 2.

2.2.3 Alternatives and Subalternatives

Alternatives to the Proposed Action take the form of assorted segments within the Project Area that could be assembled to form a number of complete routes between the Delaney and Colorado River substations. In order to effectively evaluate route alternatives, the Action Alternative routes are divided where route segments intersect. Segments are generally numbered numerically east to west from the APS Delaney Substation to the SCE Colorado River Substation; north-south interconnects are generally numbered from north to south. A total of 45 Action Alternative segments were identified, in addition to the 19 Proposed Action segments in the Project Area. Alternative segments to the Proposed Action segments are identified as follows:

- The APS Delaney Substation segment carries the letter “d”;
- I-10 segments carry the letter “i”;
- The segment north of I-10 carries the letters “in”;
- Segments north of Quartzsite carry the letters “qn”;
- Segments south of Quartzsite carry the letters “qs”;
- Segments through the Copper Bottom Pass area carry the letters “cb”;
- East-west segments in California carry the letters “ca”;
- Cross connectors providing north-south connections roughly between the Proposed Action and east-west alternative segments carry the letter “x”; and

- Segments that break across the Colorado River carry the same segment numbering but are identified as “east” and “west”.

In addition, the route alternative segments were sited to address issues raised by land management agencies, local government, individuals, and organizations.

The following considerations were used to further evaluate alternatives:

- Would the alternative segment meet the underlying Project stated objectives for the proposed Project?
- Is the alternative segment consistent with the policy objectives for the management of the area (e.g., in conformance with land use plans) and if not, would an amendment be required?
- Is the alternative segment substantially similar in design or does it have substantially similar effects as an alternative segment that is already being analyzed?
- Would the alternative segment address and resolve resource conflicts and/or identified issues?
- Would the alternative segment cause fewer adverse environmental effects (fewer detrimental effects, less severe effects, or shorter-term effects) than the proposed route for at least some resources?

The Project Area is divided into four zones, where the segments within each zone are geographically similar and could be alternatives to each other:

- East Plains and Kofa Zone
- Quartzsite Zone
- Copper Bottom Zone
- Colorado River and California Zone

Zones were established based on the relationship of alternative segments to each other, geography, common resource issues, and interconnection points. By delineating zones, existing conditions and impacts common to all segments within a zone can be identified and then conditions and impacts specific to each zone and alternative segment can be identified. Alternative segments in a zone are alternatives to each other and can be organized into alternative routes through the zone. Alternative routes (usually made up of more than one segment) in each zone can then be connected with routes in other zones to form complete alternative routes for the Project.

All alternative segments carried forward for detailed analysis were found to meet the underlying Project stated objectives for the Project and to be consistent with the policy objectives for the management of the area. While many of the alternative segments were determined to address and resolve resources conflicts and/or identified issues, a number of alternative segments are being carried forward for detailed analysis to provide a broad range of available alternatives, should analysis in the EIS or other factors render some alternative segments infeasible.

Table 2.2-2 provides alternative segment descriptions by zone.

Table 2.2-2 Alternative Segment Descriptions

SEGMENT	DESCRIPTION	ALTERNATIVE TO	BENEFIT	JURISDICTION MILES	TOTAL LENGTH (MILES)
East Plains and Kofa Zone					
d-01	Leaving APS Delaney Substation, goes directly west through Arizona state trust and private land then turns northwest to parallel the Kinder Morgan natural gas line located in Arizona State land and within a utility corridor on BLM-administered land until it intersects with the Proposed Action.	p-01, p-02, and p-03	Avoids two crossings of I-10 and the CAP and joins with a utility corridor on BLM managed lands.	Private – 14.8 BLM – 7.3 Arizona State Trust – 3.1	25.2
i-01	From the intersection of Segments p-01 and p-02, heads west-northwest and parallels I-10 to the south, as it traverses private and Arizona state trust land, crossing the CAP two times. Portions would be within a utility corridor on BLM managed lands.	p-02, p-03, and a portion of p-04	In conjunction with other segments would avoid Segment p-06 crossing the Kofa NWR; and could be assembled with other segments to constitute a route within BLM utility corridors.	Arizona State Trust – 5.3 Private – 2.8 Reclamation – 0.1 BLM – 0.1	8.3
i-02	From the intersection of Segments i-01 and x-01, heads west-northwest and parallels I-10 to the south, as it traverses BLM-administered land, and would be wholly within utility corridors.	p-04, p-05	In conjunction with other segments would avoid Segment p-06 crossing the Kofa NWR; and could be assembled with other segments to constitute a route within BLM utility corridors.	BLM – 3.3	3.3
i-03	From the intersection of Segments i-02 and x-03, heads west-northwest and parallels I-10 to the south, as it traverses BLM-administered, private, and Arizona state trust land, crossing the CAP twice at the eastern end of the segment. It is wholly within utility corridors on BLM-administered land.	A portion of p-06 and x-04	In conjunction with other segments would avoid Segment p-06 crossing the Kofa NWR; and could be assembled with other segments to constitute a route within BLM utility corridors.	BLM –12.2 Arizona State Trust – 6.2 Private – 1.5	19.9

SEGMENT	DESCRIPTION	ALTERNATIVE TO	BENEFIT	JURISDICTION MILES	TOTAL LENGTH (MILES)
i-04	From the intersection of Segments i-03, x-04, and in-01, heads west-northwest and then generally due west as it parallels I-10 to the south, as it traverses BLM-administered land, it is wholly within utility corridors.	A portion of p-06 and in-01	In conjunction with other segments would avoid Segment p-06 crossing the Kofa NWR; and could be assembled with other segments to constitute a route within BLM utility corridors.	BLM – 10.5	10.5
in-01	From the intersection with Segments i-03 and i-04, in-01 would cross to the north side of and parallel I-10 on BLM-administered land within utility corridors.	i-04 and i-05	Would locate the transmission line north of I-10 protecting dominant scenic views of the New Water Mountain Wilderness and Kofa NWR to the south.	BLM – 13.9	13.9
x-01	From the intersection with Segment p-02, heads west then northwest paralleling the CAP to the south, ending just south of I-10. Crosses BLM-administered land and Arizona state Trust land. Within utility corridors on BLM managed lands at either end.	p-03 and p-04, i-01	Would follow the CAP and consolidate disturbance and avoid CAP crossings by Segment i-01. Would place the route farther away from the Eagletail Mountains Wilderness Area.	Arizona State Trust – 3.7 BLM – 1.0	4.7
x-02a	From the intersection with Segments i-01 and i-02, heads southeast crossing Arizona state trust land and a small portion of BLM-administered land. Not within a utility corridor.	p-04	In conjunction with a portion of Segment x-01, would provide an alternative cross-connection between the Proposed Action or Segment d-01 and segments within BLM utility corridors and avoids Segment p-06 crossing the Kofa NWR.	Arizona State Trust – 3.2 BLM – 0.1	3.2

SEGMENT	DESCRIPTION	ALTERNATIVE TO	BENEFIT	JURISDICTION MILES	TOTAL LENGTH (MILES)
x-02b	From the intersection with Segments p-03, d-01, and p-04, heads northwest crossing BLM-administered and Arizona state trust land. Begins within a utility corridor on BLM managed lands, but primarily occurs outside of one.	p-04	In conjunction with Segment x-02a, would provide an alternative cross-connection between the Proposed Action or Segment d-01 and segments within BLM utility corridors and avoids Segment p-06 crossing the Kofa NWR.	Arizona State Trust – 2.6 BLM – 0.8	3.4
x-03	From the intersection of Segments p-04 and p-05, heads northwest through BLM-administered land, terminating south of I-10. Begins and ends within utility corridors, but primarily outside of them.	x-01, x-02a, x-02b, and x-04	Would provide an alternative cross-connection between the Proposed Action and segments within BLM utility corridors and avoids Segment p-06 crossing the Kofa NWR.	BLM – 5.6	5.6
x-04	From the intersection with Segments p-05 and p-06, heads northwest through primarily BLM-administered land, terminating south of I-10. Begins and ends within utility corridors, but primarily outside of them. Crosses through a parcel of Arizona state trust land and the proposed Arizona Peace Trail.	x-01 through 03, i-03, and a portion of p-06	Would provide an alternative cross-connection between the Proposed Action and segments within BLM utility corridors and avoids Segment p-06 crossing the Kofa NWR in conjunction with other segments.	BLM – 21.6 Arizona State Trust – 1.1	22.7
Quartzsite Zone					
i-05	From the intersection of Segments i-04 and x-05, heads generally west and parallels I-10 to the south, as it traverses BLM-administered land, it is wholly within utility corridors.	p-07	In conjunction with other segments, could be assembled to constitute a route almost entirely within BLM utility corridors.	BLM – 2.8	2.8

SEGMENT	DESCRIPTION	ALTERNATIVE TO	BENEFIT	JURISDICTION MILES	TOTAL LENGTH (MILES)
qn-01	Segment that crosses I-10 at the intersection of Segments i-05 and qs-01, and in-01 and qn-02; within utility corridors, solely within BLM-administered land.	North-south portion of in-01	Would follow the existing WAPA 161kV transmission line and allow Segment in-01 to connect to Segment x-06 to avoid Quartzsite and generally parallel SR 95; or to segment qs-01 to skirt the south side of Quartzsite. Would also allow Segment i-05 to connect to Segment qn-02 to skirt Quartzsite on the north.	BLM – 0.6	0.6
qn-02	From the intersection with in-01 and qn-01, skirts to the north of Quartzsite, by traveling north, then west, then southwest. Crosses SR 95 and a utility corridor, and crosses I-10 at its western end. It begins and ends within utility corridors but is mostly outside them. Primarily within BLM-administered land but is within Arizona state trust land just west of the SR 95 crossing.	qs-01, qs-02, p-08, and p-09	Would skirt Quartzsite to the north by following the existing Western/ San Diego Gas & Electric (SDG&E) 161kV transmission line on the east and north. Avoids impacts to the northern portion of the LTVA (Segments qs-01 and qs-02).	BLM – 9.8 Arizona State Trust – 1.0	10.8

SEGMENT	DESCRIPTION	ALTERNATIVE TO	BENEFIT	JURISDICTION MILES	TOTAL LENGTH (MILES)
qs-01	From the intersection of i-05, qn-01, and x-06, heads slightly southwest of Quartzsite and within the extreme northern portion of the LTVA, ending at SR 95, within BLM-administered land. Partly within a BLM designated utility corridor.	p-08, qn-02	Would avoid Quartzsite by skirting to the southeast following the existing Western/SDG&E 161kV transmission line. In conjunction with qs-02, would be shorter than Segments qn-01 and qn-02. In addition to skirting Quartzsite, would allow a southern connection down to the Proposed Action or continue an east-west route south of I-10 within BLM utility corridors.	BLM – 3.1	3.1
qs-02	Heads slightly southwest of Quartzsite and within the extreme northwestern portion of the LTVA, beginning at SR 95, within BLM-administered land. Just south of I-10 turns westerly to parallel the south side of I-10. Partly within utility corridors on BLM managed lands. Western portion parallels I-10 to the south.	Portions of p-09 and qn-02	Would avoid Quartzsite by skirting to the southwest, generally following an existing pipeline route; but also skirting south of Q Mountain.	BLM – 4.8	4.8
x-05	From the intersection of Segments p-06 and p-07, heads north-northeast through BLM-administered land, east of the LTVA. Begins and ends within utility corridors but the segment is primarily outside of them.	x-06	Would provide an alternative cross-connection between the Proposed Action and segments within BLM utility corridors; avoids Segment p-06 crossing the Kofa NWR, Quartzsite, and the LTVA in conjunction with other segments.	BLM – 10.2	10.2

SEGMENT	DESCRIPTION	ALTERNATIVE TO	BENEFIT	JURISDICTION MILES	TOTAL LENGTH (MILES)
x-06	From the intersection of Segments p-07 and p-08, heads north-northeast through BLM-administered land, on the eastern boundary of the LTVA. Begins and ends within utility corridors but the segment is primarily outside of them.	x-05 and x-07	Would provide an alternative cross-connection between the Proposed Action and segments within BLM utility corridors; avoids Segment p-06 crossing the Kofa NWR, Quartzsite, and the LTVA in conjunction with other segments.	BLM – 9.2	9.2
x-07	From the intersection with p-08 and p-09, heads due north along SR 95, through a utility corridor on BLM-administered land.	x-05 and x-06	Would provide an alternative cross-connection between the Proposed Action and segments within BLM utility corridors; avoids Segment p-06 crossing the Kofa NWR. Would follow the existing Western/ SDG&E 161kV transmission line east of SR 95.	BLM – 7.7	7.7
Copper Bottom Zone					
cb-01	From the intersection of Segments p-09 and p-10, exits the utility corridor then turns west-northwest across BLM-administered land overtop Cunningham Peak near an existing communications site.	In conjunction with other segments, p-10, p-11, p-12, cb-02, and cb-03	Together with other segments, would avoid Copper Bottom Pass, as well as Segment cb-02 through Johnson Canyon.	BLM – 3.2	3.2
cb-02	From the intersection of Segments p-10 and p-11, exits the utility corridor, heads west-southwest through Johnson Canyon and the proposed Arizona Peace Trail. All within BLM-administered land.	In conjunction with other segments, p-11, cb-01, and cb-03	Together with other segments, would avoid Copper Bottom Pass, as well as Segment cb-01 over Cunningham Peak.	BLM – 2.2	2.2

SEGMENT	DESCRIPTION	ALTERNATIVE TO	BENEFIT	JURISDICTION MILES	TOTAL LENGTH (MILES)
cb-03	From the intersection of Segments p-10 and cb-02, heads northwest through Copper Bottom Pass, generally parallel to Segment p-11. Crosses BLM- and Reclamation-managed lands and CRIT land.	p-11	Would be within a utility corridor on BLM-administered land and partially within utility corridors. Would provide the needed separation from the existing DPV1 line, allowing compliance with CAISO requirements without requiring construction upslope of the existing DPV1.	BLM – 2.2 CRIT – 2.0 Reclamation – 0.1	4.3
cb-04	From the intersection of Segments cb-01 and cb-02, heads southwest through primarily BLM-administered land, ending in Reclamation-managed land.	In conjunction with portions of p-11, p-12, and cb-03	Together with other segments avoids Copper Bottom Pass and crossing CRIT land.	BLM – 1.7 Reclamation – 0.2	1.9
cb-05	From the intersection of Segments cb-04 and cb-06, begins in Reclamation-managed land, heads southwest through BLM-administered land then turns west to avoid interference with the YPG. Crosses the proposed Arizona Peace Trail and ends within a utility corridor on BLM managed lands.	p-13	Together with other segments avoids Copper Bottom Pass and interference with the YPG. While the segment would cross the proposed Arizona Peace Trail, it would avoid following the trail along Segment p-13.	BLM – 3.9 Reclamation – 0.5	4.4
cb-06	From the intersection of Segments cb-04 and cb-05, begins in Reclamation-managed land, heads northwest through BLM-administered land then turns slightly northwest to where it intersects with the Proposed Action. Ends within a utility corridor on BLM-administered land.	In conjunction with other segments, p-11, p-12, cb-03	Together with other segments avoids Copper Bottom Pass and crossing CRIT land.	BLM – 1.3 Reclamation – 0.6	1.9

SEGMENT	DESCRIPTION	ALTERNATIVE TO	BENEFIT	JURISDICTION MILES	TOTAL LENGTH (MILES)
i-06	From the intersection with qs-02 and qn-02, heads slightly southwest and parallels I-10 to the south as it traverses BLM- and Reclamation-managed land, CRIT, and Arizona state trust land. It is within a BLM utility corridor.	p-09 through 11; cb-01 through 03	In conjunction with other segments would avoid Copper Bottom Pass, Johnson Canyon, and Cunningham Peak; and could be assembled with other segments to constitute a route almost fully within BLM utility corridors.	BLM – 3.9 Arizona State Trust – 1.7 CRIT – 1.4 Reclamation – 0.2	7.2
i-07	From the intersection with Segments i-06 and x-08, heads southwest toward the Colorado River and parallels I-10 to the south as it traverses Reclamation-managed land and Arizona state trust land.	p-12 through 14; and portions of p-15e and cb-10	Could be assembled with other segments to constitute a route almost fully within BLM utility corridors.	Reclamation – 5.1 Arizona State Trust – 1.2	6.3
x-08	From the intersection with Segments p-11, p-12, and cb-03, heads north-northwest to connect to the alternative segments paralleling I-10 within BLM utility corridors at the junction of Segments i-06 and i-07. Crosses Reclamation-managed land.	x-05, x-06, and x-07	Would provide an alternative cross-connection between the Proposed Action and segments within BLM utility corridors; could avoid Copper Bottom Pass, Johnson Canyon, or CRIT land in conjunction with other segments.	Reclamation – 1.3	1.3
Colorado River and California Zone					
cb-10	From Segment p-14, heads west through BLM-administered land and Arizona state trust land, then ends at the Colorado River.	A portion of p-15e	Offers an alternative to the Proposed Action to connect to a more northern east-west route comprised of Segment ca-01. This segment includes land submerged by the Colorado River.	Arizona State Trust – 1.0 BLM – 0.9	1.9

SEGMENT	DESCRIPTION	ALTERNATIVE TO	BENEFIT	JURISDICTION MILES	TOTAL LENGTH (MILES)
i-08s	From the intersection with Segment i-07, heads west crossing Reclamation-managed land, Arizona state trust land that is farmed, and ends at the Colorado River.	p-15e and cb-10	Would avoid the Colorado River floodplain in proximity to the I-10 crossing where the western bank of the river is heavily developed, while also avoiding the backwater areas that are important to endangered fish species.	Reclamation – 0.9 Private – 0.2 Arizona State Trust – 0.2	1.3
ca-01	From the intersection of Segments x-10 and x-11, heads west across private agricultural land following an existing canal and two-track.	p-15w and ca-05	Offers an alternative to the Proposed Action crossing agricultural land that would not impact residences or other structures (as compared to Segment ca-05).	Private – 6.7	6.7
ca-02	From the intersection of Segments x-12 and x-13, headed west crossing private agricultural land following an existing canal, until reaching the western edge of the Colorado River floodplain, then continued west, ascending a bluff onto BLM-administered land.	p-16, ca-06, and i-09b	Mostly follows existing canal, until ascending a bluff onto BLM-administered land. Would be partially within a utility corridor and extend the ca-01 route west, as a shorter alternative to that portion of the Proposed Action route.	Private – 2.8 BLM – 0.6	3.4
ca-04	From the intersection with Segment i-08s, heads west crossing private land that is farmed.	p-15e and cb-10	Would avoid the Colorado River floodplain in proximity to the I-10 crossing where the western bank of the river is heavily developed, while also avoiding the backwater areas that are important to endangered fish species.	Private – 0.4	0.4

SEGMENT	DESCRIPTION	ALTERNATIVE TO	BENEFIT	JURISDICTION MILES	TOTAL LENGTH (MILES)
ca-05	From the intersection of Segments x-09 and x-10, heads west across private agricultural land interspersed with residences along Seeley Road.	ca-01 and a portion of p-15w	Offers an east-west route across private land that, in conjunction with other segments, could provide a route within BLM utility corridors south of I-10 avoiding Blythe.	Private – 6.6	6.6
ca-06	From the intersection of Segments ca-05 and x-12, heads west across private agricultural land interspersed with residences along Seeley Road, entering BLM-administered land on the western end. Crosses the approved Blythe Mesa Solar Project.	p-16	Offers an east-west route across private land that, in conjunction with other segments, could provide BLM utility corridor route south of I-10 avoiding Blythe.	Private – 2.6 BLM – 0.2	2.8
ca-07	From its intersection with Segment x-15, heads northwest then west crossing primarily BLM-administered land along a BLM utility corridor southern boundary, then bends west-northwest to connect at the intersection with Segment ca-09.	Portion of p-17	Offers an east-west route that, in conjunction with other segments, could provide a route within BLM utility corridors south of I-10 avoiding Blythe.	BLM – 2.5 Private – 0.5	3.0
ca-09	From the intersection with Segment ca-07, heads west along BLM-administered land in BLM utility corridors and alongside the proposed Desert Quartzite Solar Project. It is also adjacent to the south edge of the existing Blythe Mesa Solar Project.	Portions of p-17 and p-18	Offers an east-west route that extends the Seeley Road route west to connect at the substation within the southern boundary of a BLM utility corridor.	BLM – 1.6 Private – 1.0	2.6

SEGMENT	DESCRIPTION	ALTERNATIVE TO	BENEFIT	JURISDICTION MILES	TOTAL LENGTH (MILES)
x-09	From the intersection with Segment ca-04, heads south through private, rural agricultural land west of the Colorado River. Not in utility corridors.	Portion of x-11	Would connect segments i-08 or ca-04 within a BLM utility corridor route to other east-west alignments south of I-10.	Private – 0.8	0.8
x-10	From the intersection with Segments x-09 and ca-05, heads south through private agricultural land west of the Colorado River. Not in utility corridors.	x-12, x-15, and p-18	Would connect Segment x-09 with Segments x-11 and cb-10, allowing a BLM utility corridor route along I-10 to connect down to other east-west routes, avoiding Blythe or Copper Bottom Pass.	Private – 1.3	1.3
x-11	From the intersection with Segment cb-10, heads north, then northwest through rural agricultural land.	A portion of p-15e	Offers an alternative to the Proposed Action to connect to a more northern east-west route comprised of Segment ca-01.	Private – 2.1	2.1
x-12	From the intersection with Segments ca-05 and ca-06, heads south from the 14th Avenue alignment across private agricultural land west of SR 78, then heads south following a canal and two-track crossing private land.	x-10, x-15, and portions of p-17 and p-18	Would connect the east-west route comprised of ca-01 north to segments that would comprise a BLM utility corridor route. It would avoid cultural resources potentially along x-15, x-16 or p-17 and p-18; and connect south to other east-west segments.	Private – 1.3	1.3
x-13	From the intersection with x-12 and ca-01, heads south generally following a canal and two-track crossing private land.	cb-10, x-16, p-17	Would connect Proposed Action north to segments that would comprise a BLM utility corridor route; and avoid cultural resources potentially along x-15, x-16 or p-17 and p-18.	Private – 2.0	2.0

SEGMENT	DESCRIPTION	ALTERNATIVE TO	BENEFIT	JURISDICTION MILES	TOTAL LENGTH (MILES)
x-15	From the intersection with ca-06 and ca-07, heads southwest across BLM-administered land a utility corridor.	x-12 and p-18	Would provide a cross-connection between the Seeley Road alignment and other east-west routes south of Blythe that would follow or possibly be within a utility corridor. Avoids cultural resources along p-17 and p-18.	BLM – 1.4	1.4
x-16	From the intersection with Segment x-15 and ca-02, heads southwest across BLM-administered and private land within a utility corridor and intersects with Segment p-16. It forms the southeastern boundary of the approved Desert Quartzite solar project.	x-13 and p-17	Would provide a cross-connection between the east-west canal alignment (ca-01 through 03) and other east-west routes south of Blythe that would follow or possibly be within a BLM utility corridor. Avoids cultural resources along p-17 and p-18.	BLM – 2.0 Private – 0.3	2.3
x-19	From Segment ca-09, heads south along BLM-administered land starting at the southern edge of a BLM utility corridor and, continuing southwest past the Colorado River Substation, then turning west to connect with the Proposed Action route along Segment p-18, to enter and terminate at the southern end of the SCE Colorado River Substation. Crosses the approved Bright Source Energy Sonoran West Crimson Solar Facility.	Portion of x-15	Would connect the east-west route either immediately south of I-10 along the 14th Avenue alignment or the Seeley Road alignment to the SCE Colorado River Substation.	BLM – 1.0	1.0

2.2.3.1 Alternative 1: I-10 Route

Figures 2.2-1 through 2.2-3 (Appendix 7) show the five subalternatives to Alternative 1.

Alternative 1 would include the segments listed in Table 2.2-3.

Table 2.2-3 Alternative 1 Segments

SEGMENT TYPE	EAST PLAINS AND KOFA ZONE	QUARTZSITE ZONE	COPPER BOTTOM ZONE	COLORADO RIVER AND CALIFORNIA ZONE
Proposed	p-01	None	None	None
Alternative	i-01 through i-04	i-05, qs-01 and qs-02	i-06 and i-07	i-08s, ca-04. ca-05, ca-06, ca-07, ca-09, x-09 and x-19

The following subalternatives (Table 2.2-4) would also meet the objectives of Alternative 1.

Table 2.2-4 Subalternatives Under Alternative 1

SUBALTERNATIVE	SUBALTERNATIVE SEGMENTS	ALTERNATIVE ROUTE SEGMENTS REPLACED	ZONE
1A	p-02, p-03, x-02a and x-02b	i-01	East Plains and Kofa
1B	p-02, x-01, and x-02a	i-01	East Plains and Kofa
1C	in-01	i-04, i-05 (must be combined with 1D)	East Plains and Kofa
1D	qn-01	N/A (must be combined with 1C)	Quartzsite
1E	x-10, ca-01, and x-12	ca-05	Colorado River and California

Segment in-01 is the only segment located in the Lake Havasu FO. A portion of this segment crosses VRM Class II designated lands and would not conform to class objectives. An RMP amendment would be required to change the portion of this segment designated VRM Class II to Class IV within the BLM utility corridor crossing VRM Class II lands.

2.2.3.2 Alternative 2: BLM Utility Corridor Route

Figures 2.2-4 through 2.2-6 (Appendix 7) show the five subalternatives to Alternative 2. Alternative 2 would include the segments listed in Table 2.2-5.

Table 2.2-5 Alternative 2 Segments

SEGMENT TYPE	EAST PLAINS AND KOFA ZONE	QUARTZSITE ZONE	COPPER BOTTOM ZONE	COLORADO RIVER AND CALIFORNIA ZONE
Proposed	p-01	None	p-09 through p-14	p-15e, p-15w, p-16
Alternative	i-01 through i-04	i-05, qs-01, x-07	None	x-15 and x-16, ca-07, ca-09, x-19

The following subalternatives (Table 2.2-6) would also meet the objectives of Alternative 2, except Subalternative 2D would not avoid CRIT land.

Table 2.2-6 Subalternatives Under Alternative 2

SUBALTERNATIVE	SUBALTERNATIVE SEGMENTS	ALTERNATIVE ROUTE SEGMENTS REPLACED	ZONE
2A	d-01, x-02a, x-02b	p-01, i-01	East Plains and Kofa
2B	p-02, p-03, p-04, x-03	i-01, i-02	East Plains and Kofa
2C	cb-02, cb-04, cb-06	p-11, p-12	Copper Bottom
2D	cb-03	p-11	Copper Bottom
2E	x-13, ca-02	p-16, x-16	Colorado River and California

2.2.3.3 Alternative 3: Avoidance Route

Figures 2.2-7 through 2.2-10 (Appendix 7) show the twelve subalternatives to Alternative 3.

Alternative 3 would include the segments listed in Table 2.2-7.

Table 2.2-7 Alternative 3 Segments

SEGMENT TYPE	EAST PLAINS AND KOFA ZONE	QUARTZSITE ZONE	COPPER BOTTOM ZONE	COLORADO RIVER AND CALIFORNIA ZONE
Proposed	p-01 through p-04	p-07 and p-08	p-09 and p-14	None
Alternative	i-03 and i-04, x-03	x-05	cb-01, cb-04, cb-05	ca-01, ca-06, ca-07, ca-09; cb-10, x-11, x-12, x-19

The following subalternatives (Table 2.2-8) would also meet the objectives of Alternative 3.

Table 2.2-8 Subalternatives Under Alternative 3

SUBALTERNATIVE	SUBALTERNATIVE SEGMENTS	ALTERNATIVE ROUTE SEGMENTS REPLACED	ZONE
3A	d-01, x-02a, x-02b, and i-02	p-01, i-01	East Plains and Kofa
3B	i-01 and i-02	p-02, p-03, p-04, x-03	East Plains and Kofa
3C	p-05 and x-04	x-03, i-03	East Plains and Kofa
3D	in-01	i-04 (must be combined with 3F and 3G, or 3H)	East Plains and Kofa
3E	qs-01 and x-07	x-06 (must be combined with 3D and 3G or 3J)	Quartzsite
3F	x-06	x-05 (must be combined with 3D and 3G or 3J)	Quartzsite
3G	qn-01	N/A (must be combined with 3D, 3E, 3F, 3H, and/or 3J)	Quartzsite
3H	qn-02	N/A (must be combined with 3D and 3L)	Quartzsite
3J	i-05	N/A (must be combined with 3E, 3F, or 3G and 3H)	Quartzsite
3K	p-10 and cb-02	cb-01	Copper Bottom
3L	i-06, x-08, p-12, and p-13	p-09, p-10, p-11 (must be combined with 3D and 3H; or 3J, 3G and 3H)	Copper Bottom
3M	p-15e, p-15w, and x-13	cb-10, x-11, ca-01	Colorado River and California

2.2.3.4 Alternative 4: Public Lands Emphasis Route

Figures 2.2-11 through 2.2-14 (Appendix 7) show the fourteen subalternatives to Alternative 4.

Alternative 4 would include the segments listed in Table 2.2-9.

Table 2.2-9 Alternative 4 Segments

SEGMENT TYPE	EAST PLAINS AND KOFA ZONE	QUARTZSITE ZONE	COPPER BOTTOM ZONE	COLORADO RIVER AND CALIFORNIA ZONE
Proposed	p-04 and p-05	p-08	p-09, p-10, p-13, p-14	p-15e and p-15w
Alternative	d-01, in-01, x-04	qn-01, x-06	cb-02, cb-04, cb-06	ca-06, ca-07, ca-09; x-12, x-13, x-19

The following subalternatives (**Table 2.2-10**) would also meet the objectives of Alternative 4.

Table 2.2-10 Subalternatives Under Alternative 4

SUBALTERNATIVE	SUBALTERNATIVE SEGMENTS	ROUTE SEGMENTS REPLACED	ZONE
4A	p-01, p-02, and p-03	d-01	East Plains and Kofa
4B	x-03 and i-03	p-05, x-04	East Plains and Kofa
4C	i-04	N/A (must be combined with 4J or 4D)	East Plains and Kofa
4D	x-05 and p-07	i-05, x-06 (must be combined with 4C)	Quartzsite
4E	cb-01	p-10, cb-02	Copper Bottom
4F	cb-05	cb-06, p-13	Copper Bottom
4G	p-11 and p-12	cb-02, cb-04, cb-06	Copper Bottom
4H	x-08 and i-07	N/A (must be combined with p-11 and 4K)	Copper Bottom
4J	i-05	N/A (must be combined with 4C)	East Plains and Kofa
4K	i-08s, ca-04, x-09	N/A (must be combined with 4H and 4N)	Colorado River and California
4L	cb-10 and x-11	N/A (must be combined with 4M)	Colorado River and California
4M	ca-01	p-15w (must be combined with 4L)	Colorado River and California
4N	x-10	N/A (must be combined with 4H, 4K, and 4M)	Colorado River and California
4P	p-16, p-17, and p-18	x-13, x-12, ca-06, ca-07, ca-09, x-19	Colorado River and California

2.2.3.5 No Action Alternative

See Chapter 2.

2.2.4 Agency Preferred Alternative

Under the Agency Preferred Alternative, the BLM would approve a total of 79.5 miles of 200-foot wide ROW within existing designated utility corridors along the following segments:

- p-01
- i-01 through i-04
- x-05
- p-07 through p-16
- x-15 and x-16
- ca-07 and ca-09; and
- x-19.

Along the Agency Preferred Alternative route, self-supporting structures would be required for the following segments in areas of high OHV use where structures with guy lines would be replaced with self-supporting (no guy lines) four-legged tangent structures under MM-REC-02:

- i-04;
- x-05; and
- p-07 through p-13.

The Agency Preferred Alternative is comprised of segments to:

- Emphasize the use of BLM utility corridors;
- Place the transmission line approximately 1 mile east of the LTVA by utilizing Subalternative 4D, thus minimizing impacts to recreational users of the LTVA;
- Consolidate development and disturbance with existing disturbance, such as along portions of the already impacted DPV1 transmission line route and I-10 corridor;
- Avoid the Town of Quartzsite;
- Avoid the Kofa NWR;
- Avoid Johnson Canyon;
- Avoid the CRIT Reservation;
- Avoid the Ehrenberg Sandbowl area;
- Avoid residential and other development east and south of Blythe;
- Consolidate development along the existing DPV1 transmission line route across private lands in California;

- Avoid the culturally sensitive area in the vicinity of the Mule Mountains southwest of Blythe; and
- Minimize impacts to VRM Class II areas, as the majority of the route would cross VRM Class III & IV-designated BLM-administered public land.

2.2.5 Proposed Facilities, Infrastructure, and Construction

2.2.5.1 Preconstruction and Construction Activities Overview

Preconstruction Activities

DCRT intends to refine the design of the Project during the Federal and state approval processes. Final engineering surveys would determine the exact locations of structures, access roads, etc. prior to construction. Access roads and structure locations would be designed based on topographic information, aerial imagery, and other relevant information in order to reduce overall impacts to resources. Results of the pedestrian cultural survey, biological surveys, and visual impacts would also be considered when micrositing the Project structures. Technical and power system studies would determine items such as conductor sizes, substation arrangements, communications needs, and similar needs. Due to the broad scope of construction, the varied nature of the construction activities, and the geographic diversity of the Project Area, DCRT envisions that multiple construction work areas would be simultaneously utilized in different areas to complete Project work within the projected timeframe and in accordance with industry performance standards.

Preconstruction activities, including preconstruction environmental surveys, materials procurement, design, contracting, ROW acquisition, and permitting efforts would all influence the Project schedule and timing of construction activities.

DCRT would obtain a ROW through a combination of ROW grants and easements negotiated between DCRT and various Federal, state, and local governments; private companies; and private landowners. During the early stages of the Project, DCRT would coordinate with property owners and land agencies to obtain right-of-entry permissions for surveys.

Environmental Safety and Training

All construction and maintenance workers would be required to participate in an environmental education program prior to beginning work on the Project. This program would be developed by DCRT prior to the start of construction and would be submitted to BLM for review and approval prior to implementation. At a minimum, the program would include the following topics: biological, cultural, paleontological, and other environmental requirements and protection measures.

After participating in the training program, each trained worker would receive a card and hardhat sticker, indicating they are cleared for access to the ROW. The construction contractor(s) would provide the BLM's CIC with an updated list of those workers who have received the training. It is the responsibility of the construction contractor(s) to ensure that all construction personnel have received the required training. A noncompliance violation would be issued if a worker is found working on the ROW without the required environmental training.

In addition, the construction contractor(s) would be responsible for providing safety training as required. All construction, operation, maintenance, and decommissioning activities would be required to comply with Occupational Safety and Health Administration regulations. The CIC would be notified by the construction contractor(s) of any accidents that occur on public land during construction of the Project.

All construction personnel working in California would be required to complete a 4-hour Leave No Trace awareness course.

General Construction Management and Controls

Vegetation Management
Prior to beginning construction of the BLM selected route, field surveys for noxious weeds, protected plants, and habitat for special status species would be conducted within the construction work limits. Vegetation removal in short-term disturbance areas would be conducted in accordance with IB-2012-097, Cutting, Removal, or Damage of Timber, Trees, or Vegetative Resources. As specified in the Habitat Reclamation and Monitoring Plan (Appendix 2B, Section 2B.10), protected plants would be salvaged on Arizona state trust lands as required under the Arizona Native Plant Law (Arizona Revised Statutes §§ 3-901 et seq.) and on other lands as directed by the BLM and other landowners and regulatory agencies. Temporary plant nurseries would be established along or near the transmission line ROW to maintain salvaged plants until they can be used for the revegetation of disturbed areas. The Vegetation Management Plan (Appendix 2B, Section 2B.11) describes vegetation management and control measures to be applied as needed during construction, operations, maintenance, and decommissioning of the Project.

Weed Management
Throughout construction of the Project, invasive and noxious weeds would be monitored and controlled as prescribed in the Noxious Weed Control Plan (Appendix 2B, Section 2B.11). Other strategies would be implemented to prevent, monitor, and control the spread of invasive and noxious weeds in compliance with BLM's policy of preventing the spread of these species. These strategies are intended to minimize the introduction of invasive and noxious weeds to the ROW. In general, all workers would attend training on identification and control of weeds. Prior to entering the work site, all vehicles, earthmoving, and excavation equipment would be inspected and cleaned of any extraneous soil and debris. Only certified weed-free straw, seed, and other materials would be used during reclamation and for other purposes. If invasive species were detected in locations disturbed during construction, immediate action would be taken to remove the invasive species from the affected area and to prevent them from spreading. Any use of herbicides would be done in accordance with a Vegetation Management Plan, and only BLM-approved herbicides applied in a manner consistent with regulations and label directions would be used.

Lighting
Given the extreme heat in summer and the short construction schedule, construction would include night work. Therefore, lighting would be used at worksites as necessary to maintain safe working conditions. Limited lighting in the material storage yards would facilitate earlier start times and improve overall safety.

Blasting
A Blasting Plan has been developed for the Project and would be included in the final POD prior to the Notice to Proceed (NTP). Blasting would be required for areas where substantial hard rock is encountered and not able to be removed via heavy excavators. Blasting could be required for the installation of structure footings or to construct access roads. Blasting is not anticipated in sedimentary and surficial deposits, or in California.

Implosive sleeves may be used on the Project during wire stringing. Terrain and accessibility were a major consideration along with proximity to dwellings, gas lines, and existing transmission lines when deciding to use implosive fittings. Where topography allows compression sleeves would be implemented, while implosive fittings would be utilized in steep mountainous terrain or long spans. Implosive sleeves would be used throughout the BLM land instead of sleeving sites due to mountainous terrain. These sleeves would splice together where one wire wheel ends and the other begins. Implosive sleeves may be used at the puller/tensioner site and then pull the wire through. If an implosive sleeve needs to be used midspan, the wire would be lowered, and a qualified handler of the implosive sleeves would hike out to the span and attach the sleeve and detonation device and wiring.

Topsoil Management
Temporary use areas such as material staging, laydown yards, and concrete batch plants would be located in areas of lesser ecological impact and previously disturbed areas to the extent practicable. This approach would minimize adverse impacts to topsoil. Depending upon selection of the Agency Preferred Alternative, some temporary use areas may be necessary in previously undisturbed areas. In these cases, proactive measures (Appendix 2A, Section 2A.2) would be taken to preserve the local topsoil and return the sites to their pre-disturbance conditions following completion of construction activities.

For all temporary use areas, a layer of topsoil would be initially removed from the area, in conformance with the Habitat Reclamation and Monitoring Plan (Appendix 2B, Section 2B.10) and the Site Plan for Soils and Hydrology, which would be included in the final POD prior to the NTP.

In general, the need for soil removal from short-term disturbance areas is anticipated to be minimal and would ultimately depend upon local site conditions at the selected area. Limited soil removal may be required for short-term disturbance areas based on geologic conditions for the following scenarios:

- Areas with unconsolidated soils which could not support the types of vehicles required to be used, soil types would typically include sandy soils. In this scenario, a temporary rock base may be installed to support vehicle traffic, and 1 to 2 inches of sandy soil may be temporarily displaced when the temporary rock base is removed.
- Areas with soils utilized for agricultural activities. In this scenario, topsoil may be removed from sites where temporary construction activities would occur and stored in an area where contamination would be limited. Typically, 3 to 6 inches of fertile topsoil may be temporarily displaced during construction activities.

- Areas where uneven soils are present and not able to support construction of transmission structures. In this scenario, grading of 0.5 to 3 feet of topsoil may be required where terrain would not allow a usable working pad. Soil would be temporarily displaced, then graded and contoured once construction is complete.
- Areas where terrain may cause erosion during construction. In this scenario, topsoil may be disturbed to place erosion control measures in place during construction and through site reclamation.

The topsoil would be stored within the general boundary of the disturbed area and covered with durable weather-proof material to protect from erosion, contamination, or wind-blown effects, as appropriate. The stockpiled topsoil would be stored as close to the site of removal as possible to minimize the need for transporting the topsoil and ensuring that topsoil from different areas are not comingled; stockpiles would not be aggregated with topsoil from other locations.

These soils would be replaced after completion of site-specific construction activities. After completion of construction related activities, the temporary use areas would be graded to near original and original topsoil would be replaced. Necessary treatments and seeding would be applied. The Habitat Reclamation and Monitoring Plan (Appendix 2B, Section 2B.10) in conjunction with the Site Plan for Soils and Hydrology, would be included in the final POD prior to the NTP, would specify in detail the methods for topsoil salvage and soil management practices to be followed for site reclamation.

Dust Control
Dust control would be managed in accordance with the Dust Control Plan for the Project (to be provided as a part of the final POD). In order to control fugitive dust, active construction areas would be watered. Water for dust control would be obtained by the construction contractor from private wells and/or a municipal water supply. Water would be provided by three 2,000-gallon water trucks, which would water access roads twice a day. Approximately 55,789,705.3 gallons of water would be required for dust control for the Proposed Action.

2.2.5.2 Transmission Structures

Support structures are proposed to be steel lattice of various configurations or steel monopoles. Steel lattice structures include self-supporting four-legged tangent structures (i.e., structures placed where the line does not angle more than 1 degrees), guyed V structures with a single footing and four support guy wires, and two-legged H-frame structures as the primary structure types. Lattice H-frame structures are proposed for areas of active agricultural activity and self-supporting lattice structures to facilitate entrance into the two substations (Appendix 7, Figure 2.2-15). For areas of conductor tension change, angles, and phasing transpositions, self-supporting four-legged dead-end structures would be utilized. A dead-end structure is a fully self-supporting structure that is used when the circuit changes to a buried cable, or at a substation as a transition to a "slack span" entering the equipment.

Guyed-V structures are proposed to be used in areas that do not parallel the existing DPV1, including in California. Guy lines would typically be located within the ROW, would have to remain at the grade that they were installed, and would have reduced distances extending from the structure foundation for lower height guyed-V structure. Permanent guy guards/markers

would be installed on all guy wires for the guyed-V structures. In areas where the topography around guyed-V structure sites would result in anchors of a designed structure extending beyond the 200-foot ROW, self-supporting structures may be substituted to keep permanent facilities within the 200-foot ROW.

The structures would be between 72 and 195 feet in height, depending on the span length required and topography, with most being shorter than 142 feet. Span lengths between structures would vary from 400 to 2,300 feet, depending upon terrain conditions, current land use, structure type used, and to achieve site-specific mitigation objectives. However, the typical span would be approximately 1,500 feet. On average, three to eight structures would be placed per mile, depending on the structure type, topography, and angles of the route.

Additional refinements for structures shown in Figure 2.2-15 (Appendix 7) may be identified during preliminary engineering but are anticipated to result in similar design and height. Each structure type would be determined during final design and selected based on site-specific conditions or to mitigate impacts resulting from the Project.

The conductor, static wire, and OPGW would maintain a horizontal configuration for all structure types except proposed monopoles. Conductor bundles for all structure types except the proposed monopoles would be installed at the same height on the structures with approximately 34 feet of spacing between the center of each conductor bundle. The static wire and OPGW would be approximately 30 feet above the phase conductors at the top of the structures.

The proposed transmission line would be located adjacent to existing linear facilities such as transmission lines, pipelines, and roads to the extent practicable. DCRT would attempt to match the Project structure locations adjacent to existing transmission line structures to the extent practicable.

2.2.5.3 Foundations and Structure Construction

Foundation Installation

Each structure type requires specific foundation configurations. The guyed V structures require a center pier foundation and four anchors for the guy wires. The center pier would be a 9 by 9 foot by 24 foot deep precast foundation. Grouted soil, grouted rock, or helical anchors would be used to secure the guy anchors in most cases; however, 3 by 24-foot concrete piers could be utilized if dictated by engineering.

For drilled anchors, each anchor hole would be about 4 to 8 inches in diameter and range in depth from 10 to 50 feet. Helical anchors could be up to 24 inches in diameter and range in depth from 20 to 40 feet. At each grouted guy anchor, a temporary trench (approximately 3 by 8 feet, and 3 feet deep) would be dug to capture grout that is re-circulated through the top of the anchor when the guy is pumped with grout. This short-term disturbance area would be contained within the 200- by 200-foot work area. The temporary trench, containing slurry from the grouting operation, would be backfilled to a minimum depth of one foot using excavated soil, and reclaimed. Where a minimum of one foot of soil cannot be established for reclamation, the consolidated slurry would be removed and disposed of off-site.

The self-supporting tangent steel structures would consist of four, 4-foot diameter foundations, which would either be cast-in place concrete, a precast foundation, or grillage foundation. Dead-end lattice structures would have four foundations approximately 6 feet in diameter. Lattice H-Frame structures would consist of two 12-foot by 18-foot foundations, comprised of the same materials listed for self-supporting steel structures. The steel monopoles would consist of one foundation, 4 to 6 feet in diameter, which would either be cast-in-place concrete or a pre-cast foundation. Each foundation would extend approximately 2 feet above the ground level.

Foundations for supporting structures would typically be drilled piers that are excavated with a truck-mounted auger. In rocky areas, foundation holes may be excavated by drilling or blasting methods, or by installing special rock anchor or micropile type foundations.

Given the Arizona/California southwest desert conditions, the alluvial plain of the Colorado River basin typically contains 7 to 10 feet of upper soils that are generally loose sand, silt, and alluvium. In these areas, shrink-swell concerns and collapsing soils are more the rule rather than the exception (DCRT 2019). This precludes DCRT from assuming that favorable soil conditions are present for the proposed transmission line; hence, DCRT has decided to use a combination of deep foundations and spread footers.

Helicopter-only foundation construction may result in excavations that must be “hand dug” (i.e., jackhammers and shovels). Foundation dimensions increase when dug by hand due to shoring requirements, safety harness requirements, and retrieval equipment requirements. Micropile foundations are an alternative to hand-dug foundations and can mitigate some of the hazards specific to hand-dug foundations. This specialized type of foundation consists of footing anchors into bedrock and requires a much smaller overall structure work area footprint and disturbance to install. Micropile structures can be completed in extremely rugged terrain with the use of specialized equipment and helicopter assistance (typically) to fly the equipment into the site. Hand dug or micropile foundations may be an optional installation in extremely rugged terrain for the Project. For each tower leg, micropile foundations would use a group of casings that would be drilled and grouted into the ground. The exposed portion of the pile group would be encased in a reinforced concrete cap from the top of the casings to a depth determined by the geotechnical study. The use of micropile foundations could reduce the required work area. Micropile foundations size would vary, but each micropile would generally range in size from approximately 5.5 to 9.6 inches in diameter and be 10 to 50 feet in depth. Each foundation would have a cluster of 3 to 20 micropiles, and each cluster would be capped with a welded plate. This cap would be slightly larger than the size of the micropile cluster, anticipated to be up to 7 feet in diameter.

Short- and long-term disturbance associated with the Proposed Action, Action Alternative segments, and the Agency Preferred Alternative is detailed in Tables 2.2-11 through 2.2-13, respectively.

S-T: short-term; L-T: long-term.
Assumptions: Short-term disturbance areas include 20 percent buffer addition for final design considerations (200’ x 200’ = 0.9 acre + 20% = 1.1 acre).
[1] Self-supporting structures used where paralleling existing DPV1 transmission line
[2]Short-term disturbance assumes approximately 1.1 acres per structure site.
[3]Long-term disturbance assumes the Project structure permanent work areas as described in Section 2.2.5.3.

Foundations for supporting structures would be drilled piers. Pier foundations are placed in a hole generally made by a truck-mounted auger. Reinforced steel and anchor bolts are placed into the hole using a truck-mounted crane. The portion of the foundation above ground would be formed. The portion below ground uses the undisturbed earth of the augured hole as the form. After the foundation has been poured, the forms would be removed, the excavation would be backfilled, and the surface of the foundation dressed. First, drilled shafts would be excavated for each structure: four holes for each self-supporting structure, two holes for each H-Frame structure, and one hole for each guyed V structure and steel monopole. The holes would be drilled using a truck-mounted excavator equipped with augers of various sizes depending on the diameter and depth requirements of the hole to be drilled. Excavation spoils would be evenly spread out within the ROW in the vicinity of each structure, unless specifically prohibited by the landowner. Spoils would be crowned around the foundations to provide positive drainage away from them.

Where solid rock is encountered, blasting, rock hauling, or the use of a rock anchoring or micro-pile system may be required. The rock anchoring or micro-pile system would be used in areas where site access is limited or where adjacent structures could be damaged by blasting or rock hauling activities. Such anchoring systems may also be used where economically and technically justified. Materials used for rock anchoring or micro-pile systems would be stored in the staging areas and not on the ROW.

For helicopter-assist construction, conventional drill rigs would be used to dig out the excavation. A helicopter would then be used to set the steel reinforcement (typically anchor bolt cages reinforced with rebar, or all-rebar cages). Concrete would be flown in by a heavy-lift helicopter using buckets. To protect the public, signs would be posted indicating construction times and possible disruptions at the entrance of the canyon prior to construction. Limiting the helicopter use by utilizing conventional construction wherever possible would limit these interruptions and decrease the number of trips in and out of sites to pour concrete.

In areas where wheel-mounted access is not possible, crews would hand dig foundation holes for each structure. Crews would hand dig foundation sites utilizing both powered and non-powered digging tools to the specifications of the design. Once the foundation excavation is complete, spoils from excavation would be airlifted offsite by helicopter and be placed in an approved spoils location or laydown yard for storage or offsite disposal. The contractor would then place steel reinforcement bars into the foundations as required by the design. Once the reinforcement bar installation is completed, the contractor would have concrete airlifted to each site by helicopter and foundations would be poured using hand tools. This type of work would only be required for sites where vehicle access is not feasible.

Reinforced steel and anchor bolts would be transported to each site by truck, either as a prefabricated cage or loose pieces, which would then be fabricated into cages on the site. Concrete would be hauled to the site in concrete trucks. Water would be required for concrete mixing. Excavated material would be spread at the site or disposed of in accordance with local ordinances and per agreement. Structures and equipment would be attached to the foundations by means of threaded anchor bolts embedded in the concrete. Some equipment such as transformers may not require anchor bolts. They would be secured to the foundation by other means. Water for SCS foundation construction is included in the construction water needs.

Steel reinforcing cages and stub angles would be installed for all lattice structures. The foundations would be designed to satisfy all Federal, state, and local design codes. The lattice structure holes would be approximately 4 to 6 feet in diameter.

Concrete would be acquired as a commercial product from a supplier. Typically, concrete would be delivered directly to the site in concrete trucks with a capacity of up to 10 cubic yards. However, in areas with limited access or environmental constraints, the concrete would be placed in the excavation with either a crane and garbro bucket or pumped from a distance of several hundred feet. Each foundation would extend approximately 2 feet above the ground level.

Structure Assembly and Installation

At local assembly and staging areas, materials would be staged and subassemblies may be fabricated. From these local assembly and staging areas, material and subassemblies would be delivered to the structure sites via flatbed truck or helicopter if required. Subsequent to full or partial assembly, sections of the structure would be assembled adjacent to the structure location. Supporting steel structures would be erected on concrete foundations. These would be set with a truck-mounted crane and attached to the foundation anchor bolts by means of a steel base plate. These structures would be used to support the energized conductors and certain types of equipment. This equipment would be lifted onto the structure by means of a truck-mounted crane and bolted to the structures, and electrical connections would then be completed. Some equipment would be mounted directly to the foundations without supporting structures; again, these would be set in place by means of a truck-mounted crane. The crane would move along the ROW as structures are erected. Some of this equipment requires assembly and testing on the pad. Electrical connections to the equipment would then be completed.

Structure assembly using helicopters would use sky cranes. Due to the overall steepness of each site requiring helicopter construction, steel bodies (sections of the towers) would have to be erected in an adjacent fly yard and flown in by the sky crane to each structure site and subsequently, then each head of the tower. The heads and bodies of the towers would have to be assembled in the fly yard area and delivered the tower via sky crane to erect on the pad site. For comparison, steel erection using conventional equipment involves the lattice pieces being hauled by the bundle to the tower site and assembled on the structure pad. The steel is built in sections and then erected together using a combination of forklifts (telehandlers) and rough-terrain or all-terrain cranes.

2.2.5.4 Conductors

Conductor, shield wire, and OPGW would be placed on the transmission line support structures by a process called stringing. Conductors with a non-specular finish would be suspended from insulator assemblies. Overhead ground wires and OPGW would be located on the peaks of each transmission structure and function to intercept lightning that would otherwise strike the conductor. All structures with a single shield wire peak would have OPGW installed at the structure peak. All structures with dual shield wire peaks would have OPGW installed on one peak, and steel shield wire installed on the other. Additionally, a grounding system would be installed at the base of each transmission structure that would consist of copper ground rods

embedded into the ground in immediate proximity to the structure foundation and connected to the structure by buried copper lead.

The first step to conductor and shield wire stringing would be to install insulators and stringing sheaves. Stringing sheaves are rollers that are temporarily attached to the lower portion of the insulators at each transmission line support structure to allow conductors to be pulled along the line. A lightweight rope known as a finger line may be placed through each sheave with each end extending to the ground. Additionally, temporary clearance structures would be erected where required prior to stringing any transmission lines. The temporary clearance structures are typically vertical wood poles with cross arms and are erected at road crossings or crossings with other energized electrical lines to prevent contact during stringing activities. Bucket trucks may also be used to provide temporary clearance. Bucket trucks are trucks fitted with a hinged arm ending in an enclosed platform called a “bucket” which can be raised to let the worker in the bucket service aerial equipment.

Once the stringing sheaves and temporary clearance structures are in place, the initial stringing operation would commence. This would consist of pulling a pilot line through the sheaves, using the finger lines, along a section of the alignment. The pilot line is then attached to the hard line, which follows the pilot line as it is pulled through the sheaves. The hard line would then be attached to the conductor or shield wire to pull it through the sheaves into its final location. Pulling the pilot line may be accomplished by attaching it to a specialized vehicle or to a small helicopter that moves along the ROW.

Pulling and tensioning equipment would use a hard line to install the ground wires and achieve the correct sagging of the transmission lines between support structures. Pulling and tensioning sites would be required about every 3 miles along the ROW and would encompass approximately 2.3 to 2.8 acres to accommodate required equipment. Equipment at sites required for pulling and tensioning activities would include tractors and trailers with spooled reels that hold the conductors, and trucks with tensioning equipment. To the extent practicable, pulling and tensioning sites would be located within the ROW; any pulling and tensioning sites on Federal lands outside the ROW would require a temporary ROW authorization from the BLM. Depending on the topography, minor grading may be required at some sites to create level pads for equipment. Wire splicing sites would be located midway between each pair of pulling/tensioning sites. Finally, the tension and sag of the conductors and shield wires would be fine-tuned, the conductors would be permanently attached to the insulators at the support structures, and the stringing sheaves would be removed.

Temporary work areas for conductor, ground wire, and OPGW pulling, and snubbing sites would also be required. During stringing operations, approximately 2 to 3 drums of cable can be pulled and spliced together; meaning pulling stations would be required every 5 to 7 miles along the transmission line route. For large angles, these pulling sites may extend beyond the ROW. Pulling sites would be approximately 600 feet by 200 feet in size (2.8 acres). Snubbing sites (where a conductor is temporarily fixed or attached to the ground for conductor-sagging purposes) would be located within the ROW and are locations where conductors are spliced together approximately every 5 to 7 miles along the transmission line route. Access to both sites would be required for necessary equipment. Table 2.2-14 presents the estimated short-term disturbance associated with wire stringing.

In the Copper Bottom Pass area (CBPA), puller/tensioner and snub sites, if possible, would be deemed drive and crush with the utilization of a soil compactor to reach compaction necessary for heavy equipment to travel sufficiently without risk of roll over, spinning out, or rutting. In instances where drive and crush disturbance cannot reach a level enough plane for the stated heavy equipment necessary, then blading would have to occur in order to keep pullers, tensioners, and wire boats level for efficient and safe wire conducting activities. All blading associated with puller/tensioner and snub sites would be temporary.

All wire pulling operations at the Colorado River crossing would comply with the stipulations provided in the USACE Clean Water Act Section 404 Permit and USACE Rivers and Harbors Act Section 10 Permit. DCRT and/or their contractor would make all reasonable efforts to communicate with the U.S. Coast Guard, local marinas, commercial boat launches, and local recreational clubs and provide advanced notice of crossing operations. To protect the public, all boat traffic would be restricted from entering the wire pulling area while stringing operations (i.e., stringing of sock line, pulling back of hard line, and stringing of conductor/OPGW) are occurring. Boat traffic may be restricted using a combination of patrol boats and warning buoys on either side of the wire pulling corridor. These restrictions would be temporary in nature and boat traffic would be allowed to resume after each wire stringing subactivity (i.e., sock line stringing, hard line pull back, conductor/OPGW stringing) was completed.

Restrictions in access to the upland areas adjacent to the Colorado River implemented to maintain public safety during construction operations would be temporary in duration. Signage advising recreation users of construction activities and directing them to alternative trails or bikeways would be installed.

Tables 2.2-14 through 2.2-16 present the estimated short-term disturbance associated with wire stringing for the Proposed Action, the Action Alternative, and the Agency Preferred Alternative segments, respectively.

All short-term disturbance areas would be reclaimed as described in the Habitat Reclamation and Monitoring Plan (Appendix 2B, Section 2B.10).

Assumptions:
Snubbing sites estimated at 2.8 acres of disturbance each located 5 miles apart along the line.
Pulling sites estimated at 2.8 acres of disturbance each at dead-end and 2.3 acres of disturbance at angles located at 5 miles apart along the line.
*Wire stringing for alternative distribution line associated with the alternative SCS. Line miles for distribution line not included in transmission line mileage total.

2.2.5.5 Insulators, Grounding, and Other Hardware

Other hardware not associated with the transmission of electricity may be installed as part of the Project as required by the FAA, particularly in the Colorado River crossing area. These transmission line markings may include aerial marker spheres, structure painting, or aircraft warning lighting which would be in accordance with FAA or DOD consultation and FAA regulations (Circular 70/7460) for aircraft obstruction marking, as necessary. These lights would be solar powered and would not require additional electrical interconnection. Specifically, structure proximity to airports and structure height are the main factors determining whether FAA regulations would apply, based on an assessment of wire/structure strike risk. Currently, it is anticipated that all structures would be designed to a height of 199 feet or less.

Current guidelines and methodologies (Avian Power Line Interaction Committee [APLIC] 2012, 2006) would be used to minimize the potential for raptors and other birds to collide with, or be electrocuted by, the transmission line. For example, aerial marker balls, or other appropriate visibility markers would be placed on the transmission line at and near the crossing of the Colorado River to increase visibility to birds using that flight corridor. Flight diverters would be installed on all transmission activities spanning or within 1,000 feet of stream and wash channels, canals, ponds, and any other natural or artificial body of water. The type of flight diverter selected would be subject to approval by BLM in coordination with USFWS and CDFW, as appropriate. Visibility markers would also be placed at other locations along the transmission line that are identified by the BLM and state wildlife agencies as having a high potential for avian collisions.

2.2.5.6 Series Compensation Station

A general layout of the SCS is shown in Figure 2.2-16 (Appendix 7).

Two alternative locations for the SCS have been identified. Both alternative locations would be on BLM-administered public land, as shown in Figure 2.2-17 (Appendix 7).

Design

A new SCS system would be needed and located under the new transmission line (or in very close proximity to the transmission line), parallel to the existing SCS associated with the DPV1 line. The SCS would be within the 200-foot wide ROW, approximately 47 miles from the APS Delaney Substation. This SCS would be equipped with switchable banks of capacitors inserted in series with a line to compensate for the voltage drop in the line, effectively allowing power transmission over greater lengths of line.

The ground surface within the fenced area of the SCS, and extending out up to 3 feet, would be covered with crushed rock. This is required for personnel safety due to grounding concerns and because of lower clearances to energized conductors within the substation as compared to transmission lines. These lower clearances are allowed by NESC 2012 because of the limited access to the SCS due to fence and gates.

A fiber optic repeater would be located in the SCS using the same distribution line for backfeed to this substation. Under the Proposed Action, the new SCS would be connected to the same APS 12kV distribution line used for the existing DPV1 SCS. This existing three-phase distribution

line would not need to be upgraded to accommodate the new SCS. The line connecting the new SCS to the distribution line would run along existing access roads and would require a 15-foot ROW along its approximately 1,000-foot length, and portions of this 15-foot ROW would likely occur within the larger 200-foot ROW for the transmission line. This line would require three new poles, either wood or galvanized steel. Each pole would be an average of 45 feet tall, would temporarily disturb approximately 0.04-acre, and would permanently disturb a 5-foot diameter area around each pole for a total long-term disturbance of less than 20 square feet per pole, or 0.0014-acre total.

The perimeter fence would be a 9-foot chain-link fence with steel posts. One foot of barbed wire would be installed at the top of the chain-link, yielding a total height of 10 feet. Locked gates would be installed at appropriate locations for authorized vehicle and personnel access.

The grounding system would consist of buried copper conductor arranged in a grid pattern and driven ground rods of adequate size, typically 8 to 10 feet in length. The ground rods and any equipment and structures would be connected to the grid conductor. The amount of conductor, size, length, and number of ground rods required would be calculated based on the fault current and soil characteristics. All metal structures and equipment would be connected to the ground grid via ground pig tails. The ground grid would extend approximately 4 feet outside of the perimeter fence to prevent unsafe reach-touch potential.

Two main types of high-voltage conductors are used in the SCS: tubular aluminum for rigid bus sections and/or stranded aluminum conductor for strain bus and connections to equipment. Rigid bus sections would be supported by porcelain insulators installed on steel supports. The bus sections would be welded together and attached to special fittings for connection to equipment. Stranded aluminum conductors would be used as flexible connectors between the rigid bus and the SCS equipment.

Clearing and Grading

Clearing of all vegetation would be required for the entire SCS area (200 feet by 315 feet), including a distance of 10 feet outside the fence for a total estimated disturbance of 1.7 acres long-term disturbance. This is required for personnel safety due to grounding concerns and because of lower clearances to energized conductors within the substation as compared to transmission lines. These lower clearances are allowed by NESC 2017 (IEEE 2016) because of the limited access to the SCS due to fence and gates.

Vegetation would be removed and a 4 to 6-inch layer of crushed rock applied to the finished surface of the SCS. The SCS would be treated with a BLM-approved and authorized soil sterilizer to prevent vegetation to ease maintenance. The entire SCS area would be graded flat, with enough slope to provide runoff of precipitation. The SCS would be graded to use existing drainage patterns to the extent possible. In some cases, drainage structures, such as ditches, culverts and sumps may be required to control runoff. The topsoil would be removed. The topsoil would be covered once stockpiled. Topsoil storage at each location is assumed to be within each site disturbance and would not increase disturbance estimates. Cleared and graded material would be disposed of in compliance with local ordinances. Material from offsite would be obtained at existing borrow or commercial sites and trucked to the SCS using existing roads and access roads.

Material Storage Yards

Construction material storage yards may include the SCS footprint or be leased by the contractor. A storage area for the SCS may be the same as or shared with transmission line crews.

Power Supply Distribution Line Connection

Under the Proposed Action, the SCS would be connected to the existing APS 12kV distribution line by a 1,000-foot connection line. Installation of the connection would be performed by APS and would take place over approximately two months. The three new poles for the line would be buried 6 feet below grade and filled with native soil. Structures would be monopoles, an average of 45 feet tall, with spans of 300 to 350 feet. Short-term construction areas for the structures would be 15-foot by 40-foot area (0.014-acre) around each pole site, for a total short-term disturbance footprint of <0.1-acre. The long-term disturbance area per structure would be 5 feet diameter.

The SCS distribution line associated with the Proposed Action along Segment p-06, parallel to the existing SCS, would be connected to the same APS 12-kV distribution line feeding the DPV1 500-kV SCS, located east of the Kofa NWR. The power required is relatively small, around 20 kW, a need to upgrade the existing 12-kV, three-phase line to accommodate the new load is not anticipated. Line distance would be approximately 1,000 feet, using three new distribution line structures.

Construction of the distribution line would take approximately two months and would be performed by a crew of three APS workers using a standard APS service truck equipped with a driller and crane. Crews would also use a bucket truck, wire puller and tensioner. Limited traffic control may be required on the access road adjacent to the line, which would consist of signage and lane closure or deviation. The traffic control would be performed in accordance with ADOT requirements. No additional material staging and laydown yards or batch plants would be required for the construction of the distribution line.

Alternative Series Compensation Station Locations

The two alternative locations for the SCS would be on BLM-administered public land near the intersection of Segments x-04 and i-03, less than 75 feet apart. Specifications for the SCS would be the same as those described under the Proposed Action.

Either alternative SCS site (i-03 or x-04) would be powered via a distribution line connecting to the existing APS 12kV distribution line in Brenda, Arizona. The associated distribution line would interconnect with APS' 12-kV system in Brenda. APS has identified a potential alignment for the proposed distribution line that would originate from the 12kV system in Brenda just south of US 60. The distribution line would extend south, generally parallel and to the east of Ramsey Mine Road for approximately 1.4 miles, breaking from Ramsey Mine Road just north of I-10 and north of the i-04 Project Segment, and be located adjacent and parallel to the I-10 ADOT ROW (Figure 2.2-17). This route would be 3.2 miles long. With a typical distribution line pole span of 300 to 350 feet, the distribution line would require approximately 55 poles. Each pole would be an average of 45 feet tall and would permanently disturb a 5-foot diameter area (<0.1 acre) around each pole. The estimated temporary construction disturbance for the connection to the distribution line would be 0.8-acre, with a long-term disturbance footprint of <0.1 acre. It would

also require the crossing of I-10, with taller than the typical 45-foot structures required on the north and south sides of the highway. These structures may also utilize guy wires at line angles or at the crossing of I-10. The crossing would be designed in accordance with the US Department of Transportation and ADOT requirements including aerial crossings and traffic control permits. APS would acquire an Encroachment Permit from ADOT and would follow all approved traffic control measures for pulling the wire across I-10. The Encroachment Permit may also include rights of ingress and egress to access the segment of line parallel to I-10 for construction purposes. No material staging, laydown yards, or batch plants would be required for the alternative distribution line.

The distribution line would be accessed using existing roads or access roads constructed for the transmission line; no new access would be required for construction of the distribution line. A crossing of I-10 would be required for the distribution line, which may require taller than average poles on either side of the crossing. The crossing would be designed in accordance with ADOT requirements, as applicable, including aerial crossings and traffic control permits.

For the SCS, up to two additional fiber optic regeneration sites would be only required if the distance from the Delaney Substation to the SCS or from the SCS to the Colorado River Substation greatly exceeds 60 miles. Locations for these additional fiber optic repeaters, if needed, would be selected minimizing the length of the distribution line.

The estimated short-term and long-term disturbance for the alternative SCS footprint would be similar to that described under the Proposed Action: the SCS would be integrated into the footprint of the transmission line with a 200-foot by 315-foot fenced area. Clearing of all vegetation would be required for the entire SCS area, including a distance of 10 feet outside the fence, for a total long-term disturbance of 1.7 acres. Each pole would be an average of 45 feet tall (except at the I-10 crossing) and would permanently disturb a 5-foot diameter area (0.0004 acre) around each pole. The estimated temporary construction disturbance for the connection to the distribution line would be 0.8-acre, with a long-term disturbance footprint of 0.02-acre.

2.2.5.7 Substation Upgrades

DCRT has completed wire-to-wire interconnection facility studies with both APS and SCE for the Project. The purpose of these studies is to identify the effects of the installation of the Project on the existing transmission grid as well as to determine the specific facilities required to effectively interconnect the Project to the Delaney and Colorado River substations. The Delaney and Colorado River substations have adequate room to accommodate all of the equipment associated with the interconnection of the TWL line. SCE and APS would perform all of the engineering, design material procurement, construction, and testing related to the interconnections of the TWL to the Colorado River and Delaney substations, respectively. It is estimated to take approximately 18-24 months to complete interconnection related work at the Delaney Substation, and approximately 27 months to complete the same task at the Colorado River Substation. DCRT anticipates the installation of the following equipment at both the substations to interconnect the TWL line to the existing 500kV buses at the respective substation:

500kV line position including -

- 500kV dead-end switchyard structure

- 3 - 500kV line drops
- 3 - 500kV coupling capacitor voltage transformers with steel pedestal support structures
- 2 - 500kV circuit breakers
- 9 - 500kV single phase disconnect switches
- 3 - 500kV single phase disconnect switches with grounding attachment
- 36 - 500kV bus support post insulators
- 1 - 500kV, 75MVAr line reactor (Colorado River Substation)
- 1 – 500kV, 136MVAr line reactor (Delaney Substation)
- 1 - 500kV sync-opening circuit breaker
- 3 - 500kV disconnect switches
- 1 - 500kV 75MVAr, 3-Phase line reactor (Delaney Substation)
- 4 - 500kV surge arresters
- 1 - 25-foot high firewall
- Installation of protection relays, fiber optic cable, lightwave, channel, and associated equipment supporting protection and supervisory control and data acquisition (SCADA) system
- Installation of new 20-foot driveway and removal of existing driveway
- Installation of one 500kV transmission structure including insulator/hardware assemblies, and two spans of conductor between the TWL´s last structure located outside the substation property line and the dead-end substation structure at the substation.

The equipment required to interconnect the Project to the Delaney and Colorado River substations is expected to be similar in type and size to the existing equipment at each substation. Exact equipment requirements would be determined after the completion of the facility studies by each interconnecting utility.

It is currently anticipated that the Project would connect to SCE’s last structure located within substation property grounds but outside the substation fence at the Colorado River Substation. For the Delaney Substation, the Project would connect to the last APS tie-in structure inside the substation fence. At both substations, installation of one 500-kV transmission structure including insulator/hardware assemblies, and two spans of wire between the Project’s last structure located outside the substation property line and the dead-end substation structure at the associated substation would be required.

CAISO requires the installation of one 75-MVAr shunt-reactor in the SCE Colorado River substation and a 136 MVAr shunt-reactor in the APS Delaney Substation – the two, existing utility-owned terminus substations of the Project. Shunt reactors are voltage modulation devices that are generally installed to provide voltage control on transmission systems, thereby enabling the power system operator to maintain the terminal voltage within specified limits to ensure

reliable operation of the bulk transmission network. There would be no new disturbance associated with these installations.

2.2.5.8 Access

Access Routes

Access routes are displayed on Figures 2.2-18 through 2.2-21 (Appendix 7).

Access to the ROW would be provided by existing roads and trails, such as those associated with the DPV1 transmission line and nearby pipelines, to the extent practicable. Access for the Project would be in accordance with an Access Road Plan included in the final POD prior to the NTP. Five types of access would be used:

Access Type A – Type A access roads would include existing public or private roads that are parallel to the ROW, or a patchwork of existing roads in the area that would provide access to or would be crossed by Project segments. These roads consist of well-maintained county dirt roads, private roads, and all paved roads. Improvements to Type A roads may include repairs to the roadbed on dirt roads without additional disturbance beyond the existing roadbed width. Surface improvements to the roadbed would only be completed to allow for safe travel conditions.

Access Type B – Type B access roads would require some level of upgrade to allow sufficient access. In conditions required for construction passage, these roads may be bladed, compacted, and widened to a maximum of 18 feet for travel surface with up to 30 feet of total disturbance overall (Table 2.2-17). This includes the 16-foot travel surface, 2-foot berms on either side, and 5 feet of material displacement on either side of the travel surface in steep terrain. In flat terrain with the exclusion of wash-crossings this total disturbance would be much less, with an approximate 18 feet of total disturbance. In moderate terrain, with the exclusion of wash-crossings, this total disturbance would be approximately 25 feet. In steep terrain with the exclusion of wash-crossings this total disturbance would be approximately 30 feet.

Access Type C – Type C access roads consist of newly bladed access roads down either side of centerline of the conductor but within the 200-foot ROW corridor as much as possible. These roads would consist of 16 to 22 feet of travel surface, 2-foot berms on either side, with a maximum of 50 feet of material displacement in steep areas (Table 2.2-17). In areas of flat terrain, except in wash crossings, disturbance would most likely not exceed 22 feet total for travel surface, berms, and material displacement. In areas of moderate terrain, except in wash crossings, disturbance would most likely not exceed 50 feet total for travel surface, berms, and material displacement. Where possible, areas that can support construction activities by drive-and-crush and/or clear-and-cut practices would be implemented.

Access Type D – Type D access spur roads would be constructed in areas where Type A, B, and C roads provide access to the vicinity of the ROW but are not adequate to provide access to structure locations. These roads would be new spur roads that would be bladed from the main access road to access the structure work areas. New spur roads would consist of native material displacement, and thus require larger disturbance areas in steeper terrain. Travel surfaces for new spur roads would range from 16 to 22 feet with 2-foot berms on either side excluding material displacement. For spur roads in flat terrain, material displacement would not exceed 3 feet on either side for a total of 22 feet if utilizing a 16-foot travel surface. For spur roads in moderate

terrain, material displacement would not exceed seven feet on either side for a total of 30 feet if utilizing a 16-foot travel surface. In steep terrain, material displacement would not exceed 76 feet of total disturbance (Table 2.2-17), this includes a 22-foot travel surface, 2-foot berms on either side, and 25 feet of cut/fill on either side. Steep terrain is defined as slopes greater than or equal to 15 percent. Long-term disturbance would consist of the cut, fill, and road base travel surface required for continued operation and maintenance of the line. Total disturbances are estimated and would be calculated during the reclamation period. Where terrain and soil conditions are suitable, non-graded overland access ("drive-and-crush") would be utilized. When drive-and-crush cannot be used, vegetation would be cleared, and roads would be cut as determined by terrain, soil, and vegetation ("clear-and-cut"). To the maximum extent possible, roads would cross drainages at grade (low-level crossing). In some cases, road cutting may be needed to drop access roads to the grade of the drainage bottom. Any material moved by road cutting would be cast upland and not deposited in washes.

Access Type E – Helicopter Access – In areas of particular biological, topographical, archaeological, and visual concerns, a helicopter may be used to assist Project construction. Areas where helicopters would be used would also include the use of the other types of access roads described above (Types B, C, and D), as possible. Roads would be used by light pick-up trucks or off-highway vehicle (OHV) for crew and tool access, and/or equipment whose tracks can adequately stay within the confines of the road disturbance boundaries without risk of roll-over or equipment failure due to stress loading of slope. However, all activities required for transmission line construction that would require large vehicles and equipment such as semi-trucks, tractor-trailers, and lo-boys would be conducted by helicopter application. Currently helicopter construction is expected for Segments p-10, p-11, cb-01, and cb-02.

Table 2.2-17 Access Types and Disturbance Widths

SLOPE	TYPE A (EXISTING MAINTAINED ROADS)	TYPE B (UPGRADED EXISTING ROADS)	TYPE C (NEW CENTERLINE ACCESS ROAD)	TYPE D (NEW ACCESS SPUR ROADS)	TYPE E (HELICOPTER)
Flat (0-7.9%)	-	18 feet	22 feet	22 feet	-
Moderate (8-14.9%)	-	25 feet	30 feet	30 feet	-
Steep (>15%)	-	30 feet	50 feet	76 feet	-

All new access roads would follow existing contours and topography to the extent practical to help blend disturbance into the surrounding geography. Roads within the ROW can meander up to 25 feet within the ROW to avoid sensitive resources, reduce disturbance, or mitigate unanticipated constructability issues in the field. Such instances would include avoidance of special status plants, unanticipated cultural resource discoveries, and unforeseen steep washes/topographic features that would require avoidance. Grading for access would be limited to the extent practicable, and unnecessary grading would not occur. Access roads would typically be located within the 200-foot ROW and be the shortest distance from structure to structure. The typical roadway approach includes a turning radius of 50 feet on either side. A 50-foot turning radius would be required at T or Y road intersections. Cross slope would be a minimum of 3

percent. The typical roadway approach includes a turning radius of 50 feet on either side for about 100 feet in length.

New access roads would also need 10-foot-wide pullouts with a total linear length of 150 feet (10-foot-wide by 100 feet with 25-foot tapers on each end). The pullouts would occur no closer than 1,000 feet on a single access road unless terrain requires less distance between them (e.g., blind corner or steep drop). The pullouts may be spaced greater than 1,000 feet apart at operator's discretion.

Permanent access roads that are located outside of the 200-foot ROW would be needed and would require additional long-term ROW. Access roads not needed for operation and maintenance of the line would be restored to their previous condition following completion of construction.

Due to steeper than average slopes, access in the CBPA poses unique challenges for the Project. There are currently no Type A roads present in the CBPA, only Type B.

Existing main access roads through the CBPA currently have an average overall disturbance width of 18 feet, allowing for 14 feet of driving surface. These roads are in relatively good condition and could be used during construction with only minor blading required within the existing footprint. Some of these access roads may require widening for construction support where the widths are not sufficient to support equipment traffic.

Type C access roads through the CBPA would consist of newly bladed or upgraded roads which would provide access to Type B and D roads.

In order to reach the proposed structure locations in the CBPA, Type D spur roads are proposed to be constructed. Some of the spur roads would be located in steep terrain with slopes that exceed 15 percent. Spur roads in steeper terrain would result in larger disturbance areas as described above. There are also several proposed Type D spur roads for tracked equipment only to some structure sites for Segment p-11. These would be in areas where full access roads cannot be developed, but it is possible to provide access to tracked equipment only with an estimated maximum width of 50 feet. These roads would be reclaimed to the fullest extent possible, as they are not suitable for use by operation and maintenance vehicles.

Estimated miles of access roads needed and estimated disturbance for the Proposed Action, Action Alternative, and the Agency Preferred Alternative segments are shown in Tables 2.2-18 through 2.2-20.

Table 2.2-18 Proposed Action Access Roads and Long-term Disturbance Summary by Segment

[1] Helicopter access would be required for these segments. Segments cb-01 and cb-02 are alternatives to each other. Should one of these segments be included in the Agency Preferred Alternative, one helicopter staging area of approximately 43.5 acres would be required.

Types A and E access would not require any new disturbance.

Construction of the distribution line to the alternative SCS would be accessed via existing routes and no new access would be required.

[1] Helicopter use is anticipated for these segments.
Access Types A and E would not require any additional ground disturbance.
Construction of the distribution line to the alternative SCS would be accessed via existing routes and no new access would be required.

Helicopter Access

Helicopter support is essential to the wire stringing process, as it provides a vital tool to project managers, field supervisors and crews to facilitate the construction process and to enhance the safety of the crews in the field. It is common to use a light helicopter to string the pilot line. The pilot line is attached to a hard line on the ground, which is then attached to the conductor for actual pulling of the conductor. Landing zones for helicopter operations during stringing on pilot line would be confined to previously disturbed pad sites or puller/tensioner sites throughout the line.

Also, in areas where access roads are not feasible due to particular biological, topographical, archaeological, and/or visual concerns, helicopters would be utilized for structure construction and setting (Type E). Helicopters would utilize material lay down or helicopter fly yards for concrete transfer, steel storage, assembly, and refueling. Two fly yards, one on either side of helicopter construction area, about five miles apart, would be sited in areas that need minimal grading. Duration of use for the fly yards is the same as the duration of construction activity within those segments. There would still be vehicle travel associated with helicopter use for crew and tool access under one of the other access road types described above.

Helicopter access is anticipated under the Proposed Action for Segments p-09, p-10, and p-11. Under the Proposed Action or Action Alternatives (Segments cb-01 or cb-02), in areas where crane access is not feasible, helicopters would be used to assist in foundation construction, airlift in sections of the structures, and to place structures on the poured foundations. Helicopters would pick up pre-assembled subsections of the structures, place them on the foundations, and ground crews would assemble the structures with hardware. This process would continue until the structure is erected.

DCRT or its' construction contractor(s) would ultimately decide the need for helicopter construction usage on the Project if not required by the BLM. The Helicopter Flight and Safety Plan would be included as a part of the final POD. The hours of operation and expected number of miles of structures that could be erected per day would be described in the Helicopter Flight and Safety Plan.

A MD600N type helicopter would be used for wire operations. The helicopter would be used for hauling and supporting men and equipment for the Project. It would also be used to fly sockline, crew members, ladders, baker boards, etc.

Prior to any helicopter operations, a daily tailboard meeting would be held with DCRT and/or their contractor employees, linemen, and the aviation crew. All personnel involved with the operation would clearly understand the scope of the work and the procedures that would be utilized. All persons working with the helicopter would be familiar with head and hand signals in the event of a radio malfunction or garbled reception.

Helicopter operations require helicopter fly yards, preferably one on either side of each helicopter construction area (about 5 miles apart maximum) for supporting helicopter only and helicopter assist construction:

Fly Yard 1 – Segment p-09, 5.8 acres of disturbance

Fly Yard 2 – Segment p-11, 20.0 acres of disturbance

Fly Yard 3 – Segment p-10 (and Alternative Segment cb-01), 7.6 acres of disturbance

Fly Yard 4 – Alternative Fly Yard – Segments cb-01/cb-02, 43.5 acres of disturbance

These fly yard locations were chosen because they limit the need for grading and can be fully reclaimed. Duration of use for the fly yards is the same as the duration of construction activity within the CBPA and the adjacent segments.

The ground area in the fly yards and the ROW would be kept free of any debris and watered down by DCRT and/or their contractor to maintain environmental conditions (dust control). Prior to landing, the helicopter would communicate to water truck personnel and the area would be watered for dust compliance. Personnel would perform a ground walk-through prior to beginning flight operations to identify any potential hazards to persons or property on the surface. Helicopters would use existing disturbance bladed for the Project such as construction sites along the ROW to land.

Table 2.2-19 indicates that Segments cb-01 and cb-02 would require helicopter access for construction. As these locations are situated in remote areas in Copper Bottom Pass, risk to the public from structure transportation is not high. Traffic control measures would be implemented in these remote areas during structure transportation activities.

The Erosion, Dust, and Air Quality Plan, included in the final POD prior to the NTP, would include information about the reduction of dust emissions generated from helicopter use.

2.2.5.9 Induced Currents on Adjacent Facilities

Induced currents on facilities such as metallic structures such as other transmission lines, railroads, pipelines, fences, or structures that are parallel to or cross the transmission line(s) occur to some degree during steady-state operating conditions and during a fault condition on the transmission line(s). Conducted currents on these facilities (directly to ground) occur during fault conditions. For example, during a lightning strike on the line(s), the insulators may flash over, causing a fault condition on the line(s); current would flow down the structure through the grounding system (that is, ground rod or counterpoise) and into the ground.

The magnitude of effects of the AC-induced currents on adjacent facilities is highly dependent on the magnitude of the current flows in the transmission line(s), the proximity and orientation of the adjacent facility to the line(s), and the distance (length) for which the facilities and the line(s) parallel one another in proximity.

The methods and equipment needed to mitigate these conditions would be determined through electrical studies of the specific situation prior to initiation of construction activities. As standard practice and as part of the Project design, electrical equipment and fencing at the substation would be grounded. Grounding of metallic objects outside of, but within 150 feet of the ROW, also may be implemented. These actions address most induced current effects on metallic facilities adjacent to the transmission line by shunting the induced currents to the ground through ground rods, ground mats, and other grounding systems, thus reducing the step and touch

potential a person may experience when touching a metallic object near the line (that is, reducing electric shock potential).

If additional gradient control wires were needed for existing pipelines, they are expected to be located within the existing pipeline ROW. Not knowing the level of mitigation that may be needed, there could possibly be some disturbance from installation of the gradient wires. An electrical study would be conducted once the proximity of the ROW to existing pipelines is known and prior to construction. This study would determine the extent and type of anti-corrosion mitigation that would be required. The gradient wires that may be required could be installed by different methods; trenching, ripping, or a combination of both.

Once the final route and any paralleled facilities, such as pipelines, have been determined, an induction study would also be completed for those facilities affected by the Project. Typically, a distribution supply line is needed to provide power for the compensation stations, fiber optic repeater stations, and cathodic protection equipment. The need for, and locations of, any new distribution lines would be determined as part of the detailed Project design, following issuance of the ROD.

There are two different ways to provide cathodic protection: galvanic and impressed current. The method of cathodic protection would be determined as part of the study, and the most operationally- and cost-effective method to protect the facilities would be used. A distribution line (impressed current) would be used if existing facilities were available. If distribution lines weren’t available where needed, other methods would be researched and used if feasible.

If any distribution lines were potentially required for impressed current cathodic protection, an induction study would be conducted once the Agency Preferred Alternative was selected. Disturbance estimates would be included in the final EIS.

A fiber optic repeater would be located in the SCS, using the same distribution line for backfeed to this substation. For Segment p-06 (Kofa NWR), the distribution line for the SCS would tie-in to the same distribution line used for the DPV project.

The proposed Project would intersect and parallel a Kinder Morgan Energy Partners Natural Gas existing pipeline ROW for a substantial portion of its length. While the width of ROWs varies based on anticipated maintenance needs and negotiations between utilities and landowners, typical pipelines in the region generally have permanent ROW widths of approximately 50 feet.

In the case of a longer parallel facility, such as a pipeline parallel to the Project over many miles, DCRT may undertake additional electrical studies to identify any additional mitigation measures that would need to be implemented to prevent damaging currents from flowing onto the parallel facility and to prevent electrical shock to any people who may come in contact with the parallel facility. Some of the typical MMs that could be considered for implementation, depending on the degree of mitigation needed, can include the following (National Association of Corrosion Engineers International 2014):

- **Fault Shields.** Shallow grounding conductors connected to the affected structure adjacent to overhead electrical transmission structures, poles, substations, etc. They are intended to provide localized protection to the structure and pipeline coating during a fault event from a nearby electric transmission power system.

- **Lumped Grounding.** Localized conductor or conductors connected to the affected structure at strategic locations (for example, at discontinuities). They are intended to protect the structure from both steady-state and fault AC conditions.
- **Gradient Control Wires.** A continuous and long grounding conductor or conductor installed horizontally and parallel to a structure (for example, pipeline section) at strategic lengths and connected at regular intervals. These are intended to provide protection to the structure and pipeline coating during steady-state and fault AC conditions from nearby electric transmission power systems.
- **Gradient Control Mats.** Typically used for aboveground components of a pipeline system, these are buried ground mats bonded to the structure and are used to reduce electrical step and touch voltages in areas where people may come in contact with a structure and be subject to hazardous potentials.

Permanent mats bonded to the structure may be used at valves, metallic vents, cathodic protection test stations, and other aboveground metallic and nonmetallic appurtenances where electrical contact with the affected structure is possible. In these cases, no standard solution exists to solve these issues every time. Instead, each case must be studied to determine the magnitude of the induced currents and the most appropriate mitigation given the ground resistivity, distance paralleled, steady-state and fault currents, fault clearing times expected on the transmission line, and distance between the line and paralleling facilities, to name a few of the parameters. Should the electrical studies indicate a need to install cathodic protection devices on a parallel facility, a distribution supply line interconnection may be needed to provide power to the cathodic protection equipment.

2.2.5.10 Temporary Use Areas

Material staging and laydown yards would be strategically located along the Action Alternative routes, with a total maximum disturbance of 34.5 acres. An average of one staging/crew show-up area per 20 line-miles is assumed for the Project, currently identified in Tonopah, Quartzsite, Salome, and Blythe. Material laydown areas, not to exceed four, would be within the ROW or adjacent. Locations for temporary use areas would be identified in the final POD and would generally be located on previously disturbed lands or in areas that are identified as minimizing environmental impacts. In some locations, only minimal site preparation would be required for material staging, laydown yards, and helicopter fly yard locations. Some areas may need to be scraped, which involves removing the top 6 inches of topsoil, by bulldozer and adding a layer of rock or compacting the dirt and/or applying dust palliatives/tackifier to provide an all-weather surface. It is likely that not all staging areas would be active at the same time. Construction would occur in a sequential manner with access crews, foundation crews, structure erection crews, stringing crews, and cleanup crews working in order throughout the Project. Quick road access is preferred for location selection.

Batch plant operations would be colocated with material staging/laydown yards. A crane would be used to set the batch plant equipment. If a batch plant is needed outside of planned material storage yards, an area of approximately 5 acres would be required. For purposes of disturbance estimates, material staging, material storage, and laydown areas are synonymous. The existing 500kV switchyards at the Delaney and Colorado River substations were designed and constructed to accommodate multiple transmission lines and generation interconnections, and as

such there would not be an expansion to the existing substation acreage or to the existing 500kV buses. No new disturbance would occur outside of the substation property boundaries.

These areas would be used only during construction and reclaimed following completion of construction as described in the Habitat Restoration and Monitoring Plan (Appendix 2B). The sites would be returned to their original contour and stockpiled topsoil would be spread on the surface. Vegetation reclamation would be designed and implemented with the goal to return the short-term disturbance areas to their pre-existing conditions to the extent practicable, given the desert environmental conditions.

To the extent practicable, temporary use areas would be located in previously disturbed areas to minimize impacts to the environment. A Stormwater Pollution Prevention Plan (included in the final POD prior to the NTP) would provide detailed, site-specific steps to minimize construction impacts to the natural environment.

2.2.5.11 Existing Utility Lines and ROW Crossings

A number of existing electric utility ROWs are present near the Project which would require spanning or encroachment. The CAP canal has a varied ROW in the Project vicinity; the Project would cross the canal twice near the Big Horn Mountains and parallel it in areas to the west. The Proposed Action would also cross major roadways, including I-10, Arizona SR 95, California SR 78, and local roads in Maricopa, La Paz, and Riverside Counties, where structures would need to be placed outside of existing ROWs.

Temporary clearance structures called guard structures would be erected over highways, transmission lines, structures, waterways, and other obstacles prior to conductor stringing. The guard structures are typically vertical 16 to 24-inch diameter wood poles with cross arms, on a 2xh-frame configuration (Appendix 7, Figure 2.2-22) and are erected at road crossings or crossings with other energized electric and communication lines to prevent contact during stringing activities.

Bucket trucks may also be used to provide temporary clearance. Bucket trucks are trucks fitted with a hinged arm ending in an enclosed platform called a ¨bucket¨, which can be raised to let the worker in the bucket service aerial equipment. Two crossing guard structures are required per crossing, one on each side.

All guard structures would be located within the Project ROW. The short-term disturbance associated within installation of guard structures would consist of a 50 by 200-foot work area at the base of each structure and three holes approximately 2 feet in diameter, with a total of 10,000 square feet (0.23-acre) of short-term disturbance per each side of the crossing. The installation method of the guard structures would be direct embedding with crushed rock and excavated material. All excavated material for the guard structures would be used to backfill these guard structures. As such, no excavated material would require offsite removal. All topsoil would be salvaged, stockpiled, and replaced on removal of the guard structures and initiation of reclamation activities.

A summary of the number and type of crossings and the associated short-term disturbance for the Proposed Action, Action Alternatives, and the Agency Preferred Alternative, by segment, is provided in Tables 2.2-21 through 2.2-23.

N/A - not applicable
* Guyed V foundations would be precast; however, grout for guyed V anchors represented here.
**Not included in transmission line structure total as these are equipment foundations.
Assume the water per structure values provided in Table 2.2-24
Dust control estimated at an average of 1,051,842 gallons per mile in Maricopa County and 210,368.4 gallons per mile in all other parts of the Project, average.
No water would be required for construction of the SCS distribution line.

Alternative SCS distribution line not included in line mile total. No water would be required for construction of the SCS distribution line.

2.2.5.13 Disposal and Cleanup

See Section 2.2.5.13 of Chapter 2.

2.2.5.14 Construction Reclamation

Cleanup

Construction sites, material storage, laydown yards, batch plants, and access roads would be kept in an orderly condition throughout the construction period in conformance with the Waste Management Plan for the Project (to be included in the final POD). Refuse and trash, including stakes and flagging, would be removed from the work areas and disposed of in local permitted landfills in accordance with local ordinances. There would be no open burning or on-site disposal of construction trash at any time during the life of the Project. Once the cleanup crew has completed a section of line, the staging area serving that portion of the line would be decommissioned and fencing around storage yards would be removed.

Soil Stabilization

Ruts and holes due to construction activities would be regraded. Disturbed surfaces would be reclaimed to as near the original contour of the land surface as possible. Permitted water diversions would be constructed along the ROW, as needed, to control surface water and minimize soil erosion. Temporary construction roads, not required for future maintenance access, would be reclaimed after construction of the Project is complete. For example, access roads to staging areas would not be required once the staging area is regraded and vegetated. Areas of soil compaction, including temporary roads and reclaimed existing roads, would be scarified as prescribed in the Habitat Restoration and Monitoring Plan (Appendix 2B). Unless directed by the landowner, the rock placed on temporary use areas (material staging, laydown, and batch plant locations, for example) would be removed from the staging area upon completion of construction, and the area reclaimed. A number of BMPs for soil stabilization would be implemented in disturbed areas. Possible stabilization methods may include reseeding, contouring of the land surface, use of water control and diversion techniques, compacting or de-compacting of underlying soil if appropriate, sediment control devices and rolled erosion control systems (RECS) because they are typically sold in rolls for ease of storage and installation and others. A detailed assessment of available stabilization procedures and technologies is included in the Habitat Restoration and Monitoring Plan for the Project.

Revegetation

Appropriate site-specific seed mixes for revegetation would be used for varying site conditions and would be specified in the Habitat Restoration and Monitoring Plan (Appendix 2B). Salvaged native plants would be used for revegetation, if appropriate, along with seeding using BLM-recommended and approved seed mixes. Preferably, seeding would occur during the months from November to January following transmission line construction. Specific details for revegetation activities would be described in the approved POD or within the Habitat Restoration and Monitoring Plan prepared for this Project. Part of the Habitat Restoration and Monitoring Plan would be the inclusion of specific success criteria that must be met to demonstrate compliance with vegetation requirements. Water requirements for revegetation would be estimated in conjunction with preparation of the Habitat Restoration and Monitoring Plan.

DCRT would adhere to Arizona's Native Plant Law, and any California legal requirements, and would work with the applicable jurisdictions to implement reclamation and reseeding of construction-disturbed areas sites, in accordance with BLM, state, and local requirements. Plants would be salvaged on state trust lands, while safeguarded and salvage restricted plants protected by the Arizona Native Plant Law would likely be salvaged on BLM and private lands, pending a decision by the BLM in accordance with the Habitat Restoration and Monitoring Plan (Appendix 2B). All plant material not salvaged could either be broken up to potentially aid in revegetation efforts and/or completely removed from the area and disposed of at an appropriate disposal facility in compliance with the Vegetation Management Plan (Appendix 2B, Section 2B.11) for the Project.

2.2.5.15 Construction Workforce and Schedule

The estimated number of workers and types of equipment required to construct the proposed transmission line are shown in Table 2.2-28 and are subject to adjustment as Project planning evolves. The estimated number of workers and types of equipment required to construct the SCS are provided in Table 2.2-29. Various phases of construction would occur at different locations throughout the construction process, and in some cases at the same time at different locations. Regular field meetings would be held with the CIC and environmental monitors to coordinate construction activities with monitoring requirements for the transmission line and ancillary facilities.

The transmission line workforce and equipment listed in Table 2.2-28 would also be used for reclamation. The workforce required for reclamation for the SCS is included in Table 2.2-29. Crew parking would be accommodated at a central staging area. Crews would then be sent out to work sites together via carpool. The central location required for crew parking would be located at one of the material storage yards closest to the work area. The most probable locations are Blythe, Quartzsite, Tonopah, and adjacent to the SCS, but the location would depend on the final route selected by the BLM. The transmission line labor force and equipment requirements provided in Table 2.2-28 is for one work front. All the following activities, except ROW survey and geotechnical investigation, would operate in up to two work fronts, simultaneously.

Commissioning and Testing	37

2.2.5.16 Project Construction Closeout

See Chapter 2.

2.2.5.17 Estimated Disturbance Summary

See Chapter 2.

2.2.6 Project Operation and Maintenance

The anticipated operations and maintenance duration is 50 years.

The NESC (ANSI C2), which governs the design and operation of high-voltage electric utility systems, obligates the applicant to maintain reliable operation of the electrical system. The design, operation, and maintenance of the Project would meet or exceed applicable criteria and requirements outlined by NESC, FERC, WECC, Avian Power Line Interaction Committee

recommendations, and U.S. Department of Labor Occupational Safety and Health Standards for the safety and protection of landowners, their property, and the general public.

In 2005, Congress passed the Energy Policy Act of 2005, which provided a regulatory basis for implementing specific incentives (and penalties) for maintaining reliable service, among other issues. As a result of the passage of the Energy Policy Act of 2005, FERC selected NERC to act as the enforcement agency for compliance with electric utility reliability and operating standards, among other issues. DCRT is required to comply with the various reliability standards promulgated through implementation of NERC policies and procedures. Additionally, DCRT is governed by WECC standards that may be in addition to or more stringent than those put forth by NERC.

2.2.6.1 Building and Fence Grounding

To mitigate possible electric shock caused by electrostatic and electromagnetic induction, all buildings, fences, center pivot irrigation systems, and other structures with metal surfaces within 150 feet of the centerline of the ROW would be grounded to the mutual satisfaction of the parties involved. Typically, residential buildings more than 150 feet from the centerline would not require grounding. Other buildings or structures beyond 150 feet from the centerline would be reviewed in accordance with the NESC to determine grounding requirements. All metal irrigation systems and fences that parallel the transmission line for distances of 500 feet or more, within 150 feet of the centerline, would be grounded (none identified at this time). All fences that cross under the transmission line would also need to be grounded. This procedure would be included in the construction specifications and, if grounding is required outside the ROW, temporary use permits or landowner consent would be obtained, as necessary.

2.2.6.2 Inspections and Maintenance

Regular inspection of transmission lines, substations, distribution lines, and support systems is critical for the Project's safe, efficient, and economical operation. Operation and maintenance activities would include transmission line patrols, annual inspections, structure and wire maintenance, and repairs of access roads.

Transmission Line Maintenance

The transmission lines would be inspected annually or as required by using fixed-wing aircraft, helicopters, ground vehicles, all-terrain vehicles, or on foot. The transmission lines and substations would be inspected for corrosion, equipment misalignment, loose fittings, vandalism, and other mechanical problems. The need for vegetation management would also be determined during inspection patrols.

Maintenance would be performed as needed. The comfort and safety of land users and local residents would be provided for by limiting noise, dust, and the danger caused by maintenance vehicle traffic. Where access is required for nonemergency maintenance and repairs, the same precautions against ground disturbance that were taken during construction would be followed, and restrictions and MMs applicable during initial construction would be followed in areas of critical biological and cultural resource concern. Any berms or boulders that were in place also would be reclaimed after completion of the maintenance work.

Reclamation procedures following completion of repair work would be similar to those prescribed during construction (Section 2.2.5.14). Damage repair may require the same types of equipment used during construction, including power augers for hole boring, backhoes for excavation, and/or concrete trucks and cranes for structure erection. Other required equipment may include power tensioners, pullers, wire trailers, crawler tractors, and trucks and pickups for hauling materials, tools, and workers. Under certain conditions, a helicopter may be used to haul in material and erect structures or string conductor in those areas where access and/or terrain conditions preclude the use of conventional methods. If structures cannot be accessed by a permanent road, workers may access structures by helicopter, foot, or all-terrain vehicle. Any necessary temporary staging areas outside the ROW would require authorization from the applicable landowner(s). Site and access road disturbances such as ruts created during damage operations would be reclaimed to satisfactory condition using rehabilitation procedures.

A permanent work area at the base of each structure is required for long-term maintenance. While revegetation would occur in this work area, minimal contouring would be performed. If, during transmission line maintenance and monitoring, it is determined that new or reconstruction activities should be implemented, DCRT would notify BLM, property owners, and/or other regulatory agencies, and obtain proper approvals, as necessary, prior to initiating new or reconstruction.

Dust control during maintenance of the transmission line would be managed the same as during construction (Section 2.2.5.1).

Vegetation Management

When necessary and approved by the BLM, DCRT would limit the height of vegetation along the ROW according to minimum conductor clearances required for the Project. Where vegetation presents a potential hazard, trees would be trimmed or cut to prevent accidental grounding contact with conductors. The transmission line would be protected with power circuit breakers and line relay protection equipment. If a conductor failure occurs, power would be automatically removed from the line. Lightning protection would be provided by ground wires and OPGW on top of the structures.

The Vegetation Management Plan (Appendix 2B, Section 2B.11) describes measures needed to control vegetation during operation of the transmission line and at associated facilities. The goal of the Project design would be to design for conductor heights that would eliminate or minimize the need for control of height of vegetation, while assuring the Project would be in conformance with NERC guidelines and in compliance with the Arizona Native Plant Law, and any California legal requirements. Should it be required, the Vegetation Management Plan would specify controls for situations where tall vegetation such as saguaro cacti, ironwood, and paloverde growing under and immediately adjacent to the path of the conductors would need to be trimmed or removed to maintain a safe clearance and to reduce the risk of power outages, fires, and other damage. As a part of the Vegetation Management Plan, a wire zone/border zone approach would be applied (Appendix 7, Figure 2.2-23a), incorporating growth rates of tall vegetation within the Project ROW, as detailed in the Vegetation Management Plan. Extensive vegetation management is only anticipated in discrete areas within the Project Area where fast growing, tall species are present. Where necessary, saguaro cacti and other protected plants that must be

removed would be salvaged and relocated in accordance with the Arizona Native Plant Law and the Habitat Restoration and Monitoring Plan (Appendix 2B) for the Project.

The conductor's position in space at any point in time is continuously changing in reaction to a number of different loading variables. Changes in vertical and horizontal conductor positioning are the result of thermal and physical loads applied to the line. Thermal loading is a function of line current and the combination of numerous variables influencing ambient heat dissipation including wind velocity/direction, ambient air temperature and precipitation. Physical loading applied to the conductor affects sag and sway by combining physical factors such as ice and wind loading. The movement of the transmission line conductor due to wind is illustrated in Figure 2.2-23a in Appendix 7 (depending on wind conditions and conductor maximum deflection).

The NESC requires 36.25 feet clearance between the maximum point of conductor sag and the ground. The Minimum Vegetation Clearance Distance (MVCD) required by the NERC for a 500kV transmission line is 7.4 feet, at an elevation between 2,000 and 3,000 feet. Winds can blow conductors away from the transmission structures, where the conductor could connect with or arc over to nearby vegetation. The furthest point a conductor could be blown from the transmission structure is the conductor maximum deflection.

The Project would be required to be inspected annually, including the incursion of vegetation growth. Palo Verde are predicted to be the quickest growing large vegetation that could interfere with the conductor, growing an average of 36 inches per year, and could intrude on the Project either vertically or radially. The Wire Security Zone is the distance between the maximum point of conductor sag and vegetation (either vertically or radially). For estimating purposes, the Wire Security Zone would add 9 feet (3 feet for vegetation growth plus a 6-foot buffer) to the MVCD, for a total of 16 feet 5 inches beyond the point of conductor maximum sag or deflection. Therefore, the maximum height of vegetation vertically and radially from the conductors at maximum sag or deflection would be approximately 13 feet 10 inches. Border zone vegetation would be height limited at to 31 feet 7 inches, gradually increasing as the distance to the conductor increases (Appendix 7, Figure 2.2-23b). Vegetation may be required to be treated according to the Vegetation Management Plan (Appendix 2B, Section 2B.11), should design adjustments, micrositing, or other avoidance measures (Appendix 2A, Section 2A.4) not be feasible or fully resolve the situation.

DCRT would comply with agency requirements regarding management of noxious weeds and invasive species within the ROW, along access roads, and at temporary use areas (for example, cleaning equipment to prevent spread of noxious weeds and invasive species), as specified in the Noxious Weed Control Plan (Appendix 2B, Section 2B.11). Chemical treatment within or adjacent to the ROW generally would be limited only to areas with noxious weeds or invasive species, and only if absolutely necessary and in accordance with the Noxious Weed Management Plan. Should the use of herbicides or pesticides be necessary, only BLM-approved products from the approved California herbicide list would be used, and only upon prior approval of the BLM Authorized Officer or owner. A pesticide use proposal (PUP) must be completed by all persons using any chemicals on BLM-administered land. End of year reports must be turned in at the completion of every calendar year. Use of pesticides and herbicides on lands that fall under the CDCA Plan as amended by the DRECP would adhere to the CMAs regulating those activities.

Series Compensation Station Maintenance

The SCS requires minor maintenance once yearly for approximately 3 to 5 days, depending on the tasks required. A crew comprised of up to four electricians and two specialists would perform this work using a man lift.

Maintenance, patrolling, and monitoring of the SCS distribution line would include ground maintenance patrols that would review the line periodically. Routine maintenance would include replacing damaged insulators as needed and tightening nuts and bolts, as well as vegetation maintenance. Access for operation and maintenance would be traveling overland within the ROW or on adjacent roads.

Substation Maintenance

It would be the responsibility of the interconnecting utilities, SCE and APS, to perform maintenance on all equipment associated with the Project inside their respective substations (APS Delaney and SCE Colorado River Substations).

Maintenance, patrolling, and monitoring of the rest of the Project, including the SCS, would be the responsibility of DCRT and would be performed on a routine basis in accordance with industry standards and manufacturer guidelines. If a large volume of a contaminant were to leak from a piece of electrical equipment, an automated alert would notify the operations center of the problem. A trained maintenance crew would be dispatched to the substation or SCS immediately to begin repairs and clean up according to all appropriate regulations and procedures.

2.2.6.3 Long-Term Access to the ROW

Authorized access roads would be used only for maintenance purposes upon completion of construction. Where long-term access is required for maintenance and operation and authorized by the BLM or other underlying landowners/managers, DCRT would maintain the ROW in a safe, useable condition. A regular maintenance program may include, but would not be limited to, blading, ditching, culvert installation, and surfacing. Access maintenance would not be initiated prior to obtaining necessary authorization from landowners or land management agencies.

Maintenance vehicles would require access to the ROW once yearly for transmission line inspection. Where the ground is uneven at drainage crossings, special precautions would be taken to ensure equipment blades do not destroy vegetation.

2.2.6.4 Signs and Markers

Warning signs would be placed on structures and at substations, marking high-voltage danger areas in accordance with industry standards.

2.2.6.5 Energy Use During Operations and Maintenance

Strengthening the regional transmission system in Arizona and California by adding additional capacity and alleviating grid congestion would indirectly facilitate increased consumption of energy by meeting increased electricity demand (Section 1.2.2). However, increases in per capita energy use are not expected to result from implementation of the Project. Nevertheless, a direct effect of this grid congestion reduction is that the Project would improve energy reliability. The Project would also facilitate the development of new renewable energy sources. Vehicle trips and equipment use during operation would be minimal and have a negligible impact on energy consumption. Nevertheless, the Project would incorporate measures in maintenance procedures to reduce wasteful energy use during operation as well.

The conductor selected for the Project, and the increase in section allowed by the triple-bundle configuration, would reduce energy losses. Aluminum conductor steel-reinforced design (ACSR) selection allows the use of aluminum, a metal with high conductivity, while steel provides the tensile strength required.

Transmission losses are also directly proportional to the square of the power transmitted, and therefore operation of this line in parallel with the DPV1, would allow power to be distributed between both lines, and therefore reducing overall transmission losses for the same amount of power transmitted.

2.2.6.6 Radio or Television Interference

DCRT would respond to complaints of radio or television interference generated by the transmission line by investigating complaints and implementing appropriate MMs, if necessary. The transmission line would be inspected on a regular basis so that damaged insulators or other components that could cause interference are repaired or replaced. These patrols would be the same thing as routine inspections and monitoring, unless a problem is reported; then a special patrol or maintenance might be done to mitigate an issue.

2.2.6.7 Contingency Planning

A representative would be selected by DCRT to provide routine and emergency planning for situations such as power outages, equipment upgrades, and fire control. The designated representative would have the authority to receive and carry out instructions from BLM.

2.2.6.8 Emergency Procedures

In the event of an emergency, crews would be dispatched quickly to repair or replace any damaged equipment. Every attempt would be made to contact the appropriate agencies or landowners along the ROW. In the event notification cannot be made, repair operations would proceed only in the case of an emergency situation with notification occurring within 48 hours after the emergency incident. Reasonable efforts would be made to protect plants, wildlife, and other resources, and minimize ground disturbance.

Emergency response procedures would be implemented for the following potential events or similar events, in conformance with the Emergency Response Plan for the Project (to be provided in conjunction with the final POD):

- downed transmission lines, damaged structures and/or conductors, or equipment failure
- fires
- sudden loss of power
- natural disasters
- serious personal injury

2.2.6.9 Compatible Uses

After construction, compatible uses in the ROW on public land would be considered and approved (if necessary) by BLM in consultation with DCRT. Examples of compatible uses within the ROW include grazing, vehicle and pedestrian access to cross under the line, recreational use, low growing vegetation, and preexisting compatible uses. Examples of uses generally not compatible with high-voltage transmission lines include commercial or residential development and any use that requires changes in surface elevation that affect electrical clearances of existing or planned facilities. Compatible uses of the ROW on Federally managed lands would have to be approved by the appropriate agency. Compatible uses within easements on private land crossed by the transmission line would be similar to those on public land and would be consistent with the terms of the easement.

2.2.7 Termination, Reclamation, and Decommissioning

Should the ROW and facilities no longer be needed, the transmission lines and associated facilities would be decommissioned on BLM-managed land. Subsequently, conductors, insulators, concrete pads for the SCS and associated facilities, and hardware would be dismantled and removed from the ROW. Transmission structures would be removed and foundations broken off at least 2 feet below ground surface. All areas of long-term disturbance would be reclaimed in accordance with a Decommissioning Plan.

Access routes and other sites disturbed during decommissioning would be reclaimed and revegetated in accordance with a Decommissioning Plan to be approved by BLM. Implementation of this plan is intended to minimize the impacts of decommissioning activities and ensure that all areas temporarily disturbed during decommissioning are returned to their prior condition. Selected contractors would also be required to develop a stormwater pollution prevention plan (SWPPP), which would provide detailed, site-specific steps to minimize impacts to the natural environment. Soil would be de-compacted and sites would be returned to their original contour where possible, salvaged topsoil distributed, and water diversions and other erosion control measures established where necessary. A site-specific mix of native seeds would be planted using BLM-approved methods, and vegetation that had been salvaged and maintained in a nursery would be planted in accordance with the approved Habitat Restoration and Monitoring Plan provided in the Reclamation, Vegetation, and Monitoring Plan. Revegetated sites would be monitored periodically to evaluate the effectiveness of erosion control measures,

inventory and control weeds, compare the progress of vegetation recovery to predetermined reclamation success criteria, and identify any additional treatment required to achieve those criteria.

Prior to termination of the ROW, the holder shall contact the BLM Authorized Officer to arrange a joint inspection of the ROW. This inspection would be held to facilitate an acceptable Decommissioning Plan. The BLM Authorized Officer must approve the Plan in writing prior to commencement of any termination activities. The Decommissioning Plan would be reviewed and approved by the BLM Authorized Officer and would include the following information:

- what facilities and access routes are to be removed, reclaimed, and/or rehabilitated;
- how facilities and access routes would be removed and the disturbed areas reclaimed;
- time of year the facilities and access routes would be removed;
- timeline or schedule of removal and reclamation activities;
- stabilization and reclamation techniques to be used during reclamation;
- appropriate BLM approved environmental analysis of the plan;
- criteria that reclamation should meet to be considered complete;
- monitoring of the stabilization and reclamation techniques for an established time period; and
- any environmental stipulations necessary for the protection of sensitive environmental and cultural resource locations

Decommissioning would be a separate undertaking under the National Historic Preservation Act, as stipulated in the revised draft PA.

2.2.8 Applicant Proposed Measures and BLM Best Management Practices

See Chapter 2.

2.2.9 Alternative Segments Considered but Eliminated from Detailed Analysis

A summary of alternative segments not carried forward for detailed analysis is provided in Table 2.2-32 and shown on Figures 2.2-24 through 2.2-27 (Appendix 7).

2.3 COMPARISON OF ALTERNATIVES

A comparison of impacts by segment and subalternatives is provided in Tables 2.2-33a-b, 2.2-34a-b, 2.2-35a-c, and 2.2-36a-d; and Tables 2.2-37 through 2.2-41, respectively.

Table 2.2-32 Alternative Segments Eliminated from Detailed Analysis

ALTERNATIVE/ SEGMENT (LENGTH IN MILES)	SEGMENT DESCRIPTION	ALTERNATIVES SCREENING CRITERIA				REASON ELIMINATED FROM DETAILED ANALYSIS
		CONSISTENT WITH PURPOSE AND NEED?	TECHNICALLY FEASIBLE?	ECONOMICALLY FEASIBLE?	ENVIRONMENTALLY SUPERIOR?	
East Plains & Kofa Zone						
ASLD-A (21.4)	Alternative to Segment p-06, x-04. Connects the Proposed Action to segments paralleling I-10; avoids the Kofa NWR. Suggested by ASLD to avoid Arizona state trust land parcels near I-10 Follows existing Kinder Morgan–El Paso Natural Gas pipeline; could share access to reduce disturbance.	Yes	Yes	Yes	No, would have similar impacts to Segment x-04, but slightly longer/less direct. Segment x-04 would better utilize existing access along the gas pipeline road.	Segment x-04 would be superior.
BLM-1 (21.8)	Alternative to Segments p-01, d-01 Parallels I-10 on south side Almost entirely on Arizona state trust and private land; within utility corridor on BLM-administered land.	Yes	Yes	Yes	No, although this segment would be shorter and would have 2 less crossings of I-10 and the CAP than the Proposed Action (p-01), it would require more new disturbance and new access as compared to the Proposed Action (p-01) and d-01, which parallel existing linear utilities with existing access. Also, this segment would require an unreasonable amount of negotiations with numerous private landowners, as well as ASLD; thus, it is not considered superior to the corresponding segments of the Proposed Action.	Segment p-01 or d-01 would be superior since they parallel existing utilities.

ALTERNATIVE/ SEGMENT (LENGTH IN MILES)	SEGMENT DESCRIPTION	ALTERNATIVES SCREENING CRITERIA				REASON ELIMINATED FROM DETAILED ANALYSIS
		CONSISTENT WITH PURPOSE AND NEED?	TECHNICALLY FEASIBLE?	ECONOMICALLY FEASIBLE?	ENVIRONMENTALLY SUPERIOR?	
BLM-4 (32.3)	Alternative to Segments p-02 through a portion of p-06; i-01 through i-03. Parallels I-10 on north side; within utility corridor on BLM-administered lands.	Yes	Yes	Yes	No, would avoid impacts to scenic views looking south from I-10 toward Courthouse Rock, the New Water Mountains Wilderness, and the Kofa NWR. Views along I-10 are more scenic to the south than the north and travelers on I-10 tend to look to the south; would parallel the CAP, which is prominent linear feature visible to the north. Would place the Alternative Series Compensation Station north of I-10, which could save a future I-10 crossing to connect to the Brenda SEZ. However, would cross both Category 2 and 3 Sonoran desert tortoise habitat, while Segment i-03 south of and parallel to I-10 would only cross Category 3 habitat. AGFD stated there is more sensitive habitat on the north side and prefers this segment not go forward.	Would impact higher quality tortoise habitat and impact other sensitive habitat more than other alternatives. La Paz County adamantly requires the line to be sited on the south side of I-10, due to their economic feasibility issues on record.
Quartzsite Zone						
XA (9.6)	Alternative to Segments i-05, qn-01 and a portion of qn-02; qs-01 and qs-02. Developed as conceptual route around north side of the Town of Quartzsite; replaced by qn-02.	Yes	Yes	Yes	No, qn-02 follows the existing WAPA 161kV transmission line and would reduce impacts by co-locating facilities and sharing access.	Replaced by Segment qn-02.
XB (2.0)	Alternative to Segment p-09, qn-02. Originally part of Segment qs-02, but qs-02 revised to dip south to avoid Quartzsite developed area.	Yes	Yes	Yes	No, the segment would have visual and land use impacts to densely developed areas on the southwest side of Quartzsite, including residential areas, as well as popular OHV routes and dispersed camping areas immediately south.	Replaced by eastern portion of Segment qs-02 on BLM lands.

ALTERNATIVE/ SEGMENT (LENGTH IN MILES)	SEGMENT DESCRIPTION	ALTERNATIVES SCREENING CRITERIA				REASON ELIMINATED FROM DETAILED ANALYSIS
		CONSISTENT WITH PURPOSE AND NEED?	TECHNICALLY FEASIBLE?	ECONOMICALLY FEASIBLE?	ENVIRONMENTALLY SUPERIOR?	
XC (5.5)	Alternative to Segments x-07, x-08 Within designated but as-yet undeveloped utility corridor; corridor is currently under review regarding whether it will continue as a corridor.	Yes	Yes	Yes	No, due to very steep and rugged topography, would result in impacts to vegetation and topography in this undisturbed area. Also, there are numerous mining claims in the area which may make route infeasible. Segments x-07 or x-08 would provide easier connection between the Proposed Action route and an I-10 route with less impacts and more certainty.	Segments x-07 or x-08 would be superior.
Copper Bottom Zone						
BLM-3 (1.6)	Alternative to Segment x-08 Connector between the I-10 and Proposed Action routes without right angle turns.	Yes	Yes	Yes	No, challenging terrain would incur more impacts to the natural topography, soils, etc. Segment x-08 offers a shorter route with less challenging terrain and portions of which are in previously disturbed areas, resulting in fewer impacts to vegetation and topography.	Segments x-08 would be superior.
cb-07 (2.8)	Alternative to Segments p-10/p-11/p-12; cb-01, cb-02	Yes	Yes	Yes	Avoids crossing Cunningham Peak, Johnson Canyon, and Copper Bottom Pass, but the terrain is challenging and would result in more impacts than Proposed Action. Also, this segment could negatively impact the YPG mission by placing road and structures near YPG boundary.	Segments dropped through coordination between BLM and YPG management due to potential national security impacts.
cb-08 (3.0)	Alternative to Segments p-10/p-11/p-12; cb-04	Yes	Yes	Yes	Avoids crossing Cunningham Peak, Johnson Canyon, and Copper Bottom Pass, but the terrain is challenging and would result in more impacts than Proposed Action. Also, this segment could negatively impact the YPG mission by placing road and structures near YPG boundary.	Segments dropped through coordination between BLM and YPG management due to potential national security impacts.
cb-09 (7.7)	Alternative to Segments p-13, cb-05	Yes	Yes	Yes	Avoids crossing Cunningham Peak, Johnson Canyon, and Copper Bottom Pass, but the terrain is challenging and would result in more impacts than Proposed Action or cb-05. Also, this segment could negatively impact the YPG mission by placing road and structures near YPG boundary.	Segments dropped through coordination between BLM and YPG management due to potential national security impacts.

ALTERNATIVE/ SEGMENT (LENGTH IN MILES)	SEGMENT DESCRIPTION	ALTERNATIVES SCREENING CRITERIA				REASON ELIMINATED FROM DETAILED ANALYSIS
		CONSISTENT WITH PURPOSE AND NEED?	TECHNICALLY FEASIBLE?	ECONOMICALLY FEASIBLE?	ENVIRONMENTALLY SUPERIOR?	
XD (4.0)	Attach transmission line to existing DPV1 structures through Copper Bottom Pass.	No, the segment would not meet the CAISO requirement of a 250-foot separation from DPV1.	Yes	Yes	Yes, would eliminate disturbance from new structures and eliminate or substantially reduce disturbance for new access routes.	Eliminated because it would not meet the CAISO requirements for the Project, to maintain separation between the Project and the existing DPV1 Transmission Line.
XF (1.6)	Alternative to Segment x-08	Yes	Yes	Yes	No, Segment x-08 would be shorter, with fewer impacts, and be easier to construct.	Segment x-08 would be superior.
Colorado River and California Zone						
ca-03 (3.5)	Alternative to Segments p-17, ca-07/ca-08/ca-09	Yes	Unknown at this time; would require negotiation with Desert Quartzite Solar Project, could adversely impact the solar project's planned operations. Desert Quartzite Solar Project is presently under environmental analysis by the BLM.	Yes	Yes, partially within a utility corridor and would cross lands already dedicated to industrial facility, reducing new disturbance/impacts. But would require Desert Quartzite Solar Facility to revise planned facility layout, negatively affecting operations.	Due to uncertainty with solar facility, would not be superior to Proposed Action or ca-07/ca-08/ca-09.
ca-08a (1.4)	Alternative to Segments p-17/p-18, ca-07	Yes	No, crosses through the existing NRG Blythe solar facility; there is not sufficient space for the ROW.	No, would require extensive redesign of the NRG Blythe solar facility to accommodate the power line.	Yes, partially within a utility corridor and crosses industrialized area.	Replaced by ca-07 once conflict with existing NRG Blythe solar facility was identified.
ca-08b (2.9)	Alternative to Segments p-17/p-18, ca-09	Yes	No, would conflict with gen-tie lines for proposed/approved solar facilities in the area; there is not sufficient space for the ROW.	Yes	Yes, partially within a utility corridor and crosses industrialized area.	Eliminated because of technical and safety conflicts with solar facility gen-tie lines. Replaced by ca-09.
i-08e (0.8)	Alternative to Segments p-15e, i-08s Adjacent to I-10, offset to south; east of Colorado River	Yes	No, there is not sufficient space for the ROW.	Yes	No, would require relocation of residences. Existing pipeline crossing and related appurtenances, RV park, and a residential community limits available area. There are three other river crossings that would have fewer impacts to existing development.	Eliminated due to insufficient space for the ROW.
i-08wa (0.3) **i-08wb** (0.9)	Alternative to Segments p-15e, i-08s, i-08sw, ca-04, x-09 Adjacent to I-10, offset to south; west of Colorado River	Yes	No, there is not sufficient space for the ROW.	Yes	Yes	Eliminated due to insufficient space for the ROW.
i-08sw (0.7)	Alternative to Segment i-08s	No, segment was stranded after elimination of segments i-08e and i-08wa.	Yes	Yes	Yes	Eliminated because it became stranded with the elimination of connecting segments.

ALTERNATIVE/ SEGMENT (LENGTH IN MILES)	SEGMENT DESCRIPTION	ALTERNATIVES SCREENING CRITERIA				REASON ELIMINATED FROM DETAILED ANALYSIS
		CONSISTENT WITH PURPOSE AND NEED?	TECHNICALLY FEASIBLE?	ECONOMICALLY FEASIBLE?	ENVIRONMENTALLY SUPERIOR?	
i-09a (1.2)	Alternative to Segments i-08s/ca-04/x-09	No, segment was stranded after elimination of Segments XGa and i-09b.	Yes	Yes	Yes	Eliminated because it became stranded with the elimination of connecting segments.
i-09b (1.6)	Alternative to Segments p-16, ca-02, and ca-06	Yes	No, is within the Blythe Airport Influence Area, where structure heights are limited.	Yes	Yes	Eliminated due to technical infeasibility.
i-09c (0.3)	Connector between i-09a and i-10 or x-14	Yes	No, is within the Blythe Airport Influence Area, where structure heights would be limited, rendering the route infeasible.	Yes	N/A	Eliminated due to technical infeasibility.
i-10 (3.6)	Alternative to Segments p-17/p-18, ca-07/ca-09	Yes	No, would require crossing existing transmission lines, going above some lines and under others, in a manner that would not be technically feasible, and given consideration for safety. Additionally, the route would be located within the Blythe Airport Influence Area, where some structure heights would be limited, rendering the route infeasible.	Yes	N/A	Eliminated due to technical infeasibility.
i-11 (3.7)	Alternative to Segments p-17/p-18, ca-09	Yes	No, would require crossing multiple existing transmission lines, going above some lines and under others, in a manner that would not be technically feasible.	Yes	N/A	Eliminated due to technical infeasibility.
i-12a (1.4)	Alternative to Segments p-17, ca-07	No, segments i-09b, i-09c, i-11, and x-18 were eliminated, leaving the segment stranded.	No, portions would be within the Blythe Airport Influence Area, where structure heights would be limited, rendering the route infeasible.	Yes	N/A	Eliminated due to technical infeasibility and because connecting segments were eliminated.
i-12b (1.1)	Alternative to Segment XGb	No, segments i-12a and i-12c were eliminated, leaving the segment stranded.	No, portions would be within the Blythe Airport Influence Area, where structure heights would be limited, rendering the route infeasible.	Yes	Yes	Eliminated due to technical infeasibility and because connecting segments were eliminated.
i-12c (1.8)	Alternative to Segments p-17, ca-07	No, because Segments i-09b, i-09c, i-11, i-12a, i-12b, and x-18 were eliminated, leaving the segment stranded.	Segment may also have failed due to structure height limitations within the Blythe Airport Influence Area.	Yes	Yes	Eliminated because connecting segments were eliminated.

ALTERNATIVE/ SEGMENT (LENGTH IN MILES)	SEGMENT DESCRIPTION	ALTERNATIVES SCREENING CRITERIA				REASON ELIMINATED FROM DETAILED ANALYSIS
		CONSISTENT WITH PURPOSE AND NEED?	TECHNICALLY FEASIBLE?	ECONOMICALLY FEASIBLE?	ENVIRONMENTALLY SUPERIOR?	
XGa (6.6)	Alternative to Segments p-15w, ca-01, ca-05	No, Segments i-08wb and x-21 were eliminated, leaving the segment stranded.	Yes	Yes	No, segment would cross through the congested Blythe business district along I-10. High density areas are more challenging: more infrastructure, safety clearance issues, and angle structures are required.	Eliminated because connecting segments were eliminated. Replaced by alternative segments further south of and following the I-10 corridor that would have fewer adverse impacts.
XGb (1.0)	Alternative to Segment i-12b	Yes	No, would be within the Blythe Airport Influence Area, where structure heights would be limited, rendering the route infeasible.	Yes	N/A	Eliminated due to technical infeasibility.
x-14 (1.4)	Alternative to Segments i-08s/ca-04/x-09	No, it became stranded with the elimination of Segments i-09b and i-09c, and i-10.	Yes	Yes	Yes	Eliminated because connecting segments were eliminated.
x-17a (0.4) **x-17b** (1.3) **x-17c** (0.4)	Alternative to Segments x-14 and x-18a & b	Yes	No, Segment x-17b conflicts with the existing NRG Blythe solar facility operations that wasn't identified until after the segment was sited.	Yes	Yes	Eliminated due to technical infeasibility.
x-18a (0.9) **x-18b** (0.2)	Together, alternative to Segments i-08s, x-14 and i-11	No, eliminated because it became stranded with the elimination of Segments i-10, i-11, and i-12a, b, and c.	Yes	Yes	Yes	Eliminated because connecting segments were eliminated.
x-20 (1.2)	Alternative to Segment x-19	No, eliminated because it became stranded with the elimination of Segment i-11	Yes	Yes	Yes	Eliminated because connecting segments were eliminated.
x-21 (1.5)	Alternative to i-08s/ca-04/x-09	No, eliminated because it became stranded with the elimination of Segments i-08wa & b	Yes	Yes	Yes	Eliminated because connecting segments were eliminated.

Table 2.2-33a East Plains and Kofa Zone Comparison of Impacts by Segment – p and d Segments

CHARACTERISTIC OR RESOURCE IMPACT		p-01	p-02	p-03	p-04	p-05	p-06	d-01
Segment length (miles)		26.7	1.0	2.1	5.5	2.0	35.7	25.2
Land ownership (miles)	BLM	12.6	-	1.0	5.0	2.0	10.8	7.3
	Reclamation	-	-	-	-	-	-	-
	USFS	-	-	-	-	-	24.9	-
	Arizona State Trust	4.7	0.5	1.1	0.5	-	-	3.1
	Private	9.2	0.7	-	-	-	-	14.8
Ground disturbance	Short-term Acres	149.7	4.4	11.7	28.0	15.5	183.5	129.4
	Long-term Acres	67.8	3.6	7.2	19.0	7.0	125.1	88.1
BLM Yuma RMP conformance	VRM	Compliant	Compliant	Compliant	Compliant	Compliant	Amendment included	Compliant
	Corridors	Conform	Conform	Conform	Conform	Conform	Conform	Conform
Other Plan conformance (Federal, county, municipal)	Plan Conformance	Yes	Yes	Yes	Yes	Yes	No - Not an appropriate use for Kofa NWR	Yes
Air Quality and Climate Change	Air Quality Emissions are proportional to the Proposed Action based on length of each segment. Due to the length of each segment, the impact of individual segments on air quality may be negligible to minor. However, the cumulative impact of all Project segments might have large total emissions, but the emissions are distributed across a long linear area. Climate Change is not available at this smaller scale.							
Geology, Minerals, and Soil Resources	Geological Hazards Minerals/Mining (access to known resources or claims) Soils	Earthquake risk long-term negligible; no mapped active faults. No active mines; negligible short-term potential for preclusion of access; soil loss/erosion risk negligible to minor, short-term to long-term; adherence to APMs & BMPs reduces risks to negligible.	Same as p-01	Same as p-01	Same as p-01	Same as p-01	Same as p-01	Same as p-01
Paleontological Resources	Potential Fossil Yield Classification	Low to unknown	Low	Low to unknown	Low to unknown	Very low to unknown	Very low, unknown, and high	Low to unknown
Biological Resources (Vegetation Resources, Wildlife, including Special Status Species and Migratory Birds)	Loss of native habitat/communities; Noxious weeds; Special Status Species & animals); Increased risk of predation or electrocution re infrastructure; Displacement via construction; Displacement via human activity including recreation; Impacts to native habitat and designated management areas; and Migratory birds.	Segment already impacted by I-10, agriculture, transmission lines, and canal, so negligible additional impact. Short-term impact to desert bighorn sheep via avoidance of Big Horn Mountains #5 wildlife water and disruption of dispersal corridor between Burnt Mountain and Big Horn Mountains.	Additional disturbance would be indistinguishable from current conditions.	Additional disturbance would be indistinguishable from current conditions.	Permanent potential habitat degradation for Sonoran desert tortoise and other wildlife.		Potential temporary habitat alteration for Gila monster, elf owl, gilded flicker, Le Conte's thrasher, and Lucy's warbler. Temporary disruption and desert bighorn sheep and Sonoran pronghorn. Permanent impact to desert bighorn sheep and Sonoran desert tortoise habitat. Golden eagle disturbance. Construction activities could have significant direct and indirect impacts on the management of Kofa NWR for wildlife. These impacts would be major,	Areas already impacted by agriculture and development. Permanent habitat loss possible for Sonoran desert tortoise, Gila monster, and Le Conte's thrasher could be lost. Permanent impact to 187 acres of desert vegetation and wildlife habitat.

CHARACTERISTIC OR RESOURCE IMPACT		p-01	p-02	p-03	p-04	p-05	p-06	d-01
							with both short- and long-term effects, and cannot be mitigated. The USFWS states the construction of a new transmission line across the Kofa NWR should not be considered as a viable alternative.	
Cultural Resources	Damage or loss of a cultural site or potential site under Federal or state registers; degradation of the setting for a cultural site where setting is significant to its listing eligibility; increased access leading to potential vandalism; disturbance of human remains	Known NRHP-eligible sites or sites requiring NRHP evaluation: 9 (cultural resources survey coverage: 46.7%). Known site density: 3.3 sites per 100 acres. Projected NRHP-eligible sites or sites requiring NRHP evaluation: 19. No known historic properties sensitive to visual considerations. No known indirect visual impacts to known historic properties from structures along this segment.	Known NRHP-eligible sites or sites requiring NRHP evaluation: 2 (cultural resources survey coverage: 13.5%). Known site density: 85.7 sites per 100 acres. Projected NRHP-eligible sites or sites requiring NRHP evaluation: 14. No known historic properties sensitive to visual considerations. No known indirect visual impacts to known historic properties from structures along this segment.	No previous Class III cultural resources survey has been conducted in the 200-foot analysis corridor. No sites have been recorded in the corridor. As a result, no meaningful evaluation of potential site density or direct effect can be made. No known historic properties sensitive to visual considerations. No known indirect visual impacts to known historic properties from structures along this segment.	Known NRHP-eligible sites or sites requiring NRHP evaluation: 3 (cultural resources survey coverage: 26.0%). Known site density: 23.3 sites per 100 acres. Projected NRHP-eligible sites or sites requiring NRHP evaluation: 12. Cultural resources potentially sensitive to visual considerations are located within the 1-mile corridor. No known indirect visual impacts to known historic properties from structures along this segment.	Known NRHP-eligible sites or sites requiring NRHP evaluation: 2 (cultural resources survey coverage: 17.9%). Known site density: 24.8 sites per 100 acres. Projected NRHP-eligible sites or sites requiring NRHP evaluation: 11. No known historic properties sensitive to visual considerations. No known indirect visual impacts to known historic properties from structures along this segment.	Known NRHP-eligible sites or sites requiring NRHP evaluation: 17 (cultural resources survey coverage: 23.8%). Known site density: 8.3 sites per 100 acres. Projected NRHP-eligible sites or sites requiring NRHP evaluation: 71. Cultural resources potentially sensitive to visual considerations are located within the 1-mile corridor. No known indirect visual impacts to known historic properties from structures along this segment.	Known NRHP-eligible sites or sites requiring NRHP evaluation: 2 (cultural resources survey coverage: 5.7%). Known site density: 5.7 sites per 100 acres. Projected NRHP-eligible sites or sites requiring NRHP evaluation: 35. One NRHP-listed site potentially sensitive to indirect visual impacts is within the indirect effects analysis area. Analysis of potential visual impacts to this historic property would be required as part of the indirect effects analysis.
Issues of Concern to Indian Tribes	Existing and new access, native infrastructure and the interconnection of the cultural and natural environment, places of elevated spiritual important to tribes, the Colorado River, the treatment of human remains, and the disturbance of previously pristine landscapes.	No known concerns to Indian tribes.	No known concerns to Indian tribes	No known concerns to Indian tribes	Native infrastructure and the interconnectedness of the cultural and natural environment.	Native infrastructure and the interconnectedness of the cultural and natural environment.	Native infrastructure and the interconnectedness of the cultural and natural environment; places of elevated spiritual importance	Native infrastructure and the interconnectedness of the cultural and natural environment; places of elevated spiritual importance

CHARACTERISTIC OR RESOURCE IMPACT		p-01	p-02	p-03	p-04	p-05	p-06	d-01
Land Use	Land use authorizations and ROWs; Residential; Agricultural; Other (i.e., nuisance impacts)	Minor, short-term effects to residential land during construction. Minor, long-term effects to residential land during operations.	Minor, short-term effects to residential land during construction. Minor, long-term effects to residential land during operations.	See Proposed Action and Alternatives 3, 1A, 2A, and 4A	See Proposed Action and Alternatives 3, 4, and 2A	See Proposed Action and Alternatives 4 and 3C	Same as p-01	Crosses more farmland than other segments and all of the NRCS-designated farmland in the East Plains and Kofa Zone (minor, short- and long-term effects).
Grazing and Rangeland	Access to range or improvements; Loss of range relative to AUMs; Fragmentation of allotments; Degradation of range quality	Two stock tanks to which access may be temporarily impeded during construction. Impact reduced to negligible with MM GR-1.	See Proposed Action and Alternatives 3, 1A, 1B, 2A, and 4A	See Proposed Action and Alternatives 3, 1A, 2A, and 4A	See Proposed Action and Alternatives 3, 4, and 2A	See Proposed Action and Alternatives 4 and 3C	Same as p-01	One stock tank to which access may be temporarily impeded during construction. Impact reduced to negligible with MM GR-1.
Recreation	Physical, access, use, or functional changes to established, designated, or planned recreation areas, resources, experiences, or activities; conflicts with Federal, state, or local policies; affect OHV designations, access, or routes; impacts to hunting access.	See Proposed Action and Alternatives 1, 2, 3, and 4A	See Proposed Action and Alternatives 3, 1A, 1B, 2A, and 4A	See Proposed Action and Alternatives 3, 1A, 2A, and 4A	See Proposed Action and Alternatives 3, 4, and 2A	See Proposed Action and Alternatives 4 and 3C	See Proposed Action	See Proposed Action and Alternatives 4, 2A, and 3A
Special Designations	Conflict with goals, objectives & resources an area is designated to protect.	See Proposed Action and Alternatives 1, 2, 3, and 4A	See Proposed Action and Alternatives 3, 1A, 1B, 2A, and 4A	See Proposed Action and Alternatives 3, 1A, 2A, and 4A	See Proposed Action and Alternatives 3, 4, and 2A	See Proposed Action and Alternatives 4 and 3C	See Proposed Action	See Proposed Action and Alternatives 4, 2A, and 3A
Noise	Exceedance of regulations or guideline; exposure of receptors to excessive noise levels; generate noise levels that pose a health risk.	No Noise Sensitive Receptors (NSR) present. See Proposed Action and Alternatives 1, 2, 3, and 4A.	No NSR present. See Proposed Action and Alternatives 3, 1A, 1B, 2A, and 4A	No NSR present. See Proposed Action and Alternatives 3, 1A, 2A, and 4A	No NSR present. See Proposed Action and Alternatives 3, 4, and 2A	No NSR present. See Proposed Action and Alternatives 4 and 3C.	No NSR present. See Proposed Action.	See Proposed Action and Alternatives 4, 2A, and 3A.

CHARACTERISTIC OR RESOURCE IMPACT		p-01	p-02	p-03	p-04	p-05	p-06	d-01
Hazards and Hazardous Materials	Generation, use, handling, or disturbance of hazardous waste that: violates Federal, state, or local laws or regulations; poses a health or safety risk to public or environment; releases hazardous emissions; creates a safety hazard to public or private airstrips; or exposes workers, schools, or the public to hazardous materials.	Negligible risk with adherence to Federal, state, and local laws and regulations; BMPs, APMs, and a HMMP; and the Hazardous Materials Mitigation Sequence.	Same as p-01	Same as p-01	Same as p-01	Same as p-01	Same as p-01	Same as p-01
Public Health and Safety	Risks to public health, safety, utilities; fire or electrocution hazard; EMF emissions	With worker education programs, adherence to BMPS and APMs, risks for adverse impacts would be negligible to minor for all receptors. Impacts to public health and safety due to EMF during operations would be long-term negligible to minor.	Same as p-01	Same as p-01	Same as p-01	Same as p-01	Same as p-01	Same as p-01
Socioeconomics & Environmental Justice	Not available at this scale							
Traffic and Transportation	Increased roadway traffic; damage to roadways, access, or road systems; risk to aviation.	All risks reduced to negligible to minor with adherence to APMs, BMPs, and MMs TT-1 and TT-2.	Same as p-01	Same as p-01	Same as p-01	Same as p-01	Same as p-01	Same as p-01
Visual Resources	Conflicts with visual standards, ordinances, or policies established; major and unmitigated visual changes that degrade or disrupt views of scenic landscapes from highly sensitive viewing locations; VRM class objectives that would not be met requiring an RMP Amendment.	Segment p-01 would conform to BLM VRM class objectives. The visual environment would benefit from changing the proposed guyed V structures to self-supporting lattice to match the existing DPV1 transmission infrastructure, which would reduce contrast and visual clutter. Minor addition to the view, marginally increasing the sense of development and visual clutter.	Same as p-01	Segment p-03 would conform to BLM VRM class objectives. Same as p-01.	Segment p-04 would conform to BLM VRM class objectives. Same as p-01.	Segment p-05 would conform to BLM VRM class objectives. Same as p-01.	Segment p-06 would conform to BLM VRM class objectives. Same as p-01.	Same as p-01

CHARACTERISTIC OR RESOURCE IMPACT		p-01	p-02	p-03	p-04	p-05	p-06	d-01
Water Resources	Impacts to surface water or groundwater quantity or availability; impediments to floodplain function from channel alterations; impacts to water rights or water quality; violations of Section 404 of the Clean Water Act or Section 10 of the Rivers and Harbors Act.	Except where floodplains are too extensive to be spanned between structures impacts should be negligible using BMPs, APMs, or avoidance through design and placement of structures. Otherwise must comply with 404 permitting or Section 10 permitting to minimize impacts. Crossings of high-risk floodplains associated with Centennial Wash, likely greater than a single span (negligible long-term effect).	Except where floodplains are too extensive to be spanned between structures impacts should be negligible using BMPs, APMs, or avoidance through design and placement of structures. Otherwise must comply with 404 permitting or Section 10 permitting to minimize impacts.	Same as p-02	Same as p-02	Same as p-02	Crossings of high-risk floodplains associated with Bouse Wash, likely greater than a single span (negligible effect). Otherwise the same as p-02.	Crossings of high-risk floodplains associated with Centennial Wash, likely greater than a single span (negligible effect). Otherwise the same as p-02.

CHARACTERISTIC OR RESOURCE IMPACT		i-01	i-02	i-03	i-04	in-01	x-01	x-02a	x-02b	x-03	x-04
Hazards and Hazardous Materials	Generation, use, handling, or disturbance of hazardous waste that: violates Federal, state, or local laws or regulations; poses a health or safety risk to public or environment; releases hazardous emissions; creates a safety hazard to public or private airstrips; or exposes workers, schools, or the public to hazardous materials.	Negligible risk with adherence to Federal, state, and local laws and regulations; BMPs, APMs, and a HMMP; and the Hazardous Materials Mitigation Sequence.	Same as i-01	Same as i-01	Same as i-01	Same as i-01	Same as i-01	Same as i-01	Same as i-01	Same as i-01	Same as i-01
Public Health and Safety	Risks to public health, safety, utilities; fire or electrocution hazard; EMF emissions	With worker education programs, adherence to BMPS and APMs, risks for adverse impacts would be negligible to minor for all receptors. Impacts to public health and safety due to EMF during operations would be long-term negligible to minor.	Same as i-01	Same as i-01	Same as i-01	Same as i-01	Same as i-01	Same as i-01	Same as i-01	Same as i-01	Same as i-01
Socioeconomics & Environmental Justice	Not available at this scale										
Traffic and Transportation	Increased roadway traffic; damage to roadways, access, or road systems; risk to aviation	All risks reduced to negligible to minor with adherence to APMs, BMPs, and MMs TT-1 and TT-2.	Same as i-01	Same as i-01	Same as i-01. Safety risk to AGFD aerial surveys reduced to minor by MM-TT-02.	Same as i-01. Safety risk to AGFD aerial surveys reduced to minor by MM-TT-02.	Same as i-01	Same as i-01	Same as i-01	Same as i-01	Same as i-01

CHARACTERISTIC OR RESOURCE IMPACT		i-01	i-02	i-03	i-04	in-01	x-01	x-02a	x-02b	x-03	x-04
Visual Resources	Conflicts with visual standards, ordinances, or policies established; major and unmitigated visual changes that degrade or disrupt views of scenic landscapes from highly sensitive viewing locations; VRM class objectives that would not be met requiring an RMP Amendment.	Same as p-01	Segment i-02 would conform to BLM VRM class objectives. Same as p-01.	Segment i-03 would conform to BLM VRM class objectives. Same as p-01. Should some combination of Segments i-03, i-04, and/or x-04 be part of the selected alternative, the Alt. SCS location would be used. The segments and Alt. SCS site would moderately contrast with the existing setting but would not be dominant in views. The Alt. SCS would conform with VRM class objectives.	OHV users would be in close proximity to the Project. Guyed V structures would pose an unacceptable human health and safety risk to OHV users; self-supporting lattice structures or monopoles would replace the guyed V structures as mitigation to eliminate the hazards. Level of development would be a major modification to the visual environment and dominate the view. VRM Class III objectives would not be met. See i-03 for Alt. SCS.	The Project along the portion of in-01 within the YFO would outsize surrounding landforms and be a major modification that dominates the view; an amendment of the Yuma RMP included to change the VRM Class from III to IV. The portion within the Lake Havasu FO would cross lands designated VRM Class II and VRM Class IV. It would not meet VRM Class II objectives. An amendment of the Lake Havasu RMP would be included.	Segment x-01 would conform to BLM VRM class objectives. Same as p-01.	Segment x-02a would conform to BLM VRM class objectives. Same as p-01.	Segment x-02b would conform to BLM VRM class objectives. Same as p-01.	Segment x-03 would conform to BLM VRM class objectives. Same as p-01.	Segment x-04 would conform to BLM VRM class objectives. Same as p-01. See i-03 for Alt. SCS.
Water Resources	Impacts to surface water or groundwater quantity or availability; impediments to floodplain function from channel alterations; impacts to water rights or water quality; violations of Section 404 of the Clean Water Act or Section 10 of the Rivers and Harbors Act.	Except where floodplains are too extensive to be spanned between structures impacts should be long-term negligible using BMPs, APMs, or avoidance through design and placement of structures. Otherwise must comply with 404 permitting or Section 10 permitting to minimize impacts.	Same as i-01	Crossings of high-risk floodplains associated with Bouse Wash, likely greater than a single span (negligible effect). Otherwise the same as i-01.	Same as i-01	Same as i-01	Same as i-01	Same as i-01	Same as i-01	Same as i-01	Crossings of high-risk floodplains associated with Bouse Wash, likely greater than a single span (negligible effect). Otherwise the same as i-01.

[1]Site density calculations include sites that have been previously determined or recommended as ineligible for the NRHP. In cases where the projected counts of NRHP-eligible sites or sites of unknown NRHP eligibility are 0 and the site density is greater than 0, the site density calculation includes NRHP-ineligible sites.

Table 2.2-34a Quartzsite Zone Comparison of Impacts by Segment – p and i Segments, and qn-01 and 02

CHARACTERISTIC OR RESOURCE IMPACT		p-07	p-08	i-05	qn-01	qn-02
Segment length (miles)		2.2	0.6	2.8	0.6	10.8
Land ownership (miles)	BLM	2.2	0.6	2.8	0.6	9.8
	Reclamation	-	-	-	-	
	Arizona State Trust	-	-	-	-	1.0
	Private	-	-	-	-	
Ground disturbance	Short-term Acres	12.8	2.7	10.4	4.2	58.2
	Long-term Acres	10.6	4.0	17.4	2.2	438.3
BLM Yuma RMP conformance	VRM	Amendment included	Amendment included	Compliant	Compliant	Compliant
	Corridors	Conform	Conform	Conform	Conform	Amendment included
Other Plan conformance (Federal, county, municipal)	Plan Conformance	Yes	Yes	Yes	Yes	No – crosses a Tier III growth area, LTVA, and designated 14-day camping area (Town of Quartzsite General Plan)
Air Quality and Climate Change	Air Quality Emissions are proportional to the Proposed Action based on length of each segment. Due to the length of each segment, the impact of individual segments on air quality may be negligible to minor. However, the cumulative impact of all Project segments might have large total emissions, but the emissions are distributed across a long linear area. Climate Change is not available at this smaller scale.					
Geology, Minerals, and Soil Resources	Geological Hazards Minerals/Mining (access to known resources or claims) Soils	Earthquake risk long-term negligible; no mapped active faults. No active mines; negligible short-term potential for preclusion of access; soil loss/erosion risk negligible to minor, short-term to long-term; adherence to APMs & BMPs reduces risks to negligible.	Same as p-07	Same as p-07	Same as p-07	Same as p-07
Paleontological Resources	Potential Fossil Yield Classification	Unknown	Unknown	Unknown	Unknown	Very low to unknown
Biological Resources (Vegetation Resources, Wildlife, including Special Status Species and Migratory Birds)	Loss of native habitat/communities; Noxious weeds; Special Status Species & animals); Increased risk of predation or electrocution re infrastructure; Displacement via construction; Displacement via human activity including recreation; Impacts to native habitat and designated management areas; and Migratory birds.	No new impacts to biological resources.		Additional disturbance associated with the Project would be indistinguishable from current conditions.		Localized site-specific impacts where farthest from human activities to common wildlife species, Gila monster, Le Contes' thrasher, kit fox, various desert amphibians, and Lucy's warbler.

CHARACTERISTIC OR RESOURCE IMPACT		p-07	p-08	i-05	qn-01	qn-02
Cultural Resources	Damage or loss of a cultural site or potential site under Federal or state registers; degradation of the setting for a cultural site where setting is significant to its listing eligibility; increased access leading to potential vandalism; disturbance of human remains	Known NRHP-eligible sites or sites requiring NRHP evaluation: 5 (cultural resources survey coverage: 14.6%). Known site density: 34.2 sites per 100 acres. Projected NRHP-eligible sites or sites requiring NRHP evaluation: 18. Cultural resources potentially sensitive to visual considerations are located within the 1-mile corridor. No known indirect visual impacts to known historic properties from structures along this segment.	Known NRHP-eligible sites or sites requiring NRHP evaluation: 0 (cultural resources survey coverage: 5.6%). Known site density: 17.9 sites per 100 acres[1]. Projected NRHP-eligible sites or sites requiring NRHP evaluation: 0. No known historic properties sensitive to visual considerations. No known indirect visual impacts to known historic properties from structures along this segment.	Known NRHP-eligible sites or sites requiring NRHP evaluation: 1 (cultural resources survey coverage: 36.3%). Known site density: 4.0 sites per 100 acres. Projected NRHP-eligible sites or sites requiring NRHP evaluation: 3. No known historic properties sensitive to visual considerations. No known indirect visual impacts to known historic properties from structures along this segment.	Known NRHP-eligible sites or sites requiring NRHP evaluation: 2 (cultural resources survey coverage: 89.6%). Known site density: 22.2 sites per 100 acres. Projected NRHP-eligible sites or sites requiring NRHP evaluation: 2. No known historic properties sensitive to visual considerations. No known indirect visual impacts to known historic properties from structures along this segment.	Known NRHP-eligible sites or sites requiring NRHP evaluation: 4 (f cultural resources survey coverage: 56.6%). Known site density: 4.7 sites per 100 acres. Projected NRHP-eligible sites or sites requiring NRHP evaluation: 7. Cultural resources potentially sensitive to visual considerations are located within the 1-mile corridor. No known indirect visual impacts to known historic properties from structures along this segment
Issues of Concern to Indian Tribes	Existing and new access, native infrastructure and the interconnection of the cultural and natural environment, places of elevated spiritual important to tribes, the Colorado River, the treatment of human remains, and the disturbance of previously pristine landscapes.	Native infrastructure and the interconnectedness of the cultural and natural environment.	No known concerns to Indian tribes.	No known concerns to Indian tribes.	No known concerns to Indian tribes.	Places of elevated spiritual importance.
Land Use	Land use authorizations and ROWs; Residential; Agricultural; Other (i.e., nuisance impacts)	See Proposed Action and Alternatives 3 and 4D	See Proposed Action and Alternatives 3 and 4	See Alternatives 1, 2, 3J, and 4J	See Alternatives 4, 1D, 3G	Contains residential land; crosses Tier III growth area (minor. long-term impact). Crosses state trust land (negligible to minor, long-term impact).
Grazing and Rangeland	Access to range or improvements; Loss of range relative to AUMs; Fragmentation of allotments; Degradation of range quality	See Proposed Action and Alternatives 3 and 4D	See Proposed Action and Alternatives 3 and 4	See Alternatives 1, 2, 3J, and 4J	See Alternatives 4, 1D, 3G	See Alternative 3H

CHARACTERISTIC OR RESOURCE IMPACT		p-07	p-08	i-05	qn-01	qn-02
Recreation	Physical, access, use, or functional changes to established, designated, or planned recreation areas, resources, experiences, or activities; conflicts with Federal, state, or local policies; affect OHV designations, access, or routes; impacts to hunting access.	See Proposed Action and Alternatives 3 and 4D	See Proposed Action and Alternatives 3 and 4	See Alternatives 1, 2, 3J, and 4J	See Alternatives 4, 1D, 3G	Crosses La Posa LTVA and Dome Rock Camping Area (moderate to major, long-term effect).
Special Designations	Conflict with goals, objectives & resources an area is designated to protect	See Proposed Action and Alternatives 3 and 4D	See Proposed Action and Alternatives 3 and 4	See Alternatives 1, 2, 3J, and 4J	See Alternatives 4, 1D, 3G	Negligible loss of acreage to lands with wilderness characteristics Polygon 35_SW.
Noise	Exceedance of regulations or guideline; exposure of receptors to excessive noise levels; generate noise levels that pose a health risk.	No NSR present. See Proposed Action and Alternatives 3 and 4D	No NSR present. See Proposed Action and Alternatives 3 and 4	No NSR present. See Alternatives 1, 2, 3J, and 4J	No NSR present. See Alternatives 4, 1D, 3G	80 NSR are present, including residences and Quartzsite Alliance Church in Quartzsite. See Alternative 3H.
Hazards and Hazardous Materials	Generation, use, handling, or disturbance of hazardous waste that: violates Federal, state, or local laws or regulations; poses a health or safety risk to public or environment; releases hazardous emissions; creates a safety hazard to public or private airstrips; or exposes workers, schools, or the public to hazardous materials.	Negligible risk with adherence to Federal, state, and local laws and regulations; BMPs, APMs, and a HMMP; and the Hazardous Materials Mitigation Sequence.	Same as p-07	Same as p-07	Same as p-07	Same as p-07
Public Health and Safety	Risks to public health, safety, utilities; fire or electrocution hazard; EMF emissions	With worker education programs, adherence to BMPS and APMs, risks for adverse impacts would be negligible to minor for all receptors. Impacts to public health and safety due to EMF during operations would be long-term negligible to minor.	Same as p-07	Same as p-07	Same as p-07	Same as p-07
Socioeconomics & Environmental Justice	Not available at this scale					

CHARACTERISTIC OR RESOURCE IMPACT		p-07	p-08	i-05	qn-01	qn-02
Traffic and Transportation	Increased roadway traffic; damage to roadways, access, or road systems; risk to aviation	All traffic and transportation risks reduced to negligible to minor with adherence to APMs, BMPs, and MMs TT-1 and TT-2.	Same as p-07	Same as p-07	Same as p-07	Same as p-07
Visual Resources	Conflicts with visual standards, ordinances, or policies established; major and unmitigated visual changes that degrade or disrupt views of scenic landscapes from highly sensitive viewing locations; VRM class objectives that would not be met requiring an RMP Amendment.	Because guyed V structures would pose an unacceptable human health and safety risk to OHV users, self-supporting lattice structures or monopoles would replace the guyed V structures as mitigation to eliminate the hazards associated with guy wires. Level of development would be a major modification to the visual environment and dominate the view. Thus, VRM Class III objectives would not be met. Because of the presence of the large self-supporting lattice structures of the DPV1 transmission line, the addition of the Project structures would be a relatively minor addition.	Same as p-07	Same as p-07	VRM Class III objectives would not be met	Segment qn-02 would conform to BLM VRM class objectives. Moderate to major impact on views of private landowners in this area.
Water Resources	Impacts to surface water or groundwater quantity or availability; impediments to floodplain function from channel alterations; impacts to water rights or water quality; violations of Section 404 of the Clean Water Act or Section 10 of the Rivers and Harbors Act.	Except where floodplains are too extensive to be spanned between structures impacts should be long-term negligible using BMPs, APMs, or avoidance through design and placement of structures. Otherwise must comply with 404 permitting or Section 10 permitting to minimize impacts.	Same as p-07	Same as p-07	Same as p-07	Same as p-07

[1]Site density calculations include sites that have been previously determined or recommended as ineligible for the NRHP. In cases where the projected counts of NRHP-eligible or site of unknown NRHP eligibility are 0 and the site density is greater than 0, the site density calculation includes NRHP ineligible sites.

Air Quality and Climate Change	Air Quality Emissions are proportional to the Proposed Action based on length of each segment. Due to the length of each segment, the impact of individual segments on air quality may be negligible to minor. However, the cumulative impact of all Project segments might have large total emissions, but the emissions are distributed across a long linear area. Climate Change is not available at this smaller scale.					
Geology, Minerals, and Soil Resources	Geological Hazards Minerals/Mining (access to known resources or claims) Soils	Earthquake risk long-term negligible; no mapped active faults. No active mines; negligible short-term potential for preclusion of access; Soil loss/erosion risk negligible to minor, short-term to long-term; adherence to APMs & BMPs reduces risks to negligible. Negligible disruption of sand transport or dunes during construction and operation.	Same as qs-01	Same as qs-01	Same as qs-01	Same as qs-01
Paleontological Resources	Potential Fossil Yield Classification	Unknown	Very low to unknown	Very low to unknown	Unknown	Unknown
Biological Resources (Vegetation Resources, Wildlife, including Special Status Species and Migratory Birds)	Loss of native habitat/communities; Noxious weeds; Special Status Species & animals); Increased risk of predation or electrocution re infrastructure; Displacement via construction; Displacement via human activity including recreation; Impacts to native habitat and designated management areas; and Migratory birds.	Additional disturbance associated with the Project would be indistinguishable from current conditions.		Golden eagle, Gila monster, elf owl, gilded flicker, and Lucy's warbler maybe impacted by segment development.	Due to existing development the Project would have minimal impact on wildlife species in these segments.	

CHARACTERISTIC OR RESOURCE IMPACT		qs-01	qs-02	x-05	x-06	x-07
Cultural Resources	Damage or loss of a cultural site or potential site under Federal or state registers; degradation of the setting for a cultural site where setting is significant to its listing eligibility; increased access leading to potential vandalism; disturbance of human remains.	Known NRHP-eligible sites or sites requiring NRHP evaluation: 0 (cultural resources survey coverage: 94. %1). Known site density: 0.0 sites per 100 acres. Projected NRHP-eligible sites or sites requiring NRHP evaluation: 0. Cultural resources potentially sensitive to visual considerations are located within the 1-mile corridor. No known indirect visual impacts to known historic properties from structures along this segment.	Known NRHP-eligible sites or sites requiring NRHP evaluation: 1 (cultural resources survey coverage: 38.4%). Known site density: 11.0 sites per 100 acres. Projected NRHP-eligible sites or sites requiring NRHP evaluation: 3. No known historic properties sensitive to visual considerations. No known indirect visual impacts to known historic properties from structures along this segment.	Known NRHP-eligible sites or sites requiring NRHP evaluation: 1 (cultural resources survey coverage: 1.0%). Known site density: 41.7 sites per 100 acres. Projected NRHP-eligible sites or sites requiring NRHP evaluation: 104. Due to the low percentage sample of existing survey coverage, the projected number of sites may be misrepresented. Cultural resources potentially sensitive to visual considerations are located within the 1-mile corridor. No known indirect visual impacts to known historic properties from structures along this segment.	Known NRHP-eligible sites or sites requiring NRHP evaluation: 5 (cultural resources survey coverage: 23.7%). Known site density: 11.2 sites per 100 acres. Projected NRHP-eligible sites or sites requiring NRHP evaluation: 21. Cultural resources potentially sensitive to visual considerations are located within the 1-mile corridor. No known indirect visual impacts to known historic properties from structures along this segment.	Known NRHP-eligible sites or sites requiring NRHP evaluation: 1 (cultural resources survey coverage: 15.4%). Known site density: 32.5 sites per 100 acres. Projected NRHP-eligible sites or sites requiring NRHP evaluation: 6. Cultural resources potentially sensitive to visual considerations are located within the 1-mile corridor. No known indirect visual impacts to known historic properties from structures along this segment.
Issues of Concern to Indian Tribes	Existing and new access, native infrastructure and the interconnection of the cultural and natural environment, places of elevated spiritual important to tribes, the Colorado River, the treatment of human remains, and the disturbance of previously pristine landscapes.	Native infrastructure and the interconnectedness of the cultural and natural environment.	Places of elevated spiritual importance.	Native infrastructure and the interconnectedness of the cultural and natural environment; intrusion on pristine landscapes.	Native infrastructure and the interconnectedness of the cultural and natural environment.	Trails have been recorded on or within 0.5- mile of Segment x-07. Trails are of significance to Indian tribes as part of traditional native infrastructure associated with the interconnectedness of the cultural and natural environment.
Land Use	Land use authorizations and ROWs; Residential; Agricultural; Other (i.e., nuisance impacts)	Minor, short-term effects to residential land during construction. Minor, long-term effects to residential land during operations.	Minor, short-term effects to residential land during construction. Minor, long-term effects to residential land during operations.	See Alternatives 3 and 4D	See Alternatives 4 and 3F	See Alternatives 2 and 3E
Grazing and Rangeland	Access to range or improvements; Loss of range relative to AUMs; Fragmentation of allotments; Degradation of range quality	See Alternatives 1, 2, and 3E	See Alternative 1	See Alternatives 3 and 4D	See Alternatives 4 and 3F	See Alternatives 2 and 3E
Recreation	Physical, access, use, or functional changes to established, designated, or planned recreation areas, resources, experiences, or activities; conflicts with Federal, state, or local policies; affect OHV designations, access, or routes; impacts to hunting access.	Crosses La Posa LTVA and Dome Rock Camping Area (moderate to major, long-term effect).	Crosses La Posa LTVA and Dome Rock Camping Area (moderate to major, long-term effect).	See Alternatives 3 and 4D	See Alternatives 4 and 3F	Crosses La Posa LTVA and Dome Rock Camping Area (moderate to major, long-term effect).

CHARACTERISTIC OR RESOURCE IMPACT		qs-01	qs-02	x-05	x-06	x-07
Special Designations	Conflict with goals, objectives & resources an area is designated to protect	See Alternatives 1, 2, and 3E	See Alternative 1	See Alternatives 3 and 4D	See Alternatives 4 and 3F	See Alternatives 2 and 3E
Noise	Exceedance of regulations or guideline; exposure of receptors to excessive noise levels; generate noise levels that pose a health risk.	251 NSR are present, including residences including La-Z Daze Trailer Park, Rice Ranch RV Park, Church of Jesus Christ of Latter-Day Saints, and LTVAs in Quartzsite.	54 NSR present, including residences associated with the Desert Gardens RV Park and Super 8 Hotel.	No NSR present. See Alternatives 3 and 4D	Variable NSR; thousands per year as it is adjacent to La Posa LTVA. See Alternatives 4 and 3F	Variable NSR; thousands per year as it is through La Posa LTVA. See Alternatives 2 and 3E
Hazards and Hazardous Materials	Generation, use, handling, or disturbance of hazardous waste that: violates Federal, state, or local laws or regulations; poses a health or safety risk to public or environment; releases hazardous emissions; creates a safety hazard to public or private airstrips; or exposes workers, schools, or the public to hazardous materials.	Negligible risk with adherence to Federal, state, and local laws and regulations; BMPs, APMs, and a HMMP; and the Hazardous Materials Mitigation Sequence.	Same as qs-01	Same as qs-01	Same as qs-01	Same as qs-01
Public Health and Safety	Risks to public health, safety, utilities; fire or electrocution hazard; EMF emissions	With worker education programs, adherence to BMPS and APMs, risks for adverse impacts would be negligible to minor for all receptors. Impacts to public health and safety due to EMF during operations would be long-term negligible to minor.	Same as qs-01	Same as qs-01	Same as qs-01	Same as qs-01
Socioeconomics & Environmental Justice	Not available at this scale					
Traffic and Transportation	Increased roadway traffic; damage to roadways, access, or road systems; risk to aviation	All traffic and transportation risks reduced to negligible to minor with adherence to APMs, BMPs, and MMs TT-1 and TT-2.	Same as qs-01	Same as qs-01	Same as qs-01	Same as qs-01
Visual Resources	Conflicts with visual standards, ordinances, or policies established; major and unmitigated visual changes that degrade or disrupt views of scenic landscapes from highly sensitive viewing locations; VRM class objectives that would not be met requiring an RMP Amendment.	Existing infrastructure begins to outsize the surrounding landscape features and dominate the view, and the Project would add to visual clutter. Guyed V structures would be replaced with monopoles to eliminate potential hazards to OHV recreation and reduce the contrast between the Project and the existing WAPA 161kV monopole structures. With monopole structures, it would have a moderate to major impact to the views of RV park residents by increasing the sense of development and visual clutter.	Guyed V structures would be replaced with monopoles to eliminate potential hazards to OHV recreation and reduce the visual clutter of the guy wires in the view. With monopole structures, it would have a negligible to minor impact to the views of RV park residents as the vertical structures would blend well with the other single pole vertical elements in the view.	Segment x-05 would conform to BLM VRM class objectives.	VRM Class III objectives would not be met. Segment x-06 would be primarily viewed from within the LTVA; as well as the access road paralleling the DPV1 or other OHV routes east of SR 95 and the LTVA. Views would be most impacted from the outer eastern edge of the LTVA. The Project would be a major modification to the visual environment.	VRM Class III objectives would not be met. Same as Segment x-06.

CHARACTERISTIC OR RESOURCE IMPACT		qs-01	qs-02	x-05	x-06	x-07
Water Resources	Impacts to surface water or groundwater quantity or availability; impediments to floodplain function from channel alterations; impacts to water rights or water quality; violations of Section 404 of the Clean Water Act or Section 10 of the Rivers and Harbors Act.	Except where floodplains are too extensive to be spanned between structures impacts should be long-term negligible using BMPs, APMs, or avoidance through design and placement of structures. Otherwise must comply with 404 permitting or Section 10 permitting to minimize impacts.	Crossings of high-risk floodplains associated with La Cholla Wash, likely greater than a single span (negligible effect). Otherwise the same as qs-01.	Same as qs-01	Same as qs-01	Same as qs-01

Other Plan conformance (Federal, county, municipal)	Plan Conformance	Yes	Yes	Yes	Yes	Yes	Yes
Air Quality and Climate Change	Air Quality Emissions are proportional to the Proposed Action based on length of each segment. Due to the length of each segment, the impact of individual segments on air quality may be negligible to minor. However, the cumulative impact of all Project segments might have large total emissions, but the emissions are distributed across a long linear area. Climate Change is not available at this smaller scale.						
Geology, Minerals, and Soil Resources	Geological Hazards Minerals/Mining (access to known resources or claims) Soils	Earthquake risk long-term negligible; no mapped active faults. No active mines; negligible short-term potential for preclusion of access; Soil loss/erosion risk negligible to minor, short-term to long-term; adherence to APMs & BMPs reduces risks to negligible. Negligible disruption of sand transport or dunes during construction and operation.	Same as p-09	Same as p-09	Same as p-09	Same as p-09	Same as p-09

CHARACTERISTIC OR RESOURCE IMPACT		p-09	p-10	p-11	p-12	p-13	p-14
Paleontological Resources	Potential Fossil Yield Classification	High to unknown	Very low to high	Very low	Very low to unknown	Unknown	Unknown
Biological Resources (Vegetation Resources, Wildlife, including Special Status Species and Migratory Birds)	Loss of native habitat/communities; Noxious weeds; Special Status Species & animals); Increased risk of predation or electrocution re infrastructure; Displacement via construction; Displacement via human activity including recreation; Impacts to native habitat and designated management areas; and Migratory birds.	The impacts of Project development would be additive to the existing habitat fragmentation for Lucy's warblers and desert toads through the narrow Copper Bottom Pass.		The impacts of Project development would be additive to the existing habitat fragmentation for desert bighorn sheep through the narrow Copper Bottom Pass.	Project development would add disturbance to a remote area in very harsh desert conditions with large areas of desert pavement.		
Cultural Resources	Damage or loss of a cultural site or potential site under Federal or state registers; degradation of the setting for a cultural site where setting is significant to its listing eligibility; increased access leading to potential vandalism; disturbance of human remains.	Known NRHP-eligible sites or sites requiring NRHP evaluation: 2 (cultural resources survey coverage: 77.4%). Known site density: 1.5 sites per 100 acres. Projected NRHP-eligible sites or sites requiring NRHP evaluation: 3. Cultural resources potentially sensitive to visual considerations are located within the 1-mile corridor. No known indirect visual impacts to known historic properties from structures along this segment.	Known NRHP-eligible sites or sites requiring NRHP evaluation: 1 (cultural resources survey coverage: 62.9%). Known site density: 5.6 sites per 100 acres[1]. Projected NRHP-eligible sites or sites requiring NRHP evaluation: 2. Cultural resources potentially sensitive to visual considerations are located within the 1-mile corridor. No known indirect visual impacts to known historic properties from structures along this segment.	Known NRHP-eligible sites or sites requiring NRHP evaluation: 2 (cultural resources survey coverage: 61.4%). Known site density: 3.3 sites per 100 acres. Projected NRHP-eligible sites or sites requiring NRHP evaluation: 3. Cultural resources potentially sensitive to visual considerations are located within the 1-mile corridor. No known indirect visual impacts to known historic properties from structures along this segment.	Known NRHP-eligible sites or sites requiring NRHP evaluation: 0 (cultural resources survey coverage: 9.8%). Known site density: 0.0 sites per 100 acres. Projected NRHP-eligible sites or sites requiring NRHP evaluation: 0. Cultural resources potentially sensitive to visual considerations are located within the 1-mile corridor. No known indirect visual impacts to known historic properties from structures along this segment.	Known NRHP-eligible sites or sites requiring NRHP evaluation: 2 (cultural resources survey coverage: 97.5%). Known site density: 7.3 sites per 100 acres. Projected NRHP-eligible sites or sites requiring NRHP evaluation: 2. An NRHP-eligible intaglio site has been recorded within the 200-foot analysis corridor. Analysis of potential visual impacts to this historic property would be required as part of the indirect effects analysis.	Known NRHP-eligible sites or sites requiring NRHP evaluation: 0 (cultural resources survey coverage: 75.2%). Known site density: 23.1 sites per 100 acres[1]. Projected NRHP-eligible sites or sites requiring NRHP evaluation: 0. No known historic properties sensitive to visual considerations. No known indirect visual impacts to known historic properties from structures along this segment.

CHARACTERISTIC OR RESOURCE IMPACT		i-06	i-07	x-08
Visual Resources	Conflicts with visual standards, ordinances, or policies established; major and unmitigated visual changes that degrade or disrupt views of scenic landscapes from highly sensitive viewing locations; VRM class objectives that would not be met requiring an RMP Amendment.	I-10 viewers would be in close proximity. Change the VRM Class III to Class IV within the BLM utility corridor.	I-10 viewers would be in close proximity.	I-10 viewers would be in close proximity.
Water Resources	Impacts to surface water or groundwater quantity or availability; impediments to floodplain function from channel alterations; impacts to water rights or water quality; violations of Section 404 of the Clean Water Act or Section 10 of the Rivers and Harbors Act.	Except where floodplains are too extensive to be spanned between structures impacts should be long-term negligible using BMPs, APMs, or avoidance through design and placement of structures. Otherwise must comply with 404 permitting or Section 10 permitting to minimize impacts.	Crossings of high-risk floodplains associated with Ehrenberg and Cinnabar Washes, likely greater than a single span (negligible effect). Otherwise the same as i-06.	Same as i-06

[1]Site density calculations include sites that have been previously determined or recommended as ineligible for the NRHP. In cases where the projected counts of NRHP-eligible or site of unknown NRHP eligibility are 0 and the site density is greater than 0, the site density calculation includes NRHP ineligible sites.

Table 2.2-36a Colorado River and California Zone Comparison of Impacts by Segment – p segments and cb-10

CHARACTERISTIC OR RESOURCE IMPACT		p-15e (Arizona)	p-15w (California)	p-16 (California)	p-17 (California)	p-18 (California)	cb-10 (Arizona)
Segment length (miles)		2.8	6.6	4.6	3.1	2.4	1.9
Land ownership (miles)	BLM	1.5	-	0.4	2.3	0.8	1.0
	Reclamation	-	-	-	-	-	-
	Arizona State Trust	1.3	-	-	-	-	0.9
	Private	-	6.6	4.2	0.8	1.6	-
Ground disturbance	Short-term Acres	20.3	41.5	35.9	18.7	25.8	12.2
	Long-term Acres	16.8	6.0	7.6	11.0	9.8	7.0
BLM RMP conformance	VRM	Compliant	Not applicable	Not applicable	Not applicable	Not applicable	Compliant
	Corridors	Conform	Not applicable	Not applicable	Not applicable	Not applicable	Conform
	RMP Amendments & Conformance	Not applicable	Amendment included (CDCA Plan)	Amendment included (CDCA Plan)	Amendment included (CDCA Plan)	Amendment included (CDCA Plan)	Amendment included
Other Plan conformance (Federal, county, municipal)	Plan Conformance	Yes	Yes	Yes	Yes	Yes	Yes
Air Quality and Climate Change	Air Quality Emissions are proportional to the Proposed Action based on length of each segment. Due to the length of each segment, the impact of individual segments on air quality may be negligible to minor. However, the cumulative impact of all Project segments might have large total emissions, but the emissions are distributed across a long linear area. Climate Change is not available at this smaller scale.						

CHARACTERISTIC OR RESOURCE IMPACT		p-15e (Arizona)	p-15w (California)	p-16 (California)	p-17 (California)	p-18 (California)	cb-10 (Arizona)
Geology, Minerals, and Soil Resources	Geological Hazards Minerals/Mining (access to known resources or claims) Soils	Earthquake risk long-term negligible; no mapped active faults. No active mines; negligible short-term potential for preclusion of access; Soil loss/erosion risk negligible to minor, short-term to long-term; adherence to APMs & BMPs reduces risks to negligible. Negligible disruption of sand transport or dunes during construction and operation.	Same as p-15e	Same as p-15e	Negligible impact to sand dunes and sand transport corridor during construction and operation.	Negligible impact to sand dunes and sand transport corridor during construction and operation.	Same as p-15e
Paleontological Resources	Potential Fossil Yield Classification	Unknown	Unknown	High to unknown	Unknown	High to unknown	Unknown
Biological Resources (Vegetation Resources, Wildlife, including Special Status Species and Migratory Birds)	Loss of native habitat/communities; Noxious weeds; Special Status Species & animals); Increased risk of predation or electrocution re infrastructure; Displacement via construction; Displacement via human activity including recreation; Impacts to native habitat and designated management areas; and Migratory birds.	Colorado River crossing open water spanned to avoid direct impacts to aquatic habitat, but 3-4 structures in river corridor would affect riparian vegetation. Reduced collision hazard to migratory birds along river corridor due to matching structure spacing and heights.	Spanned floodplain and canals west of the Colorado River but could be risk of avian mortality due to collision with towers and lines.	Spanned floodplain and canals west of the Colorado River but could be risk of avian mortality due to collision with towers and lines. Long-term impact to less than 0.1 acre of honey mesquite Alliance on non-BLM lands.	Permanent impacts to 2-3 acres of wash habitat for blue paloverde-ironwood. Potential impact to suitable habitat for Mojave desert tortoise near Mule Mountains.		Colorado River crossing, open water spanned to avoid direct impacts to aquatic habitat, but 3-4 structures in river corridor would affect riparian vegetation. Greater collision hazard to migratory birds along river corridor due to not adjacent to existing line.
Cultural Resources	Damage or loss of a cultural site or potential site under Federal or state registers; degradation of the setting for a cultural site where setting is significant to its listing eligibility; increased access leading to potential vandalism; disturbance of human remains.	Known NRHP-eligible sites or sites requiring NRHP evaluation: 3 (cultural resources survey coverage: 68.5%). Known site density: 14.1 sites per 100 acres. Projected NRHP-eligible sites or sites requiring NRHP evaluation: 10. One NRHP-listed intaglio site is within the indirect effects analysis area. Analysis of potential visual impacts to this historic property would be required as part of the indirect effects analysis.	Known NRHP-eligible sites or sites requiring NRHP evaluation: 2 (cultural resources survey coverage: 32.4%). Known site density: 15.3 sites per 100 acres. Projected NRHP-eligible sites or sites requiring NRHP evaluation: 25. No known historic properties sensitive to visual considerations. No known indirect visual impacts to known historic properties from structures along this segment.	Known NRHP-eligible sites or sites requiring NRHP evaluation: 5 (cultural resources survey coverage: 14.6%). Known site density: 47.3 sites per 100 acres. Projected NRHP-eligible sites or sites requiring NRHP evaluation: 34. Cultural resources potentially sensitive to visual considerations are located within the 1-mile corridor. No known indirect visual impacts to known historic properties from structures along this segment.	Known NRHP-eligible sites or sites requiring NRHP evaluation: 9 (cultural resources survey coverage: 100%). Known site density: 35.1 sites per 100 acres. Projected NRHP-eligible sites or sites requiring NRHP evaluation: 9. One NRHP-listed archaeological district is within the 200-foot analysis corridor. Analysis of potential visual impacts to this historic property would be required as part of the indirect effects analysis.	Known NRHP-eligible sites or sites requiring NRHP evaluation: 8 (cultural resources survey coverage: 100%). Known site density: 22.3 sites per 100 acres. Projected NRHP-eligible sites or sites requiring NRHP evaluation: 8. The Palo Verde Mesa is considered a culturally sensitive area of great importance and may contain classes of archaeological sites considered to be sensitive to visual effects.	Known NRHP-eligible sites or sites requiring NRHP evaluation: 0 (cultural resources survey coverage: 14.1%). Known site density: 0.0 sites per 100 acres. Projected NRHP-eligible sites or sites requiring NRHP evaluation: 0. Cultural resources potentially sensitive to visual considerations are located within the 1-mile corridor. No known indirect visual impacts to known historic properties from structures along this segment.

CHARACTERISTIC OR RESOURCE IMPACT		p-15e (Arizona)	p-15w (California)	p-16 (California)	p-17 (California)	p-18 (California)	cb-10 (Arizona)
Issues of Concern to Indian Tribes	Existing and new access, native infrastructure and the interconnection of the cultural and natural environment, places of elevated spiritual important to tribes, the Colorado River, the treatment of human remains, and the disturbance of previously pristine landscapes.	Native infrastructure and the interconnectedness of the cultural and natural environment; places of elevated spiritual importance; Colorado River.	Native infrastructure and the interconnectedness of the cultural and natural environment; places of elevated spiritual importance; Colorado River. Biological Resources (Vegetation Resources, Wildlife, including Special Status Species and Migratory Birds)	Loss of native habitat/communities; Noxious weeds; Special Status Species & animals); Increased risk of predation or electrocution re infrastructure; Displacement via construction; Displacement via human activity including recreation; Impacts to native habitat and designated management areas; and Migratory birds.	Spanned floodplain and canals west of the Colorado River, now agricultural, used by foraging and migrating birds, but risk of avian mortality due to collision with towers and lines.				

CHARACTERISTIC OR RESOURCE IMPACT		x-09	x-10	x-11	x-12	x-13
Cultural Resources	Damage or loss of a cultural site or potential site under Federal or state registers; degradation of the setting for a cultural site where setting is significant to its listing eligibility; increased access leading to potential vandalism; disturbance of human remains	Known NRHP-eligible sites or sites requiring NRHP evaluation: 0 (cultural resources survey coverage: 30.3%). Known site density: 0.0 sites per 100 acres. Projected NRHP-eligible sites or sites requiring NRHP evaluation: 0. No known historic properties sensitive to visual considerations. No known indirect visual impacts to known historic properties from structures along this segment.	Known NRHP-eligible sites or sites requiring NRHP evaluation: 0 (cultural resources survey coverage: 60.8%). Known site density: 0.0 sites per 100 acres. Projected NRHP-eligible sites or sites requiring NRHP evaluation: 0. No known historic properties sensitive to visual considerations. No known indirect visual impacts to known historic properties from structures along this segment.	Known NRHP-eligible sites or sites requiring NRHP evaluation: 1 (cultural resources survey coverage: 1.5%). Known site density: 125.0 sites per 100 acres. Projected NRHP-eligible sites or sites requiring NRHP evaluation: 65. Cultural resources potentially sensitive to visual considerations are located within the 1-mile corridor. No known indirect visual impacts to known historic properties from structures along this segment.	Known NRHP-eligible sites or sites requiring NRHP evaluation: 2 (cultural resources survey coverage: 4.9%). Known site density: 133.3 sites per 100 acres. Projected NRHP-eligible sites or sites requiring NRHP evaluation: 3. No known historic properties sensitive to visual considerations. No known indirect visual impacts to known historic properties from structures along this segment.	Known NRHP-eligible sites or sites requiring NRHP evaluation: 1 (cultural resources survey coverage: 3.3%). Known site density: 62.5 sites per 100 acres. Projected NRHP-eligible sites or sites requiring NRHP evaluation: 30. No known historic properties sensitive to visual considerations. No known indirect visual impacts to known historic properties from structures along this segment.
Issues of Concern to Indian Tribes	Existing and new access, native infrastructure and the interconnection of the cultural and natural environment, places of elevated spiritual important to tribes, the Colorado River, the treatment of human remains, and the disturbance of previously pristine landscapes.	No known concerns to Indian tribes.	No known concerns to Indian tribes.	Colorado River	No known concerns to Indian tribes.	No known concerns to Indian tribes.
Land Use	Land use authorizations and ROWs; Residential; Agricultural; Other (i.e., nuisance impacts)	See Alternatives 1 and 4K	See Alternatives 1E and 4N	See Alternatives 3 and 4L	See Alternatives 3, 4, and 1E	See Alternatives 4, 2E, and 3M
Grazing and Rangeland	Access to range or improvements; Loss of range relative to AUMs; Fragmentation of allotments; Degradation of range quality	See Alternatives 1 and 4K	See Alternatives 1E and 4N	See Alternatives 3 and 4L	See Alternatives 3, 4, and 1E	See Alternatives 4, 2E, and 3M
Recreation	Physical, access, use, or functional changes to established, designated, or planned recreation areas, resources, experiences, or activities; conflicts with Federal, state, or local policies; affect OHV designations, access, or routes; impacts to hunting access.	See Alternatives 1 and 4K	See Alternatives 1E and 4N	See Alternatives 3 and 4L	See Alternatives 3, 4, and 1E	See Alternatives 4, 2E, and 3M

CHARACTERISTIC OR RESOURCE IMPACT		x-09	x-10	x-11	x-12	x-13
Special Designations	Conflict with goals, objectives & resources an area is designated to protect	See Alternatives 1 and 4K	See Alternatives 1E and 4N	See Alternatives 3 and 4L	See Alternatives 3, 4, and 1E	See Alternatives 4, 2E, and 3M
Noise	Exceedance of regulations or guideline; exposure of receptors to excessive noise levels; generate noise levels that pose a health risk.	2 NSR present, residences along Colorado River in Blythe, CA.	63 NSR present, all residences along the Colorado River in Blythe, CA.	8 NSR present, all residences along the Colorado River in Blythe, CA.	2 NSR present, rural residential area southwest of Blythe, CA.	2 NSR present, rural residential area near Blythe, CA.
Hazards and Hazardous Materials	Generation, use, handling, or disturbance of hazardous waste that: violates Federal, state, or local laws or regulations; poses a health or safety risk to public or environment; releases hazardous emissions; creates a safety hazard to public or private airstrips; or exposes workers, schools, or the public to hazardous materials.	Negligible risk with adherence to Federal, state, and local laws and regulations; BMPs, APMs, and a HMMP; and the Hazardous Materials Mitigation Sequence.	Same as x-09	Same as x-09	Same as x-09	Same as x--09
Public Health and Safety	Risks to public health, safety, utilities; fire or electrocution hazard; EMF emissions	With worker education programs, adherence to BMPS and APMs, risks for adverse impacts would be negligible to minor for all receptors. Impacts to public health and safety due to EMF during operations would be long-term negligible to minor.	Same as x-09	Same as x-09	Same as x-09	Same as x-09
Socioeconomics & Environmental Justice	Not available at this scale					
Traffic and Transportation	Increased roadway traffic; damage to roadways, access, or road systems; risk to aviation	All traffic and transportation risks reduced to negligible to minor with adherence to APMs, BMPs, and MMs TT-1 and TT-2.	Same as x-09	Same as x-09	Same as x-09	Same as x-09
Visual Resources	Conflicts with visual standards, ordinances, or policies established; major and unmitigated visual changes that degrade or disrupt views of scenic landscapes from highly sensitive viewing locations; VRM class objectives that would not be met requiring an RMP Amendment.	Conforms to VRM class objectives no additional mitigation would be required.	Conforms to VRM class objectives no additional mitigation would be required. The Project would be proportional to the surrounding landscape, thus would not dominate or be a major modification; however, because it would be a new development added to a view that contains very little development, it would be a moderate to major impact on the views of nearby residents.	Conforms to VRM class objectives no additional mitigation would be required.	Conforms to VRM class objectives no additional mitigation would be required.	Conforms to VRM class objectives no additional mitigation would be required.

CHARACTERISTIC OR RESOURCE IMPACT		x-09	x-10	x-11	x-12	x-13
Water Resources	Impacts to surface water or groundwater quantity or availability; impediments to floodplain function from channel alterations; impacts to water rights or water quality; violations of Section 404 of the Clean Water Act or Section 10 of the Rivers and Harbors Act.	Except where floodplains are too extensive to be spanned between structures impacts should be long-term negligible using BMPs, APMs, or avoidance through design and placement of structures. Otherwise must comply with 404 permitting or Section 10 permitting to minimize impacts.	Same as x-09	Same as x-09	Same as x-09	Same as x-09

Table 2.2-36d Colorado River and California Zone Comparison of Impacts by Segment – x Segments West, Located in California

CHARACTERISTIC OR RESOURCE IMPACT		x-15	x-16	x-19
Segment length (miles)		1.4	2.3	1.0
Land ownership (miles)	BLM	1.4	2.0	1.0
	Reclamation	-	-	-
	Arizona State Trust	-	-	-

Other Plan conformance (Federal, county, municipal)	Plan Conformance	Not consistent with La Paz County Zoning Plan and Town of Quartzsite General Plan	Not consistent with La Paz County Zoning Plan and Town of Quartzsite General Plan	Not consistent with La Paz County Zoning Plan and Town of Quartzsite General Plan	Not consistent with La Paz County Zoning Plan and Town of Quartzsite General Plan	Not consistent with La Paz County Zoning Plan and Town of Quartzsite General Plan	Not consistent with La Paz County Zoning Plan and Town of Quartzsite General Plan
Air Quality and Climate Change	Criteria Air Pollutants – Construction	Same as Proposed Action	Same as Proposed Action				
	CO	36.0 tpy	Proportional to Total Length				
	NO_x	98.0 tpy	Proportional to Total Length				
	PM_{10}	47.8 tpy	Proportional to Total Length				
	$PM_{2.5}$	9.0 tpy	Proportional to Total Length				
	SO_2	0.2 tpy	Proportional to Total Length				
	VOC	8.6 tpy	Proportional to Total Length				
	CO_{2e}	32,500 tpy	Proportional to Total Length				

CHARACTERISTIC OR RESOURCE IMPACT		ALTERNATIVE 1	1A	1B	1C	1D	1E
	GHGs – Construction CO_{2e}	Same as Proposed Action	Same as Proposed Action				
	Criteria Air Pollutants – O&M	Would not exceed NAAQS or CAAQS	Would not exceed NAAQS or CAAQS				
	GHGs – SF_6 – O&M	Same as Proposed Action	Same as Proposed Action				
Geology, Minerals, and Soil Resources	Geological Hazards Minerals/Mining (access to known resources or claims) Soils	Uses segments ca-07, ca-09, and x-19 which would have negligible to minor impact on sand transport and dunes during construction and operation	Same as Alternative 1	Same as Alternative 1	Same as Alternative 1	Same as Alternative 1	Same as Alternative 1
Paleontological Resources	Potential damage to known paleontological resources or formations with potential to contain paleontological resources	Same as Proposed Action	Same as Alternative 1	Same as Alternative 1	Same as Alternative 1	Same as Alternative 1	Same as Alternative 1
Biological Resources (Vegetation Resources, Wildlife, including Special Status Species and Migratory Birds)	Loss of native habitat/communities; Noxious weeds; Special Status Species & animals); Increased risk of predation or electrocution re infrastructure; Displacement via construction; Displacement via human activity including recreation; Impacts to native wildlife habitat and designated management areas; and Migratory birds.	In areas where no linear facilities and few roads exist these impacts would be moderate. Protected microphyll washes and up to 0.3 acre of total wash habitat would be crossed but would be spanned through micrositing. Negligible to minor long-term impacts in undeveloped areas due to facilitating increased abundance of non-native plants, especially in dune habitats. APMs and BMPs would reduce impact. Project would cross 3.5 miles of Harwood's eriastrum habitat; measures would protect individuals and maintain sand transport. Disturbance could occur on 23 acres of suitable habitat. Minor to moderate impact with APMs and BMPs. The collision risk at the Colorado River crossing is higher than under the Proposed Action because the crossing is not adjacent to existing facilities. Negligible impacts to bighorn sheep. Negligible long-term impacts to wildlife and habitats by facilitating increased recreational access to remote areas. Project would cross only a minor amount of mostly degraded	Slightly greater, but still negligible impact to native vegetation communities and general wildlife habitat compared to Alternative 1.	Slightly greater, but still negligible impact to native vegetation communities and general wildlife habitat compared to Alternative 1.	Impacts to wildlife and vegetation the same as for Alternative 1.	Impacts to wildlife and vegetation the same as for Alternative 1.	Impacts to wildlife and vegetation the same as for Alternative 1.

CHARACTERISTIC OR RESOURCE IMPACT		ALTERNATIVE 1	1A	1B	1C	1D	1E
		habitat for Sonoran desert tortoise and is not within Sonoran pronghorn habitat. Negligible impacts to bighorn sheep. Minor short- and long-term impact to Mojave fringe-toed lizard due to possible mortality by Project activities and habitat impacts on 4 miles of habitat. Would not cross Kofa NWR. Additional hazard at the Colorado River crossing because there are no existing structures to match.					
Cultural Resources	Damage or loss of a cultural site or potential site under federal or state registers; degradation of the setting for a cultural site where setting is significant to its listing eligibility; increased access leading to potential vandalism; disturbance of human remains.	Known NRHP-eligible sites or sites requiring NRHP evaluation: 23 (cultural resources survey coverage: 30.7%). Known site density: 5.0 sites per 100 acres. Projected NRHP-eligible sites or sites requiring NRHP evaluation: 75. Key resources projected to occur include trails and intaglios.	Known NRHP-eligible sites or sites requiring NRHP evaluation: 1 (cultural resources survey coverage: 7.6%). Known site density: 16.6 sites per 100 acres. Projected NRHP-eligible sites or sites requiring NRHP evaluation: 26. Subalternative 1A would result in a reduced visual impact and less potential to affect cultural resources by ground disturbance compared to Alternative 1.	Known NRHP-eligible sites or sites requiring NRHP evaluation: 2 (cultural resources survey coverage: 2.5%). Known site density: 54.1 sites per 100 acres1. Projected NRHP-eligible sites or sites requiring NRHP evaluation: 82. Subalternative 1B results in a greater visual impact and a greater potential to affect cultural resources by ground disturbance compared to Alternative 1.	Known NRHP-eligible sites or sites requiring NRHP evaluation: 2 (cultural resources survey coverage: 2.0%). Known site density: 30.3 sites per 100 acres. Projected NRHP-eligible sites or sites requiring NRHP evaluation: 102. Subalternative 1C results in a greater visual impact and a greater potential to affect cultural resources by ground disturbance compared to Alternative 1.	Known NRHP-eligible sites or sites requiring NRHP evaluation: 2 (cultural resources survey coverage: 89.6%). Known site density: 22.2 sites per 100 acres. Projected NRHP-eligible sites or sites requiring NRHP evaluation: 2. Subalternative 1D would result in a reduced visual impact and less potential to affect cultural resources by ground disturbance compared to Alternative 1.	Known NRHP-eligible sites or sites requiring NRHP evaluation: 0 (cultural resources survey coverage: 10.6%). Known site density: 46.4 sites per 100 acres. Projected NRHP-eligible sites or sites requiring NRHP evaluation: 104. Subalternative 1E results in a greater visual impact and a greater potential to affect cultural resources by ground disturbance compared to Alternative 1.
Issues of Concern to Indian Tribes	Existing and new access, native infrastructure and the interconnection of the cultural and natural environment, places of elevated spiritual important to tribes, the Colorado River, the treatment of human remains, and the disturbance of previously pristine landscapes.	Native infrastructure and the interconnectedness of the cultural and natural environment, places of elevated spiritual importance, and the Colorado River.	Native infrastructure and the interconnectedness of the cultural and natural environment.	Native infrastructure and the interconnectedness of the cultural and natural environment.	No known concerns to Indian tribes.	No known concerns to Indian tribes.	No known concerns to Indian tribes.

CHARACTERISTIC OR RESOURCE IMPACT		ALTERNATIVE 1	1A	1B	1C	1D	1E
Land Use	Land use authorizations and ROWs; Residential; Agricultural; Other (i.e., nuisance impacts)	Same as Proposed Action except Alternative 1 would avoid the Kofa NWR and the YPG, would cross through more ASLD land, would affect more residential land and NRCS-classified farmland in California, and affect more solar facilities. It would not be consistent with Town of Quartzsite or La Paz County plans. In California, it would not be in compliance with the CDCA Plan so would require an amendment.	One additional RMP ROW amendment and one additional VRM amendment than Alternative 1.	One additional RMP ROW amendment than Alternative 1.	One additional VRM amendment than Alternative 1.	Same as Alternative 1	Same as Alternative 1
Grazing and Rangeland	Access to range or improvements; Loss of range relative to AUMs; Fragmentation of allotments; Degradation of range quality	Would impede access to three stock tanks versus two under the Proposed Action. Otherwise the Same as Proposed Action. No helicopter fly yards and no measurable impact to grazing from helicopter use.	Same as Proposed Action	Same as Proposed Action with MM GR-1 mitigation	Same as Alternative 1	Same as Alternative 1	Same as Alternative 1
Recreation	Physical, access, use, or functional changes to established, designated, or planned recreation areas, resources, experiences, or activities; conflicts with Federal, state, or local policies; affect OHV designations, access, or routes; impacts to hunting access.	Greater impacts to long-term recreation where route varies from Proposed Action as power lines would be new and may impact the quality of the recreation experience. Minor to major effects to La Posa LTVA, Dome Rock Camping Area, and the Ehrenberg Sandbowl OHV area. Kofa NWR would not be crossed. Otherwise the Same as Proposed Action.	Same as Alternative 1	Same as Alternative 1	Same as Alternative 1	Same as Alternative 1	Same as Alternative 1
Special Designations	Conflict with goals, objectives & resources an area is designated to protect	Same as Proposed Action	Same as Alternative 1	Same as Alternative 1	Same as Alternative 1	Same as Alternative 1	Same as Alternative 1
Noise	Exceedance of regulations or guideline; exposure of receptors to excessive noise levels; generate noise levels that pose a health risk.	Although there would be a difference in number of NSR, impacts would be the same as Proposed Action	Same as Proposed Action	Same as Proposed Action	Same as Proposed Action	Same as Proposed Action	Same as Proposed Action

CHARACTERISTIC OR RESOURCE IMPACT		ALTERNATIVE 1	1A	1B	1C	1D	1E
Hazards and Hazardous Materials	Generation, use, handling, or disturbance of hazardous waste that: violates Federal, state, or local laws or regulations; poses a health or safety risk to public or environment; releases hazardous emissions; creates a safety hazard to public or private airstrips; or exposes workers, schools, or the public to hazardous materials.	Same as Proposed Action	Same as Proposed Action	Same as Proposed Action	Same as Proposed Action	Same as Proposed Action	Same as Proposed Action
Public Health and Safety	Risks to public health, safety, utilities; fire or electrocution hazard; EMF emissions	Same as Proposed Action	Same as Proposed Action	Same as Proposed Action	Same as Proposed Action	Same as Proposed Action	Same as Proposed Action
Socioeconomics & Environmental Justice	Employment; Tax collection & revenue; Population or population displacement; Non-market values and ecosystem services; Revenue from recreation sector; Local economy; Reductions in property values; EJ Populations; disproportionate adverse impacts to EJ populations	Same as Proposed Action	Same as Proposed Action	Same as Proposed Action	Same as Proposed Action	Same as Proposed Action	Same as Proposed Action
Traffic and Transportation	Increased roadway traffic; damage to roadways, access, or road systems; risk to aviation	Alternative 1 would be within 0.3-mile of the Cyr Aviation Airport. The aviation safety risk associated with the Cyr Aviation Airport would be reduced to minor to moderate. Structures and lines in the Plomosa or Dome Rock Mountains would pose a minor to moderate long-term aviation hazard to AGFD aircraft; with MM-TT-02 this impact would be reduced to minor and long-term.	Same as Alternative 1	Same as Alternative 1	Same as Alternative 1	Same as Alternative 1	Same as Proposed Action

CHARACTERISTIC OR RESOURCE IMPACT		ALTERNATIVE 1	1A	1B	1C	1D	1E
Visual Resources	Conflicts with visual standards, ordinances, or policies established; major and unmitigated visual changes that degrade or disrupt views of scenic landscapes from highly sensitive viewing locations; VRM class objectives that would not be met requiring an RMP Amendment.	Impacts to viewers along I-10 would be minor to moderate. Additionally, there are larger areas of higher scenic quality south of I-10 than there are to the north, meaning that viewers along I-10 attracted to the distant scenic views to the south would be viewing these areas with the Project in the intervening landscape. In areas of moderate impact, the visibility of distant scenic quality A areas may further increase the adverse visual impact of the Project, notably Segment i-04. Addition of the transmission line would add a visible and, in many cases, noticeable development. However, most of the areas crossing BLM-managed public land would meet established VRM class objectives.	Subalternative 1A would further remove the Project from proximity to I-10 viewers and reducing visual impacts.	Subalternative 1B would further remove the Project from proximity to I-10 viewers and reducing visual impacts.	Impacts would be similar to Alternative 1 with two additional crossings of I-10, increasing impacts in those locations.	Under Subalternative 1D, impacts to I-10 travelers would be minor.	Subalternative 1E would be further south of I-10 reducing the visual impacts.
Water Resources	Impacts to surface water or groundwater quantity or availability; impediments to floodplain function from channel alterations; impacts to water rights or water quality; violations of Section 404 of the Clean Water Act or Section 10 of the Rivers and Harbors Act.	Same as Proposed Action	Same as Alternative 1	Same as Alternative 1	Same as Alternative 1	Same as Alternative 1	Same as Alternative 1

[1]Site density calculations include sites that have been previously determined or recommended as ineligible for the NRHP. In cases where the projected counts of NRHP-eligible or site of unknown NRHP eligibility are 0 and the site density is greater than 0, the site density calculation includes NRHP ineligible sites.

	VOC	9.5	Proportional to Total Length				
	CO_{2e}	35,747	Proportional to Total Length				
	GHGs – Construction CO_{2e}	Same as Proposed Action	Same as Proposed Action				
	Criteria Air Pollutants – O&M	Would not exceed NAAQS or CAAQS	Would not exceed NAAQS or CAAQS				
	GHGs – SF_6 – O&M	Same as Proposed Action	Same as Proposed Action				
Geology, Minerals, and Soil Resources	Geological Hazards Minerals/Mining (access to known resources or claims) Soils	Uses segments ca-07, ca-09, and x-19 which would have negligible to minor impact on sand transport and dunes during construction and operation	Same as Alternative 2	Same as Alternative 2	Same as Alternative 2	Same as Alternative 2	Same as Alternative 2
Paleontological Resources	Potential damage to known paleontological resources or formations with potential to contain paleontological resources	Potentially increased impacts from Proposed Action with three segments having high to very high PFYC – negligible to minor long-term impacts with mitigations	Same as Alternative 2	Same as Alternative 2	Same as Alternative 2	Same as Alternative 2	Same as Alternative 2

CHARACTERISTIC OR RESOURCE IMPACT		ALTERNATIVE 2	2A	2B	2C	2D	2E
Biological Resources (Vegetation Resources, Wildlife, including Special Status Species and Migratory Birds)	Loss of native habitat/communities; Noxious weeds; Special Status Species & animals); Increased risk of predation or electrocution re infrastructure; Displacement via construction; Displacement via human activity including recreation; Impacts to native habitat and designated management areas; and Migratory birds.	In areas where no linear facilities and few roads exist these impacts would be moderate. Protected microphyll washes and up to 0.8 acre of total wash habitat would be crossed but would be spanned through micrositing Minor long-term impacts in undeveloped areas due to facilitating increased abundance of non-native plants, especially in dune habitats. APMs and BMPs would reduce impact. Project would cross 7 miles of Harwood's eriastrum habitat; measures would protect individuals and maintain sand transport. Predation potential and electrocution risk similar to the Proposed Action. Displacement similar to the Proposed Action. Negligible long-term impacts to wildlife and habitats by facilitating increased recreational access to remote areas. Minor impact on Sonoran desert tortoise habitat, and negligible impact on Sonoran pronghorn. Avoids Mojave desert tortoise habitat. Passes through Cunningham Peak, a bighorn sheep lambing area. Impacts to wildlife habitats minimized through use of APMs and BMPs. Avoids the Kofa NWR. Migratory birds similar to Proposed Action. Increased, minor short- and long-term impact to Mojave fringe-toed lizard due to possible mortality by Project activities and habitat impacts on 4 miles of habitat.	Subalternative 2 would avoid potential disturbance associated with Segment p-01 at a developed wildlife water in the Big Horn Mountains that may be used by bighorn sheep; and avoid crossing a bighorn sheep dispersal corridor between Burnt Mountain and the Big Horn Mountains.	Overall substantially similar to Alternative 2	The increased human presence associated with constructing and operating the line could interfere with wildlife use of the developed wildlife water in Johnson Canyon. Development of Subalternative 2C could increase public access into remote habitats and could permanently alter the character and function of the area for wildlife. Subalternative 2C would result in substantially more impacts to biological resources than Alternative 2, which is parallel to existing development through Copper Bottom Pass.	Overall substantially similar to Alternative 2	Overall substantially similar to Alternative 2

CHARACTERISTIC OR RESOURCE IMPACT		ALTERNATIVE 2	2A	2B	2C	2D	2E
Cultural Resources	Damage or loss of a cultural site or potential site under Federal or state registers; degradation of the setting for a cultural site where setting is significant to its listing eligibility; increased access leading to potential vandalism; disturbance of human remains.	Known NRHP-eligible sites or sites requiring NRHP evaluation: 50 (cultural resources survey coverage: 32.5%). Known site density: 7.8 sites per 100 acres. Projected NRHP-eligible sites or sites requiring NRHP evaluation: 150. Key resources projected to occur include trails and intaglios. Areas of Indian Tribal concern (NRHP-listed Ripley Intaglio Site and Limekiln Wash Intaglio Site) are in the vicinity of this alternative route. Continued consultation with Indian Tribes and/or other interested parties potentially may identify additional resources of concern.	Known NRHP-eligible sites or sites requiring NRHP evaluation: 0 (cultural resources survey coverage: 5.4%). Known site density: 4.7 sites per 100 acres. Projected NRHP-eligible sites or sites requiring NRHP evaluation: 37. Subalternative 2A would result in a greater visual impact but a comparable amount of ground disturbance compared to Alternative 2.	Known NRHP-eligible sites or sites requiring NRHP evaluation: 5 (cultural resources survey coverage: 12.7%). Known site density: 23.1 sites per 100 acres. Projected NRHP-eligible sites or sites requiring NRHP evaluation: 40. Subalternative 2B would result in a greater visual impact and a greater potential to affect cultural resources by ground disturbance compared with Alternative 2.	Known NRHP-eligible sites or sites requiring NRHP evaluation: 0 (cultural resources survey coverage: 29.9%). Known site density: 7.7 sites per 100 acres. Projected NRHP-eligible sites or sites requiring NRHP evaluation: 10. Subalternative 2C has a higher potential to affect cultural resources based on projected site counts and the disturbance footprint, as compared to Alternative 2.	Known NRHP-eligible sites or sites requiring NRHP evaluation: 1 (cultural resources survey coverage: 15.6%). Known site density: 12.0 sites per 100 acres. Projected NRHP-eligible sites or sites requiring NRHP evaluation: 6. Subalternative 2D would result in a greater visual impact but a reduced potential to affect cultural resources by ground disturbance compared to Alternative 2.	Known NRHP-eligible sites or sites requiring NRHP evaluation: 7.6 (cultural resources survey coverage: 7.6%). Known site density: 40.0 sites per 100 acres. Projected NRHP-eligible sites or sites requiring NRHP evaluation: 53. Subalternative 2E would result in a greater potential to affect cultural resources by ground disturbance compared to Alternative 2.
Issues of Concern to Indian Tribes	Existing and new access, native infrastructure and the interconnection of the cultural and natural environment, places of elevated spiritual important to tribes, the Colorado River, the treatment of human remains, and the disturbance of previously pristine landscapes.	Native infrastructure and the interconnectedness of the cultural and natural environment, places of elevated spiritual importance, and the Colorado River.	Native infrastructure and the interconnectedness of the cultural and natural environment; places of elevated spiritual importance.	Native infrastructure and the interconnectedness of the cultural and natural environment.	Native infrastructure and the interconnectedness of the cultural and natural environment; intrusion on pristine landscapes.	Native infrastructure and the interconnectedness of the cultural and natural environment.	Native infrastructure and the interconnectedness of the cultural and natural environment.
Land Use	Land use authorizations and ROWs; Residential; Agricultural; Other (i.e., nuisance impacts)	Same as the Proposed Action except inconsistent with La Paz County Zoning Plan and possibly the Quartzsite General Plan. Avoids the Kofa NWR. Affects greater number of solar facilities. One ROW RMP amendment required and five VRM RMP amendments. In California, it would not be in compliance with the CDCA Plan so would require an amendment.	Passes through renewable energy development avoidance area and include more NRCS-classified farmland in CA. Would require two RMP ROW amendments and eight VRM RMP amendments. Otherwise similar to Alternative 2.	Would require two RMP ROW amendments and six VRM RMP amendments. Otherwise similar to Alternative 2.	Would require four RMP ROW amendments and eight VRM RMP amendments. Otherwise similar to Alternative 2.	Would require six VRM RMP amendments. Otherwise similar to Alternative 2.	Would require nine VRM RMP amendments and two RMP ROW amendments.

CHARACTERISTIC OR RESOURCE IMPACT		ALTERNATIVE 2	2A	2B	2C	2D	2E
Grazing and Rangeland	Access to range or improvements; Loss of range relative to UMs; Fragmentation of allotments; Degradation of range quality	Same as Alternative 1	No impediments to any stock tanks. Otherwise the Same as Proposed Action.	Same as Proposed Action.	Same as Alternative 2	Same as Alternative 2	Same as Alternative 2
Recreation	Physical, access, use, or functional changes to established, designated, or planned recreation areas, resources, experiences, or activities; conflicts with Federal, state, or local policies; affect OHV designations, access, or routes; impacts to hunting access.	Long-term recreation quality similar to Proposed Action except in Quartzsite Zone where powerline would be new to the landscape (negligible to minor). Two Alternative 2 segments would cross the La Posa LTVA (minor to moderate impact), but, by comparison to Alternative 1, Dome Rock Camping Area would not be crossed by Alternative 2. Otherwise similar to the Proposed Action.	Same as Alternative 2	Same as Alternative 2	Route would go through Johnson Canyon rather than the Copper Bottom Area, where the powerline would be a new feature of the landscape and may detract from the experience. Otherwise the same as Alternative 2.	Same as Alternative 2	Same as Alternative 2
Special Designations	Conflict with goals, objectives & resources an area is designated to protect	Same as for Proposed Action	Same as Alternative 2	Same as Alternative 2	Includes segments cb-02 and cb-04, which would have major long-term impacts on lands with wilderness characteristics Polygon 23 (would not meet lands with wilderness characteristics criteria).	Same as Alternative 2	Same as Alternative 2
Noise	Exceedance of regulations or guideline; exposure of receptors to excessive noise levels; generate noise levels that pose a health risk.	Although there would be a difference in number of NSR, impacts would be the same as Proposed Action	Same as Proposed Action	Same as Proposed Action	Same as Proposed Action	Same as Proposed Action	Same as Proposed Action

CHARACTERISTIC OR RESOURCE IMPACT		ALTERNATIVE 2	2A	2B	2C	2D	2E
Hazards and Hazardous Materials	Generation, use, handling, or disturbance of hazardous waste that: violates Federal, state, or local laws or regulations; poses a health or safety risk to public or environment; releases hazardous emissions; creates a safety hazard to public or private airstrips; or exposes workers, schools, or the public to hazardous materials.	Same as Proposed Action	Same as Proposed Action	Same as Proposed Action	Same as Proposed Action	Same as Proposed Action	Same as Proposed Action
Public Health and Safety	Risks to public health, safety, utilities; fire or electrocution hazard; EMF emissions	Same as Proposed Action	Same as Proposed Action	Same as Proposed Action	Same as Proposed Action	Same as Proposed Action	Same as Proposed Action
Socioeconomics & Environmental Justice	Employment; Tax collection & revenue; Population or population displacement; Non-market values and ecosystem services; Revenue from recreation sector; Local economy; Reductions in property values; EJ Populations; disproportionate adverse impacts to EJ populations	Same as Proposed Action	Same as Proposed Action	Same as Proposed Action	Same as Proposed Action	Same as Proposed Action	Same as Proposed Action
Traffic and Transportation	Increased roadway traffic; damage to roadways, access, or road systems; risk to aviation	Structures and lines in the Plomosa or Dome Rock Mountains would pose a minor to moderate long-term aviation hazard to AGFD aircraft; with MM-TT-02 this impact would be reduced to minor and long-term.	Same as Alternative 2	Same as Alternative 2	Same as Alternative 2	Same as Alternative 2	Same as Alternative 2

CHARACTERISTIC OR RESOURCE IMPACT		ALTERNATIVE 2	2A	2B	2C	2D	2E
Visual Resources	Conflicts with visual standards, ordinances, or policies established; major and unmitigated visual changes that degrade or disrupt views of scenic landscapes from highly sensitive viewing locations; VRM class objectives that would not be met requiring an RMP Amendment.	Impacts along the eastern portion (Segments i-01 through i-05) would be the same as Alternative 1. The large lattice H-frame structures would be a major modification and would dominate the views for travelers on SR 95, particularly in conjunction with the existing utility infrastructure. An additional RMP amendment would change the VRM class within the corridor to VRM Class IV.	Subalternative 2A would move the location of the Project south away from I-10, which would reduce the visual impacts.	Subalternative 2B would move the location of the Project south away from I-10, which would reduce the visual impacts.	Subalternative 2C would have no effect on visual resource impacts as viewed within the I-10 corridor.	Subalternative 2D would have no effect on visual resource impacts as viewed within the I-10 corridor.	Subalternative 2E would move the location of the Project north, roughly mid-way between the Proposed Action route and I-10; however, because of the predominate agricultural use and limited sensitive viewers, there would be no discernable change in visual impacts.
Water Resources	Impacts to surface water or groundwater quantity or availability; impediments to floodplain function from channel alterations; impacts to water rights or water quality; violations of Section 404 of the Clean Water Act or Section 10 of the Rivers and Harbors Act.	Same as for Proposed Action	Same as Alternative 2	Same as Alternative 2	Same as Alternative 2	Same as Alternative 2	Same as Alternative 2

Table 2.2-39 Alternative 3 Subalternative Impacts

Geology, Minerals, and Soil Resources	Geological Hazards Minerals/Mining (access to known resources or claims) Soils	Uses segments ca-07, ca-09, and x-19 which would have negligible to minor impact on sand transport and dunes during construction and operation.	Same as Alternative 3	Same as Alternative 3	Same as Alternative 3	Same as Alternative 3	Same as Alternative 3	Same as Alternative 3	Same as Alternative 3	Same as Alternative 3	Same as Alternative 3	Same as Alternative 3	Same as Alternative 3	Same as Alternative 3

CHARACTERISTIC OR RESOURCE IMPACT		ALTERNATIVE 3	3A	3B	3C	3D	3E	3F	3G	3H	3J	3K	3L	3M
Paleontological Resources	Potential damage to known paleontological resources or formations with potential to contain paleontological resources	Same as Proposed Action	Same as Alternative 3	Same as Alternative 3	Same as Alternative 3	Same as Alternative 3	Same as Alternative 3	Same as Alternative 3	Same as Alternative 3	Slightly higher potential for impacts than Alternative Route 3	Same as Alternative 3	Same as Alternative 3	Slightly higher potential for impacts than Alternative 3	Same as Alternative 3
Biological Resources (Vegetation Resources, Wildlife, including Special Status Species and Migratory Birds)	Loss of native habitat/communities; Noxious weeds; Special Status Species & animals); Increased risk of predation or electrocution re infrastructure; Displacement via construction; Displacement via human activity including recreation; Impacts to native habitat and designated management areas; and Migratory birds.	In areas where no linear facilities and few roads exist these impacts would be moderate. Much of this route is in pristine condition, therefore the loss of native habitat/communities is greater than the other alternatives. Moderate long-term impacts due to facilitating spread and increased abundance of non-native plants into new areas, especially into the Dome Rock Mountains and dune habitats. Project would cross 0.6 mile of Harwood's eriastrum habitat. Moderate short- and long-term impacts of ground disturbance on protected and special status plants and plant communities. Moderate impact with APMs and BMPs. The collision risk at the Colorado River crossing is higher than under the Proposed	Same as Alternative 3	Same as Alternative 3	Subalternative 3C would result in substantially greater impacts than Alternative 3, where habitats have been degraded adjacent to I-10.	Subalternative 3D would result in substantially greater impacts than Alternative 3, where habitats have been degraded adjacent to I-10.	Same as Alternative 3	Subalternative 3F would result in a reduction of impacts to vegetation and wildlife resources.	Same as Alternative 3	Subalternative 3H would result in a reduction of impacts to plant and wildlife resources by not utilizing Alternative 3 Segment x-05, which passes close to the Plomosa Mountains through good quality desert scrub habitat where several special status species may be present, and the area has not been impacted by linear facilities and developments.	Same as Alternative 3	Subalternative 3K passes through the remote, rugged slopes at Cunningham Peak and Johnson Canyon in the Dome Rock Mountains. The consequence of either option is the same—major adverse impacts to bighorn sheep and other wildlife in this near-pristine area.	Impacts to wildlife, especially to bighorn sheep, would be reduced by moving the Project out of Copper Bottom Pass, which is important to bighorn sheep	Potential impacts to biological resources from Subalternative 3M and Alternative 3 are very similar through the agricultural area just west of the Colorado River. At the river crossing, Subalternative 3M would cross adjacent to an existing utility line, where matching conductor height and structures could reduce potential collision by birds, affording a benefit to migratory birds.

CHARACTERISTIC OR RESOURCE IMPACT		ALTERNATIVE 3	3A	3B	3C	3D	3E	3F	3G	3H	3J	3K	3L	3M
		Action because the crossing is not adjacent to existing facilities. Major long-term impacts to bighorn sheep in the Dome Rock Mountains by degrading nearly pristine habitat. Major long-term impacts to bighorn sheep in the Dome Rock Mountains by facilitating increased recreational access to remote areas. Minor impact on Sonoran desert tortoise habitat, and negligible impact on Sonoran pronghorn. Passes through Cunningham Peak, a bighorn sheep lambing area. Impacts to wildlife habitats minimized through use of APMs and BMPs. Avoids the Kofa NWR. Minor short- and long-term impacts to migratory birds due to potential collision hazard with structures, conductors, and guy lines, and additional hazard at the Colorado River.												

CHARACTERISTIC OR RESOURCE IMPACT		ALTERNATIVE 3	3A	3B	3C	3D	3E	3F	3G	3H	3J	3K	3L	3M
Cultural Resources	Damage or loss of a cultural site or potential site under Federal or state registers; degradation of the setting for a cultural site where setting is significant to its listing eligibility; increased access leading to potential vandalism; disturbance of human remains.	Known NRHP-eligible sites or sites requiring NRHP evaluation: 35 (cultural resources survey coverage: 24.4%). Known site density: 9.4 sites per 100 acres. Projected NRHP-eligible sites or sites requiring NRHP evaluation: 134. Key resources projected to occur include trails.	Known NRHP-eligible sites or sites requiring NRHP evaluation: 0 (cultural resources survey coverage: 5.0%). Known site density: 4.7 sites per 100 acres. Projected NRHP-eligible sites or sites requiring NRHP evaluation: 41. Subalternative 3A would result in a greater visual impact and a greater potential to affect cultural resources compared to Alternative 3.	Known NRHP-eligible sites or sites requiring NRHP evaluation: 2 (cultural resources survey coverage: 7.5%). Known site density: 9.7 sites per 100 acres. Projected NRHP-eligible sites or sites requiring NRHP evaluation: 19. Subalternative 3B would result in less ground disturbance and visual impact compared to Alternative 3.	Known NRHP-eligible sites or sites requiring NRHP evaluation: 1 (cultural resources survey coverage: 5.9%). Known site density: 11.0 sites per 100 acres. Projected NRHP-eligible sites or sites requiring NRHP evaluation: 34. Subalternative 3C would result in a comparable visual impact and a lower potential to affect cultural resources by ground disturbance compared to Alternative 3.	Known NRHP-eligible sites or sites requiring NRHP evaluation: 2 (cultural resources survey coverage: 2.0%). Known site density: 30.3 sites per 100 acres. Projected NRHP-eligible sites or sites requiring NRHP evaluation: 102. Subalternative 3D would result in a greater visual impact and a greater potential to affect cultural resources by ground disturbance compared to Alternative 3	Known NRHP-eligible sites or sites requiring NRHP evaluation: 3 (cultural resources survey coverage: 29.0%). Known site density: 9.2 sites per 100 acres. Projected NRHP-eligible sites or sites requiring NRHP evaluation: 21. Subalternative 3E would result in a comparable visual impact but a greater potential to affect cultural resources by ground disturbance compared to Alternative 3.	Known NRHP-eligible sites or sites requiring NRHP evaluation: 3 (cultural resources survey coverage: 23.7%). Known site density: 11.2 sites per 100 acres. Projected NRHP-eligible sites or sites requiring NRHP evaluation: 21. Subalternative 3F would result in a comparable visual impact but less potential to affect cultural resources by ground disturbance compared to Alternative 3.	Known NRHP-eligible sites or sites requiring NRHP evaluation: 1 (cultural resources survey coverage: 89.6%). Known site density: 22.2 sites per 100 acres. Projected NRHP-eligible sites or sites requiring NRHP evaluation: 2. Subalternative 3G demonstrates a low sensitivity for cultural resources in the 200-foot analysis corridor compared to Alternative 3. The potential effect to cultural resources by Subalternative 3G must be further evaluated in conjunction with the pairing of Subalternative 3G with Subalternatives 3D, 3E, 3F, 3H, and/or 3J.	Known NRHP-eligible sites or sites requiring NRHP evaluation: 3 (cultural resources survey coverage: 56.6%). Known site density: 4.7 sites per 100 acres. Projected NRHP-eligible sites or sites requiring NRHP evaluation: 7. The potential effect to cultural resources by Subalternative 3H must be further evaluated in conjunction with the pairing of Subalternative 3H with Subalternatives 3D and 3L compared to Alternative 3.	Known NRHP-eligible sites or sites requiring NRHP evaluation: 0 (cultural resources survey coverage: 36.2%). Known site density: 4.0 sites per 100 acres. Projected NRHP-eligible sites or sites requiring NRHP evaluation: 3. The potential effect to cultural resources by Subalternative 3J must be further evaluated in conjunction with the pairing of Subalternative 3J with Subalternatives 3E, 3F, or 3G and 3H compared to Alternative 3.	Known NRHP-eligible sites or sites requiring NRHP evaluation: 3 (cultural resources survey coverage: 44.8%). Known site density: 4.6 sites per 100 acres[1]. Projected NRHP-eligible sites or sites requiring NRHP evaluation: 2. Subalternative 3K would result in a greater visual impact but less potential to affect cultural resources by ground disturbance compared to Alternative 3.	Known NRHP-eligible sites or sites requiring NRHP evaluation: 3 (cultural resources survey coverage: 45.5%). Known site density: 4.9 sites per 100 acres. Projected NRHP-eligible sites or sites requiring NRHP evaluation: 7. Subalternative 3L would result in a greater visual impact and a greater potential to affect cultural resources by ground disturbance compared to Alternative 3.	Known NRHP-eligible sites or sites requiring NRHP evaluation: 12 (cultural resources survey coverage: 27.0%). Known site density: 15.8sites per 100 acres. Projected NRHP-eligible sites or sites requiring NRHP evaluation: 65. Subalt 3M would result in a comparable visual impact but a greater potential to affect cultural resources by ground disturbance compared to Alternative 3.

CHARACTERISTIC OR RESOURCE IMPACT		ALTERNATIVE 3	3A	3B	3C	3D	3E	3F	3G	3H	3J	3K	3L	3M
Issues of Concern to Indian Tribes	Existing and new access, native infrastructure and the interconnection of the cultural and natural environment, places of elevated spiritual important to tribes, the Colorado River, the treatment of human remains, and the disturbance of previously pristine landscapes.	Native infrastructure and the interconnectedness of the cultural and natural environment; the Colorado River; intrusion on pristine landscapes.	Native infrastructure and the interconnected ness of the cultural and natural environment; places of elevated spiritual importance.	No known concerns to Indian tribes.	Native infrastructure and the interconnected ness of the cultural and natural environment; intrusion on pristine landscapes.	No known concerns to Indian tribes.	Native infrastructure and the interconnected ness of the cultural and natural environment.	Native infrastructure and the interconnected ness of the cultural and natural environment.	No known concerns to Indian tribes.	Native infrastructure and the interconnected ness of the cultural and natural environment; places of elevated spiritual importance.	No known concerns to Indian tribes.	Native infrastructure and the interconnected ness of the cultural and natural environment; intrusion on pristine landscapes.	Native infrastructure and the interconnected ness of the cultural and places of elevated spiritual importance.	Native infrastructure and the interconnected ness of the cultural and places of elevated spiritual importance; the Colorado River.
Land Use	Land use authorizations and ROWs; Residential; Agricultural; Other (i.e., nuisance impacts)	Avoids Kofa NWR. Inconsistent with La Paz County Zoning Plan. Would affect more NRCS-classified farmland and solar energy facilities than Proposed Action. One amendment to Yuma RMP for ROW and six for VRM. In California, it would not be in compliance with the CDCA Plan so would require an amendment.	Passes avoidance area for renewable energy development. More ASLD & NRCS-class farmland. Two RMP ROW amendments. Otherwise same as Alternative 3.	More ASLD land. Otherwise same as Alternative 3.	More ASLD land; no ROW amendments to RMP. Otherwise same as Alternative 3.	One additional VRM amendment than Alternative 3.	Passes through La Posa LTVA which may be inconsistent with Quartzsite General Plan. Otherwise same as Alternative 3.	Same as Alternative 3	Same as Alternative 3	Passes Tier III growth area. Two ROW amendments to RMP. Otherwise same as Alternative 3. Otherwise same as Alternative 3.	Same as Alternative 3	Seven segments would require amendments to RMP for VRM. Otherwise same as Alternative 3.	Same as Alternative 3	Same as Alternative 3
Grazing and Rangeland	Access to range or improvements; Loss of range relative to AUMs; Fragmentation of allotments; Degradation of range quality	Same as the Proposed Action	Removes impediments to 2 tanks under the Proposed Action but impedes access to another tank. Otherwise the same as Alternative 3	Impediments to 3 stock tanks total; negligible impact with MM GR-1. Otherwise the same as Alternative 3.	Same as Alternative 3	Same as Alternative 3	Same as Alternative 3	Same as Alternative 3	Same as Alternative 3	Same as Alternative 3	Same as Alternative 3	Same as Alternative 3	Same as Alternative 3, except no helicopter fly yards, and no measurable impacts from helicopters.	Same as Alternative 3

CHARACTERISTIC OR RESOURCE IMPACT		ALTERNATIVE 3	3A	3B	3C	3D	3E	3F	3G	3H	3J	3K	3L	3M
Recreation	Physical, access, use, or functional changes to established, designated, or planned recreation areas, resources, experiences, or activities; conflicts with Federal, state, or local policies; affect OHV designations, access, or routes; impacts to hunting access.	Long-term recreation quality similar to Proposed Action except where powerline would be new to the landscape (negligible to minor). Would not cross the La Posa LTVA, Dome Rock Camping Area, Kofa NWR, Copper Bottom Pass, or Johnson Canyon. Otherwise similar to the Proposed Action.	Same as Alternative 3	Same as Alternative 3	Same as Alternative 3	Same as Alternative 3	Would go through La Posa LTVA. Otherwise the same as Alternative 3.	Adjacent to La Posa LTVA. Otherwise the same as Alternative 3.	Same as Alternative 3	Same as Alternative 3	Same as Alternative 3	Route would go through Johnson Canyon – minor impact with mitigation. Otherwise the same as Alternative 3.	Route would go through Dome Rock Camping Area. Otherwise the same as Alternative 3.	Same as Alternative 3
Special Designations	Conflict with goals, objectives & resources an area is designated to protect	Includes segment cb-01 and cb-04 with major long-term effect to lands with wilderness characteristics Polygon 23 (would not meet lands with wilderness characteristics criteria). Noise	Exceedance of regulations or guideline; exposure of receptors to excessive noise levels; generate noise levels that pose a health risk.	Although there would be a difference in number of NSR, impacts would be the same as Proposed Action	Same as Proposed Action	Same as Proposed Action	Same as Proposed Action	Same as Proposed Action	Same as Proposed Action	Same as Proposed Action	Same as Proposed Action	Same as Proposed Action	Same as Proposed Action	Same as Proposed Action	Same as Proposed Action	Same as Proposed Action

CHARACTERISTIC OR RESOURCE IMPACT		ALTERNATIVE 3	3A	3B	3C	3D	3E	3F	3G	3H	3J	3K	3L	3M
Hazards and Hazardous Materials	Generation, use, handling, or disturbance of hazardous waste that: violates Federal, state, or local laws or regulations; poses a health or safety risk to public or environment; releases hazardous emissions; creates a safety hazard to public or private airstrips; or exposes workers, schools, or the public to hazardous materials.	Same as Proposed Action	Same as Proposed Action	Same as Proposed Action	Same as Proposed Action	Same as Proposed Action	Same as Proposed Action	Same as Proposed Action	Same as Proposed Action	Same as Proposed Action	Same as Proposed Action	Same as Proposed Action	Same as Proposed Action	Same as Proposed Action
Public Health and Safety	Risks to public health, safety, utilities; fire or electrocution hazard; EMF emissions	Same as Proposed Action	Same as Proposed Action	Same as Proposed Action	Same as Proposed Action	Same as Proposed Action	Same as Proposed Action	Same as Proposed Action	Same as Proposed Action	Same as Proposed Action	Same as Proposed Action	Same as Proposed Action	Same as Proposed Action	Same as Proposed Action
Socioeconomics & Environmental Justice	Employment; Tax collection & revenue; Population or population displacement; Non-market values and ecosystem services; Revenue from recreation sector; Local economy; Reductions in property values; EJ Populations; disproportionate adverse impacts to EJ populations	Same as Proposed Action	Same as Proposed Action	Same as Proposed Action	Same as Proposed Action	Same as Proposed Action	Same as Proposed Action	Same as Proposed Action	Same as Proposed Action	Same as Proposed Action	Same as Proposed Action	Same as Proposed Action	Same as Proposed Action	Same as Proposed Action

CHARACTERISTIC OR RESOURCE IMPACT		ALTERNATIVE 3	3A	3B	3C	3D	3E	3F	3G	3H	3J	3K	3L	3M
Traffic and Transportation	Increased roadway traffic; damage to roadways, access, or road systems; risk to aviation	Structures and lines in the Plomosa or Dome Rock Mountains would pose a minor to moderate long-term aviation hazard to AGFD aircraft; with MM-TT-02 this impact would be reduced to minor and long-term.	Same as Alternative 3	Same as Alternative 3	Same as Alternative 3	Same as Alternative 3	Same as Alternative 3	Same as Alternative 3	Same as Alternative 3	Same as Alternative 3	Same as Alternative 3	Same as Alternative 3	Same as Alternative 3	Same as Alternative 3
Visual Resources	Conflicts with visual standards, ordinances, or policies established; major and unmitigated visual changes that degrade or disrupt views of scenic landscapes from highly sensitive viewing locations; VRM class objectives that would not be met requiring an RMP Amendment.	Under Alternative 3, impacts to the I-10 corridor in the eastern portion of the Project Area would be the same as the Proposed Action. Alternative 3 would avoid any impacts to the SR 95 corridor. Impacts to the remainder of this route would the same as Alternative 2.	Subalternative 3A would reduce the effect on visual resources as viewed from I-10.	Subalternative 3B would have the same impact to this portion of the I-10 as described for Alternative 1.	Subalternative 3C would shift the Project nearly 5 miles south of I-10, virtually eliminating visual impacts in that area. Visual impacts would slowly increase as the Project approaches I-10.	Impacts from Subalternative 3D would be the same as those described for Subalternative 1C.	Subalternative 3E would have minor impacts to the views of I-10 travelers who would see the Project paralleling the WAPA 161kV transmission line; however, impacts to nearby residents would be moderate to major.	Subalternative 3F would place the Project in closer proximity to I-10, with impacts as described under Alternative 1.	Subalternative 3G would have the same impacts as described for Subalternative 1D.	Subalternative 3H would have impacts to I-10 travelers similar to Alternative 3, the addition of other segments along I-10 west of Quartzsite would increase the visual impacts, as compared to Alternative 3.	Subalternative 3J would use Segment i-05 in conjunction with other segments. See analysis of Subalternative 3F.	Subalternative 3K would have no impacts as viewed within the I-10 corridor.	Subalt 3L would move the Project along I-10 for this segment; see analysis of impacts from this segment under Alternative 1.	Subalt 3M would have no effect on visual resource impacts as viewed within the I-10 corridor.
Water Resources	Impacts to surface water or groundwater quantity or availability; impediments to floodplain function from channel alterations; impacts to water rights or water quality; violations of Section 404 of the Clean Water Act or Section 10 of the Rivers and Harbors Act.	Same as Proposed Action	Same as Alternative 3	Same as Alternative 3	Same as Alternative 3	Same as Alternative 3	Same as Alternative 3	Same as Alternative 3	Same as Alternative 3	Same as Alternative 3	Same as Alternative 3	Same as Alternative 3	Same as Alternative 3	Same as Alternative 3

CHARACTERISTIC OR RESOURCE IMPACT		ALTERNATIVE 4	4A	4B	4C	4D	4E	4F	4G	4H
Geology, Minerals, and Soil Resources	Geological Hazards Minerals/ Mining (access to known resources or claims) Soils	Uses segments ca-07, ca-09, and x-19 which would have negligible to minor impact on sand transport and dunes during construction and operation	Same as Alternative 4	Same as Alternative 4	Same as Alternative 4	Same as Alternative 4	Same as Alternative 4	Same as Alternative 4	Same as Alternative 4	Same as Alternative 4
Paleontological Resources	Potential damage to known paleontological resources or formations with potential to contain paleontological resources	Same as Proposed Action but less than Alternative 2	Same as Alternative 4	Same as Alternative 4	Same as Alternative 4	Same as Alternative 4	Same as Alternative 4	Same as Alternative 4	Same as Alternative 4	Same as Alternative 4
Biological Resources (Vegetation Resources. Wildlife, including Special Status Species and Migratory Birds)	Loss of native habitat/communities; Noxious weeds; Special Status Species & animals); Increased risk of predation or electrocution re infrastructure; Displacement via construction; Displacement via human activity including recreation; Impacts to native habitat and designated management areas; and Migratory birds.	In areas where no linear facilities and few roads exist these impacts would be moderate. Moderate long-term impacts due to facilitating spread and increased abundance of non-native plants into new areas, especially into the Dome Rock Mountains and dune habitats. Project would cross 0.6 mile of Harwood's eriastrum habitat. Moderate short- and long-term impacts of ground disturbance on protected and special status plants and plant communities. Moderate impact with APMs and BMPs. Predation potential and electrocution	Slight increase of impacts to wildlife compared to Alternative 4 due in part to coming close to a wildlife water that may be used by desert bighorn sheep and mule deer.	Minor reduction of impacts from Alternative 4, crossing less desert habitat in moderate to good condition.	Parallels I-10 and would not contribute to any substantial new impacts.	Greater impacts than for Alternative 4 as special status species may occur in desert scrub habitat within the corridor, mostly in the Plomosa Mountains.	As with Alternative 4, major adverse impacts to bighorn sheep and other wildlife in near-pristine area.	Slightly less impact to biological resources than Alternative 4 because it impacts approximately one mile less.	Impacts substantially less than for Alternative 4 by staying in an existing corridor through Copper Bottom Pass.	Fewer impacts than Alternative 4.

CHARACTERISTIC OR RESOURCE IMPACT		ALTERNATIVE 4	4A	4B	4C	4D	4E	4F	4G	4H
		risk same as Proposed Action. Major long-term impacts to bighorn sheep in the Dome Rock Mountains by degrading nearly pristine habitat. Route would be close to a wildlife water in Johnson Canyon. Major long-term impacts to bighorn sheep in the Dome Rock Mountains by degrading nearly pristine habitat and facilitating increased recreational access to remote areas. Minor impact on Sonoran desert tortoise and Sonoran pronghorn habitat. Passes through Cunningham Peak, a bighorn sheep lambing area. Impacts to wildlife habitats minimized through use of APMs and BMPs. Avoids the Kofa NWR. Migratory birds similar to Proposed Action.								
Cultural Resources	Damage or loss of a cultural site or potential site under Federal or state registers; degradation of the setting for a cultural site where setting is significant to its listing eligibility; increased access	Known NRHP-eligible sites or sites requiring NRHP evaluation: 41 (cultural resources survey coverage: 23.2%). Known site density: 10.3 sites per 100 acres. Projected NRHP-eligible sites or sites	Known NRHP-eligible sites or sites requiring NRHP evaluation: 11 (cultural resources survey coverage: 43.2%). Known site density: 4.3 sites per 100 acres. Projected NRHP-eligible sites or sites requiring NRHP evaluation: 33.	Known NRHP-eligible sites or sites requiring NRHP evaluation: 1 (cultural resources survey coverage: 3.6%). Known site density: 17.5 sites per 100 acres. Projected NRHP-eligible sites or sites requiring NRHP evaluation: 111.	Known NRHP-eligible sites or sites requiring NRHP evaluation: 0 (cultural resources survey coverage: 2.0%). Known site density: 18.5 sites per 100 acres[1]. Projected NRHP-eligible sites or sites requiring NRHP evaluation: 0.	Known NRHP-eligible sites or sites requiring NRHP evaluation: 6 (cultural resources survey coverage: 5.7%). Known site density: 38.7 sites per 100 acres. Projected NRHP-eligible sites or sites requiring NRHP evaluation: 122.	Known NRHP-eligible sites or sites requiring NRHP evaluation: 0 (cultural resources survey coverage: 4.8%). Known site density: 0.0 sites per 100 acres. Projected NRHP-eligible sites or sites requiring NRHP evaluation: 0.	Known NRHP-eligible sites or sites requiring NRHP evaluation: 0 (cultural resources survey coverage: 8.7%). Known site density: 0.0 sites per 100 acres. Projected NRHP-eligible sites or sites requiring NRHP evaluation: 0.	Known NRHP-eligible sites or sites requiring NRHP evaluation: 1 (cultural resources survey coverage: 43.7%). Known site density: 2.8 sites per 100 acres. Projected NRHP-eligible sites or sites requiring NRHP evaluation: 2.	Known NRHP-eligible sites or sites requiring NRHP evaluation: 1 (cultural resources survey coverage: 31.6%). Known site density: 8.4 sites per 100 acres. Projected NRHP-eligible sites or sites requiring NRHP evaluation: 12.

CHARACTERISTIC OR RESOURCE IMPACT		ALTERNATIVE 4	4A	4B	4C	4D	4E	4F	4G	4H
	leading to potential vandalism; disturbance of human remains.	requiring NRHP evaluation: 170. Key resources projected to occur include trails. Areas of tribal concern (NRHP-listed Ripley Intaglio Site, NRHP-listed Eagletail Petroglyph Site, and Limekiln Wash Intaglio Site) are in the vicinity of this alternative route. Continued consultation with Indian tribes and/or other interested parties potentially may identify additional resources of concern.	Subalternative 4A would result in a greater visual impact and a greater potential to impact cultural resources by ground disturbance compared to Alternative 4.	Subalternative 4B would result in a greater visual impact and a greater potential to affect cultural resources by ground disturbance compared to Alternative 4.	The potential effect to cultural resources by Subalternative 4C must be further evaluated in conjunction with the pairing of Subalternative 4C with Subalternatives 4D or 4J.	Subalternative 4D would result in a comparable visual impact and a lower potential to affect cultural resources by ground disturbance compared to Alternative 4.	Subalternative 4E would result in the same visual impact as Alternative 4.	Subalternative 4F would result in the same visual impact but a lower potential to impact cultural resources by ground disturbance compared to Alternative 4.	Subalternative 4G would result in a comparable visual impact but a lower potential to affect cultural resources by ground disturbance compared to Alternative 4.	The potential effect to cultural resources by Subalternative 4H must be further evaluated in conjunction with the pairing of Subalternative 4H with Subalternatives 4G and 4K.
Issues of Concern to Indian Tribes	Existing and new access, native infrastructure and the interconnection of the cultural and natural environment, places of elevated spiritual important to tribes, the Colorado River, the treatment of human remains, and the disturbance of previously pristine landscapes.	Native infrastructure and the interconnectedness of the landscape; places of elevated spiritual importance; the Colorado River; intrusion on pristine landscapes.	No known concerns to Indian tribes.	Native infrastructure and the interconnectedness of the landscape.	No known concerns to Indian tribes.	Native infrastructure and the interconnectedness of the landscape; intrusion on pristine landscapes.	Native infrastructure and the interconnectedness of the landscape; intrusion on pristine landscapes.	Native infrastructure and the interconnectedness of the landscape; places of elevated spiritual importance; intrusion on pristine landscapes.	Native infrastructure and the interconnectedness of the landscape.	Native infrastructure and the interconnectedness of the landscape.

CHARACTERISTIC OR RESOURCE IMPACT		ALTERNATIVE 4	4A	4B	4C	4D	4E	4F	4G	4H
Land Use	Land use authorizations and ROWs; Residential; Agricultural; Other (i.e., nuisance impacts)	Would not cross Kofa NWR. Inconsistent with La Paz County Zoning Plan. Affects more NRCS-class farmland & solar facilities than Proposed Action. Five RMP amends for ROW and VRM for seven segments. In California, it would not be in compliance with the CDCA Plan so would require an amendment.	Amendments for 8 segments for VRM. Otherwise the same as Alternative 4.	Crosses more ASLD land. Six ROW amendments to RMP. Otherwise the same as Alternative 4.	Same as Alternative 4	Six RMP amendments for ROW and eight for VRM. Otherwise the same as for Alternative 4.	Same as Alternative 4	Same as Alternative 4	Same as Alternative 4	Same as Alternative 4
Grazing and Rangeland	Access to range or improvements; Loss of range relative to AUMs; Fragmentation of allotments; Degradation of range quality	Access impediment to one stock tank; impact reduced to negligible with MM GR-1.	Access to one additional stock tank vs Alternative 4; impact reduced to negligible with MM GR-1.	Same as Alternative 4	Same as Alternative 4	Same as Alternative 4	Same as Alternative 4	Same as Alternative 4	Same as Alternative 4	Same as Alternative 4
Recreation	Physical, access, use, or functional changes to established, designated, or planned recreation areas, resources, experiences, or activities; conflicts with Federal, state, or local policies; affect OHV designations, access, or routes; impacts to hunting access.	Long-term recreation quality similar to Proposed Action except where powerline would be new to the landscape (negligible to minor). Would run adjacent to the La Posa LTVA but would avoid Dome Rock Camping Area and Kofa NWR. Would run through Johnson Canyon. Otherwise similar to the Proposed Action.	Same as Alternative 4	Same as Alternative 4	Same as Alternative 4	Same as Alternative 4	Same as Alternative 4 except that the route would cross Cunningham Peak, thus avoiding Johnson Canyon.	Same as Alternative 4	Same as Alternative 4	Same as Alternative 4

CHARACTERISTIC OR RESOURCE IMPACT		ALTERNATIVE 4	4A	4B	4C	4D	4E	4F	4G	4H
Special Designations	Conflict with goals, objectives & resources an area is designated to protect	Includes segments cb-2 and cb-04 with major long-term impacts to lands with wilderness characteristics Polygon 23 (would not meet lands with wilderness characteristics criteria).	Same as Alternative 4	Same as Alternative 4	Same as Alternative 4	Same as Alternative 4	Same as Alternative 4	Same as Alternative 4	Would not include segments cb-02 and cb-04, and therefore would not have the impact to lands with wilderness characteristics Polygon 23.	Same as Alternative 4
Noise	Exceedance of regulations or guideline; exposure of receptors to excessive noise levels; generate noise levels that pose a health risk.	Although there would be a difference in number of NSR, impacts would be the same as Proposed Action	Same as Proposed Action	Same as Proposed Action	Same as Proposed Action	Same as Proposed Action	Same as Proposed Action	Same as Proposed Action	Same as Proposed Action	Same as Proposed Action
Hazards and Hazardous Materials	Generation, use, handling, or disturbance of hazardous waste that: violates Federal, state, or local laws or regulations; poses a health or safety risk to public or environment; releases hazardous emissions; creates a safety hazard to public or private airstrips; or exposes workers, schools, or the public to hazardous materials.	Same as Proposed Action	Same as Proposed Action	Same as Proposed Action	Same as Proposed Action	Same as Proposed Action	Same as Proposed Action	Same as Proposed Action	Same as Proposed Action	Same as Proposed Action
Public Health and Safety	Risks to public health, safety, utilities; fire or electrocution hazard; EMF emissions	Same as Proposed Action	Same as Proposed Action	Same as Proposed Action	Same as Proposed Action	Same as Proposed Action	Same as Proposed Action	Same as Proposed Action	Same as Proposed Action	Same as Proposed Action

CHARACTERISTIC OR RESOURCE IMPACT		ALTERNATIVE 4	4A	4B	4C	4D	4E	4F	4G	4H
Socioeconomics & Environmental Justice	Employment; Tax collection & revenue; Population or population displacement; Non-market values and ecosystem services; Revenue from recreation sector; Local economy; Reductions in property values; EJ Populations; disproportionate adverse impacts to EJ populations	Same as Proposed Action	Same as Proposed Action	Same as Proposed Action	Same as Proposed Action	Same as Proposed Action	Same as Proposed Action	Same as Proposed Action	Same as Proposed Action	Same as Proposed Action
Traffic and Transportation	Increased roadway traffic; damage to roadways, access, or road systems; risk to aviation	Structures and lines in the Plomosa or Dome Rock Mountains would pose a minor to moderate long-term aviation hazard to AGFD aircraft; with MM-TT-02 this impact would be reduced to minor and long-term.	Same as Alternative 4	Same as Alternative 4	Same as Alternative 4	Same as Alternative 4	Same as Alternative 4	Same as Alternative 4	Same as Alternative 4	Same as Alternative 4
Visual Resources	Conflicts with visual standards, ordinances, or policies established; major and unmitigated visual changes that degrade or disrupt views of scenic landscapes from highly sensitive viewing locations; VRM class objectives that would not be met requiring	Alternative 4 would remain south of and not impact the visual resources along the I-10 until Segment i-04; impacts were previously described as follows: Segment in-01 – Subalternative 1C Segments ca-06, ca-07, ca-09, x-19 – Alternative 3. All other segments would not impact views along I-10.	Subalternative 4A would have no effect on visual resource impacts as viewed within the I-10 corridor.	Subalternative 4B would place the Project in closer proximity to I-10 with impacts as described for Alternative 2.	Subalternative 4C would have the same impacts as described for Subalternative 3C.	Subalternative 4D would have the same impacts as described for Subalternative 3F and the Proposed Action.	Subalternative 4E would have no effect on the I-10 corridor.	Subalternative 4F would have no effect on the I-10 corridor.	Subalternative 4G would have no effect on the I-10 corridor.	Subalternative 4H would place the Project along I-10 in a narrow canyon area west of the Dome Rock Mountains that opens up to broad, panoramic views. It would impact visual resources similar to impacts in the eastern portion of the Project Area.

CHARACTERISTIC OR RESOURCE IMPACT		ALTERNATIVE 4	4A	4B	4C	4D	4E	4F	4G	4H
	an RMP Amendment.									
Water Resources	Impacts to surface water or groundwater quantity or availability; impediments to floodplain function from channel alterations; impacts to water rights or water quality; violations of Section 404 of the Clean Water Act or Section 10 of the Rivers and Harbors Act.	Same as Proposed Action	Same as Alternative 4	Same as Alternative 4	Same as Alternative 4	Same as Alternative 4	Same as Alternative 4	Same as Alternative 4	Same as Alternative 4	Same as Alternative 4

[1]Site density calculations include sites that have been previously determined or recommended as ineligible for the NRHP. In cases where the projected counts of NRHP-eligible or site of unknown NRHP eligibility are 0 and the site density is greater than 0, the site density calculation includes NRHP ineligible sites.

Other Plan conformance (Federal, county, municipal)	Plan Conformance	Not consistent with La Paz County Zoning Plan	Not consistent with La Paz County Zoning Plan	Not consistent with La Paz County Zoning Plan	Not consistent with La Paz County Zoning Plan	Not consistent with La Paz County Zoning Plan	Not consistent with La Paz County Zoning Plan

CHARACTERISTIC OR RESOURCE IMPACT		4J	4K	4L	4M	4N	4P
Air Quality and Climate Change	Criteria Air Pollutants – Construction	Same as Proposed Action					
	CO	Proportional to Total Length					
	NO_x	Proportional to Total Length					
	PM_{10}	Proportional to Total Length					
	$PM_{2.5}$	Proportional to Total Length					
	SO_2	Proportional to Total Length					
	VOC	Proportional to Total Length					
	CO_{2e}	Proportional to Total Length					
	GHGs – Construction CO_{2e}	Same as Proposed Action					
	Criteria Air Pollutants – O&M	Would not exceed NAAQS or CAAQS					
	GHGs – SF_6 – O&M	Same as Proposed Action					
Geology, Minerals, and Soil Resources	Geological Hazards Minerals/Mining (access to known resources or claims) Soils	Uses segments ca-07, ca-09, and x-19 which would have negligible to minor impact on sand transport and dunes during construction and operation	Same as Alternative 4	Same as Alternative 4	Same as Alternative 4	Same as Alternative 4	Same as Proposed Action
Paleontological Resources	Potential damage to known paleontological resources or formations with potential to contain paleontological resources	Same as Alternative 4	Same as Alternative 4	Same as Alternative 4	Same as Alternative 4	Same as Alternative 4	Slightly higher potential than Alternative 4
Biological Resources (Vegetation Resources, Wildlife, including Special Status Species and Migratory Birds)	Loss of native habitat/communities; Noxious weeds; Special Status Species & animals); Increased risk of predation or electrocution re infrastructure; Displacement via construction; Displacement via human activity including recreation; Impacts to native habitat and designated management areas; and Migratory birds.	These subalternatives largely follow I-10, or cross agricultural areas, and would have fewer impacts than Alternative 4. Subalternatives 4K and 4L cross the Colorado River in areas not adjacent to the existing DPV1 line and may have result in a greater collision hazard to birds.					Potential impacts to biological resources are substantially less for Subalternative 4P than Alternative 4 by avoiding major dune habitat.

CHARACTERISTIC OR RESOURCE IMPACT		4J	4K	4L	4M	4N	4P
Cultural Resources	Damage or loss of a cultural site or potential site under Federal or state registers; degradation of the setting for a cultural site where setting is significant to its listing eligibility; increased access leading to potential vandalism; disturbance of human remains.	Known NRHP-eligible sites or sites requiring NRHP evaluation: 0 (cultural resources survey coverage: 36.3%). Known site density: 4.0 sites per 100 acres. Projected NRHP-eligible sites or sites requiring NRHP evaluation: 3. The potential effect to cultural resources by Subalternative 4J must be further evaluated in conjunction with the pairing of Subalternative 4J with Subalternative 4H.	Known NRHP-eligible sites or sites requiring NRHP evaluation: 0 (cultural resources survey coverage: 28.2%). Known site density: 0.0 sites per 100 acres. Projected NRHP-eligible sites or sites requiring NRHP evaluation: 0. The potential effect to cultural resources by Subalternative 4K must be further evaluated in conjunction with the pairing of Subalternative 4K with Subalternative 4H and 4N.	Known NRHP-eligible sites or sites requiring NRHP evaluation: 1 (cultural resources survey coverage: 7.5%). Known site density: 13.5 sites per 100 acres. Projected NRHP-eligible sites or sites requiring NRHP evaluation: 13. The potential effect to cultural resources by Subalternative 4L must be further evaluated in conjunction with the pairing of Subalternative 4L with Subalternative 4M.	Known NRHP-eligible sites or sites requiring NRHP evaluation: 0 (cultural resources survey coverage: 2.0%). Known site density: 272.7 sites per 100 acres. Projected NRHP-eligible sites or sites requiring NRHP evaluation: 442. Subalternative 4M would result in a comparable visual impact and a comparable potential to disturb cultural resources compared to Alternative 4.	Known NRHP-eligible sites or sites requiring NRHP evaluation: 0 (cultural resources survey coverage: 60.8%). Known site density:0.0 sites per 100 acres. Projected NRHP-eligible sites or sites requiring NRHP evaluation: 0. The potential effect to cultural resources by Subalternative 4N must be further evaluated in conjunction with the pairing of Subalternative 4N with Subalternatives 4H, 4K, and 4M.	Known NRHP-eligible sites or sites requiring NRHP evaluation: 3 (cultural resources survey coverage: 60.4%). Known site density: 31.1 sites per 100 acres. Projected NRHP-eligible sites or sites requiring NRHP evaluation: 36. Subalternative 4P would result in a higher visual impact, but a lower potential to affect cultural resources by ground disturbance compared to Alternative 4.
Issues of Concern to Indian Tribes	Existing and new access, native infrastructure and the interconnection of the cultural and natural environment, places of elevated spiritual important to tribes, the Colorado River, the treatment of human remains, and the disturbance of previously pristine landscapes.	No known concerns to Indian tribes.	Places of elevated spiritual important to tribes, the Colorado River.	Native infrastructure and the interconnection of the cultural and natural environment; the Colorado River.	No known concerns to Indian tribes.	No known concerns to Indian tribes.	Native infrastructure and the interconnection of the cultural and natural environment; places of elevated spiritual importance.
Land Use	Land use authorizations and ROWs; Residential; Agricultural; Other (i.e., nuisance impacts)	Same as Alternative 4	Same as Alternative 4	Same as Alternative 4	Would cross more NRCS-classified farmland than Alternative 4. Otherwise the same as for Alternative 4.	Same as Alternative 4	Same as Alternative 4
Grazing and Rangeland	Access to range or improvements; Loss of range relative to AUMs; Fragmentation of allotments; Degradation of range quality	Same as Alternative 4	Same as Alternative 4	Same as Alternative 4	Same as Alternative 4	Same as Alternative 4	Same as Alternative 4
Recreation	Physical, access, use, or functional changes to established, designated, or planned recreation areas, resources, experiences, or activities; conflicts with Federal, state, or local policies; affect OHV designations, access, or routes; impacts to hunting access.	Same as Alternative 4	Same as Alternative 4	Same as Alternative 4	Same as Alternative 4	Same as Alternative 4	Same as Alternative 4

2.4 MONITORING AND MITIGATION

2.4.1 Biological Resources

MM-BIO-01: A Compensation Plan would be developed to meet BLM requirements from the DRECP and other mitigation agreements. The Compensation Plan would include calculations of compensation ratios and mitigation acreages for loss of habitat for special status and protected native plant species, special status plant communities, Mojave desert tortoise, Sonoran desert tortoise, and any other biological resource requiring additional mitigation. As consistent with BLM policy and resource management plans, compensatory mitigation could include payment of an in-lieu fee; acquiring mitigation land or conservation easements; restoration or habitat enhancement activities on public lands; or a combination of the three (LUPA-BIO-COMP-1, LUPA-BIO-COMP-2, DFA-VPL-BIO-COMP-1, and LUPA-COMP-1; Appendix 2C).

2.4.2 Cultural Resources and Concerns of Indian Tribes

Mitigation measures for cultural resources are outlined in the revised draft PA for the Project (Appendix 2D). Measures contained in the PA would be implemented prior to and during construction and post-construction during operations and maintenance activities. Decommissioning would require separate Section 106 compliance, as stipulated in the PA.

2.4.3 Grazing

MM-GR-01: If construction would preclude or hinder livestock access to these stock ponds or other livestock water sources, DCRT would provide a suitable alternate livestock water source during construction.

2.4.4 Recreation

MM-REC-01: To mitigate effects related to the temporary construction closure of the proposed Arizona Peace Trail and other OHV routes through Johnson Canyon, MM REC-01 would require that construction of the Project occur outside of peak OHV season. Construction in Johnson Canyon would occur between the months of July and September.

MM-REC-02: In areas of high OHV use, such as in Copper Bottom Zone and the Ehrenberg Sandbowl OHV Area, proposed Project structures with guy wires would be replaced with self-supporting (no guy wires) lattice structures or monopoles. Additionally, in all other areas where guyed V structures are used, the anchor positions would be placed no less than 50 feet from any trail or road, and the guy wire would be at least 15 feet above (at its lowest point) any road or trail crossed by a guy wire. This would reduce the safety risk to OHV users.

MM-REC-03: New access roads will be gated where appropriate, and signage including road status will be posted at all new access road junctions.

2.4.5 Hazardous Materials and Hazardous and Solid Waste

MM-HAZ-01: Resource studies establishing baseline conditions for the Project included a screening-level assessment of hazardous materials sites within a 1-mile wide study area encompassing the Proposed Action and all Action Alternative Segments. The screening consisted of searching over 50 government and private databases, including lists specified in California's Government Code Section 65962.5. These databases included the EPA Hazardous Materials Incident Report System, the California "Cortese" Hazardous Waste and Substances Sites List, and the federal database listings of Unexploded Ordnance (UXO) Sites, Formerly Used Defense Sites (FUDS), and Department of Defense sites. No mapped "Superfund" sites or sites on the National Priorities List were documented; however, multiple industrial, commercial, mining, and other potentially contaminated sites are located within the hazardous materials study area, including the FUD Laguna Maneuver Area.

Results of this screening would be used to guide the continued development of Project design, including structure placement locations within a corridor along the Agency Preferred Alternative route, and where other Project-related ground disturbing activities occur outside of the corridor which could include lay-down areas, pulling stations, and access sites. Upon identification of the Agency Preferred Alternative in the final EIS for the Project, DCRT would implement the following mitigation sequence to avoid or minimize the potential for hazardous materials-related impacts to construction workers, the public, and the environment:

1. A 600-foot corridor (300 feet on either side of the centerline of the potential alignment) along the Agency Preferred Alternative route would be evaluated to identify locations where hazardous materials sites (for example, contaminated soils or buried waste) are potentially present. Areas outside of the corridor, including access roads, where Project construction-related ground disturbance could occur would also be evaluated, including a 100-foot buffer. The evaluation would be conducted by individuals trained (in accordance with ASTM E1527-13) in Phase I and II Environmental Site Assessments as presented in ASTM E1527-13. This evaluation would consist of an in-depth review of the information obtained during the initial screening described above, and may include contacting agency staff, review of aerial photographs, and windshield surveys as appropriate.
2. Sites that are identified within the 600-foot Agency Preferred Alternative route study corridor and ancillary sites where Project construction-related ground disturbance could occur through the activities described above in # 1, where a release has occurred, would be subject to a Phase I Environmental Site Assessment in accordance with ASTM E1527-13 *Standard Practice for Environmental Site Assessments: Phase I Environmental Site Assessment Process*.
3. Final Project design and construction plans would take into consideration the results of the Phase I Environmental Site Assessment, with the intent to avoid identified hazardous materials sites through the micrositing process. If a confirmed contamination site can be avoided, it would be and no further action would be indicated.

4. If a hazardous materials site identified during the Phase I Environmental Site Assessment cannot be avoided through micrositing of structures, and the site presents the potential for impacts to the public, Project workers, or the environment, a Phase II Environmental Site Assessment (in accordance with ASTM E1903) would be conducted as appropriate.
5. Depending on the results of the Phase II Environmental Site Assessment, measures may need to be implemented in order to proceed with Project construction. Given the types of hazardous materials sites most likely to be present based on the initial screening, mitigation measures could include, but may not necessarily be limited to, the following:
    - Perform all excavation at the subject site under the direction of a qualified environmental professional (who possesses professional certification for hazardous material inspections) who would field-screen soils for contamination and debris. Soils or other media showing indications of contamination based on field screening instruments, analytical sample results, or visual or olfactory observations would be disposed of and treated in a manner to be approved by the BLM and/or the appropriate state agency.
    - Collect samples for chemical analysis as appropriate to characterize the material for disposal.
    - Transport and dispose of any excavated contaminated soils or debris at an approved facility or treat on site.
    - Conduct all site work under a Health and Safety Plan (to be included in the final POD) that meets OSHA requirements, including requirements for working training and personal protective equipment.

2.4.6 Traffic and Transportation

There would not be any mitigation measures necessary related to construction activities. Mitigation related to operations would include:

MM-TT-01: Structures and lines within Segment ca-05 would constitute a moderate to major, long-term effect associated with a collision hazard at the Cyr Aviation Airport. The marking of structures and lines within 0.5 mile of such facilities with spherical markers and lighting would reduce this effect to minor to moderate.

MM-TT-02: Structures and lines within Segments in-01 and i-04 where they pass through the Plomosa Mountains and Segments i-06, cb-01, cb-02, cb-03, and cb-04 in the Dome Rock Mountains would constitute a moderate to major, long-term effect on the safety of AGFD aircraft conducting aerial wildlife surveys. The marking of structures and lines in these locations would reduce this effect to minor.

2.4.7 Visual Resources

The following measures would be applied in locations identified in the visual resources impact analysis in Chapter 4 or Appendix 4.

MM-VIS-01: Minimize disturbance at structure bases.

MM-VIS-02: No access routes would be constructed to structure sites, and thus structure sites be accessed by foot or helicopter.

MM-VIS-03: Apply surface treatments (such as Permeon, or an approved equal) to newly exposed rock and gravel to blend with surrounding rock face and minimize visual impact of attention-attracting disturbance.

MM-VIS-04: Limit height of structures to that absolutely necessary for safety and operation in order to minimize skylining and reduce the need for beacons to protect dark sky resources and maintain astronomical viewing opportunities.

MM-VIS-05: Shorten span lengths and design the route to follow canyon routes to minimize elements (conductors in particular) that would be overhead of viewers and skylined.

MM-VIS-06: Use structure type to match existing structures and reduce form contrast.

Appendix 2A Applicant Proposed Measures and BLM Required Best Management Practices

Table of Contents

This page intentionally left blank.

2A.1 AIR QUALITY AND CLIMATE CHANGE

APM OR BLM REQUIRED BMP	APM/BMP	DESCRIPTION	PRE-CONST.	CONST.	O&M	DECOM	DRECP CMA ADDRESSED*	CA ONLY	12KV LINE TO SCS
APM (Also addresses BLM Regional Mitigation Strategy for AZ SEZs MMs)	AQ-01: Fugitive Dust	The following control measures would be implemented, as applicable, to reduce PM10 and PM2.5 emissions during construction, in conjunction with an Erosion, Dust Control, and Air Quality Plan and Fugitive Dust Control Plan for the Project. *Basic control measures* The following measures would be implemented as applicable at all construction sites: • Water active construction areas sufficiently to minimize fugitive dust. • Dust control would include the use of one or more water trucks that would water access roads daily as needed to control dust throughout the construction period • Cover trucks hauling soil, sand, and other loose materials and require all trucks to maintain at least 6 inches of freeboard. • Pave, apply water, or apply nontoxic soil stabilizers as applicable on for all unpaved access roads, parking areas, and staging areas at construction sites to minimize fugitive dust. *Enhanced control measures* In addition to the "basic" control measures listed above, the following control measures may be implemented at all construction sites greater than 4 acres:	X	X		X	LUPA-AIR-01, 02, 03, and 05; LUPA-BIO-13		X

APM OR BLM REQUIRED BMP	APM/BMP	DESCRIPTION	PRE-CONST.	CONST.	O&M	DECOM	DRECP CMA ADDRESSED*	CA ONLY	12KV LINE TO SCS
		• Water, hydroseed, or apply nontoxic soil stabilizers to inactive construction areas to minimize fugitive dust. • Enclose, cover, water, or apply nontoxic soil binders to exposed stockpiles. • Limit traffic speeds on unpaved roads. • Install sandbags or other erosion-control measures to prevent silt runoff to public roadways. • Replant vegetation in disturbed areas as quickly as possible, consistent with seasonal survival considerations. *Optional control measures* Depending on the extent of dust generation, implementation of the following optional control measures may occur at larger construction sites, near sensitive receptors (residences or other occupied buildings, parks, or trails within 1,000 feet of earthmoving operations that are substantial; for example, more than excavation for tower foundations), or in situations which for any other reason may warrant additional emissions reductions: • Install wheel washers for all existing trucks, or wash off the tires or tracks of all trucks and equipment leaving the site. • Suspend excavation and grading activity when winds (instantaneous gusts) exceed 25 miles per hour (mph). Limit the area subject to excavation, grading, and other construction activity at any one time.							

APM OR BLM REQUIRED BMP	APM/BMP	DESCRIPTION	PRE-CONST.	CONST.	O&M	DECOM	DRECP CMA ADDRESSED*	CA ONLY	12KV LINE TO SCS
BMP	AQ-01 Dust Pallatives	Dust palliatives would be applied, in lieu of water, to inactive construction areas (disturbed lands or soil stockpiles that are unused for 14 consecutive days). Dust palliatives would be chosen by the Dust Control Site Coordinator and or construction contractor. Dust palliatives would be environmentally safe; comply with Federal, state, and local regulations; and would not produce a noxious odor or contaminate surface water or groundwater and, therefore, would not pose runoff concerns during rain events. Application rates for dust palliatives would follow the manufacturer's recommendations. Material Safety Data Sheets (MSDS/SDS) for any palliatives would be available on site and provided to the BLM 14 days prior to use.	X	X		X	LUPA-BIO-6, LUPA-BIO-13		
APM	AQ-02: Exhaust Emissions	The following measures would be implemented during construction to further minimize greenhouse gas emissions (carbon dioxide, methane, and nitrous oxide) per California AB 32 and criteria air pollutants from vehicle and machinery and in conjunction with the Construction Emissions Mitigation Plan for the Project: • Minimize unnecessary construction vehicle idling time. The ability to limit construction vehicle idling time depends on the sequence of construction activities and when and where vehicles are needed or staged. Certain vehicles,		X			LUPA-AIR-3	X	

APM OR BLM REQUIRED BMP	APM/BMP	DESCRIPTION	PRE-CONST.	CONST.	O&M	DECOM	DRECP CMA ADDRESSED*	CA ONLY	12KV LINE TO SCS
		such as large diesel-powered vehicles, have extended warm-up times that limit their availability for use following startup. Where such diesel-powered vehicles are required for repetitive construction tasks, these vehicles may require more idling time. The Project would apply a "common sense" approach to vehicle use, such that idling is reduced as far as possible below the maximum of 5 consecutive minutes required under Title 13 of California Code of Regulations (CCR) Section 2485 (13 CCR 2485). If a vehicle is not required for use immediately or continuously for construction activities or other safety-related reasons, its engine would be shut off. • Encourage use of natural gas- or electric-powered vehicles for light-duty trucks where feasible and available.							
APM	AQ-03: Minimize Potential Naturally Occurring Asbestos Emissions	The following measures would be implemented prior to and during construction to minimize the potential for naturally occurring asbestos emissions, in conjunction with an Asbestos Dust Mitigation Plan if asbestos, serpentinite, or ultramafic rock is determined to be present: • Prior to construction, representative samples in the general construction area would be analyzed for the presence of asbestos, serpentinite, or ultramafic rock. Analyses could be conducted as part of the geotechnical investigation.	X	X					

APM OR BLM REQUIRED BMP	APM/BMP	DESCRIPTION	PRE-CONST.	CONST.	O&M	DECOM	DRECP CMA ADDRESSED*	CA ONLY	12KV LINE TO SCS
		• In California, if asbestos, serpentinite, or ultramafic rock is determined to be present, all applicable provisions of the Airborne Toxic Control Measure (ATCM) for construction, grading, quarrying, and surface mining operations (17 CCR 93105) would be implemented, including the following: For disturbed areas of 1 acre or less: o Construction vehicle speed at the work site would be limited to 15 mph or less. o Prior to any ground disturbance, sufficient water would be applied to the area to be disturbed to prevent visible emissions from crossing the property line if asbestos, serpentinite, or ultramafic rock is determined to be present. o Areas to be graded or excavated would be kept adequately wet to prevent visible emissions from crossing the property line. o Storage piles would be kept adequately wetted, treated with a chemical dust suppressant, or covered when material is not being added to or removed from the pile. o Equipment would be washed down before moving from the property onto a paved public road.							

APM OR BLM REQUIRED BMP	APM/BMP	DESCRIPTION	PRE-CONST.	CONST.	O&M	DECOM	DRECP CMA ADDRESSED*	CA ONLY	12KV LINE TO SCS
		o Visible track-out on the paved public road would be cleaned using wet sweeping or a high-efficiency particulate air-filter-equipped vacuum device within 24 hours. For disturbed areas of greater than 1 acre: o Prepare an Asbestos Dust Mitigation Plan and obtain approval prior to construction. Implement and maintain the provisions of the approved Asbestos Dust Mitigation Plan from the beginning of construction through the duration of the construction activity.							
APM	AQ-04: Minimize Potential Emissions of Naturally Occurring *Coccidioides immitis* Fungal Spores	In addition to the AQ-1 measures to control general fugitive dust emissions, the following measures would be implemented prior to and during construction to create awareness of the risks and inhalation prevention procedures with respect to *Coccidioides immitis* fungal spores, which are naturally present in soils in the desert southwest, and inhalation of which can cause Valley Fever: • Prior to construction, and for each phase of construction, implement an Environmental Awareness Program for workers to ensure they are informed of the risks of contracting Valley Fever and the protective measures needed to minimize personal exposure to fugitive dust, as well as to minimize possible dust exposure of nearby residents and the general public.	X	X					X

APM OR BLM REQUIRED BMP	APM/BMP	DESCRIPTION	PRE-CONST.	CONST.	O&M	DECOM	DRECP CMA ADDRESSED*	CA ONLY	12KV LINE TO SCS
		• Inform workers of the possible symptoms of Valley Fever and encourage them to seek medical treatment if these symptoms manifest.							
BMP	AQ-05: Air Quality Regulation and Standard Conformance	All activities would meet the requirements of the Clean Air Act (Sections 110, 118, 160, and 176[c]) and the applicable local Air Quality Management jurisdiction(s). Fugitive dust cannot exceed local standards and requirements.	X	X	X	X	LUPA-AIR-01, LUPA-AIR-02	X	

*See Appendix 2C

2A.2 GEOLOGY, MINERALS, AND SOIL RESOURCES

APM OR BLM REQUIRED BMP	APM/BMP	DESCRIPTION	PRE-CONST.	CONST.	O&M	DECOM	DRECP CMA ADDRESSED*	CA ONLY	12KV LINE TO SCS
APM	GEO-01: Erosion and Sedimentation	DCRT would implement a SWPPP for the Project. A monitoring program would be established to ensure that the prescribed BMPs are followed throughout transmission line construction. Examples of these BMPs include the following: • Preparation, training, and maintenance for clear work-site practices, tracking controls, and materials management to minimize the direct work impacts on soil and erosion. • Installation of temporary silt fences and other containment features (including gravel bags and fiber rolls) surrounding work areas to prevent the loss of soil during rain events and other disturbances. • Utilization of storm drain inlet protection, including sediment filters and ponding barriers, to retain sediments on site and prevent excess discharge into storm drains. • Implementation of soil erosion controls, including preservation of existing vegetation, temporary soil stabilization through hydroseeding, mulching, and other techniques. • Stockpiling soils at least 100 feet from drainages to the extent possible. If soil stockpiles are within 100 feet from a drainage proper measures would be		X	X		LUPA-SW-8		X[1]

[1] APS would prepare and submit a separate SWPPP for the 12kV distribution line.

APM OR BLM REQUIRED BMP	APM/BMP	DESCRIPTION	PRE-CONST.	CONST.	O&M	DECOM	DRECP CMA ADDRESSED*	CA ONLY	12KV LINE TO SCS
		implemented such as soil tackifiers, straw wattles around the pile, and/or covering the stockpile.							
BMP	SOIL-01	During reclamation and revegetation efforts, a BLM soil scientist and/or botanist review plans and approve, as appropriate, to determine type and location of any scarification.		X				X	
BMP	SOIL-02	During reclamation and revegetation efforts, the BLM would review plans and approve, as appropriate, to determine where soil compaction would be appropriate, to avoid potential adverse conditions created by compaction.		X				X	
BMP	SOIL-03	Covers for topsoil stockpiles would be of materials resistant to damage and/or degradation from exposure to ultraviolet light and other elements and would be replaced (as needed) if they deteriorate, become worn, or damaged.		X	X	X			
BMP	SOIL-04	The disruption of desert pavement and desert varnish shall be minimized to the extent feasible. Grading for new access roads or work areas in areas covered by desert pavement and/or desert varnish shall be avoided if possible.		X		X	LUPA-SW-9		

APM OR BLM REQUIRED BMP	APM/BMP	DESCRIPTION	PRE-CONST.	CONST.	O&M	DECOM	DRECP CMA ADDRESSED*	CA ONLY	12KV LINE TO SCS
BMP	SOIL-05	Desert pavement and desert varnish in activity areas in California shall be assessed by qualified geological or biological monitors prior to construction. If disturbance from an activity is likely to exceed 10% of the desert pavement and/or desert varnish identified within the activity boundary, the BLM would determine whether the erosional and ecologic impacts of exceeding the 10% cap by the proposed amount would be insignificant and/or whether the activity should be redesigned to minimize desert pavement and/or desert varnish disturbance.	X	X		X	LUPA-SW-9	X	
BMP	SOIL-06	Side-casting of soil during road construction shall be avoided.		X			LUPA-SW-11	X	
BMP	SOIL-07	To the extent possible, avoid disturbance of desert biologically intact soil crusts, and soils highly susceptible to wind and water erosion.	X	X	X	X	LUPA-SW-10	X	

*See Appendix 2C

2A.3 PALEONTOLOGICAL RESOURCES

APM OR BLM REQUIRED BMP	APM/BMP	DESCRIPTION	PRE-CONST.	CONST.	O&M	DECOM	DRECP CMA ADDRESSED*	CA ONLY	12KV LINE TO SCS
APM	PALEO-01: Paleontological Resources Treatment Plan	DCRT would prepare a Paleontological Resources Treatment Plan that would describe procedures to be followed in the event of the discovery of paleontological resources during implementation of the Project. Upon approval of the draft plan, DCRT would follow the procedures set forth in that Plan during implementation of the Project.	X	X			LUPA-PALEO-3		X
BMP	PALEO-02: Paleontological Resources Monitor	A qualified paleontologist or geologist qualified in paleontological evaluations would provide monitoring for paleontological resources during construction in areas of high or unknown fossil potential.	X	X			LUPA-PALEO-4		X

*See Appendix 2C

2A.4 BIOLOGICAL RESOURCES (VEGETATION, INCLUDING SPECIAL STATUS SPECIES, AND WILDLIFE, INCLUDING SPECIAL STATUS SPECIES AND MIGRATORY BIRDS

APM OR BLM REQUIRED BMP	APM/BMP	DESCRIPTION	PRE-CONST.	CONST.	O&M	DECOM	DRECP CMA ADDRESSED*	CA ONLY	12KV LINE TO SCS
APM	BIO-01: Worker Environmental Awareness Program	Before starting any work, including mowing, staging, installing stormwater control structures, implementing other BMPs, removing trees, construction, and restoration, all employees and contractors performing activities and new construction would receive training on environmental requirements that apply to their job duties and work. If additional crewmembers arrive later in the job, they would be required to complete the training before beginning work. Training would include a discussion of the avoidance and minimization measures being implemented and would include information on the Federal and state Endangered Species Acts and the consequences of not complying with these Acts. An educational brochure would be provided to construction crews working on the Project. This brochure would include color photographs of special-status species as well as a discussion of avoidance and minimization measures.	X	X	X	X	LUPA-BIO-5		X

APM OR BLM REQUIRED BMP	APM/BMP	DESCRIPTION	PRE-CONST.	CONST.	O&M	DECOM	DRECP CMA ADDRESSED*	CA ONLY	12KV LINE TO SCS
BMP	BIO-01: Worker Environmental Awareness Program	The worker education program would provide interpretation for non-English speaking workers.	X	X	X	X	LUPA BIO-5		X
APM	BIO-02: Biological Monitoring and Preconstruction Survey	A qualified biological monitor would be present on the Project site during all work activities within habitat of special-status animal species. The qualified biologist would conduct a preconstruction survey of those areas immediately before work activities begin and would locate and fence off any present individuals of special status plant species.	X	X		X	LUPA-BIO-2, LUPA-BIO-DUNE-5, LUPA-BIO-IFS-6, LUPA-BIO-IFS-7, LUPA-BIO-IFS-12, DFA-BIO-IFS-1, DFA-BIO-IFS-2, LUPA-BIO-RIPWET-3		X
BMP	BIO-02: Biological Monitoring and Preconstruction Survey	Multiple biological monitors would be provided so any work site within habitat of special status species is monitored concurrently if needed.	X	X		X	LUPA-BIO-2, LUPA-BIO-DUNE-5		X

APM OR BLM REQUIRED BMP	APM/BMP	DESCRIPTION	PRE-CONST.	CONST.	O&M	DECOM	DRECP CMA ADDRESSED*	CA ONLY	12KV LINE TO SCS
APM	BIO-03: Approved Work Areas	To the extent practicable, stockpiling of material would be allowed only within the established work area. Vehicles and equipment would be parked on pavement, existing roads, and previously disturbed areas within identified work areas or access roads.	X	X		X	LUPA-BIO-13		X
BMP	BIO-03: Approved Work Areas	The BLM would approve areas to be used for stockpiling, vehicle parking, or other construction support activity that would occur outside established work areas.	X	X			LUPA-BIO-13		X
APM	BIO-04: Environmental-ly Sensitive Areas and Fencing	Environmentally sensitive areas, such as the riparian areas, xeroriparian washes, and other habitat of special status species, would be identified in the field. Barrier fences or stakes would be installed at the edge of the easement or around the sensitive area to minimize the possibility of inadvertently encroaching into sensitive habitat.	X	X			LUPA-BIO-3, LUPA-BIO-13		X
APM	BIO-05: Additional Prohibitions	Trash dumping, firearms, open fires, and pets would be prohibited at all work locations and access roads. Smoking would be prohibited along the Project alignment.	X	X	X	X	LUPA-BIO-6, LUPA-BIO-14		X
APM	BIO-06: Trash Handling	All food scraps, wrappers, food containers, cans, bottles, and other trash from the work area would be disposed of in closed trash containers.	X	X	X	X	LUPA-BIO-6, LUPA-BIO-14		X

APM OR BLM REQUIRED BMP	APM/BMP	DESCRIPTION	PRE-CONST.	CONST.	O&M	DECOM	DRECP CMA ADDRESSED*	CA ONLY	12KV LINE TO SCS
APM	BIO-07: Monofilament Plastic	No monofilament plastic would be used for erosion control (for example, matting, fiber roll, wattles, silt fencing backing). Appropriate materials include burlap, coconut fiber, or other materials as identified in the general and site-specific SWPPP.		X			LUPA-BIO-9		X
APM	BIO-08: Refueling	Vehicular and equipment refueling should not occur within 100 feet of a wetland or drainage unless secondary containment is constructed, for example, a berm and lined refueling area. Proper spill prevention and cleanup equipment would be maintained in all refueling areas in accordance with the Spill Prevention, Control, and Countermeasures Plan (SPCC) for the Project.	X	X			LUPA-BIO-9		X

APM OR BLM REQUIRED BMP	APM/BMP	DESCRIPTION	PRE-CONST.	CONST.	O&M	DECOM	DRECP CMA ADDRESSED*	CA ONLY	12KV LINE TO SCS
APM	BIO-09: Escape Ramps	All excavated steep-walled holes or trenches more than 1-foot-deep would be covered at the end of each working day with plywood or similar material or would be provided with one or more escape ramps constructed of earth fill or wooden planks. Each trench or hole would be inspected for wildlife at the beginning of each work day and before such holes or trenches are filled. Wildlife found trapped in trenches or holes would be relocated to suitable habitat outside the work area. If possible, pipes and culverts greater than 3 inches in diameter would be stored on dunnage to prevent wildlife from taking refuge in them, to the extent feasible.	X	X			LUPA-BIO-14		
APM	BIO-10: Erosion and Dust Control	The BMPs included in the SWPPP would be implemented during construction to minimize impacts associated with erosion. Watering for dust control during construction would also be used as described previously (AQ-01). Watering shall not result in prolonged ponding of surface water that could attract wildlife to the work area. Minimal or no vegetation clearing and/or soil disturbance would be conducted for site access and construction in areas with suitable topography (i.e., overland driving/overland access).		X			LUPA-BIO-9		X[2]

[2] APS would prepare, submit, and adhere to the BMPs in a separate SWPPP for the 12kV distribution line.

APM OR BLM REQUIRED BMP	APM/BMP	DESCRIPTION	PRE-CONST.	CONST.	O&M	DECOM	DRECP CMA ADDRESSED*	CA ONLY	12KV LINE TO SCS
APM	BIO-11: Vegetation Management Plan	The Vegetation Management Plan (Appendix 2B) would be approved by the BLM and implemented. That Plan describes the surveys, permitting, fee payments, and plant protection to be conducted in areas where Project design would not eliminate the need for vegetation control for the Project to be in compliance with NERC requirements. Vegetation would be trimmed or otherwise controlled for safe operation of the transmission line and would be designed to minimize impacts on special status species to the extent practicable. At a minimum, vegetation treatments shall incorporate the measures identified in the June 2016 Memorandum of Understanding regarding vegetation management along ROW for electrical transmission and distribution facilities (USDA 2016). The Plan also would describe how vegetation would be salvaged, as needed, in order to comply with the applicable Arizona Native Plant Law and California regulations.		X	X		LUPA-BIO-3, LUPA-BIO-7, LUPA-BIO-8, LUPA-BIO-13, LUPA-BIO-RIPWET-1, LUPA-BIO-SVF-1, DFA-VPL-BIO-FIRE-1		X[3]

[3] APS is currently compiling vegetation maintenance activities into a Vegetation Management Plan specific to the 12kV distribution line per BLM IM-2018-070.

APM OR BLM REQUIRED BMP	APM/BMP	DESCRIPTION	PRE-CONST.	CONST.	O&M	DECOM	DRECP CMA ADDRESSED*	CA ONLY	12KV LINE TO SCS
BMP	BIO-11: Vegetation Management Plan	In addition to the description of the Vegetation Management Plan in the corresponding APM BIO-11, the plan would also: • Meet BLM guidelines for mapping and surveying of cacti, yuccas, and succulents. • Include a wire zone/border zone/effective border zone approach to vegetation maintenance as described in Ballard, et al. 2007. • Identify tall vegetation species by geographic reach and growth rates, from relevant scientific literature (such as Drezner 2003), to be used to determine maximum allowable vegetation heights in the context of wire zone/border zone/effective border zone concepts, to accommodate identified growth periods (e.g., ten years) based on the specific vegetation community. Species examples include, but are not limited to, saguaro cactus, ironwood, palo verde, cottonwood, Gooding willow.	X	X	X		LUPA-BIO-1 LUPA-BIO-7, LUPA-BIO-8, LUPA-BIO-13 LUPA-BIO-RIPWET-1, LUPA-BIO-SVF-1, DFA-VPL-BIO-FIRE-1		X

APM OR BLM REQUIRED BMP	APM/BMP	DESCRIPTION	PRE-CONST.	CONST.	O&M	DECOM	DRECP CMA ADDRESSED*	CA ONLY	12KV LINE TO SCS
APM	BIO-12: Noxious and Invasive Species Control	A Noxious Weed Control Plan (Appendix 2B) would be developed, approved by the BLM, and implemented prior to initiation of ground disturbing activities. That Plan would identify noxious and invasive species to be addressed in the Project Area, describe measures to conduct preconstruction weed surveys, reduce the potential introduction or spread of noxious weeds and invasive species during construction, and monitor and control weeds during operation of the transmission line. It would be designed to minimize impacts on special status species to the extent practicable. Coordination with resource agencies regarding invasive plant species would be conducted before construction. BMPs would include use of weed-free straw, fill, and other materials; requirements for washing vehicles and equipment arriving on site; proper maintenance of vehicle inspection and wash stations; requirements for managing infested soils and materials; requirements and practices for the application of herbicides; and other requirements in applicable BLM Weed Management Plans.	X	X	X	X	LUPA-BIO-6, LUPA-BIO-10, LUPA-BIO-11		X[4]

[4] APS would comply with their existing noxious weed protocol in its existing vegetation management plan on file with the BLM.

APM OR BLM REQUIRED BMP	APM/BMP	DESCRIPTION	PRE-CONST.	CONST.	O&M	DECOM	DRECP CMA ADDRESSED*	CA ONLY	12KV LINE TO SCS
APM	BIO-13: Riparian Habitat Avoidance	Riparian areas and xeroriparian drainages that occur within the ROW would be denoted as environmentally sensitive areas and would be avoided during construction to the extent practicable. Existing topography would be restored to pre-Project conditions to the extent possible.	X	X			LUPA-BIO-1, LUPA-BIO-13		
APM	BIO-14: Minimizing Vegetation Clearing	In areas with suitable topography, minimal or no vegetation clearing and soil disturbance would be conducted for site access and construction (i.e. overland driving/overland access). Overland driving/overland access would be used in areas that support the necessary construction equipment. Upgrading of existing access roads and construction of new access roads would be implemented as necessary for the safe construction activities.		X			LUPA-BIO-14		X

APM OR BLM REQUIRED BMP	APM/BMP	DESCRIPTION	PRE-CONST.	CONST.	O&M	DECOM	DRECP CMA ADDRESSED*	CA ONLY	12KV LINE TO SCS
APM	BIO-15: Reclamation and Restoration	A Habitat Restoration and Monitoring Plan would be developed, approved by BLM, and implemented for construction and operation of the Project. Revegetate all sites disturbed during construction that would not be required for operation of the transmission line, and restore disturbed areas to the extent practicable, given the arid desert environment. The Plan would describe in detail methods for surveying and characterizing vegetation in disturbed areas before construction; topsoil salvage and management, erosion control, post-construction recontouring and site preparation, seeding and planting, and post-construction watering, monitoring, and remediation. It would be designed to reduce impacts on special status species to the extent practicable.	X	X	X	X	LUPA-BIO-7, LUPA-BIO-8, LUPA-BIO-10		
BMP	BIO-15: Reclamation and Restoration	As a part of the Habitat Restoration and Monitoring Plan, the soil horizons would be stored separately for the areas where the success of restoration could be crucial for rare plant species.	X	X	X	X	LUPA-BIO-7, LUPA-BIO-8	X	

APM OR BLM REQUIRED BMP	APM/BMP	DESCRIPTION	PRE-CONST.	CONST.	O&M	DECOM	DRECP CMA ADDRESSED*	CA ONLY	12KV LINE TO SCS
APM	BIO 16: Treatment of Saguaro Cactus	Measures would be implemented to minimize the number of saguaro cacti that must be relocated for the safe construction and operation of the transmission line and associated SCS distribution line. In accordance with the Vegetation Management Plan (Appendix 2B), a survey of saguaros within the ROWs would be conducted before construction and where possible, the transmission line and distribution line would be designed to minimize the number of saguaros affected by adjusting tower or pole locations and conductor height. The Plan would address plant salvaging, storing, and replanting requirements and methods, only those saguaros that are within 50-feet of the outermost conductors and could be tall enough to pose a hazard would be removed if they cannot be avoided through Project design. When possible, saguaro that must be removed would be relocated as directed by the BLM and state agency protocols. Monitoring and management of saguaros during operations would occur as described in the Vegetation Management Plan.		X	X		LUPA-BIO-SVF-1		X[5]
APM	BIO-17: Limit Off-road Vehicle Travel	Vehicular travel would be limited to established roads to the maximum extent practicable.	X	X	X	X	LUPA-BIO-13		X

[5] Management of saguaro cactus for the alternative 12kV distribution line would be completed per APS' Arizona BLM lands Vegetation Management Plan.

APM OR BLM REQUIRED BMP	APM/BMP	DESCRIPTION	PRE-CONST.	CONST.	O&M	DECOM	DRECP CMA ADDRESSED*	CA ONLY	12KV LINE TO SCS
APM	BIO-18: Copper Bottom Pass (Arizona Only)	Control of construction activities and use of construction-related vehicles in the Copper Bottom Pass area would be maintained to ensure that only planned construction traffic is allowed in the area and that minimal trips are planned to minimize disturbance to bighorn sheep. This APM does not apply to non-construction related public use of the Copper Bottom Pass area.	X	X	X	X			
BMP	BIO-19: Colorado River	In the vicinity of the Colorado River, existing structure spacing and conductor heights would be matched to the greatest extent practical to reduce the potential for bird collisions with the power line. The transmission line would span the Colorado River and the minimum number of structures possible would be located within the undeveloped floodplain. The term, "vicinity of the Colorado River" is defined to mean the river crossing, floodplain, and associated agricultural lands. In these areas, conductor bundles would be in a horizontal, parallel configuration, and match existing structure spacing and conductor heights to the greatest extent practical to reduce the potential for bird collisions with the power line. No guyed structures would be used at these locations.		X			LUPA-SW-16, LUPA-BIO-17, LUPA-BIO-RIPWET-1, LUPA-SW-13, LUPA-SW-16, LUPA-TRANS-BIO-1		

APM OR BLM REQUIRED BMP	APM/BMP	DESCRIPTION	PRE-CONST.	CONST.	O&M	DECOM	DRECP CMA ADDRESSED*	CA ONLY	12KV LINE TO SCS
APM	BIO-20: Migratory Bird Protection During Construction	If construction is scheduled during the nesting bird season (generally February 1 through August 31), the work area would be surveyed for birds protected under the Migratory Bird Treaty Act and applicable Arizona and California codes. Active nests identified during preconstruction surveys would require protective buffers or visual barriers to ensure compliance with those regulations. If the qualified biologist determines that construction activities would cause distress to nearby nesting birds, larger buffers or construction delays might be necessary to allow the birds to successfully fledge from the nest.	X	X		X	LUPA-BIO-4, LUPA-BIO-17, LUPA-BIO-RIPWET-1, LUPA-BIO-RIPWET-3, LUPA-BIO-IFS-11, DFA-BIO-IFS-1		X
APM	BIO-21: Reduction of Avian Collision	Current guidelines and methodologies appropriate to infrastructure size (APLIC 2006, 2012) would be used in the design of the proposed transmission and SCS distribution facilities to minimize the potential for raptors and other birds to collide with the lines during operations and be electrocuted. For example, aerial marker balls or other visibility markers would be placed at and near the crossing of the Colorado River to increase the visibility of the transmission line to birds using that movement corridor. Further, placement of lines significantly above existing		X	X		LUPA-BIO-16, LUPA-BIO-17, LUPA-BIO-COMP-2, LUPA-TRANS-BIO-2, LUPA TRANS-BIO-3		X[6]

[6] Practices to reduce avian collision associated with the alternative 12kV distribution line would be implemented under APS' corporate Avian Protection Plan.

APM OR BLM REQUIRED BMP	APM/BMP	DESCRIPTION	PRE-CONST.	CONST.	O&M	DECOM	DRECP CMA ADDRESSED*	CA ONLY	12KV LINE TO SCS
		transmission lines, topographic features, or tree lines would be avoided. These measures would be implemented, where practicable, in conjunction with an Avian Protection Plan for the Project (APP).							
BMP	BIO-21: Reduction of Avian Collision and Electrocution	Aerial marker balls or other visibility markers would be placed on overhead ground wires (not conductors) at crossing of the Colorado River and floodplain to increase visibility to birds using that movement corridor and marking any other static wires to improve visibility and reduce collisions. Deterrents would be added to reduce nesting and perching by ravens and other predatory birds. The APP would include requirements for monitoring the effectiveness of anti-electrocution design.		X	X		LUPA-BIO-16, LUPA-BIO-17, LUPA-BIO-COMP-2, LUPA-TRANS-1, LUPA TRANS-BIO-3		
APM	BIO-22: Sonoran Desert Tortoise Protection (Arizona)	A qualified biologist would be present during all ground-disturbing and other construction activities in non-cultivated areas in Arizona, in order to survey areas before they are disturbed, monitor construction sites for the presence of desert tortoises, and move tortoises from harm's way, in accordance with the 'Candidate Conservation Agreements for Sonoran Desert Tortoise in Arizona', dated May 27, 2016. Burrows near construction sites would be clearly delineated. Road, footing, and work area alignments would be		X					X

APM OR BLM REQUIRED BMP	APM/BMP	DESCRIPTION	PRE-CONST.	CONST.	O&M	DECOM	DRECP CMA ADDRESSED*	CA ONLY	12KV LINE TO SCS
		modified to the extent possible to avoid adversely affecting any tortoise burrows. Where burrows would be unavoidably destroyed, they would be excavated carefully using hand tools under the supervision of a field biologist with demonstrated prior experience with this species.							
APM	BIO-23: Mojave Desert Tortoise Protection (California)	A qualified-biologist would be present during all ground-disturbing and other construction activities in non-cultivated areas in California, in order to survey areas before they are disturbed, monitor construction sites for the presence of desert tortoises, and move tortoises from harm's way in accordance with USFWS protocols. Burrows near construction sites would be clearly delineated. Road, footing, and work area alignments would be modified to the extent possible to avoid adversely affecting any tortoise burrows. Where burrows would be unavoidably destroyed, they would be excavated carefully using hand tools under the supervision of a field biologist with demonstrated prior experience with this species. Other measures, as required by the USFWS in any applicable Biological Opinion, would also be implemented.	X	X			LUPA-BIO-1, LUPA-BIO-13, LUPA-BIO-IFS-5, LUPA-BIO-IFS-6 LUPA-BIO-IFS-7, LUPA-BIO-IFS-8, DFA-BIO-IFS-1	X	

APM OR BLM REQUIRED BMP	APM/BMP	DESCRIPTION	PRE-CONST.	CONST.	O&M	DECOM	DRECP CMA ADDRESSED*	CA ONLY	12KV LINE TO SCS
BMP	BIO-23: Mojave Desert Tortoise Protection (California)	A designated biologist would inspect construction pipes, culverts, or similar structures: (a) with a diameter greater than 3 inches, (b) stored for one or more nights, (c) less than 8 inches aboveground and (d) within desert tortoise habitat (such as, outside the long-term fenced area), before the materials are moved, buried, or capped. As an alternative, such materials shall be capped before storing outside the fenced area or placing on pipe racks. Pipes stored within the long-term fenced area after completing desert tortoise clearance surveys would not require inspection.	X	X			LUPA-BIO-1, LUPA-BIO-IFS-5, DFA-BIO-IFS-1	X	
BMP	BIO-24: Sensitive Plant Surveys	On BLM lands and on other lands where access is secured by the owner, a survey would be conducted during the appropriate time of year of the selected route to identify special-status plant species and imperiled or sensitive vegetation alliances. Where possible, and as required by the BLM, special-status species and vegetation alliances would be avoided during construction. This survey would be restricted to non-cultivated land.	X	X			LUPA-BIO-1, LUPA-BIO-PLANT-1, LUPA-BIO-SVF-1		X

APM OR BLM REQUIRED BMP	APM/BMP	DESCRIPTION	PRE-CONST.	CONST.	O&M	DECOM	DRECP CMA ADDRESSED*	CA ONLY	12KV LINE TO SCS
BMP	BIO-25: Sensitive Animal Surveys	A survey would be conducted of the selected route prior to construction of all work areas to identify special-status animal species, including Mojave desert tortoises, burrowing owls, and Mojave fringe-toed lizards. Where possible, and as required by the BLM, special-status species and vegetation alliances would be avoided during construction.	X	X			LUPA-BIO-1, LUPA-BIO-RIPWET-3, LUPA-BIO-DUNE-4, LUPA-BIO-DUNE-5, LUPA-BIO-IFS-6, LUPA-BIO-IFS-12		X
APM	BIO-26: Arizona Protected Plant Inventory	An inventory of plants protected under the Arizona Native Plant Law would be conducted on state trust lands as required by the Arizona State Land Department. Similar surveys would be conducted on lands managed by BLM, as directed by that agency.	X	X					X[7]
APM	BIO-27: Bighorn Sheep Lambing Areas	Construction activities would be limited from January 1 to March 31 in active bighorn sheep lambing areas identified by BLM and AGFD.	X	X	X	X			

[7] Construction of the 12kV distribution line would comply with the Arizona Native Plant Law.

APM OR BLM REQUIRED BMP	APM/BMP	DESCRIPTION	PRE-CONST.	CONST.	O&M	DECOM	DRECP CMA ADDRESSED*	CA ONLY	12KV LINE TO SCS
BMP	BIO-28: Raven Management Plan	The Raven Management Plan would be implemented for all activities to address food and water subsidies and roosting and nesting sites specific to the Common Raven. These include identification of monitoring reporting procedures and requirements; strategies for refuse management; as well as design strategies and passive repellant methods to avoid providing perches, nesting sites, and roosting sites for Common Ravens. As consistent with BLM policy and resource management plans, compensatory mitigation would be provided that contributes to LUPA-wide raven management associated with lands in the DRECP.		X	X		LUPA-BIO-6, LUPA-TRANS-BIO-1	X	
BMP	BIO-29: Bird and Bat Conservation Strategy	The Bird and Bat Conservation Strategy would provide guidance on conservation measures applicable to bird and bat species present in the Project Area, including a nesting bird management plan and a nest management plan.	X	X	X	X	LUPA-BIO-4, LUPA-BIO-16, LUPA-BIO-17, LUPA- BIO-RIPWET-1, LUPA-BIO-DUNE-5, LUPA-BIO-IFS-11, DFA-BIO-IFS-2		

APM OR BLM REQUIRED BMP	APM/BMP	DESCRIPTION	PRE-CONST.	CONST.	O&M	DECOM	DRECP CMA ADDRESSED*	CA ONLY	12KV LINE TO SCS

[9] APS is currently compiling vegetation maintenance activities into a Vegetation Management Plan specific to the 12kV distribution line per BLM IM-2018-070.

2A.6 CULTURAL RESOURCES

APM OR BLM REQUIRED BMP OR EPM	APM/BMP	DESCRIPTION	PRE-CONST.	CONST.	O&M	DECOM	DRECP CMA ADDRESSED*	CA ONLY	12KV LINE TO SCS
APM	CULT-01: Inventory and HPTP	A cultural inventory would be conducted that would document cultural resources within the area of potential effects for the Project. Based on results of this inventory, a Historic Properties Treatment Plan would be developed to specifically address direct and indirect impacts that may result from Project construction.	X	X			LUPA-CUL-4; LUPA-TRANS-CUL-1		X
APM	CULT-02: Monitoring and Discovery Plan	DCRT's contractor would prepare a Monitoring and Discovery Plan that would describe procedures to be followed in the event of the discovery of cultural resources or human remains during implementation of the Project. The Draft Monitoring and Discovery Plan would be reviewed by BLM and consulting state and federal agencies, the California and Arizona SHPOs, and local tribes. Upon approval of the Monitoring and Discovery Plan, DCRT would follow the procedures set forth in that plan during implementation of the Project.	X	X			LUPA-CUL-4; LUPA-TRANS-CUL-1		X
BMP	CULT-03: Cultural Resources Avoidance and Stipulations	DCRT would follow the avoidance procedures and other stipulations outlined in the Programmatic Agreement (PA) and in the appropriate State Historic Properties Treatment Plan for each historic property identified in the HPTP.	X	X	X	X	LUPA-CUL-4		X

APM OR BLM REQUIRED BMP OR EPM	APM/BMP	DESCRIPTION	PRE-CONST.	CONST.	O&M	DECOM	DRECP CMA ADDRESSED*	CA ONLY	12KV LINE TO SCS
BMP	CULT-04: Worker Cultural Resources Awareness Program	Before starting any work, including mowing, staging, sediment and erosion control installation, tree removal, construction, and restoration, all employees and contractors performing activities and construction would receive training on the National Historic Preservation Act, the Archaeological Resources Protection Act, and the Native American Graves Protection and Repatriation Act and the consequences of noncompliance with these acts. Training would also include cultural sensitivity to Native American concerns, since tribal monitors would be present during construction.	X	X					X
BMP	CULT-05: Cultural Resources Compensatory Fee	A compensatory mitigation fee for cumulative and indirect effects to historic properties as a result of construction is identified in the Project PA. The fee structure of the compensatory mitigation fee would be calculated in a manner that is commensurate to the size and regional impacts of the Project and would include a management fee determined and finalized in the Project PA.	X	X			LUPA-TRANS-CUL-2; LUPA-TRANS-CUL-3; DFA-VPL-CUL-1; DFA-VPL-CUL-2; DFA-VPL-CUL-3	X	
BMP	CULT-06: Sensitivity Model	BLM would develop a sensitivity model for cultural resources using the DRECP geodatabase for the purpose of selecting Project footprints to minimize impacts to recorded historic properties and areas that are culturally sensitive to Tribes.	X				LUPA-TRANS-CUL-4; DFA-VPL-CUL-4	X	

APM OR BLM REQUIRED BMP OR EPM	APM/BMP	DESCRIPTION	PRE-CONST.	CONST.	O&M	DECOM	DRECP CMA ADDRESSED*	CA ONLY	12KV LINE TO SCS
BMP	CULT-07: Sample Survey	The BLM shall ensure that a statistically significant cultural resources sample survey is conducted for consideration in Project planning in locations within the CDCA boundary.	X				LUPA-TRANS-CUL-5; DFA-VPL-CUL-5	X	
BMP	CULT-08: Project Planning	DCRT would consider the results of the BLM's cultural resources sensitivity model in Project planning and provide justification if it is not considered to be feasible.	X				LUPA-TRANS-CUL-6; DFA-VPL-CUL-6	X	

*See Appendix 2C

2A.7 RECREATION

APM OR BLM REQUIRED BMP	APM/BMP	DESCRIPTION	PRE-CONST.	CONST.	O&M	DECOM	DRECP CMA ADDRESSED*	CA ONLY	12KV LINE TO SCS
BMP	REC-01: Alternative Access and Parking Signs	Signs directing vehicles to alternative existing access and parking would be posted in the event construction temporarily obstructs parking areas near trailheads.		X			DFA-REC-1, DFA-REC-2, DFA, REC-4, DFA-REC-5, DFA-REC-7		
BMP	REC-02: Recreation Users Signs	Signs advising recreation users of construction activities and directing them to alternative trails or bikeways would be posted on both sides of all trail intersections or as determined through DCRT coordination, with the respective jurisdictional agencies. A schedule of construction activities would be posted near entrances to recreational areas as well as on the Project website. Signs would be installed near access roads notifying the public of construction activities in the area and the presence of permanent transmission facilities.		X					X
BMP	REC-03: Guy Wire Marking	Plastic mesh or paint would be used to mark guy wires in areas used for recreation. Permanent high visibility guy markers would be installed during construction.		X	X				

APM OR BLM REQUIRED BMP	APM/BMP	DESCRIPTION	PRE-CONST.	CONST.	O&M	DECOM	DRECP CMA ADDRESSED*	CA ONLY	12KV LINE TO SCS
BMP	REC-04: Alternate Route Signage	Identify alternative routes (on existing roads and trails) of equal or greater standard and access to specially designated areas if roads, primitive roads, or trails used for recreation are temporarily closed or otherwise significantly affected. The alternate route(s) would be clearly identified on signage.		X					X

*See Appendix 2C

2A.8 NOISE

APM OR BLM REQUIRED BMP	APM/BMP	DESCRIPTION	PRE-CONST.	CONST.	O&M	DECOM	DRECP CMA ADDRESSED*	CA ONLY	12KV LINE TO SCS
APM	NO-01: Noise Minimization with Portable Barriers	Compressors and other small stationary equipment used during construction would be shielded with portable barriers if located within 200 feet of a residence.		X			LUPA-BIO-12		
APM	NO-02: Noise Minimization with Quiet Equipment	In area in close proximity to sensitive receptors, quiet equipment (for example, equipment that incorporates noise control elements into the design; quiet model air-compressors or generators can be specified) would be used during construction whenever possible.		X					
APM	NO-03: Noise Minimization through Direction of Exhaust	Stationary equipment exhaust stacks and vents (i.e., on equipment like generators and lights) would be directed away from buildings where feasible.		X					
APM	NO-04: Blasting Mitigation	If blasting is required in close proximity to sensitive receptors, the timeframe that blasting activity would occur would be limited, in addition to limiting the number of blasts that occur per hour or per day.		X					

APM OR BLM REQUIRED BMP	APM/BMP	DESCRIPTION	PRE-CONST.	CONST.	O&M	DECOM	DRECP CMA ADDRESSED*	CA ONLY	12KV LINE TO SCS
BMP – Regional Mitigation Strategy for the AZ SEZs	NO-05: County, State, and Federal Noise Regulations	Project would be located far enough from residences or include engineering and/or operational methods such that county, state, and/or federal regulations for noise are not exceeded.		X	X				
BMP – Regional Mitigation Strategy for the AZ SEZs	NO-06: Hours of Daily Activity	The hours of daily activities would be limited, and noise barriers would be constructed if needed and practicable. Coordination with nearby residents is recommended.		X	X				
BMP	NO-07: Sensitive Wildlife Protection	To the extent feasible, locate stationary noise sources that exceed background ambient noise levels away from known or likely locations of and BLM sensitive wildlife species and their suitable habitat.		X	X	X	LUPA-BIO-12		

*See Appendix 2C

2A.9 HAZARDS AND HAZARDOUS MATERIALS

APM OR BLM REQUIRED BMP	APM/BMP	DESCRIPTION	PRE-CONST.	CONST.	O&M	DECOM	DRECP CMA ADDRESSED*	CA ONLY	12KV LINE TO SCS
APM	HAZ-01: Hazardous Substance Control and Emergency Response	DCRT would implement its hazardous substance control and emergency response procedures as needed in conjunction with a Hazardous Substance Control and Containment Plan and Emergency Response Plan for the Project. The procedures identify methods and techniques to minimize the exposure of the public and site workers to potentially hazardous materials during all phases of Project construction through operation. They address worker training appropriate to the site worker's role in hazardous substance control and emergency response. The procedures also require implementing appropriate control methods and approved containment and spill-control practices for construction and materials stored on site. If it were necessary to store chemicals on site, they would be managed in accordance with all applicable regulations. Material safety data sheets would be maintained and kept available on site, as applicable. Project construction would involve soil surface blading/leveling and excavation. In the event that soils suspected of being contaminated (on the basis of visual, olfactory, or other evidence) are removed		X	X		LUPA-BIO-9, LUPA-SW-6, LUPA-SW-7		X[10]

[10] APS would follow company policies and procedures for hazardous substance spills and emergency response.

APM OR BLM REQUIRED BMP	APM/BMP	DESCRIPTION	PRE-CONST.	CONST.	O&M	DECOM	DRECP CMA ADDRESSED*	CA ONLY	12KV LINE TO SCS
		during site grading activities or excavation activities, the excavated soil would be tested and, if contaminated above hazardous waste levels, would be contained and disposed of at a licensed waste facility. The presence of known or suspected contaminated soil would require testing and investigation procedures to be supervised by a qualified person, as appropriate, to meet state and federal regulations. All hazardous materials and hazardous wastes would be handled, stored, and disposed of in accordance with all applicable regulations by personnel qualified to handle hazardous materials. The hazardous substance control and emergency response procedures include, but are not limited to, the following: • Proper disposal of potentially contaminated soils. • Establishing site-specific buffers for construction vehicles and equipment near sensitive resources. • Emergency response and reporting procedures to address hazardous material spills. • Stopping work at that location and contacting the County Fire Department Hazardous Materials Unit immediately if visual contamination or chemical odors are detected; work would be resumed at this location after any necessary consultation and approval by the Hazardous Materials Unit.							

APM OR BLM REQUIRED BMP	APM/BMP	DESCRIPTION	PRE-CONST.	CONST.	O&M	DECOM	DRECP CMA ADDRESSED*	CA ONLY	12KV LINE TO SCS
		DCRT would complete its Emergency Action Plan Form as part of Project tailgate meetings. The purpose of the form is to gather emergency contact numbers, first aid location, work site location, and tailgate information.							
APM	HAZ-02: Fire Avoidance and Suppression	Per the Fire Prevention Plan for the Project: DCRT would select a welding site that is void of native combustible material and/or would clear such material for 10 feet around the area where the work is to be performed. DCRT would follow its standard practice for clearing in wildland areas. Project personnel would be directed to drive on areas that have been cleared of vegetation, park away from dry vegetation, and carry water, shovels, and fire extinguishers in times of high fire hazard. DCRT would also prohibit trash burning. Additionally, fire-suppression materials and equipment would be kept adjacent to all areas of work and in staging areas and would be clearly marked.	X	X	X	X	DFA-VPL-BIO-FIRE-1		
BMP	HAZ-02: Fire Avoidance and Suppression	APM HAZ-02 would not interfere with APM BIO-14, which encourages overland driving/access. Vehicle and equipment operators would drive on cleared areas and park away from vegetation where possible, would be responsible to monitor for fire ignition by vehicles and equipment; and would be equipped and trained to provide first response to an inadvertent wildland fire ignition associated with the Project.	X	X	X	X	DFA-VPL-BIO-FIRE-1		X

APM OR BLM REQUIRED BMP	APM/BMP	DESCRIPTION	PRE-CONST.	CONST.	O&M	DECOM	DRECP CMA ADDRESSED*	CA ONLY	12KV LINE TO SCS
BMP	HAZ-03: Equipment & Material Inventory	DCRT would provide the BLM with an inventory of equipment and materials to cover each hazardous material used at any time during the life of the Project, updating as additions to equipment and materials are made. Appropriate equipment and materials would follow specific recommendations for individual Haz Mat types in BLM Handbooks, EPA guidelines, and from the California Department of Toxic Substance Control (DTSC).	X	X	X	X	LUPA-BIO-9	X	
BMP	HAZ-04	DCRT would provide the BLM with a Pesticide/Herbicide Use Proposal, outlining the pesticides and herbicides that would be proposed for use on the Project (the 12kV line would not require pesticide/herbicide use), demonstrating conformance with BLM requirements, and seeking preapproval before use. Only BLM-approved products would be used.	X	X	X				

*See Appendix 2C

2A.10 PUBLIC HEALTH AND SAFETY

APM OR BLM REQUIRED BMP OR EPM	APM/BMP	DESCRIPTION	PRE-CONST.	CONST.	O&M	DECOM	DRECP CMA ADDRESSED*	CA ONLY	12KV LINE TO SCS
BMP	PHS-01	Portable toilets would be provided at work sites to assure that adequate facilities are available for the duration of the Project and potential exposure to human waste is avoided.	X	X	X	X			X
BMP	PHS-02	A Fire Prevention Plan would be developed for the Project.	X	X	X	X	DFA-VPL-BIO-FIRE-1		X[11]

*See Appendix 2C

[11] APS would comply with their current fire plan on file with the BLM.

2A.11 TRAFFIC, TRANSPORTATION, AND PUBLIC ACCESS

APM OR BLM REQUIRED BMP	APM/BMP	DESCRIPTION	PRE-CONST.	CONST.	O&M	DECOM	DRECP CMA ADDRESSED*	CA ONLY	12KV LINE TO SCS
APM	TT-01: Traffic Coordination	Emergency service providers would be notified of the timing, location, and duration of construction activities. Traffic control devices and signs would be used as needed. These measures would be implemented in conjunction with a Traffic and Transportation Management Plan for the Project. This plan would also include measures/protocols for aviation, including helicopter use, coordination with local air traffic control, and a Congested Area Plan, pursuant to FAA regulations.		X					X
BMP – Military & Civilian Aviation in Regional Mitigation Strategy for AZ SEZs	TT-02: Structure Lighting in Military Training Routes (MTR)	Project structures that are located within MTRs would be fitted with night-vision compatible red lighting emitting an infrared energy between 675 and 900 nanometers.			X				
BMP	TT-03: Public Access, Marking, and Public Information for Closed Access	The BLM would determine if new access routes would be retained for public access through approval of the Access Plan for the Project. If any routes of travel are not accessible and/or closed, Carsonite posts and signing would note the closures. Where routes are closed, kiosks with information panels would be posted providing public information.	X	X	X				

APM OR BLM REQUIRED BMP	APM/BMP	DESCRIPTION	PRE-CONST.	CONST.	O&M	DECOM	DRECP CMA ADDRESSED*	CA ONLY	12KV LINE TO SCS
BMP	TT-04: Access Plan	An Access Plan would be required to identify all routes where new disturbance and/or cross-country travel is proposed. Existing access would be used to the maximum extent practicable; new access would only be created when there is no other reasonable or practicable means of access.	X	X	X	X	LUPA-BIO-13		X
BMP	TT-05: Using Open and Designated Routes	The Access Plan for the Project would maximize use of open and designated access routes to the extent practicable.	X	X	X	X	LUPA-BIO-13		X
BMP	TT-06: Access Roads in Dune Habitat	Access Roads would be unpaved and constructed at grade in dune habitat. No berms or application of rock would be allowed on the California public lands portion of the Project in desert tortoise habitat. Should other adaptive access measures be required (such as temporary compaction or mats to allow access across washes), those measures would be formulated in concert with the BLM and contained in the Access Management Plan (Appendix 2B)	X	X	X	X	DFA-VPL-BIO-DUNE-1	X	
BMP	TT-07: Routes of Travel	Routes of travel for the Project on BLM-managed lands outside established roadways would be limited to those routes on the approved Access Plan.	X	X	X	X	LUPA-BIO-13		X

APM OR BLM REQUIRED BMP	APM/BMP	DESCRIPTION	PRE-CONST.	CONST.	O&M	DECOM	DRECP CMA ADDRESSED*	CA ONLY	12KV LINE TO SCS
BMP	TT-08: Prohibit Cross-Country Vehicle Use Outside Designated Work Areas	Within Project boundaries, prohibit cross-country vehicle and equipment use outside of approved designated work areas to prevent unnecessary ground and vegetation disturbance.		X	X	X	LUPA-BIO-13	X	
BMP	TT-09: Repairs to Local Roads	Local roads would be restored if road damage occurred as a result of Project construction.	X	X	X	X			X
BMP	TT-10: Notify AGFD of Helicopter Construction	DCRT would coordinate with AGFD to ensure that the use of helicopters for construction in Copper Bottom Pass would not conflict with or cause an aerial hazard to aircraft flying AGFD wildlife surveys in this location.		X					

*See Appendix 2C

2A.12 VISUAL RESOURCES

APM OR BLM REQUIRED BMP	APM/BMP	DESCRIPTION	PRE-CONST.	CONST.	O&M	DECOM	DRECP CMA ADDRESSED*	CA ONLY	12KV LINE TO SCS
APM	AES-01: Vegetation Removal and Grading	During Project construction activities, the amount of existing vegetation cleared from the route would be kept to the minimum as much as practicably possible. Grading would occur as minimally as practicable and would follow the existing land contours as much as possible.		X		X			X
APM	AES-02: Work Area Reclamation	Upon completion of the Project, all construction material and debris from the permanent ROW and temporary staging areas would be removed and the areas restored. All work areas would be graded and restored to as close to preconstruction conditions as possible.	X	X	X	X			X
BMP	AES-02: Work Area Reclamation	Work area reclamation would include pulling and tensioning sites; all disturbed work areas associated with the Project.	X	X	X	X			X
APM	AES-03: Visual Distance Zone	For Segment cb-01, to increase the visual distance zone from the Arizona Peace Trail and the Project. To minimize the view blockage or impairment caused by the transmission structures to the off-road vehicle riders using the Arizona Peace Trail, the transmission line would be located as far from the trail as can be practicably constructed, while still being located below the horizon.		X	X	X			

APM OR BLM REQUIRED BMP	APM/BMP	DESCRIPTION	PRE-CONST.	CONST.	O&M	DECOM	DRECP CMA ADDRESSED*	CA ONLY	12KV LINE TO SCS
APM Captures BLM BMP for Reducing Visual Impacts of REFs 6.4.10 – Color Treat Transmission Towers to Reduce Contrasts with Existing Landscape	AES-04: Visual Contrast	Visual Contrast. For Segment cb-01, to minimize visual contrast between the elements of the transmission line structures and the surrounding landscape. Structures would be color treated appropriate colors to most effectively blend the structures with the visible background landscape.		X	X		DFA-VPL-VRM-3		
BMP	AES-04: Visual Contrast	Color treatment of transmission structures would be applied in all areas deemed necessary by the BLM. The BLM would select/approve the color treatment to be applied under AES-04. Color treatment would be applied to Project components, such as the SCS and fencing. All conductor would be non-specular, and all structures, whether color treated or not, would have a dull, non-reflective surface.		X	X		DFA-VPL-VRM-3		

APM OR BLM REQUIRED BMP	APM/BMP	DESCRIPTION	PRE-CONST.	CONST.	O&M	DECOM	DRECP CMA ADDRESSED*	CA ONLY	12KV LINE TO SCS
APM Captures BLM BMP for Reducing Visual Impacts of REFs 6.2.10 – Collocate Linear Features in Existing ROWs or Corridors	AES-05: Location	AES-5: Collocate the transmission line as close as possible to existing transmission lines of similar size and design (while maintaining the required 250-foot setback) to minimize the overall visual impact of the Project on the surrounding areas. Keeping the proposed transmission line within the same general corridor as existing transmission lines would reduce the spread of visual impacts from areas previously not affected. Collocating with existing transmission lines would also reduce the need to construct new access roads and their associated visual impacts.		X	X	X	LUPA TRANS-BIO-4		
APM	AES-06: Siting Staging and Laydown Areas	The Project would avoid siting, staging, and laydown areas in visually sensitive areas to the extent practicable. Staging areas would be located close to transportation access points and would be sited to take advantage of previously disturbed areas to the extent practicable.	X				LUPA-TRANS-BIO-1		X
BMP	AES-06: Siting Staging and Laydown Areas	APM AES-06 would apply to all Project work areas. Also, work areas would be located to minimize impacts, including but not limited to biological and visual.	X	X	X	X	LUPA-TRANS-BIO-1		X

APM OR BLM REQUIRED BMP	APM/BMP	DESCRIPTION	PRE-CONST.	CONST.	O&M	DECOM	DRECP CMA ADDRESSED*	CA ONLY	12KV LINE TO SCS
BMP (BMPs for Reducing Visual Impacts of REFs 6.2.11)	AES-07: Avoid Siting Linear Features in the Centers of Valley Bottoms and on Ridgetops	The eye follows strong natural lines in the landscape, and these lines and associated landforms can "focus" views on particular landscape features. For this reason, linear facilities associated with renewable energy projects, such as transmission line ROWs, should be sited to avoid running across the centers of valley bottoms, and to avoid ridgetop bisection (i.e., routing the ROWs perpendicular to and over ridgelines).	X	X			LUPA TRANS-BIO-3		
BMP (BMPs for Reducing Visual Impacts of REFs 6.2.12)	AES-08: Avoid Skylining	"Skylining" of transmission/communication towers and other structures should be avoided. Transmission/communication towers and other structures should not be placed on ridgelines, summits, or other locations where they would be silhouetted against the sky. Skylining draws visual attention to the Project elements and can greatly increase visual contrast. Siting should take advantage of opportunities to use topography as a backdrop for views of facilities and structures to avoid skylining. Roads may be less visible if located along ridgetops, but if they are located on the ridge face they can be highly visible because of increased cut, fill, and side cast material.	X	X			LUPA TRANS-BIO-3		

APM OR BLM REQUIRED BMP	APM/BMP	DESCRIPTION	PRE-CONST.	CONST.	O&M	DECOM	DRECP CMA ADDRESSED*	CA ONLY	12KV LINE TO SCS
BMP (BMPs for Reducing Visual Impacts of REFs 6.2.13)	AES-09: Site Linear Facilities along Natural Lines within the Landscape	Siting of facilities, especially linear facilities (e.g., transmission lines, pipelines, roads), should take advantage of natural lines within the landscape (e.g., natural breaks in the landscape topography, the edges of clearings, or transitions in vegetation). Siting of facilities on steep slopes should be avoided. Siting linear facilities along naturally occurring lines in the landscape can reduce apparent contrast through repetition of the line element or through combination of multiple line elements into a single line element. Facilities sited on steep slopes are often more visible (particularly if either the Project or viewer is elevated); they may also be more susceptible to soil erosion, which could also contribute to negative visual impacts.	X	X					

APM OR BLM REQUIRED BMP	APM/BMP	DESCRIPTION	PRE-CONST.	CONST.	O&M	DECOM	DRECP CMA ADDRESSED*	CA ONLY	12KV LINE TO SCS
BMP (BMPs for Reducing Visual Impacts of REFs 6.3.8)	AES-10: Use Monopole, Guyed, and Lattice Electric Transmis-sion Towers Appropriate-ly	Consideration should be given to the appropriate choice of monopoles versus guyed or lattice towers for a given landscape setting. Lattice or guyed towers are less visually obtrusive on the rural landscape than monopoles, especially when placed half a mile or more from KOPs and against a landscape backdrop. When transmission towers are placed within a half mile or less from KOPs, then monopoles would occupy a smaller field of view than lattice towers. Monopoles are often more appropriate within built or partially built environments, while lattice or guyed towers tend to be more appropriate for less-developed rural landscapes, where the latticework would be more transparent against natural background textures and colors. Where transmission facilities are to be collocated in ROWs or corridors, and the existing ROW or corridor has either lattice towers only, guyed towers only, or monopoles only, the same tower type should be selected for new transmission facilities within the ROW/corridor.	X	X					
BMP (BMPs for Reducing Visual Impacts of REFs 6.6.8)	AES-11: Use Air Transport to Erect Transmis-sion Towers	In areas of the highest visual sensitivity, air transport capability should be used to mobilize equipment and materials for clearing, grading, and erecting transmission towers. The use of air transport capability preserves the natural landscape conditions		X					

APM OR BLM REQUIRED BMP	APM/BMP	DESCRIPTION	PRE-CONST.	CONST.	O&M	DECOM	DRECP CMA ADDRESSED*	CA ONLY	12KV LINE TO SCS
		between tower locations, and may reduce the need for construction roads.							
BMP	AES-12: Reclamation to Reduce Visual Impacts	The Reclamation Plan for the Project would include measures designed to reduce long-term impacts to visual resources.	X	X	X	X			X
BMP	AES-13: Shifts in Alignment to Reduce Visual Impacts	The specific location of the Project within the study area would be determined based on micro-siting of Project components and new disturbance associated with access and work areas to reduce, minimize, or eliminate visual impacts.	X	X	X	X			
BMP	AES-14: SCS Fencing Specifica-tions	The BLM would work with the applicant to design the height, type, and color of fencing used to enclose the SCS to meet the objectives of the Project, minimize or optimize visual impacts, and assure compatibility with critical infrastructure protection.		X	X				
APM	AES-15: Lighting	Limited lighting would be used during night construction to ensure safe working conditions while limiting the overall lighted area. To the extent practicable, lighting would be directed in a downward position to minimize impacts to night sky.		X					

*See Appendix 2C

2A.13 WATER RESOURCES

APM OR BLM REQUIRED BMP	APM/BMP	DESCRIPTION	PRE-CONST.	CONST.	O&M	DECOM	DRECP CMA ADDRESSED*	CA ONLY	12KV LINE TO SCS
APM	WQ-01: SWPPP Development and Implementa-tion	Following Project approval, DCRT would prepare and implement a SWPPP or an amendment to an existing SWPPP to minimize construction impacts on surface water and groundwater quality. Implementation of the SWPPP would help stabilize graded areas and reduce erosion and sedimentation. The Plan would designate BMPs that would be adhered to during construction activities. Erosion and sediment control measures, such as straw wattles, covers, and silt fences, would be installed prior to ground disturbance, based on the anticipated volume and intensity of precipitation, the nature of stormwater runoff in the Project Area, and the soil types within the Project Area. Suitable stabilization measures would be used to protect exposed areas during construction activities, as necessary and final stabilization would be completed when construction materials, waste, and temporary erosion and sediment control measure have been removed. During construction activities, measures would be implemented to prevent contaminant discharge from vehicles and equipment, including complying with the Spill	X	X			LUPA-BIO-9		X[12]

[12] APS would prepare and submit a separate SWPPP for the 12kV distribution line.

APM OR BLM REQUIRED BMP	APM/BMP	DESCRIPTION	PRE-CONST.	CONST.	O&M	DECOM	DRECP CMA ADDRESSED*	CA ONLY	12KV LINE TO SCS
		Prevention, Control, and Countermeasures requirements in 40 CFR 112. The Project SWPPP would include erosion control and sediment transport BMPs to be used during construction. BMPs, where applicable, would be designed by using specific criteria from recognized BMP design guidance manuals. Erosion-minimizing efforts may include measures such as the following: • defining ingress and egress within the Project site • implementing a dust control program during construction • properly containing stockpiled soils Erosion control measures identified would be installed in an area before construction begins and would be properly maintained until construction is complete and final stabilization begins. Temporary measures such as silt fences or wattles, intended to minimize sediment transport from temporarily disturbed areas, would remain in place until disturbed areas have stabilized. The Plan would be updated during construction as required by the SWRCB and ADEQ. The Plan would include the following components, in accordance with ADEQ requirements for coverage under the General Permit:							

APM OR BLM REQUIRED BMP	APM/BMP	DESCRIPTION	PRE-CONST.	CONST.	O&M	DECOM	DRECP CMA ADDRESSED*	CA ONLY	12KV LINE TO SCS
		• stormwater team qualifications and contact information • identification of operators • nature of construction activities • sequence and estimated dates of construction activities • site description • site map(s) • receiving waters • control measures to be used during construction activity • summary of potential pollutant sources • use of treatment chemicals • pollution prevention procedures, including spill prevention and response and waste management procedures							
APM	WQ-02: Worker Environment-al Awareness Program Development and Implementa-tion	The Project's worker environmental awareness program would communicate environmental issues and appropriate work practices specific to this Project. This awareness would include spill prevention and response measures and proper BMP implementation. The training would emphasize site-specific physical conditions to improve hazard prevention (such as identification of flow paths to nearest water bodies) and would include a review of all site-specific water quality requirements, including applicable portions of erosion control and sediment transport BMPs, Health and Safety Plan, and Hazardous Substance Control and Emergency Response Plan.	X	X					X

APM OR BLM REQUIRED BMP	APM/BMP	DESCRIPTION	PRE-CONST.	CONST.	O&M	DECOM	DRECP CMA ADDRESSED*	CA ONLY	12KV LINE TO SCS
APM	WQ-03: Vehicles and Equipment Fueling and Maintenance	Vehicle and equipment fueling and maintenance operations would be conducted in designated areas only; these areas would be equipped with appropriate spill control materials and containment.	X	X	X	X			X
BMP	WQ-04: Non-petroleum Dust Palliatives	Palliatives used for dust control would be non-petroleum products in addition to non-toxic, as specified in AQ-01.	X	X		X	LUPA-BIO-13, LUPA BIO 14	X	
BMP	WQ-05: Water Use	Water extracted or consumptively used for the construction, operation, maintenance, or remediation of the Project shall be solely for the beneficial use of the Project or its associated mitigation and remediation measures, as specified in approved plans and permits.		X			LUPA-SW-18		X
BMP	WQ-06: Avoidance of Hydrologic Alterations	Consideration shall be given to design alternatives that maintain the existing hydrology of the site or redirect excess flows created by hardscapes and reduced permeability from surface waters to areas where they would dissipate by percolation into the landscape. All hydrologic alterations shall be avoided that could reduce water quality or quantity for all applicable beneficial uses associated with the hydrologic unit in the Project area, or specific mitigation measures shall be implemented that would minimize unavoidable water quality or quantity impacts, as determined by BLM in		X		X	LUPA-SW-21, LUPA-SW-22, LUPA-BIO-DUNE-2, LUPA-BIO-DUNE-3

Appendix 2B Ten West Link Project Plans

Table of Contents

2B.1 TWL PROPOSED PLANS

Plans available as a part of the final EIS are contained in this appendix following the lists of plans. If not contained as a part of the FEIS, plans will be provided prior to BLM issuance of the Notice to Proceed.

The following is a list of applicant committed plans:

- Environmental Compliance Management Plan
- Site plan for Soils and Hydrology, to include:
    - Soil Management Plan
- Plant and Wildlife Species Conservation Measures Plan, to include:
    - Nuisance Animal Plan
    - Mojave Desert Tortoise Protection and Compensation Plan (CPUC requirement)
- Mojave Fringe-toed Lizard Avoidance and Clearance Plan
- Raven Management Plan
- Avian Protection Plan, to include:
    - Bird and Bat Conservation Strategy (BBCS)
    - Bat Management and Protection Plan (CPUC requirement)
    - Burrowing Owl Nesting Management Plan & Nest Management Plan within the BBCS
    - Nesting Bird Management Plan (Part of BBCS)
- Vegetation Management Plan, to include:
    - Succulent Management
    - Linear ROW Rare Plant Protection Plan for Harwood's eriastrum
    - Noxious Weed Management Plan
    - Special Status Plant Transplantation and Compensation Plan (CPUC requirement)
    - Invasive Species Management Plan
- Reclamation, Vegetation, and Monitoring Plan, to include:
    - Habitat Reclamation and Monitoring
    - Visual Mitigation Plan
- Historic Properties Treatment Plan
- Paleontological Resources Treatment, Monitoring, and Discovery Plan (BLM and CPUC requirement)
- Stormwater Pollution and Prevention Plan (SWPPP), to include:
    - Erosion and Sediment Control Plan
- Spill Prevention, Control and Countermeasure (SPCC) Plan, to include:
    - Waste Management Plan
- Stream, Wetland, Well, and Spring Protection Plan
- Health and Safety Plan
- Asbestos Dust Mitigation Plan
- Fugitive Dust Control and Construction Emissions Mitigation Plan
- Blasting Plan
- Environmental Health and Safety Plan (environmental training and safety practices)
- Hazardous Materials Management Plan, to include:
    - Hazmat Containment Plan

    - Inventory of Equipment and Materials to cover each hazardous material used at any time during the life of the Project
- Emergency Preparedness and Emergency Response Plan, to include
    - Fire services agreements
- Access Road Plan
- Traffic and Transportation Management Plan
- Helicopter Flight Plan/Flight and Safety Plan
- Fire Protection and Fire Prevention Plan
- Decommissioning Plan
- Compensatory Mitigation Plan

2B.2 CMA REQUIRED PLANS

The following is a list of CMA plans required in order to comply with the CDCA Plan of 1980, as amended.

CMA	PLAN NAME	BLM NOTES
LUPA-BIO-6	Raven Management Plan	
LUPA-BIO-7, etc.	Habitat Restoration Plan	Offered by the applicant in conjunction with the POD.
LUPA-BIO-9	HazMat Containment Plan – to include accidental spill controls	Prepare in collaboration with the BLM HazMat specialist. A list of anticipated HazMat will be prepared and updated in the event that new hazardous materials come into use.
	An inventory of equipment and materials to cover each hazardous material used at any time during the life of the project.	"Appropriate" equipment and materials will follow specific recommendations for individual HazMat types in BLM Handbooks, US EPA guidelines, and from the California Department of Toxic Substance Control (DTSC).
LUPA-BIO-10	Weed Control Plan	Offered by the applicant in conjunction with the POD.
LUPA-BIO-16	Bird and Bat Conservation Strategy (BBCS)	Will provide guidance on pre-construction conservation measures and other bird and bat CMAs.
LUPA-BIO-IFS-12	Burrowing Owl Nesting Management Plan & Nest Management Plan within the BBCS	If burrows cannot be avoided, LUPA-BIO-IFS-13 applies. Need to address in BBCS, burrowing owl nesting management plan (separate document) and a nest management plan within the BBCS.
LUPA-BIO-RIPWET-1	Nesting Bird Management Plan	Part of BBCS
LUPA-BIO-PLANT-2	Linear ROW Rare Plant Protection Plan for Harwood's eriastrum	
LUPA-BIO-PLANT-2	Invasive Species Management Plan	Must be specific to rare plant habitat.

CMA	PLAN NAME	BLM NOTES
LUPA-AIR-3	Environmental Compliance Management Plan	In California, the agency policy about the project also meeting the applicable California Air Quality Standards established by the California Air Resources Board needs clarification.
	Construction Emissions Mitigation Plan	
LUPA-AIR-5	Fugitive Dust Control Plan	
LUPA-SW-7	Emergency Response Plan – to include any fire services agreements	
LUPA-SW-8	Site plan for Soils and Hydrology	
DFA-VPL-BIO-FIRE-1 and BIO-DUNE-1	Fire Prevention Plan	The plan would be site specific for the transmission lines or any other construction activity that might cause a fire. The plan would set standards for the project site dealing with these issues. There are California Fire Codes and National Fire Protection Association (NFPA) codes that they would be required to meet for the project also. Mitigation is a key to preventing/ lowering the risk of a fire starting.
LUPA-BIO-DUNE-5	Mojave Fringe-toed Lizard Avoidance and Clearance Plan	

2B.3 PLANS REQUIRED BY MITIGATION

- Worker Environmental Education Program

2B.4 OTHER AGENCY-REQUIRED PLANS

Other agency-required plans include:

- Mitigation Action Plan (Western Area Power Administration)
- EMF Management Plan (CPUC)
- Special-Status Plant and Sensitive Vegetation Community Mitigation and Monitoring Plan (CPUC)
- Burrowing Owl Avoidance, Minimization, and Mitigation Plan (BOAMMP) (Part of BBCS) (CPUC)
- Cultural Resources Monitoring and Discovery Plan (CPUC)
- Field Management Plan (EMF reduction measures) (CPUC)
- Nesting Bird and Bat Management Plan (NBBMP) (CPUC)

1 Introduction

1.1 Purpose

The purpose of this Avian Protection Plan (APP)/Bird and Bat Conservation Strategy (BBCS) is to provide a description of measures that will be implemented by Delaney Colorado River Transmission, LLC (DCRT) to reduce potential impacts to birds and bats associated with the construction and operation of the Ten West Link Transmission Line Project (Project or Ten West Link). This plan provides specific information for implementing the applicable Applicant Proposed Measures (APMs), Bureau of Land Management (BLM)-Required Best Management Practices (BMPs), and Mitigation Measures (MM) contained within the Final Environmental Impact Statement (EIS).

1.2 Organization of This Plan

APMs, BMPs, and MMs contained within the Final EIS require DCRT to document a strategy for avoiding, minimizing, monitoring, and mitigating impacts to birds as a result of the Project. Specific documentation referred to in the APM/BMPs and California Environmental Quality Act (CEQA) MMs includes an Avian Protection Plan (APM/BMP BIO-21 and MM WIL-CEQA-1), Burrowing Owl Nesting Management Plan (BIO-30; referred to as a Burrowing Owl Avoidance, Minimization, and Mitigation Plan in MM WIL-CEQA-3), and Bird and Bat Conservation Strategy (BIO-29 and MM WIL-CEQA-1), which is to include a Nesting Bird Management Plan (BIO-29) and Nest Management Plan (BIO-29). The Nesting Bird Management Plan and Nest Management Plan, referred to in BIO-29, are collectively referred to as a Nesting Bird and Nest Management Plan in MM WIL-CEQA-1. MM WIL-CEQA-1 and MM WIL-CEQA-4 indicate that the BBCS must also include a Bat Management and Protection Plan.

To avoid redundancy and confusion, all avian and bat protection documentation is integrated into this single document—the Avian Protection Plan/Bird and Bat Conservation Strategy (APP/BBCS). The sections of this APP/BBCS include a Nesting Bird Management Plan (Section 6), Nest Management Plan (Section 7), Burrowing Owl Nesting Management/Avoidance, Minimization, and Mitigation Plan (Section 8), and Bat Management and Protection Plan (Section 9).

The avoidance, minimization, and mitigation requirements associated with the EIS, CEQA, and Desert Renewable Energy Conservation Plan (DRECP) Land Use Plan Amendment (LUPA) are in many cases more stringent for California than for the Project as a whole. Within Section 3, measures that apply only within California are listed separately from measures that apply Project-wide within Arizona and California. As such, some components and sections of this plan apply only within California and where applicable that is indicated within the section heading and contents. Sections and content that do not specifically indicate California only apply within Arizona and California.

This Draft APP/BBCS was developed concurrent with development of the Final EIS, and prior to issuance of the Final EIS and Record of Decision (ROD). A final APP/BBCS will be developed with the final Plan of Development (POD), after issuance of the ROD and prior to issuance of the Notice to Proceed.

1.3 Project Description

A detailed Project description, maps of the Project area, and pole diagrams are provided in the POD. A summary Project description is provided here. The Project will consist of a single-circuit, series-compensated, 500 kilovolt (kV) transmission line. The Project will begin at the Delaney Substation near Tonopah, Arizona, and terminate at the Colorado River Substation near Blythe, California. The Project is located in Maricopa and La Paz Counties in Arizona, and Riverside County in California. The Project route (BLM Preferred Alternative) parallels an existing transmission line and other linear facilities, primarily within designated utility corridors.

Approximately 103 miles of the Project are located in Arizona and 22 miles are located in California; most of the route, 81.2 miles, will cross federal and state lands, including lands managed by the BLM, Bureau of Reclamation (Reclamation), and the state of Arizona. A 0.2-mile section of the Project spans Department of Defense land (Yuma Proving Ground military installation).

Construction, operation, and maintenance activities will occur primarily within a 200-foot-wide right-of-way (ROW). The Project will also include upgrades at both the Delaney and Colorado River Substations. Up to four temporary staging areas are required for material staging and laydown yards during construction.

The proposed support structures will be steel structures of various configurations. Tangent and small-angle steel lattice structures include self-supporting, four-legged tangent structures (i.e., structures placed where the line does not angle more than one degree); guyed-V structures with a single footing and four support guy wires; and two-legged, H-frame (steel lattice or tubular steel pole) structures as the primary structure types. Permanent guy guards/markers will be installed on guy wires for the guyed-V structures as required by BMPs and mitigation measures described in the Project's Final EIS and as summarized in Appendix B of the POD. For areas of conductor tension change, large angles, and phasing transpositions, self-supporting, four-legged structures will be utilized. Steel monopoles may be used for areas of active agricultural activity and to facilitate entrance into the two substations. The structures will be between 72 and 195 feet in height, depending on the span length required and topography, with most being shorter than 142 feet. Span lengths between structures will vary from 400 to 2,300 feet, depending upon terrain conditions, current land use, and structure type used, and would be selected to achieve site-specific mitigation objectives.

The transmission line will utilize three alternating current phases of conductors. The conductors are the wire cables strung between transmission line structures over which the electric current flows. The conductors within each phase will be bundled and are typically spaced approximately 18 inches apart in an equilateral triangle configuration. Conductor bundles for all structure types except the proposed monopoles will be installed horizontal to one another (at the same height on the structure), with approximately 34 feet of spacing between the center of each conductor bundle. The static wire and optical ground wire will be approximately 30 feet above the phase conductors at the top of the structures. The minimum conductor height above ground for the transmission line will be 36.25 to 40 feet for most of the segments and 41.25 feet for the Colorado River crossing. Insulators will be used to suspend the conductors from each structure to inhibit the flow of electrical current from the conductor to the ground, the structure, or another conductor. To protect conductors from lightning strikes, two overhead ground wires will be installed on top of the structures that will transfer current from lightning strikes through the ground wires and structures into the ground. Other hardware, such as bird flight diverters, not associated with the transmission of

electricity will be installed as part of the Project. This hardware may include aerial marker spheres or aircraft warning lighting, as required for the conductors or structures by Federal Aviation Administration regulations.

The Project requires a transmission line Series Compensation Station (SCS) located at the approximate midpoint of the route. The Proposed SCS site is located near the intersection of Segments i-03 and i-04, approximately two miles south of Brenda, Arizona. The SCS will be fenced and access will be restricted. The new SCS will be connected to an existing 12 kV distribution line via a new 3.13-mile-long 12 kV line.

Access to the ROW will be provided by existing roads and trails, such as those associated with the Devers to Palo Verde transmission line and nearby pipelines, to the extent practicable. Five types of access will be used for this transmission line: existing maintained public or private roads, upgraded existing roads, new centerline access, spur roads, and helicopter access. The existing roads will be used in their present condition without improvements, unless improvements are required or are deemed to be in the Project's best interest for future use. Where existing roads can be used to access the ROW, only spur roads to each structure site will be required. Roads for access into the transmission lines will also be utilized for access to the SCS, given that the roads are adequate for the transport of materials and equipment necessary at the SCS.

After construction, Project operation and maintenance will be an ongoing activity including transmission line inspections, preventative and emergency maintenance, vegetation management including trimming and removal of vegetation within the ROW, SCS maintenance, substation maintenance, and long-term access to the ROW through general road maintenance and installation of signs and markers.

Should the ROW and facilities no longer be needed, the transmission lines and associated facilities will be decommissioned and removed. All areas of long-term disturbance will be reclaimed in accordance with a Decommissioning Plan to be developed by the ROW grant holder and approved by the BLM prior to issuance of the ROW grant. A reclamation bond will also be required per BLM bonding policy to ensure performance of reclamation activities. Access routes and other sites disturbed during decommissioning will be reclaimed and revegetated in accordance with the Decommissioning Plan (see Appendix M).

1.4 Biological Surveys

Surveys for birds and bats will be conducted in 2019 and 2020, according to the schedules provided in Table F3-1-1. As applicable, information gained in these surveys will be incorporated into the Final APP/BBCS and will inform the implementation of this plan.

TABLE F3-1-1 BIRD AND BAT SURVEYS PLANNED FOR THE PROJECT

SPECIES/SURVEY FOCUS	TIMING	LOCATION	PROCEDURES	PROJECT MITIGATION MEASURE
2019 Season				
Arizona (2019)				
Golden & Bald Eagle	February 15 – August 1	Historical Nesting areas depicted in Draft EIS Figure 3.4-4 & 3.5-9	1-mile pedestrian/visual survey in historical areas for impacted segments	CMA-LUPA-BIO-IFS-24 through CMA-LUPA-BIO-IFS-27
General Avian Surveys	Varies; January 1 to August 31	Final Route on BLM administrated lands	Pedestrian surveys	APM-BIO-20
California (2019)				
Bat hibernaculum, maternity roosts	March 1 – July 31	Suitable habitat on BLM administrated lands	Inspect for evidence of bat activity or roosting	CMA-LUPA-BIO-BAT-1, MM-BIO-CEQA-11, BMP-BIO-40
Southwestern Willow Flycatcher	1st survey: May 15 – May 31 2nd survey: June 1 – June 21 3rd survey: June 22- June 17	Critical habitat at the Colorado River Crossing	Protocol survey, as per USFWS	MM-BIO-CEQA-9
Yellow-billed Cuckoo	1st: June 15 – July 2 2nd: August 1 – September 15	Critical habitat at the Colorado River Crossing	Protocol survey, as per USFWS	MM-BIO-CEQA-9
Arizona Bell's Vireo	April - July	Critical habitat at the Colorado River Crossing	Protocol survey, as per USFWS	MM-BIO-CEQA-9
Golden & Bald Eagle	February 15 – August 1	Historical Nesting areas depicted in Draft EIS Figure 3.4-4 & 3.5-9	1-mile pedestrian/visual survey in historical areas for impacted segments	CMA-LUPA-BIO-IFS-24 through CMA-LUPA-BIO-IFS-27
2020 Season				
Arizona (2020)				
Burrowing Owl	February 1 – August 31 (Peak: April	All work areas of Final Route	Pedestrian sweep of work areas	BMP-BIO-25

SPECIES/SURVEY FOCUS	TIMING	LOCATION	PROCEDURES	PROJECT MITIGATION MEASURE
	15 – July 15)			
California (2020)				
Southwestern Willow Flycatcher	1st survey: May 15 – May 31 2nd survey: June 1 – June 21 3rd survey: June 22- June 17	Critical habitat at the Colorado River Crossing	Protocol survey, as per USFWS	MM-BIO-CEQA-9
Yellow-billed Cuckoo	1st: June 15 – July 2 2nd: August 1 – September 15	Critical habitat at the Colorado River Crossing	Protocol survey, as per USFWS	MM-BIO-CEQA-9
Arizona Bell's Vireo	April - July	Critical habitat at the Colorado River Crossing	Protocol survey, as per USFWS	MM-BIO-CEQA-9
Burrowing Owl	February 1 – August 31 (Peak: April 15 – July 15)	All work areas of Final Route	Protocol survey, as per USFWS	MM-BIO-CEQA-10, BMP-BIO-25
Bat Focus and BLM Special Status Species (including: California Leaf-nosed Bat, Pallid Bat, Townsend's Big-eared Bat)	1 – No more than 15 days prior to ground disturbance or vegetation clearing and 2 - March 1- July 31	1-Within 300 feet of Project activities 2-Suitable habitat	1-Clearance surveys 2-Inspect for evidence of bat activity or roosting	MM-BIO-CEQA-11, CMA- LUPA-BIO-DUNE-5

BLM = Bureau of Land Management; EIS = Environmental Impact Statement; USFWS = United States Fish and Wildlife Service.

2 Applicable Regulations and Permit Compliance

DCRT will obtain all necessary construction permits and ROW approvals prior to commencing construction. Additionally, the appropriate state and federal permits will be acquired from the United States Fish and Wildlife Service (USFWS), Arizona Game and Fish Department (AZGFD), and California Department of Fish and Wildlife (CDFW) prior to any handling of birds and bats, or their nests.

DCRT will comply with all applicable state and federal regulations during the construction, operation, and maintenance of the Project, including, but not limited to the regulations identified below in Sections 2.1.1 through 2.1.5.

2.1 Federal Endangered Species Act

The federal Endangered Species Act (ESA) is administered under the USFWS. The purpose of the ESA is to "provide a means whereby ecosystems upon which endangered and threatened species depend may be conserved, and to provide a program for the conservation of these species." Section 9 of the ESA prohibits purposeful or incidental "take" of listed species, including killing or harming a listed species or its habitat. If an action with a federal nexus has potential to affect a listed species, consultation under Section 7 of the ESA is required between the lead federal agency and the USFWS.

2.2 Bald and Golden Eagle Protection Act

The Bald and Golden Eagle Protection Act (BGEPA) of 1940 provides for the protection of bald eagles (*Haliaeetus leucocephalus*) and golden eagles (*Aquila chrysaetos*) by prohibiting the take; possession; sale; purchase; barter; offer to sell, purchase, or barter; transport; and export or import of any bald or golden eagle, alive or dead, including any part, nest, or egg unless allowed by permit (16 United States Code [U.S.C.] § 668 (a); 50 Code of Federal Regulations Part 22.3). "Take" is defined as "pursue, shoot, shoot at, poison, wound, kill, capture, trap, collect, molest, or disturb." "Disturb" means "to agitate or bother a bald or golden eagle to a degree that causes, or is likely to cause, based on the best scientific information available: 1) injury to an eagle, 2) a decrease in its productivity, by substantially interfering with normal breeding, feeding, or sheltering behavior, or 3) nest abandonment, by substantially interfering with normal breeding, feeding, or sheltering behavior."

2.3 Migratory Bird Treaty Act

The Migratory Bird Treaty Act (MBTA) was enacted in 1918 to put an end to the commercial trade of migratory birds and their feathers. The MBTA implements treaties and conventions between the United States, Canada, Mexico, Japan, and the former Soviet Union for the protection of migratory birds. This Act decrees that all migratory birds and their parts (including eggs, nests, and feathers) are fully protected. Under this Act, it is unlawful to pursue, hunt, take, capture, kill, possess, offer to or sell, barter, purchase, deliver, transport, or receive any migratory birds (including parts, nests, eggs or other product, manufactured or not). In practice, most bird species with non-migratory life-histories are protected under the MBTA, as well. Virtually all native bird species in the United States are protected under MBTA, with the exception of upland game birds (order Galliformes: e.g., grouse and quail). While the USFWS is the lead federal agency charged with protecting migratory birds within the United States, under Executive Order 13186 all other federal agencies are charged with conserving and protecting migratory birds and the habitats on which they depend.

Historically, incidental take (i.e., take of birds resulting from an activity when the underlying purpose of that activity is not to take birds) has been considered a violation of the MBTA. In a December 22, 2017 memorandum, M-37050 (M-Opinion), the United States Department of the Interior Office of the Solicitor issued an opinion concluding that incidental take is not a violation of MBTA. On April 11, 2018, USFWS issued a guidance Memorandum acknowledging and clarifying what changes in practice should be made in light of the M-Opinion. For example, under this guidance memo, knowingly destroying an active bird nest along with the nesting substrate (e.g., vegetation clearing for construction) does not violate MBTA unless the nest is explicitly and intentionally destroyed along with the nesting substrate (e.g., tree trimming or removal to destroy an undesired nesting colony). While

incidental take of birds is no longer considered a violation of MBTA, avoiding or minimizing take of birds to the extent practicable is still a responsible, effective, and valuable way to avoid and minimize impacts to bird populations. Furthermore, minimizing impacts to individual birds is integral to many of the APMs, BMPs, and MMs required by the POD for this Project.

2.4 Arizona State Regulations

Title 17 of the Arizona Revised Statutes grants the AZGFD the responsibilities of managing, preserving, and harvesting wildlife, and enforcing all laws for wildlife protection through the development of policies and programs including the establishment of seasons for hunting, trapping, and fishing, and game limits for all non-tribal lands in Arizona. Accordingly, AZGFD manages all wild mammals, birds, reptiles, amphibians, mollusks, crustaceans, and fish as decreed in Arizona Revised Statutes Title 17.

2.5 California State Regulations

2.5.1 California Endangered Species Act

The California Endangered Species Act (CESA; California Fish and Game Code Section 2050, et seq.) protects California's rare, threatened, and endangered species. California Fish and Game Code Sections 1900 et seq. designate rare, threatened, and endangered plants under the Native Plant Protection Act of 1977. The Proponent must consult with the CDFW regarding the possibility of "take" under the Act, similar to the federal consultation required under 16 U.S.C. § 1536. as the administering agency, the CDFW can choose to find the federal biological opinion consistent with state law (a 2080.1 consistency determination) or choose to require a separate state "take" permit (a 2081 permit) if species listed by the Act could be harmed or killed during construction or operation of a project.

2.5.2 Fully Protected Species

The legislature of the state of California designated certain species as "fully protected" prior to the creation of CESA. California Fish and Game Code Section 3511, 4700, 5050, and 5515 state that "fully protected" birds or parts thereof may not be taken or possessed at any time. Lists of fully protected species were initially developed to provide protection to those animals that were rare or faced possible extinction and included fish, mammals, amphibians and reptiles, and birds. Most fully protected species have since been listed as threatened or endangered under the CESA and/or ESA.

2.5.2.1 Birds

California Fish and Game Codes protect all birds, as well as their eggs and nests. Specifically: Section 3503 states that it is unlawful to take, possess, or needlessly destroy the nest or eggs of any bird, except as otherwise provided by California Fish and Game Commission or any regulation made pursuant thereto. Section 3503.5 states that it is unlawful to take, possess, or destroy any birds in the orders Falconiformes (raptors) or Strigiformes (owls) or to take, possess, or destroy the nest or eggs of any such bird except as otherwise provided by California Fish and Game Commission or any regulation adopted pursuant thereto.

3 Avoidance, Minimization, and Mitigation Requirements from the Final EIS

All APMs and BLM-required BMPs are listed in Appendix 2A of the Final EIS. Additionally, MMs required under CEQA are listed in Appendix 1C of the Final EIS. Many Conservation and Management Actions (CMAs) from the DRECP LUPA, also apply to this Project on BLM land within California. These measures will avoid and minimize Project-related bird and bat injuries and fatalities during the construction, operations and maintenance, and decommissioning of the Project. All of the CEQA MMs and LUPA CMAs, and some of the APM and BMPs are required only within California. A majority of the APMs, BMPs, and MMs are anticipated to reduce impacts to birds and/or bats, for example protecting habitat by minimizing vegetation clearing and restoring vegetation after construction. The avoidance, minimization, and mitigation measures (APM/BMPs and MMs) anticipated to benefit birds and bats are provided in the bulleted list below. The measures most directly applicable to implementation of this APP/BBCS are shown in **bold** and have the full text of the measure provided in Attachment A.

3.1 Measures that Apply in Arizona and California

- BIO-01: Worker Environmental Awareness Program (WEAP)
- BIO-02: Biological Monitoring and Preconstruction Survey
- BIO-03: Approved Work Areas
- BIO-04: Environmentally Sensitive Areas and Fencing
- BIO-05: Additional Prohibitions
- BIO-06: Trash Handling
- BIO-07: Monofilament Plastic
- BIO-08: Refueling
- BIO-10: Erosion and Dust Control
- BIO-11: Vegetation Management Plan
- BIO-12: Noxious and Invasive Species Control
- BIO-13: Riparian Habitat Avoidance
- BIO-14: Minimizing Vegetation Clearing
- BIO-15: Reclamation and Restoration
- BIO-16: Treatment of Saguaro Cactus
- BIO-17: Limit Off-road Vehicle Travel

- BIO-19: Colorado River
- **BIO-20: Migratory Bird Protection During Construction**
- **BIO-21: Reduction of Avian Collision and Electrocution**
- **BIO-25: Sensitive Animal Surveys**
- **BIO-29: Bird and Bat Conservation Strategy**
- BIO-32: Seasonal Restriction Dates
- **BIO-33: Construction Lighting**
- BIO-36: Feeding or Harassment of Wildlife
- BIO-38: Use of State of the Art Technology
- **BIO-39: Bird- and Bat-Friendly Fencing**
- BIO-47: Riparian Functioning Condition
- BIO-50: Engineering Controls
- BIO-51: Conductor Clearance
- BIO-52: California Riparian Habitat and Rare Plant Alliance Avoidance
- BIO-55: Access within Focus and BLM special Status Species Suitable Habitat
- MM-BIO-01: Compensation Plan
- **REC-03: Guy Wire Marking**
- APM/BMP AES-15 Lighting

3.2 Measures that Apply Only in California

- BIO-28: Raven Management Plan
- **BIO-30: Burrowing Owl Nesting Management Plan**
- **BIO-40: Project Activity Siting Near Bat Maternity Roosts**
- **BIO-45: Protection from Loss and Harassment of Golden Eagles**
- **BIO-46 Compensation for Loss of Desert Riparian Woodland**
- **BIO-48: Flight Diverters**
- **MM BIO-CEQA-2: Implement a Worker Environmental Awareness Program**

- **MM BIO-CEQA-3: Implement Biological Construction Monitoring**
- **MM-WIL-CEQA-1: Develop and Implement an Avian Management and Protection Plan (APP) and Bird and Bat Conservation Strategy (BBCS).**
- **MM WIL-CEQA-3: Develop and Implement Burrowing Owl Avoidance, Minimization, and Mitigation Plan**
- **MM WIL-CEQA-4: Develop and Implement a Bat Management and Protection Plan**
- **MM WIL-CEQA-5: Conduct Preconstruction Surveys for Maternity Colonies or Hibernaculum for Roosting Bats.**
- **MM WIL-CEQA-6: Conduct Preconstruction Surveys for Nesting and Breeding [Birds].**
- **MM WIL-CEQA-7: Conduct Focused Preconstruction Burrowing Owl Surveys.**
- **MM WIL-CEQA-8: Conduct Preconstruction Protocol Surveys for Arizona Bell's Vireo, Southwestern Willow Flycatcher, and Willow Flycatcher; Avoid Occupied Habitat; Compensate Impacts.**
- LUPA-BIO-1
- LUPA-BIO-2
- LUPA-BIO-3
- LUPA-BIO-4
- LUPA-BIO-14
- **LUPA-BIO-16**
- **LUPA-BIO-17**
- LUPA-BIO-BAT-1
- **LUPA-BIO-COMP-2**
- LUPA-BIO-DUNE-2
- **LUPA-BIO-IFS-11**
- **LUPA-BIO-IFS-12**
- **LUPA-BIO-IFS-13**
- **LUPA-BIO-IFS-14**
- **LUPA-BIO-IFS-24**

- **LUPA-BIO-IFS-25**
- **LUPA-BIO-IFS-26**
- **LUPA-BIO-IFS-27**
- **LUPA-BIO-IFS-28**
- **LUPA-BIO-IFS-29**
- **LUPA-BIO-IFS-30**
- **LUPA-BIO-IFS-31**
- **LUPA-TRANS-BIO-1**
- **LUPA-TRANS-BIO-2**
- LUPA-TRANS-BIO-3
- Development Focus Area (DFA)-BIO-IFS-1
- **DFA-BIO-IFS-2**

4 Existing Avian and Bat Resources

The Draft EIS identified three federally-listed bird species with potential to occur within the Project area: yellow-billed cuckoo (*Coccyzus americanus occidentalis*), southwestern willow flycatcher (*Empidonax traillii extimus*), and Yuma Ridgway's rail (Yuma clapper rail; *Rallus obsoletus yumanensis*; Table F3-4-1). The three species are associated with riparian (cuckoo and flycatcher) or marsh (rail) habitat along the Colorado River. The only permanent water and associated riparian vegetation in the Project area occurs along the Colorado River and in canals and drains adjacent to irrigated fields in California. The floodplain on the eastern side of the Colorado River at that crossing site is about 0.7-mile-wide, and is vegetated with sparse to moderately dense stands of tamarisk (*Tamarix* spp.) and saltbush (*Atriplex* spp.), in addition to other low shrubs. There are individual and small groups of honey mesquite (*Prosopis glandulosa*) along the eastern edge of the floodplain, but there is no overstory of cottonwoods or other native riparian tree species. The river at that location is channelized and has a thin stand of shrubs and short trees on the steep river banks. Irrigated fields are immediately west of the river at the crossing location.

According to the Draft EIS, the area east of the river has a short, patchy overstory of nonnative salt cedar and little or no understory, thus it is very unlikely that yellow-billed cuckoos or willow flycatchers nest there; however, the areas could be used infrequently during migration or other movements along the river. The nearest known suitable nesting habitat for either species is over 10 miles from the Project area (BLM 2019).

Yuma Ridgway's rail inhabits freshwater marshes in the Colorado River corridor with water greater than 12 inches deep and dense to moderately dense stands of cattails (*Typha latifolia*), bulrushes (*Schoenoplectus* spp.), and other emergent plants. However, no emergent vegetation or other suitable habitat for Yuma Ridgway's rail exists adjacent to the Colorado River at the Project crossing. Backwater channels just south of the Project area

were developed to create habitat for rare fish and have some emergent vegetation and marshes that could be used by Yuma Ridgway's rails. According to the Biological Assessment (BLM 2019), Yuma Ridgway's rails have been observed using irrigation canals and drains in the agricultural fields south and southwest of Blythe. Many of those drains have dense stands of cattails and other emergent vegetation. There is a backwater channel about 0.4 mile south of the river crossing that contains small patches of marsh habitat. Most of the length of the backwater channel has relatively steep banks and little or no marsh vegetation, but there are some small patches of cattail (*Typha latifolia*) and other marsh vegetation along the channel that might be used by Yuma clapper rails (BLM 2019).

West of the Colorado River, the transmission line route crosses numerous canals that deliver and drain water to and from irrigated fields in Palo Verde Valley. Most of the canals are lined with concrete or are cleared of vegetation. Eight of the drains, however, have about 50- to 150-foot-wide stands of vegetation along the banks of the drain, including some with narrow bands of cattail and other marsh vegetation along the bottom of the drain. Yuma clapper rails have been observed using irrigation canals and drains in the agricultural fields south and southwest of Blythe (BLM 2019). According to the BA, the species is known to use agricultural and other upland areas during dispersal and migration and is likely to pass through the Project area.

The Biological Assessment concluded that the Project may affect but is unlikely to adversely affect the three federally-listed bird species (BLM 2019).

Additional special status bird species with potential to occur in the Project area include BLM-Sensitive species, BLM-Focus species (as designated under the DRECP LUPA), California Threatened and Endangered species, California Species of Special Concern (SSC), California Fully Protected species, and Arizona Species of Greatest Conservation Need (SGCN). In addition to the three federally-listed species, there are 22 special status bird species with potential to occur within the Project area in California (Table F3-4-2) and 27 with potential to occur within Arizona (Table F3-4-3). Suitable habitat for various species occurs throughout the Project area, including within agricultural areas, which provide quality foraging habitat for some species such as raptors. Avoidance and minimization measures described throughout this APP/BBCS will protect birds wherever they occur, including within agricultural areas.

There are no federally- or state-listed threatened or endangered bat species with potential to occur in the Project area. There are six special status bat species with potential to occur within the Arizona portion of the Project area (Table F3-4-4) and eight special status bat species with potential to occur within the California portion of the Project area (Table F3-4-5).

TABLE F3-4-1 FEDERAL ESA-LISTED THREATENED, ENDANGERED, AND PROPOSED BIRD SPECIES IN OR NEAR THE PROJECT AREA[1]

SPECIES	COMMON NAME	STATUS[2,3]	HABITAT	POTENTIAL FOR OCCURRENCE
Coccyzus americanus occidentalis	Western yellow-billed cuckoo	ESA: T AZ: SGCN CA: E BLM: Sensitive BLM: Focus Species	Nests in dense, wide riparian woodlands with well-developed understories. Uses adjacent upland areas for foraging,	Present along the Colorado River in suitable habitat. The nearest documented nesting occurs 10 miles north and 15 miles south of the Project. Habitat at proposed river crossings is not suitable for nesting, although this species is likely to use the habitat during

SPECIES	COMMON NAME	STATUS[2,3]	HABITAT	POTENTIAL FOR OCCURRENCE
			including agricultural areas.	migration. The route segments cross proposed critical habitat along the Colorado River. However, according to the Project's Biological Assessment (BLM 2019) the conditions in the Project area do not support the primary constituent elements of proposed critical habitat for this species.
Empidonax traillii extimus	Southwestern willow flycatcher	ESA: E AZ: SGCN CA: E BLM: Sensitive BLM: Focus species	Nests in early successional riparian willow-dominated riparian habitats. Although they typically utilize riparian habitat during migration, they are also found foraging in surrounding areas in a wide variety of vegetation and habitat types	Present along the Colorado River in suitable habitat. Habitat at proposed river crossings is not suitable for nesting, although this species could use the habitat during migration and for foraging, including adjacent agricultural areas.
Rallus obsoletus yumanensis (Rallus longirostris yumanensis)	Yuma Ridgway's rail (Yuma clapper rail)	ESA: E AZ: SGCN CA: T BLM: Sensitive BLM: Focus species	Freshwater marshes with stands of bulrushes and cattails	Known to be present in canals and drains adjacent to agricultural fields in California. The proposed crossing of the Colorado River lacks suitable marsh habitat, but there is potential habitat in nearby backwater channels.

[2] E = Endangered; T = Threatened.
[3] BLM Focus species as designated under the DRECP LUPA.
SGCN = Species of Greatest Conservation Need.

TABLE F3-4-2 SPECIAL STATUS BIRD SPECIES (NOT INCLUDING FEDERAL ESA-LISTED SPECIES) THAT COULD OCCUR WITHIN OR NEAR THE PROJECT AREA IN ARIZONA[1]

SPECIES	COMMON NAME	STATUS DESIGNATION (ARIZONA/ BLM)[2]	HABITAT
Melozone aberti	Abert's towhee	Arizona: SGCN	Low-elevation desert riparian and desert wash habitats. Habitat includes dense vegetation, including thickets of willow, cottonwood, mesquite, and salt cedar. Likely restricted to within and near xeroriparian washes with dense shrubs and agricultural areas within Project area.

SPECIES	COMMON NAME	STATUS DESIGNATION (ARIZONA/ BLM)[2]	HABITAT
Botaurus lentiginosus	American bittern	Arizona: SGCN	Marshlands and very wet meadows. Rarely seen away from dense reeds, rushes, cordgrass, cattails and other emergent vegetation. Within Project area, restricted to Colorado River.
Vireo bellii arizonae	Arizona Bell's vireo	Arizona: SGCN	Desert riparian woodlands, primarily with dense willow or mesquite. Uncommon along lower Colorado River.
Haliaeetus leucocephalus	Bald eagle	Arizona: SGCN BLM: Sensitive	Coasts, rivers, and large lakes. Open country and mountains during migration. Migrant and winter resident along lower Colorado River.
Ceryle alcyon	Belted kingfisher	Arizona: SGCN	Occurs near water and along banks throughout the United States. Only habitat within Project area is along and near Colorado River.
Laterallus jamaicensis coturniculus	California black rail	Arizona: SGCN BLM: Sensitive	Salt and brackish water marshes. Occurs in the lower Colorado River in areas of pickleweed thickets.
Aechmophorus clarki	Clark's grebe	Arizona: SGCN	Occurs in marshes, lakes, and, less frequently, along rivers. Only habitat near the Project area is along and near Colorado River.
Buteogallus anthracinus	Common black hawk	Arizona: SGCN	Generally, within wooded washes and streams in Arizona. Uncommon migrant and winter resident in southwestern Arizona.
Progne subis hesperia	Desert purple martin	Arizona: SGCN BLM: Sensitive	Open, flat areas and farms. Inhabits saguaros in southern Arizona. Much more common in southcentral Arizona than within and near Project area.
Phalacrocorax auritus	Double-crested cormorant	Arizona: SGCN	Occurs along coasts, bays, and rivers. Only habitat near the Project area is along and near Colorado River.
Buteo regalis	Ferruginous hawk	Arizona: SGCN BLM: Sensitive	Plains and prairies throughout western North America. In southwestern Arizona, migrant and winter resident primarily near cultivated fields.
Melanerpes uropygialis	Gila woodpecker	Arizona: SGCN	Upper Sonoran Desert in areas with stands of saguaro, riparian woodlands, and suburban areas.
Colaptes chrysoides	Gilded flicker	Arizona: SGCN BLM: Sensitive	Upper Sonoran Desert in areas with stands of saguaro, riparian woodlands, and suburban areas.
Casmerodius albus	Great egret	Arizona: SGCN	Marshes and mudflats along shorelines throughout warmer areas of the world. Only habitat near the Project area is along and near Colorado River.
Aquila chrysaetos	Golden eagle	Arizona: SGCN BLM: Sensitive	Open areas, plains, and mountains throughout North America. Nests in mountains of western Arizona.
Toxostoma lecontei	Le Conte's thrasher	Arizona: SGCN BLM: Sensitive	Flat desert areas with sparse vegetation, especially saltbush flats.
Melospiza lincolnii	Lincoln's sparrow	Arizona: SGCN	Winters in the southern United States in brushes and weedy habitats. Within Project area, restricted to Colorado River and possibly along large xeroriparian washes.

SPECIES	COMMON NAME	STATUS DESIGNATION (ARIZONA/ BLM)[2]	HABITAT
Charadrius montanus	Mountain plover	Arizona: SGCN	Winters in semiarid plains and flats in the southwestern United States. Uncommon or rare along lower Colorado River.
Circus cyaneus	Northern harrier	Arizona: SGCN	Marshes, fields, and open areas.
Falco peregrinus anatum	Peregrine falcon	Arizona: SGCN	Open country and cliffs. Sometimes inhabits urban areas. Uncommon resident in southwestern Arizona.
Pandion haliaetus	Osprey	Arizona: SGCN	Open coastlines, rivers, and lakes throughout western United States. Only riparian habitat near the Project area is along and near Colorado River, although infrequently seen away from water.
Passerculus sandwichensis	Savannah sparrow	Arizona: SGCN	Associated with open plains and meadows. Uncommon in Arizona along lower Colorado River.
Egretta thula	Snowy egret	Arizona: SGCN	Marshes, tidal flats, and ponds throughout the Americas.
Anthus spragueii	Sprague's pipit	Arizona: SGCN	Grasslands, pastures, and cultivated fields with dense, low vegetation. Rare in cultivated fields along lower Colorado River.
Tyrannus crassirostris	Thick-billed kingbird	Arizona: SGCN	Breeds in southeastern Arizona in riparian gallery forests. Rare in winter along Colorado River.
Athene cunicularia hypugaea	Western burrowing owl	Arizona: SGCN BLM: Sensitive	Utilizes burrows made by mammals in arid regions and deserts. Within Project area, likely to be common only near agricultural areas and along and near Colorado River.
Aix sponsa	Wood duck	Arizona: SGCN	Wooded areas of rivers and ponds. Uncommon in winter along the lower Colorado River.

[1] From Table 3.4-9 of the Draft EIS.
[2] SGCN = Species of Greatest Conservation Need.

TABLE F3-4-3 SPECIAL STATUS BIRD SPECIES (NOT INCLUDING FEDERAL ESA-LISTED SPECIES) THAT COULD OCCUR WITHIN OR NEAR THE PROJECT AREA IN CALIFORNIA[1]

SPECIES	COMMON NAME	STATUS DESIGNATION (CALIFORNIA/ BLM)[2]	HABITAT
Vireo bellii arizonae	Arizona bell's vireo	California: Endangered BLM: Sensitive	Dense shrub vegetation in riparian areas, fields, woodlands, scrub oak, chaparral near water in arid regions. Could occur uncommonly within or near Project area.
Haliaeetus leucocephalus	Bald eagle	California: Endangered BLM: Sensitive	Coasts, rivers, and large lakes. Open country and mountains during migration. Migrant and winter resident along lower Colorado River.
Toxostoma bendirei	Bendire's thrasher	California: SSC BLM: Sensitive BLM: Focus Species	Rare or uncommon during summer, dry and semi-arid washes and other areas containing shrubs, trees, and especially yucca. Unlikely to occur in Project area.

SPECIES	COMMON NAME	STATUS DESIGNATION (CALIFORNIA/ BLM)[2]	HABITAT
Athene cunicularia	Burrowing owl	California: SSC BLM: Sensitive BLM: Focus Species	Open grasslands, savannas and plains. Occasionally in vacant lots. This species has been detected within the Project area.
Laterallus jamaicensis coturniculus	California black rail	California: Threatened BLM: Focus Species	Marshlands and very wet meadows. Rarely seen away from dense reeds, rushes, cordgrass, cattails and other emergent vegetation. Within Project area, restricted to Colorado River.
Toxostoma crissale	Crissal thrasher	California: SSC	Microphyll woodland and riparian washes, mesquite woodlands, other dense scrub vegetation. Uncommon year-round resident in region.
Micrathene whitneyi	Elf owl	California: Endangered BLM: Sensitive	Riparian forests, desert, woodlands. No suitable habitat along California route segments, but could be present uncommonly in the surrounding area.
Melanerpes uropygialis	Gila woodpecker	California: Endangered BLM: Sensitive BLM: Focus Species	Arid lowland scrub, second-growth and montane scrub, deciduous forests, riparian woodlands. There is very little or no habitat for this species in the Project area.
Colaptes chrysoides	Gilded flicker	California: Endangered BLM: Sensitive	Saguaro cactus or Joshua tree stands, riparian areas lined with cottonwood and willows in desert lowlands and foothills. There is very little or no habitat for this species in the Project area.
Aquila chrysaetos	Golden eagle	California: Fully Protected Eagle Protection Act BLM: Sensitive BLM: Focus Species	Open areas, plains, and mountains throughout North America. This species is not known to nest or forage in the vicinity of the Project area in California, and the Palo Verde Mesa offers low prey availability.
Grus canadensis tabida	Greater sandhill crane	California: Threatened BLM: Sensitive	Overwinters in agricultural fields and irrigated pastures and nearby shallow-water wetlands for roosting. Sandhill cranes, including possibly this subspecies, have been observed uncommonly in agricultural fields near Blythe.
Toxostoma lecontei	Le Conte's thrasher	California: SSC	Vegetated washes and desert scrub with saltbush, shadscale, cholla cacti, or other species suitable for nesting. This species has been detected within or near the Project area.
Asio otus	Long-eared owl	California: SSC	Uncommon to rare year-round resident in riparian and desert woodlands throughout deserts of southern California. There are no stands or riparian trees or large desert woodlands within the Project area that would be suitable habitat for this species.

SPECIES	COMMON NAME	STATUS DESIGNATION (CALIFORNIA/ BLM)[2]	HABITAT
Lanius ludovicianus	Loggerhead shrike	California: SSC	Year-round resident in open habitats with scattered shrubs, trees, posts, fences, utility lines, or other perches. This species has been detected in or near the Project area.
Charadrius montanus	Mountain plover	California: SSC BLM Sensitive	Winters in and near cultivated fields along lower Colorado River. Could occur uncommonly within and near cultivated fields.
Circus cyaneus	Northern harrier	California: SSC	Grasslands, flat areas, and hills with open habitat. This species has been detected within or near the Project area.
Asio flammeus	Short-eared owl	California: SSC	Rare in open areas, fields, and wetlands. Unlikely to occur in Project area.
Setophaga petechia sonorana	Sonora yellow warbler	California: SSC	Cottonwood, willow, and salt cedar riparian woodlands. Limited habitat within the Project area.
Piranga rubra	Summer tanager	California: SSC	Summer resident in mature cottonwood riparian woodlands along Colorado River. Limited or no habitat within and near Project area.
Buteo swainsoni	Swainson's hawk	California: Threatened BLM: Sensitive BLM: Focus Species	Plains and hills with open vegetation. This species is not expected to nest within or near the Project area.
Pyrocephalus rubinus	Vermilion flycatcher	California: SSC	Cropland, cultivated lands, desert, shrubland, riparian woodlands near water. Could occur uncommonly near cultivated fields.
Icteria virens	Yellow-breasted chat	California: SSC	Summer resident in dense, early successional riparian woodlands and thickets with willows, salt cedar, vine tangles, and dense brush with well-developed understories and some overstory for perches.
Xanthocephalus xanthocephalus	Yellow-headed blackbird	California: SSC	Freshwater wetlands with open water and dense, emergent vegetation. Foraging in fields and open cultivated areas. Could occur uncommonly along Colorado river and among agricultural fields.

[1] Adapted from Table 3.4-14 of the Draft EIS.
[2] BLM = Bureau of Land Management; FP = Fully Protected; SSC = Species of Special Concern; BLM Focus species as designated under the DRECP LUPA.

TABLE F3-4-4 SPECIAL STATUS BAT SPECIES (NOT INCLUDING FEDERAL ESA-LISTED SPECIES) THAT COULD OCCUR WITHIN OR NEAR THE PROJECT AREA IN ARIZONA[1]

SPECIES	COMMON NAME	STATUS DESIGNATION (ARIZONA/ BLM)[2]	HABITAT
Idionycteris phyllotis	Allen's (Mexican) big-eared bat	Arizona: SGCN BLM: Sensitive	Forested areas above 3,000 feet.

SPECIES	COMMON NAME	STATUS DESIGNATION (ARIZONA/ BLM)[2]	HABITAT
Myotis occultus	Arizona myotis	Arizona: SGCN	In southwestern Arizona, they are found along the lower Colorado River.
Nyctinomops macrotis	Big free-tailed bat	Arizona: SGCN	Arid lowlands and hills to 6,000 feet (1,800 meters). Roosts in crevices, buildings, and sometimes trees.
Macrotus californicus	California leaf-nosed bat	Arizona: SGCN BLM: Sensitive	Mostly found in the Sonoran desert scrub; summer and winter range the same; primarily roost in mines, caves, and rock shelters.
Myotis californicus	California myotis	Arizona: SGCN	Semi-arid and grassland areas of the southwestern United States. Roosts in caves, mines, crevices, and shrubs.
Myotis velifer	Cave myotis	Arizona: SGCN BLM: Sensitive	Desert scrub of creosote, brittlebush, palo verde, and cacti. Roost in caves, tunnels, and mineshafts, and under bridges, and sometimes in buildings within a few miles of water.

[1] From Table 3.4-9 of the Draft EIS.
[2] BLM = Bureau of Land Management; SGCN = Species of Greatest Conservation Need.

TABLE F3-4-5 SPECIAL STATUS BAT SPECIES (NOT INCLUDING FEDERAL ESA-LISTED SPECIES) THAT COULD OCCUR WITHIN OR NEAR THE PROJECT AREA IN CALIFORNIA[1]

SPECIES	COMMON NAME	STATUS DESIGNATION (CALIFORNIA/ BLM)[2]	HABITAT
Myotis occultus	Arizona myotis	California: SSC	Ponderosa pine and oak-pine woodland near water and wooded riparian areas in desert areas.
Macrotus californicus	California leaf-nosed bat	California: SSC BLM: Sensitive	Lowland desert scrub roosting in caves, abandoned mine tunnels and rock shelters in canyon walls.
Myotis velifer	Cave myotis	California: SSC BLM: Sensitive	Evergreen or pine-oak forest and pine forest at mid-high elevations and riparian habitats near desert scrub at lower elevations.
Antrozous pallidus	Pallid bat	California: SSC BLM: Sensitive	Deserts and grasslands, mostly near rocky outcrops and water. Roosts in rock crevices.
Nyctinomops femorosaccus	Pocketed free-tailed bat	California: SSC	Rocky canyons with outcroppings and high cliffs. Roosts in rock crevices and caves. Observed near shrubland, mixed tropical deciduous forest, and floodplains with sycamore and mesquite with nearby high cliffs.
Corynorhinus townsendii	Townsend's big-eared bat	California: SSC BLM: Sensitive	Near the entrance of caves, mine tunnels, and other well-ventilated areas. Night roosts can include caves as well as buildings and tree cavities. Potential foraging habitat exists along the Colorado River and in adjacent agricultural fields, and it is likely that this species is present in the area at least occasionally.
Lasiurus xanthinus	Western yellow bat	California: SSC	Roosts in trees, including woodland and riparian habitat.
Myotis yumanensis	Yuma myotis	BLM: Sensitive	Riparian, desert scrub, moist woodlands, and forests.

[1] From Table 3.4-14 of the Draft EIS.
[2] BLM = Bureau of Land Management; SSC = Species of Special Concern.

5 APP/BBCS Plan Implementation

5.1 Training

All construction and maintenance workers would be required to participate in a WEAP, prior to beginning work on the Project. DCRT will have a qualified biologist (approved by the California Public Utilities Commission [CPUC]) develop the program prior to the start of construction and submit the program to CPUC for review and approval prior to implementation. The WEAP will be prepared in accordance with APM/BMP BIO-01 and MM BIO-CEQA-2. The WEAP will be implemented throughout the duration of Project related construction activities, including Operation and Maintenance (O&M) phases. The WEAP will include the following items:

- Maps showing exclusion areas and other construction limitations. Each exclusion area may be implemented to protect specific resources, such as listed and/or special status wildlife, populations of listed and rare plants and sensitive vegetation communities, riparian habitats, seasonal depressions and known water bodies, and wetland habitat. To further protect sensitive resources, specific resources will not be identified with specific areas on the maps available to construction personnel.
- A discussion of measures to be implemented for avoidance of sensitive resources discussed in the EIS (including this appendix) and the identification of an onsite contact in the event of the discovery of sensitive species on the site; this will include a discussion on micro trash.
- Training materials and briefings will include but not be limited to: a discussion of the federal and state ESAs; the BGEPA; the MBTA; the Avian Power Line Interaction Committee (APLIC) Guidelines; the consequences of non-compliance with these regulations; identification and values of plant and wildlife species and significant natural plant community habitats; hazardous substance spill prevention and containment measures; a contact person and phone number in the event of the discovery of dead or injured wildlife; and a review of mitigation requirements.
- Protocols to be followed when road kill or injured animals are encountered in the work area or along access roads and the identification of an onsite representative to whom the road kill will be reported. Road kill or injuries will be reported to the appropriate local animal control agency and CPUC within 24 hours. Road kill or injuries of special status species will also be reported to the CDFW and USFWS (for federally-listed species) within 24 hours or as otherwise required by the Project's regulatory permits. See Section 5.6 for more information on protocols for killed or injured wildlife.
- Literature and photographs or illustrations of potentially occurring special status plant and/or wildlife species will be provided to all Project contractors and heavy equipment operators.
- A special hardhat sticker will be issued to all personnel completing the training, which will be carried with the trained personnel at all times while on the Project site.
- All new personnel will receive this training prior to beginning work. A log of all personnel who have completed the WEAP training will be kept on site.
- A copy of the WEAP will be kept at an easily accessible location within the Project site (e.g., foreman's vehicle, construction trailer) for the duration of the Project.

- A standalone version of the WEAP will be developed, that covers all previously discussed items above, and that can be used as a reference for maintenance personnel during Project operations.
- DCRT will ensure the interpretation of the WEAP is available for all non-English-speaking workers.

5.2 Public Awareness

The Project is undergoing the full National Environmental Policy Act process, including public review and comment for the EIS. This draft APP/BBCS incorporates review and input from several stakeholders, including, but not limited to BLM, USFWS, and AZGFD, and is being issued with the Final EIS to be publicly available. The final APP/BBCS issued with the Final POD prior to Notice to Proceed will be reviewed and approved by the appropriate federal and state agencies (including BLM, USFWS, AZGFD, CDFW, and CPUC) and will be made available to the public.

5.3 Construction Design Standards

Construction design plays an integral role in avoiding and minimizing avian and bat risk. Section 3 and Attachment 1 list and summarize avoidance and minimization measures contained within the Final EIS and DRECP LUPA anticipated to reduce impacts to birds and bats. All aspects of the Project were designed to meet APLIC (2006 and 2012) recommendations for minimizing electrocution and collision risk for birds and bats. Some specific engineering design features associated with this Project that will avoid and minimize risks to birds and bats include:

- The transmission line will parallel an existing transmission line (Devers-Palo Verde 1) for much of its length, including the Colorado River Crossing and adjacent agricultural lands.
- At the Colorado River Crossing, the Project will match spans and conductor height with the existing line to the greatest extent practicable.
- Conductor bundles for all structure types except the proposed monopoles would be installed horizontal to one another (at the same height on the structure), and the two ground wires would be horizontal to one another, approximately 30 feet above the conductors.
- Use of flight diverters and guy markers in key areas as described in Section 5.5.

5.4 Electrocution

Avian electrocution can occur when a bird simultaneously contacts electrical equipment, either phase to phase or phase to ground, such as when perching on a structure with insufficient clearance between the conductor phases or conductors and a grounded surface. The separation between energized and/or grounded parts influences the electrocution risk of the structure. To prevent electrocution of eagles, which are the largest bird species likely to frequent the Project area, APLIC recommends horizontal separation of 60 inches and vertical separation of 40 inches, plus 0.2 inch for every kilovolt over 60 kV. For a 500 kV line, the resulting recommended separation distances are 148 inches horizontal and 128

inches vertical phase to phase separation, and 106 inches horizontal and 86 inches vertical phase to ground separation. Because transmission lines require larger separation distances between energized/grounded parts for electrical engineering reasons, transmission lines generally do not cause avian electrocutions (APLIC 2006). The proposed Project transmission line conductor spacing is approximately 34 feet of horizontal spacing between each conductor bundle and the static wire and OPGW would be approximately 30 feet above the phase conductors at the top of the structures. Thus, spacing will greatly exceed the necessary avian-safe separation distances. Structure diagrams are provided in the Draft POD in Figures 3-1 to 3-5.

Avian electrocutions typically occur on power lines with voltages less than 60 kV (APLIC 2006). The Project will require construction of a new 3.13-mile long 12 kV line, to support a SCS, which poses an inherent electrocution risk to birds. APLIC (2006) provides avian-safe design recommendations specific to various structure designs and conductor configurations. The powerline will be constructed according to APLIC (2006) standards, to minimize electrocution risk to birds. A pole diagram can be found in the Volume I, Draft POD, Figure 3-16.

5.5 Collisions

Bird collisions with overhead wires often involve less maneuverable species such as pelicans or species with high wing-loading that fly at high speeds and low altitudes such as ducks and rails, though collisions have been documented for a wide variety of species including songbirds (APLIC 2006 and 2012; BLM 2019). Other factors that influence the likelihood of collisions with transmission lines include the habitat type where lines are located, and environmental characteristics (e.g., visibility, weather, time of day). Collisions are more likely to occur in areas with high concentrations of birds in close proximity to transmission lines (APLIC 2006 and 2012). Waterfowl and other aquatic birds, including ducks, geese, swans, cranes, and shorebirds, appear to be most susceptible to collisions when transmission lines are located near wetlands (Erickson et al. 2005; Faanes 1987). Line-related factors influencing collision risk include the configuration and location of the line and line placement with respect to other structures or topographic features. Collisions often occur with the overhead shield (ground) wire, which is smaller diameter and less visible than the primary conductors (APLIC and USFWS 2005).

The height that birds fly is an important factor for evaluating a transmission line's avian collision potential. Birds usually migrate at elevations above the height of most transmission lines. Birds migrating at night have been recorded to typically fly from 800 to 3,700 feet above the ground (APLIC 2012). However, inclement weather may result in significant reductions in flight heights and birds can be detected migrating within several feet above the ground (APLIC 2012; Manville 2016). Birds may also collide with and/or get caught on fencing, particularly unmarked low visibility wire fencing (Koenings 2004; AZGFD 2018).

Although mortality near wind turbines is recorded far more often than collisions with stationary objects, bats have been found incidentally in bird mortality searches in both transmission and distribution powerline corridors (Manville 2016). While the recommendations from APLIC (2012) have been primarily focused on avoiding and minimizing impacts to birds, the recommendations and best practices may also benefit bats.

Measures to minimize collision risk include collocating lines with existing lines, horizontal line configurations, and marking of ground wires and guy lines (APLIC 2012).

The thickness of the 500 kV conductor bundles will render them fairly visible and a relatively low risk for avian collisions during most conditions (nocturnal migrants flying low due to inclement weather may be an exception). However, the two thinner ground wires and guy lines (at guyed V-structures) pose a significant collision risk. The greatest potential collision risks associated with the Project, will be at the Colorado River crossing and near streams and washes.

According to the Biological Assessment, 228 carcasses of birds were documented from 72 species, during 16 months of monitoring at the nearby Devers to Palo Verde 2 transmission line. Of 93 observations where cause of death could be determined, six were attributed to electrocution, and 68 were attributed to collision. At least one willow flycatcher (subspecies unknown) and one clapper rail (subspecies not specified) were found under the transmission line. The willow flycatcher carcass was found during construction (prior to wire stringing) and cause of death could not be determined. The cause of death of the rail was listed as collision with the transmission line (BLM 2019).

Several Project design measures will avoid and minimize collision risk. The transmission line will parallel an existing transmission line (Devers-Palo Verde) for much of its length, including the Colorado River crossing, including adjacent agricultural lands. At the Colorado River crossing, the Project will match spans and conductor height with the existing line to the greatest extent practicable. Conductor bundles for all structure types except the proposed monopoles would be installed horizontal to one another (at the same height on the structure), and the two ground wires would be horizontal to one another, approximately 30 feet above the conductors. Bird flight diverters will also be employed as described in the following section.

5.5.1 Bird Flight Diverters

Bird flight diverters (visibility markers) are commercially available products to increase the visibility of overhead wires to birds and have been used for decades to successfully reduce the incidence of bird collisions (APLIC 2012). A variety of flight diverter products are available from several different manufacturers, such as P&R Technologies, Power Line Sentry, and Preformed Line Products. Potential options include reflective or glow in the dark markers to render the lines visible to night migrants, including most songbirds. EDM International, Inc. (2019) evaluated 15 available bird strike avoidance technologies for DCRT and recommended the use of P&R Technologies' FireFly Bird Diverter in areas of low wind and the Firefly HW in areas where winds regularly exceed 20 miles per hour. The Firefly is an active device with a swiveling plate, that sways or spins in light winds (three miles per hour) to increase visibility. The rectangular plate is covered with reflective and fluorescent marking tape for daytime and nighttime visibility. The luminescent material emits visible light for up to 12 hours after dusk, and in low light or fog conditions. The Firefly HW has a non-swiveling plate, to decrease wear in high wind areas.

Guyed-V structures are proposed to be used in areas that do not parallel the existing Devers to Palo Verde transmission line, including in California. Permanent guy guards/markers will be installed on guy wires for the guyed-V structures where required, such as on BLM land in California and in areas used for recreation. CMA LUPA-BIO-16 states that "where the use of guy wires is unavoidable, [the proponent will] demarcate guywires using the best available methods to minimize avian species strikes." BMP-REC-03 requires guy wires to be marked in areas used for recreation. The Project's ground wires and any other static wires will be marked with visibility markers at the crossing of the Colorado River and its floodplain (APM/BMP BIO-21). The specific type(s) of flight diverter selected will be subject to approval by BLM, in coordination with USFWS, AZGFD, and CDFW as appropriate.

5.5.1.1 Additional Measures for California Only

In addition to the measures described above, within California the transmission line will be marked with flight diverters within 1,000 feet of all stream and wash channels, canals, ponds, and any other natural or artificial body of water (APM/BMP BIO-48). On BLM land in California, all guy wires will be demarcated using the best available methods to minimize avian species strikes (CMA LUPA-BIO-16). The specific type(s) of flight diverter and guy wire markers selected will be subject to approval by BLM, in coordination with USFWS and CDFW.

5.5.2 Bird and Bat Friendly Fencing

All substation activities will occur within the existing substation fences, but approximately 1,000 feet of new fence will be constructed around the 1.5-acre SCS. The SCS perimeter fence will be a seven-foot-high chain-link fence with steel posts. One foot of barbed wire will be installed at the top of the chain-link, yielding a total height of eight feet. Additionally, some staging areas would be temporarily fenced during construction. Temporary fencing may be employed in areas of active construction activities, or where required for employee or public safety. Exclusion fencing may be installed to protect sensitive habitat from disturbance.

To minimize potential bird collisions with Project fencing, all newly constructed fences will utilize high visibility fencing or will be marked to increase visibility of the top wire (APM/BMP BIO-39). One recommended marking method is to install sections of PVC (polyvinyl Chloride) or HDPE (high-density polyethylene) pipe around the top wire at regular intervals (Koenings 2004; AZGFD 2018). A slot can be cut down the length of the pipe or conduit, and then sleeved over the wire. Fencing can also be made more visible to birds by attaching reflective or colorful weather-resistant flagging materials (e.g., aluminum or plastic strips) to the top wire. COR Enterprises and Pexco are two companies that manufacture vinyl fence markers, that may be easily hung from the top wire of barbed-wire fences at three-foot intervals to increase visibility without covering up the barbs (which in some circumstances may be important to maintain the fences effectiveness). Natural Resources Conservation Services (NRCS) may be contacted for recommendations on manufacturers of fence markers (NRCS 2012; Sage Grouse Initiative 2014). NRCS also provides directions for creating homemade fence markers using vinyl undersill trim and optionally adding reflective tape to increase visibility at night (NRCS 2012). BLM regularly makes and uses these in sage-grouse habitat (Personal communication, C. Fletcher, via April 2019 APP/BBCS draft review comment).

5.5.3 Lighting

In conformance with APM/BMP BIO-33 and APM/BMP AES-15, any nighttime lighting necessary to provide safe working conditions will be temporary and set up to limit light spillover outside of the construction area. Lighting will be directed and shielded downward to avoid interference with the navigation of night-migrating birds and to minimize the attraction of insects as well as insectivorous birds and bats to project infrastructure. If applicable, lighting will also be directed away from riparian and wetland vegetation, occupied habitat, and suitable habitat areas for sensitive species. Long-term nighttime lighting installed at the SCS to facilitate maintenance and repairs under emergency conditions during night time hours, will not be constant-burn lighting and will only be turned on during use.

5.6 Collision and Electrocution Fatality Monitoring

5.6.1 Construction Monitoring

Biological construction monitoring will be implemented per APM/BMP BIO-2 and MM BIO-CEQA-3. A qualified biological monitor will be present on the Project site during all work activities within habitat of special status animal species. Multiple biological monitors will be provided so any work site within habitat of special status species is monitored concurrently if needed.

The biological monitors will be approved by BLM, in consultation with USFWS and relevant state agencies (AZGFD, CDFW, CPUC), prior to construction monitoring. Resumes have been and will be provided to BLM for approvals. The biologist(s) must be knowledgeable with the life history and habitat requirements of federal- and state-listed and special status birds and bats. The qualified biologist(s) will conduct clearance surveys for listed and special status species prior to the start of construction activities each work day during initial site disturbance; clearance surveys will be conducted on a weekly basis thereafter. Locations of listed and/or special status wildlife will be flagged for avoidance and appropriate avoidance buffers established as described in MM WIL-CEQA-1 through MM WIL-CEQA-11. Results of all monitoring will be recorded on daily site observation reports and include details about the construction activities. The daily monitoring reports shall be compiled and submitted to the CPUC, BLM, CDFW, AZGFD, and USFWS for review on a weekly basis. Contents of the reports shall include at a minimum the date, time of monitoring, location, qualified biologists name, construction activities, biological conditions and species detections, and any issues encountered during the monitoring effort.

The monitors will not handle any special status bird or bat species, unless dead or injured animals are encountered. Special purpose utility permits to collect injured or dead birds and bats will be obtained from USFWS, AZGFD, and CDFW, and all conditions of the permits will be adhered to. If dead or injured special status wildlife species are detected on the construction site, the qualified biological monitor shall, immediately upon finding the remains or injured animal, coordinate with the onsite construction foreman to discuss the events that caused the mortality or injury, if known, and implement measures to prevent future incidents. The BLM Authorized Officer will be immediately notified of the injury or fatality via email. Details of the incident and prevention measures will be included within a separate monitoring incident report. If appropriate and consistent with USFWS, AZGFD, and CDFW permits, remains of dead animals shall be collected and frozen as soon as possible, and CDFW, AZGFD and USFWS, as well as all other appropriate federal and state regulatory agencies, shall be contacted regarding ultimate disposal of the remains. The incident report shall be sent to the CPUC, CDFW, AZGFD and USFWS, as well as any other appropriate Federal and State agencies, within five calendar days. The construction biological monitoring report will at a minimum include: the date, time of the finding or incident (if known), and location of the carcass, injured animal or other impacted species, and the circumstances of its death or injury (if known). Injured animals shall be taken immediately to the nearest appropriate veterinary or wildlife rehabilitation facility. The contact information for several wildlife rehabilitation facilities are provided in Section 5.9 Contact List.

5.6.2 Avian Reporting System During Operation and Maintenance

To comply with BMP BIO-21, CMA LUPA-BIO-16, and CMA LUPA-BIO-17, DCRT will maintain records of all avian and bat mortalities or injuries detected incidentally within the Ten West transmission line ROW during standard O&M activities. DCRT will report all avian

and bat mortalities or injuries observed within the Project ROW to the USFWS. To report injuries, DCRT will contact Meghan_Sadlowski@fws.gov to set up an account to enter injury and mortality data in the USFWS Injury and Mortality Reporting system. If an eagle or threatened/endangered species is found, DCRT will notify the USFWS, AZGFD, and/or the CDFW within 24 hours of the discovery and identification.

Through the avian reporting system, dead or injured bird or bat records can indicate specific problem areas where more detailed analysis is necessary. DCRT will investigate problem areas to determine whether corrective measures are appropriate. Agency coordination will be initiated as needed.

5.6.3 Preconstruction Bird and Bat Surveys to Determine Compensatory Mitigation

MM BIO-01 and CMA LUPA-BIO-COMP-2 prescribe that a Compensation Plan be completed that describes procedures for calculating a compensatory mitigation fee to be assessed for mortality impacts to bird and bat Focus and BLM special status species. The Draft Compensatory Mitigation Plan may be found in Volume III, Appendix B-3 of the POD. In practice, it is likely that most or all fatalities will be common, non-special status bird or bat species, rather than Focus and BLM special status species. Monitoring and avoidance of nesting birds is anticipated to prevent project-related mortality of eggs or nestling young during construction.

The most accurate way to estimate the amount of mortality overall to birds and bats would be with construction monitoring to identify nest failures caused by the Project (if any) and post construction fatality monitoring to identify collision or electrocution mortality (as described in Section 5.6). CMA LUPA-BIO-COMP-2, which only applies in California, states that “the initial compensation fee for bird and bat mortality impacts will be based on pre-project monitoring of bird use and estimated bird and bat species mortality from the activity” and that the fee would be reassessed every five years based on results of post construction bird and bat fatality monitoring.

Preconstruction surveys described in this draft APP/BBCS include: nest searching and monitoring for all protected birds (see Section 6.2); nest surveys specifically for golden eagles and other raptors (see Sections 5.8.2 and 6.2); species-specific surveys for burrowing owls (see Section 8); roost surveys for bats (see Section 9.1.1); presence/absence surveys for yellow-billed cuckoo, southwestern willow flycatcher, and Arizona Bell’s vireo (see Section 5.8.1); and presence/absence surveys for Yuma Ridgway’s rail if suitable habitat is present (see Section 5.8.3). If, through further conversations with BLM, it is deemed necessary to acquire more preconstruction data for implementation of MM BIO-01 and CMA LUPA-BIO-COMP-2, additional surveys may include one or more of the following: bat acoustical monitoring (USFWS 2012), avian point count surveys (USFWS 2012), and visual flight surveys for raptors, waterfowl, and other large birds (APLIC 1994; USFWS 2012 and 2013). Visual flight surveys (which include frequency, flight time, and flight height relative to the infrastructure posing collision risk) have the most potential for explicitly predicting collision fatalities; however, current research and modeling procedures that successfully predict collision fatalities based on preconstruction data are lacking, other than perhaps for golden eagle-wind turbine collisions (USFWS 2013).

5.6.4 Standardized Fatality Monitoring Program

To comply with APM/BMP BIO-21, CMA LUPA-BIO-16, and CMA LUPA-BIO-17, in addition to the Avian Reporting System described above, standardized monitoring and analysis will

be conducted as described in this section, or as revised through discussions with the appropriate agencies (BLM, CDFW, AZGFD, USFWS, and/or CPUC). Protocols implemented to monitor Project bird and bat fatalities will be consistent with USFWS (2012) and APLIC (2012) guidance. APLIC (2012) provides general guidance for implementation of standardized monitoring under power lines. USFWS (2012) provides more specific guidance that, while written with wind-energy generation facilities in mind, is consistent with the APLIC (2012) guidance and could be equally well applied to monitoring of power line fatalities. USFWS recommends the following:

- Post construction surveys should initially be performed for one or two years. Additional years of survey should be performed if indicated by results of the initial post construction surveys.
- Surveys should be conducted during all seasons.
- Survey transects should occur at an interval of 3 to 10 meters apart.
- Search protocol should be standardized to the greatest extent possible to facilitate analysis of fatality estimates.
- During searches, actual fatalities are incompletely observed, so carcass counts must be adjusted by some factor that accounts for searcher detection rates (efficiency) and removal of carcasses by scavengers.

The primary objective of the post construction avian and bat fatality monitoring for the Ten West Link will be to estimate the annual number of avian and bat fatalities attributable to the Project's transmission line. Survey of the associated 12 kV distribution line is not proposed. The results will also be used to identify problem areas where additional avoidance measures may be appropriate (e.g., line marking). Standardized fatality monitoring will be conducted at approximately one-month intervals for two years. Approximately 30 percent of the transmission line will be surveyed. To make the survey area as representative as possible of the entire transmission line, the transmission line area will be stratified by habitat type, and type of line marking. Approximately 30 percent of each strata will be surveyed.

During the monthly surveys, within each surveyed section of ROW, an observer will search for carcasses along parallel transects, spaced approximately 10 meters apart. Five transects will be searched. For each area surveyed, observers will record date, location, start and end times of survey, observer name(s), and number of carcasses found. For each carcass that is found during surveys, additional data will be recorded: species, sex, age, geographic coordinates of the carcass (recorded via Global Positioning System), habitat type, and condition of carcass. Photographic documentation of each carcass will be collected. A qualified avian and/or bat biologist, as appropriate, will determine/confirm species, age, and sex of each carcass (as allowed by carcass condition) using physical or photographic evidence collected by the field surveyors. If physically collected, carcasses will be placed in a plastic bag, labeled, and provided to the agencies as necessary. Collection of carcasses will be coordinated with the USFWS, CDFW, and AZGFD, and appropriate collection permits will be obtained from the CDFW, AZGFD, and the USFWS. Carcasses found in non-search areas will be treated as incidental discoveries. Incidental fatalities will be reported on an annual basis and the cause of death will be documented to the extent possible.

During carcass searches, actual fatalities are incompletely observed due to removal of some carcasses by scavengers and imperfect detection by surveyors. Therefore, USFWS (2012) and APLIC (2012) recommend adjusting carcass counts by correction factors that account for searcher detection rates (efficiency) and removal of carcasses by scavengers. To estimate the appropriate correction factors, searcher efficiency trials and carcass removal

trials will be conducted as recommended by USFWS (2012) and APLIC (2012). Searcher efficiency trials and carcass removal trials will be conducted in carcass search plots concurrent with carcass searches. Searcher efficiency and carcass removal will be estimated for carcasses within each of two size classes for avian species (small and large birds) and an additional class for bats, during each of the four seasons (winter, spring, summer, fall). During each season, approximately 10 carcasses of small birds, 10 carcasses of large birds, and 10 carcasses of bats (or mice as surrogates) will be distributed at random points within search plots. This should be sufficient to provide one estimate of searcher efficiency for each size class and season. Carcasses of non-native species such as house sparrows, coturnix quail, and European starlings will be used to represent small-sized birds, and species such as rock pigeons and chickens to represent large-sized birds. Trials will be conducted twice per season (eight times per year). To estimate detection of bats, bat carcasses will be used if available; otherwise mouse carcasses will be used. Trial carcasses will be placed at random locations within areas being searched prior to the carcass search (on the same day, if feasible). Personnel conducting the searches will not know the location of the trial carcasses. The number and location of the trial carcasses found during the carcass search will be recorded. The same trial carcasses will be left on the landscape and periodically checked to assess scavenger removal rates. Exact timing of carcass checks will depend on logistics, but carcasses will be checked approximately two to three times the first week, once each of the next few weeks and once more at approximately six weeks.

Statistical analysis will be conducted using methods and software developed for analyzing collision fatality data (e.g., Huso et al. 2015; USGS 2018a and 2018b). Unbiased estimates of fatalities will be derived from three components: 1) number of carcasses found during searches; 2) searcher efficiency expressed as the proportion of planted carcasses found by searchers; and 3) removal rates to estimate the proportion of fatalities that remain long enough to be available for detection by the searchers. Following completion of each full year of monitoring, DCRT will produce an annual report communicating all bird and bat fatalities observed, unbiased overall bird and bat fatality estimates, species-specific fatality estimates, and an assessment of whether fatalities vary in relation to site characteristics within the Project area. DCRT will provide the report to the appropriate agencies. The results will be used to assess risk, identify areas and issues of particular concern, and if problem areas are identified, inform decisions about additional avoidance measures as described below in Section 5.6.5. The results will also be used to calculate compensatory mitigation requirements, as prescribed by MM BIO-01 and described in the Compensatory Mitigation Plan (Volume III of the POD, Appendix B-3).

5.6.5 Adaptive Management: Mortality Reduction and Avian Enhancement.

If the results of post construction fatality monitoring (described above in Section 5.6.2 and Section 5.6.4), indicate problem areas for collision or electrocution fatalities for birds or bats, DCRT will confer with the appropriate state and federal agencies (USFWS, BLM, CPUC, CDFW, and AZGFD) regarding potential implementation of additional avoidance, minimization, or mitigation measures. The specific measure(s) chosen would depend on the nature, extent, and location of the problem area(s). Potential measures may include mortality reduction measures such as adding or replacing flight diverters, guy markers, or fence markers, retrofitting infrastructure to decrease electrocution risk, or offsite avian enhancement such as installing nest platforms

5.6.6 Compensatory Mitigation

In conformance with MM-BIO-01, a Compensation Plan is being prepared (POD Appendix B-3). The Compensation Plan will include calculations of compensation ratios and mitigation acreages for loss of habitat for any biological resources requiring additional mitigation. CMA LUPA-BIO-COMP-2 states that compensation will be paid for mortality impacts to bird and bat Focus and BLM special status species from activities in California, and a fee re-assessed every five years to fund compensatory mitigation. Section 5.6.4 of this APP/BBCS describes the Project's post construction fatality monitoring protocol. In practice, it is likely that most or all fatalities will be common, non-special status species. Monitoring and avoidance of nesting birds is anticipated to prevent mortality to eggs or nestling birds during construction.

5.7 Nest Management

Nest management will include two components:

- Monitoring and protection of breeding birds and their active nests (APM/BMP BIO-20, MM WIL-CEQA-6, APM/BMP BIO-29, and MM WIL-CEQA-1) is covered in depth in Section 6.
- Management of inactive nests (APM/BMP BIO-29) is covered in Section 7.

5.8 Special Status Species Monitoring and Avoidance

Monitoring and avoidance for special status bird and bat species will be implemented in compliance with the Final EIS avoidance and minimization measures, including:

- Within Arizona and California: APM/BMP BIO-02 and BIO-25.
- Within California only: MM WIL-CEQA-3, MM WIL-CEQA-8, BIO-40, MM WIL-CEQA-4, MM WIL-CEQA-5, BIO-45, LUPA BIO-IFS-12, LUPA BIO-IFS-13, LUPA BIO-IFS-14, LUPA BIO-IFS-24, LUPA BIO-IFS-25, LUPA BIO-IFS-26, LUPA BIO-IFS-27, LUPA BIO-IFS-28, LUPA BIO-IFS-29, LUPA BIO-IFS-30, and LUPA BIO-IFS-31.

5.8.1 Southwestern Willow Flycatcher and Arizona Bell's Vireo

MM WIL-CEQA-8 prescribes preconstruction surveys for southwestern willow flycatcher and Arizona Bell's vireo within the California portion of the Project area. However, there does not appear to be any potential nesting habitat for southwestern willow flycatcher or Arizona Bell's vireo near proposed Project activities in California. Within Arizona, marginal habitat may exist near the Colorado River (relatively sparse riparian vegetation dominated by patchy tamarisk), which is likely to be used by migrating birds but unlikely to be used by breeding birds. DCRT will conduct protocol level surveys within California and general avian surveys within Arizona in 2019 and 2020. The Nesting Bird Management Plan (Section 6) describes the preconstruction nest survey and nest avoidance protocols which apply to all protected bird species, including southwestern willow flycatcher and Arizona Bell's vireo.

5.8.1.1 Additional Measures Within California Only

Per MM WIL-CEQA-8, DCRT will conduct preconstruction focused surveys for Bell's vireo and willow flycatcher surveys within California in potential habitat within 500 feet of proposed disturbance. Though habitat is marginal at best, these surveys will be conducted at the Colorado River crossing in 2019 and 2020 (USFWS 2001; Sogge et al. 2010). The surveys will be conducted by a qualified avian biologist, approved by CPUC in consultation with USFWS and CDFW. Prior to construction, documentation will be submitted providing the results of the surveys to the CPUC for review and approval in consultation with USFWS and CDFW.

If an active breeding territory or nest is confirmed, the CPUC, USFWS, and CDFW will be notified immediately. All active nests will be monitored on a weekly basis until the nestlings fledge or the nest becomes inactive. The Proponent will provide monitoring reports to the CPUC for review on a weekly basis. In coordination with the USFWS and CDFW, a minimum 300-foot disturbance-free ground buffer will be established around the active nest and demarcated by fencing or flagging. No construction or vehicle traffic will occur within nest buffers.

The qualified biologist will have the authority to halt construction activities and will devise methods to reduce the noise and/or disturbance in the vicinity. This may include methods such as, but not limited to, turning off vehicle engines and other equipment whenever possible to reduce noise, installing a protective noise barrier between the nest site and the construction activities, and working in other areas until the young have fledged. All active nests will be monitored on a weekly basis until the nestlings fledge.

5.8.2 Golden Eagle

Golden eagle nest locations are widely scattered across the region in Arizona and have been documented in the New Water, Eagletail, and Plomosa Mountains, and potential nest sites have been identified elsewhere near the Project area (Stantec 2018; see Figure 3.4-4 of the Draft EIS for a map of previously documented golden eagle breeding areas in the Project vicinity). No known nest sites are within one mile of the Project, though the entire Project area is considered potential foraging habitat.

There is no known nesting habitat for the golden eagle within the California portion of the Project area, and the closest potentially suitable nesting location would be in the Mule Mountains, about one mile southwest of the Project area. As described in the Draft EIS, Eagle nest surveys have been conducted in the general vicinity for other projects. While nesting has not been documented recently in the Mule Mountains, there is an eagle nest within 10 miles of the Project area, as described in the Draft EIS. The Project area may provide eagle foraging habitat, but the Palo Verde Mesa offers low prey availability. An assessment of eagle prey availability on the Palo Verde Mesa (Ironwood Consulting 2016) estimated 0.0035 jackrabbits per acre.

Golden eagles are protected under BGEPA, as well as MBTA, and California codes. Golden and bald eagle pedestrian nest surveys are being conducted in 2019 within one mile of the Project in historical nesting areas in Arizona and California.

5.8.2.1 Additional Measures Within California Only

Protection measures for golden eagles are dictated by APM/BMP BIO-45, which applies only in California and commits to activities identified in LUPA BIO-IFS 24 through 31. LUPA BIO-IFS-24 states that "activities that may impact nesting golden eagles, will not be sited or constructed within 1.0-mile of any active or alternative golden eagle nest within an active golden eagle territory, as determined by BLM in coordination with USFWS as appropriate." If Project construction were to occur during the breeding season (January 1 – August 15) near an active eagle nest, the disturbance could impact nesting eagles. No known eagle nest sites are within one mile of the proposed transmission line. Existing data suggests that eagles are unlikely to nest within one mile of the Project. Golden and bald eagle pedestrian nest surveys are being conducted in 2019 within one mile of the Project in historical nesting areas. Preconstruction nest survey and avoidance measures described in Section 6 – Nesting Bird Management Plan, would protect eagles in the event that a new or previously undiscovered nest occurs near the construction area.

LUPA BIO-IFS-25 states that "cumulative loss of golden eagle foraging habitat within a 1 to 4-mile radius around active or alternative golden eagle nests (as identified or defined in the most recent USFWS guidance and/or policy) will be limited to less than 20%." The amount of habitat loss caused by construction of the transmission line will be very small relative to the area within an eagle foraging territory (e.g., four-mile radius)—well under one percent—and would not be expected to significantly contribute to a 20 percent habitat loss threshold.

LUPA BIO-IFS 26-31 apply to activities that pose a significant risk of eagle take (e.g., wind energy development). The Draft EIS states that there is no reasonably foreseeable expectation for take of golden eagles.

5.8.3 Yuma Ridgway's Rail in California

Yuma Ridgway's rail habitat does not occur at the proposed Colorado River crossing. According to the Biological Assessment (BLM 2019), Yuma Ridgway's rails have been observed using irrigation canals and drains in the agricultural fields south and southwest of Blythe. Many of those drains have dense stands of cattails and other emergent vegetation. There is a backwater channel about 0.4 mile south of the river crossing that contains small patches of marsh habitat. Most of the length of the backwater channel has relatively steep banks and little or no marsh vegetation, but there are some small patches of cattail (*Typha latifolia*) and other marsh vegetation along the channel that might be used by Yuma clapper rails (BLM 2019).

West of the Colorado River, the transmission line route crosses numerous canals that deliver and drain water to and from irrigated fields in Palo Verde Valley. Most of the canals are lined with concrete or are cleared of vegetation. Eight of the drains, however, have about 50- to 150-foot-wide stands of vegetation along the banks of the drain, including some with narrow bands of cattail and other marsh vegetation along the bottom of the drain. Yuma clapper rails have been observed using irrigation canals and drains in the agricultural fields south and southwest of Blythe (BLM 2019). According to the Biological Assessment, the species is known to use agricultural and other upland areas during dispersal and migration and is likely to pass through the Project area.

When the final Project area is determined (including all approved access routes, staging areas, turnaround areas, etc.) a desktop habitat assessment will be conducted to ensure that Project activities will not take place within 500 feet of any potentially suitable habitat. It is unlikely that suitable habitat will occur within the Project area, but if the desktop

assessment identifies possible habitat within 500 feet of proposed activities, a field habitat assessment will be conducted. If the presence of potentially suitable habitat is verified during the field habitat assessment t, the habitat will be buffered by 500 feet if practicable. If it is impractical to avoid the habitat buffer during the breeding season (February 15 - September 15), then USFWS-protocol (2017) surveys will be conducted, and construction work within the breeding season may be conducted only if surveys indicate no presence of Ridgway's rails.

5.8.4 Burrowing Owl

DCRT will conduct focused preconstruction burrowing owl surveys and implement avoidance measures (MM WIL-CEQA-7). These procedures are detailed in Section 8 — Burrowing Owl Nesting Management/Avoidance, Minimization, and Mitigation Plan (MM WIL-CEQA-3; APM/BMP BIO-30).

5.8.5 Bats

5.8.5.1 Bat Collision Risk

Although mortality near wind turbines is recorded far more often than collisions with stationary objects, bats have been found incidentally in bird mortality searches in both transmission and distribution powerline corridors (Manville 2016). While the recommendations from APLIC (2012) have been primarily focused on avoiding and minimizing impacts to birds, the recommendations and best practices may also benefit bats. On BLM land in California, guy lines will be marked to improve visibility and reduce collision risk for birds and bats. Markers will be used on the shield wires at the crossing of the Colorado River and floodplain to increase visibility to birds and bats (BIO-21). Flight diverters will be installed on all shield wires or guy lines spanning or within 1,000 feet of stream and wash channels, canals, ponds, and any other natural or artificial body of water (BIO-48). Because bat foraging use tends to be concentrated near water and/or relatively moist areas that support large insect populations, these measures are likely to greatly minimize any potential collision risk to bats.

5.8.5.2 Bat roosts and hibernacula

In California, DCRT will conduct preconstruction bat roost surveys and implement avoidance measures (APM/BMP BIO-40, MM WIL-CEQA-4, MM WIL-CEQA-5). These procedures are detailed in Section 9 — Bat Management and Protection Plan.

5.8.6 Bendire's Thrasher

As analyzed in the Draft EIS, Bendire's thrasher is unlikely to occur in the Project area. Per LUPA-BIO-IFS-11, which applies on BLM land in California, if Bendire's thrasher is detected during the course of any preconstruction surveys or construction monitoring, DCRT will conduct appropriate activity-specific biological monitoring to ensure that Bendire's thrasher individuals are not directly affected by operations (i.e., mortality or injury, direct impacts on nest, eggs, or fledglings).

5.9 Contact List

- Wildlife Rehabilitators to call for injured birds or bats:
    - For injured raptors: Wild at Heart (Emergency assistance: 480-595-5047)
    - For injured quail or other small birds: Arizona Covey (602-996-1934)
    - For injured small insectivorous birds: Wild Wings Rehab (480-893-6660)
    - For injured bats: Southwest Wildlife (480-471-9109)
    - For injured birds or bats: Lake Havasu City Humane Society (928-855-5083)
- USFWS Migratory Bird Permit Regional Offices:
    - California (Region 1) USFWS Migratory Bird Permit Office (503-872-2715; permitsR1MB@fws.gov
    - Arizona (Region 2) USFWS Migratory Bird Permit Office (505-248-7882; permitsR2MB@fws.gov)
- AZGFD Headquarters, Phoenix AZ (602-942-3000)
- CDFW Region 6-Inland Deserts Region (909-484-0167)

6 Nesting Bird Management Plan: Active Nests

6.1 Introduction

The purpose of this Nesting Bird Management Plan is to specify the DCRT strategy and specific procedures to comply with applicable federal and state regulations, as well as the applicable commitments specified in the Final EIS, for the protection of nesting birds that have potential to be impacted by Project activities, and to obtain agency concurrence on the strategy and procedures.

The applicable federal and state regulations are described in Section 2, above. The regulations specific to nesting birds that are most broadly applicable to this plan are the federal MBTA and California Fish and Game Code Section 3505, which protect not only most native birds but also their nests. USFWS defines an active nest is one that contains viable eggs and/or chicks. A nest becomes active when the first egg is laid and remains active until fledged young are no longer dependent on the nest. Nests that are empty, contain non-viable eggs, or are being built but do not yet have an egg in them are considered inactive (USFWS 2018). Destruction of inactive migratory bird nests is not a violation of MBTA (USFWS 2018). In 2016, CDFW proposed to define an active nest similarly. Proposed regulation Section 681, Title 14, Code of California Regulations clarified Section 3503 by defining several terms, including “nest” which it defined as “a site or a structure built, maintained or used by a native bird, which is occupied by eggs or nestlings, or is otherwise essential to the survival of a juvenile bird.” But on August 5, 2016, CDFW

issued a notice of decision not to proceed with the adoption of Section 681. Thus, the terms of Section 3503 remain undefined. For the purposes of this document, USFWS definition of active nest will be assumed.

All the avoidance, minimization, and mitigation measures applicable to the protection of birds and bats are listed and/or fully described in Section 3 above. The measures most directly applicable to this Nesting Bird Management Plan include APM/BMP BIO-20, MM WIL-CEQA-6, APM/BMP BIO-29, and MM WIL-CEQA-1.

6.2 Monitoring

If construction activities are scheduled to be conducted within the recognized breeding season, preconstruction nest monitoring will be conducted, and active nests will be avoided as discussed below. The breeding season has been recognized to apply in Arizona as February 1 through August 31 (APM/BMP BIO-20), and to apply in California as January 1 to August 15 for raptors and February 15 to September 15 for other species of birds.

DCRT will retain a qualified avian biologist(s) to conduct preconstruction nesting bird surveys within the recognized breeding season, for all areas near construction activities that are scheduled to take place during the breeding season; construction activities include mobilization, staging, grading, and/or construction. The exact size of the survey areas may vary among sites and will support the state-specific and species-specific avoidance buffers as specified in Table F3-6-1. Within California, at a minimum, the survey area will encompass a 500-foot buffer of Project construction activities. Survey dates may only be modified with the approval of USFWS, AZGFD, and CDFW, where applicable.

Avian biologists will be sufficiently skilled and experienced with the identification of all species expected to occur in the Project area, and with nesting habits of locally breeding birds, so as to conduct accurate and efficient surveys. The names and qualifications of the avian biologist(s) and biological monitors will be provided to the appropriate agencies for approval (USFWS, BLM, CDFW, and AZGFD) prior to the surveys. The hierarchical line of communication associated with nest monitoring and implementation of avoidance buffers would be as follows. The biological monitors would report to the avian biologist contracted by DCRT. The avian biologist would report to DCRT. DCRT (and/or the avian biologist as approved by DCRT on a case-by-case basis) will report to the CIC/BLM. DCRT would provide avoidance buffer updates to construction contractors. In the interest of efficient and timely implementation of required nest avoidance, DCRT may also delegate the avian biologist and/or biological monitors to directly convey avoidance buffer updates to the construction contractors as appropriate.

Nest survey methods will include systematic searches as well as observations of auditory and visual cues indicating reproductive behavior (Ralph et al. 1993)—e.g., keying in on alarm calls of adults or begging calls of nestlings, visually following adults carrying nesting material or food, or visually following adults exhibiting behavior consistent with incubation/foraging cycles. Systematic searches will include visually inspecting suitable nesting locations. In some cases, a nest may not be directly observed if the suspected nest location is inaccessible due to unsafe terrain, height of the nest, dense vegetation, or some other barrier that prevents the avian biologist from safely observing the nest. The avian biologist may conclude that a nest is present or determine the nest status based on breeding behavior without locating or directly observing the actual nest.

The avian biologist will conduct a preconstruction nest survey no more than 10 days (less if practicable) prior to the start of work at any given site. Additional sweeps will occur on the first day of construction and at least once every three days during construction, as described in the subsequent paragraph. Results of the initial nest survey will be submitted to the appropriate resource agencies for review and approval (USFWS, CPUC, CDFW, AZGFD, and/or BLM) no less than 72 hours prior to construction. If a nest is detected during the preconstruction nest survey, the avian biologist will include within the nest survey report the details of each nest along with minimization and avoidance measures, and buffers implemented.

On the first day of construction at any given site during the nesting season the avian biologist and/or biological monitor will perform a preconstruction sweep to identify any new nests or nesting activity that may have been initiated since the original survey. Subsequently, for the duration of construction during the nesting season, the biological monitor will perform sweeps at each work site to look for resources, including nesting birds. The sweeps will occur at least once every three days during construction, to identify new or previously undiscovered nests, document the status (active or inactive) of previously discovered nests, and ensure that Project activities are not conducted with the buffers until the nesting cycle is complete or the nest fails.

To avoid potentially causing nest failure, care will be taken to minimize any nest disturbance caused by surveying and monitoring efforts. Nests will be monitored from a distance using binoculars or a spotting scope whenever practical. In some cases, approaching the nest may be necessary to initially find the nest and/or to gather useful information about the nest stage and/or other information related to the avian biologist's determinations. When approaching a nest or potential nest area, the biologist or monitor will first determine whether there are any potential nest predators nearby (e.g., ravens, jays, or other corvids). If no predators are observed, the surveyor will approach the nest, and will not spend any more time near the nest than necessary. The avian biologist will report any inadvertent contact or effects to birds or nests within the Project area to the BLM, AZGFD, CDFW, USFWS, and CPUC.

The status and phenology of all active nests, and observed behavior of associated birds, will be documented and summarized in weekly reports provided to the appropriate resource agencies (USFWS, CDFW, AZGFD, and/or BLM). If any inadvertent contact or effects to birds or nest occurs as a result of the monitoring or construction-related work, this will be fully described in the weekly report.

6.3 Nest Avoidance

In accordance with MM WIL-CEQA-6 and APM/BMP BIO-20, if breeding birds with active nests are found prior to or during construction, the qualified avian biologist will establish a state-specific and species-specific buffer around the nest and no activities will be allowed within the buffer(s) until the young have fledged from the nest or the nest fails. Buffers will extend not only horizontally, but also vertically in the case of helicopter work (for the same distance as the horizontal specification, unless otherwise requested by BLM, USFWS, CPUC, CDFW, or AZGFD). Buffers will be marked using signs and stakes or flagging placed at the edge of the buffer facing the work area and/or access road. Species-specific avoidance buffers are described in Section 6.3.2. Procedures to adjust buffers based on specific circumstances are described in Section 6.3.1.

6.3.1 Nest Buffer Modification Procedures

The prescribed buffers may be adjusted by the qualified avian biologist based on existing conditions around the nest, planned construction activities, tolerance of the species, and other pertinent factors.

For Project activities of any disturbance level that are inconsistent with established buffer distances, the avian biologist will evaluate the proposed activity on a case by case basis. Where appropriate, the avian biologist may work with the construction team to identify an appropriate buffer revision to prevent impacts to nesting birds while minimizing constraints on construction activities. For each proposed buffer reduction, a qualified avian biologist will be consulted and will determine whether the default species-specific buffers (Table F3-6-1) may be reduced for the specific activity and duration. The avian biologist will make this determination based on the species' natural history, and its known tolerances including those observed during nesting bird management for the Project, as well as site-specific conditions such as nesting stage, behavior of the nesting birds, microhabitat near the nest, distance to construction, type of construction activity, and anticipated duration of the activity. If recommended by the avian biologist, and approved by DCRT, a reduced buffer distance may be implemented according to the procedures outlined below.

- For non-special status species, the avian biologist or biological monitor, with the approval of DCRT and the appropriate BLM-CIC personnel, may immediately adjust the buffer distance and move the signage, stakes, or flagging to indicate the new buffer distance. The decision will be documented in the form of a Level 1 variance, and DCRT will notify the appropriate agencies (BLM, CPUC, USFWS, AZGFD, and/or CDFW) of each buffer reduction, as soon as practicable.
- For special status species, DCRT will submit a Biological Level 1 Variance request to USFWS, CDFW, and/or AZGFD for agency review and approval of any proposed buffer reduction. Agency approval would be obtained prior to adjusting the buffer.

Following adjustment of the buffer, the avian biologist or biological monitor will periodically monitor the behavior of the nesting pair, as appropriate, to assess whether the new buffer distance is sufficient to minimize the risk of reducing the reproductive success of the breeding pair. If construction is disrupting the nesting birds and agitated behaviors are observed, the buffer size will revert back to its original/full extent. The appropriate monitoring schedule would be situation-specific and would be determined in consultation with the appropriate agencies. Unless otherwise determined in consultation with the agencies, monitoring would be more or less continuous (during construction) for the first 24 hours following buffer reduction, and thereafter (assuming no signs of disturbance are observed) approximately hourly to daily depending on construction circumstances, species, stage of nesting, and observed bird behavior. Monitoring would take place using binoculars and/or a spotting scope, at a distance sufficient to avoid disturbing the nesting birds, and will include assessing the bird's response to noise as well as to visual disturbance. The qualified avian biologist will have the authority to halt construction activities and will devise methods to reduce the noise and/or disturbance in the vicinity. This may include methods such as, but not limited to, turning off vehicle engines and other equipment whenever possible to reduce noise, installing a protective noise barrier between the nest site and the construction activities, and working in other areas until the young have fledged. All active nests will be monitored on a weekly basis until the nestlings fledge.

6.3.2 Species-Specific Avoidance Buffers

Tolerance to disturbance can vary from one bird species to another. As required under MM WIL-CEQA-1, Table F3-6-1 lists bird species potentially nesting in or near the Project area, and for each species provides a default avoidance buffer, approximate nesting season, typical breeding habitat, typical nest location, and federal and state status of special status species. In California (per MM WIL-CEQA-6 and MM WIL-CEQA-1), the minimum standard buffer distances are 500 feet for raptors and 300 feet for other species. Note that due to MM CEQA and DRECP LUPA specifications, avoidance buffers may differ between California and Arizona, and also between BLM land in California (which is subject to DRECP LUPA measures and is also within a DFA) and other lands in California. These nest buffers adhere to appropriate mitigation measures, including APM/BMP BIO-20, MM-WIL-CEQA-1, MM-WIL-CEQA-3, MM-WIL-CEQA-7, MM-WIL-CEQA-8, DFA-BIO-IFS-1, and LUPA-BIO-IFS-12. Nest buffers for avian species listed under CESA and federal ESA as specified in the Final EIS may need to be modified from those listed in this draft Nesting Bird Management Plan in order to conform to any applicable conditions or requirements adopted by the lead agencies or permitting agencies, including conditions of the CPUC's Decision, BLM's Record of Decision, Biological Opinion, or Incidental Take Permit. In the unlikely event that a nest is found belonging to a species not listed in Table F3-6-1, for non-special status species in California a 500-foot buffer would be used for raptors and a 300-foot buffer would be used for non-raptors; for non-special status species in Arizona a (TBD)-foot buffer would be used for raptors and a (TBD)-foot buffer would be used for non-raptors; for special status species (if not listed in Table F3-6-1), a temporary buffer of 500 feet for raptors or 300 feet for non-raptors would be applied and the appropriate agencies would be contacted immediately to identify an appropriate buffer distance. For some species and circumstances, smaller buffers may be appropriate, and these buffers may be modified according to the procedures described in Section 6.3.1.

TABLE F3-6-1 BIRD SPECIES POTENTIALLY NESTING IN OR NEAR THE PROJECT AREA

STANDARDIZED AOU NAME[1]	DEFAULT CA BUFFER (in feet)	DEFAULT AZ BUFFER[4] (in feet)	APPROXIMATE NESTING SEASON[2]	TYPICAL BREEDING HABITAT[2]	TYPICAL NEST LOCATION[2]	STATUS[3]
Cinnamon Teal	300	TBD	3/25-9/15	marshes, ponds, lakes, streams	ground	-
Ruddy Duck	300	TBD	5/5-9/5	marshes, ponds, lakes	ground	-
Gambel's Quail	300	TBD	2/15-8/31	arid brushlands, washes, often with water nearby	depression on ground	-
Pied-billed Grebe	300	TBD	2/15-9/15	marshes, ponds, lakes, streams	floating nest anchored to emergent vegetation	-
Western Grebe	300	TBD	5/31-8/31	lakes, marshes	floating platform in shallow water	-
Clark's Grebe	300	TBD	5/31-8/31	Lakes, marshes	floating platform in shallow water	AZ-SGCN
Rock Pigeon	0	0	Unprotected non-native species	primarily disturbed areas	buildings and cliffs	-
Eurasian Collared-Dove	0	0	Unprotected non-native species	primarily urban/suburban areas	trees and shrubs	-
Inca Dove	300	TBD	6/25-9/15	primarily around human habitations	trees and shrubs	-
Common Ground-Dove	300	TBD	3/1-9/30	disturbed areas; dry, open, early successional	ground, bushes, or occasionally in trees	-
White-winged Dove	300	TBD	5/1-8/31	dense thorny woodlands, cactus-palo verde deserts and riparian woodlands; also, urban/suburban areas	tree branch; usually under dense canopy	-
Mourning Dove	300	TBD	2/20-9/30	generalist; primarily edges and open woodlands	ground, bushes, or trees	-
Greater Roadrunner	300	TBD	4/15-10/15	open country with scattered shrubs	bush, small tree, or cactus, 1.0-3.0 meters (m) above the ground	-
Yellow-billed Cuckoo	500	TBD	5/31-6/15	densely-vegetated, riparian woodland, patch size usually >20 ha	tree or shrub, usually 1-6 m above ground	Federally Threatened, AZ-SGCN, CA-Endangered, BLM-Sensitive, BLM-Focus Species
Lesser Nighthawk	300	TBD	4/15-8/15	deserts, agricultural areas, brushlands, washes	bare flat ground, usually in pebbly area, no nest material	-
Common Poorwill	300	TBD	5/20-9/15	open, grassy or shrubby areas in arid or semi-arid regions	eggs usually laid on bare ground, occasionally on gravel, rock, pine needles, or leaf litter	-

STANDARDIZED AOU NAME[1]	DEFAULT CA BUFFER (in feet)	DEFAULT AZ BUFFER[4] (in feet)	APPROXIMATE NESTING SEASON[2]	TYPICAL BREEDING HABITAT[2]	TYPICAL NEST LOCATION[2]	STATUS[3]
White-throated Swift	300	TBD	3/5-8/31	mountainous or hilly country, open or forested	in crevices in cliffs	-
Black-chinned Hummingbird	300	TBD	4/20-8/31	riparian woodland	in tree or shrub	-
Anna's Hummingbird	300	TBD	5/1-11/15	chaparral, riparian woodlands, savannahs, parkland, and urban and suburban environments	tree or shrub usually 2.0-6.0 m above ground	-
Costa's Hummingbird	300	TBD	1/15-6/15	Sonoran desert scrub, Mojave desert scrub	shrub or tree, usually 1.0-2.0 m above ground	-
Ridgway's able	500	TBD	3/15-9/10	freshwater marshes with stands of bulrushes and cattails	in clumps of emergent plants, in base of shrubs, or in clumps of downed dead vegetation near uplands	Federally Endangered, AZ-SGCN, BLM-Sensitive, CA-Threatened, BLM-Focus Species
Virginia Rail	300	TBD	3/10-8/10	marsh	in robust emergent vegetation (e.g., cattails, bulrush), <15 centimeters (cm) above water	-
Common Gallinule	300	TBD	4/1-8/31	permanently flooded deep marshes	anchored in emergent vegetation close to open water	-
American Coot	300	TBD	5/1-9/10	lakes, ponds, streams, wetlands	built over water on floating platforms and almost always associated with dense stands of living or dead emergent vegetation	-
Black Rail	300	TBD	3/1-9/15	salt and brackish water marshes; occurs in the lower Colorado River in areas of pickle weed thickets	in center of clumps of vegetation, at or near upper limits of marsh vegetation, well concealed; height of nest above water or ground usually low	CA-Threatened, BLM-Focus Species, AZ-SGCN, BLM-Sensitive
Black-necked Stilt	300	TBD	4/15-8/25	shallow wetlands with emergent vegetation	nest scrape in soft substrate of alkali flat, dike or island; often over water on small islands or vegetation clumps, often completely in the open	-

STANDARDIZED AOU NAME[1]	DEFAULT CA BUFFER (in feet)	DEFAULT AZ BUFFER[4] (in feet)	APPROXIMATE NESTING SEASON[2]	TYPICAL BREEDING HABITAT[2]	TYPICAL NEST LOCATION[2]	STATUS[3]
Killdeer	300	TBD	3/1-9/15	open areas, especially sandbars, mudflats, heavily grazed pastures, and human-modified habitats	on ground, usually with sparse low vegetation or no vegetation	-
Spotted Sandpiper	300	TBD	5/10-8/25	nests in a variety of habitats (shoreline, sagebrush, grassland, and forest), but only near water	on ground within 100 m (occasionally to 300 m) of water's edge. Nest is normally under or next to herbaceous vegetation that provides some shade	-
Double-crested Cormorant	300	TBD	4/15-8/31	only habitat near the Project area is along and near Colorado River.	near water, on ground, cliffs, trees, shrubs, artificial nest structures, and transmission line towers	AZ-SGCN
Least Bittern	300	TBD	5/1-8/31	freshwater and brackish marshes with dense, tall growths of aquatic or semiaquatic vegetation (particularly *Typha, Carex, Scirpus, Sagittaria*, or *Myriscus*) interspersed with clumps of woody vegetation and open water	usually 15 - 75 cm above water, among dense, tall stands of emergent or woody vegetation, <10 m from open water	-
Great Blue Heron	300	TBD	3/10-8/15	wide variety of water and wetlands	colonial nester. Near water: trees, bushes, ground, or artificial structures	-
Great Egret	300	TBD	3/20-8/1	only habitat near the Project area is along and near Colorado River	colonial nester. Near water: trees, bushes, ground, or artificial structures	AZ-SGCN
Snowy Egret	300	TBD	3/20-8/1	marshes, tidal flats, and ponds	colonial nester. Near water: trees, bushes, ground, or artificial structures	AZ-SGCN
Cattle Egret	300	TBD	4/1-10/15	usually forage near livestock; occasionally in other disturbed areas, or near margins of aquatic areas	colonial nester. medium to tall upland trees; or in low trees or shrubs in swamps; or reed vegetation in marshes, or on islands; proximity to water not a requirement	-
Green Heron	300	TBD	2/15-7/30	only habitat near the Project area is along and near Colorado River.	solitary or colonial nester; trees or shrubs; aquatic or terrestrial sites, from ground level to 10 m high	-
Black-crowned Night-Heron	300	TBD	12/1-8/1	only habitat near the Project area is along and near Colorado River.	colonial nester; Near water: trees, bushes, ground, or artificial structures	-

STANDARDIZED AOU NAME[1]	DEFAULT CA BUFFER (in feet)	DEFAULT AZ BUFFER[4] (in feet)	APPROXIMATE NESTING SEASON[2]	TYPICAL BREEDING HABITAT[2]	TYPICAL NEST LOCATION[2]	STATUS[3]
Turkey Vulture	300	TBD	4/15-9/15	for nesting, prefers areas with nest sites (rock outcrops, fallen trees, abandoned buildings) isolated from human disturbance	lays eggs in dark recesses in great variety of sites: in rock outcrops, including ledges, caves, and crevices, and among tumbled boulders	-
Golden Eagle	5,280 on BLM land; 500 elsewhere	TBD	1/1-8/15	open areas, including deserts, and grasslands	cliffs, large trees, transmission structures	CA-Fully Protected, BGEPA, AZ-SGCN, BLM-Sensitive
Osprey	500	TBD	4/15-9/5	near waters that support fish; only habitat in Project area is near Colorado River	treetops, powerline structures, artificial nesting platforms. Usually near edge of water, rarely further than 0.5 kilometer (km), but occasionally as far as 14 km.	AZ-SGCN
Harris's Hawk	500	TBD	1/1-8/15	semi-open desert scrub, savanna, grassland, and wetland habitats	located in almost any relatively tall, sturdy structure. Common substrates include saguaro cacti, paloverde, and mesquite	-
Swainson's Hawk	2,640 on BLM land; 500 elsewhere	TBD	4/1-7/30	plains and hills with open vegetation. This species is not expected to nest within or near the Project area	tree or large shrub; nest often appears messier and less sturdy than other Buteo nests	CA-Threatened, BLM-Sensitive, BLM-Focus
Red-tailed Hawk	500	TBD	5/20-9/5	generalist species of open to semi-open habitats	trees, cliffs, powerline structures	-
Barn Owl	500	TBD	2/1-8/31	primarily open habitats: grasslands, deserts, marshes, and agricultural fields	cavities of wide variety in trees, cliffs, rock outcrops, caves, and river/arroyo banks; also, many human structures	-
Long-eared Owl	500	TBD	2/25-7/15	riparian and desert woodlands	stick nest built in tree by another species of bird	CA-SSC
Western Screech-Owl	500	TBD	3/1-6/30	diverse array of habitats, but most often riparian habitats with deciduous trees, including mesquite and palo verde	in tree cavities, most commonly those excavated by large woodpeckers including gilded flickers	-
Great Horned Owl	500	TBD	1/1-5/31	diverse array of habitats, usually in landscapes that are open or semi-open	stick nest built in tree or cliff by another species of bird	-

STANDARDIZED AOU NAME[1]	DEFAULT CA BUFFER (in feet)	DEFAULT AZ BUFFER[4] (in feet)	APPROXIMATE NESTING SEASON[2]	TYPICAL BREEDING HABITAT[2]	TYPICAL NEST LOCATION[2]	STATUS[3]
Elf Owl	500	TBD	5/1-7/20	riparian forests, desert, woodlands	cavity nester. In woodpecker holes in saguaro cacti, or riparian woodlands (especially mature Populus-Salix-Prosopis riparian woodland with <75% tamarisk)	CA-Endangered, BLM-Sensitive
Burrowing Owl	656	TBD	2/1-8/31	utilizes burrows made by mammals in arid regions and deserts; within Project area, likely to be common only near agricultural areas and along and near Colorado River	burrows; usually existing mammal, or desert tortoise, or artificial burrowlike structure	CA-SSC, BLM-Focus Species, AZ-SGCN, BLM-Sensitive
Gila Woodpecker	1,320 on BLM land; 300 elsewhere	TBD	4/1-8/31	upper Sonoran desert in areas with stands of saguaro, riparian woodlands, and suburban areas.	excavate cavities in saguaros or mesquites	CA-Endangered, BLM-Sensitive, BLM-Focus, AZ-SGCN
Ladder-backed Woodpecker	300	TBD	4/15-7/25	deserts, desert scrub, and thorn forests	cavities built in Joshua Tree, willow, cottonwood, walnut (Juglans), oak, hackberry, pine, mesquite, or agave	-
Gilded Flicker	300	TBD	4/30-8/5	upper Sonoran Desert in areas with stands of saguaro, riparian woodlands, and suburban areas	excavate cavities in saguaros, cottonwoods, or willows	CA-Endangered, AZ-SGCN, BLM-Sensitive
American Kestrel	500	TBD	4/30-8/30	open landscapes, including agricultural areas, grasslands, and deserts	woodpecker or natural cavities in trees or cliffs	-
Peregrine Falcon	500	TBD	2/15-7/30	open country and cliffs. Sometimes inhabits urban areas; uncommon resident in southwestern Arizona	ledges on cliffs or buildings; no nest material used	AZ-SGCN
Prairie Falcon	500	TBD	3/1-7/31	open landscapes, including agricultural areas, grasslands, and deserts	ledges on cliffs	-
Western Wood-Pewee	300	TBD	5/1-8/31	woodlands and forests, especially forest edge and riparian zones	cup nest in tree	-
Southwestern Willow Flycatcher	300	TBD	5/1-8/15	early successional riparian habitats, with a dense shrub-layer	in shrub or small tree, typically 1.5 – 6.0 m above the ground	Federally Endangered, AZ-SGCN, CA-Endangered, BLM-Sensitive, BLM-Focus Species

STANDARDIZED AOU NAME[1]	DEFAULT CA BUFFER (in feet)	DEFAULT AZ BUFFER[4] (in feet)	APPROXIMATE NESTING SEASON[2]	TYPICAL BREEDING HABITAT[2]	TYPICAL NEST LOCATION[2]	STATUS[3]
Black Phoebe	300	TBD	3/1-6/30	Streambanks, cattle tanks, pond	cliff or human structure; nest cemented with mud to vertical wall of site, 1.0–3.0 m above ground or high-water mark	-
Say's Phoebe	300	TBD	3/15-7/15	grassland, deserts, and agricultural land	nest woven of vegetation, placed on human structures, caves, pockets, or covered ledges on cliff faces or dirt banks; rarely cavities of trees or bushes, or nests of other species	-
Vermilion Flycatcher	300	TBD	3/5-7/15	desert scrub or deciduous riparian woodlands	typically, in trees that line riparian corridors	CA-SSC
Ash-throated Flycatcher	300	TBD	3/10-8/5	arid and semiarid scrub and open woodland, as well as riparian woodland in arid and semiarid regions	in natural cavities, woodpecker holes, nest boxes, and cavities in other human-made structures	-
Brown-crested Flycatcher	300	TBD	3/20-7/30	mature riparian woodland dominated by Fremont cottonwood, mesquite, and Gooding willow	secondary cavity nester; nests in deserted woodpecker holes or natural cavities in columnar cactus or trees	-
Cassin's Kingbird	300	TBD	4/1-8/15	wide variety of open habitats such as grasslands, desert shrub, pastures, cultivated fields, urban areas, and savannah habitats	cup nest in tree; often in isolated trees	-
Western Kingbird	300	TBD	4/15-8/1	Wide variety of open habitats such as grasslands, desert shrub, pastures, cultivated fields, urban areas, and savannah habitats	cup nest in tree; often in isolated trees	-
Loggerhead Shrike	300	TBD	2/1-7/31	open habitats with scattered shrubs, trees, posts, fences, utility lines, or other perches	cup nest in tree or shrub; vegetation with thorns usually preferred, nest averages 1.0 m above ground	CA-SSC
Bell's Vireo	300	TBD	4/1-8/1	desert riparian woodlands, primarily with dense willow or mesquite; uncommon along lower Colorado River	suspended from small, lateral or terminal forks of low, pendant branches (or even horizontal parallel stems) in dense shrubs, small trees, and occasionally herbaceous vegetation	CA-Endangered, AZ-SGCN
Common Raven	300	TBD	2/15-7/15	habitat generalist	tree, cliff, transmission structure	-
Horned Lark	300	TBD	2/15-8/15	open areas with short, and/or sparse vegetation	ground	-

STANDARDIZED AOU NAME[1]	DEFAULT CA BUFFER (in feet)	DEFAULT AZ BUFFER[4] (in feet)	APPROXIMATE NESTING SEASON[2]	TYPICAL BREEDING HABITAT[2]	TYPICAL NEST LOCATION[2]	STATUS[3]
Northern Rough-winged Swallow	300	TBD	4/15-7/31	variety of open and semi-open areas	burrow located in precipitous bank of clay, sand, or gravel	-
Violet-green Swallow	300	TBD	5/15-8/15	variety of open and semi-open areas	secondary cavity nester; nests in deserted woodpecker holes or natural cavities in trees or cliffs	-
Barn Swallow	300	TBD	3/31-8/31	variety of open and semi-open areas	mud nest on vertical wall, including cliffs or human structures	-
Cliff Swallow	300	TBD	3/31-8/31	variety of open and semi-open areas	mud nest on vertical wall, including cliffs or human structures	-
Verdin	300	TBD	3/1-8/25	desert scrub, chiefly in areas along washes where thorny vegetation occurs or in desert riparian zones	builds dome of sticks at periphery of bush or shrub; height typically 0.8–2.0 m; also builds smaller roosting nests during non-breeding season	-
Rock Wren	300	TBD	4/15-8/5	arid or semiarid areas with exposed rock	on ground in crevice on rocky hillside, beneath overhanging rock, or hole in large talus boulders	-
Canyon Wren	300	TBD	5/1-8/20	canyons and other areas with cliffs or rock outcrops	in rock caverns, crevices, cliffs, or banks	-
House Wren	300	TBD	4/1-7/31	riparian or other deciduous woodland; also, urban/suburban areas	secondary cavity nester, primarily in trees	-
Marsh Wren	300	TBD	3/15-7/31	emergent vegetation in marshes	average 1.0 m above ground or water in emergent vegetation	-
Bewick's Wren	300	TBD	3/15-7/31	brushy areas, scrub and thickets in open country, open and riparian woodland, and chaparral	utilize a variety of natural or woodpecker cavities, 0-10 m above ground, often surrounded by thick vegetation	-
Cactus Wren	300	TBD	3/1-9/30	desert scrub	bulky dome, usually in cactus or other thorny plant; build numerous nests as decoys, and/or for non-breeding roosts	-
Blue-gray Gnatcatcher	300	TBD	4/15-8/15	chaparral and woodland, including mesquite woodland	cup nest on limb of shrub or tree	-
Black-tailed Gnatcatcher	300	TBD	2/15-9/20	semiarid or desert scrub	cup nest in dense, thorny or leafy shrub or tree	-
Curve-billed Thrasher	300	TBD	2/15-8/15	desert scrub	cup nest in shrub, tree, or cactus	-

Bendire's Thrasher	500 on BLM land; 300 elsewhere	TBD	3/15-7/31	dry and semi-arid washes and other areas containing shrubs, trees, and especially yucca	cup nest in shrub, tree, or cactus	CA-SSC, BLM-Sensitive, BLM-Focus Species
LeConte's Thrasher	300	TBD	2/15-6/30	flat desert areas with sparse vegetation, especially saltbush flats	cup nest in shrub, tree, or cactus	CA-SSC, AZ-SGCN, BLM-Sensitive
Crissal Thrasher	300	TBD	1/15-7/31	microphyll woodland and riparian washes, mesquite woodlands, other dense scrub vegetation	cup nest in shrub, tree, or cactus	CA-SSC
Northern Mockingbird	300	TBD	2/15-9/15	open habitats with scattered shrubs and small trees	cup nest in tree or shrub	-
European Starling	0	0	unprotected non-native species	cities, agricultural areas and other open country with mown or heavily grazed areas and scattered trees.	secondary cavity nester; often outcompetes native birds for nest sites	-
Phainopepla	300	TBD	3/1-8/15	desert riparian areas or along washes; closely associated with desert mistletoe	cup nest on tree branch or within clump of mistletoe, 2.0-5.0 m above ground	-
House Finch	300	TBD	2/15-9/1	generalist, inhabits wide variety of natural or human-modified landscapes, from desert to forest	cup nest in wide variety of substrates, including trees, shrubs, cacti, cliffs, buildings	-
Lesser Goldfinch	300	TBD	4/1-8/31	riparian woodlands and thickets, chaparral, desert oases, ranch and farmyards, and rural, urban, and suburban parks and gardens	cup nest in tree or shrub	-
Black-throated Sparrow	300	TBD	3/15-7/31	semi-open habitat with evenly spaced shrubs and trees 1–3 m high, including creosote bush flats, desert alluvial fans, canyons, washes, and desert scrub	cup nest in shrub	-
Song Sparrow	300	TBD	2/28-9/1	riparian areas with dense shrub layer	cup nest in shrub	-
Canyon Towhee	300	TBD	2/20-10/31	semiarid uplands and environments along dry watercourses to riparian mesquite woodlands	cup nest in shrub, 1.0-3.5 m above ground	-
Abert's Towhee	300	TBD	1/20-10/1	low-elevation desert riparian and desert wash habitats. Habitat includes dense vegetation, including thickets of willow, cottonwood, mesquite, and salt cedar.	cup nest in shrub, usually <2.0 m above ground	AZ-SGCN

STANDARDIZED AOU NAME[1]	DEFAULT CA BUFFER (in feet)	DEFAULT AZ BUFFER[4] (in feet)	APPROXIMATE NESTING SEASON[2]	TYPICAL BREEDING HABITAT[2]	TYPICAL NEST LOCATION[2]	STATUS[3]
Rufous-crowned Sparrow	300	TBD	3/10-9/20	semiarid grassy shrublands and open woodlands on moderate to steep grassy and rocky hillsides and canyons	Cup nest on ground or occasionally <45 cm high in shrub	-
Yellow-breasted Chat	300	TBD	5/1-8/15	riparian thickets	cup nest, usually placed about 1.0 m above ground in dense thickets and shrubs	CA-SSC
Yellow-headed Blackbird	300	TBD	4/15-7/31	emergent vegetation of deep-water palustrine wetlands.	Nests constructed over deeper water, primarily in cattails (*Typha* spp.), bulrushes *(schoenoplectus* spp.), or reeds (*Phragmites* spp.)	CA-SSC
Western Meadowlark	300	TBD	3/15-8/31	wide range of grassland habitat, including agricultural areas and desert grasslands	cup nest on ground, well hidden beneath vegetation	-
Hooded Oriole	300	TBD	4/20-8/15	scattered trees, including desert oases, especially those with palms, and riparian areas with cottonwoods, willows, or sycamores	pendulous domed nest suspended from tree branch	-
Bullock's Oriole	300	TBD	3/15-7/31	riparian woodland	pendulous domed nest suspended from leaves of trees	-
Scott's Oriole	300	TBD	5/15-8/15	upper elevation deserts where yuccas are common	semi-pendulous domed nest. Most commonly associated with yucca trees, less commonly with palms	-
Red-winged Blackbird	300	TBD	3/1-8/10	marshes with emergent vegetation; also, agricultural areas and urban/suburban areas	Typically, in sturdy graminoid or shrub, from just above water level to 7.0 m high	-
Bronzed Cowbird	NA	NA	4/15-7/31	open fields, pastures, and scrubby areas	lay eggs in nests of other species	-
Brown-headed Cowbird	NA	NA	4/1-8/31	mixed habitats with open and wooded areas	lay eggs in nests of other species	-
Great-tailed Grackle	300	TBD	3/15-8/15	open areas with scattered trees and water nearby, including marshes, agricultural areas and urban areas	cup nest, suspended from small upright branches in shrub or sturdy graminoids	-
Lucy's Warbler	300	TBD	4/15-7/15	dense lowland riparian mesquite woodlands	nests behind loose bark of tree, in natural or woodpecker cavities, or in deserted nest of other species	-
Common Yellowthroat	300	TBD	4/15-7/15	wetlands with thick woody and/or herbaceous vegetation	cup nest usually ground in drier areas or just above water level in wet areas.	-

STANDARDIZED AOU NAME[1]	DEFAULT CA BUFFER (in feet)	DEFAULT AZ BUFFER[4] (in feet)	APPROXIMATE NESTING SEASON[2]	TYPICAL BREEDING HABITAT[2]	TYPICAL NEST LOCATION[2]	STATUS[3]
Yellow Warbler	300	TBD	5/15-8/1	cottonwood, willow, and salt cedar riparian woodlands	cup nest in upright fork of shrub or tree, usually 1.0-3.0 m above ground, but up to 14 m	CA-SSC
Summer Tanager	300	TBD	4/15-8/31	mature cottonwood riparian woodlands along Colorado River; limited or no habitat within and near Project area	cup nest in tree, 1.0-22 m above ground	CA-SSC
Northern Cardinal	300	TBD	3/20-9/1	brushy areas, such as washes and mesquite woodlands	Cup nest in tangled vines, shrub, or tree; typically, about 1.0-3.0 m above ground	-
Blue Grosbeak	300	TBD	4/20-9/15	brushy areas, including woodland edge and early successional habitats	cup nest in shrub or tree, from 15 cm to 7.0 m above ground.	-
House Sparrow	0	0	unprotected non-native species	near human habitation and other disturbed areas	in nooks and crannies on buildings, and may build domed nests in vines on walls or in trees	-

6.4 Nesting Bird Deterrent Methods

Implementation of methods to deter or exclude birds from nesting within work areas may reduce the likelihood of avian nests becoming established within the work area, and thereby minimize risk to breeding birds as well as minimizing disruption of construction work and scheduling. Prior to implementation, DCRT will notify BLM, CPUC, USFWS, AZGFD, and/or CDFW of all deterrent or exclusion plans and obtain approval as necessary.

Nesting bird deterrent methods may include, but are not limited to the following:

- Removal of vegetation outside of the nesting season, in areas that would be directly disturbed by construction during the nesting season. All necessary vegetation clearing should be conducted outside the nesting season, to the extent practicable. And where it would not cause harm or degradation to other resources, for example soils. Because restoration of desert environments is difficult, in vegetation that is low in stature it's often recommended to not clear vegetation if construction can safely be done with minimal clearing (Personal communication, C. Fletcher, BLM, via April 2019 APP/BBCS draft review comment). Although vegetation-free construction areas are ideal for deterring nesting birds, vegetation removal will be limited to that which is necessary for construction and staging. To minimize long-term impacts to ecosystems and bird habitat, unnecessary vegetation clearing will not be conducted.
- Managing construction yard trash to avoid inadvertently providing food to birds. Effective management of food waste and other trash will be important to avoid attracting birds to construction areas. Such management measures will include daily removal of trash from the remote sites and covering trash bins located at stationary sites with tightly fitting lids (i.e., wildlife-proof containers).
- Covering staged/stored straw wattle and other potential nesting material or substrates in active construction or staging areas.
- Moving equipment, vehicles, and materials on a daily basis within an active construction area.
- Using colored gravel, such as white or red, in active construction areas, staging yards, or substations. Some ground-nesting species (e.g., plovers and nightjars) are attracted to naturally-colored gravel for concealing their eggs, which are similarly colored. Unnaturally-colored gravel which would strongly contrast with the birds' eggs, can effectively discourage nesting by these birds.
- Installing visual deterrents in active construction areas. There are a wide variety of visual deterrents that can be used to discourage birds from nesting, such as predator decoys (e.g., plastic owls) or reflective ribbon (e.g., Tangle Guard Bird Repeller Ribbon; http://www.nixalite.com/tangleguard.aspx), which provides visual and auditory discomfort to birds. Visual deterrents can be affixed to construction equipment, around the perimeter of storage yards, or on towers or other facilities as appropriate, to scare birds from the area, thereby reducing the likelihood of nesting.
- Installation of appropriate-sized tarps on construction equipment and materials. Tarps will be inspected at least once per week to identify and correct any openings that may allow cavity-nesting bird species to enter. If openings are found, the tarps will be inspected for trapped wildlife before re-closure. To avoid the risk of entanglement to birds or other animals, netting will not be used as a nesting deterrent.

- Covering the ends of pipes or other materials within which birds could nest.
- Removal of inactive nests (according to the protocols described in Section 7 below).

7 Nest Management: Inactive Nests

In conformance with APM/BMP BIO-29 and MM-WIL-CEQA-1, this APP/BBCS includes a Nest Management Plan (for inactive nests), as well as a Nesting Bird Management Plan (for active nests). Destruction of unoccupied migratory bird nests (i.e., no eggs or young present) is not a violation of MBTA (USFWS 2018). USFWS defines an active nest as one that contains viable eggs and/or chicks. A nest becomes active when the first egg is laid and remains active until fledged young are no longer dependent on the nest. Nests that are empty, contain non-viable eggs, or are being built but do not yet have an egg in them are considered inactive (USFWS 2018). Eggs will be assumed to be viable unless there are signs observed to the contrary (e.g., consistent absence of adult birds at nest over multiple days, signs of part of a clutch fledging, or timing considerations such as unhatched eggs remaining in nest longer than the expected incubation period for the species). If non-viability is suspected, questions of viability will be determined in consultation with USFWS and AZGFD or CDFW. Many species do not begin to incubate until the clutch is complete in order to facilitate synchronous hatching. These nests may appear to be unattended to a naive observer. Nests would be observed over the course of days to see if the number of eggs increases indicating that egg-laying is still in progress.

This Nest Management Plan describes the protocol to remove inactive nests in and within 500 feet of active construction and/or O&M areas, in the event that DCRT chooses to remove the nests. As some groups of birds, such as raptors, and colonial-nesting species such as swallows and herons, regularly reuse nest structures, the primary purpose of inactive nest removal is to prevent the potential reuse of these nests, which would trigger avoidance requirements during the nesting season. Inactive nests may be destroyed and dropped to the ground. No nests will be taken off site or collected. The nest location may be subsequently monitored to detect any re-nesting attempts. Re-nesting attempts may be deterred, using methods detailed below or in Section 6.4, until the bird selects an alternative nest site.

The preferable time to remove inactive nests is outside of the breeding season. If possible, nest removal would occur between August 16 and December 31 for raptors, or between September 16 and February 14 for other species. At least 24 hours prior to removal of any nests, an email notification will be sent to the appropriate agencies (USFWS and AZGFD, or CDFW and CPUC, and/or BLM). The notification will provide the details of the nest location, reason for nest removal, and species previously associated with the nest, if known. If the nest is confirmed or suspected to be associated with a special status species (see Tables F3-4-1, F3-4-2, and F3-4-3), permission must be acquired from the appropriate agencies prior to removal of the nest. Within one month following nest removal, the appropriate agencies will receive a summary of nests removed.

Though nest removal will be prioritized to occur outside of the nesting season, if practicable, there may be times when nest removal during the nesting season is desired. To ensure that only inactive nests are removed, if nest removal is sought during the breeding season the following procedures will be followed, in addition to those described above. An avian biologist will monitor each nest to be removed for a minimum of one hour, to document presence or absence of activity at the nest. For raptor nests, if the angle is such that an adult in incubating position would not be visible in the nest, then a minimum of two hours of

observation will be required. Recently fledged chicks of many species (e.g., raptors, swallows) often remain dependent on the nest for a period of time after fledging—returning to the nest periodically to roost. If the biologist observes evidence of recent fledging a longer period of observation may be necessary to confirm that the nest is inactive. For example, the nest may need to be revisited at dawn or dusk to check for roosting fledglings. If possible, the biologist will check the inside of the nest to confirm the absence of eggs or chicks in the nest. For inaccessible nests (e.g., on transmission towers), the construction team responsible for removing the nest will inspect and photograph the nest from above and provide the photograph(s) to the biologist or environmental monitor. Once the biologist or monitor confirms from the photograph that the nest is empty, the nest may be removed.

8 Burrowing Owl Nesting Management / Avoidance, Minimization, and Mitigation Plan

Avoidance and minimization measures identified in the Project Final EIS (APM/BMP BIO-25, APM/BMP BIO-30, LUPA BIO-IFS-12, LUPA BIO-IFS-13, LUPA BIO-IFS-14, MM WIL-CEQA-3, and MM WIL-CEQA-7) require DCRT to conduct preconstruction surveys for nesting burrowing owls and to implement avoidance measures for active burrows that are found. These measures include:

- In Arizona and California: APM/BMP BIO-25
- In California only: APM/BMP BIO-30, LUPA BIO-IFS-12, LUPA BIO-IFS-13, LUPA BIO-IFS-14, MM WIL-CEQA-3, and MM WIL-CEQA-7.

The purpose of this burrowing owl Nesting Management/Avoidance, Minimization, and Mitigation Plan is to describe the monitoring, avoidance, and mitigation strategy that will be implemented to avoid, minimize, and mitigate impacts to burrowing owls that could result from construction and operation of the Project.

8.1 Habitat Requirements and Occurrence Status

Burrowing owls inhabit a variety of open habitats that include grassland, shrub-steppe, desert, agricultural areas, and other grassy disturbed/ruderal areas. Habitat is generally typified by short, sparse vegetation with few shrubs, level to gentle topography and well-drained soils (CDFG 2012). Burrowing owls require the presence of a mammal burrow, desert tortoise burrow, or cavity (natural or manmade) that is the appropriate size for a nest burrow. Natural rock cavities, debris piles, culverts, and pipes also are sometimes used for nesting and roosting (CDFG 2012). Although burrowing owls can excavate holes where burrows are unavailable, they rarely do so (Thomsen 1971). Burrow availability is a major factor in defining suitable burrowing owl habitat (Coulombe 1971; Green and Anthony 1989).

Within the Project area burrowing owls are most likely to nest in valley bottoms in and around farmland at the eastern and western ends of the Project area (Stantec 2018); however, occurrence is possible throughout most of the Project area, if suitable burrows occur. The Desert Quartzite Solar project conducted extensive protocol level surveys for burrowing owls between 2012 and 2015, in an area overlapping the west end of the Ten West :Link. Up to four active burrows were documented over this time frame (Ironwood Consulting 2016), confirming that burrowing owl densities are very low across Palo Verde Mesa, southwest of Blythe, California.

8.2 Preconstruction Monitoring Procedures

8.2.1 Survey

Because burrowing owls occupy burrows year-round in this region, burrowing owl surveys will occur prior to construction regardless of the time of year. Prior to conducting a site visit, occurrence data will be acquired from AZGFD-Natural Heritage Program and the California Natural Diversity Database, to locate historical observations of burrowing owls, burrowing owl nests, desert tortoise burrows, and burrowing mammals (e.g., ground squirrels, badgers). All survey activity will be conducted by qualified avian biologist(s) knowledgeable with the species. In Arizona, surveyors will have burrowing owl survey protocol certification (training provided by AZGFD). In California, surveyors will be approved by CPUC, BLM, and CDFW. To assess potential burrowing owl habitat, the approved avian biologist(s) will conduct at least one site visit covering the entire area of proposed construction activity and surrounding areas within the appropriate avoidance buffer, depending on access/landowner permission. If lawful access to adjacent areas cannot be achieved, surveys can be performed with a spotting scope or other methods. In California, the survey area will include all areas within 492 feet of proposed construction activity, per MM-WIL-CEQA-3, MM-WIL-CEQA-7, and the California Burrowing Owl Consortium (1993) survey protocol.

Following the habitat assessment described above, and no more than 14 days prior to initial ground disturbance, DCRT will conduct a focused take avoidance survey for burrowing owls in all areas determined to have potential burrowing owl habitat that are within the appropriate avoidance buffer of planned construction activity. Surveys in Arizona will be conducted in conformance with AZGFD (2009) guidance and surveys in California will be in conformance with CDFG's 2012 Staff Report on burrowing owl mitigation, with the exception of the survey buffers, which follows the California Burrowing Owl Consortium (1993). The habitat assessment may be conducted during the same visit as the take avoidance survey or at any time prior to the take avoidance survey.

As described by CDFG (2012) and AZGFD (2009), the take avoidance survey will entail walking line transects spaced 20 meters apart in California, and 10 meters apart in Arizona. In either case, at approximately 100-meter intervals, the observer will scan the surroundings with binoculars, and listen for any calling burrowing owls. The surveyor(s) will record all burrowing owl detections and potential burrowing owl burrows, as determined by the presence of one or more of the following observations: burrowing owls, pellets, prey remains, whitewash, or decoration. Care will be taken to minimize disturbance near occupied burrows during all seasons and to avoid flushing burrowing owls. As the first few hours of the morning and last couple of hours of the afternoon provide the highest detection probabilities, an attempt will be made to utilize these times of day for surveying, to the greatest extent practicable, though surveys may be conducted at any time during daylight hours, except during inclement weather (e.g., strong wind, dense fog, or precipitation). As burrowing owls may re-colonize a site after disturbance ceases, time lapses of 14 days or more between Project activities will trigger additional rounds of take avoidance surveys prior to subsequent rounds of construction activity, including, but not limited to an additional survey within 24 hours of ground-disturbing activities. Implementation of avoidance and minimization measures would be triggered by positive owl presence.

8.2.2 Reporting

Following the habitat assessment/take avoidance survey effort, DCRT will provide a report on the survey methods and results to the BLM, AZGFD, and CDFW. The report will include the following information:

- Any avoidance or relocation recommendations for review and approval by BLM and the appropriate state agencies (AZGFD, CPUC and/or CDFW).
- A detailed map(s) showing the survey area, historical burrowing owl detections as acquired during the desktop assessment, current confirmed and potential burrowing owl burrows and detections, survey transects walked, and a delineation of areas deemed unsuitable.
- For areas deemed to have unsuitable habitat, a justification will be provided, including photograph(s) and/or a written description of one or more of the following characteristics used to rule out habitat potential: topography, land use, soil type, burrow presence/absence, and/or vegetation conditions present.
- Date, start, and end time of surveys.
- Description of weather conditions (ambient temperature, wind speed, percent cloud cover, precipitation and visibility).
- Name(s) of surveyor(s) and qualifications.
- A discussion of how the timing of the survey affected the comprehensiveness and detection probability.
- A description of survey methods used including: transect spacing, point count dispersal and duration, and any calls used.
- A description and justification of the area surveyed relative to the Project area.
- A description that includes: number of owls or nesting pairs at each location (classified as nestlings, juveniles, adults, and those of an unknown age), number of burrows being used by owls, and burrowing owl sign at burrows. Include a description of individual markers, such as bands (numbers and colors), transmitters, or unique natural identifying features. If any owls are banded, request information from the United States Geological Survey-Bird Banding Laboratory and bander to compile details regarding the known history of the banded burrowing owl(s) (age, sex, origins, whether it was previously relocated) and provide these details with the report if available.
- A description of the behavior of burrowing owls during the surveys, including feeding, resting, courtship, alarm, territorial defense, and those indicative of parents or juveniles.
- A list of possible burrowing owl predators detected and documentation of any evidence of predation upon owls.
- Signed field forms, photographs, etc., as appendices to the field survey report.
- Recent color photographs of the proposed project or activity site.
- For surveys conducted in California, original California Natural Diversity Database Field Survey Forms should be sent directly to the Department's California Natural Diversity Database office, and copies should be included in the environmental document as an appendix (http://www.dfg.ca.gov/bdb/html/cnddb.html).

8.3 Avoidance and Relocation Strategy

If preconstruction focused burrowing owl surveys determine that burrowing owls occupy the Project area, a tiered avoidance and relocation strategy will be implemented to avoid burrowing owls, relocate burrowing owls, and prevent recolonization of areas (if necessary) by burrowing owls, as outlined below. These methods generally adhere to the recommendations contained in the *Staff Report on Burrowing Owl Mitigation* currently used by CDFW to guide burrowing owl mitigation measures. The three avoidance and relocation strategy tiers incorporated in this plan are:

- Tier 1 – Avoidance Buffers
- Tier 2 – Burrow Exclusion and Passive Relocation
- Tier 3 – Prevention of Recolonization

Methods to avoid impacts to burrowing owls will take precedence over passive or active relocation. If preconstruction focused burrowing owl surveys determine that burrowing owls occupy burrows within 492 feet (150 meters) of proposed construction activities, the qualified avian biologist will assess the risk of construction activities to the burrowing owl. This risk assessment shall consider several factors, including, but not limited to, the following:

- Location of the burrow relative to planned construction activities.
- Type of burrow use (i.e., occupied nest burrow or non-nesting roost burrow that may include wintering or satellite burrows).
- Type of construction activity and level of potential disturbance.
- Timing of burrow use (e.g., occupation of a burrow after construction has been started versus prior to construction).

Based on the risk assessment, the avian biologist will determine, for each occupied burrow, whether the Project is likely to substantially impact the burrow such that injury or death of a burrowing owl could occur. Indirect impacts may be substantial if construction activities could potentially cause injury or mortality of owls, including from collisions with nearby construction equipment, vehicles, or fences. The Project biologist will have discretion in determining whether an indirect impact is substantial. Avoidance buffers can be implemented to avoid direct and substantial indirect impacts to owl burrows and individuals.

8.3.1 Nest Avoidance

To comply with MM-WIL-CEQA-3, APM/BMP BIO-30, and LUPA BIO-IFS-12, burrows occupied by owls will be buffered from disturbance. Unless otherwise authorized by the appropriate agencies (depending on location—BLM, AZGFD, CDFW, and/or CPUC), a buffer, within which no activity will be permissible, will be maintained between Project activities and nesting burrowing owls. The avoidance buffer will be TBD in Arizona and 656 feet in California.

Because burrowing owls occupy burrows year-round, including outside of the breeding season, burrows will be buffered in any season if currently occupied, whether for nesting or roosting. Burrows will be monitored by a qualified biologist using non-invasive methods to determine if a smaller buffer would be adequate to protect the occupied burrow. This

determination will be based on the risk assessment described in Section 8.3 above, as well as time of year and observed nesting phenology. A smaller buffer may be implemented, but only after consultation with and approval from CDFW or AZGFD as appropriate. This would be submitted to the BLM CIC in the form of a variance.

8.3.2 Burrow Exclusion and Passive Relocation

If there is any danger that owls will be injured or killed as a result of construction activity because occupied burrow(s) cannot be avoided on-site, the birds may be passively relocated during the non-breeding season (October 16 to March 31) using burrow exclusion, in coordination with USFWS and CDFW or AZGFD. Relocation of owls during the non-breeding season will be performed by a qualified biologist using one-way doors, which should be installed in all burrows within the impact area and left in place for at least two nights. To avoid the potential for owls evicted from a burrow to occupy other burrows within the impact area, one-way doors will be placed in all potentially suitable burrows within the impact area when eviction occurs. These one-way doors will then be removed, and the burrows backfilled immediately prior to the initiation of grading.

Ideally, exclusion and burrow closure will be employed only where adjacent natural alternative burrows and non-impacted habitat occurs. If natural alternative burrows do not already occur in the adjacent habitat, artificial burrows will be installed prior to the exclusion.

Prior to implementing burrow exclusion, there must be verification that burrows are empty as specified below. Confirmation that the burrow is not currently supporting nesting or fledgling activities is required prior to any burrow exclusions or excavations. To ensure that take is avoided, biological monitoring of the occupied or potentially occupied burrow will be conducted prior to, during, and after exclusion of burrowing owls from their burrows. If the exclusion will occur immediately after the end of the breeding season, daily monitoring will be conducted for one week to confirm young of the year have fledged. Before burrow excavation, there must be verification that burrows are empty. This will be achieved through biological monitoring and burrow scoping. While the one-way doors are in place, a biologist will visit the burrows twice daily and check for evidence that owls are inside and unable to escape by looking for sign immediately inside the door and verifying that the sides of the one-way doors have not been excavated, which would allow the owl to bypass the exclusion.

If practicable, burrow excavation will be done using hand tools and backfilling to prevent reoccupation. If full visual confirmation of the burrow occupancy status cannot be achieved by means of the scope, the biologist will install corrugated piping or similar material within sections of the burrow prior to beginning excavation. Piping will be used to stabilize the burrow, prevent burrow collapse, and allow wildlife that may be present to escape the burrow during excavation if necessary. As excavation occurs, the burrow will be regularly inspected with the scope to verify that no owls or other wildlife are present, and piping will continually be re-installed for the portions of the burrow currently under excavation.

The biologist will photograph the excavation and collapsing of the burrow to document success and sufficiency.

8.3.3 Prevention of Recolonization

As practicable, the site will be rendered inhospitable to burrowing owls and fossorial mammals to avoid re-colonization until construction is complete through measures that

could include allowing vegetation to grow tall, heavy disking, or immediate, continuous grading and removal of other potential owl burrow surrogates or refugia on the site. The site will be monitored to evaluate success and, if needed, to implement remedial measures to prevent subsequent owl use and to avoid take.

8.3.4 Reporting

DCRT will develop a monthly report documenting implementation of avoidance, relocation, and monitoring for any active burrowing owl burrows detected in the survey area. This report shall be made available to the BLM, AZGFD, CPUC, and CDFW.

9 Bat Management and Protection Plan for California

Twenty-two bat species are present in the region and many of these may forage in the vicinity of the Project area, including eight special status species in California (Table F3-4-5). Monitoring and avoidance for bats will be implemented in compliance with the Final EIS avoidance and minimization measures, including: APM/BMP BIO-40, MM WIL-CEQA-4, MM WIL-CEQA-5. Each of these measures applies only within California.

9.1 Bat Roosts and Hibernacula

No known bat roosts or mines occur in or within 500 feet of the Project ROW. According to the Draft EIS, no mines, caves, or cliffs suitable for roosting are present in the Project area in California. Bat roosting may occur less commonly within trees—many species occasionally roost within tree cavities or behind large, loose flakes of bark which are likely to occur only in mature trees of relatively large species. *Lasiurus* species such as the western red bat (*L. blossevilli*) and western yellow bat (*L. xanthinus*) habitually roost (including maternity roosts) in the foliage of trees. Tree clearing during the maternity roosting season (March 1 – July 31) could result in mortality to bats if maternity roosts are destroyed or disturbed. Very few trees occur within the California portion of the Project area and tree clearing is not anticipated.

9.1.1 Survey

In conformance with MM WIL-CEQA-5, surveys for maternity roosts or hibernaculum will be conducted in California. Surveys will be conducted by a qualified bat biologist holding a CDFW collection permit and a CDFW Memorandum of Understanding allowing the handling of bats. The resume of the biologist will be provided to the CPUC and BLM for concurrence in consultation with CDFW and USFWS prior to the surveys. The bat biologist will conduct surveys for bat maternity roosts or hibernacula within 500 feet of Project activities, within 14 days prior to any grading of rocky outcrops or removal of trees with loose bark or other cavities, regardless of whether the construction disturbance occurs within the breeding season (1 March to 31 July) or the non-breeding season. Surveys will include a minimum of one day and one evening.

The methods and results of the surveys and any proposed avoidance or mitigation of roosts or hibernacula will be documented in a survey report and provided to CPUC, BLM, and CDFW for review and approval.

9.1.2 Avoidance and Mitigation

In conformance with MM WIL-CEQA-4, APM/BMP BIO-30, and APM/BMP BIO-40, the following avoidance and mitigation will be implemented to protect bat maternity roosts and hibernacula.

9.1.2.1 BLM Focus and Special Status Bat Species Maternity Roosts

Construction activities will not be sited within 500 feet of any occupied or presumed occupied maternity roost for BLM Focus or special status bat species in California. If construction activities cannot avoid these sites, construction at these sites will be delayed until the breeding cycles for the special status bats are completed. DCRT would consult with a bat specialist in order to determine when the breeding cycle for the special status bats is completed. If the maternity roost occurs within a bridge on an existing dirt or paved roadway within 500 feet of construction activities, construction may be allowed, provided that the construction activities occur only from 9:00 a.m. to 4:00 p.m. to avoid disturbance to nocturnal feedings.

9.1.2.2 Maternity Roosts with No BLM Focus or Special Status Bat Species

If an active maternity roost is found in California, the rock outcrop, structure, or tree occupied by the roost shall be avoided (i.e., not removed) by the Project if feasible. If the roost is not known or suspected to host BLM Focus or special status bat species, and avoidance of the maternity roost is not feasible, the bat biologist shall survey (through the use of radio telemetry or other CDFW approved methods) for nearby alternative maternity colony sites. If the bat biologist determines in consultation with and with the approval of the CDFW, BLM, and CPUC that there are alternative roost sites used by the maternity colony and young are not present, then no further action is required, and it will not be necessary to provide alternate roosting habitat. However, if there are no alternative roost sites used by the maternity colony, substitute bat roosting habitat shall be provided, as detailed below. If an active maternity roost is located in an area to be impacted by the Project, and alternative roosting habitat is available, the demolition of the roost site must commence before maternity colonies form (i.e., prior to 1 March) or after young are flying (i.e., after 31 July) using the exclusion techniques described below.

If a maternity roost will be impacted by the Project, and no alternative maternity roosts are in use near the site, substitute roosting habitat for the maternity colony will be provided on, or in close proximity to, the Project site no less than three months prior to the eviction of the colony. Alternative roost sites will be constructed in accordance with the specific bat species requirements in coordination with CDFW. By making the roosting habitat available prior to eviction, the colony will have a better chance of finding and using the roost. Large concrete walls (e.g., on bridges) on south or southwestern slopes that are retrofitted with slots and cavities are an example of structures that may provide alternative roosting habitat appropriate for maternity colonies. Alternative roost sites must be of comparable size and proximal in location to the impacted colony. The CDFW shall also be notified of any hibernacula or active nurseries within the construction zone.

9.1.2.3 Hibernacula and Non-maternity Roosts

If a bat hibernacula or non-maternity roost is found in California in a tree or structure scheduled to be removed or in crevices in rock outcrops within the grading footprint, the rock outcrop or tree occupied by the roost shall be avoided (i.e., not removed) by the Project if

feasible. If avoidance of the hibernacula or non-maternity roost is not feasible, the bats may be safely evicted, under the direction of a qualified bat biologist holding a CDFW collection permit and a CDFW Memorandum of Understanding allowing the handling of bats. If BLM Focus or special status bat species are known or suspected to occupy the hibernacula or non-maternity roost, DCRT would consult with CDFW prior to evicting the bats. The biologist may evict the bats by opening the roosting area to allow airflow through the cavity or other means determined appropriate by the bat biologist (e.g., installation of one-way doors). In situations requiring one-way doors, a minimum of one week will pass after doors are installed and temperatures should be sufficiently warm for bats to exit the roost because bats do not typically leave their roost daily during winter months in southern California. This action should allow all bats to leave during the course of one week. Roosts that need to be removed in situations where the use of one-way doors is not necessary in the judgment of the qualified biologist will first be disturbed by various means at the direction of the bat biologist at dusk to allow bats to escape during the darker hours, and the roost tree will be removed, or the grading will occur the next day (i.e., there will be no less or more than one night between initial disturbance and the grading or tree removal). Eviction will not occur during times when the hibernacula are occupied by inactive, hibernating bats, as determined by the qualified bat biologist.

ATTACHMENT A AVOIDANCE AND MINIMIZATION MEASURES

This page intentionally left blank.

BIO-01: Worker Environmental Awareness Program

Before starting any work, including mowing, staging, installing storm water control structures, implementing other best management practices (BMPs), removing trees, construction, and restoration, all employees and contractors performing activities and new construction would receive training on environmental requirements that apply to their job duties and work. If additional crewmembers arrive later in the job, they would be required to complete the training before beginning work. This Worker Environmental Awareness Program (WEAP) would include a discussion of the avoidance and minimization measures being implemented and would include information on the federal and state Endangered Species Acts (ESAs) and the consequences of not complying with these Acts. An educational brochure would be provided to construction crews working on the Project. This brochure would include color photographs of special status species as well as a discussion of avoidance and minimization measures. The WEAP would provide interpretation for non-English speaking workers.

BIO-02: Biological Monitoring and Preconstruction Survey

A qualified biological monitor would be present on the Project site during all work activities within habitat of special status animal species. Multiple biological monitors would be provided so any work site within habitat of special status species is monitored concurrently if needed.

BIO-20: Migratory Bird Protection During Construction

If construction is scheduled during the nesting bird season (generally February 1 through August 31), the work area would be surveyed for birds protected under the Migratory Bird Treaty Act (MBTA) and applicable Arizona and California codes, as appropriate. Active nests identified during preconstruction surveys would require protective buffers or visual barriers to ensure compliance with those regulations. If the qualified biologist determines that construction activities would cause distress to nearby nesting birds, larger buffers or construction delays might be necessary to allow the birds to successfully fledge from the nest.

APM BIO-21: Reduction of Avian Collision and Electrocution

Current guidelines and methodologies (APLIC 2006 and 2012) would be used in the design of the proposed transmission facilities to minimize the potential for raptors and other birds to collide with the transmission line during operations and/or perch on the lines and be electrocuted. For example, aerial marker balls or other visibility markers would be placed at and near the crossing of the Colorado River to increase the visibility of the transmission line to birds using that movement corridor. Deterrents would be added to reduce nesting and perching by ravens and other predatory birds. Further, placement of lines significantly above existing transmission lines, topographic features, or tree lines would be avoided. These measures would be implemented where practicable, in conjunction with the Avian Protection Plan (APP) would include requirements for monitoring the effectiveness of anti-collision and anti-perching design.

Aerial marker balls or other visibility markers would be placed on overhead ground wires (not conductors) at crossing of the Colorado River and floodplain to increase visibility to birds using that movement corridor and marking any other static wires to improve visibility and reduce collisions. Deterrents would be added to reduce nesting and perching by ravens

and other predatory birds. The APP would include requirements for monitoring the effectiveness of anti-electrocution design.

BMP BIO-21: Reduction of Avian Collision and Electrocution

Aerial marker balls or other visibility markers would be placed on overhead ground wires (not conductors) at crossing of the Colorado River and floodplain to increase visibility to birds using that movement corridor and marking any other static wires to improve visibility and reduce collisions. Deterrents would be added to reduce nesting and perching by ravens and other predatory birds. The APP would include requirements for monitoring the effectiveness of anti-electrocution design.

BIO-25: Sensitive Animal Surveys

A survey would be conducted of the selected route prior to construction of all work areas to identify special status animal species, including Mojave desert tortoises (*Gopherus agassizii*), burrowing owls (*Athene cunicularia*), and Mojave fringe-toed lizards (*Uma scoparia*). Where possible, and as required by the Bureau of Land Management (BLM), special status species and vegetation alliances would be avoided during construction.

BIO-29: Bird and Bat Conservation Strategy

The Bird and Bat Conservation Strategy (BBCS) would provide guidance on conservation measures applicable to bird and bat species present in the Project area, including a nesting bird management plan and a nest management plan.

BIO-30: Burrowing Owl Nesting Management Plan

Plan would include management direction consistent with LUPA-BIO-IFS-12, LUPA-BIO-IFS-13, and LUPA-BIO-IFS-14.

BIO-33 Construction Lighting

All long-term nighttime lighting would be directed away from riparian and wetland vegetation, occupied habitat, and suitable habitat areas for sensitive species. Long-term nighttime lighting, if required, would be directed and shielded downward to avoid interference with the navigation of night-migrating birds and to minimize the attraction of insects as well as insectivorous birds and bats to project infrastructure. Long-term nighttime lighting would avoid the use of constant-burn lighting.

BIO-39: Bird- and Bat-Friendly Fencing

When fencing is necessary, use bird and bat compatible design standards.

BIO-40: Project Activity Siting Near Bat Maternity Roosts (applies only in California)

Activities would not be sited within 500 feet of any occupied maternity roost or presumed occupied maternity roost for BLM Focus and special status bat species.

BIO-45: Protection from Loss and Harassment of Golden Eagles (applies only in California)

Provide protection from loss and harassment of active golden eagle nests through activities identified LUPA-BIO-IFS-24 through -31.

BIO-48: Flight Diverters (applies only in California)

Flight diverters will be installed on all transmission activities spanning or within 1,000 feet of stream and wash channels, canals, ponds, and any other natural or artificial body of water. The type of flight diverter selected will be subject to approval by BLM, in coordination with United States Fish and Wildlife Service (USFWS) and California Department of Fish and Wildlife (CDFW), as appropriate.

REC-03: Guy Wire Marking

Plastic mesh or paint would be used to mark guy wires in areas used for recreation. Permanent high visibility guy markers would be installed during construction.

MM BIO-CEQA-2: Implement a Worker Environmental Awareness Program (applies only in California)

BMP-BIO 1 and CMA LUPA-BIO-5 shall be incorporated within this MM BIO-CEQA-2.

- Prior to any work activities on the Project site, including surveying, mobilization, fencing, grading, or construction, a WEAP shall be prepared and implemented by the Applicant. Prior to implementation the WEAP will be approved by the California Public Utilities Commission (CPUC) with a final version completed prior to the issuance of construction permits. The WEAP shall be implemented throughout the duration of Project, including operations and maintenance (O&M) phases. Successful implementation of the WEAP will result in all on-site Project personnel being properly informed and educated on the pertinent environmental concerns related to the Project. One of the main goals of the WEAP, is that it shall reduce unintentional impacts to biological resources within the Project area and ensure that all workers are trained in accordance with these mitigation measures (MM). The WEAP shall include, at a minimum, the following items: Maps showing the known locations of listed and/or special status wildlife, populations of listed and special status plants and sensitive vegetation communities, riparian habitats, seasonal depressions and known waterbodies, wetland habitat, exclusion areas, and other construction limitations.
- A discussion of measures to be implemented for avoidance of sensitive resources discussed in the Environmental Impact Statement (EIS; including this appendix) and the identification of an onsite contact in the event of the discovery of sensitive species on the Project site; this shall include a discussion on micro trash.
- Training materials and briefings shall include, but not be limited to: a discussion of the federal ESA and CESA; the Bald and Golden Eagle Protection Act; the MBTA; the Avian Power Line Interaction Committee (APLIC) Guidelines; the consequences of non-compliance with these regulations; identification and values of plant and wildlife species and significant natural plant community habitats; hazardous substance spill prevention and containment measures; a contact person and phone

number in the event of the discovery of dead or injured wildlife; and a review of mitigation requirements.

- Protocols to be followed when road kill is encountered in the work area, or along access roads, and the identification of an onsite representative to whom the road kill shall be reported. Road kill shall be reported to the appropriate local animal control agency, the CPUC within 24 hours. Road kill of special status species shall also be reported to the CDFW and/or USFWS within 24 hours or otherwise specified in Project-specific permits.
- Literature and photographs or illustrations of potentially occurring special status plant and/or wildlife species shall be provided to all Project contractors and heavy equipment operators.
- A special hardhat sticker or wallet size card shall be issued to all personnel completing the training, which shall be carried with the trained personnel at all times while on the Project site.
- All new personnel shall receive this training and may work in the field for no more than five days without participating in the WEAP.
- A log of all personnel who have completed the WEAP training shall be kept on site.
- A copy of the WEAP shall be kept at an easily accessible location within the Project site (e.g., foreman's vehicle, construction trailer) for the duration of the Project.
- A standalone version of the WEAP shall be developed, that covers all previously discussed items above, and that can be used as a reference for maintenance personnel during Project operations.
- The Applicant shall ensure that interpretation of the WEAP is available for all non-English speaking workers.

MM BIO-CEQA-2 Implementation

Responsible Party: The Applicant shall ensure that a qualified biologist (approved by the CPUC) prepares the WEAP and that it is implemented for all on-site Project personnel.
Timing: Prior to construction, and during construction for all new on-site Project personnel.
Mitigation Monitoring and Reporting Program: The WEAP shall be developed by a qualified biologist designated by the Applicant and approved by the CPUC. A copy of the WEAP shall be kept at an easily accessible location within the Project site for the duration of the Project. A log of all personnel who have completed the WEAP training shall be kept on site.
Standards for Success: All construction/Project related personnel are trained in the key characteristics for identifying and avoiding impacts to special status species and sensitive habitats.

MM BIO-CEQA-3: Implement Biological Construction Monitoring (applies only in California)

APM BIO-2, BMP BIO-02, and CMA LUPA BIO-2 shall be incorporated within this MM BIO-CEQA-3.

No more than 30 days prior to the start of site mobilization or ground disturbing activities, the Applicant shall designate a qualified biologist(s) to monitor construction of the Project. Multiple qualified biologists shall be designated by the Applicant, as needed. Designated

qualified biologists must be approved by the CPUC, BLM, and CDFW prior to conducting construction monitoring. The biologist(s) must be knowledgeable with the life history and habitat requirements of federal and state listed and special status plants, mammals, reptiles, amphibians, and birds. The qualified biologist(s) shall conduct clearance surveys for listed and special status species prior to the start of construction activities each work day during initial site disturbance; clearance surveys can be conducted on a weekly basis thereafter. Any handling of special status species must be approved by the appropriate federal and state agencies and be done in accordance with species-specific handling protocols. During initial site disturbance, and for the duration of construction, the qualified biologist(s) shall remain on-site at all times when activities shall occur immediately adjacent to, or within, habitat that supports populations of listed and/or special status species. The designated biologist(s) shall relocate any terrestrial special status species that would be impacted by the Project. Permits and/or a Memorandum of Understanding may be required for some species. All locations of listed and/or special status plants shall be flagged for avoidance or salvage, relocation, or transplanting as described in MM VEG-CEQA-4. Similarly, locations of listed and/or special status wildlife shall be flagged for avoidance and appropriate avoidance buffers established as described in MM WIL-CEQA-1 through MM WIL-CEQA-11. Results of all monitoring shall be recorded on daily site observation reports and include details the construction activities. The daily monitoring reports shall be compiled and submitted to the CPUC, BLM, and CDFW for review on a weekly basis. Contents of the reports shall include at a minimum the date, time of monitoring, location, qualified biologists name, construction activities, biological conditions and species detections, and any issues encountered during the monitoring effort.

If dead or injured special status wildlife species and/or impacted special status plant are detected on the construction site, the qualified biological monitor shall, immediately upon finding the remains or injured animal, coordinate with the onsite construction foreman to discuss the events that caused the mortality or injury, if known, and implement measures to prevent future incidents. Details of these measures shall be included within monitoring separate incident report. Species remains shall be collected and frozen as soon as possible, and CDFW and USFWS, as well as all other appropriate Federal and State regulatory agencies, shall be contacted regarding ultimate disposal of the remains. The incident report shall be sent to the CPUC, CDFW and/or USFWS (as appropriate), as well as any other appropriate Federal and State agencies, within five calendar days. The construction biological monitoring report shall at a minimum include: the date, time of the finding or incident (if known), and location of the carcass, injured animal or other impacted species, and the circumstances of its death or injury (if known). Injured animals shall be taken immediately to the nearest appropriate veterinary or wildlife rehabilitation facility.

MM BIO-CEQA-3 Implementation

Responsible Party: The Applicant is responsible for designating qualified biologists to monitor Project construction activities that are within and/or adjacent sensitive habitats, and/or have the potential to impact special status species.

Timing: During all Project phases if biological resources are pertinent or monitoring is required by the appropriate Federal or State regulatory agency.

Mitigation Monitoring and Reporting Program: Copies of daily monitoring reports shall be compiled and submitted to the CPUC, BLM, and CDFW on a weekly basis. Separate incident reports shall be compiled and submitted to the appropriate federal and state agencies if observations of dead, injured or impacted special status species are observed during monitoring within five calendar days.

Standards for Success: Sensitive biological resources are avoided and/or impacts are reduced to a less than significant level throughout all construction activities.

MM-WIL-CEQA-1: Develop and Implement an Avian Management and Protection Plan and Bird and Bat Conservation Strategy (applies only in California)

The following APMs, BMPs, and CMAs shall be incorporated within this MM WIL CEQA-1: BMP BIO-19, APM BIO-20, APM BIO-21, BMP BIO-21, BMP BIO-29, BMP BIO-30, BMP BIO-33, BMP BIO-40, BMP BIO-45, BMP BIO-48, CMA LUPA-BIO-14, CMA LUPA-BIO-16, CMA LUPA-BIO-17, CMA LUPA-BIO-COMP-2, CMA LUPA-BIO-IFS-11, CMA-LUPA-BIO-IFS-12, CMA LUPA-BIO-BAT-1, CMA LUPA-BIO-COM-2, CMA LUPA-BIO-DUNE-5, CMA LUPA-BIO-IFS-13, CMA LUPA-BIO-IFS-14, CMA LUPA-BIO-IFS-24, CMA LUPA-BIO-IFS-25, CMA LUPA-BIO-IFS-26, CMA LUPA-BIO-IFS-27, CMA LUPA-TRANS-BIO-1, CMA LUPA-TRANS-BIO-2, and CMA LUPA-TRANS-BIO-3.

The Project Applicant shall prepare an APP and BBCS, which will also include a component for a Nesting Bird and Nest Management Plan (NBNMP), as identified in the BBCS in BMP BIO-29, in coordination with and approval by the applicable permitting/resource agencies (i.e., BLM, CDFW, USFWS, CPUC) prior to the start of construction. Additionally, the components of the Burrowing Owl Avoidance, Minimization, and Mitigation Plan (MM WIL-CEQA-3) and the Bat Management and protection Plan (MM WIL-CEQA-4) will also be included under the overarching APP/BBCS Plan. The specifics of the APP and BBCS will include the following:

- APP: The APP will follow the APLIC/USFWS 2005 APP Guidelines which specifies program design for transmission projects in order to reduce operational avian risks that result from interactions with transmission lines. This goal of this guidance is to reduce avian mortality from electrocution and collision with the transmission lines. The APP Guidelines state that although each APP developed for a specific project may be different, the overall goal of reducing avian mortality is the same across all developed APPs. The APP developed for the Project shall include, at a minimum, the following consideration and evaluation of principals identified in the APP Guidance:

    1. **Corporate policy:** Confirming the company's commitment to work cooperatively towards the protection of migratory birds.
    2. **Training:** All appropriate utility personnel, including managers, supervisors, line crews, engineers, etc. shall be properly trained in avian issues (which shall be enforced through MM BIO-CEQA-2, Implement a WEAP).
    3. **Permit Compliance:** Identify the process in which the Applicant will obtain and comply with all necessary permits related to avian issues.
    4. **Construction Design Standards**: Avian interactions shall be considered in the design and installation of the transmission line as well as during operations and maintenance of the facility. Construction configurations from the *Suggested Practices for Raptor on Power Lines; The State of the Art in 1996* and *Mitigating Bird Collisions with power Lines: The State of the Art in 1994*, or the most current editions of these documents shall be consulted during the design phase of the Project to ensure new construction is avian-safe.

5. **Nest Management:** Procedures for net management on the transmission lines shall be explained to employees during training to ensure uniform treatment of avian nest issues among personnel.
6. **Avian Reporting System:** Development of a reporting system which shall include reporting of any avian mortalities, as required by any federal or State permits. The reporting system can also help pinpoint areas of concerns by tracking both the specific locations where mortalities may be occurring, as well as the extent of such mortalities.
7. **Risk Assessment Methodology:** A focus on the areas with the highest risk to migratory birds shall be the focus of the APP and therefore, a method for evaluating the risks posed to migratory birds in a manner that identified areas and issues of particular concern shall be developed.
8. **Mortality Reduction Measures:** After completing the risk assessment, the efforts for avian protection shall be focused on areas of concern. A mortality reduction plan may need to be implemented depending on the results of the risk assessment. This approach could be implemented through direction of where monitoring should occur, where retrofits should be focused, and where new construction warrants special attention to raptor and other bird issues.
9. **Avian Enhancement Options:** In addition to taking steps to reduce mortality risk to avian species, the developed APP also may include opportunities to enhance avian populations or habitat, including developing nest platforms, managing habitats to benefit migratory birds, or working cooperatively with agencies or organizations in such efforts.
10. **Quality Control:** The developed APP may also include a mechanism to review existing practices, ensuring quality control.
11. **Public Awareness:** The developed APP shall include a method to educate the public about the avian electrocution issues, the developed APP, as well as its success in avian protection.
12. **Key Resources:** The developed APP shall identify key resources to address avian protection issues including, for example, a list of experts who may be called upon to aid in resolving avian issues.

- BBCS: The purpose of the BBCS is to outline measures/methods to minimize potential Project effects to nesting birds and avoid unauthorized take; the NBNMP (developed as a part of the BBCS) shall be approved by the above noted agencies prior to the site disturbance or preconstruction activities and be implemented by the Applicant throughout construction activities. Additionally, the current APLIC guidelines shall be incorporated into the NBNMP, which includes protections for nocturnal migrants (i.e., lighting controls) and species along the Colorado River and near agricultural fields (APLIC 2006 and 2012) (see BMP BIO-33). Specifically, these guidelines will be used to minimize the potential for attracting birds and bats to the proposed infrastructure (transmission lines and facilities). Any nighttime lighting associated with construction will be temporary and shielded in order to provide safe working conditions while limiting light spillover outside of the construction area. Implementation of APM AES-15 will also ensure that lighting, will be directed in a downward position. Preconstruction surveys shall be completed in accordance with MM WIL-CEQA-6 below and if breeding birds with active nests are found prior to or during construction, a qualified avian biologist shall establish a minimum 300-foot buffer (500 feet for raptors) around the nest and no activities

shall be allowed within the buffer(s) until the young have fledged from the nest or the nest fails (CPUC 2016). The prescribed buffers may be adjusted by a qualified avian biologist based on existing conditions around the nest, planned construction activities, tolerance of the species, and other pertinent factors. Buffer reductions for listed or special status species may require coordination with the USFWS and/or CDFW. The qualified avian biologist shall conduct regular monitoring of the nest to determine success/failure and to ensure that Project activities are not conducted within the buffer(s) until the nesting cycle is complete or the nest fails. An avian biologist shall be responsible for documenting the results of the surveys (MM WIL-CEQA-6 below), nest buffers implemented, and the results of ongoing monitoring and shall provide a copy of the monitoring reports for impact areas to the appropriate resource agencies (i.e., USFWS and CDFW) (CPUC 2016).
If trees with nests are to be removed as part of Project construction activities, they shall be done so outside of the nesting season to avoid additional impacts to nesting raptors. If removal during the nesting season cannot be avoided all trees shall be inspected for active nests by the avian biologist. If nests are found within these trees, and contain eggs or young, no activities within a 300-foot buffer for nesting birds and/or a 500-foot buffer for raptors shall occur until the young have fledged the nest (CPUC 2016). At a minimum, the NBNMP shall include the following:

- Definitions of standard nest buffers for each species or group of species, depending on characteristics and conservation status for each species.
- A notification procedure for buffer distance reductions should they become necessary under special circumstances.
- A monitoring protocol including qualifications of monitors, monitoring schedule, and field methods, to ensure that any Project-related effects to nesting birds shall be minimized.
- A protocol for documenting and reporting any inadvertent contact or effects to birds or nests.
- A summary of applicable state and federal laws and regulations, including definition of what constitutes a nest or active nest under state and federal law.
- A list of bird species potentially nesting on or near the Project area, indicating approximate nesting seasons, nesting habitat, typical nest locations (e.g., ground, vegetation, structures), tolerance to disturbance (if known) and any conservation status for each species.
- A discussion of how construction of the Project has been scheduled, to avoid or minimize project impacts to nesting birds. Activities that may adversely affect breeding birds shall be scheduled outside the nesting season, as feasible.
- Discussion on nest buffer modification or reduction guidelines, including reporting procedures to the appropriate agencies (i.e., CDFW, USFWS, and CPUC).
- Discussion on use of nest deterrents and communication protocols for on-site monitors.
- Monitoring and reporting requirements.

- Detailed noise monitoring guidelines for active breeding territories and/or nests for special status species that may occur within 500 feet of the Project area.
- Procedures for the calculation of a fee, to be reassessed every five years, to fund compensatory mitigation for bird and bat mortality impacts; this shall be based on requirements described in CMA LUPA-BIO-COMP-2.

MM WILCEQA-1 Implementation

Responsible Party: The APP/BBCS shall be developed and implemented by the Applicant and approved by the BLM, CDFW, USFWS, CPUC.
Timing: The APP/BBCS shall be prepared/approved prior to the start of construction activities and shall be implemented throughout the duration of construction. The APP specifically shall be implemented throughout the life of the Project while the BBCS shall focus on the construction and maintenance of the Project.

Mitigation Monitoring and Reporting Program: The Applicant shall retain a qualified avian biologist (approved by the CPUC) to perform monitoring surveys within 500 feet of the Project area. The qualified avian biologist shall report any inadvertent contact or effects to birds or nests within the Project area to the BLM, CDFW, USFWS, and CPUC. The Applicant shall develop a monthly report documenting compliance with this measure and any actions taken regarding the NBNMP. This report shall be made available to the BLM, CDFW, USFWS, and the CPUC. The monitoring requirements for the APP shall conform to the APLIC Guidance including identifying and responding promptly to any avian mortality and including adaptive management for avian issues related to the Project.

Standards for Success: Adverse effects to birds shall be avoided or minimized to less than significant levels.

MM WIL-CEQA-3: Develop and Implement Burrowing Owl Avoidance, Minimization, and Mitigation Plan (applies only in California)

The following BMPs and CMAs shall be incorporated within this MM WIL-CEQA-3 and MM WIL-CEQA-7: BMP BIO-30, CMA-LUPA-BIO-IFS-12, CMA LUPA-BIO-IFS-13, and CMA LUPA-BIO-IFS-14.

The Burrowing Owl Avoidance, Minimization, and Mitigation Plan (BOAMMP) would include management direction consistent with LUPA-BIO-IFS-12, LUPA-BIO-IFS-13, and LUPA-BIO-IFS-14 and will be developed as a part of the APP/BBCS (MM WIL-CEQA-1). The Applicant shall submit a BOAMMP to BLM and CPUC for approval prior to any ground disturbing activities in California. The BLM and CPUC will include CDFW in the review process and incorporate their comments as appropriate. The BOAMMP will include direction for burrowing owls which shall include a combination of active and passive relocation efforts consistent with LUPA BIO-IFS-12, LUPA BIO-IFS-13, and LUPA-BIO-IFS-14. Any relocation shall include follow up monitoring procedures.

If burrowing owls, or burrowing owl habitat is found within the Project area during preconstruction surveys as described in MM WIL-CEQA-7, the following measures shall be implemented and enforced by the BLM and CPUC throughout construction of the Project. If preconstruction focused burrowing owl surveys determine that burrowing owls occupy the Project area, a tiered approach referred to as an Avoidance and Relocation Strategy shall be implemented to avoid burrowing owls, relocate burrowing owls, and prevent

recolonization of areas (where needed, such as construction and/or substation areas) by burrowing owls, as outlined below. These methods generally adhere to the recommendations contained in the *Staff Report on Burrowing Owl Mitigation* currently used by CDFW to guide burrowing owl mitigation measures. The four avoidance and relocation strategy tiers are:

- Tier 1 – Avoidance Buffers
- Tier 2 – Passive Relocation
- Tier 3 – Prevention of Recolonization
- Tier 4 – Active Relocation (Optional)

Methods to avoid impacts to burrowing owls shall take precedence over passive or active relocation. If preconstruction focused burrowing owl surveys determine that burrowing owls occupy the project area, including within the 150-meter buffer, the qualified Project biologist will evaluate each occupied burrow to determine whether the Project is likely to directly impact or substantially indirectly impact the burrow such that injury or death of a burrowing owl could occur. Avoidance buffers can be implemented to avoid direct and substantial indirect impacts to owl burrows and individuals. A substantial indirect impact would be a situation where even though the burrow is not directly impacted during construction, the construction activities could potentially cause injury or mortality of owls, including from collisions with nearby construction equipment, vehicles, fences, or walls. The Project biologist will have discretion in determining whether an indirect impact is substantial. If occupied burrowing owl burrows are found within the Project disturbance footprint or survey buffer during preconstruction surveys, or if burrowing owls arrive on site after construction activities commence, a qualified biologist shall assess the risk of construction activities to the burrowing owl. This risk assessment shall consider several factors, including, but not limited to, the following:

- Location of the burrow (e.g., inside the disturbance footprint, within 5.0 meters (16.4 feet) of the disturbance footprint, more than 40 meters (131.2 feet) from the disturbance footprint).
- Type of burrow use (i.e., occupied nest burrow or non-nesting roost burrow that may include wintering or satellite burrows, referred to herein simply as “roost burrow”).
- Type of construction activity and level of potential disturbance (e.g., high disturbance, such as mass grading and excavation versus low disturbance, such as painting and landscaping).
- Timing of burrow use (e.g., occupation of a burrow after construction has been started versus prior to construction).

Avoidance buffers shall be strictly required for occupied nest burrows so that nesting activities are not disturbed and nesting pairs have the opportunity to rear and successfully fledge young. Per the guidelines outlined by the *Staff Report on Burrowing Owl Mitigation*, a standard minimum avoidance buffer ranging between 200 meters (656 feet) and 500 meters (1,640 feet) will be initially applied to occupied nest sites between April 1 and October 15. Burrows will be monitored by a qualified biologist to determine if a smaller buffer would be adequate to protect the active nest site. A smaller buffer may be implemented, but only after consultation with and approval from CDFW.

Establishing avoidance buffers from occupied roost burrows during October 16 through March 31 or from burrows that have been determined to not support nesting (through the

non-invasive methods cited above) during the breeding season will initially be based on the buffers described in the *Staff Report on Burrowing Owl Mitigation*. Burrows will be monitored by a qualified biologist to determine if a smaller buffer would be adequate to protect the active nest site. A smaller buffer may be implemented, but only after consultation with and approval from CDFW. Roost burrows detected during preconstruction surveys fall into three categories: (1) burrows within the proposed project disturbance footprint; (2) burrows in close proximity to the disturbance footprint; and (3) burrows farther from the disturbance footprint, but still potentially within the impact area for burrowing owl.

The Applicant shall report any special status species and natural communities detected during Project surveys to the CNDDB.

MM WIL-CEQA-3 Implementation

Responsible Party: The BOAMMP shall be developed and implemented by the Applicant and approved by the BLM, CPUC, and CDFW.
Timing: The BOAMMP shall be prepared prior to the start of construction activities and shall be implemented throughout the duration of construction.

Mitigation Monitoring and Reporting Program: The Applicant shall develop a monthly report documenting compliance with this measure and any actions taken regarding the BOAMMP. This report shall be made available to the BLM, CPUC, and CDFW.
Standards for Success: Any significant impacts to nesting or burrowing owls shall be avoided or minimized to less than significant levels.

MM WIL-CEQA-4: Develop and Implement a Bat Management and Protection Plan (applies only in California)

The following BMPs and CMAs shall be incorporated within this MM WIL CEQA-4: BMP BIO-29, BMP BIO-33, BMP BIO-40, CMA LUPA-BIO-14, CMA LUPA-BIO-16, CMA LUPA-BIO-17, CMA LUPA-BIO-BAT-1, CMA LUPA-BIO-COMP-2, CMA LUPA-BIO-DUNE-5, and CMA LUPA-TRANS-BIO-1.

The Bat Management and Protection Plan will be developed as a part of the with the BBCS (MM WIL-CEQA-1). The Bat Management and Protection Plan shall be submitted to the BLM, CPUC, and CDFW for approval prior to any ground disturbing activities. The Bat Management and Protection Plan will include direction for roosting bats and shall include, at a minimum, the following:

- If non-breeding bat hibernacula are found in trees scheduled to be removed or in crevices in rock outcrops within the grading footprint, the bats shall be safely evicted, under the direction of a qualified bat biologist, by opening the roosting area to allow airflow through the cavity or other means determined appropriate by the bat biologist. Roosts that need to be removed shall first be disturbed by various means at the direction of the bat biologist at dusk to allow bats to escape during the darker hours, and the roost tree shall be removed or the grading shall occur the next day (i.e., there shall be no less or more than one night between initial disturbance and the grading or tree removal).
- If active maternity roosts or hibernacula are found, the rock outcrop or tree occupied by the roost shall be avoided (i.e., not removed) by the Project. If avoidance of the maternity roost is not feasible, the bat biologist shall survey (through the use of radio telemetry or other CDFW approved methods) for nearby alternative maternity colony sites. If the bat biologist determines in consultation with and with the

approval of the CDFW, BLM, and CPUC that there are alternative roost sites used by the maternity colony and young are not present, then no further action is required, and it will not be necessary to provide alternate roosting habitat. However, if there are no alternative roosts sites used by the maternity colony, substitute bat roosting habitat shall be provided, as detailed below. If an active maternity roost is located in an area to be impacted by the Project, and alternative roosting habitat is available, the demolition of the roost site must commence before maternity colonies form (i.e., prior to 1 March) or after young are flying (i.e., after 31 July) using the exclusion techniques described above.

- If a maternity roost will be impacted by the Project, and no alternative maternity roosts are in use near the site, substitute roosting habitat for the maternity colony shall be provided on, or in close proximity to, the Project site no less than three months prior to the eviction of the colony. Alternative roost sites will be constructed in accordance with the specific bat's requirements in coordination with CDFW. By making the roosting habitat available prior to eviction, the colony will have a better chance of finding and using the roost. Large concrete walls (e.g., on bridges) on south or southwestern slopes that are retrofitted with slots and cavities are an example of structures that may provide alternative roosting habitat appropriate for maternity colonies. Alternative roost sites must be of comparable size and proximal in location to the impacted colony. The CDFW shall also be notified of any hibernacula or active nurseries within the construction zone.
- If special status bat species occur at these roosting/nursery sites, then construction activities shall avoid these sites and a surrounding buffer distance of 500 feet. If construction activities cannot avoid these sites, construction at these sites shall be delayed until the breeding cycles for the special status bats are completed. The Applicant shall consult with a bat specialist in order to determine when the breeding cycle for the special status bats is completed. The Applicant shall consult with CDFW regarding eviction of non-breeding special status bats.

  If roosting bats occur within bridges on existing dirt or paved roadways within 500 feet of construction activities, construction may be allowed, provided that the construction activities occur only from 9:00 a.m. to 4:00 p.m. to avoid disturbance to nocturnal feedings.

MM WIL-CEQA4 Implementation

Responsible Party: The Bat Management and Protection Plan shall be developed and implemented by the Applicant and approved by the BLM, CPUC, and CDFW.

Timing: The Bat Management and Protection Plan shall be prepared prior to the start of construction activities and shall be implemented throughout the duration of construction.

Mitigation Monitoring and Reporting Program: The Applicant shall develop a monthly report documenting compliance with this measure and any actions taken regarding the Bat Management and Protection Plan. This report shall be made available to the BLM, CPUC, and CDFW.

Standards for Success: Any significant impacts from construction activities to bat species shall be avoided or minimized to result in less than significant levels.

MM WIL-CEQA-5: Conduct Preconstruction Surveys for Maternity Colonies or Hibernaculum for Roosting Bats (applies only in California)

The following BMPs and CMA shall be incorporated within this MM WIL-CEQA-5: APM BIO-2, BMP BIO-02, BMP BIO-25, CMA DFA-BIO-IFS-1, CMA LUPA-BIO-1, CMA LUPA-BIO-16, and CMA LUPA-BIO-DUNE-5.

The Applicant shall conduct surveys for roosting bats within 500 feet of Project activities, within 14 days prior to any grading of rocky outcrops or removal of trees with loose bark or other cavities. Surveys shall be conducted during the breeding season (1 March to 31 July) and the non-breeding season. Surveys shall be performed by a qualified bat biologist (i.e., a biologist holding a CDFW collection permit and a Memorandum of Understanding with CDFW allowing the biologist to handle bats). The resume of the biologist shall be provided to the CPUC and BLM for concurrence in consultation with CDFW and USFWS prior to the biologist beginning field duties on the Project. Surveys shall include a minimum of one day and one evening.

The Bat Management and Protection Plan (MM WIL-CEQA-4) shall be implemented throughout construction for any active bat roosts within the area. The Applicant shall submit documentation providing preconstruction survey results and any avoidance of roosting and nursery sites to the CPUC, BLM, and CDFW for review and approval.

MM WIL-CEQA-5 Implementation

Responsible Party: The surveys for maternity colonies or hibernaculum for roosting bats shall be completed by a qualified biologist (i.e., a biologist holding CDFW collection permit and a Memorandum of Understanding with CDFW allowing the biologist to handle bats). **Timing:** The surveys shall be completed within 14 days prior to any grading activities or removal of trees within 500 feet of the Project.

Mitigation Monitoring and Reporting Program: The Applicant shall submit documentation in the form of a report or technical memorandum that provides the preconstruction survey results and any avoidance of roosting and nursery sites to the CPUC, BLM, and CDFW for review and approval.

Standards for Success: Surveys for bat roosting and nursery sites are completed within the Project area and required buffer distances.

MM WIL-CEQA-6: Conduct Preconstruction Surveys for Nesting and Breeding. (applies only in California)

The following APMs, BMPs, and CMAs shall be incorporated within this MM WIL-CEQA-6: APM BIO-2, BMP BIO-02, APM BIO-20, BMP BIO-25, CMA DFA-BIO-IFS-1, CMA LUPA-BIO-1, CMA LUPA-BIO-16, CMA LUPA-BIO-IFS-26, and CMA LUPA-BIO-RIPWET-3. The Applicant shall retain a qualified avian biologist(s) (approved by the CPUC, BLM, and CDFW) to conduct preconstruction nesting bird surveys, within the recognized breeding season (generally 15 February – 15 September [1 January – 15 August for raptors]), for all areas within 500 feet of construction activities; construction activities include mobilization, staging, grading, and/or construction. These survey dates may only be modified with the approval of CDFW and USFWS (where applicable). Measures intended to exclude nesting birds shall only be implemented with the prior approval by the CDFW and/or USFWS. If breeding birds with active nests are found prior to or during construction, the qualified avian biologist shall establish a minimum 300-foot buffer (500 feet for raptors) around the nest and

no activities shall be allowed within the buffer(s) until the young have fledged from the nest or the nest fails. The prescribed buffers may be adjusted by the qualified avian biologist based on existing conditions around the nest, planned construction activities, tolerance of the species, and other pertinent factors. Buffer reductions for listed or special status species may require coordination with the USFWS and/or CDFW. The qualified avian biologist shall conduct regular monitoring of the nest to determine success/failure and to ensure that Project activities are not conducted within the buffer(s) until the nesting cycle is complete or the nest fails. The avian biologist shall be responsible for documenting the results of the surveys, implementing nest buffers, and documenting the results of ongoing monitoring by providing a copy of the monitoring reports for impact areas to the appropriate resource agencies (i.e., USFWS and CDFW). If trees with nests are to be removed as part of Project construction activities, they shall be done so outside of the nesting season to avoid additional impacts to nesting raptors. If removal during the nesting season cannot be avoided, all trees shall be inspected for active nests by the avian biologist. If nests are found within these trees, and contain eggs or young, no activities within a 300-foot buffer for nesting birds and/or a 500-foot buffer for raptors shall occur until the young have fledged the nest.

MM WIL-CEQA-6 Implementation

Responsible Party: The surveys for nesting and breeding avian species shall be completed by a qualified avian biologist (approved by the CPUC, BLM, and CDFW).

Timing: The surveys shall be completed within the recognized breeding season prior to construction activities for all areas within 500 feet of construction.

Mitigation Monitoring and Reporting Program: The Applicant shall submit documentation in the form of a report or technical memorandum that provides the preconstruction survey results and any avoidance of nesting recommended to the CPUC, CLM, and CDFW for review and approval.

Standards for Success: Nesting and breeding bird surveys are conducted within the Project site and required buffer distances prior to ground disturbing activities.

MM WIL-CEQA-7: Conduct Focused Preconstruction Burrowing Owl Surveys. (applies only in California)

To meet CEQA requirements, the following APMs, BMPs, and CMAs are incorporated within this MM BIO-CEQA-7: APM BIO-2, BMP BIO-02, BMP BIO-25, CMA DFA-BIO-IFS-1, CMA LUPA-BIO-1, CMA LUPA-BIO-12, and CMA LUPA-BIO-16. Prior to initial ground disturbance (no more than 14 days prior) the Project Applicant shall conduct focused surveys for burrowing owls within suitable burrowing owl habitat. Surveys will be completed by a qualified biologist(s) with proven burrowing owl experience. Focused burrowing owl surveys shall be conducted in accordance with the *Staff Report on Burrowing Owl Mitigation* (2012 Staff Report; CDFG 2012), with the exception of the survey buffers, which follows the California Burrowing Owl Consortium (1993). Surveys shall be conducted by walking 20-meter transects. Preconstruction surveys shall be conducted not only within construction area, but also within a reasonable buffer around the area, generally 150 meters (492 feet). If burrowing owls, including any active burrowing owl burrows, are not found during the preconstruction survey, no further action is required.

The only exception to the above requirements would be if any given construction area has become inactive for more than 14 days. Because burrowing owls can recolonize a site after a few days, if time lapses between Project activities for 14 days or more, this shall trigger subsequent preconstruction avoidance surveys, including, but not limited to an additional survey within 24 hours of ground-disturbing activities.

MM WIL-CEQA-7 Implementation

Responsible Party: The focused preconstruction surveys for burrowing owls shall be conducted by a qualified biologist (approved by the CPUC, BLM, and CDFW).

Timing: The focused preconstruction burrowing owl surveys shall be completed no more than 14 days prior to the start of construction activities.

Mitigation Monitoring and Reporting Program: The Applicant shall submit documentation in the form of a report of technical memorandum that provides the preconstruction survey results and any avoidance or relocation recommendations to the CPUC, BLM, and CDFW for review and approval.

Standards for Success: Burrowing owl surveys are completed within all suitable habitats in the Project area and required buffer distances.

MM WIL-CEQA-8: Conduct Preconstruction Protocol Surveys for Arizona Bell's Vireo, Southwestern Willow Flycatcher, and Willow Flycatcher; Avoid Occupied Habitat; Compensate Impacts (applies only in California)

The following APMs, BMPs, and CMAs shall be incorporated within this MM WIL-CEQA-8: APM BIO-20; APM BIO-21; BMP BIO-21; BMP BIO-29; BMP BIO-35; BMP BIO-36; BMP BIO-40; BMP BIO-48; BMP BIO-55; CMA LUPA-BIO-1; CMA LUPA-BIO-2; CMA LUPA-BIO-3; CMA LUPA-BIO-4; CMA LUPA-BIO-12; CMA LUPA-BIO-16; CMA LUPA-BIO-17; CMA LUPA-BIO-COMP-2; CMA LUPA-TRANS-BIO-1; and CMA LUPA-TRANS-BIO-2.

If Project related activities are scheduled to occur during the breeding season (generally 15 February – 15 September) the Applicant shall have a qualified avian biologist, approved by the CPUC, BLM, and CDFW, conduct protocol surveys prior to the start of construction for Arizona Bell's vireo, southwestern willow flycatcher, and willow flycatcher in suitable habitat within the Project area and 500 feet of disturbance areas. The surveys shall follow all current agency protocols (i.e., CDFW, USFWS). Prior to construction, documentation shall be submitted providing the results of the preconstruction focused surveys for Arizona Bell's vireo, southwestern willow flycatcher, and willow flycatcher to the CPUC for review and approval in consultation with USFWS and CDFW. Protocol or focused nest location surveys, as appropriate, shall be conducted within one year prior to the start of construction and shall continue annually until completion of construction and restoration activities. If an active breeding territory or nest is confirmed, the CPUC, USFWS, and CDFW shall be notified immediately. All active nests shall be monitored on a weekly basis until the nestlings fledge or the nest becomes inactive. The Applicant shall provide monitoring reports to the CPUC for review on a weekly basis. In coordination with the USFWS and CDFW, a minimum 300-foot disturbance-free ground buffer shall be established around the active nest and demarcated by fencing or flagging. No construction or vehicle traffic shall occur within nest buffers.

The qualified biologist shall have the authority to halt construction activities and shall devise methods to reduce the noise and/or disturbance in the vicinity. This may include methods such as, but not limited to, turning off vehicle engines and other equipment whenever possible to reduce noise, installing a protective noise barrier between the nest site and the construction activities, and working in other areas until the young have fledged. All active nests shall be monitored on a weekly basis until the nestlings fledge.

Impacts and mitigation for federal- and state-listed species shall be addressed through either the Section 7 or Section 10(a)(1)(B) process under the federal ESA with the USFWS, and either the Section 2080 or Section 2080.1 process under the CESA with the CDFW. Additionally, direct impacts to federally-listed species' critical habitat that cannot be avoided shall also be addressed through either the federal ESA Section 7 or Section 10(a)(1)(B) process. Formal federal ESA consultation for federally-listed species that have at least a moderate potential to occur and may be impacted by the Project include the Mojave Desert tortoise, razorback sucker, southwestern willow flycatcher, western yellow-billed cuckoo, and Yuma Ridgway's rail. CESA consultation for state-listed species that have at least a moderate potential to occur and may be impacted by the Project include greater sandhill crane, Mojave Desert tortoise, razorback sucker, Swainson's hawk, southwestern willow flycatcher, western yellow-billed cuckoo, and Yuma Ridgway's rail. Additional mitigation may be required by each agency during the regulatory permitting process. Mitigation for impacts to listed species habitat shall consider and overlap with compensation for special status plants, sensitive vegetation communities, and jurisdictional waters and wetlands.

MM BIO-CEQA-8 Implementation

Responsible Party: The focused protocol surveys for Arizona Bell's vireo, southwestern willow flycatcher, and willow flycatcher shall be conducted by a qualified biologist(s).

Timing: The focused surveys shall be conducted during the required protocol windows should construction activities occur between 15 February and 15 September.

Mitigation Monitoring and Reporting Program: The Applicant shall submit documentation in the form of a report of technical memorandum that provides the survey results and any avoidance or relocation recommendations to the CPUC, BLM, and CDFW for review and approval. Responsible parties for the consultation include USFWS and CDFW.

Standards for Success: Protocol Arizona Bell's vireo, southwestern willow flycatcher, and willow flycatcher surveys are completed within all suitable habitats in the Project area and required buffer distances.

LUPA-BIO-16 (California):

For activities that may impact Focus and BLM sensitive birds, protected by the ESA and/or MBTA, and bat species, implement appropriate measures as per the most up-to-date BLM state and national policy and guidance, and data on birds and bats, including but not limited to activity specific plans and actions. The goal of the activity-specific bird and bat actions is to avoid and minimize direct mortality of birds and bats from the construction, operation, maintenance, and decommissioning of the specific activities. Activity-specific measures to avoid and minimize impacts may include, but are not limited to:

- Siting and designing activities will avoid high bird and bat movement areas that separate birds and bats from their common nesting and roosting sites, feeding areas, or lakes and rivers.
- For activities that impact bird and bat Focus and BLM special status species, during project siting and design, conducting monitoring of bird and bat presence as well as bird and bat use of the project site using the most current survey methods and best procedures available at the time.
- Reusing or co-locating new transmission facilities and other ancillary facilities with existing facilities and disturbed areas to reduce habitat destruction and avoid additional collision risks.
- Reducing bird and bat collision hazards by utilizing techniques such as unguyed monopole towers or tubular towers. Where the use of guywires is unavoidable, demarcate guywires using the best available methods to minimize avian species strikes.
- When fencing is necessary, use bird and bat compatible design standards.
- Using lighting that does not attract birds and bats or their prey to project sites including using non-steady burning lights (red, dual red and white strobe, strobe-like flashing lights) to meet Federal Aviation Administration requirements, using motion or heat sensors and switches to reduce the time when lights are illuminated, using appropriate shielding to reduce horizontal or skyward illumination, and avoiding the use of high-intensity lights (e.g., sodium vapor, quartz, and halogen).
- Implementing a robust monitoring program to regularly check for wildlife carcasses, document the cause of mortality, and promptly remove the carcasses.

LUPA-BIO-17 (California)

For activities that may result in mortality to Focus and BLM Special–Status bird and bat species, a BBCS will be prepared with the goal of assessing operational impacts to bird and bat species and incorporating methods to reduce documented mortality. The BBCS actions for impacts to birds and bats during these activities will be determined by the activity-specific bird and bat operational actions. The strategy shall be approved by BLM in coordination with USFWS, and CDFW as appropriate, and may include, but is not limited to:

- Incorporating a bird and bat use and mortality monitoring program during operations using current protocols and best procedures available at time of monitoring.
- Activity-specific operational avoidance and minimization actions that reduce the level of mortality on the populations of bird and bat species, such as:
    - Evaluation and installation of the best available bird and bat detection and deterrent technologies available at the time of construction.

The following provides the DRECP vegetation type and Focus and BLM special status species biological CMAs to be implemented throughout the LUPA Decision Area.

Riparian and Wetland Vegetation Types and Associated Species (RIPWET)

Riparian Vegetation Types

- Sonoran-Coloradan Semi-Desert Wash Woodland/Scrub

Riparian and Wetland Bird Focus Species

- Southwestern Willow Flycatcher
- Western Yellow-billed Cuckoo
- Yuma Ridgway's Rail

LUPA-BIO-COMP-2: Birds and Bats (California)

The compensation for the mortality impacts to bird and bat Focus and BLM special status species from activities will be determined based on monitoring of bird and bat mortality and a fee re-assessed every five years to fund compensatory mitigation. The initial compensation fee for bird and bat mortality impacts will be based on pre-project monitoring of bird use and estimated bird and bat species mortality from the activity. The approach to calculating the operational bird and bat compensation is based on the total replacement cost for a given resource, a Resource Equivalency Analysis. This involves measuring the relative loss to a population (debt) resulting from an activity and the productivity gain (credit) to a population from the implementation of compensatory mitigation actions. The measurement of these debts and gains (using the same "bird years" metric as described in Appendix D of the LUPA) is used to estimate the necessary compensation fee.

Each activity, as determined appropriate by BLM in coordination with USFWS, and CDFW as applicable, will include a monitoring strategy to provide activity-specific information on mortality effects on birds and bats in order to determine the amount and type of compensation required to offset the effects of the activity, as described above and in detail in Appendix D of the LUPA. Compensation will be satisfied by restoring, protecting, or otherwise improving habitat such that the carrying capacity or productivity is increased to offset the impacts resulting from the activity. Compensation may also be satisfied by non-restoration actions that reduce mortality risks to birds and bats (e.g., increased predator control and protection of roosting sites from human disturbance). Compensation will be consistent with the most up to date Department of the Interior mitigation policy.

LUPA-BIO-IFS-11 (California)

If Bendire's thrasher is present, conduct appropriate activity-specific biological monitoring to ensure that Bendire's thrasher individuals are not directly affected by operations (i.e., mortality or injury, direct impacts on nest, eggs, or fledglings).

LUPA-BIO-IFS-12

If burrowing owls are present, a designated biologist will conduct appropriate activity-specific biological monitoring to ensure avoidance of occupied burrows and establishment of the 656-foot (200-meter) setback to sufficiently minimize disturbance during the nesting period on all activity sites, when practical.

LUPA-BIO-IFS-13

If burrows cannot be avoided on-site, passive burrow exclusion by a designated biologist through the use of one-way doors will occur according to the specifications in Appendix D or

the most up-to-date agency BLM or CDFW specifications. Before exclusion, there must be verification that burrows are empty as specified in Appendix D or the most up-to-date BLM or CDFW protocols. Confirmation that the burrow is not currently supporting nesting or fledgling activities is required prior to any burrow exclusions or excavations.

LUPA-BIO-IFS-14

Activity-specific active translocation of burrowing owls may be considered, in coordination with CDFW.

LUPA-BIO-IFS-24

Provide protection from loss and harassment of active golden eagle nests through the following actions: Activities that may impact nesting golden eagles, will not be sited or constructed within one mile of any active or alternative golden eagle nest within an active golden eagle territory, as determined by BLM in coordination with USFWS as appropriate.

LUPA-BIO-IFS-25

Cumulative loss of golden eagle foraging habitat within a one to four mile radius around active or alternative golden eagle nests (as identified or defined in the most recent USFWS guidance and/or policy) will be limited to less than 20 percent. See **CONS-BIO-IFS- 5** for the requirement in Conservation Lands.

LUPA-BIO-IFS-26

For activities that impact golden eagles, the Applicant will conduct a risk assessment per the applicable USFWS guidance (e.g., the Eagle Conservation Plan Guidance) using best available information as well as the data collected in the pre-project golden eagle surveys.

LUPA-BIO-IFS-27

If a permit for golden eagle take is determined to be necessary, an application will be submitted to the USFWS in order to pursue a take permit.

LUPA-BIO-IFS-28

In order to evaluate the potential risk to golden eagles, the following activities are required to conduct two years of pre-project golden eagle surveys in accordance with USFWS Eagle Conservation Plan Guidance as follows: 1) Wind projects and solar projects involving a power tower; 2) other activities for which the BLM, in coordination with USFWS, and CDFW as appropriate, determines take of golden eagle is reasonably foreseeable or there is a potential for take of golden eagle.

LUPA-BIO-IFS-29

For active nests with recreational conflicts that risk the occurrence of take, provide public notification (e.g., signs) of the sensitive area and implement seasonal closures as appropriate.

LUPA-BIO-IFS-30

For activities where ongoing take of golden eagles is anticipated, develop advanced conservation practices per USFWS Eagle Conservation Plan Guidance.

LUPA-BIO-IFS-31

As determined necessary by BLM in coordination with USFWS and CDFW, as appropriate, for activities/projects that are likely to impact golden eagles, implement site-specific golden eagle mortality monitoring in support of the preconstruction, pre-activity risk assessment surveys.

LUPA—TRANS-BIO-1 (California)

Where feasible and appropriate for resource protection, site transmission activities along roads or other previously disturbed areas to minimize new surface disturbance, reduce perching opportunities for the Common raven, and minimize collision risks for birds and bats.

LUPA—TRANS-BIO-2 (California)

Flight diverters will be installed on all transmission activities spanning or within 1,000 feet of stream and wash channels, canals, ponds, and any other natural or artificial body of water. The type of flight diverter selected will be subject to approval by BLM, in coordination with USFWS and CDFW as appropriate, and will be based on the best available scientific and commercial data regarding the prevention of bird collisions with transmission and guy wires.

DFA-BIO-IFS-2: Implement the following setbacks shown below in Table 22 from the DRECP LUPA (see below) as applicable in the DFAs.

Table 22
Individual Species DFA Setback Requirements

Species	DFA Setbacks
Reptile	
Desert tortoise	None.
Flat-tailed horned lizard	None.
Bird	
Bendire's thrasher	Setback pre-construction, construction, and decommissioning, and other activities 500 feet from active nests.
Burrowing Owl	656 feet (200 meters) from active nesting sites.
California condor	Setback wind and transmission projects 5 miles from nest sites. Setback solar, geothermal, and other activities than may impact condors 1.5 miles from nest sites and out of direct line of site from nest sites.
Gila woodpecker	Setback pre-construction, construction, and decommissioning, and other activities that may impact the species 0.25 mile from suitable habitat during the breeding season (April 1 through July 31).
Golden eagle	Setback activities 1 mile from active or alternative nests within an active territory as described in **LUPA-BIO-IFS-24**.
Swainson's Hawk	0.5 mile from active nests.
Mammal	
Desert bighorn sheep	None.
Mohave ground squirrel	None.

1 Introduction

1.1 Project Description

The Ten West Link Transmission Line Project (Project) proposed by Delaney Colorado River Transmission, LLC (DCRT) would consist of a single-circuit, series-compensated, 500 kilovolt (kV) transmission line. The Project would begin at the Delaney Substation near Tonopah, Arizona, and terminate at the Colorado River Substation near Blythe, California. The Project would be located in Maricopa and La Paz Counties in Arizona, and Riverside County in California. The Project route (Bureau of Land Management [BLM] Preferred Alternative) would parallel an existing transmission line and other linear facilities, primarily within designated utility corridors.

The BLM Preferred Alternative would span approximately 125.0 miles, including 103.4 miles in Arizona and 21.6 miles in California. Of the total length, approximately 81.2 miles would be on federal land, 17.6 miles would cross state of Arizona land, and approximately 26.2 miles would cross private land. Most of the route would cross federal land, including lands managed by the BLM and Bureau of Reclamation (79.4 miles and 1.6 miles, respectively). A 0.2-mile section of the Project would also span Department of Defense land (Yuma Proving Ground military installation).

Construction, operation, and maintenance activities would occur primarily within a 200-foot-wide right-of-way (ROW). The Project would also include upgrades at both the Delaney and Colorado River Substations in the existing footprint. Up to four staging areas would be required for material staging and laydown yards during construction. These areas would be temporary in terms of disturbance; selected based upon the final alignment chosen for this Project; and would be approximately 10 acres in size each. Currently identified staging and laydown yards occupy 34.5 acres.

The proposed support structures would be steel structures of various configurations. Tangent and small-angle steel lattice structures include self-supporting, four-legged tangent structures (i.e., structures placed where the line does not angle more than one degree); guyed-V structures with a single footing and four support guy wires; and two-legged, H-frame (steel lattice or tubular steel pole) structures as the primary structure types. Permanent guy guards/markers will be installed on guy wires for the guyed-V structures as required by BMPs and mitigation measures described in the Project Draft Environmental Impact Statement (EIS) and as summarized in Appendix B of the Plan of Development (POD). For areas of conductor tension change, large angles, and phasing transpositions, self-supporting, four-legged structures would be utilized. Steel monopoles may be used for areas of active agricultural activity and to facilitate entrance into the two substations. The transmission towers would typically be between 72 and 195 feet in height, depending on the span length required and topography, with the average tower height being approximately 160 feet. Span lengths between structures would vary from 400 to 2,300 feet, depending upon terrain conditions, current land use, structure type used, and to achieve site-specific mitigation objectives.

The transmission line will utilize three alternating current phases of conductors. The conductors are the wire cables strung between transmission line structures over which the electric current flows. The conductors within each phase will be bundled and are typically spaced approximately 18 inches apart in an equilateral triangle configuration. Conductor bundles for all structure types except the proposed monopoles would be installed

horizontal to one another (at the same height on the structure), with approximately 34 feet of spacing between the center of each conductor bundle. The static wire and optical ground wire would be approximately 30 feet above the phase conductors at the top of the structures. The minimum conductor height above ground for the transmission line would be 36.25 feet for most of the segments and 41.25 feet for the Colorado River crossing. Insulators would be used to suspend the conductors from each structure to inhibit the flow of electrical current from the conductor to the ground, the structure, or another conductor. To protect conductors from lightning strikes, two overhead ground wires would be installed on top of the structures that would transfer current from lightning strikes through the ground wires and structures into the ground. Other hardware, such as bird flight diverters, not associated with the transmission of electricity will be installed as part of the Project. This hardware may include aerial marker spheres or aircraft warning lighting, as required for the conductors or structures by Federal Aviation Administration regulations.

The Project requires a transmission line Series Compensation Station (SCS) located at the approximate midpoint of the route. The Proposed SCS site is located near the intersection of Segments i-03 and i-04 approximately two miles south of Brenda, Arizona. The SCS would be fenced and access would be restricted. The new SCS would be connected to an existing 12 kV distribution line via a new 3.13-mile-long 12 kV line.

Access to the ROW would be provided by existing roads and trails, such as those associated with the Devers to Palo Verde transmission line and nearby pipelines, to the extent practicable. Five types of access would be used for this transmission line: existing maintained public or private roads, upgraded existing roads, new centerline access, spur roads, and helicopter access. The existing roads would be used in their present condition without improvements, unless improvements are required or are deemed to be in the Project's best interest and for future use. Where existing roads can be used to access the ROW, only spur roads to each structure site would be required. Roads for access into the transmission lines would be also utilized for access to the SCS, given that the roads are adequate for the transport of materials and equipment necessary at the SCS.

After construction, Project operation and maintenance would be an ongoing activity including transmission line inspections, preventative and emergency maintenance, vegetation management including trimming and removal of vegetation within the ROW, SCS maintenance, substation maintenance, and long-term access to the ROW through general road maintenance and installation of signs and markers.

Should the ROW and facilities no longer be needed, the transmission lines and associated facilities would be decommissioned and removed. All areas of long-term disturbance would be reclaimed in accordance with a Decommissioning Plan to be developed by the ROW grant holder and approved by the BLM prior to issuance of the ROW grant. A reclamation bond would also be required per BLM bonding policy to ensure performance of reclamation activities. Access routes and other sites disturbed during decommissioning would be reclaimed and revegetated in accordance with the Decommissioning Plan.

1.2 Purpose, Need, and Plan Progression

As the lead federal agency, the BLM released the Draft EIS on August 31, 2018. Mitigation measures identified within the Draft EIS require avoidance and minimization measures to reduce Project impacts and require compensatory mitigation for residual impacts to sensitive resources. Implementation of avoidance and minimization measures are described in detail in the POD and associated plan appendices, while this Compensatory

Mitigation Plan (CMP) specifically focuses on Compensatory Mitigation. This Draft CMP is a living document, anticipated to progress through three main stages. In the current stage, this document is a compilation and summary of compensatory mitigation requirements and the approaches identified, to date, for satisfying the requirements. It identifies the mitigation approach to be used, as well as data needs, and identifies areas where discrepancies within the Draft EIS will need to be clarified. After the appropriate parties review and reach consensus on the approach (this would include, at a minimum, DCRT, BLM, California Public Utilities Commission [CPUC], California Department of Fish and Wildlife [CDFW], and United States Fish and Wildlife Service [USFWS]), the second phase will entail calculating compensatory mitigation requirements (mitigation debits) based on final engineering design and spatial analysis of impacted resources. Final compensatory mitigation calculations will be determined following analysis of pre-construction surveys, micrositing of facilities, final impact calculations, and consultation with the regulatory agencies during the environmental permitting process. After mitigation debits are calculated, the third phase will involve disseminating out the details of specific mitigation actions (credits), potentially including mitigation lands to be placed under conservation easements, locations and methods of habitat restoration efforts, specific mitigation banks, in lieu fee payments, or other compensatory mitigation actions. The Final CMP will document specific mitigation actions, calculate the anticipated mitigation credits and debits, and set up a tracking mechanism to document the ongoing balance of mitigation credits and debits in order to document sufficiency in meeting compensatory mitigation requirements.

The avoidance, minimization, and mitigation requirements associated with the EIS, California Environmental Quality Act (CEQA), and Desert Renewable Energy Conservation Plan (DRECP) and Land Use Plan Amendment (LUPA; BLM 2016) often differ between California and Arizona. Within Section 1.4 and Section 2, measures that apply only within California are listed separately from measures that apply only within Arizona and measures that apply Project-wide within Arizona and California. As such, many components and sections of this plan apply only within one state and, where applicable, that is indicated within the section heading and contents.

1.3 Applicable Regulations and Management Policies

Impacts to sensitive resources will be compensated in accordance with mitigation measures identified in the Project Draft EIS (including the CEQA mitigation measures contained in Appendix 1C of the Draft EIS), and any revisions contained in the Final EIS, Record of Decision (ROD) and ROW Grant, and the DRECP LUPA, described below.

1.3.1 Desert Renewable Energy Conservation Plan and Land Use Plan Amendment.

The DRECP LUPA was prepared to implement the Desert Renewable Energy Conservation Plan, which amends the California Desert Conservation Area (CDCA) Plan. The DRECP LUPA is applicable only to BLM-administered land in California and does not address the Colorado River corridor. The DRECP LUPA provides a landscape approach to renewable energy and conservation planning in the California Desert that streamlines the process for development of utility-scale renewable energy generation and transmission consistent with federal and state renewable energy targets and policies, while simultaneously providing for the long-term conservation and management of biological, cultural, and aesthetic resources. In addition to BLM designated sensitive species, the DRECP LUPA identifies additional “Focus” species, which it defines as species whose conservation and management are provided for in the DRECP LUPA. The DRECP LUPA

includes Conservation and Management Actions (CMAs) that establish avoidance, minimization, and mitigation requirements within the planning area, including those that are specific to Development Focus Area (DFA) allocations that the Project crosses along all BLM Preferred Segments on BLM managed land in California.

1.4 Mitigation Measures in the Final EIS that are Directly Applicable to this Plan

All Applicant Proposed Measures (APMs) and BLM-required Best Management Practices (BMPs) are listed in Appendix 2A of the Draft EIS. Additionally, Mitigation Measure (MM) BIO-01 is found in Appendix 2 of the Draft EIS. MMs required under CEQA and CMAs from the DRECP LUPA are listed in Appendix 1C of the Draft EIS. The CEQA MMs are required only within California, and the DRECP LUPA CMAs are required only on BLM land within California. Numerous APMs, BMPs, MMs, and CMAs, are applicable to avoidance, minimization, and onsite mitigation measures. The measures directly applicable to this CMP are listed below. Each of the following measures applies in California only. There are no requirements for compensatory mitigation that apply to the Arizona portion of the Project

2 Compensation Ratios and Overview of Requirements

The required compensation ratios and general compensatory mitigation requirements, as stipulated in the Project Draft EIS and DRECP LUPA, are compiled and summarized in Table 2-1. Compensatory ratios and requirements vary among the resources, and locations (California or Arizona, BLM or non-BLM land) as well as the type of impact (temporary habitat loss, permanent habitat loss, or direct mortality).

Temporary habitat loss will include structure work areas, staging areas, and temporary access routes. Areas where temporary disturbance impacts sensitive resources (as listed in Table 2-1) will be reclaimed with similar native species compositions to those present prior to construction, as described in the Reclamation, Vegetation, and Monitoring Plan (Appendix L-1 of the POD). Mitigation ratios for temporary impacts will be 1:1, except where specifically noted otherwise within this plan.

Permanent habitat loss will be associated with permanent Project features such as new structures, permanent travel surfaces of access roads, vegetation trimming for conductor clearance, and the SCS. Mitigation ratios for permanent habitat loss will range from 1:1 up to 5:1, depending on resource. Compensation would also be required for direct mortality, should it occur, to birds and bats (e.g., from electrocution or collision with shield wires or conductors). As consistent with BLM policy, compensatory mitigation for permanent habitat loss or direct mortality could include payment of an in-lieu fee; acquiring mitigation land or conservation easements; restoration or habitat enhancement activities on public lands; or a combination of these approaches.

The exact amount of compensatory mitigation required for each resource will be determined following analysis of all pre-construction surveys, micrositing of facilities, final impact calculations, and consultation with the regulatory agencies during the environmental permitting process. All created or restored habitats will be monitored per the requirements in the Reclamation, Vegetation, and Monitoring Plan (Appendix L-1 of the POD). All lands identified for preservation would require the recordation of a conservation easement. The easement could be held by the CDFW (in California) or an approved land management entity; the easement will be recorded upon purchase of the lands; refer to MM-BIO-CEQA-5 for details and requirements for easements on mitigation lands. All lands identified for preservation will require approval from the resource/permitting agencies where applicable (i.e., BLM, USFWS, Arizona Game and Fish Department, CDFW, and CPUC).

On July 24, 2018, BLM instructed its personnel, via Instruction Memorandum 2018-093, that the agency lacks authority to require monetary payments and other forms of offsite compensatory mitigation as a condition of obtaining authorization for the use of public lands. However, according to discussions between DCRT and BLM, the pre-existing DRECP-LUPA is not superseded by Instruction Memorandum 2018-093. The Project is subject to existing stipulations that require compensatory mitigation. Consistent with Instruction Memorandum 2018-093, and as an alternative to fee payments or offsite mitigation, it may be appropriate to amend the DRECP-LUPA to rescind the compensation requirements. The Final CMP will reflect any DRECP-LUPA amendments that remove or reduce compensatory requirements. This Draft CMP reflects current requirements within the DRECP LUPA, as reflected in the Draft EIS.

This page intentionally left blank.

TABLE 2-1 COMPENSATION RATIOS AND REQUIREMENTS

APPLICABLE AREA	RESOURCE	MITIGATION RATIO	MITIGATION COMMENTS	SOURCE
Arizona	-	-	There are no compensatory mitigation requirements for the portion of the Project within Arizona.	-
California	Temporary impacts to Jurisdictional Waters and Wetlands	1:1	On-site habitat restoration with similar species compositions to those present prior to construction, as described in the Reclamation, Vegetation, and Monitoring Plan. All mitigation for temporary impacts to jurisdictional waters/wetlands shall be approved by the appropriate federal and state regulatory agencies prior to Project activities.	MM BIO-CEQA-4
California	Permanent impacts to Jurisdictional Waters and Wetlands	2:1	Minimum of 2:1 mitigation ratio or as otherwise specified by the appropriate federal and state regulatory agencies. Permanent impacts to riparian desert woodland habitats that are jurisdictional shall be mitigated at a ratio of 5:1. Off-site creation, enhancement, and/or preservation; or participation in an established mitigation bank program. All mitigation for permanent impacts to jurisdictional waters/wetlands shall be approved by the appropriate federal and state regulatory agencies prior to Project activities. All lands identified for preservation would require the recordation of a conservation easement. Delaney Colorado River Transmission, LLC (DCRT) shall coordinate with the California Public Utilities Commission (CPUC), Bureau of Land Management (BLM) and California Department of Fish and Wildlife (CDFW) to determine the conditions of the conservation easement, including the required acreage to be conserved and the required monitoring and management of the conserved lands, as appropriate.	CMA LUPA-BIO-COMP-1, MM BIO-CEQA-4, MM VEG-CEQA-4
California	Temporary impacts to sensitive vegetation communities (blue palo verde-ironwood woodland, mesquite thickets, big galleta alliance, arrowweed alliance, and bush seepweed scrub)	1:1	On-site habitat restoration with similar species compositions to those present prior to construction, as outlined in the Reclamation, Vegetation, and Monitoring Plan. All mitigation for temporary impacts to sensitive vegetation communities shall be approved by the appropriate federal and state regulatory agencies prior to Project activities.	MM BIO-CEQA-4

APPLICABLE AREA	RESOURCE	MITIGATION RATIO	MITIGATION COMMENTS	SOURCE
California	Permanent impacts to sensitive vegetation communities (blue palo verde-ironwood woodland, mesquite thickets, big galleta alliance, arrowweed alliance, and bush seepweed scrub)	5:1	Creation, restoration, enhancement, land acquisition (i.e., preserve), or a combination of these options, depending on the activity specifics and BLM approval/authorization. All mitigation for permanent impacts to sensitive vegetation communities shall be approved by the appropriate federal and state regulatory agencies prior to Project activities. All lands identified for preservation would require the recordation of a conservation easement. DCRT shall coordinate with CPUC, BLM, and CDFW to determine the conditions of the conservation easement, including the required acreage to be conserved and the required monitoring and management of the conserved lands, as appropriate.	CMA LUPA-BIO-COMP-1, APM/BMP BIO-46, MM BIO-CEQA-4, MM VEG-CEQA-4
California	Temporary impacts to special status plant species	1:1	On-site habitat restoration with similar species compositions to those present prior to construction, as outlined in the Reclamation, Vegetation, and Monitoring Plan. All mitigation for temporary impacts shall be approved by the appropriate federal and state regulatory agencies prior to Project activities.	MM VEG-CEQA-4
California	Permanent impacts to special status plant species	3:1	Identification of impacts to special status plants will be based on the results of the floristic surveys. Compensation shall include off-site creation, enhancement, and/or preservation or participation in an established mitigation bank program. DCRT shall coordinate with CPUC, BLM, and CDFW to determine the appropriate mitigation strategy and final replacement ratios and acreages. All mitigation shall be approved by the appropriate federal and state regulatory agencies prior to Project activities.	MM VEG-CEQA-4
California	Permanent impacts to Mojave desert tortoise, including habitat loss and potential take	2:1? (per MM WIL-CEQA-10; or 3:1? Per MM WIL-CEQA-11)	MM WIL-CEQA-10 defines habitat loss as “all lands directly disturbed…that will no longer provide viable long-term habitat for the Mojave Desert tortoise. Mitigation may include off-site creation, enhancement, and/or preservation, and/or participation in an established mitigation bank program. Impacts and mitigation for the Mojave desert tortoise shall be addressed through either the Section 7 or Section 10(a)(1)(B) process under the Federal Endangered Species Act (FESA) with the United States Fish and Wildlife Service (USFWS), and either the Section 2080 or Section 2080.1	MM WIL-CEQA-10, MM WIL-CEQA-11

APPLICABLE AREA	RESOURCE	MITIGATION RATIO	MITIGATION COMMENTS	SOURCE
			process under the California Endangered Species Act (CESA) with the CDFW.	
California	Temporary impacts to Mojave fringe-toed lizard	1:1	On-site habitat restoration with similar species compositions to those present prior to construction, as outlined in Reclamation, Vegetation, and Monitoring Plan.	MM WIL-CEQA-11
California	Permanent impacts to Mojave fringe-toed lizard	3:1	Compensation may include preservation through acquisition of offsite lands with an attached conservation easement, purchase of credits from an approved mitigation ban, or onsite or offsite enhancements of habitat that support known population of Mojave fringe-toed lizard.	MM WIL-CEQA-9, MM WIL-CEQA-11
California	Temporary or Permanent impacts to potential habitat of federal or California state-listed T&E species	TBD	Impacts and mitigation for federal- and state-listed species shall be addressed through either the Section 7 or Section 10(a)(1)(B) process under the FESA with the USFWS, and either the Section 2080 or Section 2080.1 process under the CESA with the CDFW.	MM WIL-CEQA-8
California	Temporary impacts to other special status wildlife, including terrestrial herpetofauna	1:1	On-site habitat restoration with similar species compositions to those present prior to construction, as outlined in Reclamation, Vegetation, and Monitoring Plan.	MM WIL-CEQA-11
California	Permanent impacts to other special status wildlife, including terrestrial herpetofauna	2:1 or 3:1	MM WIL-CEQA-11 appears to provide conflicting guidance as to the appropriate mitigation ratio. Compensation will include: a) off-site creation, enhancement, and/or preservation, and/or b) participation in an established mitigation bank program.	MM WIL-CEQA-11
BLM land in California	Golden eagle mortality	Consistent with USFWS Eagle Conservation Plan guidance	Required to contribute to a Desert Renewable Energy Conservation Plan (DRECP)-wide golden eagle monitoring program, if the activity/project(s) has been determined, through the environmental analysis, to likely impact golden eagles. The Project is not likely to impact golden eagles, thus compensatory mitigation should not be required.	CMA LUPA-BIO-COMP-3, CMA LUPA-BIO-COMP-4
BLM land in California	Mortality to bird and bat Focus and BLM Special Status Species		Compensation will be determined based on monitoring of bird and bat mortality and a fee re-assessed every five years to fund compensatory mitigation. The initial compensation fee for bird and bat mortality impacts will be based on pre-project monitoring of bird use and estimated bird and bat species mortality from the activity. The approach to calculating the operational bird and bat compensation is based on the total replacement cost for a given resource, a	LUPA-BIO-COMP-2; MM WIL-CEQA-1

APPLICABLE AREA	RESOURCE	MITIGATION RATIO	MITIGATION COMMENTS	SOURCE
			Resource Equivalency Analysis. This involves measuring the relative loss to a population (debt) resulting from an activity and the productivity gain (credit) to a population from the implementation of compensatory mitigation actions. The measurement of these debts and gains (using the same "bird years" metric as described in Appendix D) is used to estimate the necessary compensation fee. Each activity, as determined appropriate by BLM in coordination with USFWS, and CDFW as applicable, will include a monitoring strategy to provide activity-specific information on mortality effects on birds and bats in order to determine the amount and type of compensation required to offset the effects of the activity, as described above and in detail in Appendix D. Compensation will be satisfied by restoring, protecting, or otherwise improving habitat such that the carrying capacity or productivity is increased to offset the impacts resulting from the activity. Compensation may also be satisfied by non-restoration actions that reduce mortality risks to birds and bats (e.g., increased predator control and protection of roosting sites from human disturbance). Compensation will be consistent with the most up to date Department of Interior mitigation policy.	
BLM land in California	Common Raven		Compensatory mitigation would be provided that contributes to LUPA-wide raven management associated with lands in the DRECP. DCRT shall submit payment into an account established for the Project held by the National Fish and Wildlife Foundation to support the USFWS Regional Raven Management Program. The one-time fee shall be as described in the cost allocation methodology or more current guidance as provided by USFWS. The contribution to the regional raven management plan will be $105 per acre impacted.	APM/BMP BIO-28, MM WIL-CEQA-2, CMA LUPA-BIO-6
BLM land in California	Cultural Resources: Effects to historic properties.		Only for the portion of the undertaking in California, the BLM will impose a compensatory mitigation fee for cumulative and indirect effects to historic properties as a result of construction. The mitigation fee will be calculated in a manner that is determined by Appendix G of the DRECP Programmatic Agreement (PA). If Appendix G of the DRECP	APM/BMP CULT-05, POD Appendix E1: Programmatic Agreement, CMA LUPA-TRANS-CUL-2, CMA DFA-

APPLICABLE AREA	RESOURCE	MITIGATION RATIO	MITIGATION COMMENTS	SOURCE
			PA has not been completed at the time the PA is executed, the BLM will develop mitigation in a manner that is commensurate to the size and regional impacts of the Undertaking, in consultation with the Consulting Parties. The BLM will have final approval of these treatment measures and the BLM will ensure that these treatment measures are described in the Historic Property's Treatment Plan All types of project-specific treatment may be considered to mitigate the specific cumulative and indirect adverse effects of the Undertaking.	VPL-CUL-2
BLM land in California	Visual: Visual Resource Inventory (VRI) Class II	1:1	The Draft EIS visual impact analysis determined that the introduction of the Project into the viewshed would not result in a scenic quality reduction of VRI Class II areas enough to lower the VRI class (e.g., from VRI Class II to VRI Class III). Therefore, no compensatory mitigation is required for visual resources.	CMA DFA-VRM-2

This page intentionally left blank.

3 Jurisdictional Waterways and Wetlands

The Project is not expected to directly impact wetlands, but will cross numerous dry washes, some of which will likely be Waters of the United States. As required by MM BIO-CEQA-4, all mitigation for temporary or permanent impacts to jurisdictional waters/wetlands in California shall be approved by the appropriate federal and state regulatory agencies prior to Project activities. MM BIO-CEQA-4 stipulates that temporary impacts to jurisdictional waterways and wetlands will be restored onsite at a ratio of 1:1. Although MM BIO-CEQA-4 does not explicitly specify whether it's use of the term "jurisdictional" applies to United States Army Corps of Engineers (USACE)-jurisdictional waters or to Waters of the State, the wording implies that it intended USACE-jurisdiction waters and that is the interpretation proposed to be followed within this CMP. These areas will be restored to similar species compositions to those present prior to construction, utilizing methodology described in the Reclamation, Vegetation, and Monitoring Plan (Appendix L-1 of the POD). MM BIO-CEQA-4 also stipulates that, within California, permanent impacts to jurisdictional waterways and wetlands will be mitigated at a ratio of 2:1 (which will also satisfy the 2:1 ratio stipulated for wetlands in CMA LUPA-BIO-COMP-1).

Compensatory mitigation of permanent impacts may be in the form of off-site creation, enhancement, and/or preservation; or participation in an established mitigation bank program. All created or restored habitats shall be monitored per the requirements in the Vegetation Management Plan, and the Special-Status Plant and Sensitive Vegetation Community Mitigation and Monitoring Plan. All lands identified for preservation would require the recordation of a conservation easement. As required by MM BIO-CEQA-4, DCRT would coordinate with CPUC, BLM, and CDFW to determine the conditions of the conservation easement, including the required acreage to be conserved and the required monitoring and management of the conserved lands, as appropriate.

The specific compensatory mitigation acreage and method will be determined when final engineering design, wetland and waterway delineations, and a USACE Preliminary Jurisdictional Determination facilitate calculation of the acreage of permanent impacts to jurisdictional waterways and wetlands. Mitigation shall consider overlap with compensation for other resources.

4 Sensitive Vegetation Communities

Within California, per APM/BMP BIO-46, MM BIO-CEQA-4, MM VEG-CEQA-4, and CMA LUPA-BIO-COMP-1, permanent impacts to desert riparian woodland and other sensitive vegetation communities will be compensated at the ratio of 5:1. Specific desert riparian woodland vegetation types that may be present within the Project area include blue palo verde (*Parkinsonia florida*)-ironwood (*Olneya tesota*) woodland and honey mesquite (*Prosopis glandulosa*) thickets. Additional sensitive vegetation communities that may be present include big galleta (*Pleuraphis rigida*) alliance, arrowweed (*Pluchea sericea*) alliance, and bush seepweed (*Suaeda moquinii*) scrub.

Per MM BIO-CEQA-4 and MM VEG-CEQA-4, temporary impacts to sensitive vegetation communities in California will require on-site habitat restoration (1:1) with similar species compositions to those present prior to construction, as outlined in the Reclamation, Vegetation, and Monitoring Plan. All mitigation for temporary impacts to sensitive vegetation communities will be approved by the appropriate federal and state regulatory agencies (CPUC, CDFW, and BLM) prior to Project activities, prior to implementation.

Compensation will be identified in coordination with the appropriate federal and state regulatory agencies. Compensation requirements may be fulfilled through restoration and enhancement, land acquisition (i.e., conservation easement/preserve), an established mitigation bank program (if available), or a combination of these options, depending on the activity specifics and state and federal approval/authorization.

Off-site compensation lands would consist of habitat occupied by the impacted sensitive vegetation community(s). Off-site compensation will be documented within the Final CMP and approved in consultation with the appropriated federal and state regulatory agencies. DCRT would provide for open space/conservation easements on all acquired lands or provide the required funds for the acquisition of easements to a “qualified easement holder”; CDFW is a qualified easement holder. To qualify as a “qualified easement holder” a private land trust must have substantial experience managing open space/conservation easements that are created to meet mitigation requirements for impacts to special-status species, have adopted the Land Trust Alliance’s Standards and Practices, and have a stewardship endowment fund to pay for its perpetual stewardship obligations. DCRT would also provide the “qualified easement holder” with adequate funds to cover administrative costs incurred during the creation of the easement, funds in the form of a non-wasting endowment to cover the cost of monitoring and enforcing the terms of the easement in perpetuity.

Restoration or enhancement can be used to mitigate impacts and depending upon the degree of impact, habitat restoration may be as simple as removing debris and controlling public access. In more complex situations, however, partial or total restoration of degraded habitat may require extensive revegetation, and soil protection and stabilization programs. The strategy would include at a minimum: (a) BLM approved genetically and ecologically appropriate native plant materials suitable for the site; (b) a description of any required topsoil salvage, plant salvage, seeding techniques, and methods to stabilize and shape soil surface to reduce soil erosivity; (c) monitoring and reporting protocols; and (d) success criteria. Restoration would be tailored to the specific project site based on the habitat and species involved.

Any restoration or enhancement for sensitive vegetation communities would be monitored to assess progress and to make recommendations for successful management. Monitoring would be performed by a qualified biologist/botanist designated by DCRT. At a minimum, Monitoring would include qualitative and quantitative methods as described in the Vegetation Management Plan and the Special-Status Plant and Sensitive Vegetation Community Mitigation and Monitoring Plan. Monitoring would identify the need for remediation or maintenance work well in advance of final success/failure determination. Monitoring and maintenance progress toward achieving success criteria, conditions, and all observations pertinent to eventual success would be documented in the Post-Construction Vegetation Management Quarterly Monitoring Progress Reports, and the Annual Post-Construction Vegetation Management Report, as described in the Vegetation Management Plan.

The specific compensatory mitigation acreages and method will be determined in coordination with the appropriate federal and state regulatory agencies when final route selection and engineering design facilitates calculation of the acreage of permanent impacts to sensitive plant communities. Mitigation shall consider overlap with compensation for other resources.

5 Special Status Plant Species

5.1 Species with Potential to Occur

Per MM VEG-CEQA-4 impacts to special status plant species in California will be mitigated. For the purposes of this mitigation, special status plants are defined as those with a California Rare Plant Ranking (CRPR) of 1 or 2 and/or BLM sensitive species. Table 5-1 below, adapted from Table 3.4-5 in the Draft EIS, lists the special status species identified in the Draft EIS as having potential to occur in the Project area in California. Many of the species are unlikely to occur. Per BMP BIO-24 and MM VEG-CEQA-2, special status plant surveys will be conducted prior to construction. They are currently scheduled to be conducted in 2020. Temporary and permanent impacts will be assessed based on the results of the floristic surveys and final engineering design.

TABLE 5-1 SPECIAL STATUS PLANT SPECIES WITH POTENTIAL TO OCCUR IN THE PROJECT AREA IN CALIFORNIA*

Common Name	Scientific Name	Status (California/BLM)	Habitat
Euphorbia abramsiana	Abrams' spurge	CRPR: 2B.2	Sandy soils in Mojave desert scrub and Sonoran desert scrub from 5 to 915 meters (15 to 3,000 feet) above MSL. Annual herb. Blooms September to November. Has been found north of Interstate 10 near McCoy Mountains and could occur within or near biological Project area in creosote bush association with sandy soil.
Hymenoxys odorata	Bitter hymenoxys	CRPR: 2B.1	Occurs in sandy soils in riparian scrub and Sonoran desert scrub from 45 to 150 meters (147 to 492 feet) above MSL. Annual herb. Blooms February to November. Low potential to occur along Colorado River and in woodland washes within Project area.
Teucrium cubense ssp. depressum	Dwarf germander	CRPR: 2B.2	Occurs in Desert dunes, playa margins and Sonoran desert scrub from 45 to 400 meters (147 to 1,312 feet) above MSL. Annual herb. Blooms March to November. Has not been found in or near Project area but could occur on sandy soils there and in surrounding region.
Euphorbia platysperma	Flat-seeded spurge	CRPR: 1B.2 BLM: Sensitive	Sonoran deserts scrub habitats with sandy soils and dunes below 200 meters (660 feet) above MSL. Could occur on sandy soils within or near Project area but has not been found there.
Ditaxis claryana	Glandular ditaxis	CRPR: 2B.2	Perennial herb that prefers low-elevation sandy soils in Mojave and Sonoran desert creosote scrub habitats in southern California below 100 meters (328 feet) above MSL. Could occur within or near Project area but has not been found there.
Astragalus sabulonum	Gravel milkvetch	CRPR: 2B.2	Occurs in desert dunes and Mojave/Sonoran desert scrub from –53 to 910 meters (–173 to 2,985 feet) above MSL. Annual herb. Blooms February to July. Could occur within or near Project area but has not been found there.
Eriastrum harwoodii	Harwood's eriastrum	CRPR: 1B.2 BLM: Sensitive	Occurs in Desert dunes from 125 to 915 meters (410 to 3,001 feet) above MSL. Annual herb. Blooms March to June. This species has been found on stabilized dunes and other sandy soils in the biological Project area.
Astragalus insularis var. harwoodii	Harwood's milkvetch	CRPR: 2B.2	Occurs in sandy or gravelly soils along desert dunes and Mojave desert scrub below 710 meters (2,329 feet) above MSL. Annual herb. Blooms January to May. This species has been found in the biological Project area.

Common Name	Scientific Name	Status (California/BLM)	Habitat
Colubrina californica	Las Animas colubrina	CRPR: 2B.3	Perennial deciduous shrub found in Mojave and Sonoran desert scrub and Joshua Tree woodland. Preferred habitat includes sandy, gravelly soils and dry canyons from 10 to 1,000 meters (32 to 3,280 feet) above MSL. Blooms April to June. Has been found north of Interstate 10 near McCoy Mountains but not within Project area. Unlikely to occur in sandy soil within Project area.
Calliandra eriophylla	Pink fairy-duster	CRPR: 2B.3	Perennial deciduous shrub associated with dry wash woodlands in the Sonoran Desert from 120 to 1,500 meters (393 to 4,921 feet) above MSL. Blooms January to March. Low potential to occur in desert woodlands within Project area.
Carnegiea gigantea	Saguaro	CRPR: 2B.2	Large perennial succulent and signature species of Sonoran desert scrub. Known to prefer gravelly slopes and rocky soils on mountains or bajadas. Blooms May to June. Could occur in desert woodlands and upper slopes surrounding Project area.

* Adapted from Table 3.4-5 in the Draft EIS. Includes plant species with a CRPR of 1 or 2.
CRPR = California Rare Plant Ranking
MSL = mean sea level
1A = Plants presumed extirpated in California and either rare or extinct elsewhere
1B = Plants rare, threatened, or endangered in California and elsewhere
2A = Plants presumed extirpated in California, but common elsewhere
2B = Plants rare, threatened, or endangered in California, but more common elsewhere
0.1 Seriously endangered in California
0.2 Fairly endangered in California
0.3 Not very endangered in California

5.2 Mitigation for Impacts

All mitigation shall be approved by the appropriate federal and state regulatory agencies (CPUC, CDFW, and BLM) prior to Project activities.

Temporary impacts to special status plant species in California will require on-site habitat restoration (1:1) with similar species compositions to those present prior to construction, as outlined in the Reclamation, Vegetation, and Monitoring Plan.

According to MM VEG-CEQA-4, permanent impacts to special status plant species will require compensatory mitigation at a ratio of 3:1.

Compensation will be identified in coordination with the appropriate federal and state regulatory agencies. Compensation requirements may be fulfilled through restoration and enhancement, land acquisition (i.e., conservation easement/preserve), an established mitigation bank program (if available), or a combination of these options, depending on the activity specifics and state and federal approval/authorization.

Off-site compensation lands would consist of habitat occupied by the impacted special status plant species at the appropriate ratio of acreage and the number of plants for any occupied habitat affected by the Project. Occupied habitat will be calculated on the Project site and on the compensation lands as including each special-status plant occurrence. Off-site compensation will be documented within the Final CMP and approved in consultation with the appropriated federal and state regulatory agencies.

The Proponent shall provide for open space/conservation easements on all acquired lands or provide the required funds for the acquisition of easements to a “qualified easement holder”; CDFW is a qualified easement holder. To qualify as a “qualified easement holder” a private land trust must have substantial experience managing open space/conservation

easements that are created to meet mitigation requirements for impacts to special-status species, have adopted the Land Trust Alliance's Standards and Practices, and have a stewardship endowment fund to pay for its perpetual stewardship obligations. The Proponent shall also provide the "qualified easement holder" with adequate funds to cover administrative costs incurred during the creation of the easement, funds in the form of a non-wasting endowment to cover the cost of monitoring and enforcing the terms of the easement in perpetuity.

For special-status plant restoration or enhancement activities, several techniques may be applied including salvage, propagation and off-site introduction, and restoration.

Salvage: DCRT will consult with the designated qualified biologist/botanist, as well as the appropriate federal and state regulatory agencies, regarding the feasibility and likely success of salvage efforts for each special-status plant species. If salvage is deemed to be feasible, then DCRT will incorporate salvage measures into the Project-specific Special-Status Plant and Sensitive Vegetation Community Mitigation and Monitoring Plan, which shall be approved by the appropriate federal and state regulatory agencies prior to implementation.

Propagation and Off-Site Introduction: If salvage and relocation is not believed to be feasible for one or more impacted species, then DCRT will consult with the appropriate federal and state agencies, as well as other qualified entities if needed, to develop an appropriate experimental propagation and relocation strategy, based on the life history of the species affected. The strategy will include at minimum: (a) a planting methodology including strategies for species specific collection and salvage measures for plant materials (e.g., cuttings), seed, or seed banks, to maximize success likelihood; (b) details regarding storage of plant, plant materials, or seed banks; (c) location of the proposed propagation facility, and proposed methods; (d); time of year that the salvage and other planting or transplantation practices will occur; (e) irrigation; (f) erosion controls; (g) success criteria; and (h) a detailed monitoring program. All propagation and off-site introduction strategies shall be documented in the Special-Status Plant and Sensitive Vegetation Community Mitigation and Monitoring Plan for the Project.

Restoration: Restoration may be used to mitigate impacts and depending upon the degree of impact, habitat restoration may be as simple as removing debris and controlling public access. In more complex situations, however, partial or total restoration of degraded habitat may require extensive revegetation, and soil protection and stabilization programs. The strategy will include at a minimum: (a) BLM approved genetically and ecologically appropriate native plant materials suitable for the site; (b) a description of any required topsoil salvage, plant salvage, seeding techniques, and methods to stabilize and shape soil surface to reduce soil erosivity; (c) monitoring and reporting protocols; and (d) success criteria. Restoration would be tailored to the specific site based on the habitat and species involved.

All mitigation for special-status plant species will be monitored to assess progress and to make recommendations for successful establishment. Monitoring will be performed by a qualified biologist/botanist designated by DCRT. At a minimum, monitoring will include qualitative and quantitative methods as described in the Vegetation Management Plan and the Special-Status Plant and Sensitive Vegetation Community Mitigation and Monitoring Plan. Monitoring shall identify the need for remediation or maintenance work well in advance of final success/failure determination. Monitoring and maintenance progress toward achieving success criteria, conditions, and all observations pertinent to eventual success shall be documented in the Post-Construction Vegetation Management Quarterly

Monitoring Progress Reports, and the Annual Post-Construction Vegetation Management Report, as described in the Vegetation Management Plan. In addition to the Vegetation Management Plan annual and quarterly reporting specifications, reporting for mitigation monitoring and maintenances shall also include progress reports that: (a) estimated species survival; (b) species health and overall vigor; (c) the establishment of volunteer native species; (d) topographical/soils conditions; (e) problem weed species; (f) the use of the site by wildlife; (g) significant drought stress; and (h) recommended remedial measures deemed necessary to ensure compliance with specified success criteria.

If federally- and/or state-listed plant species are identified within Project disturbance areas, then impacts and mitigation will be addressed through either the Section 7 or Section 10(a)(1)(B) process under the Federal Endangered Species Act (FESA) with the USFWS, and either the Section 2080 or Section 2080.1 process under the California Endangered Species Act (CESA) with the CDFW. Consultation with the appropriate resource agencies would be required to develop acceptable mitigation prior to construction.

The specific compensatory mitigation acreages and method will be determined in coordination with the appropriate federal and state regulatory agencies when final route selection and engineering design facilitates calculation of the acreage of impacts. Mitigation shall consider overlap with compensation for other resources.

6 Special Status Wildlife

6.1 Mojave Desert Tortoise

Mojave desert tortoise (*Gopherus agassizii)* is a federally-listed threatened species that is known to occur in desert scrub on the Palo Verde Mesa of California southwest of the Colorado River Substation. Designated critical habitat occurs outside the Project area, approximately three miles west of the substation, and will not be impacted.

The Mojave Desert Tortoise Protection and Compensation Plan details the avoidance, minimization, and onsite mitigation measures to be implemented to protect Mojave Desert tortoise. Currently it appears that there are no measures within the Final EIS requiring mitigation for temporary impacts to Mojave desert tortoise habitat. MM WIL-CEQA-11 states that: “With the exception of desert tortoise, compensation for temporary impacts to special-status terrestrial herpetofauna (including Couch’s spadefoot toad and Mojave fringe-toed lizard) potential/modeled habitat shall include on-site habitat restoration at a minimum 1:1 ratio.” Impacts and mitigation for the Mojave desert tortoise shall be addressed through either the Section 7 or Section 10(a)(1)(B) process under the FESA with the USFWS, and either the Section 2080 or Section 2080.1 process under the CESA with the CDFW.

MM WIL-CEQA-10 requires a 2:1 mitigation ratio for permanent impacts to Mojave desert tortoise, including habitat loss and potential take. MM WIL-CEQA-11 appears to provide conflicting guidance, indicating that “compensation for permanent impacts to desert tortoise and special-status wildlife on-site surveyed habitat shall include a) off-site creation, enhancement, and/or preservation, and/or b) participation in an established mitigation bank program at a minimum 3:1 ratio”. It is anticipated that the conflict between these requirements will be resolved prior to issuance of the ROD, and that the mitigation ratio requirements will be clearly presented within the ROD. MM WIL-CEQA-10 defines habitat loss as “all lands directly disturbed…that will no longer provide viable long-term habitat for

the Mojave Desert tortoise." Compensation for permanent impacts may include off-site creation, enhancement, and/or preservation or participation in an established mitigation bank program such as the National Fish and Wildlife Foundation. The Proponent shall coordinate with CPUC, BLM, and CDFW to determine the appropriate mitigation strategy and final replacement ratios and acreages. All mitigation shall be approved by the appropriate federal and state regulatory agencies prior to Project activities.

DCRT will fund or acquire, protect and transfer two acres of Mojave Desert tortoise habitat for every acre of habitat within the final Project footprint, and provide associated funding for the acquired lands. DCRT will acquire the land, in fee or in easement, within 12 months from the time the resource impact occurs, unless a 6-month extension is approved by the Authorizing Officer.

If compensation lands are acquired in fee title or in easement, the requirements for acquisition, initial improvement and long-term management of compensation lands include all of the following:

- Be within the appropriate Habitat Unit or, if sufficient land is unavailable, in other locations within approved by the appropriate federal and state regulatory agencies.
- Provide habitat for Mojave Desert tortoise with capacity to regenerate naturally when disturbances are removed.
- Be prioritized near larger blocks of lands that are either already protected or planned for protection, or which could feasibly be protected long-term by a public resource agency or a non-governmental organization dedicated to habitat preservation.
- Be connected to lands with Mojave Desert tortoise habitat equal to or better quality than the Project site, ideally with populations that are stable, recovering, or likely to recover.
- Not have a history of intensive recreational use or other disturbance that does not have the capacity to regenerate naturally when disturbances are removed or might make habitat recovery and restoration infeasible.
- Not be characterized by high densities of invasive species, either on or immediately adjacent to the parcels under consideration, that might jeopardize habitat recovery and restoration.
- Not contain hazardous wastes that cannot be removed to the extent that the site could not provide suitable habitat.
- Have water and mineral rights included as part of the acquisition, unless consultation with the appropriate federal and state agencies occurs and there is an agreement in writing to the acceptability of land.

The DRECP provides two habitat models for Mojave desert tortoise habitat. The first model is a 2009 model created by the United States Geological Survey (Nussear et al. 2009; DRECP 2019a), models a continuous surface of habitat suitability from 0 (non-habitat) to 1 (habitat), with areas greater than 0.6 being considered predicted occupied habitat. In this model, the habitat suitability ranges from 0-0.2 in the eastern portions of the Palo Verde Mesa, up to 0.2-0.4 at and near the Colorado River Substation—not within the range of predicted occupied habitat. The other model provided by the DRECP was created in 2012 by combining additional data to refine the United States Geological Survey model and

provide a binary output (suitable habitat or not habitat; DRECP 2019b). According to the more recently refined binary model, there is not any suitable Mojave desert tortoise habitat within the Project area, thus compensatory mitigation may not be necessary. In conformance with MM WIL-CEQA-10 and MM WIL-CEQA-11, DCRT will retain a designated qualified biologist to assess for Mojave Desert tortoise habitat. The results of those surveys, along with final engineering design, will be used to determine the mitigation requirements for Mojave Desert tortoise habitat loss.

The specific compensatory mitigation acreages and method will be determined in coordination with the appropriate federal and state regulatory agencies when final route selection and engineering design facilitates calculation of the acreage of permanent impacts to sensitive plant communities. Mitigation shall consider overlap with compensation for other resources.

6.2 Impacts to Federally or California-listed Threatened and Endangered Species

Formal FESA consultation for federally-listed species that have potential to occur and may be impacted by the Project include the Mojave Desert tortoise, razorback sucker, southwestern willow flycatcher, western yellow-billed cuckoo, and Yuma Ridgway's rail. CESA consultation for state-listed species that have potential to occur and may be impacted by the Project include greater sandhill crane, Mojave Desert tortoise, razorback sucker, Swainson's hawk, southwestern willow flycatcher, western yellow-billed cuckoo, and Yuma Ridgway's rail. Mitigation may be required by each agency during the regulatory permitting process, and would be incorporated in this CMP prior to construction. The specific compensatory mitigation acreages and method will be determined in coordination with the appropriate federal and state regulatory agencies when final route selection and engineering design facilitates calculation of the acreage of permanent impacts to sensitive plant communities. Mitigation shall consider overlap with compensation for other resources.

6.3 Mojave Fringe-toed Lizard

Mojave fringe-toed lizard (*Uma scoparia*) is a BLM-sensitive species that inhabits sparsely vegetated dunes, flats, riverbanks and washes with fine, loose sand. This species is common on sandy soils on the Palo Verde Mesa within the Project area. The Fringe-Toed Lizard Linear ROW Protection Plan describes the potential for Mojave fringe-toed lizard to occur in the Project area, including known occurrences, location of potential suitable habitat. It also details the avoidance, minimization, and onsite mitigation methods proposed to protect Mojave fringe-toed lizard.

Mitigation for Mojave fringe-toed lizard will take into account overlap with mitigation for other resources, particularly Harwood's eriastrum, as the two species are associated with similar habitat.

In compliance with MM WIL-CEQA-11, temporary impacts to Mojave fringe-toed lizard potential/modeled habitat will require on-site habitat restoration with similar species compositions to those present prior to construction, as outlined in the Reclamation, Vegetation, and Monitoring Plan.

For permanent habitat loss and direct impacts to Mojave fringe-toed lizards, MM WIL-CEQA-10 requires compensatory mitigation at a ratio of 3:1. DCRT will coordinate with

CPUC, BLM, and CDFW to determine the appropriate mitigation strategy and final replacement ratios and acreages. All mitigation will be approved by the appropriate federal and state regulatory agencies prior to Project activities. Compensation may include preservation through acquisition of offsite lands with an attached conservation easement, purchase of credits from an approved mitigation ban, or onsite or offsite enhancements of habitat that support known population of Mojave fringe-toed lizard. Off-site compensation lands and/or established mitigation bank program would be identified, if available, in coordination with the appropriate federal and state regulatory agencies.

On all acquired lands, DCRT would provide for open space/conservation easements or provide the required funds for the acquisition of easements to a “qualified easement holder”; the CDFW is a qualified easement holder. To qualify as a “qualified easement holder” a private land trust must have substantial experience managing open space/ conservation easements that are created to meet mitigation requirements, have adopted the Land Trust Alliance’s Standards and Practices, and have a stewardship endowment fund to pay for its perpetual stewardship obligations. DCRT would also provide the “qualified easement holder” with adequate funds to cover administrative costs incurred during the creation of the easement, funds in the form of a non-wasting endowment to cover the cost of monitoring and enforcing the terms of the easement in perpetuity.

The compensation lands selected for acquisition will meet the following criteria:

- Be deposits of Aeolian or fine windblown sands typically associated with dunes, washes, hillsides, and margins of dry lakes, with potential to contribute to Mojave fringe-toed lizard habitat connectivity and build linkages between known populations of Mojave fringe-toed lizards and preserve lands with suitable habitat.
- To the extent feasible, be connected to lands currently occupied by Mojave fringe-toed lizard.
- To the extent feasible, be near larger blocks of lands that are either already protected or planned for protection, or which could feasibly be protected long-term by a public resource agency or a non-governmental organization dedicated to habitat preservation.
- Provide quality habitat for Mojave fringe-toed lizard, that has the capacity to regenerate naturally when disturbances are removed.
- Not have a history of intensive recreational use or other disturbance that might make habitat recovery and restoration infeasible.
- Not be characterized by high densities of invasive species, either on or immediately adjacent to the parcels under consideration, that might jeopardize habitat recovery and restoration.
- Not contain hazardous wastes that cannot be removed to the extent the site is suitable for habitat.
- Not be subject to property constraints (i.e., mineral leases, cultural resources).
- Be on land for which long-term management is feasible.

The specific compensatory mitigation acreages and method will be determined in coordination with the appropriate federal and state regulatory agencies when final route selection and engineering design facilitates calculation of the acreage of permanent impacts to sensitive plant communities. Mitigation shall consider overlap with compensation for other resources.

6.4 Impacts to Other Special Status Wildlife

Table 6-2 below summarizes the status and habitat information for each special status wildlife species (that was not covered above) with potential to occur in the California portion of the Project. Many, but not all, of the special status species in Table 6-2 have DRECP habitat models identifying potential habitat. The models are coarse in scale and do not appear likely to reliably represent suitable habitat distribution for most species. After the final route is selected, prior to construction, it may be appropriate to conduct a Project-scale field-based habitat assessment for special status wildlife species in California, to validate and/or refine the existing coarse-scale models in support of implementation of compensatory mitigation.

6.4.1 Terrestrial Herpetofauna

Compensation for impacts to Mojave Desert tortoise and Mojave fringe-toed lizard are discussed above in Section 6.1 and Section 6.3. MM WIL-CEQA-11 requires compensatory mitigation for other special status herpetofauna in California. According to the Draft EIS, other special status herpetofauna with potential to occur within the Project area in California include Couch's spadefoot toad (*Scaphiopus couchii*), Sonoran desert toad (*Bufo alvarius*), and Sonoran mud turtle (*Kinosternon sonoriense*). Couch's spadefoot is associated with desert upland and cropland/hedgerow, as well as aquatic environments. According to the Draft EIS they have a high potential to occur in and near ephemeral pools and agricultural areas in the eastern portion of Project area in California. The Sonoran desert toad occurs in a variety of upland habitats within several miles of permanent or temporary water sources. These upland habitats include creosote bush desert scrub, and the edges of agriculture. The Sonoran mud turtle inhabits aquatic environments and are rare along the lower Colorado River.

In compliance with MM WIL-CEQA-11, temporary impacts to potential/modeled habitat for special status terrestrial herpetofauna will require on-site habitat restoration with similar species compositions to those present prior to construction, as outlined in the Reclamation, Vegetation, and Monitoring Plan.

Impacts in California to the habitat of special status wildlife species (that are not already covered above) will be mitigated, per MM WIL-CEQA-11, at a minimum mitigation ratio of 2:1. MM WIL-CEQA-11 appears to provide conflicting guidance as to the appropriate mitigation ratio, as detailed below in Section 6.4.2. It is anticipated that the conflict between these requirements will be resolved prior to issuance of the ROD, and that the mitigation ratio requirements will be clearly presented within the ROD. Compensation will be identified in coordination with the appropriate federal and state regulatory agencies (CPUC, CDFW, and BLM), and may include off-site creation, enhancement, and/or preservation or participation in an established mitigation bank program.

DCRT would provide for open space/conservation easements on all acquired lands or provide the required funds for the acquisition of easements to a "qualified easement holder"; CDFW is a qualified easement holder. To qualify as a "qualified easement holder" a private land trust must have substantial experience managing open space/conservation easements that are created to meet mitigation requirements for impacts to special-status species, have adopted the Land Trust Alliance's Standards and Practices, and have a stewardship endowment fund to pay for its perpetual stewardship obligations. DCRT would also provide the "qualified easement holder" with adequate funds to cover administrative costs incurred during the creation of the easement, funds in the form of a non-wasting

endowment to cover the cost of monitoring and enforcing the terms of the easement in perpetuity.

The specific compensatory mitigation acreages and method will be determined in coordination with the appropriate federal and state regulatory agencies when final route selection and engineering design facilitates calculation of the acreage of permanent impacts to sensitive plant communities. Mitigation shall consider overlap with compensation for other resources.

6.4.2 All Other Special Status Wildlife Habitat

Clarification is needed from CPUC regarding three statements within MM WIL-CEQA-11: *Conduct Pre-construction Surveys for Listed and Special-Status Terrestrial Herpetofauna and Compensation for Impacts.* The three statements are specifically:

- *Compensation for permanent impacts to desert tortoise and special-status wildlife on-site surveyed habitat shall include: a) off-site creation, enhancement, and/or preservation; and/or b) participation in an established mitigation bank program at a minimum 3:1 ratio.*

- *Compensation for temporary and permanent impacts for all other special-status wildlife habitat shall include a combination of: a) on-site habitat creation or enhancement with similar species compositions to those present prior to construction; b) off-site creation, enhancement, and/or preservation, and/or; c) participation in an established mitigation bank program at a 2:1 minimum ratio.*

- *With the exception of desert tortoise, compensation for temporary impacts to special-status terrestrial herpetofauna (including Couch's spadefoot toad and Mojave fringe-toed lizard) potential/modeled habitat shall include on-site habitat restoration at a minimum 1:1 ratio.*

Five issues associated with these three statements require clarification in order to interpret mitigation requirements for the preparation of this CMP:

- The 3:1 ratio identified in the first statement seems to contradict the 2:1 mitigation ratio for Mojave desert tortoise identified in MM WIL-CEQA-10.

- It is not clear what if any difference there is between "special-status wildlife on-site surveyed habitat" in the first statement (requiring 3:1 mitigation ratio) and "all other special-status wildlife habitat" in the second statement (requiring 2:1 mitigation ratio).

- It is not clear if "special-status wildlife" refers to all special status wildlife (e.g., mammals, birds), or if it only refers to special status terrestrial herpetofauna. The latter interpretation seems more consistent with the rest of the content of MM WIL-CEQA-11: *Conduct Pre-construction Surveys for Listed and Special-Status Terrestrial Herpetofauna and Compensation for Impacts*.

- Depending on which species each of the statements is intended to apply to, the second statement may conflict with the third statement regarding the appropriate mitigation ratio for temporary impacts.

- The third statement explicitly excludes desert tortoise (in California) from the 1:1 mitigation requirement for temporary impacts. There does not appear to be any other APM, BMP, or MM in the Final EIS requiring mitigation for temporary impacts to Mojave desert tortoise, which would make it unique among resources requiring compensatory mitigation.

TABLE 6-2 SPECIAL STATUS WILDLIFE SPECIES WITH POTENTIAL TO OCCUR WITHIN THE PROJECT AREA IN CALIFORNIA[1]

SCIENTIFIC NAME	COMMON NAME	STATUS [2]	HABITAT INFORMATION
Scaphiopus couchii	Couch's spadefoot	California: SSC BLM: Sensitive	Desert, arid, and semi-arid shrublands/chaparral, shortgrass plains, cropland/hedgerow, savanna. High potential to occur in and near ephemeral pools and agricultural areas in eastern portion of Project area in California.
Bufo alvarius	Sonoran desert toad	California: SSC	Occurs in a variety of habitats including creosote bush desert scrub, grasslands, along major river corridors, and the edges of agriculture. Generally, within several miles of permanent or temporary water sources.
Uma scoparia	Mojave fringe-toed lizard	California: SSC BLM: Sensitive	Sparsely vegetated dunes, flats, riverbanks and washes with fine, loose sand. This species is common on sandy soils within the Project area.
Kinosternon sonoriense	Sonoran mud turtle	California: SSC	Usually found in rocky streams, creeks, and rivers. It also inhabits ponds, cattle tanks, and ditches. Within Project area, rare along lower Colorado River.
Taxidea taxus	American badger	California: SSC	Agricultural land, grassland, and other open areas and brush lands with sparse groundcover. This species has been detected near the Project area.
Myotis occultus	Arizona myotis	California: SSC	Ponderosa pine and oak-pine woodland near water and wooded riparian areas in desert areas.
Macrotus californicus	California leaf-nosed bat	California: SSC BLM: Sensitive	Lowland desert scrub roosting in caves, abandoned mine tunnels and rock shelters in canyon walls.
Myotis velifer	Cave myotis	California: SSC BLM: Sensitive	Evergreen or pine-oak forest and pine forest at mid-high elevations and riparian habitats near desert scrub at lower elevations.
Sigmodon arizonae plenus	Colorado River cotton rat	California: SSC	Riparian thickets, dense grass cover, drier grassy areas. Likely rare or absent along Colorado River in Project area.
Felis concolor brownii	Yuma mountain lion	California: SSC	From mountains to valley bottoms where prey is abundant. Absent or very rare in Project area.
Ovis canadensis nelson	Desert bighorn sheep	California: FP BLM: Sensitive BLM: Focus Species	Canyons, hills, and mountains in rough terrain throughout the southwestern United States. There is no habitat for this species within the Project area.
Antrozous pallidus	Pallid bat	California: SSC BLM: Sensitive	Deserts and grasslands, mostly near rocky outcrops and water. Roosts in rock crevices.
Nyctinomops femorosaccus	Pocketed free-tailed bat	California: SSC	Rocky canyons with outcroppings and high cliffs. Roosts in rock crevices and caves. Observed near shrubland, mixed tropical deciduous forest, and floodplains with sycamore and mesquite with nearby high cliffs.

SCIENTIFIC NAME	COMMON NAME	STATUS [2]	HABITAT INFORMATION
Corynorhinus townsendii	Townsend's big-eared bat	California: SSC BLM: Sensitive	Near the entrance of caves, mine tunnels, and other well-ventilated areas. Night roosts can include caves as well as buildings and tree cavities. Potential foraging habitat exists along the Colorado River and in adjacent agricultural fields, and it is likely that this species is present in the area at least occasionally.
Lasiurus xanthinus	Western yellow bat	California: SSC	Roosts in trees, including woodland and riparian habitat.
Myotis yumanensis	Yuma myotis	BLM: Sensitive	Riparian, desert scrub, moist woodlands, and forests, typically near open water.
Toxostoma bendirei	Bendire's thrasher	California: SSC BLM: Sensitive BLM: Focus Species	Rare or uncommon during summer, dry and semi-arid washes and other areas containing shrubs, trees, and especially yucca. Unlikely to occur in Project area.
Athene cunicularia	Burrowing owl	California: SSC BLM: Sensitive BLM: Focus Species	Open grasslands, savannas and plains with mammal burrows. Occasionally in vacant lots. This species has been detected within the Project area.
Toxostoma crissale	Crissal thrasher	California: SSC	Microphyll woodland and riparian washes, mesquite woodlands, other dense scrub vegetation. Uncommon year-round resident in region.
Aquila chrysaetos	Golden eagle	California: FP Eagle Protection Act BLM: Sensitive BLM: Focus Species	Open areas, plains, and mountains throughout North America. This species is not known to nest or forage in the vicinity of the Project area in California, and the Palo Verde Mesa offers low prey availability.
Toxostoma lecontei	Le Conte's thrasher	California: SSC	Vegetated washes and desert scrub with saltbush, shadscale, cholla cacti, or other species suitable for nesting. This species has been detected within or near the Project area.
Asio otus	Long-eared owl	California: SSC	Uncommon to rare year-round resident in riparian and desert woodlands throughout deserts of southern California. There are no stands or riparian trees or large desert woodlands within the Project area that would be suitable habitat for this species.
Lanius ludovicianus	Loggerhead shrike	California: SSC	Year-round resident in open habitats with scattered shrubs, trees, posts, fences, utility lines, or other perches. This species has been detected in or near the Project area.
Charadrius montanus	Mountain plover	California: SSC BLM Sensitive	Winters in and near cultivated fields along lower Colorado River. Could occur uncommonly within and near cultivated fields.
Circus cyaneus	Northern harrier	California: SSC	Grasslands, flat areas, and hills with open habitat. This species has been detected within or near the Project area.
Asio flammeus	Short-eared owl	California: SSC	Rare in open areas, fields, and wetlands. Unlikely to occur in Project area.
Setophaga petechia sonorana	Sonora yellow warbler	California: SSC	Cottonwood, willow, and salt cedar riparian woodlands. Limited habitat within the Project area.
Piranga rubra	Summer tanager	California: SSC	Summer resident in mature cottonwood riparian woodlands along Colorado River. Limited or no habitat within and near Project area.

SCIENTIFIC NAME	COMMON NAME	STATUS [2]	HABITAT INFORMATION
Pyrocephalus rubinus	Vermilion flycatcher	California: SSC	Cropland, cultivated lands, desert, shrubland, riparian woodlands near water. Could occur uncommonly near cultivated fields.
Icteria virens	Yellow-breasted chat	California: SSC	Summer resident in dense, early successional riparian woodlands and thickets with willows, salt cedar, vine tangles, and dense brush with well-developed understories and some overstory for perches.
Xanthocephalus xanthocephalus	Yellow-headed blackbird	California: SSC	Freshwater wetlands with open water and dense, emergent vegetation. Foraging in fields and open cultivated areas. Could occur uncommonly along Colorado river and among agricultural fields.

[1] Specific mitigation requirements have not been determined and may not be required for all species.
Table is adapted from Table 3.4-8 and Table 3.4-14 in the Draft EIS.
[2] BLM = Bureau of Land Management
FP = Fully Protected
SSC = Species of Special Concern
BLM Focus Species = as designated under the DRECP LUPA

6.5 Bird and Bat Mortality

The DRECP LUPA emphasizes conservation related to wind and solar energy development, as well as transmission. Among the larger biological impacts of wind, and to some extent solar, development are bird and bat collision fatalities. Transmission lines are known to result in bird and bat mortality from collision and/or electrocution, though with the implementation of BMPs, the transmission line fatalities are anticipated to be much fewer than what are typically observed at wind and solar facilities. In compliance with mitigation measures specified in the DRECP LUPA, the Draft EIS requires assessment of and compensatory mitigation for bird and bat mortality that occurs as a result of the Project.

6.5.1 Bird and Bat Monitoring to Facilitate Estimates of Mortality

MM-WIL-CEQA-1 includes a requirement to provide "*procedures for the calculation of a fee, to be reassessed every five years, to fund compensatory mitigation for bird and bat mortality impacts; this shall be based on requirements described in CMA LUPA-BIO-COMP-2*". LUPA-BIO-COMP-2, which is applicable to the Project on BLM land in California, states that compensatory mitigation for mortality impacts to bird and bat DRECP Focus and BLM Special Status Species will be determined based on monitoring of bird and bat mortality, and that a fee will be re-assessed every five years to fund compensatory mitigation. It goes on to state that "*Each activity, as determined appropriate by BLM in coordination with USFWS, and CDFW as applicable, will include a monitoring strategy to provide activity-specific information on mortality effects on birds and bats in order to determine the amount and type of compensation required."* And that "*The initial compensation fee for bird and bat mortality impacts is to be based on pre-project monitoring of bird use and estimated bird and bat species mortality from the activity."*

The proposed monitoring strategy is described in The Draft Avian Protection Plan/Bird and Bat Conservation Strategy (APP/BBCS; Appendix F3 of the POD), and will include, at a minimum, two years of standardized post-construction bird and bat fatality monitoring; an opportunistic avian reporting system for avian and bat mortalities detected during standard operation and maintenance activities, nest searching and monitoring for all protected birds; nest surveys specifically for golden eagles and other raptors; species-specific surveys for burrowing owls; roost surveys for bats; presence/absence surveys for willow flycatcher and

Bell's vireo; and presence/absence surveys for Ridgway's rail if suitable habitat is present. Additional preconstruction surveys may be conducted if determined necessary through discussions with BLM and CDFW. The monitoring results would be used to estimate mortality impacts and calculate compensatory mitigation requirements for mortalities occurring on BLM land in California.

6.5.2 Species That May Require Compensatory Mitigation

Bird and bat Focus and BLM Sensitive Species analyzed in the Draft EIS that would require mitigation for mortality on BLM land in California are listed below along with the anticipated occurrence likelihood/relative abundance within the Project area on BLM land in California. The occurrence likelihood/relative abundance is based on DRECP habitat models (DRECP 2019a and 2019b), eBird data (eBird 2019), aerial imagery, vegetation cover type information presented in the Draft EIS, and the professional opinion of the biologist/plan author. Additional information about each species status and habitat associations may be found within Tables 6-1 and 6-2. Species that would require mitigation are:

- Birds
    - Southwestern willow flycatcher—very unlikely to occur (within the Project area on BLM land in California)
    - Yuma Ridgway's rail—very unlikely to occur
    - Arizona Bell's vireo—very unlikely to occur
    - California black rail—very unlikely to occur
    - Elf owl—unlikely to occur
    - Gila woodpecker—unlikely to occur
    - Gilded flicker—unlikely to occur
    - Greater sandhill crane—unlikely to occur
    - Swainson's hawk—may occur uncommonly
    - Western yellow-billed cuckoo—very unlikely to occur
    - Bendire's thrasher—unlikely to occur
    - Burrowing owl—may occur uncommonly
    - Golden eagle—may occur uncommonly
    - Mountain plover—may occur uncommonly
- Bats—Bat fatalities have rarely been reported under power lines.
    - California leaf-nosed bat—may occur
    - Cave myotis—unlikely to occur
    - Pallid bat—may occur
    - Townsend's big-eared bat—may occur uncommonly
    - Yuma myotis—may occur uncommonly

6.5.3 A Priori Fatality Predictions

It is likely that the Project will not result in any mortality to bird and bat DRECP Focus and BLM Special Status Species for the following reasons. None of the DRECP Focus and BLM Sensitive bird species are anticipated to commonly occur within the California portion of the Project area, and many of the species are very unlikely to occur. Bat fatalities have only rarely been reported under power lines and likely do not occur in substantial numbers. DCRT will implement numerous BMPs as recommended by the Avian Power Line Interaction Committee and described within the APP/BBCS, including but not limited to the following:

- The Project transmission line conductor spacing will exceed the necessary avian-safe separation distance which will greatly reduce the probability of electrocution.
- The transmission line will be collocated with an existing transmission line (Devers-Palo Verde 1) for much of its length, including the Colorado River Crossing.
- At the Colorado River Crossing, the Project will match spans and conductor height with the existing line to the greatest extent practicable.
- Conductor bundles for all structure types except the proposed monopoles would be installed horizontal to one another (at the same height on the structure), and the two ground wires would be horizontal to one another, approximately 30 feet above the conductors.
- Permanent guy guards/markers will be installed on all guy wires for the guyed-V structures.
- The Project's ground wires and any other static wires will be marked with marker balls or other flight deterrents at the crossing of the Colorado River and its floodplain and within 1,000 feet of stream and wash channels, canals, ponds, and any other natural or artificial body of water.
- To minimize potential bird collisions with Project fencing, all newly constructed fences will utilize high visibility fencing or will be marked to increase visibility of the top wire.
- Surveys for, and avoidance of, active nests.

It is likely that most or all bird or bat fatalities will be common, non-Special-Status species. Monitoring and avoidance of nesting birds is anticipated to prevent mortality to eggs or nestling birds during construction.

Given all the above considerations, the most reasonable a priori estimate for the first five-year period is that the Project would not cause any mortality for each of the above species.

6.5.4 Calculation of Compensation for Bird and Bat Mortality.

The mortality estimates will be reassessed every five years based on the results of fatality monitoring, which will be conducted using the methodologies described in the APP/BBCS. If at one of the five-year reassessments mortality has been documented or estimated to occur to any DRECP Focus or BLM Sensitive species, compensation will be satisfied by

restoring, protecting, or otherwise improving habitat such that the carrying capacity or productivity is increased to offset the mortality impact. Compensation may also be satisfied by non-restoration actions that reduce mortality risks to birds and bats (e.g., increased predator control and protection of roosting sites from human disturbance).

The approach to calculating the operational bird and bat compensation would involve measuring the relative loss to a population (debt) resulting from an activity and the productivity gain (credit) to a population from the implementation of compensatory mitigation actions. The measurement of these debts and gains (using the same "bird years" metric as described in Appendix D of the DRECP LUPA) is used to estimate the necessary compensation fee.

Based on the description of analysis methods found in Appendix D of the DRECP LUPA, it appears that "bird year" losses and gains were estimated using species maximum longevity, rather than the more appropriate metric of annual survival rate, thus yielding questionable estimates of life expectancy. More importantly, it is not clear why the "bird years" should differ (in a generalizable and predictable way) between a bird life that is "lost" and a bird life that is "gained," and indeed the estimates provided in DRECP LUPA Appendix D for DRECP Focus species result in statistically identical "bird year" estimates for "losses" and "gains," i.e., the range of estimates for "lost bird years" for each species overlaps the range of estimates for "gained bird years." Therefore, for the sake of simplicity and clarity, if mortality occurs and triggers compensatory mitigation, it would be assumed that "bird years" per lost bird equals "bird years" per gained bird, and each bird life "gained" will offset a single bird life "lost."

If compensation is to occur in the form of restoration or preservation of breeding habitat, the restored nesting habitat compensation acreage per whole bird loss would be the most pertinent metric. If mortality occurs to one of the species for which estimates are provided in DRECP LUPA Appendix D, then the provided estimate will be used. Otherwise an estimate will be calculated using average home-range size estimates for the species in question if available or for taxonomically and ecologically similar species, if necessary.

Restored Nesting Habitat Compensation Acreage per Whole Bird Loss estimates provided in DRECP LUPA Appendix D are as follows:

- Willow flycatcher—5 acres
- Bell's vireo—2 acres
- Yellow-billed cuckoo—20 acres
- Gila woodpecker—24 acres
- Ridgway's rail—2 acres
- Black rail—2 acres

For species that do not breed within the DRECP LUPA Plan Area (e.g., mountain plover and greater sandhill crane), restoration or improved management of breeding habitat is not feasible. However, restoration and maintenance of foraging habitat, with the aim of increasing winter survival may be possible.

An alternative to habitat restoration or preservation, threat reduction actions could be used to compensate for mortality. According to DRECP LUPA Appendix D, compensation for bat mortality would need to take the form of threat reduction compensation, rather than habitat preservation or restoration. DRECP LUPA Appendix D recognizes several threat reduction measures, including the following which may be considered for this Project, if impacts trigger mitigation requirements:

- Nest site and roost protections.
- Retrofitting – Power line retrofitting following current Avian Power Line Interaction Committee standards in the LUPA Plan Area could reduce the risk of future electrocutions. As a compensation action, power line retrofitting must be in addition to existing, ongoing retrofitting programs being conducted by the utilities.
- Repowering existing wind facilities – Aging, inefficient wind power generation facilities that may kill or injure birds and bats may present an opportunity to repower or re-site or remove them to reduce the amount of ongoing mortality.
- Predator control and management programs, such as this Project's Raven Management Program (Appendix F-5 of the POD) or cowbird control. Again, the effectiveness of these compensation actions requires an understanding of both the lifetime contribution of an individual and the gains to the population in terms of avoided losses. It is unknown if the scale at which it would need to be implemented would make this a feasible approach for compensation.
- For bats, compensation would almost entirely consist of management actions designed to reduce threats from encroachment of human activity on significant roosts. For example, human access to mines may be restricted by funding gating and/or fencing that does not block bat access at abandoned mine features.

Given the low likelihood that the Project will result in mortality to any DRECP Focus or BLM sensitive species, and the inability to predict which, if any, species will experience mortality, a specific and detailed calculation of specific compensatory mitigation actions would not be appropriate at this time. Prior to each five-year reassessment, if mortality triggers a need for compensatory mitigation, DCRT, in collaboration with BLM, will identify commensurate specific compensatory actions or monetary compensation.

6.5.5 Golden Eagle Mortality

CMA LUPA-BIO-COMP-3 and CMA LUPA-BIO-COMP-4 require Project proponents to contribute to a DRECP-wide monitoring program, if the Project is determined, through environmental analysis, to likely impact golden eagles within the DRECP area (as it pertains to the Project, BLM land in California). According to the Draft EIS, there is no golden eagle nesting habitat in or near the DRECP portion of the Project area and while the Project area may provide eagle foraging habitat, but the prey base of black-tailed jackrabbits and desert cottontails is considered very low. The Project is not likely to impact golden eagles through direct mortality or indirect impacts. Therefore, DCRT will not be responsible for contributing to the golden eagle monitoring program. If new evidence leads to the documentation or expectation of golden eagle mortality, compensatory mitigation will be provided as described above.

7 Raven Management

During the past few decades, the population of the common raven (*Corvus corax*) has increased substantially in the Desert Southwest, primarily in response to human-provided subsidies of food, water, and nest sites. Ravens are a major predator of many special status species, including the federally threatened Mojave desert tortoise. Per BMP BIO-28, MM WIL-CEQA-2, and CMA LUPA-BIO-6 compensatory mitigation will be provided that contributes to LUPA-wide raven management. The Raven Management Plan, Appendix

F-5 of the POD, provides a detailed prescription of measures to avoid and minimize the Project's unintentional augmentation of raven populations. Per MM WIL-CEQA-2, DCRT will submit payment into an account established for the Project held by the National Fish and Wildlife Foundation to support the USFWS Regional Raven Management Program. The one-time fee shall be as described in the cost allocation methodology or more current guidance as provided by USFWS. The contribution to the regional raven management plan will be $105 "per acre impacted." The correct interpretation of the words "per acre impacted" will be determined based on conversations with BLM and/or CDFW. Preliminarily, this document assumes it to mean acres of permanent and temporary ground disturbance.

8 Cultural Resources

Per BMP CULT-05 and LUPA-TRANS-CUL-2, DCRT will pay a compensatory mitigation fee for cumulative and indirect effects to historic properties as a result of construction. The fee structure of the compensatory mitigation fee will be calculated in a manner that is commensurate to the size and regional impacts of the Project, as determined by Appendix G of the DRECP Programmatic Agreement (PA), which has not been completed to date. If Appendix G of the DRECP PA has not been completed at the time the PA is executed, the BLM will develop mitigation to address cumulative and indirect adverse effects in a manner that is commensurate to the size and regional impacts of the Undertaking, in consultation with the Consulting Parties. This fee structure would be determined by the BLM and contained in the Project-specific PA.

According to the Draft EIS, *"Specific impacts to historic properties are unknown until Class III identification studies and indirect effect analyses of the selected route are completed, and additional information regarding engineering design is available. As a result, evidence is currently insufficient to state specific direct or indirect impacts to particular historic properties or to discuss specific measures to resolve potential effects to those properties."* When the potential impacts to historic properties are identified, avoidance and minimization measures will be adopted to the extent practicable to prevent impacts, and any remaining residual impacts will be compensated as described above.

9 Visual Resources

As detailed in Appendix 1c of the Draft EIS and in the DRECP LUPA, CMA DFA-VRM-2 requires compensatory mitigation for visual impacts based on underlying Visual Resource Inventory (VRI) Classes. Specifically, DFA-VRM-2 states that regional mitigation is required.

> "…based on the VRI class and the underlying visual values (scenic quality, sensitivity, and distance zone) for the activity area as it stands at the time the ROD is signed for the DRECP LUPA. Compensatory mitigation may take the form of reclamation of other BLM lands to maintain (neutral) or enhance (beneficial) visual values on VRI Class II and III lands. Other considerations may include acquisition of conservation easements to protect and sustain visual quality within the viewshed of BLM lands. The following mitigation ratios will be applied in DFAs:
>
> - VRI Class II 1:1 ratio
> - VRI Class III ½ (0.5): 1 ratio

- VRI Class IV, no mitigation required

Additional mitigation will be required where activities affect viewsheds of specially designated areas (e.g., National Scenic and Historic Trails)."

As detailed in the Draft EIS (Table 3.11-5, page 3-78; Appendix 2C, page 62), only VRI Class II areas are crossed by the Project, and the visual impact analysis determined that the introduction of the Project into the viewshed would not result in a scenic quality reduction of VRI Class II areas enough to lower the VRI class (e.g., from VRI Class II to VRI Class III). Therefore, no compensatory mitigation is required for visual resources, and no additional analysis has been conducted as part of this CMP.

1 Introduction

The data and information provided with this Mojave Fringe-Toed Lizard Avoidance and Clearance Plan (Plan) is for the Ten West Link Transmission Project (Project) proposed by Delaney Colorado River Transmission, LLC (DCRT) on the California portion only. The purpose of this Plan is to address direct impacts resulting from the construction, operation, and maintenance of the Project to the Bureau of Land Management (BLM) sensitive (and California species of concern) Mojave fringe-toed lizard (*Uma scoparia*) and their associated sand dune habitats. Direct impacts would be potential habitat loss and species injury and/or mortality. This project-specific Plan describes the avoidance management strategy and mitigation procedures that would minimize impacts to the species and their habitat. The DCRT is responsible to ensure all supervision, guidance, and verification of the mitigations and protocols outlined in the Plan are achieved and receive approval by the BLM.

1.1 Project Description and Location

As shown in Figure F-6-1 – Ten West Link Proposed Action Overview, the Project is approximately 125.3 miles of 200-foot-wide right-of-way (ROW) with 103.7 miles of the route in Maricopa and La Paz Counties, Arizona and 21.6 miles in Riverside County, California. Of the total length, approximately 81.3 miles cross lands managed by federal agencies including the BLM, the Department of Defense, and the Bureau of Reclamation.

The Project's overhead transmission line would extend between Arizona Public Service's Delaney Substation near Tonopah, Arizona and Southern California Edison Company's Colorado River Substation, located near Blythe, California. The Project route (BLM Preferred Alternative) would parallel an existing transmission line and other linear facilities, primarily within designated utility corridors. For further design and details, refer to the Plan of Development (Volume I). Any changes or additions to the requirements for this Plan will be updated when the Record of Decision has been issued.

1.2 Relevant Laws, Regulations, and Management Policies

1.2.1 Federal

Administered by the United States Fish and Wildlife Service (USFWS), the Endangered Species Act (ESA) of 1973, as revised, was established to protect species at risk of becoming extinct (16 United States Code [U.S.C.] § 1531). In 2006, a private-citizen petition was sent to the USFWS to list the Mojave fringe-toed lizard populations residing near the Amargosa River in Southern California. After a 12-month review of current population and genetic trends during 2008, the USFWS Ventura Field Office concluded that the species did not warrant protection under the ESA (Federal Register, Volume 76, No. 61321). However, the BLM Colorado River District Offices list the species as sensitive, requiring special management consideration to promote conservation and reduce the likelihood of future listing of the species.

1.2.2 State of Arizona

The Mojave fringe-toed lizard is a Species of Greatest Conservation Need under the Arizona Game and Fish Department's State Wildlife Action Plan (Arizona Game and Fish

Department [AGFD] 2016) and a sensitive species on BLM administered lands in Arizona. The preferred alternative passes very close to suitable habitat within Arizona borders; however, the Project will not impact these areas. There is no suitable habitat for Mojave fringe-toed lizards for the portion of the Project in California for which BLM Arizona governs.

1.2.3 State of California

The California Department of Fish and Wildlife (CDFW) lists the Mojave fringe-toed lizard as a species of concern. This classification lists species either as state-extirpated; experiencing population declines or range retractions; or having small, existing populations demonstrating high vulnerability to risk (CDFW 2018).

A statute passed in 1970, the California Environmental Quality Act (CEQA) requires state and local agencies to identify the significant environmental impacts of their actions and to avoid or mitigate those impacts, if feasible (California Natural Resources Agency 2014). Under CEQA guidelines, any species of concern should be included in project-impacts analysis (California Public Resources Code § 15380). The California Public Utilities Commission (CPUC) is responsible for determining if the Project will be constructed in accordance with CEQA requirements and issue to DCRT a Certificate of Public Convenience and Necessity for transmission infrastructure within California.

The Plan covers the requirements of the following Mitigation Measures (MM) under CEQA, as depicted in Appendix 1C of the Draft Environmental Impact Statement (EIS), for the Mojave fringe-toed lizard:

- MM Biological (BIO)-CEQA-1: Implement Biological Resources Applicant Proposed Measures (APMs), BLM Best Management Practices (BMPs), and Conservation and Management Actions (CMAs) as part of the Project and applied prior to, during, and after Project activities to avoid or minimize Project related impacts on biological resources (see Section 1.2.4). Where an APM, BMP, or CMA is subjective (i.e., “where appropriate,” “where feasible”), DCRT or their contractor will consult with BLM and CPUC to determine applicability of each measure prior to the disturbance of a covered resource. Weekly and monthly documentation of compliance will be provided to the BLM and CPUC; further details are provided in Appendix 1C of the Draft EIS.

- MM BIO-CEQA-2: Prior to any work activities on the Project including but not limited to surveying, mobilizations, fencing, grading, or construction, DCRT will implement a Worker Environmental Awareness Program (WEAP) approved by the CPUC and will be implemented throughout the duration of Project-related construction activities including the operation and maintenance phases (see Sections 1.2.3 and 4.3).

- MM BIO-CEQA-3: DCRT will implement biological construction monitoring no more than 30 days prior to the start of site mobilization or ground disturbance activities; approved, designated biologist(s) will be retained by DCRT to monitor construction of the Project (see Sections 1.2.3, 4.1, 4.2, and 4.4).

- MM WIL-CEQA-9: DCRT will be responsible for compensation as a result of impacts to the Mojave fringe-toed lizard. Compensation is determined after field surveys are conducted by qualified/approved biologists; all avenues of avoidance and minimization measures have been applied to the Project design; and impacts (temporary and permanent) have been identified. DCRT will submit to the BLM and CPUC a Mojave Fringe-Toed Lizard Protection and Compensation Plan that will be in accordance with the BLM and CPUC regulatory agencies policies and protocols. Approval from the BLM and CPUC will proceed Project commencement and be implemented during all Project phases, as necessary (see Section 5).

- MM WIL-CEQA-11: Where suitable habitat is present, pre-construction biological surveys must be conducted prior to the start of Project construction for listed and special status terrestrial herpetofauna (i.e., lizards, snakes, tortoise). DCRT will retain qualified biologists approved by the BLM and CPUC (see Sections 4.1, 4.3, and 4.4).

  Clearance surveys for special-status terrestrial herpetofauna shall be conducted prior to the initiation of construction each day in suitable habitat. Specimens found within disturbance areas or potentially affected by the Project shall be relocated to the nearest suitable habitat outside work areas and away from construction activity (see Section 4.4).

In addition, Mojave fringe-toed lizards are a Focus species identified in the Desert Renewable Energy Conservation Plan (DRECP). The DRECP is a primary constituent on Mojave fringe-toed lizard conservation in California and provides known occurrences of the species and associated habitats, particularly on the Palo Verde Mesa near the west end of the Project (DRECP 2014).

1.2.4 Project-Specific Requirements

As depicted in the MM BIO-CEQA-1, the Plan has been prepared to address Project-specific requirements for Biological Resource APMs and BLM's BMPs and are summarized in Table F-6-1. The APMs and BMPs listed are applicable during the pre-construction, construction, post-construction/restoration, and operation and maintenance phases of the Project. Their comprehensive nature covers the listed CEQA requirements (MM BIO-CEQA-1, BIO-CEQA-2, BIO-CEQA-3, WIL-CEQA-9, and WIL-CEQA-11), as well as the CMA standards required in regard to the Mojave fringe-toed lizard listed in Table F-6-2.

The CMA standards comply with the California Desert Conservation Area Plan of 1980, as amended (see Project's DEIS Appendix 2B.2; BLM 2018a). Several CMA standards listed in Table F-6-2 also meet requirements of MM WIL-CEQA-9 in minimizing impacts to the Mojave fringe-toed lizard; further details can be found in Section 4.3. All Project-specific requirements listed provide the regulatory framework that the Project must wholly comprehend and comply with.

TABLE F-6-1 DCRT AND BLM PROJECT-SPECIFIC REQUIREMENTS

Measure[1]	Description [1, 2]
APM BIO-01	Before starting any work, including mowing, staging, installing stormwater control structures, implementing other BMPs, removing trees, construction, and restoration, all employees and contractors performing activities and new construction would receive training on environmental requirements that apply to their job duties and work. If additional crewmembers arrive later in the job, they would be required to complete the training before beginning work. Training would include a discussion of the avoidance and minimization measures being implemented and would include information on the federal and state Endangered Species Acts and the consequences of not complying with these Acts. An educational brochure would be provided to construction crews working on the Project. This brochure would include color photographs of special-status species as well as a discussion of avoidance and minimization measures. (Addresses California Management Action [CMA] standard Land Use Plan Amendment [LUPA]-Biological Mitigation Measure [BIO]-05 and Mitigation Measure [MM] BIO-California Environmental Quality Act [CEQA]-2)
BMP BIO-01	The worker education program would provide interpretation for non-English speaking workers. (Addresses CMA standard LUPA-BIO-05 and MM BIO-CEQA-2)
APM BIO-02	A qualified biological monitor would be present on the Project site during all work activities within habitat of special-status animal species. The qualified biologist would conduct a preconstruction survey of those areas immediately before work activities begin and would locate and fence off any present individuals of special status plant species. (Addresses CMA standard LUPA-BIO-2, LUPA-BIO-DUNE-5, LUPA-BIO-Individual Focus Species [IFS]-06 and 07, Development Focus Area [DFA]-BIO-IFS-01 and 02, and MM BIO-CEQA-3)
BMP BIO-02	A qualified biological monitor would be present on the Project site during all work activities within habitat of special-status animal species. The qualified biologist would conduct a preconstruction survey of those areas immediately before work activities begin and would locate and fence off any present individuals of special status plant species. (Addresses CMA standard LUPA-BIO-2, LUPA-BIO-DUNE-5, LUPA-BIO-IFS-06 and 07, and DFA-BIO-IFS-01 and 02 and MM BIO-CEQA-3)
APM BIO-03	To the extent practicable, stockpiling of material would be allowed only within the established work area. Vehicles and equipment would be parked on pavement, existing roads, and previously disturbed areas within identified work areas or access roads. (Addresses CMA standard LUPA-BIO-13)
BMP BIO-03	The BLM would approve areas to be used for stockpiling, vehicle parking, or other construction support activity that would occur outside established work areas. (Addresses CMA standard LUPA-BIO-13)
APM BIO-09	All excavated steep-walled holes or trenches more than 1.0-foot deep would be covered at the end of each working day with plywood or similar material or would be provided with one or more escape ramps constructed of earth fill or wooden planks. Each trench or hole would be inspected for wildlife at the beginning of each work day and before such holes or trenches are filled. Wildlife found trapped in trenches or holes would be relocated to suitable habitat outside the work area. If possible, pipes and culverts greater than three inches in diameter would be stored on dunnage to prevent wildlife from taking refuge in them, to the extent feasible. (Addresses CMA standard LUPA-BIO-14)

Measure[1]	Description [1, 2]
APM BIO-10	The Best Management Practices (BMPs) included in the Stormwater Pollution Prevention Program would be implemented during construction to minimize impacts associated with erosion. Watering for dust control during construction would also be used as described previously (Air Quality [AQ]-01). Watering shall not result in prolonged ponding of surface water that could attract wildlife to the work area. Minimal or no vegetation clearing and/or soil disturbance would be conducted for site access and construction in areas with suitable topography (i.e., overland driving/overland access). (Addresses CMA standard LUPA-BIO-14)
APM BIO-17	Vehicular travel would be limited to established roads to the maximum extent practicable. (Addresses CMA standard LUPA-BIO-13)
BMP BIO-25	A survey would be conducted of the selected route prior to construction of all work areas to identify special-status animal species, including Mojave desert tortoises, burrowing owls, and Mojave fringe-toed lizards. Where possible, and as required by the Bureau Land Management (BLM), special-status species and vegetation alliances would be avoided during construction. (Addresses CMA standards LUPA-BIO-01, LUPA-BIO-DUNE-04/05, and LUPA-BIO-IFS-06, DFA-BIO-IFS-01, and MM WIL-CEQA-11)
BMP BIO-32	Species-specific seasonal restriction dates per AGFD and CDFW and in applicable RMPs would be observed. (Addresses CMA standard LUPA-BIO-04 and LUPA-BIO-DUNE-5)
BMP BIO-35	All construction materials would be visually checked for the presence of wildlife prior to their movement or use. Any wildlife encountered during the course of these inspections would be allowed to leave the construction area unharmed. (Addresses CMA standard LUPA-BIO-14)
BMP BIO-36	The intentional feeding or harassment of wildlife on site is prohibited. (Addresses CMA standard LUPA-BIO14)
BMP-BIO-38	Use state-of-the-art, commercially available construction and installation techniques, as approved by BLM, appropriate for the specific activity/project and site, that minimize new site disturbance, soil erosion and deposition, soil compaction, disturbance to topography, and removal of vegetation. (Addresses CMA standards LUPA_BIO-09 and 15)
BMP BIO-49 (California only)	A Mojave Fringe-toed Lizard Management Plan would be prepared that identifies specific conservation measures to minimize Project-related impacts to sand dunes and sand transport areas, to map suitable habitat within construction zones, and methods to achieve clearance survey within suitable habitat so animals are not killed by construction activities. (Addresses CMA standard LUPA-BIO-01 and LUPA-BIO-DUNE-02/04/05, and MM BIO-CEQA-9)
BMP BIO-53 (California only)	Project facilities would be sited to avoid dune vegetation. Unavoidable impacts to dune vegetation would be limited and Project facilities access roads that would be sited to minimize unavoidable impacts. Access roads will be designed and constructed to be at grade with the ground surface to avoid inhibiting sand transportation. Access roads would be unpaved, and access roads would be designed and constructed to be at grade with the ground surface to avoid inhibiting sand transport. (Addresses CMA standard LUPA-BIO-01 and 13, LUPA-BIO-DUNE-02 and 04, LUPA-Transportation [TRANS]-BIO-4, and DFA-Variance Process Land designation [VPL]-BIO-DUNE-1)
BMP BIO-54 (California only)	Within aeolian corridors that transport sand to dune formations and vegetation types downwind, all activities would be designed and operated to facilitate the flow of sand across activity sites and avoid the trapping or diverting of sand from the aeolian corridor. Structures would consider the direction of sand flow and, to the extent feasible, build and align structures to allow sand to flow through the site unimpeded. Fences would be designed to allow sand to flow through and not be trapped. (Addresses CMA standard LUPA-BIO-01, LUPA-BIO-DUNE-01/02/04, LUPA-TRANS-BIO-04, and DFA]-VPL-BIO-DUNE-02)

Measure[1]	Description [1, 2]
BMP BIO-55 (California only)	Construction of new roads and/or routes would be avoided to the extent practicable within Focus and BLM Special Status Species suitable habitat within identified linkages for those Focus and BLM Special Status Species, unless the new road and/or route is beneficial to minimize net impacts to natural or ecological resources of concern. These areas would have a goal of "no net gain" of Project roads and/or routes. (Addresses CMA standard LUPA-BIO-13 and LUPA-BIO-DUNE-04)
BMP VEG-01	Any removal of vegetation resources would be conducted in accordance with BLM IB 2012-097 (Addresses CMA standard LUPA-BIO-15)
BMP VEG-02	Minimize natural vegetation removal through implementation of crush and drive or cut or mow vegetation rather than removing entirely. Locations for drive and crush travel or cut/mow would be determined in conjunction with the Access Road Plan (Appendix 2B of the Project DEIS). (Addresses CMA standard LUPA-BIO-14)

[1] APM = Applicant Proposed Measure; BIO = Biological Mitigation Measure; BLM =, Bureau of Land Management; BMP = Best Management Practices; CMA = Conservation and Management Action; DFA = Development Focus Areas; DRECP = Desert Renewable Energy Conservation Plan; DUNE = Dune Habitats; IFS = Individual Focus Species; LUPA = Land Use Plan Amendment; TRANS = Transportation; VPL = Variance Process Land designation.

[2] The Draft Environmental Impact Statement (EIS) mitigation measure language was copied from the Project Draft EIS Appendix 2A and 2B (BLM 2018a). References for the requirement descriptions can be found in the source documents. Any requirements from the Final EIS will be updated in the final Plan of Decision management plans.

TABLE F-6-2 CMA PROJECT SPECIFIC REQUIREMENTS (CALIFORNIA ONLY)

Measure[1]	Description [1, 2]
LUPA-BIO-01	Conduct a habitat assessment of Desert Renewable Energy Conservation Plan (DRECP) Focus and Bureau of Land Management (BLM) Special Status Species' suitable habitat for all activities and identify and/or delineate the DRECP vegetation types, rare alliances, and special features (e.g., aeolian sand transport resources, Joshua tree, microphyll woodlands, carbon sequestration characteristics, seeps, climate refugia) present using the most current information, data sources, and tools (e.g., DRECP land cover mapping, aerial photos, DRECP species models, and reconnaissance site visits) to identify suitable habitat for DRECP Focus and BLM Special Status Species. If required by the relevant species-specific California Management Actions (CMAs), conduct any subsequent protocol or adequate presence/absence surveys to identify species occupancy status and a more detailed mapping of suitable habitat to inform siting and design considerations. If required by relevant species-specific CMAs, conduct analysis of percentage of impacts to suitable habitat and modeled suitable habitat.
LUPA-BIO-03	Resource setbacks (see Glossary of Terms in the Project Draft Environmental Impact Statement [EIS]) have been identified to avoid and minimize the adverse effects to specific biological resources. Setbacks are not considered additive and are measured as specified in the applicable CMA. Allowable minor incursions (see Draft EIS Glossary of Terms), as per specific CMAs do not affect the following setback measurement descriptions. Generally, setbacks (which range in distances for different biological resources) for the appropriate resources are measured from: • The edge of each of the DRECP desert vegetation types, including but not limited to those in the riparian or wetland vegetation groups (as defined by alliances within the vegetation type descriptions and mapped based on the vegetation type habitat assessments described in Land Use Plan Amendment [LUPA]-Biological Mitigation Measure [BIO]-01). • The edge of the vegetation extent for specified DRECP Focus and BLM sensitive plant species. • The edge of suitable habitat or active nest substrates for the appropriate DRECP Focus and BLM Special Status Species.

Measure[1]	Description [1, 2]
LUPA-BIO-04	For activities that may impact DRECP Focus and BLM Special Status Species, implement all required species-specific seasonal restrictions on pre-construction, construction, operations, and decommissioning activities. Species-specific seasonal restriction dates are described in the applicable CMAs. Alternatively, to avoid a seasonal restriction associated with visual disturbance, installation of a visual barrier may be evaluated on a case-by-case basis that will result in the breeding, nesting, lambing, fawning, or roosting species not being affected by visual disturbance from construction activities subject to seasonal restriction. The proposed installation and use of a visual barrier to avoid a species seasonal restriction will be analyzed in the activity/project specific environmental analysis.
LUPA-BIO-05	All activities, as determined appropriate on an activity-by-activity basis, will implement a worker education program that meets the approval of the BLM. The program will be carried out during all phases of the project (site mobilization, ground disturbance, grading, construction, operation, closure/decommissioning or project abandonment, and restoration/reclamation activities). The worker education program will provide interpretation for non-English speaking workers, and provide the same instruction for new workers prior to their working on site. As appropriate based on the activity, the program will contain information about: • Site-specific biological and nonbiological resources. • Information on the legal protection for protected resources and penalties for violation of federal and state laws and administrative sanctions for failure to comply with LUPA CMA requirements intended to protect site-specific biological and nonbiological resources. • The required LUPA and project-specific measures for avoiding and minimizing effects during all project phases, including but not limited to resource setbacks, trash, speed limits, etc. • Reporting requirements and measures to follow if protected resources are encountered, including potential work stoppage and requirements for notification of the designated biologist. • Measures that personnel can take to promote the conservation of biological and nonbiological resources.

Measure[1]	Description [1, 2]
LUPA-BIO-13	Implement the following CMA for project siting and design: • To the maximum extent practicable site and design projects to avoid impacts to vegetation types, unique plant assemblages, climate refugia as well as occupied habitat and suitable habitat for DRECP Focus and BLM Special Status Species (see "avoid to the maximum extent practicable" in Draft EIS Glossary of Terms). • The siting of projects along the edges (i.e., general linkage border) of the biological linkages identified in Appendix D of the Project Draft EIS (Figures D-1 and D-2) will be configured (1) to maximize the retention of microphyll woodlands and their constituent vegetation type and inclusion of other physical and biological features conducive to DRECP Focus and BLM Special Status Species' dispersal, and (2) informed by existing available information on modeled DRECP Focus and BLM Special Status Species habitat and element occurrence data, mapped delineations of vegetation types, and based on available empirical data, including radio telemetry, wildlife tracking sign, and road-kill information. Additionally, projects will be sited and designed to maintain the function of Special Status Species connectivity and their associated habitats in the following linkage and connectivity areas: o Within a 5-mile-wide linkage across Interstate 10 centered on Wiley's Well Road to connect the Mule and McCoy mountains (the majority of this linkage is within the Chuckwalla Areas of Critical Environmental Concern and Mule-McCoy Linkage Areas of Critical Environmental Concern). • Delineate the boundaries of areas to be disturbed using temporary construction fencing and flagging prior to construction and confine disturbances, Project vehicles, and equipment to the delineated Project areas to protect vegetation types and focus and BLM Special Status Species. • Long-term nighttime lighting on project features will be limited to the minimum necessary for project security, safety, and compliance with Federal Aviation Administration requirements and will avoid the use of constant-burn lighting. • Long-term nighttime lighting on project features will be limited to the minimum necessary for Project security, safety, and compliance with Federal Aviation Administration requirements and will avoid the use of constant-burn lighting. • To the maximum extent practicable (see Draft EIS Glossary of Terms), restrict construction activity to existing roads, routes, and utility corridors to minimize the number and length/size of new roads, routes, disturbance, laydown, and borrow areas. • To the maximum extent practicable (see Draft EIS Glossary of Terms), confine vehicular traffic to designated open routes of travel to and from the project site, and prohibit, within project boundaries, cross- country vehicle and equipment use outside of approved designated work areas to prevent unnecessary ground and vegetation disturbance. • To the maximum extent practicable (see Draft EIS Glossary of Terms),construction of new roads and/or routes will be avoided within DRECP Focus and BLM Special Status Species suitable habitat within identified linkages for those DRECP Focus and BLM Special Status Species, unless the new road and/or route is beneficial to minimize net impacts to natural or ecological resources of concern. These areas will have a goal of "no net gain" of project roads and/or routes. • Use nontoxic road sealants and soil stabilizing agents.

Measure[1]	Description [1, 2]
LUPA-BIO-14	Implement the following general standard practices to protect DRECP Focus and BLM Special Status Species: • Feeding of wildlife, leaving of food or trash as an attractive nuisance to wildlife, collection of native plants, or harassing of wildlife on a site is prohibited. • Any wildlife encountered during the course of an activity, including construction, operation, and decommissioning will be allowed to leave the area unharmed. • Domestic pets are prohibited on sites. This prohibition does not apply to the use of domestic animals (e.g., dogs) that may be used to aid in official and approved monitoring procedures/protocols, or service animals (dogs) under Title II and Title III of the American with Disabilities Act. • All construction materials will be visually checked for the presence of wildlife prior to their movement or use. Any wildlife encountered during the course of these inspections will be allowed to leave the construction area unharmed. • All steep-walled trenches or excavations used during the project will be covered, except when being actively used, to prevent entrapment of wildlife. If trenches cannot be covered, they will be constructed with escape ramps, following up-to-date design standards to facilitate and allow wildlife to exit, or wildlife exclusion fencing will be installed around the trench(s) or excavation(s). Open trenches or other excavations will be inspected by a designated biologist immediately before backfilling, excavation, or other earthwork. • Minimize natural vegetation removal through implementation of crush and drive or cut or mow vegetation rather than removing entirely.
LUPA-BIO-15	Use state-of-the-art, as approved by BLM, construction and installation techniques, appropriate for the specific activity/project and site, that minimize new site disturbance, soil erosion and deposition, soil compaction, disturbance to topography, and removal of vegetation.
LUPA-BIO-COMP-01	Impacts to biological resources, identified and analyzed in the activity specific environmental document, from activities in the LUPA Decision Area will be compensated using the standard biological resources compensation ratio, except for the biological resources and specific geographic locations listed as compensation ratio exceptions, specifics in CMAs LUPA-BIO-Compensation [COMP]-2 through -4, and previously listed CMAs. Compensation acreage requirements may be fulfilled through non-acquisition (i.e., restoration and enhancement), land acquisition (i.e., preserve), or a combination of these options, depending on the activity specifics and BLM approval/authorization. Refer to CMA LUPA-COMP-1 for the timing requirements for initiation or completion of compensation (compensation activities must be initiated or completed within 12 months from the time the resource impact occurs).
LUPA-BIO-DUNE-01	Because DRECP sand dune vegetation types and aeolian sand transport corridors are, by definition, shifting resources, activities that potentially occur within or bordering the sand dune DRECP vegetation types and/or aeolian sand transport corridors must conduct studies to verify the location [refer to Appendix D of the Project Draft EIS, Figure D-7] and extent of the sand resource(s) for the activity-specific environmental analysis to determine: • Whether the proposed activity(s) occur within a sand dune or an aeolian sand transport corridor. • If the activity(s) is subject to dune/aeolian sand transport corridor CMAs. • If the activity(s) needs to be reconfigured to satisfy applicable avoidance requirements.

Measure[1]	Description [1, 2]
LUPA-BIO-DUNE-02	Activities that potentially affect the amount of sand entering or transported within aeolian sand transport corridors will be designed and operated to: • maintain the quality and function of aeolian transport corridors and sand deposition zones, unless related to maintenance of existing facilities/operations/activities; • avoid a reduction in sand-bearing sediments within the aeolian sand system; • and minimize mortality to dune-associated DRECP Focus and BLM Special Status Species.
LUPA-BIO-DUNE-03	Any facilities or activities that alter site hydrology (e.g., sediment barrier) will be designed to maintain continued sediment transport and deposition in the aeolian corridor in a way that maintains the aeolian sorting and transport to downwind deposition zones. Site designs for maintaining this transport function must be approved by BLM in coordination with United States Fish and Wildlife Service and California Department of Fish and Wildlife as appropriate.
LUPA-BIO-DUNE-04	Dune formations and other sand accumulations (i.e., sand ramps, sand sheets) with suitable habitat characteristics for the Mojave fringe-toed lizard (i.e., unconsolidated blow-sand) will be mapped according to mapping standards established by the BLM National Operations Center.
LUPA-BIO-DUNE-05	Dune formations and other sand accumulations (i.e., sand ramps, sand sheets) with suitable habitat characteristics for the Mojave fringe-toed lizard (i.e., unconsolidated blow-sand) will be mapped according to mapping standards established by the BLM National Operations Center. If suitable habitat characteristics are identified during the habitat assessment, clearance surveys (see Draft EIS Glossary of Terms) for Mojave fringe-toed lizard will be performed in suitable habitat areas.
LUPA-BIO-IFS-06	When working in areas where protocol or clearance surveys are required (see Appendix D of the Project Draft EIS), biological monitoring will occur with any geotechnical boring or geotechnical boring vehicle movement to ensure no desert tortoises are killed or burrows are crushed.
LUPA-TRANS-BIO-04	Siting of transmission activities will be prioritized within designated utility corridors, where possible, and designed to avoid, where possible, and otherwise minimize and offset impacts to sand transport processes in aeolian corridors, rare vegetation alliances and DRECP Focus and BLM Special Status Species. Transmission substations will be sited to avoid aeolian corridors, rare vegetation alliances, and sand-dependent DRECP Focus and BLM Special Status Species habitats.
DFA-VPL-BIO-DUNE-01	Activities in Development Focus Areas (DFAs) and Variance Process Land designations (VPLs), including transmission substations, will be sited to avoid dune vegetation (i.e., North American Warm Desert Dune and Sand Flats). Unavoidable impacts (see “unavoidable impacts to resources” in the Draft EIS Glossary of Terms) to dune vegetation will be limited to transmission projects, except transmission substations, and access roads that will be sited to minimize unavoidable impacts. • For unavoidable impacts (see “unavoidable impacts to resources” in the Draft EIS Glossary of Terms) to dune vegetation, the following will be required: o Access roads will be unpaved. Access roads will be designed and constructed to be at grade with the ground surface to avoid inhibiting sand transportation.
DFA-VPL-BIO-DUNE-02	Within aeolian corridors that transport sand to dune formations and vegetation types downwind inside and outside of the DFAs, all activities will be designed and operated to facilitate the flow of sand across activity sites and avoid the trapping or diverting of sand from the aeolian corridor. Buildings and structures within the site will take into account the direction of sand flow and, to the extent feasible, build and align structures to allow sand to flow through the site unimpeded. Fences will be designed to allow sand to flow through and not be trapped.

Measure[1]	Description [1, 2]
DFA-BIO-IFS-01	Conduct the following surveys as applicable in the DFAs (see Appendix 1C of the Project Draft EIS).

[1] BIO = Biological Mitigation Measure; BLM = Bureau of Land Management; CMA = Conservation and Management Action; COMP = Compensation Mitigation Measure; DFA = Development Focus Areas; DRECP = Desert Renewable Energy Conservation Plan; DUNE = Dune Habitats; IFS = Individual Focus Species; LUPA = Land Use Plan Amendment; TRANS = Transportation; VPL = Variance Process Land designation.
[2] The Draft Environmental Impact Statement (EIS) mitigation measure language was copied from the Project Draft EIS Appendix 2B and 2C (BLM 2018a). References for the requirement descriptions can be found in the source documents. Any requirements from the Final EIS will be updated in the final Plan of Decision management plans.

2 Purpose and Objectives

Per MM WIL-CEQA-9 and WIL-CEQA-11, the purpose of this Plan is to discuss species occurrences and known suitable habitat; provide potential for indirect and/or indirect permanent impacts; and site-specific enhancement measures for the protection of sand sources and sand transport corridors on the compensation lands (CPUC and BLM 2011). The implementation of the APMs, BMPs, and CMA measures listed in Table F-6-1 and F-6-2 avoid and minimize impacts to the Mojave fringe-toed lizard and the sandy habitats this species requires. These measures apply during construction, operation, and maintenance of the Project. The specific Plan objectives include:

1. Identify suitable habitat for the Mojave fringe-toed lizard.
2. Provide avoidance and minimization measures and identify roles and responsibilities for their implementation.
3. Provide the survey and monitoring requirements for successful salvaging of existing Mojave fringe-toed lizards within the Project area.
4. Identify compensation requirements for direct impacts to dune habitats and/or habitats with fine-loose sand accumulations and Mojave fringe-toed lizard.

As a whole, the primary objective to the Plan is to ensure no Mojave fringe-toed lizards are injured or killed during construction activities and to protect the species range from being altered.

3 Species Habitat

The Mojave fringe-toed lizard is only found in habitats with loose, fine-grained sand and is widespread on the Palo Verde Mesa west of the agricultural fields in Riverside County, California; it is not expected to be found in agricultural fields. These habitats or sand dune systems require “aeolian” or wind transport of requisite sand into areas from upwind sources. The avenues of sand transport provide the freedom of movement that is critical to numerous plants and animals found only on active dunes, or habitats that have a layer of mobile fine sand. Other sand accumulations including sand ramps, sand sheets, and alluvial fans where sand buildup occurs are also suitable habitat for the Mojave fringe-toed lizard. Sand-covered alluvial fans known to occur in Riverside County, California; Riverside County encompasses the Project west of the Colorado river. Small parcels of habitat exist along the west-central border of Arizona within the northern portion of La Paz County (AGFD 2017); however, the Project does not impact these parcels and these areas will not be considered for surveys.

Patches of active dunes and fine-grained sandy habitats are dependent on the dominant vegetation for stability and natural barriers, which include creosote bush (*Larrea tridentata*), white bursage (*Ambrosia dumosa*), brittlebush (*Encelia farinosa*), white ratany (*Krameria grayi*), and cheesebush (*Ambrosia salsola*; University of California 2019; DRECP 2014). Details on data sources and habitat mapping development can be found in the Project Draft EIS Chapter 3.4.2.1 – Vegetation Resources, Including Special Status Plants and Noxious and Invasive Weeds (BLM 2018a).

Harwood's eriastrum (*Eriastrum harwoodii,* BLM Sensitive Species) is an annual herb that is often associated with sand accumulation or dune systems and is commonly associated with the Mojave fringe-toed lizard due to their shared habitat preference for active sand and dune systems. As shown in Figure F-6-2 – Ten West Link Mojave Fringe-toed Lizard Habitat, a majority of Harwood's eriastrum plants are located within known Mojave fringe-toed lizard habitat polygons. Further details on mapped data can be found in the Project's Draft EIS Chapter 3.4 (BLM 2018a).

As shown in Figure F-6-2, the majority of the Colorado River Substation is surrounded by active windblown sand deposits from the aeolian process. Three segments (x-19, ca-09, ca-07) cross documented occurrences of Mojave fringe-toed lizards and Harwood's eriastrum. Potential Project-related impacts to the Mojave fringe-toed lizard include injury or mortality during vegetation removal, collapsed burrows, and being struck by construction equipment and vehicles. The primary defense mechanism of this species is to flee and bury themselves in loose sand; thus, increasing the potential that Project activities may crush individuals during the use of access roads and construction areas (BLM 2018a).

4 Avoidance and Clearance Plan

The following subsections describe the Mojave fringe-toed lizard avoidance mitigation and clearance practices that will be implemented during the pre-construction, construction, post-construction/restoration phases of the Project. DCRT or their contractor shall be responsible for all aspects of management of this species as described in this Plan.

4.1 Designated Biologist

The Designated Biologist(s) will be independently or jointly assigned by DCRT or their contractor for their components of the Project and will have been approved by BLM, CPUC, and CDFW, 30 days before the start of surveys or monitoring. The Designated Biologist(s) will be responsible for facilitating the implementation of avoidance, minimization, and mitigation measures for the Plan. In addition, the Designated Biologist(s) will be responsible for drafting the methods for biological surveys, schedule development, agency coordination, reporting, supervision of field staff including Biological Monitors, and ensuring Biological Monitors working in aeolian sand and dune systems have expertise identifying Mojave fringe-toed lizards, as well as their tracks, and behaviors.

4.2 Biological Monitor

As outlined in BMPs BIO-01 and BIO-02 and per MM BIO CEQA-2, the Biological Monitor(s) will meet the requirements of a qualified biologist, must be approved by the CPUC and BLM prior to conducing biological monitoring for construction. Each Biological Monitor must be knowledgeable with the life history and habitat requirements of the Mojave fringe-toed

lizard; have prior construction monitoring experience on projects within desert habitats; and knowledge working in aeolian sand and dune systems is desirable (BLM 2018a). The duties of the Biological Monitor(s) will be on-site at all times when activities (i.e., initial site disturbance, all construction phases) will occur immediately adjacent to, or within, habitat that supports populations of the Mojave fringe-toed lizard. This will ensure that Project activities remain in compliance with the conservation measures outlines in this Plan, which are designed to minimize impacts to special status species, native vegetation, wildlife habitat, and unique resources. The Biological Monitor(s) will report biological impact concerns to the Designated Biologist(s), where applicable. The Biological Monitor(s) will be the field contact representative(s) for construction workers and the Designated Biologist(s).

4.3 Avoidance Procedures

Management of the Mojave fringe-toed lizard includes avoidance and minimization of species impacts, as well as preservation of occupied habitat and avenues that transport aeolian sand. Based on the established management strategies for the closely-related Coachella Valley fringe-toed lizard (*Uma inornata*), which are outlined in the Coachella Valley Multiple Species Habitat Conservation Plan (Coachella Valley Conservation Commission 2012 and 2014) and the DRECP Draft Environmental Impact Report (EIR)/EIS Appendix Q – Baseline Biological Report (DRECP 2014), and the Project Draft EIS mitigation measures (Table F-6-1 and F-6-2) required by the BLM and CPUC (per CEQA standards MM BIO-CEQA-1/2/3, WIL-CEQA-9, and WIL-CEQA-11), the following actions will be implemented:

A. WEAP: As part of the APM/BMP BIO-01 and per requirement of MM BIO-CEQA-2, the Project is required to implement a WEAP and include pertinent information in the WEAP about the potential presence of the BLM-sensitive Mojave fringe-toed lizard including identification of the species, mitigation actions, and a procedure to be followed should the species be found during construction.

B. Public Access: The Project is required to control and manage impacts that degrade aeolian sand systems and prevent flow of sand transport including public access in known occupied and potential habitat (except on designated routes of travel), road development that would produce habitat fragmentation, and other human disturbance. In the event that habitat degradation appears to be unavoidable, inform the Designated Biologist and BLM so that the BLM may determine appropriate mitigation or compensation (see Section 5 for further details on compensation).

C. Invasive Plants: Implement mitigation actions that minimize or avoid introduction of any identified noxious or invasive weed species, where feasible, if their presence has been determined to impact to Mojave fringe-toed lizards and Harwood's eriastrum-associated habitats. For further details, see Appendices F-6 and F-7 in the Plan of Decision (POD).

D. Invasive and Nuisance Animals: Control of invasive and nuisance animal species will be implemented to minimize or avoid indirectly impacting the Mojave fringe-toed lizard species. Further details are provided in Appendix F-4 of the POD.

E. Active Season: Construction activities will be conducted during Mojave fringe-toed lizard active periods (March-October), to allow for lizards to be located during surveys and make it easier to avoid them (see BMP BIO-32). Due to their ability to

be highly mobile, this will increase the likelihood of species detection during surveys. Thus, direct causes of mortality will be minimized.

F. Open Excavations: Open trenching, holes, or other excavations that are more than 1.0-foot deep must be covered at the end of each working day or would be provided with one or more escape ramps constructed of earthen fill or wooden planks (see APM BIO-09). Each trench, hole or other excavation would be examined for Mojave fringe-toed lizards prior to start of work. No backfilling will occur until the excavated hole has been examined for this species and relocated by a Biological Monitor to suitable habitat outside the work area. If exclusion fencing around trenches are required and located adjacent or within suitable habitat, DCRT or their contractor must have prior BLM approval, in order to ensure the Mojave fringe-toed lizards will not become entangled or trapped.

If trenches cannot be covered, they will be constructed with escape ramps, following up-to-date design standards to facilitate and allow wildlife to exit, or wildlife exclusion fencing will be installed around the trench(s) or excavation(s). Open trenches or other excavations will be inspected by a designated biologist immediately before backfilling, excavation, or other earthwork.

G. Resource Setbacks: If resource setbacks are identified, DCRT or their contractor will coordinate with BLM and CPUC to determine the edges of aeolian sand habitats in order for construction activity to avoid or minimize adverse effects of these desert vegetation types (see CMA standard LUPA-BIO-03). Any resource setbacks likely would be identified during pre-construction habitat assessments. Environmental Resource Area signage will be installed at the appropriate buffer distance (i.e., resource setback), if suitable habitat is within or encroaches into Project work areas and access roads. If required and approved, exclusion fencing will also be installed at the appropriate buffer distance (see Section 4.4).

H. Construction Techniques: Construction activities will use state-of-the-art and commercially-available techniques per BLM approval, to minimize new disturbance, soil erosion, soil compaction, vegetation removal, and disturbance of topography, in order to avoid impacts to the Mojave fringe-toed lizard and its vegetation alliances (see BMP BIO-55, VEG-01, and VEG-02).

I. Overland Access: In areas where possible, minimize or avoid vegetation clearing and/or soil disturbance of topography suitable for overland driving or access (see APM BIO-10). In addition, construction activity that alters hydrology of work sites and roads must take into consideration the continued-sediment transport and deposition within aeolian corridors and have BLM prior approval; in order to maintain the sorting and transporting to downward deposition zones to the extent feasible (see CMA standard LUPA-BIO-DUNE-03).

J. Facility Design: Project facilities are near or within aeolian sand systems, the facilities will be designed in a manner that will allow flow of sand transport and minimize removal of Mojave fringe-toed lizard habitats (see BMP BIO-53).

K. New Roads/Routes: New roads/routes will avoid Mojave fringe-toed lizard suitable habitat within identified linkages, unless the new road and/or route is beneficial to minimize net impacts to natural or ecological resources of concern (BMP BIO-55).

L. Designated Areas: Designated areas for stocking materials and parking Project-related vehicles and equipment must be BLM approved and/or by the biological staff prior to use within or near aeolian sand habitats (see APM/BMP BIO-03).

M. Speed: All vehicles and equipment traveling onsite on unpaved public and private roads and on work sites adjacent to and/or within sandy habitats must follow speed limits of 15 miles per hour or less. Off-road traffic outside of designated areas for the Project will be prohibited (MM BIO CEQA-3).

N. Water Usage: To avoid attracting Mojave fringe-toed lizards to the Project work areas, water use for dust suppression will not allow prolonged ponding of surface water (see APM BIO-10) and no feeding or harassing of wildlife will not be tolerated on the Project (BMP BIO-36).

O. Material Mobilization: Prior to transporting any stock piles and stored materials near or within aeolian sand habitats or transport corridors, a biological monitor must check for any presence of Mojave fringe-toed lizards (see BMP BIO-35).

P. Sand Corridors: When possible, Project activity and operation will be designed to facilitate flow of aeolian sand corridors which transport sand to dune formations, sand sheets/ramps, and vegetation types preferred by the Mojave fringe-toed lizard. Avoid trapping or diverting sand transport that may attract Mojave fringe-toed lizards to work areas (see BMP BIO-54).

4.4 Survey and Monitoring Procedures (California Only)

4.4.1 Pre-construction Surveys

Pre-construction surveys for the Mojave fringe-toed lizard will be conducted to identify suitable habitats (i.e., dune systems, aeolian sand, sand accumulations, scattered vegetation), extent of sand resources, and presence of the species (BMP BIO-25 and MM WIL-CEQA-11). The Designated Biologist that conducts these surveys must be approved by BLM and CPUC. Suitable habitat, if present, shall be mapped using the BLM National Operations Center habitat-mapping standards.

As stated in MM WIL-CEQA-11, surveys will be conducted at a minimum of three daytime surveys and one nighttime survey within one week of vegetation clearing, or per further instruction from BLM and CPUC. All potential indirect and direct impacts shall be evaluated, and avoidance, minimization, compensation, and mitigation shall be approved by the appropriate federal and state regulatory agencies prior to project commencement. Where possible, the Mojave fringe-toed lizard and their vegetation alliances will be avoided during Project activities (BMP BIO-25).

As stated in MM WIL-CEQA-11, DCRT or their contractor will prepare a technical report that includes the detailed results of pre-construction surveys of the Mojave fringe-toed lizard combined with the other terrestrial herpetofauna survey results and submitted to the BLM, CPUC, and CDFW.

4.4.2 Clearance Surveys

As outlined in BMP BIO-25, BIO-49, MM WIL-CEQA-11, and based on surveying protocols for the closely-related Colorado fringe-toed lizard (*Uma notata*) defined within the Habitat Conservation Plan and Final EIR/EIS for the Imperial Irrigation District in Southern California (BLM 2018a; Imperial Irrigation District 2002), a clearance survey will be conducted within suitable habitat as defined in BIO-49, to ensure any existing Mojave fringe-toed lizards within Project work areas (i.e., pad/wire sites, access roads, yards, project disturbance) are avoided. All observations of the species tracks, burrows, discovered lizards, and relocations must be documented including a description of the observation, appropriate coordinates, time, temperature, and date.

Per MM WIL-CEQA-11, the clearance surveys will occur each day prior to construction at each work area in suitable habitat. At completion of surveys, a Biological Monitor will be on-site during construction activities if potential habitat is identified adjacent or within the Project work areas. Specimens found within disturbance areas or potentially affected by the Project shall be relocated to the nearest suitable habitat outside disturbance areas.

When additional conservation efforts are necessary, work areas near or within sandy habitats will be evaluated to determine if perimeter/exclusion fencing should be installed to preserve sensitive species and habitat from entering an active site during construction.

4.4.3 Monitoring

Per requirements of MM BIO-CEQA-3, Biological Monitor(s) will be qualified biologists designated by DCRT or their contractor and must be approved by the CPUC, BLM and CDFW prior to conducting construction monitoring. Biological Monitors will be during Project construction or maintenance activity that is adjacent or within a sand dune system or sand avenue to ensure the Project follows all of the Projects POD requirements (see APM/BMP BIO-02). Monitoring for the species will only occur when surface temperatures are between 96 degrees Fahrenheit (°F) and 112°F (36 degrees Celsius [°C] and 44°C) and during their active season between March and October (Imperial Irrigation District 2002; BLM 2018b). Construction activity that must occur within suitable habitat for the Mojave fringe-toed lizard will take place during the active season for this species, if possible. In the event that construction activity must occur outside the active season, inform the Designated Biologist so that the BLM may determine appropriate mitigation or compensation. Construction during active season will allow for a greater probability of detecting Mojave fringe-toed lizards during pre-construction surveys and will increase the effectiveness of avoidance measures.

As stated in the MM BIO-CEQA-3, monitoring reports will be completed daily and copies will be compiled and submitted to the CPUC, BLM, and CDFW on a weekly basis. When necessary, the Biological Monitor(s) will relocate the Mojave fringe-toed lizard that would be impacted by the Project; permits and/or a Memorandum of Understanding may be required (MM BIO-CEQA-3; Draft EIS Appendix 1C).

If any fringe-toed lizards are captured within the Project work areas, they will be released immediately outside the Project work areas. Specimens will be released in the shade of a shrub. No lizards will be held in captivity or in transport for longer than 10 minutes after their initial capture. If necessary, lizards will be transported in clean, white, plastic 5-gallon buckets (Center of Conservation Biologist 2005). Survey specifications will be updated based on the Final EIS requirements.

If an injured or dead Mojave fringe-toed lizard is encountered during activity on the construction site, an incident report will be submitted to the CPUC, CDFW and/or USFWS (as appropriate) within five calendar days. The incident report will include the date, time of the finding or incident (if known), and location of the carcass or injured animal and circumstances of its death or injury (if known). As feasible and approved by the BLM, injured animals will be taken immediately to the nearest appropriate veterinary or wildlife rehabilitation facility. The Biological Monitor will, immediately upon finding the remains or injured animal, coordinate with the Designated Biologist and construction supervisory staff to discuss the events that caused the mortality or injury, if known, and implement measures to prevent future incidents. Details of these measures will be included with the report. Species remains will be collected and frozen as soon as possible, and CDFW and USFWS, as appropriate, will be contacted regarding ultimate disposal of the remains (MM BIO-CEQA-3; Draft EIS Appendix 1C).

When unforeseen circumstances arise during the implementation of avoidance and mitigation efforts, DCRT or their contractor may be required to coordinate with BLM and USFWS on adaptive management strategies. The monitoring program as depicted in APM/BMP BIO-02 is designed to be flexible. The Plan balances the requirements of management with the need to adapt through monitoring and construction and per guidance from the BLM, CPUC, and/or USFWS. Any adaptive management strategies required for the Mojave fringe-toed lizard or their habitats will be addressed on a case-by-case basis for the Project (LADWP 2015). Specific adaptive monitoring will be updated based on the Final EIS requirements.

5 Compensation for Direct Impacts

As stated in CMA standard LUPA-BIO-COMP-01, DCRT will be required to provide compensation as a result of permanent habitat loss and direct impacts to the Mojave fringe-toed lizards on the Project. The standard biological resource compensation ratio will be at a minimum 3:1, which may include compensation lands purchased in fee, or in easement in whole or in part (see CMA standard LUPA-BIO-COMP-1). This may include off-site creation, enhancement, and/or preservation, and/or participation in an established mitigation bank program. In the case for temporary impacts, compensation provided by DCRT will include on-site habitat creation or enhancement with similar species compositions to those present prior to construction at a ratio of 1:1 (see Appendix 1C of the Project Draft EIS).

Where land acquisition fulfills the 3:1 mitigation for direct impacts, DCRT will provide funding for the acquisition in fee title or in easement, initial habitat improvements and long-term maintenance and management of the compensation lands. Compensation shall be initiated or completed within 12 months from the time the resource impact occurs, unless a six month extension is approved by the appropriate federal and state regulatory agencies (MM WIL-CEQA-9). For compensation lands, the following criteria must be met (MM WIL-CEQA-9; BLM 2018c; CPUC and BLM 2011):

- Be deposits of aeolian or fine windblown sands typically associated with dunes, washes, hillsides, and margins of dry lakes, with potential to contribute to Mojave fringe-toed lizard habitat connectivity and build linkages between known populations of Mojave fringe-toed lizards and preserve lands with suitable habitat.
- To the extent feasible, be connected to lands currently occupied by Mojave fringe-toed lizard.

- To the extent feasible, be near larger blocks of lands that are either already protected or planned for protection, or which could feasibly be protected long-term by a public resource agency or a non-governmental organization dedicated to habitat preservation.
- Provide quality habitat for Mojave fringe-toed lizard, that has the capacity to regenerate naturally when disturbances are removed.
- Not have a history of intensive recreational use or other disturbance that might make habitat recovery and restoration infeasible.
- Not be characterized by high densities of invasive species, either on or immediately adjacent to the parcels under consideration, that might jeopardize habitat recovery and restoration.
- Not contain hazardous wastes that cannot be removed to the extent the site is suitable for habitat.
- Not be subject to property constraints (i.e., mineral leases, cultural resources).
- Be on land for which long-term management is feasible.

1 Introduction

The data and information provided in this Plant and Wildlife Species Conservation Measures Plan (Plan) is for the Ten West Link Transmission Project (Project) proposed by Delaney Colorado River Transmission, LLC (DCRT). The purpose of the Plan is to assist the Project meeting their obligations to protect biological resources during the planning, design, and implementation of the Project using the Bureau of Land Management (BLM) principles and procedures designed for high-voltage transmission line projects.

The Plan presents the anticipated impacts on plant and wildlife resources associated with the Project and identifies the Best Management Practices (BMPs), stipulations, protocols, and/or techniques required to reduce these impacts. This Plan implements actions to minimize any likelihood for a "take" on the federally and state threatened and endangered species. No aquatic biological measures will be addressed in this Plan. Protection of water resources and BMPs identified are included in Appendix G in the Project's Plan of Development (POD). Comprehensive information and restrictions will be outlined on the Environmental Maps provided in Appendix A, Volume II of the POD.

1.1 Organization of the Plan

To facilitate the review and understanding of this Plan, the following is organized into four primary sections:

1. Introduction – Presents the overall summary of the Plan.

2. Regulatory Framework – Provides descriptions of relevant regulatory requirements and agencies with specific authority over the laws and regulations associated with the Plan.

3. Plant and Wildlife Concerns – Outlines the types of impacts that would affect plant and wildlife species within the Project area.

4. Mitigation Measures for Special Status Species – Describes each designated resource and their potential occurrence in the Project area; specific agency concerns and impacts for which mitigation was identified; and the appropriate Applicant Proposed Measures (APMs) and BMPs to address concerns and reduce impacts during design, construction, operation, and maintenance of the Project.

5. Seasonal Restrictions – Describes timeframes during which Project activities are spatially/temporally restricted due to activities of specific species as described by the BMPs.

6. The Mojave Desert Tortoise Protection and Compensation Plan (California only) – Provides descriptions, regulatory requirements, and protocols for protection and preservation of the Mojave desert tortoise (*Gopherus agassizii*).

2 Regulatory Framework

The following federal authorities, regulations, Resource Management Plans, initiatives, and general guidelines are applicable to the Project. These regulations provide the framework that the Project must wholly comprehend and comply with.

2.1 Federal Regulations

2.1.1 Federal Endangered Species Act of 1973

Administered by the United States Fish and Wildlife Service (USFWS), the Endangered Species Act (ESA) of 1973, as revised, was established to protect species at risk of becoming extinct (16 United States Code [U.S.C.] § 1531). As amended in Section 7 (a)(2), the USFWS requires that "*Each Federal agency shall, in consultation with and with the assistance of the Secretary, insure that any action authorized, funded, or carried out by such agency is not likely to jeopardize the continued existence of any endangered species or threatened species or result in the destruction or adverse modification of habitat of such species …*"

The ESA includes multiple layers of protection where endangered species are the most in danger of becoming extinct, threatened species are at risk of becoming endangered, and candidate species are those that are being considered for listing as threatened or endangered. Under Section 9 of the ESA, a "take" is defined as to harass, harm, pursue, hunt, shoot, kill, trap, capture, or collect, or to attempt to engage in any such conduct.

2.1.2 Federal Land Policy and Management Act of 1976

The Federal Land Policy and Management Act is a national law governing the way the BLM administers public lands. Section 102(a)(8) (43 U.S.C. § 1701) declares "*public lands be managed in a manner that will protect the quality of scientific, scenic, historical, ecological, environmental, air and atmospheric, water resource, and archeological values; that, where appropriate, will preserve and protect certain public lands in their natural condition; that will provide food and habitat for fish and wildlife and domestic animals; and that will provide for outdoor recreation and human occupancy and use.*"

2.1.3 Migratory Bird Treaty Act

The regulatory framework protecting birds includes the ESA, the Migratory Bird Treaty Act (MBTA) of 1918, codified in 16 U.S.C. § 703-712, and subsequent amendments. The MBTA decrees that all migratory birds and their parts (including eggs, nests, and feathers) are fully protected and addresses the destruction or removal of active nests of those species. Under this Act, it is unlawful to pursue, hunt, take, capture, kill, possess, offer to or sell, barter, purchase, deliver, transport, or receive any migratory birds (including parts, nests, eggs or other product, manufactured or not). In practice, most bird species with non-migratory life-histories are protected under the MBTA, as well. Virtually all native bird species in the United States are protected under MBTA, with the exception of upland game birds (order Galliformes: e.g., grouse and quail). While the USFWS is the lead federal agency charged with protecting migratory birds within the United States, under Executive Order 13186 all

other federal agencies are charged with conserving and protecting migratory birds and the habitats on which they depend.

2.1.4 Bald and Golden Eagle Protection Act

The Bald and Golden Eagle Protection Act ([BGEPA]; 16 U.S.C. § 668-668d; 50 Code of Federal Regulations [CFR] Part 22) of 1940 protects bald eagles (*Haliaeetus leucocephalus*) and golden eagles (*Aquila chrysaetos*) by prohibiting, except under certain specified conditions, the take, possession, and commerce of any bald or golden eagles, alive or dead, including any part, nest, or egg. The BGEPA authorizes take of eagles "where the take is compatible with the preservation of the bald eagle and the golden eagle; it is necessary to protect an interest in a particular locality; is associated with, but not the purpose of, the activity; and cannot practicably be avoided" (50 CFR Part 22.26).

2.1.5 BLM Special Status Species Management Policy

In BLM Manual 6840, the Special Status Species Management Policy authorizes each BLM state director to designate sensitive species within their respective jurisdictions and protect them on BLM-administered lands. Each state has their own process for sensitive species list development; however, BLM-sensitive species may require specific protection measures. BLM special status species are: 1) species listed or proposed for listing under the ESA; and 2) species requiring special management consideration to promote their conservation and reduce the likelihood and need for future listing under the ESA, which are designated as BLM sensitive by the State Director(s). All federal candidate species, proposed species, and delisted species in the five years following delisting are considered BLM sensitive species.

2.1.6 Executive Order 13186

Executive Order 13186 requires federal agencies to protect migratory birds and to consider impacts on migratory bird species during project planning. This Executive Order declares that "*each federal agency taking actions that have, or are likely to have, a measurable negative effect on migratory bird populations is directed to develop and implement, within 2 years, a Memorandum of Understanding (MOU) with the* [USFWS] *that shall promote the conservation of migratory bird populations*."

2.1.7 BLM Memorandum of Understanding to Promote Conservation of Migratory Birds

BLM MOU WO-230-2010-04 (*MOU between the* [BLM] *and* [USFWS] *to Promote the Conservation of Migratory Birds*) directs the BLM to evaluate the effects of BLM's action on migratory birds on a project level and implement approaches to reduce these effects.

2.2 State Regulations

2.2.1 Arizona Revised Statute Title 17

The Arizona Revised Statute (A.R.S.) Title 17 establishes and defines the organization and management of the Arizona Game and Fish Department (AZGFD) and Commission and covers the organizational responsibilities, conservation, fishing and hunting, funding, and other regulations related to wildlife.

2.2.2 Arizona Native Plant Law

The Arizona Department of Agriculture maintains a list of plants protected under the A.R.S. Title 3, Chapter 7, Section R3-3-208; the Arizona Native Plant Law (ANPL). It was enacted to protect rare plant species and to protect some species from being over harvested.

2.2.3 State Comprehensive Wildlife Conservation Strategy

Congress mandated each state to establish a Comprehensive Wildlife Conservation Strategy that directs the integration and implementation of ongoing and planned management actions and provides a primary conservation tool for keeping fish and wildlife in healthy populations and off the list of threatened or endangered species. Each state was required to develop a State Wildlife Action Plan by the year 2005. For Arizona, it was heavily revised in subsequent years into the current 2012-2022 Arizona's State Wildlife Action Plan (AZGFD 2012). California's first State Wildlife Action in 2005 was completed by the California Department of Fish and Game (now the California Department of Fish and Wildlife [CDFW]) and was updated in 2015 (CDFW 2015).

2.2.4 California Endangered Species Act

The CDFW established the California Endangered Species Act (CESA) as a policy of the state to protect any native species or subspecies of bird, mammal, fish, amphibian, reptile, or plant which is in serious danger of becoming extinct throughout all, or a significant portion, of its range due to one or more causes, including loss of habitat, change in habitat, overexploitation, predation, competition, or disease (California Fish and Game Code [CFGC] § 2062). For projects that affect both a federally- and state-listed species, compliance with an ESA "incidental take authorization" can satisfy the CESA if the CDFW determines that it is "consistent" with CFGC § 2080.1.

2.2.5 California Code of Regulations Title 14

The official California Code of Regulations Title 14 defines the organization and management of the CDFW and addresses the organizational responsibilities, conservation, fishing and hunting, funding, and other regulations related to wildlife. In addition, it identifies the different conservancy organizations across the state that oversee specific conservation areas.

2.2.6 California Environmental Quality Act

Section 15380 (B) of the California Environmental Quality Act (CEQA) states that a species is considered rare if "the species is likely to become endangered within the foreseeable future throughout all or a significant portion of its range and may be considered "threatened" as that term is used in the Federal Endangered Species Act." In addition, any species of concern should be included in project-impacts analysis (California Public Resources Code § 15380).

The California Public Utilities Commission (CPUC) is responsible for determining if the Project will be constructed in accordance with CEQA requirements and issue to DCRT a Certificate of Public Convenience and Necessity for transmission infrastructure within California. The following list briefly identifies the Mitigation Measures (MM) under CEQA

related to special status species; further details for each MM are provided in Appendix 1C of the Draft Environmental Impact Statement (EIS):

- **MM BIO-CEQA-1.** Implement biological resources APMs, BLM BMPs, and Conservation and Management Actions (CMAs; see Section 2.2.7).
- **MM BIO-CEQA-2.** Implement a Worker Environmental Awareness Program.
- **MM BIO-CEQA-3.** Implement biological construction monitoring.
- **MM VEG-CEQA-1.** Develop and implement a Vegetation Management Plan.
- **MM VEG-CEQA-2.** Conduct pre-construction floristic surveys.
- **MM VEG-CEQA-3.** Conduct focused surveys for Harwood's eriastrum (*Eriastrum harwoodii).*
- **MM VEG-CEQA-4.** Compensation for impacts to special status plant species and sensitive communities.
- **MM WIL-CEQA-1.** Develop and implement an Avian Management and Protection Plan and Bird and Bat Conservation Strategy.
- **MM WIL-CEQ-2.** Develop and implement a Raven Management Plan.
- **MM WIL-CEQA-3**. Develop and implement a Burrowing Owl Avoidance, Minimization, and Mitigation Plan.
- **MM WIL-CEQA-4.** Develop and implement a Bat Management and Protection Plan.
- **MM WIL-CEQA-5**. Conduct pre-construction surveys for maternity colonies or hibernaculum for roosting bats.
- **MM WIL-CEQA-6**. Conduct pre-construction surveys for nesting and breeding.
- **MM WIL-CEQA-7.** Conduct focused pre-construction burrowing owl surveys.
- **MM WIL-CEQA-8.** Conduct pre-construction protocol surveys for Arizona bell's vireo (*Vireo bellii*), Southwestern willow flycatcher (*Empidonax traillii extimus*), and willow flycatcher (*Empidonax traillii*); avoid occupied habitat; compensate impacts.
- **MM WIL-CEQA-9**. Compensation for impacts to Mojave fringe-toed lizard (*Uma scoparia*).
- **MM WIL-CEQA-10.** Compensation for impacts to Mojave desert tortoise.
- **MM WIL-CEQA-11**. Conduct pre-construction surveys for listed and special status terrestrial herpetofauna and compensation for impacts.

2.2.7 Desert Renewable Energy Conservation Plan and Land Use Plan Amendment

The Desert Renewable Energy Conservation Plan (DRECP), implemented by the Land Use Plan Amendment (LUPA), is a landscape-scale planning effort to both identify specific

development focus areas for high-quality renewable energy and transmission access within areas where environmental impacts can be managed and mitigated, while simultaneously providing for long-term conservation and management of BLM designated special status species and associated habitats (BLM 2016).

In addition to BLM designated sensitive or "special status" species, species that conservation and management are provided for in the DRECP LUPA are identified as "Focus" species. Both Focus and BLM special status species are addressed in the CMAs applicable for the Project throughout this Plan. Developed from the DRECP LUPA, the CMAs are contained in another land use planning process called the California Desert Conservation Area (CDCA) Plan, see Section 2.2.8 below.

2.2.8 California Desert Conservation Area Plan

The CDCA Plan, first published in 1980, covers a total of 25-million acres of BLM administered lands. This plan was a first step towards conflict resolutions on land use management within the area after Congress enacted the Federal Land Policy and Management Act of 1976. This act directed BLM to inventory the CDCA and its resources and develop this plan. It was amended to include protection for the BLM sensitive Harwood's eriastrum in California (Chapter 2 of the Draft EIS; BLM 1980).

Specific CMA standards are required to be incorporated with all activities of the Project via MM BIO-CEQA-1 and the CDCA Plan. The APMs and BMPs that have been developed/identified for the Project comply with the CMAs. Multiple CMA standards are reflected in more than one APM or BMP. The following list briefly identifies the relevant CMA standard related to special status species; further details are provided in Appendix 1C and 2C of the Draft EIS:

- **LUPA-BIO-1.** Conduct a habitat assessment of Focus and BLM special status species' suitable habitat for all activities and identify and/or delineate the DRECP vegetation types, rare alliances, and special features (e.g., aeolian sand transport resources, Joshua tree, microphyll woodlands, carbon sequestration characteristics, seeps, climate refugia) present using the most current information, data sources, and tools (e.g., DRECP land cover mapping, aerial photos, DRECP species models, and reconnaissance site visits) to identify suitable habitat for Focus and BLM special status species.

- **LUPA-BIO-2.** Designated biologist(s), will conduct, and oversee where appropriate, activity-specific required biological monitoring during pre-construction, construction, and decommissioning to ensure that avoidance and minimization measures are appropriately implemented and are effective.

- **LUPA-BIO-3.** Resource setbacks have been identified to avoid and minimize the adverse effects to specific biological resources.

- **LUPA-BIO-4.** For activities that may impact Focus and BLM special status species, implement all required species-specific seasonal restrictions on pre-construction, construction, operations, and decommissioning activities.

- **LUPA-BIO-5.** All activities, as determined appropriate on an activity-by-activity basis, will implement a worker education program that meets the approval of the BLM.

- **LUPA-BIO-6**. Subsidized predator standards, approved by BLM, in coordination with the USFWS and CDFW, will be implemented during all appropriate phases of activities, including but not limited to renewable energy activities, to manage predator food subsidies, water subsidies, and breeding sites.

- **LUPA-BIO-8.** All activities that are required to close and decommission the site (e.g., renewable energy activities) will specify and implement project-specific closure and decommissioning actions that meet the approval of BLM.

- **LUPA-BIO-9.** Implement the LUPA CMA standards to protect water and wetland dependent resources.

- **LUPA-BIO-10.** Consistent with BLM state and national policies and guidance, integrated weed management actions, will be carried out during all phases of activities, as appropriate

- **LUPA-BIO-11.** Implement control of nuisance animals and invasive species to avoid and minimize impacts to special status species and their habitats.

- **LUPA-BIO-13.** Implement project siting and design standards that avoid impacts to habitat and suitable habitat for Focus and BLM special status species.

- **LUPA-BIO-14.** Implement general standard practices to protect Focus and BLM special status species including wildlife feeding, wildlife encounters, domestic pets, visual check of construction materials prior to use, trenches/excavations, and vegetation removal, to the extent practical.

- **LUPA-BIO-15.** Use state-of-the-art, as approved by BLM, construction and installation techniques, appropriate for the specific activity/project and site, that minimize new site disturbance, soil erosion and deposition, soil compaction, disturbance to topography, and removal of vegetation.

- **LUPA-BIO-16.** For activities that may impact Focus and BLM sensitive birds protected by the ESA and/or MBTA, and bat species, implement appropriate measures as per the most up-to-date BLM state and national policy and guidance, and data on birds and bats, including but not limited to activity specific plans and actions.

- **LUPA-BIO-17.** For activities that may result in mortality to Focus and BLM Special–Status bird and bat species, a Bird and Bat Conservation Strategy will be prepared with the goal of assessing operational impacts to bird and bat species and incorporating methods to reduce documented mortality.

- **LUPA- BIO-RIPWET-1.** The riparian and wetland DRECP vegetation types and other features listed in the Draft EIS (Table 17) will be avoided to the maximum extent practicable, except for allowable minor incursions with the specified setbacks.

- **LUPA-BIO-RIPWET-3**. For activities that occur within 0.25 mile of a riparian or wetland DRECP vegetation type and may impact BLM Special Status riparian and wetland bird species, conduct a pre-construction/activity nesting bird survey for BLM special status riparian and wetland birds according to agency-approved protocols.

- **LUPA-BIO-DUNE-1.** Because DRECP sand dune vegetation types and aeolian sand transport corridors are, by definition, shifting resources, activities that potentially occur within or bordering the sand dune DRECP vegetation types and/or aeolian sand transport corridors must conduct studies to verify the location (Appendix D of the Draft EIS) and extent of the sand resource(s) for the activity-specific environmental analysis.

- **LUPA-BIO-DUNE-2.** Activities that potentially affect the amount of sand entering or transported within aeolian sand transport corridors will be designed and operated to; maintain quality and function of aeolian sand transport corridors and sand deposition zones; avoid reduction in sand-bearing sediments within habitat; and minimize mortality to DUNE-associated Focus and BLM Special Status species.

- **LUPA-BIO-DUNE-4**. Dune formations and other sand accumulations (i.e., sand ramps, sand sheets) with suitable habitat characteristics for the Mojave fringe-toed lizard (i.e., unconsolidated blow-sand) will be mapped according to mapping standards established by the BLM National Operations Center.

- **LUPA-BIO-DUNE-5**. If suitable habitat characteristics are identified during the habitat assessment, clearance surveys for Mojave fringe-toed lizard will be performed in suitable habitat areas.

- **LUPA-BIO-BAT-1**. Activities, except wind projects, will not be sited within 500 feet of any occupied maternity roost or presumed occupied maternity roost as described below.

- **LUPA-BIO-PLANT-1.** Conduct properly timed protocol surveys in accordance with the BLM's most current (at time of activity) survey protocols for plant Focus and BLM special status species.

- **LUPA-BIO-PLANT-2.** Implement an avoidance setback of 0.25 mile for all Focus and BLM special status species occurrences. Setbacks will be placed strategically adjacent to occurrences to protect ecological processes necessary to support the plant Species.

- **LUPA-BIO-PLANT-3.** Impacts to suitable habitat for Focus and BLM special status plant species should be avoided to the extent feasible and are limited [capped] to a maximum of one percent of their suitable habitat throughout the entire LUPA Decision Area.

- **LUPA-BIO-SVF-1.** For activity-specific NEPA analysis, a map delineating potential sites and habitat assessment of the following special vegetation features is required: yucca clones, creosote rings, saguaro cacti, Joshua tree woodland, microphyll woodland, and thorn stands.

- **LUPA-BIO-SVF-6.** Microphyll woodland: impacts to microphyll woodland will be avoided, except for minor incursions.

- **LUPA-BIO-VEG-2**. Management of cactus, yucca, and other succulent species will adhere to current up-to-date BLM policy.

- **LUPA-BIO-VEG-3.** Allow for the collection of plant material consistent with the maintenance of natural ecosystem processes.

- **LUPA-BIO-IFS-3.** All culverts for access roads or other barriers will be designed to allow unrestricted access by Mojave desert tortoises and will be large enough that desert tortoises are unlikely to use them as shelter sites (e.g., 36 inches in diameter or larger). Desert tortoise exclusion fencing may be utilized to direct tortoise use of culverts and other passages.

- **LUPA-BIO-IFS-5.** Following the clearance surveys within sites that are fenced with long-term desert tortoise exclusion fencing a designated biologist will monitor initial clearing and grading activities to ensure that desert tortoises missed during the initial clearance survey are moved from harm's way.

- **LUPA-BIO-IFS-6.** When working in areas where protocol or clearance surveys are required (see Appendix D), biological monitoring will occur with any geotechnical boring or geotechnical boring vehicle movement to ensure no desert tortoises are killed or burrows are crushed.

- **LUPA-BIO-IFS-7**. A designated biologist will accompany any geotechnical testing equipment to ensure no tortoises are killed and no burrows are crushed.

- **LUPA-BIO-IFS-8.** Inspect the ground under the vehicle for the presence of desert tortoise any time a vehicle or construction equipment is parked in desert tortoise habitat outside of areas fenced with desert tortoise exclusion fencing.

- **LUPA-BIO-IFS-11**. If Bendire's thrasher (*Toxostoma bendirei*) is present, conduct appropriate activity-specific biological monitoring to ensure that Bendire's thrasher individuals are not directly affected by operations (i.e., mortality or injury, direct impacts on nest, eggs, or fledglings).

- **LUPA-BIO-IFS-12**. If burrowing owls (*Athene cunicularia*) are present, a designated biologist will conduct appropriate activity-specific biological monitoring to ensure avoidance of occupied burrows and establishment of the 656 feet setback to sufficiently minimize disturbance during the nesting period on all activity sites, when practical.

- **LUPA-BIO-IFS-13.** If burrows of burrowing owls cannot be avoided on-site, passive burrow exclusion by a designated biologist) through the use of one-way doors will occur according to the specifications in Appendix D of the Draft EIS or the most up-to-date agency BLM or CDFW specifications.

- **LUPA-BIO-IFS-14.** Activity-specific active translocation of burrowing owls may be considered, in coordination with CDFW.

- **LUPA-BIO-IFS-24.** Provide protection from loss and harassment of active golden eagle (*Aquila chrysaetos*) nests through activities that may impact nesting golden eagles, will not be sited or constructed within 1.0-mile of any active or alternative golden eagle nest within an active golden eagle territory, as determined by BLM in coordination with USFWS as appropriate.

- **LUPA-BIO-IFS-25.** Cumulative loss of golden eagle foraging habitat within a one to four mile radius around active or alternative golden eagle nests (as identified or defined in the most recent USFWS guidance and/or policy) will be limited to less than 20 percent.

- **LUPA-BIO-IFS-26.** For activities that impact golden eagles, applicants will conduct a risk assessment per the applicable USFWS guidance using best available information as well as the data collected in the pre-project golden eagle surveys.

- **LUPA-BIO-IFS-27**. If a permit for golden eagle take is determined to be necessary, an application will be submitted to the USFWS in order to pursue a take permit.

- **LUPA-BIO-COMP-1.** Impacts to biological resources, identified and analyzed in the activity specific environmental document, from activities in the LUPA decision area will be compensated using the standard biological resources compensation ratio, except for the biological resources and specific geographic locations listed as compensation ratio exceptions, specifics in CMAs LUPA-BIO-COMP-2 through -4, and previously listed CMAs.

- **LUPA-BIO-COMP-2**. The compensation for the mortality impacts to bird and bat Focus and BLM special status species from activities will be determined based on monitoring of bird and bat mortality and a fee re-assessed every five years to fund compensatory mitigation. The initial compensation fee for bird and bat mortality impacts will be based on pre-project monitoring of bird use and estimated bird and bat species mortality from the activity.

- **LUPA-SW-13**. BLM will manage all riparian areas to be maintained at, or brought to, proper functioning condition.

- **LUPA-SW-16.** The 100-year floodplain boundaries for any surface water feature in the vicinity of the project will be identified. If maps are not available from the Federal Emergency Management Agency, these boundaries will be determined via hydrologic modeling and analysis as part of the environmental review process. Construction within, or alteration of, 100-year floodplains will be avoided where possible, and permitted only when all required permits from other agencies are obtained.

- **LUPA-TRANS-BIO-1.** Where feasible and appropriate for resource protection, site transmission activities along roads or other previously disturbed areas to minimize new surface disturbance, reduce perching opportunities for the Common Raven (*Corvus corax*), and minimize collision risks for birds and bats.

- **LUPA-TRANS-BIO-2**. Flight diverters will be installed on all transmission activities spanning or within 1,000 feet of stream and wash channels, canals, ponds, and any other natural or artificial body of water.

- **LUPA TRANS-BIO-3.** When siting transmission activities, the alignment should avoid, to the maximum extent practicable, being located across canyons or on ridgelines.

- **LUPA-TRANS-BIO-4.** Siting of transmission activities will be prioritized within designated utility corridors, where possible, and designed to avoid, where possible, and otherwise minimize and offset impacts to sand transport processes in aeolian corridors, rare vegetation alliances and Focus and BLM special status species. Transmission substations will be sited to avoid aeolian corridors, rare vegetation alliances, and sand-dependent Focus and BLM Special Status Species habitats.

- **DFA-VPL-BIO-DUNE-1.** Activities in the North American Warm Desert Dune and Sand Flats (Development Focus Areas [DFAs] and Variance Process Lands [VPLs]), including transmission substations, will be sited to avoid dune vegetation.

- **DFA-VPL-BIO-DUNE-2**. Within aeolian corridors that transport sand to dune formations and vegetation types downwind inside and outside of the DFAs, all activities will be designed and operated to facilitate the flow of sand across activity sites and avoid the trapping or diverting of sand from the aeolian corridor.

- **DFA-BIO-IFS-1**. Conduct the following surveys as applicable in the DFAs as shown in Table 21 of the DRECP LUPA.

- **DFA-BIO-IFS-2**. Implement the following setbacks shown below in Table 22 of the DRECP LUPA as applicable in the DFAs.

3 Plant and Wildlife Concerns

The plant and wildlife species covered under state and federal ESAs and/or MBTA that may potentially occur within the Project area are organized in the following categories:

- Special Status Plants
- Special Status Wildlife
- Migratory Birds

Resource surveys are required to determine the presence or absence of BLM, USFWS, DRECP (USFWS 2016a), state sensitive plant and wildlife species, active raptor nests, and noxious weeds within the Project area. This Plan identifies APMs and BMPs that will be implemented to protect specific plants, wildlife, and migratory birds in the Project area and ensure the Project is consistent with management objectives to protect biological resources. Specific impacts on plant and wildlife resources are defined in the following sections.

3.1 Disturbance and Displacement

For wildlife and plants within and adjacent to the Project right-of-way (ROW), disturbance and displacement will result in temporary changes in habitat use during construction activities, long-term changes due to the presence of Project features (e.g., transmission structures and facilities), and an increase in human activity associated with Project operation and maintenance.

The introduction and/or spread of noxious weeds further increases competition and displacement of native plant species; decreases food resources for native wildlife to survive; and increases the likelihood of wildfires. Disturbance also impacts natural soil structure and hydrology resulting in displacement or loss of plant species and can ultimately alter habitat types. Implementation of measures compatible with the Project design standards is required to minimize disturbance and displacement of wildlife and plants as a result of the Project construction, operation, and maintenance activities.

3.2 Habitat Loss and Fragmentation

Permanent loss and fragmentation of plant and wildlife habitat will occur as a result of the Project, due to clearing and grading of access roads and work areas; installation of transmission structures; and vegetation management within the ROW. Habitat loss as a result of these land conversion actions is the most common impact on native wildlife limiting resources and biodiversity. In addition, significant construction actions can alter habitats that potentially fragment previously connected populations; however, it is unlikely for the Project due to the fact that the majority of construction is within previously disturbed areas of vast desert paralleling existing transmission lines and highways, a restoration plan is in place for temporary disturbances (see Appendix L-1 of the POD), and the aerial nature of transmission lines do not typically result in fragmented populations. Implementation of measures compatible with the Project design standards is required to minimize habitat loss and resources to the extent practical.

3.3 Plant and Wildlife Mortality

Project activities will result in some mortality of plants and possibly wildlife with limited mobility; more specifically, mortality risks are higher during vegetation management, clearing, and/or grading operations associated with construction, operation, and maintenance of the Project. Wildlife species that occupy burrows may experience mortality if burrows are damaged or destroyed by heavy machinery. In addition, there will be an increased potential for avian mortality due to collisions with shield wires/fiber optical ground wire and/or conductors.

The presence of transmission line structures will increase perching and roosting opportunities for raptors and corvids, leading to increased predation on potential sensitive wildlife species. Additionally, herbicide use for weed treatments, may affect sensitive plant species, resulting in mortality. Implementation of mitigation measures compatible with the Project design standards is required to reduce the potential for increased plant and wildlife mortality.

4 Mitigation Measures for Special Status Species

This section of the Plan outlines the APMs and BMPs relevant for plant and wildlife resources previously discussed (BIO refers to biological mitigation measure; VEG refers to vegetation mitigation measure). The discussion is organized to provide an overview of each designated resource and their potential for occurrence in the Project area, agency concerns and impacts for which mitigation was identified, and the appropriate APMs and BMPs to address concerns and reduce impacts during design, construction, operation, and maintenance of the Project.

4.1 Special Status Plants

4.1.1 Background

As described in Chapter 3 of the Draft EIS, no plant species currently listed or proposed for listing under the ESA or CESA are anticipated to be present within the Project area. In Arizona, a total of 11 plant species classified as sensitive by the BLM have potential to be found in or near the Project area. Under the ANPL, a total of 33 plant species were listed with potential to be found in or near the Project area (Draft EIS Appendix 3).

In California, the BLM grants sensitive status to designated plants with a California Rare Plant Rank (CRPR) of 1B (rare, threatened, or endangered in California). Based on a review of the California Native Plant Society online inventories and CDFW's Natural Diversity Database, a total of 15 special status plant species were identified to have potential to be present in or near the Project area (Draft EIS Appendix 3). Table F-2-1 lists the special status plant species with their associated status (CRPR, ANPL, and/or BLM Sensitive) and their potential to occur within or near the Project area.

TABLE F-2-1 SPECIAL STATUS PLANT SPECIES THAT MAY OCCUR WITHIN OR NEAR THE PROJECT AREA

Common Name	Scientific Name	Status[1]	Occurrence[2]
Abrams' spurge	*Euphorbia abramsiana*	CRPR-2B.2	Likely; suitable habitat and recorded presence north of Project.
Ajo lily	*Hesperocallis undulata*	ANPL-SR	Possible; not known to occur but suitable habitat present.
Alverson's foxtail cactus	*Coryphantha alversonii*	BLM: Sensitive[3]	Not likely; historically not recorded.
Barrel cactus	*Ferocactus wislizeni*	ANPL-SR	Likely; suitable habitat.
Beavertail cactus	*Opuntia basilaris var. basilaris*	ANPL-SR	Likely; known to occur and suitable habitat.
Beehive cactus	*Echinomastus johnsonii*	ANPL-SR	Unlikely; historically recorded near southern Arizona border.
Big galleta	*Pleuraphis (Hilaria) rigida*	BLM: Sensitive[3]	Likely; known to occur and suitable habitat.
Bigelow's nolina	*Nolina bigelovii*	ANPL-SR, HR	Possible; not known to occur but suitable habitat present.
Bitter hymenoxys	*Hymenoxys odorata*	CRPR-2B.1	Unlikely; low potential to occur along Colorado River, woodland washes.
Blue paloverde	*Parkinsonia florida*	ANPL-SA	Likely; known to occur and suitable habitat.
Blue sand lily	*Triteliopsis palmeri*	ANPL-SR	Unlikely; low potential in sandy areas but recorded along Arizona southern border.
Buckhorn cholla	*Cylindropuntia acanthocarpa var. acanthocarpa*	ANPL-SR	Unlikely; presence known north of Interstate 10 near McCoy Mountains and uncommon in sandy soils within Project area.
Bush muhly	*Muhlenbergia porteri*	BLM: Sensitive[3]	Likely; known to occur and suitable habitat.
California ditaxis	*Ditaxis serrata var. californica*	CRPR-3.2	Unlikely; presence known north of Interstate 10 near McCoy Mountains and uncommon in sandy soils within Project area.

Common Name	Scientific Name	Status[1]	Occurrence[2]
Catclaw acacia	*Acacia greggii*	BLM: Sensitive[3]	Likely; known to occur and suitable habitat.
Cottonwood	*Populus fremontii*	BLM: Sensitive[3]	Likely; known to occur and suitable habitat.
Crucifixion thorn	*Castela emoryi*	ANPL-SR	Unlikely; historically recorded near southern Arizona border.
Desert agave	*Agave deserti spp. simplex*	ANPL-SR	Unlikely; not known to occur but further north and west of Project area.
Desert holly	*Atriplex hymenelytra*	ANPL-SR	Possible; not known to occur but suitable habitat.
Desert unicorn-plant	*Proboscidea althaeifolia*	CRPR-4.3	Present within the Project area.
Desert willow	*Chilopsis linearis*	ANPL-SA	Likely; known to occur and suitable habitat.
Devil's cholla	*Grusonia kunzei*	ANPL-SR	Unlikely; no suitable habitat present.
Diamond cholla	*Cylindropuntia ramosissima*	ANPL-SR	Unlikely; historically recorded closer to southern borders.
Ditaxis claryana	*Glandular ditaxis*	CRPR-2B.2	Possible; not known to occur but suitable habitat present.
Dudleya	*Dudleya arizonica*	ANPL-SR	Possible; not known to occur but suitable habitat present.
Dune buckwheat	*Eriogonum deserticola*	BLM: Sensitive[3]	Not likely; historically not recorded.
Dwarf germander	*Teucrium cubense ssp. depressum*	CRPR-2B.2	Possible; not known to occur but suitable habitat present.
Elephant tree, torote	*Bursera microphylla*	ANPL-SR	Unlikely; historically recorded closer to southern borders.
Flat-seeded spurge	*Euphorbia platysperma*	CRPR-1B.2, BLM: Sensitive[3]	Possible; not known to occur but suitable habitat present.
Foothill paloverde	*Parkinsonia microphylla*	ANPL-SA	Possible; not known to occur but suitable habitat present.
Goodding's willow	*Salix gooddingii*	BLM: Sensitive3	Likely; known to occur and suitable habitat present.
Gravel milkvetch	*Astragalus sabulonum*	CRPR-2B.2	Possible; not known to occur but suitable habitat present.
Harwood's eriastrum	*Eriastrum harwoodii*	CRPR-1B.2, BLM: Sensitive	Present within the Project area.
Harwood's milkvetch	*Astragalus insularis var. harwoodii*	CRPR-2B.2	Present within the Project area.
Hedgehog cactus	*Echinocereus engelmannii var. chrysocentrus*	ANPL-SR	Likely; suitable habitat present.
Ironwood	*Olneya tesota*	ANPL-SA, HR	Possible; not known to occur but suitable habitat present.
Kearney sumac	*Rhus kearneyi spp. kearneyi*	ANPL-SR	Likely; suitable habitat present.
Las Animas colubrina	*Colubrina californica*	CRPR-2B.3	Unlikely; presence north of Interstate 10 and uncommon in sandy soils within Project area.
Long leaf sandpaper plant	*Petalonyx linearis*	BLM: Sensitive[3]	Not likely; historically not recorded.
Mesquite	*Prosopis spp.*	ANPL-SA, HR	Likely; suitable habitat present.

Common Name	Scientific Name	Status[1]	Occurrence[2]
Night blooming cereus	*Peniocereus greggii*	ANPL-SR	Possible; not known to occur but suitable habitat present.
Ocotillo	*Fouquieria splendens*	ANPL-SR	Likely; suitable habitat present.
Parish wild onion	*Allium parishii*	ANPL-SR	Possible; not known to occur but suitable habitat present.
Desert Christmas cactus	*Cylindropuntia leptocaulis*	ANPL-SR	Possible; not known to occur but suitable habitat present.
Pincushion cactus	*Mammillaria tetrancistra*	ANPL-SR	Unlikely; low potential to occur in desert woodlands.
Pink fairy-duster Ribbed cryptantha	*Calliandra eriophylla*	CRPR-2B.3	Unlikely; low potential to occur in desert woodlands.
Queen-of-the-night	*Peniocereus greggii var. transmontanus*	ANPL-SR	Unlikely; historically recorded closer to southern borders.
Ribbed cryptantha	*Cryptantha costata*	CRPR-4.3	Present within the Project area.
Saguaro cactus	*Carnegiea gigantea*	ANPL-SR, CRPR-2B.2	Present within the Project area.
Sand food	*Pholisma sonorae*	ANPL-HS	Unlikely; low potential to occur in desert sandy areas and historically recorded closer to southern borders.
Scaly sandplant	*Pholisma arenarium*	ANPL-HS	Possible; not known to occur but suitable habitat present.
Scrub oak	*Quercus turbinella*	BLM: Sensitive[3]	Likely; known to occur and suitable habitat.
Silver cholla	*Cylindropuntia echinocarpa*	ANPL-SR	Present within the Project area.
Smoke tree	*Psorothamnus spinosus*	ANPL-SA	Possible; not known to occur but suitable habitat present.
Teddy-bear cholla	*Cylindropuntia bigelovii*	ANPL-SR	Present within the Project area.
Utah vine milkweed	*Funastrum utahense*	CRPR-4.2	Possible; not known to occur but suitable habitat present.
Winged cryptantha	*Cryptantha holoptera*	CRPR-4.3	Present within the Project area.

[1]As listed in the Draft EIS Appendix 3 including the following status levels:
ANPL = Arizona Native Plant Law, statuses include: HS = Highly Safeguarded, SR = Salvage Restricted, SA = Salvage Assessed, HR = Harvest Restricted;
CRPR = California Rare Plant Ranking, statuses include 1A = Plants presumed extirpated in California and either rare or extinct elsewhere, 1B = Plants rare, threatened, or endangered in California and elsewhere, 2A = Plants presumed extirpated in California, but common elsewhere, 2B = Plants rare, threatened, or endangered in California, but common elsewhere, 3 = Plants about which more information is needed (review list), 4 = Plants of limited distribution (watch list), 0,1 = Seriously endangered in California, 0.2 = Fairly endangered in California, 0.3 = Not very endangered in California
BLM: Sensitive = BLM special status species.
[2]Sources: BLM 2006, BLM 2008, BLM 2010, BLM 2012a, BLM 2012b, BLM 2014, AZGFD 2015.
[3]Not on the BLM sensitive species list in AZ

4.1.2 Mitigation Measures for Plant Species

Based on the concerns of federal and state agencies discussed in Section 3, the key mitigation strategy for reducing impacts to special status plant species is to require surveys and avoidance of populations where they are detected (BMP BIO-24). The AMPs and BMPs (and their associated CEQA and CMA requirements) applicable to minimize potential adverse effects to special status plant species and their habitats include the following

(derived from Appendix 2B and 2C of the Draft EIS; will be updated when the EIS is finalized):

- **APM/BMP BIO-1**. Before starting any work, including mowing, staging, installing stormwater control structures, implementing other BMPs, removing trees, construction, and restoration, all employees and contractors performing activities and new construction would receive training on environmental requirements that apply to their job duties and work. If additional crewmembers arrive later in the job, they would be required to complete the training before beginning work. Training would include a discussion of the avoidance and minimization measures being implemented and would include information on the federal and state ESAs and the consequences of not complying with these Acts. An educational brochure would be provided to construction crews working on the Project. This brochure would include color photographs of special status species as well as a discussion of avoidance and minimization measures. The worker education program would provide interpretation for non-English speaking workers. (Addresses MM BIO-CEQA-1; CMA LUPA-BIO-5)

- **APM/BMP BIO-3.** The BLM would approve areas to be used for stockpiling, vehicle parking, or other construction support activity that would occur outside established work areas. (Addresses MM WIL-CEQA-9/10/11; CMA LUPA-BIO-13)

- **APM BIO-4.** Environmentally sensitive areas, such as the riparian areas, xeroriparian washes, and other habitat of special status species, would be identified in the field. Barrier fences or stakes would be installed at the edge of the easement or around the sensitive area to minimize the possibility of inadvertently encroaching into sensitive habitat. (Addresses MM VEG-CEQA-1/2/4, WIL-CEQA-10, and WIL-CEQA-11; CMA LUPA-BIO-3 and LUPA-BIO-13)

- **APM BIO-10.** The BMPs included in the Stormwater Pollution Prevention Plan would be implemented during construction to minimize impacts associated with erosion. Watering for dust control during construction would also be used as described previously (AQ-01). Watering shall not result in prolonged ponding of surface water that could attract wildlife to the work area. Minimal or no vegetation clearing and/or soil disturbance would be conducted for site access and construction in areas with suitable topography (i.e., overland driving/overland access).

- **APM/BMP BIO-11.** The Vegetation Management Plan would be approved by the BLM and implemented. That Plan describes the surveys, permitting, fee payments, and plant protection to be conducted in areas where Project design would not eliminate the need for vegetation control for the project to be in compliance with North American Electric Reliability Corporation requirements. Vegetation would be trimmed or otherwise controlled for safe operation of the transmission line and would be designed to minimize impacts on special status species to the extent practicable. The Plan also would describe how vegetation would be salvaged, as needed, in order to comply with the applicable ANPL and California regulations. (Addresses MM VEGA-CEQA-1/2/3; CMA LUPA-BIO-9)

- **APM BIO-12**. A Noxious Weed Management Plan would be prepared, approved by the BLM, and implemented to address potential impacts associated with the spread and establishment of noxious weeds. (Addresses MM VEG-CEQA-1; CMA LUPA-BIO-6/10/11)

- **APM BIO-13.** Riparian areas and xeroriparian drainages that occur within the easement would be denoted as environmentally sensitive areas and must be avoided during construction to the extent practicable. Existing topography would be restored after construction is complete, to pre-Project conditions to extent possible. (Addresses MM VEG-CEQA-1 and VEG-CEQA-4; CMA LUPA-BIO-1 and LUPA-BIO-13)

- **APM BIO-14.** In areas with suitable topography, minimal or no vegetation clearing and soil disturbance would be conducted for site access and construction (i.e., overland driving/overland access). Overland driving/overland access would be used in areas that support the necessary construction equipment. Upgrading of existing access roads and construction of new access roads would be implemented as necessary for safe construction activities. (Addresses MM VEG-CEQA-1 and VEG-CEQA-4; CMA LUPA-BIO-14)

- **APM/BMP BIO-15 (California only).** A Habitat Restoration and Monitoring Plan would be developed, approved by BLM, and implemented for construction and operation of the Project. Revegetate all sites disturbed during construction that would not be required for operation of the transmission line, and restore disturbed areas to the extent practicable, given the arid desert environment. The Plan would describe in detail methods for surveying and characterizing vegetation in disturbed areas before construction; topsoil salvage and management, erosion control, post-construction recontouring and site preparation, seeding and planting, and post-construction watering, monitoring, and remediation. It would be designed to reduce impacts on special status species to the extent practicable. (Addresses MM VEG-CEQA-1 and VEG-CEQA-4; CMA LUPA-BIO-7/8/10)

- **APM BIO-16.** Measures would be implemented to minimize the number of saguaro cacti that must be relocated for the safe construction and operation of the transmission line. In accordance with the Vegetation Management Plan, a survey of saguaros within the ROW would be conducted before construction and where possible, the transmission line would be designed to minimize the number of saguaros affected by adjusting tower locations and conductor height. The Plan would address plant salvaging, storing, and replanting requirements and methods, only saguaro that are within 50-feet of the outermost conductors and could be tall enough to pose a hazard would be removed if they cannot be avoided through Project design. When possible, saguaro that must be removed would be relocated as directed by the BLM and state agency protocols. Monitoring and management of saguaros during operations would occur as described in the Vegetation Management Plan. (Addresses MM VEG-CEQA-1 and VEG-CEQA-4; CMA LUPA-BIO-SVF-1)

- **APM BIO-17.** Vehicular travel would be limited to established roads to the maximum extent practicable. (Addresses MM WIL-CEQA-9/10/11; CMA LUPA-BIO-13)

- **BMP BIO-24.** A survey would be conducted during the appropriate time of year of the selected route to identify special status plant species and imperiled or sensitive vegetation alliances. Where possible, and as required by the BLM, special status species and vegetation alliances would be avoided during construction. This survey would be restricted to non-cultivated land. (Addresses MM VEG-CEQA-2/3/4; CMA LUPA-BIO-1**,** LUPA-BIO-PLANT-1, and LUPA-BIO-SVF-1)

- **APM BIO-26.** An inventory of plants protected under the ANPL would be conducted on State Trust lands as required by the Arizona State Land Department. Similar surveys would be conducted on lands managed by BLM, as directed by that agency.

- **BMP BIO-31 (California only)**. Implementation of requirements specific to Harwood's eriastrum; further details provided in the Harwood's eriastrum Linear ROW Protection Plan; see Appendix F-8 of the POD. (Addresses MM VEG-CEQA-3 and VEG-CEQA-4; CMA LUPA-BIO-1/3/4/6/13, LUPA-BIO-DUNE-2, LUPA-BIO-PLANT-2, and LUPA-BIO-PLANT-3)

- **BMP BIO-32.** Species-specific seasonal restriction dates would be observed. (Addresses CMA LUPA-BIO-4 and LUPA-BIO-DUNE-5)

- **BMP BIO-37.** The collection of native plants on site is prohibited without required permits and tags. (Addresses MM VEG-CEQA-1 and VEG-CEQA-4; CMA LUPA-BIO-14)

- **BMP BIO-41.** Management of cactus, yucca, and other succulents would adhere to current up-to-date BLM policy. All activities would follow applicable BLM state and national regulations and policies for salvage and transplant of cactus, yucca, and other succulents. Preconstruction surveys of disturbance zones would include preparation of maps delineating special vegetation features. BLM may consider disposal of succulents through public sale, as per current up-to-date state and national policy.

- **BMP BIO-42.** Promote appropriate levels of dead and downed wood on the ground, outside of campground areas, to provide wildlife habitat, seed beds for vegetation establishment, and reduce soil erosion, as determined appropriate on an activity-specific basis. (Addresses CMA LUPA-BIO-VEG-2)

- **BMP BIO-46 (California only).** Any loss of desert riparian woodland would be compensated at the ratio of 5:1 (ratio of compensation is California only); compensation requirements may be fulfilled through restoration and enhancement, land acquisition (i.e., preserve), or a combination of these options, depending on the activity specifics and BLM approval/authorization. (Addresses CMA LUPA-BIO-17 and LUPA-BIO-COMP-1)

- **BMP BIO-47.** BLM would manage all riparian areas to be maintained at, or brought to, proper functioning condition. (Addresses CMA LUPA-BIO-17, LUPA-BIO-RIPWET-1, and LUPA-SW-13)

- **BMP BIO-51.** To minimize vegetation trimming, micro-siting and design considerations (including tower height) would be applied so the catenary formed by the conductors (the bottom of the sag) avoids saguaros and is not directly over wash vegetation, to the extent practicable. (Addresses MM VEG-CEQA-1; CMA LUPA-BIO-17, LUPA-BIO-RIPWET-1, and LUPA-BIO-SVF-6)

- **BMP BIO-52 (California only).** For California portions, apply a 200-foot setback from the outer perimeter of Coloradan semi-desert wash woodland/scrub vegetation. Preconstruction surveys of disturbance zones would include preparation of maps delineating special vegetation features. Minor incursions would be allowed to balance minimizing vegetation trimming (BIO-51), while maintaining an

appropriate setback, as determined based on site-specific conditions. (Addresses VEG-CEQA-1/2/4; CMA LUPA-BIO-3/13/17, LUPA-BIO-RIPWET-1, LUPA-BIO-SVF-1, and LUPA-BIO-SVF-6)

- **BMP BIO-53 (California only).** Project facilities would be sited to avoid dune vegetation. Unavoidable impacts to dune vegetation would be limited and access roads would be sited to minimize unavoidable impacts. Access road would be unpaved and designed and constructed to be at grade with the ground surface to avoid inhibiting sand transport. (Addresses MM VEG-CMA-1/2/3/4, WIL-CEQA-9, and WIL-CEQA-11; CMA LUPA-BIO-1, LUPA-BIO-13, LUPA-BIO-DUNE-2, LUPA-BIO-DUNE-4, LUPA-TRANS-BIO-4, and DFA-VPL-BIO-DUNE-1)

- **BMP BIO-54 (California only).** Within Aeolian corridors that transport sand to dune formations and vegetation types downward all activities, would be designed and operated to facilitate the flow of sand across activity sites, and avoid the trapping or diverting of sand from the Aeolian corridor. Structure design take into account the direction of sand flow and, to the extent feasible, build and align structures to allow sand to flow through the site unimpeded. Fences would be designed to allow sand to flow through and not be trapped. (Addresses MM VEG-CEQA-1, VEG-CEQA-4, WIL-CEQA-9, and WIL-CEQA-11; CMA LUPA-BIO-1, LUPA-BIO-DUNE-1, LUPA-BIO-DUNE-2, LUPA-BIO-DUNE-4, LUPA-TRANS-BIO-4, and DFA-VPL-BIO-DUNE-2)

- **BMP BIO-55 (California only).** Construction of new roads and/or routes would be avoided within Focus and BLM Special Status Species' suitable habitat within identified linkages for those Focus and BLM Special Status Species unless the new road and/or route is beneficial to minimize net impacts to natural or ecological resources of concern. These areas would have a goal of "no net gain" of Project roads and/or routes. (Addresses MM VEG-CEQA-1, VEG-CEQA-4, WIL-CEQA-8/9/10/11; CMA LUPA-BIO-13 and LUPA-BIO-DUNE-4)

- **BMP VEG-1.** Any removal of vegetation resources would be conducted in accordance with BLM Information Bulletin 2012-097. (Addresses MM VEG-CEQA-1 and VEG-CEQA-4; CMA LUPA-BIO-15 and LUPA-BIO-SVF-1)

- **BMP VEG-2.** Minimize natural vegetation removal through implementation of drive and crush or cut or mow vegetation rather than removing entirely. Locations for drive and crush travel or cut/mow would be determined in conjunction with the Access Road Plan; see Appendix K-1 of the POD. (Addresses MM VEG-CEQA-1 and VEG-CEQA-4; CMA LUPA-BIO-14)

4.2 Special Status Wildlife

4.2.1 Background

Special status wildlife species include species listed as threatened, endangered, or candidates under the federal ESA; classified as BLM sensitive; and/or listed under CESA. These species were queried through the USFWS Information for Planning and Conservation database (USFWS 2016b), BLM resource management plans, CDFW's Biogeographic Information and Observation System and Natural Diversity Database (CDFW 2016), Arizona Online Environmental Review, and related documents, as well as evaluating published and unpublished information regarding listed species in the Project area.

All species protected under the federal ESA are classified as special status species by the BLM. A total of six federally-listed species were identified with potential to be present in or near the Project area, which include three wildlife species: the threatened Mojave desert tortoise, endangered razorback sucker (*Xyrauchen texanus*) and the endangered Sonoran pronghorn (*Antilocapra americana sonoriensis)*. The other three species are migratory birds and can be found in Section 4.3. Table F-2-2 lists the special status wildlife species with their associated status (Arizona and California listings, BLM Sensitive and Focus species, and federal status, if applicable) and their potential to occur within or near the Project area.

For more detailed information and requirements related to the Mojave desert tortoise, see Section 6 that includes the Mojave Desert Tortoise Protection and Compensation Plan.

TABLE F-2-2 SPECIAL STATUS WILDLIFE SPECIES THAT MAY OCCUR WITHIN OR NEAR THE PROJECT AREA

Common Name	Scientific Name	Status[1]	Occurrence[2]
Reptiles			
Chuckwalla	*Sauromalus ater*	BLM: Sensitive in CA	Possible; not known to occur but suitable habitat present
Gila monster	*Heloderma suspectum*	Arizona: SGCN	Possible; not known to occur but suitable habitat present
Mojave desert tortoise	*Gopherus agassizii*	ESA: T Arizona: SGCN California: T; BLM: Sensitive and Focus in CA	Likely; known to be present on the Palo Verde Mesa around the Colorado River Substation
Mojave fringe-toed lizard	*Uma scoparia*	Arizona: SGCN; California: SSC BLM: Sensitive in AZ and CA	Likely; known to occur and suitable habitat present
Rosy boa	*Lichanura trivirgata*	BLM: Sensitive in CA	Unlikely; no suitable habitat present
Sonora mud turtle	*Kinosternon sonoriense*	California: SSC BLM: Sensitive in AZ and CA	Possible; not known to occur but suitable habitat along lower Colorado River
Sonoran coralsnake	*Micruroides euryxanthus*	Arizona: SGCN	Possible; not known to occur but suitable habitat present
Sonoran desert tortoise	*Gopherus morafkai*	Arizona: SGCN; BLM: Sensitive in AZ	Likely; known to occur and suitable habitat present
Amphibians			
Couch's spadefoot	*Scaphiopus couchii*	California: SSC BLM: Sensitive in CA	Likely; known to occur and suitable habitat present in and near ephemeral pools and agricultural areas in eastern portion of Project Area in California
Sonoran desert toad	*Bufo alvarius*	Arizona: SGCN; California: SSC	Possible; occurs within several miles of permanent or temporary water sources and may occur in a variety of habitats along Colorado River or agricultural drainages

Common Name	Scientific Name	Status[1]	Occurrence[2]
Fish			
Razorback sucker	*Xyrauchen texanus*	ESA: E Arizona: SGCN California: E; BLM: Sensitive in CA	Likely; suitable habitat along lower Colorado River and the transmission line would span critical habitat
Mammals			
Allen's (Mexican) big-eared bat	*Idionycteris phyllotis*	Arizona: SGCN; BLM: Sensitive in AZ	Unlikely; low potential to occur in desert woodlands
American badger	*Taxidea taxus*	California: SSC	Likely; known to occur and suitable habitat present
American beaver	*Castor canadensis*	Arizona: SGCN	Possible; potential to occur along Colorado River
Arizona myotis	*Myotis occultus*	Arizona: SGCN; California: SSC	Possible; not known to occur but suitable habitat present near water and wooded riparian areas in desert
Arizona pocket mouse	*Perognathus amplus*	Arizona: SGCN	Unlikely; suitable habitat present in Harquahala and Ranegras plains outside the Project area
Big free-tailed bat	*Nyctinomops macrotis*	Arizona: SGCN	Possible; inhabits arid lowlands and hills to 6,000 feet (1,800 meters) and roosts in crevices, buildings, and sometimes trees
California leaf-nosed bat	*Macrotus californicus*	Arizona: SGCN; California: SSC BLM: Sensitive in AZ and CA	Possible; not known to occur but suitable habitat present in lowland desert scrub
California myotis	*Myotis californicus*	Arizona: SGCN	Possible; not known to occur but suitable habitat present in desert caves, mines, crevices, and shrubs
Cave myotis	*Myotis velifer*	Arizona: SGCN; California: SSC BLM: Sensitive in AZ and CA	Possible; not known to occur but suitable habitat present in desert caves, mines, crevices, and shrubs
Colorado River cotton rat	*Sigmodon arizonae plenus*	Arizona: SGCN; California: SSC	Unlikely; occurs within riparian thickets, dense grass cover, and drier grassy areas. Likely rare or absent along Colorado River in the Project area
Desert bighorn sheep	*Ovis canadensis mexicana*	Arizona: SGCN; California: FP BLM: Sensitive in CA; BLM Focus Species in CA	Possible; occurs in all mountain ranges around the Project Area; existing habitat not typical of their preferences; however, their migration routes to available resources may cross the Project area
Pallid bat	*Antrozous pallidus*	California: SSC BLM: Sensitive in CA	Possible; not known to occur but suitable habitat present in rock crevices and near water

Common Name	Scientific Name	Status[1]	Occurrence[2]
Pocketed free-tailed bat	*Nyctinomops femorosaccus*	California: SSC	Possible; occurs in rocky canyons roosting in rock crevices and trees; observed near shrubland but, not known to roost in shrubland
Sonoran pronghorn	*Antilocapra americana sonoriensis*	ESA: NSE Arizona: SGCN	Possible; suitable habitat present and a managed population (nonessential experimental population or NSE) within the Kofa National Wildlife Refuge may occur near or along Project area
Townsend's big-eared bat	*Corynorhinus townsendii*	California: SSC BLM: Sensitive in AZ and CA	Likely; not known to occur but occurs in desert caves, mines, crevices, and shrubs near water; potential foraging habitat along Colorado River and agricultural areas
Western yellow bat	*Lasiurus xanthinus*	California: SSC	Possible; not known to occur, but suitable habitat present in riparian areas
Yuma mountain lion	*Felis concolor brownii*	California: SSC	Unlikely; no suitable habitat from mountains to valley bottoms and present typically occurs where prey is abundant
Yuma myotis	*Myotis yumanensis*	BLM: Sensitive in CA	Possible; not known to occur but suitable habitat present including riparian, desert scrub, moist woodlands, and forests, typically near open water

Note: Avian species are within a separate table within this Plan (Table F-2-3).
[1]As listed in the Draft EIS Appendix 3 and will be updated once Final EIS is complete. Species listing include E = Endangered and T = Threatened; NSE = Nonessential experimental population; BLM focused species as designated under the DRECP LUPA; SGCN = Species of Greatest Conservation Need; BLM = Bureau of Land Management; FP = Fully Protected; SSC = Species of Special Concern.
[2]Source: USFWS 2016b.

4.2.2 Mitigation Measures for Wildlife Species

Based on the significant concerns of federal and state agencies discussed in Section 3, the key mitigation strategy for reducing impacts to special status wildlife species is to minimize habitat loss, wildlife mortality, and protect natural resources. The APMs and BMPs (and their associated CEQA and CMA requirements) applicable to minimize potential adverse effects to special status wildlife species and their habitats include the following:

- **APM/BMP BIO-1.** Before starting any work, including mowing, staging, installing stormwater control structures, implementing other BMPs, removing trees, construction, and restoration, all employees and contractors performing activities and new construction would receive training on environmental requirements that apply to their job duties and work. If additional crewmembers arrive later in the job, they would be required to complete the training before beginning work. Training would include a discussion of the avoidance and minimization measures being implemented and would include information on the federal and state ESAs and the consequences of not complying with these Acts. An educational brochure would be provided to construction crews working on the Project. This brochure would include color photographs of special status species as well as a discussion of avoidance and minimization measures. The worker education program would provide interpretation for non-English speaking workers. (Addresses MM BIO-CEQA-1; CMA LUPA-BIO-5)

- **APM/BMP BIO-2.** Multiple biological monitors would be provided so any work site within habitat of special status species is monitored concurrently if needed. (Addresses MM BIO-CEQA-3, VEG-CEQA-2, WIL-CEQA-5/6/7/10/11; CMA LUPA-BIO-2, LUPA-BIO-DUNE-5, LUPA-BIO-IFS-6, LUPA-BIO-IFS-7, LUPA-BIO-IFS-12, DFA-BIO-IFS-1, DFA-BIO-IFS-2, and LUPA-BIO-RIPWET-3)

- **APM BIO-4.** Establish environmentally sensitive areas in the field; install fencing, flagging or stakes around identified sensitive area easements to minimize encroachment. (Addresses MM VEG-CEQA-1/2/4, WIL-CEQA-10, and WIL-CEQA-11; CMA LUPA-BIO-3 and LUPA-BIO-13**)**

- **APM BIO-5.** Trash dumping, firearms, open fires, and pets would be prohibited at all work locations and access roads. Smoking would be prohibited along the Project alignment. (Addresses CMA LUPA-BIO-6 and LUPA-BIO-14)

- **APM BIO-6.** All food scraps, wrappers, food containers, cans, bottles, and other trash from the work area would be disposed of in closed trash containers. (Addresses CMA LUPA-BIO-6 and LUPA-BIO-14)

- **APM BIO-9.** All excavated steep-walled holes or trenches more than one-foot-deep would be covered at the end of each working day with plywood or similar material or would be provided with one or more escape ramps constructed of earth fill or wooden planks. Each trench or hole would be inspected for wildlife at the beginning of each work day and before such holes or trenches are filled. Wildlife found trapped in trenches or holes would be relocated to suitable habitat outside the work area. If possible, pipes and culverts greater than three inches in diameter would be stored on dunnage to prevent wildlife from taking refuge in them, to the extent feasible. (Addresses CMA LUPA-BIO-14)

- **APM BIO-13.** Riparian areas and xeroriparian drainages that occur within the easement would be denoted as environmentally sensitive areas and would be avoided during construction to the extent practicable. Existing topography would be restored to pre-Project conditions to the extent possible. (Addresses MM VEGA-CEQA-1/2/3; CMA LUPA-BIO-9)

- **APM BIO-18.** Control of construction activities and use of construction-related vehicles in the Copper Bottom Pass area would be maintained to ensure that only planned construction traffic is allowed in the area and that minimal trips are planned to minimize disturbance to bighorn sheep. This APM does not apply to non-construction related public use of the Copper Bottom Pass area.

- **APM BIO-22.** In reference to the Sonoran desert tortoise (*Gopherus morafkai*), a qualified biologist would be present during all ground-disturbing and other construction activities in non-cultivated areas in Arizona. The qualified biologist will survey areas before they are disturbed, monitor construction sites for the presence of desert tortoises, and move tortoises from harm's way. Burrows near construction sites would be clearly delineated. Road, footing, and work area alignments would be modified to the extent possible to avoid adversely affecting any tortoise burrows. Where burrows would be unavoidably destroyed, they would be excavated carefully using hand tools under the supervision of a field biologist with demonstrated prior experience with this species.

- **APM/BMP BIO-23 (California only).** In reference to the Mojave desert tortoise, a qualified biologist would be present during all ground-disturbing and other construction activities in non-cultivated areas in California. The qualified biologist will survey areas before they are disturbed, monitor construction sites for the presence of desert tortoises, and move tortoises from harm's way in accordance with USFWS protocols. Burrows near construction sites would be clearly delineated. Road, footing, and work area alignments would be modified to the extent possible to avoid adversely affecting any tortoise burrows. Where burrows would be unavoidably destroyed, they would be excavated carefully using hand tools under the supervision of a field biologist with demonstrated prior experience with this species.

  In addition, a qualified biologist would inspect construction pipes, culverts, or similar structures: (a) with a diameter greater than three inches, (b) stored for one or more nights, (c) less than eight inches aboveground and (d) within desert tortoise habitat (such as outside the long-term fenced area) before the materials are moved, buried, or capped.

  As an alternative, such materials shall be capped before storing outside the fenced area or placing on pipe racks. Pipes stored within the long-term fenced area after completing desert tortoise clearance surveys would not require inspection. (Addresses MM WIL-CEQA-10 and WIL-CEQA-11; CMA LUPA-BIO-1, LUPA-BIO-13, LUPA-BIO-IFS-5, LUPA-BIO-IFS-6 LUPA-BIO-IFS-7, LUPA-BIO-IFS-8, and DFA-BIO-IFS-1)

- **BMP BIO-25.** A survey would be conducted of the selected route prior to construction of all work areas to identify special status animal species, including Mojave desert tortoises, burrowing owls, and Mojave fringe-toed lizards. Where possible, and as required by the BLM, special status species and vegetation alliances would be avoided during construction. (Addresses MM VEG-CEQA-4, WIL-CEQA-5/6/7/9/11; CMA LUPA-BIO-1, LUPA-BIO-RIPWET-3, LUPA-BIO-DUNE-4, LUPA-BIO-DUNE-5, LUPA-BIO-IFS-6, and LUPA-BIO-IFS-12)

- **APM BIO-27.** Construction activities would be limited from January 1 to March 31 in active bighorn sheep lambing areas identified by BLM and AZGFD.

- **BMP BIO-29.** The Bird and Bat Conservation Strategy would provide guidance on conservation measures applicable to bird and bat species present in the Project Area, including a nesting bird management plan and a nest management plan. (Addresses MM WIL-CEQA-1/4/8; CMA LUPA-BIO-4, LUPA-BIO-16, LUPA-BIO-17, LUPA- BIO-RIPWET-1, LUPA-BIO-DUNE-5, LUPA-BIO-IFS-11, and DFA-BIO-IFS-2)

- **BMP BIO-32.** Adhere to specific seasonal restrictions of sensitive species. (Addresses CMA LUPA-BIO-4 and LUPA-BIO-DUNE-5)

- **BMP BIO-33.** All long-term nighttime lighting would be directed away from riparian and wetland vegetation, occupied habitat, and suitable habitat areas for sensitive species. Long-term nighttime lighting, if required, would be directed and shielded downward to avoid interference with the navigation of night-migrating birds and to minimize the attraction of insects as well as insectivorous birds and bats to project infrastructure. (Addresses MM WIL-CEQA-1 and WIL-CEQA-4; CMA LUPA-BIO-13, LUPA-BIO-16, and LUPA-BIO-DUNE-5)

- **BMP BIO-34**. Application of dust abatement in the form of water will be done with the minimum amount of water necessary to meet safety and air quality standards and in a manner that prevents the formation of puddles, which could attract wildlife and wildlife predators. (Addresses CMA LUPA-BIO-6)

- **BMP BIO-35.** All construction materials would be visually checked for the presence of wildlife and nesting birds prior to their movement or use. Any wildlife encountered during the course of these inspections would be allowed to leave the construction area unharmed. (Addresses MM WIL-CEQA-8/9/10/11; CMA LUPA-BIO-14)

- **BMP BIO-36**. The intentional feeding or harassment of wildlife on site is prohibited. (Addresses MM WIL-CEQA-8/9/10/11; CMA LUPA-BIO-14)

- **BMP BIO-39**. When fencing is necessary, use bird and bat compatible design standards. (Addresses CMA LUPA-BIO-16 and LUPA-BIO-DUNE-5)

- **BMP BIO-40 (California only).** Activities would not be sited within 500 feet of any occupied maternity roost or presumed occupied maternity roost. (Addresses WIL-CEQA-1/4/8; CMA LUPA-BIO-16, LUPA-BIO-DUNE-5, and LUPA-BIO-BAT-1)

- **BMP BIO-43.** Allow for the collection of plant material consistent with the maintenance of natural ecosystem processes for the purpose of wildlife habitat. (Addresses MM VEG-CEQA-1 and VEG-CEQA-4; CMA LUPA-BIO-VEG-3)

- **BMP BIO-44 (California only).** For the tortoise protection requirements, all culverts for access roads or other barriers would be designed to allow unrestricted access by desert tortoises and would be large enough that desert tortoises are unlikely to use them as shelter sites (e.g., 36 inches in diameter or larger). Desert tortoise exclusion fencing may be utilized to direct tortoise use of culverts and other passages.

  Biological monitoring would occur with any geotechnical boring or geotechnical boring vehicle movement to ensure no desert tortoises are killed or burrows are crushed. A designated biologist would accompany any geotechnical testing equipment to ensure no tortoises are killed and no burrows are crushed.

  The ground would be inspected under vehicles for the presence of desert tortoise any time a vehicle or construction equipment is parked in desert tortoise habitat. If a desert tortoise is seen, it may move on its own. If it does not move within 15 minutes, a designated biologist may remove and relocate the animal to a safe location. Vehicular traffic would not exceed 15 miles per hour within the areas not cleared by protocol level surveys where desert tortoise may be impacted.

  Vehicular traffic would not exceed 15 miles per hour within the areas not cleared by protocol level surveys where desert tortoise may be impacted. (Addresses MM WIL-CEQA-10 and WIL-CEQA-11; CMA LUPA-BIO-IFS-3/5/6/7/8)

- **BMP BIO-47.** As they are important to many listed wildlife species, the BLM would manage all riparian areas to be maintained at, or brought to, proper functioning condition. (Addresses CMA LUPA-BIO-17, LUPA-BIO-RIPWET-1, and LUPA-SW-13)

- **BMP BIO-49.** A Fringe-toed Lizard Linear ROW Protection Plan would be prepared that identifies specific conservation measures to sand dunes and sand transport areas, to map suitable habitat, and clearance surveys to prevent animal mortality. (Addresses MM VEG-CEQA-3, WIL-CEQA-9, and WIL-CEQA-11; CMA LUPA-BIO-1, LUPA-BIO-DUNE-2, LUPA-BIO-DUNE-4, and LUPA-BIO-DUNE-5)

- **BMP BIO-51.** To minimize vegetation trimming, micro-siting and design considerations (including tower height) would be applied so the catenary formed by the conductors (the bottom of the sag) avoids saguaros and is not directly over wash vegetation, to the extent practicable. (Addresses MM VEG-CEQA-1; CMA LUPA-BIO-17, LUPA-BIO-RIPWET-1, and LUPA-BIO-SVF-6)

- **BMP BIO-55 (California only).** Construction of new roads and/or routes would be avoided within Focus and BLM Special Status Species suitable habitat within identified linkages for those Focus and BLM Special Status Species, unless the new road and/or route is beneficial to minimize net impacts to natural or ecological resources of concern. These areas would have a goal of “no net gain” of project roads and/or routes. (Addresses MM VEG-CEQA-1, VEG-CEQA-4, WIL-CEQA-8/9/10/11; CMA LUPA-BIO-13 and LUPA-BIO-DUNE-4)

- **BMP BIO-56**. Any measures regarding the Sonoran pronghorn (*Antilocapra americana sonoriensis*) by the USFWS in the Biological Opinion would be implemented.

4.3 Migratory Birds

4.3.1 Background

More than 350 species of birds have been documented in southwestern Arizona and California and are protected under the MBTA. The primary method of conservation of many of these species is protecting their associated habitats. The majority of the Project area is present in or near the Sonoran desert scrub and xeroriparian washes that are preferred habitats of these species. Many of these bird species are found within low-elevation riparian habitats and freshwater marshes (BLM 2006 and 2008) which exist along the Colorado River. Migratory birds most likely breed and forage in these habitats; thus, any active nest locations will be identified and protected during the construction, operation, and maintenance of the Project. In addition to the MBTA, eagles are afforded further protection under the BGEPA.

Typically, raptors have more stringent seasonal restrictions than other birds (e.g., passerines). Specific mitigation measures will be applied to protect active raptor nests during construction and maintenance activities. Active nest locations and associated raptor species may or may not change from year to year. Historical nesting locations will be taken into account during preconstruction nesting surveys, if available. Further details on nesting management and specific survey protocols can be found in Avian Protection Plan/Bird and Bat Conservation Strategy (Appendix F-3 of the POD). Table F-2-3 lists the migratory bird species with their associated status (Arizona and California listings, BLM Sensitive and Focus species, and federal status, if applicable) and their potential to occur within or near the Project area.

TABLE F-2-3 MIGRATORY BIRDS SPECIES THAT MAY OCCUR WITHIN OR NEAR THE PROJECT AREA

Common Name	Scientific Name	Status[1]	Occurrence[2]
Abert's towhee	*Melozone aberti*	Arizona: SGCN	Likely; suitable habitat present
American bittern	*Botaurus lentiginosus*	Arizona: SGCN	Likely; known to occur and suitable habitat present within Colorado River area
Arizona Bell's vireo	*Vireo bellii arizonae*	Arizona: SGCN; California: E; BLM: Sensitive in CA	Possible; not known to occur but suitable habitat present
Bald eagle	*Haliaeetus leucocephalus*	Arizona: SGCN; BLM: Sensitive in AZ	Possible; suitable habitat for wintering along lower Colorado River
Belted kingfisher	*Megaceryle alcyon*	Arizona: SGCN	Possible; suitable habitat present within Colorado River area
Bendire's thrasher	*Toxostoma bendirei*	California: SSC; BLM: Sensitive and Focus Species in CA	Unlikely; inhabits dry and semi-arid washes and other areas containing shrubs, trees, and especially yucca
Burrowing owl	*Athene cunicularia*	California: SSC: BLM: Sensitive and Focus Species in CA and AZ	Likely; known to occur and suitable habitat present
California black rail	*Laterallus jamaicensis coturniculus*	Arizona: SGCN; California: T; BLM: Sensitive in AZ and CA	Likely; known to occur and suitable habitat present within Colorado River area
Clark's grebe	*Aechmophorus clarkii*	Arizona: SGCN	Possible; suitable habitat present within Colorado River area
Common black hawk	*Buteogallus anthracinus*	Arizona: SGCN	Possible; suitable habitat for wintering
Crissal thrasher	*Toxostoma crissale*	California: SSC	Possible; suitable habitat present throughout region
Desert purple martin	*Progne subis hesperia*	Arizona: SGCN; BLM: Sensitive in AZ	Possible; more common in southcentral Arizona than within Project area; however, prefers open flat areas and farms. Inhabits saguaros in southern Arizona
Double-crested cormorant	*Phalacrocorax auritus*	Arizona: SGCN	Possible; suitable habitat present within Colorado River area
Elf owl	*Micrathene whitneyi*	California: E; BLM: Sensitive in CA	Unlikely; no suitable habitat present in CA portion of the Project area and marginal suitable habitat in AZ portion of the Project area
Ferruginous hawk	*Buteo regalis*	Arizona: SGCN; BLM: Sensitive in AZ	Possible; suitable habitat for wintering near cultivated fields

Common Name	Scientific Name	Status[1]	Occurrence[2]
Gila woodpecker	*Melanerpes uropygialis*	Arizona: SGCN; California: E; BLM: Sensitive and Focus Species in CA	Possible; suitable habitat present
Gilded flicker	*Colaptes chrysoides*	Arizona: SGCN; California: E; BLM: Sensitive in CA and AZ	Possible; suitable habitat present
Golden eagle	*Aquila chrysaetos*	Arizona: SGCN; BLM: Sensitive in AZ; California: Fully Protected; Eagle Protection Act; BLM: Sensitive and Focus Species in CA	Unlikely; not known to nest or forage in the vicinity of the study area in California, and the Palo Verde Mesa offers low prey availability
Great egret	*Casmerodius albus*	Arizona: SGCN	Possible; suitable habitat present within Colorado River area
Greater sandhill crane	*Grus canadensis tabida*	California: T; BLM: Sensitive in CA	Possible; suitable habitat for wintering near cultivated fields
Le Conte's thrasher	*Toxostoma lecontei*	Arizona: SGCN; BLM: Sensitive in AZ; California: SSC	Likely; known to occur and suitable habitat present
Lincoln's sparrow	*Melospiza lincolnii*	Arizona: SGCN	Possible; suitable habitat present within Colorado River area and possibly along large xeroriparian washes
Loggerhead shrike	*Lanius ludovicianus*	California: SSC	Likely; known to occur and suitable habitat present
Long-eared owl	*Asio otus*	California: SSC	Unlikely; no suitable habitat present
Mountain plover	*Charadrius montanus*	Arizona: SGCN; California: SSC BLM Sensitive in CA	Possible; suitable habitat present within Colorado River area and possibly near cultivated fields
Northern harrier	*Circus cyaneus*	Arizona: SGCN; California: SSC	Likely; known to occur and suitable habitat present
Osprey	*Pandion haliaetus*	Arizona: SGCN	Possible; suitable habitat present within Colorado River area
Peregrine falcon	*Falco peregrinus anatum*	Arizona: SGCN	Unlikely; no suitable habitat present
Savannah sparrow	*Passerculus sandwichensis*	Arizona: SGCN	Unlikely; no suitable habitat present

Common Name	Scientific Name	Status[1]	Occurrence[2]
Short-eared owl	*Asio flammeus*	California: SSC	Unlikely; no suitable habitat present
Snowy egret	*Egretta thula*	Arizona: SGCN	Unlikely; no suitable habitat present
Sonora yellow warbler	*Setophaga petechia sonorana*	California: SSC	Unlikely; limited suitable habitat present
Southwestern willow flycatcher	*Empidonax traillii extimus*	ESA: E AZ: SGCN CA: E; BLM: Sensitive and Focus Species in CA and AZ	Possible; habitat along Colorado River may not be suitable for nesting; however, may be for foraging and/or during migration
Sprague's pipit	*Anthus spragueii*	Arizona: SGCN	Possible; cultivated fields with dense low vegetation suitable habitat; however, considered rare along lower Colorado River
Summer tanager	*Piranga rubra*	California: SSC	Possible; may be present along the Colorado River
Swainson's hawk	*Buteo swainsoni*	California: T; BLM: Sensitive and Focus Species in CA	Unlikely; no suitable habitat present
Thick-billed kingbird	*Tyrannus crassirostris*	Arizona: SGCN	Unlikely; no suitable habitat present
Vermilion flycatcher	*Pyrocephalus rubinus*	California: SSC	Possible; suitable habitat for wintering near cultivated fields
Western burrowing owl	*Athene cunicularia hypugaea*	Arizona: SGCN; BLM: Sensitive in AZ	Possible; suitable habitat near cultivated fields and Colorado River area
Western yellow-billed cuckoo	*Coccyzus americanus occidentalis*	ESA: T AZ: SGCN CA: E; BLM: Sensitive and Focus Species in CA and AZ	Possible; suitable migratory habitat present within Colorado River area and Project area intersects proposed critical habitat
Wood duck	*Aix sponsa*	Arizona: SGCN	Possible; suitable habitat present within Colorado River area
Yellow-breasted chat	*Icteria virens*	California: SSC	Possible; suitable habitat present
Yellow-headed blackbird	*Xanthocephalus*	California: SSC	Possible; suitable habitat present within cultivated fields and Colorado River area
Yuma Ridgway's rail	*Rallus obsoletus yumanensis*	ESA: E AZ: SGCN CA: T; BLM: Sensitive and Focus Species in CA and AZ	Possible; no proposed crossing of the Colorado River has suitable marsh habitat, but there is potential habitat in nearby backwater channels

[1]As depicted in Appendix 3 of the Draft EIS and will be updated when Final EIS is complete. Species listing includes E = Endangered and T = Threatened; NSE = Nonessential experimental population; BLM focused species as designated under the DRECP LUPA; SGCN = Species of Greatest Conservation Need; BLM = Bureau of Land Management; FP = Fully Protected; SSC = Species of Special Concern.
[2]Source: USFWS 2016b.

4.3.2 Mitigation Measures for Migratory Birds

Based on the significant concerns of federal and state agencies discussed in Section 3, the key mitigation strategies for reducing impacts to special status migratory bird species and their nests include preconstruction nest surveys in work areas, implementation of seasonal restrictions and buffers around active nests, limiting removal and clearing of vegetation, and reclamation of disturbed areas. The APMs and BMPs (and their associated CEQA and CMA requirements) applicable to minimizing potential adverse effects to migratory birds include the following:

- **APM/BMP BIO-1.** Before starting any work, including mowing, staging, installing stormwater control structures, implementing other BMPs, removing trees, construction, and restoration, all employees and contractors performing activities and new construction would receive training on environmental requirements that apply to their job duties and work. If additional crewmembers arrive later in the job, they would be required to complete the training before beginning work. Training would include a discussion of the avoidance and minimization measures being implemented and would include information on the federal and state ESAs and the consequences of not complying with these Acts. An educational brochure would be provided to construction crews working on the Project. This brochure would include color photographs of special status species as well as a discussion of avoidance and minimization measures. The worker education program would provide interpretation for non-English speaking workers. (Addresses MM BIO-CEQA-1; CMA LUPA-BIO-5)

- **APM BIO-2.** Multiple biological monitors would be provided so any work site within habitat of special status species is monitored concurrently if needed. (Addresses MM BIO-CEQA-3, VEG-CEQA-2, WIL-CEQA-5/6/7/10/11; CMA LUPA-BIO-2, LUPA-BIO-DUNE-5, LUPA-BIO-IFS-6, LUPA-BIO-IFS-7, LUPA-BIO-IFS-12, DFA-BIO-IFS-1, DFA-BIO-IFS-2, and LUPA-BIO-RIPWET-3)

- **APM BIO-4.** Establish environmentally sensitive areas in the field; install fencing, flagging or stakes around identified sensitive area easements to minimize encroachment. (Addresses MM VEG-CEQA-1/2/4, WIL-CEQA-10, and WIL-CEQA-11; CMA LUPA-BIO-3 and LUPA-BIO-13**)**

- **APM BIO-5.** Trash dumping, firearms, open fires, and pets would be prohibited at all work locations and access roads. Smoking would be prohibited along the Project alignment. (Addresses CMA LUPA-BIO-6 and LUPA-BIO-14)

- **APM BIO-6.** All food scraps, wrappers, food containers, cans, bottles, and other trash from the work area would be disposed of in closed trash containers. (Addresses CMA LUPA-BIO-6 and LUPA-BIO-14)

- **APM BIO-13.** Riparian areas and xeroriparian drainages that occur within the easement would be denoted as environmentally sensitive areas and would be avoided during construction to the extent practicable. Existing topography would be restored to pre-Project conditions to the extent possible. (Addresses MM VEGA-CEQA-1/2/3; CMA LUPA-BIO-9)

- **BMP BIO-19.** In the vicinity of the Colorado River, existing structure spacing and conductor heights would be matched to the greatest extent practical to reduce the potential for bird collisions with the power line. The transmission line would span

the Colorado River and the minimum number of structures possible would be located within the undeveloped floodplain. The term, “vicinity of the Colorado River” is defined to mean the river crossing, floodplain, and associated agricultural lands. In these areas, conductor bundles would be in a horizontal, parallel configuration, and match existing structure spacing and conductor heights to the greatest extent practical to reduce the potential for bird collisions with the power line. No guyed structures would be used at these locations. (Addresses MM WIL-CEQA-1; CMA LUPA-SW-16, LUPA-BIO-17, LUPA-BIO-RIPWET-1, LUPA-SW-13, LUPA-SW-16, and LUPA-TRANS-BIO-1)

- **APM BIO-20.** If construction is scheduled during the nesting bird season (generally February 1 through August 31), the work area would be surveyed for birds protected under the MBTA and CFGC. Active nests identified during preconstruction surveys would require protective buffers or visual barriers to ensure compliance with those regulations. If the qualified biologist determines that construction activities would cause distress to nearby nesting birds, larger buffers or construction delays may be necessary to allow the birds to successfully fledge from the nest. (Addresses MM WIL-CEQA-1/6/8; CMA LUPA-BIO-4, LUPA-BIO-17, LUPA-BIO-RIPWET-1, LUPA-BIO-RIPWET-3, LUPA-BIO-IFS-11, and DFA-BIO-IFS-1)

  APM/BMP BIO-21. Current guidelines and methodologies would be used in the design of the proposed transmission facilities to minimize the potential for raptors and other birds to collide with the transmission line during operations and be electrocuted. For example, aerial marker balls or other visibility markers can be placed at and near the crossing of the Colorado River to increase the visibility of the transmission line to birds using that movement corridor. The Avian Protection Plan (Appendix F-3 of the POD) includes requirements for monitoring the effectiveness of anti-electrocution design. (Addresses MM WIL-CEQA-1 and WIL-CEQA-8; CMA LUPA-BIO-16, LUPA-BIO-17, LUPA-BIO-COMP-2, LUPA-TRANS-BIO-2, and LUPA TRANS-BIO-3)

- **BMP BIO-28 (California only).** While primarily a tool for minimizing impacts to common ravens (*Corvus corax*), the Raven Management Plan (Appendix F-5 of the POD) contributes to protection of migratory bird nesting as common ravens are covered under the MBTA in California only. (Addresses CMA LUPA-BIO-6 and LUPA-TRANS-BIO-1)

- **BMP BIO-29.** The Bird and Bat Conservation Strategy would provide guidance on conservation measures applicable to bird and bat species present in the Project area, including a nesting bird management plan and a nest management plan. (Addresses MM WIL-CEQA-1/4/8; CMA LUPA-BIO-4, LUPA-BIO-16, LUPA-BIO-17, LUPA- BIO-RIPWET-1, LUPA-BIO-DUNE-5, LUPA-BIO-IFS-11, and DFA-BIO-IFS-2)

- **BMP BIO** 30 **(California only).** Burrowing Owl Nesting Management Plan is required for protection and management of burrowing owls (*Athene cunicularia*) within the Project area. (Addresses CMA LUPA-BIO-1, LUPA-BIO-16, LUPA-BIO-IFS-12/13/14, DFA-BIO-IFS-1, and DFA-BIO-IFS-2)

- **BMP BIO-32.** Adhere to specific seasonal restrictions of sensitive species. (Addresses CMA LUPA-BIO-4 and LUPA-BIO-DUNE-5)

- **BMP BIO-33.** All long-term nighttime lighting would be directed away from riparian and wetland vegetation, occupied habitat, and suitable habitat areas for sensitive species. Long-term nighttime lighting, if required, would be directed and shielded downward to avoid interference with the navigation of night-migrating birds and to minimize the attraction of insects as well as insectivorous birds and bats to Project infrastructure. (Address MM WIL-CEQA-1 and WIL-CEQA-4; CMA LUPA-BIO-13, LUPA-BIO-16, and LUPA-BIO-DUNE-5)

- **BMP BIO-35.** All construction materials would be visually checked for the presence of wildlife and nesting birds prior to their movement or use. Any wildlife encountered during the course of these inspections would be allowed to leave the construction area unharmed. (Addresses MM WIL-CEQA-8/9/10/11; CMA LUPA-BIO-14)

- **BMP BIO-36.** The intentional feeding or harassment of wildlife on site is prohibited. (Addresses MM WIL-CEQA-8/9/10/11; CMA LUPA-BIO-14)

- **BMP BIO-39**. When fencing is necessary, use bird and bat compatible design standards. (Addresses CMA LUPA-BIO-16 and LUPA-BIO-DUNE-5)

- **BMP BIO-45 (California only).** Provide protections from loss and harassment of active golden eagle nests. (Addresses MM WIL-CEQA-1; CMA LUPA-BIO-16, LUPA-BIO-IFS-24/25/26/27)

- **BMP BIO-47.** BLM would manage all riparian areas to be maintained at, or brought to, proper functioning condition. (CMA LUPA-BIO-17, LUPA-BIO-RIPWET-1, and LUPA-SW-13)

- **BMP BIO-48 (California only).** Flight diverters would be installed on all transmission activities spanning or within 1,000 feet of stream and wash channels, canals, ponds, and any other natural or artificial body of water. The type of flight diverter selected would be subject to approval by BLM, in coordination with USFWS and CDFW, as appropriate. (Addresses MM WIL-CEQA-1 and WIL-CEQA-8; CMA LUPA-TRANS-BIO-2)

- **BMP BIO-51.** To minimize vegetation trimming, micro-siting and design considerations (including tower height) would be applied so the catenary formed by the conductors (the bottom of the sag) avoids saguaros and is not directly over wash vegetation, to the extent practicable. (Addresses MM WIL-CEQA-1 and WIL-CEQA-8; CMA LUPA-BIO-17, LUPA-BIO-RIPWET-1, and LUPA-BIO-SVF-6)

- **BMP BIO-55 (California only).** Protection of special status species suitable habitat by avoiding construction of new roads or routes within special status species suitable habitats. (Addresses MM VEG-CEQA-1, VEG-CEQA-4, WIL-CEQA-8/9/10/11; CMA LUPA-BIO-13 and LUPA-BIO-DUNE-4)

- **BMP NO-07.** To the extent feasible, locate stationary noise sources that exceed background ambient noise levels away from known or likely locations of and BLM sensitive wildlife species and their suitable habitat. (Addresses CMA LUPA-BIO-12)

5 Seasonal Restrictions

Per BMP BIO-32, species-specific seasonal restrictions must be adhered to for pre-construction species surveys and construction activities throughout the life of the Project. The following table provides a general description of the required species and/or focus surveys, their time frames for the next two calendar years, and associated mitigation measures applicable to each survey or species.

TABLE F-2-4 SPECIES SURVEY SEASONAL RESTRICTIONS

Species/Survey Focus	Timing	Location	Project Mitigation Measure
Arizona (2019)			
Plant Salvage Assessments	Post-ROD	BLM administrated lands on Final Route	APM-BIO-11, BMP-BIO-41, Draft EIS Appendix 2b, Draft EIS Appendix 2 pg. 23, CMA-LUPA-BIO-VEG-5, APM-BIO-26
Bat hibernaculum, maternity roosts	March 1 – July 31	Suitable habitat on BLM administrated lands	CMA-LUPA-BIO-BAT-1, MM-BIO-CEQA-11, BMP-BIO-40
Rare, Threatened, & Endangered Plant Species Surveys	Blooming season (varies) Typ. February – May	BLM administrated lands on Final Route	APM-BIO-24, BMP-BIO-11, BMP-BIO-31
Noxious Weed Survey	May – August	BLM administrated lands on Final Route	APM-BIO-12, CMA-LUPA-BIO-11
Pre-construction Vegetation Plots	Post-ROD	BLM administrated lands on Final Route	Post-reclamation re-vegetation/monitoring
Gold & Bald Eagle	February 15 – August 1	Historical Nesting areas depicted in Draft EIS Figure 3.4-4 & 3.5-9	CMA-LUPA-BIO-IFS-24 through CMA-LUPA-BIO-IFS-27
General Avian Surveys	Varies; January 1 to August 31	Final Route on BLM administrated lands	APM-BIO-20
California (2019)			
Plant Salvage Assessments	Post-ROD	BLM administrated lands	APM-BIO-11, BMP-BIO-41, Draft EIS Appendix 2b, Draft EIS Appendix 2 pg. 23, CMA-LUPA-BIO-VEG-5
Bat hibernaculum, maternity roosts	March 1 – July 31	Suitable habitat on BLM administrated lands	CMA-LUPA-BIO-BAT-1, MM-BIO-CEQA-11, BMP-BIO-40
Rare Plant Alliances	Post ROD (June 2019 – November 2019)	CA Project lands outside Ag fields	BMP-BIO-52

Species/Survey Focus	Timing	Location	Project Mitigation Measure
Southwestern Willow Flycatcher	1st survey: May 15 – May 31 2nd survey: June 1 – June 21 3rd survey: June 22-June 17	Critical habitat at the Colorado River Crossing	MM-BIO-CEQA-9
Yellow-billed Cuckoo	1st: June 15 – July 2 2nd: August 1 – September 15	Critical habitat at the Colorado River Crossing	MM-BIO-CEQA-9
Arizona Bell's Vireo	April - July	Critical habitat at the Colorado River Crossing	MM-BIO-CEQA-9
Noxious Weed Survey	May – August	Final Route on BLM administrated lands	APM-BIO-12, CMA-LUPA-BIO-11
Pre-construction Vegetation Plots	Post-ROD	Final Route on BLM administrated lands	Post-reclamation re-vegetation/monitoring
Gold & Bald Eagle	February 15 – August 1	Historical Nesting areas depicted in Draft EIS Figure 3.4-4 & 3.5-9	CMA-LUPA-BIO-IFS-24 through CMA-LUPA-BIO-IFS-27
Arizona (2020)			
Sonoran Desert Tortoise Clearance Surveys	Prior to ground disturbance	All work areas of Final Route	APM-BIO-22
Burrowing Owl	February 1 – August 31 (Peak: April 15 – July 15)	All work areas of Final Route	BMP-BIO-25

6 The Mojave Desert Tortoise Protection and Compensation Plan (California)

6.1 Applicable Regulations and Management Policies

6.1.1 Federal

Endangered Species Act

The federal ESA, Section 7 (16 U.S.C. § 1531 et seq., 50 CFR Part 17.1 et seq.) provides for the designation and protection of threatened and endangered plant, as well as animal species, and habitat critical to their survival. The ESA authorizes the USFWS to review a proposed federal action to assess potential impacts to listed species. Listed species are those that have been listed in the Federal Register as threatened or endangered as defined by the ESA. The ESA prohibits the "take" of listed species. The ESA and implementing regulations define "take" to include mortality and other actions that could result in adverse impacts such as harassment, harm, or loss of critical habitat.

Desert Renewable Energy Conservation Plan and Land Use Plan Amendment

The LUPA, prepared to implement the DRECP, is applicable only to BLM administered land in California. The DRECP and LUPA provide a landscape approach to renewable energy and conservation planning in the California desert that streamlines the process for development of utility-scale renewable energy generation and transmission consistent with federal and state renewable energy targets and policies, while simultaneously providing for the long-term conservation and management of Special Status Species and vegetation types. In addition to BLM designated sensitive species, the LUPA identifies additional "Focus" species, which it defines as species whose conservation and management are provided for in the DRECP BLM LUPA.

BLM Manual 6840: Special Status Species Management

This manual provides policy and guidance for conserving species classified as Special Status species by the BLM. BLM Special Status species include species listed or proposed for listing under the federal ESA and species identified by the BLM State Director as requiring special management considerations to promote their conservation and to reduce the likelihood and need for future listing under the ESA.

6.1.2 California

California Endangered Species Act

The CESA was enacted in 1984 to parallel the federal ESA and allows the CFGC to designate species, including plants, as threatened or endangered. Under the CESA it is illegal to import, export, "take", possess, purchase, sell, or attempt to do any of those actions to species that are designated as threatened, endangered, or candidates for listing, unless permitted by CDFW. "Take" is defined as "hunt, pursue, catch, capture, or kill, or attempt to hunt, pursue, catch, capture, or kill."

There are 156 species, subspecies, and varieties of plants that are protected due to their threatened or endangered status under CESA. Under CESA, the CDFW may permit take or possession of threatened, endangered, or candidate species for scientific, educational, or management purposes, and may also permit take of these species that is incidental to otherwise lawful activities if certain conditions are met. Some of the conditions for incidental take include that the take is minimized and fully mitigated, that adequate funding is ensured for this mitigation, and that the activity will not jeopardize the continued existence of the species.

California Environmental Quality Act

Section 15380 (B) of CEQA states that a species is considered rare if "the species is likely to become endangered within the foreseeable future throughout all or a significant portion of its range and may be considered "threatened" as that term is used in the Federal Endangered Species Act." In addition, any species of concern should be included in project-impacts analysis (California Public Resources Code § 15380). The CPUC is responsible for determining if the Project will be constructed in accordance with CEQA requirements and issue to DCRT a Certificate of Public Convenience and Necessity for transmission infrastructure within California.

6.2 Purpose and Objectives of this Plan

As the lead federal agency, the BLM released the Draft EIS on August 31, 2018, including an appendix providing CEQA documentation, and is currently developing the Final EIS. APMs, BLM-Required BMPs, and CEQA MMs contained within the EIS require DCRT to prepare and implement a Mojave Desert Tortoise Protection and Compensation Plan for work activity in the California portions of the Project. The APMs, BMPs, and MMs are detailed in Section 6.3.

The Project is required to comply with CMAs from the DRECP-LUPA for all Project activities on BLM land in California. Due to known occurrences of Mojave desert tortoise and potentially suitable habitat on BLM land within several of the alternative segments in the California portion of the Project, the LUPA-BIO-IFS-3 through LUPA-BIO-IFS-9 CMA would apply to the portion of the Project located in California. These CMAs are detailed in Section 6.3.

The purpose of the CMAs is to protect the existing population of Mojave desert tortoises at such a level that they are a sustainable and healthy population. Take will be minimized through implementation of the CMAs. For the purposes of implementing this Plan for Mojave desert tortoise, “take” is defined as to harass, harm pursue, hunt shoot, wound, kill, trap, capture, collect, or attempt to engage in any such conduct.

APMs and BMPs contained in Appendix 2A of the Draft EIS and summarized below in Section 6.3 of this Plan, would also apply and reduce the impacts of the Project on Mojave desert tortoise.

6.3 Avoidance and Minimization Measures

All avoidance and minimization measures applicable to this Plan and protection of the Mojave desert tortoise are as follows:

MM WIL-CEQA-10 (California): Compensation for Impacts to Mojave Desert Tortoise. To fully mitigate for habitat loss and potential take of Mojave desert tortoise, DCRT and/or their Construction Contractor(s) will provide compensatory mitigation at a minimum ratio of 2:1. For the purposes of this measure, the Project site (i.e., footprint) means all lands directly disturbed in the construction and operation of the Project, including all linear features, as well as undeveloped areas inside the Project’s boundaries that will no longer provide viable long- term habitat for the Mojave desert tortoise. To satisfy this measure, DCRT or their Construction Contractor(s) will acquire, protect and transfer two acres of Mojave desert tortoise habitat for every acre of habitat within the final Project footprint, and provide associated funding for the acquired lands, as specified below. DCRT shall coordinate with CPUC, BLM, and CDFW to determine the appropriate mitigation strategy and final replacement ratios and acreages. All mitigation shall be approved by the appropriate federal and state regulatory agencies prior to Project activities. See Section 6.8 for details.

MM WIL-CEQA-11 (California): Conduct Pre-Construction Surveys for Listed and Special Status Terrestrial Herpetofauna and Compensate Impacts. Prior to ground disturbance or vegetation clearing within the Project site, DCRT and/or their Construction Contractor(s) shall retain an approved/qualified biologist to conduct surveys for special-status terrestrial herpetofauna (e.g., lizards, snakes, tortoise) where suitable habitat is present and directly impacted by construction vehicle access, or maintenance. Focused

surveys shall consist of a minimum of three daytime surveys and one nighttime survey within one week of vegetation clearing. The qualified biologist shall be present during all activities immediately adjacent to or within habitat that supports special-status terrestrial herpetofauna. Clearance surveys for special-status terrestrial herpetofauna shall be conducted by the qualified biologist prior to the initiation of construction each day in suitable habitat. Special-status terrestrial herpetofauna found within the area of disturbance or potentially affected by the Project shall be relocated to the nearest suitable habitat that shall not be affected by the Project. See Sections 6.5 and 6.6 for details.

APM BIO-2: A qualified biological monitor would be present on the Project site during all work activities within habitat of special-status animal species. The qualified biologist would conduct a preconstruction survey of those areas immediately before work activities begin and would locate and fence off any present individuals of special status plant species.

BMP BIO-2: Multiple biological monitors would be provided so any work site within habitat of special status species is monitored concurrently if needed.

APM BIO-4: When appropriate, environmentally sensitive areas, such as the riparian areas, xeroriparian washes, and other habitat of special status species, would be identified in the field. Barrier fences or stakes would be installed at the edge of the easement or around the sensitive area to minimize the possibility of inadvertently encroaching into sensitive habitat.

APM BIO-17: Vehicular travel would be limited to established roads to the maximum extent.

APM BIO-23: Mojave Desert Protection (California). A qualified biologist would be present during all ground-disturbing and other construction activities in non-cultivated areas in California, in order to survey areas before they are disturbed, monitor construction sites for the presence of desert tortoises, and move tortoises from harm's way in accordance with USFWS protocols. Burrows near construction sites would be clearly delineated. Road, footing, and work area alignments would be modified to the extent possible to avoid adversely affecting any tortoise burrows. Where burrows would be unavoidably destroyed, they would be excavated carefully using hand tools under the supervision of a field biologist with demonstrated prior experience with this species. Other measures, as required by the USFWS in any applicable Biological Opinion, would also be implemented.

BMP BIO-23: Mojave Desert Tortoise Protection (California). A designated biologist would inspect construction pipes, culverts, or similar structures: (a) with a diameter greater than three inches, (b) stored for one or more nights, (c) less than eight inches aboveground and (d) within desert tortoise habitat (such as, outside the long-term fenced area), before the materials are moved, buried, or capped. As an alternative, such materials shall be capped before storing outside the fenced area or placing on pipe racks. Pipes stored within the long-term fenced area after completing desert tortoise clearance surveys would not require inspection.

BMP BIO-25: Sensitive Animal Surveys. A survey would be conducted of the selected route prior to construction of all work areas to identify special status animal species, including Mojave desert tortoises, burrowing owls, and Mojave fringe-toed lizards. Where possible, and as required by the BLM, special status species and vegetation alliances would be avoided during construction.

BMP BIO-32: Species-specific seasonal restriction dates per AZGFD, CDFW, and in applicable resource management plans would be observed.

BMP BIO-36: The intentional feeding or harassment of wildlife on site is prohibited.

BMP BIO-44: Mojave Desert Tortoise Protection (California).

- All culverts for access roads or other barriers would be designed to allow unrestricted access by desert tortoises and would be large enough that desert tortoises are unlikely to use them as shelter sites (e.g., 36 inches in diameter or larger). Desert tortoise exclusion fencing may be utilized to direct tortoise use of culverts and other passages.
- Biological monitoring would occur with any geotechnical boring or geotechnical boring vehicle movement to ensure no desert tortoises are killed or burrows are crushed.
- A designated biologist would accompany any geotechnical testing equipment to ensure no tortoises are killed and no burrows are crushed.
- The ground would be inspected under vehicles for the presence of desert tortoise any time a vehicle or construction equipment is parked in desert tortoise habitat. If a desert tortoise is seen, it may move on its own. If it does not move within 15 minutes, a designated biologist may remove and relocate the animal to a safe location.
- Vehicular traffic would not exceed 15 miles per hour within the areas not cleared by protocol level surveys where desert tortoise may be impacted.

BMP BIO-55 (California): Construction of new roads and/or routes would be avoided to the extent practicable within Focus and BLM special status species suitable habitat within identified linkages for those Focus and BLM special status species, unless the new road and/or route is beneficial to minimize net impacts to natural or ecological resources of concern. These areas would have a goal of “no net gain” of project roads and/or routes.

CMA LUPA-BIO-1 (California): Conduct a habitat assessment of Focus and BLM special status species’ suitable habitat for all activities and identify and/or delineate the DRECP vegetation types, rare alliances, and special features (e.g., Aeolian sand transport resources, Joshua tree, microphyll woodlands, carbon sequestration characteristics, seeps, climate refugia) present using the most current information, data sources, and tools (e.g., DRECP land cover mapping, aerial photos, DRECP species models, and reconnaissance site visits) to identify suitable habitat for Focus and BLM special status species. If required by the relevant species-specific CMAs, conduct any subsequent protocol or adequate presence/ absence surveys to identify species occupancy status and a more detailed mapping of suitable habitat to inform siting and design considerations. If required by relevant species-specific CMAs, conduct analysis of percentage of impacts to suitable habitat and modeled suitable habitat.

BLM will not require protocol surveys in sites determined by the designated biologist to be unviable for occupancy of the species, or if baseline studies inferred absence during the current or previous active season. Utilize the most recent and applicable assessment protocols and guidance documents for vegetation types and jurisdictional waters and wetlands that have been approved by BLM, and the appropriate responsible regulatory agencies, as applicable.

CMA LUPA-BIO-2 (California): Designated biologist(s) will conduct, and oversee where appropriate, activity-specific required biological monitoring during pre-construction, construction, and decommissioning to ensure that avoidance and minimization measures

are appropriately implemented and are effective. The appropriate required monitoring will be determined during the environmental analysis and BLM approval process. The designated biologist(s) will submit monitoring reports directly to BLM.

CMA LUPA-BIO-3 (California): Resource setbacks have been identified to avoid and minimize the adverse effects to specific biological resources. Setbacks are not considered additive and are measured as specified in the applicable CMA. Allowable minor incursions as per specific CMAs do not affect the following setback measurement descriptions. Generally, setbacks (which range in distances for different biological resources) for the appropriate resources are measured from the edge of each of the DRECP desert vegetation types, including but not limited to those in the riparian or wetland vegetation groups (as defined by alliances within the vegetation type descriptions and mapped based on the vegetation type habitat assessments described in LUPA-BIO-1). In addition, it will also be measured from the edge of suitable habitat or active nest substrates for the appropriate Focus and BLM special status species.

CMA LUPA-BIO-4 (California): For activities that may impact Focus and BLM Special Status Species, implement all required species-specific seasonal restrictions on pre-construction, construction, operations, and decommissioning activities. Species-specific seasonal restriction dates are described in the applicable CMAs. Alternatively, to avoid a seasonal restriction associated with visual disturbance, installation of a visual barrier may be evaluated on a case-by-case basis that will result in the breeding, nesting, lambing, fawning, or roosting species not being affected by visual disturbance from construction activities subject to seasonal restriction. The proposed installation and use of a visual barrier to avoid a species seasonal restriction will be analyzed in the activity/project specific environmental analysis.

CMA LUPA-BIO-6 (California): Subsidized predator standards (e.g., common ravens [*Corvus corax*] that prey on Mojave desert tortoise), approved by BLM, in coordination with the USFWS and CDFW, will be implemented during all appropriate phases of activities, including but not limited to renewable energy activities, to manage predator food subsidies, water subsidies, and breeding sites including the following:

- The application of water and/or other palliatives for dust abatement in construction areas and during project operations and maintenance will be done with the minimum amount of water necessary to meet safety and air quality standards and in a manner that prevents the formation of puddles, which could attract wildlife and wildlife predators.

- All activity work areas will be kept free of trash and debris. Particular attention will be paid to “micro-trash” (including such small items as screws, nuts, washers, nails, coins, rags, small electrical components, small pieces of plastic, glass or wire, and any debris or trash that is colorful or shiny) and organic waste that may subsidize predators. All trash will be covered, kept in closed containers, or otherwise removed from the project site at the end of each day or at regular intervals prior to periods when workers are not present at the site.

CMA LUPA-BIO-12 (California): For activities that may impact Focus or BLM Special Status Species, implement the following LUPA CMA for noise: To the extent feasible, and determined necessary by BLM to protect Focus and BLM sensitive wildlife species, locate stationary noise sources that exceed background ambient noise levels away from known or likely locations of and BLM sensitive wildlife species and their suitable habitat.

- Implement engineering controls on stationary equipment, buildings, and work areas including sound-insulation and noise enclosures to reduce the average noise level, if the activity will contribute to noise levels above existing background ambient levels.

- Use noise controls on standard construction equipment including mufflers to reduce noise.

CMA LUPA-BIO-13 (California): Project siting and design will implement the following:

- To the maximum extent practicable site and design projects to avoid impacts to vegetation types, unique plant assemblages, climate refugia as well as occupied habitat and suitable habitat for Focus and BLM special status species.

- The siting of projects along the edges (i.e., general linkage border) of the biological linkages identified in Appendix D of the Draft EIS will be informed by existing available information on modeled focus and BLM special status species habitat and element occurrence data, mapped delineations of vegetation types, and based on available empirical data, including radio telemetry, wildlife tracking sign, and road-kill information.

- Additionally, projects will be sited and designed to maintain the function of Focus and BLM special status species connectivity and their associated habitats in the following linkage and connectivity areas.

- Delineate the boundaries of areas to be disturbed using temporary construction fencing and flagging prior to construction and confine disturbances, Project vehicles, and equipment to the delineated project areas to protect vegetation types and focus and BLM special status species.

- To the maximum extent practicable, restrict construction activity to existing roads, routes, and utility corridors to minimize the number and length/size of new roads, routes, disturbance, laydown, and borrow areas.

- To the maximum extent practicable, confine vehicular traffic to designated open routes of travel to and from the project site, and prohibit, within project boundaries, cross-country vehicle and equipment use outside of approved designated work areas to prevent unnecessary ground and vegetation disturbance.

- To the maximum extent practicable, construction of new roads and/or routes will be avoided within Focus and BLM special status species suitable habitat within identified linkages for those Focus and BLM special status species, unless the new road and/or route is beneficial to minimize net impacts to natural or ecological resources of concern. These areas will have a goal of “no net gain” of project roads and/or routes.

- Use of nontoxic road sealants and soil stabilizing agents.

CMA LUPA-BIO-14 (California): General practices to implement to protect Focus and BLM special status species:

- Feeding of wildlife, leaving of food or trash as an attractive nuisance to wildlife, collection of native plants, or harassing of wildlife on a site is prohibited.

- Any wildlife encountered during the course of an activity, including construction, operation, and decommissioning will be allowed to leave the area unharmed.

- Domestic pets are prohibited on sites. This prohibition does not apply to the use of domestic animals (e.g., dogs) that may be used to aid in official and approved monitoring procedures/protocols, or service animals (dogs).

- All construction materials will be visually checked for the presence of wildlife prior to their movement or use. Any wildlife encountered during the course of these inspections will be allowed to leave the construction area unharmed.

- All steep-walled trenches or excavations used during the project will be covered, except when being actively used, to prevent entrapment of wildlife. If trenches cannot be covered, they will be constructed with escape ramps, following up-to-date design standards to facilitate and allow wildlife to exit, or wildlife exclusion fencing will be installed around the trench(s) or excavation(s). Open trenches or other excavations will be inspected by a designated biologist immediately before backfilling, excavation, or other earthwork.

- Minimize natural vegetation removal through implementation of crush and drive or cut or mow vegetation rather than removing entirely.

CMA LUPA-BIO-IFS-3 (California): All culverts for access roads or other barriers will be designed to allow unrestricted access by desert tortoises and will be large enough that desert tortoises are unlikely to use them as shelter sites (e.g., 36 inches in diameter or larger). Desert tortoise exclusion fencing may be utilized to direct tortoise use of culverts and other passages.

CMA LUPA-BIO-IFS-5 (California): Following the clearance surveys within sites that are fenced with long-term desert tortoise exclusion fencing a designated biologist will monitor initial clearing and grading activities to ensure that desert tortoises missed during the initial clearance survey are moved from harm's way.

- A designated biologist will inspect construction pipes, culverts, or similar structures: (a) with a diameter greater than three inches, (b) stored for one or more nights, (c) less than eight inches aboveground and (d) within desert tortoise habitat (such as, outside the long-term fenced area), before the materials are moved, buried, or capped.

- As an alternative, such materials shall be capped before storing outside the fenced area or placing on pipe racks. Pipes stored within the long-term fenced area after completing desert tortoise clearance surveys will not require inspection.

CMA LUPA-BIO-IFS-6 (California): When working in areas where protocol or clearance surveys are required (Appendix D of the DRECP), biological monitoring will occur with any geotechnical boring or geotechnical boring vehicle movement to ensure no desert tortoises are killed or burrows are crushed.

CMA LUPA-BIO-IFS-7 (California): A designated biologist will accompany any geotechnical testing equipment to ensure no tortoises are killed and no burrows are crushed.

CMA LUPA-BIO-IFS-8 (California): Inspect the ground under the vehicle for the presence of desert tortoise any time a vehicle or construction equipment is parked in desert tortoise habitat outside of areas fenced with desert tortoise exclusion fencing. If a desert tortoise is seen, it may move on its own. If it does not move within 15 minutes, a designated biologist may remove and relocate the animal to a safe location.

CMA LUPA-BIO-IFS-9 (California): Vehicular traffic will not exceed 15 miles per hour within the areas not cleared by protocol level surveys where desert tortoise may be impacted.

CMA DFA-BIO-IFS-1 (California): Conduct the following surveys as applicable in the DFAs.

CMA DFA-VPL-BIO-IFS-1 (California): To the maximum extent practicable, activities will be sited in previously disturbed areas, areas of low-quality habitat, and areas with low habitat intactness in desert tortoise linkages.

6.4 Species Habitat and Occurrence Within the Project Area

The Mojave desert tortoise is known to be present on the Palo Verde Mesa around the Colorado River substation west of the agricultural areas. Though the sandiest areas are typically not well suited to support Mojave desert tortoise burrows, evidence of Mojave desert tortoises representing a low-density population have been found in the vicinity of the Colorado River Substation and elsewhere on the mesa. Tortoise habitat conditions tend to improve closer to the Mule Mountains, which are located approximately two miles south of the Colorado River Substation.

6.5 Preconstruction Surveys

Per MM WIL-CEQA-11, CMA LUPA-BIO-1, DFA-BIO-IFS-1, and BMP BIO-25, prior to conducting any ground-disturbing activities where suitable Mojave desert tortoise habitat is present, pre-construction surveys for Mojave desert tortoise will be conducted by an approved/qualified biologist. Focused surveys shall be conducted during the period when they are most active (i.e., March through May or September through mid-November). During the pre-construction clearance survey, the qualified biologist shall inspect construction pipes, culverts or similar structures with (a) a diameter greater than three inches, (b) stored for one or more nights, (c) less than eight inches aboveground, and (d) within Mojave desert tortoise habitat, before the materials are moved, buried, or capped. As an alternative, such materials shall be capped before storing outside the fenced area or placing on pipe racks, pipes stored within the long-term fenced area after completing desert tortoise clearance surveys would not require inspections.

During surveys, burrows near construction sites will be clearly delineated. Road, footing, and work area alignments would be modified to the extent possible to avoid adversely affecting any tortoise burrows. Where burrows would be unavoidably destroyed, each burrow would be excavated carefully by Qualified/Designated Biologist(s) with demonstrated prior experience using hand tools and scopes to ensure any tortoises present will be identified and safely removed (APM BIO-23).

Per CMA LUPA-BIO-IFS-5 and if appropriate following initial clearance surveys, the Designated Biologist(s) will monitor initial clearing and grading activities during installation of tortoise fencing for long-term exclusion of desert tortoises to ensure any undiscovered

desert tortoises are moved from harm's way. Surveys for Mojave desert tortoise shall be conducted using techniques outlined in the *Desert Tortoise (Mojave Population) Field Manual (Gopherus agassizii*) (USFWS 2009).

6.6 Construction Phase Avoidance and Minimization

Per MM WIL-CEQA-11, if Mojave desert tortoise habitat is present within the Project site and/or adjacent areas, at a minimum, the following avoidance and minimization measures shall be employed to reduce potential species impacts:

- Mojave desert tortoise habitat and burrows, if present shall be mapped using the BLM National Operations Center habitat mapping standards.
- If potential habitat is identified in or adjacent to the Project site, then a qualified biological monitor shall be on-site during all Project activities, as necessary. The qualified biological monitor shall directly monitor site clearing and shall be onsite during grading activities to find and move Mojave desert tortoises missed during the initial pre-construction tortoise clearance survey. Should a tortoise be discovered, it shall be relocated or translocated as described in this Plan.
- ESA signage and exclusion fencing shall be installed at the appropriate buffer distance i.e., resource setback), if suitable habitat is within or encroaches into the Project site.
- During Project activities, including on specific linear features (e.g., fencing, transmission lines, and access roads) and during operation and maintenance, all live Mojave desert tortoises and active burrows shall be avoided to the extent possible. DCRT and/or their Construction Contractor(s) shall ensure that the qualified biologist and biological monitor monitors any Project activities in unfenced areas for presence of Mojave desert tortoises. If an active burrow cannot be avoided by construction activities, the burrow shall be excavated using protocols in *Desert Tortoise (Mojave Population) Field Manual (Gopherus agassizii)* (USFWS 2009). If a tortoise wanders into an unfenced, active Project work area, does not leave the area on its own accord (i.e., within 15 minutes), and cannot be avoided by Project activities, DCRT and/or their Construction Contractor(s) shall ensure that that the qualified biologist captures the Mojave desert tortoise, implements a health assessment of the tortoise, relocates it to previously identified appropriate Project-adjacent habitat away from any active, unfenced Project work areas, and monitor the individual via telemetry, in accordance with the aforementioned Protocol. The qualified biologist and biological monitor shall have a copy of all measures, federal and state permits, when monitoring Project activities. The qualified biologist and biological monitor shall have the authority to halt all non-emergency activities that are in violation of the measures. Work shall proceed only after hazards to Mojave desert tortoise are removed, the species is no longer at risk, or the individual has been moved from harm's way by the qualified biologist. A Mojave Desert Tortoise Quarterly Compliance Report will be submitted quarterly to the appropriate federal and state regulatory agencies.
- Vehicular traffic would not exceed 15 miles per hour within the areas not cleared by protocol-level surveys where desert tortoise may be impacted (also stated in BMP BIO-44 and CMA LUPA-BIO-IFS-9).
- **Fencing:** DCRT and/or their Construction Contractor(s) shall ensure that temporary and/or permanent tortoise exclusionary fencing is installed around active portions of the Project area following the pre-construction tortoise survey. The exclusionary

fencing, whether temporary or permanent in nature, and shall be installed according to specifications in the *Desert Tortoise (Mojave Population) Field Manual (Gopherus agassizii)* (USFWS 2009). Specifications requires fencing to be buried 12 inches below the ground surface and extend to 22 to 24 inches above the ground surface. If a phased approach is implemented during the construction phase, the exclusionary fencing may be installed in phases, with pre-construction surveys conducted prior-to and clearance surveys conducted immediately after installation of the exclusionary fence. DCRT and/or their Construction Contractor(s) shall also ensure that tortoise exclusionary fencing is maintained during the decommissioning phase to keep tortoises from accessing active work areas. Throughout the construction and decommissioning phases, the tortoise exclusionary fence shall be checked regularly to ensure its integrity.

- Security Gates - For security fencing, DCRT and/or their Construction Contractor(s) shall ensure that the Project's perimeter security fence includes exclusionary fencing that prevents Mojave desert tortoises, and other burrowing animals, from accessing the Project site. The exclusionary fencing shall be installed at the base of the security in accordance with the protocols listed above, and cattle guards shall be installed at entrances to the Project. Specifically, security gates shall be designed with minimal ground clearance to deter ingress by tortoises. Tortoise guards shall be installed at gate locations.
- Fence Flagging - All fencing installation corridors shall be flagged to assist the qualified biologist in studying the fence route and surveying within 24 hours prior to the initiation of fence construction. Prior to the surveys DCRT and/or their Construction Contractor(s) shall provide all appropriate federal and state regulatory agencies map figures clearly depicting the limits of construction disturbance for the proposed fence installation.
- Fence Installation - The exclusion fencing shall be installed prior to the onset of site clearing and grubbing. The fence installation shall be supervised by the qualified biologist and monitored to ensure the safety of any tortoise present.
- Fence Inspections - Following installation of the Mojave desert tortoise exclusion fencing, the fencing shall be regularly inspected during construction, operations, and decommissioning. If Mojave desert tortoise were moved out of harm's way during fence construction, fencing shall be inspected daily for the first seven days to ensure a recently moved tortoise has not been trapped within the fence. Thereafter, fencing shall be inspected quarterly and during and within 24 hours following major rainfall events. A major rainfall event is defined as one for which flow is detectable within the fenced drainage. Any damage to the fencing shall be temporarily repaired immediately to keep Mojave desert tortoises out of the site, and permanently repaired within 48 hours of observing damage. Inspections of site fencing shall occur for the life of the Project.
- Temporary fencing shall be inspected weekly and, where drainages intersect the fencing, during and within 24 hours following major rainfall events. All temporary fencing shall be repaired immediately upon discovery and, if the fence may have permitted Mojave desert tortoise entry while damaged, the qualified biologist shall inspect the area for Mojave desert tortoise.

- Tortoise Encounters - If a tortoise is encountered along the inside or outside of the fence, the qualified biologist shall capture and relocate in accordance with the protocols listed above (i.e., USFWS 2009, Chapter 7), perform a health assessment, attach a radio transmitter to the tortoise in accordance, and release the Mojave desert tortoise in a previously identified Project-adjacent relocation areas supporting Mojave desert tortoise habitat in accordance with USFWS and all other appropriate federal and state regulatory agencies.
- Fence Removal - Temporary exclusionary fencing shall be removed following completion of the construction and decommissioning phases.

Other avoidance and minimization for the Mojave desert tortoise include:

- All construction pipes, culverts, and similar structures: (a) with a diameter greater than three inches, (b) stored for one or more nights, (c) less than eight inches aboveground and (d) within desert tortoise habitat (such as, outside the long-term fenced area), will be inspected by a Designated Biologist before the materials are moved, buried, or capped. As an alternative, such materials shall be capped before storing outside the fenced area or placing on pipe racks. Pipes stored within the long-term fenced area after completing desert tortoise clearance surveys would not require inspection When appropriate (e.g., near habitat where tortoises are known to occur) construction material will be visually checked for the presence of desert tortoises prior to movement or use. If tortoises are encountered during inspection, they will be allowed to leave the construction area unharmed (BMP BIO-23, CMA LUPA-BIO-14, LUPA-BIO-IFS-3, and LUPA-BIO-IFS-5).

- Vehicles would be limited to established roads to the maximum extent possible (APM BIO-17 and CMA LUPA-BIO-13).

- Vehicles and construction equipment parked or have not moved within 15 minutes must be inspected by a Designated Biologist to ensure there is no presence of desert tortoises on the ground under the vehicle, near the vehicle, or around tires and buckets touching the ground. Desert tortoises present will be allowed to leave the area unharmed; only with prior approval, a Designated Biologist may remove/relocate the animal to a safe location (BMP BIO-44 and CMA LUPA-BIO-IFS-8).

- When feasible, construction of new roads, sites, and/or routes will be avoided within Focus and BLM special status species suitable habitat, unless the new road or route is beneficial to minimize net impacts to protected biological resources (BMP BIO-55 and CMA LUPA-BIO-13).

- When possible, construction activities will be sites in previously disturbed areas, areas of low-quality habitat, or areas with low habitat intactness to desert tortoise linkages (CMA DFA-VPL-BIO-IFS-1).

- All culverts for access roads or other barriers would be designed to allow unrestricted access by desert tortoises and would be large enough that desert tortoises are unlikely to use them as shelter sites (BMP BIO-44).

- Seasonal restrictions for the Mojave desert tortoise must be adhered to for pre-construction, construction, operations, and decommissioning activities on the Project (CMA LUPA-BIO-4 and BMP BIO-32).

- Water used for dust abatement during Project activities will be done with the minimum amount of water necessary to meet safety and air quality standards and in a manner that prevents the formation of puddles, minimize the potential to attract desert tortoises and predators (e.g., common ravens) that would prey on desert tortoises (CMA LUPA-BIO-6).

- Domestic pets are prohibited on sites to avoid harassment, injury, or mortality to desert tortoises (CMA LUPA-BIO-14).

- All Project personnel will not feed or harass desert tortoises (BIO BIO-36 and CMA LUPA-BIO-14).

- All steep-walled trenches or excavation used during Project activities will be covered, except when being actively used, to prevent entrapment of desert tortoises. If covering is not an option, openings will be constructed with escape ramps, following up-to-date design standards to allow wildlife to safely exit; or wildlife exclusion fencing will be installed around the open trench or excavation. Openings with no cover must be inspected prior to use each day (CMA LUPA-BIO-14 and LUPA-BIO-IFS-3).

6.7 Construction Monitoring

Per MM BIO-CEQA-2, APM/BMP BIO-2, and CMA LUPA-BIO-2, no more than 30 days prior to the start of site mobilization or ground disturbing activities, DCRT and/or their Construction Contractor(s) will retain Qualified and/or Designated Biologists to monitor construction of the Project. Qualified and/or Designated Biologists will be approved by the CPUC and BLM prior to conducting construction monitoring. The biologists must be knowledgeable with the life history and habitat requirements of the federal threatened Mojave desert tortoise. Qualified/Designated Biologists will conduct clearance surveys for listed and special status species prior to the start of construction activities each work day during initial site disturbance; clearance surveys can be conducted on a weekly basis thereafter. Qualified Biologists handling desert tortoise must be USFWS-approved Designated Biologists and comply with the Biological Opinion assumed to be issued for the Project. Designated Biologist(s) typically are the lead Qualified Biologist(s) onsite responsible for coordinating daily on-site biological monitoring as well as data entry and agency-required reporting.

During initial site disturbance and for the duration of construction, the Qualified/Designated Biologists will be on-site at all times when activities will occur immediately adjacent to or within habitat that supports populations of listed and/or special status species. Per CMA LUPA-BIO-14, desert tortoises encountered during the course of an activity including constructions, operation, and decommissioning will be allowed to leave the area unharmed while the Qualified Biologist observes nearby. If necessary, the Qualified/Designated Biologists will relocate any terrestrial special status species that would be impacted by the Project; permits and/or Memorandum of Understanding may be required for some species.

In addition, burrows detected during initial ground-disturbing activities must be clearly delineated. Road, footing, and work area alignments would be modified to the extent possible to avoid adversely affecting any tortoise burrows. As discussed in Section 6.5, burrows that must be unavoidably destroyed, are excavated carefully by Qualified/ Designated Biologists using hand tools and continually assessed for tortoises until entire burrow has been completely excavated (APM BIO-23).

Pre-construction activities including geotechnical testing equipment or soil boring must have Qualified/Designated Biologists monitoring all movement and activity to ensure no desert tortoises are injured or burrows are crushed (BMP BIO-44, CMA LUPA-BIO-IFS-6, and LUPA-BIO-IFS-7).

If, during construction, the Qualified Biologist observes a dead or injured special status wildlife species on the construction site, a written report will be sent to the CPUC, CDFW, and/or USFWS (as appropriate) within five calendar days. The report will include the date/time of the finding or incident (if known), and location of the carcass or injured animal and circumstances of its death or injury (if known). Injured animals will be taken immediately to the nearest appropriate veterinary or wildlife rehabilitation facility. The Qualified/ Designated Biologist will, immediately upon finding the remains or injured animal, coordinate with the onsite construction foreman to discuss the events that caused the mortality or injury, if known, and implement measures to prevent future incidents. Details of these measures will be included with the report. Species remains will be collected and frozen as soon as possible and CDFW and USFWS, as appropriate, will be contacted regarding ultimate disposal of the remains (CPUC 2016).

All tortoises will be handled by Qualified Biologists in accordance with the *Desert Tortoise (Mojave Population) Field Manual (Gopherus agassizii)* (USFWS 2009) and only to move animals out of immediate harm's way. No translocations are anticipated for this effort.

6.8 Compensation

In conformance with CMA LUPA-BIO-COMP-1 and MM-WIL-CEQA-1010, a Compensation Plan will be prepared. The Compensation Plan will include calculations of compensation ratios and mitigation acreages for loss of habitat for any biological resources requiring additional mitigation. If take of Mojave desert tortoise potential or modeled habitat during construction is unavoidable the Compensation Plan would outline compensation requirements based on the estimated number of acres taken. Compensation for temporary impacts to desert tortoise potential/modeled habitat will include on-site habitat restoration at a minimum 1:1 ratio. Compensation for permanent impacts to desert tortoise potential/modeled habitat will include a) off-site creation, enhancement and/or preservation and/or b) participation in an established mitigation bank program at a minimum 2:1 ratio (MM WIL-CEQA-10).

For the purposes of this MM WIL-CEQA-10, the Project site (i.e., footprint) means all lands directly disturbed in the construction and operation of the Project, including all linear features, as well as undeveloped areas inside the Project's boundaries that will no longer provide viable long- term habitat for the Mojave desert tortoise. To satisfy this measure, DCRT or their Construction Contractor(s) will acquire, protect and transfer two acres of Mojave desert tortoise habitat for every acre of habitat within the final Project footprint, and provide associated funding for the acquired lands, as specified below. DCRT shall coordinate with CPUC, BLM, and CDFW to determine the appropriate mitigation strategy and final replacement ratios and acreages. All mitigation shall be approved by the appropriate federal and state regulatory agencies prior to Project activities.

Another option can satisfy some or all of the requirements in this measure, in lieu of acquiring lands itself, by depositing funds into an account established with the National Fish and Wildlife Foundation. Land will be acquired, in fee or in easement, within 12 months from the time the resource impact occurs, unless a six-month extension is approved by BLM. If compensation lands are acquired in fee title or in easement, the requirements for

acquisition, initial improvement and long-term management of compensation lands include all of the following:

- Be within the appropriate habitat unit or, if sufficient land is unavailable, in other locations within approved by the appropriate federal and state regulatory agencies.
- Provide habitat for Mojave desert tortoise with capacity to regenerate naturally when disturbances are removed.
- Be prioritized near larger blocks of lands that are either already protected or planned for protection, or which could feasibly be protected long-term by a public resource agency or a non-governmental organization dedicated to habitat preservation.
- Be connected to lands with Mojave desert tortoise habitat equal to or better quality than the Project site, ideally with populations that are stable, recovering, or likely to recover.
- Not have a history of intensive recreational use or other disturbance that does not have the capacity to regenerate naturally when disturbances are removed or might make habitat recovery and restoration infeasible.
- Not be characterized by high densities of invasive species, either on or immediately adjacent to the parcels under consideration, that might jeopardize habitat recovery and restoration.
- Not contain hazardous wastes that cannot be removed to the extent that the site could not provide suitable habitat.
- Have water and mineral rights included as part of the acquisition, unless consultation with the appropriate federal and state agencies occurs and there is an agreement in writing to the acceptability of land.

Further information on compensation due to impacts can be found in the Compensatory Mitigation Plan, Appendix B-3 of the Project POD.

1 Introduction

The data and information provided within this Raven Management Plan (RMP) is for the Ten West Link Transmission Project (Project) proposed by Delaney Colorado River Transmission, LLC (DCRT). The purpose of this RMP is to address potential direct impacts, due to construction, operation, and maintenance of the Project, to the federally and state protected desert tortoise (*Gopherus* spp.) by eliminating and minimizing known attractants that can be exploited by the desert tortoise's primary predator, the common raven (*Corvus corax*). This Project-specific RMP describes the raven management strategy and reporting procedures for the California portion of the Project.

1.1 Project Description and Location

As shown in Figure F-5-1 – Ten West Link Project Overview, the Project is approximately 125.0 miles of 200-foot-wide right-of-way. Of the total length, approximately 81.2 miles cross lands managed by federal agencies including the Bureau of Land Management (BLM), Bureau of Reclamation, and Department of Defense. The Project would be located approximately 103.4 miles within Maricopa and La Paz Counties in Arizona, and 21.6 miles within Riverside County, California. Portions of the Project would be located within designated Section 368 West-Wide Energy Corridors or BLM RMP-designated utility corridors. Portions of the Project parallel Southern California Edison's existing Devers to Palo Verde transmission line and similar linear features.

The Project's overhead transmission line would extend between Arizona Public Service Company's Delaney Substation near Tonopah, Arizona and Southern California Edison Company's Colorado River Substation, located west of Blythe, California. The Project would also include the construction of a Series Compensation Station located approximately in the middle of the Project route and would be connected to Arizona Public Service's 12 kilovolt network through a new 12 kilovolt distribution line. For further design and details, refer to the Project's Draft Environmental Impact Statement (EIS) Section 1.2 (BLM 2018). Once completed, updates or new requirements within the Final EIS will be updated in the final Plan of Decision management plans.

1.2 Relevant Laws, Regulations, and Management Policies

The federal and state regulations applicable to the RMP are summarized in this section. These regulations, along with the Project-specific requirements, provide the regulatory framework that the Project must wholly comprehend and comply with.

1.2.1 Federal Laws and Regulations

1.2.1.1 Federal Endangered Species Act

Administered by the United States Fish and Wildlife Service (USFWS), the Endangered Species Act (ESA) of 1973, as revised, was established to protect species at risk of becoming extinct (16 United States Code [U.S.C.] § 1531). The ESA includes multiple layers of protection where endangered species are the most in danger of becoming extinct, threatened species are at risk of becoming endangered, and candidate species are those that are being considered for listing as threatened or endangered.

Under Section 9 of the ESA, a “take” is defined as to harass, harm, pursue, hunt, shoot, kill, trap, capture, or collect, or to attempt to engage in any such conduct. This RMP implements actions to minimize the potential for desert tortoise “take” as a result of Project activities, which may potentially attract raven presence and thereby increase the risk of tortoise predation.

1.2.1.2 Migratory Bird Treaty Act

The regulatory framework for protecting birds includes the ESA, the Migratory Bird Treaty Act (MBTA) of 1918, codified in 16 U.S.C. § 703-712, and subsequent amendments. The MBTA decrees that all migratory birds and the parts (including eggs, nests, and feathers) are fully protected and addresses the destruction or removal of active nests of those species. Under this Act, it is unlawful to pursue, hunt, take, capture, kill, possess, offer to or sell, barter, purchase, deliver, transport, or receive any migratory birds (including parts, nests, eggs or other product, manufactured or not). In practice, most bird species with non-migratory life-histories are protected under the MBTA, as well. Virtually all native bird species in the United States are protected under the MBTA, including the common raven. If a common raven is recorded as a repeat offender in predating desert tortoises, removal of the offender may be required upon issuance of a depredation permit under the MBTA. This activity is governed by Section 4 of the Environmental Assessment to Implement a Desert Tortoise Recovery Plan Task: Reduce Common Raven Predation on the Desert Tortoise (USFWS 2008).

1.2.1.3 USFWS California Raven Management Program

The USFWS Ventura office cooperated with several other agencies including the BLM, National Park Service, Department of Defense, and the Department of Agriculture to complete the Environmental Assessment to Implement a Desert Tortoise Recovery Plan Task: Reduce Common Raven Predation on the Desert Tortoise (USFWS 2008). The USFWS proposes to design a common raven management program addressing the common raven predation in the California desert region. The 2018 analysis on common raven monitoring and management data collected between 2013 and 2017 within the California range of the desert tortoise is underway. Results of the data analysis are estimated to be for in early 2019 (National Fish and Wildlife Foundation 2018).

1.2.2 California State Laws and Regulations

1.2.2.1 California Endangered Species Act

The California Department of Fish and Wildlife (CDFW) established the California Endangered Species Act as a policy of the state to protect any native species or subspecies of bird, mammal, fish, amphibian, reptile, or plant which is in serious danger of becoming extinct throughout all, or a significant portion, of its range due to one or more causes, including loss of habitat, change in habitat, overexploitation, predation, competition, or disease (California Fish and Game Code [CFGC] § 2062). For projects that affect both a federally and state listed species, compliance with an ESA “incidental take authorization” can satisfy the California Endangered Species Act if the CDFW determines that it is “consistent” with CFGC § 2080.1.

1.2.2.2 California Environmental Quality Act

A statute passed in 1970, the California Environmental Quality Act (CEQA) requires state and local agencies to identify the significant environmental impacts of their actions and to avoid or mitigate those impacts, if feasible (California Natural Resources Agency 2014). The California Public Utilities Commission (CPUC) is responsible for determining if the Project will be constructed in accordance with CEQA requirements and issue to DCRT a Certificate of Public Convenience and Necessity for transmission infrastructure within California.

The Plan covers relevant requirements of the following Mitigation Measures (MM) under CEQA, as depicted in Appendix 1C of the Draft EIS:

- MM Biological (BIO)-CEQA-1: Implement Biological Resources Applicant Proposed Measures (APMs), BLM Best Management Practices (BMPs), and Conservation and Management Actions (CMAs) as part of the Project and applied prior to, during, and after Project activities to avoid or minimize Project related impacts on biological resources (see Section 1.2.3). Where an APM, BMP, or CMA is subjective (i.e., "where appropriate," "where feasible"), DCRT or their contractor will consult with BLM and CPUC to determine applicability of each measure prior to the disturbance of a covered resource. Weekly and monthly documentation of compliance will be provided to the BLM and CPUC; further details are provided in Appendix 1C of the Draft EIS.

- MM BIO-CEQA-2: Prior to any work activities on the Project site, including surveying, mobilization, fencing, grading, or construction, a Work Environmental Awareness Program (WEAP) shall be prepared and implemented by DCRT or their Construction Contractor(s). Prior to implementation the WEAP will be approved by the CPUC with a final version completed prior to the issuance of construction permits. The WEAP shall be implemented throughout the duration of Project, including operation and maintenance phases. Successful implementation of the WEAP will result in all on-site Project personnel being properly informed and educated on the pertinent environmental concerns related to the Project. One of the main goals of the WEAP, is that it shall reduce unintentional impacts to biological resources within the Project area and ensure that all workers are trained in accordance with this MM. The WEAP shall include, but not limited to, the following items (specific to this Plan):

    - A discussion of measures to be implemented for avoidance of sensitive resources discussed in the Draft EIS (including this Plan) and the identification of an onsite contact in the event of the discovery of sensitive species (e.g., desert tortoise) on the Project site; this shall include a discussion on micro trash.

    - Training materials and briefings shall include, but not be limited to: a discussion of all relevant regulatory guidelines; the consequences of non-compliance with these regulations; identification and values of plant and wildlife species and significant natural plant community habitats; hazardous substance spill prevention and containment measures; a contact person and phone number in the event of the discovery of dead or injured wildlife (attractant to common ravens); and a review of mitigation requirements.

- Protocols to be followed when road kill (attractant to common ravens) is encountered in the work area, or along access roads, and the identification of an onsite representative to whom the road kill shall be reported. Road kill shall be reported to the appropriate local animal control agency, the CPUC within 24 hours. Road kill of special -status species shall also be reported to the CDFW and/or USFWS within 24 hours or otherwise specified in Project-specific permits.

- MM BIO-CEQA-3: DCRT will develop and implement biological construction monitoring no more than 30 days prior to the start of site mobilization or ground disturbing activities, the Applicant shall designate a qualified biologist(s) to monitor construction of the Project. Multiple qualified biologists shall be designated by the DCRT and/or their Construction Contractor(s), as needed. Designated qualified biologists must be approved by the CPUC, BLM, and CDFW prior to conducting construction monitoring. The biologist(s) must be knowledgeable with the life history and habitat requirements of federal- and state-listed and special-status plants, mammals, reptiles, amphibians, and birds. The qualified biologist(s) shall conduct clearance surveys for listed and special-status species prior to the start of construction activities each work day during initial site disturbance; clearance surveys can be conducted on a weekly basis thereafter. Any handling of special-status species must be approved by the appropriate federal and state agencies and be done in accordance with species-specific handling protocols. During initial site disturbance, and for the duration of construction, the qualified biologist(s) shall remain on-site at all times when activities shall occur immediately adjacent to, or within, habitat that supports populations of listed and/or special-status species. The designated biologist(s) shall relocate any terrestrial special-status species that would be impacted by the Project.

  Permits may be required for some species (e.g., nest removal or depredation permit to remove common ravens issued by USFWS). All locations of listed and/or special-status plants shall be flagged for avoidance or salvage, relocation, or transplanting. Similarly, locations of listed and/or special-status wildlife shall be flagged for avoidance and appropriate avoidance buffers established. Results of all monitoring shall be recorded on daily site observation reports and include details the construction activities. The daily monitoring reports shall be compiled and submitted to the CPUC, BLM, and CDFW for review on a weekly basis. Contents of the reports shall include at a minimum the date, time of monitoring, location, qualified biologists name, construction activities, biological conditions and species detections, and any issues encountered during the monitoring effort.

  If dead or injured special-status wildlife species (attractant for common ravens) and/or impacted special-status plants are detected on the construction site, the qualified biological monitor shall, immediately upon finding the remains or injured animal, coordinate with the onsite construction foreman to discuss the events that caused the mortality or injury, if known, and implement measures to prevent future incidents. Details of these measures shall be included within monitoring separate incident report. Species remains shall be collected and frozen as soon as possible, and CDFW and USFWS, as well as all other appropriate federal and state regulatory agencies, shall be contacted regarding ultimate disposal of the remains. The incident report shall be sent to the CPUC, CDFW and/or USFWS (as appropriate), as well as any other appropriate federal and state agencies, within five calendar days. The construction biological monitoring report shall at a minimum include: the date, time of the finding or incident (if known), and location of the

carcass, injured animal or other impacted species, and the circumstances of its death or injury (if known). Injured animals shall be taken immediately to the nearest appropriate veterinary or wildlife rehabilitation facility.

- MM WIL-CEQA-2: DCRT will develop and submit an RMP to the BLM, CDFW, and County for approval prior to the start of ground disturbance and issuance of a County grading permit. The RMP will:
    - Provide education to Project personnel (MM-BIO-CEQA-2).
    - Identify conditions associated with the Project that might provide raven subsidies or attractants.
    - Describe management practices to avoid or minimize conditions that might increase raven numbers and predatory activities.
    - Describe control practices for offending common ravens.
    - Establish thresholds that would trigger implementation of control practices.
    - Implement adaptive management.
    - Address monitoring and nest removal during construction and for the life of the Project.
    - Identify measures within this plan designed to reflect the above details.

DCRT will provide funding for implementation of the USFWS Regional Raven Management Program. See Section 7 for further details.

1.2.3 Project-Specific Regulatory Requirements

The RMP was prepared to address the Project-specific regulatory requirements identified in the Draft EIS. These measures are summarized in Table F-5-1, and are applicable during the preconstruction, construction, and post-construction/restoration phases of the Project.

Specifically, the BLM BMP Biological (BIO)-28 satisfies the requirements outlined in two CMA standards LUPA-BIO-01 and LUPA-BIO-06 and the MM BIO-CEQA-2, required for common raven management. The CMA standards comply with the California Desert Conservation Area Plan of 1980, as amended (see Project Draft EIS Appendix 2B.2 – CMA Required Plans; BLM 2018). The two CMA standards are also listed in Table F-5-1.

Additionally, BMP-BIO-21 requires that deterrents be installed to reduce nesting and perching opportunities for predatory birds, including the raven. Standards for success includes implementation of mitigation requirements throughout the duration of construction and ravens are, to the extent possible, deterred from nest/foraging within the Project site.

TABLE F-5-1 PROJECT-SPECIFIC MITIGATION REQUIREMENTS

Measure[1]	Description[2]
APM BIO-01	Before starting any work, including mowing, staging, installing stormwater control structures, implementing other BMPs, removing trees, construction, and restoration, all employees and contractors performing activities and new construction would receive training on environmental requirements that apply to their job duties and work. If additional crewmembers arrive later in the job, they would be required to complete the training before beginning work. Training would include a discussion of the avoidance and minimization measures being implemented and would include information on the federal and state Endangered Species Acts and the consequences of not complying with these Acts. An educational brochure would be provided to construction crews working on the Project. This brochure would include color photographs of special status species as well as a discussion of avoidance and minimization measures. (Addresses California Management Action [CMA] Land Use Plan Amendment [LUPA]-Biological Mitigation Measure [BIO]-05 and Mitigation Measure [MM] BIO-California Environmental Quality Act [CEQA]-2)
BMP BIO-01	The worker education program would provide interpretation for non-English speaking workers. (Addresses CMA LUPA-BIO-05 and MM BIO-CEQA-2)
APM BIO-21	Current guidelines and methodologies would be used in the design of the proposed transmission facilities to minimize the potential for raptors and other birds to collide with the transmission line during operations and/or perch on the lines and be electrocuted. For example, aerial marker balls or other visibility markers would be placed at and near the crossing of the Colorado River to increase the visibility of the transmission line to birds using that movement corridor. Deterrents would be added to reduce nesting and perching by ravens and other predatory birds. Further, placement of lines significantly above existing transmission lines, topographic features, or tree lines would be avoided. These measures would be implemented, where practicable, in conjunction with an Avian Protection Plan for the Project. The Avian Protection Plan would include requirements for monitoring the effectiveness of anti-collision and anti-perching design.
BMP BIO-21	Aerial marker balls or other visibility markers would be placed on overhead ground wires (not conductors) at crossing of the Colorado River and floodplain to increase visibility to birds using that movement corridor and marking any other static wires to improve visibility and reduce collisions. Deterrents would be added to reduce nesting and perching by ravens and other predatory birds. The Avian Protection Plan would include requirements for monitoring the effectiveness of anti-electrocution design.
BMP BIO-28 (California only)	The Raven Management Plan would be implemented for all activities to address food and water subsidies and roosting and nesting sites specific to the common raven. These include identification of monitoring reporting procedures and requirements; strategies for refuse management; as well as design strategies and passive repellent methods to avoid providing perches, nesting sites, and roosting sites for common ravens. As consistent with BLM policy and resource management plans, compensatory mitigation would be provided that contributes to Land Use Plan Amendment (LUPA)-wide raven management associated with lands in the Desert Renewable Energy Conservation Plan.

Measure[1]	Description[2]
CMA LUPA-BIO-6 (California only)	Subsidized predator standards, approved by BLM, in coordination with the United States Fish and Wildlife Service (USFWS) and California Department of Fish and Wildlife (CDFW), will be implemented during all appropriate phases of activities, including but not limited to renewable energy activities, to manage predator food subsidies, water subsidies, and breeding sites including the following: • Common raven management actions will be implemented for all activities to address food and water subsidies and roosting and nesting sites specific to the common raven. These include identification of monitoring reporting procedures and requirements; strategies for refuse management; as well as design strategies and passive repellent methods to avoid providing perches, nesting sites, and roosting sites for common ravens. • The application of water and/or other palliatives for dust abatement in construction areas and during project operations and maintenance will be done with the minimum amount of water necessary to meet safety and air quality standards and in a manner that prevents the formation of puddles, which could attract wildlife and wildlife predators. • Following the most recent national policy and guidance, BLM will take actions to not introduce, dispose of, or release any non- native species into areas of native habitat, suitable habitat, and natural or artificial waterways/water bodies containing native species. • In addition to implementing the measures above on activity sites, each activity will provide compensatory mitigation that contributes to LUPA-wide raven management.
CMA LUPA-TRANS-BIO-1 (California only)	Where feasible and appropriate for resource protection, site transmission activities along roads or other previously disturbed areas to minimize new surface disturbance, reduce perching opportunities for the common raven, and minimize collision risks for birds and bats.

1 APM = Applicant Proposed Measure; BMP = Best Management Practice; CMA = Conservation and Management Action; BIO = Biological; LUPA = Land Use Plan Amendment; TRANS = Transmission

[2] The Environmental Impact Statement description language is directly from the Project Draft Environmental Impact Statement (Draft EIS) Appendices 2A and 2B (BLM 2018). References for the requirement descriptions can be found in the source documents. Any updates or new requirements determined within the Final Environmental Impact Statement will be updated in the final Plan of Decision management plans.

2 Purpose and Objectives

In recent decades, the common raven population has increased substantially in the southwestern deserts of the United States, primarily in response to human-provided subsidies of food, water, and nest sites (USFWS 2008). Common ravens are a major predator on the threatened desert tortoise (Boarman 1992). The goal of this RMP is to implement non-lethal measures to deter common ravens from the vicinity by eliminating or minimizing raven attractants (e.g., surface water, trash, animal and plant waste materials; and perching, nesting, and roosting sites) during construction, operation, and maintenance of the Project.

As specified in BIO-CEQA-2, the primary RMP objectives include:

1. Identify Project-specific attractants and conditions of concern that may attract common ravens to the area.

2. Provide non-lethal common raven management measures and identify roles and responsibilities for their implementation.

3. Provide the monitoring and reporting requirements for successful implementation of the common raven management measures.

4. Describe adaptive management conditions and strategies for unanticipated circumstances that require additional mitigation support.

3 Potential Common Raven Attractants

3.1 Perch and Nest Opportunities

Common ravens depend on human encroachment to expand into areas where they were previously absent or in low abundance (Kristan and Boarman 2007; USFWS 2008). Common raven predation on juvenile tortoises has been evidenced in the desert by the remains of tortoise carcasses under raven nests, direct observations, and carcasses with distinctive common raven damage (Boarman 1992). Utility structures provide a competitive edge to hunting by facilitating perching high over available food sources, which supports common raven predation activities.

The addition of buildings, billboards, landscape trees, and other structures has introduced common raven nesting opportunities in the desert where they were otherwise very limited. Although many common ravens have been observed in these and other anthropogenic structures, lattice transmission towers and wooden distribution lines have been recorded to increase common raven nesting relative to other nesting substrates (Steenhof et al. 1993). The Breeding Bird Survey data from 1968 to 2004 indicated increase in the common raven populations of more than 700 percent in the west Mojave Desert and more than 70 percent in the east Mojave Desert (USFWS 2008).

3.2 Food and Water Attractants

Common ravens are considered scavengers that obtain a high percentage of their diet from human subsidies such as food, garbage, and road kill (Kristan and Boarman 2007). The potential for road kill due to construction activities and use of access roads could attract common ravens.

The construction, operation, and maintenance of the Project could result in increased food and waste generation due to increased personnel visiting the Project area, particularly during construction. Improper waste management may attract common ravens to the Project area.

During construction, disturbance of the soil and/or vegetation would occur from heavy equipment operation. This disturbance would result in the “unearthing” and exposure of natural food sources for common ravens such as rodents and insects. Common ravens could be attracted to the soil disturbance areas to prey upon unearthed, injured, or dead animals. Similarly, water used during construction, operation, and maintenance for dust abatement, concrete mixing, and revegetation efforts has the potential to attract common ravens.

4 Common Raven Control and Management

Any control methods constituting take of common ravens or their nests – as defined in the MBTA – would require a depredation permit from the USFWS pursuant to the MBTA. The

following minimization and avoidance measures include non-lethal measures to deter common ravens from frequenting the Project, while avoiding common raven take.

The non-lethal measures outlined below are primarily based on guidance from the USFWS Draft Environmental Assessment to Implement a Desert Tortoise Recovery Plan Task: Reduce Common Raven Predation on the Desert Tortoise (USFWS 2008), Summary of Predation by Corvids on Threatened and Endangered Species in California and Management Recommendations to Reduce Corvid Predation (Liebezeit and George 2002), and Boarman's research and guidance for reducing common raven predation on desert tortoises (Kristan and Boarman 2003 and 2007; Boarman 1992). Approved and published RMPs were also reviewed for projects in the southern California deserts (POWER Engineers, Inc. 2015; CH2MHill 2008 and 2017).

4.1 Perch Deterrents

As outlined in APM/BMP BIO-21 – Reduction of Avian Collision and Electrocution, bird perch deterrents have been shown to discourage birds from perching, roosting, and nesting along electrical lines (Slater and Smith 2010). Perch deterrents, including wire spikes or similar perching/nesting deterrents, are often made of plastic or stainless-steel spikes that can be effective in discouraging birds from landing on structures. Bird spikes are designed to be affixed to structures to provide long-term deterrence; therefore, may be more practical to deter nesting on poles/structures and within substations. Such devices are not likely practical for use on equipment, material storage areas, or contractor yards. Installation of bird spikes on tower structures concurrent with structure construction may discourage birds from nesting on tower structures during construction (see Appendix F-3, Volume III of the Plan of Development).

4.2 Worker Environmental Awareness Program

The Project is required to implement a WEAP to inform all Project personnel of the environmental compliance measures required for the Project. All Project personnel would be required to participate in a WEAP prior to beginning work on the Project. This program would be developed by DCRT prior to the start of construction and would be submitted to the BLM and CPUC for review and approval prior to implementation.

The WEAP will be prepared in accordance with APM/BMP BIO-01, BIO-35, and MM BIO-CEQA-2. The WEAP will be implemented throughout the duration of Project-related construction activities and will include, but not limited to discussion on the following:

- Identification of federal and state ESAs and MBTA and the consequences of non-compliance with these acts.
- Identification and values of plant and wildlife species and significant natural plant community habitats; maps showing exclusion areas and other construction limitations.
- Hazardous substance spill prevention and containment measures.
- Project-specific measures to be implemented for avoidance of sensitive resources and the identification of an onsite contact in the event of the discovery of sensitive species on the site.

- Procedures regarding discovery of dead or injured wildlife and a review of mitigation and reporting requirements.

- Protocols on common ravens and their nests, along with how to avoid attracting the species, such as proper trash removal, trash containment, micro trash, and control of puddling water.

4.3 Litter Control Program

As outlined in BMP BIO-06 – Trash Handling (BLM 2018), a litter-control program will be implemented during construction, operation, and maintenance. The purpose of the litter-control program is to reduce the attractiveness of the area to opportunistic predators such as the common raven as well as the kit fox (*Vulpes macrotis*) and coyote (*Canis latrans*). Trash and food items will be disposed of properly in predator-proof containers with re-sealing lids. Trash containers will be emptied, and construction waste will be removed daily from the Project area and disposed of in an approved landfill. This would also satisfy requirements established in BMP BIO-36 – Feed or Harassment of Wildlife (BLM 2018).

4.4 Injured or Dead Wildlife

Attractants for common ravens can include unearthing prey items such as rodents during grading activities as well as, injured, or dead wildlife within the Project work areas. Per MM BIO-CEQA-2 and BIO-CEQA-3, any carcasses or roadkill encountered in Project work areas or along access roads must be immediately identified, cause of injury or mortality recorded, and reported by the Biological Monitor or Designated Biologist (see Section 5).

Local animal control agency and CPUC (California only) will be notified of the roadkill within 24 hours. In addition, CDFW (California only) and USFWS must be notified about roadkill of special -status species (e.g., desert tortoise or common raven) within 24 hours or otherwise specified in species-specific permits. Carcasses must be placed in secure trash cans in accordance with state and federal regulations. As feasible, implement measures to prevent future incidents. Details of these measures shall be included within monitoring separate incident report. Special status species remains shall be collected and frozen as soon as possible, and CDFW and USFWS, and other appropriate federal and state regulatory agencies as necessary, shall be contacted regarding ultimate disposal of the remains (MM BIO-CEQA-2).

The incident report shall be sent to the CPUC, CDFW, /or USFWS (as appropriate), as well as any other appropriate agencies, within five calendar days. The construction biological monitoring report shall at a minimum include: the date, time of the finding or incident (if known), and location of the carcass, injured animal or other impacted species, and the circumstances of its death or injury (if known). Injured animals shall be taken immediately to the nearest appropriate veterinary or wildlife rehabilitation facility (MM BIO-CEQA-3).

4.5 Surface Water Management

Water attractants are thought to be an important factor contributing to common raven increases in desert areas (USFWS et al. 2008). The primary use of water on the Project will be dust suppression (BMP AQ-01 – Fugitive Dust; BLM 2018). Water used for dust suppression will be used in small quantities, so that puddling is discouraged. The biological monitors on site will check for areas of standing water, determine their cause, eliminate

them, and determine how to avoid the situation in the future. Any puddles from construction activities will be filled with dirt or sand upon their discovery.

4.6 Removal of Inactive Common Raven Nests

Per the guidelines of the Project Avian Protection Plan, all construction in California within 300 feet of an active nest (non-raptors) is to be halted immediately until the condition of the nest can be ascertained as unobtrusively as possible (BLM 2018). The MBTA prohibits indiscriminate killing of migratory birds including the common raven (USFWS 2008). In addition, bird nests are protected by the MBTA and by CFGC. Like the MBTA, the CFGC 3503 and 3503.5, state that it is illegal to take, possess, or needlessly destroy the nest or eggs of any bird, except as otherwise provided by CFGC or pursuant regulations. However, it is lawful to remove inactive nests year-round, and to remove nests during the non-breeding season (defined as August 31 through February 1) for most birds, including the common raven.

Nest construction for common ravens begins in late January to mid-April and nest construction takes from one to two weeks. Egg-laying usually occurs five to six days after nest completion, with clutch size ranging from three to five eggs. Incubation lasts 20 to 25 days (Boarman and Heinrich 1999). The nestling period ranges from four to seven weeks, with an average of three chicks produced per nest each year. Fledglings will stay near the nest for four to eight weeks following their first flight, with most nests fledged by June. In the event that a common raven nest with eggs is located in or around the Project, the nest will be removed following the completion of the nesting cycle and outside the avian breeding season (defined as February 1 through August 31; USFWS et al. 2008). Common raven nest removal will be conducted on all property structures for the life of the Project.

If an active common raven nest (i.e., a maintained nest which is occupied by eggs or nestlings or is otherwise essential to the survival of a juvenile bird) creates a safety hazard for the Project, a depredation permit under MBTA must be obtained from the USFWS Migratory Bird Division for it to be removed (USFWS 2013).

4.7 Active Nesting Buffers

If a common raven nest is identified as active within the Project area, it is protected under the MBTA. An appropriate buffer should be recorded and marked with the appropriate flagging. All construction would avoid the area until the hatchlings have fledged the nest. If the buffer crosses the Project access roads, DCRT or their contractor will coordinate with the BLM to determine if a drive-through only zone could be established, where the buffer can be entered by construction vehicles and equipment if no stopping occurs. Special signage will be installed at both ends of the buffer zone. If the buffer intersects with a high disturbance area, DCRT or their contractor will coordinate with BLM to determine if a buffer reduction is applicable (see Nesting Bird Management Plan in Appendix F-3).

4.8 Elimination of Offending Common Ravens

When common ravens are recorded to have predated on desert tortoises within the Project area, they are deemed offending common ravens. Elimination of offending common ravens is not the first course of action and will be avoided, if possible, through the implementation of the methods described in this RMP. If methods to deter the offending common ravens fail and they continue to be a threat to desert tortoises within the Project area, lethal action may

be necessary. Any lethal action must be coordinated through the BLM, USFWS, and, if in California, CDFW given that the common ravens and their active nests are protected under the MBTA and CFGC.

5 Monitoring and Reporting Plan

The following subsections describe the common raven monitoring, management, and control practices that will be implemented during the preconstruction, construction, post-construction/restoration phases of the Project. DCRT or their contractor shall be responsible for all aspects of common raven management described in this RMP.

5.1 Responsible Parties

Prior to discussion of the monitoring and reporting requirements, a description of those responsible for the implementation of these procedures is included below.

5.1.1 Designated Representative

A Designated Representative from the DCRT or their contractor will be responsible for communications with BLM and Designated Biologist(s), and for overseeing compliance with the RMP. Contact information of the Designated Representative will be provided to the BLM prior to construction activities.

5.1.2 Designated Biologist

The Designated Biologist(s) will be independently or jointly assigned by the DCRT or their contractor for their components of the Project and will have been approved by BLM, USFWS, and CDFW, 30 days before start of surveys or monitoring. The Designated Biologist(s) will be responsible for facilitating the implementation of avoidance, minimization, and mitigation measures for the RMP, and will have expertise identifying common ravens, common raven nests, and desert tortoise remains (e.g., carcass, shell, and bone fragments). In addition, the Designated Biologists will hold a bachelor's degree or higher in Biological Sciences, Zoological Sciences, or a related field.

The Designated Biologist(s) will have specific experience in the implementation of similar environmental compliance programs, and ensure compliance with all biological avoidance, minimization, and mitigation measures for the Project. In addition, the Designated Biologist(s) will be responsible for drafting the methods for biological surveys, schedule development, agency coordination, reporting, and supervision of field staff including Biological Monitors.

5.1.3 Biological Monitors

The Biological Monitor(s) will meet the requirements outlined in the BMP BIO-01 and BIO-02 (BLM 2018) and will have prior construction monitoring experience, on projects in desert habitats. The Biological Monitor(s) will be the field contact representative(s) for construction personnel and the Designated Biologist(s) and will be responsible for daily on-site monitoring as well as regular data entry or reporting.

The duties of the Biological Monitor include:

- Being present during all work activities within habitat of special status species and serving as the field contact representative(s) for construction workers and the Designated Biologist(s).
- Being responsible for daily on-site monitoring as well as regular data entry or reporting.
- Minimizing impacts to special status species, native vegetation, wildlife habitat, and unique resources by ensuring that construction personnel follow WEAP training requirements.
- Identifying potential issues or signs of common raven activity and/or predation near potential desert tortoise habitat.
- Reporting concerns to the Designated Biologist(s) where applicable.

5.2 Monitoring Procedures

A Biological Monitor will be on-site to ensure construction-related subsidies available for common ravens are minimized or eliminated. Biological Monitors will observe and document any perceptible increase in common raven numbers and activity due to construction activities.

If construction or vegetation removal is to occur during the avian breeding season (defined as February 1 through August 31 in APM-BIO-20 – Migratory Bird Protection During Construction; BLM 2018), a qualified biologist will conduct preconstruction survey (pre-activity “sweep”) to determine if active nests of any bird species are present within the vicinity of construction. Surveys shall be conducted in areas within 300 feet of proposed disturbance areas including tower sites, laydown/staging areas, substation sites, and access/spur road locations. Surveys of birds shall be conducted for all areas from February 1 to August 31. DCRT or their contractor shall be responsible for designating qualified biologists who can conduct pre-construction surveys and monitoring for breeding birds. The Biological Monitors shall be responsible for documenting the results of the surveys and the ongoing monitoring, and the Designated Biologist(s) will provide a copy of the monitoring reports for impacts areas to the respective agencies. If for any reason a bird nest must be removed during the nesting season, DCRT or their Construction Contractor(s) shall provide written documentation providing concurrence from the USFWS and CDFW authorizing the nest removal.

Biological Monitors will be responsible for identifying any offending common ravens that are noted to prey on the desert tortoise. Potential common raven nests and any significant sightings of common ravens, such as individuals observed consuming trash or water brought in for construction, will be recorded and included in the quarterly compliance report. These observations will be used to help determine whether there is a need for perch deterrents.

5.3 Reporting Procedures

The Designated Biologist(s) will prepare daily written observation and inspection records summarizing: oversight activities and compliance inspections, observations of species,

including common ravens and their sign, survey results, and monitoring activities. In addition, the Designated Biologist will immediately report any observations of predation on desert tortoise by common ravens in the Project area to the BLM (Notification of Take or Injury) and USFWS within three days.

A quarterly compliance report will include the daily written observations mentioned above. The report will be submitted to the BLM and will include notes on the implementation of this RMP.

During construction, annual reports will be submitted to the BLM no later than January 31 of every year of construction. The annual report will include any documented common raven monitoring data and any common raven management that was implemented during construction activities. The annual report will include any significant dates and relevant data such as injuries to common ravens, mortality, or circumstances. All reports regarding common ravens will be included in the annual report provided to the BLM and USFWS.

The quarterly and annual reporting on the RMP will include the following data:

- Date construction commenced.
- List of all common raven sightings, number of individuals, locations, and dates.
- List including location and date of all common raven nests found.
- List of any nests that were removed including the rationale for removal and how the determination was made that the nest was inactive.
- Any observed predation on desert tortoise by common ravens.
- List any tortoise remains found in the vicinity of an active common raven nest and verify the nesting stage of the offending common ravens (e.g., incubating, feeding nestlings), describe how agency notifications were completed, and detail the process of event of elimination of the offending common raven(s).
- Summary of monitoring results.
- Photographs and any other relevant documentation or significant data gathered.

6 Adaptive Management (California)

Adaptive management will be required if measures identified in this RMP are ineffective in controlling raven nesting/foraging within the Project area; and ultimately, ineffective in controlling raven predation on the desert tortoise. Ravens are notoriously adaptive and clever, requiring the need for developing new methods of adaptive management. For example, biologists found some success in using conditioned aversion to reduce predation by ravens on the eggs of California least terns (*Sterna antillarum browni*) and similar methods may be developed to reduce predation on juvenile tortoises (Avery et al. 1995).

In San Francisco, California, a longitudinal study was carried out to evaluate the effects of oiling eggs of territorial ravens on the predation of black-crowned night herons (*Nycticorax nycticorax*) nests and recorded an increase in reproductive success for the black-crowned night herons (Brussee and Coates 2018). Flexibility and willingness to adopt new or

experimental methods, are likely to be crucial for the effectiveness of any long-term raven management plan. DCRT will consult with the BLM and the USFWS prior to implementing adaptive management changes.

7 USFWS Regional Raven Management Program

Within California and per the requirements of BMP BIO-28, CMA LUPA BIO-6, and BIO-CEQA-2, DCRT will provide financial assurance to the USFWS Regional Raven Management Program in addition to implementing this Plan. This payment will be submitted either to the Project sub-account of the Renewable Energy Action Team Account held by the National Fish and Wildlife Foundation in support of the USFWS Regional Raven Management Program (National Fish and Wildlife Foundation 2018) or to more current guidance provided by USFWS. The contribution will be $105 per acre of land impacted in California.

1 Introduction

The data and information provided in this Reclamation, Vegetation, and Monitoring Plan (Plan) is for the Ten West Link Transmission Project (Project) proposed by Delaney Colorado River Transmission, LLC (DCRT). The guidelines outlined in the Plan were established by the Bureau of Land Management (BLM) principles and procedures, specifically designed for high-voltage transmission projects. The Plan will address specific reclamation activities to be implemented in all construction areas disturbed by the Project and on BLM-administered lands. Reclamation on private properties will be coordinated by DCRT and associated landowners.

The intent of this Plan is to establish and implement reclamation treatments in order to reclaim Project-related disturbances; prevent unnecessary degradation of the environment during construction; restore temporary use areas; and reclaim disturbed areas such that they are ecologically functional and visually compatible with the surrounding environment to the maximum extent possible. All construction activities will comply with all stipulations for reclamation outlined in the Project's Plan of Development (POD) and other applicable documents including the BLM's Record of Decision, Right-of-Way (ROW) Grant and Notice to Proceed.

Details outlined within this Plan are based on guidance from BLM approved and published reclamation plans, prepared for renewable energy and transmission line projects including the Sun Valley to Morgan Transmission Line in Arizona (EC Source 2017a and 2017b), Energy Gateway South Transmission Line in Wyoming (Rocky Mountain Power 2016), and Mohave County Wind Farm in Arizona (URS 2013).

1.1 Organization of the Plan

To facilitate the review and understanding of the Plan, it is organized into six primary sections:

1. Introduction – presents the overall summary and purpose of the Plan.

2. Regulatory Requirements and Authorities – provides descriptions of relevant regulatory requirements and agencies with specific authority within the laws and regulations associated with the Plan.

3. Overview of Existing Environments – describes the vegetation communities that will be affected during construction and post-construction actions.

4. Reclamation Levels – provides details of the reclamation components including plan framework, methodology, and actions to be implemented for the Project.

5. Description of Reclamation Actions – describes the reclamation treatments and activities for each phase of the Project

6. Monitoring – outlines the reclamation monitoring protocol including route and site monitoring to properly document the progression of reclamation success.

1.2 Purpose of the Plan

The purpose of the Plan is to define and recommend construction and reclamation actions (or treatments) that will meet the goals and objectives established by the BLM under the applicable requirements and authorities, as described in the POD, the BLM's Record of Decision, and the Project's Draft Environmental Impact Statement (EIS) in order to recover habitat for sensitive species. In addition, it will provide the protocols and procedures necessary for implementing and monitoring the required reclamation actions.

In adherence to Section 4.13 of the POD, this Plan will be submitted for review and approval by the BLM designated representative prior to the start of any reclamation actions.

2 Regulatory Requirements and Authorities

The following federal authorities, regulations, Resource Management Plans, initiatives, and general guidelines applicable to the Plan are summarized in this section. These regulations provide the regulatory framework that the Project must comply with.

2.1 Federal Regulations, Laws, and Authorities

2.1.1 BLM Terms and Conditions Right-of-Way Grant, Title 43 Code of Federal Regulations Part 2805.12

BLM terms and conditions established in the Title 43 Code of Federal Regulations (CFR) Part 2805.12 state that the Project must: "(Section 8) *Comply with project-specific terms, conditions, and stipulations, including requirements to: (i) Restore, revegetate, and curtail erosion or conduct any other rehabilitation measure the BLM determines necessary; (iii) Control or prevent damage to: (A) Scenic, aesthetic, cultural, and environmental values, including fish and wildlife habitat; (B) Public and private property; and (C) Public health and safety; (iv) Provide for compensatory mitigation for residual impacts associated with the [right-of-way (ROW)] ;* [and] *(vi) Ensure that you construct, operate, maintain, and terminate the facilities on the lands in the ROW in a manner consistent with the grant or lease, including the approved POD, if one was required*."

2.1.2 Federal Land Policy and Management Act of 1976

Section 102(a)(8) (43 United States Code [U.S.C] § 1701) declares "*…public lands be managed in a manner that will protect the quality of scientific, scenic, historical, ecological, environmental, air and atmospheric, water resource, and archeological values; that, where appropriate, will preserve and protect certain public lands in their natural condition; that will provide food and habitat for fish and wildlife and domestic animals; and that will provide for outdoor recreation and human occupancy and use*."

2.1.3 Endangered Species Act of 1973

As amended in Section 7 (a)(2) of the Endangered Species Act, the United States Fish and Wildlife Service (USFWS) requires that "…e*ach Federal agency shall, in consultation with and with the assistance of the Secretary, insure that any action authorized, funded, or carried out by such agency is not likely to jeopardize the continued existence of any*

endangered species or threatened species or result in the destruction or adverse modification of habitat of such species …"

2.1.4 Executive Order 13112

Executive Order 13112 requires all federal agencies to prevent the introduction and spread of invasive species through a series of actions including early detection and response, monitoring of known invasive populations, and native species restoration; specifically requiring that a federal agency will "…*not authorize, fund, or carry out actions that it believes are likely to cause or promote the introduction or spread of invasive species*."

2.1.5 Carlson-Foley Act

The Carlson-Foley Act (43 U.S.C. §1241) requires federal land-management agencies to terminate any invasive plant populations growing on their jurisdictional lands. The Carlson-Foley Act states that the federal agency must "*permit the commissioner of agriculture or other proper agency head of any State in which there is in effect a program for the control of noxious plants to enter upon any lands under their control or jurisdiction and destroy noxious plants growing on such land if- (1) such entry is in accordance with a program submitted to and approved by such department or agency: Provided, That no entry shall occur when the head of such Federal department or agency, or his designee, shall have certified that entry is inconsistent with national security; (2) the means by which noxious plants are destroyed are acceptable to the head of such department or agency; and (3) the same procedure required by the State program with respect to privately owned land has been followed*."

2.1.6 Federal Noxious Weed Act of 1974

Under the Federal Noxious Weed Act, the Public Law 93-629 and 76 U.S.C. § 2801 directs the management of invasive plant species on federally-managed lands, including transport of noxious weeds and how to contain their spread on federal lands.

2.1.7 BLM Manual 1740-1 Integrated Vegetation Management

BLM Manual 1740-1 outlines policies and procedures on planning and implementing resource improvements and treatments including forestry, invasive species, and range management.

2.2 State Regulations, Laws, and Authorities

2.2.1 California Code of Regulations: Noxious Weed Species

The California Code of Regulations Title 3 – Plants and Agriculture, Division 4 - Plant Industry, Chapters 3-7 focus primarily on invasive species and management; specifically, discussing plant quarantine, weed eradication, and listing plants species determined to be invasive in the state of California.

2.2.2 California Environmental Quality Act

A statute passed in 1970, the California Environmental Quality Act (CEQA) requires state and local agencies to identify the significant environmental impacts of their actions and to avoid or mitigate those impacts, if feasible (California Natural Resources Agency 2014). The California Public Utilities Commission (CPUC) is responsible for determining if the Project will be constructed in accordance with CEQA requirements and issue to DCRT a Certificate of Public Convenience and Necessity for transmission infrastructure within California.

2.2.3 Arizona Revised Statutes Title 3

Arizona Revised Statutes (ARS) Title 3 – Agriculture (ARS 3-205.01) outlines the abatement of Arizona noxious weeds, stating that "…*the director may treat, spray, control, suppress or eradicate noxious weeds, crop pests or diseases through a countywide, area-wide or statewide program or programs that have been approved or authorized by the department. If such countywide, area-wide or statewide program or programs affect cotton, the program or programs must also be approved by the cotton research and protection council. The director may take whatever actions that are necessary to assist, support or enforce such programs including entering any fields to treat, spray, control, suppress or eradicate noxious weeds, crop pests or diseases under these authorized or approved programs*."

2.3 Project-Specific Requirements

This Plan was prepared to address Project-specific regulatory requirements applicable during the pre-construction, construction, and post-construction phases of the Project, that cover the BLM terms and conditions in 43 CFR Part 2805.12 (see Section 2.1.1). The Project-specific regulatory requirements including the BLM Best Management Practices (BMPs) and DCRT's Applicant Proposed Measure (APM) are summarized in Table L-1-1.

Table L-1-2 describes the California requirements for the Project. As depicted in Appendix 1C of the Draft EIS, this would include the Mitigation Measures (MM) under CEQA and relevant CEQA MMs are listed in Table L-1-2. In addition, the Conservation and Management Actions (CMAs) required under the California Desert Conservation Area Plan of 1980 as amended (BLM 2018), are described in Table L-1-2. The BMPs and APMs address pertinent CEQA MMs and CMAs which is also noted within the descriptions of Table L-1-1.

Specific ROW Grant stipulations received pertinent to the reclamation actions will be added to this section of the Plan (see Table 1-3 of the POD).

TABLE L-1-1 PROJECT-SPECIFIC APMS AND BMPS ADDRESSED UNDER THIS PLAN

Originiator[1]	Measure[4]	Description[1, 2]	Project Phase			CA Only
			Pre-Constr.	Const.	O&M	
APM	BIO-12	A Noxious Weed Control Plan (Appendix 2B in the Project Plan of Decision) would be developed, approved by the BLM, and implemented prior to initiation of ground disturbing activities. That Plan would identify noxious and invasive species to be addressed in the Project Area,	X	X	X	

Originiator[1]	Measure[4]	Description[1, 2]	Project Phase			CA Only
			Pre-Constr.	Const.	O&M	
		describe measures to conduct pre-construction weed surveys, reduce the potential introduction or spread of noxious weeds and invasive species during construction, and monitor and control weeds during operation of the transmission line. It would be designed to minimize impacts on special status species to the extent practicable. Coordination with resource agencies regarding invasive plant species would be conducted before construction. BMPs would include use of weed-free straw, fill, and other materials; requirements for washing vehicles and equipment arriving on site; proper maintenance of vehicle inspection and wash stations; requirements for managing infested soils and materials; requirements and practices for the application of herbicides; and other requirements in applicable BLM Weed Management Plans. (Addresses CMA LUPA-BIO-6, -10, and -11)				
APM	BIO-15	A Habitat Restoration and Monitoring Plan would be developed, approved by BLM, and implemented for construction and operation of the Project. Revegetate all sites disturbed during construction that would not be required for operation of the transmission line, and restore disturbed areas to the extent practicable, given the arid desert environment. The Plan would describe in detail methods for surveying and characterizing vegetation in disturbed areas before construction; topsoil salvage and management, erosion control, post-construction recontouring and site preparation, seeding and planting, and post-construction watering, monitoring, and remediation. It would be designed to reduce impacts on special status species to the extent practicable. (Addresses CMA LUPA-BIO-7/8/10)	X	X	X	
BLM	BIO-15	As a part of the Habitat Restoration and Monitoring Plan, the soil horizons would be stored separately for the areas where the success of restoration could be crucial for rare plant species. (Addresses CMA LUPA-BIO-7/8)	X	X	X	X
APM	BIO-26	An inventory of plants protected under the Arizona Native Plant Law would be conducted on State Trust lands as required by the Arizona State Land Department. Similar surveys would be conducted on lands managed by BLM, as directed by that agency.	X	X		
BLM	BIO-41	[Succulent Management]	X	X	X	

Originiator[1]	Measure[4]	Description[1, 2]	Project Phase			CA Only
			Pre-Constr.	Const.	O&M	
		All activities would follow applicable BLM state and national regulations and policies for salvage and transplant of cactus, yucca, and other succulents. Pre-construction surveys of disturbance zones would include preparation of maps delineating special vegetation features. (Address CMA LUPA-BIO-7, LUPA-BIO-SVF-1, LUPA-BIO-VEG-1, -5, and -6)				
BLM	BIO-42	Promote appropriate levels of dead and downed wood on the ground, outside of campground areas, to provide wildlife habitat, seed beds for vegetation establishment, and reduce soil erosion, as determined appropriate on an activity-specific basis. (Addresses CMA LUPA-BIO-VEG-2)	X	X	X	
BLM	BIO-43	Allow for the collection of plant material consistent with the maintenance of natural ecosystem processes. (Addresses CMA LUPA-BIO-VEG-3)	X	X	X	
BLM	SOIL-01	During reclamation and revegetation efforts, a BLM soil scientist and/or botanist review plans and approve, as appropriate, to determine type and location of any scarification.		X		X
BLM	SOIL-02	During reclamation and revegetation efforts, the BLM would review plans and approve, as appropriate, to determine where soil compaction would be appropriate, to avoid potential adverse conditions created by compaction.		X		X
APM	AES-02	Upon completion of the Project, all construction material and debris from the permanent right-of-way and temporary staging areas would be removed and the areas restored. All work areas would be graded and restored to as close to pre-construction conditions as possible.	X	X	X	
BLM	AES-02	Work area reclamation would include pulling and tensioning sites; all disturbed work areas associated with the Project.	X	X	X	
BLM	AES-12	The Reclamation Plan for the Project would include measures designed to reduce long-term impacts to visual resources.	X	X	X	
BLM	AQ-01	[In conjunction with an Erosion, Dust Control, and Air Quality Plan and Fugitive Dust Control Plan for the Project]] The following measures would be implemented as applicable at all construction sites: • Replant vegetation in disturbed areas as quickly as possible, consistent with seasonal survival considerations.	X	X		

[1] APM = Applicant Proposed Measure; BLM = Bureau of Land Management; BMP = Best Management Practice; SOIL = Soil Mitigation Measure; AES = Aesthetic Mitigation Measure; AQ = Air Quality Mitigation Measure; BIO = Biological Mitigation Measure; LUPA = Land Use Plan Amendment.
[2] The Environmental Impact Statement mitigation measure language was copied from the Project Draft Environmental Impact Statement (EIS) Appendix 2A and 2B (BLM 2018). References for the requirement descriptions can be found in the source documents.

TABLE L-1-2 PROJECT-SPECIFIC CALIFORNIA REQUIREMENTS UNDER THIS PLAN*

Requirement[1]	Description[1, 2]
MM BIO-CEQA-1	Implement Biological Resources APMs, BLM BMPs, and CMAs as part of the Project and applied prior to, during, and after Project activities to avoid or minimize Project related impacts on biological resources; see Section 1.2.4. Where an APM, BMP, or CMA is subjective (I.e., "where appropriate", "where feasible"), DCRT or their Construction Contractor(s) will consult with BLM and CPUC to determine applicability of each measure prior to the disturbance of a covered resource. Weekly and monthly documentation of compliance will be provided to the BLM and CPUC; further details are provided in Appendix 1C of the Draft EIS.
CMA LUPA-BIO-6	Subsidized predator standards, approved by BLM, in coordination with the USFWS and CDFW, will be implemented during all appropriate phases of activities, including but not limited to renewable energy activities, to manage predator food subsidies, water subsidies, and breeding sites including the following: • The application of water and/or other palliatives for dust abatement in construction areas and during project operations and maintenance will be done with the minimum amount of water necessary to meet safety and air quality standards and in a manner that prevents the formation of puddles, which could attract wildlife and wildlife predators. • Following the most recent national policy and guidance, BLM will take actions to not introduce, dispose of, or release any non- native species into areas of native habitat, suitable habitat, and natural or artificial waterways/water bodies containing native species. All activity work areas will be kept free of trash and debris. Particular attention will be paid to "micro-trash" (including such small items as screws, nuts, washers, nails, coins, rags, small electrical components, small pieces of plastic, glass or wire, and any debris or trash that is colorful or shiny) and organic waste that may subsidize predators. All trash will be covered, kept in closed containers, or otherwise removed from the project site at the end of each day or at regular intervals prior to periods when workers are not present at the site. In addition to implementing the measures above on activity sites, each activity will provide compensatory mitigation that contributes to LUPA-wide raven management.*
CMA LUPA-BIO-7	Where Desert Renewable Energy Conservation Plan vegetation types or Focus or BLM Special Status Species habitats may be affected by ground disturbance and/or vegetation removal during pre-construction, construction, operations, and decommissioning related activities but are not converted by long-term (i.e., more than two years of disturbance, see Glossary of Terms) ground disturbance, restore these areas following the standards, approved by BLM authorized officer, following the most recent BLM policies and procedures for the vegetation community or species habitat disturbance/impacts as appropriate, summarized below: • Implement site-specific habitat restoration actions for the areas affected including specifying and using: o The appropriate seed (e.g., certified weed-free, native, and locally and genetically appropriate seed) o Appropriate soils (e.g., topsoil of the same original type on site or that was previously stored by soil type after being salvaged during excavation and construction activities) o Equipment o Timing (e.g., appropriate season, sufficient rainfall) o Location o Success criteria o Monitoring measures o Contingency measures, relevant for restoration, which includes seeding that follows BLM policy when on BLM administered lands. • Salvage and relocate cactus, nolina, and yucca from the site prior to disturbance

Requirement[1]	Description[1, 2]
	using BLM protocols. To the maximum extent practicable for short-term disturbed areas (see Glossary of Terms), the cactus and yucca will be re-planted back to the original site. • Restore and reclaim short-term (i.e., 2 years or less) disturbed areas, including pipelines, transmission projects, staging areas, and short-term construction-related roads immediately or during the most biologically appropriate season as determined in the activity/project-specific environmental analysis and decision, following completion of construction activities to reduce the amount of habitat converted at any one time and promote recovery to natural habitats and vegetation as well as climate refugia and ecosystem services such carbon storage.
CMA LUPA-BIO-8	All activities that are required to close and decommission the site (e.g., renewable energy activities) will specify and implement project-specific closure and decommissioning actions that meet the approval of BLM, and that at a minimum address the following: • Specifying and implementing the methods, timing (e.g., criteria for triggering closure and decommissioning actions), and criteria for success (including quantifiable and measurable criteria). • Recontouring of areas that were substantially altered from their original contour or gradient and installing erosion control measures in disturbed areas where potential for erosion exists. • Restoring vegetation as well as soil profiles and functions that will support and maintain native plant communities, associated carbon sequestration and nutrient cycling processes, and native wildlife species. • Vegetation restoration actions will identify and use native vegetation composition, native seed composition, and the diversity to values commensurate with the natural ecological setting and climate projections.
CMA LUPA-BIO-10	Consistent with BLM, state, and national policies and guidance, integrated weed management actions, will be carried out during all phases of activities, as appropriate, and at a minimum will include the following: • Thoroughly clean the tires and undercarriage of vehicles entering or reentering the project site to remove potential weeds. • Store project vehicles on site in designated areas to minimize the need for multiple washings whenever vehicles re-enter the project site. • Properly maintain vehicle wash and inspection stations to minimize the introduction of invasive weeds or subsidy of invasive weeds. • Closely monitor the types of materials brought onto the site to avoid the introduction of invasive weeds and non-native species. • Reestablish native vegetation quickly on disturbed sites. • Monitor and quickly implement control measures to ensure early detection and eradication of weed invasions to avoid the spread of invasive weeds and non-native species on site and to adjacent off-site areas. • Use certified weed-free mulch, straw, hay bales, or equivalent fabricated materials for installing sediment barriers.
CMA LUPA-BIO-11	Implement the following CMAs for controlling nuisance animals and invasive species: • No fumigant, treated bait, or other means of poisoning nuisance animals including rodenticides will be used in areas where Focus and BLM Special Status Species are known or suspected to occur. • Manage the use of widely spread herbicides and do not apply herbicides effective against dicotyledonous plants within 1,000 feet from the edge of a 100-year floodplain, stream and wash channels, and riparian vegetation or to soils less than 25 feet from the edge of drains. Exceptions will be made when targeting the base and roots of invasive riparian species such as tamarisk and *Arundo donax* (giant reed). Manage herbicides consistent with the most current national and California BLM policies. • Minimize herbicide, pesticide, and insecticide treatment in areas that have a high risk for groundwater contamination.

Requirement[1]	Description[1, 2]
	• Clean and dispose of pesticide containers and equipment following professional standards. Avoid use of pesticides and cleaning containers and equipment in or near surface or subsurface water. • When near surface or subsurface water, restrict pesticide use to those products labeled safe for use in/near water and safe for aquatic species of animals and plants.
MM VEG-CEQA-1	The overall purpose of this measure is to develop and implement a Vegetation Management Plan; however, within this measure holds the CEQA requirements of post-construction surveys, monitoring, and reports related to vegetation restoration. The Vegetation Management Plan shall detail procedures to manage, monitor, mitigate, and restore native vegetation and habitat, as well as provide controls for noxious and invasive weed species. The Vegetation Management Plan shall incorporate the APMs, BMPs, and CMAs, by including the specifications detailed in the Habitat Restoration and Monitoring Plan, the Noxious Weed Management Plan/Invasive Species Management/Control Plan, and all other applicable vegetation management mitigation and monitoring plans associated with the Project.
CMA LUPA-BIO-VEG-1	Management of cactus, yucca, and other succulents will adhere to current up-to-date BLM policy.
CMA LUPA-BIO-VEG-2	Promote appropriate levels of dead and downed wood on the ground, outside of campground areas, to provide wildlife habitat, seed beds for vegetation establishment, and reduce soil erosion, as determined appropriate on an activity-specific basis.
CMA LUPA-BIO-VEG-3	Allow for the collection of plant material consistent with the maintenance of natural ecosystem processes.
MM VEG-CEQA-4	Compensation for impacts to special-status plant species and sensitive communities; specific to reclamation and/or restoration of vegetation includes the following: <u>Onsite Compensation:</u> Compensation for unavoidable temporary impacts to special-status plant species shall include on-site habitat restoration with similar species compositions to those present prior to construction at a ratio of 1:1. Restoration measures shall be documented in the Vegetation Management Plan (MM-VEG-CEQA-1), as well as the Special-Status Plant and Sensitive Vegetation Community Mitigation and Monitoring Plan. <u>Off-Site Compensation:</u> It was assumed that Project-related impacts would result in the loss of more than 10 percent of the on-site population of any special-status plant species with a CRPR of 1 or 2. Compensation for permanent impacts to special-status plant species based on the results of the floristic surveys shall include off-site creation, enhancement, and/or preservation or participation in an established mitigation bank program at a minimum 3:1 replacement ratio. DCRT or their Construction Contractor(s) shall coordinate with CPUC, BLM, and CDFW to determine the appropriate mitigation strategy and final replacement ratios and acreages. All mitigation shall be approved by the appropriate federal and state regulatory agencies prior to Project activities. DCRT or their Construction Contractor(s) shall restore all temporary impacts to sensitive vegetation communities (e.g., blue Palo Verde [*Cercidium floridum*]-ironwood [*Olneya tesota*] woodland, mesquite [*Prosopis* spp.] thickets, bush seepweed [*Suaeda nigra*] scrub, etc.) and special-status species habitat at a minimum ratio of 1:1, as detailed in the Vegetation Management Plan (MM-VEG-CEQA-1) and the Special-Status Plant and Sensitive Vegetation Community Mitigation and Monitoring Plan (MM-VEG-CEQA-4). To compensate for permanent impacts to sensitive vegetation communities and special-status species habitat, DCRT or their Construction Contractor(s) shall provide the creation and/or restoration of habitat at the following ratios: • Permanent impacts to sensitive vegetation communities, (e.g., riparian desert woodland habitats, blue Palo Verde-ironwood woodland, mesquite thickets) shall be mitigated at a ratio of 5:1;

Requirement[1]	Description[1, 2]
	• Permanent impacts to other sensitive vegetation communities shall also be mitigated at a ratio of 5:1; and • Permanent impacts to jurisdictional waters/wetlands shall be mitigated at a minimum ratio of 2:1, or as otherwise specified by the appropriate federal and state regulatory agencies. Off-site compensation lands and/or established mitigation bank program will be identified, if available, in coordination with the appropriate federal and state regulatory agencies. Off-site compensation lands will consist of habitat occupied by the impacted special-status plants at the appropriate ratio of acreage and the number of plants for any occupied habitat affected by the Project. Occupied habitat will be calculated on the Project site and on the compensation lands as including each special-status plant occurrence. Off-site compensation shall be documented in the Project-specific Special-Status Plant and Sensitive Vegetation Community Mitigation and Monitoring Plan and approved in consultation with the appropriated federal and state regulatory agencies. DCRT or their Construction Contractor(s) shall provide for open space/conservation easements on all acquired lands or provide the required funds for the acquisition of easements to a "qualified easement holder"; the CDFW is a qualified easement holder. To qualify as a "qualified easement holder" a private land trust must have substantial experience managing open space/conservation easements that are created to meet mitigation requirements for impacts to special-status species, have adopted the Land Trust Alliance's Standards and Practices, and have a stewardship endowment fund to pay for its perpetual stewardship obligations. DCRT or their Construction Contractor(s) shall also provide the "qualified easement holder" with adequate funds to cover administrative costs incurred during the creation of the easement, funds in the form of a non-wasting endowment to cover the cost of monitoring and enforcing the terms of the easement in perpetuity. For special-status plant restoration or enhancement activities, several techniques can be applied including: Salvage: DCRT or their Construction Contractor(s) shall consult with the designated qualified biologist/botanist, as well as the appropriate federal and state regulatory agencies, regarding the feasibility and likely success of salvage efforts for each special-status plant species. If salvage is deemed to be feasible, then DCRT or their Construction Contractor(s) shall incorporate salvage measures into the Project-specific Special-Status Plant and Sensitive Vegetation Community Mitigation and Monitoring Plan, which shall be approved by the appropriate federal and state regulatory agencies prior to implementation. Propagation and Off-Site Introduction: If salvage and relocation is not believed to be feasible for special-status plants, then DCRT or their Construction Contractor(s) shall consult with appropriate federal and state agencies, as well as other qualified entities if needed, to develop an appropriate experimental propagation and relocation strategy, based on the life history of the species affected. The strategy will include at minimum: (a) a planting methodology including strategies for species specific collection and salvage measures for plant materials (e.g., cuttings), seed, or seed banks, to maximize success likelihood; (b) details regarding storage of plant, plant materials, or seed banks; (c) location of the proposed propagation facility, and proposed methods; (d); time of year that the salvage and other planting or transplantation practices will occur; (e) irrigation; (f) erosion controls; (g) success criteria; and (h) a detailed monitoring program. All propagation and off-site introductions strategies shall be documented in the Special-Status Plant and Sensitive Vegetation Community Mitigation and Monitoring Plan for the Project. Restoration: Restoration can be used to mitigate impacts and depending upon the degree of impact, habitat restoration may be as simple as removing debris and controlling public

Requirement[1]	Description[1, 2]
	access. In more complex situations, however, partial or total restoration of degraded habitat may require extensive revegetation, and soil protection and stabilization programs. The strategy will include at a minimum: (a) BLM approved genetically and ecologically appropriate native plant materials suitable for the site; (b) a description of any required topsoil salvage, plant salvage, seeding techniques, and methods to stabilize and shape soil surface to reduce soil erosivity; (c) monitoring and reporting protocols; and (d) success criteria. Restoration must be tailored to the specific project site based on the habitat and species involved. Monitoring and Maintenance: All mitigation for special-status plant species shall be monitored to assess progress and to make recommendations for successful establishment. Monitoring shall be performed by qualified biologist/botanist that DCRT or their Construction Contractor(s) has designated. At a minimum, Monitoring shall include qualitative and quantitative methods as described in MM VEG-CEQA-1 for the Vegetation Management Plan and MM VEG-CEQA-4 Special-Status Plant and Sensitive Vegetation Community Mitigation and Monitoring Plan. Monitoring shall identify the need for remediation or maintenance work well in advance of final success/failure determination. Monitoring and maintenance progress toward achieving success criteria, conditions, and all observations pertinent to eventual success shall be documented in the Post-Construction Vegetation Management Quarterly Monitoring Progress Reports, and the Annual Post-Construction Vegetation Management Report, as described in the Vegetation Management Plan measure (MM-VEG-CEQA-1). If federally- and/or state-listed plant species are identified within project disturbance areas, then consultation with the appropriate resource agencies will be required to develop acceptable mitigation prior to construction, which may include additional measures. Conservation measures to protect or restore listed special-status plant species, or their habitat, may be required by the appropriate federal and state regulatory agencies before impacts are authorized.
CMA LUPA-BIO-VEG-5	All activities will follow applicable BLM state and national regulations and policies for salvage and transplant of cactus, yucca, other succulents, and BLM Sensitive plants.
CMA LUPA-BIO-VEG-6	BLM may consider disposal of succulents through public sale, as per current up-to-date state and national policy.

[1] APM = Applicant Proposed Measure; BIO = Biological Mitigation Measure; BLM = Bureau of Land Management; BMP = Best Management Practice; CDFW = California Department of Fish and Wildlife; CEQA = California Environmental Quality Act; CMA = Conservation Management Action; CPUC = California Public Utilities Commission; CRPR = California Rare Plant Ranking; DEIS =Draft Environmental Impact Statement; DCRT = Delaney Colorado River Transmission, LLC; LUPA = Land Use Plan Amendment; MM =Mitigation Measure; VEG = Vegetation

[2] The Environmental Impact Statement mitigation measure language was copied from the Project DEIS Appendix 2B and 2C (BLM 2018). References for the requirement descriptions can be found in the source documents.

3 Overview of Existing Environments

The Project is located in the North American Deserts Ecoregion (Level I division) and the Sonoran Basin and Range subdivision (Level III division) (United States Environmental Protection Agency 2013). This ecoregion is characterized by scattered low mountains and has large tracts of federally-owned lands. The majority of the Project area is included within two subdivisions of the Sonoran Desert: Lower Colorado River Valley and Arizona Uplands, represented by various plant associations and habitat types (including physical features).

As stated in the Project's Draft EIS, the Project Area is in the Sonoran Desert subdivision of the physiographic province with elevations from 100 feet above mean sea level (amsl) in the desert valley floor to 4,000 feet amsl in the hills, buttes, and mountain tops (Fenneman 1931).The Arizona mountain ranges in and near the Project area are generally lower than

3,700 feet in elevation with valley bottoms ranging from approximately 300 to 1,200 feet amsl; however, the California flat terrain of the Project area has elevations ranging from approximately 250 to 2,500 feet amsl.

Reclamation actions and treatments will be specific to the Project setting, where the vegetation communities are situated. Resource impacts will be effectively mitigated through these reclamation activities. Reclamation of temporarily disturbed lands would occur primarily during the construction and post-construction phases of the Project. Once pre-construction plant surveys are completed in the field, known vegetation communities will be updated within the POD appendices, as necessary. Descriptions of the following existing environments can also be found within the Vegetation Management Plan (Appendix F-7 of the POD).

3.1 Biotic Communities and Existing Habitat Series

The Project will consider each existing habitat series as reclamation actions are implemented along the ROW. Details on existing environments are based on guidance from land-cover data provided in the Project Draft EIS, the Biotic Communities in the Southwestern United States and Northwestern Mexico (Brown 1994), and the Manual of California Vegetation (California Native Plant Society 2009).

Portions of the Project occur within the Lower Colorado River Valley and Arizona Uplands. The Lower Colorado River Valley subdivision is the most arid subdivision of the Sonoran Desert and is characterized by open vegetative communities with unique flora tolerant of extremely high temperatures. The Arizona Uplands is a mixture of multi-dissected slopes and plains more watered and considered the least desert-like desert scrub in North America (Brown 1994). See below for the vegetation series that the Project intersects within this subdivision.

3.1.1 Creosote Bush-white Bursage Scrub Series

Within the Lower Colorado River Valley subdivision, creosote bush - white bursage (*Larrea tridentata – Ambrosia dumosa*) are widespread occurring from steep slopes to old volcanic rock formations. This series includes other species such as big galleta (*Hilaria rigida*), indigo bush (*Psorothamnus schottii*), longleaf ephedra (*Ephedra trifurca*), and wild buckwheat (*Eriogonum deserticola*). This community is an indicator of “soil arability” where sandy loams occur around plant mounds (Brown 1994; California Native Plant Society 2009).

3.1.2 Allscale Scrub Series

Within the Lower Colorado River Valley subdivision, allscale scrub mixed saltbush seriesor mixed saltbush series (*Atriplex* spp.) generally prefers gently sloped valleys and often creates patches of habitat within creosote bush-bursage habitats. Allscale saltbush (*Atriplex polycarpa*) dominate this shrub canopy that includes four-wing saltbush *(Atriplex canescens*), cheesebush (*Ambrosia salsola*), bladderpod *(Cleome isomeris*), Alkali goldenbush *(Isocoma acradenia*), and creosote bush. The saltbush scrub occurs typically where soils are more saline (Brown 1994).

3.1.3 Blue Paloverde – Ironwood – Woodland Series

Within the Lower Colorado River Valley, a vegetation community referred to as the blue palo verde – ironwood woodland (*Parkinsonia florida – Olneya tesota*) or can be considered desert dry wash woodland (California Native Plant Society 2019). Typically, this series is open to fairly dense assemblages along washes and similar places where blue palo verde, ironwood, desert lavender (*Hyptis emoryi*), indigo bush, jojoba (*Simmondsia chinensis*), and other Sonoran typical species may exist (Brown 1994; California Native Plant Society 2009).

3.1.4 Saguaro – Foothill Palo Verde – Velvet Mesquite Desert Scrub

From the Arizona uplands Subdivision, the most iconic of vegetative series within the Sonoran Desert is the paloverde – cacti – mixed scrub or saguaro (*Carnegiea gigantea*) - foothill palo verde (*Cercidium microphyllum*) - velvet mesquite (*Prosopis velutina*) desert scrub. This series develops from valley floors on bajadas, washes, and mountain sides where broken ground and multi-dissected sloping plains occur. Low cover would include brittlebush (*Encelia farinose*), fagonbush (*Fagonia laevis*), creosote bush, and Hall's purple bush (*Tetracoccus hallii*) and cacti including teddy bear cholla *(CylindropuntiaCylindropuntia bigelovii*), desert ChristmasC cactus (*Opuntia leptocaulis*), pencil cholla (*Cylindropuntia arbuscular*), Engelmann's prickly pearpp (*Opuntia engelmannii*), hedgehog cactus (*Echinocereus fasciculatus*), fishhook pincushion (*Mammillaria microcarpa*), and compass barrel cactus (*Ferocactus acanthodes;* Brown 1994; California Native Plant Society 2009).

3.1.5 Jojoba Scrub Series

A local dominance within the Arizona Uplands is called the Jojoba Scrub. Jojoba is an unusual evergreen shrub with thick, bluish-green foliage and acorn-like fruits popular for game stock to forage. Intermittent with California sagebrush (*Artemisia californica*), can cholla (*Cylindropuntia californica*), hedgehog cactus, Acton's brittlebush (*Encelia actonii*), brittlebush, California buckwheat (*Eriogonum fasciculatum*), broom snakeweed (*Gutierrezia sarothrae*), beavertail cactus (*Opuntia basilaris*), and Mojave yucca (*Yucca schidigera*), this series mostly occurs in the upper limits along open well-drained slopes and alluvial fans (Brown 1994; California Native Plant Society 2009).

3.1.6 Mesquite Series

Mesquite Series, also known as mesquite thickets, bosques, or *Prosopis* woodland alliance, is a dominant mix of mesquite (*Prosopis* spp.) including the honey mesquite (*Prosopis glandulosa*), velvet mesquite, (*Prosopis velutina*), and screwbean mesquite (*Prosopis pubescens*) that tend to exist near areas of intermittently flooded soils or floodplains, stream banks, washes, or surrounding alkali sinks or salty basins within the Lower Colorado River Valley subdivision (Brown 1994; California Native Plant Society 2009).

3.1.7 Bush Seepweed Series

A biotic community of bush seepweed (*Suaeda nigra=Suaeda moquinii*), iodine bush (*Allenrolfea occidentalis*), saltbush spp., and desert broom (*Baccharis sarothroides*), that can occur around areas of high salt concentrations like margins of dry or wet lakes within the Lower Colorado River Valley subdivision (Brown 1994; California Native Plant Society 2009).

3.1.8 Creosote Bush Scrub

The creosote bush scrub mirrors the creosote bush-white bursage series with creosote bush dominating, but white bursage and big galleta plants less important and exist on alluvial fans, bajadas, or upland slopes with pavement surfaces (California Native Plant Society 2009). Other common plants include spiny hopsage (*Grayia spinosa*), saltbush spp., Mojave yucca, brittlebush, bladder sage (*Salazaria mexicana*), shadscale saltbush (*Atriplex confertifolia*), and Nevada ephedra (*Ephedra nevadensis*; Brown 1994).

3.1.9 Other Land Use Cover

Other land use cover categories that the Project intersects include agricultural lands (irrigated row and field crops), urban or residential landscape, and open water including the Colorado River (BLM 2018). DCRT will coordinate with private landowners in areas where the Project crosses private properties.

It is crucial for reclamation efforts of the Project to match the specific ecological communities disturbed, to the maximum extent practicable. Reclamation actions including topsoil salvage provides seeds and organic materials typical of a certain area which are important for ecological recovery (see Section 5.1.6). During pre-construction efforts, plants including mature trees, sensitive species, succulents, and cacti will be assessed if preservation or transplanting actions can be applied (see Sections 5.1.3 and 7.1.4). The Succulent Management Plan within the Vegetation Management Plan (Section 15 within Appendix F-7 of the POD) provides planting and transplanting specific to succulent species. The Special Status Plant Transplantation Plan and Compensation Plan within the Vegetation Management Plan (Section 16 within Appendix F-7 of the POD) provides more details on transplanting and preserving of special status plant species. Native forbs, herbaceous flowering plants, shrubs, and grasses that are dominant to the specific disturbed region will be used within the Project seed mixes, as approved by the BLM (see Section 5.2.3).

4 Reclamation Levels

The purpose of establishing Reclamation Levels (RL) is to assist with the implementation of reclamation activities. Project modification or variances may occur, and these RLs provide clear guidance on what reclamation activities will be required for those changes. Each RL was determined based on type(s) of construction activity, facility features, the area of associated disturbance, and disturbance type and duration. Activities associated with Project construction of principal and supplemental facilities include:

- Surveying the Project centerline and work areas.
- Pre-construction resource surveys for sensitive resources and noxious weeds.
- Upgrading or construction of access roads (temporary and permanent).
- Clearing and grading activities.
- Excavating and installing foundations.
- Structure assembly and installation on pad sites (temporary and permanent).

- Stringing conductors and ground wires.
- Clean-up and reclamation of affected areas.

Details of these activities and their associated disturbance characteristics can be found in Section 4.2 and within Project Disturbance described within the POD (Section 3.4.1 of the POD). The following subsections will break down disturbance duration and types as well as the five RLs based upon Project activities and disturbances.

4.1 Disturbance Durations

Disturbance duration would be either temporary or permanent. These are subsequently described and include details on construction activities that are associated with each disturbance duration.

4.1.1 Temporary Disturbances

Temporary disturbance areas include those intended for short-term use during construction during the Project. Roads and areas only needed for the construction of the line but not for operation and maintenance will be fully reclaimed to previous contours to match surrounding topography to the extent practical. These areas include but are not limited to:

- Structure sites; typical temporary work area assumed for each structure, with exception to the structure base dimensions (long-term disturbance for operation and maintenance).
- Puller/tensioner sites; area of work where conductor, shield wire, and pulling equipment (i.e., puller, tensioner, wire wheels, wire boats) must be stationed in order to pull, string, and create the necessary tension of wire required transmission line support; roads placed for the access to puller/tensioner and guard pole sites will be fully reclaimed and seeded during the reclamation phase.
- Laydown yards; synonymous for material staging and storing.
- Access roads; temporary access roads required to access the structure sites and not needed for operation and maintenance of the line (i.e., spur roads).
- Turn-outs or pull-outs; areas along access roads that provide an appropriate location for turning and moving aside the road safely and remain within the approved ROW limits.
- Snub sites; area where conductor is temporarily fixed or attached to the ground for conductor-sagging purpose.
- Helicopter fly yard; areas for supporting helicopter construction only.
- Guard structures or guard pole sites; temporary clearance structures set up over highways, transmission lines, structures, waterways, and other obstacles prior to conductor stringing.

Blading within temporary disturbances are generally allowed with the purpose of leveling the site but will be restored after construction activity ceases. For more details on all Project-related construction activities and features, see Section 3 and 4 of the POD.

4.1.2 Permanent Disturbances

Permanent disturbance areas include those intended for long-term use for Project operation, and maintenance activities after construction is completed. This includes areas where a blading has permanently transformed the landscape by removing vegetation and leveling the sites (see Section 3.1 of the POD). Examples include, but are not limited to:

- Structure base sites; areas within structure sites required for long-term maintenance and operation of the structures.
- Access roads; new access roads located outside the ROW or access roads to each structure site for long-term maintenance and operation of the transmission line.
- Guyed-V; structures that include a single footing and four support guy wires anchored into the ground.
- Series Compensation Station (SCS; see Section 3.1.11 of the POD); proposed SCS and Site-Distribution Line that will be permanent, with the exception of distribution structure sites (temporary disturbance).

Existing access roads and pre-disturbed areas that are not Project-related disturbances are also categorized as permanent disturbance (“no new disturbance”). These areas would not require improvements by the Project (i.e., vegetation removal, grading); and thus, would not require reclamation actions.

Table L-1-3 identifies the anticipated construction features and describes the area of potential temporary or permanent disturbance within the Project. Two construction features are represented in temporary and permanent disturbance durations.

For all roads that remain in place for operation and maintenance of the Project, travel surfaces in the width of the roadbed will be permanent disturbance, with the road-base intact and unseeded. Cuts and fills to support the permanent road matrix will remain in place with clean-up activities performed. Such activities include: berms rounded to a reasonable slope that would remain in place for safety, erosion, and sediment control. In low-lying slopes, berms may be track walked to a lower height than necessary for steep areas and allow wildlife (e.g., desert tortoise [*Gopherus* spp.]) to safely escape the road bed. Reinforced water bars will be placed on roads up to the operator’s discretion.

Fill may be pulled up or rounded and blended in a roughened state for seed bed preparation, with seeding to follow completion of reclamation dirt work activities. It is assumed that only the permanent width of the travel surface is accounted for as permanent disturbance and cuts and fills reseeded are considered temporary disturbances.

TABLE L-1-3 CHARACTERISTICS OF CONSTRUCTION DISTURBANCE FOR THE PROJECT[1]

Construction Feature	Description[2]
Temporarily Disturbed Land	
Structure sites	Estimated total work sites to be approximately 200 feet by 200 feet or maximum 1.1 acre (the total number of structures will be determined when the route is finalized)
Wire pulling/tensioning sites	Dimensions estimated 500 feet by 200 feet
Snubbing sites	Estimated 200 feet by 600 feet
Laydown yards	Anticipated four sites totaling 34.5 acres
Access roads (improve existing, spur, pull-out, and new)	Access roads estimated for 16-foot surface and 2-foot-wide berms on each side = 20 feet[3]; maximum 18-foot-wide[3]e; see Table 3.3 of the POD (if pullouts are required = 10-foot-wide by 150 feet length[3])
Helicopter fly yards	Preliminary fly yards (total of four) estimated between 5.8 acres to 43.5 acres; see Table 3.8 of the POD
Guard structure sites	50 feet by 200 feet (10,000 square feet) work area at each structure (2 typical per crossing; additional at highways)
SCS Site-Distribution Line[4]	15 feet by 40 feet per structure
Permanently Disturbed Land	
Structure base sites (within structure sites)	Dimensions estimated 50 feet by 50 feet for structure base site and 9 feet by 9 feet for each foundation
Access roads (improve existing, spur, and new)	From 16-foot to 22-foot travel surface[3]
Guyed-V structures	Estimated 81 square feet with a 9-foot by 9-foot base; total 84.1 square feet per structure
SCS[4]	Estimated 200 feet by 315 feet fenced area and additional 10 feet of disturbance outside the fenced area; total permanent disturbance approximately 1.7 acres
SCS Site-Distribution Line[4]	18-inch radius per structure

[1]Table derived from EC Source 2017a.
[2]Details derived from Section 3 of the POD.
[3]If existing roads need to be improved beyond existing disturbance widths, depending on degree of slope and amount of displaced soils, the maximum total disturbance width is 30 feet, with exception to Copper Pass Bottom Pass maximum total disturbance width of 50 feet (Section 3.1.10 of the POD).
[4]SCS = Series Compensation Station

4.2 Disturbance Types

Four broad disturbance types are defined based on activities associated with the construction or Project facilities and are considered when identifying the appropriate RLs and practices. These disturbance types are described below.

4.2.1 No New Disturbance

No new disturbance includes existing access roads or pre-disturbed locations that do not require improvements and will remain permanent after Project construction is complete.

4.2.2 Drive and Crush

Vegetation is crushed by equipment and, generally, not cropped or removed from the site. Soil compaction occurs, but no surface soil is removed, preserving existing root mass and topsoil so vegetation may re-sprout after the conclusion of construction. “Drive and crush” will likely be used for Project wire-stringing sites and helicopter fly yards where possible.

4.2.3 Clear and Cut

Vegetation is brushed off the work area in order to provide suitable access for equipment and vehicles. The soil is compacted, but no surface soil is removed (i.e., no blading of topsoil).

4.2.4 Grade

Similar to “clear and cut,” all vegetation is removed within the work area; however, surface soils are either altered or displaced to another location upon review and approval of the CIC. This provides suitable access for equipment and vehicles as well as the installation of structures. Typically, the work area can require a heavier level of ground disturbance and, in some cases, work requires grading and filling (i.e., removed soil becomes the fill material) for new access roads, clearing and grading that may be associated with structure installation, or improve existing access.

Based on the type and duration of disturbance associated with the construction features of the Project, each level of reclamation can be identified below.

4.3 Reclamation Levels Defined

4.3.1 Reclamation Level 1 (RL1)

RL1 is characterized by a minimal level of disturbance and a minimal level of reclamation intensity (Permanent). Construction in these areas produces no new disturbance, requiring minimal pre-construction treatment, and will normally require no post-construction actions (outside of routine maintenance). As described below in Section 5.1.1, some RL1 areas will require pretreatment of existing weeds to protect from the infestation and spread of noxious weeds.

4.3.2 Reclamation Level 2 (RL2)

RL2 is characterized by a low level of disturbance and a moderate level of reclamation intensity (Temporary). Construction and disturbance activities in these areas are temporary, resulting in disturbance being confined to overland construction. Vegetation crushing will require a moderate level of reclamation actions. As presented below in Section 5, reclamation actions focus on noxious weed control and soil decompaction.

4.3.3 Reclamation Level 3 (RL3)

RL3 is characterized by moderate level of disturbance and a high level of reclamation intensity (Temporary). Construction in these areas produces moderate temporary disturbance that requires clearing, cutting of vegetation, and several reclamation actions as presented in Section 5. In addition, cleared vegetation will be used as mulch cover, and supplemental mulch (e.g., straw certified weed-free by California County Agricultural Commissioners in conjunction with the California Department of Food and Agriculture) may be used to protect cleared areas. As appropriate, areas of reclamation will be flagged, or signage installed to provide protection.

4.3.4 Reclamation Level 4 (RL4)

RL4 is characterized by a moderate/high level of disturbance and a moderate level of reclamation intensity (Permanent). Construction in these areas produces a high level of permanent disturbance. These areas are associated with long-term maintenance and operation of the Project; specifically, new permanent access roads and structure pads. Minimal reclamation action is required including no revegetation and minimal soil replacement. Topsoil should be salvaged to be used in other areas slated for topsoil replacement.

4.3.5 Reclamation Level 5 (RL5)

RL5 is characterized by a high level of disturbance and the maximum level of reclamation intensity (Temporary). Construction in these areas produces a high level of disturbance, due to vegetation and soil removal. This reclamation level applies to long-term reclamation areas such as wire pulling/tensioning sites, construction yards, and laydown areas located on federal lands. These areas require the maximum level of reclamation actions including soil and plant salvage, ongoing weed control, topsoil replacement, monitoring transect selection, earthwork, reseeding, replacement of soil and mulch, transplant salvage, signage, supplemental mulch, and post-construction monitoring (more details in Section 5).

Table L-1-4 provides the relationship between the disturbance types, disturbance durations, and RLs.

TABLE L-1-4 RECLAMATION LEVELS – DISTURBANCES*

Disturbance Type	Disturbance Duration	
	Permanent	Temporary
No New Disturbance	RL1	-
Drive and Crush	-	RL2
Clear and Cut	-	RL 3
Grade	RL 4	RL 5

*Table derived from EC Source 2017a.

Table L-1-5 demonstrates how the relationships identified in Table L-1-4 are applied to construction features.

TABLE L-1-5 RECLAMATION LEVELS – CONSTRUCTION AND DISTURBANCE[1]

Construction Feature	Disturbance Type	Disturbance Duration		Reclamation Level
		Permanent	Temporary	
Structure sites (base area permanent)	Drive and crush		X	RL2
	Clear and cut		X	RL3
	Grade	X	X	RL5
Wire pulling and tensioning sites[2]; laydown yards; fly yards	Drive and crush		X	RL2
	Clear and cut		X	RL3
	Grade		X	RL5
SCS and Site-Distribution Line; Guyed-V structures	Grade	X		RL4
Existing paved roads, access roads (no improvements)	No new disturbance	X		RL1
Existing access roads (with improvements)	Grade	X		RL4
New access road	Drive and crush		X	RL2
	Clear and cut		X	RL3
	Grade	X	X	RL4/RL5

[1]Table derived from EC Source 2017a.
[2] Wire pulling and tensioning sites within Copper Bottom Pass and Plomosa Mountains will require grading; possibly temporary disturbance.

5 Description of Reclamation Actions

Reclamation actions are physical treatments and activities that will occur throughout each phase of the Project, specified for each reclamation area. They are specific to the RLs

previously discussed and illustrated below in Table L-1-6. These actions will facilitate resource protection during construction, recovery for areas temporarily disturbed by Project construction and promote the re-establishment of native vegetation that is similar in species composition cover and diversity to pre-construction condition.

All reclamation actions described in this Plan are consistent with the relevant mitigation measures defined in Table L-1-1 and Table L-1-2 and will be updated, as necessary, upon finalization of the Final POD. Table L-1-6 illustrates appropriate reclamation actions and RLs for each phase of Project construction (pre-construction, construction, and post-construction). Locations of the reclamation areas, facility features, disturbance types, and vegetation communities will be identified in the Project Layout Maps (Appendix A of the POD).

Specifically, Table L-1-6 is a discernment tool for RLs presented in Table L-1-5 as they occur in the reclamation area. If a project variance is required due to unforeseen environmental or engineering constraints, Table L-1-6 provides guidance to determine which reclamation actions should be applied and where modifications may be required. As described below, pre-construction actions are those that occur before the construction of the Project is initiated. Their purpose is to preserve resources or features of interest and include activities associated with ROW preparation for reclamation and pre-construction activities. Post-construction actions concentrate on activities scheduled after Project construction has been completed, such as reclamation and maintenance activities.

TABLE L-1-6 RECLAMATION LEVELS AND ACTIONS[1]

Reclamation Actions	RL1	RL2	RL3	RL4	RL5
Pre-construction					
Noxious Weed Abatement Implementation	X	X	X	X	X

Monitoring	X	X	X	X	X

[1] Table derived from EC Source 2017a.

[2] RL – Reclamation Level.

5.1 ROW Preparation and Pre-construction Actions

ROW preparation consists of installing flagging to demarcate the ROW boundaries, sensitive areas, access road limits, and construction work areas. Pre-construction plant surveys and ROW assessments provide baseline information to gauge reclamation success (see Vegetation Management Plan; Appendix F-7 of the POD). This also helps increase focus on protecting sensitive areas and resources; specifically, by recording sensitive plants to preserve in place, identifying areas infested by noxious weeds, and documenting of potential storage areas for soil and organic materials (i.e., dead plants, rocks). In addition, site monitoring will also be established, as described in Section 7 of this Plan.

Project construction and disturbance shall commence after all ROW preparation and pre-construction actions have been completed. Pre-construction action for reclamation purposes are defined in detail below and organized by their sequence of implementation. Note that some actions may be concurrent.

5.1.1 Noxious Weed Abatement Implementation

Guidelines are provided in the Noxious Weed Management Plan (Section 5 within Appendix F-4 of the POD), to implement noxious weed treatments where they are present along the Project ROW as well as addressing the preventative measures to control the spread of noxious weeds during construction (see APM-BIO-12 in Table L-1-1). These actions are key in minimizing impacts to sensitive plants. Once the pre-construction control measures have been implemented, subsequent actions for ROW preparation may proceed.

5.1.2 Vegetation Inventory

As stated in APM/BMP-BIO-15 and APM-BIO-26 in Table L-1-1 and MM VEG-CEQA-1, vegetation inventory will be conducted by the Construction Contractor(s) or Reclamation Subcontractor (see Vegetation Management Plan; Appendix F-7 of the POD). The focus of inventory includes cacti and succulent specimens suitable for “preserve in place” or “plant salvage” (see Succulent Management Plan; Section 15 within Appendix F-7 of the POD).

5.1.3 Preserve in Place

This treatment includes the preservation of existing vegetation to reduce visual impacts and/or when mature or sensitive plant specimens are present to enhance habitat recovery (see aesthetics [AES] APM/BMP-AES-02). This preservation of specimens may be requested by the BLM as well as recommended by the Construction Contractor(s) and/or Reclamation Subcontractor on a case-by-case basis.

Eligible specimens may include mature trees, sagebrush, succulents, and/or sensitive species. Diverse vegetation groupings would provide seed and a microclimate for future seedling germination. Flagging or fencing of eligible specimens should be completed prior to ground disturbance. The Construction Contractor(s) shall ensure any Project activity will not disturb the specimens.

5.1.4 Plant Salvage

In accordance with Table L-1-6 and required in BMP-BIO-41 and BMP-BIO-43, succulent plants may be considered for salvage if they will potentially be impacted by construction activities and are in a healthy condition as determined by the Reclamation Subcontractor and/or Environmental Compliance Manager (ECM).

The Vegetation Management Plan and Succulent Management Plan (Appendix F-7 of the POD) will identify succulent species, appropriate plant sizes for salvaging, specialized transport techniques of salvaged plants, storage, maintenance, and replanting. This plan shall be approved by the BLM prior to site disturbance.

The Construction Contractor(s) shall appropriately flag eligible plants for salvage. A list describing quantity and species of plants that were salvaged will be provided by the Construction Contractor(s) or the Reclamation Subcontractor to the BLM upon completion of salvage activities. The Construction Contractor(s) or Reclamation Subcontractor will transplant salvaged plants out of harm's way to designated areas, approved by the ECM.

Plants salvaged from permanent disturbance locations are only to be moved once and replanted in their final location. Studies in Arizona have shown moving salvaged plants multiple times can lead to lower survivability and undue stress on the individuals (Arizona Department of Transportation Research Center 2012; Arizona Public Service Electric Company [APS] 2017). Therefore, the "once-move" technique should be evaluated as a better suited option in lieu of nurseries.

5.1.5 Monitoring Transect Selection

As discussed below in Section 8, preliminary site monitoring locations shall be established along the ROW, based on Project engineering data provided during pre-construction surveys (see Vegetation Management Plan; Appendix F-7 of the POD). Sites shall be selected for the reclamation areas and vegetation communities traversed by the Project. The number of sites will be provided to the BLM. Once monitoring site locations are finalized, photographs shall be taken prior to any construction-related disturbance.

5.1.6 Topsoil Segregation

Required under APM/BMP-BIO-15, BMP-SOIL-01, and MM VEG-CEQA-1, this treatment includes the separation and setting aside of topsoil containing organic material and the seed-base of plants for post-construction replacement. In addition, the Construction Contractor(s) is to conduct topsoil salvage and include all rocks and vegetation as mulch. The depth of topsoil separation is dependent on the soil type where the reclamation activity occurs.

This topsoil should be labeled clearly and securely to protect inadvertent use as fill. Topsoil shall never be mixed with subsoil and separation from subsoils shall be maintained. When stockpiled, topsoil shall be protected from erosion, through the application of tackifiers, water, the establishment of a cover crop, tarp covers weighted down, or other methods. Disruption of stockpile topsoil shall be kept to a minimum.

5.2 Post-Construction Actions

Post-construction reclamation actions occur after the Project has been completed. These treatments focus on stabilizing permanent use areas and reclaiming temporary areas for re-establishment of native vegetation. Reclamation activities would commence following the completion of construction activities in an area. Post-construction reclamation actions are defined below and are organized by their sequence of implementation.

5.2.1 Earthworks

These activities may include recontouring, soil decompaction, and the application of appropriate soil erosion preventative measures. Earthmoving equipment replaces the removed material as close to the pre-construction contour as possible to restore the visual quality and provide stability to the slope (see APM/BMP-AES-02 in Table L-1-1). Soil decompaction may include ripping or scarifying to a depth below the root zone to promote water infiltration and root penetration (see BMP-SOIL-01 and MM VEG-CEQA-1). Erosion control measures such as water bars may be installed at the discretion of the Construction Contractor(s) and/or ECM. As indicated within Section 4.14.2 of the POD, all permanent travel surfaces will be left with an in-slope to cut bank, and water bars as necessary to reduce long-term erosion on road surfaces. Berms will be rounded or compacted to reduce visual contrast and will remain in place for safety purposes on slopes while allowing wildlife to safely escape road beds.

Recontouring also includes backfilling excavated holes and trenches during construction activities so that the natural terrain contours are maintained to the extent practicable. The Construction Contractor(s) will evenly distribute excess subsoil from excavated or graded areas (around transmission structure bases) over disturbed areas, to be moistened and compacted to a relative average density comparable to undisturbed adjacent material before re-spreading topsoil. A BLM designated representative will review and approve soil reclamation treatments (see BMP-SOIL-02). Subsoils will not be spread outside flagged construction areas and will be restricted to areas of permanent disturbance, if possible. Excessive subsoils that cannot be reasonably spread (i.e., those that would substantially change the grade of recontouring compared to adjacent conditions, or subsoils with an excessive depth that may impair ROW rehabilitation and reclamation) will be removed to an approved disposal site.

Where decompaction is required, the surface will be ripped or scarified to a depth of six inches as appropriate (e.g., not applicable to rock faces, severe slopes, or cliff areas), and will retain a buffer from existing vegetation or plants designated as “preserve in place.” Depth and area of compaction relief will depend on site-specific conditions and BLM would review and approve, as appropriate, the scarification type and location (see BMP-SOIL-01). Cross-ripping is preferable, and care should be taken to preventing inversion of the soil layers and preserve any vegetation in place. Deep sandy soils do not need to be decompacted and will not be ripped. Noxious Weed Abatement Implementation actions are included in post-construction monitoring and treatment, as necessary.

5.2.2 Topsoil Replacement

Salvaged topsoil will be replaced and dispersed evenly over the surface of disturbed sites. The purpose of this practice is to prevent mixing fertile, shallow soils with deeper infertile soils that may be less productive in the re-establishment of habitats due to rock, gravel, sand, calcareous layers, salinity or other chemical components that would adversely affect

the desired vegetation. The site will be left adequately rough after surface soil placement to provide micro sites for seed germination and to prevent significant movement of soil by seasonal weather events (wind or rain). In addition, further erosion control and soil stabilization methods (i.e., hydromulch) may be required to minimize soil movement, particularly for heavily sloped areas or for fine-textured soils. Surface soil will not be handled excessively during windy conditions.

5.2.3 Seeding

As stated in VEG-CEQA-1, reseeding involves planting new seed of desired plant species in affected areas. Federal land management agencies will approve the appropriate seed mix of species best suited to each reseeding site. A BLM or agency designated botanist or Authorized Officer will approve the seed mixes, seeding method, amendments, and timing. Further descriptions on preferred methods and plant palettes is found in the Vegetation Management Plan (Appendix F-7 of the POD).

The federal land-management agencies will be open to suggestions for seed mix revision, but they must approve any changes suggested by the Construction Contractor(s). Seed mixes will be based on vegetation communities described in Section 3 – Overview of Existing Environments and site-specific vegetation conditions identified in the field by the Construction Contractor(s) or Reclamation Subcontractor and approved by a BLM Authorized Officer. Reseeding shall be conducted at the first appropriate time after completion of construction (required for air quality, see BMP-AQ-01 in Table L-1-1).

5.2.4 Alternative Seeding

Within the Arizona portion of the Project, alternative seeding is primarily administered for ground cover in disturbed or weed infested areas by seeding of annual grasses and/or forbs. Annuals provide short-term soil cover, stabilization and a source of organic litter until other vegetation can become established (required for air quality BMP, see BMP-AQ-01 in Table L-1-1). Standard or priority reclamation areas may be treated with this reclamation action to manage noxious weed infestations. The annual grasses are usually sterile rye or oats since the regeneration of non-natives is not desirable. Similar to regular seeding, alternative seed mix compositions and methods of dispersing seeds will be determined through coordination with a BLM representative. See also the Vegetation Management Plan (Appendix F-7 of the POD).

5.2.5 Transplant Salvage

In coordination with a qualified BLM specialist, succulent plants, such as cacti, yucca, and agave species will be replanted in the same general location (as much as possible) and with the proper compass orientation as recorded prior to initial removal (as stated in BMP-BIO-41 in Table L-1-1). Plants transplanted from permanent use areas will be relocated to areas adjacent to the ROW, as close as possible to original conditions and similarly oriented. All salvaged plant material will be replanted in natural patterns. Saguaros (*Carnegiea gigantea*) and large yucca species will be carefully removed from the ground, taking care to not damage stems, roots or the base of the plant. Yuccas will be re-planted in groups of three or more for a natural effect. Each transplant will be filled with water and allowed to drain once.

Salvaged plants may require the installation of temporary protective measures to minimize herbivory and/or disturbance from off-highway vehicle users. Prior to removal of saguaros,

BLM requires a qualified biologist to inspect flagged saguaros for nests to avoid impacts to migratory birds during the nesting season (February 15 through August 1). The plants will be adequately maintained for one full year to ensure protective measures are intact. If salvaged plants are in an area susceptible to off-highway vehicle access, the closure of access roads may be recommended in specific areas, as approved by the BLM.

Salvaged succulents may be strategically placed or concentrated in certain areas to deter access. A combination of plants, snags or rocks may be used in these areas, where appropriate, as directed by the BLM. Transplantation and maintenance of plant material will be performed in accordance with the survival rates and success criteria described below in Section 8. See the Succulent Management Plan and Vegetation Management Plan for further descriptions on plant and succulent salvage as well as requirements for saguaros (both plans within Appendix F-7 of the POD).

5.2.6 Supplemental Mulch

Mulch usually consists of shredded plant material (i.e., hydroseeding, or similarly bonded fiber matrix mulch), but also includes wood fiber, paper mulch or biodegradable erosion matting. Due to straw mulch not being conducive to desert conditions (significantly slow biodegradation), hydroseeding, wood fiber, use of tackifiers, or erosion blankets would be the most favorable option. Hydroseeding is also a viable seeding method.

The quantity of mulch to be used will be recommended based on site conditions and will be installed according to the manufacturer's specifications. Alternative mulches will be certified weed-free as specified in the Noxious and Invasive Weed Management Plan (Section 18 within Appendix F-7 of the POD).

5.2.7 Off-highway Vehicle Deterrents

Operation of off-highway vehicles can cause physical damage to stabilization structures and soils as well as mortality to plants. Access by such vehicles will be limited in areas of reclamation. Measures to control off-highway vehicles and other unauthorized vehicle use of the ROW will be determined in coordination with the BLM at the appropriate time.

Specific areas of potential access to the ROW by off-highway vehicles will be identified and measures to minimize and discourage access will be developed as appropriate. These measures may include the installation of signs, fences with latching/locking gates, selectively placed boulders and salvage transplants, and/or mulch of heavy woody material.

When instances of unmanaged off-highway vehicle traffic occur, they will be accurately documented in a timely manner and provided to the BLM. Development of off-highway vehicle deterrents will be determined on a case-by-case basis based on BLM requirements and Construction Contractor(s) recommendations.

5.2.8 Signage

Reclamation areas will require informational signs pertaining to reclamation efforts in order to prevent further disturbance by the public. DCRT will install and provide notification of sign locations to the BLM, following completion of post-construction reclamation actions and prior to the initiation of reclamation monitoring.

5.2.9 Reclamation Monitoring

As stated in MM VEG-CEQA-1, reclamation monitoring will be conducted prior to construction and continue through post-construction phases of the Project – see Section 6. Evaluation of reclamation success will be based on criteria as described in Section 6.3. See also the Vegetation Management Plan (Appendix F-7 of the POD).

5.3 Modifications and Field Changes

Adjustments to RLs or actions by the Construction Contractor(s) may be necessary if the Project conditions change. However, any changes to these RLs and the associated reclamation actions will be reviewed and approved by the BLM and/or respective federal land-management agency (i.e., Bureau of Reclamation, Department of Defense, USFWS). Specific guidance on coordination with agencies in the process of implementation of reclamation actions and any associated adjustments are specified in the Environmental Compliance Management Plan (Appendix F-1 of the POD).

This Plan is intended to provide flexibility with respect to construction and unknown constraints that may be encountered in the field. Necessary changes to the original disturbance level or duration will be documented by the Construction Contractor(s) and RLs will be reassessed using Tables L-1-4 and L-1-5 to ensure that appropriate reclamation actions are implemented.

6 Monitoring

In accordance with APM/BMP-BIO-15, MM VEG-CEQA-1, and the Vegetation Management Plan (Appendix F-7 of the POD), post-construction monitoring is required to evaluate reclamation success of restored areas associated with the construction of Project facilities. This section of the Plan will accomplish the following:

1. Describe the purpose of the monitoring process.
2. Define the reclamation monitoring practices to be implemented.
3. Present reclamation goals and success standards.
4. Discuss adaptive management measures and site release from monitoring.

As discussed previously, DCRT, Construction Contractor, and/or Reclamation Subcontractor will be responsible for monitoring reclamation efforts for the Project. Per MM VEG-CEQA-1, reclamation monitoring efforts will be conducted by a qualified biologist that is knowledgeable in vegetation management and restoration specific to the vegetation communities within and adjacent to the Project. Reclamation success standards will be used by the BLM to determine if the implemented reclamation actions have adequately achieved the goals and objectives outlined in this Plan with consideration for the local site conditions. The monitoring practices include standard techniques for monitoring sites, data collection, and the measures used in calculating reclamation success.

Specific monitoring requirements, including the data analysis protocol, will be developed by the Construction Contractor and/or the Reclamation Subcontractor in cooperation with the BLM. This will allow the BLM to make more accurate conclusions pertaining to reclamation

success based on site conditions, such as biotic community and climatic conditions once construction has been completed. Adaptive management may be necessary to determine appropriate remedial actions for sites that have not demonstrated a trend toward reclamation success.

Implementation of remedial actions will be based on the monitoring data and an annual report will be submitted for up to five years following completion of construction. After five years of post-construction monitoring, a final report will be submitted to the BLM summarizing monitoring data, observations and the overall trend toward reclamation. Once the report is accepted by the BLM and the reclamation goals have been deemed achieved, DCRT will be released from further reclamation and monitoring.

6.1 Monitoring Methodology

All monitoring sites will be delineated during pre-construction activities and will include the collection of baseline data for subsequent post-construction monitoring. Post-construction monitoring and data collection will be conducted during spring and/or fall, after construction and reclamation actions are complete. After each monitoring effort, a summary of monitoring information will be provided to the BLM for review and discussion of reclamation conditions. As currently anticipated, construction activities will result in varying disturbance levels that will require two types of monitoring:

- General Route Monitoring – general field reconnaissance (windshield survey) and reporting of conditions in treated areas along the entire length of the Project ROW.
- Site Monitoring – detailed field reconnaissance and reporting at designated reclamation monitoring sites and control areas along the Project ROW.

The Construction Contractor(s) or Reclamation Subcontractor will consult with the BLM in order to adapt these protocols, as needed, and meet localized conditions and concerns. Details of the monitoring types and how these practices will be assigned to the areas affected by the Project is presented below.

6.1.1 Route Monitoring

Route monitoring is a general field review of the entire Project ROW, where accessible by vehicle, to be conducted in conjunction with site monitoring. When an area is not accessible by vehicle, the surveyor can access it on foot or using off-highway vehicles such as a quad or all-terrain vehicle. This review will document the overall recovery conditions associated with the construction of the transmission line. Items reviewed may include but are not limited to: the application of preserved and/or salvaged plants; successful performance of the noxious weed management plan; and/or the performance of erosion prevention techniques applied to a site.

Upon observation of unauthorized access, conditions regarding disturbance it caused along the ROW should be documented. Where reclamation signage and/or deterrents have been removed or damaged, the BLM should be notified so remedial actions can take place. Potential remediation locations should be documented by the transmission line structure number or global positioning system coordinates.

6.1.2 Site Monitoring

Preliminary site monitoring locations (transects) will be established along the ROW where necessary prior to construction. Locations will take into consideration resource data collected during pre-construction surveys and Project engineering data provided in the Project's Layout Maps (Appendix A of the POD). Once the site monitoring locations have been identified, the results will be provided to the BLM to determine the quantity of site monitoring locations required for the Project. Subsequently, BLM will approve the final determination of transect site locations.

Cooperation with the Construction Contractor(s) and/or Reclamation Subcontractor may be necessary immediately prior to construction if changes to the construction work area(s) affect the location of the preliminary transect monitoring site. Once transect locations are finalized, photographs will be taken: (1) prior to any construction-related disturbance, (2) when initial reclamation efforts have been completed, and (3) during each monitoring visit.

Paired vegetation transects will be installed for each transect monitoring site and documented as treatment or control for quantitative monitoring. In general, the treatment transect will be placed within an affected area (normally within the immediate ROW), and the control transect will be placed immediately adjacent to the ROW, on undisturbed ground. Size and quantity of each transect will be based on the final footprint of disturbed areas, in cooperation with the BLM. For consistency, transect pairs should be sized and oriented in a similar manner; especially if terrain or construction conditions require deviation. In addition, the location of transect sites should avoid areas susceptible to future human disturbance (e.g. off-highway vehicle, transmission line maintenance, or planned future utilities), where possible, to preserve the integrity of each transect for the duration of the monitoring period.

Following completion of construction, plots will be examined on a quarterly basis during the first year and biannually during years two and three. Parameters that will be used to measure reclamation success are presented within Section 6.3 of this Plan but may be modified in coordination with BLM and based on the Construction Contractor and/or Reclamation Subcontractor retained to collect the data. During site monitoring, an assessment of noxious and invasive weed establishment will be completed, along with subsequent recommendation for removal or treatment, if necessary. However, it should be noted that monitoring for known noxious weeds locations may occur independently from reclamation monitoring as outlined in the Noxious Weed Management Plan (Section 5 within Appendix F-7 of the POD).

Erosion control will also be considered in reclamation monitoring as a key indicator to measure the trend toward reclamation success (where applicable), and remedial actions may be taken in conjunction with monitoring efforts to control erosion, as recommended by the BLM (refer to BMP-AQ-01 in Table L-1-1). These remedial actions will also follow stipulations in the Fugitive Dust Control Plan and Construction Emissions Mitigation Plan (Appendix H-1 of the POD).

6.2 Monitoring Requirements

Construction features, their disturbance type, and the expected duration associated with these features are addressed by monitoring reclamation according to the RLs and their correspondence with the construction features. A summary of reclamation monitoring requirements for these construction components is shown in Table L-1-7**.**

TABLE L-1-7 RECLAMATION AND MONITORING COMPONENTS[1]

Construction Feature	Disturbance Type	Disturbance Duration		Reclamation Level	Restoration Monitoring
		Permanent	Temporary		
Structure work area	Drive and crush		X	RL2	Route
	Clear and cut		X	RL3	Route
	Grade	X	X	RL5	Route, Site[2]
Wire pulling and tensioning sites; laydown yards	Drive and crush		X	RL2	Route
	Clear and cut		X	RL3	Route
Structure base area	Grade	X		RL4	None
Existing paved roads, access roads (no improvements)	No new disturbance	X		RL1	None
Existing access roads (with improvements)	Grade	X		RL4	None
New access road	Drive and crush		X	RL2	Route
	Clear and cut		X	RL3	Route
	Grade	X	X	RL4/RL5	None/Route, Site[2]

[1] Table derived from EC Source 2017a.
[2] Site monitoring will be conducted for priority reclamation areas where RL5 actions have been implemented.

6.3 Reclamation Goals and Success Standards

Reclamation success is defined by the progression of vegetation and soils towards pre-construction disturbance conditions, to the extent practicable. The primary goal of revegetation will be achievement of at least 70 percent of the pre-construction percent coverage within a 5-year reclamation monitoring period or as further specified by the BLM. Nonetheless, success is dependent on environmental conditions and proper implementation of reclamation actions to avoid future disturbance and protect the natural recovery of vegetation communities.

Reclamation will be pursued immediately on disturbed lands where future operations and maintenance are not needed. The four categories of reclamation success standards include surface and soil stabilization, control sites, revegetation, and landscape reconstruction. These success standards apply on BLM lands, unless additional federally-managed lands are specified. Particular reclamation success standards on private lands and state lands may vary and will be developed in coordination with private landowners and/or the State Land Board, as appropriate.

6.3.1 Surface and Soil Stabilization Standards

Contaminated soils, hazardous materials, or any other undesirable material on a site will be isolated and removed to protect the landscape and reclamation efforts. To conserve soils and minimize erosion or sedimentation, recontouring will try to match the surface of the site according to the natural landscape around the site. Water management techniques will be implemented to establish stable slopes and drainage features (also protecting surface water and groundwater resources). The soil surface must be stable while obtaining adequate surface roughness to reduce runoff and capture rainfall (SWCA 2011).

6.3.2 Control Site Standards

Control sites will exhibit the target plant community that is located adjacent to, or near, the Project-affected treatment sites. Control sites will be established within areas that were not disturbed by the Project and will allow the monitor to objectively assess the progression of reclamation success of the site monitoring locations.

If the final monitoring report provides the evidence that typical environmental conditions are being met, reclamation actions properly implemented, and disturbances are being replaced by vegetation similar to surrounding areas, the Plan is trending towards its goals of success. Target percentages (to be determined by the BLM) of native species cover (amount vegetation canopy per unit) and density (number of plant species per unit) for reclamation success will be evaluated relative to control conditions. Percent cover and density will be based on the quantitative data collected from the control plot for each site monitoring location.

6.3.3 Revegetation Standards

The vegetation will stabilize the sites and support the planned post-disturbance land use, provide for natural plant community succession and development, be self-perpetuating, and noxious weeds will be control in accordance to Appendix 2B of the POD. Revegetation will be deemed successful after the monitoring time frame is complete or when the following revegetation criteria are met (SWCA 2011; EC Source 2017b):

- A self-sustaining, and approved native vegetative stand is established on the site. Vegetation density will be sufficient to control soil erosion as well as non-native plant invasion and re-establish wildlife habitat.

- Seed mixtures will be developed based on site-specific characteristics following BLM guidance. If the first seeding does not exhibit signs of successful stand establishment by the next seeding window, seeding methods will be applied once again. If no evidence of seedlings or seed take is shown, methods and procedures will be re-evaluated, and proposed actions submitted in the annual report. If evidence of growth is occurring after a seeding session, only areas with little to no growth evidence will be treated within the following seeding season. If the same treated areas are not presenting signs of success, methods and procedures will be evaluated with the BLM.

- Diversity of species will be sufficient and established on sites within public lands. No single species within seed mixes will account for more than 30 percent of total vegetative composition on public lands unless it is reflected in adjacent undisturbed reference sites.

- After a vegetative stand is established, individual pad site regrowth percentages must achieve at least 70 percent cover of the adjacent control site percentages within a 5-year reclamation monitoring period or as further specified by the BLM. Desired cover percentages will be based on basal coverage; where the stem meets the ground. Cover percentages will be calculated using the point-intercept method (see below) at each paired control and treatment transect/site monitoring location to collate the ecological growth for each year. No sites can be submitted for release prior to three growth seasons starting from the first seeding session.

- Part of successful revegetation includes maintaining native plant communities with minimal weed occurrences. Reclamation species should be outcompeting weed species within a few years of reclamation initiation; however, total percent cover of these species should be commensurate with adjacent reference sites. The BLM has zero tolerance for state-listed noxious weed species and all noxious weeds will be controlled.

Initial point-intercept data will be collected for each site monitoring location by randomly establishing linear transects within the fully reclaimed area of the site. Transect size and quantity will be determined based on the final footprint of disturbed areas and structure work areas anticipated to be temporarily disturbed, in cooperation with BLM. Study plots must be placed only in areas that were seeded. Transects will be plotted by Universal Transverse Mercator coordinates at the start and end point of each line will be documented in a Project spreadsheet in order to be used for future data collections. The same study plots will be used for each site monitoring season to maintain a baseline of consistency and fairness to all parties. Place holders or “hubs” may be used to mark the start/end location of each plot in the field. No place holder will be used that may pose a risk to plant growth, wildlife, or the public (EC Source 2017b).

Each transect will contain a specific number of points (i.e., one point per 10 centimeters or per foot). Each point that hits a desired species will be tallied, and overall species intercept points will be divided by the overall number of points for that plot. The two plots will then be averaged together for the overall cover percentage of that site. Averaging will be fulfilled by adding the two percentages together and dividing by two. Site percentage must reach 70 percent of control site cover percentages. For example, if a control site percentage yields 80 percent cover, then a 56 percent cover will need to be achieved for that pad site to satisfy release criteria. Field data sheets pertaining to cover percentage calculations will be kept and provided within the annual report (EC Source 2017b).

6.3.4 Landscape Reconstruction Standards

Landscape reconstruction will be deemed successful when the original landform has been restored or approximated for disturbed areas that are not required for regular operations and maintenance activities. For landscape reconstruction to be deemed successful, the reclaimed landscape will have the characteristics that approximate the visual quality of adjacent areas with regard to location, scale, contour, color, and orientation of major landscape features and will support existing and future land uses. Erosional features will be less than or equal to the surrounding area (SWCA 2011).

6.4 Data Collection

Reclamation monitoring will include both quantitative (numerical) and qualitative (descriptive) data collection at the designated monitoring sites approved by the BLM. Quantitative monitoring will document the trend and degree of change at each site while qualitative monitoring will detect the initiation of change and changes resulting from environmental conditions, such as precipitation, allowing for a record of change over time.

Observations of vegetation and soil conditions will be used as the main indicator of reclamation recovery and when assessing progress toward functionality. Measurements and descriptions will be accompanied by photographs that will be used to document the status of recovery at all monitoring sites.

For monitoring consistency, a protocol for photo documentation, sampling points, and standardized data-recording forms will be developed by the Construction Contractor(s) and/or Reclamation Subcontractor. Photographic reference points will be the primary method of qualitative monitoring; however, qualitative and quantitative information will be gathered during the general route monitoring and site monitoring for the Project. Qualitative and quantitative data are described in detail below.

6.4.1 Qualitative Data

Qualitative monitoring provides a tangible method to document site conditions and ensure that sites are progressing toward the success standard established by the BLM. Qualitative monitoring will occur for both routing and site monitoring. Per MM VEG-CEQA-1, qualitative monitoring will be performed monthly in all vegetation management areas for the first year following the completion of the Project and subsequent vegetation management implementations. Thereafter, qualitative monitoring will be conducted on a quarterly basis, until final completion and approval by the BLM. Unpredictable weather patterns may affect reclamation success within the BLM-approved monitoring time frame. Qualitative evaluations conducted at predetermined monitoring sites will serve as a representative indicator for similarly disturbed areas in the same vegetation community. In addition, they will also serve as a baseline when conducting overall route surveys for the remainder of the treated areas within that vegetation community.

Photographic documentation of during data reconnaissance will be taken for accuracy. Photographs of the control sites and structure pad site study areas will be taken with the bi-annual inspections and must contain temporary placards or signs indicating the site location (i.e., “structure 13-2”). Photographs will be included for structure pad sites requesting release by the Construction Contractor(s) or Reclamation Subcontractor.

Any non-Project related disturbances that affect the reclamation success shall be recorded and photographed during route monitoring. In some instances, conflicting land management, grazing habitats, unmanaged off-highway vehicle traffic, severe weather events, or overlapping construction of other projects may inhibit reclamation success in affected areas. If reclamation failure is determined because of these external influences, DCRT will not be held responsible for continued reclamation activity and associated monitoring of these areas.

Recovery from construction disturbance activities (e.g., clearing and grading) within semi-arid and arid climatic zones typically require several years; thus, the monitoring plan will assess the trend toward reclamation success standards as outlined in Section 8.3. Trends include the following:

- Seedbank recruitment - Presence and condition of certain site characteristics that encourage recruitment of native vegetation, indicating important functional processes are in place that initiate regeneration (i.e., pollination and seed dispersal). Site characteristics include, but are not limited to, the presence of: seedlings, flowering plants, insects, birds, and/or bats.

- Stabilization of soils – Lack of erosion is typically evidence that soils have been adequately stabilized.

- Avoidance of species competition – Noxious weeds could potentially compete with native perennial species; relatively high abundances of noxious weeds can have negative effects on site conditions.

- Animal presence - Evidence of animal use indicates habitat conditions have been restored, however, grazing by domestic animals can negatively affect reclamation success if unmanaged. Areas that received heavy use by domestic livestock will be recorded with photographs. Additionally, areas that receive heavy use by domestic livestock over repeated years will be considered to have met reclamation standards.

- Patterns of vegetation - Patches of established vegetation can be indicative of successful site conditions if they reflect patterns observed in surrounding (control) vegetation. Once recruitment conditions have been met, established vegetation is anticipated to contribute to the maintenance and functionality of the community to ensure continued success after monitoring has concluded.

6.4.2 Quantitative Data

Per MM VEG-CEQA-1, a qualified biologist will conduct quantitative monitoring annually for year one through five, or for subsequent years until the success standards has been met. The desirable vegetation cover will be numerically measured (percent of canopy cover per unit of area) on treatment sites identified as priority reclamation areas and approved by the BLM, during the second- and third-year growing seasons. In turn, the measurements will be compared to the control transect for each site to determine if there is evidence of a trend reclamation success. In terms of measurements, the MM VEG-CEQA-1 specifies the qualified biologist(s) will record data using a sampling method (series of one meter square quadrants within each vegetation management area) to measure the absolute and relative cover and density of each plant species.

In year two or three, the qualitative monitoring methods will be dependent on growth within the vegetation management and may deviate from the quadrat methodology to a method called the toe-point transects (sampling mark created using boot-notch during a 5-paced transect; Evans and Love 1957) or other method as instructed by the BLM. Data will include, but not be limited to: measuring native species growth performance, estimating native and non-native species coverage, seed mix germination, native species recruitment and reproduction, and species diversity. Based on these results, the designated biologist(s) will provide recommendations for maintenance, adaptive management, or remedial work efforts that may be needed to meet success standards. During subsequent years of quantitative assessments, vegetation will have had enough time to display establishment on the areas affected by the Project. In addition, the trends toward reclamation success and remedial actions will be identified, as necessary. By the final year of quantitative monitoring, it is anticipated that the effects of remedial actions or climatic events will be discernibly evident on treated sites.

Vegetation density monitoring (number of plants per unit of area) is sensitive to changes in the vegetation community caused by climate conditions and resource uses and shall document information on seedling emergence, survival, and mortality. The qualified biologist(s) will focus on dominant or indicator perennial species as determined by control-site observations of the adjacent plant community. Like vegetation cover, species density will be evaluated by comparing the total number of indicator species in the treatment site to that of the control site. Other plant species will be inventoried but densities will not be

evaluated. Density and cover data, along with other biometrics, will be logged on standard field data sheets developed by the Construction Contractor(s) and/or Reclamation Subcontractor with prior BLM approval.

6.4.3 Monitoring Reports

As stated in MM VEG-CEQA-1 for quarterly reporting, data collected for post-construction reclamation monitoring will be compiled within a Post-Construction Vegetation Management Quarterly Monitoring Progress Report developed by the Construction Contractor(s) and/or Reclamation Subcontractor for the first year for the reclamation monitoring. Reports will include the following:

- Summary of overall site status and remedial recommendations.
- Estimated species coverage and diversity.
- Health and overall stamina of plant species.
- Establishment of volunteer native species.
- Topographical/soils conditions.
- Problems or development of weed species.
- Usage of the site by wildlife, as feasible.
- Significant signs of drought stress.
- Recommended adaptive management measures deemed necessary to ensure compliance with specific success standards (see below), in the case where standards are not fulfilled.

In addition, and as stated in MM VEG-CEQA-1, an Annual Post-construction Vegetation Management Report will be completed for years one through five by the Construction Contractor(s) and/or Reclamation Subcontractor, providing the results of annual quantitative monitoring. Annual reporting will include, at a minimum, the following:

- Name, title, and company of all persons involved in restoration monitoring and report preparation.
- Maps or aerials showing vegetation management (i.e., restoration and invasive weed management areas), transect locations, and photos documentation with locations.
- Explanation of the methods used to perform vegetation management, including, but not limited to, the number of acres for restoration and/or areas treated for removal of non-native plants.
- Assessment of the treatment success.
- List of plant species and their coverage and diversity measured during yearly quantitative surveys.

- Compliance/non-compliance with required vegetation management success standards.
- Summary of species health and overall vigor.
- Establishment of volunteer native species.
- Hydrological and topographical conditions.
- Usage of the site by wildlife, as feasible.
- Presence and development of invasive weed species.
- Recommended adaptive management measures deemed necessary to ensure compliance with specific success standards (see below), in the case where standards are not fulfilled.

The Construction Contractor(s) and/or Reclamation Subcontractor will forward annual reports to BLM, CPUC, and CDFW at the end of each year following implementation of the reclamation monitoring, until the established success criteria have been met.

6.5 Adaptive Management and Site Release

The BLM requires that an adaptive management protocol is implemented as part of reclamation monitoring activities for the Project. The adaptive management actions allow frequent review and feedback on the progress of reclamation. Effective monitoring is an essential element of adaptive management because it provides reliable feedback on the effects of reclamation actions, resulting in early implementation of remedial actions.

Adaptive management actions may be recommended on a case-by-case basis where feasible, and as determined by the BLM, within the monitoring time frame. If adaptive measures become necessary, monitoring data will identify the deficient components of reclamation efforts such as native vegetation cover, soil compaction or lack of natural surface material. Examples of reclamation actions may include measures such as supplemental seeding, mulching and additional weed and/or erosion control measures. Recommendations could also include waiting prior to taking remedial action to determine if favorable germination/establishment conditions are affected.

There is a possibility that some sites will be incapable of progressing towards the established success standards. This may be due to conflicting land management, environmental limitation, or other conditions not associated with the Project. Some cases could include unmanaged off-highway vehicle access, grazing of domestic livestock, natural disasters, or construction from other projects. If BLM determines reclamation failure has been caused by similar types of conditions, neither DCRT nor any of its contractors or subcontractors will be held responsible for continued reclamation and monitoring of these sites.

All adaptive management actions will be subject to review and approval by the BLM. The Construction Contractor(s) and/or Reclamation Subcontractor hired to complete reclamation actions and monitoring and will use all reasonable methods to ensure that reclamation is progressing toward the success standards identified in Section 8.3 of this Plan. Once the final report documenting reclamation success has been completed, approved success

standards have been met, and are accepted by the BLM, DCRT will be released from further reclamation and monitoring.

1 Introduction

The Ten West Link Transmission Line Project (Ten West Link or Project) proposed by Delaney Colorado River Transmission, Limited Liability Corporation (DCRT) would consist of a transmission line between the Delaney Substation in Maricopa County, Arizona and the Colorado River Substation in Riverside County, California. A detailed Project Description is provided in Section 3, below, and further described the Project's Plan of Development (POD).

This document outlines the establishment of a Vegetation Management Plan (Plan) that has been developed for the Project. The purpose of the Plan is to establish a procedure for maintaining right-of-way (ROW) conductor vegetation clearance, clearing of access roads, work areas, and associated Project facilities, protection of special status species, prevention of the introduction of noxious weeds, and to prevent vegetation-related outages associated with the Project. This Plan includes measures designed to reduce long-term impacts to visual resources.

This Plan further includes a Succulent Management section (Section 15), which describes the approaches for succulents throughout the Project area; a Special Status Plant Transplantation and Compensation section (Section 16), which sets forth the options for transplanting or compensating for impacts to special status plants; Rare Plant Linear ROW Protection for Harwood's Eriastrum (Section 17), which describes the protection measures to be implemented to minimize impacts to the Harwood's eriastrum; and a Noxious and Invasive Weed Management section (Section 18), which spells out the methods to be utilized to minimize the introduction or spreading of noxious and invasive weeds to or within the Project area.

The techniques and procedures to manage, monitor, mitigate, and restore native vegetation and habitat and are documented in Appendix L-1 Reclamation, Vegetation, and Monitoring Plan.

The route for the proposed transmission line Project has not yet been secured; once the route has been finalized any changes will be reflected in the final draft of this Plan.

2 Permits and Governing Documents

Portions of the Project will be governed by a Bureau of Land Management (BLM) ROW Grant and Record of Decision (ROD). Vegetation management activities must be conducted as regulated by these documents and as described within the Project, North American Electric Reliability Corporation (NERC) guidelines, Arizona Native Plant Law (ANPL), and California regulations associated with vegetation removal and plant salvage, where applicable, or as directed by the California Public Utilities Commission (CPUC) during the process to obtain a Certificate of Public Convenience and Necessity.

If, during the course of work, additional permitting requirements are identified as needed, DCRT will take measures to acquire these permits and incorporate them into this Plan. Additional permitting may include but is not limited to a Collectors Permit and Removal Permit from the Arizona Department of Agriculture (AZDA) for saguaro cactus relocation. On BLM lands, the contractor must get a shipping permit from BLM before transporting the plants. Associated fees from obtaining permits related to allowing for impacts (removal/relocation) of theses plant species will be paid by DCRT.

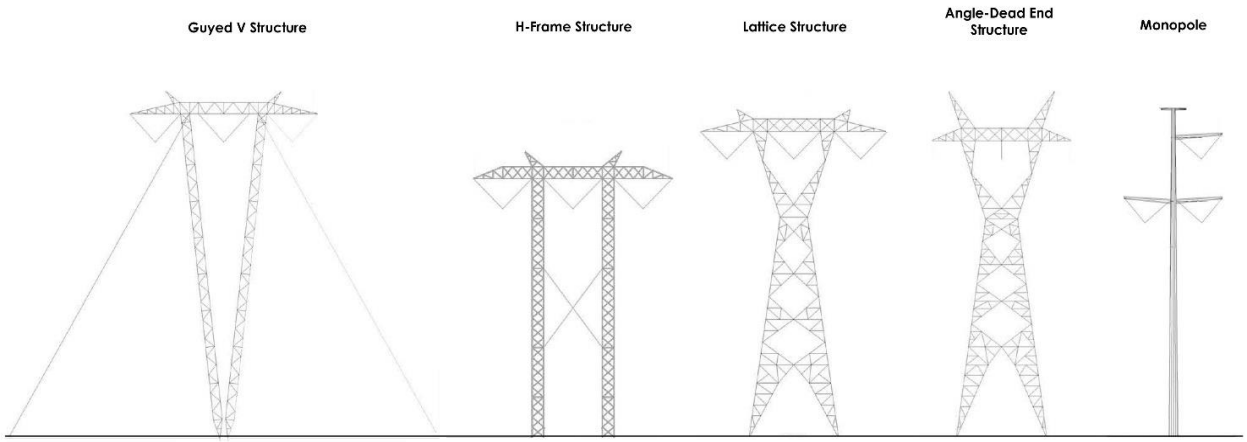
3 Project Location and Overview

The proposed Project consists of the construction of approximately 125 miles of a new single-circuit 500 kilovolt (kV) transmission line along with associated access roads. Approximately 103.4 miles of the line in will be in Maricopa and La Paz Counties, Arizona and 21.6 miles in Riverside County, California with 79.4 of those miles on BLM-administered federal lands. The new line will provide service between the Arizona Public Service (APS) Delaney Substation, located near Tonopah, Arizona, and the Southern California Edison (SCE) Colorado River Substation, located just southwest of Blythe, California. The Project ROW will be located within varying elevations from 100 feet elevation in desert and agricultural vegetation communities up to 4,000 feet in the mountain terrain. The proposed route will parallel existing linear utility corridors including transmission lines and natural gas pipelines.

The structures proposed for the Project will be comprised of different lattice tower configurations and monopoles as shown below in Figure F-7-1. Depending on the topography and span length (400 feet to 2,300 feet) the structures will vary in height from 72 feet to 195 feet. DCRT proposes to acquire a 200-foot-wide ROW for construction, operation, and maintenance of the 500 kV line.

Project maps further detailing the structure locations, access roads and sensitive areas will be located in the Appendix A of the Final POD.

FIGURE F-7-1 TEN WEST STRUCTURE TYPES



This page intentionally left blank.

4 Vegetation Overview

The predominant native vegetation communities include Sonora-Mojave-creosote-bush-white-bursage-desert-scrub and mixed-cacti-desert-scrub. Project vegetation communities are further described within POD Appendix L-1 – Reclamation, Vegetation and Monitoring Plan.

Preconstruction plant surveys will be completed by a biological monitor prior to construction activities on non-cultivated lands. These surveys will be conducted to establish a native percent background vegetation which will ultimately be utilized for restoration goals. Vegetation clearing for access roads and work areas will occur within the Project disturbance footprint; however, DCRT anticipates that the majority of Project clearing activities for conductor clearance will occur within the Copper Bottom Pass Area and in areas that have ironwood (*Olneya-tesota*), palo verde (*Parkinsonia* spp.) and honey mesquite (*Prosopis glandulosa*) species. Some tree clearing of 40-foot-tall salt cedar (*Tamarix ramosissima*) will also occur near the transmission line crossing of the Colorado River.

The Project area falls within two subdivisions of the Sonoran Desert: Lower Colorado River Valley and Arizona Uplands, represented by various plant associations and habitat types with vegetation that is tolerant of extremely high temperatures and drought. Tall growing vegetation that may require trimming, pruning, or removal may include saguaro cacti (*Cereus giganteus*), ironwood, and palo verde. This vegetation (if growing within the ROW below the conductor spans) has potential to come in contact with the line at certain heights and would need to be removed to maintain a safe clearance. Furthermore, this reduces the risk of power outages, fires, and other damage.

Other large desert species that may pose a safety hazard, but are eligible for salvage include saguaros, Joshua trees, yuccas, agave, and ocotillos. See Section 15 of this Plan for more information on saguaro cacti salvage.

Any vegetation removed that can be used in reclamation efforts (i.e., plant material or slash) will be maintained on site for use during reclamation. This plant material can be used as a windrow for habitat creation or scattered across this site after seeding has been completed.

DCRT will coordinate with all agencies and private landowners prior to any vegetation removal.

5 Vegetation Surveys

Since the Project spans two states (California and Arizona), the requirements for surveys prior to vegetation removal will be specific to that region and planning area, including the BLM. In Arizona, a plant inventory will be conducted prior to any vegetation removal or relocation activities to survey for plants protected under the ANPL as required by the AZDA. Vegetative surveys for plants in California will be in compliance with the Manual of California Vegetation, and the California Desert Conservation Area Plan.

The plant surveys will be conducted within the approved ROW, along the Project's access roads and all other associated disturbances for the Project. Surveys will be completed

during the appropriate time of year for noxious weeds, protected plants, and areas that are identified as habitat for special status species. No plant species currently listed or proposed for listing under the Endangered Species Act (ESA) are expected to be found within the Project ROW.

A qualified botanical monitor will conduct pre-construction surveys during the pre-construction phase of the Project. If plants, with any type of special status as indicated in this Plan, are discovered during these surveys all applicable mitigation measures will be implemented. Mitigation measures will be in compliance with ANPL, California regulations, and BLM requirements associated with vegetation removal and plant salvage, where applicable.

6 Environmental Protection Measures

All impacts would be minimized through implementation the Project's Applicant Proposed Measures (APM) and BLM-Required Best Management Practices (BMP). A monitor will be present during earth disturbing activities within habitat of special-status animal/plant species. Post construction surveys and monitoring for re-vegetation success will be completed once construction and initial reclamation has been completed.

The environmental protection measures that apply to the vegetation management plan include the following:

- APM/BMP BIO-01: Worker Environmental Awareness Program (WEAP)
- APM/BMP BIO-02: Biological Monitoring and Preconstruction Survey
- APM/BMP BIO-03: Approved Work Areas
- APM BIO-04: Environmentally Sensitive Areas and Fencing
- APM BIO-05: Additional Prohibitions
- APM BIO-10: Erosion and Dust Control
- APM/BMP BIO-11: Vegetation Management Plan
- APM BIO-12: Noxious and Invasive Species Control
- APM BIO-14: Minimizing Vegetation Clearing
- APM/BMP BIO-15: Reclamation and Restoration
- APM BIO-16: Treatment of Saguaro Cactus
- APM BIO-17: Limit Off-road Vehicle Travel
- BMP BIO-24: Sensitive Plant Surveys
- APM BIO-26: Arizona Protected Plant Inventory
- BMP BIO-31: Treatment of Harwood's Eriastrum
- BMP BIO-32: Seasonal Restriction Dates
- BMP BIO-37: Native Plant Collection Prohibition
- BMP BIO-38: Use of State of the Art Technology
- BMP BIO-41: Succulent Management

- BMP BIO-42: Dead and Downed Wood
- BMP BIO-43: Collection of Plant Material
- BMP BIO-46: Compensation for Loss of Desert Riparian Woodland
- BMP BIO-47: Riparian Functioning Condition
- BMP BIO-50: Engineering Controls
- BMP BIO-51: Conductor Clearance
- BMP BIO-52: California Riparian Habitat and Rare Plant Alliance Avoidance (California only)
- BMP BIO-53: Protection of Dune Vegetation (California only)
- BMP BIO-54: Protection of Sand Transport (California only)
- BMP BIO-55: Access within Focus and BLM special Status Species Suitable Habitat (California only)
- BMP VEG-01: Removal of Vegetation
- BMP VEG-02: Avoid Vegetation Removal
- BMP TT-08: Prohibit Cross-Country Vehicle Use Outside Designated Work Areas (California only)
- APM AES-01: Vegetation Removal and Grading

There are additional mitigation measures that are limited in scope to California as part of the California Environmental Quality Act (CEQA). These include:

- MM BIO-CEQA-4: Develop a Habitat Restoration, Mitigation, and Monitoring Plan
- MM BIO-CEQA-5: Develop a Special Status Plant Transplantation and Compensation Plan
- MM BIO-CEQA-12: Compensation for Impacts to Sensitive Vegetation Communities
- MM VEG-CEQA-1: Develop and Implement a Vegetation Management Plan
- MM VEG-CEQA-2: Conduct Pre-Construction Floristic Surveys
- MM VEG-CEQA-3: Conduct Focused Surveys for Harwood's Eriastrum
- MM VEG-CEQA-4: Compensation for Impacts to Special-Status Plant Species and Sensitive Communities

7 Safety

Safety is of upmost importance for all Project work activities. Federal and State Occupational Safety and Health Administration and American National Standard Institute safety requirements governing vegetation management work practices shall be followed at all times. Activities shall be conducted in a manner that minimizes both vegetation management crew and public safety risks. All employees involved in vegetation management work activities will have all necessary training in the use of any tools and/or equipment to be utilized. Training shall include proper use of personal protective equipment, proper operating techniques, and establishment of safe work areas appropriate to the work

being performed. In addition, a Fire Protection and Prevention Plan (Appendix J-2) has been prepared for the Project, which addresses items such as fire emergency procedures, fire suppression and prevention measures, and fire incident reporting.

8 Planned Vegetation Management Sequence

Vegetation management activities and estimated timeframes follow:

Pre-Construction Surveys	TBD
Salvage	TBD
Work Area and Access Road Clearing	TBD
ROW Clearing Between Spans	TBD
Final Grading, Cleanup, and Restoration	TBD
Seeding for Permanent Stabilization	TBD
Post-Construction Surveys	TBD
Monitoring	TBD
Reporting	TBD

9 Techniques and Methods

All vegetation management activities will be performed in compliance with NERC and Federal Energy Regulatory Commission (FERC) vegetation management specifications, relevant items from the BLM Manual 1740-2 Integrated Vegetation Management and IB-2012-097 and stipulation found within the Project's Final POD, ROD and ROW Grant. The documents referenced above cover policies and techniques to manage vegetation that has the potential to come in contact with the transmission line creating a fault or cascading effect. If there is a conflict between the POD, and the requirements of the land-manager/ landowner or NERC and FERC vegetation management requirements, DCRT will work with the appropriate parties to resolve the situation. A copy of BLM Manual 1740-2, IB-2012-097, and NERC Standard FAC-003-2 can be found in Attachment C – Agency Vegetation Management Regulatory Manuals. Additionally, the Project will comply with FERC Standards and the National Electrical Safety Code.

The majority of the clearing activities will need to be planned for the area in the ROW (200 feet wide) and more specifically the wire zone area. There are only a few spots where the Project might experience blowout outside of the 200-foot corridor. However, these are at spots with long spans, such as going up a large hill or across a canyon. At these locations, the conductors will be high up so vegetation management will not be a factor. The wire zone is a 139-foot-wide section of the ROW located directly under the wires and the border zones extends outward about approximately 31 feet on either side of the wire zone. The wire zone is required to be cleared of high vegetation to minimize the likelihood of a plant, shrubs, or tree, encountering the line. High-growing vegetation is permitted in the border zone, but

may be pruned if it begins to encroach on the wire zone. The wire zone and border zone may be adjusted, as appropriate, based on topography. Please reference Figure F-7-2 shown below, as adapted from the Draft Environmental Impact Statement (EIS) Appendix 7 Part 1 Figure 2.2-23a. DCRT will identify tall growing vegetation species within the wire zone anticipation species include, but are not limited to, saguaro cactus, ironwood, palo verde, cottonwood (*Populus* sp.), goodding willow (*Salix gooddingii*) and mesquite (*Prosopis* spp.).

The transmission line must maintain a clearance of 30 feet between the conductor sag and the ground. Please reference Figure F-7-3 shown below, as adapted from the Draft EIS Appendix 7 Part 1 Figure 2.2-9b. The Minimum Vegetation Clearance Distance (MVCD) required by the NERC for a 500 kV transmission line is 7.4 feet, at an elevation between 2,000 and 3,000 feet. Additionally, the desert has a high probability for windy conditions and so vegetation may need to be removed if it falls within the Wire Security Zone. The Wire Security Zone would add nine feet (three feet for vegetation growth plus a six-foot buffer) to the MVCD, for a total of 16 feet five inches beyond the point of conductor maximum sag or deflection. Therefore, the maximum height of vegetation vertically and radially from the conductors at maximum sag or deflection would be approximately 13 feet 10 inches. Border zone vegetation would be height limited to 31 feet seven inches, gradually increasing as the distance to the conductor increases.

9.1 Chemical Control Methods

In select areas, herbicides may be used to control incompatible tree species that have the potential to regenerate from the root systems and grow into the minimum conductor-vegetation clearance requirements. All herbicide applications will be performed in accordance with federal, state, and local regulations, and in compliance with land manger and/or landowner requirements. All herbicide applications on federal lands will be in accordance with the applicable Pesticide Use Proposals obtained for the Project.

The purpose of herbicide treatment is to efficiently maintain clearances obtained following mechanical and/or manual treatments. Use of herbicides to manage vegetation along the ROW also lengthens the maintenance cycle and reduces the need for future hand and mechanical treatments. Vegetation targeted for herbicide treatments includes most vegetation that is targeted for manual and mechanical treatment, the exception being that saguaros would not be treated using herbicides. Herbicide treatment involves vegetation that is less than 10 feet tall whose physiology is such that it could encroach within the associated FAC-003 clearance distance, impact the reliability of the transmission line or transmission line facilities (e.g., structures, guy wires) or poses a fire fuel load concern. Only BLM-approved products from the approved California herbicide list would be used in California and only upon prior approval of the BLM Authorized Officer or landowner.

All herbicide treatment will be documented on pesticide application records for each herbicide approved by a Pesticide Use Proposal and kept in the Project office on site.

Additional restrictions on Project herbicide applications can be found in Section 18 of this Plan – Noxious and Invasive Weed Management Plan.

9.2 Additional Vegetation Clearing Requirements During Construction

Clearing of vegetation in and adjacent to the ROW will be minimized to limit disturbance to resources, reduce visual contrast, and protect nesting habitats, to the extent practicable while still satisfying conductor-clearance requirements. Vegetation will be removed selectively to blend the edge of the ROW into adjacent vegetation patterns, as practicable and appropriate. Vegetation will be removed selectively in riparian habitats and will be minimal along the Colorado River to protect sensitive resources in those area.

Where the ROW crosses sensitive roads and trails, such as scenic or historic designated routes, selective clearing shall allow natural vegetation to be left in the ROW on each side (as possible). Also, cutting or pruning of trees will occur so the fresh cut is oriented away from these areas where possible. To the extent practicable, pruning should occur around the entire tree, to reduce the appearance of flat sided trees facing facilities.

Danger trees shall be identified individually for trimming or removal. Danger trees are those which are located off the ROW and may contact electric facilities either through growth or if it should fall. DCRT will coordinate with the BLM prior to any off ROW tree trimming or removal.

9.3 Routine and Hazard Maintenance

DCRT will perform continued vegetation inspections throughout the life of the Project (pre-, during-, and post-construction). The owner (DCRT) will perform maintenance once yearly during the post construction phase for the up to 50 years of the BLM land lease. A crew with an accompanying environmental specialist will access areas requiring pruning or removal and acquire proper permitting or permission prior to any vegetation removal. Vegetation maintenance will also be performed with avian nesting practices in mind, either by performing it outside the typical nesting season or in coordination with a qualified biologist to inspect as necessary. Mowing will only occur in the immediate area around the structures. In other areas, vegetation that can get high enough to become a danger will be cut. Other relatively low-growing vegetation will remain under the conductors.

Mechanical tree clearing methods will involve the use of equipment such as chain saws, rakes, shovels, brush hooks, and mowers to clear vegetation. Manual treatment methods will include hand crews for all hazard vegetation work and for some routine vegetation maintenance work. Hand crews consist of line clearance tree workers that use hand tools (e.g., chain saws, hand saws, rope) to cut down or prune vegetation. Typically, only pick-up trucks are used as a means of travel to the work site, but a bucket truck and/or chipper may also be used.

Vegetation management crews will prune trees in preference to cutting trees and will cut trees in preference to removing them completely. Cut material may be placed in slash piles and/or used as vertical mulch as approved by the BLM and other acting agencies. Pruning will be accomplished by use of pruning saws, power saws, nippers, bow saws, or cross-cuts. Use of axes for pruning will be prohibited.

Vegetation that presents a hazard to the power line and structures require treatment on an ongoing basis outside the routine maintenance cycle. The need to treat hazard vegetation is not common due to the ongoing routine maintenance but is occasionally required.

These hazards are categorized into three levels and are treated slightly different for each level:

Level 1 Emergency Hazard: An emergency caused by vegetation occurs when vegetation is arcing to the line, has caused a power fault, is burning from contact or arcing with the line, and when all or a portion of a tree is in contact with the line from falling or growth into wires. Emergencies due to vegetation on a large 500 kV line are uncommon, but if it were to occur, it is a very serious threat. DCRT must act immediately to eliminate the hazard no matter the weather, road conditions, or time of day or year.

Level 2 Imminent Threat Hazard: There can be two types of imminent threat hazards: 1) alive or dead standing tree or vegetation having defects in the roots, butt, bole or limbs, which predispose it to imminent mechanical failure which could damage whole or part of the power line or structure; and 2) an imminent threat hazard may also be a tree or branch that has come close enough to the power line such that it poses a safety risk to the public and tree workers. Imminent threat hazards must be treated as soon as possible once the hazard is identified. These hazards are typically treated within a week of identification.

Level 3 Off Cycle Hazard: This type of hazard includes any live or dead tree that poses a future threat to the power line or structures and cannot be left untreated for the next growing season or next maintenance cycle. These hazards do not pose an immediate threat but must be treated prior to the next growing season, or out of cycle, before it becomes an

imminent threat. Treatment of Off Cycle trees may sometimes be scheduled around seasonal timing restrictions.

Vegetation maintenance protocol typically includes:

- Tall growing vegetation within the ROW is cut down and may be treated with herbicides.
- For each structure along the line, woody vegetation, including tall shrubs and trees, would be cut down and treated with herbicides (herbicide treatment excludes cacti) underneath the structure and 50 feet out from each footer of the structure.
- Low lying vegetation (e.g., creosote bush and grasses) within 50 feet around the structures will remain in place during maintenance. Maintenance vehicles will crush vegetation within 50 feet around each structure, but woody shrubs would be removed because they create puncture and tripping hazards.
- Lower growing vegetation, such as creosote bush and small cacti, that do not fall within 50 feet around the structures are left on the site untreated unless: 1) the shrub or cacti blocks access on the existing access routes within the ROW; or 2) the shrub density is high, causing a fuel load issue under the line. In the case of high density vegetation, the shrubs are thinned to a reasonable and safe density level while providing as much protection as possible to the line and structures in case of fire.
- Where line spans high above canyons and slopes, either no treatment will be needed, or some thinning may be needed to break up fuels under the line.
- Stumps from vegetation treatments are cut no greater than 12 inches above the ground, and where possible, are cut flush to the ground. For the hand crew operations, slash is lopped and scattered throughout the immediate area in a manner such that the debris lies no deeper than 18 to 24 inches above the ground. Where chippers are used, the chips are broadcast across the ROW. For mower operations, the majority of vegetation, except larger logs, are mulched by the mower and material is broadcast across the ROW.
- Access for all treatment methods is done using only established roads and access routes to approach the ROW. Crews performing vegetation maintenance may need to access cacti that are sited for trimming or removal that are outside of structure work areas or the Project's access road plan due to clearance issues. If this is required, vehicles will travel within the ROW and will use drive and crush methods whenever possible to minimize disturbance.
- Vegetation maintenance crews will make every effort to keep impacts within the ROW to a minimum. DCRT will only work within the ROW when the soils are dry enough to prevent ruts.
- All vehicles will be operated in a safe and prudent manner.

10 Access Road and Work Area Vegetation Clearing

Where necessary, vegetation will be cleared in approved locations to construct safe and operational work spaces. As with tree clearing for conductor clearance, the least invasive

and most efficient methods will be utilized in accordance with POD directives. Areas requiring clearing will include access roads, fly yards, structure work areas, pulling and tensioning sites, splicing locations, and turn out locations within Project access roads.

Vegetation clearing activities along access roads will also be performed in accordance with the restrictions provided for each access road type. The five Access Road types discussed below are described in further detail in Section 3 of the Project's POD:

- Access Type A – existing maintained public and private roads, which are paved, gravel, or dirt. These roads will be left in their original condition with no additional disturbance outside of the existing road matrix necessary to accommodate Project construction vehicles and equipment.
- Access Type B – existing roads that may require some level of improvement to accommodate Project construction vehicles and equipment.
- Access Type C – access roads that will be created, where necessary, to provide access along the length of the Project's ROW. DCRT will blade these roads along the transmission line's outermost conductor phase, but inside the Project's 200-foot-wide ROW to the extent possible.
- Access Type D – access spur roads that DCRT will blade to connect Access Types A, B, or C roads to structure work areas along the Project's ROW.
- Access Type E –helicopter assist access. In areas of biological, topographical, archaeological, and visual concerns, the use of helicopter-assisted construction may be implemented for construction activities. Light-duty pickup trucks, tracked equipment, and off-highway vehicles may be used.

Appendix K1 – Access Road Plan and Appendix K2 – Traffic and Transportation Management Plan of the POD provides further definition of Project access road types. Access road types for specific roads are further identified within the POD Map Sets. Please reference the POD for further information.

11 Landowner/Land Manager Coordination

All private landowners will be contacted by DCRT a minimum of 48 hours or as required by easement agreements prior to the start of vegetation management activities on their respective properties. All landowner communications will be documented and maintained by DCRT's Land Agent. Additionally, DCRT will coordinate with the BLM or their designated representative for vegetation management activities on BLM-administered lands.

12 Inspection

Safety and environmental inspections of vegetation management activities will be routinely conducted by Project personnel during construction. Areas inspected and found to be inadequate will be promptly addressed. All follow-up and corrective actions will be documented and coordinated with the appropriate persons.

The Project would be inspected annually to check for vegetation growth within the Project's ROW and proximity to the conductor. Palo verde are predicted to be the quickest growing large vegetation that could interfere with the conductor; however, all vegetation will be

inspected within the wire zone that could either vertically or radially come in contact with any lines.

13 Environmental Resources

All POD requirements pertaining to the protection of environmental resources will be followed. This includes implementation of mitigation measures intended to reduce impacts to streams, washes, wetlands, springs, soils, cultural resources, paleontology, sensitive wildlife species, sensitive plant species, land use, and visual resources.

14 Responsible Parties

A list of personnel responsible for the management and implementation of this Plan can be found below.

TABLE F-7-1 CONTACT LIST

Name	Title	Company	Contact Information
(TBD)	Project Manager	DCRT	(TBD)
(TBD)	Environmental Manager	DCRT	(TBD)
(TBD)	Project Manager	Subcontractor	(TBD)

(TBD)	Lead Biologist	Subcontractor	(TBD)

15 Succulent Management

15.1 Introduction

15.1.1 Purpose

This Succulent Management section represents the commitment on the part of DCRT to protect succulent plant species. The overall objective is to provide measures to protect these resources from potential impacts during construction, operation, and maintenance and salvage those plants which cannot be protected. This Succulent Management section incorporates environmental protection measures contained in the Draft Environmental Impact Statement for the Project. This Succulent Management section is intended for use as a guide to determine the appropriate site-specific measures to be implemented during construction activities.

15.1.2 Goals and Objectives

Certain succulent species (especially some cacti) have physiological adaptations that result in high success rate for salvage and transplant. The goals of this Succulent Management section are to: 1) provide insight into the succulent types present in the Project area and their salvage assessment criteria and the regulations governing them; and 2) identify salvage methods for succulent plant species to implement prior to construction activities. These activities would support and achieve agency and state requirements to:

- Protect native succulent plant species.
- Salvage native succulent plant species.

15.2 Regulatory Compliance

The following provides a brief overview of federal and state legislation and regulatory compliance applicable to biological resources in the Project area that were considered in the development of this section.

15.2.1 Federal

The federal ESA, Section 7 (16 United States Code [U.S.C.] § 1531 et seq., 50 Code of Federal Regulations [CFR] Part 17.1 et seq.) provides for the designation and protection of threatened and endangered plants, as well as animal species, and habitat critical to their survival. The ESA authorizes the United States Fish and Wildlife Service (USFWS) to review a proposed federal action to assess potential impacts to listed species. Listed species are those that have been listed in the Federal Register as threatened or endangered as defined by the ESA. The ESA prohibits the “take” of listed species. The ESA and implementing regulations define “take” to include mortality and other actions that could result in adverse impacts such as harassment, harm, or loss of critical habitat.

The BLM does not allow the collection or the take of cacti and yucca on federally-managed lands without a special use or other applicable permit. Although most cactus species are not on the BLM’s Sensitive Plant List, the BLM typically requires some level of salvage of succulent species. These standards usually follow a hierarchy of perceived horticultural value, whereby those species most valued by landscapers and collectors (hence, those most commonly lost due to poaching on federal lands) are most frequently identified for salvage. The BLM District office will determine which succulent species will require salvage as well as any management requirements.

15.2.2 States

15.2.2.1 Arizona

The ANPL (Arizona Revised Statutes §§ 3-901 et seq.) was enacted to protect rare plant species and to protect some species from being over harvested. There are four Protected Native Plant Categories:

1. Highly Safeguarded – These plants are threatened for survival or are in danger of extinction. Protection includes not only the plants themselves, but their plant parts such as fruits, seeds and cuttings. A few examples of species in this category are

saguaro, Arizona willow, and some agave and cacti (*Agavaceae* and *Cactaceae* families).

2. Salvage Restricted – This large group of plants are subject to damage and vandalism. This is a large list of species with 32 plant families represented, the largest being numerous species of cacti.
3. Salvage Assessed – This much smaller group of plants have enough value if salvaged to support the cost of salvaging. This list includes desert willow (*Chilopsis linearis*), palo verde, ironwood, smoke tree (*Psorothamnus spinosus*) and several mesquite species.
4. Harvest Restricted – Also a smaller group, these plants are protected due to the fact that they are subject to excessive harvesting because of the intrinsic value of products made with their wood or fiber. Included in this group are bear grass (*Nolina microcarpa*), yucca (*Yucca* spp.), ironwood, and mesquite.

15.2.2.2 California Endangered Species Act

The California ESA was enacted in 1984 to parallel the federal ESA and allows the California Fish and Game Commission (CFGC) to designate species, including plants, as threatened or endangered. Under the California ESA it is illegal to import, export, "take," possess, purchase, sell, or attempt to do any of those actions to species that are designated as threatened, endangered, or candidates for listing, unless permitted by California Department of Fish and Wildlife (CDFW). "Take" is defined as "hunt, pursue, catch, capture, or kill, or attempt to hunt, pursue, catch, capture, or kill." There are 156 species, subspecies, and varieties of plants that are protected due to their threatened or endangered status under California ESA. Under California ESA, CDFW may permit take or possession of threatened, endangered, or candidate species for scientific, educational, or management purposes, and may also permit take of these species that is incidental to otherwise lawful activities if certain conditions are met. Some of the conditions for incidental take include that the take is minimized and fully mitigated, that adequate funding is ensured for this mitigation, and that the activity will not jeopardize the continued existence of the species.

The Native Plant Protection Act of the 1977 Fish and Game Code (Sections 1900 through 1913) directed the CFGC to carry out the Legislature's intent to "preserve, protect and enhance rare and endangered plants in this State." The Native Plant Protection Act gave the CFGC the power to designate native plants as "endangered" or "rare" and protect endangered and rare plants from take.

The California Desert Native Plants Act of 1983 (Division 23 [commencing with Section 80001]) of the Food and Agricultural Code is intended to protect California desert plants from unlawful harvesting on both public and privately held lands, and to provide the information necessary to legally harvest native plants. This code allows removal of certain non-listed desert plants under permits issued by the county agricultural commissioner or sheriff. The Act specifically defines plants that may have limited harvest with appropriate landowner approval and permitting. "Landowner" includes the public agency administering any public lands within the areas subject to this division. The county agricultural commissioner may establish specific cutting, harvesting, and plant care criteria that would include the most favorable and practical horticultural methods and seasons to ensure the survivability of the plants, as well as to ensure compliance with existing local, state, and federal regulations.

Under California Penal Code Section 384a, a person shall not willfully or negligently cut, destroy, mutilate, or remove plant material that is growing upon state or county highway ROWs. In addition, a person shall not willfully or negligently cut, destroy, mutilate, or remove plant material that is growing upon public land or upon land that is not his or hers without a written permit from the owner of the land, signed by the owner of the land or the owner's authorized agent. In addition, removing or damaging plants from property that a person does not own without permission may constitute trespass and/or petty theft.

15.3 Succulent Plant Management

15.3.1 Succulent Plants Occurring in the Project Area

No plant species listed under the federal ESA would be expected to occur in the Project area. However, in Arizona more than 200 species protected by the ANPL, including 16 cacti or succulents (e.g., saguaro, cholla, pincushion, hedgehog, and beavertail), occur within the Project area. In California, only one succulent species was identified as likely to occur in the Project area (the saguaro cactus), and it is considered fairly endangered by California Rare Plant Ranking (CRPR) (not an endangered species, but "Least Concern"). The saguaro cactus is protected under the California Desert Native Plants Act. Table F-7-2 identifies the 16 succulent plant species likely to be present in the Project area.

TABLE F-7-2 SUCCULENTS LIKELY TO BE PRESENT IN THE PROJECT AREA

Scientific Name[1]	Common Name	Arizona Designation[2]	California Designation[3]	Growth Form[4]
Agave deserti spp. simplex	Desert agave	ANPL-SR	-	Y
Carnegiea gigantea	Saguaro cactus	ANPL-SR	CRPR: 2B.2	S
Carnegiea gigantea	Saguaro cactus 'crested'	ANPL-HS	-	S
Cylindropuntia acanthocarpa var. *acanthocarpa*	Buckhorn cholla	ANPL-SR	-	J
Cylindropuntia bigelovii	Teddy-bear cholla	ANPL-SR	-	J
Cylindropuntia echinocarpa	Silver cholla	ANPL-SR	-	J
Cylindropuntia kunzei	Devil's cholla	ANPL-SR	-	J
Cylindropuntia leptocaulis	Pencil cholla	ANPL-SR	-	J
Cylindropuntia ramosissima	Diamond cholla	ANPL-SR	-	J
Echinocereus engelmannii var. *chrysocentrus*	Hedgehog cactus	ANPL-SR	-	S
Echinomastus johnsonii	Beehive cactus	ANPL-SR	-	S
Fouquieria splendens	Ocotillo	ANPL-SR	-	J
Mammillaria tetrancistra	Pincushion cactus	ANPL-SR	-	S
Peniocereus greggii	Night blooming cereus	ANPL-SR	-	S
Peniocereus greggii var. *transmontanu*	Arizona queen-of-the-night	ANPL-SR	-	S
Opuntia basilaris var. *basilaris*	Beavertail cactus	ANPL-SR	-	J

Source: Draft Environmental Impact Statement

[1] Additional cacti and yucca protected under the ANPL could be present in the Project area.

[2] ANPL status: HS – Highly Safeguarded, SR – Salvage Restricted, SA – Salvage Assessed, HR- Harvest Restricted
[3] California Rare Plant Ranking (CRPR): List 2B – Plants rare, threatened, or endangered in California, but more common elsewhere; List 0.2 – Fairly endangered in California.
[4] S – single-stemmed cacti, J – jointed (segmented) cacti, Y – yucca and agave.

15.3.2 Growth Forms

The cacti, agave and yucca (collectively termed “succulents”) of the Project area are all native species; there are no introduced non-native succulents in the area. All of these plants store moisture in plant tissues above the ground, and for some of these succulents (barrel cacti), their entire aboveground biomass acts as a single water storage organ. Cacti are also leafless, and their chlorophyllous surfaces consist of the tissue covering their stems. Most taxa are heavily armed with stout siliceous spines. Many species of Opuntia are also armed with glochids, millimeter-scale spines that readily detach and penetrate the skin. Cactus species readily generate rootlets and root systems in response to seasonal increases in soil moisture. However, even with these commonalities, there are several distinct morphologies among these Sonoran Desert succulents that are relevant to their handling and salvage.

15.3.2.1 Single-stemmed Succulents

The single-stemmed succulents are those cactus species characterized by a single stem, usually slightly inflated. The single-stemmed succulent species are indicated in Table F-5-1. The barrel cactus a prominent plant of the Sonoran Desert, is an example of a single-stemmed succulent. It is a single stemmed columnar cactus that typically grows to a height of three to five feet, although taller specimens do occur (Benson 1977). Barrel cacti have a shallow root system that may extend two feet below the surface dependent upon the species. Single-stemmed succulents also include plants that have up to a dozen stems sprouting out to make up one individual, such as a barrel cactus with many heads or a hedgehog cactus (*Echinocereus engelmannii*). However, these stems always branch from the ground-level perennating (that is, persistent from year-to-year) buds, and the stems neither branch nor are they segmented.

The saguaro is another prominent plant of the Sonoran Desert that is classified as a single-stemmed succulent. It is a large, long lived, columnar cactus that is typically found on rocky or gravelly soils of foothills, canyons, and benches at 600 to 3,600 feet elevation (Benson 1977). The saguaro lifespan is estimated to be up to 200 years and can grow to a height of 50 feet and attain a weight of six to seven tons (Kearney and Peebles 1969). The saguaro is a very slow growing plant; it may only stand two feet at 30 years and reaches sexual maturity around 60 years of age. The saguaro root system is shallow, generally less than four inches deep and spreading in all directions to a distance approximately equal to the height of the plant. The shallow roots provide support and allow the plant to take advantage of even very light showers. A few roots may descend to three feet.

15.3.2.2 Segmented Succulents

The segmented, or jointed, cacti in the Project area as indicated in Table F-5-1. include chollas (*Opuntia* subgen. *Cylindropuntia*), ocotillo (*Fouquieria splendens*), and prickly-pears, such as the beavertail cactus (*Opuntia basilaris* var. *basilaris*). Chollas are typically ascendant and shrub-like, although their branching architecture consists of succulent, cylindrical joints. Buckhorn chollas (*O. acanthocarpa*) can exceed five feet in height and, with dense golden spines, can be more visually appealing compared to the nondescript and smaller silver cholla (*O. echinocarpa*). Cholla joints are cylindrical, and those of most

species are relatively short and detach easily from the mother plant with no injury to the plant. Their spines are typically sheathed with microscopic recurved barbs designed to "hitchhike" once they attach to the foot of an animal. Accordingly, cholla cacti often reproduce through vegetative propagation as dropped joints are scattered beyond the parent plant to, take root elsewhere.

An ocotillo is not a cactus, but a woody shrub that grows 10 to 20 feet tall with a short thick trunk and many long, spiny branches. Ocotillo, like cacti, use several genetic adaptations for the Sonoran Desert habitat. Its roots have a layer of cork-like cells around them to retain moisture. It is able to quickly leaf and blossom any time there is enough water. It waits for moisture in a leafless and dry stage. The south facing side of the plant is tougher and more heat resistant than the north side. The ocotillo can reproduce by fertilization and dispersal of seed, but generally has more success by vegetative propagation.

Prickly-pear cacti are ascendant plants with an architecture composed of flat, jointed, succulent pads. Some prickly-pears (*Opuntia chlorotica*) can grow up to five feet tall in the Project area, while other taxa (e.g., *O. basilaris*) can be diminutive, consisting of a few to approximately a dozen pads that do not branch extensively.

15.3.2.3 Yucca and Agave

Although technically succulents, yucca and agave species are unrelated to cacti. They are perennial monocots (grasses and allies) and are classified in the lily hierarchy. Agave and yucca belong to the same subfamily (Agavoideae) and have a similar appearance, with long, thin leaves bearing a sharp point at the end, radiating from a central stem to form a symmetric rosette. The main distinguishing features for yucca include leaves which are narrower, thinner, and less tapering than agave, as well as the absence of spines along the edges of the leaves, but often bear thin, curly white hairs instead. Agave leaves are generally wider, thicker, more tapering (lanceolate) and are often edged by spines without thin hairs. There were no known yucca species identified in the Project area, but one agave species was identified, desert agave (*Agave deserti* spp. *simplex).* Yuccas and agaves do not possess the same physiological attributes of cacti and thus do not respond as well to transplantation.

15.3.3 Succulent Adaptation to Desert Environments

The ecophysiology of North American cacti was a principal subject of study during the first decades of the twentieth century, as summarized by McGinnies (1981). Cacti resist desiccation partly because they lack traditional leaves and have a very small surface-to-mass ratio. Their cuticle is also thick, with stomata that close tightly during the day, open after dark, and respire at night to reduce moisture loss. Their root systems can also grow rapidly in response to increases in soil moisture, and rootlets also dieback readily, minimizing moisture loss caused by soil desiccation. Injuries, whether to the stem or root system of cacti, also callous quickly in the absence of fungi or other pathogens. Cacti are also rich in water and nutrients.

Many of the physiological adaptations of succulents to desert environments allow them to be relatively easy to transplant successfully if appropriate measures are taken. Some of these measures anticipate the vulnerability of cacti to soil pathogens. Rooted primarily in dry soils, cacti typically do not have the resistance to fungal pathogens possessed by most plants of more humid habitats.

The transplant success rates for yucca species are significantly below those for cactus species.

15.3.4 Succulents to be Salvaged

Pre-construction surveys and monitoring will be conducted to minimize impacts to succulents by identifying species and recording their location. The survey information will be provided to the BLM for approval prior to transplantation. Plant salvage assessments will be conducted in both Arizona and California in 2019, Post-Record of Decision on BLM administered lands for the Final Route. The procedure will entail an on-site pedestrian survey for BLM listed salvageable species. For each individual succulent species encountered, an assessment will be made of the likelihood that the salvage, propagation, and transplantation of that individual would be successful. DCRT and/or their contractor will perform health assessments based on: 1) height; 2) size class; 3) overall health of the plants (necrosis, trunk damage, etc.); and 4) feasibility of transplant assessments by looking at surrounding topography, soil, slope, and final placement area. Each succulent plant determined to be within height restrictions (discussed in the following sections), feasibly able to transplant, and in good or excellent condition will be salvaged. The general health condition of each plant will be assessed and evaluated using the following assessment criteria:

- Excellent – Over 80 percent live branches and stable root system. Vibrant green, few holes or marks, no evidence of rot or damage. Plump, Evidence of new growth.
- Good – Over 60 percent live branches and mostly stable root system. Green throughout, some holes or marks, but no evidence or rot. Skin generally even and smooth, appearance generally plump.
- Fair – Less than 60 percent live branches and/or mostly stable root system. Generally green, holes or marks with some indication of rot. Skin generally uneven in texture. Lacking girth.
- Poor – Less than 40 percent live branches and unstable root system. Yellowish color, evident damage or rot on skin, appearance of wrinkling or wilting. Retains tissue connection to base. Thin. Leaning. Top of main stem shrunken or leaning.
- Imminent Mortality – Dry, brown base, no green tissue connecting base and upper green, partly green or yellow tissue.
- Dead – Dry, brown, no green tissue.

Evidence of old tissue damage, scarring, and holes or roots do not directly indicate a saguaro is in poor health. A saguaro should not be disregarded for lack of plumpness if it is in similar condition to other saguaros in the area.

The following APMs and BMPs will ensure proper identification and treatment of succulents to be salvaged.

APM-BIO-11: Vegetation Management Plan – The Vegetation Management Plan would be approved by the BLM and implemented. That Plan describes the surveys, permitting, fee payments, and plant protection to be conducted in areas where Project design would not eliminate the need for vegetation control for the Project to be in compliance with NERC requirements. Vegetation would be trimmed or otherwise controlled for safe operation of the transmission line and would be designed to minimize impacts on special status species to the extent practicable. At a minimum, vegetation treatments shall incorporate the measures identified in the June 2006 Memorandum of Understanding regarding vegetation

management along ROW for electrical transmission and distribution facilities (United States Department of Agriculture [USDA] 2006). The Plan also would describe how vegetation would be salvaged, as needed, in order to comply with the applicable ANPL and California regulations.

BMP-BIO-11: Vegetation Management Plan – In addition to the description of the Vegetation Management Plan in the corresponding APM-BIO-11, the plan would also:

- Meet BLM guidelines for mapping and surveying of cacti, yuccas, and succulents.
- Include a wire zone/border zone/effective border zone approach to vegetation maintenance.
- Identify tall vegetation species by geographic reach and growth rates, from relevant scientific literature (such as Drezner 2003), to be used to determine maximum allowable vegetation heights in the context of wire zone/border zone/effective border zone concepts, to accommodate identified growth periods (e.g., 10 years) based on the specific vegetation community. Species examples include, but are not limited to, saguaro cactus, ironwood, palo verde, cottonwood, Goodding's willow.

APM-BIO-26: Arizona Protected Plant Inventory – An inventory of plants protected under the ANPL would be conducted on State Trust lands as required by the Arizona State Land Department. Similar surveys would be conducted on lands managed by BLM, as directed by that agency.

BMP-BIO-41: Succulent Management (Compliance with CMA-LUPA-BIO-VEG-1 General Vegetation Management and CMA-LUPA-BIO-VEG-5 and 6) – Management of cactus, yucca, and other succulents would adhere to current up-to-date BLM policy. All activities would follow applicable BLM state and national regulations and policies for salvage and transplant of cactus, yucca, and other succulents. Preconstruction surveys of disturbance zones would include preparation of maps delineating special vegetation features. BLM may consider disposal of succulents through public sale, as per current up-to-date state and national policy.

CMA-LUPA-BIO-VEG-5 (California only) – All activities will follow applicable BLM state and national regulations and policies for salvage and transplant of cactus, yucca, other succulents, and BLM Sensitive plants.

15.3.4.1 Single-stemmed Succulents

The species listed in Table F-7-3 will be salvaged by transplanting (removing the entire plant) wherever possible in situations where they will be threatened with destruction by construction activities (blading, crushing, or flail mowing). These single-stemmed succulents are not adapted to vegetative propagation like the segmented (jointed) cacti. Therefore, their salvage will involve transplantation of whole plants. The number of plant species included in Table F-7-3 may change once pre-construction surveys for succulents are complete.

TABLE F-7-3 SINGLE-STEMMED SUCCULENTS TO BE SALVAGED BY TRANSPLANTING THE ENTIRE INDIVIDUAL

Scientific Name[1]	Common Name
Carnegiea gigantea	Saguaro cactus
Carnegiea gigantea	Saguaro cactus 'crested'
Echinocereus engelmanii var. chrysocentrus	Hedgehog cactus

Scientific Name[1]	Common Name
Echinomastus johnsonii	Beehive cactus
Peniocereus greggii	Night blooming cereus
Peniocereus greggii var. transmontanu	Arizona queen-of-the-night
Ferocctus wislizeni	Fishhook barrel cactus

[1] Additional cacti protected under the ANPL could be present in the Project area.

Barrel Cacti: The fishhook barrel cactus (*Ferocactus wislizeni*) is classified as Salvage Restricted under the ANPL. The Natural Resources Conservation Service ([NRCS] 2009) and Arizona Department of Transportation ([ADOT] 2012) indicates a small-sized cacti species such as a two-foot-tall saguaro or small barrel cacti can attain a 95 percent survival rate. This report includes all barrel cacti of the small and medium size categories, those that fit into a one- to five-gallon bucket as eligible for salvage assessment.

Saguaro: Saguaro cacti are classified as Salvage Restricted under the ANPL and CRPR classifies saguaro cacti as 2B.2. (List 2B – Plants rare, threatened, or endangered in California, but more common elsewhere; List 0.2 – Fairly endangered in California). Crested saguaros are classified as Highly Safeguarded under the ANPL and are not classified in California.

DCRT will work with the BLM to determine which saguaros may be salvageable, to be determined on an individual plant basis within the ROW. Factors such as terrain, access, health, and number of arms on a saguaro would determine if it can be salvaged. Where possible, DCRT would relocate saguaros that meet all the following criteria in accordance with the Record of Decision; *Salvage Techniques for Saguaro Cacti, Barrel Cacti and Ocotillo* produced by NRCS in 2009; *Evaluation of Salvage and Replanted Native Plants* on ADOT Projects (ADOT 2012); the *Long-term Study of Preserved and Transplanted Saguaros in an Urban Housing and Golf Course Development* by Harris et al. 2004; the *Native Plant Preservation Manual* produced by Pima County Development Services in 1998; and *Best Management Practices for Saguaro Translocation and Replanting* by Arizona Game and Fish Department (AGFD) in 2019. Vegetative species deemed as highly safeguarded or salvage restricted will be evaluated for potential transplantation based on the following criteria:

- All efforts should be made to avoid moving these cacti to the extent practicable.
- The saguaro is within the clearance limits and 15 feet tall or less.
- The saguaro is within the wire zone of the lines or could potentially grow to become a hazard to the lines in the future within the line easement period.
- The saguaro does not occur within a cultural site; if so, the proper protocol for Historic Properties Protection will be followed. This might include hand salvage with proper cultural monitors present.
- Terrain, access, and other environmental or logistical factors are favorable to relocation of the saguaro (e.g., minimal difficulty of extraction or transplantation).
- The saguaro is in good health (absent of necrosis, sunburn, tissue rot, parasites, etc.), with minimal arms as determined by qualified biologists or the BLM or BLM-approved contractor. Saguaros with arms longer than seven to eight feet, central stem lengths greater than 25 feet, and more than seven to eight arms are likely nearing the end of their lifespans. Those that are thinning and balding at the tops

with spine loss, numerous bird holes, or other obvious damage and blemishes are also poor candidates (AGFD 2019).

- Substrate is conducive to successful salvage (e.g., no bedrock, rocky steep terrain).
- There are no accessibility constraints.
- There are no safety hazards for the salvage equipment.

Saguaros that do not meet the criteria outlined above may be removed by mechanical crews if they are close enough to be a potential threat to the transmission line (approximately 22 feet from wires) as determined by DCRT. Additionally, prior to removal of saguaros during nesting seasonal restrictions (February 15 through August 31), a qualified biologist will inspect flagged saguaros for nests to avoid impacts on migratory bird nesting season.

APM-BIO-16: Treatment of Saguaro Cactus – Measures would be implemented to minimize the number of saguaro cacti that must be relocated for the safe construction and operation of the transmission line. In accordance with the Vegetation Management Plan a survey of saguaros within the ROW would be conducted before construction and where possible, the transmission line would be designed to minimize the number of saguaros affected by adjusting tower locations and conductor height. The Plan would address plant salvaging, storing, and replanting requirements and methods, only those saguaro that are within 50-feet of the outermost conductors and could be tall enough to pose a hazard would be removed if they cannot be avoided through Project design. When possible, saguaro that must be removed would be relocated as directed by the BLM and state agency protocols. Monitoring and management of saguaros during operations would occur as described in the Vegetation Management Plan.

15.3.4.2 Segmented Succulents

The species listed in Table F-7-4 can be vegetatively propagated and therefore, their salvage will be primarily through the recovery of cuttings of pads (prickly-pears) or joints (chollas). Prickly-pear and cholla species will be salvaged by uprooting them during construction and leaving them within the slash piles to be spread by equipment post-reclamation. The number of plant species listed in Table F-7-4 may change once pre-construction surveys for succulents are complete.

TABLE F-7-4 SEGMENTED SUCCULENTS TO BE SALVAGED USING PADS, JOINTS, OR CUTTINGS REMOVED FROM THE PLANT

Scientific Name[1]	Common Name
Agave deserti spp. *simplex*	Desert agave
Cylindropuntia acanthocarpa var. acanthocarpa	Buckhorn cholla
Cylindropuntia bigelovii	Teddy-bear cholla
Cylindropuntia echinocarpa	Silver cholla
Cylindropuntia kunzei	Devil's cholla
Cylindropuntia leptocaulis	Pencil cholla
Cylindropuntia ramosissima	Diamond cholla
Fouquieria splendens	Ocotillo

Scientific Name[1]	Common Name
Opuntia basilaris var. basilaris	Beavertail cactus

[1] Additional cacti protected under the ANPL could be present in the Project area.

15.3.4.3 Yucca and Agave

Yuccas are often transplanted on desert restoration sites. However, survivorship is notably reduced in yucca transplants compared to other succulents, and the costs may be much higher (Bainbridge 2007; Bamberg Ecological 2006). At Castle Mountain Mine, transplanted Mojave yucca (*Yucca schidigera*) mortality within three years after planting was reported from 30 to over 50 percent. Subsequent years saw higher mortality rates, and by the end of the study, the transplant program for yuccas was not considered successful (Bamberg Ecological 2005 and 2006). In a study reported by Abella and Newton (2009), double-transplanted Mojave yucca had survival rates of only 39 to 53 percent over the limited (two-year) monitoring period; rainfall was potentially above average for the study period.

Yucca: Yucca species (*Yucca* var.) are listed under the Salvage Restricted category within the ANPL under the Agavaceae (Agave) Family. According to the Standard Operating Procedures for the Salvage, Transportation, and Care of Cacti and Yucca on BLM Land by the BLM (n.d.) all yucca less than six feet tall could be salvaged, though it is not recommended due to high mortality rates. All yucca over six feet tall have high mortality rates when transplanted and will be deemed unsalvageable.

Agave: All Agave (*Agave* var.) are considered Highly Safeguarded by the ANPL. If encountered on the ROW, Agave will be evaluated for species verification. Currently, there are no federally-listed agave species in the Project area. All agave encountered will be considered eligible for Salvage Assessment, although it is not recommended due to the potential mortality of species after transplant.

15.3.5 Salvage Techniques

All personnel engaged in succulent salvage will wear appropriate protective clothing and receive safety training that will include coaching regarding how best to avoid Opuntia glochids and the crushing hazard posed by the weight of a mature barrel cactus.

15.3.5.1 Succulent Salvage and Cleaning

Single-stemmed Cacti, Yucca, and Agave

Data from pre-construction surveys for succulents will be used for planning and relocation operations. Underground utilities will be marked prior to salvage activities. The larger single-stemmed cactus, such as the saguaro, will be salvaged using a hand crew or an excavator with a special attachment. The plant will first be wrapped with burlap or other appropriate material, and a guide rope will be affixed, if necessary. The bucket of the equipment or hand crew will then scoop the plant (including the proximal portion of the root mass) out of the ground. The minimum length for the saguaro excavated taproot is 18 inches, but if soil conditions allow for a deeper excavation and removal of more of the tap root, this should be done (AGFD 2019).

Smaller single-stemmed succulents will be salvaged using two-man crews with shovels. The succulent will be manually dug out of the ground, taking care to minimize damage to the roots proximal to the plant. Each plant will bear a vinyl tag identifying its provenance and date of harvest. For efficiency, the tags will be color-coded and labeled prior to the beginning of each day's work.

If a saguaro appears fully hydrated and is in superb condition, then generally watering is not necessary prior to extraction. A fully hydrated saguaro before a move creates a reserve the plant can use while regenerating the 80 percent or more of the roots it will lose when excavated (AGFD 2019). If the saguaro is dehydrated (shrunken ribs, pinched tips), and/or the hot season is approaching, then it is recommended that they be well watered at least once prior to extraction (AGFD 2019). Since the saguaro cacti for this Project are in remote locations, an attempt will be made to water dehydrated saguaros prior to extraction, but is not probable without roads and therefore watering will occur post extraction, if necessary.

Segmented Cacti

Because they grow readily from cuttings (actual cuttings, or just joints or pads removed from the plant), most species of segmented cacti (Table F-7-4) can be more efficiently salvaged by removing parts of the plant, rather than transplanting the entire plant. This also allows for economy of scale to the extent that one plant can yield several new plants depending on how many of its cuttings are propagated.

Prickly-pear and cholla species will be salvaged by uprooting them during construction and leaving them within the slash piles to be spread by equipment post-reclamation.

15.3.6 Salvage Protocol

15.3.6.1 Tagging

Upon Health and Feasibility Assessments, DCRT and/or their contractor will tag individual plants with a plant identification number and document their Global Position System (GPS) location. Plant identification numbers are written on color coded vinyl tags specific to withstand weather. These tags are attached to individual plants using either 26-gauge silver, galvanized steel wire, or thin braided rope so as not to endanger the health of the plant by the introduction of ferrous microbes. Plant identification tags are color coded by three colors to simplify communication to construction crews, which diminishes confusion. Colors are picked for three categories: 1) salvageable, 2) non-salvageable, 3) avoid.

Red will be used for those who meet all requirements for translocation, blue for species who did not meet requirements for salvage and will be deemed "unsalvageable" and consequently removed mechanically, and yellow for cacti to be avoided. A tracking sheet will be kept with plant identification, salvage status, health status, and feasibility, and will be available to the Compliance Inspection Contractor (CIC) or BLM upon request.

For all single-stemmed cacti and yucca undergoing whole plant transplant, all individuals would be flagged on the north side to facilitate correct orientation during transplantation. Saguaro cacti will be flagged on the north side at one foot above ground level to facilitate replanting the saguaro facing the same direction, and to the same depth, at which it was growing.

15.3.6.2 Transplanting

Moving salvaged plants multiple times can lead to lower survivability and undue stress on the individuals. Mature salvaged saguaros exhibited higher chances of survival using the “once-move” technique in which they were only relocated once (ADOT 2012). As indicated by the study, each saguaro has an approximate 50 percent chance of survival with saguaros 12 feet and under exhibiting a 70 percent chance when salvaged, however each move lowers survival by 20 percent after the initial relocation each time Harris et al. (2004) and ADOT (2012) found the taller saguaros had a lower survival rate and exhibited poorer health due to their weight damaging trunk tissue and depth required for root survival. In addition, the presence of arms had a negative effect on saguaro survival rate and overall health following transplant (APS 2017). Thus, the “move once” (i.e., extracted and loaded onto the cradle, transported to the new permanent site, and then directly re-planted from the cradle) technique will be employed for this Project for on-site salvage of all types of succulents.

Saguaros and other cacti can be planted essentially throughout the year, although spring is the most ideal season. The days when the soils are saturated by rains (summer or winter) should be avoided because the monsoons can result in excess soil moisture which promotes root rot (AGFD 2019).

Shallow swales and holes will be scooped-out and individual cactus placed upright. For saguaro, excavate the new hole to a width twice as wide as the extant root ball. The cactus will be oriented correctly in the north-facing direction to the extent possible and roots covered by pushing soil around the plant base. The saguaro should be replanted no deeper (or within one to two inches) than its original level in the ground. A saguaro planting detail is included as Attachment F. For the native soil used as backfill, it is especially important to remove any rocks or caliche chunks over three inches in diameter, as these large rocks could damage roots they contact. The backfill must be firmly compacted around the plant. If the north marking tag gets lost, the north side of a saguaro may be determined by: 1) saguaros generally have a sloping top that is oriented to the south, and 2) the north side of the saguaro is a lighter green color than the south side (AGFD 2019). Positioning will be checked for stability and adjusted as necessary. Saguaro will be vertically straight and balanced.

Taller cactus may be supported by loosely tying to lathe strips or other upright support. Experience indicates that saguaros less than 12 feet do not require additional support if the backfill is well tamped (AGFD 2019). This height can be extended to 15 feet for saguaros with no arms. Saguaros over 15 feet tall or those between 12 to 15 feet with arms should have additional support or bracing (AGFD 2019). The preferred support system consists of three guy wires strung through sections of fiber-reinforced hose or tree straps. Galvanized wire rope is recommended. Sections of hose are placed around the plant two-thirds up from the base of the saguaro. Triangulate the three guy wires from the hose sections surrounding the plant column and stake them into the ground using 24-inch #4 rebar. Ensure the collar is not too tight around the stem. The use of wooden 2x4 supports covered with carpet at the point of contact with the stem are not recommended as the carpet can retain moisture which promotes decay. Lath and support structures will be removed following the five-year monitoring period.

Create a tapered mound or cone of soil around the base of the saguaro to divert water away from the stem to reduce rot or pathogens from contacting the stem base. The cone is not compacted so it will eventually erode away. Some of the excavated dirt should be used to create a water-collecting basin around the saguaro. These designs facilitate the efficient use of supplemental water and also capture some additional runoff water from rainfall events.

Salvaging techniques for transplant along access roads, structure sites, or general ROW may require the off-road drive-and-crush travel of rubber-tired vehicles such as a backhoe for placement. Off-road travel will be limited to 10 to 15 feet from disturbance area. Off-road travel is predicted to be required for translocation of saguaro cacti which cannot be done by hand due to their weight. Prior to this technique, all other salvageable species within the area in danger of being crushed will be transplanted.

Plant species that can be salvaged are transplanted adjacent to, or within a similar area, of original terrain and slope orientation. Species such as saguaros have been salvaged using a specialized attachment carpeted for species' protection, on a backhoe or excavator. Impressions are made within the dirt of the final location area for water catchment. Final transplant location areas are identified with GPS coordinates and documented. The BLM may also use transplanted succulents to rehabilitate previously disturbed areas within their jurisdiction.

Placement of Salvaged Species will occur along existing access roads and structure work areas outside of wire clearance specifications and construction activities. Placing Species along the roads and structure work areas will provide access by water trucks in which they will be watered by hose or spray within two weeks of transplant. Hose and/or spray watering techniques will be done at a low velocity so as not to damage the species further or cause excessive puddling.

All cultural sites would be located and flagged with a buffer prior to saguaro removal and relocation. If a saguaro occurs in a cultural site, it would not be relocated or treated using mechanical equipment unless the proper monitors are present. Saguaros and Salvage Species in cultural sites that are within 22 to 30 feet vertical distance and 50 feet horizontal distance of the conductors as maximum load conditions will be cut using hand crews or else pruned. Specimens considered unsalvageable outside of cultural areas will be treated mechanically. Mechanical methods may include mowers, excavators, and pruning.

A Collectors Permit and Removal Permit will be obtained from the AZDA for the saguaro salvage operation on non-BLM lands, if required. On BLM lands, the contractor must get a shipping permit from BLM before transporting the plants. Saguaros to be relocated would be moved to an area absent of cultural resources outside of the wire zone and away from the low sag area for these lines. Wherever possible, transplanted saguaros within the ROW on BLM land would be relocated to an acceptable area or along the edge of the ROW near to where they were removed so that they may continue to be beneficial to local wildlife. As an alternative to relocation or removal, pruning may be used as determined by the BLM. Saguaros may require future treatment if pruning is implemented and they grow within the 22- or 50-foot violation distance. Pruning of the plant would involve topping or removing arms, making cuts at a 45-degree angle and sealing the wound with a sealing compound.

15.3.6.3 Saguaro Post-Planting Care and Monitoring

Watering Newly Transplanted Saguaros

Plant the cactus into dry ground, backfill and do not water immediately to settle the backfill. Recommended watering regimes will vary by season and transplantation date. Initiate post-transplant saguaro watering according to the following guidelines:

- The initial post-transplant watering regime should emphasize avoiding prolonged excessively moist conditions by providing intermittent watering in well drained conditions.

- Saguaros transplanted in the spring, summer, or early fall months should remain in the dry backfill soil for four weeks before initial watering begins. Four weeks is the recommended time for plants whose roots were not air-dried.

- If saguaros are transplanted in the later fall or early winter, they should have a full month of dry soil time to reduce any onset of root rot, but they can receive an initial watering after this dry period if there has been no rainfall. Root development and activity is generally inhibited by the cooler weather, and the cool, moist conditions may facilitate root rot. However, it is also not advisable that a newly transplanted saguaro should stand without any water for many months. The recommended schedule is to provide some water for those cacti which are disposed to use it, but also long enough periods between watering to deter the continued development of any root rot that might start.

Watering will be done by water truck as the roads are available and are being watered, otherwise supplemental watering will not be provided.

Other Post-Planting Management Practices

Do not cultivate and otherwise disturb area around the trunk (up to seven feet diameter) to avoid damaging shallow roots. Do not mulch with any material that reflects or intensifies light. Do not cover soil with plastic sheets. Fertilization is generally not necessary.

15.3.7 Succulent Salvage Techniques Summary

The following conclusions are based upon *Salvage Techniques for Saguaro Cacti, Barrel Cacti, and Ocotillo* completed by NRCS (2009). This information was gathered from available sources including interviews with salvage contractors and experts in the field, and literature review. This information is meant to summarize the most technically correct procedures for removing and transplanting saguaros, barrel cacti, and ocotillos.

1. Saguaros and barrel cacti can be transplanted at any time of the year with success, except during the winter rainy season when cool temperatures and moisture promote decay in fresh transplants. This may require some advanced scheduling to prevent a long operation from advancing into the wet season. Spring is the optimum time due to the typically dry weather and dry soil conditions which help reduce transplant rot. Although monsoons occur during the summer, the rain tends to be short duration with little soil penetration and the hot weather tends to prevent fungal growth.
2. Saguaro and barrel cacti less than five feet tall can be transplanted by hand. For cacti above five feet, a cradle which supports the plant to a holding yard or to a new location, will be necessary.
3. All three species incur damage when moved. The plants must have a two-week healing period before water is applied. This period allows the roots time to dry, sealing wounds, cuts, and abrasions. When removing saguaro, take as much of the root system as possible from the excavated area.

4. The preferred support system for saguaro consists of three guy wires strung through sections of hose. The sections of hose are placed around the plant two thirds up from the base. Triangulate the three guy wires from the hose sections surrounding the plant column and stake them into the ground, making sure the collars are not too tight. Carpet should not be substituted for hose sections. Carpet retains excess moisture and promotes decay. Storing plants is only recommended when circumstances dictate. Immediate transfer of plants to their permanent location ensures the best survival rate. This method results in the reduction of excessive mechanical handling, reducing the probability of plant damage.
5. The commonly accepted industry standard to determine saguaro transplant success is one to two years after transplanting. The consensus of the technical community is that four to five years is necessary to determine survival.
6. A small mound of soil should be built around and against the base of the saguaro (below the fleshy part to prevent decay). The mound should slope away from the saguaro into a basin that surrounds the cactus. The basin should be three to four inches deep and three times the diameter of the plant.
7. Backfill will consist of native soil. It is important that there is no standing water against the fleshy parts of the saguaro. The water should drain down and away from the plant to prevent fungal infection and decay. This is also true for barrel and ocotillo. The planting depth for the barrel and saguaro cacti should not exceed the callused portion of the base. Moisture contact to the callused area does not appear to promote plant tissue degeneration.
8. Generally, transplant success is greater with barrel cactus followed by saguaros.
9. Duplication of solar orientation when transplanting is crucial for cacti but not necessary for smaller ocotillo. It may be beneficial for large, old ocotillo to be planted in its original solar orientation. Saguaro and barrel cacti that were removed from the shade of another plant (such as palo verde) should be transplanted into locations that will provide shade or they may sunburn and their survival could be diminished.

15.3.8 Succulent Reuse, Donation, Sale, or Nurseries

Although it has been suggested for this Project that salvaged succulents could be used for seed source, this practice is not widely used in revegetation in the arid west because vegetative propagation of cacti is simple and effective.

Approved donation or approved sale of cacti may be identified by DCRT and the BLM as appropriate manners of disposition of the cacti not immediately transplanted. There would be some use for cacti in revegetation of temporary disturbance areas, but this use would be limited. Succulents will be transplanted into recently seeded areas to provide increased microhabitat heterogeneity.

Although not recommended for this Project, an open-air nursery could be used to house succulents if the plants are not immediately transplanted, donated, or transferred to another party. Cacti planted in the open-air nursery for long-term stockpiling can be accessed to collect seed in favorable years after they set fruit. Their proximity in the nursery should promote good pollination.

15.3.9 Compensation

On state-owned lands in Arizona, DCRT may choose to pay for succulent plant damage instead of relocating these plants. Compensation fees are governed by the state. Generally, the BLM and ADOT require salvage, but ultimately the BLM will decide the species to salvage.

15.3.10 Monitoring and Reporting

Monitoring and reporting will begin the quarter (three months) after the first target species are salvaged and continue for up to five years or until success criteria are met, whichever occurs first.

15.3.10.1 Monitoring

Pre-Construction to Five-years Post-Construction

A BLM approved third-party consultant Botanist will monitor all transplanted individuals monthly for a period of two years post-transplantation using a schedule that includes irrigation if necessary and the removal of invasive plant species. After two years, the BLM approved third-party consultant Botanist, will implement a quarterly monitoring schedule until a period of up to five years, or until the success criteria are met or otherwise noted by the AZDA and/or BLM. Lath and support structures will be removed following the five-year monitoring period.

Success Criteria

After two years, a success threshold of 50 percent survivorship of salvaged and transplanted species is targeted and will be the measurable objective that defines success.

Adaptive Management

Documentation of techniques used, timing, weather conditions, changes in protocol, and success or failure will be performed by an authorized Botanist at regular intervals. Adaptive management may be employed whenever necessary and will be determined by the Project's Environmental Compliance Monitor, Designated Biologist, and an Authorized Botanist in coordination with the BLM.

15.3.10.2 Reporting

Monitoring reports are required to evaluate monitoring results to determine if success standards are being met; and if not, to determine what adaptive control measures should be implemented and the rationale for the use of these measures and evaluation of the success of these measures.

Quarterly Reports

Quarterly monitoring results will be presented in a summary report and will include:

- Summaries of any transplanting or seed collection/cuttings conducted in the previous quarter.
- Adaptive management efforts implemented, including date, location, type of treatment, and results.
- Ongoing evaluation of success of transplantation and seedling propagation measures.

Copies of these reports will be kept on file and a copy of each quarterly summary will be sent to the BLM, AZDA, and CDFW for review and comment.

Annual Reports

Annual salvage and transplantation results will be presented in an annual report that will include:

- All salvage and transplantation activities conducted in the previous year.
- Adaptive management efforts implemented, including date, location, type of treatment, and results.
- Ongoing evaluation of success of transplantation and seedling propagation measures.

Copies of these reports will be kept on file and a copy of each annual report will be sent to the BLM, AZDA, and CDFW for review and comment.

Special Reports

Two-Year Post-Construction Monitoring Report

After the initial two-year post-transplanting monitoring is completed, a comprehensive monitoring report will be produced to describe the outcome of vegetation salvage and transplantation on the Project for the initial two-year period. This report will be submitted to the BLM, AZDA, and CDFW for review and comment.

Five-Year Post-Construction Monitoring Report

After the five-year post-construction monitoring has been completed, a final and comprehensive monitoring report will be produced to describe the outcome of vegetation salvage and transplantation on the Project. This report will be submitted to the BLM, AZDA, and CDFW for review and comment.

15.3.11 Environmental Protection Measures

Implementation of the Succulent Management section, environmental protection measures described in this section, as well as adherence to the following environmental protection measures will ensure succulent plant species are managed accordingly during construction activities, reclamation, and operation and maintenance activities associated with the Project:

- BMP-BIO-01: WEAP

- BMP-BIO-43: Collection of Plant Material
- BMP-VEG-01: Removal of Vegetation
- BMP-VEG-02: Avoid Vegetation Removal

15.3.12 California Environmental Quality Act Compliance

There are additional mitigation measures that are limited in scope to California. These include:

- MM BIO-CEQA-4: Develop a Habitat Restoration, Mitigation, and Monitoring Plan
- MM BIO-CEQA-5: Develop a Special Status Plant Transplantation and Compensation Plan
- MM BIO-CEQA-12: Compensation for Impacts to Sensitive Vegetation Communities
- MM VEG-CEQA-1: Develop and Implement a Vegetation Management Plan
- MM VEG-CEQA-2: Conduct Pre-Construction Floristic Surveys
- MM VEG-CEQA-3: Conduct Focused Surveys for Harwood's Eriastrum
- MM VEG-CEQA-4: Compensation for Impacts to Special-Status Plant Species and Sensitive Communities

16 Special Status Plant Transplantation and Compensation

16.1 Introduction

This Special Status Transplantation and Compensation section sets forth the methods DCRT and its Construction Contractor(s) will undertake to transplant special status plant species and/or compensate for damage or removal of special status plant species during construction, operation, and maintenance of the Ten West Link.

16.1.1 Purpose

This Special Status Plant section represents the commitment on the part of DCRT to protect special status plant species. The overall objective is to provide measures to protect these resources from potential impacts during construction, operation, and maintenance and salvage and transplant those plants which cannot be protected. Compensation may be required for special status plants which are impacted and cannot be salvaged and/or transplanted in California. This Special Status Plant section incorporates environmental protection measures contained in the Draft EIS for the Project. This Special Status Plant section is intended for use as a guide to determine the appropriate site-specific measures to be implemented during construction activities.

16.1.2 Goals and Objectives

The goals of this Special Status Plant section are to: 1) identify the special status plant species present in the Project area and the regulations governing them; 2) identify transplantation methods for special status plant species to implement prior to construction activities; and 3) present compensation options for impacts to special status plant species in California. These activities would support and achieve agency and state requirements to:

- Protect native special status plant species.
- Salvage and transplant native special status plant species.
- Use salvaged native special status plant species in reclamation activities.
- Compensate for potential loss of special status plant species.

16.2 Regulatory Compliance

For an overview of the federal and state legislation and regulatory compliance applicable to special status plant resources in the Project area that were considered in the development of this plan, see the Succulent Management section (Section 15) and the Linear ROW Rare Plant Protection section for Harwood's Eriastrum (Section 17).

16.3 Special Status Plant Species Eligible for Transplantation

Certain succulent species (especially some cacti) have physiological adaptations that result in high success rate for salvage and transplant. Other species including trees, shrubs, and annual and perennial herbs are not candidates for transplant due to low success rate for salvage and transplant.

16.3.1 Endangered Species Act Threatened, Endangered, and Proposed Plant Species

No plant species listed under the ESA would be expected to occur within the Project area.

16.3.2 Other Special Status Plant Species - Arizona

The AZDA maintains a list of plants protected under the ANPL. That list includes four categories of protected plants: Highly Safeguarded, Salvage Restricted, Salvage Assessed, and Harvest Restricted. Highly Safeguarded plants include rare species; many of the species under other classifications are widespread throughout the Project area. Table F-7-2 in the Succulent Management Section (Section 15) lists succulent plant species protected under the ANPL that are likely to be present in the Project area in Arizona.

16.3.3 Other Special Status Plant Species – California

In addition to BLM designated sensitive plant species, the BLM confers sensitive status on California State endangered, threatened, and candidate species, and rare plant species with a California Rare Plant Rank of 1B (rare, threatened, or endangered in California and elsewhere) that are on BLM-administered land or affected by BLM actions (Land Use Plan

Amendment [LUPA]). Sixteen special status plant species have been found or could be present in the Project area. However, none of those species are classified as endangered, threatened, or rare by the California Fish and Game Commission (CDFW 2019). Only one of these 16 plant species is a succulent: the saguaro. The CRPR for the saguaro is 2B.2. The 2B ranking indicates the plants are rare, threatened, or endangered in California, but more common elsewhere and the 0.2 ranking indicates the plant is fairly endangered (not an endangered species, but “Least Concern”) in California. The saguaro cactus is protected under the California Desert Native Plants Act.

16.4 Special Status Species to be Transplanted

Pre-construction surveys and monitoring will be conducted to minimize impacts to succulents by identifying species and recording their location. The survey information will be provided to the BLM for approval prior to transplantation. Plant salvage assessments will be conducted in both Arizona and California in 2019, Post-Record of Decision on BLM administered lands for the Final Route. The procedure will entail an on-site pedestrian survey for BLM listed salvageable species. For each individual succulent species encountered, an assessment will be made of the likelihood that the salvage, propagation, and transplantation of that individual would be successful as described in the Succulent Management Section.

16.5 Salvage Techniques and Protocol

The salvage techniques and protocol described in the Succulent Management Section will be followed for special status succulent plant species.

16.6 Re-planting Techniques

The re-planting techniques described in Succulent Management Section will be followed for special status succulent plant species.

17 Rare Plant Linear ROW Protection for Harwood’s Eriastrum

17.1 Applicable Regulations and Management Policies

17.1.1 Desert Renewable Energy Conservation Plan and Land Use Plan Amendment

The LUPA, prepared to implement the Desert Renewable Energy Conservation Plan (DRECP), is applicable only to BLM-administered land in California. The DRECP and LUPA provide a landscape approach to renewable energy and conservation planning in the California desert that streamlines the process for development of utility-scale renewable energy generation and transmission consistent with federal and state renewable energy targets and policies, while simultaneously providing for the long-term conservation and management of special status species and vegetation types. In addition to BLM designated sensitive species, the LUPA identifies additional “Focus” species, which it defines as species whose conservation and management are provided for in the DRECP BLM LUPA.

17.1.2 BLM Manual 6840: Special Status Species Management

This manual provides policy and guidance for conserving species classified as Special Status species by the BLM. BLM Special Status species include species listed or proposed for listing under the federal ESA and species identified by the BLM State Director as requiring special management considerations to promote their conservation and to reduce the likelihood and need for future listing under the ESA.

17.1.3 California Native Plant Protection Act of 1977 (CFGC 1900-1913)

This CFGC law includes provisions that prohibit the taking of listed rare or endangered plants from their natural habitat. The law also includes a salvage requirement for landowners. Furthermore, it gives the CDFW the authority to designate native plants as endangered or rare and provides specific protection measures for identified populations.

17.2 Purpose and Objectives

As the lead federal agency, the BLM released the Draft EIS on August 31, 2018 (BLM 2018), including an appendix providing CEQA documentation, and is currently developing the Final EIS. APMs, BLM-Required BMPs, and CEQA Mitigation Measures (MMs) contained within the EIS require DCRT to prepare and implement a Rare Plant Linear ROW Protection Plan for Harwood's Eriastrum (*Eriastrum harwoodii*).

The Project is required to comply with Conservation and Management Actions (CMAs) from the DRECP LUPA for all Project activities on BLM land in California.

Under the Agency-Preferred Alternative, the BLM would amend the California Desert Conservation Area Plan of 1980, as amended to state:

The Ten West Link Project is authorized to include construction within 0.25-mile of occurrences of Harwood's eriastrum, provided that a Linear Right-of-Way Rare Plant Protection Plan for Harwood's eriastrum is developed and approved by the California State Director. The Rare Plant Linear ROW Protection Plan would meet the DRECP goal of promotion of the ecological processes in the BLM Decision Area that sustain vegetation types of Focus and BLM Special Status Species and their habitat. The Rare Plant Linear ROW Protection Plan would have the objectives of:

> *1. Avoidance of take of Harwood's eriastrum individuals to the maximum extent practical; and*
>
> *2. Avoidance of impacts to Harwood's eriastrum suitable habitat to the maximum extent practical.*

For the purposes of implementing this Rare Plant Linear ROW Protection Plan for Harwood's Eriastrum, "take" is defined as the killing of live plants. Disturbance of the soil seedbank is not considered take, though potential seedbank disturbance will be minimized to the greatest extent practicable. The California BLM State Director would approve the Harwood's Eriastrum Rare Plant Linear ROW Protection Plan prior to ground or vegetation disturbing activities commencing on public lands in California.

APMs and BMPs contained in Appendix 2A of the Draft EIS and summarized below in Section 17.3 of this Harwood's eriastrum Plan, would also apply and reduce the impacts of the Project on BLM special status plant species.

17.3 Avoidance and Minimization Measures

The primary avoidance and minimization measure applicable to this Harwood's eriastrum section and protection of Harwood's eriastrum is APM/BMP BIO-31, which includes the following:

1. Pre-construction surveys would be required for non-agricultural areas in California.
2. Avoid Harwood's eriastrum individuals through micro-siting facilities to the maximum extent practical.
3. Within suitable habitat for Harwood's eriastrum, use overland travel (drive and crush) in lieu of road construction to pad sites to the maximum extent practical.
4. On non-agricultural Public Lands in California, an authorized botanist would be on-site for all construction activities involving surface disturbance or overland travel.
5. Within suitable habitat for Harwood's eriastrum, keep equipment to the minimum necessary to accomplish the work.
6. On public lands in California, avoid establishing features that would interfere with the movement of sand to the maximum extent practical.
7. Laydown and temporary use sites would not be located within suitable habitat for Harwood's eriastrum.
8. On public lands in California, use existing roads or routes to the maximum extent practical.
9. Develop and implement an Invasive Species Management Plan (specific to the rare plant habitat) that the California State Director would approve prior to a notice to proceed for work on public lands in California.
10. No surface disturbance or overland travel would occur within occupied habitat for Harwood's eriastrum from 15 February through the 31 July. This stipulation does not apply to verified, unoccupied habitat. (It is important to clarify that not all suitable habitat is occupied. As defined in the Draft EIS, occupied habitat is classified by the location of a live Harwood's eriastrum plant. Presence/absence surveys conducted at the appropriate time of year [as described in Section 17.5.2 below] may verify that some habitat is unoccupied during a particular year).
11. No take of Harwood's eriastrum individuals would be allowed without California BLM State Director approval.
12. Prepare a Harwood's eriastrum Linear ROW Protection Plan.
13. Project impacts to suitable habitat combined with current impacts shall be limited (capped) to a maximum of one percent of Harwood's eriastrum habitat across all BLM lands included within the DRECP.

Additional APM/BMPs contained within the Final EIS are anticipated to avoid and minimize impacts to Harwood's eriastrum. APM/BMPs anticipated to benefit Harwood's eriastrum are

provided in a bulleted list below. The full text of all APM/BMPs may be found in Appendix 2c of the Draft EIS.

- MM-VEG-CEQA-3: Conduct Focused Surveys for Harwood's Eriastrum
- MM-VEG-CEQA-4: Compensation for Impacts to Special-Status Species and Sensitive Communities
- BIO-01: WEAP
- BIO-02: Biological Monitoring and Preconstruction Survey
- BIO-03: Approved Work Areas
- BIO-04: Environmentally Sensitive Areas and Fencing
- BIO-05: Additional Prohibitions
- BIO-10: Erosion and Dust Control
- BIO-11: Vegetation Management Plan
- BIO-12: Noxious and Invasive Species Control
- BIO-14: Minimizing Vegetation Clearing
- BIO-15: Reclamation and Restoration
- BIO-17: Limit Off-road Vehicle Travel
- BIO-24: Sensitive Plant Surveys
- BIO-31: Treatment of Harwood's eriastrum
- BIO-32: Seasonal Restriction Dates
- BIO-37: Native Plant Collection Prohibition
- BIO-38: Use of State of the Art Technology
- BIO-53: Protection of Dune Vegetation
- BIO-54: Protection of Sand Transport
- BIO-55: Access within Focus and BLM special Status Species Suitable Habitat
- MM-BIO-01: Compensation Plan

17.4 Species Habitat and Occurrence Within the Project Area

Harwood's eriastrum (*Eriastrum harwoodii*), also known as Harwood's woolystar, is the only BLM-designated sensitive species known to be present within the Project area. Harwood's eriastrum is a small, annual forb endemic to California. It grows to 20 centimeters (cm) tall, with densely wooly, linear, threadlike 1.0 to 3.5 cm long leaves. The species blooms from March to June and has small (6.0 to 7.5 millimeter-wide) five-petaled, pale yellow to white flowers (DeGroot et al. 2015).

Harwood's eriastrum grows only on active windblown sand deposits within California. The species has never been documented within Arizona. Potentially suitable habitat occurs in the portions of the Project area on the Palo Verde Mesa, which include the non-agricultural lands in California, which are in or near a series of sand dunes. This dune system relies on free movement of wind-transported sand. Harwood's eriastrum has been documented within

the Project area on the Palo Verde Mesa. As an annual with variable germination rates dependent on rainfall and shifting sand conditions, the abundance and location of Harwood's eriastrum individuals may vary among years reflecting scattered rainfall events as well as shifting sand dune habitat. According to the Draft EIS, surveys of the Project area in 2016 did not locate this species, but during 2017 surveys, 94 Harwood's eriastrum plants were recorded in the Project area. Figure F-7-4, reproduced from Figure 3.4 of the Draft EIS, shows where rare plants were located during 2017 surveys. Other projects have previously documented over 3,000 Harwood's eriastrum plants on the deep sandy soils of the Palo Verde Mesa (Ironwood Consulting, Inc. 2016).

17.5 Implementation

17.5.1 Planning Phase Avoidance and Minimization

The Project's Draft EIS analyzed the cumulative impact of the Project and previous developments on Harwood's eriastrum habitat across all BLM lands within the DRECP in relation to the one percent limit specified within the DRECP-LUPA and in BMP BIO-31. It was concluded that the sum of impacted habitat from the Project and other evaluated projects is below the one percent limit. The DRECP modeled 288,404 acres, including most of the Palo Verde Mesa and nearby Chuckwalla Valley, as the distribution of Harwood's eriastrum on BLM lands addressed by the DRECP-LUPA. According to the Draft EIS, all Project-related ground disturbance activities were calculated for each Project Alternative, using the DRECP habitat model. Project disturbance would depend on which alternative is selected, with the most impactful alternative resulting in disturbance of 48.2 acres of Harwood's eriastrum habitat (only 0.017 percent of the total modeled habitat range-wide). However, this estimate of Project impact acreages does not consider additional reductions in disturbance that would be achieved through micro-siting. Other BLM-approved projects have occurred on the Palo Verde Mesa and nearby Chuckwalla Valley, including the Colorado River Substation, Desert Sunlight Solar Farm, and Genesis Solar Energy Project. A total of 313.6 acres of modeled Harwood's eriastrum habitat has been impacted by these past projects (Colorado River Substation 77.3 acres; Desert Sunlight Solar Farm 0 acre; Genesis Solar Energy Project 236.3 acres). This total acreage of impacted DRECP-modeled habitat would increase to 361.8 acres of DRECP-modeled habitat upon construction of the Project. There is a total of 103,958 acres of modeled Harwood's eriastrum habitat in the Chuckwalla Valley; all projects in Chuckwalla Valley combined result in impacts to 0.35 percent of DRECP-modeled Harwood's eriastrum habitat within Chuckwalla Valley, or 0.12 percent of modeled habitat range-wide.

Several Project design features will minimize impacts to Harwood's eriastrum habitat. Laydown yards or staging areas will not be located on the Palo Verde Mesa or within potential Harwood's eriastrum habitat elsewhere in California. During the initial micro-siting of structures, pulling and tensioning sites, and access routes, previously documented locations of Harwood's eriastrum (e.g., from 2017 Project surveys, California Natural Diversity Database data, or additional preconstruction surveys) will be avoided to the greatest extent practicable. To the extent feasible, final micro-siting (e.g., overland access routes) will be adjusted based on the most recent preconstruction Harwood's eriastrum surveys. To avoid or minimize construction of new roads in potential Harwood's eriastrum habitat, existing roads and overland travel will be used to the greatest extent practicable. If deemed appropriate, Project access (outside of the February 15-July 31 growing season) through recently occupied habitat may utilize timber mats to decrease potential soil compaction and seedbank disturbance.

Ten West Link
Harwood's Eriastrum Survey Results and DRECP-Modeled Habitat.

This page intentionally left blank.

Though the DRECP-LUPA maps most of the Palo Verde Mesa as potential Harwood's eriastrum habitat (Figure F-7-4), the Project's Draft EIS states that active sand transport is limited primarily to a corridor north of the Colorado River Substation. This corridor is about 1.0-mile-wide extending approximately five miles to the east, consistent with the location of highest concentrations of Harwood's eriastrum in the Project area, based on previous surveys. This is illustrated in Figure F-7-5, which is reproduced from Figure 3-5 of the Draft EIS. In accordance with BMP-BIO-53 and BMP-BIO-54, within aeolian (wind-transport) corridors that transport sand to dune formations, activities will be designed and operated to facilitate the flow of sand. Any access roads constructed in dune habitat would be designed and constructed to be at grade with the ground surface to avoid inhibiting sand transport. Structure design and micro-siting will take into account the direction of sand flow and, to the extent feasible, structures will be built and aligned to allow sand to flow through the site unimpeded. If construction of fencing is necessary, it will be designed to allow sand to flow through and not be trapped.

17.5.2 Invasive Species Management

Maintenance of sand dune habitat is dramatically affected by the presence of the non-native, invasive Sahara mustard, and Russian thistle, which in some years may virtually shut down aeolian sand migration. The Noxious and Invasive Weed Management Section (Section 18) describes the approach that will be used to control and manage these and other invasive plant species with potential to degrade sand dune habitat.

17.6 Preconstruction Surveys

Per MM VEG-CEQA-3, prior to conducting any activities that may modify vegetation, surveys for Harwood's eriastrum will be conducted by qualified botanist(s) in all non-agricultural areas in California where Project activities will result in vegetation disturbance (e.g., clearing, mowing, or ground-breaking). The qualified botanist will be approved by the CPUC, BLM, and CDFW. If possible, these surveys will be conducted concurrent with surveys for other special status plant species (as required by APM/BMP-BIO-24 and MM VEG-CEQA-2). During the floristic surveys every plant taxon that occurs on site will be identified to the taxonomic level necessary to determine species listing and status. Surveys will adhere to the following protocols:

- Guidelines for Conducting and Reporting Botanical Inventories for Federally Listed, Proposed and Candidate Plant (USFWS 2000).
- Protocols for Surveying and Evaluating Impacts to Special-Status Native Plant Populations and Sensitive Natural Communities (CDFW 2018).
- Survey Protocols Required for National Environmental Policy Act/ESA Compliance for BLM Special-Status Plant Species (BLM 2009).

To maximize the likelihood of locating Harwood's eriastrum, if present, surveys will be conducted during the appropriate bloom season. The general blooming season for Harwood's eriastrum is March to June (DeGroot et al. 2015), but the optimal survey timing for this and other sensitive species may vary from year to year, depending on annual variations in weather. Prior to surveying, the BLM botanist (Palm Springs Field Office) will be consulted regarding optimal timing for surveys of Harwood's eriastrum and other special status plant species. Because this annual species has highly variable germination rates, dependent on rainfall, plant locations may shift among years reflecting scattered rainfall events. Therefore, surveys from past years may not accurately reflect distribution of

individual plants in the current year. If construction in potential Harwood's eriastrum habitat is scheduled to occur between February 15 and July 31, preconstruction surveys would occur during the same season as construction, to determine occupancy. If individuals and/or populations of Harwood's eriastrum are determined present within the Project area during pre-construction floristic surveys, Project activities shall be reduced and minimized to avoid impacts to the extent feasible, as described below in Section 17.7.

A pre-construction Harwood's Eriastrum Floristic Survey Report will document the methods and results of the surveys and will document measures to avoid, minimize, or mitigate for Harwood's eriastrum. The report will be submitted to the appropriate federal and state agencies. The floristic survey results will also be documented in this Vegetation Management Plan.

17.7 Construction Phase Avoidance and Minimization

Vegetation management will be implemented during construction as required by MM-VEG-CEQA-1 and described in this Plan. The Vegetation Management Plan includes Succulent Management (Section 15), Special Status Plant Transplantation and Compensation (Section 16), and Noxious Weed and Invasive Species Management (Section 18).

Since Harwood's eriastrum is an annual, individuals will be avoided to the maximum extent feasible through micro-siting facilities after identification of current populations. No surface disturbance or overland travel will take place within occupied habitat for Harwood's eriastrum from February 15 through July 31. This stipulation does not apply to unoccupied habitat, as verified during same-year surveys. Occupied habitat is defined as the location of a live Harwood's eriastrum plant. Upon the death and desiccation of the annual plant, or the absence of germination due to lack of precipitation, the area would be included as suitable habitat but would not be considered occupied habitat. If construction will occur outside of, but adjacent to occupied habitat, appropriate signage, barrier fences, and/or stakes would be installed at the edge of the approved work area or around the occupied habitat to minimize the possibility of inadvertently encroaching onto occupied habitat. A site-specific buffer zone will be developed to prevent direct or indirect disturbance to Harwood's eriastrum from construction activities, erosion, inundation, or dust. The size of the buffer will depend upon the proposed use of the immediately adjacent lands and the plant's ecological requirements to be specified by the designated qualified biologist/botanist (see Section 17.5.4. The minimum buffer will be 50 feet from the perimeter of the occupied habitat or the individual. If a smaller buffer is necessary due to other Project constraints, then DCRT will develop and implement site-specific monitoring and put other measures in place to avoid species impacts.

Prior to commencing onsite work all construction personnel will attend a Worker Environmental Awareness Program, which will educate the participants regarding pertinent environmental issues and stipulations to be implemented during construction.

Within suitable habitat, construction equipment will be kept to the minimum necessary to accomplish the work. In these areas, construction will use drive and crush access wherever possible to minimize disturbance to potential seedbank areas. Stockpiling of material would be allowed only within established work areas and will not be located within suitable habitat for Harwood's eriastrum. Vehicles and equipment would be parked on pavement, existing roads, and previously disturbed areas within identified work areas or access roads, and to the extent practicable, new routes outside of those Project approved will not be established that interfere with Harwood's eriastrum habitat or with the movement of sand.

17.8 Construction Monitoring

On non-agricultural public lands in California, a qualified botanist (approved by CPUC, BLM, and CDFW) will be onsite for all construction activities involving surface disturbance or overland travel. The onsite botanist will reassess each area for presence of Harwood's eriastrum individuals and monitor construction activities to ensure proper implementation of Harwood's eriastrum avoidance and minimization measures. The onsite botanist will provide brief weekly reports to the BLM botanist via email and, as necessary, keep the BLM botanist apprised of any emerging issues relevant to Harwood's eriastrum.

In the event that avoidance of one or more Harwood's eriastrum individuals is deemed particularly difficult or impractical, the California State Director would be consulted prior to any activity that could result in the take of the species. No take of Harwood's eriastrum individuals would be allowed without prior California State Director approval.

17.9 Post-construction Avoidance, Minimization, and Mitigation

In conformance with MM-BIO-01, a Compensation Plan will be prepared. The Compensation Plan will include calculations of compensation ratios and mitigation acreages for loss of habitat for any biological resources requiring additional mitigation. If take of Harwood's eriastrum during construction is unavoidable and, with permission from the California State Director, live plants are killed, the Compensation Plan would outline compensation requirements based on the estimated number of plants taken.

A Reclamation, Vegetation, and Monitoring Plan has been developed and included in the POD as Appendix L-1. Pending approval by BLM, that plan will be implemented for construction, operation and maintenance of the Project. The Reclamation, Vegetation, and Monitoring Plan includes protocols and methods for the revegetation of all sites disturbed during construction for which revegetation will not conflict with safe operation of the transmission line, and restoration of disturbed areas to the extent practicable, given the arid desert environment. The Reclamation, Vegetation, and Monitoring Plan provides detailed methods for surveying and characterizing vegetation in disturbed areas before construction, topsoil salvage and management, erosion control, post-construction recontouring and site preparation, seeding and planting, and post-construction watering, monitoring, and remediation. To the extent practicable, it is designed to reduce impacts on Special Status species, including Harwood's eriastrum. Additionally, topsoil stripped in Harwood's eriastrum habitat will be stored separately from other topsoil and replaced during reclamation to facilitate revegetation, should seeds exist.

The Noxious Weed and Invasive Species Management Section (Section 18 of this Plan) describes the approach that will be used before, during, and after construction to control and manage invasive plant species with potential to degrade sand dune habitat.

During the operation and maintenance of the Project, to the extent practicable, surface disturbance will be avoided between February 15 and July 31 within occupied or potentially occupied habitat of Harwood's eriastrum. This stipulation does not apply to unoccupied habitat, as verified during the current year's surveys. Occupied habitat is defined as the location of a live Harwood's eriastrum plant. Upon the death and desiccation of the annual plant, or the absence of germination due to lack of precipitation, the area would not be considered occupied habitat.

In the event that avoidance of occupied or potentially occupied Harwood's eriastrum habitat is deemed to be inconsistent with the operational and maintenance needs of the Project, the California State Director would be consulted prior to any activity that could result in take of the species. No take of Harwood's eriastrum individuals would be allowed without prior California State Director approval. An exception to this rule would be made in cases of emergency, where immediate access is necessary for safety reasons, and the necessary timing precludes the ability to contact the California State Director prior to access. As Harwood's eriastrum is an annual plant, transplantation of live plants would not be practical or recommended. However, if take of Harwood's eriastrum is unavoidable and approved by the California State Director, an effort will be made to collect seeds from the impacted plants or from the nearest practical Harwood's eriastrum populations and the collected seeds would be used to reseed the affected area during reclamation. Additionally, any loss of occupied habitat will be compensated offsite at a ratio of 3:1, as described in the Compensatory Mitigation Plan (POD Appendix B-3).

18 Noxious and Invasive Weed Management

18.1 Introduction

This Noxious and Invasive Weed Management section sets forth the methods DCRT and its Construction Contractor(s) will undertake to prevent, mitigate and control the spread of noxious and invasive weeds during construction and operation and maintenance of the Ten West Link.

Federal Invasive Species Executive Order 13112 defines an invasive plant as an alien, non-native, species whose introduction causes or is likely to cause economic or environmental damage or harm to human health (United States Federal Register 1999). The BLM defines a noxious weed as a plant that interferes with management objectives for a given area of land at a given point in time. A noxious weed is any plant designated by a federal, state, or county government as injurious to public health, agriculture, recreation, wildlife or property. Noxious weeds are opportunistic plant species that readily flourish in disturbed areas, thereby preventing native plant species from re-establishing communities.

Road construction and other ground-disturbing activities associated with construction, operation and maintenance of the Project could potentially allow noxious weed species to establish in new locations or for a pre-existing noxious weed location to increase in extent and/or density. Prevention, treatment, monitoring, and documentation measures, as described in this section, would reduce the probability of this occurring as a result of the Project. This section describes the status of noxious weed species in the Project area, the regulatory agencies responsible for the control of noxious and invasive weeds, and steps that DCRT and its Construction Contractor(s) would take to prevent the establishment and spread of noxious weed species due to Project construction, operation and maintenance activities. Updates to this section would include information on locations of weed problem areas within the Project footprint and proposed treatment methods as applicable.

18.1.1 Purpose

The purpose of this section is to describe and recommend methods for managing noxious weeds during and after construction of the Project that would meet federal and state regulatory requirements and guidelines for noxious weed management. These methods are

described in this section as follows: 1) plan purpose, goals, and objectives; 2) noxious weed inventory; 3) management practices and agency requirements; 4) the use of herbicides; and 5) monitoring.

The focus of noxious weed control efforts is to prevent establishment of new infestations and to prevent existing infestations from expanding (as documented by pre-construction surveys) as a result of Project activities. DCRT is only responsible for the control of noxious weeds that are a result of construction-related, surface-disturbing activities. DCRT is not responsible for noxious weed species that occur adjacent to Project areas or for controlling or eradicating a species that were present prior to the Project. Eradication of these infestations is not the responsibility of DCRT and would not be attempted, although containment would be the goal where required by state regulations. The control of invasive species (not classified as noxious weeds) is addressed in Appendix L-1, Reclamation, Vegetation, and Monitoring Plan.

18.1.2 Goals and Objectives

The goals of this section are to: 1) prevent the spread of existing noxious weeds; and 2) avoid noxious weed invasion into new sites during and following construction of the Project. This would be accomplished by executing agency requirements to:

- Prevent and manage the spread of noxious weeds.
- Implement weed control measures for the Project.
- Use herbicides safely.
- Monitor noxious weed management effectiveness.

Information gathered during pre-construction surveys and provided by land management agencies may be used to monitor and control the spread of noxious weeds on the Project ROW. Proposed noxious weed management measures are listed in this document along with relevant regulatory requirements.

18.2 Regulatory Compliance

The following provides a brief overview of federal and state legislation and regulatory compliance applicable to biological resources in the Project area that were considered in the development of this section.

18.2.1 All Lands

Relevant regulations applicable to all lands include:

- Noxious Weed Act of 1974 - Public Law 93-629 (7 U.S.C. § 2801 et seq.; 88 Stat. 2148).
- United States Environmental Protection Agency Federal Insecticide, Fungicide, and Rodenticide Act (7 CFR Part 136, 40 CFR Parts 140-189).
- Clean Water Act Sections 303(d) and 404.
- ESA of 1973, as amended Section 7(a)(2).

- USDA State Noxious-Weed Seed Requirements Recognized in the Administration of the Federal Seed Act – 7 CFR Part 201.
- Noxious Weed Control and Eradication Act of 2004, 7 U.S.C. §§7781-7786, Subtitle E.
- Plant Protection Act of 2000, 7 U.S.C. § 7701 et seq. (supersedes the Federal Executive Order 13112 of February 3, 1999, on Invasive Species).
- National Invasive Species Act of 1996, 16 U.S.C. § 4701.
- Nonindigenous Aquatic Nuisance Prevention and Control Act of 1990, 16 U.S.C. § 4701.

18.2.2 Bureau of Land Management

Relevant regulations applicable to BLM lands include:

- Federal Land Policy and Management Act Sec. 101(a)(8).
- United States Department of Interior Manual 517 DM 1—Integrated Pest Management Policy.
- Final Vegetation Treatments Using Herbicides Programmatic Environmental Impact Statement.
- BLM Integrated Vegetation Management Handbook H1740-2.
- BLM Terms and Conditions of ROW Grants and Temporary Use Permits 43 CFR Part 2881.2.
- BLM Field Office Resource Management Plans.

18.2.3 Bureau of Reclamation

Relevant regulations applicable to Bureau of Reclamation lands include:

- Federal Land Policy and Management Act Sec. 101(a)(8).
- United States Department of Interior Manual 517 DM 1—Integrated Pest Management Policy.

18.2.4 State of Arizona

- Arizona Revised Statutes, Title 3 Agriculture: Chapter 2, Article 1 – Dangerous Plant Pests and Diseases; Chapter 2, Article 5 – Pesticides; Chapter 2, Article 6 – Pesticide Control; Chapter 2, Article 6.1 – Integrated Pest Management Program.

18.2.5 State of California

- California Food and Agriculture Code: Division 4, Part 4 – Weeds and Pest Seeds; Division 6 – Pest Control Operations; Division 7, Chapter 2 – Pesticides and Chapter – Restricted Materials.

18.2.6 Federal- and State-Listed Noxious Weeds

Table F-7-5 identifies the 15 noxious weed species known to be present in the BLM planning areas which are crossed by the route.

TABLE F-7-5 FEDERAL AND STATE-REGULATED NOXIOUS WEEDS FOUND IN OR NEAR THE BIOLOGICAL STUDY AREA

Scientific Name	Common Name	Federal Designation	Arizona Designation[1]	California Designation
Acroptilon repens	Russian knapweed	-	Prohibited; Restricted	Noxious
Alhagi maurorum	Camelthorn	-	Prohibited; Restricted	Noxious
Arundo donax	Giant-reed	-	-	Noxious
Carduus nutan	Musk thistle	-	-	Noxious
Centaurea diffusa	Diffuse knapweed	-	Prohibited; Restricted	Noxious
Centaurea solstitialis	Yellow star thistle	-	Prohibited; Restricted	Noxious
Cuscuta spp.	Dodder	-	Prohibited; Restricted	Noxious
Eichhornia crassipes	Water hyacinth	-	Prohibited; Restricted	-
Halogeton glomeratus	Halogeton	-	Prohibited; Restricted	Noxious
Hydrilla verticaillata	Hydrilla	-	Prohibited	Noxious
Onopordum acanthium	Scotch thistle	-	Prohibited; Restricted	Noxious
Salvinia molesta	Giant salvinia	Noxious	Prohibited	-
Salsola tragus	Prickly Russian thistle	-	-	Noxious
Tamarix spp.	Saltcedar	-	-	Noxious
Tribulus terrestris	Puncturevine	-	Prohibited; Regulated	Noxious

[1] Regulated - may be controlled to prevent further infestation or contamination; Restricted - shall be quarantined to prevent further infestation or contamination; Prohibited - prohibited from entering the state.
Source: BLM 2018.

18.2.7 Responsible Parties

DCRT will have the overall responsibility of directing and monitoring noxious weed management efforts for the Project. The Construction Contractor(s) may retain the services of a company who specializes in noxious weed management to implement the protocols identified in this section during construction. It is anticipated that post-construction noxious weed monitoring would occur concurrently with the practices outlined in Appendix L-1 – Reclamation, Vegetation, and Monitoring Plan as appropriate.

18.3 Noxious Weed Management

The management of noxious weeds will be considered throughout all stages of the Project including:

- Educating all construction personnel regarding the identified problem areas and the importance of preventive measures and treatment methods.

- Specific measures to prevent the spread of noxious weeds during construction and operation and maintenance activities.
- Preconstruction and post-construction treatment methods to be applied to areas where noxious weeds are present.

The following is a description of the measures that may be required for noxious weed management as directed by the BLM Authorized Officer or State Quarantine Officer. Applicable measures will be agreed on prior to the onset of any ground disturbing activities, and this Noxious and Invasive Weed Management Plan will be modified accordingly. The APM with regards to noxious weed management is

APM-BIO-12: Noxious and Invasive Species Control (Compliance with CMALUPA-BIO-6, 10 and 11) – A Noxious Weed Control Plan would be developed, approved by the BLM, and implemented prior to initiation of ground disturbing activities. That Plan would identify noxious and invasive species to be addressed in the Project Area, describe measures to conduct preconstruction weed surveys, reduce the potential introduction or spread of noxious weeds and invasive species during construction, and monitor and control weeds during operation of the transmission line. It would be designed to minimize impacts on special status species to the extent practicable. Coordination with resource agencies regarding invasive plant species would be conducted before construction. BMPs would include use of weed-free straw, fill, and other materials; requirements for washing vehicles and equipment arriving on site; proper maintenance of vehicle inspection and wash stations; requirements for managing infested soils and materials; requirements and practices for the application of herbicides; and other requirements in applicable BLM Weed Management Plans.

CEQA Compliance

The following MMs will ensure compliance with CEQA in the California portions of the Project:

- MM-BIO-CEQA-1
- MM-VEG-CEQA-1

18.3.1 Identification of Problem Areas and Education

Prior to the initiation of construction activities, all construction personnel will be instructed on the importance of controlling noxious weeds through the Worker Environmental Awareness Program. As part of start-up activities, the Construction Contractor(s) will provide information and training to all personnel regarding noxious weed management. The importance of preventing the spread of noxious weeds in areas not infested and controlling the proliferation of weeds already present will be emphasized. Prior to construction, areas of concern previously identified during the weed survey will be flagged by the Construction Contractor(s) and reviewed by the CIC. This flagging will alert construction personnel to the presence of noxious weeds and prevent area access until noxious weed management control measures, as described below, have been implemented.

The type and locations of Project-specific noxious and invasive weed species are unknown as of right now. Noxious and invasive plant surveys will be conducted May to October 2019 on BLM administered lands for the Final Route. Once the noxious and invasive weed

species are known, specific pesticide use will be submitted for treatment in a BLM Pesticide Use Proposal and approved prior to use.

CEQA Compliance

The following MM will ensure compliance with CEQA in California portions of the Project: MM-VEG-CEQA-2.

18.3.1.1 Weed Management Personnel Requirements

Weed Management actions shall be carried out by a weed management specialist with the following qualifications:

- Training and experience in native plant taxonomy/identification.
- Training and experience in field ecology and plant community mapping.
- Possession of a Commercial Applicator's License for pesticides from the Arizona Department of Agriculture and/or California Department of Food and Agriculture (if chemical control is needed).
- Training in weed management or Integrated Pest Management with an emphasis in weeds.
- Experience in coordination with agency and private landowners.
- Attendance at a BLM-approved noxious weed training course.

18.3.2 Other Specific Stipulations and Methods

18.3.2.1 Invasive Species Management within Harwood's Eriastrum Habitat

The BLM sensitive species Harwood's eriastrum inhabits sand dune habitat along the western end of the Project area. This habitat is often impacted by noxious weeds as well as other non-native, invasive weeds such as Sahara mustard. Within this habitat area, efforts will be made to avoid introduction and spread of invasive weeds, regardless of its status as a noxious weed, as described previously. Implementation of various mitigation APMs and BMPs would attempt to control direct and non-direct impacts to native desert plant communities and special status plants. Application of the mitigation measures defined in this plan would ultimately minimize the potential introduction of noxious and/or invasive weeds in these habitats.

During any pre- and post-construction monitoring for weeds, any identified weed infestation areas that may need treatment within Harwood's eriastrum habitat would be surveyed for the presence of Harwood's eriastrum individuals. If any individuals of Harwood's eriastrum are found, control methods would avoid take of Harwood's eriastrum by careful spot treatment of non-native, invasive species and/or temporal avoidance of the Harwood's eriastrum growing season (approximately February 15 – July 15), and would avoid methods with potential to kill or otherwise impact the Harwood's eriastrum seedbank within the soil. Chemical treatment would only be applied if absolutely necessary and if approved by BLM.

18.3.2.2 Preventative Measures

The following preventative measures will be implemented to prevent the spread of noxious weeds during construction activities, reclamation and rehabilitation efforts, and maintenance operations associated with the Project. Detailed information regarding reclamation, along with the control of invasive plant species is provided in Appendix L-1 – Reclamation, Vegetation, and Monitoring Plan.

All equipment, tools, and tires shall be properly cleaned and decontaminated of noxious weeds before entering the Project region. Prior to construction activities (e.g., including clearing, grubbing), a Weed Decontamination Form (Attachment D) will be submitted to the Project Designated Biologist. The Weed Decontamination Form shall verify that construction related equipment used by the contractor(s), has been cleaned and deemed weed free, before entering the Project region.

These preventative measures are to be applied on a case-by-case basis, where applicable and necessary, at the discretion of the BLM, CIC, and the Construction Contractor's environmental monitors (weed specialists).

CMA-LUPA-BIO-10 (California only): Standard Practices for Weed Management (portions) - Closely monitor the types of materials brought onto the site to avoid the introduction of invasive weeds and non-native species. Use certified weed-free mulch, straw, hay bales, or equivalent fabricated materials for installing sediment barriers. Reestablish native vegetation quickly on disturbed sites.

18.3.2.3 Control Measures

DCRT and their Construction Contractor(s) will implement noxious weed control measures in accordance with existing regulations and BLM requirements. Control measures will be based on species-specific and site-specific conditions (e.g., proximity to water or riparian areas, agricultural areas, and season) and will be coordinated with the BLM Authorized Officer or his/her designated representative, the CIC, and the Construction Contractor's weed management specialist. If existing populations are currently under treatment by the BLM or other individuals, DCRT and their Construction Contractor are encouraged to engage in cooperative management efforts to treat the noxious weeds associated with the Project area. In the event new noxious weed populations are identified on the Project in the future, the protocols and methods outlined in this section will be followed. The weed management specialist contracted by the Construction Contractor(s) shall provide a detailed control methodology for each noxious weed species documented. The BLM Authorized Officer will review and approve this Noxious and Invasive Weed Management section prior to implementation. Control measures may include one or more of the following methods prior to implementation of reclamation actions.

Mechanical

Mechanical methods rely on cutting roots with a shovel or other hand tools or equipment that can be used to mow or disc weed populations. This type of methodology is useful for smaller, isolated populations in areas of sensitive habitats or if larger populations occur in agricultural lands where tillage can be implemented. Some rhizomatous plants can spread by discing or tillage and implementation will be species specific. If such a method is used in areas to be reclaimed, subsequent seeding will be conducted to re-establish a desirable

vegetative cover that will stabilize the soils and slow the potential re-invasion of noxious weeds.

Wash Stations

This section summarizes the concepts for removing seeds from vehicles and equipment to control the spread of noxious weeds and invasive species. One method of removing weeds is to use air compressors or an air knife to blow the weeds off vehicles. Another method of removing weeds is to use water to wash away the weed seeds from equipment before it leaves a weed-infested area. This will prevent transporting and spreading seeds and spores. Seeds and spores are found in vegetation, dirt, and mud clinging to the undercarriage or underbody parts (such as wheels, wheel wells, running boards, drive train, and bumpers). Equipment and technologies related to the use of weed wash stations that may be employed for the Project are described below: runoff containment, spraying equipment, water supply, filtration, water treatment, and pumping equipment.

Runoff Containment - Even when containment is used, invasive seeds may be blown beyond the containment system during washing. To mitigate this, the Construction Contractor will inspect wash sites regularly and treat for weeds as necessary. Wastewater containment can be accomplished several ways. Four typical forms of containment discussed below are consistent with BMPs.

- Geotextile cloth – The cloth captures large particles in the permeable barrier and allows water to percolate back into the soil. Because most seeds are larger than 200 microns, the cloth prevents or reduces seed transplantation at the loading area. Geotextile cloth is made of a polycarbonate fiber with a natural affinity for hydrocarbons, which prevents oil or grease from draining into the soil.

- Geotextile lined rock pits – These pits are a 10-foot by 10-foot area of bull-rock or smaller that is underlain by geotextile. When weed wash stations are decommissioned, the rock is removed from the pit in a manner that allows treatment with herbicides. The rock and geotextile will be tagged as weed infested and disposed of properly. Records are kept of all herbicides used, treatment dates, target species treated, and progression of infestation areas.

- Flexible mat – Flexible mats come in many sizes and styles. They serve as portable berm systems to contain wash water and debris. They are a durable, chemical-resistant rubber material. Some models have berms that are permanently attached to the perimeter, while others have removable inserts. Permanent berms on flexible mats can make storage difficult. One plain rubberized mat has polyvinyl chloride sewer pipe fitted under the sides with foam cushions under the approach and departure ends. Prior to installation, lay geotextile or similar cloth underneath to prevent sharp rocks from penetrating the mat. The plain mat rolls or folds up for handling and storage.

  Flexible mats may tear, but onsite repairs are easy. It is recommended that conveyor belting in the wheel tracks be used to prevent punctures or tears. Flexible mats, and the materials used to form containment berms, can be installed by two people. The material is easily transported in a 1/2- to 3/4-ton truck. Low-ground-clearance vehicles can be accommodated with this system. One problem with this system is that flexible mats may create sludge puddles that vehicles track through, picking up the just washed off mud. Flexible mats require workers to bend over more often than when using an elevated rack system to wash vehicles.

- Elevated washrack: Some manufacturers build portable elevated wash racks. One option is a wash rack with panels in 10-, 12-, and 14-foot widths. The eight-foot-long panels are placed side by side to the desired length. They are designed to carry axle loads of 12 tons, and need support on just two sides. Another option is a similar modular wash rack with six- by eight-foot panels designed to handle 15,000-pound wheel loads. Both systems can handle wheeled or tracked equipment, and the runoff is collected in the center or in a gutter alongside. Raised panels make it easier to wash the underbody. Containment walls are available that allow access to both sides of the vehicle and reduce overspray when the walls are set in a staggered position. Washracks can have automatic sprayers or may be operated manually.

Spraying Equipment - Two methods of spraying are standard in the vehicle-and equipment-washing installations: high pressure with low volume and low pressure with high volume. High pressure is above 1,000 pounds per square inch (psi), and high volume is more than 10 gallons per minute (gal/min). In both categories, hand-held (wand) systems and automated systems are available. Although simplicity of operation might favor an automated system, reliability, effectiveness, efficiency, and economy favor manual sprayers.

It is recommended that heavy debris first be removed manually by trowel, shovel, or brush before the vehicle returns to the loading area. All remaining debris can be washed off before the equipment is loaded. Some manual follow-up spray cleaning should accompany automated systems use.

- High-Pressure, Low-Volume Spraying - Many household and industrial pressure washers have outputs of up to 4,000 psi. Flows generally range from two to five gal/min and with attachments, these high-energy spraying systems can remove the most tenacious debris. Models are available at home improvement stores. The low-water consumption reduces supply water and wastewater needs. However, these high-pressure sprayers produce large amounts of debris scatter and overspray.

- Low-Pressure, High-Volume Spraying - The one-inch combination barrel nozzle is particularly effective for equipment washing. It uses 13 gal/min at 50 psi when adjusted for a narrow cone spray pattern. A one- inch ball shutoff ahead of the nozzle minimizes spray pattern adjustments and enables instant shutoff. The long spray range and low-pressure coverage minimizes injury. The combination barrel nozzle requires a high-water volume compared to other high-pressure washing systems.

- Undercarriage Spray Bars - Undercarriage spray bars (and other somewhat automatic systems) use lower pressure and higher flow. The number, size, nozzle shape or holes in a spray bar, and water pressure determine water-use rate. Spray bars fabricated from pipe with threaded ports and individual nozzles have many spray patterns.

The Construction Contractor will select the appropriate spraying equipment based on the needs of the Project.

Water Supply - The Construction Contractor will select and provide water and water disbursing equipment as necessary for Project needs. Water trucks are typical and range from 1,000 to 4,000 gallons in general. Water would be obtained from private wells and/or municipal supplies with permitted and allocated water rights. Collecting and recycling of water is an option, especially with automated sprayers.

Filtration - If wash water will be recycled and reused in any wash system, filtration will be used to remove invasive seeds from the used wash water and prevent vehicle cross-contamination. In addition, water treatment may be necessary to kill small bacteria, fungi, or neutralize other contaminants. Before dumping in a sanitary sewer system, wastewater often requires filtration or treatment. Several types of water filters are suited for this purpose. Often, filter technology developed for agriculture (irrigation), industrial waste treatment, and household swimming pools can be adapted to wash-station water treatment. Filter types include: gravity, centrifugal, screen, disk, bag, cartridge, and particle media (sand).

All filters have limitations regarding the particle size they can trap. Most weed seeds exceed 100 microns, and most fungal spores exceed five microns. Filtration below 10 microns is possible but not practical at higher flows in heavily contaminated water with a portable system. Most filtration systems incrementally reduce particle size by stages. The first stage might be a coarse bag filter and/or a settling tank. Other stages could be used depending on the final particle size to be removed and the systems flow rate.

Pumping Equipment - Water trucks, water trailers, and portable wildfire pumps could provide primary spray or recovery pumps for wash systems. Water trucks can draft and pump simultaneously without drawing from their reservoir; however, some water trucks have a bypass line that constantly sends a small amount of process water back to the freshwater tank. For that reason, water truck pumps are not recommended for drafting unless they are drafting from a postfilter sump.

Spraying, recovering, and filtering operations require pumps. A wash system has at least two pumps – a sump pump and a pressure pump – and, depending on filtration methods for water recycling, a third pump for the filters.

Conservation Management Action

The following CMA will be applied to this Project. CMA-LUPA-BIO-10 is the Project requirement and the runoff containment, etc., described above is how the weed washing will be mitigated.

CMA-LUPA-BIO-10 (California only): Standard Practices for Weed Management – Consistent with BLM state and national policies and guidance, integrated weed management actions, will be carried out during all phases of activities, as appropriate, and at a minimum will include the following:

- Thoroughly clean the tires and undercarriage of vehicles entering or reentering the project site to remove potential weeds.
- Store project vehicles on site in designated areas to minimize the need for multiple washings whenever vehicles re-enter the project site.
- Properly maintain vehicle wash and inspection stations to minimize the introduction of invasive weeds or subsidy of invasive weeds.
- Closely monitor the types of materials brought onto the site to avoid the introduction of invasive weeds and non-native species.
- Reestablish native vegetation quickly on disturbed sites.

- Monitor and quickly implement control measures to ensure early detection and abatement of weed invasions to avoid the spread of invasive weeds and non-native species on site and to adjacent off-site areas.

- Use certified weed-free mulch, straw, hay bales, or equivalent fabricated materials for installing sediment barriers.

Behavioral

Behavioral control methods rely on preventative education of the public and construction, operation, and maintenance personnel. Behavioral control of noxious weeds can also include the minimization of vehicular travel through areas of known populations. Noxious weed populations identified during surveys or by BLM/county weed control officials will be cordoned off (except where access for construction or maintenance is required) to avoid spreading seed or plant materials.

Biological

Biological control involves using living organisms (insects, diseases, livestock) to control noxious weeds to achieve management objectives. Many noxious weed species have been introduced recently into North America and have few natural enemies to control their populations. The biological control agent is typically adapted to a specific species and selected for their ability to attack critical areas of the plant that contribute to its persistence. The use of biological control methods is not expected for this Project.

Chemical

Chemical control can effectively abate noxious weeds through use of selective herbicides. Pesticide treatment can be temporarily effective for large populations of noxious weed where other means of control may not be feasible. Before construction, only pesticides approved by the BLM will be applied to the identified noxious weed populations on BLM administered land to reduce their spread. Pesticide applications will be controlled, as described in Section 18.5 – Pesticide Application, Handling, Spills, and Cleanup, to minimize the impacts on the surrounding vegetation. In areas of dense noxious weed populations, a broader application will be used and a follow-up seeding program will be implemented. Attachment G includes a list of BLM-Approved Herbicides. A Pesticide Use Proposal and Safety Data Sheets for the chemicals, which will be compiled by the Construction Contractor(s) and submitted to the BLM for review and approval prior to initiation of construction activities.

Reclamation Actions

As specified in Appendix L-1 – Reclamation, Vegetation, and Monitoring Plan, areas where weed control measures have been implemented and require post-construction reclamation actions (e.g., seeding), the following specific stipulations and methods are applicable.

18.3.3 Agency Specific Requirements

Through the implementation of this section and in conjunction with the BLM, the Project will comply with Arizona and California state statutes. The following is a discussion regarding BLM stipulations, and personnel and equipment requirements.

18.3.3.1 Bureau of Land Management

The *Final Programmatic Environmental Impact Statement on Vegetation Treatment on BLM Land in Seventeen Western States (BLM 2016)* lists herbicides acceptable (refer to Attachment G – BLM-Approved Herbicides) for use on BLM-administered lands. Herbicides listed in Table 1 in Attachment G may be used in the Project area after approval by the BLM; however, some herbicides may not be approved for use on land administered by the BLM Colorado River District Office. The herbicides approved for use on the Project will be reviewed and approved by the BLM prior to beginning construction. Guidelines for use of chemical control of vegetation on BLM-administered lands are presented in the Chemical Pest Control Manual. These guidelines require submittal of a Pesticide Use Proposal and Safety Data Sheets for the chemicals, which will be compiled by the Construction Contractor(s) and submitted to the BLM for review and approval prior to initiation of construction activities. A Pesticide Application Record will be submitted to BLM to document the treatments that took place under the Pesticide Use Proposal.

The occurrence of noxious weeds within the Project will be reported to the lead BLM district office for the Project. The appropriate weed control procedures, including target species, timing of control, and method of control, will be determined in consultation with the BLM and the Construction Contractor(s), based on the procedures outlined in this section. The Proponent may be able to take advantage of any existing cooperative agreements between the BLM and the counties by providing the funds required for county personnel to implement the necessary weed control procedures. If not, the Proponent will be responsible for providing the necessary personnel or hiring a contractor to implement the weed control procedures with the qualifications as described in Section 18.3.1.1- Weed Management Personnel Requirements. All Project-related weed control activities will be conducted in accordance with local BLM management requirements.

18.4 Monitoring

A weed management specialist or approved biologist, contracted by the Proponent, will monitor the Project and any other areas of disturbance associated with the Project during operation and maintenance activities. Monitoring will be conducted biannually during the spring and fall and will coincide with seasons when the species identified during preconstruction inventories may be identified in the field. This monitoring may coincide with the reclamation monitoring identified and outlined in Appendix L-1 – Reclamation, Vegetation, and Monitoring Plan. Growing seasons will vary from year-to-year; therefore, the length of monitoring will vary as well.

18.4.1 Reclamation Monitoring

During reclamation monitoring, the Proponent, or representative contractor for the Proponent, will initiate monitoring of previously identified affected/disturbed areas during the first spring following construction and proceed with monitoring during subsequent intervals. Monitoring will occur in all areas where the Project has a high risk of introducing or spreading noxious weeds, including previous weed wash station areas and areas of ground disturbance or vegetation clearing.

Noxious weed monitoring will occur biannually for five years following completion of each portion of the Project. In addition, noxious weed conditions will be included in the evaluations of revegetation success as described in Appendix L-1 – Reclamation, Vegetation, and Monitoring Plan. The Proponent will document its observations following

the above-noted field inspections and make these monitoring reports available to the BLM and states, as required.

Sensitive plant occurrences affected by Project activities will be monitored annually for the first five years following Project implementation. Individual counts of sensitive plants will be undertaken in affected areas to determine whether the sensitive plants are recolonizing the site. An annual report with photographs from permanent photo plots, individual plant counts within the affected areas, and noxious weed presence and treatment data would be provided to the BLM botanist.

Areas where the spread of noxious weeds are noted, particularly in previously unaffected locations, will be further evaluated to determine if these areas require remedial action and additional treatment. The Proponent will identify such areas to the agencies, state, county, and milepost (or nearest transmission structure number) and will record any additional noxious weed control treatment. A report summarizing ROW stability, revegetation progress, percent of cover, and weed populations will be provided to the BLM as described in Appendix L-1 – Reclamation, Vegetation, and Monitoring Plan.

18.4.2 Ongoing Monitoring and Control

The Proponent will be responsible for ongoing weed monitoring and control inside of the ROW for the five-year monitoring phase. The Proponent will consult with the BLM and counties should they have a concern pertaining to noxious weeds within their jurisdiction. The BLM also may contact the Proponent to report on the presence of noxious weeds. The Proponent will be required to monitor and control noxious weeds at a level that does not exceed the density or extent of their conditions identified during preconstruction surveys for the full term of the ROW grant/special-use authorization and will manage any new population that is demonstrated to be the result of Project construction (i.e., not introduced to the ROW because of new populations surrounding the ROW), operation, or maintenance of the Project.

The Proponent will not be responsible for the eradication or management of pre-existing noxious weed populations or new or recurring noxious weed populations caused by the spread of noxious weeds from adjacent lands. Also, the Proponent will not be responsible for noxious weeds introduced into the Project area by activities other than Project construction, operation, and maintenance (e.g., recreational use, grazing, other construction project); natural occurrences (e.g., fire); noxious weeds outside the Project ROW; or noxious weeds along existing access roads not improved by the Project.

Operations personnel will be trained in the identification of predominant noxious weed populations, and the Proponent will control the weeds on a case-by-case basis in consultation with the BLM as appropriate. If determined necessary, a report on actions taken will be provided in the form of monitoring reports to the BLM on a predetermined schedule.

18.5 Pesticide Application, Handling, Spills and Cleanup

18.5.1 Pesticide Application and Handling

Only BLM specified non-toxic substances approved by state and federal regulations shall be used for noxious and invasive weed control. The use of any chemical weed control

measures on or near any area that may wash into or blow onto Metropolitan Water District of Southern California property or agricultural lands participating in the Fallowing Program will be conditioned on the approval of Metropolitan or its designated representative. The list of pesticides to be used will be reviewed and approved by the BLM prior to construction, and pesticide application will be based on information gathered from the weed districts and BLM. The tentative Project-approved pesticides are listed in Attachment G – BLM-approved Herbicides. Before application, all required permits from the local authorities will be obtained (the weed districts and BLM). Permits may contain additional terms and conditions that go beyond the scope of this management plan. The following BMP and CMA will be applied to the Project.

BMP-HAZ-04: DCRT would provide the BLM with a Pesticide/Herbicide Use Proposal, outlining the pesticides and herbicides that would be proposed for use on the Project (the 12 kV line would not require pesticide/herbicide use), demonstrating conformance with BLM requirements, and seeking preapproval before use. Only BLM approved products would be used.

CMA-LUPA-BIO-11 (California only): Nuisance Animals and Invasive Species – Manage the use of widely spread herbicides and do not apply herbicides effective against dicotyledonous plants within 1,000 feet from the edge of a 100-year floodplain, stream and wash channels, and riparian vegetation or to soils less than 25 feet from the edge of drains. Exceptions will be made when targeting the base and roots of invasive riparian species such as tamarisk and *Arundo donax* (giant reed). Manage herbicides consistent with the most current national and California BLM policies. Minimize herbicide, pesticide, and insecticide treatment in areas that have a high risk for groundwater contamination. Clean and dispose of pesticide containers and equipment following professional standards. Avoid use of pesticides and cleaning containers and equipment in or near surface or subsurface water. When near surface or subsurface water, restrict pesticide use to those products labeled safe for use in/near water and safe for aquatic species of animals and plants.

18.5.2 Pesticide Spills and Cleanup

All reasonable precautions will be taken to avoid pesticide spills. APM-HAZ-01 outlines several preventative measures to be taken for the Project to achieve this.

APM-HAZ-01: Hazardous Substance Control and Emergency Response (Compliance with CMA-LUPA-BIO-09, CMA-LUPA-SW-06 and 07) - DCRT would implement its hazardous substance control and emergency response procedures as needed in conjunction with a Hazardous Substance Control and Containment Plan and Emergency Response Plan for the Project. The procedures identify methods and techniques to minimize the exposure of the public and site workers to potentially hazardous materials during all phases of Project construction through operation. They address worker training appropriate to the site worker's role in hazardous substance control and emergency response. The procedures also require implementing appropriate control methods and approved containment and spill-control practices for construction and materials stored on site. If it were necessary to store chemicals on site, they would be managed in accordance with all applicable regulations. Material safety data sheets would be maintained and kept available on site, as applicable.

All hazardous materials and hazardous wastes would be handled, stored, and disposed of in accordance with all applicable regulations by personnel qualified to handle hazardous materials. The hazardous substance control and emergency response procedures include, but are not limited to, the following:

- Proper disposal of potentially contaminated soils.
- Establishing site-specific buffers for construction vehicles and equipment near sensitive resources.
- Emergency response and reporting procedures to address hazardous material spills.
- Stopping work at that location and contacting the County Fire Department Hazardous Materials Unit immediately if visual contamination or chemical odors are detected; work would be resumed at this location after any necessary consultation and approval by the Hazardous Materials Unit.

DCRT would complete its Emergency Action Plan Form as part of Project tailgate meetings. The purpose of the form is to gather emergency contact numbers, first aid location, work site location, and tailgate information.

18.5.3 Worker Safety and Spill Reporting

In addition to the environmental protection measures described in Section 18.5.2, more information regarding handling of hazardous materials may be found in Appendix I-1 – Hazardous Materials Containment Plan and Appendix I-2 – Spill Prevention, Control, and Countermeasures Plan.

ATTACHMENT G BLM-APPROVED HERBICIDES

The *Final Programmatic Environmental Impact Statement on Vegetation Treatment Using Herbicides on BLM Land in Seventeen Western States* lists herbicides acceptable for use on BLM-administered lands. Table F-7-G1 shows the chemicals approved for use in Arizona and California.

TABLE F-7-G1 HERBICIDES APPROVED FOR USE ON PUBLIC LANDS IN ARIZONA AND CALIFORNIA

Chemical Name	Chemical Name
2,4-D	Hesazinone
2,4-DP	Imazapyr
Asulam	Mefluidide
Atrazine	Metasulfuron methyl
Bromacil	Picloram
Chlorsulfuron	Simazine
Clpyralid	Sulfoneturon methyl
Dicamba	Tebuthiuron
Fosamine	Triclopyr
Glyphosate	

A Pesticide Use Proposal will be submitted to the lead BLM district office and it will specify the herbicide to use based on the noxious and invasive species found.

1 Introduction

Construction of the Ten West Link Transmission Project (Project or Ten West Link) has the potential to temporarily increase fugitive dust particularly in areas with high winds and fragile soils. Ambient levels of criteria air pollutants such as nitrogen oxides, hydrocarbons, particulate matter, and carbon monoxide may also be temporarily increased near the construction zone due to emissions from heavy construction equipment. The nitrogen oxide, hydrocarbon, and carbon monoxide compounds are considered ozone precursor emissions. Notably, reductions of greenhouse gas emissions are a major concern in California.

This Fugitive Dust Control Plan and Construction Emissions Mitigation Plan (Plan) describes Delaney Colorado River Transmission, LLC (DCRT or Proponent) and/or its contractor's approach for avoiding and minimizing impacts to air quality due to fugitive dust and construction emissions from the proposed Project.

1.1 Plan Purpose

This Plan represents the commitment on the part of DCRT to protect air quality resources. The overall objective is to provide measures to protect these resources from potential impacts during construction, operation, and maintenance of the transmission line. This plan incorporates mitigation measures contained in the Draft Environmental Impact Statement (EIS) for the Project. This Plan is intended for use as a guide to determine the appropriate site-specific measures to be implemented during construction activities. The goals of this Plan are to control Project-related fugitive dust and construction emissions as a factor in air quality.

2 Regulatory Compliance

Construction, operation, and maintenance of the Project would include activities that create fugitive dust and construction emissions that could impact air quality resources. The following regulations and associated permits and authorizations may be required for the Project.

2.1 Federal

- The Clean Air Act, which was last amended in 1990, requires the United States Environmental Protection Agency (USEPA) to set National Ambient Air Quality Standards (40 Code of Federal Regulations [CFR] Part 50) for pollutants considered harmful to public health and the environment. The Clean Air Act identifies two classifications of national ambient air quality standards: primary and secondary. Primary standards provide public health protection, including protecting the health of "sensitive" populations such as asthmatics, children, and the elderly. Secondary standards provide public welfare protection, including protection against decreased visibility and damage to animals, crops, vegetation, and buildings.

- Bureau of Land Management (BLM) – Right-of-way (ROW) grant and temporary use permit: Federal Land Policy and Management Act of 1976; 43 United States Code §§1761-1771; 43 CFR Part 2800.

2.2 State Regulations

2.2.1 Arizona

- Arizona Department of Environmental Quality (ADEQ), Arizona Pollutant Discharge Elimination System, Stormwater Construction General Permit; Arizona Revised Statues Title 49, Chapter 2, Article 3.1; Arizona Administrative Code Title 18, Chapter 9, Article 9 and Chapter 11, Article 1.

- ADEQ, Air Quality Division, administers a Fleet Vehicle Inspection Program that allows owners or lessees of fleet vehicles to inspect their vehicles for compliance with emissions, rather than taking them to the state inspection stations. Permits are available for the inspection of non-diesel vehicles, diesel vehicles, or a combination thereof.

- ADEQ may require a Concrete Batch Plant General Permit. This permit would allow the production of concrete by the Construction Contractor at the associated material storage or laydown yard, if needed. This permit covers the following types of equipment: silos, boilers, internal combustion engines, baghouses, storage bins, storage piles, wash plants, direct-fired fuel burning equipment and vehicular traffic.

- ADEQ may require a General Permit for Vehicle and Equipment Washes. Every person who applies for a Type 3 general permit, as provided by Arizona Administrative Code Title18, Chapter 9, Article 3, must file a Notice of Intent to Discharge required by Arizona Administrative Code R18-9-A301(B). In addition to this form, applicants must complete the appropriate Notice of Intent Supplemental Form. A separate Notice of Intent form and Notice of Intent Supplemental form must be completed for each discharging facility (i.e., unit, discharge point) intended to be covered under a general permit. A person intending to operate under a general permit must comply with all the provisions of the general permit and other applicable requirements of statute and rule.

2.2.2 California

- The California Environmental Protection Agency, California Pollutant Discharge Elimination System, Construction General Permit Order 2009-0009-DWQ (amended by 2010-0014-DWQ and 2012-0006-DWQ). In California, the Stormwater Program is administered by the California Regional Water Quality Control Boards. The Project is within the Colorado River Regional Water Quality Control Board.

- The California Air Resources Board has oversight over air quality in the state of California. Regulation of individual stationary sources and area sources has been delegated to local air pollution control agencies. The Project is within the Mojave Desert Air Quality Management District (MDAQMD). MDAQMD may require the following permits:

    - Rule 201 Permit to Construct - A person shall not build, erect, install, alter or replace any equipment, the use of which may cause the issuance of air contaminants or the use of which may eliminate, reduce or control the issuance of air contaminants without first obtaining written authorization for such construction from the Air Pollution Control Officer.

- Rule 202 Temporary Permit to Operate – for operation of equipment.

- Rule 203 Permit to Operate – A person shall not operate or use any equipment, the use of which may cause the issuance of air contaminants or the use of which may reduce or control the issuance of air contaminants, without first obtaining a written permit from the Air Pollution Control Officer or except as provided in Rule 202.

- Rule 206 Posting of Permit to Operate – A person granted a permit under Rule 203 shall not operate or use any equipment unless the entire permit to operate or a legible facsimile of the entire permit is affixed upon the equipment in such a manner that the permit number, equipment description, and the specified operating conditions are clearly visible and accessible.

- Rule 403 covers fugitive dust for areas in attainment of PM_{10} (particulate matter 10 micrometers or less in diameter) and $PM_{2.5}$ (particulate matter 10 micrometers or less in diameter).

- Truck and Bus Regulation - The regulation requires diesel trucks and buses that operate in California to be upgraded to reduce emissions. Newer heavier trucks and buses must meet PM filter requirements beginning January 1, 2012. Lighter and older heavier trucks must be replaced starting January 1, 2015. By January 1, 2023, nearly all trucks and buses will need to have 2010 model year engines or equivalent.

- Heavy-Duty (Tractor-Trailer) Greenhouse Gas Regulation – The tractors and trailers subject to this regulation must use United States Environmental Protection Agency SmartWay^{SM} certified tractors and trailers or retrofit their existing fleet with SmartWay^{SM} verified technologies.

- In-Use Off-Road Diesel-Fueled Fleets Regulation - On July 26, 2007, the California Air Resources Board adopted a regulation to reduce diesel particulate matter and oxides of nitrogen emissions from in-use (existing) off-road heavy-duty diesel vehicles in California.

- The new Portable Equipment Registration Program Regulation and the Portable Diesel Engine Airborne Toxic Control Measure went into effect November 30, 2018.

- Mobile Sources Certification Programs - New motor vehicles and engines must be certified by the California Air Resources Board for emission compliance before they are legal for sale, use, or registration in California.

- Title 13 of California Code of Regulations § 2485. If a vehicle is not required for use immediately or continuously for construction activities or other safety-related reasons, its engine would be shut off.

- Application for Internal Combustion Engine – for use of equipment such as electrical generator, compressor, pump, paint spray gun, conveyor or drive, and fire pump.

- Concrete Batch Plant Operation – Certification, permitting and emissions inventory for operation of a concrete batch plant.

- Dust Control Permit – Required if dust generating activities would be more than insignificant.

2.3 Local Regulations

2.3.1 Arizona

- The Maricopa County Air Quality Department (MCAQD) has jurisdiction over the protection of air quality in Maricopa County, Arizona. Rule 310 of Regulation III, "Control of Air Contaminants" limits particulate matter emissions from operations and activities that generate sources of fugitive dust. The rule requires measures to prevent, reduce and/or mitigate emissions of particulate matter. Attachment A includes the MCAQD application package and it will be completed and submitted prior to construction activities.

- Section 302 of MCAQD Rule 310 requires that earthmoving activities disturbing areas larger than 0.1 acre obtain a dust control permit from MCAQD. The construction site superintendent (or other onsite representative) and all water truck (water-pull) operators must complete MCAQD's Basic Dust Control Training (Section 309 of Rule 310) every three years. Sites at which greater than five acres are disturbed must designate a Dust Control Coordinator who has full authority to implement compliance with dust control requirements including dust suppression measures, construction site inspections and management controls. The designated Dust Control Coordinator must complete an approved Comprehensive Dust Control Training Class at least once every three years. The Dust Control Coordinator's training identification card must be readily available while he/she is acting as the Dust Control Coordinator.

- Section 401 of MCAQD Rule 310 outlines Dust Control Permit requirements. A Dust Control Plan must be submitted with the application for a Dust Control Permit. The required contents of a Dust Control Plan are found in Section 402.3 of MCAQD Rule 310. The plan must be approved by MCAQD and must effectively control dust at the Project site. The contents of the plan must be kept current and if it is found to be ineffective, it must be revised to better control Project-related dust.

- MCAQD also requires signs for construction activities that may produce fugitive dust. For all sites with a Dust Control permit that are five acres or larger, except for routine maintenance and repair done under a Dust Control Block permit, the owner and/or operator shall erect and maintain a Project information sign at the main entrance such that members of the public can easily view and read the sign at all times. Such sign shall have a white background, have black block lettering that is at least four inches high, and shall contain at least all of the following information: 310-21 308.1 Project name and permittee's name; 308.2 Current Dust Control permit number; 308.3 Name and local phone number of person(s) responsible for dust control matters; 308.4 For dust complaints call MCAQD at (602) 372-2703 or 1-800-635-4617.

- MCAQD does not issue a permit for general combustion emissions associated with earthmoving equipment and construction vehicles. However, operators of certain types of portable combustion equipment like emergency generators and concrete batch plants may be required to apply for a permit to operate the equipment.

3 Overview

The air quality study area for the Draft EIS is a 31-mile (50-kilometer) radius around the Proposed Action and Action Alternatives. A 31-mile radius was chosen to be consistent with minimum air quality analyses required by the USEPA Prevention of Significant Deterioration regulations. Current air quality conditions in the study area were obtained from the USEPA's AirData website for the nearest monitor locations for each pollutant considered (carbon monoxide, nitrogen dioxide, ozone, PM_{10}, $PM_{2.5}$, and sulfur dioxide). Given the rural, unpopulated nature of the study area, concentrations of most pollutants are well below the National Ambient Air Quality Standards. The exception is ozone, and the eastern portion of the study area near Phoenix is in a nonattainment area. The USEPA estimated that Arizona greenhouse gas emissions were approximately 92.3 million metric tons per year for calendar year 2000. The California Air Resources Board estimated 440.4 million metric tons of carbon dioxide equivalent for the state in 2015.

Per the Draft EIS, the Proposed Action would result in emissions of criteria pollutants, hazardous air pollutants, and greenhouse gases, but operational emissions and impacts would be much lower than construction phase emissions (Draft EIS, Appendix 4, Tables 4.2-1 through 4.2-3). Fugitive dust, engine exhaust, concrete batch plant emissions, and sulfur hexafluoride emissions from gas insulated circuit breakers in the switchyards would be the sources of air quality impacts. The emissions of criteria air pollutants would not exceed the conformity emissions thresholds for the Phoenix nonattainment/maintenance area or the daily and annual MDAQMD significance thresholds for the Riverside corridor.

4 Fugitive Dust

Soil conservation for the Project includes minimizing impacts that will negatively affect soils from the construction and operation of the Project, such as minimizing wind and water erosion, surface disturbance, and construction activities in highly erodible soils. Erosion potential is the result of several factors including slope, vegetation cover, climate, and the physical and chemical characteristics of the soil. Increased soil erosion may occur when vegetation is removed during construction, or in areas where the surface is disturbed by heavy equipment. Wind is also an erosion factor throughout portions of the Project area.

Where disturbance is anticipated in areas of steep terrain with high potential for erosion, vegetation clearing, and grading will be conducted in a manner to minimize these effects. Soil stabilization and reclamation practices will also be implemented to reduce erosion. In areas of soil disturbance or compaction (e.g., temporary work areas) soil treatment and reclamation will be implemented as directed in Appendix G-2 Stormwater Pollution Prevention Plan and Appendix L-1 – Reclamation, Vegetation, and Monitoring Plan.

Air quality control measures are intended to minimize fugitive dust and air emissions, and to maintain conditions as free from air pollution where practical. All requirements of those entities having jurisdiction over air quality matters will be adhered to, and any permits needed for construction activities will be obtained, as described in Section 2. The Construction Contractor(s) will not proceed with any construction activities without taking appropriate precautions to prevent excessive particulate matter from becoming airborne and creating nuisance conditions.

Where necessary, water may be used as BLM-approved dust control methods during construction, including for the grading of roads or the clearing of vegetation in the ROW, and

will be applied on unpaved roads, material stockpiles, and other surfaces, which can create airborne dust. Water for the Project will be obtained from the following potential sources: 1) drawn from Central Arizona Project canal locations with permits through the Central Arizona Project and water withdrawal agreements; 2) from municipal resources using water use agreements (typically from metered set-up at fire hydrants); or 3) from private wells under water use agreements with landowners. Where application of water is not possible, material stockpiles will be enclosed or covered. In addition, open bodied trucks transporting materials likely to become airborne will be covered. Soil tracks or other materials that may become airborne will promptly be removed from paved roads. Techniques to minimize and control dust during rock blasting operations will be implemented.

4.1 Environmental Protection Measures

4.1.1 Erosion Control Measures

- Vegetation will be cleared, and the construction ROW will be graded only to the extent necessary. Vegetation within the ROW will be trampled or cut at or near the ground level.
- Except for the areas to be excavated, the vegetative root systems and subsurface soils will be left intact to the greatest extent practicable to help stabilize the soils during construction.
- Trees will be trimmed instead of cutting down, where possible, and cut at the base rather than bulldozing them.
- ROW boundaries will be clearly staked or flagged and no disturbance will be allowed beyond these limits.
- Access roads will be designed to fit the terrain by avoiding unstable slopes and highly erodible conditions, to the extent practicable.
- Signs will be placed along access roads to discourage off-road vehicle use in adjacent areas.
- Utilize mulch, tracking, matting or slope length shortening to protect soils and prevent excessive erosion and sedimentation.
- Utilize appropriate drainage control structures to direct surface water runoff away from road surfaces to prevent rilling and rutting and to control sediment discharges.
- Appropriate site-specific seed mixes for revegetation will be used along with salvaged native plants.

APM-GEO-01: Erosion and Sedimentation (Compliance with Conservation Management Actions [CMA]-LUPA-SW-8) – DCRT would implement a Stormwater Pollution Prevention Plan (SWPPP) for the Project. A monitoring program would be established to ensure that the prescribed Best Management Practices (BMPs) are followed throughout transmission line construction. Examples of these BMPs include the following:

- Preparation, training, and maintenance for clear work-site practices, tracking controls, and materials management to minimize the direct work impacts on soil and erosion.
- Installation of temporary silt fences and other containment features (including gravel bags and fiber rolls) surrounding work areas to prevent the loss of soil during rain events and other disturbances.
- Utilization of storm drain inlet protection, including sediment filters and ponding barriers, to retain sediments on site and prevent excess discharge into storm drains.
- Implementation of soil erosion controls, including preservation of existing vegetation, temporary soil stabilization through hydroseeding, mulching, and other techniques.
- Stockpiling soils at least 100 feet from drainages to the extent possible. If soil stockpiles are within 100 feet from a drainage proper measures would be implemented such as soil tackifiers, straw wattles around the pile, and/or covering the stockpile.

APM-BIO-07: Monofilament Plastic (Compliance with CMA-LUPA-BIO-9) – No monofilament plastic would be used for erosion control (for example, matting, fiber roll, wattles, silt fencing backing). Appropriate materials include burlap, coconut fiber, or other materials as identified in the general and site-specific SWPPP.

APM-BIO-10: Erosion and Dust Control (Compliance with CMA-LUPA-BIO-9) – The BMPs included in the SWPPP would be implemented during construction to minimize impacts associated with erosion. Watering for dust control during construction would also be used as described previously (AQ-01). Watering shall not result in prolonged ponding of surface water that could attract wildlife to the work area. Minimal or no vegetation clearing and/or soil disturbance would be conducted for site access and construction in areas with suitable topography (i.e., overland driving/overland access).

BMP-BIO-38: Use of State-of-the-Art and Commercially-Available Technology (Compliance with CMA-LUPA-BIO-9 and CMA-LUPA-BIO-15) – Use state-of-the-art, commercially-available construction and installation techniques, as approved by BLM, appropriate for the specific activity/project and site, that minimize new site disturbance, soil erosion and deposition, soil compaction, disturbance to topography, and removal of vegetation.

BMP-BIO-50: Engineering Controls - Appropriate engineering controls would be used to minimize impacts on dry wash, dry wash woodland, and chenopod scrub, including downstream occurrences, resulting from surface water runoff, erosion, sedimentation, altered hydrology, accidental spills, or fugitive dust deposition to these habitats. Appropriate buffers and engineering controls would be determined through agency consultation.

APM-WQ-01: SWPPP Development and Implementation (Compliance with CMA-LUPA-BIO-9) – Following Project approval, DCRT or their contractor would prepare and implement a SWPPP or an amendment to an existing SWPPP to minimize construction impacts on surface water and groundwater quality. Implementation of the SWPPP would help stabilize graded areas and reduce erosion and sedimentation. The Plan would designate BMPs that would be adhered to during construction activities. Erosion and sediment control measures, such as straw wattles, covers, and silt fences, would be installed prior to ground disturbance, based on the anticipated volume and intensity of precipitation, the nature of stormwater runoff in the Project Area, and the soil types within the Project Area. Suitable

stabilization measures would be used to protect exposed areas during construction activities, as necessary and final stabilization would be completed when construction materials, waste, and temporary erosion and sediment control measure have been removed. During construction activities, measures would be implemented to prevent contaminant discharge from vehicles and equipment, including complying with the Spill Prevention, Control, and Countermeasures requirements in 40 CFR Part 112. The Project SWPPP would include erosion control and sediment transport BMPs to be used during construction. BMPs, where applicable, would be designed by using specific criteria from recognized BMP design guidance manuals. Erosion-minimizing efforts may include measures such as the following:

- Defining ingress and egress within the Project site.
- Implementing a dust control program during construction.
- Properly containing stockpiled soils.

Erosion control measures identified would be installed in an area before construction begins and would be properly maintained until construction is complete and final stabilization begins. Temporary measures such as silt fences or wattles, intended to minimize sediment transport from temporarily disturbed areas, would remain in place until disturbed areas have stabilized. The Plan would be updated during construction as required by the State Water Resources Control Board and ADEQ. The Plan would include the following components, in accordance with ADEQ requirements for coverage under the General Permit:

- Stormwater team qualifications and contact information.
- Identification of operators.
- Nature of construction activities.
- Sequence and estimated dates of construction activities.
- Site description.
- Site map(s).
- Receiving waters.
- Control measures to be used during construction activity.
- Summary of potential pollutant sources.
- Use of treatment chemicals.
- Pollution prevention procedures, including spill prevention and response and waste management procedures.

APM-WQ-02: Worker Environmental Awareness Program Development and Implementation – The Project's worker environmental awareness program would communicate environmental issues and appropriate work practices specific to this Project. This awareness would include spill prevention and response measures and proper BMP implementation. The training would emphasize site-specific physical conditions to improve hazard prevention (such as identification of flow paths to nearest water bodies) and would include a review of all site-specific water quality requirements, including applicable portions of erosion control and sediment transport BMPs, Health and Safety Plan, and Hazardous Substance Control and Emergency Response Plan.

California

BMP-SOIL-07 (California only): (Compliance with CMA-LUPA-SW-10) – To the extent possible, avoid disturbance of desert biologically intact soil crusts and soils highly susceptible to wind and water erosion.

4.1.2 Working in Wet Soils

- Construction and operation and maintenance activities will be restricted to properly support construction or maintenance equipment (i.e., when heavy equipment creates ruts greater than four inches deep over a distance of 100 feet or more).
- Construction or maintenance activities will be re-routed around wet areas, ensuring that the new route does not cross into sensitive resource areas.
- Use wide-track or balloon-tire vehicles and equipment, or other weight dispersing systems, use geotextile cushions, prefabricated equipment pads or similar materials to minimize damage to the substrate.

See BMPs, Applicant Proposed Measures (APMs) and mitigation measures (MM) in Section 4.1.1.

4.1.3 Dust Control Measures

- Minimize disturbed land areas to the extent practicable with Project design considerations.
- Use frequent watering to maintain visible moisture and/or form a soil crust, while preventing pooling to the extent possible.
- Use a water truck to maintain moist disturbed surfaces and actively spread water during visible dusting episodes to minimize visible fugitive dust emissions. For projects with exposed sand or fines deposits (and for projects that expose such soils through earthmoving), chemical stabilization or covering with a stabilizing layer of gravel will be required to eliminate visible dust/sand from sand/fines deposits.
- Treat actively disturbed areas with BLM-approved dust palliatives. Only BLM specified non-toxic substances approved by state and federal regulations shall be used for dust control. The use of any chemical dust control measures on or near any area that may wash into or blow onto Metropolitan Water District of Southern California fee property or agricultural lands participating in the Fallowing Program will be conditioned on the approval of Metropolitan or its designated representative.
- Maintain a visible crust and sufficient moisture on any storage piles or cover with tarps.
- All maintenance and access vehicular roads and parking areas shall be stabilized with either chemical or gravel or application of water, sufficient to eliminate visible fugitive dust from vehicular travel and wind erosion. Take actions to prevent Project-related track-out onto paved surfaces, and clean any Project-related track-out within 24 hours. Install track-out control devices such as grizzly bars grates, wheel washers or gravel pads located at all entrances and exits, as required by

dust control regulations. All other earthen surfaces within the Project area shall be stabilized by natural or irrigated vegetation, water, compaction, chemical or other means sufficient to prohibit visible fugitive dust from wind erosion. Utilize street sweepers to remove any visible soil/mud/dirt tracked onto paved access roads.

- Helicopter landing and takeoff areas shall be stabilized with either dust palliatives or water to reduce fugitive dust created by the aircraft.
- Limit vehicle speeds on access roads to less than 15 miles per hour.
- Cover haul truck cargo bed with tarps and maintain six inches of freeboard.
- Halt dust generating activities on high-wind event days, and/or during periods of adverse meteorological conditions which could cause or contribute to violations of air quality standards. In California, adhere to MDAQMD rules.
- All perimeter fencing shall be wind fencing or the equivalent, to a minimum of four feet of height or the top of all perimeter fencing. The owner/operator shall maintain the wind fencing as needed to keep it intact and remove windblown dropout. This wind fencing requirement may be superseded by local ordinance, rule or Project-specific biological mitigation prohibiting wind fencing.
- After work is completed in each project area, revegetate to stabilize soils.
- During post-construction, apply dust suppression measures such as watering, application of approved dust palliatives, or cover vacant lots with gravel.

APM-AQ-01: Fugitive Dust (Compliance with Conservation Management Action [CMA]/ Land Use Plan Amendment [LUPA]-AIR-2, 3, and 5) - The following control measures would be implemented, as applicable, to reduce PM_{10} and $PM_{2.5}$ emissions during construction, in conjunction with an Erosion, Dust Control, and Air Quality Plan and Fugitive Dust Control Plan for the Project.

Basic Control Measures

The following measures would be implemented as applicable at all construction sites:

- Water active construction areas sufficiently to minimize fugitive dust.
- Dust control would include the use of one or more water trucks that would water access roads daily as needed to control dust throughout the construction period.
- Cover trucks hauling soil, sand, and other loose materials and require all trucks to maintain at least six inches of freeboard.
- Pave, apply water, or apply nontoxic soil stabilizers as applicable on for all unpaved access roads, parking areas, and staging areas at construction sites to minimize fugitive dust.

Enhanced Control Measures

In addition to the “basic control measures” listed above, the following control measures may be implemented at all construction sites greater than four acres:

- Water, hydroseed, or apply nontoxic soil stabilizers to inactive construction areas to minimize fugitive dust.

- Enclose, cover, water, or apply nontoxic soil binders to exposed stockpiles.

- Limit traffic speeds on unpaved roads.

- Replant vegetation in disturbed areas as quickly as possible, consistent with seasonal survival considerations.

Optional Control Measures

Depending on the extent of dust generation, implementation of the following optional control measures may occur at larger construction sites, near sensitive receptors (residences or other occupied buildings, parks, or trails within 1,000 feet of earthmoving operations that are substantial; for example, more than excavation for tower foundations), or in situations which for any other reason may warrant additional emissions reductions:

- Install wheel washers for all exiting trucks or wash off the tires or tracks of all trucks and equipment leaving the site.

- Suspend excavation and grading activity when winds (instantaneous gusts) exceed 25 miles per hour.

Limit the area subject to excavation, grading, and other construction activity at any one time.

APM-AQ-04: Minimize Potential Emissions of Naturally Occurring *Coccidioides immitis* Fungal Spores – In addition to the AQ-01 measures to control general fugitive dust emissions, the following measures would be implemented prior to and during construction to create awareness of the risks and inhalation prevention procedures with respect to *Coccidioides immitis* fungal spores, which are naturally present in soils in the desert southwest, and inhalation of which can cause Valley Fever:

- Prior to construction, and for each phase of construction, implement an Environmental Awareness Program for workers to ensure they are informed of the risks of contracting Valley Fever and the protective measures needed to minimize personal exposure to fugitive dust, as well as to minimize possible dust exposure of nearby residents and the public.

- Inform workers of the possible symptoms of Valley Fever and encourage them to seek medical treatment if these symptoms manifest.

BMP-AQ-01: Dust Palliatives – Dust palliatives would be applied, in lieu of water, to inactive construction areas (disturbed lands or soil stockpiles that are unused for 14 consecutive days). Dust palliatives would be chosen by the Dust Control Site Coordinator and or construction contractor. Dust palliatives would be environmentally safe; comply with federal, state, and local regulations; and would not produce a noxious odor or contaminate surface water or groundwater and, therefore, would not pose runoff concerns during rain events. Application rates for dust palliatives would follow the manufacturer's recommendations. Material Safety Data Sheets for any palliatives would be available on site and provided to the BLM 14 days prior to use.

California

BMP-AQ-05 (California only): Air Quality Regulation and Standard Conformance (Compliance with CMA/LUPA-AIR-02) – All activities would meet the requirements of the Clean Air Act (Sections 110, 118, 160, and 176[c]) and the applicable local Air Quality Management jurisdiction(s). Fugitive dust cannot exceed local standards and requirements.

CMA-LUPA-AIR-1 (California only) – All activities must meet the following requirements:

- Applicable National Ambient Air Quality Standards (Section 109).
- State Implementation Plans (Section110)
- Prevention of Significant Deterioration, including visibility impacts to mandatory Federal Class I Areas (Section 160 et seq.).
- Conformity Analyses and Determinations (Section 176[c]).
- Apply BMPs on a case by case basis.
- Applicable local Air Quality Management Jurisdictions (e.g., 403 South Coast Air Quality Management District [SCAQMD]).

CMA-LUPA-AIR-2 (California only) – Because Project authorizations are a federal undertaking, air quality standards for fugitive dust may not exceed local standards and requirements.

CMA-LUPA-AIR-4 (California only) – Because fugitive dust is the number one source of PM_{10} and $PM_{2.5}$ emissions in the Mojave and Sonoran Deserts, fugitive dust impacts to air quality must be analyzed for all activities/projects requiring an EIS and Environmental Assessment.

The National Environmental Policy Act (NEPA) air quality analysis may include modeling of the sources of PM_{10} and $PM_{2.5}$ that occur prior to construction and/or ground disturbance from the activity/project, and show the timing, duration and transport of emissions off site. When utilized, the modeling will also identify how the generation and movement of PM_{10} and $PM_{2.5}$ will change during and after construction and/or ground disturbance of the activity/project under all activity/project specific NEPA alternatives. The BLM air resource specialist and Authorizing Officer will determine if modeling is required as part of the NEPA analysis based on estimated types and amounts of emissions. The BLM National Operations Center in conjunction with the California BLM determined modeling is not required for this Project (Draft EIS 2018, Appendix 2C-35, Table 2C.1.2 Air Resources).

CMA-LUPA-AIR-5 (California only) – A fugitive Dust Control Plan will be developed for all projects where the NEPA analysis shows an impact on air quality from fugitive dust. (The development of this plan satisfies CMA-LUPA-AIR-5.)

4.1.4 Construction Phase

The Environmental Compliance Manager will regularly inspect or coordinate the inspection of project activities for compliance with dust control and air quality regulations. Environmental inspectors perform daily inspections, identify sensitive resources, act as a

resource to construction personnel and oversee any corrective actions. Daily logs will be completed by inspectors as necessary; issues of noncompliance will be documented and addressed as quickly as possible. The Compliance Inspection Contractor works under the director control and supervision of the BLM and will be responsible for overseeing implementation of the environmental protection measures identified in Section 4.

The construction contractor(s) will be contractually bound to comply with all laws, regulations and permit requirements, including the mitigation measures and other stipulations and methods set forth in the ROW grant, Plan of Development, and Record of Decision throughout all phases of the Project. The contractor(s), serving as an "operator" under ADEQ's Construction General Permit and California Environmental Protection Agency's Construction General Permit, will submit a Notice of Intent.

4.1.4.1 Training

All construction personnel will participate in environmental trainings to build the Project safely and in compliance with erosion prevention, dust control, and air quality protection regulations. The general orientation would include definitions and a discussion of the main areas of focus on construction projects which are fugitive dust and engine emissions. Training would include a discussion of the following applicable Project rules and regulations: The federal Clean Air Act, Maricopa County Rule 310, and Mojave Desert Dust Control. Personnel will attend training as appropriate and required.

Training would include a discussion of BMPs, Valley Fever facts, and Valley Fever prevention as indicated below.

- BMPs for the control of fugitive dust may include, but are not limited to:
    - Preservation of vegetation.
    - Maximum speed of 15 miles per hour unless posted otherwise.
    - Stabilized construction exits.
    - Water application along access roads and work sites.
    - Application of dust suppressants and tackifiers.
    - Topsoil and spoil stock pile management.
- Valley Fever
    - It is caused by spores of the fungus *Coccidioides immitis* or *Coccidioides posadasii*.
    - Valley fever is also referred to as "San Joaquin Valley fever" or "desert rheumatism."
    - Valley fever lives in soil of southwest United States, south central Washington and parts of Mexico and South America.
    - Sickness comes from breathing in airborne fungal spores; usually affects the lungs but can spread in severe cases.

  - Five to ten percent of infections cause lasting lung damage.
  - Symptoms are flu-like and may take one to three weeks to appear and last for weeks or months.

- Valley Fever Prevention
  - Use proper dust prevention/control practices to limit fugitive dust.
  - Limit exposure to outdoor dust in endemic areas.
  - Avoid areas with a lot of dust like construction/excavation sites.
  - Wear an N95 or better respirator.
  - Stay inside during dust storms; close windows.
  - Avoid activities that involve disturbance and contact with dirt or dust, including yard work, gardening, and digging.
  - Use air filtration measures indoors.
  - Clean skin injuries well with soap and water to reduce the chances of developing a skin infection, especially if the wound was exposed to dirt or dust.
  - Take preventive antifungal medication if your healthcare provider says you need it.

Rule 310 of the MCAQD includes the following requirements for basic dust control training:

a. At least once every three years, the persons specified in Section 309.1(b) or Section 309.1(c) of this rule shall successfully complete a Basic Dust Control Training Class conducted or approved by the Control Officer.

b. The following persons present at a site that is subject to a permit issued by the Control Officer requiring control of PM_{10} emissions from dust-generating operations shall complete a Basic Dust Control Training Class as specified in Section 309.1(a) of this rule: 1) water truck drivers; 2) water-pull drivers; and 3) the site superintendent or other designated on-site representative of the permit holder, if present at a site that has more than one acre of disturbed surface area.

c. A Dust Control Block Permit permittee/holder shall have, at a minimum, one individual trained in accordance with the Basic Dust Control Training Class as specified in Section 309.1(a) of this rule, if present at a site that has more than one acre of disturbed surface area.

d. All persons having successfully completed training during the 2018 and 2019 calendar years shall be deemed to have satisfied the requirement to successfully complete the Basic Dust Control Training Class, if the training that was completed was conducted or approved by the Control Officer. Completion of the Comprehensive Dust Control Training Class, as required in Section 309.2 of this rule, shall satisfy the requirement of this section of this rule.

e. The Control Officer may suspend or revoke for cause including, but not limited to, inappropriate ethical activities or conduct associated with the dust control program or repeated failure to follow the training requirements, a certification issued to a person having successfully completed a Basic Dust Control Training Class conducted or approved by the Control Officer. The Control Officer will provide written notification to such person regarding such suspension or revocation.

Rule 310 of the MCAQD includes the following requirements for comprehensive dust control training:

a. At least once every three years, the Dust Control Coordinator, who meets the requirements of Section 310 of this rule, shall successfully complete the Comprehensive Dust Control Training Class conducted or approved by the Control Officer.

b. The Control Officer may suspend or revoke for cause including, but not limited to, inappropriate ethical activities or conduct associated with the dust control program or repeated failure to follow the training requirements, a certification issued to a person having successfully completed a Comprehensive Dust Control Training Class conducted or approved by the Control Officer. The Control Officer will provide written notification to such person regarding such suspension or revocation.

Rule 310 of the MCAQD includes the following requirements for the dust control coordinator:

310.1 The permittee for any site of five acres or more of disturbed surface area subject to a permit issued by the Control Officer requiring control of PM_{10} emissions from dust-generating operations shall have on-site at least one Dust Control Coordinator trained in accordance with Section 309.2 of this rule at all times during primary dust-generating operations related to the purposes for which the Dust Control permit was obtained.

310.2 The Dust Control Coordinator shall have full authority to ensure that dust control measures are implemented on-site, including conducting inspections, deployment of dust suppression resources, and modifications or shut-down of activities as needed to control dust.

310.3 The Dust Control Coordinator shall be responsible for managing dust prevention and dust control on the site.

310.4 At least once every three years, the Dust Control Coordinator shall successfully complete a Comprehensive Dust Control Training Class conducted or approved by the Control Officer.

310.5 The Dust Control Coordinator shall have a valid dust training certification identification card readily accessible on-site while acting as a Dust Control Coordinator.

310.6 The requirement for a Dust Control Coordinator shall lapse when all of the following actions/events/procedures occur: a) the area of disturbed surface area becomes less than five acres; b) the previously disturbed surface areas have been stabilized in accordance with/in compliance with the standards and/or requirements of this rule; and c) the Dust Control permit holder provides notice to the Control Officer of acreage stabilization.

310.7 The Dust Control Block Permit permittee/holder shall have on sites that have more than one acre of disturbed surface area at least one individual, who has been trained in accordance with the requirements of Section 309.1(c) of this rule. One such individual shall be designated by the Dust Control Block Permit permittee/ holder as the Dust Control Coordinator. The Dust Control Coordinator shall be present onsite at all times during primary dust-generating activities that are related to the purposes for which the permit was obtained.

4.2 California Environmental Quality Act

In compliance with the California Environmental Quality Act (CEQA) the following mitigation measure will be adhered to:

MM-AQ-CEQA-1 – Consistent with APM AQ-01, and MDAQMD Rule 403.2, a Fugitive Dust Control Plan shall be prepared for the Project prior to the start of construction and shall be implemented throughout all construction phases of the Project. This Fugitive Dust Control Plan shall be prepared by the Proponent at least 30 days prior to construction which shall be approved by the California Public Utilities Commission (CPUC) and MDAQMD. The Proponent shall ensure that the Fugitive Dust Control Plan is implemented throughout construction activities and shall keep records of compliance on site and submit monthly reports to CPUC and MDAQMD. This Fugitive Dust Control Plan shall comply with the MDAQMD Guidelines and include all of the control measures listed in APM AQ-01. In addition to these control measures, the Fugitive Dust Control Plan shall also include signage related to fugitive dust that will include the following specifications:

- A minimum 48-inch high by 96-inch wide sign containing the following shall be located within 50 feet of each Project site entrance, meeting the specified minimum text height, black text on white background, on one-inch A/C laminated plywood board, with the lower edge between six and seven feet above grade, with the contact name of a responsible official for the site and a local or toll-free number that is accessible 24 hours per day:
    - [Site Name] {four-inch text}
    - [Project Name/Project Number] {four-inch text}
    - IF YOU SEE DUST COMING FROM {four-inch text}
    - THIS PROJECT CALL: {four-inch text}
    - [Contact Name], PHONE NUMBER XXX-XXXX {six-inch text}
    - If you do not receive a response, Please Call {three-inch text}
    - The MDAQMD at 1-800-635-4617 {three-inch text}

Additionally, the following control measures shall be included in the Fugitive Dust Control Plan:

- Traffic speeds on unpaved roads shall not exceed 15 miles per hour.

- Drop heights from excavators and loaders shall be minimized to distances no more than five feet.

- Appoint a construction relations officer to act as a community liaison concerning on-site construction activity, including resolution of issues related to PM_{10} and $PM_{2.5}$ generation from combustion emissions and fugitive dust generation.

- An on-site supervisor with a current fugitive dust control class certification shall be present who is available within 30 minutes to respond to any fugitive dust control issue at the site during normal business hours.

- The operation shall keep on-site records of specific dust control actions taken.

- All perimeter fencing shall be wind fencing or the equivalent of four feet of height or the top of all perimeter fencing (this wind fencing requirement may be superseded by local ordinance, rule, or Project-specific biological mitigation prohibiting wind fencing).

- A wheel washing system shall be installed and used to remove bulk material from tires and vehicle undercarriages before vehicles exit the unpaved construction site.

Responsible Party: The Applicant shall be responsible for ensuring the Fugitive Dust Control Plan is prepared and implemented throughout construction activities.

Timing: The Fugitive Dust Control Plan shall be prepared at least 30-days prior to the start of construction and implemented throughout all construction activities.

Mitigation Monitoring and Reporting Program: Monthly reports shall be prepared by the Applicant and submitted to the CPUC and MDAQMD. These monthly reports shall include a summary of any calls received regarding fugitive dust and all compliance actions taken.

Standards for Success: Fugitive dust will be minimized throughout all construction activities and compliance with MDAQMD Rule 403.2 shall be achieved.

5 Construction Emissions

Vehicles emit many pollutants into the air, including carbon monoxide, carbon dioxide, hydrocarbons, nitrogen oxides, sulfur oxides, and volatile organic compounds. These pollutants then combine to form secondary pollutants such as fine particulate matter and ozone.

Given the rural, unpopulated nature of the Project area, concentrations of most pollutants are well below the National Ambient Air Quality Standards. The exception is ozone, and the eastern portion of the study area near Phoenix is in a nonattainment area (Draft EIS 2018).

Construction of the Project would result in emissions of criteria pollutants, hazardous air pollutants, and greenhouse gases, but operational emissions and impacts would be much lower than construction phase emissions. However, any increase in greenhouse gas construction emissions may be offset to the extent the Project allows for the displacement of fossil fuel energy generation with renewable energy sources through the provision of new transmission infrastructure to interconnect future renewable energy resources in both

Arizona and California. As such, there may be a beneficial contribution to anthropogenic climate change (BLM 2019).

Construction emission mitigation measures are intended to minimize air quality impacts, and to maintain conditions as free from air pollution where practical. All requirements of those entities having jurisdiction over air quality matters will be adhered to, and any permits needed for construction activities will be obtained. The Construction Contractor(s) will not proceed with any construction activities without taking reasonable precautions to prevent excessive particulate matter from becoming airborne and creating nuisance conditions.

Excessive exhaust emissions from vehicles and heavy equipment will be prevented by proper maintenance. Idling of equipment will be limited to reduce exhaust emissions. There will be no open burning of construction trash or other open fires.

5.1 Environmental Protection Measures

In addition to applicable design and operational standards, regulations, laws and permit requirements, the following design features and BMPs, APMs, and mitigation measures have been identified to avoid or minimize potential fugitive dust and construction emissions related impacts. Another applicable plan includes the K-2 Traffic and Transportation Management Plan.

5.1.1 Air Quality Measures

To alleviate traffic congestion and decrease the number of vehicles traveling to the Project work areas, the Construction Contractor will encourage personnel to carpool to work each day. Additionally, crews will commute from show up yards to the work sites in company provided crew vehicles after meeting at the show-up yard locations. Additionally, the following general practices will help to reduce construction vehicle emissions.

- Minimize construction related trips of workers and equipment.
- Use existing roads for construction and access whenever possible and minimize areas disturbed outside of the power line ROW.
- Eliminate or minimize idling of motor vehicles and motorized equipment.
- Follow manufacturer recommendations for engine maintenance and operation to optimize emission performance.
- Utilize newer equipment that meets the most stringent federal or state standards as much as practicable.
- Locate diesel engines, motors and equipment as far as practicable from sensitive areas and receptors.

California

APM-AQ-02 (California only): Exhaust Emissions (Compliance with CMA/LUPA-AIR-3) – The following measures would be implemented during construction to further minimize greenhouse gas emissions (carbon dioxide, methane, and nitrous oxide) per California

AB32 and criteria air pollutants from vehicle and machinery and in conjunction with this Construction Emissions Mitigation Plan for the Project:

- Minimize unnecessary construction vehicle idling time. The ability to limit construction vehicle idling time depends on the sequence of construction activities and when and where vehicles are needed or staged. Certain vehicles, such as large diesel-powered vehicles, have extended warm-up times that limit their availability for use following startup. Where such diesel-powered vehicles are required for repetitive construction tasks, these vehicles may require more idling time. The Project would apply a “common sense” approach to vehicle use, such that idling is reduced as far as possible below the maximum of five consecutive minutes required under 13 California Code of Regulations § 2485. If a vehicle is not required for use immediately or continuously for construction activities or other safety-related reasons, its engine would be shut off.

- Encourage use of natural gas- or electric-powered vehicles for light-duty trucks where feasible and available.

CMA-LUPA-AIR-1 (California only) – All activities must meet the following requirements:

- Applicable National Ambient Air Quality Standards (Section 109).

- State Implementation Plans (Section110)

- Prevention of Significant Deterioration, including visibility impacts to mandatory Federal Class I Areas (Section 160 et seq.).

- Conformity Analyses and Determinations (Section 176[c]).

- Apply best management practices on a case by case basis.

- Applicable local Air Quality Management Jurisdictions (e.g., 403 SCAQMD).

CMA-LUPA-AIR-3 (California only) – Where impacts to air quality may be significant under NEPA, requiring analysis through an EIS, require documentation for activities to include a detailed discussion and analysis of Ambient Air Quality conditions (baseline or existing), National Ambient Air Quality Standards, criteria pollutant nonattainment areas, and potential air quality impacts of the proposed Project (including cumulative and indirect impacts and greenhouse gas emissions). This content is necessary to disclose the potential impacts from temporary or cumulative degradation of air quality. The discussion will include a description and estimate of air emissions from potential construction and maintenance activities, and proposed mitigation measures to minimize net PM_{10} and $PM_{2.5}$ emissions. The documentation will specify the emission sources by pollutant from mobile sources, stationary sources, and ground disturbance. A Construction Emissions Mitigation Plan will be developed.

5.2 California Environmental Quality Act

In compliance with CEQA the following mitigation measure will be adhered to in California:

MM-AQ-CEQA-1 – Consistent with APM AQ-02 a Construction Emissions Mitigation Plan shall be developed by the Applicant for the Project at least 30-days prior to the start of

construction activities and shall be implemented by the Applicant throughout all construction activities. The Construction Emissions Control Plan shall be approved by the CPUC and MDAQMD and the Applicant shall keep records of compliance with this Plan on site and submit monthly reports to CPUC and MDAQMD. Successful implementation of with measure will result in minimization of exhaust emissions from worker vehicles, construction equipment, and vehicles. The Construction Emissions Mitigation Plan may include the following measures:

- Use ultra-low sulfur diesel fuel (e.g., <15 parts per million).
- Use clean-burning on- and off-road diesel engines. Heavy-duty diesel-powered construction equipment manufactured after 1996 (with federally mandated "clean" diesel engines) shall be utilized.
- The Applicant shall develop a program and require construction workers to carpool to construction sites.
- Restrict construction vehicle idling time to less than five minutes.
- Properly maintain mechanical equipment.
- Use particle traps and appropriate controls to reduce diesel particulate matter. Other equipment includes devices such as specialized catalytic converters (oxidation catalysts) control approximately 20 percent of diesel particulate matter, 40 percent of carbon monoxide, and 50 percent of hydrocarbon emissions.
- Provide temporary traffic controls, such as a flag person, during all phases of construction to maintain a smooth traffic flow (see Appendix K-2 Traffic and Transportation Plan, MM-TRANS-CEQA-2 for more details).
- Provide dedicated turn lanes for movement of construction trucks and equipment on- and off-site.
- During Project construction, all off-road diesel-powered construction equipment greater than 50 horsepower shall meet the Tier 4 emissions standards, where available. In addition, all construction equipment shall be outfitted with the Best Available Control Technology devices certified by California Air Resources Board. Any emissions control device used by the contractor shall achieve emissions reductions that are no less than what could be achieved by a Level 4 diesel emissions control strategy for a similarly sized engine as defined by California Air Resources Board regulations (i.e., if Project construction goes beyond the anticipated schedule).
- A copy of each unit's certified tier specification, Best Available Control Technology documentation, and California Air Resources Board or MDAQMD operating permit shall be provided to the CPUC at the time of mobilization for each applicable unit of equipment.

Responsible Party: The Applicant shall be responsible for ensuring the Construction Emissions Control Plan is prepared and implemented throughout construction activities.

Timing: The Construction Emissions Control Plan shall be prepared at least 30 days prior to the start of construction and implemented throughout all construction activities.

Mitigation Monitoring and Reporting Program: Monthly reports shall be prepared by the Applicant and submitted to the CPUC and MDAQMD. These monthly reports shall include a summary of any compliance actions taken.

Standards for Success: Construction emissions will be minimized and would not exceed MDAQMD significance thresholds. Additionally, any State standards regulating construction emissions would be met (i.e., California Air Resources Board Tier 4 emission standards and Title 1. California Code of Regulations Section 2485 standards).

6 Reclamation

Upon completion of the Project construction activities, the construction contractor's environmental inspectors will monitor the implementation of the reclamation treatments as stipulated in Appendix L- Reclamation, Vegetation, and Monitoring Plan of the Plan of Development. Reclamation activities will continue to minimize fugitive dust and construction emissions. On federal lands, the Compliance Inspection Contractor and BLM Authorized Officer must approve proposed site stabilization/reclamation measures before construction activities are considered complete for the Project. DCRT and/or its contractors will also be required to meet the stabilization requirements and post-construction conditions of the Arizona and California Construction General Permit. The same practices for fugitive dust control and construction emissions as described in this Plan will occur during reclamation, except for dust palliatives.

7 Operation and Maintenance Phase

After construction and reclamation, operation and maintenance activities will continue to incorporate BMPs and other mitigations discussed throughout this Plan to minimize fugitive dust and construction vehicle emissions, as needed. Protocol may be adapted based on the applicability to the operation and maintenance task.

1.0 EXECUTIVE SUMMARY

This Paleontological Resource Impact Mitigation and Monitoring Plan (PRIMMP) was prepared by Paleo Solutions, Inc. (Paleo Solutions) in support of the DCR Transmission, LLC (DCRT) Ten West Link Transmission Line Project (Project). The PRIMMP is designed to mitigate effects to paleontological resources, through implementation of monitoring and a plan for discoveries, in accordance with the National Environmental Policy Act (NEPA), and to reduce impacts on paleontological resources to below the level of significance pursuant to the California Environmental Quality Act (CEQA). This PRIMMP serves as the Paleontological Resource Treatment Plan, Paleontological Monitoring and Discovery Plan, and the Paleontological Resources Monitoring and Mitigation Plan required for this Project, as directed by Mitigation Measure (MM) CUL-CEQA-3. This work was required by the Bureau of Land Management (BLM) Colorado River District Office in order to fulfill their responsibilities as the lead agency under NEPA, as well as the California Public Utilities Commission (CPUC) as the lead agency under CEQA. This report was prepared in accordance with BLM procedures (BLM IM 2016-124 [2016] and BLM Manual and Handbook H-8270-1 [1998]), and the requirements of Applicant Proposed Measure (APM) PALEO-01, Best Management Practice (BMP) PALEO-02, and MM CUL-CEQA-3 (see Appendix E).

DCRT proposes to construct, operate, maintain, and decommission a series-compensated, 500 kilovolt (kV) alternating current (AC) overhead transmission line within a 200-foot right-of-way (ROW), which spans approximately 114 miles from the Arizona Public Services Company (APS) Delaney Substation near the community of Tonopah, Maricopa County, Arizona to the Southern California Edison Company (SCE) Colorado River Substation near the City of Blythe, Riverside County, California. The purpose of the Project is to transmit 3,200 megawatts (MW) between the two substations and to provide connection capability for new energy projects in the region. The 114-mile route proposed by DCRT (i.e., the Proposed Action of the Draft Environmental Impact Statement [EIS]) would parallel an existing transmission line and other linear facilities, such as the Devers to Palo Verde Number 1 Transmission Line, with 97 miles in Arizona and 17 miles in California. The Proposed Action would cross federal lands administered by the BLM, the Bureau of Reclamation (BOR), the U.S. Fish and Wildlife Service (USFWS) (Kofa National Wildlife Refuge), the Department of Defense (DOD) (Yuma Proving Ground), and the Bureau of Indian Affairs (BIA) (Colorado River Reservation). In addition to the 114-mile route, a transmission line series compensation station, which includes a 12 kV electric distribution line, would be situated along the middle of the route and would be constructed parallel to the Devers to Palo Verde Number Transmission Line, south of Vicksburg, Arizona. In addition to the Proposed Action described above, the Draft EIS identified Four Action Alternatives and associated subalternatives, which are composed of individual segments that can be interchanged among the different alternatives. For the purposes of this PRIMMP, the BLM preferred route(s), composed of various individual segments and alternative segments extracted from portions of the Proposed Action and all Four Action Alternatives and associated subalternatives, is discussed herein and referred to as "the Project"; however, note that the Project alignment has not been finalized at the time of drafting this PRIMMP and may change after approval of the Final EIS in 2019. The BLM preferred route (i.e., the Project area) intersects land administered by the State of Arizona, BLM, BOR, and DOD (Yuma Proving Ground), as well as private/undetermined land. The subalternative route CB-03, which is not part of the BLM's preferred route, also intersects land administered by the BIA (Colorado River Reservation) and is included in this report (Table 1; Appendices B and F).

In the baseline technical study of the proposed route (i.e., the Proposed Action) and the alternative segments in support of the Draft EIS, the BLM's Potential Fossil Yield Classification (PFYC) system was used to classify mapped geologic units based on the relative abundance of vertebrate fossils or scientifically significant invertebrate or plant fossils and their sensitivity to adverse impacts. For this PRIMMP, Paleo Solutions has refined the geologic mapping of the Project area to use the highest

resolution geologic maps available and published by Miller (1970), Ort and Skotnicki (1993), Richard et al. (1994), Sherrod et al. (1990), and Stone (1988-1990, and 2006). Additionally, the paleontological potential of the Project area was re-assessed based on the refined geologic mapping and fossil occurrence data.

Geologic units underlying the Project area and within a quarter-mile buffer were mapped by Miller (1970), Ort and Skotnicki (1993), Richard et al. (1994), Sherrod et al. (1990), and Stone (1988-1990 and 2006). In total, 42 geologic units and their PFYC were assessed within a quarter-mile buffer of the Project area, including Proterozoic slaty metavolcanics rocks (Xm); middle Proterozoic granitoid (Yg); Precambrian quartz monzonite (pCqm); Precambrian or Mesozoic metavolcanics rocks (pCv); Paleozoic(?) rocks and Precambrian and Mesozoic rocks, undifferentiated (pCu); Paleozoic(?) quartz-albite-muscovite-chlorite schist with meta-tuffaceous rock, Unit 3 (pC3); Paleozoic(?) vitreous quartzite, medium to massively bedded, Unit 4 (pC4); Paleozoic(?) dolomite, tan, chert, massively bedded, Unit 5 (pC5); Jurassic volcanic rocks (Jv); Jurassic volcanic rocks of Dome Rock sequence (Jv); Jurassic volcanic rocks of Dome Rock sequence, upper bedded unit (Jvbu); Cretaceous or Jurassic McCoy Mountains Formation, lower part, undivided (KJmlu); Miocene and Oligocene(?) volcanic rocks of Bear Hills (Tbh); Miocene and Oligocene(?) fanglomerate, sedimentary breccia, and slide blocks (Tf); Miocene or Oligocene andesite (Ta); Miocene or Oligocene lower basaltic volcanic rocks (Tbl); Miocene middle basalt unit (Tbm); Miocene felsic volcanic rocks (Tf); Miocene basalt of New Water Mountains (Tnw); Miocene fanglomerate (Tf); Tertiary(?) tufa (Tbt); Tertiary older hornblende-biotite andesite (Ta); Quaternary and Tertiary(?) alluvial fan and fluvial deposits (QTa); Quaternary or Tertiary hornblende-biotite andesite (QTa); Quaternary or Tertiary basalt of Black Mesa (QTbu); Quaternary or Tertiary dissected fan deposits (QTdf); Quaternary or Tertiary older alluvium (QToa); Pleistocene and/or Pliocene alluvial deposits of the Ehrenberg area (QTe); Pleistocene or Pliocene alluvial deposits of Mule Mountains (QTmm); Quaternary alluvium and talus (Qat); Quaternary alluvium of modern washes (Qw); Quaternary surficial deposits (Qs); late to early Pleistocene alluvium (Qm/Qo); Pleistocene alluvial deposits of Palo Verde Mesa (Qpv); Holocene and late Pleistocene talus (Qt); Holocene and late Pleistocene alluvium/eolian deposits (Qyc/Qye/Qy); Holocene and Pleistocene alluvium (Qa); Holocene and Pleistocene alluvial-fan and alluvial-valley deposits, Unit 3 (Qa3); Holocene alluvial-fan and alluvial-valley deposits (Qa6); Holocene alluvium of modern Colorado River flood plain (Qr); Holocene eolian sand (Qs); and Holocene alluvium of modern washes (Qw). Note that geologic ages tagged with a "(?)" are estimates and represent poorly constrained geologic ages.

The Project area is underlain by moderate paleontological potential (PFYC 3), unknown potential (PFYC U), low potential (PFYC 2), and very low potential (PFYC 1). In accordance with APM PALEO-01, BMP PALEO-02, and MM CUL-CEQA-3 a paleontological monitor will conduct full-time monitoring during all excavations impacting native sediments with moderate paleontological potential (PFYC 3). Part-time monitoring (i.e., spot-checking) will be conducted daily in areas with unknown paleontological potential (PFYC U). If sediments are deemed to be non-conducive to fossil preservation (e.g., high energy [very coarse grained], heavily oxidized [indicating long sediment exposure at the surface], etc.), then monitoring in those areas may be reduced at the discretion of the Project Paleontologist in consultation with the BLM. Construction activities will be spot-checked when excavation depths exceed 10 feet in areas mapped as low paleontological potential (PFYC 2) geologic units to check for the presence of underlying geologic units of higher paleontological potential. If it is subsequently determined that paleontologically sensitive deposits will not be impacted by Project activities, then monitoring in those areas may be reduced at the discretion of the Project Paleontologist in consultation with the BLM. Paleontological monitoring will not be conducted for excavations impacting very low paleontological potential (PFYC 1) (see Tables 2 and 3; see Appendix C).

Prior to earthmoving activities, a paleontological resource awareness training shall be conducted to inform construction personnel of the possibility for fossil discoveries. In such a case, all activity

within a 50-foot radius of the discovery site will cease until a qualified paleontologist has examined and evaluated the find. If the discovery is determined to be significant, the BLM Colorado River District Office and the appropriate BLM field office shall be consulted, and the discovery will be salvaged and prepared to the point of curation and permanent preservation. All significant paleontological resources will be curated at the Natural History Museum of Los Angeles County (NHMLA), which is the approved repository on Paleo Solutions' BLM paleontological use permits for California and Arizona (Appendix D), or another BLM-approved fossil repository, along with their associated field data. Upon conclusion of ground disturbance, a confidential paleontological monitoring report, including detailed locality data, shall be prepared according to BLM specifications. A non-confidential report shall be submitted to DCRT.

2.0 INTRODUCTION

This PRIMMP was prepared by Paleo Solutions in support of the Ten West Link Transmission Line Project. The PRIMMP is designed to mitigate effects to paleontological resources, through implementation of monitoring and a plan for discoveries, in accordance with NEPA, and to reduce impacts on paleontological resources to below the level of significance pursuant to CEQA. This PRIMMP serves as the Paleontological Resource Treatment Plan, Paleontological Monitoring and Discovery Plan, and the Paleontological Resources Monitoring and Mitigation Plan required for this Project, as directed by MM CUL-CEQA-3. This work was required by the BLM Colorado River District Office in order to fulfill their responsibilities as the lead agency under NEPA, as well as the CPUC as the lead agency under CEQA. This report was prepared in accordance with BLM procedures (BLM IM 2016-124 [2016] and BLM Manual and Handbook H-8270-1 [1998]), and the requirements of APM PALEO-01, BMP-PALEO-02, and MM-CUL-CEQA-3 (see Appendix E).

This PRIMMP was prepared by Paleo Solutions' Qualified Paleontologist Geraldine Aron, M.S., Principal Investigator Courtney Richards, M.S., and Senior Paleontologist Mathew Carson, M.S. GIS mapping was provided by GIS Analyst Barbara Webster, M.S., and Senior Paleontologist Mathew Carson, M.S.

2.1 PROJECT DESCRIPTION AND LOCATION

2.1.1 Project Description

DCRT proposes to construct, operate, maintain, and decommission a series-compensated, 500 kV AC overhead transmission line within a 200-foot ROW, which spans approximately 114 miles from the APS Delaney Substation near the community of Tonopah, Maricopa County, Arizona to the SCE Colorado River Substation near the City of Blythe, Riverside County, California (Figure 1). The purpose of the Project is to transmit 3,200 MW between the two substations and to provide connection capability for new energy projects in the region. The 114-mile route proposed by DCRT (i.e., the Proposed Action of the Draft EIS) would parallel an existing transmission line and other linear facilities, such as the Devers to Palo Verde Number 1 Transmission Line, with 97 miles in Arizona and 17 miles in California. The Proposed Action would cross federal lands administered by the BLM, the BOR, the USFWS (Kofa National Wildlife Refuge), the DOD (Yuma Proving Ground), and the BIA (Colorado River Reservation) (Figure 1). In addition to the 114-mile route, a transmission line series compensation station, which includes a 12 kV electric distribution line, would be situated along the middle of the route and would be constructed parallel to the Devers to Palo Verde Number Transmission Line, south of Vicksburg, Arizona (Figure 1).

Due to the scope of the Project and its intersections with federal lands, the BLM required an EIS to study impacts of the Project and to assess Project alternatives. In addition to the Proposed Action described above, the Draft EIS identified Four Action Alternatives and associated subalternatives, which are composed of individual segments that can be interchanged among the different alternatives. The four alternatives include Alternative 1: Interstate 10 Route, Alternative 2: BLM Utility Corridor, Alternative 3: Avoidance Route, and Alternative 4: Public Lands Emphasis Route; the Draft EIS contains a detailed description and assessment of the Four Action Alternatives, so they will not be discussed in detail here. For the purposes of this PRIMMP, the BLM preferred route(s), composed of various individual segments and alternative segments extracted from portions of the Proposed Action and all Four Action Alternatives and associated subalternatives, is discussed herein and referred to as "the Project" (Figure 1; Appendix B); however, note that the Project alignment has not been finalized at the time of drafting this PRIMMP and may change after approval of the Final EIS in 2019. The BLM preferred route (i.e., the Project area) intersects land administered by the State of Arizona, BLM, BOR, and DOD (Yuma Proving Ground), as well as private/undetermined land

(Table 1). The subalternative route CB-03, which is not part of the BLM's preferred route, also intersects land administered by the BIA (Colorado River Reservation) and is included in this report (Table 1; Appendices B and F).

2.1.2 Project Location

The Project spans from the APS Delaney Substation near the community of Tonopah, Maricopa County, Arizona to the SCE Colorado River Substation near the City of Blythe, Riverside County, California (Figure 1; Appendix B). The Project area and additional subalternatives described in this PRIMMP encompass approximately 4,457 acres and are mapped on the USGS Saddle Mountain (AZ), Burnt Mountain (AZ), Big Horn Peak (AZ), Courthouse Well (AZ), Lone Mountain (AZ), Hope SE (AZ), Hope SW (AZ), New Water Well (AZ), Vicksburg (AZ), Bear Hills (AZ), Plomosa Pass (AZ), Quartzsite (AZ), South of Quartzsite (AZ), Cunningham Mountain (AZ), Dome Rock Mountains SW (AZ), Blythe (AZ and CA), Ripley (CA), and Roosevelt Mine (CA) 7.5-minute topographic quadrangles. The Project area intersects land administered by the State of Arizona, BLM, BOR, and DOD (Yuma Proving Ground), as well as private/undetermined land. Public Land Survey System (PLSS) and land surface management/ownership are provided in Appendix F.

2.2 POTENTIAL FOSSIL YIELD CLASSIFICATION SYSTEM

The PFYC system was developed by the BLM (BLM, 2016). Because of its demonstrated usefulness as a resource management tool, the PFYC system has been utilized for many years for projects across the country, regardless of land ownership. It is a predictive resource management tool that classifies geologic units on their likelihood to contain paleontological resources on a scale of 1 (very low potential) to 5 (very high potential) and U (unknown potential). This system is intended to aid in predicting, assessing, and mitigating paleontological resources. The PFYC ranking system is summarized in Table 2.

In the baseline technical study of the proposed route (i.e., the Proposed Action) and the alternative segments in support of the Draft EIS, the BLM's PFYC system was used to classify mapped geologic units based on the relative abundance of vertebrate fossils or scientifically significant invertebrate or plant fossils and their sensitivity to adverse impacts. The baseline technical study used existing PFYC maps and geologic unit tables published by the BLM, including the BLM's Desert Renewable Energy Conservation Plan EIS and its supporting paleontological resource appendix (BLM, 2014), and the U.S. Department of Energy and BLM Programmatic EIS, Designation of Energy Corridors on Federal land in 11 Western States and its supporting PFYC appendix (U.S. Department of Energy and BLM, 2007) to classify geologic units within the Ten West Link Transmission Line corridor(s) within California and Arizona, respectively. Geologic mapping data was based on digital geologic maps of California and Arizona from the U.S. Geological Survey (2014); however, these geologic maps are at low geographic resolutions, such as 1:750,000 scale for California and 1:1,000,000 scale for Arizona, which do not comply with MM CUL-CEQA-3, which requires all geologic and paleontological potential (PFYC) maps to be assessed at a scale resolution of 1:100,000 or higher. Moreover, the low resolution of geologic mapping used in the baseline study resulted in a broad range of PFYC assignments (PFYC 2/3/U) for one mapped geologic unit, which is unsuitable for defining paleontological mitigation and/or monitoring requirements. Additionally, some of the geologic units were given PFYC assignments based on previous versions of the BLM PFYC system classes and not on the most recent BLM (2016) description of the PFYC system (Table 2). For example, some Holocene-age sedimentary geologic units were assigned Very Low (PFYC 1) paleontological potential; however, these units should be Low (PFYC 2) paleontological potential based on the most recent version of the BLM's PFYC system (BLM, 2016) (Table 2).

For this PRIMMP, Paleo Solutions has refined the geologic mapping of the Project area to use the highest resolution geologic maps available and published by Miller (1970), Ort and Skotnicki (1993),

Richard et al. (1994), Sherrod et al. (1990), and Stone (1988-1990, and 2006), ranging in scale from 1:24,000 and 1:100,000, pursuant to MM CUL-CEQA-3 and following best practices in mitigation paleontology (Murphey et al., 2014). Additionally, the paleontological potential of the Project area was re-assessed based on the refined geologic mapping and fossil occurrence data.

Table 2. Potential Fossil Yield Classification (BLM, 2016)

BLM PFYC Designation	Assignment Criteria Guidelines and Management Summary (PFYC System)
1 = Very Low Potential	Geologic units are not likely to contain recognizable paleontological resources.
	Units are igneous or metamorphic, excluding air-fall and reworked volcanic ash units.
	Units are Precambrian in age.
	Management concern is usually negligible, and impact mitigation is unnecessary except in rare or isolated circumstances.
2 = Low	Geologic units are not likely to contain paleontological resources.
	Field surveys have verified that significant paleontological resources are not present or are very rare.
	Units are generally younger than 10,000 years before present.
	Recent eolian deposits
	Sediments exhibit significant physical and chemical changes (i.e., diagenetic alteration) that make fossil preservation unlikely
	Management concern is generally low, and impact mitigation is usually unnecessary except in occasional or isolated circumstances.
3 = Moderate Potential	Sedimentary geologic units where fossil content varies in significance, abundance, and predictable occurrence.
	Marine in origin with sporadic known occurrences of paleontological resources.
	Paleontological resources may occur intermittently, but these occurrences are widely scattered
	The potential for authorized land use to impact a significant paleontological resource is known to be low-to-moderate.
	Management concerns are moderate. Management options could include record searches, pre-disturbance surveys, monitoring, mitigation, or avoidance. Opportunities may exist for hobby collecting. Surface-disturbing activities may require sufficient assessment to determine whether significant paleontological resources occur in the area of a proposed action and whether the action could affect the paleontological resources.
4 = High Potential	Geologic units that are known to contain a high occurrence of paleontological resources.
	Significant paleontological resources have been documented but may vary in occurrence and predictability.
	Surface-disturbing activities may adversely affect paleontological resources.
	Rare or uncommon fossils, including nonvertebrate (such as soft body preservation) or unusual plant fossils, may be present.
	Illegal collecting activities may impact some areas.
	Management concern is moderate to high depending on the proposed action. A field survey by a qualified paleontologist is often needed to assess local conditions. On-site monitoring or spot-checking may be necessary during land disturbing activities. Avoidance of known paleontological resources may be necessary.
5 = Very High Potential	Highly fossiliferous geologic units that consistently and predictably produce significant paleontological resources.
	Significant paleontological resources have been documented and occur consistently
	Paleontological resources are highly susceptible to adverse impacts from surface disturbing activities.
	Unit is frequently the focus of illegal collecting activities.
	Management concern is high to very high. A field survey by a qualified paleontologist is almost always needed and on-site monitoring may be necessary during land use activities. Avoidance or resource preservation through controlled access, designation of areas of avoidance, or special management designations should be considered.

BLM PFYC Designation	Assignment Criteria Guidelines and Management Summary (PFYC System)
U = Unknown	Geologic units that cannot receive an informed PFYC assignment
	Geological units may exhibit features or preservational conditions that suggest significant paleontological resources could be present, but little information about the actual paleontological resources of the unit or area is unknown.
	Geologic units represented on a map are based on lithologic character or basis of origin, but have not been studied in detail.
	Scientific literature does not exist or does not reveal the nature of paleontological resources.
	Reports of paleontological resources are anecdotal or have not been verified.
	Area or geologic unit is poorly or under-studied.
	BLM staff has not yet been able to assess the nature of the geologic unit.
	Until a provisional assignment is made, geologic units with unknown potential have medium to high management concerns. Field surveys are normally necessary, especially prior to authorizing a ground-disturbing activity.

3.0 DEFINITION AND SIGNIFICANCE OF PALEONTOLOGICAL RESOURCES

As defined by Murphey and Daitch (2007): "Paleontology is a multidisciplinary science that combines elements of geology, biology, chemistry, and physics in an effort to understand the history of life on earth. Paleontological resources, or fossils, are the remains, imprints, or traces of once-living organisms preserved in rocks and sediments. These include mineralized, partially mineralized, or unmineralized bones and teeth, soft tissues, shells, wood, leaf impressions, footprints, burrows, and microscopic remains. Paleontological resources include not only fossils themselves, but also the associated rocks or organic matter and the physical characteristics of the fossils' associated sedimentary matrix.

The fossil record is the only evidence that life on earth has existed for more than 3.6 billion years. Fossils are considered non-renewable resources because the organisms they represent no longer exist. Thus, once destroyed, a fossil can never be replaced. Fossils are important scientific and educational resources because they are used to:

- Study the phylogenetic relationships amongst extinct organisms, as well as their relationships to modern groups;
- Elucidate the taphonomic, behavioral, temporal, and diagenetic pathways responsible for fossil preservation, including the biases inherent in the fossil record;
- Reconstruct ancient environments, climate change, and paleoecological relationships;
- Provide a measure of relative geologic dating that forms the basis for biochronology and biostratigraphy, and which is an independent and corroborating line of evidence for isotopic dating;
- Study the geographic distribution of organisms and tectonic movements of land masses and ocean basins through time;
- Study patterns and processes of evolution, extinction, and speciation; and
- Identify past and potential future human-caused effects to global environments and climates."

Fossil resources vary widely in their relative abundance and distribution and not all are regarded as significant. According to the BLM IM 2009-011, a "Significant Paleontological Resource" is defined as:

> "Any paleontological resource that is considered to be of scientific interest, including most vertebrate fossil remains and traces, and certain rare or unusual invertebrate and plant fossils. A significant paleontological resource is considered to be of scientific interest if it is a rare or previously unknown species, it is of high quality and well-preserved, it preserves a previously unknown anatomical or other characteristic, provides new information about the history of life on earth, or has an identified educational or recreational value. Paleontological resources that may be considered not to have scientific significance include those that lack provenience or context, lack physical integrity due to decay or natural erosion, or that are overly redundant or are otherwise not useful for research. Vertebrate fossil remains and traces include bone, scales, scutes, skin impressions, burrows, tracks, tail drag marks, vertebrate coprolites (feces), gastroliths (stomach stones), or other physical evidence of past vertebrate life or activities" (BLM, 2008).

Vertebrate fossils, whether preserved remains or track ways, are classified as significant by most state and federal agencies and professional groups (and are specifically protected under the California Public Resources Code). In some cases, fossils of plants or invertebrate animals are also considered significant and can provide important information about ancient local environments.

The full significance of fossil specimens or fossil assemblages cannot be accurately predicted before they are collected, and in many cases, before they are prepared in the laboratory and compared with previously collected fossils. Pre-construction assessment of significance associated with an area or formation must be made based on previous finds, characteristics of the sediments, and other methods that can be used to determine paleoenvironmental and taphonomic conditions.

4.0 LAWS, ORDINANCES, REGULATIONS, AND STANDARDS

This section of the report presents the federal, state, and local regulatory requirements pertaining to paleontological resources that will apply to this project.

4.1 FEDERAL REGULATORY SETTING

If any federal funding is used to wholly or partially finance a project, it is sited on federal lands, involves a federal permit, and/or includes a perceived federal impact, federal laws and standards apply, and an evaluation of potential impacts on paleontological resources may be required. The management and preservation of paleontological resources may be required. The management and preservation of paleontological resources on public and federal lands are prescribed under various laws, regulations, and guidelines.

4.1.1 National Environmental Policy Act (16 USC Section 431 et seq.)

The National Environmental Policy Act of 1969, [NEPA] as amended (Pub. L. 91-190, 42 U.S.C. 4321-4347, January 1, 1970, as amended by Pub. L. 94-52, July 3, 1975, Pub. L. 94-83, August 9, 1975, and Pub. L. 97-258 § 4(b), Sept. 13, 1982) recognizes the continuing responsibility of the Federal Government to "preserve important historic, cultural, and natural aspects of our national heritage . . ." (Sec. 101 [42 USC § 4321]) (#382). With the passage of the Paleontological Resources Preservation Act (PRPA) (2009), paleontological resources are considered to be a significant resource and it is therefore now standard practice to include paleontological resources in NEPA studies in all instances where there is a possible impact.

4.1.2 Antiquities Act of 1906 (16 USC 431-433)

The Antiquities Act of 1906 states, in part:

> That any person who shall appropriate, excavate, injure or destroy any historic or prehistoric ruin or monument, or any object of antiquity, situated on lands owned or controlled by the Government of the United States, without the permission of the Secretary of the Department of the Government having jurisdiction over the lands on which said antiquities are situated, shall upon conviction, be fined in a sum of not more than five hundred dollars or be imprisoned for a period of not more than ninety days, or shall suffer both fine and imprisonment, in the discretion of the court.

Although there is no specific mention of natural or paleontological resources in the act itself, or in the act's uniform rules and regulations (43 CFR 3), "objects of antiquity" has been interpreted to include fossils by the National Park Service, the BLM, the US Forest Service, and other federal agencies. Permits to collect fossils on lands administered by federal agencies are authorized under this act. However, due to the large gray areas left open to interpretation due to the imprecision of the wording, agencies are hesitant to interpret this act as governing paleontological resources.

4.1.3 Paleontological Resources Preservation, Omnibus Public Lands Act, Public Law 111-011, Title VI, Subtitle D (PRPA, 2009)

This legislation directs the Secretaries (Interior and Agriculture) to manage and protect paleontological resources on federal land using "scientific principles and expertise." PRPA incorporates most of the recommendations of the report of the Secretary of the Interior entitled Assessment of Fossil Management on Federal and Indian Lands (2000) in order to formulate a consistent paleontological resources management framework. In passing the PRPA, Congress officially recognized the scientific importance of paleontological resources on some federal lands by declaring that fossils from these lands are federal property that must be preserved and protected. The PRPA codifies existing policies of the BLM, National Park Service, U.S. Forest Service, Bureau of Reclamation, and U.S. Fish and Wildlife Service, and provides the following:

- Uniform criminal and civil penalties for illegal sale and transport, and theft and vandalism of fossils from federal lands;
- Uniform minimum requirements for paleontological resource-use permit issuance (terms, conditions, and qualifications of applicants);
- Uniform definitions for "paleontological resources" and "casual collecting"; and
- Uniform requirements for curation of federal fossils in approved repositories.

This document does not specifically trigger any paleontological requirements, other than those under NEPA for project impact evaluations if there is a federal nexus.

4.1.4 Federal Land Policy and Management Act (FLPMA) of 1976

The Federal Land Policy and Management Act (FLPMA) of 1976 (43 U.S.C. 1712[c], 1732[b]); sec. 2, Federal Land Management and Policy Act of 1962 [30 U.S.C. 611]; Subpart 3631.0 et seq.), Federal Register Vol. 47, No. 159, 1982 does not refer specifically to fossils. However, "significant fossils" are understood and recognized in policy as scientific resources. Permits, which authorize the collection of significant fossils for scientific purposes, are issued under the authority of FLPMA. Under FLPMA, federal agencies are charged to:

Manage public lands in a manner that protects the quality of scientific, scenic, historical, ecological, environmental, air and atmospheric, archaeological, and water resources, and, where appropriate, preserve and protect certain public lands in their natural condition (Section 102 (a)(8) (11));

Periodically inventory public lands so that the data can be used to make informed land-use decisions (Section 102(a)(2)); and

Regulate the use and development of public lands and resources through easements, licenses, and permits (Section 302(b)).

4.1.5 BLM Procedures and Policies for Managing Paleontological Resources

The PFYC system was developed by the BLM (2016) and provides an estimate of the potential that significant paleontological resources will be discovered within a particular mapped geological unit. The system is used to determine potential impacts to paleontological resources for federal actions involving surface disturbance, land use planning, or land tenure adjustment. Implementation of the PFYC system does not require changes to existing land use plans, project plans, or other completed efforts. However, integration into plans presently being developed is recommended. The IM 2016-124 revision is an update to the guidance that was introduced in IM 2008-009 (2007).

The BLM Manual and Handbook H-8270-1 [1998] provides policies and direction for the BLM's Paleontological Resource Management Program as well as detailed procedures and standards for implementing policies. According to Section 6 of the BLM Manual and Handbook H-8270-1 [1998], it shall be BLM's policy to:

1) Actively work with other Federal, State, and Local Government Agencies, professional organizations, private land owners, educational institutions, and other interested parties to enhance and further the BLM's and the public's needs and objectives for paleontological resources.

2) Consider paleontological resource management a distinct BLM program, to be given full and equal consideration in all its land use planning and decision making actions.

3) Maintain a staff of professional paleontologists to provide BLM decision makers with the most current and scientifically sound paleontological resource data and advice.

4) Mitigate adverse impacts to paleontological resources as necessary.

5) Facilitate appropriate public and scientific use of and interest in paleontological resources.

6) Utilize the additional skills and resources of the Bureau's recreation and minerals programs to develop and implement interpretation strategies and products to enhance public understanding, appreciation, and enjoyment of paleontological resources.

7) Vigorously pursue the protection of paleontological resources from theft, destruction, and other illegal or unauthorized uses.

8) Authorize land tenure adjustments, when appropriate, as means to protect paleontological localities.

4.2 STATE REGULATORY SETTING

4.2.1 State of California

California Environmental Quality Act (CEQA)

The procedures, types of activities, persons, and public agencies required to comply with CEQA are defined in the Guidelines for Implementation of CEQA (State CEQA Guidelines), as amended on March 18, 2010 (Title 14, Section 15000 et seq. of the California Code of Regulations) and further amended January 4th, 2013. One of the questions listed in the CEQA Environmental Checklist is: "Would the project directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?" (State CEQA Guidelines Section 15064.5 and Appendix G, Section V, Part C).

State of California Public Resources Code

The State of California Public Resources Code (Chapter 1.7), Sections 5097 and 30244, includes additional state level requirements for the assessment and management of paleontological resources. These statutes require reasonable mitigation of adverse impacts to paleontological resources resulting from development on state lands, and define the excavation, destruction, or removal of paleontological "sites" or "features" from public lands without the express permission of the jurisdictional agency as a misdemeanor. As used in Section 5097, "state lands" refers to lands owned by, or under the jurisdiction of, the state or any state agency. "Public lands" is defined as lands

owned by, or under the jurisdiction of, the state, or any city, county, district, authority, or public corporation, or any agency thereof.

4.3 LOCAL REGULATORY SETTING

Maricopa County and La Paz County do not contain goals or policies pertaining to paleontological resources within their respective county Comprehensive Plans (County of Maricopa, 2016; County of La Paz; 2005). Additionally, the Tonopah/Arlington Area Plan (County of Maricopa, 2000) and the Town of Quartzsite, Arizona General Plan (2014) do not contain goals or policies pertaining to paleontological resources. Therefore, these jurisdictions are omitted from this report.

4.3.1 Riverside County

The Riverside County General Plan requires consideration of paleontological resources under the Multipurpose Open Space Element of the general plan (County of Riverside, 2015). The Riverside County General Plan recommendations are based on the Society of Vertebrate Paleontology (SVP) Guidelines (SVP, 2010) for the mitigation of paleontological resources. The Multipurpose Open Space Element of the general plan (County of Riverside, 2015) provides the following requirements for paleontological sensitive areas within the county:

- OS 19.6 Whenever existing information indicates that a site proposed for development has high paleontological sensitivity as shown on Figure OS-8, a paleontological resource impact mitigation program (PRIMP) shall be filed with the County Geologist prior to site grading. The PRIMP shall specify the steps to be taken to mitigate impacts to paleontological resources.

- OS 19.7 Whenever existing information indicates that a site proposed for development has low paleontological sensitivity as shown on Figure OS-8, no direct mitigation is required unless a fossil is encountered during site development. Should a fossil be encountered, the County Geologist shall be notified and a paleontologist shall be retained by the project proponent. The paleontologist shall document the extent and potential significance of the paleontological resources on the site and establish appropriate mitigation measures for further site development.

- OS 19.8 Whenever existing information indicates that a site proposed for development has undetermined paleontological sensitivity as shown on Figure OS-8, a report shall be filed with the County Geologist documenting the extent and potential significance of the paleontological resources on site and identifying mitigation measures for the fossil and for impacts to significant paleontological resources prior to approval of that department.

- OS 19.9 Whenever paleontological resources are found, the County Geologist shall direct them to a facility within Riverside County for their curation, including the Western Science Center in the City of Hemet.

4.3.2 City of Blythe

The City of Blythe General Plan 2025 requires consideration of paleontological resources under the Open Space and Conservation Elements section of the general plan (City of Blythe, 2007). The general plan requires that a site-specific analysis is conducted for future development projects within the planning area (City of Blythe, 2007). The City of Blythe General Plan 2025 contains one guiding policy, *Policy 25: Protect archaeologic, historic, and paleontologic resources for their aesthetic, scientific, educational, and cultural value* (City of Blythe, 2007). Furthermore, the Open Space and Conservation Elements section contains two implementation policies, which require institutional records searches for areas of high sensitivity, retention of a consulting archaeologist (or paleontologist) to conduct field

reconnaissance surveys, and/or preparation of a mitigation plan outlining mitigation measures that are consistent with state law.

5.0 GEOLOGY AND PALEONTOLOGY

The Project area is located within the Basin and Range Geomorphic Province in Arizona, as well as the eastern portion of the Colorado Desert Geomorphic Province in California. The Basin and Range includes most of the western United States and portions of northwestern Mexico that formed as a result of tectonic compression and subsequent extension approximately 20 to 17 million years ago during the Miocene. The Basin and Range is characterized by northwest-southeast-trending mountain ranges of igneous-metamorphic formations, separated by broad, nearly flat depositional basins filled with relatively younger alluvial or volcanic deposits (Norris and Webb, 1990). The Colorado Desert lies mostly below sea level and is located on the land extension of the Gulf of California. The province is bounded in the north by the southern edge of the Transverse Ranges, in the east by the Colorado River, in the west by the Peninsular Ranges, and in the south by Mexico (Norris and Webb, 1990) and represents a depression block formed as a result of tectonic rifting along the Gulf of California.

Geologic history of the overall region spans the Proterozoic to the present. Within the Basin and Range, the oldest rocks are early to middle Proterozoic granitic basement rocks formed deep below the earth's surface and early to middle Proterozoic high- to low-grade metamorphic rocks, such as gneiss, schist, and phyllite. Portions of the Project area situated north-northwest of the Delaney Substation are near the southern edge of the Big Horn Mountains, which consist of Proterozoic metamorphic rocks with Mesozoic igneous intrusions, which were subsequently overlain by Miocene basalt-rhyolite volcanic rocks and sedimentary rocks. West of Delaney Substation and south of the Project alignment, the northwest- to southeast-trending Eagletail Mountains consist of eroded basaltic cliffs and peaks of Tertiary- to Quaternary-age. The Plomosa and Dome Rock mountain ranges, located adjacent to Quartzsite, Arizona and Blythe, California, consist of sedimentary geologic units formed during the Paleozoic, as well as volcanic and sedimentary rocks of Mesozoic-age. Within the Colorado Desert of California, the Project area transverses the Palo Verde Valley, which consists of Pliocene- through Holocene-age alluvial deposits underlain by Miocene- and Pliocene-age sedimentary deposits and Miocene-age fanglomerate deposits. Situated northwest of the Palo Verde Valley, the McCoy Mountains consist of sandstone, mudstone, and conglomerate of the McCoy Mountains Formation, with extensive igneous rocks, composed of andesite, rhyolite, granite, and basalt rocks, with flows, dikes, and pyroclastic deposits (Norris and Webb, 1990).

Geologic units underlying the Project area and within a quarter-mile buffer were mapped by Miller (1970), Ort and Skotnicki (1993), Richard et al. (1994), Sherrod et al. (1990), and Stone (1988-1990 and 2006) (Appendix B). In total, 42 geologic units were assessed within a quarter-mile buffer of the Project area, including Proterozoic slaty metavolcanics rocks (Xm); middle Proterozoic granitoid (Yg); Precambrian quartz monzonite (pCqm); Precambrian or Mesozoic metavolcanics rocks (pCv); Paleozoic(?) rocks and Precambrian and Mesozoic rocks, undifferentiated (pCu); Paleozoic(?) quartz-albite-muscovite-chlorite schist with meta-tuffaceous rock, Unit 3 (pC3); Paleozoic(?) vitreous quartzite, medium to massively bedded, Unit 4 (pC4); Paleozoic(?) dolomite, tan, chert, massively bedded, Unit 5 (pC5); Jurassic volcanic rocks (Jv); Jurassic volcanic rocks of Dome Rock sequence (Jv); Jurassic volcanic rocks of Dome Rock sequence, upper bedded unit (Jvbu); Cretaceous or Jurassic McCoy Mountains Formation, lower part, undivided (KJmlu); Miocene and Oligocene(?) volcanic rocks of Bear Hills (Tbh); Miocene and Oligocene(?) fanglomerate, sedimentary breccia, and slide blocks (Tf); Miocene or Oligocene andesite (Ta); Miocene or Oligocene lower basaltic volcanic rocks (Tbl); Miocene middle basalt unit (Tbm); Miocene felsic volcanic rocks (Tf); Miocene basalt of New Water Mountains (Tnw); Miocene fanglomerate (Tf); Tertiary(?) tufa (Tbt); Tertiary older hornblende-biotite andesite (Ta); Quaternary and Tertiary(?) alluvial fan and fluvial deposits (QTa);

Quaternary or Tertiary hornblende-biotite andesite (QTa); Quaternary or Tertiary basalt of Black Mesa (QTbu); Quaternary or Tertiary dissected fan deposits (QTdf); Quaternary or Tertiary older alluvium (QToa); Pleistocene and/or Pliocene alluvial deposits of the Ehrenberg area (QTe); Pleistocene or Pliocene alluvial deposits of Mule Mountains (QTmm); Quaternary alluvium and talus (Qat); Quaternary alluvium of modern washes (Qw); Quaternary surficial deposits (Qs); late to early Pleistocene alluvium (Qm/Qo); Pleistocene alluvial deposits of Palo Verde Mesa (Qpv); Holocene and late Pleistocene talus (Qt); Holocene and late Pleistocene alluvium/eolian deposits (Qyc/Qye/Qy); Holocene and Pleistocene alluvium (Qa); Holocene and Pleistocene alluvial-fan and alluvial-valley deposits, Unit 3 (Qa3); Holocene alluvial-fan and alluvial-valley deposits (Qa6); Holocene alluvium of modern Colorado River flood plain (Qr); Holocene eolian sand (Qs); and Holocene alluvium of modern washes (Qw). Note that geologic ages tagged with a "(?)" are estimates and represent poorly constrained geologic ages. These geologic units are described below, and their paleontological potential classifications as interpreted by Paleo Solutions are summarized in Table 3 (maps are presented in Appendix B).

5.1 PROTEROZOIC TO QUATERNARY INTRUSIVE AND EXTRUSIVE IGNEOUS ROCKS

The Project area is underlain by two Proterozoic intrusive igneous rocks and 14 Proterozoic to Quaternary extrusive igneous rocks, all of which have a very low (PFYC 1) potential to produce scientifically important paleontological resources (Appendix B; Table 3).

Igneous rocks are crystalline or non-crystalline rocks that form through the cooling and subsequent solidification of lava or magma. Intrusive (plutonic) igneous rocks form below the earth's surface, and extrusive (volcanic) rocks form on the earth's surface. Lava and magma are formed by the melting of pre-existing plutonic rocks in the earth's crust or mantle due to increases in temperature, changes in pressure, or changes in geochemical composition. Extreme temperatures in the environments in which intrusive igneous rocks form prevent the preservation of fossils. The formation of extrusive igneous rocks as a result of volcanic processes is associated with extremely high temperatures that also generally prevents the preservation of fossils.

The following Proterozoic to Quaternary intrusive and extrusive igneous rocks are present within the Project area or its quarter-mile buffer (Miller, 1970; Ort and Skotnicki, 1993; Richard et al., 1994; Sherrod et al., 1990; and Stone, 1988-1990; 2006):

- Granitoid (Yg), Middle Proterozoic: Undivided granitoid unit ranging from porphyritic biotite monzogranite to granodiorite; lacks pre-Mesozoic tectonic fabric (Richard et al.., 1994).

- Slaty metavolcanics rocks (Xm), Proterozoic: Green-colored, fine-grained metavolcanics rocks; slaty fabric, likely originating from andesite; unit contains lenses of banded iron formation and quartz veins (Orts and Skotnicki, 1991).

- Quartz monzonite (pCqm), Precambrian: An intrusive igneous rock composed of even-grained biotite quartz monzonite, spanning an area of approximately four square miles (Miller, 1970).

- Metavolcanic rocks (pCv), Precambrian or Mesozoic: Partially metamorphosed rhyolitic to dacitic intrusive, flow, and tuffaceous rocks derived from volcanic activity; dark green to light gray in color; sheared from tectonic activity in some areas and locally schistose (Miller, 1970).

- Volcanic rocks (Jv), Jurassic: Mainly light gray to light greenish-gray, rhyodacitic volcanic and metavolcanics rocks composed of microcrystalline, felsic groundmass and phenocrysts of felsic minerals; generally unbedded, but commonly foliated and metamorphosed; deposited in an ash-flow tuff, flows, and hypabyssal porphyry (Richard et al., 1994; Stone, 2006).

- Volcanic rocks of Dome Rock sequence (Jv), Jurassic: Rhyolitic to dacitic, massive volcanic quarts porphyry, composed of microcrystalline, felsic groundmass and phenocrysts of quartz, feldspar, and biotite; foliated and metamorphosed, with local sandstone and conglomerate of reworked volcanics (Stone, 1988-1990).

- Volcanic rocks of Dome Rock sequence, upper bedded unit (Jvbu), Jurassic: Felsic tuff and tuffaceous sedimentary rock, thinly to thickly bedded; overlain by the McCoy Mountains Formation (Stone, 1988-1990).

- Volcanic rocks of Bear Hills (Tbh), Miocene and Oligocene?: Primarily basalt lava flows, with breccia, scoria, felsic tuff, andesite and rhyolite lava flows, and rhyolite plugs; includes minor sandstone, siltstone, and evaporite deposits; overlain by the New Water Mountains (Tnw) basalt (Sherrod et al., 1990).

- Andesite (Ta), Miocene or Oligocene: Andesitic lavas and hypabyssal intrusive rocks, with associated breccia and tuff; dark reddish-brown to gray; large flow deposits in which bedding and/or flow foliation is highly variable; present within the southern Little Harquahala Mounatins, northwestern Eagletrail Mountains, northwestern Bear Hills, and within the Bouse Hills (Richard et al., 1994).

- Lower basaltic volcanic rocks (Tbl), Miocene or Oligocene: Mafic volcanic rocks located throughout the Bouse Hills, Big Horn Mountains, Eagletail Mountains, and the Harquahala Mountains; ranges in lithology from vascular to amygdaloidal andesitic to basaltic lava flows; widely altered, including local replacement by brown to tan calcite; contains interbedded units of brown to reddish-brown sandstone, felsic tuff, conglomerate, monolithologic breccia, gray limestone, and orange iron-stained siliceous rock beds (Richard et al., 1994).

- Middle basalt unit (Tbm), Miocene: Includes Burnt Mountain volcanic rocks in Big Horn Mountains; rock types include aphyric to crystal-poor, slightly vesicular basalt lava, gray and brown variably porphyritic and vesicular andesite lava flows, and associated tuffs, lahars, and breccias (Richard et al., 1994).

- Felsic volcanic rocks (Tf), Miocene: Dacitic to rhyolitic lavas and pyroclastic rocks, forming dome complexes with associated breccia rinds and block and ash deposits; light colored with distal portions grading into light gray to white, massive to flow-banded felsic minerals, laterally grading into breccia and tuff (Richard et al., 1994).

- Basalt of New Water Mountains (Tnw), Miocene: Porphyritic to aphyric olivine basalt lava flows, with vesicles filled with calcite and silica, and interbedded with silicic volcanic rocks, including invasive and subjacent tuff and tuffaceous sandstone; overlain by fanglomerate deposits (Sherrod et al., 1990).

- Older hornblende-biotite andesite (Ta), Tertiary: Andesite breccia deposit, possibly several thousand feet thick, and composed of pink, gray, and reddish-brown hornblende-biotite andesite flow deposits, interbedded locally with tuffaceous sediments (Miller, 1970).

- Hornblende-biotite andesite (QTa), Quaternary and Tertiary: Dark gray to black; 200 to 400 feet thick, with individual flow approximately 50 feet thick; uncomfortably overlies andesite

breccia and older hornblende andesite (Ta); composed of small phenocrysts of hornblende, biotite, and plagioclase, with groundmass of plagioclase, glass, and opaque minerals; formed as lava flows, which abut against older volcanic rocks (Miller, 1970).

- Basalt of Black Mesa (QTbu), Quaternary and Tertiary: Volcanic deposits containing mineral olivine; subdivided into two parts: lower interbedded tuffaceous rocks, approximately 400 to 500 feet thick, with beds 10 to 50 feet thick; and upper basalt flows, approximately 700 feet thick, with individual flows 20 to 50 feet thick (Miller, 1970).

5.2 PALEOZOIC(?) METAMORPHIC ROCKS

The Project area is underlain by two Paleozoic(?) metamorphic rock units, both of which have a very low (PFYC 1) potential to produce scientifically important paleontological resources (Appendix B; Table 3).

Metamorphic rocks result from the transformation of other rocks due to high temperature and high pressure. The parent rock can be igneous, sedimentary, or a pre-existing metamorphic rock. Metamorphic rocks comprise a large portion of the earth's crust and are classified on the basis of their chemistry and mineralogy. Most do not preserve fossils due to the conditions under which they were formed. However, metasedimentary rocks are formed from common sedimentary rock types such as limestone, shale, mudstone, siltstone, sandstone, and conglomerate. These types of metamorphic rocks do sometimes preserve fossils, but rarely fossils of scientific importance. Examples of fossils in metasedimentary rock include mollusks preserved in marble and echinoderms and graptolites preserved in slate.

The following Paleozoic metamorphic rocks are present within the Project area or its quarter-mile buffer (Miller, 1970):

- Quartz-albite-muscovite-chlorite schist, metatuffaceous rock, Unit 3 (pC3), Paleozoic(?): Approximately 450 feet thick, predominately quartz-albite-muscovite-chlorite schist, interbeds composed of buff- to pink-colored, carbonate, calcareous quartzite and approximately 10 feet thick; likely originated from fine-grained sedimentary clastic rock with interbeds of extrusive volcanic flows or intrusive hypabyssal sills (Miller, 1970).

- Vitreous quartzite, medium to massively bedded, Unit 4 (pC4), Paleozoic(?): Approximately 400 feet thick, overlying quartz-albite-muscovite-chlorite schist, metatuffaceous rock, Unit 3 (pC3) with a gradational contact; quartzite is massively bedded, vitreous, light tan to white, well sorted (Miller, 1970). According to Miller (1970), this unit may be correlative or equivalent to the Coconino Sandstone of the areas north and west of Black Mesa.

5.3 PALEOZOIC SEDIMENTARY ROCKS

According to Miller (1970), Paleozoic(?) rocks and Precambrian or Mesozoic rocks, undifferentiated (pCu) are present within a quarter-mile buffer of the Project area and may belong to the Precambrian or Mesozoic metavolcanic rocks described in section 5.1. These rocks consist of deformed dolomite and sheared metavolcanic rocks (Miller, 1970); however, they remain poorly studied and may be correlative to other Paleozoic sediments or volcanic deposits in the immediate vicinity (Appendix B; Table 3).

Overlying the Paleozoic(?) metamorphic vitreous quartzite, medium to massively bedded, Unit 4 (pC4) is the Paleozoic(?) dolomite, tan, chert, massively bedded, Unit 5 (pC5) (Appendix B; Table 3). Unit 5 consists of tan, massively bedded carbonate rock, with irregularly distributed chert masses, and is approximately 400 feet thick; though, the true thickness is difficult to ascertain due to its poor bedding (Miller, 1970). The lower contact between the underlying Unit 4 and Unit 5 consists of a

bedding-fault, and the upper contact of Unit 5 is also faulted, abutting Unit 5 against the underlying Unit 3.

The Paleozoic(?) dolomite, tan, chert, massively bedded, Unit 5 (pC5), as well as the underlying metamorphic Units 4 and 3 (see previous section), have undergone extreme plastic deformation, in stark contrast to the brittle deformation of the rocks in the Quartzsite region (Miller, 1970). Unit 5 may be correlative or equivalent to the Mississippian-age Escabrosa Limestone, which consists of 415 feet of dolomite, limestone, cherty limestone of southeastern Arizona, which has yielded invertebrate fossils of *Syringopora surcularia* (tabulate coral) and *Vesiculophyllum* cf. *V. incrassatum* (rugose coral); however, Miller (1970) cautions that this correlation may not be positive.

The Paleobiology Database (PBDB) and the University of California Museum of Paleontology (UCMP) collections database contain no records of Paleozoic fossils within the alignment of the Project area or its vicinity (PBDB, 2018; UCMP, 2018). However, Paleozoic sedimentary rocks from northern, eastern, and southern Arizona in general have yielded numerous invertebrate fossil taxa, including corals, brachiopods, bryozoans, bivalves, gastropods, and echinoderms, as well as vertebrate fossils of shark (Chrondrichthyes) (PBDB, 2018; UCMP, 2018). Although dolomitized limestone typically does not yield well preserved fossils due to chemical alterations of the original calcium carbonate sediments and shelly fossils, Paleozoic(?) rocks and Precambrian or Mesozoic rocks, undifferentiated (pCu), and Paleozoic(?) dolomite, tan, chert, massively bedded, Unit 5 (pC5) may contain fossils, especially if correlative or equivalent to fossiliferous limestone units elsewhere in Arizona, as suggested by Miller (1970). Therefore, until these geologic units can be further assessed in the field, Paleozoic(?) rocks and Precambrian or Mesozoic rocks, undifferentiated (pCu), and Paleozoic(?) dolomite, tan, chert, massively bedded, Unit 5 (pC5) both have an unknown (PFYC U) paleontological potential.

5.4 CRETACEOUS AND JURASSIC SEDIMENTARY ROCKS

One Cretaceous and Jurassic sedimentary rock unit is mapped by Stone (1988-1990; 2006), consisting of the McCoy Mountains Formation, lower part, undivided (KJmlu) (Appendix B; Table 3). This geologic unit is present within the McCoy Mountains, Dome Rock Mountains, Plomosa Mountains, and Livingston Hills and is composed of tan quartzose sandstone and maroon mudstone and siltstone, correlative to the Member A, consisting of tan, fine- to medium-grained quartzite and minor chert- and quartzite-clast conglomerate interbedded with maroon mudstone and siltstone that yields calcareous nodules and lenses (Stone, 1988-1990). Conglomerate clasts of the McCoy Formation, lower part, undivided are also composed of volcanic rocks (Stone, 1988-1990). Stone (2006) further elaborates that the McCoy Mountains Formation is primarily sandstone and conglomerate, with minor shale, mudstone, and siltstone, and is largely or entirely of fluvial origin. Geologic mapping by Stone (1988-1990) divides the McCoy Mountains Formation, lower part, into five informal members (Members A through E), with the upper part contain seven additional informal members (Members F through L) (Stone, 2006). The maximum thickness of the lower part is approximately 7,710 feet (Stone 1988-1990).

According to the PBDB (2018) and the UCMP (2018) online database, no paleontological resources have been recovered from the McCoy Mountains Formation, lower part, undivided (KJmlu). However, sandstone, shale, mudstone, and siltstone layers of fluvial origin may contain scientifically significant paleontological resources. Therefore, the McCoy Mountains Formation, lower part, undivided (KJmlu) has a moderate (PFYC 3) paleontological potential.

5.5 MIOCENE AND OLIGOCENE SEDIMENTARY ROCKS

According to geologic mapping by Stone (2006), Miocene and Oligocene(?) fanglomerate, sedimentary breccia, and slide blocks, undivided (Tf), are exposed along Riverside Mountains and

consist of distinctly to indistinctly bedded, poorly to well sorted conglomerate and sandstone, consisting of angular to rounded clasts transported downslope. The total thickness of these deposits can be more than 1 kilometer thick (Stone, 2006). Additionally, another Miocene-age fanglomerate (Tf) unit is mapped by Sherrod et al. (1990) in the Vicksburg quadrangle and consists of poorly to moderately sorted, moderately to well-consolidated sand and gravel exposed the Basalt of Black Mesa (Tbm). Megabreccia and sedimentary breccia are also present near the base of the Tertiary stratigraphic section in the Eagletail Mountains and near the top of the stratigraphic section in the Big Horn Mountains (Richard et al., 1994) (Appendix B; Table 3).

Because these geologic units are not given formal formation names, they are not searchable within the PBDB and the UCMP online database. Fanglomerates and breccias form under high-energy conditions that would destroy any possible fossil material during transport and deposition. However, interbedded finer-grained deposits within the fanglomerate and breccias may contain scientifically significant paleontological resources. Therefore, until these geologic units can be further assessed in the field, Miocene and Oligocene(?) fanglomerate, sedimentary breccia, and slide block, undivided (Tf) and Miocene-age fanglomerate (Tf) have an unknown (PFYC U) paleontological potential.

According to geologic mapping by Stone (1988-1990), Tertiary(?) tufa (Tbt) deposits are present in the Blythe 30' x 60' quadrangle, and consist of thin, locally extensive sheets of white to light-gray limestone, derived from carbonate mineral precipitate from ambient temperature water. These tufa deposits have been noted to coat Miocene and older bedrock units and locally includes minor conglomerate deposits (Stone, 1988-1990). Tertiary(?) tufa (Tbt) deposits have a very low (PFYC 1) paleontological potential.

5.6 UNNAMED TERTIARY AND OLDER QUATERNARY SEDIMENTARY DEPOSITS

The Project area and its quarter-mile buffer are underlain by 14 unnamed Tertiary and older Quaternary (Pleistocene to Holocene) sedimentary deposits (Miller, 1970; Ort and Skotnicki, 1993; Richard et al., 1994; Sherrod et al., 1990; and Stone, 1988-1990; 2006), which have a moderate (PFYC 3) to low (PFYC 2) paleontological potential (Appendix B; Table 3).

Geologic units with a moderate (PFYC 3) paleontological potential are: Quaternary and Tertiary(?) alluvial fan and fluvial deposits (QTa), Quaternary and Tertiary dissected fan deposits (QTdf), Quaternary and Tertiary older alluvium (QToa), Pleistocene and/or Pliocene alluvial deposits of the Ehrenberg area (QTe), Pleistocene and Pliocene alluvial deposits of Mule Mountains (QTmm), late to early Pleistocene alluvium (Qm/Qo), and Pleistocene alluvial deposits of Palo Verde Mesa (Qpv), which are described below.

- Alluvial fan and fluvial deposits (QTa), Quaternary and Tertiary(?): Unconsolidated to weakly consolidated gravel and sand forming alluvial fans and terraces of the Colorado River; alluvial fans consist of angular, poorly sorted gravel and sand derived from nearby areas of high topographic relief; fluvial deposits consist of rounded, moderately to well sorted gravel and sand transported by the ancestral Colorado River, with crossbedded structures (Stone 1988-1990).

- Dissected fan deposits (QTdf), Quaternary and Tertiary: Consists of weakly consolidated fanglomerate gravel and sand, deeply dissected, forming longitudinal hills near mountain slopes (Stone, 1988-1990).

- Older alluvium (QToa), Quaternary and Tertiary: Within the Quartzsite quadrangle, consists of unconsolidated to poorly consolidated older alluvium, poorly sorted; distinguished from younger alluvium only by its topographic expression and degree of dissection (Miller, 1970).

- Alluvial deposits of the Ehrenberg area (QTe), Pleistocene and/or Pliocene: Heterogeneous deposits of sand and gravel, dissected; well-exposed on cliff faces and edge of the Colorado River flood plain and its tributary washes; consists of weakly to moderately consolidated, light gray to brownish-gray, fine- to coarse-grained sandstone, planar laminated to cross stratified; calcareous cementation of sand grains; sandstone unit contains pebbles and conglomeratic lenses, the latter of which can be several feet thick, of locally derived rounded and angular gravel (Stone, 2006).

- Alluvial deposits of Mule Mountains (QTmm), Pleistocene or Pliocene: Characterized by weakly to moderately consolidated sand and pebbly sand deposits, interbedded with locally derived gravel deposits; light gray, tan, and light reddish-brown, fine- to coarse-grained, well to moderately sorted, thin bedded, and locally cross-bedded; sand clasts contain rounded river pebbles of quartzite and chert; unit is deeply dissected (Stone, 2006).

- Alluvium (Qm/Qo), late to early Pleistocene: Middle to older alluvial deposits consisting undivided younger and older middle alluvium (Qm) and older alluvial deposits of coarse gravel and cobbles to boulders, with minor amounts of fine-grained sediments (Qo). Older alluvium commonly forms a 1-5 meters thick veneer unconformably overlying older basin fill or bedrock; both deposits are deeply dissected (Richard et al., 1994).

- Alluvial deposits of Palo Verde Mesa (Qpv), Pleistocene: Consists of unconsolidated to weakly consolidated deposits of sand, pebbly sand, silt, and clay exposed along the scarp of the Paleo Verde Mesa near the flood plain of the Colorado River; scarp consists of 20 to 30 meters thick exposures, with an upper, slope-forming unit of tan to light gray, sandy and pebbly alluvium and a lower, cliff-forming unit of light reddish-brown, interbedded fine-grained sand, silt, and clay (Stone, 2006).

Geologic units with a low (PFYC 2) paleontological potential are Quaternary alluvium and talus (Qat), Quaternary alluvium of modern washes (Qw), Quaternary surficial deposits (Qs), Holocene and late Pleistocene talus (Qt), Holocene and late Pleistocene alluvium/eolian deposits (Qyc/Qye/Qy), Holocene and Pleistocene alluvium (Qa), and Holocene and Pleistocene alluvial-fan and alluvial-valley deposits, Unit 3 (Qa3), which are described below.

- Alluvium and talus (Qat), Quaternary: Undifferentiated in the Quartzsite quadrangle; consists of heterogenous mixture of angular, unsorted boulders, cobbles, sand, and fine-grained sediments (Miller, 1970).

- Alluvium of modern washes (Qw), Quaternary: Unconsolidated, locally derived gravel and sand (Stone, 1988-1990).

- Surficial deposits (Qs), Quaternary: Consists of unconsolidated alluvium, colluvium, talus, sand, and gravel in modern washes; surficial sediments consist of unconsolidated to poorly consolidated gravel, sandy gravel, and sand, with silt and boulders; boulders and disaggregated rock rubble are also present around steep slopes (Ort and Skotnicki, 1993).

- Talus (Qt), Holocene and late Pleistocene: Consisting of unconsolidated, poorly sorted, angular gravel to boulder-sized sediments along the sides of steep slopes (Richard et al., 1994).

- Alluvium/eolian deposits (Qyc/Qye/Qy), Holocene and late Pleistocene: Active alluvial deposits consist of primarily sand and silt confined to active and recently active (Holocene-age) deposits of major drainages; eolian deposits consist of young (Holocene-age) fine-grained, non-indurated sand; and young alluvium (Holocene- to late Pleistocene-age) consists

of surfaces primarily underlain by well-sorted sand and stilt, with occurrences of fine gravel, slightly to highly dissected by active drainages (Richard et al., 1994).

- Alluvium (Qa), Holocene and Pleistocene: Poorly to moderately sorted, unconsolidated to weakly consolidated sand and gravel; alluvial fans that are deeply dissected, especially in intermontane areas, streams, and terraces along active washes of the New Water Mountains (Sherrod et al., 1990).

- Alluvial-fan and alluvial-valley deposits, Unit 3 (Qa3), Holocene and Pleistocene: Consists of alluvial-fan deposits of gravel and sand, slightly to heavily dissected, with desert pavement, consisting of moderately to highly compacted, angular to subangular rock fragments; dark brown to black desert varnish on some clasts, with relatively abundant granitic gravel with no varnish; pavement surfaces contain networks of sandy channels, varying in depth (Stone, 2006).

According to the UCMP online database (2018) numerous fossils have been recovered from unnamed Tertiary and Quaternary deposits throughout Arizona and California. From Maricopa County, Arizona, fossil tortoise (*Gopherus huecoensis*) and unspecified invertebrates have been recorded from unnamed Tertiary-age (Pliocene) deposits. From La Paz County, Arizona near Quartzsite, fossil gastropod (*Epiphragmophora hutsoni*) has been recorded from Quaternary to Recent deposits. Elsewhere in Arizona, Yavapai County has yielded Miocene-age horse (Hipparionini), oreodont (*Merychyus minimus*), and indeterminant mammal (Mammalia). From Mohave County, numerous fossil vertebrates have been recorded, including bird (Aves), fox (*Vulpes*), carnivoran mammals (Fissipeda), horse (*Pliohippus*, Hipparionini), and eutherian mammal (Eutheria), as well as fossil plants of Miocene-age. Within Coconino County, extinct hyena (*Chasmaporthetes ossifragus*), giant marmot (*Paenemarmota barbouri*), and tortoise (*Gopherus huecoensis*) have been recorded from Pliocene-age deposits. Navajo County has yielded Pleistocene-age fossil localities, including bighorn sheep (*Ovis canadensis*) and unspecified vertebrate and invertebrate fossils. From an unspecified county within Arizona, a fossil locality yielded Pleistocene-age horse (*Equus major*). The UCMP (2018) also contains records of fossil vertebrates and invertebrates of Plio-Pleistocene-age recorded within Riverside County, California, with one locality yielded unspecified vertebrate fossils from near Blythe.

Based on the widely spread, but scientifically significant, vertebrate, invertebrate, and plant fossils of Tertiary- to Quaternary-age, excluding late Pleistocene-age to Holocene-age deposits, from southwestern Arizona and southeastern California, these geologic units have a moderate (PFYC 3) paleontological potential. Late Pleistocene- to Holocene-age Quaternary sediments are likely too young to contain paleontological resources near the surface; thus, these geologic units have a low (PFYC 2) paleontological potential.

5.7 UNNAMED HOLOCENE SEDIMENTARY DEPOSITS

The Project area is underlain by four unnamed Holocene-age sedimentary deposits, all of which have a low (PFYC 2) potential to produce scientifically important paleontological resources (Appendix B; Table 3).

Holocene-age (less than 11,000 years old) sediments are typically too young to contain fossilized material (Society of Vertebrate Paleontology [SVP], 2010), but they may overlie sensitive older (e.g., Pliocene- and Pleistocene-age) deposits at variable depth. Holocene-age deposits are assigned a low (PFYC 2) paleontological potential at the surface using BLM (2016) guidelines; however, they have an unknown paleontological potential in the subsurface since there is potential for these deposits to be conformably underlain by older, paleontologically sensitive geologic units.

The following Holocene-age sedimentary deposits are present within the Project area (Stone, 2006):

- Alluvial-fan and alluvial-valley deposits (Qa6), Holocene: Characterized by a lack of desert varnish, fine-grained in size, consisting of sand, pebbly sand, and sandy pebble-gravel, with thin accumulations of eolian sand not mapped are present within this unit; proximal to mountain ranges, deposits consist of coarse-grained, unvarnished gravel deposits that grade downslope to fine-grained deposits; also includes minor washes and channels comparable to Holocene-age alluvium of modern washes (Qw) (Stone, 2006).

- Alluvium of modern Colorado River flood plain (Qr), Holocene: Consists of unconsolidated clay, silt, and sand; presently covered by agricultural land or thick vegetation (Stone, 2006).

- Eolian sand (Qs), Holocene: Consists of unconsolidated sand dunes and sheets, partially stabilized by vegetation (Stone, 2006).

- Alluvium of modern washes (Qw), Holocene: Characterized as unconsolidated, angular to subangular gravel and sand transported from local mountain ranges, with boulder- to cobble-sized clasts in wash deposits near mountain ranges, grading downstream to pebble and sand deposits; wash sediments grade laterally and downstream into alluvial sand and gravel (Stone, 2006).

Table 3. Paleontological Potential (PFYC) by Geologic Unit

Geologic Unit	Map Abbreviation	Age	Paleontological Potential (PFYC)
Slaty metavolcanic rocks	Xm	Proterozoic	Class 1 – Very Low
Granitoid	Yg	Middle Proterozoic	Class 1 – Very Low
Quartz monzonite	pCqm	Precambrian	Class 1 – Very Low
Metavolcanic rocks	pCv	Precambrian or Mesozoic	Class 1 – Very Low
Paleozoic(?) rocks and Precambrian and Mesozoic rocks, undifferentiated	pCu	Paleozoic?	Class U – Unknown
Quartz-albite-muscovite-chlorite schist; meta-tuffaceous rock, Unit 3	pC3	Paleozoic?	Class 1 – Very Low
Vitreous quartzite, medium to massively bedded, Unit 4	pC4	Paleozoic?	Class 1 – Very Low
Dolomite; tan, chert, massively bedded, Unit 5	pC5	Paleozoic?	Class U – Unknown
Volcanic rocks	Jv	Jurassic	Class 1 – Very Low
Volcanic rocks of the Dome Rock sequence	Jv	Jurassic	Class 1 – Very Low
Volcanic rocks of the Dome Rock sequence, upper bedded unit	Jvbu	Jurassic	Class 1 – Very Low
McCoy Mountains Formation, lower part, undivided	KJmlu	Cretaceous or Jurassic	Class 3 - Moderate
Volcanic rocks of Bear Hills	Tbh	Miocene and Oligocene?	Class 1 – Very Low
Fanglomerate, sedimentary breccia, and slide blocks	Tf	Miocene and Oligocene?	Class U – Unknown
Andesite	Ta	Miocene or Oligocene	Class 1 – Very Low
Lower basaltic volcanic rocks	Tbl	Miocene or Oligocene	Class 1 – Very Low
Middle basalt unit	Tbm	Miocene	Class 1 – Very Low
Felsic volcanic rocks	Tf	Miocene	Class 1 – Very Low
Basalt of New Water Mountains	Tnw	Miocene	Class 1 – Very Low

Geologic Unit	Map Abbreviation	Age	Paleontological Potential (PFYC)
Fanglomerate	Tf	Miocene	Class U – Unknown
Tufa	Tbt	Tertiary?	Class 1 – Very Low

Eolian sand	Qs	Holocene	Class 2 - Low
Alluvium of modern washes	Qw	Holocene	Class 2 - Low
Water	H2O	N/A	Class W - Water

6.0 RESEARCH GOALS

The sediments in the Project area have the potential to contain scientifically important fossil remains that could be unearthed during construction in areas where native sediments of moderate or unknown paleontological potential are disturbed, either at the surface or in the subsurface. The fossils found in southwestern Basin and Range and eastern Colorado Desert geomorphic provinces provide critically important paleoecological and paleoenvironmental data. They provide direct

evidence of the composition and phylogenetic diversity of the paleobiota, paleobiologic features of individual taxa, and evolutionary relationships of the fauna and flora through time. In combination, the fossil assemblages at individual localities, together with the sediments in which they are preserved, also provide indirect evidence of the nature of paleoclimates and paleoenvironments, and importantly, the geographic distributions of different paleoenvironment types, such as the fluctuating ocean shorelines, locations of inland lakes and swamps, upland habitats, and lowland habitats, such as basin floors. It is important to bear in mind that the type and scope of research that can be accomplished by the receiving institution or others, is entirely dependent upon the types and numbers of fossils that are discovered and their stratigraphic and sedimentological context. If no fossils are discovered, then no paleontological research will be possible.

The recovery of fossils from Project excavations as the result of implementation of the mitigation measures outlined below and in Appendix E, would add to existing paleontological data and help better document the prehistory of southwestern Arizona, where fossil locality data is scant, and of southeastern California. The recovered fossils will provide information that may be useful in more accurately and precisely determining the ages of the sedimentary units in which they were preserved depending upon the biostratigraphic utility of the fossil specimens and potential for radiometric dating. Depending upon the types of fossils that are recovered from Project excavations and the quality of their preservation, the existing fossil record of Arizona and California will be enhanced by the addition of new specimens of known taxa, the discovery of taxa that have not been previously reported from the general area, and possibly the discovery of previously unknown taxa. In combination, the fossil assemblage from the Project area would have the potential to add new paleoecologic and paleoenvironmental information to our existing knowledge of the Paleozoic to Holocene of southwestern Arizona and southeastern California.

7.0 MITIGATION AND FOSSIL RECOVERY PLAN

The mitigation and fossil recovery plan is designed to mitigate effects to paleontological resources in accordance with NEPA, and to reduce impacts on paleontological resources to below the level of significance pursuant to CEQA. The proposed mitigation plan consists of the following ten components that will be more fully described below:

1) Construction Monitoring
2) Fossil Recovery
3) Screenwashing of Bulk Matrix Sampling
4) Laboratory Preparation, Analysis, and Museum Pre-Curation
5) Reporting
6) Significance Criteria
7) Staffing and Schedule
8) Unanticipated Discoveries
9) Curation
10) Permits

7.1 CONSTRUCTION MONITORING

A BLM approved Project Paleontologist will attend the Project's pre-construction meeting to discuss mitigation concerns, field procedures for paleontology, safety protocols, and establish communications. Following the meeting, a site specific health and safety plan (HASP) with emergency contact information should be prepared. All monitoring personnel will be required to review the HASP prior to entry to the site and shall have a copy in their vehicle at all times. Prior to any project excavation, a Worker Environmental Awareness Program (WEAP) training for all earth moving personnel and their supervisors will be presented to inform them of the possibility for fossil

discoveries, as required by MM CUL-CEQA-3. The program will inform personnel of the types of fossils that may be encountered, the types of lithologies in which fossils could be preserved, the monitor's authority to temporarily halt or redirect work to evaluate discoveries, procedures to be followed if potential fossils are unearthed at the project site, and the penalties for disturbing paleontological resources.

In accordance with APM PALEO-01, BMP PALEO-02, and MM CUL-CEQA-3 a paleontological monitor will conduct full-time monitoring during all excavations impacting native sediments with moderate paleontological potential (PFYC 3), including Cretaceous or Jurassic McCoy Mountains Formation, lower part, undivided (KJmlu); Quaternary and Tertiary(?) alluvial fan and fluvial deposits (QTa); Quaternary and Tertiary dissected fan deposits (QTdf); Quaternary and Tertiary older alluvium (QToa); Pleistocene and/or Pliocene alluvial deposits of the Ehrenberg area (QTe); Pleistocene and/or Pliocene alluvial deposits of the Mule Mountains (QTmm); late to early Pleistocene alluvium (Qm/Qo); and Pleistocene alluvial deposits of Palo Verde Mesa (Qpv) (see Tables 2 and 3; see Appendix C).

Spot checking will be conducted daily in areas with unknown paleontological potential (PFYC U), including Paleozoic(?) rocks and Precambrian and Mesozoic rocks, undifferentiated (pCu); Paleozoic(?) dolomite; tan, chert, massively bedded, Unit 5 (pC5); Miocene and Oligocene(?) fanglomerate, sedimentary breccia, and slide blocks (Tf); and Miocene fanglomerate (Tf) (see Tables 2 and 3; see Appendix C). If sediments are deemed to be non-conducive to fossil preservation (e.g., high energy [very coarse grained], heavily oxidized [indicating long sediment exposure at the surface], etc.), then monitoring in those areas may be reduced at the discretion of the Project Paleontologist in consultation with the BLM.

Construction activities will be spot-checked when excavation depths exceed 10 feet in areas mapped as low paleontological potential (PFYC 2) geologic units to check for the presence of underlying geologic units of higher paleontological potential, including Quaternary alluvium and talus (Qat); Quaternary alluvium of modern washes (Qw); Quaternary surficial deposits (Qs); Holocene and late Pleistocene talus (Qt); Holocene and late Pleistocene alluvium/eolian deposits (Qyc/Qye/Qy); Holocene and Pleistocene alluvium (Qa); Holocene and Pleistocene alluvial-fan and alluvial-valley deposits, Unit 3 (Qa3); Holocene alluvial-fan and alluvial-valley deposits, Unit 6 (Qa6); Holocene alluvium of modern Colorado River flood plain (Qr); Holocene eolian sand (Qs); and Holocene alluvium of modern washes (Qw) (see Tables 2 and 3; see Appendix C). If it is subsequently determined that paleontologically sensitive deposits will not be impacted by Project activities, then monitoring in those areas may be reduced at the discretion of the Project Paleontologist in consultation with the BLM.

Paleontological monitoring will not be conducted for excavations impacting very low paleontological potential (PFYC 1) Proterozoic slaty metavolcanic rocks (Xm); middle Proterozoic granitoid (Yg); Precambrian quartz monzonite (pCqm); Precambrian and Mesozoic Metavolcanic rocks (pCv); Paleozoic(?) quartz-albite-muscovite-chlorite schist; metatuffaceous rock, Unit 3 (pC3); Paleozoic(?) vitreous quartzite, medium to massively bedded, Unit 4 (pC4); Jurassic volcanic rocks (Jv); Jurassic volcanic rocks of the Dome Rock sequence (Jv); Jurassic volcanic rocks of the dome rock sequence, upper bedded unit (Jvbu); Miocene and Oligocene(?) volcanic rocks of Bear Hills (Tbh); Miocene or Oligocene andesite (Ta); Miocene and Oligocene lower basaltic volcanic rocks (Tbl); Miocene middle basalt unit (Tbm); Miocene felsic volcanic rocks (Tf); Miocene basalt of New Water Mountains (Tnw); Tertiary(?) tufa (Tbt); Tertiary older hornblende-biotite andesite (Ta); Quaternary or Tertiary hornblende-biotite andesite (QTa); and Quaternary or Tertiary basalt of Black Mesa (QTbu) (see Tables 2 and 3; see Appendix C).

Paleontological resource monitoring of construction excavations involves field inspections of cut slopes, trenches, spoils piles, and all graded surfaces in accordance with project safety requirements for occurrences of freshly exposed fossil remains. The primary responsibility of paleontological

monitors should always be to adhere to all project safety requirements, and to only inspect and evaluate fossil discoveries when conditions are safe to do so. If a fossil is discovered by a monitor in a construction excavation, the monitor must immediately notify the equipment operator and/or site project manager to stop work, and then mark the area surrounding the site with flagging until the discovery can be fully explored and evaluated. The paleontological monitor shall notify the Project Paleontologist, who shall notify DCRT and the BLM via a phone call followed up by written documentation, photographs, and significance determination. If the fossil is collected, a letter to this effect will be submitted to the BLM along with a locality form. If it is a non-significant fossil discovery, the Project Paleontologist will notify the resident engineer and work may resume. Construction activities in the immediate vicinity of the site shall stop until authorization for work to continue is provided by the Project Paleontologist. If a concentration of fossils is found, the area will be flagged and the site project manager and Project Paleontologist will be notified to determine necessary action. Any action will be communicated to BLM.

All paleontological monitors will be trained in commercially reasonable construction site safety protocols prior to entering any construction site. Additional safety training may be provided to paleontological monitors by the contractor and required prior to entry to the project site. Paleontological monitors should always wear all required project specific personal protective equipment (PPE), review and retain a copy of a site-specific health and safety plan, and attend any required safety meetings. Monitors should be equipped with flagging, survey stakes, and tools for fossil exploration and recovery including x-acto knives, awls, brushes, picks, chisels and shovels. Other essential tools for monitors include chemical preservatives such as vinac or butvar, cyanoacrylate glue, specimen containers such as vials and plastic bags, a GPS receiver, a field notebook, data recording forms, a digital camera, and a plaster kit. All paleontological monitoring will be conducted by qualified monitors approved by the BLM under the direction of a Project Paleontologist who meets the criteria outlined in BMP PALEO-02 and MM CUL-CEQA-3.

Monitors will prepare daily monitoring logs that will be submitted to the Project Paleontologist.

7.2 FOSSIL RECOVERY

When scientifically significant fossil discoveries are made by construction monitors, they will be quickly and professionally explored and evaluated in order to minimize construction delays. Additional paleontologists should be brought to assist with the recovery as needed. Recoveries may consist of the relatively rapid removal of small isolated fossils from an active cut, to hand-quarrying of larger fossils over several hours, to excavations of large fossils or large numbers of smaller fossils from a bone bed over several days. The duration of each excavation is determined by the size, preservation, and number of fossils at each locality, and all excavations must be carried out in consultation with the site project manager.

Paleontological resources will be mapped, photographed, recorded, and collected for later documentation that will be included in the final technical report. At each paleontological locality, data recorded will minimally include the field number, date of discovery and date of collection, geographic coordinates, elevation, formation, stratigraphic provenance, lithologic description of sediment that produced the fossil(s), type(s) of fossils and type(s) of element(s), taphonomic and paleoenvironmental interpretations, associations with other fossils, photograph(s), and collector(s). All fossils must be properly labeled prior to removal from the locality where they were discovered. All scientifically important fossils should be recovered and fully documented within a detailed stratigraphic framework as construction conditions and safety considerations permit. Significance criteria and recovery procedures are discussed below.

7.3 SCREENWASHING OF BULK MATRIX SAMPLES

Scientifically significant fossils of small or even microscopic size consisting of vertebrates, invertebrates, plants, or trace fossils, may be discovered during the monitoring program. At the discretion of the Project Paleontologist in consultation with the BLM and DCRT, bulk matrix samples should be collected from such localities if it is determined that the fossils could yield scientifically important information. Such samples would be transported to the paleontological laboratory for soaking, re-drying, washing, and picking/sorting in order to fully document the microfaunal and microfloral diversity. The Society of Vertebrate Paleontology (SVP) guidelines (2010) recommend a minimum sample size of 2,000 pounds. However, in practice, the amount of matrix sampled should depend on the abundance or lack thereof of fossils preserved within the matrix (Murphey et al., 2014), which is typically ascertained by wet-screening of 20-pound test samples in the field. Sampling should be done in such a way as to prevent or minimize interference with construction. For example, construction equipment can often expedite the sampling process by assisting with the removal of matrix from the excavation and establishment of a stockpile in an area removed from construction equipment in order to permit the paleontological monitor to transfer the matrix from the stockpile to buckets and remove them from the site.

7.4 LABORATORY PREPARATION, ANALYSIS, AND MUSEUM PRE-CURATION

Following preparation, all fossils should be inventoried as part of the pre-curation process and then identified to taxon and element by a technical specialist, as necessary. Pre-curation involves the assignment of locality numbers and preparation of fossil locality forms, the assignment of unique catalogue numbers to each specimen, the application of specimen numbers to each fossil specimen, entry of specimen data into a computerized database, and the placement of each fossil into archival vials, trays or cradles, depending upon its size. The inventoried collection should be transferred to a paleontological repository along with all associated data. Fossil identification should be to the lowest taxonomic possible level (ideally Family or lower). All fossils should be labeled with their field locality number, which is traceable to the metadata including collector, date of collection, UTM coordinates (NAD83 datum), elevation, lithologic description, taxon, and element description at a minimum. The properly inventoried fossil collection should then be analyzed taxonomically, taphonomically, and/or biostratigraphically. The types of analyses that can be performed will be dependent upon the nature of the fossil collection. All data, including the results of the analysis, should be compiled along with the fossil specimen inventory and detailed paleontological locality forms, maps and photos for inclusion in the paleontological monitoring report. All scientifically significant fossils collected during the monitoring program will be transferred to the NHMLA, the current repository listed on Paleo Solutions' California and Arizona BLM Paleontological Use Permits, or another BLM-approved repository, where those fossils deemed to be appropriate for curation by the museum will be accessioned and permanently housed so that they will be available for scientific research, education, and display. Upon receipt of the fossil collection, a signed repository receipt form will be issued, and a copy will be appended in the final mitigation report.

7.5 REPORT

A confidential paleontological mitigation report will be prepared within 90 days of the completion of field work. The report shall include dates of field work, results of monitoring, fossil analysis, significance evaluation, conclusions, locality forms, and an itemized list of specimens. A signed confidential copy of the paleontological monitoring report shall be submitted to BLM, and approval will be requested to release the confidential report to CPUC. A signed non-confidential copy of the report shall be submitted to DCRT. Additionally, if construction monitoring results in the discovery

and recovery of paleontological resources, a copy of the report will be submitted along with the recovered fossils to the NHMLA (or another appropriate fossil repository). The report will be prepared according to BLM specifications, which includes two (2) confidential hardcopies sent to the BLM. Copies of the report in electronic (PDF) format will be sent to other agencies and DCRT. BLM approval of this report will signify the completion of the paleontological mitigation program.

7.6 SIGNIFICANCE CRITERIA

For the purpose of this project, scientifically significant fossils are generally defined as those that are identifiable to taxon and/or element, and thus are potentially useful for scientific research purposes. However, unidentifiable fossils may also be collected if they are potentially useful to the overall analysis (see Section 3). For example, an unidentifiable bone fragment of late Pleistocene age may be suitable for radiocarbon dating depending upon the preservation state of the bone. Rock or sediment samples may also be collected if they provide information necessary for depositional and paleoenvironmental interpretations.

Paleontological monitors should always use caution when making decisions about significance in the field, and collect fossils if they are unsure of their significance. For example, when monitoring construction sites, it is often difficult to see the full extent of a fossil being recovered because it is collected partially encased in sedimentary matrix and as a result it may not be possible to determine the significance of a fossil specimen until it has been partially prepared. Generally, bone fragments with no articular surfaces that are not associated with other fragments to which they might be re-assembled in the laboratory should not be collected, or should be discarded if they are found to be non-significant once they have been partially prepared in the laboratory.

7.7 UNANTICIPATED DISCOVERIES

Prior to earthmoving activities, the paleontological monitor shall inform construction personnel of the possibility for fossil discoveries, and will instruct personnel to immediately inform their supervisor if any bones or other potential fossils are unearthed at the Project site and a paleontological monitor is not present. In such a case, workers should immediately cease all activity within a 50-foot radius of the discovery site until a paleontologist can be mobilized to the Project site to examine and evaluate the find. Work may not resume in the discovery area until it has been authorized by the Project Paleontologist.

7.8 STAFFING AND SCHEDULE

A construction schedule has not been determined at this time, but the project is expected to start in 2019. The construction manager will notify the paleontological contractor at least 24 hours in advance (and up to 48 hours in advance when possible), when a monitor is needed on the construction site. It is not possible to predict the number and type(s) of fossils that may be discovered and recovered during construction.

All paleontological monitoring will be conducted by qualified monitors approved by the BLM under the direction of a Project Paleontologist who meets the criteria outlined in BMP PALEO-02.

7.9 CURATION

If significant paleontological resources are recovered, they will be curated at the NHMLA, the current repository listed on Paleo Solutions' California and Arizona BLM Paleontological Use Permits, or another BLM-approved repository. Storage fees will be paid for by the project owner, not the BLM, CPUC, or paleontological consultant. A curation agreement for NHMLA is attached as Appendix D.

7.10 PERMITS

All paleontological work will be conducted under California BLM Paleontological Use Permit CA-16-03P (Expiration March 16, 2019) and Arizona BLM Paleontological Use Permit AZ-000669 (Expiration August 13, 2021) (Appendix A). Fieldwork Authorizations will be obtained from the BLM Palm Springs-South Coast and Yuma Field Offices. Qualified Paleontologist, Geraldine Aron, M.S., will oversee all work as the permit holder and administer for the Project in collaboration with Paleo Solutions' Principal Investigator Courtney Richards, M.S., with oversight by Vertebrate Paleontologist Paul Murphey, Ph.D.

APPENDIX A: BLM PALEONTOLOGICAL USE PERMITS

United States Department of the Interior
BUREAU OF LAND MANAGEMENT
Arizona State Office
One North Central Avenue, Suite 800
Phoenix, Arizona 85004-4427
www.blm.gov/az/

AUG 28 2018

8270 (9300)
Permit No. AZ-000669

Paleo Solutions
Attention: Geraldine Aron
911 S. Primrose Avenue, Unit N
Monrovia, CA 91016

Dear Ms. Aron:

Enclosed is a permit to conduct paleontological investigations on land administered by the Bureau of Land Management (BLM). Your permit number is AZ-000669. Please include it in any permit-related correspondence. Your permit is for survey/reconnaissance and limited surface collection of paleontological materials for 3 years, beginning August 13, 2018.

The Special Conditions attached to your permit contain permitting requirements. We would like to call your attention to the following three requirements, in particular:

1. Prior to beginning each season's field work, you must contact the Field Manager(s) who administers the area in which you will be working and obtain their signature on a copy of your permit. Maps and the addresses of BLM Arizona Field Offices are included with this letter.

2. A completed Paleontological Locality Form (8270-3) must be submitted for each location where fossils are collected or recorded.

3. Annual and final reports must be submitted as described in the Special Conditions.

If your work plans or any other stipulations of your permit change, please notify this office immediately to obtain appropriate modifications to your permit. If you have questions about our permitting requirements, please contact Matt Basham, Deputy Preservation Officer, at 602-417-9216, or by email at mbasham@blm.gov.

Sincerely,

Jody L. Weil
Deputy State Director

Geraldine Aron
Paleo Solutions, Inc.
911 S. Primrose Ave, Unit N
Monrovia, CA 91016

Dear Ms. Aron:

The Bureau of Land Management (BLM) is pleased to issue a 3-year Scientific Paleontological Permit (*CA-16-03P*) to Paleo Solutions, Inc. for use on Public Lands managed by California BLM as specified in your permit. This permit is issued under the authority of the Federal Land Policy and Management Act (FLPMA) and the Antiquities Act of 1906. Keep a copy with you at all times in the field.

This permit authorizes the permit holder to conduct and collect paleontological resources pertaining to both scientific research and commercial projects. BLM would like to emphasize a few points. First, this permit assigns to your firm the responsibility to submit reports and other documents in a timely fashion and such submittal will be a major point of review of your firm's performance under this permit. Second, you are required to contact the appropriate Field Office to obtain a Field Use Authorization before you begin any fieldwork. Please allow the Field Office sufficient lead-time to process your application for a Field Use Authorization. The Field Office may impose additional conditions and stipulations at that time. Third, please be mindful that it is your firm's responsibility to ensure assignment of supervisory field personnel (crew chiefs) to projects that have at least four months' local experience and who otherwise meet the standards of the Bureau.

Our office is enclosing a map of California BLM Field Offices with phone numbers of cultural heritage staff and a copy of your permit with attached National special permit conditions. BLM draws your attention to these stipulations and encourages you to read and understand them. Please sign page 5, as indicated, and **return a copy of this signature page to the California BLM State Office within 30 days of your receipt of the permit**. Your permit will be valid after your signature is received.

Should you have any questions contact James Barnes at email jjbarnes@blm.gov or by phone 916-978-4676.

Sincerely,

Tom Pogacnik
Deputy State Director
Natural Resources Division

13. Permittee is required to observe the listed standard permit conditions and the special permit conditions attached to this permit.	
14. Signature and title of approving official Tom Pogacnik, Deputy State Director, Natural Resources Division	15. Date 03/17/2016

15. Standard Permit Conditions

a. This permit is subject to all applicable provisions of 43 CFR Part 3, 43 CFR 7, and 25 CFR 262, and applicable departmental and bureau policies and procedures, which are made a part hereof.

b. The permittee and this permit are subject to all other Federal, State, and local laws and regulations applicable to the public lands and resources.

c. This permit shall not be exclusive in character, and shall not affect the ability of the land managing bureau to use, lease or permit the use of lands subject to this permit for any purpose.

d. This permit may not be assigned.

e. This permit may be suspended or terminated for breach of any condition or for management purposes at the discretion of the approving official, upon written notice.

f. This permit is issued for the term specified in 11 above.

g. Permits issued for a duration of more than one year must be reviewed annually by the agency official and the permittee.

h. The permittee shall obtain all other required permit(s) to conduct the specified project.

i. Archeological project design, literature review, development of the regional historic context framework, site evaluation, and recommendations for subsequent investigations must be developed with direct involvement of an archeologist who meets the Secretary of the Interior's Standards for Archeology and Historic Preservation; fieldwork must be generally overseen by an individual who meets the Secretary of the Interior's Standards for Archeology and Historic Preservation.

j. Permittee shall immediately request that the approving official (14. above) make a modification to accommodate any change in an essential condition of the permit, including individuals named and the nature, location, purpose, and time of authorized work, and shall without delay notify the approving official of any other changes affecting the permit or regarding information submitted as part of the application for the permit. Failure to do so may result in permit suspension or revocation.

k. Permittee may request permit extension, in writing, at any time prior to expiration of the term of the permit, specifying a limited, definite amount of time required to complete permitted work.

l. Any correspondence about this permit or work conducted under its authority must cite the permit number. Any publication of results of work conducted under the authority of this permit must cite the approving bureau and the permit number.

m. Permittee shall submit a copy of any published journal article and any published or unpublished report, paper, and manuscript resulting from the permitted work (apart from those required in items q. and s., below), to the approving official and the appropriate official of the approved curatorial facility (item 12 above).

n. Prior to beginning any fieldwork under the authority of this permit, the permittee, following the affected bureau's policies and procedures, shall contact the field office manager responsible for administering the lands involved to obtain further instructions.

o. Permittee may request a review, in writing to the official concerned, of any disputed decision regarding inclusion of specific terms and conditions or the modification, suspension, or revocation of this permit, setting out reasons for believing that the decision should be reconsidered.

p. Permittee shall not be released from requirements of this permit until all outstanding obligations have been satisfied, whether or not the term of the permit has expired. Permittee may be subject to civil penalties for violation of any term or condition of this permit.

15. Standard Permit Conditions (continued)

q. Permittee shall submit a preliminary report to the approving official within a timeframe established by the approving official, which shall be no later than 6 weeks after the completion of any episode of fieldwork, setting out what was done, how it was done, by whom, specifically where, and with what results, including maps, GPS data, an approved site form for each newly recorded archeological site, and the permittee's professional recommendations, as results require. If other than 6 weeks, the timeframe shall be specified in Special Permit Condition p. Depending on the scope, duration, and nature of the work, the approving official may require progress reports, during or after the fieldwork period or both, and as specified in Special Permit Condition r.

r. Permittee shall submit a clean, edited draft final report to the agency official for review to insure conformance with standards, guidelines, regulations, and all stipulations of the permit. The schedule for submitting the draft shall be determined by the agency official.

s. Permittee shall submit a final report to the approving official not later than 180 days after completion of fieldwork. Where a fieldwork episode involved only minor work and/or minor findings, a final report may be submitted in place of the preliminary report. If the size or nature of fieldwork merits, the approving official may authorize a longer timeframe for the submission of the final report as specified in Special Permit Condition q.

t. Two copies of the final report, a completed NTIS Report Documentation Page (SF-298), available at http://www.ntis.gov/pdf/rdpform.pdf, and a completed NADB-Reports Citation Form, available at http://www.cr.nps.gov/aad/tools/nadbform_update.doc, will be submitted to the office issuing the permit.

u. The permittee agrees to keep the specific location of sensitive resources confidential. Sensitive resources include threatened species, endangered species, and rare species, archeological sites, caves, fossil sites, minerals, commercially valuable resources, and sacred ceremonial sites.

v. Permittee shall deposit all artifacts, samples and collections, as applicable, and original or clear copies of all records, data, photographs, and other documents, resulting from work conducted under this permit, with the curatorial facility named in item 12, above, not later than 90 days after the date the final report is submitted to the approving official. Not later than 180 days after the final report is submitted, permittee shall provide the approving official with a catalog and evaluation of all materials deposited with the curatorial facility, including the facility's accession and/or catalog numbers.

w. Permittee shall provide the approving official with a confirmation that museum collections described in v. above were deposited with the approved curatorial facility, signed by an authorized curatorial facility official, stating the date materials were deposited, and the type, number and condition of the collected museum objects deposited at the facility.

x. Permittee shall not publish, without the approving official's prior permission, any locational or other identifying archeological site information that could compromise the Government's protection and management of archeological sites.

y. For excavations, permittee shall consult the OSHA excavation standards which are contained in 29 CFR §1926.650, §1926.651 and §1926.652. For questions regarding these standards contact the local area OSHA office, OSHA at 1-800-321-OSHA, or the OSHA website at http://www.osha.gov.

z. Special permit conditions attached to this permit are made a part hereof.

16. Special Permit Conditions

☒ a. Permittee shall allow the approving official and bureau field officials, or their representatives, full access to the work area specified in this permit at any time the permittee is in the field, for purposes of examining the work area and any recovered materials and related records.

☒ b. Permittee shall cease work upon discovering any human remains and shall immediately notify the approving official or bureau field official. Work in the vicinity of the discovery may not resume until the authorized official has given permission.

☒ c. Permittee shall backfill all subsurface test exposures and excavation units as soon as possible after recording the results, and shall restore them as closely as reasonable to the original contour.

☒ d. Permittee shall not use mechanized equipment in designated, proposed, or potential wilderness areas unless authorized by the agency official or a designee in additional specific conditions associated with this permit.

☒ e. Permittee shall take precautions to protect livestock, wildlife, the public, or other users of the public lands from accidental injury in any excavation unit.

☒ f. Permittee shall not conduct any flint knapping or lithic replication experiments at any archeological site, aboriginal quarry source, or non-site location that might be mistaken for an archeological site as a result of such experiments.

☒ g. Permittee shall perform the fieldwork authorized in this permit in a way that does not impede or interfere with other legitimate uses of the public lands, except when the authorized officer specifically provides otherwise.

☒ h. Permittee shall restrict vehicular activity to existing roads and trails unless the authorized officer provides otherwise.

☒ i. Permittee shall keep disturbance to the minimum area consistent with the nature and purpose of the fieldwork.

☒ j. Permittee shall not cut or otherwise damage living trees unless the authorized officer gives permission.

☒ k. Permittee shall take precautions at all times to prevent wildfire. Permittee shall be held responsible for suppression costs for any fires on public lands caused by the permittee's negligence. Permittee may not burn debris without the authorized officer's specific permission.

☒ l. Permittee shall conduct all operations in such a manner as to prevent or minimize scarring and erosion of the land, pollution of the water resources, and damage to the watershed.

☒ m. Permittee shall not disturb resource management facilities within the permit area, such as fences, reservoirs, and other improvements, without the authorized officer's approval. Where disturbance is necessary, permittee shall return the facility to its prior condition, as determined by the authorized officer.

☒ n. Permittee shall remove temporary stakes and/or flagging, which the permittee has installed, upon completion of fieldwork.

☒ o. Permittee shall clean all camp and work areas before leaving the permit area. Permittee shall take precautions to prevent littering or pollution on public lands, waterways, and adjoining properties. Refuse shall be carried out and deposited in approved disposal areas.

☐ p. Permittee shall submit the preliminary report within _____ days/weeks of completion of any episode of fieldwork..

☐ q. Permittee shall submit the final report within _____ days/weeks/months after completion of fieldwork..

☐ r. Permittee shall submit progress reports every _____ months over the duration of the project.

☒ s. California special permit conditions are attached.

Special Permit Conditions Continuation Sheet: California Conditions

- a. Work under this permit is limited to specific service approved for each permit. This may consist of non-collection survey, limited testing to determine site content and limits or extensive testing emergency excavation and/or salvage projects. Testing/ excavation projects may be conducted under the authority of this permit only upon completion of ARPA consultation with Native American Groups and written approval from the Bureau for such work. (CARIDAPs for the purpose of the identification of archaeological resources are authorized under a FLPMA/ARPA Permit).
- b. Permittees shall verbally and subsequently in writing contact the appropriate BLM Field Manager prior to the beginning of each of his field operations (with follow-up written notification) to inform the BLM of specific work to be conducted. At this time, the BLM Field Manager may impose additional stipulation as deemed necessary to provide for the protection and management of resource values in the general site or project area.
- c. All cultural artifacts and other related materials such as notes, photographs, etc., acquired under the provisions of this permit **remain the property of the United States Government and may be recalled at any time for the use of the Department of the interior or other agencies of the Federal Government.** Cultural materials collected under the provisions of this permit must be curated at a repository approved by the BLM. Curation shall be at a local qualified repository, if feasible, and an approved curation facility shall be designated prior to all field projects. An itemized list of all materials with accession numbers, curated at the repository will be submitted to the State Office and to the appropriate Field Office within 180 days of the completion of individual field projects. A copy of a receipt from the curation facility must be submitted with the list or catalogue.
- d. Permittees shall acquire a primary number from the appropriate Information Center for each cultural resource documented while undertaking work authorized by this permit.
- e. The BLM Field Manager or authorized representative may require a monthly letter progress report outlining what was accomplished. This report, if required, is due by the fifth day of the following month, unless different arrangements are approved.
- f. The individual(s) in direct charge must be academically qualified and possess adequate field experience. At least two weeks prior to initiation field work, the permittees must provide the BLM Field Manager with the vitae of individuals proposed to be in direct charge if not approved at the time of permit issuance. A list of field crew members should be submitted at the same time. Only the individual(s) listed in Item No. 8 of the permit is/are authorized to be in direct charge of field work conducted under this permit.
- g. The person(s) in direct charge of field work, shall be on site at all times when work is in progress. Failure to comply with permit stipulations will result in removal of subject's name(s) from the approved list of person-in-direct-charge.
- h. Care should be exercised to avoid directly or indirectly increasing access or potential vandalism to sensitive sites.
- i. All National Permit Stipulations are binding. The authority for issuing permits in the Bureau of Land Management rests solely with the State Director as Delegated by the Secretary of the Interior and all further delegation is prohibited by Secretarial Order. No Modification of National Permit Conditions 8 or 9 or of the California Special Permit Conditions may occur except by written decision of the State Director.
- j. The Bureau of Land Management shall be cited in any report of work done under this permit, including publications such as books, news articles and scientific publications, as well as oral reports, films, television programs, and presentations in other media.

By signing below, I, the Principal Investigator, acknowledge that I have read and understand the Permit for Archeological Investigations and agree to its terms and conditions as evidenced by my signature below and initiation of work or other activities under the authority of this permit.

APPENDIX C: MONITORING REQUIREMENTS BY WORK LOCATION

Segment	Geologic Unit	Paleontological Potential (PFYC)	Paleontological Requirements
ca-06	Qr: Alluvium of the modern Colorado River flood plain (Holocene)	Class 2 - Low	Part-time monitoring during excavations 10 feet deep or greater
	Qpv: Alluvial deposits of Palo Verde Mesa (Pleistocene)	Class 3 - Moderate	Full-time monitoring
ca-07	Qa6: Alluvial-fan and alluvial-valley deposits, Unit 6 (Holocene)	Class 2 - Low	Part-time monitoring during excavations 10 feet deep or greater
	Qpv: Alluvial deposits of Palo Verde Mesa (Pleistocene)	Class 3 - Moderate	Full-time monitoring
ca-09	Qa6: Alluvial-fan and alluvial-valley deposits, Unit 6 (Holocene)	Class 2 - Low	Part-time monitoring during excavations 10 feet deep or greater
	Qs: Eolian sand (Holocene)	Class 2 - Low	Part-time monitoring during excavations 10 feet deep or greater
cb-01	QTa: Alluvial fan and fluvial deposits (Quaternary and Tertiary?)	Class 3 - Moderate	Full-time monitoring
	Jv: Volcanic rocks of the Dome Rock sequence (Jurassic)	Class 1 - Very Low	No monitoring
cb-02	QTa: Alluvial fan and fluvial deposits (Quaternary and Tertiary?)	Class 3 - Moderate	Full-time monitoring
	Jv: Volcanic rocks of the Dome Rock sequence (Jurassic)	Class 1 - Very Low	No monitoring
cb-03	QTdf: Dissected fan deposits (Quaternary or Tertiary)	Class 3 - Moderate	Full-time monitoring
	Qw: Alluvium of modern washes (Quaternary)	Class 2 - Low	Part-time monitoring during excavations 10 feet deep or greater
	Jv: Volcanic rocks of the Dome Rock sequence (Jurassic)	Class 1 - Very Low	No monitoring
	Jvbu: Volcanic rocks of the Dome Rock sequence, upper bedded unit (Jurassic)	Class 1 - Very Low	No monitoring
	QTa: Alluvial fan and fluvial deposits (Quaternary and Tertiary?)	Class 3 - Moderate	Full-time monitoring
cb-04	QTa: Alluvial fan and fluvial deposits (Quaternary and Tertiary?)	Class 3 - Moderate	Full-time monitoring
	Jv: Volcanic rocks of the Dome Rock sequence (Jurassic)	Class 1 - Very Low	No monitoring
	QTdf: Dissected fan deposits (Quaternary or Tertiary)	Class 3 - Moderate	Full-time monitoring
cb-05	QTa: Alluvial fan and fluvial deposits (Quaternary and Tertiary?)	Class 3 - Moderate	Full-time monitoring
	Tf: Fanglomerate, sedimentary breccia, and slide blocks (Miocene and Oligocene?)	Class U - Unknown Potential	Part-time monitoring during excavations (no depth threshold)

Paleo Solutions Inc
911 South Primrose Avenue, Unit J
Monrovia, CA 91016

Attn: Jennifer Kelly, Assistant Project Manager

Subject: Acceptance of fossil vertebrate remains from Paleontological Mitigation Related Projects on Bureau of Land Management properties in California

Dear Jennifer:

This letter will confirm our conditions regarding acceptance of the fossil vertebrate remains from Paleontological Mitigation Related Projects on Bureau of Land Management properties in California by the Department of Vertebrate Paleontology of the Natural History Museum of Los Angeles County [LACM-VP]. The Department is willing to consider accepting the collection(s) if all the following conditions are met:

All localities must be described according the standard format used on the LACM-VP locality form, including a description of the geographic position, lithology, stratigraphy, and depositional environment if known.

All localities must be plotted on standard USGS topographic maps.

All specimens must be fully stabilized and prepared.

All specimens must be designated in such a way as to directly tie them to the localities described above.

All specimens must be identified to the lowest taxonomic level possible.

The collection must be accompanied by both printed and digital copies of any field notes and mitigation or salvage reports.

The collection must be accompanied by a deed-of-gift or letter of transmittal giving free and clear title of the collection to the Natural History Museum of Los Angeles County.

The collection must be accompanied by specimen cabinets, drawers and trays similar to those used by the LACM-VP. This requirement is waved for a relatively small collection.

We estimate our costs for curation tasks for the localities described above, as well as the actual cataloguing of the specimens including placing the numbers on the bones, at $20 per locality and $15 per specimen. We further estimate our costs for the permanent storage and maintenance of a collection at $300 per cubic foot of fully prepared vertebrate fossils. If the equipment and supplies, including specimen cabinets, drawers, and trays, as well as the curation tasks for localities and specimens, are not provided by the donor, then we would greatly appreciate a donation to offset our costs. Any donation must be accompanied by a letter clearly stating that the donation is to be used solely for the permanent curation and storage of a specific collection of vertebrate fossils.

Sincerely,

Samuel A. McLeod

Samuel A. McLeod, Ph.D.
Vertebrate Paleontology

APPENDIX E: PALEONTOLOGICAL RESOURCES MITIGATION MEASURES

- APM PALEO-01: Paleontological Resources Treatment Plan. DCRT would prepare a Paleontological Resources Treatment Plan that would describe procedures to be followed in the event of the discovery of paleontological resources during implementation of the Project. Upon approval of the draft plan, DCRT would follow the procedures set forth in that Plan during implementation of the Project.

- BMP PALEO-02: Paleontological Resources Monitor. A qualified paleontologist would provide monitoring for paleontological resources during construction in areas of high or unknown fossil potential.

- MM CUL-CEQA-3 Protect Paleontological Resources. The mitigation actions required by APM PALEO-01 and BMP PALEO-02 shall be accomplished by following the guidance within BLM IM 2009-11, which the CPUC has accepted as appropriate for CEQA (DRECP EIS/EIR). The following steps should be taken:
    - Project developers shall document in a paleontological resources assessment report whether paleontological resources exist in a project area on the basis of the following: the geologic context of the region and site and its potential to contain paleontological resources (including the PFYCs on site), a records search of institutions holding paleontological collections from California desert regions, a review of published and unpublished literature for past paleontological finds in the area, and coordination with paleontological researchers working locally in potentially affected geographic areas (or studying similar geologic strata).
    - If the PFYC (or PFYCs) of the geologic units to be encountered during project construction has not been determined, the project developer shall use the best available data and field surveys, as applicable, to develop a site-specific map of the PFYC ratings. The PFYC map shall be at a scale equal to or more detailed than 1:100,000. Depending on the extent of existing information available and the sensitivity of the site, development of the resource assessment and PFYC map could require the completion of a paleontological survey.
    - If paleontological resources are present at the site or if the geologic units to be encountered by the project (at the surface or the subsurface) have a PFYC Class of 3, 4, or 5, a Paleontological Resources Management Plan shall be developed. The elements of the plan shall be consistent with BLM IM 2009-11 and shall be prepared and implemented by a professional paleontologist as defined under Secretary of the Department of the Interior Standards. The plan shall include the following:
        - The qualifications of the principal investigator and monitoring personnel
        - Construction crew awareness training content, procedures, and requirements
        - Any measures to prevent potential looting, vandalism, or erosion impacts
        - The location, frequency, and schedule for on-site monitoring activities
        - Criteria for identifying and evaluating potential fossil specimens or localities

- A plan for the use of protective barriers and signs, or implementation of other physical or administrative protection measures
- Collection and salvage procedures
- Identification of an institution or museum willing and able to accept any fossils discovered
- Compliance monitoring and reporting procedures

- The Paleontological Resources Management Plan shall also identify if all geologic units that would be affected by the project have been determined to be within an area with a PFYC Class of 1 or 2, the lead agency shall include paleontological resources as an element in construction worker awareness training and shall include measures to be followed in the event of unanticipated discoveries, including suspension of construction activities in the vicinity. The measure shall stipulate that the site be protected from further earth moving or damage until a qualified paleontologist can assess the significance and importance of the find and until the fossil specimen or locality can be recorded and salvaged, if necessary.

- The Paleontological Resources Management Plan shall evaluate all of the construction methodologies proposed on a site, including destructive excavation techniques. Where applicable, the principal investigator shall include in the plan an evaluation of the potential for such techniques to disturb or destroy paleontological resources, an evaluation of whether loss of such fossils would represent a significant impact, and discussion of mitigation or compensatory measures (such as recordation/recovery of similar resources elsewhere on the site) that are necessary to avoid or substantially reduce the impact.

This page intentionally left blank.

1 Introduction

This Fire Protection and Prevention Plan (Plan) describes the measures to be taken by Delaney Colorado River Transmission, LLC (DCRT or Proponent) and its Construction Contractor(s) to ensure fire prevention and suppression measures are carried out in accordance with federal, state, and local regulations for the Ten West Link Transmission Project (Project or Ten West Link). Measures identified in this Plan apply to work within the Project area defined as the right-of-way (ROW); access roads; temporary work and storage areas; and other areas used during construction, operation, maintenance, and decommissioning of the Project.

1.1 Plan Purpose

The purpose of the Plan is to provide safe procedural practices, environmental protection measures, and other specific stipulations and methods to prevent and respond to fires during construction and operation of the Project. The final Plan will provide construction crews, environmental monitors, the Construction Contractor's Fire Marshal, and Compliance Inspection Contractor (CIC) with Project-specific information concerning fire protection procedures. The detailed final Plan will define fire prevention practices, establish fire protection requirements, control of combustible materials and flammable liquids and establish communication for agency responses in the event of a fire. Procedures in this Plan will apply to all land jurisdictions.

2 Regulatory Compliance

The Bureau of Land Management (BLM) requires holders of ROW grants to prepare a Fire Protection and Prevention Plan and adhere to its requirements during construction. The Project will be subject to state, county and federally enforced laws, ordinances, rules and regulations that pertain to fire prevention and suppression activities. Key regulatory agencies include the BLM, Blythe Fire Departments, California Department of Forestry and Fire Protection, and Maricopa, La Paz, Yuma, and Riverside County Fire Districts near the Project area.

3 Responsibilities

3.1 Project Proponent

DCRT and its' contractors are responsible for identifying fire prevention measures, monitoring adherence to fire protection protocols, developing emergency response procedures and communicating this information to Project personnel. To facilitate this goal, DCRT, through its Project Manager and Environmental Compliance Manager, will maintain regular and consistent communication with the Construction Contractor's Fire Marshal, CIC, environmental inspectors and Construction Contractor(s) to implement fire prevention measures and response to fire incidents throughout the construction process. In the event of a fire, the BLM Fire Management Officer (FMO), Construction Contractor's personnel, operations and maintenance crews (as applicable), DCRT Project Manager, and local fire departments would be involved in the emergency response.

3.2 Bureau of Land Management and Other Land Jurisdictions

The BLM FMO will oversee all fire control activities in his/her administrative unit. The FMO will coordinate with the CIC and/or BLM Authorized Officer in the event of a fire to review follow-up reporting and suggested adaptive management measures. All wildfires will be managed in accordance with the BLM's Phoenix District Fire Management Plan and California Desert District Fire Management Plan.

Procedures in this Plan will apply to all land jurisdictions within the Project area.

3.3 Compliance Inspection Contractor

In the event of a fire on BLM land, and all other land jurisdictions, the CIC will report the incident to the Prescott Dispatch Center, Federal Interagency Communication Center, and Perris Emergency Coordination Center and assist with follow-up investigations of the incident with the FMO, Construction Contractor's Fire Marshal, and BLM Authorized Officer.

3.4 Construction Contractor

Fire prevention measures identified in this Fire Protection and Prevention Plan will be implemented and adhered to by all construction personnel, operation and maintenance personnel, and decommissioning personnel. Contractor(s) will provide fire suppression training and equipment to their employees to prevent or minimize the spreading of fires that may occur. Training should include identifying predetermined locations for employees to assemble should a fire occur that cannot be safely controlled with the personnel and resources available.

During Project construction, the contractor(s) will be responsible for fire prevention, initial fire suppression actions and rehabilitation as directed by the DCRT Project Manager. Fires resulting from contractor activities, occurring in or out of the Project area, will be addressed immediately, in a manner that protects personnel safety. In the event of a fire, it will be the responsibility of the Construction Contractor(s) to respond to the incident and report to the DCRT Project Manager, CIC, Environmental Compliance Manager and the Construction Contractor's Fire Marshal. The Construction Contractor(s) will be responsible for any fire started, in or out of the Project area, by its employees or operations during construction as well as for fire suppression and rehabilitation. The Construction Contractor(s) will take aggressive action to prevent and suppress fires on, and adjacent to, the Project area and will utilize personnel and equipment for fighting fires within the Project area. If a fire is started by construction crews and can be adequately and sufficiently put out with the tools on-site then crews will do so, if the fire spreads quicker than expected the first concern is personnel safety and the site should be evacuated. The site should also be evacuated if the fire is exceptionally hot or has toxic fumes. Project personnel will not fight large fires with water trucks or equipment unless instructed by the BLM or emergency crews. On-site Project water trucks will be used for fire control if requested by the BLM or emergency crews.

Specific construction-related activities and safety measures will be implemented during construction of the transmission line to prevent fires and to ensure quick response and suppression in the event a fire occurs as specified in this Fire Protection and Prevention Plan. Fire prevention and protection measures shall be utilized for construction, reclamation, operation and maintenance and decommissioning if needed.

3.4.1 Construction Contractor's Fire Marshal

Each Construction Contractor will identify a Fire Marshal for the transmission line construction project. A Fire Marshal(s) shall be dedicated for construction, reclamation, operation and maintenance, and decommissioning if needed. The Fire Marshal's responsibilities include the following:

- Participate in communications with the CIC.
- Issue current fire potential and fire safety warnings.
- Perform inspections of contractor storage areas, especially areas where flammable materials are stored, to ensure safety measures are being followed.
- Perform corrective actions when fire protection requirements are not in compliance.
- Inspect tools, first-aid supplies and fire suppression equipment to ensure readiness in the event of an emergency.
- Post smoking and fire rules at centrally visible locations.
- Identify activities that present fire risk, issue warnings as appropriate and communicate prevention strategies to construction personnel.
- Communicate activities that must be limited or modified during periods of increased fire danger.
- Periodically conduct briefings for personnel to remind of the requirements of the Fire Protection and Prevention Plan.
- Enforce Project rules on smoking in the Project area, including prohibiting smoking in areas other than those designated by the BLM.
- Report all wildfires in accordance with the notification procedures described in the notification section (below).
- Report fires to 911 first and then to the CIC, and DCRT Project Manager in accordance with the notification procedures identified in this Plan.
- Coordinate initial response to contractor-caused fires with the Project areas. Suppression activities should be continued until fire response agencies have arrived and taken control of the site. Fire suppression personnel and equipment, including water trucks, will be dispatched within 15 minutes from the time a fire is reported.
- Assist with follow-up investigations of the fire incident with the CIC, FMO, and DCRT Project Manager as needed. Provide adaptive management measures, as necessary, to prevent future fire incidents.
- Manage rehabilitation efforts in accordance with BLM and DCRT directives.

3.4.2 Contractor Employees

The Contractor Employees' responsibilities include the following:

- Be familiar with and implement fire prevention measures included in this Fire Protection and Prevention Plan.
- Communicate any concerns regarding fire risks to your company's Fire Marshal.
- In the event of a fire, immediately call 911, then notify the Contractor Project Manager and CIC and initiate fire suppression activities is accordance with your level of emergency response training.
- Know the locations of Project tools, fire suppression equipment, first-aid kits and safety zone assembly areas.

4 Fire Prevention Plan

4.1 Preconstruction and Construction

The National Fire Protection Association codes and standards includes numerous documents which are applicable to this Project including, but not limited to the following:

- Standard for Electrical Safety in the Workplace
- Standard for Fire Prevention During Welding, Cutting, and Other Hot Work
- Standard for Safe Havens and Interchange Lots for Vehicles Transporting Explosives
- Recommended Practice on Static Electricity
- Standard for Portable Fire Extinguishers
- Standard for General Storage
- Standard for Wildfire Control

Methods and procedures to be implemented prior to and during construction, operation, maintenance, and termination of the Project to minimize the risk of fire are described in the following sections.

4.1.1 Training
